The Morovis Plan, intended for towns like Morovis, with no high school or transportation, was a system of free studies, with a student center for lectures, library with reference books, films, projector, and scientific apparatus for experiments and demonstrations. Each center had three teachers, one for languages and humanities, one for science and mathematics, and one for clerical work. The extension office gave examinations three times during the year, December 8 to 10, March 1 to 3, and May 23 to 28. In forthcoming years, the plan was extended to Rincón, Hormigueros, Cidra, and Las Marías. It was discontinued when high schools or transportation were provided for all towns.

Efraín Sánchez Hidalgo, 1957 to 1960

Upon the resignation of Mariano Villaronga on account of illness, Governor Luis Muñoz Marín appointed Efraín Sánchez Hidalgo as secretary of education. A professor of educational psychology at the University of Puerto Rico, Dr. Hidalgo was a veteran of World War II and earned his Ph.D. from Columbia University (66).

Governor Muñoz Marín was very much concerned with the role of education in his economic and political programs. The economists supplied by "Fomento," the Puerto Rico Development Agency, had presented their ideas, and he had discussed them with Everett Reimer, secretary of the Committee for Human Resources, who was his personal adviser on education (67). The Puerto Rico
Planning Board, organized by Governor Tugwell in 1942, had become a successful brain trust and had increased its power and functions year by year. The Governor attempted to collect all the information necessary to make long-term plans for education.

In September 1957, the lower House of the Legislature passed a resolution ordering its public instruction committee to make an evaluation of the school system. Two months later, in a meeting of the Governor’s cabinet, with the secretary present, it was agreed that his office would also make investigations and prepare recommendations to attack vigorously the problems of student retention. These recommendations would include information on schoolrooms, transportation, scholarships, teachers, and all other factors that would lead to keeping students in the schools. Beresford L. Hayward, a young member of Chicago’s planning board, was brought to the department as planning consultant, and he submitted his report to Secretary Hidalgo in August 1958. This proved to be a very thorough study and is the beginning of what may be called the period of scientific educational reform.

One of the projects Dr. Hidalgo initiated almost as soon as he took charge of the department was known as a “Consultation of the People.” All public schools worked through the consultation to take the necessary measures to meet the needs pointed to in the survey. The secretary was able to offer preliminary optimistic results of this consultation in his annual report for 1957-58, but he resigned before he could apply the findings of the project to the reform itself.

In the fall of 1958, through the mediation of Professor Carl J. Friedrich, Governor Muñoz Marín contracted to bring three distinguished European professors to make another general survey and give advice and counsel to the secretary. The three distinguished educators, Christian Caselmann of the University of Heidelberg, Lamberto Borghi of the University of Florence, and Morten Bredsdorff of Teachers College of Vordinborg, Denmark, submitted their final report in May 1959. But these men continued to be vitally interested in the island’s education. Carl Friedrich delivered the university’s lectures in January 1958, published as a study of the political and juridical structure of the Commonwealth (68). Dr. Bredsdorff returned to Puerto Rico twice, during the summer of 1960 and during the summer of 1967.

In the meantime, in September 1958, the Legislature’s public instruction committee signed a contract with the Superior Council of Education (the University of Puerto Rico Board of Trustees) to make a survey of education in Puerto Rico, as ordered by the resolution it passed the previous year. Directed by Ismael Rodríguez Bou, a prolific writer and scholar and the permanent secretary of the “Consejo Superior de Enseñanza” (CSE), the council made one of the most thorough studies of education to this time. The report was published in three volumes by the University of Puerto Rico Press in June 1962 (69). Although this was the best work of its kind prepared in Puerto Rico, Rodríguez Bou continued to carry out many additional surveys (70).

Hayward’s survey, the one by Rodríguez Bou, and the European reports proved to be of paramount importance for the reform that has continued to be carried on under the present administration of Angel Quintero Alfaro. As Governor Muñoz Marín stated in his State of the Commonwealth message to the Legislature for 1960, he was proclaiming 1960-70 to be the Decade of Education.

Cándido Oliveras, 1960 to 1965

Cándido Oliveras succeeded Hidalgo in May 1960. Although he had been an instructor at the university, he was an economist and a public administrator rather than an educator. At the time of his appointment, Oliveras was president of the Planning Board and had held many important administrative positions in the government. He chose for his undersecretary a distinguished young professor of humanities, Angel Quintero Alfaro, a graduate of the University of Chicago and dean of the College of General Studies at the University of Puerto Rico.

The secretary and his assistant were reformers by nature and came to the department with the intention to carry through the reforms suggested by Hayward, the European professors, and the Superior Council. These recommendations would mean a complete overhaul of the system of public education in Puerto Rico. For instance, it would mean taking measures to retain students in the schools and continuing the work of improving and retaining teachers, fostering better community relations, instituting a program of scholarships, and building school facilities. It would require the use of teaching aids, such as machines and programmed instruction, to build a program of quality education.

Of great importance in the reform of Puerto Rico’s educational system was the idea that there should be an equalization of educational opportunities in rural and urban areas, as well as an effort to include more of the population. For instance, this would mean establishing nursery schools and kindergartens, improving the community education and adult education programs, and adding programs for retarded and gifted students. It also would cover increases in salaries and pensions, along with other marginal benefits, for the teachers. There would be a renewal of the second unit, and looming over all would be the language issue. The reform also would include administrative decentralization, with the establishment of local school boards. Many of these ideas had been advocated for years by the teachers association.

To carry out these reforms, Oliveras, backed and counseled by his undersecretary, Quintero Alfaro, instituted in September 1961 a series of meetings in the central office, beginning with a discussion of a philosophy of
education for Puerto Rico. This first meeting was held in
two sessions of about 3 hours each, with the Governor
present along with most of the leading educators on the
island. The subsequent meetings, all held in one session
each, discussed topics such as the curriculum, the student
body, teachers, planning, organization, and community
education.

Within 2 months after the discussions had been
started, Secretary Oliveras held one of the most interesting
and helpful seminars on language teaching in the history of
the island. Many distinguished scholars from abroad came
to Puerto Rico (71). These men, in cooperation with the
University of Puerto Rico professors and program directors
of the Department of Education, have been very influential
in improving language teaching. Professor Wallace Lambert
of McGill University returned later to work in the depart-
ment for a short time.

The secretary also inaugurated two other outstanding
activities: the establishment of exemplary schools and the
regionalization of administrative and supervisory functions.
These have been continued and improved upon since
Oliveras' term of office and are still in progress.

Fortunately, the secretary was strongly backed in all
of his efforts by Governor Muñoz Marín. In his message
to the Fourth Legislative Assembly in February 1964, the
Governor raised the issue of the purpose of the Common-
wealth and dedicated a long section to education. He stated
that the Puerto Rican purpose should transcend party lines
and should be affirmed by the people. He continued: "The
vitality of a people is the vitality of its collective pur-
pose . . . Material abundance, without moral and spiritual
excellence is not enough. Neither can the will of the people
be limited to the service of intangible concepts at the cost
of material well being."

In his speech, the Governor went on to explain six
points to implement the purpose, and the first was educa-
 tion. "Our attitude toward education and the teacher must
change in a revolutionary way . . . The country's educa-
tion needs a basic guide. No other more comprehensive and
simple than the Preamble to our Constitution" (72). He
stated that no child should be without school nor a school
without a complete curriculum or enough well-trained and
well-motivated teachers. A second goal should be an educa-
tion so personalized as to consider individual differences.
And third, he stated that education was a vital, never-
ending process. It must include libraries, museums, good
television, good radio, good cultural institutions, excellent
and abundant books at low prices, and all possible forms
and means for improving everybody's understanding, as
well as their life and their work for its sustenance.

Governor Luis Muñoz Marín stepped down in January
1965, after handpicking his successor, Governor Roberto
Sánchez Vilella. On February 1, 1965, the new Governor
appointed Angel Quintero Alfaro to succeed Oliveras as
secretary of education. Director Quintero then selected as
his subsecretary Pedro José Rivera, also a Ph.D. from the
University of Chicago and at the time dean of students at
the University of Puerto Rico. A good team, Quintero and
his subsecretary agreed wholeheartedly with the message on
education expressed by the former Governor and have
attempted to put it into practice.

To make universality a reality, the secretary has
attempted to expand opportunity from nursery schools to
adult and community education. He has organized work
camps, especially for dropouts of high school age, and re-
habilitation has been intensified and improved. A TV pro-
gram, added to the WIPR broadcasting station during the
term of Secretary Sánchez Hidalgo, has been expanded and
used to full advantage.

Quintero also has attempted to bring about more con-
tinuity in education by testing new techniques and organi-
zations to bridge the gaps between the different levels of
the system from elementary to college, and also between
schools and the community. This has meant developing a
flexibility so as not to limit the development of the gifted
students and perhaps will mean dropping the 6-3-3 organi-
zation for an alternative, such as the 6-6. It also means
utilizing the advanced placement plan.

Secretary Quintero agreed wholeheartedly with the
purpose of improving the quality of teaching in Puerto
Rico. This has meant installing modern teaching aids, such
as teaching machines and programmed instruction. A psychol-
ogist himself, the secretary is quite interested in the appli-
cation of new methods and technical devices evolving from
psychological research and experimentation. Teacher educa-
tion has been improved and coordinated with the schools
of education at the university and the colleges. Seminars have
been organized, and the department has arranged travel
abroad for teachers, directors, and supervisors. Top educa-
tors have come from abroad. The department also has
eliminated the double enrollment, increased the exemplary
schools, and used to best advantage the regional offices,
curriculum centers, centers of study and supervision, and
organizational guiding districts.

To ensure diversification, the department attempted
several projects to individualize training according to the
potential and ambition of each student from nursery to
college, including the retarded and the gifted. There also
was an effort to bring about equalization of facilities and
opportunities for the rural and urban zones, as well as an
equalization of opportunity for all. To implement these
programs, Dr. Quintero used all personnel and economic
resources at his command—insular, federal, and private
foundations—as well as all means and forms of instruction.
He disposed of a number of obsolete practices and created
and/or introduced new ones. In June 1965, commenting on
all aspects of his educational ideas, he stated: "A lot de-
pends on our resources . . . and also on the methods we
employ . . . If we use our imagination it (the problem of
double enrollment) can be solved in a decade" (73). He
stated that the goals of his administration would be won with better organization and improved communication between the teacher in the classroom and the department. He also hoped to upgrade the position of the teacher and to persuade more people to enter the profession. And, of course, he said he hoped for more and better materials and a greater use of facilities.

In projecting future plans, Dr. Quintero stated that he expects an itinerate principal to be available in every rural area as a nucleus for the more isolated schools, each nucleus including a second unit up to the ninth grade. He praised the exemplary schools as one of the outstanding projects, with more than 30 such schools constantly improving through tested materials, programs, and methods. There were already 9 secondary schools with 1,623 students and 13 vocational schools serving 18,000 students. There are vocational programs for young adults outside the school and special courses for commerce and industry enrolling 35,000 students annually.

The undersecretary, Pedro José Rivera, also has analyzed the advance in quantity and quality of the island's schools. He has stated that the goals cannot be accomplished if the educational program follows the traditional patterns and that the department must help the schools break obsolete forms of work, generate more successes in operations, and incorporate more stimulating ways of educational action to bring about offerings of a higher quality. This is being done and is now under trial.

The last statement of Quintero Alfaro concerning his educational policy is his Memorandum, April 23, 1968, addressed to all his teaching, supervisory, and technical staff. In this document, a summing up of the educational conference held in San Juan from April 8 to 10, he summarized not only his accomplishments, but also his projects to 1980.

The most important of his long list of recommendations concern preschool education (Head Start and education in the cradle) and postsecondary education, which means a widening of the program to embrace all the life of the citizen.

For the preschool period the secretary contemplates organizing a first cycle of education without grades, individualized by groups of teachers, for pupils between 4 and 8 years. The main purpose of this cycle is the global development of the child; his adaptation to the school environment; and the strengthening of his imagination, creativity, and liking for education. A thorough study of child rearing should be undertaken in three or six communities for ages 3 to 6 to guide preschool education.

The benefits of high school and postsecondary education should be extended to the rural zones. For these purposes the rural high school should be also a community center. A curriculum commission should be created composed of both educators and qualified citizens that will revise continually the educational program, from the second year of the child to postsecondary education.

These accomplishments and projections would never have been possible without federal support. For the year 1966-67, out of a total budget of $204,557,248, the federal sources contributed $40,238,450. For the year 1967-68, this contribution was increased to $44,769,701 (74).

Out of 46 possible activities using federal funds, 40 have been organized, among them six Job Corps in Vieques, Río Grande, Arecibo, Guayama, Juana Díaz, and Mayagüez. Also, a Center of Educational Opportunities has been operating in San Juan, with combined federal and insular funds, for dropouts of high school age. Up to the present, this center has been very successful. Federal resources have been of paramount importance in elimination of double enrollment, training of teaching personnel, strengthening of vocational education and rehabilitation, library service, production and distribution of textbooks and educational materials, the Head Start centers, utilization of mechanical aids and teaching machines, and courses for Civil Defense.

INTRODUCTION

Although Rhode Island is the smallest state in the Union — 200 Rhode Islands can be swallowed up in the massive State of Texas — it does bear, ironically enough, the longest official name: Rhode Island and Providence Plantations. And although its highest point (Jerimoth Hill) is only 812 feet above sea level, Rhode Island’s geographical dimensions do not diminish one whit its spirit and vision, for the history and heritage of Rhode Island are as rich and varied as its people and as solid and deep as the actual bedrock on which it stands. The long chronicle of Rhode Island men and women, of events and utterances and achievements, is an enduring testimony of its special endowments: Roger Williams, Anne Hutchinson, John Clarke, Nathanael Greene, Oliver Hazard Perry, Ambrose Burnside, Henry Barnard, Moses Brown, Samuel Slater, Gilbert Stuart, Nelson Aldrich, Theodore Francis Green, George M. Cohan, “Gabby” Hartnett, and “Nap” Lajoie are but a few of the worthies of the State of Rhode Island who have left their impress on the history of this state and nation. Even our little rooster, the Rhode Island Red, symbolizing the activity and the vitality of the state, has gained national renown.

Thus, as the history of education in Rhode Island is reviewed, there will be expressions of “firsts” which are made, not in the spirit of boastfulness, but in the spirit of forgivable pride, for the educational achievements of this state are fitting measurements of its historic and persistent eagerness to explore new avenues, new ideas, and new techniques. And as we attempt to present the development of education from 1900 to 1968, the hallmarks of education in Rhode Island prior to 1900 must be clearly identified mainly because the great body of legal structure established during this early period was to lay the foundation for future development.

EARLY COLONIAL PERIOD

The Charter of 1663 granted by King Charles II of England to the “English Colony of Rhode Island and Providence Plantations in New England in America” declared the intent of the colony “to hold forth a lively experiment that a most flourishing civil state may stand and best be maintained with a full liberty in religious concerns” (1). Three centuries later, one looks at these words now inscribed above the Rhode Island State House entrance and realizes with what penetrating prophecy they were to proclaim the story of this state.

As one notes the key role this state was to play in the establishment of an independent nation; in the development of a highly industrialized country; in the guarantee of religious freedom to all; in its contribution to art, to the theater, to sports, and in its leadership in the field of education, it is evident that Rhode Island has fulfilled its promise of a “lively experiment.”

Rhode Island did not follow the traditional pattern exhibited in other colonies where local units complied with laws on mandating schools that the various colonies had enacted. In this state, the towns and corporate groups established their own schools, and state legislation followed some years later. For example, the first statewide legislation in education did not appear until 1800; yet, as early as 1640, a public school system was being established in Newport. Indeed, Charles Carroll, author, historian, and educator, recorded Newport’s free public school as the first such system in all English America (2).

During the early colonial period, three basic types of schools were in operation in Rhode Island. The first kind was public schools supported wholly or in part by the individual towns through such practices as land grants for school sites; house lots for the schoolmaster; and tracts of land, the income from which provided support of the schools. In some communities, the town built the schoolhouse and leased or rented the facility to the schoolmaster. In still other districts, the town paid the schoolmaster wholly or in part to provide instruction to the children. Town records indicate that around 1750 Barrington, Bristol, Middletown, Newport, Portsmouth, Providence, and Warwick maintained public schools.

A second and more common type of school in the early colonial period was the private school. These schools were in the most part church-affiliated: Congregationalist
Episcopal, Baptist, Society of Friends, Jewish. Societies or individuals established and supported others.

The student of school law interested in the matter of public funds to support sectarian schools will find it worthy of mention that as early as 1790 the school committee of the town of Providence recommended that the town pay to the Society of Friends a share of the public school money for tuition purposes. However, there is no record that an appropriation was made to implement this plan.

A third type of school was the Dame School, an educational pattern derived from the English system in which, for a small fee, a woman of the neighborhood would give instruction in the fundamentals of reading, writing, arithmetic, and some “finishing” subjects to young children. It is only natural to assume that in this period many children of the wealthy families were instructed on a private tutorial basis.

First Statewide Legislation

To John Howland — barber, soldier with Washington at the Battle of Trenton, Providence town treasurer, member of the school committee, leader of civic and social groups — must go the major credit for the initial statewide legislation for public schools. As a leader of the Providence Association of Mechanics and Manufacturers, John Howland used the influence of this powerful organization to advocate free public schools. While Providence and a few other communities maintained free public schools around 1800, support and maintenance of the schools varied widely around the state, and the cry of unequal educational opportunity was not uncommon even in those days.

The extent of the state’s involvement in support of schools at that time was to exempt school property from taxation, to grant charters, and to permit local communities or groups to hold lotteries for construction and maintenance of schools. As early as 1764, permission was granted to hold a lottery to establish Rhode Island College in Warren. This institution moved to Providence in 1770 and developed into one of the nation’s greatest institutions of higher learning — Brown University.

A petition drafted by Howland and presented to the General Assembly in 1799 expressed concern —

That numbers of the rising generation whom nature has liberally endowed, are suffered to grow up in ignorance, when a common education would qualify them to act their parts in life with advantage to the public and reputation to themselves.

That in consequence of there being no legal provision for the establishment of schools, and for want of public attention and encouragement, this so essential part of our social duty is left to the partial patronage of individuals, whose cares do not extend beyond the limits of their own families, while numbers in every part of the state are deprived a privilege which it is the common right of every child to enjoy.

In Rhode Island, unlike the newly formed states of the Northwest territories (which enjoyed federally supported educational endowments), the traditional system of government existed for two centuries before public education was recognized as a general responsibility of the state.

Education received little public support before 1800. The schools were supported by individuals who leagued together for the common purpose of promoting education. It was more than a century and a half after the charter of Rhode Island was granted before the General Assembly assumed any degree of responsibility to promote public education through tax support.

In 1800, a law was passed making “free” schools mandatory and making local taxes permissive. In an attempt to make this new approach to education more palatable to the towns, the General Assembly provided state aid by remitting one-fifth of the taxes paid by the respective towns to the state. Apparently it was a tasteless dish, since few towns other than Providence and Smithfield showed any real effort to raise tax money for their schools. The law was repealed in 1803.

Still, the advocates of free schools, supported by the local press and key members of the General Assembly, continued to press for statewide legislation. It was not until 1828 that the assembly effected enduring legislation. It avoided mandating public schools, but it did permit the taxes for this purpose, limiting the amount that could be raised locally. This law provided “that the town meeting shall appoint a school committee to have the power to locate schools and make necessary rules and regulations.” What the General Assembly did, in effect, was to create state government machinery—the town school committee—and set it in motion, supplanting the interested groups that had formerly, and voluntarily, espoused the cause of education. Subsequently, Rhode Island adopted a constitution which, for the most part, made the General Assembly “a state school committee to promote for the whole State those functions which the law of 1828 had assigned to the new governmental agency, the town school committee.”

A school bill was enacted in 1828, but the final compromise produced not “free” schools but “public” schools. Public schools, while open to all children of the district, made certain charges, such as for tuition, books, and even maintenance of school property. The bill made provisions for an annual appropriation ($10,000) for support of public schools and for a permanent school fund.

A survey made by educator Oliver Angell in 1831 shows the effects of the Law of 1828. Some significant indications of improvements in this short period included the fact that the total number of schools had increased from 294 to 504, that the number of children receiving public
school instruction had increased from fewer than 1,400 to approximately 14,000, and that more than half the towns in the state (17 of 31) made local appropriations to supplement state assistance. It appears that the School Act of 1828 had made some notable improvements even though its critics bemoaned the fact that the legislation included no provision for collection of statistics or measurement of educational progress.

The period from 1828 to 1842 has been described as a critical period of adjustment in Rhode Island education, for the schools found themselves in strong competition with the industrial expansion. The textile industry, initiated through Samuel Slater's development of the first cotton spinning mill in America, was quick to recruit older boys and girls for service in the mills. The need for child labor laws was evident if school enrollments were not to stagnate. It should be of interest to school historians that Providence at this time conducted school on a year-round basis and that Providence, in 1839, appointed a professional superintendent of schools, Nathan Bishop, whom Gleeson described as "the first superintendent of schools to be appointed in America" (9).

In 1841 and 1842, Rhode Island found itself beset with political troubles as Thomas Wilson Dorr led a "people's revolt" against the "landholders" to establish a new constitution. Dorr's efforts to take over the state government were unsuccessful, but his agitation did produce a new constitution in 1842, which provided in Article XII:

Of Education

Section 1. The diffusion of knowledge, as well as of virtue, among the people being essential to the preservation of their rights and liberties, it shall be the duty of the General Assembly to promote public schools and to adopt all other means which they may deem necessary and proper to secure to the people the advantages and opportunities of education (10).

The Constitution of 1842 has prevailed to the present day with few revisions, although a constitutional convention assembled in 1967 to modernize the previous document.

A State System Established

In 1843, Wilkins Updike, a representative from South Kingstown, made a stirring plea before the General Assembly for a survey to be made of the schools of the state. Updike attacked the physical condition of schools, inadequacy of instruction, lack of uniformity of textbooks, and poor preparation of teachers. As a result, Governor James Fenner appointed Henry Barnard, fresh from his position as secretary of the school commissioners of Connecticut, to be state agent to perform the survey. Substantially, the plan underscored two principal considerations: an appraisal of the public schools and an awakening of public interest to promote better education. The study bore fruit, for the resultant Law of 1845, commonly called the Barnard Law, included measures for the improvement of education and for a state system of administration.

The Barnard Law provided for the appointment of a commissioner of public schools whose duties required him to "wear many hats" as an educational expert or adviser to the General Assembly, a publicity agent for maintaining public interest, an efficiency agent for projects for improvement of schools, an amiable counselor of school officials, the dispenser of state aid, a state superintendent of schools, an agent for training teachers, a school statistician, and a judicial officer. Because of the excellent survey Barnard made and the resulting rapport established with the General Assembly, it was only natural that this man, often called the "outstanding American educational reformer of the nineteenth century" (11), was appointed commissioner of public schools in 1845.

With the passage of the Barnard Law, the General Assembly had instituted a state system for administration and supervision of education. It provided, further, for the compulsory support of schools by towns, extended authority of school committees, certification of teachers, a minimum school year, school reports, and other measures for strengthening the quality of education, such as restriction on the size of classes. However, the law was not without its defects, as time would prove. The statute called for the creation of trustees in school districts, which was to bring about conflicts of authority. Also, the law made no provisions for compulsory attendance or an appropriation to train teachers. Giant strides had been made, nevertheless, in establishing the foundations for a state system of education that has carried to the present day.

Barnard's tenure of office lasted to 1849, at which time he resigned for reasons of ill health, but he was to earn the undying gratitude of a most appreciative state. Barnard later went on to even greater endeavors culminating with his selection as the first U.S. Commissioner of Education in 1867.

Elisha Reynolds Potter, who had been Henry Barnard's assistant and associate, succeeded to the position of commissioner in 1849. A resourceful and experienced lawyer and public officer, Commissioner Potter, in rewriting the Barnard Law in 1851, recast it into legal language, a change that tended to make the legislation more effective. Potter ably promoted the theories and general policies of Commissioner Barnard.

Through his efforts, after two unsuccessful ventures in private normal schools, a state-supported normal school for preparing teachers was established in 1854. He repressed agitation that might have precipitated a religious conflict in public education and that might have provoked as serious a controversy in Rhode Island as elsewhere. He was keenly aware of the significance of the commissioner's judicial authority and did much through exercise of this power to...
subsequently, as associate justice of the Supreme Court of Rhode Island, Potter wrote the opinion of the court in the Cottrell case, a decision which laid down the rule for the appellate jurisdiction of the commissioner. Realizing the importance of a close affiliation with the General Assembly as the repository of power through law to advance public education, he recommended in 1855 the establishment of a State Board of Education. He further advocated free schools, or the abolition of tuition (rate bills), and also free textbooks. During the Potter administration, which lasted until 1855, the state appropriation was increased from $25,000 to $50,000.

The decade from 1845 to 1855 was indeed one of phenomenal achievement and progress. The contributions of Barnard and Potter in establishing and fortifying the state system of education were to endure to the present time. The vision of Barnard and the judicial ability of Potter combined to establish a firm foundation on which to develop a sound educational system.

A Period of Consolidation

The 15-year period, 1855 to 1869, might best be described as a plateau period during which gains were consolidated. One explanation for the lack of new advances might be that the commissioners in these years were not as successful as their predecessors in promoting legislation and securing its passage.

Reverend Robert Allyn of East Greenwich succeeded Commissioner Potter and served from 1855 to 1858. His most significant service was an investigation of school enrollment, attendance, finance, and a detailed statistical report to the General Assembly. Reverend Allyn further sustained the judicial authority and made recommendations for free schools and free textbooks.

John Kingsbury served as commissioner in 1858-59. In his year of service, he visited schools and reported on conditions as he found them, thus affording a basis for comparison of schools with Barnard’s report.

Joshua B. Chapin was commissioner from 1859 to 1861 and again from 1863 to 1869. Henry Roussaniere was the interim commissioner from 1861 to 1863. Chapin strongly advocated the abolition of tuition and was rewarded when, in 1868, the General Assembly passed legislation to that end. It was Dr. Chapin who, fighting for equal status for women teachers, noted that “females have peculiar talent, and when properly educated, have greater power over the manners, morals, and minds of children” (12).

New Horizons

When Thomas W. Bicknell succeeded Dr. Chapin as commissioner in 1869, he restored vigorous leadership to the position. He immediately directed his efforts to the need for a State Board of Education, and the General Assembly responded in 1870 with such legislation. This new State Board of Education was made up of the Governor, lieutenant governor, and six members of the General Assembly, two from Providence County and one each from the other four counties. The board was empowered with “the general supervision and control of the public schools...with such high schools, normal schools, and normal institutions as are or may be established and maintained wholly or in part by the state...” (13). With Commissioner Bicknell as its counselor, the newly created state board was successful in achieving mandatory supervision, town appropriations to equal state appropriations, truancy legislation, support for evening schools, and free public libraries. Among Commissioner Bicknell’s most active campaigns at the time of his resignation in 1875 was his fight for the eradication of illiteracy.

Thomas B. Stockwell served as commissioner from 1875 to 1905, a period equal to the combined terms of all his predecessors. Supported vigorously by the state board, Stockwell continued the campaign against illiteracy. Fighting for compulsory attendance laws, Commissioner Stockwell, following the axiom of Horace Mann that every child has a right to education, advocated that society had a right to demand that every child be educated. His efforts led to a gradual succession of truancy laws, child labor laws, and, finally, compulsory attendance statutes.

During his tenure, Stockwell also was instrumental in securing legislation in the areas of school census, state support for secondary schools, free textbooks, increased supervision of schools, consolidation of schools, and state certification of teachers. A telling piece of legislation, passed in 1904, abolished the practice, instituted by the Barnard Law of 1845, of establishing multiple school districts in a community and centralized the control and operation of schools under school committees. Five years after the passage of the Barnard Law, there were 322 school districts in Rhode Island, and final abolition of this fragmentation of school control was slow in developing. The Rhode Island College of Agriculture and Mechanic Arts, the Rhode Island Institute for the Deaf, the Rhode Island School of Design, and the State and Home School all were founded during Stockwell’s tenure. Among Stockwell’s noteworthy achievements was his publication of A History of Public Education in Rhode Island, which has served as a work of reference to students of early Rhode Island history.

In summary, this chapter has attempted to outline the major developments leading to the establishment of a state system of administration of free public education through a State Board of Education, a commissioner of public schools, local school committees in charge of town systems, and school superintendents.
As of 1900, the state board and the commissioner of public schools had the following responsibilities:

**Board of Education**

- To maintain general supervision and control of the public schools of the state
- To prescribe and cause to be enforced all rules and regulations necessary to carrying into effect the laws in relation to public schools
- To serve with the commissioner of public schools as a board of trustees, to manage the Rhode Island Normal School, admit students thereto, and pay the traveling expenses of students
- To elect the commissioner of public schools
- To supervise the education of deaf, blind, and imbecile children of school age
- To examine teachers and issue certificates of qualification and eligibility to teach
- To approve courses of study in high schools and standards for high schools as conditions precedent to payment of state aid to high schools
- To apportion the state's appropriation of teachers' money
- To provide teachers institutes
- To hear and decide appeals in disputes arising under school law
- To supervise the public schools generally
- To direct courses of study prescribed by town school committees
- To serve as ex officio secretary of the State Board of Education
- To report annually to the State Board of Education
- To serve as a member of the board of trustees of the Rhode Island Normal School.

Clearly it is evident that a strong foundation for free public education has been established through the administrative echelons of authority, local and state financial assistance to public schools, free tuition, free textbooks, preparation and certification of teachers, and compulsory attendance laws.

**Commissioner of Public Schools**

- To visit as often as practicable every town in the state for the purpose of inspecting the schools and diffusing as widely as possible—by public addresses and personal communication with school officers, teachers, and parents—a knowledge of the defects and desirable improvements in the administration of the system and the government and instruction of the schools
- To apportion the state's appropriation of teachers' money
- To provide teachers institutes
- To hear and decide appeals in disputes arising under school law
- To supervise the public schools generally
- To direct courses of study prescribed by town school committees
- To serve as ex officio secretary of the State Board of Education
- To report annually to the State Board of Education
- To serve as a member of the board of trustees of the Rhode Island Normal School.

At the turn of the century, the 37 local governmental units in the state employed approximately 2,000 teachers and provided free public education to slightly over 70,000 pupils. Total expenditures for schools amounted to $1.5 million. While public secondary education had not as yet been mandated, 19 public high schools were in operation. In addition, the private and parochial school enrollments totaled approximately 15,000. A number of private academies and private schools, such as the Moses Brown School, LaSalle Academy, East Greenwich Academy, St. Mary's Seminary, Elmhurst Academy, and Lapham Institute, provided secondary education.

The population of the state at this time numbered 428,556, of whom approximately 30 percent were foreign-born. Rhode Island was indeed a melting pot, giving haven and opportunity to thousands of Irish, Italians, French-Canadians, Poles, Portuguese, and others, most of whom were absorbed into the labor force of the rapidly expanding industries of the state. The ethnic diversity of the state can best be characterized by a statement of Stuart Hale, the Providence Journal-Bulletin staff writer:

> Take a staid, industrious Yankee town. Add a full measure of sturdy Italian stock and blend in liberal amounts from the Emerald Isle (remove the brogue, but slowly). Sprinkle with honest Polish faces (leaving in the polkas), and the sons and daughters of French Canada. Spice with the products of Portugal, Greece, Armenia, and other warm lands. Stir well and serve...that's Providence (14).

In such a rich milieu, it was only natural for the schools to play a meaningful role in providing a basic education to the growing population. However, the problems of the schools of the state were many. Among the most pressing were the problems of school finance; the extension of free education to all through the secondary grades; the many problems involving teacher welfare, such as salaries, tenure, pensions, and professional improvement; the extension of the school year; the need for a drastic reduction of school districts; and provisions for the safety and health of schoolchildren.

**The Ranger Era: 1905-35**

As was noted in the previous section, the district system within towns was abolished, and the centralization of school management under one school committee was accomplished by Commissioner Stockwell in 1904. His successor, Walter E. Ranger, led the way to a new era of school improvements. Walter E. Ranger came to Rhode Island from Vermont, where he had served as state superintendent of schools. His strong background and experience...
In his first year of service, Commissioner Ranger undertook a general survey of schools. In his second year, he produced a monumental report recommending pensions for teachers, a state system of traveling libraries, a state home and school for the feeble-minded, state certification of superintendents, extension of high school education, industrial and trade education, improved school sanitation, reasonable tenure for teachers, and a summer school for teachers. During the course of the term of his office, Commissioner Ranger was able to see these vital educational matters and many other recommendations he had proposed enacted into law.

Concern for the improvement of teachers' professional preparation and economic status resulted in legislation dealing with state certification, pensions, minimum salary, and professional improvement programs. The "uniform high standard" Act of 1898, which was the culmination of an extensive state board report on education in the state as requested in a 1906 General Assembly resolution, had placed the authority of certification in the State Board of Education instead of in districts, school committees, and teacher-training institutions. The board established four grades of certificates and moved gradually toward the upgrading of teachers through higher standards.

In 1903, the commissioner of public schools was granted authority to withhold an amount of state school money equal to the wages paid by any town to a teacher without a state certificate, thereby permitting district enforcement of the certification statutes. Through a succession of revisions of standards over the years — with major revisions in 1909, 1923, 1938, 1951, and 1964 — the level of teacher standards has increased to the stage where at the present time all teachers at both elementary and secondary levels must obtain a master's degree within a period of 6 years following receipt of the provisional certificate. (Chart I of Appendix B shows in graphic form the dramatic upgrading of preparation of teachers from 1900 to 1960.)

Rhode Island has been among the leaders in the certification movement throughout the years and has eagerly participated in reciprocity compacts as established in 1948 among 8 states in the Northeast and later expanded to a total of 11 states for the purpose of easy mobility of teachers across state lines. The department has sought and cooperated in the NCATE movement to extend this same philosophy even beyond the 11-state boundaries and looks hopefully toward the most recent efforts of establishing a policy of reciprocity for all 50 states.

As a companion measure to certification standards, Ranger advocated extension education of teachers through courses at the Rhode Island Normal School and the Rhode Island School of Design, and through the Graduate Department of Education at Brown University. In 1916, a study of state normal schools by the National Bureau of Education gave special commendation to the normal school for its excellent undergraduate program for preparation of teachers. In 1920, Rhode Island Normal School developed a full 4-year program and changed its name to the Rhode Island College of Education; in 1959, it attained its current status as Rhode Island College.

Concern for teacher welfare prompted Ranger to advocate teacher pensions and minimum salary laws. In 1907, legislation was enacted providing for pensions of up to $500 per year to any person 60 years old who had been a teacher for 35 years, 25 of which had to be in the public schools of the state. Modifications in later years were to provide for disability pensions and less stringent requirements to qualify for a pension. The notable feature of this pension program was that it was supported wholly by the state.

Minimum salary for teachers was one of the original 10 points recommended by Ranger in his report to the General Assembly in 1906. While this recommendation had been made by several of the previous commissioners, no legislation was enacted until 1909 when the assembly provided that "the annual salary of a teacher regularly employed in any public school of the state shall not be less than $400" (15). (The average salary at that time was $681.) It further provided state reimbursement to towns on a matching basis for the expense of meeting this requirement.

This statute was instrumental in lengthening the school year because in some communities the school committees determined that the increasing of annual salary need not increase the weekly wage and construed the statute to justify a lengthening of the school year. At the time of the Barnard Law in 1845, the school year varied throughout the state from 4 months in some communities to a full year in Providence. The Barnard Law established a minimum of 4 months of school, and in 1872 the minimum was increased to 6 months. In 1871, the average school year in Rhode Island was 35 weeks, the longest in New England. In 1895, it reached 189 days, and by 1915 it was 195 days. In 1914, the minimum school year became 36 weeks, and in 1917 it became 180 days.

At the recommendation of Commissioner Ranger, the General Assembly in 1909 increased state aid to communities providing secondary schools and mandated that any town not maintaining a high school must make provision at the expense of the town for the free attendance of its children at some approved high school or academy. This statute made it obligatory to provide a high school education. In 1914, the state board established minimum requirements for approval of high schools in order to qualify for state aid. It also appointed an inspector of high schools to visit and examine the schools. The criteria for approval included a school calendar of at least 38 weeks; a faculty of three or more teachers, with a ratio of at least one teacher for every 30 students; a teacher load of not more than 5 hours of instruction time excluding other duties; proper certification of teachers; a minimum of 15 units of study in
a 4-year course; adequate instructional equipment; a well-equipped library; and proper standards of admission, instruction, and discipline.

With the mandating of secondary school education, the state had now developed a full span of public-supported elementary, secondary, and college education. As was noted earlier, the Rhode Island Normal School was established in 1854 to provide for the preparation of teachers in the state schools. The school's present teacher preparation program dates back to 1871, as established under a board of trustees made up of the state board and the commissioner of public instruction. At the turn of the century, the enrollment of the school numbered 218 students.

The Rhode Island College of Agriculture and Mechanic Arts in Kingston provided for public education in the fields of agriculture, mechanical engineering, civil engineering, electrical engineering, 4-year teacher courses in applied science and home economics, and 2-year courses in agriculture and domestic science. This institution, established in 1892 with assistance from the Morrill (land grant) Act, was controlled by a board of seven members — the commissioner of public instruction, one member appointed by the State Board of Agriculture, and five members appointed by the Governor. In 1909, this institution, with an enrollment of 250, became the Rhode Island State College.

While the above data might indicate that attention during this period focused only on the development of a system of preparatory education for college, nothing could be further from the truth. The General Assembly in 1910 requested the commissioner of public schools to determine the status and needs of the state in respect to industrial, vocational, and agricultural education and to recommend improvements in these areas. Commissioner Ranger responded with a 100-page report indicating the status of such programs and recommended the establishment of an adult and state support for vocational education not only in regular day programs but also in adult evening schools. When the General Assembly responded with legislation providing financial assistance, Pawtucket, Central Falls, Warwick, and Westerly were among the first communities to avail themselves of it.

When the federal Vocational Education Act was passed in 1917, the recommendations of Commissioner Ranger and the action of the General Assembly placed Rhode Island in an advantageous position, because the machinery was already operational to implement its provisions.

The effect of the federal legislation in vocational education on the department structure is readily apparent as one notes the reorganization of the education department in 1930, which called for a commissioner of education (title changed in 1920) and abolished the position of assistant commissioner established in 1910. It established a vocational education division, an adult education division, and a research and studies division. The function of the last division was to audit financial accounts of school systems, to collate and summarize statistical reports, to direct research studies, and to survey school systems. The establishment of an adult education division can be attributed to Commissioner Ranger's efforts to promote Americanization and literacy classes as well as general adult educational improvement.

In 1922, a report made by a commission established to study educational problems led to the enactment of the Peck bill, which provided for financial support to local school districts on the basis of the number of schools, classrooms, and $1.50 per capita in average daily attendance. Among other provisions of this bill were the prohibition of commercial activities in schools and the approval of private schools by the state board instead of by local school committees. The proposal created considerable controversy and became an issue in the general state elections in that year. Although the legislation was enacted, the issue was far from dead, and in 1925 the power to approve or disapprove private schools was restored to the local school committees.

In his desire to improve the school environment and health services to schoolchildren, Commissioner Ranger successfully advocated state aid for medical inspections, dental inspections, physical education, sanitation standards, and safety measures. Coupled with new compulsory attendance measures, these recommendations resulted in substantial improvements in school conditions throughout the state.

In concern for the welfare of its adults as well as its youth, the State Board of Education, acting in its capacity as the State Board for Vocational Education, undertook a program of industrial vocational education in 1919 for the purpose of rehabilitating adults. Rhode Island thereby became one of the first states in the nation to undertake such a program. In 1920, federal legislation was introduced providing for vocational guidance and counseling services, vocational training, and maintenance and support for individuals qualifying for such services. When federal funds became available in 1921, a joint federal-state effort was established that has continued to the present day. Indeed, this state has developed such an extensive program of vocational rehabilitation that it ranks among the top six state agencies in the country in the percent of individuals restored to gainful self-sufficiency. In 1935, when the Board of Education was abolished, a separate Board for Vocational Education was created to meet the requirements of federal rehabilitation statutes.

On October 30, 1930, Commissioner Ranger was honored with a banquet on the completion of 25 years of service to this state. At this occasion, John J. Tigert, former U.S. Commissioner of Education, discussed the achievements of the Ranger era.

Reviewing the record of the Commissioner of Education of Rhode Island for this epoch in education, his administration parallels, if it does not transcend, the progress made in a national way ... He has been among the leaders, and in no one of the progressive measures
accomplished throughout the country has he ever failed to keep abreast in his home state . . . It is not possible to enumerate all the legislative measures that have been adopted in Rhode Island during this time . . .

Minimum employment age for children raised to 14 years
Enactment of the first teachers' pension law
A minimum salary law for teachers
State aid for medical inspection of school children
Compulsory school attendance for children up to sixteen years of age, unless the child is fifteen years old and employed
Physical education made mandatory.

Along the line of equalizing educational opportunities and the promotion of guidance and vocational work, Dr. Ranger has always interested himself in the success of these movements. He has made a notable contribution through his support of the Federal-State College at Kingston . . .

He secured also the establishment of the Exeter School for Feeble Minded . . .

He procured state aid for traveling libraries.

... the certificate law was extended to superintendents.

Other measures which have aided administration have been: the extension of the school census to cover ages four to twenty-one instead of five to fifteen years; the authorization of the survey of state school finances and administration, followed by a complete report and a division of survey and research established in the State Department of Education. Mention was made of the fact that training for citizenship has come to be a paramount objective in American education. So far as I know, Dr. Ranger was one of the first to lay stress at this point, and I am sure there is no one who has given more unstinted of time and effort to promote the teaching and training of good citizens. He secured legislation which required the principles of popular and representative government to be taught in all the schools of the state.

During his administration appropriations for schools have increased approximately 150 per cent. State aid has been greatly increased for high schools, and towns have been required to provide high school instruction. Appropriations have been secured for the provision of free state scholarships for post-graduate courses at Brown University, at Rhode Island School of Design, and in the Rhode Island College of Pharmacy. School committees of towns have been authorized to spend money at a rate established by preceding appropriation if the town meeting fails to appropriate for school purposes.

The name of the Rhode Island Normal School has been changed to the Rhode Island College of Education and larger appropriations have been secured. He has been a prime factor in the securing of new buildings for the Rhode Island College of Education and for the State College at Kingston (16).

Truly, Walter E. Ranger served Rhode Island well. He retired in 1935.

Rhode Island in the Depression

The stock market crash of 1929 and the consequent Depression created acute economic problems in Rhode Island. However, although many small businesses failed, the state's banks did not suffer any permanent failures (17).

In Rhode Island, as well as other parts of the country, federal agencies, such as the National Recovery Administration (NRA), the Works Progress Administration (WPA) and others, were organized and established to assist in the care and welfare of the unemployed.

With characteristic vigor, the state board struck a chord of municipal support of public schools in its annual report (1931) to the General Assembly. Despite economic depression, the statements and the sentiments of the board's report and those that followed it were consistently responsive to the needs of the schools. The report noted that the state had ample reason for legitimate pride in the fact that, while school budgets had been prepared with considerably more care than ever before, there had been little disposition to enforce a retrenchment at the expense of public education (18). The report particularly stressed the fact that curtailments in the field of education were unwise if for no other reason than the obvious one that educational losses were "irretrievable" (19). The report concludes with a rather incisive philosophical and practical observation that clearly exemplifies the fact that, even in the midst of such unsettled times as the Depression, the purpose and the dedication of those entrusted with the vital matter of the education of its youth stood unshaken: "There remains only a remote possibility, an almost certain impossibility, that a child's loss of opportunity for education can be recouped. No community can afford to save money at the expense of the education of the rising generation" (20).

According to the report made at the end of the fiscal year 1931-32, Rhode Island was one of only a very few states which remained able to report, in a roll call of the states, "all schools open, and all school terms maintained" (21). Furthermore, although the rate of increase had lost the acceleration of earlier years, Rhode Island still could report a slight gain in expenditures for current maintenance of school (22). The report also noted, however, that Rhode Island was not without its dislocations and curtailments in the educational crisis that had gripped the nation during those dark days after 1929. Rigid cutbacks in a program of new buildings were effected, and major reductions in expenditures were realized at the expense of teachers, maintenance of plants, textbooks, and educational
supplies. The report lamented the facts of the reductions as being "wholly inconsistent with sound educational policy" (23). The report further observed that "teachers were courageous, generous, self-sacrificing in continuing cheerful service under depressing conditions which had included in several towns and cities long waits for the payment of salaries after the latter had been reduced in amount" (24).

The board viewed these conditions as "unbearable and intolerable" (25). It recommended that the State of Rhode Island assume a larger share of responsibility for the support of the public school system and urged that the General Assembly establish a revised state program that would include—

1. A large increase in state appropriation for public education to be apportioned to towns and cities;
2. A decrease in the burden imposed by statute upon towns and cities;
3. A realignment of taxation for school support whereby school taxable property would be relieved in part and more of the burden of school support would be transferred to general taxation of the type from which the state derived its revenue;
4. Ample assurance from continued adequate financial support of public school programs to prevent the ills which attend delayed payments of salaries particularly;
5. A renewed construction program to be made possible in part by the relief of property from taxation for general maintenance and a realignment of capital outlays (26).

The board concluded its annual report by reflecting on the fact that "its position [was] justified by the imposition in the last year of an exaction of $425,000 on 4,000 public school teachers in the name of alleged economy" (27).

During the Depression, voices spoke for and against certain educational policies in Rhode Island. An anecdote can well illustrate both the support for and criticism of education in many quarters of the state during those bleak days.

Superintendent Deering of West Warwick carried the fight for his teachers into a town meeting, shoring up a defense of their meager salaries by vigorously resisting a budget reduction for the school system of that town. The proposal, if passed, would have resulted in even smaller pay envelopes for the teachers. Deering cited the high qualifications required for appointment as a teacher and pointed out that the salaries paid in West Warwick were already lower than in several nearby municipalities. A citizen then rose to state that no group had done more for the town of West Warwick than the teachers. A rejoinder to this by an exponent of the proposed budget cut drew loud opposition when he remonstrated, saying, "Are the school teachers so much more intelligent and discerning than their sisters employed in the mills or the wives of men struggling to get a living or mothers of children who want something to eat?" (28).

One teacher, pleading her own case, pointed out that she had spent 16 years in preparation for teaching school and received an annual salary of $1,100, which amounted to little more than $21 per week (29).

In its final vote, the town meeting supported Superintendent Deering's position.

A NEW ORDER

On January 1, 1935, Governor Theodore Francis Green, who had taken over the gubernatorial reins of Rhode Island in 1932, engineered the enactment of a reorganization statute that completely restructured the entire government of the state. In the field of education specifically, the State Board of Education was abolished after 65 years of existence, and the Office of Commissioner also was abolished after 90 years of existence. The reorganization of public education service set up a State Department of Education with a director of education succeeding to the powers and functions of both the state board and the commissioner. James F. Rockett, superintendent of schools in Woonsocket, Rhode Island, was appointed director of education and assumed office in March 1935. At the same time, a promotion and supervision division was created within the new department to assist in the functions of the director of education. Charles Carroll was appointed to this position.

The reorganization statute also abolished the board of trustees of Rhode Island College. A board of regents within the state department was established to govern the state institutions. Further, all library activities were transferred from the State Department of Education to the library division under the secretary of state. The Bureau of the Blind was transferred from the public welfare division to the Department of Education, and the School for the Deaf was placed under the director of education, with the assistance of an advisory board.

In compliance with federal regulations, the State Board for Vocational Education was established, consisting of the directors of education, of agriculture and conservation, and of labor. This board, functioning also as the state agency for vocational rehabilitation, was increased to five members in 1939 by the addition of two members appointed by the Governor.

The termination of a State Board of Education in 1935 ended the participation of lay leaders as policy makers in the education field from that time until 1951, when Governor Dennis J. Roberts established a new education board. The contributions of the individual board
members from 1870 to 1935 would be too numerous to mention. However, the service of certain individuals merits documentation. Probably without peer in length of service was Frank Hill, representative from Hopkinton, whose tenure on the board for over 36 years commenced in 1867. Others distinguished for their lengthy service are Frank Thompson, 33 years (1890-1923); George T. Baker, 26 years (1894-1920); E. Charles Francis, 24 years (1909-33); and Samuel H. Cross, 24 years (1870-82 and 1885-97).

As mentioned earlier, the new director of the State Department of Education, appointed by the Governor with the consent of the Senate, assumed all powers and duties of the previous board and the commissioner. The state appropriations for education remained practically unchanged.

Among Director Rockett’s first recommendations made to the General Assembly were requests for additional state aid in the form of equalization aid. It had been clearly established that the local school departments were handicapped by the failure of the state to modernize its tax system and to balance the burdens between the property tax and other tax bases. The property tax still remained as the sole source of support for local operations. With economic growth developing at uneven rates, serious consideration was required of the state to develop a plan for taking into account the varying abilities of communities to support schools at a minimum level of effectiveness.

The policy of state support by general appropriations allocated with some concern for relative need was approximately a century old in Rhode Island. The cry of the education community then became one for equalization of educational opportunity through a program of tax equalization. With this background, the General Assembly in 1936 enacted the McEntee-Kiernan bill, which appropriated $200,000 for the purpose of equalization of educational opportunities in the several cities and towns. This aid took into account the relative abilities of the communities to support a basic program of education and provided for grants of $2.50 per pupil in average daily attendance. It further required a minimum level of support by a school district to qualify for such aid. With the passage of the McEntee-Kiernan bill, the state took a significant step forward in assuming its constitutional role as the agency with prime responsibility for the education of its children.

The matter of school transportation received the attention of the General Assembly in 1937 when it enacted legislation requiring school committees to provide—

Suitable transportation to and from school for pupils attending public schools of elementary and high school grades who reside so far from any public school as to make their regular attendance at school impracticable and for any pupil whose regular attendance would otherwise be impracticable on account of physical disability or infirmity.

The statute further indicated that “for pupils attending private schools of elementary and high school grades, except such schools as are operated for profit, the same rights and privileges as to transportation to and from school as are provided for pupils attending public schools” (31). In light of the many problems that attended the implementation of such legislation, Director of Education Rockett issued the following memorandum to school administrators in August 1937:

Many inquiries have come to the state department of education regarding various interpretations and rulings of the above act. Inasmuch as several legal technicalities were involved, the approval of the following interpretations was requested and secured from the Attorney General:

The matter of suitable transportation is a mandatory legal requirement and must be furnished wherever necessary in the same manner as school maintenance, books, supplies, instruction, etc.

By “suitable transportation” is meant either the furnishing of a suitable conveyance or the furnishing of sufficient funds to allow transportation for the pupil through means of a suitable conveyance.

Such suitable transportation must be furnished for two groups of pupils: first, those pupils who reside so far from any public school as to make their regular attendance at school impracticable, and second, those whose regular attendance would be impracticable, in the absence of such transportation, on account of physical disability or infirmity.

“Who reside so far from any public school” is to be interpreted as beyond a reasonable walking distance to

The cries of the education community then became one for equalization of educational opportunity through a program of tax equalization.
be determined by the school committee after giving con-
consideration to age of children, local conditions, and
hazards involved... (32).

This interpretation has served as a general guideline to
the present time in the matter of resolving disputes on
transportation.

In 1939, legislation was passed creating a separate
Board of Trustees of State Colleges, which assumed the
powers, duties, and functions of the board of regents for-
merly within the state department. This new corporate
board assumed control over the Rhode Island State College
and the Rhode Island College of Education. The board,
composed of the director of education (ex officio) and six
other members, has continued to the present time as the
governing body of the public-supported institutions of
higher learning with only a slight expansion in the board
composition, which now totals nine members.

In December 1939, Director of Education Rockett,
in a communication to Senator Charles T. Algren, chairman
of the Legislative Council, made an urgent request for a
commission to study the "educational hodge-podge of laws"
and to make recommendations to unify and coordinate the
laws governing education. A number of categorical aid pro-
grams had developed over the years which indeed needed
revaluation. A few of these statutes provided aid for sup-
port of superintendents' salaries, promotion of health,
support of public schools, reference books and apparatus,
evening schools, manual training and household arts, voca-
tional education, Americanization classes, consolidation of
schools, equalization aid, and transportation. For some of
these programs, the support to the individual communities
amounted to $200 (reference books) or $250 (health). The
General Assembly, convinced of the need for a review of
the statutes, authorized the establishment of such a com-
mission.

The Commission on the Legal Structure of Rhode
Island Public Education, with Dr. Rocke tt as its chairman
and Paul R. Mort of Columbia as the director of studies,
conducted an extensive study of all phases of elementary
and secondary education in the state. It made recom-
mendations, in a two-volume report, which were to serve as
guides for legislation in the years to come. Among its chief
provisions were recommendations regarding state-operated
vocational training, state-operated programs for handi-
capped children, state-operated Americanization educa-
tion, continuing census by school departments, employ-
ment of visiting teachers rather than truant officers,
minimum salary schedule for teachers, adequate tenure
legislation, supplementary retirement plan, testing and
selection of prospective teachers by the State Department
of Education, changes in election of school committee
members, delineation of powers of superintendent and
school committee, changes in business and fiscal operations,
appointment of a State Board of Education, legislative
functions of school committee, reorganization of school
districts, equalization of burden of school support, and
recodification of school laws (33).

The above are but a sampling of the 66 general and
specific recommendations made by the commission over a
15-month period from September 1940 to December 1941.
The foresight and wisdom of Dr. Mort were reflected in
recommendations which, 25 years later, still have great re-
levance and significance. Although the report did not pro-
duce sweeping legislative programs, the study and recom-
mendations have served as a base of reference for a number
of separate educational statutes over the years. Director
Rockett had established a solid foundation from which to
promote new legislation.

Teacher tenure, one of the above-mentioned areas,
was of growing concern to Rockett, to the Rhode Island
Institute of Instruction, and to the teachers themselves.
While some communities, such as Pawtucket, had provided
for some measure of job security, it was clearly established
that to provide real and effective tenure would require legis-
lation mandating school committees to guarantee that
security. After several vigorous campaigns, the General
Assembly enacted such legislation in 1946.

In 1945, the minimum salary of teachers employed
on a full-time basis was raised to $1,200. As noted earlier,
the first minimum salary statute as enacted in 1909 estab-
lished a base of $400 per annum. In 1922, this level was
raised to $650 and remained as such until the 1945 legis-
lation.

Another interesting piece of legislation enacted
during Rockett's administration called for the estab-
ishment and maintenance of the Rhode Island Nautical
School under the aegis of the director of education. It pro-
vided for the instruction of students in the science of
navigation, for the acquisition of a suitable vessel, and even
for a schedule of cruises. The school never materialized, as
no appropriation was provided. The legislation, however,
still exists in the current education laws.

In 1947, after a long and illustrious career in public
education, James Rockett was succeeded by Michael F.
Walsh. Walsh had served as dean, assistant superintendent,
and acting superintendent of schools in Newport, Rhode
Island, and also served as a member of the study com-
mision under Rockett. Familiar with the recommendations
of that commission, Director Walsh set out to improve
teacher welfare and strengthen the State Department
of Education.

The General Assembly of 1947 responded to the need
for teacher salary increases and established a state salary
grant of $600 to every teacher regularly employed by any
city or town. This grant was earmarked specifically for
teachers' salaries and was designed to supplement rather
than to supplant existing salary schedules. In effect, it also
raised the minimum salary schedule to $1,800 per year. A
state sales tax was initiated to support this grant. The state
appropriation in support of this act was $2,340,000 for the
fiscal year 1947-48, and a similar amount was appropriated for the fiscal year 1948-49. This became the largest state appropriation for any single educational purpose in the history of the state up to that time.

The $600 salary grant was followed in 1948 by a statewide retirement program for teachers which significantly expanded the benefits afforded teachers under the prior pension system. Optional annuity, non-duty and duty disability, and insurance clauses were provided within the retirement plan. The amount payable is equal to 1.7 percent of "average compensation" for each year of credited service not exceeding 45 years. Thus, the maximum allowance is 75 percent of average compensation.

The 1947 General Assembly also enacted legislation that provided for the establishment, maintenance, and operation of nonprofit school lunch programs in the public and nonpublic schools of the state. From this legislation developed the only state-operated school lunch service in the United States. Initially staffed with only a few people, the school lunch services division has grown to a force of over 650 under department control and in 1965 served 4.2 million balanced meals in the schools of 36 cities and towns.

In May of 1947, Walsh, in a letter to U.S. Commissioner of Education John W. Studebaker, requested the Office of Education to make an appraisal of the organization and functions of the department and "to outline a program for the development and improvement of the services of the department with a view of meeting the long-term post-war educational needs of the state." A team of USOE specialists, headed by Fred Beach, reviewed the existing operation (see Chart III, Appendix B) that provided for a director of education and three assistant directors—one for vocational education, one for administration, and one for instruction.

The recommendations of the committee included recodification of all state education laws; educational programs, including vocational, at grades 13 and 14; guidance, testing, and counseling services; research and statistical services; teacher certification services; and supervisors in academic areas. It was felt that these recommendations would enhance the principal department functions of leadership, planning, research, and advisory service to local education agencies. This 1947 study, in essence, became a reaffirmation and reinforcement of the 1942 study, which had previously made strong recommendations for department restructuring, state financing, school district reorganization, creation of a State Board of Education, broader state services to local school districts, and recodification of education laws.

The establishment of the professional position of supervisor of teacher certification is an example of the enhancement of the department role and services. The acquisition in 1948 of William P. Robinson, Jr., to serve in that capacity led to full-time evaluation of credentials, teacher education service to colleges and universities, counseling of prospective teachers, increased certification standards, and Rhode Island's involvement in such compacts as the 8-state reciprocity certification agreement in 1949 and its extension to 11 states in 1956.

Reestablishment of a State Board of Education

As previously noted, the studies and surveys of 1942 and 1947 had reaffirmed the need for a lay group to serve as a policy-making body to the director of education. The two principal reasons for creating such a board were, first, that the delegation of legislative power to a single individual was particularly open to question and, second, that prudence and experience always dictate, whenever policies are being established, that they can best be developed by the involvement of a number of persons.

There had been some community ground swell from various civic and professional groups for the establishment of a State Board of Education during the 1940's, but it was not until 1951 that the General Assembly enacted legislation creating such a board consisting of seven members to be appointed by the Governor.

On June 25, 1951, Governor Dennis J. Roberts swore in the members of the State Board of Education. An organizational meeting was conducted in the Governor's chamber, at which the Reverend Cornelius B. Collins was elected chairman and Michael F. Walsh was appointed commissioner of education. Dr. Walsh had served from 1947 as director of education.

The several responsibilities of the board indicate that it shall have general supervision and control of public schools, be the policy-forming and planning agency for the public school system of the state, determine and adopt policies for the more efficient operation of any phase of public school education, and review the educational needs of the state. (See Powers and Duties of the Board, Appendix C.)

Among the duties and responsibilities of the commissioner of education, as spelled out in the statute, are to carry out the policies and programs formulated by the Board of Education, to approve and distribute state funds, to interpret school law, to have general supervision of the Department of Education, and to appoint the several officers and employees of the department. (See Duties of the Commissioner, Appendix C.)

Mindful of its mandate, the board proceeded to promulgate new certification standards; scholarship programs for teachers, undergraduates, nurses, and special education personnel; and a program for the education of retarded children. It initiated a detailed study of the state aid laws in 1953, which culminated in the enactment in 1955 of the foundation program.

This legislation was a reassuring and cardinal step in improving the financial condition of the schools, for it made provision to assist those communities having financial difficulties because of a relatively small tax base. This principle, commonly known as the equalization principle,
assured every child the opportunity of obtaining at least an acceptable minimum education. The impact of this legislation is revealed by the fact that the statute brought 15 percent of the total money provided by the act to the education of the 10 percent of the children in communities most handicapped by lack of taxing ability. It also established a minimum salary scale of $3,200 to $5,200 for certified teachers, as well as pupil-teacher ratios. The board recommendation for a tax equalization board was also accepted.

The matter of providing vocational education programs adequate to the needs of the youth and industries of the state received considerable deliberation by the state board. Spearheaded by board member Edwin C. Brown, surveys and needs of the state were developed, and recommendations were prepared for legislative action. Although the board recommended at least $4 million to initiate state-operated programs, the General Assembly's initial approval amounted to only $600,000. On the basis of this legislation, a state-operated vocational-technical school was established in 1954. The school became operational in 1958 on a small scale, but efforts of the state board had been recognized in that this legislation was to establish the basis for further statewide vocational-technical programs in the 1960's.

Further improvements in the late 1950's were the recodification of education laws in 1956, the establishment of programs for the education of gifted children (1958 enactment with a $60,000 appropriation), and a study commission on higher education. In April 1959, Governor Christopher Del Sesto approved the State Board of Education's recommendation for a departmental reorganization. This reorganization provided for a commissioner of education; a deputy commissioner and two associate commissioners, each of whom headed a major division; and four chiefs, each of whom headed a minor division. (See Chart IV, Appendix B.)

The reorganization of the department incorporated the establishment of the instruction division, which had been recommended by the 1942 study, as a department function to assist local school districts in the various instructional fields. This was made even more imperative because of the 1958 federal legislation commonly identified as NDEA. Department specialists in mathematics, science, modern foreign languages, and guidance would not be available to local education agencies.

As was noted earlier, a commission had been appointed in 1957 to study higher education and to report to the General Assembly the suggested measures to meet the needs of the future. The commission made several recommendations, among them being significant expansion of the University of Rhode Island and Rhode Island College facilities; development of a state junior college system; and a state scholarship program. While the first and second recommendations were to be developed by the Board of Trustees of State Colleges, the latter recommendation was placed under the commissioner of education. Rhode Island thus became one of the first six states to establish a state scholarship program for qualified college-bound youth of the state. Grants ranging from $250 to $1,000 per year are made to 5 percent of the total of the graduating class (public and nonpublic) to attend the college of their choice.

In its role of advising the General Assembly and Governor of needed educational legislation, the State Board of Education, in its 1959 recommendations for legislative action, indicated its goal—

To assure quality education for all Rhode Island youth. That is, at least an adequate minimum education for every child in the state and at the same time encourage the citizenry of Rhode Island through their local communities and through guidance from the Department of Education to improve upon this minimum in every way possible (34).

Although the 1955 foundation act had provided an initial step in realigning the fiscal posture of education in the state, a stronger state-local partnership was required. The 1965 act establishing a state equalization board, a 1967 amendment to the foundation act, and the 1958 permissive legislation for school district reorganization were additional steps in promoting this joint responsibility. The board's recommendation for new school operation and a school housing legislation included several interesting features: a guaranteed minimum of 25 percent of the full cost of education to all communities; an equalization factor to assist the less affluent school districts; an "education improvement fund," available to the state board to encourage local innovation and experimentation; the elimination of 12 categorical aid statutes; incentives (increased aid) to encourage small school districts to regionalize; and a new minimum salary scale for teachers ($4,000-$6,000).

A truly encouraging feature of these recommendations was the open-end proposal that the state would share, not just in the minimum amount, but in all expenditures at whatever level the local school district chose for both operational and capital outlays.

With the concerted effort of many education-minded groups, Chapters 26 and 27 of the Public Laws of 1960 were enacted by the General Assembly and signed by Governor Del Sesto. Rhode Island thus became the first state to provide open-end state support for school operations and construction. The enactment of this statute, and its subsequent amendment in 1964 increasing the state's share, have greatly enhanced the opportunity for all school districts to provide a quality education. This legislation has been nationally acclaimed for its goal of genuinely making the state and local education agency partners in the education enterprise.
EMERGENT CHALLENGES FOR THE STATE EDUCATIONAL SYSTEM

The period of the 1960's can best be described as one in which the State Board of Education has made a serious appraisal of the role and responsibilities of the board and the department and, convinced of the leadership functions of these agencies, has moved with conviction and vigor to fulfill its duties. After its reestablishment in 1951, the board provided a number of rules, regulations, and standards (see Appendix D). For example, in the areas of teacher certification, education of handicapped children, approval and accreditation of secondary schools, school libraries, and vocational education, the board established new standards or higher standards where they were deemed necessary.

Early in 1963, Commissioner Walsh was forced to retire because of ill health. William P. Robinson, Jr., deputy commissioner, who had been serving as acting commissioner during Walsh’s absence, was appointed commissioner in February 1963. Familiar with the educational problems of the state, Commissioner Robinson in September. 1963 outlined specific areas of special concern both for the board and the General Assembly. Among the most pressing issues identified were future development of vocational education in the state; increased financial assistance for school districts; special assistance to economically depressed areas; de facto segregation; dropout problem; school district reorganization; special education; and department staffing.

The matter of vocational education had become a statewide issue with the advent of the federal vocational act of 1963 and the availability of $10 million of state funds through bonds and appropriations. After much debate and discussion, the state embarked on a program of secondary vocational-technical programs in area-comprehensive high schools and a postsecondary vocational-technical program as a joint venture with the Board of Trustees of State Colleges as part of the junior college system. It was finally determined to establish a separate vocational high school in the Blackstone Valley in response to the requests of educational, civic, and legislative leaders of the area. Few educational topics in recent years have received as much wholesome and heated debate as the issue of statewide vocational-technical education. In any event, the department staff has been significantly strengthened to perform the statewide mandate by the addition of a new position of associate commissioner for vocational-technical education and a number of consultants in research, technical, distributive, and business education, and in curriculum development.

The commissioner recommended increased state aid with special consideration to the problems of the larger urban communities because of their greater financial burden, larger numbers of economically and culturally deprived children, and, as in the case of Providence, the problem of de facto segregation. The state board was indeed sensitive to these problems and developed recommendations for legislative action in an attempt to ameliorate these conditions.

In the matter of school district reorganization, the board’s desire to develop the most efficient and effective school organizational pattern led it to seek out department and consultant studies. As noted throughout this chapter, the matter of proliferation of separate, inadequate, and expensive school programs was a constant concern of commissioners and state boards. The problem is further complicated as the state considers the cost effectiveness of providing additional state aid to provide equal educational opportunity. Recommendations have been proposed ranging from a single state-operated school system to varying numbers of regionalized systems.

Of continuing and growing concern to the board has been the matter of department organization and staffing to meet the challenge of the new era in education. Buttressed with the recommendations of the commissioner and previous department studies, the board has made this item a priority in its recommendations to the Governor and to the General Assembly.

Generous outlays and fresh programs of the federal government have stimulated the vigor of the State of Rhode Island and its public officials. According to one report, in 1966, state departments, collectively, administered approximately $3 billion. In addition, from 1961 to 1966, federal programs have increased from 10 to 20 and “the size of appropriations has increased substantially in recent years” (35).

The emergence of a number of federal programs of the magnitude of the Elementary and Secondary Education Act of 1965 has placed an even greater responsibility for leadership and consultative services on the shoulders of the department. The implementation of the Title V provisions of ESEA has brought a significant growth in personnel and services in the state agency. As the board seeks to develop a statewide information data system and to automate department processes, the Title V legislation has been of great assistance. Rhode Island indeed welcomes this growing federal concern for the education of all its citizens.

Another program which has been of special interest to this state has been the development of the nationwide Compact for Education. Governor John Chafee has been among those early leaders in attempting to develop a common interest and pool of information among the states as they study the important matters of education. Rhode Island expects the compact to be a catalyst for many new and exciting innovations as the states move closer to each other in developing new concepts in education.

Appendix B

Chart I.--CHANGING SCHOOL STANDARDS IN RHODE ISLAND

**FADING**

**EARLY 20th CENTURY**

- Mass instruction methods predominant.
- Little or no responsibility is assumed by teachers for the learning of individual children.
- Children tested for rejection is central strategy of the school.
- Very limited opportunity for the unusual child, particularly in lower grades. Dropout rate often over 50%.
- Little or no community participation in school activities.
- Teaching materials and equipment sparse.
- Discipline: training to act in accordance with arbitrary rules.

**DOMINANT**

**MIDDLE 20th CENTURY**

- Mass methods of instruction dominate but with varying degrees of identification of individual differences and learning needs.
- Emergence of special groups (retarded, handicapped, gifted) for emphasis on individual learning in small classes.
- Broadening curriculum and opportunities for the unusual child.
- Dropout rate over 30%.

**EMERGING**

**LATE 20th CENTURY**

- Responsibility for individual learning of all children is central strategy of the school. Mass methods of instruction not dominant. Children grouped for instruction but taught as individuals.
- Opportunity for the unusual child is extensive, particularly in the lower grades. Children tested for diagnostic purposes rather than for rejection.
- Dropout rate negligible.
- Extensive community participation in school activities.
- Adequate teaching materials.
- Discipline: orderly growth of the individual through increased reliance on one's self and one's own powers.

**SCHOOL PATTERN**

**TYPICAL CLASS SIZE**

4 - 6

- Professional personnel per 100 pupils.
- Salaries are nine-tenths of total costs.
- Salary ranges: Min. $4,000 to $4,500, Max. $6,000 to $6,500.

**5 - 7**

- Professional personnel per 100 pupils.
- Salary ranges: Min. $4,500 to $5,000, Max. $6,500 to $7,000.

**6 - 8**

- Professional personnel per 100 pupils.
- Salary ranges: Min. $4,500 to $5,000, Max. $7,000 to $12,000.

**NO TYPICAL CLASS SIZE**

- "Classes" range from one pupil to over 100 pupils.
- Salaries are two-thirds of total costs.

**Costs Per Child**

- $300
- $400
- $500
- $600
- $700
- $800

Staff of the School

*Guidance service was placed in the Vocational Division because Federal vocational funds are available to pay one half the supervisor's salary. Since Guidance includes but is not limited to vocational education, the supervisor might work more effectively if placed in one of the other divisions when such are established. Moreover such action would not now affect availability of Federal funds.
Appendix B

Chart IV.--RHODE ISLAND DEPARTMENT OF EDUCATION, 1965

Education is a responsibility of the state as prescribed in the state constitution. By legislative act, this state responsibility is placed in the Department of Education headed by a Board of Education. The Board formulates and adopts all basic educational policies which are executed by the Commissioner of Education. The powers and duties of the Board and the Commissioner are established by law.

In April of 1959, the Department was reorganized by the Board as shown above, and the organization was approved by the Governor as required by law. It provides for the Commissioner a staff composed of a Deputy Commissioner, two Associate Commissioners, each of whom heads a major division, and four chiefs, each of whom heads a minor division.

STATE BOARD OF EDUCATION

Powers and Duties of the Board — (General Laws (1956), 16-14, Vol. III, p. 495)

The State Board of Education shall have the power and shall be required —

To be responsible for the formation and adoption of state educational policies.

To adopt standards and qualifications for the certification of teachers and to provide for the issuance of certificates.

To establish rules for the approval and accrediting of secondary schools.

To review the subjects and courses of study to be taught and instructional standards to be maintained in the elementary and secondary schools.

To be responsible for the distribution of state school funds.

To study, review, and make recommendations for the design, construction, and location of school buildings when so requested by any school authority.

To recommend standards for school libraries and to provide school library services.

To make recommendations relative to the transportation of pupils, school bus routes, time schedules, and other matters pertaining to pupil transportation, together with the right to cause every city and town school department to submit its respective school bus routes, schedules, and other matters pertinent hereto.

To enforce the provisions of all laws relating to schools and education.

To decide appeals from decisions of the commissioner.

To prescribe forms for the use of local school committees and local officers.

To adopt and require standard accounting and auditing procedures for local school officers.

To provide for the organization of the State Department of Education and to establish divisions, bureaus, or other administrative units within the department with the approval of the Governor.

THE COMMISSIONER OF EDUCATION

Duties of the Commissioner — (General Laws (1956), 16-1-5, Vol. III, p. 497)

It shall be the duty of the commissioner of education —

To carry out the policies and program formulated by the State Board of Education.

To evaluate credentials of applicants for certificates, to verify that the certification of teachers is in accordance with law and established standards, and to issue such certificates at the direction of the board.

To certify the approval of accredited schools.

To recommend to the board an outline of the subjects and courses of study and the instructional standards for elementary and secondary schools.

To approve the distribution of state school funds in accordance with law and the regulations of the board.

To verify that school sites and school building plans are in accordance with law and regulations.

To exercise supervision over school libraries and library services.

To certify that school bus routes and schedules and all contracts for pupil transportation conform with provisions of law and the rules and regulations of the board.

To require the observance of all laws relating to schools and education.

To interpret school law and to decide such controversies as may be appealed to him from decisions of local school committees.

To prepare and recommend standard forms for the use of local schools.

To prepare, with the assistance of the department of administration, a manual of standard financial records and procedures for local school officers.

To have general supervision of the State Department of Education and to appoint the several officers and employees of the department subject to the provisions of the state merit system act.

DEVELOPING A SCHOOL SYSTEM

The Free Schools

Pauper Schools. Some time before 1696, a private citizen, Richard Morgan, left money for founding a free school in South Carolina (1). The Free School Act of 1710 stated, however, that such legacies had not been put to proper use, which was one of the reasons for its passage.

The Society for the Propagation of the Gospel in Foreign Parts, incorporated in 1701 in London under auspices of the Church of England, sent missionaries to teach in the province the following year. Since this group attempted to fill the needs of the Negro and Indian slaves as well as those of the wealthy landowners, it was rebuffed by the aristocracy (2). Despite this antipathy, private schools were established and did flourish, mainly to provide a Christian education. "The knowledge of grammar and the latin and greek languages, and of mathematics, could be obtained in Carolina at any time after 1712, or the 42nd year subsequent to the settlement of the province" (3).

The Free School Act of 1710 stated in its preamble:

John Douglas should be preceptor or teacher of said school; and that on his ceasing to be so the commissioners should appoint his successor who should be of the religion of the church of England, and capable of teaching the latin and greek languages—that the teacher should have a salary of £100 per annum, to be paid out of the public treasury, and the use of lands and buildings belonging to the school, for which he was to teach twelve scholars, to be nominated by the commissioners, free of expense; and for all others he was to receive at the rate of £4 per annum (4).

The reference to free tuition for those nominated by the commissioners tells the story of the state's educational program for more than two centuries. South Carolinians did not like the free education because of their prejudice against "pauper" schools. The wealthy continued to send their children to private schools, followed by the grand tour of Europe; the "poor but proud" either sent their children to tuition schools for a limited time or they did not send them at all, and only the paupers attended the free schools.

"The first public school in America, in the accepted sense, existed in Charleston, at least as early as 1743" (5). One author describes these schools as follows:

The Church of England . . . conceived public education, aside from collegiate education, as intended for orphans and children of the poor, and as a charity which the State was under little or no obligation in providing. All children of the middle and upper classes of society attended private or church schools or were taught by tutors in the home, and for such instruction paid a proper tuition fee. Paupers and orphans, in limited numbers and for a limited time, were provided with some form of useful education at the expense of the Church and of the State (6).

By the end of the Revolution, there were 11 public schools, 3 charitable grammar schools, and 8 private schools in the state's 24 parishes and districts. Most of the 200 teachers were from England.

It was not until 1811 that Stephen Elliott introduced into the Legislature "an act to establish free schools throughout the state." Thus, Elliott became known as the "father of the first public school system in South Carolina" (7). The Legislature appropriated $300 a year for each school and provided for all pupils to receive elementary instruction free of charge, preference being given to poor orphans and children of indigent parents. The act bore as little fruit as the provincial act 100 years earlier, probably because it favored paupers.

Reverend Thrummel of All Saints Parish in 1829 expressed the state's view of public education as a charity:

It is bounty intended for the poor. The rich will not avail themselves of it, since they do not need it, while the poor will rather keep their children at home altogether, rather than by sending them to free schools, attach to them, as they think and feel, the stigma of being poor and of receiving an education as paupers (8).

The primary detriment to the free public school system was "that its need was not felt by the people" (9).

The will of John De La Howe in 1796 provided for the first school to teach manual labor in the United States. The following year, an agricultural or farm school opened "to receive and train free of charge neglected and
dependent children” (10). For many years, the Agricultural Society of South Carolina operated it but later gave title to the Legislature, and in 1918, it was operated directly under the Legislature. In November 1937, a fire completely destroyed the school. It has been rebuilt and now is state-supported.

C. G. Memminger and the Charleston Schools. Despite the popular prejudice against public schools, free schools were accepted in Charleston. In 1855, Christopher Gustavus Memminger instituted a plan for improving the city schools that lasted until February 1865, when the last call for troops to fight on the side of South Carolina in the Civil War took every white male from 16 to 60. “Under his wise and progressive leadership the common school system of that city, with the Charleston College, Citadel Academy, Orphan House and High School, had given to Charleston the educational distinction it now holds among the large cities of the Southern States” (11).

In 1803, the year Memminger was born in Württemberg, Germany, his father died; his mother emigrated to America 4 years later with her parents. Mrs. Memminger died shortly after reaching Charleston, and the grandparents left for Philadelphia, leaving the boy in the Orphan House in Charleston. When he was 11, he was adopted by Thomas Bennett, later a Governor of South Carolina, and applied for citizenship in 1824. Memminger became an outstanding attorney and served as secretary of the treasury of the Confederate states.

In 1834, together with W. J. Bennett, son of the Governor, Memminger made a study of South Carolina’s schools. He made many trips to the North, especially to the New England states. As a result, he was instrumental in having the Legislature pass an act permitting the Charleston municipal government to levy a special tax for educational purposes. By 1856, the Charleston school system, patterned on the New York plan, was well established, with heads of the schools brought in from the North.

The first training school for teachers in South Carolina, the Memminger Normal School, was established in 1859 in Charleston. It was organized to train female teachers for the state, and student teaching was offered in the elementary schools of Charleston for a period of 8 weeks. Certificates were awarded at the end of a 3-year course. The course was based on the Lancastrian, or monitorial, system where able pupils helped with instruction, and was along classical lines although students learned the theory and practice of teaching.

At this time, there was a new spirit toward the state’s educational institutions. Before the American Revolution, many of South Carolina’s youth had been educated in Great Britain. But now the feeling was different—Great Britain no longer was the mother country. There was a marked increase in the academies, and the records of the graduates indicate that the training was excellent.

In 1855, at the invitation of the Governor, Henry Barnard of Connecticut visited Charleston and aroused the people’s interest in educational conditions by his earnest and eloquent presentation of the school system he had developed in the North. Memminger took advantage of this interest to petition the Legislature to establish a common school system for the city. For the first time, the Legislature passed an act giving the commissioners power to impose a local tax on property, in addition to the state fund.

In July 1856, C. G. Memminger gave a masterly explanation of the new law at the inauguration of the common school system for Charleston. He pointed out that the old system of 1811 could not be improved as long as a confession of pauperism was required. Teachers were brought in from the North, and the schools were graded according to the Massachusetts plan. By 1860, there were 4,000 pupils in the Charleston schools.

Many serious-minded people, though engaged in the more critical issues of the time, recognized the importance of public schools. When a bill appropriating funds for a State Department of Education, to promote the development of a system of free schools, was introduced in the Legislature in 1861, an eloquent speech in support of the measure by James H. Carlisle, a young Spartanburg teacher, convinced the lower House to pass it immediately. The Senate, however, considered the measure an unwarranted extravagance and defeated it.

Thus, the history of the free school movement in South Carolina from 1811 to 1865 illustrates the difficulty of establishing a system of universal education in an aristocratic state. One observer reported: “In no country or Commonwealth has there been witnessed so remarkable a spectacle of unanimity of purpose among the leaders of public opinion on the subject of popular education, with almost utter failure of results, as in South Carolina” (12).

South Carolina endured the ordeals of war and entered the Reconstruction period with the state controlled by the Republicans through a carpetbagger government. It was during Reconstruction that this Republican government adopted a constitution which first recognized free public education in the state. Thus, this Constitution of 1868 marked a decided era in South Carolina’s educational history: It laid the organizational basis for public education enterprise which has survived to this day.

The First State Superintendent, J. K. Jillson

The man largely responsible for these provisions was Justus Kendall Jillson, a delegate to the constitutional convention, who had been persuaded by the Massachusetts Freedman’s Bureau to teach in a Negro school in Camden, South Carolina. He was responsible for the constitution’s article on education, providing for a state superintendent and a State Board of Education; property and poll taxes
The constitution stated that no law to that effect between the ages of 6 and 16 years, but it is probable that a compulsory attendance law was never actually in effect. The constitution stated that no law to that effect should be passed until a system of public schools "has been thoroughly and completely organized," and facilities made available to all inhabitants for the free education of their children. There is no evidence that such an organization was ever completed, nor is there evidence that facilities for a free education were afforded to all.

Jillson himself, who had become State Senator and chairman of the Senate's Committee on Education, was nominated for the state superintendency by the Republican state nominating convention and defeated his Democratic opponent, J. A. Leland. Although a Massachusetts carpetbagger, Jillson was never touched by the scandals that tainted many in the Reconstruction government. Described by a Charleston paper in 1869 as "puffy, fat, petbagger, Jillson was never touched by the scandals that tainted many in the Reconstruction government. Described by a Charleston paper in 1869 as "puffy, fat, broad, wordy, and well informed" (13), he was scrupulously honest and devoted to education. Even Jillson's political enemies acknowledged that he labored as hard and conscientiously as any state officer to perfect a plan that would be acceptable to the public and fulfill the purposes of his department.

Despite his efforts and contributions, Jillson struggled against insuperable odds. Although he was still a member of the Senate, the new state superintendent could not get the assembly to fulfill the terms of the 1868 constitution by introducing legislation to establish free schools throughout the state until February 1870. Even the Charleston paper expressed its regrets that this admirable bill had failed.

When the "Act To Establish and Maintain a System of Free Common Schools for the State of South Carolina" finally did pass, Superintendent Jillson found he did not have sufficient money to run the schools. Despite his urgings, the Legislature in 1870 appropriated only $50,000 for school purposes, less than 25 cents per pupil (14). By 1873, the annual school appropriation was up to $300,000, and the school population had increased by more than 33,000 pupils. But the unpaid balances of state school appropriations for the previous 3 years amounted to over $322,000, and most teachers had been waiting that long to receive their salaries (15). By the end of Jillson's term in 1876, the school system was on the verge of collapse. This was attributed in large measure to the Reconstruction government's squandering these appropriations for other purposes and to the incompetent, dishonest, and overpaid country commissioners' absorbing a large part of the available funds (16).

Jillson faced other frustrations in his earnest efforts to build a good state school system. As a strong abolitionist, he had been responsible in large measure for the constitution's including the following provision: "All the public schools, colleges and universities of this State, supported in whole or in part by the public funds, shall be free and open to all the children and youths of the State, without regard to race or color" (17). Mixed schools were a practical impossibility. The majority of the superintendents reported that Negro as well as white parents preferred separate schools. The entire body of trustees and faculty resigned from the School for Deaf, Dumb, and Blind when it was ordered to receive Negro students in the same classes and tables as the whites. When no others could be found to take their places, the school was closed for 3 years.

Jillson reported to the General Assembly that probably no state in the Union was so cursed with poor teachers as was South Carolina. He charged that the county boards of examiners granted certificates to people with poor moral attributes. He asked that the teaching profession be regarded equal in dignity, honor, and importance to that of theology, medicine, or law. But the General Assembly ignored his pleas.

Hugh S. Thompson Established a State System

Jillson was not renominated on the Republican ticket in 1876, the year marking the fall of the Radical regime (18). The Republican candidate, John R. Tolbert, was defeated by the Democratic nominee, Hugh S. Thompson. Thompson, a native Charlestonian from one of the oldest families in the state, was a Southern gentleman of culture, modesty, noble bearing, and attractive manners. His background for this position was excellent. He graduated from South Carolina Military Academy and taught in that institution until 1861. After serving in the Confederate Army in the defense of Charleston, he became head of the Classical School at Columbia (19). When he took office in 1877, along with the newly elected Governor, General Wade Hampton, it was possible to begin carrying out the 1868 constitution.

Thompson and his clerk comprised the entire working force of the department when, on May 1, 1877, he took the first steps actually to establish a state public school system. He faced some of the same problems as his predecessor, such as incompetent county commissioners, the almost total absence of teachers in the country districts, quarrels over locating schools in partially settled neighborhoods, and the extreme poverty of the people. On top of this, his predecessor's efforts increased the old opposition to the public schools. A large part of the money collected from the poll tax the first year had to be used to pay school debts of the previous administration.

But with the hearty support of Governor Hampton, Thompson set about gathering the ablest schoolmen in the state to help him formulate a new school law. He studied the laws then in force and noticed glaring deficiencies, particularly in duties and powers of county school
commissiners and local trustees. He studied laws of other states and made his recommendations in his first annual report in 1877. The Legislature passed the new school law in December 1877, but it did not go into effect until the following year.

Under the 1878 law, the State Board of Examiners, composed of the state superintendent and four persons appointed by the Governor, became the central authority. The board had the authority to interpret school laws, to set up rules for examining prospective teachers, and to adopt a uniform set of textbooks, and had other powers and duties as are held by the present State Board of Education.

By assisting Thompson in checking plunder and incompetency, it enabled him to lay the foundations for a system of public schools in the state. It established and graded the elementary schools for both races and started normal institutes and schools to train teachers.

It was very difficult to induce the people to levy the necessary taxes to provide good teachers. However, several followed Charleston's example and adopted plans of local taxation. One by one, the towns and counties fell into line, until finally voluntary taxation became almost statewide, and the people wrote provisions for a local tax into the Constitution of 1895. In 1878, the General Assembly levied a 2-mill tax for school purposes, which, with the poll tax, remained the sole support of the public schools. The Legislature made no appropriations except for the State Department of Education.

Superintendent Thompson and the board, as one of its first acts in May 1878, commended the white teachers in the Negro schools and took steps to secure better teachers. A series of summer institutes was initiated. These, in part, prompted the University of South Carolina to offer teacher-training courses in 1882; 5 years later, it opened a statewide normal school. In his 1878 report, Thompson stated: “Teachers’ Conventions, Teachers’ Institutes, and Normal Schools are powerful agencies which, if properly employed, will raise the profession of teaching to the dignity to which, by its importance, it is entitled” (20).

In his last annual report, Thompson pointed out that the schools had increased from 2,493 to 3,183, and the number of teachers from 2,674 to 3,413. By comparing the number of schools to teachers it is evident that the majority were one-teacher schools. Attendance had increased from 102,396 to 145,974, which was the largest number of pupils ever attending the state’s public schools. The average school term was 4 months. In assessing Thompson’s contribution, one historian states:

In the face of political and social chaos, with the white people opposed to public schools, afraid of Negro domination, disgusted and angry; and with the Negroes suspicious and sullen, the whites very poor and the Negroes all paupers, Thompson undertook the task of building a system of schools on the basis of the original provision in the constitution formed by the hated Reconstruction government. It took splendid courage and far-seeing statesmanship to do this. With firmness, tact, and patience, by earnest teaching and wise action, Thompson succeeded in six years in inducing the people of South Carolina to accept his plans for universal education. He will always stand as one of the wisest, strongest, and most devoted men of that troubled period (21).

Asbury S. Coward succeeded Thompson in 1882 and served 4 rather uneventful years. It was during this time and that of his successor, James Henry Rice, that Benjamin R. Tillman led a movement of the “plain people” against the “aristocrats.” Tillman, afterwards Governor and Senator, and his farmers were primarily interested in agriculture and industrial education, and they awakened the people to their importance.

Designating Authority

W. D. Mayfield was elected state superintendent in 1890, and the 8 years he served were the longest term of any superintendent up to that date. It was during his term that the Constitution of 1895 was adopted, the one under which South Carolina has continued to operate. Although many people had lamented the Constitution of 1868 when it was adopted by a Radical group, nothing had been done about a new constitution for 28 years, 18 of them when Democrats were in power. Actually, the Constitution of 1895 made no essential changes in the provisions for public education, but it did provide for separate schools for the white and Negro races and authorized a 3-mill tax in every county for school purposes.

The following year, the General Assembly passed an “Act To Declare the Free School Law of the State” (22). Although the law was slightly amended 4 years later, it remained a fundamental law until further revisions in 1964 (23). This act defined the duties, responsibilities, and powers of the superintendent, the state board, the county board, and the trustees. It further provided that if the 3-mill tax, the poll tax, and the net income from the alcoholic beverage tax should not yield sufficient revenue for the schools, the Legislature could levy additional taxes as necessary.

In 1898, John J. McMahan became state superintendent. Although little occurred during his one term in office, his reports do throw some light on the conditions at the time. In 1900, he complained:

It is a misnomer to say that we have a system of public schools. In the actual working of the great majority of schools in this State, there is no system, no orderly organization. Each County supports its own schools with practically no help from the State as a whole. Each District has as poor school as its people will tolerate—and in some Districts anything will be tolerated (24).
In his report of 1902, he stated—perhaps with justification—"the errors in the County Superintendents' reports almost destroy one's beliefs in the truth of statistics" (25).

THE ADMINISTRATION OF O. B. MARTIN

The Awakening of the Public to Education

A change in attitude toward public education as the responsibility of citizens was being felt more and more strongly with the beginning of the new century. The idea, prevalent for more than two centuries, that "free schools" were pauper schools and that those who could afford it should patronize private tutors and academies was changing toward one of public support. Previously, little or no thought was given to the masses and their educational needs, except by the Reconstructionists.

In 1853, James H. Thornwell (26) had written a much publicized letter to Governor John L. Manning detailing the importance of the college and its leadership in all educational matters. In his first annual report, the new state superintendent refers to this letter and quotes much of it. He strongly defends "common schools" and argues the cause of public education. He includes this quotation from Dr. Thornwell's letter: "If we must dispense with one or the other (public schools or colleges), I have no hesitation in saying that on the score of public good alone it were wiser to dispense with the schools. One sun is better than a thousand stars" (27). This philosophy was not restricted to Dr. Thornwell, but was typical. Dr. Thornwell, however, did believe in public education and supported the schools strongly.

Superintendent Martin was sensitive to the public sentiment and realized it was ready for change. Accordingly, in one of the early acts of his administration, he called an educational conference which met in the Senate chamber in Columbia on April 11, 1903. The invitation included a number of educators and those interested in the schools to discuss some of the problems facing education, particularly the need for more funds. The Southern Education Foundation, along with the Peabody Fund, showed keen interest in the education welfare of the Southern states and agreed to underwrite the meeting. The conference, the first on record of its kind to be held in the state, was well attended. Described at length in the Charleston News and Courier, and other newspapers, it received wide publicity.

Within a week, Winthrop College called a second conference to be held in Columbia from April 14 to 16, this time for county superintendents. Martin, delighted with both meetings, stated:

To my mind, the Conference in Columbia and the Conference of County Superintendents at Winthrop College the following week, are among the most important meetings ever held in the State. . . . Both meetings were unanimous in the belief that the most immediate and pressing need is the development of the rural schools, and they further resolved to contribute all possible aid to that end (28).

Educators stressed the importance of rural schools, which, from that time, received increasing support from the Legislature. Although the need was widespread, Martin is responsible for publicizing it and should be given credit for much that was accomplished. Thus was born the "educational campaign," as it was known, mentioned in subsequent annual reports.

The General Assembly reacted quickly during the following session and passed two items of legislation, both designed to improve rural schools. In February 1904, the assembly enacted "An Act To Encourage the Establishment of Libraries in the Public Schools of the Rural Districts" (29). The following month, the State Board of Education adopted rules and regulations to implement the new law, and in his 1905 report Martin reported that 600 libraries had already been established under the act.

The same session of the assembly adopted legislation that inaugurated state aid for building schools in South Carolina. The law, strictly limited to rural schools, reimbursed county boards $50 for each $100 raised, but no school was to receive more than $350. Martin said the act was one "which I think will encourage the establishment of many new schoolhouses with better equipment" (30). But the law actually spawned many small, inadequate schools, which could be eliminated only by consolidation 50 years later.

Superintendent Martin expressed an interest in consolidation as early as 1905. Many educators were concerned because too many little schools were being constructed, and they believed that a number of districts should merge. Local interests prevented such consolidations, and schools already established hesitated to merge with newer institutions.

The state had instituted a uniform adoption of textbooks in 1882, but with only one text for each subject or grade. The law permitted a 10-percent markup over list price, and sometimes the markup was on both a county and local basis. As a result, people were paying prices that varied considerably from the list prices. Martin suggested that the state establish a central depository (31). With so much attention focused on education, the General Assembly was amenable to new ideas. In 1906, there was organized at Winthrop College the School Improvement Association, which accomplished much in strengthening rural schools and improving plants and facilities. Formed by Winthrop and the State Department of Education, the association became a part of the department and remained active for 20 years, financed by an annual appropriation from the Legislature.
At the same time, in 1906, the Kindergarten Association of South Carolina organized to secure legal recognition of kindergartens, particularly to secure legislation similar to that enacted in Florida. Despite its efforts, this association accomplished little as the state was not yet ready to assume the burden. It is still not ready, for although there is permissive legislation allowing districts to form kindergartens (32), there is no state aid for them, and financial support remains the responsibility of the districts. The movement is still under way, with the South Carolina Education Association and other groups exerting pressure on the Legislature. A number of kindergartens have been organized and are functioning under the Elementary and Secondary Education Act of 1965, but these are limited to the underprivileged.

A third movement should be mentioned: the continuation of summer schools and summer institutes for teachers. Begun during Thompson’s administration, they received greater emphasis during Martin’s term. The summer schools were well staffed and attracted many teachers. Unquestionably they greatly improved the competency of teachers and brought new ideas into the state.

The High School Act of 1907

After Martin’s election, there was a growing interest in public high schools, particularly where there were none. Municipalities, willing to levy taxes for their support, had established high schools, but the state’s emphasis was on rural high schools. Education leaders had carried on an active campaign in the General Assembly to establish and improve the state’s high schools. Finally, the assembly passed the High School Act in February 1907, although appropriations were not made until the following July. Fifty-eight new high schools were established under this law during the first 5 months of the 1907-1908 school session.

The first state appropriation (renewable annually) for public schools in South Carolina amounted to $50,000, but only $28,000 was expended the first year. The State Board of Education also was designated as the State High School Board, and for the first time the State Department of Education added an employee (although part-time), when W. H. Hand, of the University of South Carolina, was named state high school inspector.

The high schools were categorized according to 4-year, 3-year, and 2-year terms. Under the law and according to the rules of the state board the state furnished financial assistance only to those schools having a minimum enrollment of 25 pupils, taught by at least two teachers.

Some of the schools started industrial and commercial education at the turn of the century, but Superintendent Martin addressed a letter to county superintendents in October 1907, urging that all schools include the teaching of agriculture as soon as possible. The Act of 1909 strengthened the High School Act of 1907 by including city high schools in its provisions and by removing some of the limitations, particularly the restrictions on communities with less than 1,000.

The High School Act focused on rural high schools. It paid little attention to curriculum and did not adopt a state-approved course of study. Teachers were poorly trained, and there were no true certification requirements. As a result, the preparation varied widely for the few who attempted college. The rapid increase in the number of small high schools compounded problems that were long in solving. Yet a start had been made.

Martin’s Final Annual Report

Superintendent Martin’s 1907 report pointed out that between 1869 and 1907 enrollment increased from 28,409 to 314,399 and the number of teachers from 528 to 6,228. Expenditures of $77,949 in his first year in office rose to $1,853,572 during his final year, while the number of schools increased from 630 to 4,995—mostly rural, one- and two-teacher schools.

THE ADMINISTRATION OF J. E. SWEARINGEN

The Man and His Times

Capitalizing on the new mood of the people towards the public schools and their willingness to support them, Martin’s successor, J. E. Swearingen, carried on his movement with vigor. Swearingen inherited the new schools established under the High School Act of 1907 and did much to strengthen them during his 14 years in office. During this time, legal changes developed rapidly, and there were the beginnings of state school administration. He was at the helm during World War I and the 1920-21 depression, which also saw the emergence of the dreaded boll weevil. This period also saw the beginning of compulsory attendance and the start of the tremendous impact of federal aid to education.

Swearingen, totally blind from an accident in his youth, had made a brilliant record as a mathematics major at the University of South Carolina. His uncanny memory enabled him to amass an incredible amount of information that he could recall instantly. As state superintendent his secretary would read to him the correspondence, which he would file in order in his pocket. He would dictate his answers from memory concisely and without error. The annual reports also show this remarkable ability to acquire, retain, and transmit detailed information stored in memory. There are many stories about Superintendent Swearingen’s keen memory and touch. For instance, on one occasion he walked into a supervisor’s office where a county superintendent stood whose home Swearingen had
visited several years before. The county superintendent remarked that he had brought his wife along. Swearingen greeted her and then remarked that she had put on some weight. The astonished woman admitted she had and asked him how he knew it. "Oh," he replied easily, "by the feel of your palm."

He insisted that all office doors remain open and checked each morning to see who was late. On one occasion a supervisor came in quite early to do some work and closed the door behind him for privacy. As usual, Swearingen felt his way to each office and, finding the supervisor’s door closed, was heard to say quite audibly, "Damn him, he is late."

While Swearingen took every opportunity to ask and even demand needed legislation, he was quick to give the General Assembly full credit for enacting good educational laws. Perhaps it was his ability to recognize sound legislation that kept him in rapport with the lawmakers. His opening statement in the report for 1910 was succinct: "The legislative session of 1910 was emphatically educational" (33). Statements of a similar nature are found frequently among his other annual reports.

Legal Changes in Finance

The Constitution of 1868 had placed the responsibility for education squarely on the county, and this was repeated in the Constitution of 1895. With the development of schools in the larger cities and towns, townships gradually became the administrative unit instead of the counties, and they requested legislation permitting special taxes.

Commencing with the passage of the High School Act of 1907, counties were split into districts, and it was those districts which gradually became the administrative unit of state finance. Although the Constitution of 1895 attempted to outlaw special legislation, it was powerless to control what happened during the years that followed.

Districts were created in such rapid order that by 1922 the reports listed 1,993 in the state. However, 46 of these districts were located in two counties and consequently are reported twice; the actual number of administrative districts in the state was 1,947. Consolidation gradually reduced the number of districts to 1,220 by the year 1947. This reduction came about chiefly by dissolution of districts without schools. Through the efforts of the State Department of Education and the Educational Finance Commission (created by the 1951 Legislature), the number was drastically reduced to 107 (34).

In his 1910 report, Swearingen pointed out that the most significant act passed by that General Assembly was No. 585: "A Joint Resolution To Provide for a Commission To Examine and Revise the School Law of the State and To Recommend Changes in the Same" (35). The resolution passed unanimously in both the House and the Senate, although it had met with scant consideration the previous year before the legislators had studied it.

Ten years later, nothing had been done to revise the school law, although the assembly had appointed a committee to draft a new school code. "Unfortunately this recommendation [to draft a new school code] was not approved. The need is still unsupplied" (36). Finally, the General Assembly passed Act No. 292: "A Joint Resolution To Create a Committee To Make a Continuous Study of the Educational System of the Public Schools of the State" (37). This committee was a continuation of the committee authorized by the General Assembly in 1963 under Concurrent Resolution H1651. The assembly appointed the committee, and it is studying the school law. The committee will recommend a new school code in 1968.

In 1916, the state supplied barely a twelfth of the funds expended in its public school education (38). All other moneys were raised from local taxation, which varied greatly by district. In 1965, state aid funds for public schools amounted to 60 percent, local taxes to 34 percent, and federal funds accounted for the remaining 6 percent. There is still a wide variation in the sums local districts appropriate for schools.

With the growth of the state’s share came a corresponding increase in state school administration. Swearingen wrote in 1920: "The multiplication of local school laws is becoming a serious problem. A few general laws would be far simpler and far more effective than the hundreds of local acts now scattered through the Statutes" (39). This is still a serious problem.

The assembly revised the High School Act of 1907 several times, as well as the acts providing state aid for construction. The Aid to Weak Schools Act, first introduced in 1909, was revised a number of times (40).

The Mill Schools

Textile mills gradually became more and more important in South Carolina, replacing agriculture as the chief industry. The mills were reluctant to accept some of the local taxes to support the schools, many preferring to build and maintain their own and pay teachers’ salaries. As a result, in 1915, the General Assembly created the Office of State Supervisor of Mill Schools in the State Department of Education.

The mill schools supervisor’s first report in 1916 states: "I have yet to discover why mill children should be separated from the other white children of the state and enrolled in different schools" (41). The same remark is to be found in subsequent reports. Actually, some of the so-called mill schools were partially financed by the state. The supervisor in his 1919 report classified these mill schools in three categories: regular public schools drawing state and county aid through public taxation and regularly supervised by state and county authorities; schools
supported in part by public funds and in part by the mill (many schools in this class were under the control of the regular school authorities); and schools owned and controlled entirely by the mill.

The schools owned and maintained by the mills had no tax levies, except the constitutional tax collected from the county “in a more or less legal way” (42). The supervisor reported that their biggest difficulty was insufficient space, and it was not uncommon to find 50 to 75 children in one classroom. The schools also had trouble with attendance, and one report mentioned that many first- and second-graders were not enrolled, thus ignoring the compulsory attendance law. Most of the schools operated double sessions daily, and the supervisor made one of the earliest references to a 12-month school session when he suggested that mills schools operate on a year-round basis. Many of the mills constructed imposing buildings, some of which are in existence today.

Changes in taxation laws gradually obviated the need for these schools, and they do not appear in the reports after 1925 (43).

Compulsory Attendance

Regular school attendance had always been a problem. Not only had the state long attempted to enroll those who should be in school, but it was also concerned about the high rate of dropouts and ensuing illiteracy. Night classes and adult education attempted to cut the illiteracy rate, but it still remained high.

Jillson strongly believed in compulsory attendance, and it was largely through his insistence that it was introduced in the Constitution of 1868. Unfortunately, it was not enforced. The Constitution of 1895 eliminated compulsory attendance, and the state remained without an attendance law for two decades. For years, many tried to get the Legislature to pass a regular attendance law, but they were unsuccessful until 1915, and then over the objections of Governor Cole L. Blease. In his annual message to the members of the General Assembly in January 1914, Governor Blease stated that “people do not need and they do not want compulsory education; what they need and what they want and what they demand, and what they are going to have is adequate school facilities” (44). The law required attendance at school of children between the ages of 8 and 14, but its weakness lay in the fact that it was a “local option compulsory attendance law” (45).

Most of the districts did not accept its provisions, and the law remained rather ineffectual. In 1937, the assembly passed the Regular Attendance Law stipulating that children between the ages of 6 and 16 should enroll in school and maintain regular attendance. It also provided for attendance teachers in each county, whose salaries were to be paid by the state. The law further required an annual census of all school-age children. Most important, this was not a “local option compulsory attendance law”—it was applicable to all (46).

The Legislature strengthened the Regular Attendance Law in both 1955 and 1961 by making more specific the duties of the attendance teachers, or attendance supervisors as they were renamed in 1955.

The U.S. Supreme Court decision of 1954 caused considerable uncertainty and confusion. Actually, South Carolinians feared integration and the complete breakdown of segregation as practiced in the state for many years. As a result, the Legislature in 1955 repealed sections of the attendance law providing for regular school attendance. Two years later, the Legislature attempted to give more importance to the work of attendance supervisors. The Regular Attendance Law of 1937 was not strictly enforced, nor was the 1957 act. Thus, in reality, the state has no compulsory attendance law although sentiment is rapidly developing for it at present.

Vocational Education

As early as the 1906-1909 school session, the state superintendent asked schools to introduce home economics, or courses in cooking and sewing as they were called at the time. Five years later, some schools were offering such courses (47). At the same time, several larger high schools offered industrial arts programs and a few business courses. Courses in agriculture were introduced in Darlington County during the session of 1914-15 (48), but the real beginning of agricultural education commenced with the Toole Act of 1916 (49).

When Congress passed the Smith-Hughes Act in 1917, South Carolina acted quickly to come under the law. President Woodrow Wilson signed the act on February 23, 1917, and 3 days later the state accepted its provisions. This funded programs in agriculture, trade and industrial education, and home economics. Although agriculture and trade and industries were already common, home economics did not get a real start until 1920 (50).

In his 1918 report, Swearingen stated that “South Carolina must enlarge the scope of her colleges by introducing vocational instruction at Clemson, Winthrop and the State College” (51). The institutions of higher learning accepted the challenge and promptly started vocational courses. Today, there is practically no field not covered.

The federal Smith-Hughes Act was implemented by the George-Reed Act of 1929, the George-Ellzey Act of 1934, the George-Deen Act of 1936, and the George-Barden Act of 1946 (52). The Vocational Education Act of 1963 provided the final impetus. Now vocational areas include not only agriculture, home economics, and trade and industries, but also distributive education, industrial arts, manpower, office occupations,
and health occupations. The state maintains two area trade schools at present and plans more than 50 area vocational centers.

World War I

The World War I years placed a strain on the schools in two ways. First, South Carolina had made a real beginning in building schools, but now construction halted abruptly. A rapid recovery followed, however, and according to the 1921 report, progress was evident. Second, there was a serious shortage of teachers. Swearingen had reported:

Every Department of Education has been affected by the war. . . . Hundreds of our best young men have left the teacher's desk to don the uniform. Many young women have also left the classroom to take up the work and business of the men who have gone into the Army. It has been far more difficult to run the school this year than usual. The shortage of teachers will become even more pressing in the future (53).

This was one of the first references to women's leaving the classroom for work and business.

The South Carolina Association

The South Carolina Education Association has played a prominent part in educational progress, particularly during the last 30 years. It has been active in affairs affecting teacher welfare, especially salaries, and has lent its full support in many other ways to such programs as teacher retirement, certification, and the twelfth-grade movement.

First known as the Teachers Association, when formed in 1850 at the request of Governor Whitemarsh B. Seabrook, it languished during the 30 years that followed. Attempts to revive it in 1870 during Reconstruction failed. In 1881, about 125 teachers met in Greenville and organized a permanent State Teachers Association, renamed in 1924 the South Carolina Education Association.

During Swearingen's last year in office, in 1922, E. S. Dreher, then president of the association, formed departments of classroom teachers, superintendents, etc., which became important to its success. A full-time secretary-treasurer was elected in 1924. Today, the organization has some 25 departments, with permanent committees and commissions, and 28 employees.

In 1906, the Negro Teachers organized the Palmetto Education Association. Together, the Palmetto Education Association and the South Carolina Education Association have a total membership of approximately 27,000, and there are indications at present that the two organizations will merge.

Swearingen's Final Report

In the last year of Superintendent Swearingen's tenure, South Carolina suffered from both the depression of 1920-21 and the boll weevil. Swearingen reported in 1922:

Unfortunately, owing to the hard times of the past two years, the State appropriations have been insufficient to take care fully of all applications meeting the requirements. This failure, and the fact that payment of taxes has been slow throughout the State, have worked in many instances real hardship on teachers, schools, and county superintendents. Many country teachers have failed to get their salaries for the last month or two of their school terms, which has tended to discourage them in their work (54).

In this final report, Swearingen showed a total enrollment of 479,309 compared to the 314,399 at the beginning of his term 14 years earlier, and teachers had increased in number from 6,228 to 10,814. Expenditures had increased from $1,853,572 to $9,517,968.

THE ADMINISTRATION OF JAMES H. HOPE, 1922-46

Superintendent James H. Hope began his administration while the state was recovering from the depression following World War I, and it continued on through the Depression and World War II. He maintained his office consecutively for 24 years, the longest on record. "It was during the administration of James H. Hope, State Superintendent of Education from 1922 to 1946 . . . that public education was accelerated and many of the fine services provided by the State were inaugurated" (55).

Fortunately, when Hope took office the Legislature was generally sympathetic and responsive to the public's genuine interest in education. At the end of his first year, he stated:

In submitting to you this report of school activities for 1922-23 and financial receipts and disbursements for the fiscal year just closing I am impelled to say that never in the history of the State have the schools had more loyal support in their several activities than they have had at the hands of this present General Assembly (56).

This and subsequent Legislatures enabled Hope to bring about improvements, including a new state law (the 6-0-1 Law), the addition of the twelfth grade, upgrading of certification and teacher education, a teacher retirement law, and the Textbook Law.

The 6-0-1 Law

In his 1923 report, Hope analyzed in detail his plan for a new state aid law in keeping with his philosophy that "the money should be taken from where it is, to educate the
children of the State where they are" (57). Such a measure had long been urged by both the State Department of Education and the State Teachers Association. The following year, the General Assembly enacted the act, which was known as the "6-0-1 Law."

Superintendent Hope had argued that there were "so many state aid laws for schools on the statute books that very few school officials, to say nothing of the masses, understand their operation" (58). These included the Term Extension Law, Rural Graded School Law, Equalizing Law To Guarantee a Seven-Month Term, Law To Establish and Maintain High Schools, Law To Relieve Overcrowding of Elementary Grades of Approved High Schools, and the Law To Encourage the Erection of Adequate School Buildings. The new law wiped out these previous acts and provided the following:

After requiring each county to use a three-mill constitutional tax and to levy a four-mill ad valorem tax, the state supplements these two sources of revenue by direct state appropriation and pays the salary of all public school teachers under a given schedule for the first six months, provided the district or county runs its school or schools an additional month (59).

The new state aid law resulted in higher teachers' salaries, better buildings and equipment, longer school terms, and greatly simplified methods of accounting in the State Department of Education. Although it reflected the will of the people as well as that of the department and the teachers association, the law was not entirely satisfactory. All counties were required to pay the 7-mill tax, which became the state fund for equalization. Yet, counties varied widely in the money each could raise to supplement the fund. This disparity still exists.

Certification and Teacher Education

From the founding of the Memminger Normal School in 1859, there was considerable interest in educating teachers for South Carolina. After the War Between the States, public appeals to the Legislature for state normal schools failed because the government lacked the funds. But, in 1883, South Carolina College (now the University of South Carolina) offered the first college courses designed for teachers. In the meantime, beginning in 1880, the state established summer institutes for teachers, and, in 1904, the Legislature appropriated $1,000 for a state summer school.

David B. Johnson, superintendent of schools in Columbia, so impressed the Legislature with the small training school for teachers he had started that it decided to establish a state normal and industrial school. In 1886, this school became Winthrop College. Five years later, the institution became a state-supported college as the South Carolina Industrial and Winthrop Normal School. In 1920, the name was changed to Winthrop College, the South Carolina College for Women.

By 1918, 15 institutions of higher learning had added to their curriculums normal courses patterned after the course of study at the university. In 1921, the state department published its first rules and regulations for the certification of teachers graduated from these colleges. These requirements were revised many times, and it was not until 1945 that student teaching was made compulsory for every prospective teacher. Today, 22 colleges and universities offer student teaching in South Carolina.

Teachers were certified by a board of examiners, beginning in 1897, and this continued until 1945. Conscious of the need for an improved program of teacher education and certification, the State Board of Education authorized a study of the qualifications of South Carolina teachers (60). The South Carolina Education Association and other interested groups strongly supported the survey. The publication of the results (61) became the basis for state board action in 1944, when it adopted new certification regulations providing for a professional single salary schedule based on education, experience, and grade on the National Teacher Examination. These new regulations were revised the following year and remain in effect as a qualification for the distribution of state aid for teachers' salaries. (South Carolina is the only state which requires the National Teacher Examination for certification. The state also requires that the examination be given in the state under state administration.)

Vocational Rehabilitation

The Smith-Bankhead Act, passed by Congress in 1920, required the states to match federal appropriations. Since South Carolina could not find the matching funds, it was 7 years before it participated in the vocational rehabilitation program. In March 1927, the General Assembly passed a joint resolution " authorizing the State Superintendent to accept allotments of Federal Aid available for rehabilitation and to set up this service in South Carolina" (62). The department employed a supervisor of vocational rehabilitation that year, but it was not until 1935 that the assembly approved the program item in the department's appropriation.

The Vocational Rehabilitation Act of 1943 superseded the Smith-Bankhead Act and changed the annual appropriation to a permanent program. At this time, the emphasis shifted from vocational education to physical restoration. Although the program remained in the department for 30 years, its impact was not really educational.

In 1955, Congress passed legislation permitting vocational rehabilitation to become a separate agency. The assembly removed the program from the department 2 years later and established it as a separate agency.
School Lunch Program

The state department organized the School Lunch Improvement Association in 1920 and directed its activities for 6 years. The association began serving hot lunches in schools and aroused considerable interest in the program. Although it was dissolved in 1926, the schools continued serving lunches. When federal funds became available in 1932 for employing labor for this purpose, the entire program received considerable encouragement. In 1933, in the heart of the Depression, the Reconstruction Finance Corporation allocated funds to develop a statewide program as a relief measure. The program was expanded by the Civil Works Administration and by the Emergency Relief Administration in 1935. The objectives were to establish useful work projects for needy persons and to feed well-balanced meals to malnourished children. The program also encouraged the production and canning of foods for lunchroom use.

The Emergency Relief Administration was discontinued in 1943, but that same year the Legislature passed a School Lunch Act which enabled the state department to continue the program, employing a state director and a supervisor for each county. Thus, the program continued without interruption. In 1943 the U.S. War Food Administration reimbursed schools for lunches served, and 3 years later, Congress passed the School Lunch Act. It has been revised and improved by subsequent acts (63).

Of pupils in average daily attendance in 1966, approximately 75 percent received lunches. The total cost of the program exceeds $28 million and is expected to continue increasing. For instance, breakfasts are planned for the disadvantaged, as well as feeding programs for pupils attending summer schools. South Carolina is justly proud of its efforts in this area.

Textbook Commission

As stated earlier, O.B. Martin suggested a central depository for textbooks in his annual report for 1905. Evidently, Martin did not realize that a depository had been in operation since 1893 (64). However, since counties and many bookstores stocked the books, it was not until 1925 that full use was made of the central depository.

The State Board of Education, formerly responsible for a uniform adoption of textbooks, continued to have responsibility under the new legislation. A 1926 act transferred the duty to administer provisions of the textbook law to a new agency, the Textbook Commission, and made the state superintendent of education a member of the commission.

The Textbook Commission's chief purpose was to provide pupils with a system of rental textbooks. Under the law, the state owns books which it rents to pupils at an amount "in its discretion." The original amount set was one-third of the list price, but the rent was subsequently reduced on some texts as finances permitted. The law also permitted library books and audiovisual equipment to be furnished. One interesting section of the law that will undoubtedly create future legislation reads: "The State Schoolbook Commission shall waive rentals for as many of the grammar and high school grades as available funds will permit, to the end that textbooks shall be supplied to the school children of the State without charge at the earliest possible date" (65).

The state board started the practice of multiple adoptions in 1941, and it continues to the present. Since single adoptions restricted the curriculum, the schools responded enthusiastically to the multiple adoptions.

One section of the textbook law states that "provisions of this section shall not apply to any school district that provides free schoolbooks to the value of twenty thousand dollars or more to the children of such school district" (66). Another section stipulated that "school districts enrolling five thousand or more pupils shall have the right to set up rental or free textbook systems and choose and purchase their own textbooks" (67). School districts were quick to take advantage of these provisions and claim the many exceptions. This has, of course, invalidated the theory of uniform adoptions (68). The 1964 General Assembly made it mandatory that the commission give up its independent status in 2 years and become a division in the State Department of Education.

Twelve-Year School Program

Alone among the states, South Carolina continued to graduate students from the eleventh grade, although tests indicated that students were at a disadvantage compared to those who attended school a year longer (69). The Legislature's reluctance to adopt a proposal for a 12-year system stemmed in part from the finances required and in part from a skepticism of something new. However, the doubts were overcome, and in January 1944 "the General Assembly passed unanimously a Concurrent Resolution requesting the State Board of Education to proceed at once with plans for setting up a twelfth grade within the school system of the State" (70).

The state board responded the very next day by making the twelfth grade an integral part of the state's public school system. The board acted on the basis that the twelfth grade was not an additional grade to be placed on top of the eleventh grade nor the insertion of a grade somewhere along the educational ladder, but rather an extra year to be employed throughout the total public school system to strength and enrich the whole program.

A series of workshops and study conferences were held to study the problems brought by the new law and
determine how best to implement it. Until the twelfth grade was fully effective, students were permitted to follow courses leading to an eleventh-grade or twelfth-grade certificate. The last eleventh-grade certificates were issued in 1948.

**Adult Education**

Despite its long history and rich cultural heritage, South Carolina continues to rank distressingly low in literacy. The state is on the bottom of the list in the percent of Selective Service draftees passing preinduction and induction mental tests, forty-ninth in the percent of population 14 years old and older classed as illiterate, and tied for last place in median school years completed by persons who are 25 years old and older (71). This condition has always existed.

The state's efforts have reduced illiteracy. From 1900 to 1910, there was a reduction of 7 percent of the illiterate white population, and from 1910 to 1920, there was a total reduction of 22 percent. “South Carolina outranked every other state in the Union in percentage reduction of illiteracy and per cent gain in school attendance” (72). And this was before the department added a supervisor of adult education, who inaugurated more vigorous efforts to combat illiteracy.

The Opportunity School, founded in 1921 as a summer session at the Daughters of the American Revolution school at Tamasee, was operated on various college campuses until the state acquired a former army air base in 1946, which was in part deeded to the school. The school remained under the State Department of Education until 1957, when the Legislature created an autonomous board to operate it. The Legislature names a majority of the trustees and gives it an annual appropriation.

The Opportunity School is unique. The minimum age for enrolling is 16, but there is no maximum age. Its purpose is to provide an education for those who were denied one, by offering room and board and an academic course of study. It affords an opportunity for anyone to earn a South Carolina certificate of high school equivalency or the school's diploma. Through its regular session, summer school, and special courses it reaches about 500 pupils annually.

**The Depression and War Years**

South Carolina schools were hit hard during the early thirties, although the U.S. government plugged many holes punctured by the Bank Holiday. Salaries of teachers tanked to a lobe ebb. During the 1932-33 session, the state could not meet aid demands and in desperation resorted to promises to pay or “script.” Under this system, all but the wealthier districts were forced to pass this script on to teachers, and to get cash the teachers were forced to discount them where they could. Schools operated on austere budgets, and many services were curtailed.

On the state level, programs in agriculture, home economics, trade and industries, and many others faced limited appropriations for equipment. The lack of funds prevented the development of any new experimental courses. On the local level, science laboratories suffered because supplies could not be replaced and it was impossible to purchase new equipment. Few schools had libraries, and all lacked the funds to purchase needed books.

Gradually, government spending and prewar activities restored the economy. Then the state, along with the rest of the nation, faced the necessities of World War II. Schools met the new demands with courage but some uncertainty. The state department's vocational division, particularly trades and industries, was called on by the military for training programs at defense and military installations. The department cooperated with the schools' agriculture and home economics departments to develop such programs as home gardens and canning foods. The military's use of audiovisual and visual equipment in training programs had a powerful impact on education.

As in World War I, there was a staggering loss of teachers. The schools later lost students as boys flocked to the colors despite the department's stress on the importance of completing their education. Schools took part in food stamp programs, in war bond drives, and some inaugurated military programs. Finally, in 1945, education faced an atomic peace and many dramatic changes.

**Retirement**

Perhaps no legislation has done more for teacher morale than the Retirement Law of 1945. Those who faced an uncertain future with dread now had something to look forward to when their teaching days were over. In his final report, Hope said: “The desire to reward long and faithful service, and offer security to the capable efficient teacher is in process of fruition through the Retirement Law” (73).

The need for a retirement program had been obvious for a long time, and as early as the 1936-37 school year, the South Carolina Education Association had spearheaded a drive for one. The association quickly secured support from the State Employees Association, the State Congress of Parents and Teachers, and other groups interested in teacher welfare. However, a number of legislators were unwilling for the state to take on this financial burden, and many did not understand the estimates of actuaries or the operations of a retirement system. The profession itself was indifferent, especially those under retirement programs in larger school systems. At the same time, many private citizens questioned setting up a retirement system for what they considered a select group. And when World War II erupted, most efforts were subordinated to it.
The association continued to hold meetings in every county and hearings before committees of the Legislature. Gradually, it overcame opposition and indifference, and the Legislature enacted the Retirement Law in 1945. Two years later, it placed the state retirement system under the State Budget and Control Board. Its membership is not restricted to teachers, and all state employees are members.

The Completion of Twenty-Four Years

Although recognizing the many unfavorable educational comparisons between South Carolina and other states, Hope stated: "The only fair evaluation of progress is in comparison between actual situations as they exist within the State at any given times, rather than emphasizing our relative position in regard to other states where conditions may be wholly unrelated" (74). His 1946 report presented exhaustive statistics to show the progress made during his administration.

During this period of progress, the State Department of Education grew considerably. Swearingen left a staff of 24, 6 of them on loan from colleges and 5 paid by the General Education Board. Hope had on his staff 133, part of the salaries and travel of 2 paid by the General Education Board. There was also a growth in attendance. Mixed with these fears was the late realization that there was not true equality of schools and that Negro schools were definitely inferior. These feelings were frustrated with the realization that under the existing tax structure a building program to meet needs of Negro students was impossible.

ADMINISTRATION OF JESSE T. ANDERSON, 1946-66

Reorganization of the State Department of Education

State Superintendent Jesse T. Anderson, who was to retire in December 1966, served 20 consecutive years—longer than any of his predecessors, next to Hope. In carrying out Hope's programs and beginning others, his administration reflected the many changes occurring in education.

The first problem Anderson faced was to reorganize the state department and put it on a firmer basis. From its founding in 1868 until 1947, the department had not been organized. In fact, there was little need for organization in the early days—state funds were not appropriated for a department, and the staff was small. In one of his first acts, Anderson grouped his employees into five divisions, effective July 1, 1947. At his request, the Legislature appropriated additional funds to add personnel. The Legislature also acceded to his request for 14 area teacher helpers, one for each judicial circuit, but in all succeeding sessions the General Assembly failed to allocate funds for this purpose. Anderson did continue to change the pattern of the department to meet changing needs and conditions.

State Legislation

Early in 1947, the Legislature authorized the Peabody Survey to study the statewide organization of schools. The committee reported to the Legislature in 1948, calling for a county-unit organization and a foundation program for education. The legislators did not accept the report because they thought it too expensive to implement. But, the following year, near the close of the session, the assembly, by a joint resolution, directed county boards of education to appoint committees to study school district organization.

The same year, 1949, the House of Representatives appointed the Hollings Committee to study the needs of the schools (75), and the State Department of Education made members of its staff available to the committee. It investigated school construction and transportation in a number of states and reported to the General Assembly early in 1951. This, in part, resulted in the assembly's creating a State Educational Finance Commission and enacting a 3-percent sales tax.

For a number of years prior to the Supreme Court decision of 1954, there had been fears regarding desegregation. Mixed with these fears was the late realization that there was not true equality of schools and that Negro schools were definitely inferior. These feelings were frustrated with the realization that under the existing tax structure a building program to meet needs of Negro students was impossible.

The Educational Finance Commission. James Francis Byrnes, inaugurated Governor in 1951 (76), realized the plight of South Carolina education and was determined that adequate schools for Negroes would be constructed as one way of preventing desegregation. It was largely because of his interest that the assembly accepted the Hollings Committee recommendations and in 1951 passed the 3-percent sales tax and established the State Educational Finance Commission.

Although the Legislature created separate agencies for textbooks (1936), school building and transportation (1951), educational television (1960), and technical education (1961), both the state superintendent of education and the Governor were appointed members of each commission. The Governor also served as a member of the State Board of Education until a new board took office January 1, 1954. The State Department of Education influenced each of these commissions and the State Educational Finance Commission; the state superintendent played a significant role in policies affecting school construction, district reorganization, and transportation.
The powers and duties of the new finance commission were enormous: It was charged to set up a school construction program and a state-owned transportation system, and to conduct as soon as practicable a survey of the entire school system. Accordingly, in 1951, the commission made an exhaustive survey of the entire state. Numerous teams sought to discover building needs and how districts could best be reorganized and consolidated. The 1951 act granted counties construction aid on the basis of certain criteria, principally that a district should have a high school for each race and that a high school's minimum enrollment should be an anticipated 250. The Legislature did not mandate the criteria, and the reorganization was not perfect. Yet, it resulted in consolidating 1,220 districts to 107 between 1951 and 1956.

Districts were given construction aid on the basis of $15 per pupil enrolled (77). Under the terms of the law, 20-year bonds were issued, enabling the state to inaugurate a construction program in 1952. This resulted in mergers among many small schools. At the same time, the powers, duties, and responsibilities of the state department's schoolhouse planning section were transferred to the commission.

Similarly, the transportation section of the state department was transferred to the commission in 1951. Since 1928, counties or districts had owned their school buses, or else transportation was done by contract. The 1951 law made the state responsible for transporting all pupils who lived over 1.5 miles from their schools; thus South Carolina purchased and operated the buses. The State Highway Department fueled and maintained all buses until the commission took this over. At present, it operates regional maintenance shops throughout the state. After a thorough course of instruction, students were hired as drivers.

**Educational Television.** The Legislature became convinced that television could be used to enrich the curriculum and strengthen courses. In 1957, it adopted a concurrent resolution requesting that a legislative committee study the use of television in the public schools. The following March, the committee recommended that a pilot project be set up in one of the schools in Columbia. During the summer of 1958, in a studio built at Dreher High School, the project began with two subjects, French and geometry. The following summer, the program expanded to include algebra and was extended to five area schools in Columbia.

In 1960, the General Assembly created the South Carolina Educational Television Commission, which inaugurated a program of videotapes on closed-circuit television. The new commission expanded rapidly and in 1963 had two open-circuit stations, with plans for open-circuit programs to reach every school in the state.

**Technical Education.** In its 1961 session, the assembly created the Technical Education Commission to implement a statewide system of technical education. To meet funding requirements established by Congress under the Manpower Development and Training Act of 1962, the commission was placed under the advisory supervision of the state department in 1963. Thus, the commission administers the Manpower Development and Training Act as well as the Special Training for Economic Progress (STEP) launched in 1964.

The law gave the State Committee for Technical Education the following responsibilities: technical training of high school graduates; “crash” training of persons for jobs in new or expanding industries; increased emphasis on industrial arts programs and basic industrial vocational programs within existing high school curricula; and upgrading and updating of employed workers. The committee has become deeply involved with all of these except vocational education in the secondary schools, which remains in the state department.

**Reorganization of the State Board of Education**

In accordance with the provisions of the Constitution of 1895, the State Board of Education consisted of seven members appointed by the Governor, with the Governor ex officio chairman and the state superintendent of education ex officio secretary. The South Carolina School Boards Association and the South Carolina Education Association concluded, however, that the state should have a new state board, with the authority to appoint a superintendent of education. These two groups campaigned successfully, and, in 1962, the Legislature permitted referendums on both issues. The proposed state board would be composed of one representative elected from each judicial circuit by the county legislative delegations of each circuit.

The following November, the first referendum passed, but the second, calling for appointment of the state superintendent of education was rejected. This rejection may be partly due to a general feeling that the State Board of Education was not truly elective and could become political.

The new State Board of Education took office January 1, 1964. The act ratifying the 1963 referendum authorized the General Assembly to define the duties and responsibilities of the new board. Although this has been done, it is expected to be charged with more duties and responsibilities as new needs arise.

**Federal Aid**

Traditionally, South Carolina has distrusted federal aid; legislative leaders and many others warned that it would lead to control. But historically, the state has accepted funds from the government as a welcome relief from increased taxation and to enrich the state's programs. South Carolina
accepted federal funds from many programs, such as those dealing with the GI Bill of Rights, vocational education, adult education, the National Defense Education Act of 1958, Public Law 815 and Public Law 874 of 1950, and the Elementary and Secondary Act of 1965. These funds were always accepted, however, with a wary eye for any controls such aid might bring. There were still warnings from those who feared federal aid, particularly when federal aid bypassed the State Department of Education in such legislation as the Lanham Act and the Works Progress Administration.

Despite the opposition, most people clearly saw the advantages of rapidly expanding federal activities in education and entered each program willingly as federal aid expanded beyond vocational assistance and rehabilitation. South Carolina accepted the National Defense Education Act of 1958 and its subsequent expansion. But, although many districts accepted the matching provisions of Titles III and V, there were many that would not or could not match the equalizing funds. As a result, no year since the program began has South Carolina used all of its allocations.

The Vocational Education Act of 1963 doubled the allocations spent in this area, and the state matched all funds. The Lanham Act of 1941 and the subsequent provisions of Public Laws 815 and 874, financially assisting areas where the impact of federal activities results in a severe drain on school districts, particularly aided South Carolina because of its many defense installations. Public Law 815 grants funds for construction, and Public Law 874 gives financial help to districts where the government has acquired property and its activities result in an influx of new students. Assistance to adult education will undoubtedly be of tremendous value in the state's fight against illiteracy.

The Civil Rights Act of 1964 revived fears of federal control. Yet, the state accepted its provisions, and most districts have indicated that they intend to comply. There was not one incident of violent opposition, thus sparing South Carolina the misfortunes of some states.

The Servicemen's Readjustment Act, more popularly known as the GI Bill of Rights, enacted by Congress in June 1944, was implemented when the Governor designated the state department as the certifying agency in South Carolina. It provided vocational readjustment and restored lost educational opportunities to those whose careers had been interrupted or impeded by active military service. The bill also extended the opportunity of a higher education to those who might not otherwise be able to afford it. The original GI Bill of Rights has been amended and the benefits extended a number of times. The Veterans' Readjustment Benefits Act of 1966 replaces the 1944 Serviceman's Readjustment Act and makes the benefits available to those who have seen service since January 1, 1955. In September 1947, the department entered into an agreement to become the agent of all schools operating the institutional on-the-farm training programs for veterans. Prior to this, the Veterans Administration had contracted directly with the individual schools.

The GI Bill of Rights has been the largest adult education program in the state. Thousands have been able to secure a college education; thousands have returned to high school and earned diplomas; many others have received special training in various fields. Since the program's inception, of the 146,000 who have received benefits under the bill, 90,000 entered college.

It is difficult for many younger people to appreciate fully the changes that have occurred with the growing impact of federal aid, but not for those whose memories extend back to the prewar days when federal programs were extremely limited. Today, there is hardly a phase of education, either on the local or state level, that is not affected by governmental activity.

School lunches are now generally accepted by even the harshest critics of federal aid. Categorical help in many areas has strengthened curriculums. Vocational assistance has developed courses undreamed of earlier and has extended specialized training beyond school age. The National Defense Education Act of 1958 has instilled new life into practically every field and has revolutionized teaching. Federal aid to impacted areas has helped solve problems: once thought insoluble. Adult education programs have brought hope to many and are challenging illiteracy. The Elementary and Secondary Education Act of 1965 has uncovered many submerged problems and provides opportunity for long-needed experimentation.

With all these advances, however, one problem remains and grows larger with each program: How far shall the U.S. government go? Should federal aid remedy weaknesses that were once considered to be problems for local agencies and the state to handle? These questions are not yet answered.

Summary

Jesse Anderson's administration epitomized the advances public education has made in South Carolina since it was founded as a colony in 1670. The stigma attached to public schools for almost three centuries has gone. Although about 20,000 students are still enrolled in private schools, the old idea that free schools are "pauper" institutions has given way to pride in public education and a determination to give it support. Perhaps this is the most significant change, as we see statewide taxation both expected and encouraged. Jillson's determination that education should be integrated has taken 100 years to become real; but the Civil Rights Act of 1964 is the law of the land, and a gradual phasing out of the state's dual system is inevitable. Similarly, his ardent desire for compulsory education also is destined to become the law of the land.
There was dissatisfaction when a 1955 act took regular attendance off the statutes, and there are indications that compulsory attendance will be restored. Anderson best expressed this desire to extend the benefits when he said that “public education should provide education opportunities that [would] give every boy and girl the privilege of developing his or her greatest potential” (78). Practically every state superintendent since Jillson has realized that education provides an opportunity to do something tangible for the great majority who are not college-bound. With today's stress on vocational education, that opportunity is realized.

Almost one-quarter of a billion dollars has been spent on school construction during the last 20 years. With demands for more schools for an expanding population and with demands for additional facilities to meet changing needs, it is dubious that all requirements will ever be met. The building program has ended the trend begun in 1907 by the High School Act. No longer is there proliferation of small, inadequate schools—the trend is toward larger schools, adequately financed, offering broad courses of study. There are now 1,383 elementary and secondary schools, a reduction of more than 1,600 during the last two decades. The once common one-teacher schools all have been abandoned.

South Carolina has achieved striking progress in consolidating school districts, reducing almost 2,000 to 108. Much of this resulted from the construction program and criteria established by the State Educational Finance Commission. Consolidation: of small inadequate schools into larger units would not have been possible if transportation to larger centers had not been provided. Today, more than 5,000 buses transport almost 350,000 children daily. This has improved attendance and kept young people in school for more years than ever before.

Anderson takes great pride in the school's holding power—more students are staying in school until graduation. Attendance is now 90 percent, and a drive is underway to reduce further the number of dropouts. In 1967, 44 percent of those who started the first grade 12 years before were in their last year of school. The number of dropouts remains distressingly high, but the percentage of those who remain in school has doubled in a decade. Along with the improved attendance by whites, the number of Negroes remaining 12 years increased by almost 300 percent. Better schools and better programs, as well as improved transportation, have contributed to the increased enrollment and greater holding power. There were more than 12,000 Negro seniors in 1966, compared to 4,000 in 1951, and only 300 some 20 years ago.

For many years, high schools have had to meet certain standards before receiving accreditation. Elementary schools, on the other hand, had no standards and no official guidelines until 1961, when purely voluntary standards were developed. More and more schools have officially adopted the voluntary standards.

The State Department of Education expanded and reorganized to keep up with the increasing tempo of the times. When Anderson took office, his departmental staff numbered 133; he left a staff of 865, which had increased by 500 when the State Educational Finance Commission and the Textbook Commission merged with the department in 1966. There are indications that more personnel will be added to meet the growing needs resulting from increasing federal aid.

Much happened during Anderson's administration—probably more than during any comparable period since the State Department of Education was organized almost a century ago. But there are still questions unanswered and problems to be solved to challenge Cyril B. Busbee, who became state superintendent of education in January 1967.

The new State Board of Education, which took office on January 1, 1964, worked hard to formulate a philosophy, establish policies, define its role, and clearly establish relationships with the superintendent. The latter is important because under the present law relationships between a newly established board and a new superintendent can be secured only by mutual cooperation. Establishing this relationship also becomes a responsibility of the new superintendent.

In April 1967, the State Board of Education finally adopted a philosophy statement, setting out its responsibilities for planning, regulating, upholding, and improving education. It recognized that the state superintendent and the department were responsible for administrative functions. But it agreed that there should be a minimum quality of education below which no school district should be allowed to fall. And this would require a system of state financial aid.

The board stated that there should be an annual evaluation of educational quality in each school district in the state. To correct weaknesses, the state superintendent should develop a 5-year plan, which the board would approve after open hearings and reevaluate and update annually. Each local school district should have a 1-year plan within the long-range master plan. The board recognized, however, that a number of local districts were too small to offer a high-quality level of education and should be consolidated with neighboring districts. Thus, the board will make consolidation recommendations where pertinent.

The state board's statement of educational philosophy emphasized the importance of local control. South Carolina has jealously guarded her autonomy in education and has respected the right of districts in determining local policy, even though this has changed in recent years, and federal programs have affected local interests. The new superintendent must take these changes into serious consideration.

9. Ibid.

14. "Centennial of a Seer," South Carolina Schools, XIX, No. 4 (Summer 1968), 6-7. According to a South Carolina state census in 1871, there were 209,376 children between the ages of 6 and 16 years in the state at the time.

17. South Carolina, Constitution (1868), art. 10, sec. 10.

18. Evidently Jillson did not seek renomination. He returned to Springfield, Massachusetts, and worked as a book agent of sorts. Despondent and suffering from acute rheumatism, he committed suicide on December 8, 1881.

19. He later served as Governor of the state, Assistant Secretary of the Treasury, a member of the U.S. Civil Service Commission, and comptroller of a leading insurance company in New York City.

20. Superintendent of Education, Annual Report, 1878, pp. 55-56. In this report, Thompson quoted from a speech by the Reverend B. Sears, general agent of the Peabody Educational Fund. Like other advocates of in-service training of teachers, it had a "modern approach":

The great fault with untrained teachers is that they do little but teach the words and formulas of books. A normal graduate teaches things, principles, thoughts; every point is examined orally, and subjects are sifted by the exercise of the judgment as well as the memory. The pupil is made to see with his own eyes and to rely on his own observations. Books are a mere syllabus, a skeleton, to be clothed with flesh by the teacher and pupil. Practical knowledge of almost every kind is worked in continually with the subjects of study. All the common objects of sight, such as flowers, plants, trees, rocks, birds, insects, tame and wild animals, forms, colors and dimensions, manners, morals, laws of health, gymnastic exercises, drawing and the cultivation of the voice, receive special attention. This common sense knowledge of useful things is a vital part of popular education. Instead of this, how often are the poor children wearied with the endless repetition of mere words, the dry and stale lumber of the books.

23. The 1964 revisions amended the composition of the State Board of Education and were more specific in the duties and responsibilities of the board and the superintendent of education.

26. James H. Thornwell was born in 1812 and died in 1862. An 1831 graduate of the University of South Carolina (then known as the South Carolina College), he was ordained to the Presbyterian ministry, but 4 years later he returned to his alma mater, where he served as professor and president for 25 years.

28. Ibid., p. 9.

This discussion is continued later under "The Administration of James H. Hope, 1922-46."

This legislation dates back to 1913.

Among laws enacted were "An Act To Provide an Equalization Fund for Needy Schools and Repeal an Act Entitled 'An Act To Guarantee Adequate Facilities and Teaching Corps in Needy School Districts.'" This act gave more support to needy school districts. Also enacted were "An Act To Establish and Maintain High Schools," and "An Act To Relieve the Overcrowding of Pupils in the Elementary Grades of State-Aided High Schools." The same assembly passed "An Act To Encourage the Erection of Adequate School Buildings," and another act permitting school districts to levy special taxes up to 15 mills. This same year, the Legislature passed "An Act To Require Levy of a Three Mill Constitutional Tax for Schools." These laws all were designed to improve the tax structure of school districts. Of particular importance was passage of the 6-0-1 Law of 1924, which superseded most of the school aid bills previously passed and was chiefly responsible for the demise of the mill schools.

For full information about the investigation, see University of South Carolina, Steering Committee, The Investigation of Educational Qualifications of Teachers in South Carolina, Directory, Purposes and Plans (Columbia: The Committee, January 1942).

The R.L. Bryan Company is the central depository for the state. Arthur St. J. Simons, chairman of the Board of Directors, states that his company has been the central depository since 1893. Other sources corroborate the statement.

EDUCATION IN SOUTH DAKOTA PRIOR TO 1900

In 1862, the Dakota Territorial Legislature established a board of education composed of the Governor, the treasurer, and the secretary of the territory and authorized the appointment of a superintendent of public instruction who would also serve as the board's secretary (1). The board would recommend revisions in the school law, make reports to the Legislature, and select the textbooks for the common schools. The members of the board and the superintendent were to be paid $3 a day while on duty, plus an allowance for travel. Two years later, in 1864, the board formally organized, and it appointed James S. Foster as the first superintendent of public instruction. The superintendent was directed to keep a record of the board's official acts and to promote high standards of education in the territory. His duties also included visiting schools, conferring with the county superintendents, and distributing to them blank forms for collecting statistics. He was responsible for reporting annually to the board about the condition of the territory's common schools, for listing their expenditures, and for suggesting how they might improve their organization and methods of instruction.

Superintendent Foster, born in Salisbury, Connecticut, had come under the influence of the great New England educator, Horace Mann. He was a man of ability, and his reports reflect his knowledge and zeal. When the 1865-66 Territorial Legislature abolished the position of secretary to the board and created an elective board of education, the new members in 1866 appointed Foster as superintendent of public instruction (2).

When Foster took office, the Dakota Territory had no schools except a few private ones and had passed no official acts; therefore, his first report in December 1864 consisted chiefly of recommendations, such as the fundamental necessity of a regular levy to support the schools. In his 1867 report, Foster cautioned that to avoid future trouble, it was necessary that the territory's first districting be done with care to reduce the need for redistricting. He urged the Legislature to pass a law providing for an equitable division of property when the districts were created. The superintendent also pointed out the need for a normal school in this new region, "especially of the propriety of federal provision for such a school" (3).

In 1867, no one qualified for the education board, so it was dropped – the last board in the territory until 1887, when the Legislature revived it on the recommendation of Superintendent A. Sheridan Jones. The 1867 Legislature provided for an elected superintendent who would serve a 2-year term. In addition to his other powers, the superintendent was granted the authority to approve all textbooks used in the public schools, regulate the certificates to teach issued by the county superintendents, conduct territorial teachers institutes, discourage the use of sectarian books in the public schools, and assist in selecting books for libraries. The law ordered him to furnish copies of school laws to district officers, hear the appeals of county superintendents, and render interpretations of these laws. The superintendent's salary was established at $4 per day, plus an allowance for materials.

In 1869, T. M. Stuart was appointed state superintendent. Stuart served only a few months, and Foster was appointed to fill out his 2-year term. J. W. Turner was appointed superintendent in 1870. The 1870-71 Legislature had authorized the superintendent to appoint a deputy, and Foster, although busy with other matters, agreed to serve in this position (4).

During these years, the superintendents devoted most of their efforts to improving teaching and school management by developing courses of study and conducting institutes for teachers. They counseled with county superintendents and school district board members on the operation and fiscal management of the school districts. Unfortunately, the state superintendents had meager funds to carry out their duties. The lack of funds for printing may be one of the reasons why the official reports are virtually nonexistent from 1867 to 1884 (5).

The early superintendents were paid inadequately for the many responsibilities of their office. For instance, in 1873 the salary was fixed at $600 per year, and then changed in 1875 to $5 per day for the time actually devoted to school business. The $600 was restored in 1877 — the same as it had been 4 years earlier.
The state superintendency assumed considerable importance when William H. H. Beadle accepted the position in 1879. His work during the 6 years he held office was of great value to the territory and later to the state in developing and systemizing a plan of public instruction. His efforts in saving the school lands of the Dakotas, and indirectly the school lands of other states, have been widely acknowledged. After a study of other states, he became aware of the school lands of other states, and, in 1883, he convinced the Legislature to make the township the local unit for school operation. By 1886, it had been adopted by 68 of the territory's 83 organized counties. These 68 counties consisted of only 365 school districts, while the 15 older counties, where the smaller unit district system was firmly entrenched, had 1,150 districts (6). Even after the township system was abolished, the township school districts remained the basic unit in many counties.

The Legislature again changed the state department's structure in 1887 by delegating all of the superintendent's duties to the Territorial Board of Education. In addition, the board was given the authority to revoke teacher certificates, prescribe a course of study for common and high schools, adopt and furnish schoolhouse plans, and specify the duties of the deputy superintendent. The superintendent was now an administrator, responsible for the full management and supervision of the schools. His most important responsibilities involved deciding controversies and disputes according to the laws or the board's rules and regulations. He kept then—as now—the books, maps, charts, and plans for school buildings in his office.

When South Dakota became a state in 1889, its constitution provided for a superintendent of public instruction to be elected for a term of 2 years at a salary of $1,800 per year. The new state's Legislature, in its first session in 1890, abolished the education board and transferred its powers and duties to the superintendent. Except for tinkering with the laws as they applied to operating schools in the counties, townships, and districts, the Legislature made no more changes in the state's educational system until 1901. During this period, the department was apparently a one-man operation.

EDUCATION IN SOUTH DAKOTA, 1900-65

In 1901, the South Dakota Legislature undertook a complete revision of the school laws. The superintendent's duties were changed very little, but he was given responsibility for supervising all common and high schools. For the first time, the superintendent was provided with an office at the state capitol and was directed to file his papers, reports, and the public documents received from the county superintendents so that they could be inspected by the Legislature at any time. His salary remained at $1,800 per year, but he was given $200 for expenses incurred while traveling on the business of the department. The superintendent also was authorized to appoint a deputy at a salary of $1,200 per year.

The Legislature passed a compulsory attendance law in 1905, but the superintendent's biennial report for 1906-1908 indicates that the pupils in the rural districts attended on an average only 85 days per year while those in the independent districts attended 131 days. About 69 percent of the pupils attended schools in rural districts where the eighth grade was the highest offered; 71 percent were enrolled in the independent districts—5 percent in the high schools and 26 percent in the lower grades. Unfortunately, although the law required every child between 8 and 14 to attend school, too often the school officials were hesitant to enforce it. Since in many schools the teachers and administrators preferred to expel mischievous children, Superintendent H. H. Ustrud recommended that the attendance law be enforced by a juvenile court.

At the end of the first decade of the twentieth century, many improvements had taken place in curriculum and school buildings, but the schools still found it difficult to secure qualified teachers. There was a growing interest in instruction in manual training, domestic science, and agriculture, but teachers with the proper training were scarce, and those already teaching were trying to do too much without adequate apparatus and laboratories. However, Superintendent Ustrud stated that he was particularly pleased that in many places modern school buildings had replaced the old box-shaped schoolhouses with cross lights and poor ventilation and heating, erected with no thought for the welfare and comfort of the children. But he added:

This condition is too often the exception and not the general rule. In the march of progress in the educational world the country school is lagging behind. Over two-thirds of the children of school age in our state are attending the country schools, and in their behalf I would plead for a square deal (7).

Superintendent Ustrud called for an educational awakening. He challenged the people to put their schoolhouses in good condition and pay enough to attract the best teachers so that they could build something they would be proud of. He stated: "The time is now for a concerted action on the part of all our citizens for better educational facilities for our children. In the sparsely settled communities I would recommend that state aid be provided for the buildings of schoolhouses" (8).

To carry out his recommendations, Ustrud urged that the county superintendents be given more authority over local school boards in selecting teachers and spending...
public funds. He contended that in a number of cases school officers were employing uncertified teachers. He recommended that the certificates required by law for the county superintendents should require bookkeeping and accounting so they could assist school officers with their accounting and reporting.

C. G. Lawrence, a former Lincoln County superintendent, became state superintendent in January 1911. His staff consisted of a deputy, a clerk responsible for issuing teaching certificates, a statistical clerk, and one stenographer. The superintendent conferred with the county superintendents, attended various school officers and teachers meetings, visited the high schools, and gathered the statistics for a biennial report to the Governor and the general public. He worked closely with the South Dakota Education Association and the county superintendents in developing recommendations for legislation to improve the schools.

Superintendent Lawrence was particularly interested in improving the quality of teaching in South Dakota. He estimated that each year approximately 1,500 inexperienced teachers without training in professional education — and many who had completed only 1 or 2 years of high school — were being employed in the rural schools. Although they had passed the state’s examination for certificates, he felt that “they have not been properly prepared for undertaking the difficult work of teaching.” He contended that “the only remedy for this weakness in our educational system is the establishment of normal training in our high schools to supplement the work of our regular normal schools” (9). He proposed that the Legislature authorize financial support for normal training departments in the high schools; such a plan had been adopted by the Kansas Legislature in 1909, and it had proven extremely popular.

A committee composed of city superintendents, high school principals, and a representative from the state department drafted recommendations for legislative action authorizing additional normal training courses in certain high schools. No action was taken, however, until State Superintendent Fred L. Shaw included these recommendations in his biennial report of October 1918. The Legislature approved the bill the following year and appropriated $30,000 in 1919 and $60,000 for 1920 to aid high schools approved by the state superintendent to “maintain a normal department for the training of teachers with special reference to work in the rural schools of the state.” The state superintendent was authorized to “prescribe the conditions of admission to the normal training classes, the course of instruction, and the rules and regulations under which such instruction shall be given” (10). The annual financial assistance per school ranged from $500 to one enrolling from five to ten pupils in normal training classes to $1,000 to schools enrolling over twenty in such classes.

Superintendent Lawrence also took up school consolidation as a solution to the problem of the many small rural schools. In 1913, the Legislature passed an act providing for reorganization to reduce the number of rural schools. The department prepared for public distribution five bulletins covering general education problems, one of which was designed to assist voters when the question of consolidation was put before the various communities.

Superintendent Lawrence resigned in September 1914 to return to Lincoln County as superintendent of the Canton city schools. He was replaced by Charles H. Lugg. Superintendent Lugg agreed that consolidation offered a solution to the rural school problem, but he warned that “it must not be accepted without a clear understanding of the experience of other communities that have tried it, and the knowledge that it is not suitable for all conditions” (11).

When it became apparent that the United States would be involved in World War I, a number of people demanded that the schools do their “patriotic duty” by dismissing the students early to speed up agricultural production. France and England, having tried this, warned that it was a mistake from both a patriotic and an economic standpoint to cripple the schoolwork of those who would eventually have to assume the burden of the present struggle. The warnings were not heeded, however, and students and teachers withdrew from their classrooms to the extent that those who remained lost their enthusiasm and spirit. The federal government finally began a campaign to keep the schools running at full efficiency.

In South Dakota, a number of neighborhoods were comprised of immigrants who could not read or write English and in some cases could not speak it. Many fell prey to anti-American propaganda. In 1918 the Legislature met in an extra session and passed an act “forbidding the use of any foreign language as the language of instruction in any schools or educational institutions of the state, either public or private, except as it may be necessary in teaching the foreign language itself as one of the subjects of study in our secondary and higher institutions” (12). At the same time, the teaching of German was suspended in all educational institutions for the duration of the war.

These conditions, along with the fact that in many cases the majority of electors in some school districts did not believe in education — even to promote literacy — caused the schools to be looked upon as nuisances interfering with the right of parents to force their children to labor whenever they needed them. Some of the school buildings were in such bad condition that they hampered students in their work. These factors prompted the 1919 Legislature to enact the Americanization Act, with its main aim to disseminate propaganda and maintain strong schools.

In July 1919, M. M. Guhin assumed the position of state director of Americanization and immediately began a campaign to explain the need, purpose, and spirit of his
program. Night schools were established in the many foreign-language-speaking communities — the most successful being in the one-room country schools. A number of teachers worked without compensation except for the many expressions of appreciation from their students for helping them learn to read and write. As a result, "the real process of naturalization began taking place — a process involving attitude and emotional response to America" (13).

Many of the native-born citizens suffered from near illiteracy rather than absolute illiteracy. For instance, it was common to receive letters like the following:

Dere Ser;

Rescevd; I will led you no that I cand go to sc- ul. I paist the fourd grad and some other higher grads. I whout send you my report card bout I cand find it no more. Ill teall the trought thads onosto good (honest to God)

Im twenty two years old (14).

The older people who attended the night schools became convinced of the importance of education. After the first few years, many of the evening schools had served their purpose, so they were discontinued, and the day schools offered the citizenship training. The Americanization and vocational rehabilitation programs were combined in 1927, but since the need for the former had diminished, the 1931 Legislature repealed the Americanization Act and drastically reduced the appropriation. As the money dwindled, the Americanization program came to a close, but not before it had established the principle that every child in South Dakota should grow up with the opportunity to attend a public school in his own community and learn to read and write the English language.

Superintendent Lugg realized that his predecessors had suffered many frustrations in dealing with the Legislature on items of a professional and technical nature. The South Dakota schools had been surpassed by the schools in the adjoining states despite the efficient work the school system had done in the past. He stated that it was time for the Legislature to confine itself to determining fundamental issues and not consider the details of school regulation. He added:

Practically every legislature since statehood has been called upon to consider a vast array of bills pertaining to educational matters, many of which were well advised while many were not. A deep-seated prejudice has sprung up in the minds of many of our best and most experienced legislators against any legislation pertaining to schools — a condition that is most unfortunate (15).

Lugg recommended that the Legislature create a State Board of Education to regulate matters that were purely professional and technical, such as the details concerning teachers institutes, certification of teachers, courses of study, and school reports. He also contended that a board was needed because the department's functions were increasing and all of the responsibilities that he would turn over to the board were now unjustly placed on the state superintendent's shoulders. Neither the public nor the Legislature was willing to accept this recommendation for a state board for another 40 years, but many board proponents after Lugg continually repeated his arguments.

The Legislature did create a vocational education state board to take advantage of the Smith-Hughes Act passed by Congress in 1917, but no funds were appropriated to administer the act. The State Board of Regents loaned the superintendent two instructors from the colleges to serve as inspectors of the high school programs initiated under the provisions of the Smith-Hughes Act.

The Legislature also created a commission to study South Dakota's educational problems and ordered it to report to the Governor prior to July 1, 1918. Under the chairmanship of Harold M. Foght of the U.S. Bureau of Education, the commission offered many helpful suggestions for administering and reorganizing the public educational system. Although the 1919 Legislature implemented none of the major recommendations, when Fred L. Shaw was appointed state superintendent in September 1918 to complete Lugg's unexpired term, he immediately began a vigorous campaign to improve the department's status. He found that the South Dakota department's appropriation was the smallest of any state in the Union.

Perhaps the survey commission's report contributed to his success in obtaining the legislation he desired. The Legislature appropriated $20,600 each for the 1920 and 1921 fiscal years to take full advantage of the funds available for vocational education under the Smith-Hughes Act. It authorized the State Board of Vocational Education to approve high schools recommended by the state superintendent for departments of vocational agriculture, home economics, and trade and industrial education, and to appoint officers and assistants to administer the vocational education program. This was important legislation because it lodged the vocational education program within the Department of Public Instruction instead of placing it in another agency as in a number of other states.

The Legislature also increased the appropriations for the department. This enabled Superintendent Shaw to add an assistant superintendent, a high school supervisor, a rural school supervisor, a supervisor of home economics, and a director with two assistants to supervise the adult education and Americanization program. For the first time, the department was in a position to perform many of the supervisory and inspection duties assigned to the state superintendent.

Superintendent Shaw was equally concerned about the general status of education and the quality of instruction in the schools. He campaigned for authorization
to add field superintendents in the county superintendents’ offices who could visit and counsel with teachers in the rural communities. He supported legislation requiring all districts to provide free textbooks for their pupils rather than the previous system, whereby books were furnished only when a majority of a district’s electors petitioned the school board to provide them.

Superintendent Shaw reorganized his state department into four “departments” or sections in addition to himself and his deputy. The high school department consisted of the high school supervisor, the vocational agriculture supervisor, and the home economics supervisor; the rural education and Americanization department included a director, three assistants, and a truant officer; the rehabilitation department consisted of a director; and the certification department was made up of the chairman of the board of examiners, an examination clerk, and a credentials clerk. Six stenographers were employed for all departments.

During Shaw’s second term, considerable progress was made in the local school systems in both the urban and rural districts. Many buildings were constructed, and a number of old buildings were remodeled. Teachers took advantage of the normal training programs established in some 60 high schools; at the end of this period, approximately 25 percent of the state’s teachers had an equivalent of 2 or more years of work at the college level above a 4-year high school education, and 50 percent of the teachers held first-grade or higher certificates. The state course of study for the elementary and secondary schools was thoroughly revised and reorganized. Most of the high schools followed the new course, which emphasized a curriculum adapted to the various needs of the community along vocational lines.

The rural schools remained a problem. They still employed many inexperienced teachers, and too often local school boards failed to provide the proper tools and working conditions. In 1919, the Legislature attempted to solve the problem in part by appropriating state aid to standardize the rural schools. Shaw was later convinced that this financial assistance did indeed improve education in many rural districts, and he encouraged its continuation in the face of considerable opposition. In his 1922–24 report he referred to this campaign against state aid:

Perhaps the most notable happening during the last three years has been the persistent campaign of propaganda against the public schools which is being carried on by organizations under sinister and un-American influence. All efforts to meet the financial demands of the public school system have been suppressed with the utmost skill and the minds of many well meaning people have been poisoned by prejudices against all forms of public school support except the limited local support derived from a property tax which is recognized as the least effective and most unfair means of raising public revenue (16).

The rural schools also were helped by a free high school tuition law passed in 1921, which provided an opportunity for every boy and girl in South Dakota to achieve a high school education at public expense. This placed an increasing demand on the high schools to provide facilities and teachers for expanding enrollments. At the same time, progress continued to be made in consolidating the rural schools, which in many cases were now providing 12 full years of education.

Superintendent Shaw repeatedly recommended separating the educational system from partisan politics and asked that the Legislature submit to the people a constitutional amendment creating a State Board of Education. He further suggested that the state board of regents and superintendent of public instruction offices be abolished and these functions be assumed by a State Board of Education consisting of three members elected on a nonpartisan ballot. He felt that this would remove the schools from the vicissitudes of politics and would enable the state to adopt a permanent, forward-looking educational program. The Legislature seriously considered the proposal from time to time, but its proponents failed to gain sufficient support to win approval.

The 1923 Legislature enacted a law permitting the schools to release time for religious instruction despite Shaw’s attitude that it was unnecessary. He felt that it relieved the teacher from the responsibility of presenting broad ethical and moral instruction in the classroom. He admitted that there was a need for religious instruction and that the average child received practically none. But he believed that the solution should be in the home and church rather than the responsibility of the state. He contended that the church was not doing all it should to revive the religious atmosphere of the home, because in far too many cases the religious atmosphere of the church was also wanting. Thus, if any legislation should attempt to further religious instruction, Shaw argued that it should be designed to encourage a revival of the religious spirit both in the church and the home, with the emphasis on the responsibility of these institutions. He concluded that no matter how much formal instruction might be given, the result in terms of developing a religious spirit would be an absolute failure. He stated:

The condition of the Jewish race at the time of the coming of the Messiah is a striking example that a nation may have a thorough knowledge of the Scriptures and be very punctilious in the matter of religious performance without having very much religious spirit. This is a matter of great importance upon which the Legislature will be called to act but must not act hastily, or with prejudice (17).

The growth and development of the department and the improvement in the quantity and quality of educational opportunities during Superintendent Shaw’s 6-year
administration are evidence of one of the brighter periods in the educational history of South Dakota. His forward-looking philosophy, coupled with his enthusiastic, energetic leadership and practical approach to the problems confronting education, affected the Legislature and the general public. It is true he was aided in large measure by the favorable economic situation that emerged after the stringent war years, which created an environment for accepting new ideas and changes in educational methodology and techniques. The conservative element of society, which had mainly controlled educational purse-strings since the state's beginnings, was momentarily overcome by the glittering promises of the bright future pictured for the 30-year-old state. Although Shaw strived to maintain the momentum created in the early years of his administration, the golden era was short-lived. The conservative philosophy returned to dominate the educational administration, the golden era was short-lived. The conservative philosophy returned to dominate the educational scene during the waning months of his term, and the fortunes of the Department of Public Instruction deteriorated rapidly.

C. G. St. John was elected superintendent of public instruction in the fall of 1924 and assumed the office the following January. St. John attempted to reverse the conservative trend by pleading that the existing services and support for the rural schools be maintained. In his first report to the Governor in December 1926, he stated:

Our rural schools must not be handicapped by any plan of retrenchment in expenditures. They are the foundation of liberty and progress. A depression in the schools today will be felt in the industry and progress of tomorrow. The children from every farm and fireside are calling to us — challenging us as to what we will do for them and their future welfare. We can not turn a deaf ear to this challenge. We must promote schools, equip them with the best that we can afford, and see that every person who is entrusted with the care and training of our children must be especially prepared for her work. The future intelligence of our citizenship of tomorrow is too important to be left to the possibility of chance, so we must know when we issue a certificate to a teacher that she has the proper training to present the subject matter to her pupils in a scientific manner. Let us do this for our children and they will rise up and bless us (18).

Despite St. John's efforts, his term saw the inauguration of a period of retrenchment that curtailed the prestige, activities, and effectiveness of the department for the next 16 years. The Legislature decreased education appropriations to such a level that by the end of St. John's 4-year tenure, only six professional people remained besides the state superintendent and his deputy. This eliminated the two rural school supervisors and the high school supervisor and abolished the rural education and Americanization department; these duties were assigned to the supervisor of rehabilitation. The supervisor of agriculture and the supervisor of home economics were retained as well as the chairman of the board of examiners and the credentials clerk. In effect, the professional staff of the department was reduced to the size and effectiveness of the period prior to 1920.

Superintendent St. John made recommendation after recommendation, most of them completely unheeded by the Legislature. He labored strenuously to preserve the state support plan for the rural schools, but he had to acknowledge that the state was —

Passing through a period of financial stress, owing to poor crops and bank failures, and school finances have been considerably handicapped...The schools also are receiving their share of criticism as their cost is a large part of the public expense (19).

In his report to the Governor in December 1926, he pointed out that his records proved beyond any doubt that the small amount appropriated for state aid had been a "wonderful source" for improving the rural schools; about one-fourth could now meet the qualifications set by the department for standard schools.

St. John reported that many rural schools still needed buildings with modern equipment for lighting, heating, and ventilating; library books; up-to-date sets of maps, globes, and charts; and teachers with training and experience. He pointed out that a 1925 department survey found that in the 50 counties reporting, 9.9 percent of the pupils in the eighth grade failed in the standard schools, and 24 percent failed in the nonstandard schools. Since it cost $98 per pupil to keep a child in school, it was evident that a great saving of both time and cost could be made if he did not have to repeat a course.

Even though the superintendent agreed to taking a slight reduction in the amount necessary to maintain the aid program by eliminating the schools that had received financial support for 10 years and proposed a small tax on incomes above $5,000 to provide the funds, his pleadings fell on deaf legislative ears.

The rural schools, always laboring under serious handicaps, suffered severely from this loss of revenue. The financial support decreased about 30 percent in the standard rural schools, and a slackening in the enforcement of the compulsory attendance law resulted in the rural districts’ losing students. The superintendent charged that the Legislature's refusal to appropriate the $360,000 in state aid provided by law was probably the greatest cause for a loss in both standards and attendance. About 40 percent of the state aid had come from taxes levied against railroads, telegraph and telephone lines, and city property, but now all of the money had to come from the local farm property if the districts were to maintain standard schools. Many of the rural schools needed painting and repairs that could not be done if left to the resources of the local boards.
Before he left office, Superintendent St. John recommended an amendment to the state constitution that would change the method of electing the county superintendent and the state superintendent so that these offices could be removed from politics. He believed that these officers should be selected because of their fitness for the positions. However, this proposal was not accepted for another decade.

E. C. Giffen, a rural school supervisor under St. John, became superintendent of public instruction in January 1929. An increase in the budget enabled the department to add a supervisor of elementary education and a supervisor of secondary education (20), bringing the total professional staff to eight, not counting the superintendent and his deputy. The position of assistant superintendent was eliminated and replaced by the office of executive secretary of the Young Citizens League.

The Young Citizens League, organized mainly in the rural schools, sponsored worthwhile activities for the homes, schools, and communities. The department encouraged this work by distributing 5,000 copies of a monthly eight-page paper, The Young Citizen, consisting in part of contributions from boys and girls. The organization also gave music instruction in schools throughout the state. A special committee developed a prospective music course especially adapted to the rural schools, and 7,500 copies of it were distributed free to the teachers. Superintendent Giffen stated: "Out of this has grown South Dakota's Young Citizens League program. The program began with one county and has grown until last year approximately forty counties successfully organized a County Chorus" (21).

Superintendent Giffen shared much of the philosophy of his predecessor and continued most of his programs. The department developed a new course of study for the elementary and secondary schools, which combined history, geography, civics, and some phases of science and health into a social studies course. The new curriculum also included reading, literature, language, grammar, spelling, and handwriting in the language arts. But the most significant accomplishment of Superintendent Giffen came in his second term — the recodification of the school laws by the 1931 Legislature, which markedly changed the statutes relating to transportation, tuition, and certification, and implemented a uniform accounting and reporting system in the school districts. The new 1931 code completely revised and raised the certification and training standards for teachers. Teachers in all high schools were required to have a baccalaureate degree, and elementary teachers had to have a 2-year certificate (a certificate backed by 2 years of college).

A number of schools were now demanding the extremely popular vocational education program. Adult farm organizations cooperated with the agriculture program, providing information on cooperation, land utilization, marketing, and taxation. A survey showed that 50 percent of the students who had taken vocational agriculture courses in high school were engaged in work closely related to it. The homemaking program was expanded, and interest grew in the trades and industrial education programs.

When the budget for the Americanization program was cut to one-half the amount requested in 1931, the department decided to curtail the aid paid to the schools and to use the balance of the funds to match federal money available for training disabled persons. Thus, when the Americanization program ended, the rehabilitation program became more significant. Approximately 90 persons were in training, and over 100 requests for assistance were on file.

The Depression caught many school districts heavily in debt, and the financial assistance the state should render continued to be one of the most perplexing and complex problems. The state superintendents during this period continually urged more state support for the public school system. Superintendent Giffen reported as follows:

In 1916 the total indebtedness of school districts was only $5,000,000. In 1920, the amount was $8,500,000. In 1924, the indebtedness had reached $19,500,000. By 1926 school districts had reached the peak of outstanding indebtedness and at that time owed a total of $20,200,000. Since 1926 there has been a slight tendency to decrease the indebtedness until now (1932) the outstanding indebtedness of the school districts amounts to approximately $17,000,000 (22).

The superintendent stated that he knew the debts had to be paid, and at the same time there had to be some relief from the burden of taxation for school purposes. This could be done either by closing many schools until the obligations were met or by completely revising the system of taxation to bring in new sources of revenue to the depleted school treasuries. But, he pointed out, the constitution clearly stated that the state must provide equal educational opportunities for every child of school age, and equal educational opportunities had never existed and never could be established until the provisions of the constitution were carried out as the framers intended.

The superintendent contended that the tremendous tax burden for public education should not be entirely a local affair, but that the state had to assume its responsibilities. He concluded:

My plea to the legislature is to maintain the present standard of public schools for the children of the state. When the legislature begins to cut public expenditures, it should not begin with the schools. It should begin with the least necessary political jobs and offices and with the further construction of highways and public buildings. The education of the children of our state is of far greater importance than material construction of any kind. We recognize that many retrenchments must be made until economic recovery is obtained. Let us,
1154 EDUCATION IN THE STATES: HISTORICAL DEVELOPMENT AND OUTLOOK

therefore, make our cuts in the direction of material construction where recovery can be made later, when conditions warrant such recovery.

Complete information concerning the problem of school finance of this state is contained in this report and should serve as the basis upon which to formulate legislation with a view to bringing about a solution of the problem of school support (23).

I. D. Weeks assumed the Office of Superintendent of Public Instruction in January 1933, when the Depression was at its worst. Agricultural states were particularly hard hit, and the situation was made worse by a continuing drought and grasshopper infestation. The 1933 Legislature dusted off Superintendent St. John's recommendations to the 1927 Legislature and passed a tax on gross income, with 50 percent of the proceeds allocated to the permanent school fund and distributed to districts on the basis of the school census, and 5 percent allocated to the distressed school districts by a prescribed formula.

At the same time, the Legislature reduced the department's annual budget from approximately $76,000 to $27,000 (24). Despite this reduction, Superintendent Weeks was able to continue all the major activities of the department and assumed the administration of all relief projects connected with elementary and secondary education, including the distribution of the 5-percent gross income tax fund. He was able to add a supervisor of trades and industrial education and a supervisor of adult education, but financial assistance for home economics instruction was virtually eliminated. Federal funds enabled him to expand the vocational rehabilitation program.

The inequalities of educational opportunity offered by the small high schools became increasingly deplorable during this period. Many were forced to reduce their staffs substantially. The department attempted to help the students by initiating a correspondence course, which offered them a greater opportunity than did their schools' limited faculty. To further assist these small high schools, the department established an "approved list" of those doing acceptable work on a limited scale and whose school officials were cooperating with the state department, even though they were unable to meet the requirements for regular accreditation.

Representatives of numerous lay organizations held a statewide conference in February 1934 to discuss the educational crisis and agreed to appoint a citizens committee to prepare recommendations for legislation. To facilitate the work of this committee, R. W. Kraushaar, the department's supervisor of secondary education, conducted extensive studies of the school system's financial support, curriculum, buildings, and administration. While the Legislature was slow to respond to the committee's suggestions and recommendations, many of Kraushaar's suggestions were eventually enacted into law.

The 1935 Legislature proposed two constitutional amendments, both of which the voters approved in the general election of 1936. These provided for the election of the state superintendent and the county superintendents on a nonpolitical ballot and removed the 4-year limit on the county superintendents' tenure. Despite the claims of its proponents, this change appears to have had little effect on the prestige and fortunes of the department or on the educational group's recommendations to the Legislature. The Legislature increased the department's budget a mere $1,300, and this was spent for some much needed office equipment, such as typewriters and filing cases.

The 1935 Legislature enacted a 2-percent sales tax and designated 8 percent of the proceeds for the distressed school districts. This reduced the local property tax levy by an amount equal to that received from the state. But, by the end of 1936, the financial condition of most districts was critical, with over 25 percent operating on registered warrants.

From the beginning of the Depression, the Permanent School Fund (25) had been the target of various schemes to support the state's staggering economy, and it became the concern of various educational groups and leaders to defeat these proposals. Fortunately, the commissioners of school and public lands, who have been custodians of the school lands since statehood, had always received the hearty and spontaneous cooperation of the South Dakota Education Association. When various groups tried to shift deficits in farm loans, which many counties had acquired through defaulted payments during the Depression, onto the Public Lands Fund, Commissioner Ben Strool successfully staved off the threat.

The forces favoring the change then proposed constitutional amendments to this effect, but these were defeated by the combined efforts of the SDEA, the Beadle Club (26), the PTA, and aroused citizens. Superintendent Weeks cautioned those proposing a change in the administration of the Permanent School Fund: "This fund in South Dakota is one of the largest in the nation. It must be kept inviolate..." (27). The Permanent School Fund was preserved, and today it annually provides approximately $2.5 million in interest and income for the public schools, thanks to the foresightedness and perseverance of these dedicated educational leaders and citizens.

The Depression period did emphasize the importance of a state support program for public education. Even though many school districts reduced their indebtedness substantially, the reduction was often accomplished by budget cuts that seriously affected the efficiency of the schools. The 1939 Legislature began appropriating a stipulated amount for state support rather than a percentage of the state sales tax. At the same time, the Legislature assigned the superintendent the task of distributing the state aid, and he retained this duty until 1959, when it was transferred to the Department of Public Instruction.
Public school enrollment decreased approximately 15 percent during the 1930's, and the teaching force was reduced 10 percent. The teachers were better prepared than ever in the state's history, but low salaries, lack of equipment, and poor building maintenance caused many of the best trained ones to seek employment elsewhere. Although the agricultural economy of the state improved substantially during the early 1940's, many people left the state for jobs in industry as the nation prepared for an all-out war effort against Japan and Germany. This exodus included many teachers and prospective teachers, so the teacher shortage became acute. Because of transportation difficulties stemming from tire and gas rationing, a number of rural schools were reopened, creating a demand for more rural teachers.

Superintendent J. F. Hines requested increased aid for distressed school districts and direct aid to the schools to alleviate some of these problems, but the 1941 Legislature turned a deaf ear. It even reduced the department's annual budget to $20,000. Again, in 1943, he recommended that the distressed school appropriation be increased from $150,000 to $250,000 and the general aid to all districts be not less than $1.5 million. He also included a request for a $6,000 increase in the department's budget to maintain his present staff and support an additional deputy or assistant superintendent. The 1943 Legislature increased the department budget to $30,050 annually but failed to provide for the assistant superintendent.

Teachers continued to leave the profession and the state to join the armed forces or to work in the war plants or at other private jobs. Superintendent Hines commented:

While the war itself has been the primary cause we cannot ignore the fact that security, better salary schedules and retirement have contributed their share. School districts cannot compete with industry and teachers are mindful of the extremely low salaries offered during the depression (28).

To meet this severe shortage, certificates were reinstated without additional college credits, and high school graduates were encouraged to take the examination for second-grade certificates. In his report to the Governor and the 1947 Legislature, Superintendent Hines recommended that a minimum salary law and a teacher tenure law be enacted and that the certification laws be amended to permit enough flexibility to meet the changing tin...s.

Incredible as it seems, the superintendent himself was still receiving a salary of only $1,800 a year—the salary set by the Constitution of 1889. In 1946, a constitutional amendment was approved giving the Legislature the authority to fix the salaries of any constitutional officers by two-thirds vote in each house. The 1947 Legislature increased the salary of the superintendent of public instruction to $4,800 per year.

By the end of the war, although the number of department staff members remained the same, their duties had shifted, and they had assumed many new responsibilities. For instance, the high school supervisor had taken over the responsibility for occupational information and guidance services, and a director had been appointed for a new division in curriculum and research. To meet these new responsibilities, Superintendent Hines asked the 1947 Legislature for an increase in the department's budget. He pointed out that more and more was expected of the department each year and that to give this service, it needed the best-trained personnel. During the war, both vocational rehabilitation and vocational education had become increasingly important, and these were in dire need of funds when the peace came. Hines also asked for more authority to decide school questions.

But the appropriations for the 1946-48 biennium continued to be far below the department's needs. The director of curriculum and research resigned, and his duties were taken over by the distributive education officer, thus reducing the staff to eight professional people in addition to the superintendent and his deputy.

At the close of the 1946-48 biennium, Superintendent Hines retired. He had served 2.5 years as deputy and 13.5 years as superintendent during the most difficult and frustrating period in the department's history. A capable administrator and a dedicated educator, he had surrounded himself with an efficient, talented, and dedicated staff. His pleas for funds to improve conditions and expand programs had fallen mainly on unsympathetic ears. The teaching force had reached new heights both numerically and professionally, but it had rapidly declined during the Depression as the population dwindled due to the drought and the economic circumstances. In quantity and quality, the teaching force had reached an all-time low. Economic conditions improved after 1940, but the frugality of the school boards and the Legislature during the previous 10 years had become so firmly entrenched that the shortage of professionally trained and qualified teachers—even under reduced professional requirements—continued for another two decades.

Harold S. Freeman was elected state superintendent in the fall of 1948 and assumed office in January 1949. He obtained a small increase in the department's appropriations and established a number of new positions, including a school lunch director, an additional rehabilitation officer, a supervisor of Indian education, and a surplus commodity supervisor, all related to federal programs. The professional staff now numbered 13 in addition to the state superintendent; although the position of deputy was still authorized by law, it was not filled.

Finances were still precarious in a majority of districts operating high schools, because the tax base and mill-levy limit were not sufficient, and these districts were accumulating large debts. The rural schools still had a
teacher shortage. In his recommendations to the 1951 Legislature, Superintendent Freeman stated:

Our State Department of Public Instruction has the least number of professional employees of any state in the United States. If this department is to assume the leadership which should rightly be expected of it, additional personnel will be necessary in order to offer the services expected of it by the schools of the state. In the meantime we are offering extended service as time, personnel, and finances will permit. We believe that the State Department of Public Instruction is a service organization for the schools of the state and shall strive to operate it on that basis to the best of our ability (29).

In 1950, a U.S. Office of Education study of all state departments revealed that South Dakota claimed to offer services in 28 areas, but that of the 156 man-months of professional staff time devoted to department services, 151 were spent in only 7 of the 28 areas: guidance, 6; instructional services, 18; research and statistics, 6; school lunch, 13; teacher certification, 24; vocational education, 48; and vocational rehabilitation, 36. The remaining 21 areas of service received an aggregate of only 5 man-months of service. The study also revealed that 68 percent of the department’s time was devoted to federally subsidized programs of guidance, school lunch, vocational education, and vocational rehabilitation (30).

The 1951 Legislature yielded to Superintendent Freeman’s requests and appropriated funds to improve and increase the department’s services. Four new positions were created: a consultant on school law, finance, and accounts; a consultant on school buildings and facilities; a consultant on school district reorganization; and a statistician. The high school supervisor was relieved of his responsibility for vocational guidance, and a separate position was created for this service. The supervisor of education was no longer responsible for the Young Citizens League as an executive secretary was again employed for this organization. One director was placed in charge of both commodity distribution and the school lunch program. The total staff now consisted of 19 professional persons plus the superintendent.

The financial resources were still inadequate to meet the needs of many schools. The 1951 Legislature decided to follow a recommendation Superintendent Freeman had made in his first biennial report and enacted a school district reorganization plan to increase the size and tax base of many districts. The act proved to be cumbersome and time consuming, and despite the efforts of the department’s personnel little was actually accomplished. Twenty-four counties established county planning committees, but there was no real reduction or enlargement of the school districts.

The School District Reorganization Act was really a long-range program, special appropriations were still needed to support current operations. The 1951 Legislature appropriated $100,000 for the 1951-53 biennium to establish a plan for educating crippled and physically handicapped children, and a supervisor of special education was hired. It also authorized a vocational rehabilitation division, and the State Board of Education also became the State Board of Vocational Education. The vocational rehabilitation division was created within the board and headed by a director responsible for the administration of the vocational rehabilitation program. Other personnel in the division were to be appointed by the superintendent of public instruction on the recommendation of the director and approval of the board. The department also hired a director and three assistants to administer the Veterans’ Readjustment Assistance Act of 1952 — commonly referred to as “institutional-on-farm training” — passed by the Eighty-Second Congress.

Another study by the U.S. Office of Education in 1952 showed that 86 percent of the department’s professional staff devoted their efforts to federally subsidized programs — only 14 percent were connected with strictly state-sponsored functions and services. The study also revealed that the highest salary paid in the department was not over $4,999, and although the state required at least a bachelor’s degree for the position of supervisor, two supervisors did not have degrees.

Most independent school districts continued to be plagued by low assessed evaluations and limited mill levies. Increased costs for maintenance caused many districts to operate with a deficit and with no hope of balancing the budget from current revenues. The county elementary school equalization fund enacted by the 1953 Legislature gave considerable relief to a majority of the common (rural) school districts, enabling them to become financially solvent.

At this time, South Dakota had a large number of common school districts (authorized to operate only an elementary school program) that did not operate schools and often had few expenses due to the fact that they contained few or no resident children of school age. The property owners in these districts enjoyed extremely low tax rates. The purpose of the county elementary school equalization fund legislation was to levy at least one-half of the cost of operating the elementary schools in the county over all of the property located in the common school districts in the county. The receipts of this levy were prorated back to the districts on the basis of their individual expenses. This had the effect of causing all of the property to support at least a portion of the educational program of the state.

The 1953 Legislature decided that the State Board of Education should be composed of seven members, all appointed by the Governor for 7-year overlapping terms; none could be a professional educator. The superintendent was named as the ex officio president without power to
vote. The board was authorized to consult and advise the superintendent concerning matters relating to elementary and secondary education in addition to its duties relating to vocational education and the vocational rehabilitation program. For the first time, the members of the board were authorized to receive a salary of $10 per day when in session in addition to mileage and hotel expenses.

The school law was still badly in need of revision and recodification, so the state board directed the department's school law consultant to coordinate this task. E. V. Morrill, an attorney with considerable experience in school law and past chairman of the Senate education committee, was employed as a legal adviser and, with the assistance of a representative from the attorney general's office, drafted a bill to present to the 1955 Legislature. They patterned the composition and powers of the State Board of Education and the powers and duties of the superintendent and Department of Public Instruction — where the state constitution permitted — on the recommendations of the National Council of Chief State School Officers as presented in its 1952 publication, "The State Department of Education." The Legislature enacted these changes in 1955.

Under the new laws, the duties of both the state board and the superintendent were greatly extended. For instance, in addition to its duties relating to vocational education and vocational rehabilitation and its power to consult and advise the superintendent concerning elementary and secondary education, the board was given the power to appoint and affix the salaries of the department's professional staff (except the deputy superintendent) on the superintendent's recommendation. The board was to formulate policies and adopt rules necessary to carry out its functions, hear all appeals arising from its rules and regulations, recommend to the Governor and Legislature laws necessary for the state's educational needs, publish the laws relating to education, set minimum standards for school districts, and reject or approve all master plans for reorganization. It was given the authority to prescribe the requirements for teacher certificates, adopt a state course of study, and establish the standards for classifying, approving, and accrediting public and nonpublic schools.

The state superintendent, in addition to his other duties, was to keep the state board advised as to the status of the public schools, delegate and administer executive functions to the department's personnel, examine the high schools and all elementary grades, and accredit the high schools to institutions of higher education. He was to prepare and submit to the state board the courses of study, and classify, approve, and accredit public and nonpublic schools.

In analyzing the effect of these legal changes, the Legislative Research Council stated:

It marks the first time that the Legislature (1) made the Superintendent of Public Instruction directly responsible for the conduct of many of his duties to the State Board of Education; (2) recognized that the professional staff of the Department of Public Instruction was more than the office staff of the Superintendent by placing control of such staff's appointments and salaries with the State Board of Education; (3) authorized the State Board of Education to act in more than a merely advisory capacity in matters other than vocational education and vocational rehabilitation; and (4) directed the superintendent to delegate his ministerial and executive duties to the professional staff of the Department of Public Instruction (31).

The 1957 Legislature changed the board's structure and substantially amended the powers granted to it in 1955. The new law made appointments to the board subject to the Senate's approval and provided for the Governor to fill the vacancies so that each supreme court district was represented. The terms were limited to 5 years, and no appointed member could succeed himself. Instead of spelling out all the duties and powers in great detail, the 1957 amendment repealed many of these subsections and provided that "the State Board shall be responsible for the adoption of all policies for carrying out educational functions as relate to elementary and secondary schools, or as may be vested in the State Department" (32). The board's power to establish standards for approving building plans was limited to suggesting standards, and it could do no more than consult with the superintendent about school district reorganization.

The 1957 Legislature directed the state board to transfer to the superintendent three functions: publishing laws relating to education, prescribing a uniform system for gathering educational data, and accepting and distributing commodities, moneys, goods, and services available from the state or federal government.

Superintendent Freeman died in May 1957, and Deputy Superintendent W. G. Elliot served as "acting superintendent" until M. F. Coddington assumed office in June 1958, following his appointment by the Governor. The department's services and program had substantially improved and expanded during Freeman's tenure. The professional staff had increased from 8 in 1948 to 30 in 1958, almost a 300-percent increase (33). While much of this expansion was related to programs sponsored or financed by the federal government, the educational program for exceptional children, which had added a psychologist and a teaching consultant during the previous biennium, was primarily supported from state appropriations. The school law had been completely revised, and a State Board of Education had been created that was responsible for elementary and secondary education, including the certification of teachers. The state legislative appropriations increased from $1.5 million in 1949 to $2.5 million in 1958. (Despite this increase, the state appropriations were...
barely able to keep pace with the increasing costs of the
local administrative units.)

The State Board of Education agreed in December 1958 to accept responsibility for administering Title III of
the National Defense Education Act (NDEA) passed by
Congress earlier in the year to strengthen elementary and
secondary instruction in science, mathematics, and foreign
languages. In the following session, the Legislature failed to
provide an administrator for the program, so the deputy
superintendent assumed this responsibility. NDEA also
partially financed the Iowa Tests of Educational Develop-
ment for grades 9 through 12 in all South Dakota high
schools during the 1959-60 school year. The University of
South Dakota supplied the balance from its research funds.
Many schools were able to inaugurate programs or expand
their services for handicapped children because the Legis-
lature appropriated over $500,000 for special education in
the 1958-60 biennium.

The secondary education division completely revised
standards for accrediting the high schools; they were now
classified on the basis of the quantity and quality of their
program. By the end of 1962, 98 public schools and 14
nonpublic schools were classified as first-class accredited
schools, and 150 public and 11 nonpublic schools received
second-class accreditation. Over 74 percent of all high
school students were enrolled in the first-class accredited
schools.

By 1960, the state board had adopted certification
requirements for counselors in the vocational guidance
division. The guidance and special education divisions were
then merged in July 1961 to form the pupil personnel
services division. The department also established a school
administration and law division in July 1960 by combining
the former school law, finance, and accounts division and
the research, records, and reports division. School buildings,
school district reorganization, and transportation comprised
a third division. The surplus commodities distribution
program was merged with the school lunch and special milk
program, and both came under the administration of a
single director. The practical nurse education program was
combined with the trade, industrial, and distributive pro-
grams. The vocational rehabilitation department established
four district and two subdistrict offices. In summarizing
the accomplishments of his second term, Superintendent
Coddington stated:

In numbers only, the increased participation in such
areas of vocational rehabilitation, school lunch, and
service to the retarded stands out. Improvement of the
physical plants among the schools, an increasing number
of school buses, more school district reorganization, new
modernized courses of study in several fields, added
science equipment encouraged by and assisted with the
National Defense Education Act, more adequate Indian
Education Programs, increased state aid, an upgrading of
certification requirements for teachers and improved
scholastic opportunities for more high school students
also present more definite achievements based on sound
foundations set up in former years (34).

With funds from Title X of NDEA, the state board
created the statistical services division in July 1963. Some
electronic data-processing equipment was obtained, and the
division began compiling the data used by the department's
various divisions. This equipment was especially helpful in
the distribution of state aid to school districts.

In 1963, the Legislature appropriated $7,500 to
finance a survey of the possible advantages of educational
television (ETV). The 1965 Legislature accepted the survey
group's recommendations and created a board of directors,
separate and apart from the State Board of Education,
except that the state superintendent was a member, to
establish policy and exercise control over the proposed
state ETV network (35).

Since 1917, when the Legislature voted to accept the
Smith-Hughes Act aid, the state superintendent had served
as the director of vocational education. When Congress
enacted the Vocational Education Act of 1963, it became
apparent that a full-time director for the vocational division
was needed, and the State Board of Vocational Education
created this position in March 1964. The board also
appointed a director for the vocational rehabilitation
division created by the 1951 Legislature. This officer was
governed by the rules and regulations established by the
State Board of Vocational Education and was responsible
to the state superintendent only in appointing personnel.

When policy relating to vocational rehabilitation was
considered at regular or special meetings, the board
convened as the State Board of Vocational Education. It
met as the State Board of Education when considering
policies, rules, and regulations relating to the other aspects
of elementary and secondary education.

In the 1965 session, a small group of legislators ex-
pressed dissatisfaction with certain features of the state's
plan for utilizing federal funds under the Vocational Educa-
tion Act. They succeeded in getting a bill passed creating
a vocational education division under the State Board of
Vocational Education (the State Board of Education). The
board was directed to adopt policy for promoting and
coordinating vocational training in technical education, to
approve or disapprove state plans submitted to federal
agencies, and to make recommendations to the Governor
and Legislature. It was also made responsible for distrib-
bution of funds appropriated by the Legislature and granted
by federal agencies to the public secondary, postsecondary,
trade, and technical schools for state plans approved by the
board.

The 1965 law also stipulated that the Governor
would appoint the director of the vocational education
division on recommendation of the board. He would have
to have a master's degree with special training in vocational education from an accredited institution of higher learning. His salary was set at not more than $12,000, the actual amount to be determined by the Governor, who had the power to remove him at any time for cause. The director was to serve as the division's chief administrative officer and have general control and supervision over all vocational training and technical education in the public schools. He was to select the staff personnel under the direction of the board, which would set the qualifications while he would set the salaries subject to the board's approval. He was required to keep the board advised of the status of the programs, administer all of the policies adopted by the board, prepare the state plans for board approval, submit the courses of study to the board, prescribe uniform systems of gathering and reporting data on vocational training and technical education, conduct research and compile statistics relating to the training, and establish a system of fiscal control and fund reporting.

At the same time, the State Board of Vocational Education decided to appoint a full-time director of vocational education in 1964. Superintendent Coddington organized the State Department of Instruction into a division of instruction and a division of administration, each headed by an assistant superintendent. The lines of authoritative communication to the sections assigned to each of these divisions existed more in fancy than in fact. The two assistant superintendents continued serving as section directors, one for secondary education and the other for school district reorganization, school buildings, and transportation, which left them little time to devote to the supervision of the other sections in their divisions. The long-standing practice of each section director's reporting directly to the state superintendent contributed to the assistant superintendents' frustrations. Nevertheless, the personal relationships continued on a cordial, professional, and cooperative basis. When additional personnel were hired to relieve the assistant superintendents of some of their routine duties, the new plan began to function.

THE DEPARTMENT TODAY

Organization

As of June 1967, the state education administration in South Dakota consisted of the State Board of Education, the superintendent of public instruction, and the Department of Public Instruction. (See Appendix B.) The state board consists of seven members appointed by the Governor, subject to the approval of the Senate, for 5-year overlapping terms (36). The board is responsible for adopting all policies governing the department and for carrying out the functions relating to elementary and secondary education vested in the department. The state board also serves as the State Board of Vocational Education and formulates policies for the vocational education and vocational rehabilitation divisions.

The superintendent of public instruction, elected on a nonpartisan ballot for a 2-year term, is a constitutional officer in the executive branch of the state government. His salary is determined annually by the Legislature. The superintendent is the executive secretary and the executive officer of the State Board of Education and is responsible for executing and administering all policies promulgated by the board. He has the power to appoint and prescribe the duties of a deputy and is chairman of the State Library Commission, chairman of the Teachers Retirement Liquidation Board, a member of the Indian Commission, a member of the State Planning Commission, and an appointed member of the Governor's Traffic Safety Council.

The Department of Public Instruction is unique in the executive branch of the state government. Although numerous references are made to it in the laws, it has never been expressly established and is not clearly identified in the statutes or the constitution. Nevertheless, it is commonly considered to consist of the superintendent of public instruction and the professional and clerical personnel under the direct jurisdiction of his office and the state board. The majority of its functions are those the Legislature has assigned to the superintendent. In fact, one of the duties of the superintendent is to delegate ministerial and executive functions to the staff of the department. In a few instances, the Legislature has specifically directed that a particular function, such as the distribution of state aid to school districts, be performed by the department. But no true distinction exists between the powers and duties of the superintendent and those of the department.

The general administration of the department is vested in the office of the superintendent and his immediate staff, which consists of an executive assistant and the comptroller. The comptroller is responsible for departmental internal services, including personnel and fiscal management, and he reports directly to the superintendent. As directed by the state board, he maintains a working relationship with the state budget officer and the employment division.

The department is divided into two general areas—instruction and administration—each under the supervision of an assistant superintendent. Under the assistant superintendent for administration are the divisions of school district reorganization, transportation, school buildings, statistical services in NDEA Title X, research and public information, school administration and legal services, and school lunch and food commodity distribution. He is also responsible for the Great Plains School District Reorganization Project and the Midwestern States Educational Information Project.
The Great Plains School District Reorganization Project is a cooperative, comprehensive 2-year study of the school districts in the Great Plains area conducted by the education agencies of Nebraska, Missouri, Iowa, and South Dakota. This project is administered through the Nebraska education department by a steering committee composed of representatives of each participating agency and the project director. A state director stationed in each state constitutes the professional staff of the project, which is funded by a Title V grant of $355,000 under the Elementary and Secondary Education Act of 1965 (ESEA).

Thirteen states have embarked on a Midwestern States Educational Information Project to develop and implement a unique educational information system pertaining to pupils, staff, instruction, finance, and facilities. Since Iowa is the contracting state, the central staff is located in Des Moines. Each of the cooperating states, including South Dakota, is represented on the policy committee or governing body by one person at the administrative level. The coordinating committee and five subcommittees, one for each of the five basic areas of concern, each composed of a representative from each participating state, constitute the organization. A state coordinator financed by the project is located in each state to assist staff members with their assignments.

Under the assistant superintendent for instruction are the divisions of elementary education, secondary education, curriculum, pupil personnel services, NDEA Titles III and V, teacher education and certification, Indian education, adult basic education, ESEA Titles I and II, and the instruction and subject area specialists. The assistant superintendents report to the superintendent on the activities of their areas.

Federal Programs

The state-federal programs and local services division is unique in that its head reports directly to the superintendent. It supplies up-to-date information on federal educational programs, and the coordinator occasionally assumes administration of these under the state board's jurisdiction until an administrator is appointed. Under the federal impact law (P.L. 81-874), this division distributes approximately $3 million in funds annually to school districts.

Under NDEA, Title III, funds are provided to strengthen instruction in science, mathematics, modern foreign languages, and other critical areas in schools through grants approved by the state department. It provides for laboratories and other special equipment, including audiovisual and printed materials other than textbooks. It also provides some funds for remodeling space for such equipment and materials. The department also has received a grant for expanding supervisory services in specified areas of instruction and for administering the state's plan. Under ESEA Title III, four educational planning centers have been established and funded from an allocation to South Dakota of approximately $1,100,000.

The state board created an adult basic education division in 1967 to administer approximately $50,000 annually for adult education, expected to be available to South Dakota under Title III of P.L. 89-750, Elementary and Secondary Education Act Amendments of 1966. Studies indicate that the adult basic education program is needed by the reservation Indians and in the larger cities.

The Indian education division is concerned mainly with the administration of the Johnson-O'Malley Act, a federal program designed to provide funds for school districts based on the percent of nontaxable Indian land, the ratio of Indian to non-Indian enrollment, the financial need, and the quality of the educational program. It also reimburses the districts for lunches and milk given free to needy Indian children.

The department's school lunch division serves as a state agency for the programs administered on a national level by the food distribution division of the U.S. Department of Agriculture, such as the National School Lunch Program, the Special Milk Program, the child care centers, and summer camps; the commodity program for needy persons in the counties and on the Indian reservations; the institutional commodity programs; and the commodity program for summer camps. New programs in connection with the War on Poverty and the Child Nutrition Act of 1966, which offers a pilot breakfast program and additional food services, will undoubtedly create more duties and responsibilities for this division.

The state department helps local districts take advantage of federal money under Title I of ESEA to develop special programs for educationally deprived children in areas where low-income families are concentrated. The grants under this title are made directly to the school systems from funds available to the state, as there are no matching requirements. With more than 2,000 school districts, South Dakota has had considerable difficulty using the money available under this title because of many small individual allocations and the lack of local personnel to implement the projects. During its first year, the state approved projects to spend only 68 percent of the funds available; only three other states were below this percentage. The unused funds cannot be reallocated without the approval of the U.S. Commissioner of Education.

There is no doubt that the multiplicity of small districts unable to use these grants is causing a hardship and loss of money, since the larger districts could readily use these funds.

An analysis of the projects approved in 1966 reveals that the major concern of school administrators is to provide educationally disadvantaged children with the basic skills to ensure their success in later years. This means that the greatest emphasis is being placed on remedial work in reading. But the state has had difficulty administering and
implementing this title because of Congress’ failure to pass an appropriations bill in time for local educational agencies to plan effectively for using the funds.

South Dakota also receives funds under Title II of ESEA to supplement state and local funds for school library resources and other printed instructional material. The allocation within the state is on the basis of need, justified by the quality and quantity of library resources available in the elementary schools compared to those available in the secondary schools.

The Civil Defense adult education division was created in May 1963 to administer and operate a personal and family survival training program and a radiological monitor training program (RAMONT). Under contract from the U.S. Office of Education, the department offers 12-hour courses for personal and family survival in times of nuclear and man-made disasters. The department has trained a number of certified teachers as personal and family-survival instructors. The purpose of RAMONT is to train radiological monitors for the stations operated by the local Civil Defense directors.

The department’s pupil personnel services administer funds available to South Dakota from the federal government to provide materials from the American Printing House for the Blind to partially sighted children in the elementary and secondary schools. It also administers the $46,000 available for training professional personnel for educating handicapped children and this money has had a marked effect on the quality of instruction. The division also expects to take advantage of any funds available under ESEA Title VI by adding a speech and hearing specialist, more psychological services, and consultants in special education.

Federal funds provide 68.44 percent of the basic support program for vocational rehabilitation, 75 percent of the extension and improvement grants, and 90 percent of the funds for in-service training programs in this field. The vocational rehabilitation division also operates an old-age and survivor’s insurance (OASI) disability determination program under contract with the U.S. Department of Health, Education, and Welfare, financed entirely by federal funds.

The vocational education division’s major responsibility has been to administer the federally aided vocational education programs. Under the Smith-Hughes and George-Barden Acts, the federal government allots approximately $380,000 to South Dakota each year for programs in agriculture, distributive education, home-making, trades and industries, practical nurse training, and technical education. These funds are matched by state and local funds; the administrative and teacher-training costs are considered an administrative responsibility. The remaining amount after matching the administrative costs is distributed to the local districts on a 50-percent federal and a 50-percent state and local matching basis to reimburse the school boards for the various programs.

The federal Vocational Education Act provided funds to supplement those available under the Smith-Hughes and George-Barden programs and, in addition, provided funds for business and office education and health occupations. Under the Manpower Development and Training Act and the Area Redevelopment Act, special training courses for the unemployed and the underemployed are entirely federally financed. The South Dakota Legislature provides an annual appropriation of $100,000 to the vocational education division.

**RELATIONSHIPS WITH OTHER AGENCIES AND ORGANIZATIONS**

**Department of Finance**

The State Board of Finance, consisting of the Governor, the state treasurer, the secretary of state, the state auditor, the attorney general, the commissioner of school and public lands, the superintendent of banks, and the secretary of finance, carries on advisory supervision of all funds received by the state treasury and general supervision of the State’s fiscal affairs. All departments and agencies are subject to the rules and regulations adopted and administered by the State Board of Finance. Thus, before the Department of Public Instruction can purchase any item or order any printing work, it must have the approval of the finance department’s purchasing and printing division.

The education department must abide by the finance board’s rules and regulations relating to the employment of personnel, compensation plans, and salary schedules, and the board approves payrolls and allocates office space for all state agencies housed in the capitol building and the city of Pierre. The employment division keeps annual leave, sick leave, and time records for all state employees and approves monthly payrolls. The state travel commission is responsible for all state-owned vehicles, and the capitol supply service provides office supplies and materials to the various departments operating in the capitol building and its various annexes. A microfilming service maintained by the central services division has been of considerable benefit to the education department in controlling and storing its records.

The finance department is also responsible for keeping a complete inventory of all property owned by the state. Each agency must submit to the department an annual inventory showing what is on hand, the disposition of any property transferred or discarded, and the addition of any new property since the last report.

**Office of the Budget**

The Legislature created the Office of the Budget to promote economy and efficiency in the fiscal management of
the state government. Each agency must prepare and submit an annual budget to the budget board, which reviews the requests and makes its recommendations. The Governor and the budget director submit these requests, together with the recommendations of the budget board, to the Legislature. After the appropriations are made, the operating budgets for all state agencies are then submitted to the Office of the Budget for approval.

Committee for Education

State Superintendent J. F. Hines and a small group of city superintendents organized the Committee for Education in 1942 to promote desirable school legislation. During its early years, it served primarily as a vehicle for soliciting funds to employ a lobbyist during the legislative sessions. It had no constitution and no committees. The South Dakota Education Association and the South Dakota School Boards Association contributed to the fund, along with a number of the larger school districts and interested individuals.

Even though the organization was conceived and led by a dominant and forceful educator, Charles Dalthorp, superintendent of the Aberdeen City school system, its early efforts were not very successful. The membership base was too small and its effort involved only a few people, the majority being educators. Though it championed worthy causes, it was handicapped because the group was considered to be an “educator’s pressure group” and not truly representative of the public.

Other statewide organizations were invited to join the Committee for Education in 1946. A constitution was adopted, committees were appointed, and the organization was incorporated under the laws of South Dakota. Its membership consisted of the Associated School Boards of South Dakota, the American Association of University Women (South Dakota state division), the South Dakota Congress of Parents and Teachers, the South Dakota Education Association, the Department of School Administration, the Department of Higher Education, the County Superintendents’ Association, and the South Dakota Federation of Women’s Clubs.

With these changes, the Committee for Education became an action group. It published a “Report to the People,” the first in a series of bulletins carrying carefully documented statements portraying the condition of the state’s educational system and from four to six specific legislative proposals. These bulletins were circulated to the membership, to the legislators, and to the general public. The committee secured some legislation in the 1947 session and continued to grow in membership and influence. By 1958, 17 statewide organizations claiming a combined membership of around 75,000 had affiliated.

The committee’s efforts have been directed at four main concerns through the years: to increase state support for the schools (since 1958, through a minimum foundation program), to increase salaries for the state superintendent and his staff, to secure additional services to the schools by the Department of Public Instruction, and to achieve school district reorganization. All of these have been accomplished in varying degrees. Many fine pieces of school legislation have been proposed by the committee and ultimately enacted, including increased mill-levy limitations for local school districts (1947), state funds to administer the school lunch program (1949), state support for education for the physically and mentally handicapped (1951), and the creation of an education board for elementary and secondary education (1953 and 1955). The committee also was instrumental in getting the Legislature to pass teacher tenure laws and retirement legislation in 1951, a school district reorganization law in 1951 and 1955, and a raise in the constitutional debt limit for school districts from 5 to 10 percent of the assessed valuation in 1954.

Perhaps the greatest test of the committee’s sincerity and resoluteness occurred in 1955, when the Legislature completely revised the school laws to include a number of suggestions proposed by the committee. A well-organized opposition group, claiming that the new code would force school district reorganization against the will of the minority, that it would violate the long-standing tradition of local control, and that it would infringe on the parents’ freedom to select the school for their children, attempted to refer the new code to a vote of the people in the 1956 general election.

Referendum petitions were circulated and filed with the secretary of state in time to prevent the new code from becoming effective on the usual date, July 1, 1955. The committee, desiring to avoid a long struggle and anxious to get on with the improvements included in the code, empowered its president, Mrs. George Headley, to act in its behalf as plaintiff and employed attorneys to examine the petitions. They succeeded in proving to both the circuit and state supreme courts that a substantial number of technical errors in the petitions reduced the total number of acceptable signatures to below the number required. The new code then became the school law in South Dakota on September 9, 1955. Subsequent minor amendments forced through the Legislature at the insistence of the opposition eroded some of its effectiveness, but the main tenets of the new code remained in effect.

The Associated School Boards of South Dakota, one of the original members at the time of incorporation, withdrew its membership from the committee in 1960, but not its moral support. This association had become well organized and well financed, and its board of directors felt it could be more effective with the Legislature as an independent agency with its own lobbyist. The South Dakota Farm Bureau Federation withdrew its membership in 1963, due to some of its local organizations’ opposition to the committee’s stand on the 12-year school district proposal.
These two losses have been offset by the addition of other groups, thus maintaining a membership level of some eighteen statewide organizations, the majority related more or less to education.

The South Dakota Education Association

Territorial Superintendent W. H. H. Beadle, urged by several county superintendents to organize a state teachers association, called a meeting in July 1884 and founded the South Dakota Education Association, which adopted its constitution in 1886. General Beadle, elected its first president, held office for three consecutive annual terms. E. A. Dye succeeded Beadle as territorial superintendent and served as president of the SDEA in 1887. Superintendents G. L. Pinkham, M. M. Ramer, C. H. Lugg, G. W. Nash, C. G. Lawrence, I. D. Weeks, and H. S. Freeman all served in both capacities, but, except for Pinkham, not at the same time. Thus, a cordial professional relationship has existed between the superintendent of public instruction and the SDEA since its beginning. In fact, the early biennial reports by the superintendents usually included convention programs and resolutions adopted at the annual meetings of the SDEA.

The organization's executive committee was enlarged in 1922, and the superintendent of public instruction automatically became a member of the board of directors, the governing body of the association. This relationship has continued to the present and has proven to be mutually beneficial, as the SDEA almost invariably supports the proposals for educational progress sponsored by the State Board of Education, the superintendent, and his staff.

Associated School Boards of South Dakota

SDEA, recognizing the need for an organization of school board members, provided them the opportunity to create one at its annual convention in 1906. On the 1906 convention program of SDEA, the meeting was designated as the "School Board Department." The organization was not officially recognized as a department in the constitution, however, until its revision in 1912. The "School Board Department" was deleted in the 1953 revision of the constitution.

The 1949 Legislature created the Associated School Boards of South Dakota and authorized it to adopt a constitution and bylaws (37). It authorized membership dues and the use of school district funds for a delegate to attend the state convention and other meetings. The association was directed to report annually to the superintendent of public instruction and later to the state board "any matters which pertain to an increase in the efficiency of the public school system" (38). The secretary-treasurer of the association was required to prepare a complete financial report for its membership.

D. B. Doner, the registrar at South Dakota State College in Brookings and a member of the school board of the Brookings Independent School District, served part time as the secretary-treasurer until 1954, when the membership adopted a dues schedule sufficient to permit the hiring of a full-time executive secretary. J. W. Deacon became the first executive secretary in February 1955 and served for a year before he resigned. He was succeeded by William G. Elliot, who resigned after a few months to become deputy superintendent of public instruction. Gordon Nelson, the present executive secretary, was hired in October 1957 and established a permanent office for the Associated School Boards in Huron.

Relationships with the department, the superintendent of public instruction, and the state board have been maintained at a high professional level over the years. The Associated School Boards has worked closely with the State Board of Education promoting legislation. It keeps school board members informed through its conventions, workshops, and publications. The organization's major legislative activity in recent years has been directed toward increasing state financial support for public schools and improving the method of distribution; increasing the effectiveness of the local school districts through appropriate reorganization; and strengthening the state department through increased appropriations for salaries and improved office accommodations and working conditions for the professional and clerical staff.

South Dakota High School Activities Association

The South Dakota High School Athletics Association was organized at a meeting of school superintendents and high school principals at the SDEA convention at Brookings in December 1905. Its purpose was to regulate interschool athletic competition and supervise the state championship tournaments. A five-member board of control, consisting of four superintendents and/or high school principals and one athletic coach, representing the various sized schools, acts as the governing body and establishes the policies, rules, and regulations. A full-time executive secretary has been employed since 1937.

The association's early efforts were directed toward protecting the true value of athletic competition, too often sacrificed because of local pressure to win. It also hoped to keep inflated athletic values from jeopardizing those that should be expected from the academic and other non-athletic school activities.

Parallel associations for other types of school activities involving interschool competition, such as forensics and music, were formed from time to time, but many of these had a difficult time because they produced no revenue. After an intensive study by the South Dakota Association of School Administrators and the High School
Principal's Association, the High School Athletics Association was enlarged in 1960 to include all high school activities. The name was then changed to the South Dakota High School Activities Association, and the membership of the board of control was limited to superintendents and high school principals. In 1964, the board of control was enlarged to include a school board member representing the Associated School Boards.

All accredited public high schools were eligible for membership, as were the federal Indian schools and private and parochial high schools if their applications were supported by two-thirds of the membership. The federal Indian schools were accepted, but the private and parochial schools consistently failed to receive the necessary two-thirds vote. This prompted the Legislature to prohibit the association from excluding private and parochial schools, and after 2 years of litigation the supreme court upheld the legislation. Since July 1966, all accredited high schools in the state are eligible for membership.

The South Dakota High School Activities Association now coordinates and supervises all interschool activities at the high school level, except such organizations as the Future Farmers, Future Homemakers, and Future Teachers organizations. A good working relationship exists between the administrative personnel of the association and the division of secondary education in the Department of Public Instruction.

**State Library Commission**

The efforts to establish a free library commission date back to 1905 when Mrs. Stella Marie Stutenroth of Watertown, chairwoman of the legislative committee of the South Dakota Federation of Women's Clubs, caused to be introduced into the legislature a bill which would have established such a commission (39).

This was an era of bad roads, poor transportation, and no radio or television. People read for recreation, so reading materials were in great demand. Few public libraries were operating in the state, and there were practically none in the rural areas. Women's clubs envisioned a central library system of traveling libraries of South Dakota in 1908, 1910, and 1912. In 1912, the state-owned traveling libraries for which the law provided. However, the Supreme Court Library remained under the management of the supreme court; and the city, town, township, and school district libraries remained under the control of their respective boards of trustees or boards of education. Thus, only the State Library and the traveling libraries were placed under the Free Library Commission (40).

The 1913 Legislature did establish a Free Library Commission. Free libraries were defined as the Supreme Court Library; the State Library; the free public libraries of several cities, towns, townships, and school districts; and the state-owned traveling libraries for which the law provided. However, the Supreme Court Library remained under the management of the supreme court; and the city, town, township, and school district libraries remained under the control of their respective boards of trustees or boards of education. Thus, only the State Library and the traveling libraries were placed under the Free Library Commission (40).

The commission consisted of five members: the Governor, the superintendent of public instruction, the state librarian, and two appointees chosen by the State Library Association and the State Federation of Women's Clubs to serve 3-year terms. The law provided for the superintendent of public instruction to serve as president of the commission and as state librarian. The commission was to maintain its offices in the State Library at the capitol.

The commission's first regular meeting was held at the State Library in April 1913. The 1915 Legislature changed the law to make it permissive instead of mandatory for schools to purchase only books found on the list published by the commission. Two years later, the Legislature created a board of county library trustees, and while this did not directly affect the commission, it did expand the scope of its organizational, promotional, and assistance duties to a fairly large degree. The State Library was kept totally separate from what was called for many years the "Commission Library," but cooperation between them continued for a long time. In 1920, it was reported that "by mutual consent, neither the Free Library Commission nor the State Library duplicate unnecessarily any of the material contained in the library of the other department" (41). In 1943, the Legislature abolished the State Library and the office of the state librarian; the director of the Free Library Commission took over these duties.

In 1953, the duties of the commission were again defined. Its name was changed to State Library Commission, and it was designated as the State agency to apply to and receive from any private agency or the federal government or any agency thereof such gifts or funds as are granted or allotted for promoting library services as now or hereafter may be available to the state of South Dakota or any political subdivision or agencies (42).
This later caused several problems in administering funds available to South Dakota school districts for improving school libraries and other provisions under Title II of ESEA. Both the commission and the State Board of Education felt that they had the primary responsibility for administering these funds. A cooperative arrangement was agreed to by both agencies for administering the funds during the 1965-66 and 1966-67 school years. But to clarify the situation and definitely fix the responsibility, the 1967 Legislature amended this section with following sentence:

The provisions of this section shall not apply to funds or gifts which are granted or allotted to the State of South Dakota or to local public school districts for the purpose of acquiring library books or other library resource materials for local public school districts (43).

In 1957, the membership of the commission was increased to five appointed members serving 5-year overlapping terms. Two new appointments were to be made from nominations presented to the Governor by the South Dakota Junior Chamber of Commerce and the Associated School Boards of South Dakota.

Because of the close relationship between the state superintendent and the State Library Commission, both in the statutes and in practical operation, the commission has been the agency over the years to establish standards and provide supervision for school libraries. As a result of the controversy over the federal funds under Title II, the 1967 Legislature directed the state board to have full and complete supervision over school libraries. A cooperative working relationship continues between the State Library Commission and the Department of Public Instruction on the administration and supervision of school libraries. School librarians are invited to attend workshops conducted by the director, and many school administrators continue to take advantage of the services offered by the library commission in the development and maintenance of school libraries.

FOOTNOTES

1. Dakota Territorial Legislature, Session Laws (1864), ch. 41.
2. The first board of education was composed of Territorial Governor Newton Edmunds, Secretary of the Territory Jon Hutchinson, and Treasurer J. O. Taylor. The first elected board in 1866 consisted of J. W. Turner, S. A. Bentley, and William Walters.
4. No information is available as to why the Legislature began appointing superintendents in apparent contradiction to the law of 1867.
5. From 1878 until 1884, only one report can be found, and this is in double columns covering only a few pages. In 1882, Superintendent William H. H. Beadle addressed a report to all school officers, carefully noting that this was done at his own expense. Superintendent of Public Instruction, "History of Education in South Dakota," Fourteenth Biennial Report, 1916-1918, pp. 19-20.
8. Ibid.
14. Ibid., p. 17. The person writing the report probably added the "(honest to God)".
19. Ibid., p. 5.
20. R. W. Kraushaar was appointed supervisor of secondary education in 1929 and served for 8 years. During his first 2 years, he directed a committee of educators in preparing an administrative handbook for the South Dakota schools and made a study of the South Dakota school law for the recodification committee. He was also responsible for preparing a system of financial accounting that guided the school system for more than a quarter of a century.
23. Ibid.
24. The 1933 Legislature also changed the composition of the State Board of Education to include one representative each from labor, homemaking, and agriculture, and a superintendent or principal of an independent school district. The Governor was to appoint all four to 4-year terms.
25. The Permanent School Fund is composed of proceeds from the sale of the state school and public lands. Income from the investments of the fund plus the income from rents on the land is distributed annually to the school districts on a per-capita (school census) basis. The school census includes all resident persons from age 6 through age 20 as of November 1.

26. This was an organization named after former Superintendent William H. H. Beadle, founded in March 1934 to “honor men who have done outstanding work in the cause of education in South Dakota” and to “perpetuate the contributions to education of General Beadle, and to honor his name.” Its main purpose has been to protect the school lands and the Permanent School Fund. Hunkins, op. cit., pp. 65-67.

31. Ibid., pp. 8-10.

32. Ibid.

33. The institutional on-farm training staff was fading out and was reduced to one supervisor at the end of the 1958-60 biennium. Eleven of the 29 professional staff members were hired by a vocational rehabilitation division. An accountant, a statistician, and a consultant on school business administration were added to the research division.

35. For further information, see South Dakota, Session Laws (1965), ch. 67.

36. The Legislature in 1959 amended the law relating to the state board by eliminating two provisions: that a city superintendent of schools could not be a member of the board and that members of the board could not succeed themselves. State Legislative Research Council, op. cit., pp. 8-10.

EARLY HISTORY

The people of Tennessee accepted the basic ideas and principles of public education only after bitter public debate. That a democracy had a duty to ensure equal educational opportunity for all its youth was a concept at issue in this state—as in most others—throughout the nineteenth century. The European dogma that the education of all was dangerous to society and that it was not one man's responsibility to help educate the child of another continued to be held by the wealthy and privileged classes of Tennessee throughout most of the century.

Tennessee's first constitution, in 1796, had been silent on the question of education; thus, by implication it left the task of educating youth to private initiative by individuals or religious groups. One religious group, the Scottish Presbyterians, had been the leading educational thrust in the old Southwest Territory and continued its outstanding work after Tennessee achieved statehood.

Samuel Doak, a Princeton graduate and Presbyterian minister, was Tennessee's first teacher. He opened his home in Jonesboro to use as a school in 1781. In steady succession after this, Martin Academy (later Washington College), Davidson Academy (successively the University of Nashville and George Peabody College for Teachers), Greeneville College (later Tusculum), and Blount College (later the University of Tennessee) were established by Presbyterian ministers before 1800. Private academies and colleges were thus the first educational establishments in the state and became the foundation of the educational structure in Tennessee. Most of these institutions were financially undernourished, depending primarily on tuition for continued operation. (Tuition was advertised in 1829 by the Nashville Female Academy at $70 for a 5-month period to include board, washing, firewood, candles, and servant hire.) Other forms of financing attempted were the lottery (first used in 1801 as a device to raise funds for educational institutions in New York State and North Carolina), sale of stock, and personal gifts from wealthy patrons. Academies generally were considered college preparatory schools and were attended by only a small minority of school-age pupils. From a peak of several hundred academies chartered in Tennessee, the number declined sharply after the Civil War. The last one was chartered in 1889.

Legislators and other public figures gave little more than lip service to public schools in the early nineteenth century. Older states, like Tennessee, did not share in the congressional land grants for public education to the degree which did states created later. Consequently, Tennessee turned in 1806 to the device of a permanent public school fund to support its early efforts in public education. This method never had the desired effect, however, because it was a relatively small amount and because it checked any tendency to raise school taxes locally. In addition, careless management of the fund over the years severely damaged the image of public education in the state.

Election of Tennessee's Andrew Jackson as President of the United States in 1829 symbolized the end of the old class order centered in the Northeast and Tidewater areas of the nation. His enunciation of "confidence in the virtue and good sense of the people," and the sum of his actions as President eventuated in a democratic revolution which promoted the development of public education across the country.

New York, in 1812, was the first state to create an office to exercise general supervision of public education. Tennessee waited, however, for the impetus from Jacksonian democracy to establish its first state position of educational leadership. The General Assembly created the Office of Superintendent of Public Instruction in 1836, requiring the person in this position to control the common school fund and to formulate plans for the advancement of public education.

Robert H. McEwen became the first state superintendent, but his gross mismanagement of the fund (much of which he lent to friends and relatives who were caught by the Panic of 1837) placed him under such a cloud that he was barely able to finish two terms of office. Subsequent investigation of this matter severely damaged the prestige of his office and the concept of public schools, and, for the next 4 years, those who served as state superintendent did so only as figureheads. The office was abolished in 1844.
In 1853, a new Governor of Tennessee ascended the steps of the almost completed state capitol building. This man was Andrew Johnson, who—despite his total lack of formal education—was later to become President of the United States. The dynamic new Governor was anxious to provide for the youth of his era a free public school education, an opportunity which he himself had been denied. The 1850 census had shown that a substantial portion of the total white population over 20 years of age could neither read nor write. Johnson therefore recommended to the Legislature that a property tax be levied on the people of the whole state in order to infuse “life and energy to our dying or dead system of common school education” (4). Under his leadership, Tennessee passed the first property tax for public education in the state’s history, an action which almost doubled the amount of funds available for that purpose.

The state did not have long to enjoy its new status, for the people soon found themselves in the unrelenting grip of the Civil War. And with the coming of this tragedy, public school progress during the Johnson administration ground to a halt.

In the immediate postwar South, no system of public education was to be found. Private schools reopened for children of privileged Southern families, and until 1872 the educational activities of the Freedman’s Bureau continued among Southern Negroes. Yet the majority of Southern white children were growing up in illiteracy because of the lack of opportunity for an education.

In 1867, the Radical Legislature passed an effective act for the reorganization of public schools which provided for a structure of organization and authority—and included an appropriate system of taxation to support the measure. However, these tax funds were almost completely diverted to the payment of interest on state bonds issued to aid railroad construction. The effectiveness of this measure was thus largely compromised.

John Eaton, Jr., a New Hampshire-born minister who had served with Ulysses S. Grant as a chaplain during the Civil War, became state superintendent during the period 1867-69. A man of considerable talent and energy, Eaton toured the state in 1869 for a personal view of school conditions, after which he prepared a comprehensive survey of Tennessee’s educational needs. In his report, he cited a need for sharply increased funds and substantial changes in program including the establishment of normal schools for training of teachers and equal opportunities for Negroes (5). This report, however, shared the same fate as other work of the Radical regime: The reorganized Conservative state government of 1870 repealed practically all the legislation of the immediate postwar period.

Like other Southern states, Tennessee waited upon Northern philanthropy and the activities of a concerned citizenry for the impetus to establish a public school system which would take root and grow.

Early in the 1870’s, there emerged on Tennessee’s public forum a man who was representative of the concerned citizenry and whose voice became more eloquent and compelling than any other state figure of his time in the support of public education. This man was Joseph Buckner Killebrew—farmer, educator, journalist, author, orator, and one of the most distinguished public servants that Tennessee has produced. Born in Montgomery County near Clarksville, Killebrew struggled against great odds to gain an education. His talent was so apparent, however, that a generous benefactor undertook his outstanding career at the University of North Carolina. After the war, Killebrew embarked on a decade of public service in Tennessee which included the office of assistant state superintendent of public instruction and agent for the Peabody Fund.

Throughout 1871, as Killebrew wrote an agricultural column for the Nashville Union and American and made speeches around the state on the problems of the farmer and other matters at public issue, he spoke frequently in support of education. “The idea of public education,” he said, “is one too deeply imbedded in the spirit of the age to be successfully resisted” (6). He argued with all of the logic and appeal at his command that the material interests of the state demanded an effective system of public education:

We may inveigh against the principles of taxing one man to educate the children of another; we may declaim against the interference of the State in matters that concern mostly the parents of children; we may ascribe unworthy motives to the friends of public schools, yet after all the great truth stares us in the face, that we cannot have an increase of population and resist this dominant idea of the age, and we cannot be prosperous without an increase in population (7).

But opposition to this “dominant idea of the age” was both sizable and powerful. In Tennessee, as in other Southern states, it was the former slaveholding planter who opposed direct taxes on his property for the maintenance of public schools and, indeed, the principle of public education itself. Early in 1871, William G. Harding, eminent proprietor of Belle Meade Plantation in Nashville, spoke out against universal education at a meeting of the Davidson County Farmer’s Club. “I cannot believe,” he said, “that we have yet reached the period and perhaps never will, when the drudgery of plantation and household work will require intelligent and educated minds” (8). Arguing primarily against education for the Negro, he projected his argument to include all manual labor. His plea was that education was neither necessary nor desirable for all men.

In spite of such opposition, however, the tide of sentiment for an effective system of public education ran forward, encouraged by Northern philanthropy. In June 1872, Barnas Sears, former president of Brown University
and then general agent for the Peabody Fund, in his report to the Peabody Fund trustees, discussed the unfortunate change in the public school law in Tennessee which had taken place in 1870. He stated, however, that a reaction had set in against the inadequate public school system and that sentiment in the state was already changing toward better schools. To support his statement, he cited a request received the previous December from the State Teachers' Association for $1,500 to support an agent who would work with interested organizations and state officers of the association in creating sentiment favorable to public schools. The result of granting this request, he said, was that a "highly intelligent and influential gentleman" was appointed agent of the fund; and in January 1872 he was made the assistant superintendent of public instruction (the state treasurer at this time still maintained the ex officio title of state superintendent of public instruction), a fact which in itself showed the merit of the appointment (9). This new agent for the Peabody Fund in Tennessee was Killebrew.

Just seven weeks after assuming his positions with the Peabody Fund and with the Department of Public Instruction, Killebrew delivered an important and memorable report to the Legislature. His report outlined the conditions of the existing public school system county by county, including statements on the amount of taxes voted for support of schools, the number of school commissioners elected, the number of schools in operation, the number of months in operation annually, and the number of pupils enrolled. Killebrew prefaced his report with an impressive argument for the establishment of an effective system of public instruction, an argument based primarily on economic considerations. He stated that the greatest obstacle to be overcome was the prevalent idea that education should be a matter of private initiative. Killebrew quickly discounted this line of reasoning by stating that this conception could just as easily be used to apply to police systems, courts, penitentiaries, and other public institutions. Public schools, he said, were a public responsibility in the same way as were these other institutions (10).

In concluding his report, Killebrew pleaded for the appointment of a full-time state superintendent of public instruction who would direct the state educational system; he also recommended the appointment of county superintendents who would serve a function on the local level analogous to that of the state superintendent. Dr. Sears, in a report to the trustees of the Peabody Fund, complimented Killebrew's report, calling it "most valuable ..., of the most elevated character ..., and well adapted to awaken the people from their lethargy" (11).

Supporters of the public school system continued their efforts to arouse sentiment for its establishment throughout 1872 in preparation for the Thirty-Eighth General Assembly. They were so successful that Governor John C. Brown, in an address to the assembly, urged the adoption of a state educational system which would include a full-time state superintendent and a State Board of Education. He pointed out the fact that Tennessee ranked third highest of the states of the Union in illiteracy and that the prosperity and permanence of the state government depended on the intelligence of the people. He therefore advocated that the Legislature act accordingly and remedy this serious educational deficiency (12).

The result of this dedicated activity by Killebrew, the State Teachers' Association, the Peabody Fund, and Governor Brown's administration was the passage in 1873 of "An Act To Establish and Maintain a Uniform System of Public Schools in Tennessee." This act has remained until the present time the basic framework of the state system of education in Tennessee.

The act, in brief, provides for a state superintendent of public instruction, county superintendents, and district school directors with the state superintendent having central responsibility for ensuring that the state school laws are faithfully executed. The legislation also stipulates that the superintendent see to the collection and dissemination of statistical and other information related to the schools.

The permanent school fund was fixed at $2,512,500 with 6-percent interest on the state indebtedness to be paid annually to the schools. In addition, every male was taxed $1 (a poll tax), and a 1-mill tax on the property tax dollar was established, both for the support of public education.

Thus the sentiment for public education seemed partially won in Tennessee, and over the whole South there were encouraging signs of an awakening interest in the subject. Sears felt able to report to the Peabody Fund trustees in October 1874 that "the public mind in nearly all these states of the South is more and more imbued with the doctrine of free schools; and nothing in the future is more certain than the acceptance of that principle by the people at large" (13). Events in Tennessee, however, revealed that Sears' optimism was premature.

To be sure, there was some immediate improvement in the state system after the passage of the 1873 act. In contrast to the conditions prevalent at that time, illustrated in Killebrew's report—one-fifth of the state's population had no opportunity for any sort of education, in many counties there were no schools of any sort, and fewer than one-third of the counties had levied any supplementary tax for educational purposes (14)—the next few years witnessed some improvement in the system. By 1879, two-thirds of the counties had levied some sort of supplementary tax for schools, and the great majority of Tennessee's counties had established schools. From a low point of $89,000 in 1871, total annual expenditure on education had risen to $815,000 by 1879 (15). Also, through the interest and influence of Barnas Sears and the Peabody Fund, a normal school was joined to the University of Nashville in 1875 as the first teacher-training institution in the state (16).
Despite these encouraging developments, Tennessee's school system continued until the end of the century to languish in relationship to its needs. Reports of the state superintendent of public instruction show conclusively that, in spite of tremendous efforts by concerned citizens, there was little real improvement in the condition of public education in Tennessee before 1900. Although some system of public schools was established in a majority of the counties by the turn of the century, the average length of the school term did not exceed 4 months and often was less. The average daily attendance of pupils did not exceed two-fifths of the scholastic population. Average teacher pay was less than $35 a month, and total expenditure for schools in the state averaged no more than $1 million a year. Many counties levied no tax to supplement state support for schools, and the number of teachers did not at any time exceed 8,000, with the result that the average teacher-pupil ratio was approximately 1 to 49 (17).

The basic reason for this lack of progress was an economic one. Agriculture, in which 80 percent (18) of the people were engaged in the post-Civil War South, was in an increasingly depressed state from 1870 until the end of the century. The loss of the slave labor system upon which the plantation economy had depended was a blow from which Tennessee and the South were slow to recover. Soil exhaustion and erosion were daily burdens with which the farmer labored. Rising costs and declining returns continued as constant factors in the agricultural picture for three decades after the war. Thus the estimated value of farm products in the state fell from $86,472,847 in 1870 to $55,194,181 in 1890 (19). Therefore, real progress in public education in the state was to wait until the twentieth century. The loss of the slave labor system upon the plantation economy had depended was a blow from which Tennessee and the South were slow to recover.

As the century drew to a close, the South's economy slowly began to improve. Cotton, which in 1898 brought 6¢ per pound, brought 9.5¢ in 1902 (20). Industrial prospects became brighter, and large infusions of new philanthropy for Tennessee and the South loomed on the immediate horizon.

A review of the nineteenth-century progress in public education development shows that much had been done to gain support of the concept. An organizational structure had been brought into being through the Act of 1873, and this was undergirded by legislation in 1875 forming a State Board of Education. Finally, in 1899, a State Textbook Commission was created to establish uniform texts for public schools. The state had neared the threshold of breaking the barrier to permanent progress in public education.

THE EDUCATIONAL CAMPAIGN PERIOD AND AFTER: 1900-45

The period from 1903 to 1913 has been described by one authority as "the most intensive and extensive educational crusade in the history of the state" (21). Indeed, at this time, a bevy of talented, well-trained, and concerned men were available to begin their work. Led by Philander Priestly Claxton, they were to cover the state for a decade preaching the cause of public education and ensuring the passage of the important legislations of 1909 and 1913.

P.P. Claxton was the most brilliant and best trained of this competent group, which included Charles Dabney, president of the University of Tennessee, and Seymour Mynders, Robert L. Jones, and John W. Brister, all superintendents of public instruction from 1903 to 1913. The Governors of this era also were educationally minded.

The acknowledged leader of the educational forces, Claxton was born in 1862 in Bedford County, Tennessee. He graduated with high honors from the University of Tennessee in 1882, matriculating for only 2.5 years. Later in his life, he wrote that one evening while attending the increasingly famous Johns Hopkins Graduate School, he was walking through the streets of Baltimore when "a certain streak of altruistic enthusiasm" caused him to decide to devote his life to the improvement of education in the Southern states (22). Thus, after several months of study in Germany, he returned home to fulfill this vision. For a time he worked in the school systems of North Carolina as a teacher, as county and city superintendent, and later as professor of pedagogy and German at Greensboro Normal and Industrial School. In 1897, he began to publish the North Carolina Journal of Education in which he advocated such progressive educational measures as 10-month schools which would be compulsory and free to all, school consolidation, transportation of students at public expense, establishment of kindergartens, improved curriculums, and higher quality of instruction.

Northern philanthropy had established an interest in the cause of improving the quality of Southern education at its Conference for Education in the South, first held in West Virginia in 1898. This interest was made effective in the formation of its executive arm, the Southern Education Board, which was gradually merged into a larger, more comprehensive, and more richly endowed organization—the General Education Board, a body which became largely underwritten by the Rockefeller family. The union of these two organizations was consummated in 1915. Charles Dabney served on the Southern Education Board and with its consent called Claxton to Knoxville in 1902 to become chief of the investigation and information bureau of the board. In a short while, Claxton was publishing statistics on the deficiencies of Tennessee's school system which would be used as background for the upcoming educational campaign years. During this same time, Dabney asked him to initiate a summer school for teachers to be called "Summer School of the South," which was to be underwritten by the board. This work Claxton did so successfully that total enrollment during the first summer of 1902 comprised 2,019 teachers who came from 28 states and 1.
territory (23). During this year, he also was asked to establish and become head of the first Department of Education at the university, a task which he performed with his usual competence. Throughout the next few years, he worked very closely with the superintendents of public instruction in ordering the drive for improved public education.

As the campaign era moved successfully toward its end, Claxton accepted appointment as U.S. Commissioner of Education, a post which he occupied from 1911 to 1921. He was sometimes called the "Horace Mann of the South" (24), and Dabney once stated his belief that when Claxton's work was known, he would be ranked as one of the foremost school reformers of the country (25).

James B. Frazier was elected Governor of Tennessee in November 1902. A graduate of the state university, he had attended the Conference for Education in the South and had visited and lectured before the Summer School of the South in 1902. His message to the Legislature in January 1903 established his vital personal concern for education and its improvement: "Universal education," he said, "is the only safeguard for universal suffrage. It is the bedrock of our civilization as well as our prosperity;... it has come to be universally conceded in all the American Commonwealths that public education is a function of the State." (26). He stated that the first imperative need was money with which to improve the public schools of the state. He recommended that the surplus left in the treasury at the end of the school year be distributed to the schools and that counties be allowed to increase taxes for school purposes to enable them to maintain public schools for at least 6 months of each year. He recommended school consolidation and the making of school districts co-extensive with civil districts. He suggested that state aid to Peabody College as a teacher-training institution be continued and that the state university be given necessary aid. This address was probably the most important any Governor of Tennessee had made on matters of education to this time.

Governor Frazier wisely appointed an able man, Seymour A. Mynders, superintendent of public instruction. A graduate of the University of Tennessee, Mynders had been a teacher and an administrator in various divisions of the public school system. He possessed both warmth and tact in dealing with everyone.

Mynders immediately began to work with Claxton and others in organizing a systematic campaign for better schools in Tennessee to be undertaken by the General Education Board. The campaign consisted of sending out speakers to canvas the state in behalf of public education. Commencements, religious meetings, meetings of farmers, and even picnics were chosen as fertile fields to be cultivated. Ministers were asked to speak on education, and newspaper editors, to write on educational topics. Even women's clubs and labor unions heard speakers on education. Claxton wrote that—

Usually these rallies lasted all day with picnic-dinners. The best of them had wagonloads of watermelons. At these we spoke to more than 100,000 people during the year. In many places the attendance ran up to two, three, or four thousand and once to six thousand. In a political campaign year... we had much larger attendance at our educational meetings than the political speakers had (27).

At these meetings with the citizens of the state, the campaign speakers bore down hard on seven points:

More money for elementary schools with per capita distribution; special help for weak schools in poor counties; school library needs; state appropriation to supplement salaries of county superintendents; state appropriation for county high schools; three normal schools for the preparation of white teachers and one for Negro teachers; and a larger appropriation to the University of Tennessee (28).

Throughout these biennial campaigns, Claxton worked with Mynders, Jones, and Brister toward their common goal. With one exception, the superintendent's headquarters in Nashville was campaign headquarters, and during each legislative session Claxton was constantly on Capitol Hill proving to be an excellent lobbyist for the cause of education.

Robert L. Jones, state superintendent from 1907 to 1911, was, like his predecessor, a competent educator. Born in White County and graduated from Burritt College, he had done additional work at the University of Chicago. Jones had been a teacher, principal, county and city superintendent, and college president before coming to the superintendency. He had been president of the State Teachers' Association in 1905 and had served on the State Textbook Commission.

The general education bill of 1909 was to a great extent a monument to Jones's talents. This important act expressed the need to improve, unify, and extend the public education system of Tennessee by providing state revenue to support all levels of public education. Twenty-five percent of the gross revenue of the state was allocated to education under this legislation. The bulk of this support went to the counties, apportioned on the basis of scholastic population with an equalization clause and a special effort to promote the development and maintenance of high schools. A considerable portion also went to establish three normal schools for the training of teachers in each grand division of the state and an agricultural and industrial normal school for Negroes. Important amendments to the general education act provided for a change of the local administrative unit from the school district to the county and an allowance for school consolidation in the interest of greater effectiveness.

John W. Brister, who attended Peabody College, the University of Chicago, and had taught at Montgomery Bell
Academy, entered the superintendency of public instruction in 1911 with some handicap. He was without the broad public school acquaintance which his immediate predecessors had enjoyed. Also, he emerged on the scene as Claxton was leaving Tennessee and just as the state political atmosphere was heating up again between the prohibitionists and those who favored legal liquor. As if these disadvantages were not enough, he was only Governor Hooper's compromise choice for the position (29).

That Brister was able to secure a positive legislative program during his tenure of office was thus greatly surprising and was a substantial tribute to his competence. His monuments were the various educational measures of 1913 which increased the general school fund from 25 percent to 33.3 percent of the state's gross revenue, established compulsory school attendance for all children 8 to 14 years old for 80 consecutive days, provided for uniform examination and certification of teachers, and gave additional authority to county boards to consolidate schools and provide transportation for pupils.

Although coming to an end with Brister's ouster, this crusading period was one of substantial accomplishment. Many county high schools were established, four normal schools were built at Johnson City, Murfreesboro, Memphis, and Nashville (and another was to be added at Cookeville in 1915), some school consolidation was initiated, school libraries were given a modicum of support, teacher training was improved, and, finally, a formula was developed to guarantee a certain level of state support for public education across the state.

Albert Williams, a former high school supervisor and a competent, aggressive, and popular young man, assumed the position of superintendent of public instruction in 1919. He was immediately successful in adding to the financial base of public education by securing a small property tax for this purpose, and in strengthening the compulsory school attendance law. Under his leadership, the State Teachers' Association was reorganized into an effective body, the Public Schools Officers' Association was strengthened, and at Williams' invitation Claxton was asked to preside over a Citizens' Conference on Education held at Monteagle in August 1920. This conference opted for minimum 8-month school terms, adequate support of high schools, support for the university and the normal schools, and sufficient funds to place the state in an improved educational position nationally. By the end of Williams' term of office in 1921, the state equalization fund had climbed to $570,000 from a $873,000 point in 1913.

The primary educational breakthrough of this era came during the administration of Governor Austin Peay (1922-27). Peay appointed as his educational leader Perry L. Harned, who, like himself, was from Montgomery County.

Harned had one of the richest backgrounds of any person yet to assume the position of superintendent of public instruction. He had been a member of the State Board of Education since 1901 and had served as its chairman. He had been a member of the textbook commission. He was the first high school inspector under the educational act of 1909 and had also served as state elementary supervisor. He had been a leader of the Public School Officers' Association and the State Teachers' Association. Harned also was a political figure, having served as county and state campaign manager for former Governors. His opposition to A.H. Roberts' successful candidacy in 1918 was said to have caused the Governor to gain repeal of the law allowing the state board to elect the state superintendent (30). Henceforth after 1919, the Governor himself would have this power of appointment.

In the first few years of Peay's administration, Harned and proponents of public school progress convinced Peay that education was one of the most important responsibilities of the state. Together, these men brought into being a series of measures undergirding education which were to help make this administration one of the most important in the history of the state. As a part of his reorganization of the state government, Peay changed the name of the superintendent of public instruction to commissioner of education and gave him cabinet status. In addition, he codified all the school laws in the great Act of 1925 which, among other things, provided for an equalization fund guaranteeing 8-month school terms for all counties which would ensure certain local financial support; repealed numerous pieces of cumbersome local legislation; initiated an improved method of licensing teachers, supervisors, and superintendents; devised a uniform system for the promotion of elementary school children; and increased the school fund by levying a tobacco tax, most of which was earmarked for public education. In addition, the normal schools were converted into teachers colleges, and an extensive building program was undertaken for rural schools and for all units of higher education. Two new institutions made their appearance as a result of the 1927 legislation. These were Austin Peay Normal College at Clarksville and a junior college at Martin, a part of the University of Tennessee system.

Peay's administration undergirded Harned's educational program to the fullest degree. And while these progressive years did not bring a millennium to Tennessee public education, they did provide a solid plateau from which to continue the upward ascent. This progress, however, was interrupted by the Depression years which represented a difficult time for public education in the state. In 1933, appropriations for higher education were cut 66.6 percent, secondary schools 28 percent, and elementary schools 19.5 percent. Throughout the period of Depression and World War II, retrenchment or hold-the-line fiscal philosophy prevailed in state government. Continued progress therefore awaited the conclusion of World War II and more favorable administration attitudes toward public education.
The advent of World War II hit hard at the public schools of Tennessee. Throughout the state public schools suffered severely with the influx of so many of its teachers, both men and women, into the armed forces. With the conclusion of the war, however, and with the election of Jim Nance McCord as Governor in 1944, prospects for educational improvement brightened considerably. The Tennessee Education Association launched during this period an intensive campaign for better schools, but it was apparent to everyone that new tax sources would have to be found before substantial improvements were made.

In 1945, the General Assembly passed a law requiring Burgin Dossett, the commissioner of education, to undertake a survey of public education in the state and report his findings to the 1947 assembly (31).

Under Dossett's able guidance, this study estimated the adequacy of the state's public educational effort and found it deficient in many important areas. It pointed up, for example, that only 46 of 100 Tennessee children finished high school (32). It showed that the majority of school plants were of insufficient size and were poorly equipped, and that the local financial structure in the support of schools was wholly inadequate. It found that Tennessee ranked tenth among Southern states in the assessed valuation of property per child of school age, and it found a great variation in financial ability of counties to support public education. For example, one county in the state had 12 times the resources of the poorest county, and thus there was an obvious need for considerably greater equalization. It found that Tennessee's support of public education was low when compared with other Southern states, with only 33.9 percent of the state tax revenue going to public schools. It recommended a single tax fund for elementary and high school programs to guarantee an adequate equalization program for grades 1 through 12 with an assurance of a certain level of local effort. It also called for one policy-making body, a State Board of Education, to formulate policies for all phases of the state educational program—elementary through the university levels—and advocated that this board be composed of nine members, appointed by the Governor, serving for 9-year terms. It advocated that the chief administrative officer—the commissioner of education—be appointed by the State Board of Education on the basis of professional qualifications for an indefinite term. It also advised that the personnel of the state department be placed under Civil Service.

As a result of this survey, Governor McCord asked for a 2-percent sales tax: from the 1947 General Assembly with the bulk of the proceeds to go for education. This act began a new era for schools across the state. It appropriated $24,870,932 for public elementary and secondary schools in its first year and ensured that local governments would contribute no less than $19,500,000 per annum. Perhaps the most important aspect of this measure was the reorganization of aid to local school units. The old equalization programs were poorly financed and conceived. Yet, since very early in this century, there had been some degree of equalization pointing directly toward the elementary school level. Following closely the recommendation of the study report, a new minimum foundation program was initiated at this time, including grades 1 through 12 and incorporating all facets of the local educational program except capital outlay, which was brought into the program in 1949. The establishment of this program surely must rank high in the record of public school progress in this century.

The year 1955 brought forth an economic index as a basis for determining local relative ability to match equalizing funds. Such factors as retail sales tax collections, automobile registration payments, value of agricultural products sold, and the number of gainfully employed nongovernmental workers were all weighed to estimate closely the actual resources of a county. From 1947 to 1967, the local contributions to the equalization fund have declined from $19.5 million to $17.5 million, whereas the state share has risen over these years from $25 million to approximately $165 million. Thus the state share of the equalization fund in 1967-68 is nearly 90 percent.

Governor McCord's support of the sales tax for public schools cost him a third term, but he rested on a job well done. Under the administrations of Governors Gordon Browning, Frank Clement, and Buford Ellington, education has continued to move forward in Tennessee. Governor Clement supported a 3-percent sales tax in 1955 in behalf of education, and educational funds thus reached a new high level (33). Although many persons questioned the wisdom of using the basically regressive sales tax to finance state public education, the various gubernatorial administrations worked under the handicap of a state constitution which prohibited the passage of a state income tax. A sales tax seemed, therefore, to be the most expedient way to raise large sums of money to support the expanding public education system. This method of state financing has continued to be followed throughout the decade of the 1960's. In 1963, the General Assembly passed a local option sales tax, enabling local governments to add 1 percent to the present 3-percent state tax. One-half of the revenue from this source was earmarked for educational purposes.

Federal Aid

Tennessee had a favorable attitude toward federal aid to education dating from an earlier period. The General
Assembly in 1945 made the first gesture on the part of the state to encourage such aid. It passed a joint resolution which stated in part that since World War II had pointed up the great difference in educational opportunity in various regions of the nation and since Tennessee had found itself near the top of the list of states whose men were rejected for the armed services because of educational deficiencies, there was a great need for the passage of federal legislation to relieve this inequality. The resolution continued by asking the Tennessee congressional delegation to support the various bills regarding federal aid in Congress.

Although this aid has not been received unquestioningly or with unanimous acclaim, the vast majority of Tennesseans have felt that there were ample constitutional safeguards which thus enabled the state to receive this help in true partnership with the federal and local governments, out of a mutual interest in the advancement of public education at all levels.

**Desegregation**

The decade of the 1960's has been in every sense a revolutionary one for public education in Tennessee. In addition to enormous increases of funding at all levels of government, desegregation of the public schools has made substantial progress.

Tennessee moved slowly toward some compliance with the landmark U.S. Supreme Court decision of Brown v. Topeka in 1954. On the whole, the state's response to this decision was moderate. One of the state's leading newspapers, the Memphis Commercial Appeal, in an editorial on May 18, 1954, said that, "the main thing now is for the American people to face this thing squarely as an accomplished fact and work out our destiny for the general good and the greater glory of the nation" (34). Because of the skillful handling of this matter by Governor Frank Clement, Tennessee remained completely free of state legislation designed to preserve segregation in schools and also was free from any public school closing which other Southern states experienced. The first public school to be integrated in Tennessee was at Clinton, Anderson County, in September 1956. Here a notorious agitator, John Kasper, created considerable disturbance before Governor Clement, opting for the preservation of law and order and seeking to preserve the peace and carry out the law, sent in the state guard to quell the disturbance. The second school to be integrated in the state was the Nashville Hattie Cotten Elementary School in September 1957. Again, Kasper was on the scene agitating—and the result was a bomb explosion which destroyed much of the school. For his role here, Kasper served a prison term (35).

On the whole, however, Tennessee's movement toward integration was relatively peaceful, if slow. The percentage of Negroes in integrated schools was only 1 percent by 1960 and 2.7 percent by early 1964. With the coming of the Civil Rights Act of 1964, however, the pace was to quicken substantially since this law contained a clause which forbade the use of federal funds by any public agency (including schools) which practiced racial discrimination. Very quickly the percentage of Negro students attending desegregated schools began to rise—to 6 percent in 1965, to 16 percent in 1966, to 29 percent in 1967, and to 34 percent by early 1968 (the second highest percentage of desegregation of all 11 Southern states for all of these years), figured on the basis of the state's kindergarten through twelfth-grade program. At this writing, there are only 2 of the state's 151 systems which are out of compliance with the Office of Education regulations. The State Department of Education has set a tentative deadline of the 1969-70 school year for total abolishment of the dual racial structure of schools.

**Personal Legacies**

Through the years, there have been key professional staff members of the department who deserve special recognition for their contributions over long periods of dedicated service. Such men were George Freeman, whose name was synonymous with vocational education for four decades; James B. Calhoun in the school plant area; Roy Vance in secondary work; and Lee Thomas in the elementary area. Still active are Clarence A. McCanless, who has one of the longest tenures in the Department of some 35 years in fiscal and legal matters; Wesley Pickel, who has spent most of his long years in school plant and construction and dispenses gentle wisdom along with his technical advice; and William E. Turner, whose concerned and selfless work with the General Education Board and later the State Department of Education in upgrading the quality of Negro schools helped so much to promote the understanding and goodwill which the majority of Negro and white Tennesseans have displayed in this era of change.

During the last two decades, the various commissioners who have served have been able and dedicated. Burgin Dossett, Jack Smith, James A. Barksdale, Quill Cope, and Joe Morgan all were gentlemen of the highest order who brought professional competence and integrity to the department.

Throughout this period of profound change in the 1960's, however, the state department has had at its head a man of unusual strength and resourcefulness. J. Howard Warf came to this position in January 1963, from an educational and a political background. Although he has never been without opposition in both professional and political circles, he nevertheless has conducted affairs of the department in regard to matters of school desegregation and the handling of large-scale federal financing in a strong, statesmanlike way. Throughout these years, he has upheld the laws of the land firmly and without equivocation. His success in doubling the state appropriation for education...

during his years of office is also noteworthy. Undoubtedly, his administration will be judged one of the stronger ones as the history of the department is further written.

THE DEVELOPMENT OF THE STATE DEPARTMENT OF EDUCATION

The State Department of Education in Tennessee is primarily a twentieth-century institution. It has been said that this unit of state government was more a result than a cause of the educational revival of the early part of the twentieth century. Indeed there was a permanent superintendent of public instruction's office from 1873 on, but it was not until 1891 that a clerk was provided to cope with some of the clerical detail. Under Myndes' administration (1903-1907), the department had three persons with one stenographer having been added. During the Jones administration (1907-11), there were added an elementary school inspector, a high school inspector, and a school improvement organizer. In 1913, a director of libraries and a supervisor of certification were brought in, and the following year a supervisor of rural Negro schools and a supervisor of industrial work were added. During 1920, a supervisor of Smith-Hughes work, an associate high school inspector, and a supervisor of physiology and hygiene were added, and in 1921, the supervisor of teacher training joined the department. Over the years there has been a steady increase in the number of personnel on the staff of the state department as the programs of service to the schools have increased in number and depth. Table I traces the growth of the department from 8 staff members in 1910, to 43 in 1930 and, as a result of considerable growth after World War II, to 140 members in 1950. With the tremendous growth in state concern for education during the 1950's, combined with a new interest in education by the federal government, the department grew to 777 persons by 1960. In 1967, primarily as a result of the enormous impact of federal programs on the state department and on local education which amounted to $70 million annually, the number of state department personnel had grown to 1,139, including 669 professional and 470 clerical positions.

This growth in staff is also wholly correlated with an increase in state funding for educational purposes. Table 2 shows that from an initial appropriation of $15,000 in 1875, the state's educational interest grew to the point 50 years later that it contributed $1.2 million to education by 1925. A quarter of a century later in 1950, the state appropriation for education was $58.3 million. Within the next decade, this figure almost tripled. By 1960, the appropriation was $142.3 million, a figure which itself was to more than double in 8 short years. The fiscal 1968-69 state appropriation for all public education purposes is $313.2 million.

The state department is constitutionally founded through Section 49-101 of the Tennessee Code Annotated which states that "there is established a system of public instruction" (36). This system is further defined in Section 49-102 as being composed of the commissioner of education, the State Board of Education, the county superintendents, and the county and city boards of education.

The state department has as its basic function the provision of leadership in planning, research, consultative services, public relations, and in-service education. In addition, the regulation of such matters as the establishment and maintenance of certain standards, a guarantee of educational opportunities to all persons, the protection of life and health in the schools, the safeguarding and use of public school funds, and the coordination of the operations of state and local education agencies are all of concern and active interest for the department.

The commissioner of education is the chief state school officer in Tennessee and is by virtue of his office chairman of the State Board of Education. His duties within this framework have grown with the department's general expansion to the point that this position is one of the most demanding and highly pressured in state government. For example, he has responsibility for the expenditure of almost 50 percent of the state budget. He is responsible with the state board for 6 state universities, 5 community colleges, 4 special schools, 24 area vocational-technical schools, 3 technical institutes, and various vocational rehabilitation centers over the state, the educational TV network, and the galaxy of new federal programs, all of which relate to public education. He also is a member of numerous boards and commissions which demand some degree of time and attention. All of this work is in addition to the routine responsibility which has been traditionally identified with the department and its operation as the central office in relationship to public schools.

Within the framework of the expansion of the department, it is revealing to view through Table 3 some statistical comparisons of growth and progress in the public schools over the last 35 years.

Two reorganizations of the state department also should be noted. The first was under Quill Cope in the mid-1950's which established the positions of coordinators (see Appendix B), and the second was under J. Howard Warf, which established the positions of assistant commissioners of education (see Appendix B).

CURRENT PROGRAMS AND ACTIVITIES

Public education in Tennessee today is a program of vast proportions. The complex work and vital programs are presented, in brief, below.

Special Schools

Tennessee has four schools known as special schools which are operated directly by the State Board of Education and

</table>
its chairman, the commissioner of education. These are the School for the Blind located near Nashville, which dates from 1844 as a state institution and had 225 pupils in residence in 1968; the School for the Deaf in Knoxville, founded in 1845 and with 325 students in residence; the Tennessee Preparatory School in Nashville, which became a state institution in 1885 and as a residential school focuses on the needs of dependent children of which there are 750 presently enrolled; and finally, York Institute located by legislative enactment at Jamestown in 1925. This latter institution operates as a county high school enrolling 650 pupils and is maintained by the state in honor of Sergeant Alvin C. York in commemoration of his valor and heroism in World War I.

Field Services
This area was established recently to provide the commissioner of education direct liaison with the county superintendents and with the Legislature.

Informational Services
This unit also has developed quite recently from Title V of the Elementary and Secondary Education Act with responsibility for such publications as a departmental newsletter and a sleek informational magazine designed to tell the story of the work of the department. In addition, this unit handles news releases, does supportive research for speeches by department members, handles routine correspondence for the department, and develops documentary films.

Equal Educational Opportunity
Under the requirements of federal guidelines and the increasingly strict enforcement proceedings of the U.S. Office of Education and the federal courts, it has seemed advisable to offer every assistance possible to superintendents and local boards of education in their desegregation problems—especially in negotiating their desegregation plans with the USOE. For this purpose, the state commissioner of education established in 1965 the Division of Equal Educational Opportunity which is financed by an ESEA Title IV grant. From the beginning this unit has attempted to ensure that public school systems of Tennessee are in approved compliance with the Civil Rights Act where at all possible so that they might continue to be eligible to receive federal funds under the several categories authorized by Congress.

Teacher Certification
In 1951, the General Assembly gave to the State Board of Education complete authority for setting requirements for certification of teachers, supervisors, principals, and superintendents and for the issuance of certificates. Subsequent to this delegation of authority, the state board appointed an Advisory Council on Teacher Education and Certification composed of representative educators to make extensive studies in regard to teacher education and certification. Over the years, this council has made significant reports to the state board and has adopted the “Approved Program” approach, whereby the board approves separately the teacher education program of each institution.

Educational Loan Corporation
The Tennessee Educational Loan Corporation has, since it was established in 1963, guaranteed 10,634 loans to 7,782 worthy Tennessee students in a total amount of $7,915,000 to further their education beyond the high school level.

Higher Education
The Division of Higher Education has existed in the State Department of Education for several years. It was reorganized, however, in August 1963, when a new position of assistant commissioner for higher education was created with responsibility for carrying out the administrative, academic, financial, research, planning, and coordinating functions in the development, evaluation, and improvement of college and university programs for which the state board and the state department have responsibility. This coincided with granting of use of state bond authority for institutions of higher education for the financing of structures which were revenue producing and thus could repay the bonds. And also, it coincided with the Higher Education Facilities Act which aided construction.

The state board serves as the governing body for six state universities—Austin Peay State University, East Tennessee State University, Memphis State University, Middle Tennessee State University, Tennessee Agricultural and Industrial State University, and Tennessee Technological University; in addition, it has the responsibility for three new state-community colleges already operating in Columbia, Jackson, and Cleveland and for two additional ones at Tullahoma and Dyersburg slated to open in 1969.

The division also serves in a consultative role for the state board and the state department in the evaluation of teacher education programs and as liaison with other institutions and agencies in the general areas of higher learning.

Statistical Services
This unit, which dates from 1959, has responsibility for computer services and statistics and operates basically under Title I of NDEA and Title V of ESEA. At this point, it works with the annual statistical report of the state department and aids in collection and dissemination of educational data in all areas. It has been particularly successful in automating school lunch reports and in placing the total vocational rehabilitation client file on the computer. The full potential of effective use of the computer for the department, however, has not been reached as yet.
Educational Television

Educational television had its beginning in Tennessee with the appointment in 1953 of the first Educational Television Commission, which was instrumental in having an engineering site survey made of the state and in securing the assignment of eight channels for educational purposes. The General Assembly in 1955 created the first permanent Educational Television Commission composed of the Governor, the commissioner of education, and one other citizen selected by the Governor.

The first fully operative station in the state was WKNO-TV, Channel 10, Memphis, which went on the air in June 1956. It was followed by station WDCN-TV, Channel 2, Nashville, which began telecasting in September 1962.

In 1963, the State Board of Education became the primary authority for operating educational television in Tennessee and started work to operate an educational TV network so that each public school in the state might ultimately be within receiving distance. In July 1963, the State Board of Education, through its chairman, created the Division of Educational Television in the State Department of Education and began to employ staff personnel for the division.

Plans for construction of the Sneedville educational TV station on Short Mountain began in mid-1965, and station WSJK-TV, Channel 2, officially went on the air in March 1967, with temporary studio facilities located at the University of Tennessee in Knoxville. Construction of permanent studio facilities at East Tennessee State University in Johnson City and at the University of Tennessee are expected to be completed in July 1968 and September 1969, respectively.

In July 1966, the State Board of Education received a construction permit from the Federal Communications Commission to activate Channel 45 in Chattanooga. It is anticipated that by 1970 the Tennessee educational TV network will be completed with a single-channel system providing educational programs to every school system within the state. This network will consist of six stations interconnected by microwave so that programs may originate from any one of five production centers.

Finance and Administrative Services

This division has the responsibility of distributing state funds for educational purposes in conformity with the laws, rules, and regulations governing this distribution. Over the years, as state funds for educational purposes have increased rapidly and with the enormous federal contribution to local education, the various superintendents and school boards in the state have requested assistance from the state department in establishing accounting systems; in initiating methods of keeping necessary records; in interpreting the laws, rules, and regulations; and in completing the many reports and forms necessary to disperse the funds properly.

To handle these requests, Tennessee has established a system of supervisors over the state, with each supervisor expected to make periodic visits to the administrative offices of every school district and to offer whatever assistance is needed.

This division is also responsible for ensuring that local units maintain the level of financial effort required by law. It also makes projections of needed increases in teacher salaries, costs of the minimum foundation program, sick leave, and textbooks for the commissioner of education and the state board to use in preparing each budget.

School Food Service Program

After the National School Lunch Act was passed in 1946, there was little major change in this basic legislation until 1962 when the apportionment formula was changed. The change provided for substantially greater amounts of reimbursement money which Tennessee received because of its relatively high participation rate. In addition, the Special Commodity Assistance Program and the Special Cash Assistance Program for especially needy schools joined with the School Food Service portion of ESEA Title I to provide substantial growth of this outstanding program.

During 1966-67, two new additions were added to the basic School Food Service Program. One was a pilot breakfast program provided in school for children either from economically deprived families or who rode long distances to school. The second portion of this important addition was a provision through the Child Nutrition Act for needed equipment to prepare lunches and breakfasts.

Division of Instruction

This unit of the state department has grown out of the work of early elementary and high school inspectors. Today, its responsibility covers the whole instructional program of public schools. In addition, it has assumed some authority over ancillary services and advises the commissioner of education and the state board in a number of ways. In the area of curriculum and supervision, this unit issues high school and equivalency diplomas to the youth of Tennessee and works closely with the study councils of principals, supervisors, teachers, and superintendents in seeking solutions to problems confronting Tennessee school systems. It provides consultative and supervisory services to local school systems in the areas of health and physical education, health services, art, and music; it also renders services to local systems in developing plans for curriculum improvement, for in-service education of teachers, and for the implementation of experimental programs. Through its seven major offices across the state, the area of curriculum and supervision also provides supervisory, regulatory, and consultative services of a general nature.
This division also offers consultative services and workshops on audiovisual aids. It distributes funds for the purchase of instructional materials and offers advice in the use of textbooks. It constantly seeks to upgrade and administer new acts which reflect this effort. It offers guidance and counseling services, a program which has expanded greatly since 1958 when there were 7 qualified counselors in Tennessee to a point where there are now 700 such persons with varying degrees of qualifications.

Psychological service for the public schools is a relatively new area of interest for the state department, and this program, too, has been substantially expanded over the few years of its operation.

A new program of adult basic education began in 1965 and is directed primarily to those persons who have less than a fifth-grade education. Civil Defense adult education also is operated by this division.

Shortly after its inception in 1958, Title III of NDEA was placed under this division for administration. The purpose of this important act is to provide substantial assistance in various forms to individuals and to states and their subdivisions to ensure trained manpower of sufficient quality and quantity to meet the national defense needs of the United States. Title III authorizes matching grants of federal funds to states and loans to nonprofit private schools to help equip and remodel laboratories and classrooms; it also offers other grants to assist states in expanding their supervisory and related services in science, mathematics, and foreign languages. Tennessee began to participate in this act in 1959 and was pleased to see additional subject areas such as history, civics, geography, English, and reading added to Title III in 1964. Economics joined the list in 1965 and industrial arts in 1966. Supervisors have been employed to administer the various units of this act, and, on the whole, staff members have assumed leadership roles in curriculum matters pertaining to their respective subject area specialty.

In 1955, Tennessee established the area of special education in the Division of Instruction. During that year, there were 1,000 handicapped children receiving instruction in public schools across the state. By 1967, this service had been included in the minimum foundation school program, and the scope of its effort had been considerably broadened. Now, children who are physically handicapped—either orthopedically, visually, or linguistically—can participate in this program. Those who are psychologically handicapped by mental retardation or emotional disturbances can also be included. Since 1959, almost 1,000 new teaching positions have been added in the area of special education in Tennessee.

This division also administers Title I of the Elementary and Secondary Education Act of 1965. Title I is by far the most significant portion of this law insofar as the amount of money involved and the type of assistance it provides is concerned. Offering financial aid to school systems to educate America's economically deprived children, this is one of the major pieces of social legislation of our time. Under this law, each state receives federal aid for its schools commensurate with the number of children ages 5 through 17 in the state who fall within the legal definition of economically deprived. Virtually all of this money, however, is spent by the local educational agencies.

In the first 3 years of the operation of this title, over $95 million was granted to Tennessee to provide compensatory education for children from economically destitute families. This money also stimulated a vital and new activity in the state-supported schools for delinquent, neglected, handicapped, and migrant children. Also, corrective and remedial reading, health and nutrition, physical education, mathematics, science, and social studies have all been areas of focus in this program.

School Plant and Pupil Transportation

The Division of School Planning officially became a separate unit of the state department in 1929. The division did not at this time, however, have the authority to establish school building standards. Substantive legislation in this regard did not appear until 1955 when an act was passed providing that the state board had the authority to establish minimum standards for school sites, school attendance centers, construction of buildings for school purposes, major repairs of buildings for school purposes of a capital outlay nature, and equipment for buildings for school purposes. The act specifically forbade school districts to obligate or expend school funds of a capital outlay nature which did not conform to standards adopted by the state board.

Since 1947, 24,070 teaching stations, 435 libraries, 322 shops, and 609 gymnasiums have been built. In addition, the state has constructed 355 gymatoriums, 1,501 cafeterias, 136 cafeteriums, 349 multipurpose rooms, and other auxiliary rooms. During the fiscal year 1966-67, there was more money spent on public school construction than at any other time in the history of the state—$55 million.

In the last few years, substantial achievement has been made in upgrading the maintenance of vehicles and in improving the caliber of driver personnel. In fiscal 1966-67, the state transportation maintenance and operation allocation was $10.4 million, excluding capital outlay.

Special Services

The Tennessee Educational Agency for Surplus Property began operation in early 1946 as a division of the state department. The objective of this agency was to assist educational institutions in the state to obtain federal surplus property.

In the latter part of 1958, a new warehouse was constructed, and a few years later, an IBM accounting and
inventory system was inaugurated for this program. By 1968, the amount of property which had been transferred was in the neighborhood of $125 million, figured at acquisition cost to the federal government.

Library and Archives

For many years, this unit had encompassed the state regional library extension service, archival preservation of the state's records, and the State Library reference service. Since 1958, it has operated under the State Department of Education whose commissioner is advised in the conduct of its programs by a seven-member Library and Archives Commission.

State Museum

The State Museum dates from 1920 when it was established to house the relics and mementoes of World War I. After World War II, it was expanded to include the same kinds of materials from this war. Over the years, it has come to house not only items of a military nature, but also archaeological exhibits, natural history objects, and exhibits of state resources, as well as Civil War and Spanish-American War materials.

Vocational-Technical Education

In 1917, the Congress of the United States recognized the need for vocational education programs which would prepare youth and adults for employment in a growing economy resulting from the industrial development taking place in the United States and the demands for an improved agriculture. The Smith-Hughes Act, or National Vocational Education Act, was signed by President Woodrow Wilson in February 1917. The first Vocational Education Act appropriated, on a permanent basis, federal funds to the states for training in agriculture, home economics, trades and industry, and teacher education. The Tennessee General Assembly, in session at the time, passed an Enabling Act in March 1917 to allow the state to take full advantage of the federal funds and designated that the State Board of Education should also serve as the State Board for Vocational Education.

Prior to this act and only 2 days after the signing of the Smith-Hughes Act, one of the first vocational agriculture programs in the nation got under way at Grove High School in Paris, Tennessee. During the remainder of 1917, four additional agriculture programs were initiated. During that year, 340 students were enrolled in these five programs.

Over the past 50 years, Tennessee has enlarged its vocational-technical schools, and technical institutes. One of the most significant developments which have allowed growth, expansion, and innovation in Tennessee's program of vocational-technical education was the passage of the Vocational Education Act of 1963. Appropriations by this act are not designed specifically for a given service or program and may be spent where there is a need for job-type training. The act requires that training be organized to serve all persons who want, need, and can profit from vocational-technical education.

Tennessee has gradually shifted from an agricultural to an industrial economy. This industrial growth has brought to the state sophisticated industry which performs exacting manufacturing and engineering operations. Occupational training programs in the state have thus been forced to expand in order to provide training demanded by these new employment opportunities. To provide a steady supply of trained and capable employees, Tennessee has set up a statewide system of area vocational-technical schools, basing training needs on present and prospective occupational needs of the area served and the state as a whole. The legislation creating these schools was passed by the General Assembly in 1963.

The first construction contract for new facilities was awarded in April 1964 for the Shelbyville State Area Vocational-Technical School. Twenty-two area schools are now in operation, and construction on two more will begin during 1968. These schools, cooperating closely with industrial development agencies in providing training for new and expanding industries, have become increasingly important to industrial growth in the state. Most of these schools which have operated for at least 1 year have extensive waiting lists.

In addition to this available training, three vocational-technical institutes have been approved; two are in operation now, and one is soon to be completed. These institutes have primarily a postsecondary focus and are located in the major metropolitan centers of the state.

Vocational-technical education in Tennessee has as its controlling purpose the training of individuals for useful employment. It is designed to meet the needs of persons 14 years of age and over who are preparing for or who have already entered various kinds of careers.

Vocational Rehabilitation

The federal Vocational Rehabilitation Act of 1920 was designed as legislation for the aid of persons who were injured in industrial accidents or who were otherwise unable to be employed. This legislation followed closely the passage of the Soldier Rehabilitation Act of 1918 which had a similar purpose.

Tennessee was one of the first states in the nation to join with the federal government in implementing this newly passed act. An executive order was issued
establishing the first state-federal rehabilitation program
within a few days after the passage of the federal act. Ten-
nessee's rehabilitation program, however, is traditionally
measured from 1921, when the Legislature passed an act es-

lishing it at the state level. This program has operated
from the beginning under the vocational education board.
It has always been a

grant-in-aid program with state funds
being matched with federal funds. During the year ending
June 1922, the first full year of the division's operation, the
program rehabilitated 26 handicapped persons at an average
cost of $38.58 each.

A major expansion of the program came in 1954
when Public Law 565 greatly improved the federal govern-
ment's ability to make grants to the states and also estab-
lished a system of grants for projects and for training.

Additional expansion came in 1965 when Public Law
89-333 made additional funds available and included
behavioral disorders as a handicapping condition eligible for
rehabilitation services. Federal funds available to Tennessee
in 1968-69 are more than $18 million. At current level, the
state is taking advantage of less than one-third of the funds
available for both of its public programs for handicapped
people, the Division of Vocational Rehabilitation in the
State Department of Education and the Rehabilitation
Services for the Blind in the Department of Public Welfare.

In general, the vocational rehabilitation division spon-
sors such programs as an intensive treatment-rehabilitation
center for juvenile offenders at Jordonia in cooperation
with the Department of Corrections; a correctional rehabil-
itation center for adult public offenders at the state prison;
a special education-rehabilitation work study program in
cooperation with the Division of Instruction; 14 vocational
training centers for the mentally retarded and other phys-
ically disabled persons in areas throughout the state; a
rehabilitation facility at Central State Hospital in coopera-
tion with the Department of Mental Health; an out-patient
rehabilitation facility in Memphis in cooperation with Les
Passes Club, the City of Memphis, and Shelby County; a
disability determination section operated by contract with
the Social Security Administration; and a health referral
program operated by contract with the U.S. Public Health
Service.

Any person of work age who has a physical or mental
disability or a behavioral disorder resulting from educa-
tional, social, environmental, or economic deprivation
whose disability constitutes a barrier to employment is
eligible for the services of the Division of Vocational
Rehabilitation, provided there is a reasonable chance that
the services of the agency can make the person employable.

CONCLUSION

From an embryo in 1873, the Tennessee State Department
of Education has grown to a full-fledged educational body.

Growth was slow, however, until the early twentieth
century, when it began to have a significant staff and an
influence in the development of public education in the
state. During the Peay administration, the department was
elevated in official importance, and the commissioner of
education became a member of the administrative cabinet
for the first time.

It was not until the post-World War II period, how-
ever, that the department began to grow toward the
dimension of size and influence which it now occupies.
Enormous increases in state funding plus the recent
entrance of the federal government into large-scale public
education financing have determined the department's
development in the last quarter century.

With this expansion and growth, it is natural that
many problems have developed as new programs are ini-
tiated before older ones are yet consolidated. Nevertheless,
the department, with its great number of concerned and
dedicated persons, insists that it will continue to move for-
toward to meet the needs of the individual child and youth
wherever he is found in the state. This would seem to be at
once its challenge and its responsibility.

Appendix A

TENNESSEE CHIEF STATE SCHOOL OFFICERS

The Office of State Superintendent of Public Instruction was created in 1836 and was abolished in 1844. The following superintendents were elected by the Legislature:

1836-40  Robert H. McEwen
1840-41  Robert P. Currin
1841-44  Scott Terry

From 1844 to 1867, the state treasurer was ex officio superintendent of public instruction. In 1867, the office was again created. The following superintendents were elected by the people and served for the respective periods shown below:

1867-69  John Eaton, Jr.
1869-71  A. J. Tipton

In 1870, the office was again abolished, and the duties developed upon the state treasurer, who was made ex officio superintendent of public instruction.

In 1873, the office was recreated, and the following officers, appointed by the Governor and confirmed by the Senate, have served the terms shown below:

1872-73  Joseph B. Killebrew (asst. supt.)
1873-75  John M. Fleming
1875-81  Leon Trousdale
1881-82  W. S. Doak
1882  Julia A. Doak (Apr.—July)
1882-83  G. S. Crawford
1883-87  Thomas H. Paine
1887-91  Frank M. Smith
1891-93  W. R. Garrett
1893-95  Frank M. Smith
1895-97  S. G. Gilbreath

1897-99  Price Thomas
1899-1903  Morgan C. Fitzpatrick
1903-1907  Seymour Mynders
1907-11  R. L. Jones
1911-13  J. W. Brister
1913-15  S. H. Thompson
1915-19  S. W. Sherrill
1919-21  Albert Williams
1921-23  J. B. Brown

Under the reorganization bill of 1923, the State Department of Public Instruction became the State Department of Education. The title of the chief state school officer was changed to commissioner of education.

EDUCATIONAL PATTERNS BEFORE 1900

The Republic

Among the reasons enumerated in the Texas Declaration of Independence of 1836 for severing political ties with Mexico was that the Mexican government had "failed to establish any public system of education, although possessed of almost boundless resources (the public domain) ..." (1).

However, when the fathers of the republic came to write their own constitution and provide for public education, they found that the use of the public domain to finance adequate schools was easier said than done.

The first Anglo-American public school law in Texas was that of 1840, providing for the surveying and setting aside of four leagues (17,712 acres) of land in each county which could be sold by the county commissioners for the purchase of necessary endowments, one half for the use and benefit of an academic school of each county, and the remainder distributed equally among the various common school districts. The county judge and his associates were the school board, empowered to establish districts, administer teacher certificates, and supervise the schools. Provision also was made for two universities.

The Texians (2) were applying the ideas that lay behind the Northwest Ordinance of 1787, the academy system, and the English tradition of the common school. Counties were the largest unit of educational administration they contemplated, and there was no provision for state school taxation.

In fact, the Law of 1840 never had much effect; home instruction continued to be the rule and itinerant schoolmasters the exception to that rule until after the Civil War. The republic, when it gave specific attention to public education, did so by issuing charters to seminaries and academies, colleges and universities, most of which were private or denominational schools that prospered for a time and then, with a few notable exceptions, failed (3).

The State

A new state constitution in 1845 provided that one-tenth of the annual state tax revenue be set aside as a perpetual fund for the support of free public schools. This established a policy of assisting the people in private and community educational enterprises.

The Constitution of 1845 marked the acceptance, in principle, of general taxation for education and an end to the dream of financing public schools solely out of the limitless supply of land (4).

The tithe of state revenue and the county lands together, however, proved insufficient. By 1850, the facts were distressingly obvious: Only 15 percent of the state's children were being instructed to any purpose. An ingenious solution, in the School Law of 1854, set apart $2 million of the $10 million in 5-percent U.S. Indemnity Bonds received in settlement of Texas' boundary claims against the United States as a permanent school fund. Loaned to railroad companies at 6 percent, this fund was expected to provide income sufficient to pay teachers' salaries.

Provision was made for free tuition of the indigent and orphans out of the tithe of annual state revenue, but there were never actually any pauper schools in Texas. Nearly all children were recipients of the state bounty, while the poor for the most part preferred ignorance with pride to the humiliation and taunts that accompanied a pauper's child to school.

The 1854 law also permitted the patrons of any school to employ the teacher of a primary department of any college or academy, and convert the primary department of that institution into a common school. As a result of this, the state found itself subsidizing religious and private schools on a larger scale than before. Only in two or three counties populated by German refugees of 1848 were actual public common schools formed. Elsewhere, the private school interests triumphed, even forcing the abandonment of the districting provision of the 1845 constitution.

The larger communities led the way to better schools. A free public school promoted by the German population made its appearance in San Antonio in 1853. This was the beginning of the ultimately enormous differential between urban and rural education.

The various Protestant denominations also were active in establishing schools, yet often left the connection
between the school and the church that had founded it deliberately vague, lest patronage be limited to only one denomination. The Texas Grand Masonic Lodge appointed a superintendent of education, chartered schools, and aided community school boards by furnishing buildings and making loans.

Reconstruction

The Civil War left Texas industrially prostrate. Agriculture was revolutionized by Emancipation, and a whole new social order had to be developed before prosperity was again possible. The railroads, whose repayments and interest were the source of school funds, defaulted or paid in depreciated and unacceptable currency, while much of the balance of the school fund was diverted to other purposes, being reduced to virtually nothing by 1865. Private schools and universities were decimated.

In 1866, a new constitution was drawn up, closely resembling in its educational provisions the School Law of 1854. The radical Republicans quickly set aside this constitution, and Reconstruction began. Overnight, so to speak, Texas went from one form of education to another. The Carpetbag Constitution of 1869 required free public schools for all inhabitants from 6 to 18, established a state superintendent of public instruction, laid off all counties into school districts, made attendance compulsory for 4 months of the year, set up the permanent school fund again, put all county school lands under state control, made one-fourth of all annual revenues from general taxation a source of school support, established a poll tax of $1 on every voter as another source of school moneys, and demanded local taxation sufficient to build a school in every district and operate it for 10 months a year. It provided every necessity for administering a completely modern school system except public support.

The provisions of this "infamous" law do not look so infamous today and might have worked to the benefit of the state had they not aroused intense opposition. The reaction evoked, in the form of hatred for compulsory attendance, education of Negroes, alleged extravagance, and Northern textbooks, was to have long-lasting harmful effects on education.

When the disputed Hayes-Tilden election of 1876 permitted the South in general to escape all vestiges of Reconstruction, the carpetbag school law in Texas was overthrown, leaving public education in a state of chaos.

The Constitution of 1876

The only things upon which Texans could generally agree when Article VII of the new state constitution was written were that there must be separate schools for white and Negro children and that the permanent school fund must never again be diverted to any extraneous purpose. All other points caused intense and protracted dispute. As finally adopted, Article VII abolished the state superintendent's office and all supervisory functions, ended compulsory attendance and districting, made the school age 8 to 14, rendered local taxation for schools impossible, returned county lands to the respective counties, and restricted the proportion of state general revenue for support of schools to one-fourth or less of the state occupation and ad valorem taxes. In addition, 45 million acres of public domain were set apart for public school support, and the permanent school fund derived therefrom invested in bonds. With amendments from time to time to correct some of its defects, this is the constitution "enjoyed" by Texas until the present.

The school law was rewritten in 1876 to conform to the new constitution. The so-called community system, unique to Texas, was the result. Parents organized themselves into school communities and submitted to the county judge—ex officio superintendent—a list of children to be schooled. The judge in turn appointed three trustees to hire teachers and oversee the school. At the end of the year, a report of attendance was made, after which reimbursement was made from the state available school fund.

This system had some advantages—chiefly those related to the sparsely settled and rapidly growing character of a frontier state—but disadvantages were numerous and abuses frequent.

By 1879, it was obvious that the community system was not working. In that year, Governor O.M. Roberts vetoed the general appropriation bill, charging that annual revenues were insufficient to meet expenses of government, pay the Reconstruction debt, and permit the allocation of one-fourth of all state moneys for schools. Schools were instead allotted only one-sixth, an action that provoked a second bitter fight over free public schools.

In 1883, the first amendment to Article VII of the 1876 constitution was passed by a small majority (5). It provided one-fourth of the revenue derived from the state occupation tax, the poll tax, as before, and an ad valorem tax of such amount, not to exceed 20¢ on the $100 valuation, as would suffice to maintain public free schools for 6 months a year.

In 1884, the school law was again rewritten. The Office of State Superintendent was re-created; all counties were redistricted except 53 in East Texas and the Rio Grande Valley, which continued the "community" system; local taxation up to 20¢ on $100 valuation was permitted if two-thirds of local voters approved it; the state ad valorem tax was affirmed; and the permanent school fund was to be invested in county and other bonds to increase the amount of interest it earned.

Inadequate though it may have been, the School Law of 1884 was the last time that changes in the structure of public education occasioned bitter struggle and sweeping reversals of policy. Changes in the schools proceeded in a
more orderly manner during the last 15 years of the nineteenth century.

The Independent School District

A series of laws gradually granted cities and towns more freedom in the development and administration of their schools. Thus was born and grew the independent school districts. By 1900, there were 526 of them; in these independent districts the high school displaced the earlier academy. The common schools, on the other hand, continued to be ungraded, disorganized, staffed by poorly paid or unpaid teachers, and housed in barns, church buildings, Masonic temples, and county jails.

The contrast between the quality of these two kinds of schools began to lead to demands for change, and the needs of the independent districts began to generate improvements.

For example, with the introduction of grading the need for standardization of textbooks became obvious. In 1897, the Legislature established a uniform textbook law, with provision for a state textbook adoption board.

A system of accreditation was created in 1885 when high schools sent selected test papers for examination by the faculty of the newly founded (1883) University of Texas. If found satisfactory, the high school sending the exhibit was considered to be affiliated with the university, and its graduates were admitted without entrance examinations.

At the close of the century, State Superintendent Kendall advised the Legislature to authorize the State Board of Education to invest the permanent school fund in the building bonds of independent school districts. Such districts had been having difficulty selling bonds, which they had been permitted to do only since 1895 (6). When the permanent school fund began to be used to underwrite them, school district bond issues started to build school buildings, and common schools suddenly began to see some advantages to becoming independent districts.

**THE EARLY TWENTIETH CENTURY**

Superiority of the Urban School

As the new century arrived, the superiority of the urban schools and independent districts over rural and common schools ranged from 30 to 50 percent no matter what index was chosen: expenditure per child, length of term, value of school property, or teachers' salaries. Complacency about Texas' general educational posture was high, however, for did not the state have the largest permanent school fund in the Union and the largest income from this source?

W. S. Sutton, professor of education and dean at the University of Texas, issued a bulletin in 1904 containing what he called "Some Wholesome Educational Statistics" chosen to puncture complacency. These were comparative national rankings which showed that Texas stood thirty-seventh in the amount spent per capita, forty-second with respect to length of school year, and thirty-eighth in percent of scholastic population enrolled in school.

The Conference for Education

In 1907, the Conference for Education was formed through the initiative of Dr. Sutton, State Superintendent R. B. Cousins, and H. C. Pritchett, president of Sam Houston Normal Institute. At a meeting in Austin, officers of the conference were selected from among the laymen and educators present (7). A public information campaign was begun. Annually, for about 5 years, a mass meeting was held to discuss public school problems; information bulletins were published; agitation was conducted for the passage of two constitutional amendments.

The first amendment, passed in 1908, permitted use of school tax funds to buy equipment for common school buildings, abolished the rule that two-thirds of the voters had to concur to permit local school taxes, and increased the limit on local taxation from 20¢ to 50¢ on the $100 valuation. The second, in 1909, permitted formation of school districts that crossed county lines.

A large number of small contributions from Texas schoolteachers and a few large sums from lay sponsors financed the Conference for Education; after 1912, the State Department of Education, the Extension Division of the A&M College, and the PTA (then known as the Congress of Mothers) assumed its functions.

Birth of Rural Aid

In 1911, as a result of further agitation by the conference, a rural high school law was passed which established county boards of education, authorized the State Department of Education to classify county (common) schools according to the number of teachers employed, permitted creation of rural high schools and the consolidation of common school districts, and arranged for free tuition (8). The State Board of Education was allocated $50,000 to aid rural districts in equipping new schools.

If this law did not provide sufficient money to accomplish all it permitted, it did open the door for communities with funds to do what had never been possible before, thereby making the inequities of rural education still more conspicuous.

In 1915, a special state aid bill for rural and small town schools was passed, which appropriated $1 million for the task. The operation of this law was to have far-reaching consequences for the structure and development of education in Texas.
Entitled an Equalization Aid Law, it was familiarly known as rural aid. Although the formal title gives an indication of the feelings which prompted the measure, it is a misnomer nevertheless, because it was not really designed to erase the inequalities between rural and urban schools. The law's express purpose was to inspire efforts at self-improvement and to provide a source of funds for lengthening the school year (9).

Many school buildings in rural districts were mere shanties, or worse; the chief effort of the rural aid law in its beginnings was directed to the construction of modern, sanitary schoolhouses. Any district could receive aid once only without meeting any conditions. To receive it more than once, a district had to show that each school ground was at least 1 acre in extent and that each building met state specifications, had equipment prescribed in the state course guide, and subsisted on a local school tax of at least 50¢ on $100 valuation.

Originally, aid was given only to schools with fewer than 200 students, and payments to any given school could not exceed $500 per annum. But both these provisions were gradually broadened; by 1949, any school with less than 1,500 students qualified, and the sums allocated were far greater than $500.

Rural Aid and State Department Reorganization

One of the first effects of the rural aid law was to oblige the reorganization of the State Department of Education. Properly speaking, there was no such department in Texas before 1915, because the state superintendent had little money and less staff. Under R. B. Cousins, for example, in the years 1907-1908 there were a chief clerk, a teachers' certificate clerk, a statistics clerk, a mail clerk, an auditor, a stenographer, a porter (10).

This tiny band labored to produce the 600-page biennial report, a pamphlet on Texas school laws, a textbook circular listing all adoptions, an apportionment circular, a public school officer's guide, the Course of Study for the Public Free Schools of Texas (86 pages, 20,000 copies—enough for every teacher to have one), and "fifty thousand circulars in the interest of the Amendment" (11).

"There is urgent need of additional clerical help," Cousins wrote in 1909. "Not a man has been added to the force in ten years, and the work has more than quadrupled" (12).

More help did not arrive until the operations of the rural aid law compelled a complete reorganization of the state department in 1916. The Smith-Hughes law followed in 1917. The institution then emerged with a professional staff of 29 and a structure of nine divisions (13). The duties of the high schools division included the conduct of visits and the making of reports on the accreditation status of high schools. While the rural schools division administered rural aid with a director and two assistants, the high schools division required the services of a chief supervisor and five supervisors (14).

Accreditation of High Schools

When the State Department of Education assumed the burden of accrediting high schools, fewer than half the pupils in Texas had access to that form of education. The high schools division accordingly made it its business not only to examine applicant schools for standards, but to promote the establishment of more high schools (15).

By the mid-1920's, it had become the paramount purpose of every Texas community to have its own high school. Administrative excellence thereby came to be identified with the securing of full state accreditation in all subjects within 2 years of setting up a new high school. Accreditation was by subject; a school might be accredited in math but not in English. The method of determining fitness was to read pupils' examination papers. This method was better than none, but it had serious flaws which quickly came to light.

With college enrollments climbing sharply during the third and fourth decades of the century, the pressure to get accredited was intense. Weaker schools throughout the state began to complain, because they could never quite make it across the line to fully accredited status, and their graduates had difficulty entering good colleges.

As early as the mid-twenties, some supervisors in the high schools division began filing accreditation reports that dealt with the amount and kind of instructional supervision, the economic health of the district, and the adequacy of the school system as a whole rather than solely with the quality of examination papers. Two parallel standards of accreditation gradually evolved. Not until the reorganization of the whole educational structure of Texas in 1949-50 was the system of accreditation subjected to thorough study. The state board adopted new standards for accreditation in 1954, and the granting of accreditation by subject was abandoned (16).

State Purchase of Textbooks and Compulsory Attendance

As early as 1888, State Superintendent Oscar Cooper recommended provision of free state-adopted textbooks to public school pupils in Texas and cited the advantages that accrued to pupils in California as a result of that state's establishment of a textbook printing house. In 1891, the first bill directed at promoting uniform adoption of textbooks passed the Legislature, but memories of the Radical Republican school law and its Northern textbooks remained strong. Not until 1897 did a second uniform textbook bill become law, setting up a State Board of Textbook Adoption (17).
The 1897 Uniform Textbook Act was still a long way from a plan of state purchase. Adoption of such a plan depended, as events revealed, on the operation of a compulsory attendance law.

In 1903, the state’s first child labor law, enacted under the nationwide stimulus of progressivism, forbade the employment of children under 15 in certain forms of labor, with exceptions for agriculture.

In 1908, the Interscholastic League, an association of secondary schools for encouragement and regulation of athletic competition, was founded. By means of these debates, public attention was directed to the rational arguments for compulsory attendance and diverted from further fruitless brooding on the melancholy past. In 1915, the subject chosen for debate in all league meets in Texas was: “Should Attendance in the Public Schools Be Compulsory?”

In 1910, the University of Texas established the Interscholastic League, an association of secondary schools for the purpose of providing textbooks for all. It was manifestly impractical to compel children to attend schools that lacked sufficient books. In 1915, therefore, the Legislature passed a compulsory school attendance law requiring 60 days of school. During World War I, the duration of attendance was raised to 80, then 100 days.

Passage of compulsory attendance confronted school administrators with the problem of providing textbooks for all. It was manifestly impractical to compel children to attend schools that lacked sufficient books. In 1915, therefore, the Legislature passed a compulsory school attendance law requiring 60 days of school. During World War I, the duration of attendance was raised to 80, then 100 days.

Passage of compulsory attendance confronted school administrators with the problem of providing textbooks for all. It was manifestly impractical to compel children to attend schools that lacked sufficient books. In 1915, therefore, the Legislature passed a compulsory school attendance law requiring 60 days of school. During World War I, the duration of attendance was raised to 80, then 100 days.

Gradual Expansion of Rural Aid

In 1915, the rural aid bill appropriated the sum of $1 million for the program of incentives to rural schools. Over the years that followed, the appropriations grew larger as the administrators of rural aid found ways to expand its original goals and means.

For example, the twenties were a period of road building and improvement that began with paving on only a tiny portion of more than 18,000 Texas miles of dirt roads and ended with more than one-third of the state’s highways rescued from the mud. It was natural that bus transportation should appear an excellent solution to the problems of providing equal educational opportunity to rural children. Soon after the great surge of highway improvement began, funds for school buses began to be included in rural aid. By the mid-thirties, it proved economical to centralize all bus purchasing and supplies in the state department.

Rural aid also soon included “ample provision for the payment of high school tuition for such students as are compelled to leave their home districts to secure high school instruction” (18).

The largest portion of rural aid, however, came to be expended for teachers’ salaries, with the intention of guaranteeing a minimum salary for teachers in eligible districts.

In 1918, for example, a teacher holding a permanent certificate was entitled to be paid a maximum of $85 out of state per-capita money, and a holder of a certificate of the second grade could earn $60. Then as now, wealthy schools paid their teachers more than this state maximum; but since nothing constrained poor schools to pay their teachers as much as that, they often paid considerably less.

Modification of rural aid to incorporate salary aid was intended to guarantee a minimum salary. It did not work as hoped, however, for two reasons: the salary aid was not extended automatically, eligible districts had to request it, and the district had to match the aid funds dollar for dollar. Many districts were reluctant to pay teachers as much as $85 per month lest they then earn more than clerks in stores and thereby undermine the established social order. In spite of this reluctance, the salary aid component of rural aid appropriations grew until it was larger than bus funds and tuition payments combined (19).

The School Survey of 1925

Texans thought their state had made progress in education as a result of the reforms instigated by the Conference for Education and by professional and parent associations from 1908 onward. Although there had been improvements in actual terms, in relative terms the state stood almost exactly where it had when the century began, as shown by the 1920 Index Number for State School Systems, published by L. P. Ayres of the Russell Sage Foundation. Texas ranked thirty-ninth.

The friends of education in Texas had organized a Better Schools Campaign to pass the constitutional amendment raising the ad valorem state tax to provide free textbooks. In the spring of 1920, the Better Schools Campaign was again mobilized with the announced purpose of promoting an amendment whereby all school districts would be granted the power to vote for their schools such support as they deemed necessary, thereby removing “all constitutional limit on the rate of tax” in school districts (20).
Texas teachers assessed themselves to raise a war chest of about $4,000 with which the Better Schools Campaign, led by Annie Webb Blanton, state superintendent, organized a May 1 "tag day." The proceeds of tag day were $24,000 for a state campaign fund and an equal sum for county campaign funds. The amendment passed by a large majority (21).

In 1921, the Legislature established a Committee on the Survey of the State Institutions of Higher Education, headed by Oscar H. Cooper, former state superintendent from 1887 to 1890. This committee reported that no investigation of colleges and universities was possible without a parallel inquiry into the public schools. In response to this report, the Legislature in 1923 appointed a large and representative commission with a mandate to conduct a general study of the school system of Texas. The commission engaged George A. Works of the College of Agriculture at Cornell to be director of the study. Despite all kinds ofiggling obstacles, such as statewide floods and no advances for travel or per diem, the Texas Educational Survey Report was completed and published in 1925.

The Texas Educational Survey Report
The survey, at that time one of the most extensive investigations of the operation of a state's schools and department of education ever made, pointed out a number of facts:

- Rural children did not have much chance for a high school education; fewer than 1 percent of the common school districts maintained 4-year high schools.
- Thirty-three percent of all white pupils and 70 percent of all colored pupils attended school less than 6 months. Half of all white pupils were 1 year overage in their grade by Texas standards, to say nothing of standards in other states. Seventy percent of all Negro pupils were 1 year overage, and half of all Negro pupils were 2 years overage.
- There was no standard method of taking the school census, upon which the state apportionment of per-capita money was based. No uniform plan for assessing property values was followed.
- The ex officio State Board of Education, composed of the Governor, the comptroller, and the appointed secretary of state, lacked money and time to meet.
- The state superintendent's functions were vague and were assigned by the ex officio board rather than prescribed by law. As the result of changes and reforms, the State Department of Education, consisting of some 56 professional people, had grown too big for the scattered rooms it occupied in the pink granite capitol, yet remained too small for the task it was supposed to do.
- The Smith-Hughes Act had already begun to prove inadequate, particularly at meeting the needs of rural schools and those in smaller cities. Other states had begun to supplement the act, and the survey strongly implied that Texas should do likewise if it wished to crawl out of thirty-ninth place.

The organization and development of junior high schools required more attention because many students were in need of better terminal education. In 1925, only Beaumont and San Antonio operated such schools.

Extensive reorganization of higher education was necessary. A properly financed and administered junior college program was needed, as was some unified administration of senior institutions.

Some of the recommendations of the survey report were followed, others were not, and still others were eventually effected by gradual changes in demographic patterns.

For example, the number of independent school districts had grown from about 500 in 1910 to 805 in 1920. By 1930, there were approximately 1,000 of them, a figure which remained relatively constant thereafter, fluctuating only about 5 percent. While not all independent districts provided superior educational opportunities, they were more likely to do so than the small common schools. Common school districts had numbered more than 8,000 in the first decade of the century; their number shrank to about 7,000 in 1930, to about 5,000 at the outbreak of World War II, and to 3,516 in 1949 on the eve of administrative reorganization. Such changes in relative numbers of kinds of districts were partly the result of deliberate policies of the state, including incentives toward reorganization which were part of rural aid bills from the 1920's onward, and partly the result of rural population decline.

At the same time, however, very little progress was made with respect to the difference between Negro pupil attendance and white pupil attendance. The general average was lowered by the low levels maintained in Negro schools. Negro per-capita money was used to operate the white schools for 8 or 9 months, leaving the Negro schools to operate 6 months or less.

Reforms were not slow in coming with regard to the organization of the State Department of Education and the duties of the state superintendent of education, but they came under circumstances that generated a certain bitterness and introduced for a time a definite bias into the administration of public education in Texas.

The position of state superintendent, when restored reluctantly in 1884, was that of an elective functionary with a term of 2 years. Only three state superintendents served longer than 4 years in the period from 1884 to 1924. There was little continuity in the policies of successive superintendents, and administrative continuity depended greatly on the succession of chief clerks who carried on the real work of the office. No one was more aware of these facts than S. M. N. Marrs, state superintendent from 1923 to 1932 (22).

Marrs was convinced that the state superintendent ought to hold a position analogous to that of a local
superintendent of schools—as the executive for a board of concerned laymen. With the report of the Texas Educational Survey as an authoritative reference, he worked to convince the Legislature and the people that Texas needed a State Board of Education with time to devote to the creation of a continuous program of development and improvement of education. His efforts bore fruit with the passage of an amendment to the constitution in 1929, which created a nine-member appointed State Board of Education (23).

The Office of State Superintendent Changes

S. M. N. Marrs died suddenly in the spring of 1932, and Governor Ross Sterling appointed C. N. Shaver, former superintendent of Huntsville, to serve out his remaining term of office.

Through the years, the people of Texas had gradually come to regard the office of state superintendent as essentially nonpolitical, even though elective. Campaigns for the office were frequently unopposed races in which the candidates sought to inform rather than harangue the voters and to mobilize support for new educational programs rather than simply to garner votes for himself (24). Miss Blanton’s campaigns were good, if untypical, examples of this procedure, marked as they were by the same evangelical appeal that had been applied to votes for women and the call for national prohibition.

In 1932, however, the incumbent found himself opposed. L. A. Woods of Waco stumped the state presenting a program of action for education, enlisting personal support, making promises, and playing politics. The character of the campaign represented a sharp break with tradition. Politics, Texas style, were introduced into the campaign for chief state school officer.

One of the charges Dr. Woods brought against the incumbent, for example, was that the State Department of Education was too remote from the people, and geared to do everything for the city schools, nothing for rural ones (25).

This contained enough truth to hurt: The high schools division was large, and high schools were found principally in urban areas. Far from neglecting rural schools, however, the state department in the twenties had done much to help them by increasing the per-capita allotment, encouraging consolidation, and promoting free tuition.

But the Depression was bearing down hard everywhere, and Texas faced deficits that threatened to reduce promised per-capita apportionment below levels previously reached and to force it to renege on obligations to aid rural schools to the amount of more than $800,000.

The electorate was more conscious of the smarting of these wounds than of the steady progress made in the preceding decade.

The state was not the only political unit having difficulty financing its share of public education. Local school districts had been hit hard at the beginning of the thirties by the adoption of a homestead amendment that resulted in a loss of ad valorem revenue totaling more than $9.6 million in 1932, or nearly one-third of the state’s available school fund (26).

Nor was that all. Taxpayers associations were springing up all over Texas with the announced objective of suspension or elimination of property taxes, which they claimed no longer could be paid. In some localities, these groups succeeded in wreaking havoc with local property valuations (27).

The financial straits in which public education lay gave validity to another of Dr. Woods’s election charges—that the pedagogical experimentation of the twenties had produced an extravagant expansion of scholastic programs. Dr. Woods urged the electorate to demand that a process of deflation be applied to Texas schools as well as to other elements of government.

Dr. Woods urged that school overhead be reduced and in paid newspaper ads used the slogan, “Not More Money for the Schools, but More Schools for the Money.” In a corollary to that slogan, the reserved and academic tone of the State Department of Education was to be changed. In particular, the vocational education components of education were to be brought into new prominence and expanded in scope.

In response to the financial pressures of the Depression, the districting plan of Texas schools was becoming a chaotic scramble to annex the most valuable revenue-bearing properties. Though all schools were suffering, the rich schools were not suffering as much as the poor (28).

To cope with this inequity, Dr. Woods proposed that the state department take a more prominent role than before in the districting of schools (29). After he took office, he created a research division, which became responsible for educational surveys designed to document the need for consolidation where necessary.

THE ADMINISTRATION OF L. A. WOODS

Dr. Woods and His Opponents

If Dr. Woods waged a thoroughly political campaign, the times provided ample excuse for it. That his administration also was steeped in politics was the natural consequence of the campaign. Nevertheless, many people never forgave him for the way he said and did what was necessary in the circumstances. The educational world in Texas was soon divided into his supporters and his opponents.

Among his first opponents were some members of the State Department of Education—a natural result of some of the campaign accusations. The new superintendent tried to
surround himself with people loyal to him, but he found that there were some established patterns of administration that lay beyond his control. In particular, some professional personnel were paid not by the state but by the various philanthropic foundations active in education (30). In addition, certain earmarked funds placed restrictions on expenditures. In spite of such checks, however, the new state superintendent complied with the customs of the time and with the tradition of patronage in politics. A new state of personnel was installed.

A second and more enduring set of opponents consisted of the appointed nine-member State Board of Education (31). Dr. Woods felt that the state board cramped his style. For its part, the board regarded the state superintendent as neither a politician-educator nor an educator-politician, but simply as a politician. This point is made in the following excerpt from a board report:

Leaders in the field of public education in Texas have endorsed the idea of selection of the State Superintendent of Public Instruction by the State Board of Education on the basis solely of educational qualifications and administrative experience. Accession to this office should not be controlled by current noneducational, political issues.

Appointment of the State Superintendent of Public Instruction would enable that officer to devote more time to the functions of the office than is possible under the present set-up which calls for much political "fence building." Legislation providing appointment of the State Superintendent is respectfully recommended (32).

The state board itself was open to the charge of "politics," since its members were appointed rather than elected. Woods's reply to the board's animadversions was more succinct than their statement: "It is hereby recommended that the State Superintendent's office be kept as far as possible out of politics; therefore the State Superintendent should continue to be elected by the people of the State" (33).

Neither party to the feud could conquer or subdue the other; the state superintendent had his supporters well organized, as will be shown subsequently; the State Board of Education had its own budget, with which it produced its own biennial report to the Legislature in a manner completely independent of the state department (34).

Woods and His Supporters. True to his campaign promises, Woods set out to "bring the State Department of Education close to the people" by doing everything possible for rural and small town schools—a popular move with the rural-dominated Legislature.

In his second term of office, he established the post of deputy state superintendent as a way of bringing the department closer to the schools of the vast state. Twenty-four deputies were responsible, in regions ranging in size up to twenty-five or more counties, for checking on the eligibility of schools for rural aid, and for helping schoolmen prepare rural aid budgets for their districts.

Although the job of deputy state superintendent paid only $3,600 per annum (35)—a small salary even in those times—the post was eagerly sought, for it was viewed as a path of advancement for ambitious school administrators.

The deputies were frequently called to Austin to receive and relay information or to participate in planning conferences, especially when new legislative proposals were to be offered or new school legislation implemented. They thus constituted a vital link of communication between the needs of the schools and the decision-making apparatus of the state. Their efforts enabled the State Department of Education to raise the per-capita apportionment higher each year. They also helped reflect Dr. Woods, for in addition to maintaining contact with his supporters in schools and communities around the state, the deputies cultivated personal acquaintances with members of the Legislature, thus giving the superintendent a rapport with lawmakers that must have done much to sustain his political longevity.

Role of the Educational Foundations

In spite of being understaffed and overcommitted, the State Department of Education in Texas during the thirties and forties was not merely the toy of social, political, and technological forces. From time to time, it managed to originate or skillfully adapt methods for assistance to the public schools.

Some credit for the creative vigor of the department probably belongs to the various philanthropic educational foundations, such as the General Education Board of the Rockefeller Foundation, the Carnegie Foundation, the Jefferson Fund, the Julius Rosenwald Fund, and the Peabody Foundation.

The effects of these philanthropies were quite substantial in view of the minor sums of money they bestowed; indeed, many people without intimate understanding of education have been baffled by how such relatively small amounts could be any help at all in such vast fields of need.

For example, in 1902, a special investigating committee appointed by the Texas Legislature to look into the operations of the educational philanthropies reported that the Peabody General Agent had dispensed $4,000 to Sam Houston State Teacher's College, $1,000 in support of "summer normals," $800 to North Texas State Teacher's College, and $600 to Prairie View College during the biennium. The investigating committee accordingly termed the Peabody Fund a farce, and scornfully said that "it would do as much good to throw it at a bird or give it to a railroad conductor" (36).

Not so, replied State Superintendent Arthur Lefevre in his biennial report. The value of these moneys lay in the...
fact that they were not subject to the laws and regulations governing ordinary state expenditures for the administration of public schools and so could be used for whatever purpose the state superintendent might choose.

In former times, lack of sufficient funds severely limited the planning function of the state department. Leadership, in modern education, depends largely on planning. Before the advent of federal programs intended to promote planning, funds for any planning that was done were often discretionary money from philanthropic foundations, used to pay the salaries of professional personnel who were trained for certain specific new tasks.

For example, the General Education Board financed a year of study at Teachers College of Columbia University for a member of the staff who became, on his return to Texas, director of research and finance, and concurrently director of studies for the State Board of Education (37). The General Education Board also paid the salaries and the operating expenses of a school plants division until 1935, at which time the Legislature transferred support of the division to state funds.

The Jeanes supervisory services provided a handful of professional personnel who worked with Negro teachers to improve their limited skills and train them in new elements of curriculum such as vocational subjects.

In the State Department of Education, the General Education Board financed a Negro education division. When this support terminated in 1942, after 20 years, the superintendent requested that it be taken up by the state.

Similarly, in 1946, the state assumed the burden of supporting a health and physical education division, maintained for 6 years by the Kellogg Foundation (38).

Thus, indirectly, philanthropic support supplied impetus to the adoption of new modes of dealing with problems and to a greater consciousness of needs.

Woods's Accomplishments

When the waves of curriculum reform reached Texas schools in the early Depression years, the response of the state educational leadership was commendable. The Texas State Teachers Association began the movement by adopting a resolution at its statewide meeting in November 1932 calling on the state board and the state superintendent to sponsor broad-scale curriculum revision.

Woods honored the resolution by calling together in 1933 a group of recognized experts in curriculum (39). Under the leadership of Henry Otto of the University of Texas, this team of consultants devised a five-track plan which set up certain definite objectives in terms of desirable qualities of citizens in a democratic society, rather than simply outlining pages of textbooks in various subjects as had been the custom.

In following up this plan, curriculum consultants of the state department, in conference with representatives of subject teachers, wrote units for practically every offering in the state guide. Then representatives of schools and curriculum areas from all over Texas were called together to criticize the plans and units. More than 30,000 teachers participated before the revisions were concluded.

When all agreed-upon changes had been incorporated in the units, they were published and urged on teachers. To provide a continuing reinforcement for the new curriculum plans, the textbooks division became the curriculum and textbooks division, headed by J. Carl Mathews. The state superintendent requested permission from the Legislature to “adopt whatever books are needed for the development of a well-rounded educational program” (40).

The practice of multiple adoptions of textbooks, begun during the twenties with reference to high school subjects, was thus extended to apply to elementary curriculum as well.

Another innovation of Dr. Woods's was the introduction of public school music supervision and the promotion of public school music programs. The list of state-adopted texts included music books and materials. In 1936, the Texas School of the Air, a pioneering effort at using the mass media of communication for curriculum enrichment and some direct instruction, was launched.

The Woods administration also saw the beginning of various new techniques of communication within the professional community, such as the Midwinter Conference of Public School Administrators and the issuance for a time of a monthly 'information bulletin, “With the Public Schools,” by the information and statistics division.

But by far the greatest accomplishments of those years were the sixfold increase in the appropriation for rural aid and the reduction by half or more of the number of common school districts, with the consequent improvement in the quality and quantity of educational opportunity for rural children.

The expansion of rural aid and a concomitant growth in per-capita apportionment for schools were both responses of the state to the fact that local tax support of schools shrank during the thirties from a decline in taxable values and widespread delinquency in tax payment.

The reduction of the number of common schools was also partly a result of the Depression and partly a result of skillful development of administrative techniques for facilitating consolidation, such as the formula which permitted small districts to transfer their pupils to the tutelage of larger ones without losing their identity.

The virtues and defects of Dr. Woods's administration were closely linked. In his fence building, the state superintendent sometimes sacrificed long-range educational improvements for short-run political advantage. And the concentration on problems of rural and small town schools led to a situation in which the large urban school systems were left to work out their own problems—which were not
small, only different—strictly alone. Such a policy had to change under the pressure of demographic shifts such as those brought by World War II.

DEVELOPMENT SINCE WORLD WAR II

The Coming of Gilmer-Aikin

At the end of the war, it was obvious to everyone in public education that a number of problems—some longstanding, some new—stood in need of immediate solutions. The crop of war babies would soon reach school age and tax further the already overcrowded physical plant. Dilapidated buildings, inadequate equipment, and a shortage of qualified teachers were at the head of the list of priorities for schools. During the war, the budget of the state department omitted the school plants and structural safety division, because no one had had materials with which to construct other than temporary classrooms and because the professional staff of the division had been called into military service (41).

The superintendent recommended that the Legislature increase teachers' salaries to provide a minimum of $2,000 for those with degrees or the equivalent and an annual increase of $200 for holders of master's degrees (42).

Then, at the regular session of the Fiftieth Legislature, Representative Blankenship of Dallas introduced a bill incorporating the plan of the Texas State Teachers Association (TSTA) for raising teaching salaries—a bill whose language did not differ in any major way from the recommendation of the state superintendent except proposing that "if the available (school fund) failed to provide $55 per capita (the amount required to finance the salary increase), then the amount necessary to make this payment should be transferred from...the omnibus tax bill..." (43).

Legislators had no objection to giving the teachers more money, but some of the more conservative ones took alarm at the proposal to finance the pay increase—no matter to how small an extent—out of the general revenue fund of the state. About the middle of the session, therefore, Senator Taylor and Representative Gilmer introduced a conservative counterplan for financing higher salaries for teachers.

The conservative bill set up the same minimum salary schedule as the Blankenship bills but provided that the state should contribute aid above per capita only to those schools which could show need. This would have resulted in no extra state money for the richer school districts, including some in the large cities. Moreover, the counterplan called for a biennial appropriation bill which would have meant that most Texas schools would be forced to operate on a 2-year plan subject to the will of all future Legislatures (44). The TSTA promptly criticized the Taylor counterplan, charging that it was "a serious effort (by) the South Texas Chamber of Commerce and other special interest groups...to defeat the objectives and needs of the schools of the State" (45).

Soon, the public school teachers regarded Senator Taylor and Representative Gilmer not only as the chief enemies of the public schools but also as the personification of all the evils implied in the words special interests. Both men were novices in the field of school financing and somewhat taken aback at the intensity of the rejection their plan received, but they thought that if a group of interested people gave the problem thorough study, a feasible way to replace the per-capita method of financing could be found (46).

In March 1947, therefore, Representative Gilmer introduced House Concurrent Resolution 48, calling for an 18-member study committee to tackle all questions relating to the improvement of the public school system of Texas (47). In the Senate, Senator Aikin, a longtime friend of education and ally of the TSTA, sponsored the resolution—a fact which mollified that association somewhat. The TSTA had already concluded that the committee, if appointed, would accomplish little and therefore that the matter was not worth contesting (48).

The committee was provided $25,000 of House contingency funds with which to operate. It was known as the Gilmer-Aikin Committee after the sponsors of the resolution and at its first meeting elected Senator Taylor its chairman—a move which did nothing to convince Texas teachers of its disinterested character (49).

The Gilmer-Aikin Committee spent 1947 deciding what it would work on. In December came a very important turning point—when Edgar L. Morphet, nationally known authority on educational finance, met with the committee and suggested some tested techniques for selling a program of modernized public education to the people. Morphet—

Made it perfectly clear that success in Florida, [where he had been executive director of the Citizens' Committee that had secured educational reform] was attained primarily through citizens' organizations operating throughout the state and working with the main committee (50).

The Gilmer-Aikin Committee acted on this advice and proceeded to organize as the Floridians had done. It hired L. D. Haskew, dean of the School of Education at the University of Texas, as its technical adviser. Five statewide advisory committees were chosen to work with the existing subcommittees of the Gilmer-Aikin Committee. Wherever possible, county committees of lay and professional people also were formed. H. A. Moore, a member of the committee, was appointed executive director (51).

By September 1948, the subcommittee reports were sufficiently advanced to permit circulation of a tentative draft of proposals. After the proposals had been scrutinized by all the advisory committees, they were published as a
booklet, *To Have What We Must*. Among the 33 specific recommendations were those calling for a minimum foundation program of education that would combine state and local support with the state underwriting costs above a reasonable uniform effort. Others called for the establishment of local administrative units designed for most efficient school management, the redesign of state administrative machinery, a minimum state salary schedule for teachers, and such administrative and legal changes as were necessary for consistency (52).

The committee handled public relations ably but nevertheless failed to get its proposals presented to a special session of the Legislature because of growing opposition from both the state board and the state superintendent of public instruction (53). The Gilmer-Aikin Bills had to be presented during the regular session of 1949.

To write the proposals of the Gilmer-Aikin Committee into the language of bills, Senator Taylor called on the officers and legislative committee of the TSTA for assistance, an invitation that had the effect of thawing the coolness the association had felt toward the committee (54).

As finally cast in the form of bills, the committee's proposals provided for reorganization of the state administration of education through consolidation and rationalization of existing educational divisions of the state into one central education agency—the Texas Education Agency—composed of the State Board of Education, a commissioner of education chosen by the board (Senate Bill 115), and a State Department of Education; establishment of a minimum foundation program for education, including setting up of formulas for financial allotments, and the payment of the difference between program costs and the combination of local funds and state per-capita payments from the special Foundation School Fund (Senate Bill 116); and a plan of automatic financing to eliminate the need for biennial appropriations by the Legislature (Senate Bill 117) (55).

Dr. Woods was aware of the advantages of a minimum foundation program and favored the plan for automatic financing, but he opposed the reorganization of the State Department of Education, especially the plan of having the state board appoint the commissioner of education. If he had chosen to oppose only the reorganization bill (Senate Bill 115) while giving support to the other two, Dr. Woods might have been the first commissioner of education chosen by the newly constituted state board. Instead of adopting a position from which to bargain, however, the state superintendent took a completely intransigent stand (56).

Members of the appointed State Board of Education also opposed Senate Bill 115 because it provided that board members should be elected. Their opposition was not so overt, however, as that of the State Department of Education (57).

Other opposition came from a small group of representatives of textbook publishing companies, who disliked a provision of Senate Bill 115 that called for multiple adoption of textbooks in elementary grades (58).

By February 1949, the Texas State Teachers Association had decided, however, that the bills contained no hidden clauses but were in fact what they purported to be—a design to improve education in Texas. The association therefore began using its full weight in support of the bills. Three or four days each week, Charles Tennyson, public relations director of the association, invited various House members and Senate and House sponsors to lunch with him and members of the TSTA legislative committee (59).

In addition, close contacts were maintained with school people known to favor the bills, and they in turn brought influence to bear on their representatives. Many meetings were held around Texas to arouse the enthusiasm of school people and to discuss the issues. A new pressure technique seldom used with previous Legislatures was employed extensively—the filling of the galleries with supporters of the program both at committee hearings and throughout the House debate. This had a wholesome effect in keeping members in line with their pledges to support the bills. The proponents used every legitimate device that could be devised (60).

The state superintendent employed every means at his disposal, from radio talks to form letters to city and county superintendents and school boards, and pamphlets. He attacked Gilmer-Aikin in the newspapers, warning that passage of the bills would be disastrous to equal educational opportunity for youth in rural areas and small towns. A substitute bill designed to undermine the Gilmer-Aikin proposals was introduced in the House, and Dr. Woods was quite active in its support (61).

The attempt to arouse public interest was highly successful on both sides of the measure, but the proponents had organized earlier and more thoroughly and managed their bills very skillfully in committee and on the floor. In the final days of the legislative session of 1949, the three bills passed.

The Minimum Foundation School Program Evaluated

Passage of the Gilmer-Aikin Bills was widely hailed as victory in Texas for modern concepts of educational administration. Yet, in the opinion of some experts, the foundation school program which emerged from the new law was an expedient rather than a true plan for educational excellence—an expedient, furthermore, which was substantially altered by the Legislature in the process of passage (62).

The intent of the measures was to put a fiscal floor under poor schools (which wealthy ones could exceed if they so desired) while making certain that no district was
able to substitute state support for local taxes. However, under the foundation school laws it is still advantageous for a district to be small, i.e., to make the state minimum the school's maximum and so escape the necessity for increasing local taxation (63).

Moreover, instead of proceeding to regularize the assessment of property taxes from county to county, the Legislature has permitted wide variations to increasing local taxation (63). Despite these criticisms, however, the foundation school program has enabled Texas to come much closer than ever before to providing equal educational opportunity for its children.

In the interim period during the summer of 1949, the Governor appointed L. P. Sturgeon to act as commissioner of education pending the appointment of a permanent executive by the elected State Board of Education (64).

For its part, the state board spent seven months interviewing a large number of competent school administrators before settling on J. W. Edgar, whose membership on the Gilmer-Aikin Committee had made him reluctant to permit consideration of his name (65).

Dr. Edgar was a member of Texas Association of School Administrators, composed of superintendents of schools in cities of 100,000 population or more. Some interpreted his appointment as indicating a swing in the direction of policies favorable to big city schools. This was a justifiable presumption, but a mistaken one. There was to be no continuation of the political atmosphere that had existed in the previous two decades.

J. W. Edgar Emphasizes Professionalism

The most important new policy the new chief state school officer cultivated was one of asking rather than telling. Keeping himself very much in the background, he tried to assume the role that S. M. N. Marrs had envisioned for the office by assiduously promoting cooperative planning and thorough preliminary studies. By declining to impose solutions of his own devising, he tried to let the state board perform its function of reaching informed policy decisions, however tedious such a procedure might often be. He attempted to bring about harmony between the large-school and small-school administrators associations and succeeded in involving these organizations in some cooperative planning. He cultivated a greater degree of local autonomy of decision making in schools.

The new law prohibited the State Department of Education from making any overt efforts to secure school district consolidations, but Edgar himself met from time to time with local boards of trustees in an attempt to set forth clearly the exact facts about the true cost of a high-quality educational program (66).

To help small schools desirous of maintaining their identity, Dr. Edgar caused to be launched a State Small Schools Study aimed at discovering better ways to assist districts with less than 500 average daily attendance. From this study grew the establishment of a Texas Small Schools Project in the administrative services division.

As redesignated in 1950, the State Department of Education consisted of four departments: school administration and finance, agency administration, instructional services, and vocational services.

An assistant commissioner or a deputy commissioner headed each office. Under the Office of Instructional Services were grouped, for example, the curriculum development, professional standards (including both certification and accreditation functions) and special education divisions. The last named moved after 1960 into a new vocational rehabilitation and special education department.

Cooperative Planning and Advisory Committees

Immediately after it came into office, the State Board of Education called for a careful study of teacher certification as the first step toward improvement of professional standards as the Gilmer-Aikin Act directed.

Under Dr. Edgar's leadership, the appropriate associations were involved in establishing a planning committee to develop procedures for a statewide study (67). This was followed by a statewide conference on teacher certification in July 1950, at which some tentative proposals for new requirements were formulated and subsequently issued as a bulletin, Toward Professional Competence for Teachers.

During the 1950-51 school year, thousands of study groups were formed among professionals and laymen, who submitted reports which were compiled for a second statewide conference in July 1951. This conference decided that certification requirements should be formulated to support desired teacher-education programs.

A steering committee of 19 assumed the responsibility of publication, continued study, and the writing of revised proposals. As a result of its labors, a second publication, Proposed Standards for the Certification of Texas Teachers, was issued in 1952. It was duly disseminated and critiqued; its recommendations were revised after much testimony.

The resulting consensus became the basis for changes in the certification requirements in Texas. The procedure followed in this particular instance may be taken as broadly typical of the procedure in other cooperative planning ventures under the minimum foundation school act as administered by Commissioner Edgar (68).

In addition to reliance on advisory committees and study commissions, the State Department of Education under the leadership of Dr. Edgar began, during the fifties, to place greater emphasis on formal in-service training for staff members.
In 1950, under the leadership of Warren Hitt, deputy commissioner, a special program of staff development was organized. It was affiliated with the School of Education of the University of Texas at Austin and provided 3 hours of credit in educational administration. During the first year it was conducted, the course analyzed problems of state educational administration and explored techniques of operation. During its second year, the course analyzed leadership opportunities. “One technical skill emerged as important . . . arranging conferences, clinics, workshops, area meetings, etc., and performing in group situations” (69).

This staff in-service program was part of a larger project in action-research in administrative techniques, funded by the Kellogg Foundation, which lasted from 1950 to 1956 (70).

A part of the responsibility assigned the State Board of Education under the minimum foundation school laws was evaluation of the outcomes of the new program. In 1953, the Texas Research League, a nonprofit research organization, was engaged to conduct an objective study of the administration and financing of the foundation program.

The league report found that the foundation school program had “contributed substantially to the progress of public school education in Texas” (71). It also identified certain defects in the program, including a failure to carry out planned reorganization of school districts, inefficient methods of calculating the current classroom teacher and operating allotments, inequities in the measurement of local capacity for program cost sharing, and a loophole in the modes of calculating local district fund assignment. The report recommended that the state board apportion funds among districts on the basis of average daily attendance rather than scholastic population and that the annual scholastic census be conducted biennially and in a standard sampling manner (72).

Acting on these recommendations, the state board made legislative recommendations designed to promote desirable changes in the statutes. Some of the recommendations met with approval, and others did not (73).

Through the leadership of the state department, various technical improvements were made in the operation of the system of textbook selection and approval, and recommended refinements in the management of the permanent school fund were secured.

More Attention for Spanish-Speaking Children

During the course of World War I, when xenophobia rose in the United States and when the German Empire attempted to capitalize on Mexican resentment of U.S. expansionism, mutual distrust between the nationalities in Texas created a demand for educational policies that would enforce acculturation of minorities. The existence of a large group of Spanish-speaking people within the borders of Texas was viewed for the first time as a “problem.” Legislation was enacted making English the only “language of instruction” in Texas schools.

The Texas Educational Survey Report of 1925 devoted an entire chapter to the subject of teaching Mexican-American children and made a number of recommendations, such as the following:

In the opinion of the Survey Staff, they should be segregated in the first two or three grades, when they are unable to speak English . . . . This recommendation has been made with some reluctance, as the . . . practice varies from community to community. In some instances it has been used for the purpose of giving to Mexican children a shorter school year, inferior buildings and equipment and poorly paid teachers (74).

Segregation, whether for instructional purposes or for other reasons, remained the rule in many schools until the period after World War II, when agitation for reform began to make itself felt, resulting in at least two court decisions that struck down separate instruction for Spanish-speaking pupils.

In 1958, Felix Tijerina of Houston, national president of the League of United Latin American Clubs, conceived the idea of setting up schools outside the public schools to attempt to equip Spanish-speaking pupils with a minimum English vocabulary before their entry into public school. This “Little School of the 400” (400 English words) was successful in leading to establishment by the Texas Education Agency of a preschool program for non-English speaking children. There followed in 1963 the establishment of the Texas Project for the Education of Migrant Children (by far the greatest number of whom are Mexican-American), which attempted to benefit the children whose parents follow the crops by compressing the school curriculum into 6 months through lengthening of the school day. These projects developed new methods of teaching Spanish-speaking children and thus facilitated a trend, now under way, toward the cultivation of bilingual instruction.

National Defense Education Act

The availability of funds under NDEA brought both direct and indirect changes to the structure and programs of the State Department of Education.

In direct fashion, the advent of NDEA led to the addition of staff in several parts of the state department, particularly consultants in the curriculum areas of interest to the U.S. Congress: mathematics, science, and foreign languages. As NDEA was subsequently broadened, the staff of the program development division in the office of instruction continued to expand, and program approval of applications for NDEA funds to support guidance and
counseling and library materials became a new function of the office of administration.

Indirectly, NDEA led to other kinds of expansion. In 1959, the National Education Association secured a grant under the act to set up regional conferences throughout the nation to plan for the establishment of research and dissemination projects in instructional media.

The following year, Texas representatives attended two of these regional conferences. The delegation of 18 persons from all components of the educational enterprise returned home to become an advisory committee on instructional media, which requested the Texas Education Agency to submit a proposal to the U.S. Office of Education for a dissemination project contract under Title VII of NDEA.

To carry out the initial phases of the project, the instructional media division was organized within the office of instruction. Its four professional personnel recruited and trained a staff of 24 demonstration teachers and employed suitable means to publicize the project (75).

NDEA funds also made possible the establishment of an electronic computer and the hiring of personnel to process statistical and research data (76).

In 1965, the Elementary and Secondary Education Act ushered in an entirely new era in public education in Texas, as in other states. The effects of this legislation and funding cannot be historically assessed, for the changes brought about as a result of Title I, Title III, and Title V are still under way, and the outcome of many projects started under the various titles is not yet known. Not merely the magnitude of funds available, but the purposes to which those funds were to be directed, were in many cases unprecedented.

One result of the massive infusion of funds (more than $180 million for Texas under Title I alone) was of course an increase in the sheer size and number of functions of the State Department of Education, bringing with it new problems of coordination and control, reorganization, and redirection of effort. Revisions in structure are still being made in an effort to cope with the changes. One significant change occurred in 1966 with the inauguration of an office of planning as part of the commissioner's office, financed with funds from Title V of ESEA. This office was instrumental in the introduction of new concepts of internal communication and cooperative planning for instructional purposes, and in the creation of a new educational entity in Texas—the Regional Education Service Center—of which there are 20, each with its staff of specialists responsible for providing schools with services and assistance they could not otherwise obtain. The centers are not intermediate units of administration, but service organizations only; nonetheless, they are likely repositories of certain functions of the State Department of Education that have heretofore been concentrated in the state capital. It therefore appears that one indirect result of the largest and most recent federal aid program is a decentralization and rationalization of the State Department of Education. It also seems likely that a prime result of federal aid programs is an accelerated adoption of more modern techniques of management and planning by the state department.

As it was once with private philanthropy, so now it appears to be with federal aid. A program begun with the help of outside funds is quite likely to be continued in some form after those funds are withdrawn, if it should be. The changes wrought in the State Department of Education by the intervention of federal aid are irreversible. Their significance is quite disproportionate to the relative size of federal (8 percent) and state (48 percent) expenditures for public education in Texas. If federal aid should cease tomorrow, the changes it has brought would be likely to endure.

FOOTNOTES

2. The earliest Anglo-American settlers of the region used the word Texian, now archaic, to refer to themselves. It has come to mean only the culture and the people of prestatehood times.
3. Some survivors of the period are Baylor University, founded in 1845; Austin College, founded 1849; and Southwestern University at Georgetown, originally Ruterville University, in 1840.
4. The term free schools meant charity institutions to the advocates of private and church education and free tuition to the advocates of free schools for all children—an artful compromise of which the constitution writers were proud.
5. Governor Ireland, the Texas State Teachers Association, and many political leaders of the state backed the amendment. Behind these supporters lay the persuasive activities of Barnas Sears, general agent for the Peabody Fund, which had been active in Texas throughout the South since 1869 with small but judicious grants to establish exemplary schools, subsidize the travel allowance of the secretary of the ex officio State Board of Education, and promote the establishment of normal institutes and summer training programs for teachers.
7. The executive board included Clarence N. Ousley, chairman, publisher of the Fort Worth Record; H. H. Harrington, vice chairman, president of A&M; A. N. McCallum, recording secretary, superintendent of Austin public schools; W. S. Sutton, corresponding secretary, dean of the School of Education, University of Texas; and E. P. Wilmot, treasurer, president of the Austin National Bank. Clarence Ousley was also chosen chairman of the Executive Board, whose
members included David F. Houston, president of the University of Texas; H. C. Pritchett, president of Sam Houston Normal Institute; Oscar H. Cooper, state superintendent from 1887 to 1891; R. B. Cousins, state superintendent; and J. L. Long, superintendent of the Dallas public schools. As its general agent the conference hired F. M. Braley, former chief clerk of the State Department of Education and later state superintendent.

8. The classification of common schools and the accreditation of high schools by the state department did not begin until 1917, when the University of Texas completed phasing out of affiliation procedures.

9. In 1915, approximately 70 percent of the state's population lived in the country, and about one-third of all labor on farms was that of school-age children. The school term in rural districts was 4 months or less. About 18 percent of city children attended high school; on 7 percent of rural children did. About 1 percent of all Texas students graduated from high school.

11. Ibid.

12. Ibid.

13. The divisions were administration and law, high schools, rural schools, audits and accounts, statistics and reports, examinations (for teaching certificates), certification, mail and supplies, and vocational education. The last, in Texas as elsewhere, included subdivisions of agriculture, home economics, and industrial arts.

15. Ibid., p. 31.

During this time (the period 1917-1952) more than 2,000 regulations were made having to do with all aspects of the elementary and secondary school programs. The influence of the committee was one of the most powerful forces in Texas education. An example of this is found in the fact that the State did not have a certificate law during this time that ensured a teacher holding a college degree, but accreditation regulations had this requirement and about 97 percent of Texas teachers had degrees by 1950.

17. The bill establishing this body and defining its functions was first passed in 1891, but when it came to the secretary of state's office it was discovered that opponents of the measure had secretly caused the enabling clause to be excised from the bill after passage and engrossment. Hence the 1891 bill never became effective. Superintendent of Public Instruction, Twenty-Third Biennial Report (1925), p. 25.

19. From the $1 million of the 1915-17 biennium, rural aid grew to $3 million in the mid-1920's, to $6 million in the early Depression years, then to $11 million in 1936-37, doubling approximately every 6 years. P.E. Hutchinson, legislative accountant, “Report to the Joint Legislative Committee, Fiftieth Legislature” (unpublished typewritten report in Mr. Hutchinson's personal files, March 1947).

20. Superintendent of Public Instruction, Twenty-Second Biennial Report (1924), p. 12. Constitutional limits were lifted, but statutory ones were still imposed.

21. Miss Blanton, a noted feminist and founder of Delta Kappa Gamma—a sorority for women in education—aroused strong loyalty and a crusading spirit on behalf of better schools among women teachers.

22. Starlin Marion Newberry Marrs had been a teacher and county school superintendent in Texas from 1885 to 1889, chief clerk of the state department from 1889 to 1890, superintendent of schools at Terrell until 1919, chief supervisor of high schools in the reorganized state department from 1919 to 1923, and successor to Miss Blanton as state superintendent.

23. The State Board of Vocational Education and the State Board of Education were combined in the same body by this legislation, and vocational rehabilitation was taken out of the charge of the eleemosynary institutions and placed under the State Board of Vocational Education—a plan unique to Texas which has worked efficiently and smoothly ever since.

24. Because Texas was a one-party state, the campaign for state superintendent was actually one betwixt rival Democrats in an all-white primary rather than a contest in the general election. In the 1932 primary in July, Woods charged that C. N. Shaver had never completed high school, let alone attended Columbia Teachers College, the University of Chicago, or the University of Texas, as the incumbent claimed. Austin Statesman, July 17, 1932, p. 4.

25. Candidate Woods was asked to address a gathering at Comanche “protesting educational administrative policies and arbitrary methods and expenses.” This meeting was said to be indicative of the feelings of small town and rural people at the time. Austin Statesman, July 13, 1932, p. 2.

26. “As a result of the adoption of the homestead amendment—a commendable step toward relieving real estate of its disproportionate tax burden—the schools face a loss...of from one-fourth to one-third of the present state available school fund.” Superintendent of Public Instruction, Twenty-Seventh Biennial Report (1932), p. 12.
27. N. S. Holland, *A Brief History of the Texas Association of School Administrators* (Chicago: Nystrom & Co., 1953), p. 42. In San Antonio, where approximately $2.6 million in unpaid taxes was owed to the city and school district, teachers were sent out during the summer of 1932 to call personally on the 250 biggest delinquents in hopes of collecting sufficient funds to pay the more than $500 million in back salaries owed them. *Austin Statesman*, July 4, 1932, p. 3.

28. Dr. Woods, as organizer and principal of the first rural high school in Texas (at Mart), was confident of his ability to come to the aid of the poor districts. He had also served as a county superintendent (McLennan Co.). He claimed to be, however, "in no sense a politician or even politically minded." *Austin Statesman*, paid political advertisement for Woods, July 3, 1932, p. 2.

29. Virtually every biennial report during Dr. Woods's administration emphasized the need for fewer small, inefficient units of administration and hailed the reduction in numbers of Texas districts.

30. The General Education Board of the Rockefeller Foundation financed the training of a specialist in research; the Jeans Fund and the Julius Rosenwald Fund were supporters of supervisors of Negro education.

31. "It was said that Dr. Woods came to Austin with a bill in his pocket to abolish the State Board." Interview with Ruth Huey, director of homemaking education (retired), June 27, 1967.

34. The state board could and did pursue independent courses of action, such as launching a second statewide survey of education in 1936 with the help of WPA funds. This survey disclosed little new information; the same old problems and inequities were again identified. It did, however, draw up the first atlas of school district boundaries ever made in Texas, thereby throwing the districting muddle into high relief.

37. This was Henry F. Alves, later a division head in the U.S. Office of Education and director of the Kellogg Foundation's five-state project in educational administration.

39. The group included such people as Sam Culpepper, E. L. Galyean, S. D. McAlister, R. H. Rhodes, Bascom Story, Tom Spence, Edgar A. Wilson, and Cecil Yarbrough.

41. *Superintendent of Public Instruction, Thirty-Fourth Biennial Report* (1946), p. 22. The feud between Dr. Woods and the State Board of Education was still in progress, also; the State Board of Education had elected someone other than the state superintendent (its ex officio secretary) as executive secretary of vocational education—an action that had the effect of separating the operations of vocational education from the Department of Education for a brief but aggravating time. *Ibid.*, p. 23.

45. *Ibid*.

47. Members of the committee coming from the House were Representative Claude Gilmer; Representative Ottis Lock, former superintendent of schools; and Mrs. Rae Files Still, chairman of the House Education Committee and a former classroom teacher. Members appointed by the Speaker were R. L. Thomas of Dallas; Peyton L. Townsend of Dallas; and J. C. Peyton of El Paso, director of the Texas Manufacturers' Association. From the Senate were Senator A. M. Aikin; Senator James E. Taylor; and Senator Gus Strauss. The president of the Senate (then lieutenant governor, later Governor) Allan Shivers appointed C. B. Downing, superintendent at Albany; J. W. Edgar, superintendent at Austin and later commissioner of education; and H. A. Moore, superintendent at Kerrville. The Governor appointed Beauford Jester; H. W. Stilwell, superintendent at Texarkana; B. F. Pittinger, former dean of education at the University of Texas; Nan Proctor, a teacher; Mrs. J. G. Smith, former president of the Texas PTA; J. Turrentine, former dean of education at Texas State College for Women; and Wright Morrow, Houston lawyer and National Democratic committee man. *Ibid.*, p. 19.

49. Frederick Eby, professor emeritus of education at the University of Texas, testified later that he had been asked to serve on the committee but had declined because of his doubts about its impartiality. *Ibid.*, p. 19.

54. Ibid., p. 40.
55. Ibid., pp. 2-10.
56. The reason he did so is not precisely known, but the opinions and desires of some of his principal subordinates heavily influenced Dr. Woods's decision. Ibid., p. 43.
57. Ibid., p. 82.
58. Ibid., p. 83.
59. Ibid., p. 70.
60. Ibid., pp. 71-73.
61. Ibid., pp. 74-77.
62. Interview with Bascom Hayes, professor of educational administration, University of Texas, April 3, 1967.
63. Interview with Bascom Hayes, April 3, 1967.
64. Sturgeon is currently executive director of governmental and public relations with the Texas State Teachers Association. At the date mentioned, he was superintendent of New Boston, Texas, schools.
65. During World War II, Edgar had been superintendent at Orange, Texas, acquiring valuable experience as local administrator of the Lanham Act, the first "Federal Aid to Impacted Areas" school aid measure. From Orange, he became superintendent at Austin, then a city of more than 100,000. His experience was thus very broad, indeed unique, if one takes into account his service with the Gilmer-Aikin Committee.
66. One alternative any small district faces is consolidation, but often, after hearing the whole story, a school board will choose to increase its taxes rather than consolidate. The rate of voluntary consolidation remains about the same as it was during the thirties.
67. The Texas State Teachers Association, the Texas Vocational Association, and the Texas Council on Teacher Education all were conducting or about to begin studies of their own. The conference was attended by representatives of every professional education organization and school-related group in the state, from the PTA to the Texas Association of School Boards.
68. Through the 10 years from 1954 to 1963 the State Board of Education authorized 37 advisory commissions. They met for a mean period of approximately 1.5 years. Only 10 of them met for more than 2 years before completing their task and being disbanded. One of the 10 long-term commissions was on school accreditation and has been in existence continuously since 1918. Other than this commission, only the advisory commissions on administration of vocational education, on utilization of school facilities and personnel, on the project in teacher recruitment and education by television, on coordination of special education and vocational rehabilitation, and on state text selection took more than 3 years to reach closure.

70. Warren Hitt and Henry F. Alves, *Educational Leadership: The Emerging Role of State Departments of Education* (Austin: University of Texas, 1955). This project also raised the status and effectiveness of the various voluntary associations of school administrators: Texas Association of School Boards; Texas Association of School Administrators; Texas Association of Supervisors and Curriculum Directors; and the Texas Association of Secondary School Principals.
72. Ibid., pp. 2-14, passim.
73. Recommendation to redefine a scholastic as a child in average daily attendance was presented to the Texas Legislature in 1957, 1959, 1961, 1963, 1965, and 1966 without result. On the other hand, a recommendation that school districts be eligible for consolidation incentive aid payments was adopted by the Fifty-Eighth Legislature without benefit of recommendation. Successive recommendations are in *Recommendations for Legislative Consideration on Public Education in Texas* (Austin: Texas Education Agency, 1957, 1959, 1961, 1963, 1965, and 1966). These are short pamphlets prepared prior to each regular legislative session by the Texas Education Agency and distributed to legislators. They vary from 16 to 32 pages in length.
76. Texas Education Agency, *Forty-First Biennial Report* (Austin: The Agency, January 1959), p. 70. Among other tasks, the computer was used to develop Texas and local school norms for a statewide achievement and ability test program inaugurated in 1958.

DEVELOPING A PATTERN OF CENTRALIZED
CONTROL OF EDUCATION
PRIOR TO 1900

Education Fundamental to Mormonism

For 46 years preceding its admission as a state on January 4, 1896, Utah had been a territory, and 3 years prior to this a religious colony. During this time basic patterns were established, so an understanding of the educational views and efforts of the Mormon founders of the public school system, the acts of the territorial assembly, the regents' plan of control, and the area's social, economic, and religious problems is necessary for interpreting the organizational development and functions of the Office of State Superintendent of Public Instruction.

The first company of Mormon settlers who entered Salt Lake Valley in July 1847, like many who followed, had migrated from Illinois. Mormonism had come into existence when six original members founded a church in upstate New York in 1830. Building a membership and propagating their theological concepts made education especially important, and church leaders constantly encouraged it. To live the creed, the members had to be conversant with it. Members had to prepare themselves for effective proselyting if others were to accept the principles of the doctrine. Indeed, if the purpose of Mormon life was to be fulfilled, certain beliefs had to be understood and observed, all of them indicating that things of lasting value depended upon education: "Seek not for riches, but for wisdom" (1); "The glory of God is intelligence" (2); "Whatever principle of intelligence we attain unto in this life, it will rise with us in the resurrection" (3).

Territorial Superintendents Increase Centralization

These Mormon pioneers brought centralized control of education with them, and this has continued to be a basic characteristic of educational organization and administration in Utah, despite shifts and adaptations through periods of religious, economic, social, and political change. For instance, those who founded the University of Deseret in 1850 intended the board of regents to do more than organize and operate an institution of higher learning. In effect, the regents were to operate very much like a territorial education board, giving overall control and supervision to education throughout the territory. With the help of the university, the regents would provide a plan for administering the common schools throughout the proposed state. Governor Brigham Young gave additional impetus to a centralized plan of supervision and a uniform program in 1851 in a message to the Legislative Assembly:

A Superintendent of Public Instruction, with a fixed salary, might be of incalculable benefit, at this early period of our national existence, in the formation of a uniform system of common schools, as well as an introduction system of public instruction . . . " (4).

The Legislative Assembly enacted into law the Governor's recommendations in October 1851, strengthening the authority of the chancellor and regents by authorizing them to appoint a Superintendent of Primary Schools, for the Territory of Utah, under their supervision and discretionary control . . ." (5). Three years later, it amended the law, making it mandatory for the chancellor and regents to appoint a superintendent of common schools who would hold his office at the pleasure of the board.

Another basic law with respect to the common schools was enacted by the Territorial Legislature in 1852. This law initiated the establishment of local districts and trustees. The board of regents recommended this legislation in an attempt to make education available for all the people of the territory. The powers of local districts were limited, and the superintendent of the common schools was required to make a full and complete report, including enrollments, funds collected and expended, and the length of the school year. These new duties, combined with the individual leadership that the territorial superintendents displayed, gave them a significant role in developing a more centralized control of education.

Duties of Superintendents

The board of regents appointed Elias Smith as the first territorial superintendent of common schools in 1851, and
he served until replaced by William Willis in 1856. Although the law was still vague and made superintendents responsible to the board of regents, the most difficult task for these early superintendents was to establish an effective relationship with the local districts. The local schools were under the direction of three local trustees, until an 1860 law created the office of county superintendent. The law listed the county official’s duties, the most important being “to make an annual report to the territorial superintendent of common schools . . . stating the particulars contained in the trustees’ and teachers’ reports” (6). This provided a complete structure for school organization and administration, giving the territorial superintendent a line of administrative relationships extending down through county and local administrative officers to the teacher and, in effect, establishing the superintendent as the head of the territorial school system.

An 1890 law provided the territorial superintendent the legal basis for operating as the chief executive for the school organization, giving him almost the same authority as he has today. It allowed him to develop strong leadership as he labored for a uniform system of public schools. Superintendent Jacob S. Boreman stressed adequate reporting, rating of schools, the advantages of uniform textbook adoption, the necessity of carefully selecting and training teachers, the need for legislative action to provide uniform teachers’ examinations, and the desirability of placing teacher certification within the central agency. The superintendent has had, since 1890, the legal responsibility of giving written answers to all questions concerning school law requested by local authorities. And he was charged by the same law with the business operation of the district schools and management of the revenues appropriated for their support (7).

The territorial superintendents were usually effective in recommending legislation. For instance, the compulsory attendance law passed in 1890, which required parents of children between 8 and 14 years to send them to school at least 16 weeks each school year—with a penalty for failing to do so—was devised by Superintendent Boreman. The law also required superintendents to visit schools. Although the laws had not previously required visits, superintendents had directly contacted districts and provided supervision, rendering invaluable service. In fact, by 1878, the superintendent found it necessary to enlist a few other people to help him check the progress of pupils and teaching methods during these visits. Sometimes he gave demonstrations at 1 held conferences with the teachers and trustees. After the 1890 law made visiting mandatory, one superintendent reported: “The results of this experience, which the law requires me to give, have been most gratifying . . .” (8). Like other duties assumed by or thrust on superintendents, under their leadership this program of supervision contributed to the pattern of centralized control which developed prior to statehood.

Non-Mormons Influence Education

Most of the early Mormon pioneers were New Englanders who had endured persecution and hardships for their faith and were searching for a place where they might live their creed without interference. In establishing themselves in Utah, they took on a cultural oneness. After the completion of the transcontinental railroad in 1869, newcomers increasingly intruded on their haven. Also, the discovery of various mineral deposits throughout the territory brought capital and labor from the outside. In contrast to the particularly agrarian philosophy and life style of the Mormons, more and more “gentile” commercialists established themselves in Salt Lake City (9). This shift in the population’s religious and social composition during the latter quarter of the nineteenth century brought friction between the Mormons and the non-Mormons. The non-Mormon newcomers were not willing to subject their youngsters to an education influenced by Mormon church leaders and objected to “paying taxes for maintenance of school buildings unless a public body established by civil law, and not the church, held title to the ground and schoolhouse, thereon . . .” (10).

The result was an interdenominational balance of common schools run by the Mormons and private schools operated by other Christian denominations. The Episcopal Church organized the first private school in 1867. In 1884, President Chester A. Arthur reported to Congress:

The denominational schools now number 79 with an average of nearly 6,000 pupils in average daily attendance, many of whom are the children of Mormon parents. These schools are distributed as follows—Episcopalian, 5; Methodist, 10; Congregational, 26; Presbyterian, 35; Baptist, 2; Catholic, 1 (11).

Establishing a State Board of Education, 1896

When Utah was admitted to statehood in 1896, the constitution stated: “The general control and supervision of the public school system shall be vested in a State Board of Education, consisting of the Superintendent of Public Instruction, and such other persons as the Legislature may provide” (12). The Legislature followed this mandate with an act in April 1896 stating:

The State Board of Education shall consist of the State Superintendent of Public Instruction, the president of the State University, the principal of the State Agricultural College and two other persons of large experience and eminent professional standing to be appointed by and with the consent of the Senate for a period of four years. The State Superintendent of Public Instruction shall be Chairman of the State Board . . . (13).

The board met for the first time in June 1896 in the office of the first state superintendent of public instruction, John R. Park.
The State Superintendent's Major Functions, 1896-1900

In addition to duties that had developed during the territorial period, the new state superintendent took on two additional functions of major significance. One was to develop a uniform statewide system of administration and supervision by consolidating districts and county units. Many years before he became state superintendent, Park had advocated a law providing for the consolidation of all school districts into county school districts except in cities of more than 5,000 population. Such a bill was introduced in 1888, but it failed, and no similar legislation was proposed until after statehood (14). A year after Park took over the state superintendent's office, he explained in detail in his first report a proposed county-unit system, carefully pointing to its advantages. Courageously, he stated: "I urge at this time that the adoption of this plan be seriously considered for our schools, to be known to us as the county or county district plan, as the county is the lowest available civil unit for us" (15). His proposal attracted increasing support, but no action took place before his death in 1900.

The second major function assumed by the state superintendent was teacher certification. When the 1896 Legislature created the superintendent's office and the State Board of Education, it specifically authorized the board to issue state diplomas and state certificates. During these early years, the primary concern of the board was teacher certification, and it is entirely possible that this problem, earlier the focus of numerous recommendations by territorial superintendents, was a strong factor in the creation of the board itself. Certainly it had been a major reason for the chartering of the University of Deseret, and territorial superintendents had complained for years about the confusion in the existing system of teacher examinations and certificates under the 1852 law, which allowed county boards of examiners, consisting of three men appointed by the county court, to issue certificates. With no legal standards, a wide variety of practices had developed. Although the 1890 Legislature gave the territorial commissioner authority to issue certificates valid in any county, it also gave cities the right to certify their own teachers, and the appointed county boards of examiners also continued to grant certification.

DEVELOPING THE OFFICE OF THE STATE SUPERINTENDENT OF PUBLIC INSTRUCTION

The administrative arm of the state board is the Office of the State Superintendent of Public Instruction, consisting of all the employees who assist the board in providing general control and supervision of the public school system. Through the years, the office has been referred to in official documents, superintendents' biennial reports, and the statutes by many names, such as "state school office staff," "office of the state superintendent," and "state department of education." Currently, it is referred to as the Office of the State Superintendent of Public Instruction, or simply the office.

The development of its structure and organization was inevitably aligned to the changing structure and organization of the state board, since the state superintendent was both chairman of the board and head of the office from the beginning of statehood until 1951. Before 1896, the territorial superintendent had served either under the board of regents of the University of Deseret or with no board at all, the latter case holding true a major portion of the time. The composition of the board remained fairly constant from 1896 to 1915, when the number of members increased from five to nine, the Governor appointing six instead of two, which increased lay participation in forming policy for the state school system. Appendix B, Supplement I, summarizes the evolution of both the superintendent and the state board, pointing up some of the changes whereby one affected the other.

Despite the increased lay support, the board was much criticized. For one thing, the Governor traditionally appointed two educators to the board along with the three ex officio educators; thus, five of the nine members were engaged in educational work. In 1926, a survey group recommended that the Governor appoint all nine members, who would then select the superintendent and set his salary without specific legal restrictions. No legislation resulted, but the agitation continued. Seven years later, another commission conducted another study and ended with similar recommendations.

In his 1934 biennial report, Superintendent Charles H. Skidmore strongly recommended that the state pass a constitutional amendment eliminating the state superintendent from the ballot and providing for the board to be appointed by the Governor or elected by the people. The House had passed such a bill in the previous session with little opposition, but it failed by one vote to get the necessary two-thirds majority in the Senate. With the platforms of both major political parties favoring such legislation, it seemed certain that it would be passed by the 1935 Legislature. A law did pass which adjusted the method of selecting the board, a method followed for the next 16 years, but did not change its relationship to the superintendent. Why the Legislature did not act favorably on the superintendent's recommendation is something of a mystery. Skidmore failed to give the reasons in his next report, but it could be that local school district personnel and board members effectively lobbied for the law that passed.

The issue did not die. The Legislature authorized the Governor to appoint a fact-finding commission to study the school system and state educational institutions in 1939; the commission's report the following year again advised
that the state board select the state superintendent. Ten years later, the National Education Association conducted another survey at the request of the state board and came to the same conclusion.

From 1928 to 1949, nearly every superintendent's biennial report, supported by every survey but two since 1926, recommended that the board be made an elective body with the authority to appoint the state superintendent. Despite the efforts of strong spokesmen like Superintendent Skidmore and his predecessor, Superintendent C. N. Jensen, it was E. Allen Bateman, a tall, strong-willed man, who provided the leadership needed to finally achieve success. In stating his case, Dr. Bateman made the following claims:

No state which has its chief state school officer appointed by the State Board of Education has ever changed this method of appointment.

To permit the people of the state to control the state public school system, they should elect the members of the State Board of Education. To permit the State Board to be responsible for the proper execution of policies and procedures which it adopts, the Board should appoint its chief administrative officer. The members of the State Board of Education should be elected by the people, probably by judicial district areas, as at present, and by a non-partisan method of election. The present conventions of school board members should be used as nominating conventions, with the right of supplemental nomination by petition, and election should be held in December at the time of the regular district school board election (16).

As recommended by Dr. Bateman, the necessary constitutional amendments were submitted to the people in the 1950 general election, and they passed. The constitution now reads:

The general control and supervision of the public school system shall be vested in a State Board of Education, the members of which shall be elected as provided by law. The board shall appoint the State Superintendent of Public Instruction, who shall be executive officer of the board (17).

When the 1951 Legislature failed in its regular session to enact the legislation demanded by the amendments, a special session called that June passed a law providing for a nine-member elected board which would appoint the state superintendent—the climax of a 25-year effort.

Changes in Size and Structure of the Office, 1896-1950

Figure 1 shows that from statehood until the outbreak of World War II, the office changed very little in size. In fact,

![Diagram](image-url)
the professional staff consisted of only the state superintendent and his deputy until 1910, increasing to only 11 professional people during the next 30 years. These positions were established by statute until 1921, when the state board was given authority to appoint its own staff. Most of the expansion from 1910 to 1940 resulted from federal support of state vocational educational programs and the addition of full-time directors for secondary schools, elementary schools, health and physical education, teacher certification, and research and statistics. Four of the nine professional positions added during this period were in the area of vocational education, supported in part by federal funds.

The number of professionals nearly tripled from 1940 to 1950, expanding to 31. The secretarial staff increased even more, jumping from 8 to 37. This growth was due primarily to the office's becoming involved in federally aided programs in national defense, veterans' training, vocational rehabilitation, and the school lunch program. By 1950, 71 percent of the office's 68 employees were working in federally supported activities (18).

Examples of patterns of organization followed by the office prior to 1950 are found in Appendix B.

**Growth from 1950 to 1965**

The office has had its greatest expansion since 1960. It had earlier increased in staff from 68 to 97 (43 percent) between 1950 and 1960. Staff size has more than doubled since then, and it now stands at over 200. The office not only initiated new programs but expanded and diversified its responsibilities in almost every area. From 1951 to 1966, elementary, secondary, and vocational education, special educational services, research and planning, and finance and publications received considerable boosts, attributable in large measure to the National Defense Education Act of 1958, which especially influenced elementary and secondary curriculum staffing. Table 1 shows systematic staff growth in research and planning, finance and publications, vocational education, and special educational services. A rather startling expansion of the vocational rehabilitation staff during these years was due to the integration of services for the visually handicapped with the general rehabilitation program in 1964.

The rapid increase in the office's personnel in the areas of elementary and secondary education, instructional media, research and planning, finance and publications, and vocational rehabilitation has caused concern among legislators, others holding political office, and local school district personnel. The latter in particular are apprehensive about the possibility of additional state control as well as an increase in federal control.

To cope with its expanding responsibilities, the office has had to make organizational adjustments as shown in Appendix B. A second deputy superintendent was appointed in 1962 in a realignment of responsibilities under the deputies; prior to this, directors and heads of institutions reported directly to the state superintendent. The 1964 chart reflects Superintendent T. H. Bell's efforts to redeploy his staff and consolidate smaller, closely related units into larger divisions. Those services having to do primarily with instruction carried out in local districts for grades K-12 and on the adult level were to be administered through divisions grouped under a deputy superintendent for instruction. A deputy for administration was given jurisdiction over services not primarily instructional and those having to do with post-high school or special institutions. The 1966 chart shows the addition of a third deputy superintendent with responsibility for post-high school institutions formerly assigned to the deputy for administration. An administrative assistant also has been added.

PROGRAMS AND SERVICES

The Office of Public Instruction conducts the services and programs for which the state board is responsible and which are essential to the general control and supervision of the public school system. As in other state education agencies, it helps the board perform two roles: (a) as a regulatory agency for the public elementary and secondary schools, and (b) as a governing agency for several special programs operated on a statewide basis.

The office assumed responsibility early in its history for establishing a teacher certification program, developing a uniform statewide system of administration and supervision by consolidating school districts under county boards, providing direction for the high school movement, interpreting laws, disbursing school funds, and giving leadership to the instructional program. Services required in the early years of statehood were relatively simple in nature. Today, in our rapidly changing society, both education and the services required of the office are increasing in number and complexity.

The Impact of Federal Assistance Programs

In recent years and particularly since 1958, federal aid programs affecting education have proliferated, forcing changes in both the nature and scope of the office's services. Relatively large sums are now available to the office under the National Defense Education Act of 1958, the Manpower Development and Training Act of 1961, the Vocational Education Act of 1963, the Economic Opportunity Act of 1964, and the Elementary and Secondary Education Act of 1965. This has placed the office in a strong leadership-regulatory role by involving it in program planning and in processing, approving, and distributing federal money to local school districts.

In 1965, under Title I of ESEA, the state approved district projects and distributed over $2.8 million and rendered consultant services for programs designed to help the educationally disadvantaged child. Programs for instructional media resources, vocational education, manpower development and training, statistics, equipment and materials for subject areas termed critical for national defense, and guidance and counseling have demanded new or expanded administrative and consultant services, placing the office's personnel in an evaluative role and increasing their contacts and communications with the local school districts.

Although most federal programs have changed and strengthened the role of the office, there are two exceptions: ESEA Title III and the Manpower Development and Training Act. Title III, which supports the establishment of innovative demonstration centers, is administered by the U.S. Office of Education directly with local districts. Project approval rests with the Office of Education and not with the state superintendent, although the state's recommendations are solicited. Funds under the Manpower Act are channeled through the U.S. Department of Labor. Although the need, type, and location of programs are worked out in cooperation with the state superintendent, they are ultimately determined by the U.S. Employment Service.

On the other hand, some federal programs have increased the office's capabilities with 100 percent grants for administering the acts or specifically for strengthening selected service areas. All federal programs administered by the office provide funds for state administration and supervision or for program strengthening. Two that are specifically geared to fortify the office's management and leadership roles are Title X of NDEA and Title V of ESEA. Title X permits the office to strengthen its data-processing management, programing, management operation, key-punch, pupil, staff, and property accounting functions. Title V has enabled the office to employ an administrative assistant to the state superintendent; a chief accountant; an administrator for the instructional media division; specialists in audiovisual materials, education of the physically and mentally handicapped, and art and music instruction; a specialist in teacher certification and training; a specialist in school accreditation; and a publications editor and typist for curriculum development. It also financed an outside management study and provided $40,000 for special curriculum development projects in 1966.

The impact of these federal aid programs on the office's service capabilities are illustrated by Table 2. As of

</table>
April 1966, 106 (79 percent) of the 134 professional positions were subsidized in full or in part by federal funds; only 27 positions (20 percent) were supported entirely by state funds. Anticipated federal and private expenditures for the 1966 fiscal year accounted for more than 53 percent of the office’s total, compared to approximately 31 percent in 1950.

Actions Stimulating the Office’s Educational Leadership

The Legislature has recently moved to help the office develop its leadership capabilities and supervisory services. For example, it has earmarked over $100,000 in mineral-leasing funds annually for research projects approved by the office. It has increased state aid to school districts, particularly for vocational education, special education, libraries, and extended-year and summer programs, and has placed additional responsibilities on the office for setting standards, approving and distributing grants, and providing consultant services.

State superintendents themselves, recognizing the increasing demands on public education, have taken steps to improve and extend staff leadership in service capabilities. They have made concerted efforts to recruit outstanding persons with advanced degrees and wide experience. The state board has released time to professional personnel for advanced training. The office has developed new and meaningful relationships with such organizations as the Society of Superintendents, the Utah School Boards Association, and the Coordinating Council of Higher Education. And it has assigned supervisory responsibilities to local school districts for certain facets of the new bivulevel teacher certification program. A recent survey by a management consultant firm found that 29 of 38 responding districts rated the office’s staff either “above” or “well above” average. No district ranked the staff below average.

Post-High School and Special Institutions

The state constitution charges the state board with controlling and supervising the public school system, which is defined as kindergartens, common schools, high schools, institutions for the deaf and blind, an agricultural college, a university, and such other schools as the Legislature may establish. In practice, however, the state board has never attempted to exercise control over the universities, the Utah State Industrial School, or the Utah Training School, although it did serve as the governing board for the public junior colleges for many years.

Utah has no locally controlled, public, post-high school educational institutions. The College of Eastern Utah (formerly Carbon Junior College) is a branch of the University of Utah; Snow Junior College is a branch of Utah State University; and the three other 2-year post-high school institutions—Dixie Junior College, Utah Trade Technical Institute at Provo, and Salt Lake Trade Technical Institute—are controlled by the State Board of Education. The Coordinating Council of Higher Education coordinates these five along with all other public higher education institutions. Snow College was a state school from 1932 until 1951. On the other hand, the Salt Lake Trade Technical Institute and Utah Trade Technical Institute at Provo have been operated by the state board since their establishment.

During the early 1960’s, the control of these institutions received considerable attention. The Coordinating Council of Higher Education sponsored legislation introduced in 1965 to create a junior college commission to govern them, but it was fought strenuously by the state board, its staff, and the institutions under its control. The bill passed the Senate but failed in the House.

A School for the Deaf was established in connection with the University of Utah in 1884. Along with the School for the Blind, established on the campus in Ogden 12 years later when Utah became a state, it is under the direction of the state board. The 1896 law stated that these schools were to develop self-respecting, self-supporting individuals who, in spite of their handicaps, could sustain themselves in competition with so-called normal members of society.

Traditionally, the presidents of the post-high school institutions under the state board’s control and the superintendent of the schools for the deaf and blind have brought their agendas to the state board for approval monthly. Prior to 1961, each reported directly to the state superintendent to work out his agenda. From 1961 to 1965, they reported to the deputy superintendent for administration, and since 1966, to the new deputy superintendent for institutions.

Adult Education

In 1934, in the nadir of the Depression, the Legislature authorized every district board of education to raise and appropriate funds to establish classes in general adult education and appropriated $20,000 to the state board to assist them. This state support was reduced to $15,000 for the 1937-39 biennium, and to only $10,000 per biennium in the years after World War II, distributed on a basis of $51.50 to each class, approved by the state superintendent. This state support to the school districts continued to diminish until it ceased altogether.

The state board had appointed a supervisor of family life for adults in 1945, but it was the 1958-59 school year before the first full-time director of general education, supported by a grant from the National Association of Public School Adult Educators, was appointed to the office. When the grant expired and the director accepted a position at the University of Utah, a part-time director replaced him. In 1965, another full-time specialist was appointed, half of his salary coming from Title II-B of the Economic Opportunity Act of 1964 for adult basic education programs.
By the 1965-66 school year, 32,067 persons were enrolled in 1,565 classes, with 12,061 completing requirements for graduation from adult high schools in 503 classes. An additional 1,240 were enrolled in the adult basic education programs funded by Title II-B. Most of the funds for adult education were coming from fees paid by the enrollees, which, of course, kept many who needed the program from signing up. The school districts supplied some funds, and about $29,000 was appropriated by the Legislature to support general adult education for the 1965-67 biennium.

Communication and Public Relations

Too often the public has not been aware of the importance and the activities of the state superintendent’s office, despite its publications and its efforts to build public relations. Eighteen newsletters are mailed to members of the education profession today, prepared somewhat sporadically by various divisions. Most of these started in the late 1950’s or early 1960’s, but the “News Letter of the Division of Health, Physical Education and Recreation” began as early as 1929. Of special interest are the office’s official policy statements titled “Items to Superintendents,” which are mailed to all district superintendents only “when something happens.” They usually contain administrative procedures, statistical information from the finance division, or information about programs administered by other divisions. The content is approved by the administrative staff.

To inform employees about meetings, administrative policy and practices, and other personnel items, the office has published an interior newsletter called “The Education Courier” since 1962. In September 1966, it became a weekly publication.

In the near future, regular monthly news bulletins, containing information of more general interest to educators than the smaller, more specialized newsletters, will be prepared by the modern, well-equipped publication section, possibly replacing a number of the smaller ones. A full-time staff member is now in charge of public relations and dissemination of information, and it may be that the office eventually will distribute a weekly column to newspapers across the state. The office also will use radio, television, and regular announcements to help explain its functions to the public.

Curriculum and Instruction

One of the office’s central concerns is the quality of instruction in the schools—the learnings planned for students, the broad objectives to which these should lead, and the performance of teachers. This concern has manifested itself in such activities as suggesting educational objectives to the schools; developing courses of study; evaluating textbooks; recommending, and in some cases approving, expenditures for materials and equipment; encouraging or actually setting forth guidelines for organization, accreditation, and quality of education; promoting new curriculum programs; encouraging and directing the development of library and media services, and approving expenditures of special state and federal funds in this area; and providing supervisory and consultative services to assist program improvement, in-service development, and innovation.

Objectives. The office has always been concerned with establishing objectives of education, but in a rather informal way prior to 1953, when the Legislature mandated that the state course of study committee define the aims, purposes, philosophy, and objectives of the public elementary and secondary schools. With the office’s leadership, educators and laymen throughout the state worked out a statement which was finally approved by the state course of study committee in 1956 (19). It has served as a guidepost for curriculum development in Utah since that time.

Course of Study. Prior to statehood, textbooks and the teacher’s personal judgment largely determined the content of subjects taught in the schools. But in 1894, a detailed course of study—characteristic of this period, when formalism and standardization held sway across the nation—was published for the common schools, grades 1 through 9. The purposes were to (a) help develop and systematize the schoolwork, (b) serve as an outline specifying the textbook pages to be covered per period of time, and (c) stimulate improvement by suggesting desirable teaching methods and philosophies.

Following the recommendation of the state superintendent, the 1907 Legislature ended the old method of voluntary course of study development by providing for a state course of study committee. Under the leadership of State Superintendent A. C. Nelson, the committee developed a course of study for each subject the following year, obviously influenced by the concepts of John Dewey, G. Stanley Hall, and others. State Superintendent E. G. Gowens initiated a greater effort to relate curriculum to live situations and to develop courses of study that would see curriculum making and teaching as one extended process. In 1916, he helped devise a uniform minimum curriculum, providing the opportunity, at the district and school levels, for adaptation to local needs, using the 6-6 plan of organization as a basis.

For the next 30 years, courses were infrequently reviewed, but in 1946, the office provided for continuous review. Curriculum committees were organized in each elementary and secondary subject field to help the office and the state course of study committee. The composition of these curriculum committees was altered in 1959 to ensure a more orderly procedure for adopting courses of study.
Currently, specialists in the office work with curriculum committees continuously involved in developing courses of study. Teachers, administrators, supervisors, and college faculty cooperate with the office staff to produce curriculum guides for each subject area. Financing these committees has proven difficult; until recent federal legislation brought financial relief, committee members had to be subsidized by their local districts.

Textbook Adoption. Although the territorial superintendents had led many efforts to bring about uniformity in textbooks almost from the time of the first settlements, the constitution gave neither the Legislature nor the state board the power to prescribe them for the schools. Until the State Textbook Commission was formed in 1909, the state superintendent called conventions of district superintendents to adopt textbooks.

In the early years of statehood, there was little correlation between course of study development and textbook adoption. As time passed, the relationship changed, at least in theory, from textbook domination of the course of study to a situation in which the textbook was adopted as a tool in teaching a course. Actually, adoption developed as a highly centralized program, because until 1935 only one book was adopted for each course. A trend toward multiple adoptions began in that year. Provisions were made in 1941 to combine the membership of the course of study committee and the textbook commission, thus facilitating correlation between courses of study and textbooks.

Even more flexibility has developed during the past two decades. In recent years, the same committee that develops curriculum guides has evaluated the textbooks, and its recommendations are acted on by the State Course of Study Committee-Textbook Commission. New textbooks are evaluated and considered for adoption each year, with the official adoption list distributed annually to those who need it. Adoption is for four years.

Standards, Accreditation, and Quality. The first standards for high schools, established in 1911, were largely quantitative—such as requiring a 9-month school term. Periodic revisions were frequently the result of new programs for financial support. In 1926, when the office was making a vigorous effort to secure accreditation from the Northwest Association of Secondary and Higher Schools, a new state accreditation program was developed for upgrading high schools. Gradually the association replaced the state, accrediting 84 of the 93 public and private high schools in 1966.

After the city of Ogden inaugurated the first junior high program in 1910, curriculum and instruction naturally oriented around its pattern as the junior high school movement spread rapidly. A statement of evaluative criteria gradually developed and, when published in 1960, drew considerable attention across the nation. When the state board approved a voluntary program of state accreditation for junior high schools 3 years later, these criteria were used as a part of the process. By the end of the 1965-66 school year, 17 junior high schools were accredited.

From the first decade of the century, occasional efforts were made to establish standards for elementary schools. When the board devised a voluntary program for accrediting junior high schools, it also approved one for the elementary schools. But because no adequately developed criteria and procedures had been devised, actual accreditation was delayed until after the close of 1965.

The office has attempted to improve the quality of instruction throughout the state in a number of ways. Periodically, it has secured the board's approval to upgrade high school graduation requirements and programs of study, the most recent major revisions occurring in 1957 and 1958 (see Appendix C). It also carried out a school merit-rating program from 1953 until the 1961 Legislature declined to appropriate further money for the program. Utah has never had a prescribed statewide standardized testing program, but the office does list recommended tests and requires that only approved tests be used if the users claim reimbursement under Title V of NDEA. All districts conduct their own testing programs with consultant help from the office.

In keeping with its long-held interest in quality education, the office has given leadership to curriculum enrichment and expansion. For instance, during World War I, when the nation found itself industrially unprepared and many of its young men physically unfit for military service, it gave special attention to vocational education and health education. Agriculture, home economics, trade and industrial education, distributive education, and health and physical education all were added to the curriculum.

The rapid technological changes and the social, economic, and political stresses of the period since World War II have demanded more and better education for an enlarged population. This has challenged the office to further enrich and expand the curriculum, resulting in further additions such as driver education and programs for the disadvantaged. Title III of NDEA, ESEA, and the Vocational Education Act of 1963 have been a major influence in stimulating richer offerings in vocational subjects, science, mathematics, foreign languages, social studies, English, and reading. Another new curricular emphasis that has influenced most of the subject areas was that of a state-sponsored effort to strengthen America through education.

Instructional Media Services. As early as 1911, the Legislature delegated the responsibility for promoting new and better libraries to the state board. Howard R. Driggs, the first man assigned to the task, visited libraries, called conventions of librarians, and arranged for librarianship courses at the University of Utah. Through the years, the office exerted efforts to bring about greater cooperation between
public and school libraries; improve library management; hold annual conventions for librarians; and recommend standards, methods, and booklists. The County Library Law enacted in 1917, encouraged and supported by the state superintendent and his staff, improved the state’s library picture considerably. Following directly on county consolidation, this county library system was very effective in establishing libraries, in promoting after-school education, and in supplementing the activities of the schools in general. For many years, the office carried out these library activities in a commendable way, although little staff time seems to have been provided for them between 1946 and 1964.

Following the enactment of a federal library law in 1957, the Legislature established a State Library Commission to oversee the public libraries and to cooperate with the schools and other agencies in carrying out its work. Although the library commission had professional librarians on its staff, it was not until 1965 that the state superintendent’s office could budget for a professional librarian to give leadership to school library work. The Legislature provided special funds for the libraries in the districts, and Title II of ESEA allotted money for library resources; both of these acts, coming at a time when school library resources were at a low ebb, were welcomed with open arms despite federal red tape.

The office became interested in educational television when the Federal Communications Commission allocated Channel 7 to Utah for this purpose in 1951. Superintendent Bateman, anxious to take advantage of this action, persuaded the Legislature to enact a bill in 1953 establishing a Utah Educational Television Foundation, only to have Governor J. Bracken Lee veto it after the Legislature had adjourned. The very next year, an interested group formed a nonprofit corporation, also named the Utah Educational Television Foundation, which established a broadcasting station for Channel 7 in cooperation with the University of Utah on its campus and commenced operating on a limited basis in 1957. When the office received an appropriation for ETV the following year, it appointed a specialist to provide statewide leadership. More assistance was ensured when the Joint Committee on Educational Television, consisting of state board members and the Coordinating Council of Higher Education, was organized in 1961.

With money from ESEA, the office established for the first time an educational media division, bringing under one head library services, audiovisual services, ETV, and related services. In addition to supplying leadership, this division approved district applications for special state and federal funds and for library services and materials.

Kindergarten and Preschool Education. Although the constitution included kindergarten as a part of the public schools, Dr. Park, the first state superintendent, took a strangely negative view toward making kindergarten an integral part of the system. His successor, Emma J. McVicker, the only woman state superintendent in Utah’s history, took the opposite view. Following her urgings, several laws were passed in 1902 promoting kindergarten for children from 4 to 6 years old. By the 1910-11 school year, over 11,000 children were enrolled. To further this progress, the State Federation of Women’s Clubs strongly urged the state board to send another message encouraging all districts with the required 2,000 population to establish kindergartens. Today, all districts have kindergartens, most of them operating the full year. Since 1921, the office has provided for the kindergarten program, working closely with local districts, and since 1964 has cooperated with local representatives of the Office of Economic Opportunity in encouraging Head Start programs for preschool children.

Summer and Extended-Year Programs. Prior to 1964, most of the public school programs were limited to 9 months, the exceptions being summer kindergartens and summer programs for vocational agriculture and homemaking. Through the combined efforts of local districts and the office in 1965, the Legislature was persuaded to provide $800,000 for conducting minimum programs, including basic and enriched courses, curriculum development, and in-service activities for teachers. The state board was responsible for the standards for these programs. The results after the first year were good, and there was every indication that the program would continue, since practically every district participated.

Educational Opportunity for Exceptional Children. The Legislature initiated its first special education programs for handicapped children in 1953 by authorizing state financial assistance for districts operating classes for such children. The state board then approved both general and special standards for children who were mentally retarded, those needing speech and hearing correction, those needing remedial help, those who were deaf or hard of hearing, those who were blind or partially seeing, and those who were hospitalized or homebound. By the 1965-66 school year, 652 special classes were serving 17,546 children.

The state superintendent received permission from the board in 1957 to establish a committee that would advise the districts on how to educate gifted children. Following a tentative report 3 years later, the committee turned in a final report in 1962 which evoked such diverse reactions that the board could not agree to approve it. Some members were concerned that intellectual snobishness would be encouraged. Finally, the board did approve an advanced placement program for faster students, worked out in cooperation with higher education institutions and assisted by a Ford Foundation grant. The program has developed rapidly.
Legal Services

In 1890, the Legislature passed an act with the following provisions:

The state superintendent shall advise with superintendents and with school boards and other school officers upon all matters involving the welfare of the schools. He shall, when requested by superintendents or school officers, give them written answers to all questions concerning the school law. His decisions shall be held to be correct and final until set aside by a court of competent jurisdiction or by subsequent legislation (20).

This statute is generally regarded by students of school law to be well designed, since it is unsound to require the courts “to answer a purely educational question as distinguished from a purely legal one...” (21). It has not been challenged but has been discussed by lawyers, judges, and school people. In a court case decided by the Utah Supreme Court, the justice who wrote the opinion in which the majority concurred referred to it as “an unusual statute, where one not an attorney may act in that capacity...” (22). He did not challenge the law, but advised the defendant to seek the legal counsel of the state superintendent.

State Superintendent C. N. Jensen wrote to the attorney general in 1924 asking for an opinion on a question raised by a member of a local district board of education and passed along the board member’s letter. The attorney general, considering this a request from an individual and not an official request from the board of education, advised Jensen as follows:

It is the policy of this office not to advise individuals relative to matters of this kind and I believe you will be safe in following the same policy. You, by law, are the legal advisor of school boards and in this instance the school board has not asked you for advice or an opinion. You should hold yourself in a position to advise the board, should they so desire, and not attempt to advise individuals on questions involving the powers and duties of the board. By following this policy I find it avoids friction and is the safer policy to pursue, under the conditions (23).

Attorney General Joseph Chez issued an opinion to Superintendent Charles H. Skidmore in March 1933 on the state superintendent’s rendering opinions to public school officers, concluding that since a local board of education “is not a legal part of or subdivision of the county, but rather an independent corporation, [that] the county attorney is not the official legal advisor to the local board of education” (24). He further distinguished between the legal advice given by the attorney general to state officers and the answers furnished local school superintendents by the state superintendent, concluding that—

This section of the Constitution [the section which deals with the Attorney General] provides, and the law also further provides that the Attorney General is adviser for the Superintendent of Public Instruction, thus the several Boards of Education seek legal advice from the Attorney General’s office through the State Superintendent of Public Instruction.

It is my opinion that the several Boards of Education can seek the legal services they wish, so long as the services pertain to school matters, from the Attorney General’s Office, through the Department of Public Instruction (25).

Over the years, the state superintendent has been called on many times to render opinions concerning the schools. Believing that these opinions carry the weight of law “until set aside by a court of competent jurisdiction or by subsequent legislation” (26), he has not been reluctant to interpret these legal questions. In fact, with increasing enrollments and a proliferation of new responsibilities over pupils and public welfare, he issues a written opinion to some district almost weekly. “Off-the-cuff” legal advice is given daily over the telephone and through personal consultations. The subjects are as diverse as the problems confronting the local administrators, so the superintendent is required to have a knowledge of the state’s laws as well as court cases decided daily across the nation. Since he does not maintain a legal staff, he must rely on the attorney general’s office staff for advice. With the help of these competent attorneys and his own staff’s understanding of educational administrative problems, the state superintendent will continue to answer legal questions concerning the operation of the public schools.

Organization of Effective Local District and Attendance Units

From the time Utah became a state, Dr. Parks and other state superintendents worked to establish a county-unit plan. School and civic leaders repeatedly pointed to the shortage of high schools and protested to both state officials and legislators the lack of graded, effective elementary school programs which could not be corrected without a legally ordered consolidation of districts. Permissive consolidation was granted in 1905, and 10 years later consolidation became mandatory for all counties.

The high school movement demonstrated that lack of consolidation was a barrier to establishing and improving high schools. The High School Law of 1911 established a state high school fund and required the state board to set the standards and the length of school year that high schools would have to achieve before obtaining payments. It adopted a 36-week minimum school year and set the standards for the number of years of high school to be offered, the employment of certified teachers, the course of study to be followed, and graduation requirements. Professor Mosiah Hall, the state’s first high school inspector,
served with distinction, visiting the schools and reporting on their condition, and making a significant contribution to their growth and improvement. The swift increase in enrollments following enactment of the 1911 law, as noted in Table 3, somewhat parallels the national picture, where the number of high school students nearly doubled every decade from 1890 to 1930. Between 1900 and 1920, however, the rate of increase in Utah far outstripped that for the nation. Just as interesting is the rapid shift in comparative enrollment percentages among public high schools, Latter-Day Saint secondary schools, and other denominational secondary schools between 1890 and 1925, as shown in Figure 2.

Actually, consolidation in Utah preceded the national consolidation movement, the state essentially having what is called a county-unit pattern of organization since 1915. There are currently 40 school districts and 29 counties. Cities of the first and second class (a total of five) are school districts in themselves by constitutional authority and cannot by legislative action be consolidated with any segment of the county in which they exist.

*From several biennial reports of the state superintendent of public instruction, 1900-1930.

State superintendents, students of school administration, and legislative councils have suggested during the past few decades that Utah might further reduce the number of

Figure 2. — GROWTH OF PUBLIC HIGH SCHOOL ENROLLMENT, 1890-1925

Source:

local districts. For instance, one county contains three very small districts, one of which is a city district and the other two comprehending the remainder of the county. A bill to form one district from the three failed in the 1965 session because these districts vigorously opposed it. Indications are that further legislative action will be sought in the next session, the Utah Legislative Council studying the problem during the interim. Anticipating such legislation, the three district boards requested early in 1966 that the office make a survey to determine the best plan for implementing the impending consolidation, and it is currently under way.

In addition to developing the county-unit plan and influencing interdistrict consolidation, the office also sought to encourage in-district reorganization of schools wherever it seemed possible to improve educational programs at equal or lower per-pupil costs. Because the state is sparsely populated, with districts covering large areas, and because consolidated districts were established early, many believe that the potential for improving by consolidation is greater through in-district reorganization than through interdistrict reorganization. So many schools have small enrollments. Of 169 secondary schools operating in 1965, 25 had fewer than 50 students graduating; of 406 elementary schools, 111 had fewer than 7 teachers.

For many years, the finance program has given the state board the authority to grant additional distribution units (approximately $8,590 per 27 students in average daily attendance during the 1965-66 school year) for schools that must necessarily be small. But as social, economic, and transportation conditions change, so must the criteria for determining which schools should continue operations. In recent years, to promote in-district reorganization, the office has withheld special school status from some schools that had previously been granted additional distribution units. Walter D. Talbot, the deputy superintendent for administration, proposed a new set of criteria in 1966 for determining which schools should receive special status and special distribution units (27). Currently, it is being studied by various educational groups and the state board.

Through participation in such programs as Title III of ESEA and growing recognition by small local districts that they cannot on their own adequately provide such services as special education and supervision, local officials in consultation with the state superintendent are exploring ways of providing additional services on a regional or interdistrict basis. Legislation was to be sought in 1967 to assist with this.

Public School Finance

Utah has run the gamut of known methods of financing public schools. In the beginning, teaching was exchanged for produce; later, schools received only private financing; finally, they were supported by public funds. The Legislative Assembly levied taxes to support the public schools shortly after the beginning of education in Utah, but it was not until 1874 that it “passed an act that initiated a trend that has prevailed from that time to the present in attempting to make education free” (28). Prior to 1874—and for some years to follow—taxes were permissive rather than mandatory. This, coupled with the facts that districts were fiscally dependent on several agencies and that the federal government refused to appropriate money for territorial schools, made the financial problems more difficult.

Development of Finance Programs for Maintenance and Operation. Each biennial legislative session from 1874 to 1880 amended and enlarged the revenue law. The drive to secure an adequate financial base for the public schools was climaxcd by passage of an act in 1890 designed to make public schools free to all people. Instead of raising school revenue only by district taxes, territorial taxes, school taxes, tuition fees, donations, and rent, this new law—and subsequent legislation—granted the trustees much greater latitude.

The Free School Act was amended in 1903 to require boards of education to furnish, free of charge, textbooks and supplies to all but high school students. Also, now that Utah was no longer a territory, other states’ experiences in finance were brought to bear to induce the state to establish state revenues for local districts that complied with certain minimum standards. A law was passed 2 years later permitting local districts to apply for state money to employ teachers at a minimum salary of $300 if local taxes were insufficient to meet the standard. In other words, this standard established the salary of teachers as the criterion by which state money could be obtained. This remained a working principle for a number of years, although the teachers’ salaries increased to $450 in 1909, to $525 in 1915, and to $600 in 1917. The time a school district would employ a teacher increased from 28 to 32 weeks in 1917, thus increasing educational opportunities for students.

Although the elementary schools generally could be run without charging tuition, the high schools up to 1909 were suffering from a lack of funds. The Legislature proposed a constitutional amendment to increase maximum taxation for a high school fund. The voters approved it, the 1911 Legislature implemented it, and the money was apportioned to the districts. The Legislature increased the levy 3 years later, at the same time voting to give local boards the authority to levy a local tax for initiating and maintaining high schools.

Yielding to pressure from many people and organizations, the Legislature ordered consolidation in all counties which had not already organized county high school districts. The law made it mandatory that all county school districts consolidate, with a few exceptions.

The consolidation undoubtedly helped the financial picture considerably, but there were still wide differences in
per-capita wealth among districts, causing many people to demand greater state support for education through an equalization program. These efforts culminated in 1919, when the voters ratified a constitutional amendment resulting in greater school revenue. The Legislature acted 2 years later to establish the “$25 School Fund” under which the state paid the districts $25 for each school-age person as determined by the school census. Not only did this fail to meet the “equalization” goal (although it brought in more money for operation), but it widened the disparity between rich and poor districts. A survey commission pointed out these gross inequities in 1926, and, after constant urging by state and Utah Education Association officials, the 1929 Legislature finally proposed a constitutional amendment calling for “an equalization fund which, when added to other revenues provided for this purpose by the legislature, shall be $5.00 for each person of school age as shown by the last preceding school census” (29). This plan to place more state money at the disposal of the districts was completed in 1931—not without additional state control, however. One educational historian wrote:

The legislature passed an “act creating and defining a uniform program of public school education in the State of Utah, creating a state equalization fund and providing for the apportionment of any revenue made available for an equalization fund.” The act provided new minimum educational requirements and gave the state board of education full power to administer the fund. The law provided that “Districts not approved by the State board of education . . . shall not participate in the equalization fund” (30).

The new law instituted several important concepts in educational finance. It was weighted in favor of high school students, recognizing that their education cost more; it gave consideration to the increased cost of transporting children; it made allowance for one- and two-room schools in districts requiring additional money to achieve equality; it considered the ability of districts to finance education; and it provided a “cost of living” increment by adjusting the amount per student each year until a maximum was reached in 1936-37. Along with the fiscal independence (except at the state level) won earlier, these provisions promised to adequately care for school needs for some time to come.

Unfortunately, the nation’s and state’s economic futures were still uncertain, the recovery from the Depression breaking sharply in 1937 to bring additional problems in school finance. Again in 1938, the Legislature proposed further amendments which would increase tax money available for a uniform school fund. As it was finally put into effect, the law established the principle of the distribution unit, defined the unit, and set aside $1,655 to be allocated to each unit from local taxes and the state. The principle of equalization was retained in the provision that “no school district having a per capita assessed valuation of $4,000 or more per census child shall receive more from the $5.00 equalization fund than such district received in 1936-37” (31).

For some strange reason, the Legislature amended the 1937 law 2 years later to provide for the distribution of funds on a per-student basis as practiced earlier. The amendments which apportioned the uniform school fund money provided for several new practices: (a) Expenses were authorized for the state board to investigate special and unequal conditions in the districts; (b) funds were provided, not to exceed $75,000, for the board to make payments to districts to equalize education and improve educational practices; and (c) funds were added to the revenues from the state district school fund, the high school fund, the equalization fund, and a local levy of 10 mills on the assessed valuation of tangible property in each district, to equal $86 per student in average daily attendance.

World War II and the inflation that followed created acute problems with teacher salaries. By 1943, it was necessary for the Legislature to act again. At first, it appeared that for the second time in history the lawmakers would tie the apportionment of state funds directly to teacher salaries. They appropriated $658,000 from the general fund to the uniform school fund, $175,000 to be used exclusively for teachers’ salaries, the remainder to be “apportioned and distributed on a per capita basis of the number of full-time employees during the school year, 1942-43, of the local boards of education . . . and . . . used solely and exclusively for the payment of salaries and wages of employees” (32). At the same time, the Legislature appropriated an additional $2,632,000 for the biennium beginning July 1943 to pay salaries of employees. The law also specified that after 1942-43, no district could receive this money unless it paid the following salaries:

(a) To certificated teachers who do not hold a degree, not less than $840.00 per annum.

To certificated teachers who hold a bachelor’s degree, not less than $960.00 per annum.

(b) There shall be an increase in salary of teachers in excess of the minimum salaries above mentioned to teachers who maintain their legal certification . . . $50.00 per year for the first six years of experience . . . and shall average an increase of not less than $45 per year for at least sixteen years of experience inclusive of the first six years.

(d) The board of education of each district shall prepare and adopt annually a schedule of the salaries of clerks, stenographers, custodians, janitors, bus drivers and other employees and file the same with the state board of education and no payments may be made in excess of said schedules (33).
The cost of education increased rapidly during the war. Again, in 1945, the Legislature found it necessary to raise the taxation limit for school districts to raise more money. Significantly, Utah returned to the distribution-unit formula containing the equalization feature of a guaranteed minimum program per unit for a minimum levy of 10 mills at the local level. The figure was increased, however, to $3,000 per unit. It retained the $5 equalization figure and the high school fund, appropriating $500,000 for transportation payments on the basis of the number of students transported 2.5 or more miles to school.

At a special legislative session called in 1946, it was proposed that the constitution be amended to restrict the state’s contribution to no more than 75 percent of the total cost of a minimum school program, with no more than 75 percent of the state’s portion to come from a state property tax levy. The following year, the law perpetuated the distribution-unit principle, setting its value at $3,300, setting the classroom unit at each 30 weighted pupils, the secondary students receiving weights of 1.5, and elementary, 1.0. It also increased the transportation appropriation to $675,000, retaining the principle of a flat grant.

The report of a survey committee established in 1951 to study school building conditions and the need for new buildings stirred considerable discussion during the 1953 legislative session, resulting in an act whereby the state supported construction more directly. But it required a special session to complete all of the business for the schools. The Legislature increased the value of the distribution unit to a maximum of $4,050, at the same time giving the districts an option of qualifying for a basic program on a sliding scale (based on the number of pupils levied by the district) from $3,450 to $4,050. It also provided for a supplemental state-supported program not to exceed 12 percent of the basic program. A new concept in financing transportation was enacted, based on $19 per pupil regularly enrolled in kindergarten through grade 6 and actually transported 1.5 miles each way between home and school, and 2 miles or more for grades 7 through 12. Unfortunately, the Legislature specified that “in no event [could] more than three-fourths of the total actual transportation cost” (34) be paid from state funds.

In each biennial session from 1953 to 1963 (excluding 1955), the Legislature amended the uniform school program. In 1957, it increased the distribution unit from $4,050 to $4,800 on a sliding scale for the basic program, plus a supplement not to exceed 12 percent of the basic. Two years later, the unit was again increased to $5,150, and the supplemental program to 15 percent of the basic. Finally, a dramatic increase was enacted in 1963 to a distribution-unit value of $6,850 for a local levy of 16 mills, the supplemental program increasing to $437 per distribution unit or an amount provided by local levy of 4 mills, whichever was greater. The leeway program, which had started at 25 percent of the basic program in 1957, was now 16 percent of the basic program. Transportation payments, $20 per student in 1957, were now based on $2 per mile annually for the average number of miles traveled per day by each student eligible for transportation (35).

Public school support continued to increase, so that by fiscal 1967, the value of the basic program distribution unit had reached $7,250, and the supplemental or “board leeway” program $140 per distribution unit per mill. The voted leeway program was changed drastically to allow a guaranteed program of $100 per distribution unit per mill for fiscal 1966, and $110 for fiscal 1967. The levy requirements at the local level remained at 16 mills for the basic program, increasing from a mandatory 4 to a permissive 11 mills in 1966 and 12 mills in 1967 for the board leeway program; the voted leeway program increased 10 mills as a local option on a vote by the people. In addition, transportation allocations were increased to $2.50 per average daily pupil mile, annually. Efforts to increase activity in library programs and summer and extended-year programs received a state appropriation of $700,000 in fiscal 1966 and $800,000 in fiscal 1967 (36).

The tradition of local districts’ being solely responsible for financing school construction ended in 1951. Superintendent Bateman had been instrumental in introducing a bill in 1949 which would have authorized state funds to help local districts erect needed buildings. The bill failed, but a similar one passed 2 years later providing state financial assistance from a $2 million appropriation to qualified districts, establishing another milestone in the state’s educational history. This aid, continuing since 1951, had an appropriation for the 1965-67 biennium of $6 million.

The principle of state aid for capital outlay was further strengthened by the enactment of the continuing school building program in 1959. This went beyond the concept of state emergency aid or aid on a supplemental basis for an indefinite period, establishing the equalization concept at the state level for school construction. While the appropriation was not sufficient to solve all problems and state supplemental aid continued to be necessary, it did provide long-range assistance which the office had long desired.

Pupil Personnel Services

Pupil personnel services had their beginning in both Utah and the nation in the vocational education movement that emerged during the first and second decades of the twentieth century. The Smith-Hughes Act of 1917 not only stimulated the growth of vocational education, but also recognized the need for helping young men and women with their vocational decisions, in turn giving rise to the guidance and counseling movement. Administrators from Salt Lake City, Jordan, Granite, and the Grand Districts recognized their responsibility in this new area and were

Leadership on the state level emerged from a whole complex of factors and influences, taking definite form when a supervisor of guidance was appointed by the office in 1943. Despite his contributions, the position was not filled for a long period after he left until NDEA initiated a new era for these services, with a new state director appointed to head an independent division. The money available through Title V of NDEA, though small in amount, stimulated guidance programs considerably, and the results can be easily observed. In 1964, the Division of Pupil Personnel Services became a section along with special education and adult education, within a consolidated Division of Special Educational Services.

Utah has promoted the concept of “pupil personnel services” in contrast to the more restricted term guidance services. Under this heading, the specific areas are identified as psychological services, psychometric services, guidance, school social work, school health programs, pupil accounting, and identification and diagnostic services for special education. This section attempts to provide leadership throughout the state in all of these areas through the supervisory and consultative services it brings to local district personnel. (See Table 4.)

Research

In the early history of the office, the research section was combined with the finance division, its main duties centering on collecting data from districts on costs, salaries, enrollments, days of school, transportation, and similar statistics. Financed by a uniform school fund allocation for research, its personnel assisted with surveys and other research when time and money permitted.

Research was given a bit more status when an assistant director was assigned primarily to research during the 1944-46 biennium. But from 1946 to 1950, despite the recognized need for research in many areas, research meant mainly gathering and interpreting statistical data in school finance. When Governor J. Bracken Lee vetoed a $20,000 appropriation to the research office, a bitter battle followed between the board and the Governor, which undoubtedly impaired relations for many years (37).

During the next few years, numerous grants from public and private agencies formed the basis for important research, particularly the Kellogg Foundation’s support for research in administration during the 1950-52 biennium. In keeping with its new status, the research division was separated from the finance division. Almost immediately, it reactivated the Utah Educational Research Council originally organized in 1946, which published its first bulletin (continued on a yearly basis since that time) in 1952—a listing of graduate studies completed in Utah institutions. The council also published research on pupil transportation and was of considerable help in developing a new formula for financing Utah schools. Revised into a nonprofit organization with the office’s director of research as its executive secretary and treasurer, the council solicited considerable funds from various industries and funding organizations. Thus, it was able to initiate a school building survey and several studies in curriculum and instruction.

Of particular significance was a series of studies sponsored in cooperation with the office and financed by the Kennecott Copper Company. The Utah Secondary School Principals Association also cooperated with the
office in sponsoring studies in the general area of new procedures in the utilization of staff in the secondary school, financed through private foundation grants. A full-time director of research was employed during the 1958-60 biennium, and the research division became a clearinghouse for all questionnaires and requests regarding information and statistical data. It also undertook two major projects: (a) the follow-up of Utah students attending out-of-state colleges or universities, and (b) an investigation of the relationship between teacher competency and teacher turnover.

The Legislature gave a considerable boost to educational research in 1961 by earmarking an annual percentage of revenue from the federal Mineral Leasing Act. This led to a vast expansion in research activities and to experiments in the utilization of staff and facilities in such areas as American values—the center of much attention and funds. With the aid of a Ford Foundation grant, the office was able to participate in the launching of the Western States Small Schools Project and appointed a director for the Utah portion. The research division also cooperated with the university's economic education centers and in the development of the Utah Council on Economic Education, which was to serve in an advisory capacity for research and studies in economics.

The percentage of money allocated from the Mineral Leasing Fund was increased in the 1962-64 biennium. A new Division of Research and Planning was established, with sections on small-school improvement, statistics, curriculum, research, and school plant planning. This work continues to be important in improving the quality of education in the state.

School Food Services

Even prior to the Depression years, a few schools had inaugurated some type of supplementary food program. But it was the Works Progress Administration that gave impetus to the school lunch movement in 1935 with a program whose purposes were (a) to feed needy and undernourished school children, (b) to create employment, and (c) to create a noncommercial outlet for agricultural surpluses. The "school lunch" proved to be such a success and received so much school and community support that, starting in 1943, Congress voted to continue it on a year-to-year basis. The program was finally revised and put on a long-term permanent basis in 1946, and it is under this law that the national program operates today.

The office of the superintendent has administered the school lunch program since 1943, acting as an agent for the federal government and cooperating with the federal workers who in the early stages of the program dealt directly with local school districts in all its phases. The Legislature set a tax of 4 percent (amended to 8 percent in 1965) on the retail price of wines and liquors and allocated $20,000 per year (increased to $45,000 in 1965) of the resulting revenue to the state board for administering and supervising the program and the remainder to the school districts according to the number of lunches served. Revenue from this liquor tax increased from $393,000 in 1943 to $1,273,000 for the 1965-66 fiscal year. Table 5 shows these details. In 1944, 282 school lunch units in 36 of the 40 school districts fed 31,800 students daily. At the beginning of the 1966-67 school year, 481 schools in 39 districts were serving approximately 125,000 students daily.

With passage of the 1946 National School Lunch Act, the federal government ceased maintaining a staff of workers to deal directly with local school districts in all phases of the program. The superintendent's office took over the administration, and the positions of cannning supervisors were abolished as garden growing and canning programs initiated by the Works Progress Administration were discontinued. The present staff consists of a program administrator, three specialists, three clerical personnel, and one supervisor of commodity distribution.

Perhaps supervision has had more effect on the nature and direction of the school lunch program than any other factor, serving as a means of communication among school districts. It is an instrument for maintaining high standards and aids the local units through personal contacts, letters, publications, workshops, conferences, demonstrations, and TV programs. Food workers, managers, and supervisors also are helped by spot-checks by the nutritional and administrative survey to determine as accurately as possible the status of local programs and the areas where the office can be of greatest assistance.

Through the years, since the school lunch program's humble beginnings in the early 1930's, a new set of objectives has evolved. The program is no longer geared only to helping the needy child; it is now directed toward improving the nutritional status of all children. No longer is the program interested in just feeding the child; it is now interested in helping him to learn, and the program is designed to provide "lunch schoolrooms" as well as "school lunchrooms."

School Plant Planning

The office's responsibility for coordinating school plant services was a part-time duty assigned to a member of the staff until the Legislature enacted a law in 1951 appropriating $2 million for emergency aid (aid provided by the state to assist districts that could not meet building needs with their own resources) to local districts. This immediately forced the office to assign a man full time to handle these new responsibilities. At first, this director's activities involved working with two commissions created by the 1951 act: the School Building Survey Commission, which appropriated emergency funds for school construction, and the Public School Survey Commission. Due to the Depression and war conditions, for 20 years preceding the passage

of this act school building construction had been seriously curtailed.

The state board adopted standards for school construction during the 1952-54 biennium as the law required. But in its January 1953 report to Governor Lee, the temporary School Building Survey Commission stated that in its opinion the standards for the emergency program were too high, considering the minimum standards mentioned in the new law. Although the Governor asked the Legislature in both its regular session and its special session in December 1953 to look into these charges, it did not see fit to make a formal investigation, but reenacted the provisions of the 1951 law for another 2 years. The following year, the Governor requested that the Legislative Council investigate. During the summer, the council's educational committee held informal hearings at which the state board presented a brief general defense of its procedures with a request that the temporary building survey commission present written, specific reasons why it felt the emergency standards were too high. The Governor immediately ordered all funds frozen and requested the attorney general and the state auditor to investigate the commission's charges. Fortunately, the freeze was soon modified to permit construction to proceed.

The Legislature passed the Continuing School Building Act in 1959, requiring all districts to file a comprehensive program of their construction plans for a 5-year period. The districts estimated their total needs at $106,357,000. The Legislature appropriated $4 million in 1961, and during the 1962-64 biennium the office approved construction of 19 new elementary schools, 8 new secondary schools, and additions and modifications of 29
elementary and 19 secondary schools. During the next biennium, the school plant planning division merged with statistics and research in the Division of Research and Planning, and construction proceeded at a greater rate. State construction aid increased to $5,700,000 in the 1962-64 biennium and $6 million to 14 participating districts in the following biennium. By the end of 1964, total expenditures stood at $66,850,000.

The school planning division did more than allocate funds. As early as 1954, it began publication of a series of guides devoted to planning facilities for food services, industrial arts, vocational agriculture, and home economics. After 1956, new guides were published to assist in planning for elementary schools, secondary schools, physical education facilities, homemaking facilities, educational specifications, and a long-range program of school construction. These guides were revised and updated in 1964. The program of property accounting instituted during the 1962-64 biennium to get current information on all capital equipment has resulted in a manual on physical facilities and equipment and a start on a second manual on property accounting.

It has been recognized in recent years that the services of the division need expanding, and some steps have been taken. For example, a basic record system has been planned which will accumulate the data in usable form to greatly simplify future surveys. The data should allow at any time the study and evaluation of practices in school construction and of the services rendered by the division.

Under the current law, the state superintendent has the power to prepare a code of standards for any school construction in excess of $20,000. He can enforce compliance because contracts cannot be let until he signs his approval to the plans and specifications.

Supervisory and Consultant Services

From the early history of the office, the board and the state superintendent were charged with the general control and supervision of the public school system and with responsibilities stipulated in specific programs that allowed the office to provide supervisory and consultant services to the extent budgets permitted. As the staff grew from two professional members in 1900 to over a hundred in 1965, the office had many lean years in trying to exercise this leadership. A considerable amount of help has come recently from federal funds.

The early development of the county-unit plan helped the office considerably in providing supervisory services at the district and school level, reducing the need for so many visits by office personnel. Very gradually, these services shifted from an emphasis on classroom visits to (a) providing leadership in arranging meetings for groups of teachers in subject matter areas and grade levels; (b) working with groups of superintendents and administrators; (c) holding regional and state in-service workshops; (d) making team in-service visits and team evaluations of schools and programs; (e) publishing bulletins, guides, newsletters, and recommended lists of materials; (f) sponsoring in-service telecasts. Consultant services were being provided in a wide range of areas by 1965, including finance, transportation, research, food services, and curriculum and instruction.

A questionnaire sent to local superintendents during 1965-66 revealed that the outlying rural areas were quite concerned because they were not in close enough contact with the state superintendent's office. They tended to favor regional offices in one or more areas, which would enable them to obtain more immediate assistance. A major concern expressed by many staff members has been the need for additional supervisory and nonteaching professionals at the district level.

Teacher Education and Certification

During the early years of statehood, the state board and the superintendent concerned themselves primarily with teacher certification, considering each applicant individually. But they constantly struggled with a great dilemma: a need for more teachers and the desire to hire teachers with more formal education. Beginning with territorial Superintendent Campbell in 1866, the office solved the problem in part by granting scholarships to selected students desiring to teach. As Utah followed the trend toward substituting credits and courses for examinations, the office shortly after the turn of the century found itself spending more and more time adopting teacher preparation curriculums and inspecting teacher education programs.

The board's duties increased greatly as it assumed more control over certification, so that in 1913 it established a certification committee to act for it in clear-cut cases. Within 2 years, the board required all beginning elementary teachers to have 1 year beyond high school and required high school teachers to have college degrees. No longer limited to certifying county teachers as in early years, the board and the office controlled the examination and certification of all teachers within county districts by 1915. Legislation in 1919, 1925, and 1929 completed the process, making the board responsible for certifying superintendents and city teachers and expanding its duties in certifying other teachers. These laws further stipulated that no person was entitled to teach, supervise, or act as superintendent unless he was properly certified.

The requirements were continually upgraded after 1922 so that by World War II beginning elementary teachers had to have the same 4 years of training as secondary teachers. Further strengthening of requirements took place in 1946 (38). After several years of discussion between State Superintendent T. H. Bell and teacher-training institutions and the Utah Education Association, on Bell's recommendation the state board approved a new two-level
certification program to begin in 1966. Teachers completing an approved 4-year preparation program could be issued a basic professional certificate; those who had taught successfully for 3 years and took an approved fifth year of training could qualify for the professional certificate. Administrators were required to have 2 years of training beyond the bachelor's degree. Teacher educational programs were to be reevaluated at 5-year intervals.

Like many other states, Utah issued letters of authorization on an emergency basis to employ teachers with less than standard training during major wars and other periods of teacher shortage. It is satisfying to note that for the 1965-66 school year, more than 98.8 percent were properly certified.

Transportation

Transportation became an important item on the Legislature's agenda following the consolidation legislation of 1915 and the Compulsory School Attendance Act of 1919, particularly in the larger county districts. In 1931, the Legislature enacted one of the state's more important education provisions (still appearing in the current minimum school program law), stipulating that all pupils living more than 2.5 miles from school were to be transported to and from their classes, or a reasonable arrangement was to be made toward such transportation. This act was little modified until 1961, when state support was changed to an amount equal to $2 per mile annually for the average number of pupils actually in grades K - 6 who traveled 1.5 miles or more each way daily and for each secondary school student, grades 7 - 12, who traveled 2 or more miles each way. The Legislature increased the allowance to $2.50 per mile in 1965 and at the same time agreed to transport students going to school under "hazardous conditions" when the state board approved.

During the 1965-66 school year, 83,296 pupils were transported to and from school, including 9,000 at district expense—eligible under the 1.5-mile and 2-mile limits, and 2,400 due to hazardous conditions; districts transporting pupils because of hazardous conditions were reimbursed at the rate of $2.50 per annual average mile. This means that Utah districts employed the full-time equivalent of 442 persons at a cost of $3,300,000 in 1965-66, including $2,900,000 for maintenance and operation and $363,000 for capital outlay. The state reimbursed the local districts for about 69 percent of the cost of maintenance and operation.

Vocational Education

Since the 1870's, when Brigham Young established Brigham Young College in Logan, the schools have taught vocational education. But the real impetus came with the Legislature's acceptance of funds under the Smith-Hughes Act of 1917, aiding programs in vocational agriculture, homemaking, business and trade, and industrial training. The Legislature voted an appropriation for this purpose in 1919, designating the State Board of Education as the State Board for Vocational Education. The law states:

The State Board of Education is hereby designated as the State Board for Vocational Education, and the State Superintendent of Public Instruction is hereby designated as its chief executive officer.

The State Board for Vocational Education shall have all necessary authority to cooperate with the United States Office of Education in the administration of the said Act of Congress, to administer any legislation enacted pursuant thereto by the State of Utah and to administer the funds provided by the Federal Government and the State of Utah for the promotion and maintenance of vocational education in agricultural subjects, trade and industrial subjects, business and distributive education subjects, home economics subjects, and education in health, civic and patriarch service (39).

Additional federal funds were accepted by the board under the George-Reed Act of 1929, the George-Elzy Act of 1934, and the George-Deen Act of 1936 (for distributive education). Until passage of the George-Barden Act of 1946, which increased federal funds by nearly 400 percent, most vocational training was at the high school and adult levels; it now became possible to establish postsecondary preparatory programs in the junior colleges. At the same time, the state board established the Salt Lake Area Vocational School in Salt Lake City and the Central Utah Vocational School in Provo.

Although most postsecondary vocational education has been in the trade and technical areas, the Practical Nurse Education Act of 1955, NDEA, and the 1963 Vocational Education Act added new dimensions. They inaugurated new programs in health occupations, technician training, office occupations, home economics "for gainful employment," and appropriate classes for the academically and socioeconomically disadvantaged, and made funds available to encourage more effective teacher training, occupational guidance, and local and state supervision. The office has also been concerned with other vocational programs since 1940. For instance, during World War II, over 65,000 persons were enrolled in a Vocational Education for National Defense program, while others were trained in food production under the Student Youth Act. Over 30,000 veterans participated in veterans' institutional on-the-farm and on-the-job training from 1945 to 1957. The Manpower Development and Training Act has retrained and upgraded the skills and abilities of more than 1,500 persons since 1962. Table 6 provides partial details. Advisory committees, composed of representatives from labor, management, the farm, and the home, aid in

a Enrollments as shown by reports to the U.S. Office of Education. Programs in which enrollments are not listed were not in operation during the years as listed.
b Number trained under Title III, George-Barden Act.

determining the training needs of youth and adults. The Legislature appropriates money for a number of vocational categories, and for every dollar of federal funds spent in 1965 state and local funds contributed an additional $3. Thirty-eight of the 40 school districts and eight post-secondary schools conducted vocational training in 1966. Thus, the agricultural, business, and industrial growth of Utah is inseparably tied to vocational education financed by both the national government and the state and administered by the office’s staff.

Vocational Rehabilitation

Congress first showed interest in the rehabilitation of civilians when it passed the Smith-Sears Act in 1918. Together with the Vocational Rehabilitation Act of 1920, the program was placed on a more or less experimental basis. Appropriations were meager, granted from one Congress to another until 1935, when the program was put on a permanent basis in the federal Social Security law.

Until 1943, the program amounted to little more than vocational guidance, training, the provision of prosthetic appliances, occupational adjustment, and placement. Amendments passed in 1943, known as Public Law 78-113, liberalized the program considerably, extending services to the mentally disabled (including the mentally retarded), and provided medical, surgical, and psychiatric services, hospitalization, training, maintenance, and occupational tools. Generously financed, the program shifted from a scholarship to a needs-of-the-client basis. The law was amended again in 1954, further expanding the financing, providing for rehabilitation facilities and centers throughout the country, and setting up training grants and traineeships to attract personnel with graduate and specialized training in rehabilitation.

The act was again amended in 1965, this time to create workshops, rehabilitation centers, and other rehabilitation resources; to remove the requirement of economic need for some services; and to provide for grants to states to undertake comprehensive, in-depth planning projects so they could serve all who needed them by 1975. It supplied more money but put all states on an equal matching ratio.

RELATIONSHIPS WITH OTHER STATE AGENCIES AND ORGANIZATIONS

Inherent in the Governor’s office are broad appointive powers, and with his veto power, his responsibility for formulating biennial budgets, and his membership on the State Board of Examiners, he exercises considerable control over public education. The superintendent’s office must work with the Governor as well as with the attorney general, the Legislature, and the Legislative Council. The 13-member council, established in 1947 as a research and investigating body for the Legislature, has spent much time in recent years trying to solve educational problems. Since
the office depends on the attorney general for legal assistance, such functions as purchasing land, writing contracts, and providing legal opinions asked for by districts all require a close working relationship between the two agencies.

The office maintains many other relationships, and practically every professional staff member has numerous contacts with outside groups. Some are official, such as dealings with the state personnel division, the state finance department, and the State Board of Examiners. Memberships in the Exchange Club, the Utah Vocational Association, the League of Women Voters, and others are often informal and voluntary. But all are vital. Without dynamic and cooperative interaction with other state agencies and organizations, the office could not carry out its constitutional mandate to provide general control and supervision over the public school system. Although all contacts are important, this section will deal with the relationships of major significance to the overall work of the office (40).

Coordinating Council of Higher Education

The Legislature created a Coordinating Council of Higher Education in 1959, endowing it with advisory powers to coordinate the services and programs of all publicly supported post-high school institutions. As mentioned earlier, it was at first composed of nine members, six appointed by the Governor and three representing the board of regents of the University of Utah, the board of trustees of Utah State University, and the State Board of Education (41). Subsequently, two persons were added, one representing the board of trustees of Weber State College and the other representing the College of Southern Utah (now a 4-year institution with a separate board). The Governor appoints the members of each higher education board while the members of the state board are elected by popular vote (42).

The statute establishing the coordinating council requested it to exercise leadership and give direction to statewide planning of public and post-high school education, define the role and program of each public post-high school educational institution, establish criteria for the budget, study new methods of instruction and new techniques for increasing efficiency, and define the standards and regulations for recruiting and admitting students. The state board has had a representative on the council. Some college administrators and their boards, protective of their own rights and authority, have been fearful of the council’s power.

Joint Committee on Educational Television

The emergence and growth of educational television in Utah has been dramatic. Several attempts were made to provide a structure for coordinating ETV, but it was the indication that federal financial assistance might be available that brought this effort to a climax. Fear that there would be no authorized central agency to coordinate and receive federal funds led to the establishment of the Joint Committee on Educational Television. The committee, consisting of four members each from the State Board of Education and the Coordinating Council on Higher Education, serves as a forum for discussion of mutual problems. It receives and administers federal funds and, in consultation with the Utah Television Foundation, makes recommendations to the Legislature.

State Board of Examiners, Department of Finance, and State Personnel Office

The State Board of Examiners’ power over education resides in the state constitution, which stipulates that the Governor, the attorney general, and the secretary of state—

Shall constitute a Board of Examiners, with power to examine all claims against the State, except salaries or compensation of officers fixed by law, and perform such other duties as may be presented by law; and no claim against the State, except for salaries and compensation of officers fixed by law, shall be passed upon by the legislature without having been considered and acted upon by the said Board of Examiners (43).

A perusal of the minutes of the State Board of Education gives examples of these controls. The Board of Examiners
forced Superintendent E. Allen Bateman to go without salary for nearly a year in 1951-52, and the Board of Education was able to secure payment to him only by going to court. In May 1954, the Board of Examiners refused salary increases for 15 Board of Education employees.

The finance department and its personnel office also exercise budgetary and other controls over the state board and its institutions. They have the power to approve or disapprove job positions, determine the number of jobs as related to salary, and write salary schedules for all state employees. Since the Board of Education is constitutionally charged with controlling and supervising the public school system, and its members are elected by the citizens, it would seem that, once the Legislature has appropriated money, the board should be entrusted to spend it wisely, unfettered by red tape or additional controls other than reasonable reports and audits. Such an agency needs the freedom to employ the staff necessary to give leadership for its policies and to use its discretionary power in setting salaries. Yet, the truth is that it has been denied such power by the personnel director, the finance director, and the Board of Examiners. In this regard, the state board has less authority than a local board of education or universities which by law have a similar relationship to the Board of Examiners. As long as this condition exists, the state board will be inhibited from fully carrying out the tasks for which it was established; only when it is given the freedom to make expenditures within its approved appropriations and budgets will it achieve the stature necessary to render the educational leadership so urgently needed in Utah today.

State Course of Study Committee and Textbook Commission

Both the committee and commission, created in 1907 and 1909 respectively, have been described earlier. Since 1941, the personnel of the two have been one and the same. Membership consists of the state superintendent, who serves as chairman, the dean of the College of Education at the University of Utah, the dean of the College of Education at Utah State University, three district superintendents appointed by the state board, and five lay citizens appointed by the Governor. The deputy superintendent for instruction serves as secretary.

This committee has the responsibility to establish aims, purposes, objectives, and a philosophy of education to guide the schools, and to approve courses for all districts. The textbook commission adopts textbooks with regard to these objectives and courses. The state board then executes the directives of these official agencies, and an examination of the minutes reveals that they have worked in close harmony with the office, getting assistance from its instructional staff.

State Department of Health and State Department of Welfare

The office has long enjoyed a harmonious relationship with these departments, working with them in such areas as special education, Indian affairs, day-care centers, mental health, mental retardation, Civil Defense, health education, and training programs for welfare clients. Since passage of ESEA, the need for greater cooperation has been recognized, and in recent months a joint committee has been meeting periodically.

State Land Board

It is highly important that school lands be well managed, since they have contributed substantially to Utah education in the past and offer considerable potential support for the future. Membership of the State Land Board managing them consists of the state superintendent (or whomever the state board designates) and five other persons appointed by the Governor with the advice and consent of the Senate, all holding 6-year terms (44). This board directs, manages, and controls all lands granted to the state by the U.S. government or others, and land lying below the water's edge of any lake or stream to which the state is entitled, except in the case of lands used or set apart for public purposes or occupied by public buildings. It may sell or lease these lands in the best interests of the state in accordance with the law, depositing all money collected in the state treasury. Certain funds are earmarked for the public elementary and secondary schools, the University of Utah, Utah State University, and other specific educational uses.

State Library Commission

This commission, composed of nine members appointed by the Governor with the advice and consent of the Senate for 6-year overlapping terms (45), was created in 1957. It operates a State Library and is empowered to provide for its housing and to promote and develop public library services throughout the state in cooperation with the state municipal libraries, schools, or other agencies. It employs the necessary staff, sets the rules and standards, and distributes books and materials. Its bookmobiles have become very popular in the rural areas. The office of the state superintendent has always worked closely with this commission.

State School Boards Association

This association was officially recognized in 1959 as "an organization and agency of the school boards of Utah and representative of members of said school boards" (46). It
holds annual conferences, works to keep its members informed of educational happenings, helps sponsor legislation, and makes other attempts to upgrade the public school system. The office has worked closely with the association in many instances to seek answers to common problems, and all members of the state board are members of it.

**Utah Education Association**

Although it was not until 1870 that the territory's teachers organized to meet twice each year in Salt Lake City, a number of early educators who became territorial superintendents were active in local associations. The association's first president, territorial Superintendent Robert L. Campbell, joined with his successors, such as John R. Park and Karl G. Maeser, to promote its work. It has flourished, and by 1965, it could boast of 12,286 members (47).

Historically, the office and the Utah Education Association have enjoyed a cooperative, wholesome relationship, especially in teacher education and certification and the development of school legislation. Staff members from each organization have served on the other's committees. During the last decade, however, frictions have developed, and although they are ameliorated at present, they should be noted for the sake of historical accuracy.

In the months following Sputnik, the state board considered lengthening the school year. Officials of the UEA requested that the board initiate additional action "to provide classroom conditions which will permit a substantial increase in the quality as well as the quantity of the school program" (48). After considerable discussion, the board increased the minimum days in the school year from 172 to 177, beginning in the fall of 1958. At the same time, it agreed that improvements were needed in many areas, including curriculum, teacher qualifications, salaries, and school buildings, but it was of the opinion that "all of these objectives cannot be achieved at one time" (49). The board expressed its intention to further lengthen the school day to approximately the same as the average in other states.

Several months later, on Superintendent Bateman's recommendation, the board adopted a motion placing the schools on a minimum of 180 days, beginning with 1959. This prompted a vigorous protest from association officials who criticized the action in an issue of the *Utah Education Review*, contending that the board and state superintendent had not given the teachers' viewpoints adequate consideration. The board reviewed the entire matter in its May meeting and charged that the UEA had been unfair, but took no further action.

More friction developed in 1964. Over a period of several years, there had been considerable debate between school groups and the political structure over the need for improving the quality of education, the rate of expenditure per pupil, and teachers' salaries compared to those in the other Rocky Mountain states. Open conflict developed between the association and Governor George Dewey Clyde, and when the Governor refused to accept the recommendations of a study committee jointly agreed to by him and the UEA, the association declared a 2-day work recess. In a special session the first day of the recess, the state board directed State Superintendent T. H. Bell to request the attorney general to immediately petition the court to serve a temporary restraining order on the UEA leadership so that it could not interfere in any way with the teachers' contractual obligations. A majority of the UEA members failed to show up at their schools during the recess. The restraining order was served but removed less than a week later when it became clear that further violations of contracts would not be recommended or approved by the UEA leadership.

Both the UEA and its parent organization, the National Education Association, placed sanctions on Utah, and opening the schools in the fall of 1964 proved difficult. A change in Governors and favorable legislation in 1965 apparently eliminated the conflict, although scars remained. Relationships between the office and the association were very good at the close of 1966.

to $775, with the districts required to impose 12 mills to qualify for a guarantee on the supplemental program. Utah, Laws (1961), pp. 361-67.

36. The basic program distribution unit of $7,250 was the amount guaranteed by the state in 1967 for every 27 students in average daily attendance in the regular program, grades 1-12. Districts received the same guarantee for every 50 students in average daily attendance at the kindergarten level. Still different requirements were in force with respect to special education programs and small isolated schools. Utah, School Laws (1965), Title 53, ch. 7, defines the various terms in detail and explains how these amounts are determined.

37. For further information, see Minutes of the Utah State Board of Education, April 29, 1949, pp. 1746-47; October 7, 1949, pp. 1804-1807. (Mimeographed.)

38. The requirements for certification of administrators, supervisors, teachers, school librarians, and counselors were strengthened in 1946 by board action.

40. Since the relationship with the U.S. Office of Education has been discussed in the section on programs and services, it is given no explanation here.

41. The representatives for the board of regents of the University of Utah and the board of trustees of Utah State University also represented their branch colleges.

42. Dixie Junior College at St. George, the Salt Lake Trade Technical Institute, and the Utah Trade Technical Institute of Provo are the institutions of higher learning under the control of the State Board of Education.

44. For purposes of appointment, the state is divided into five districts.

45. One member is appointed on recommendation from each of the following agencies: the Office of the State Superintendent of Public Instruction, the Law Library Board, the Legislative Council, and the State Historical Society Board. At least two of the other five members must be appointed from rural areas. The secretary of state serves as an ex officio member of the commission.

PROGRAM OF STUDIES FOR UTAH SECONDARY SCHOOLS, IN EFFECT AFTER 1958 (Continued)

Bateman, "Items for Superintendents, State Program of Studies for Secondary Schools and High Schools Graduation Requirements, as Amended," April 10, 1958, pp. 29-33.

Any secondary school, on a personal guidance basis, may exempt any students from meeting any one unit or its equivalent of these requirements provided the number does not exceed 5 percent of the class enrollment, and any student may be exempted from meeting two units of the requirements, provided the number of students so exempted does not exceed 2 percent of the class enrollment.

Remedial programs may be substituted for basic language arts courses at any level. At least two units of the last three must be English. There may be substituted for either eleventh- or twelfth-grade English, one unit from among the subjects offered in grades 10-12 in the general area of language arts. One unit of foreign language may be substituted for ninth-grade language arts or for a unit of English in the senior high if the substitution was not made in the ninth grade.

The "1" indicates the number of "contact" units (representing 50 minutes multiplied by the number of days in the school year for the senior high and a class period held each day all year long for the junior high). "R" indicates that the subject is required. "0" indicates that the subject must be offered in the school. An arrow indicates the condition noted is to take place somewhere within the grades covered by the arrow.

Provided the high school has an enrollment of at least 350 students, grades 10-12.

One unit in addition to American history and government is required in grades 10-12. The unit may be from one or a combination of the following: world history, one unit; America's social and economic problems, one unit; sociology, one-half unit; world geography, one-half unit; or economics, one-half unit.

Algebra, geometry, second year algebra and consumer mathematics must be offered.

One additional unit is recommended for the junior high. At the senior high level this requirement must be filled by either biology, botany, zoology, physiology (if not substituted for health), agricultural science, physics, chemistry, senior physical science, or a combination of any two of the biological science courses. Biology and physics, chemistry or senior physical science must be offered.

One-half unit physiology may be substituted for the health requirement.

This work shall be taken on a half-unit basis in any two of the grades 10-12.

It is recommended that one-half unit be required in each of grades 7 and 8, although one unit in grades 8 or 9 will fulfill the requirement. It is recommended that a full year elective be offered in grade 9.

INTRODUCTION

The advocates of better schools at an Arlington, Vermont, town meeting were trying to persuade their fellow citizens to replace the meager one-room district school and two-room village schools with a modern school. The problem was a universal one; the town had little money. Opponents of the new school—as Dorothy Canfield Fisher, Vermont author and longtime resident of Arlington, remembers—had had the best of the meeting, concentrating their arguments on what they called "hard facts." The need, they said, was for other things—especially bridges, which are important to a town surrounded by streams, as Arlington is.

The sense of the meeting shifted abruptly, however, when the town grocer remarked, "What we are being told here is that if we keep up our bridges, we won't have money enough to run decently good schools for our children. If that is so . . . then I say, LET THE BRIDGES FALL DOWN." The grocer then put the real question to his fellow citizens: "Which would you rather have, forty years from now in our town—dumb ignorant people that can't earn a decent living to take care of their children, going over good bridges? Or folks with well-trained brains who know their way around? Such people can build their own bridges" (1). Arlington voted to build a better school.

The dilemma expressed in Dorothy Canfield Fisher's anecdote has been a real one in Vermont. As residents of a small, predominantly rural, and invariably poor state, Vermonters have been forced to pick their improvements gingerly. Despite a strong commitment to educational improvement, they have not always been able to do what they would like for their schools. State Superintendent of Education Mason S. Stone's comment of 1908 wryly captures the essence of this dilemma:

"The penal institutions in Vermont are in excellent condition, and within a few years, the State has erected a splendid hospital for the insane. Now that the State has its criminals and insane well housed and cared for, it would be well to devise means for improving its schools, and thus prevent as far as possible patronage upon those other institutions (2)."

Despite a lack of adequate revenues, Vermont has consistently made an impressive and continuing effort to provide the best education possible (3). One of the major forces in providing the best possible education has been the Vermont Board of Education, which has, in cooperation with the state commissioner of education, provided educational leadership for the state since 1915.

The board's task has not always been an easy one. In addition to inadequate finances, it has had to cope with problems arising out of Vermont's continuing ruralism. Unlike most states, Vermont did not experience a major population growth in the first half of the twentieth century; its problem has been the continuing decline in the population of its rural communities (4). The result of this population shift has been a relative decline in the property values of many Vermont communities and a subsequent unwillingness on the part of these communities to foot their education bill. Another result has been that the distribution of Vermont's population has tended to concentrate the wealth of the state in a few of its larger towns and place on these towns an inequitable tax burden. Because its population has remained relatively stable, Vermont has only recently had to face the problems of urban schools and the population explosion which forced many states to adopt double sessions in already crowded schools while they sought desperately to solve educational problems.

Continuing on the positive side of the ledger, the state board in Vermont has not been the political football it has been in other states. Since the legislation of 1915 (to be discussed below), Vermont has enjoyed the advantages of having a professional department of education reasonably unbuffeted by the winds of political change. To be sure, politics in Vermont have affected education—it would not be realistic to view Vermont education as being free of politics—but political corruption, e.g., the buying and selling of educational posts, which has occurred in some states, has not been much a part of Vermont education. The board has also benefited from Vermont's until recently unblemished Republicanism, which ensured that the vagaries of party politics, and the consequent insidious spoils system, would not dominate Vermont educational policies.
As a result of the board's professionalism and stability, educators in Vermont have displayed commendable willingness to innovate and experiment in education. Vermonters in Washington, from Senator Justin Morrill, sponsor of the Land Grant College Act of 1862, and Senator Carroll S. Page, one of the leading advocates of the Smith-Hughes Act of 1917, to the incumbent Senators, George Aiken and Winston Prouty, have consistently advocated programs of federal aid to education (5). On the state level, the commissioners of education have prided themselves on keeping abreast of national trends in education. Francis L. Bailey, a former teacher in Carleton Washburne's well-known Winnetka, Illinois, school system and an Ed. D. from Teachers College, Columbia University, prides himself on having played an active role in the National Education Association and keeping up with the latest innovations (6).

A. John Holden, Jr., commissioner of education from 1948 to 1965, spent a Wanderjahr in Germany studying rural education and returned to Vermont to try to put some of his ideas to work in the one-room Morse School in East Montpelier. Dr. Holden, who recalls his teaching at the Morse School as "a single-handed effort to do something radical with the one-room school," was trying to utilize what he saw as some of the inherent advantages of the one-room school (7).

This spirit of trying to make the best of difficult circumstances has been an important influence in Vermont education. It has encouraged Vermont educators to struggle against their twin problems of poverty and population shifts.

NINETEENTH-CENTURY BACKGROUND

The Carnegie Commission for the Advancement of Teaching, which conducted a thorough survey of the Vermont school system in 1912, recognized that the state had never assumed a constructive responsibility for public educational policy. This was due, the commission said, to "the sturdiness and independence of local communities in Vermont, the isolation of . . . geographic sections of the state . . . and the absence of any dominating city centers of population" (8).

The commission believed that the absence of a positive state policy in education explained the lack of an appropriate machinery for administration, supervision, and inspection of the state school system. Throughout the nineteenth century, the state had experimented with various methods of school administration and had apparently found no system completely adequate.

Early settlers in Vermont, attracted to the lumber industry and a growing potash trade, followed the Connecticut River northward. The river became their chief connection with the outside world. Logs and sawed lumber were shipped downriver to Hartford, Connecticut, upstream by pole boats came necessities of living, rum, and molasses. Residents on both sides of the river, including Dartmouth College President Eleazer Wheelock, became advocates of a "Valley State" that would include towns on both sides of the river. Wheelock and others hoped that Hanover, New Hampshire, home of Dartmouth, would serve as the state capital (9).

As a result of this situation, Vermont's early political history presents a welter of moves and countermoves regarding Vermont's political future. Proposals ranged from giving Vermont the territory east of the Connecticut and west to the Hudson to dividing Vermont between New York and New Hampshire along the ridge of the Green Mountains. Naturally enough, this political confusion retarded the development of a common school system in Vermont. Despite some earlier abortive proposals, it was not until after Vermont was admitted to the Union in 1791 that the State Legislature required towns to provide schools to teach English, writing, and arithmetic. Educational development proceeded slowly until the election of Cornelius Van Ness as Governor in 1823. In his inaugural address, Governor Van Ness suggested, "Knowledge and virtue are the main pillars of a free government; and the only foundation on which they can stand is education." Governor Van Ness saw "no injustice in compelling the rich to contribute to the education of the poor," and he, therefore, recommended revision and strengthening of Vermont's education laws (10). His successor, Ezra Brooks, persuaded the Legislature to consider some of Van Ness's proposals. In 1827, the Legislature set up a Board of Commissioners for common schools. This first State Board of Education was abolished 6 years later, chiefly because it prescribed texts to be used in the common school.

Vermont's strong tradition of localism also contributed to its inability to establish any kind of effective central administration of the schools. In 1845, the Legislature established the Office of State Superintendent of Schools to supervise educational policy more efficiently; in 1851, however, not agreeing to the need for such an officer, the Legislature refused to appoint a superintendent. In 1856, the Legislature once again apparently saw the need of some central direction for the schools and established another State Board of Education, consisting of the Governor, the lieutenant governor, and three others to be appointed by the Governor. This awkward agency administered education for 18 years. Then it was abolished because, in the eyes of the legislators, it was too aggressive and officious for men who possessed mere academic knowledge of conditions and schools. In 1874, the Legislature revived the Office of State Superintendent of Schools. Thus for most of the nineteenth century, educational administration in Vermont was varied and complex. Educators and the Legislature shifted administrative responsibility from state to town and town to state with great frequency and with little regard for
educational efficiency. Not until 1892, when Mason Stone was elected state superintendent of schools, was the modern movement toward a more centralized state educational system begun (11). Historically, Vermont has maintained that education is a local affair and has accepted regionalization reluctantly.

MASON STONE AND EARLY EDUCATIONAL REFORM

At the turn of the century, Vermont entered an era of educational reform which culminated in the school legislation of 1915. The reform bill was based on the recommendations of the Carnegie Foundation in 1912, but the initial reform impulse began earlier. One of the prime contributors to this drive toward more active state leadership in education was Mason S. Stone. A native of Waterbury Center, Vermont, and a graduate of the University of Vermont, Stone served as state superintendent of education from 1892 to 1916. Except for a 3-year interlude, 1902 to 1905, when the U.S. government sent him to the Philippines to help set up a school system for that newly acquired territory, Mason Stone dominated Vermont education. He came to the superintendent's office with a good deal of experience in educational administration: he had been principal of Williston Academy, Bristol High School, and People's Academy in Morrisville, Vermont. He had spent 2 years as supervisor of schools for Orleans County and a year as superintendent of schools in Southampton, Massachusetts.

Unlike many educators—before and since—Stone delighted in the political maneuvering inherent in the election of a superintendent. He took pride in knowing each of Vermont's 246 legislators personally and almost always had a majority of them favorably disposed toward him. One senses without being able to document it that Stone's delight with the politics of his office enhanced his role as an educational leader. Every new Legislature required that Stone reformulate and reargue and consequently strengthen his educational program. Former Commissioner Ralph E. Noble, who knew Stone quite well, remembers best his "black, bright and very intelligent eyes" (12).

Surveying the problems of Vermont education in 1900, Stone recognized that the schools, especially in rural areas, were suffering from lack of adequate financial support and of skilled supervision. He believed that the inequities that grew out of this situation could only be resolved through skilled supervision at state expense. Like many of his contemporaries, Stone realized that the district school system, controlled by local boards of education, was becoming increasingly inadequate to meet modern educational needs. Society's demands on education were becoming more specialized, and educational methods were going to have to be more sophisticated and scientific. Stone recognized that educational administration would have to be a full-time professional occupation.

Inefficiency is not the fault of the superintendents; it is the defect of the system. The superintendents are the appointees of the local school boards, and they are without question the most capable persons available in the various towns. But as school affairs are adventitious to their regular trade, business or profession, the supervision of the schools is a matter of secondary importance. Frequently, too, the persons called to the supervision of the schools are less informed in the educational matters than the teachers (13).

Stone recommended that towns be combined into supervisory units, over which a professional supervisor would be placed for each supervisory union district. The salary of this supervisor should be paid by the state and should be large enough to attract a person "who, on account of his character and power, will be recognized in the various towns as a public-speaker, businessman and educator" (14).

Some of Stone's aims were realized in 1906 when the General Assembly passed an education bill that provided for the voluntary union of towns for the purpose of school supervision. The salaries of the union superintendents were to be subsidized by the state. In addition, the act provided for a permanent school fund, consolidation of rural schools, school transportation, and standardization principles for high schools.

Stone, continuing his crusade for a better school system, declared that teacher training and vocational training were the state's two biggest remaining problems. He insisted that the state had an obligation to provide adequate teaching if it made education compulsory. He shared the concern of many educators with practical education. He recognized that the complex needs of a growing industrial society were going to require a new approach to education. In the 1908 School Report, Stone outlined the vocational needs of Vermont and the existing attempts to meet those needs through state-supported vocational education. The chief occupation of Vermont was agriculture, and Stone felt that the agricultural future of the state depended on how well the educational system could prepare Vermont's youth to take their place in this field. "Apparently Vermont's future success in agriculture will depend upon the opportunities the state affords for preparation for intensive farming. Today Vermont has done scarcely anything in this direction" (15).

Aside from the State Agricultural College, which had an enrollment of 79 students in 1912-13 (16), the state had done little to further educational opportunities in vocational areas. In 1908, the Legislature authorized annual state aid of $250 for any elementary school that included
vocational education in its curriculum, but by 1912, only four schools were receiving such aid (17). In 1910, when the Randolph State Normal School was discontinued, the Randolph State School of Agriculture took its place. It was the only real trade school in the state that was exclusively a state effort.

The school legislation of 1910 realized more of Stone’s plans for educational progress. For example, medical inspection of schoolchildren was made mandatory, and teacher-training courses in high schools were instituted.

Significant progress was made under Stone’s leadership, but in 1912, there was still no centralized administrative agency to coordinate educational activities. The year 1912 marked a turning point in Vermont educational history. A conference of school superintendents and principals had recommended a more centralized school system, and in 1912 the Legislature provided for a State Board of Education, to be appointed by the Governor. One of the board’s chief responsibilities was the appointment of the state superintendent of education, who had been elected up to that time by the Legislature.

The board also was charged with the responsibility of determining qualifications for union superintendents and teachers. In 1913, the board agreed on standards for these positions: Union superintendents were required to possess a college degree or 4 years of normal school training, at least 2 years of teaching experience, and knowledge of the history of education, educational psychology, school administration, and methods of teaching; the requirements for a teaching certificate were a satisfactory teaching record, a college degree or 4 years of normal training, and academic background in the areas of history and principles of education, psychology of education, methods of teaching, and school administration (18). These standards reflected an increasing concern with the professionalization of education.

The most significant event marking 1912 as an educational turning point was the election of Republican Governor Allen M. Fletcher. In the election, which was decided by the Legislature because no candidate received a majority vote, Fletcher campaigned on a platform that was every bit as progressive as that of the Progressive party, which had split the Republican party in half. The campaign was heavily influenced by national issues, for the state platforms were practically identical (19). The Vermont Republican party in 1912 was concerned with administrative reform and more specifically with the consolidation of commissions and departments and with economy in state spending. Fletcher apparently saw educational reform as a part of the overall administrative reform that he had promised Vermont’s voters. It was on his recommendation that the General Assembly of 1912 passed a resolution calling for him to create a nine-man commission—such as he had earlier requested—to study the state school system.

THE CARNEGIE SURVEY AND ITS AFTERMATH

Vermont’s appointment of an educational commission was a reflection of a national educational mood. Progressive educators, in their attempt to professionalize the nation’s school systems, were beginning to use scientific tools for evaluating them. The school survey was one such method that was gaining increasing national acceptance in the second decade of the twentieth century (20).

The Vermont Educational Commission in 1912 engaged the Carnegie Foundation for the Advancement of Teaching to conduct a complete educational survey of the state. The Vermont commission held that it was necessary to employ a body of experts in order to conduct the survey properly and to ensure the objectivity of the results and recommendations. “The Commission wanted the facts: to hew the line and let the chips fall where they would in its seeking after the truth of the educational conditions of the state” (21).

In its final report, the Carnegie Foundation complimented Vermont on its progressive activity. It pointed out that this inquiry represented the first comprehensive effort on the part of any state to study its school system as a whole from the elementary school to the university. It also stated that the Foundation assumed that educational institutions in Vermont were not unrelated agencies, but formed parts of one educational system, whether controlled by the state or not.

Guy Potter Benton, president of the University of Vermont in 1913, praised Governor Fletcher and the commission in a speech in which he claimed that this investigation was the most important of all such studies in the nation because it was so comprehensive. He added: “We have an educational commission in this state which is unique in the history of such commissions and a sure guarantee of unselfish and patriotic service which will put Vermont in the vanguard of educational progress in this country” (22).

The State Board of Education, which was appointed in 1912, voted in 1913 to instruct the superintendent of education to cooperate with the Carnegie survey staff in its study of educational conditions (23).

The Carnegie commission’s recommendations, which were reviewed by the Vermont commission and submitted in the form of a bill, ranged from elementary school curriculum to the financing of higher education. The emphasis of the report and the resulting legislation, however, were administrative in nature. The commission was convinced that no substantial progress could take place unless Vermont adopted a clear policy in educational matters and a centralized administrative agency to guide the state. The administrative system was the focal point in the recommended reform program. Without an effective state-controlled administrative system, no other reforms were possible.
The Carnegie survey team clearly supported the trend toward state-controlled administration that was gaining acceptance across the country. The report stated that the once widely accepted plan of electing the superintendent by popular vote or by legislative election was being replaced by a plan which placed control with a small, appointed Board of Education, composed of laymen who served without pay. Vermont had adopted this method in 1912, but the survey recommended that the board’s powers should be increased so that it would have general control of the entire educational system of the state. The commissioner of education, to be appointed by the board, was to be a man “of such breadth of education, of such special training, of such varied educational experience, and with such a record of successful performance as will entitle him to be entrusted with the important responsibilities of the Board” (24). Public educational policy would be determined by the Legislature and executed by the Office of the Commissioner, which was to receive guidance from a small, public-spirited Board of Education. The typically progressive ideal of freeing education from political interference, yet making it responsive to popular will, is evident in the survey team’s recommendation. General principles of progressive education seem to have had as much influence on this reform measure as did the specific needs of the State of Vermont.

Another major reform, adopted by the Legislature in 1915, also was an attempt to centralize the state’s educational system. School unions had been optional since 1906, and the Carnegie Foundation recommended the extension of union supervision. The Vermont commission, convinced that the experiment in union supervision was producing beneficial effects, recommended to the Legislature that union supervision be made mandatory.

The legislation was passed in 1915. It included, in addition to the administrative reforms mentioned above, provisions for curriculum revision, transportation and board, vocational education, courses in teacher training, and examination and certification of teachers. In order to receive the benefits of the act, which included state subsidies for union supervision, teachers in rural communities, and courses in teacher training and vocational education, the towns were required to raise a percentage of their school finances through local taxation and to meet qualifications to be established by the state board. One very significant recommendation of the Carnegie report that was not included in the legislation was the elimination of state support to all institutions of higher education in the state in favor of one state-supported university. The relationship of the state to the University of Vermont, Middlebury College, and Norwich University was unusual: It corresponded neither to the typical New England college supported by endowment nor to the state university owned by the state. All of these institutions were controlled by private trustees, but the state contributed to their costs of operation. In view of the state’s primary responsibility to elementary and secondary education, the survey recommendation was that state aid to Middlebury College and Norwich University be terminated. This issue was hotly contested by the interested parties, and the Legislature finally refused to take the action recommended by the commission.

Another significant recommendation on which the Legislature did not act was the establishment of a central, state-owned teacher-training college to replace the inefficient normal schools at Johnson and Castleton. The Legislature did authorize the board to establish, at no expense to the state, a teacher-training college. However, the project was not given serious consideration until 1921.

The 1915 school law marked the culmination of an era of progressive innovation in the state. Under Mason Stone’s leadership, Vermont had made a concerted effort to launch its school system into the twentieth century. Stone, however, was less than pleased with the eventual outcome. He resigned his post as superintendent in June 1915 and was only persuaded to accept the office of commissioner on the condition that he be replaced as soon as the welfare of the state permitted (25). Stone had not anticipated that the reform impulse he had so diligently nurtured would result in what he called a paternalistic and bureaucratic educational system.

With centralization of people came centralization of government and with centralization of government came more officials, more autocratic power, and more expense. And so a state of mind was automatically prepared and the swollen and arbitrary school law of 1915 found a congenial atmosphere in which to flourish, operate, and perpetuate itself (26). To Mason Stone, the legislation was bureaucratic; to his contemporaries, it was progressive. To be progressive in 1915 was to be right.

In 1915, the state board, under the leadership of the disappointed Mason Stone, was faced with the enormous task of implementing the new school legislation. Stone’s dissatisfaction was not an auspicious beginning for a task of this magnitude. Its accomplishment was to face even greater difficulties in the future, in the form of statewide reaction against the new legislation and finally against the board and its policies.

The first job tackled by the newly constituted board was the reorganization of supervisory unions in accordance with the principle of mandatory supervision. The board determined principles by which the reorganization should take place. The territory of existing districts was to be preserved; county lines would be observed as far as possible; districts would be composed of towns closely associated commercially and politically; and contiguous towns and topographic conditions would be taken into consideration. The advice of the towns was solicited. The board requested that the towns already organized in unions evaluate their
systems and make recommendations. The remainder of the towns were asked to decide what other towns they would like to become affiliated with (27). The board then turned to determining qualifications for the position of union superintendent. The existing superintendents were given priority, and qualifications were quite general. A union superintendent should have "good personality, good habits, good industry, good health and good sense" (28). The board was concerned with professional supervision, but qualifications had to remain broad and flexible because of the state's inability to hire a sufficient number of candidates who could meet the requirements of extensive background and education (29).

The board accepted Mason Stone's resignation in 1916, and Milo Hillegas, associate professor at Teachers College, Columbia University, and former member of the Carnegie commission, was invited to fill the position of commissioner of education. Born in Plattsburgh, New York, Hillegas received a Ph. D. from Columbia in 1912 and had a varied background in teaching and school administration. He had taught high school in Fort Dodge, Iowa, from 1898 to 1900 and served as principal of schools in Schuylerville, New York, from 1902 to 1904. From 1904 to 1908, he was principal in Chatham, New York, and then served as editor-in-chief for the U.S. Bureau of Education from 1910 to 1911.

As commissioner, Hillegas faced the difficult problem of implementing the 1915 legislation. There was some feeling in the state that the board should have chosen a Vermonter to fill this important position. The rural press stated quite frankly that they were watching Mr. Hillegas carefully, although they would give the man a few months before beginning to criticize his methods and plans (30). "Undaunted by criticism, and with a firm resolution to effect the improvements intrusted to his administration, Dr. Hillegas vigorously attacked the problem of reorganizing Vermont's educational affairs" (31).

One of Hillegas' most pressing problems was the shortage of teachers, caused in part by the country's entry into World War I and in part by the state's lack of funds. In a competitive market, Vermont could not afford to keep its teachers by raising their salaries. In spite of this problem, the board under Hillegas' leadership continued to raise professional standards for teachers and teacher-training institutions. The board was particularly concerned that teachers understand the conditions of rural life and its relationship to educational methods. In a further attempt to provide trained teachers for the rural schools, the 1915 legislation included a state subsidy program to aid the towns in paying a minimum wage to teachers.

Normal school standards also were upgraded in this period (32). Applicants were required to possess a high school education, and the course of study included principles and methods and psychology and ethics as well as the standard subject matter. In order to meet the heavy demand for rural elementary school teachers, the "lower course" of study was retained. Only 2 years of high school were required for this 1-year course. The board had also recommended in 1913 that normal school principals be asked to consult the U.S. government reports on rural education in the formulation of their curriculums. It was further recommended that instruction be provided in rural sociology and economics, schoolhouse construction and sanitation, rural schoolhouse organization, and use of the educational resources available in a rural community (33).

The acts of 1912 and 1915 had established state subsidies for vocational education programs in high schools. The board had reviewed and approved 16 of these by 1914. A considerable boost was given to Vermont's vocational education program by the passage of the federal Smith-Hughes Act of 1917. The first bill of its kind, the Smith-Hughes Act provided money for vocational education in high schools through a matching program with the states. The money could be spent in paying salaries of teachers, supervisors and directors of agricultural projects, and teachers of industrial subjects, and in the preparation of teachers of agriculture, trade, and home economics. Vermont's share of the original appropriation was $15,000; the state added $45,000 to that sum. The bulk of the total was spent on training teachers of vocational subjects, and the remainder was used to pay teachers' salaries.

Hillegas felt that World War I offered Vermont schoolchildren an opportunity for public service and educational experience. The Public Safety Committee financed the establishment of the Green Mountain Guard, a group of boys and girls from the public schools who worked in gardens and on farms. The children performed a public service while learning many valuable principles. In his annual report he stated: "The schools of Vermont have been strengthened during the period of the war because boys and girls have been led to work with a purpose such as did not exist earlier. They have been keen to understand current events and to do their share in helping win the war" (34).

Hillegas resigned at the end of his 5-year leave of absence from Columbia University, and Clarence H. Dempsey became commissioner of education in 1921. Born in Washington Mills, New York, Dempsey was educated at Boston University and Norwich University in Vermont. He had studied at the Universities of Munich and Berlin from 1896 to 1898. A former St. Johnsbury, Vermont, school superintendent, Dempsey was hailed as a Vermonter returning to the state. With this auspicious beginning, Dempsey should have had an easier experience than Hillegas, but he had to survive a heated controversy about the state's normal schools and a period of reactionary legislation.

Under the pressures of wartime, the student body at the state's normal schools declined. Hillegas had recognized that this was a nationwide phenomenon. Nevertheless, in 1919, the Legislature refused to extend the charter of the
Johnson and Castleton normal schools. As of August 1920, the state had no normal schools for the training of teachers. The board was faced with a fait accompli and was not happy with the situation.

The board faced both a long- and a short-range problem. It was on this authority that the board acted. Provisions had to be made for those students currently enrolled in the normal schools, and the future of teacher training in the state had to be planned. First, the board arranged for students to complete their course of study at the University of Vermont, which provided a special course, with tuition paid by the state, for students of Johnson and Castleton. It then proceeded to the larger problem of future plans.

The board had been authorized by the 1919 Legislature to provide, at no cost to the state, a single centralized teacher-training institution. In the 1920 Biennial Report, the board recommended that the state take advantage of a Carnegie Corporation offer of $100,000 for the purpose of constructing a single teacher-training college in Burlington. The University of Vermont would contribute $200,000 to the project, and the school would be affiliated with the university. The state would be required to appropriate $100,000 annually for the maintenance of the institution.

The proposal was introduced to the 1921 Legislature with the strong support of Commissioner Dempsey and the state board. The board's public endorsement of this proposal was unprecedented in Vermont educational history. Commissioner Dempsey, speaking to the Legislature, urged the state to take responsibility for the establishment of an adequate teacher-training system. There was, however, strong opposition to the plan. Representative Stearns of Johnson introduced a bill which would reopen the normal schools and extend teacher-training courses in the high schools. Stearns claimed that a central collegiate-level institution would tend to provide the kind of education that would lure teachers away from rural school teaching. He also maintained that the university, not the state, would benefit from the institution. "The state," he claimed, "is not being given one dollar. It is being given to the University of Vermont and the University is going to let the State Board come down there and run a teachers college in connection with the University." (35). The state board was accused of representing the private interests of the university. Needless to say, Mr. Stearns also accused the state board of representing the private interests of Johnson, Vermont. The Burlington Free Press claimed that: "The Johnson-Castleton education bill is misnamed. It should be entitled 'An Act To Keep Vermont as It Is.' Instead of providing new facilities for the training of teachers, it takes the old facilities, regroups them, stamps a strange name on them and says, here is the panacea for Vermont's educational ills." (37).

One other interesting charge deserves mention. Mr. Stearns, addressing the Legislature, said, "Some of you have seen a short gentleman for the last two weeks who has been lobbying here for this [centralization] bill." (38). Stearns was referring to Mason Stone, who was back on the educational scene. Mr. Stone, Stearns alleged, had a private motive for his endeavor. He was supposed to have said in 1910 that his greatest ambition was to see the creation of a centralized normal school with himself at its head. Whatever the motives of Stearns, the board, or Mason Stone, the Vermont House of Representatives rejected the board's proposal and adopted the Stearns bill.

The normal school controversy was but a prelude to an even more bitter controversy over the very nature of educational progress in the state. Increasingly, local school officials had become critical of the reforms of Hillegas and the Carnegie commission. Commissioner Dempsey was the doubtful beneficiary of a political mood that had become fatigued with change and reform. Political attitudes had been well expressed in a Burlington Free Press editorial on Governor Proctor's views on education. Proctor, according to the Free Press, believed that "our schools have reached a high standard which must be retained . . . we should avoid experimentation in education; we can economize by cutting down overhead" (39). One later commentator on Vermont education noted that "the legislature retained the high standards by jettisoning the most important phase of the state education plan, namely the compulsory union supervision" (40).

A reactionary mood had begun to affect educational policy as early as 1919. The Legislature in that year revoked the board's authority to appoint union superintendents and returned this power to local school officials. In 1923, the whole superintendency system collapsed. The legislation of 1923 reduced the State Board of Education from five members to three, eliminated compulsory supervision, and reduced the staff of the State Department of Education. In place of compulsory supervision, each town was empowered to select one of three methods of school supervision: (1) hire a town superintendent, (2) hire a supervising principal, or (3) form a union with other towns and hire a union superintendent.

Professional positions in the state department were abolished, and in their place the board could hire as many deputy commissioners and helping teachers as were required, but with a total salary limit of $20,000. Two deputy commissioners and two helping teachers were actually appointed. Despite this turn of events, Commissioner Dempsey noted ruefully in the fifth Biennial Report of the state board and commissioner of education that "reasonably adequate and prompt service has been rendered" (41).

One positive feature of the act is that it empowered the state board to establish minimum standards for state approval and state aid. Minimum essential standards were established by 1924, and the board also issued suggestions for improving the schools. Standard courses were required...
in 4-year high schools, senior high schools, junior high schools, and 2-year high schools. Special provisions were made for one- or two-teacher high schools, which were justified only if qualified teachers and suitable equipment were provided.

The years following the legislation of 1923 were, on the whole, quiet ones in Vermont. Educators seemed to breathe a sigh of relief; the reform pressure no longer existed. The familiar routines prevailed once more. The state department had not lost its enthusiasm for action; Dempsey reported critically in 1924 that "the state is in the peculiar position here of doing less for its superior young people that are devoting themselves to the training and education of the youth of Vermont than it is for its insane and criminal charges" (42). What had happened, however, is that the state and the public had ceased to listen to the educational innovators. Dempsey could report the problems facing Vermont education, and he did—telling the public about the problems of the rural schools, which were losing nearly one-third of the school directors every year—but little was done.

One significant reform movement that the department was able to maintain was its drive for the standardization of rural schools. The board sought to ensure that every school building be maintained in excellent repair. It declared through manifestos and visiting committees that schools should be attractive, grounds suitable for play and exercise, classrooms properly lighted, heated, furnished, "cheerful, clean and pleasing," and that there be adequate sanitation facilities and ample supplies of books and other educational materials (43).

The board had hoped that state aid could be used as an inducement to the towns and communities to operate standardized schools: obviously, with the mood of the Legislature, this was not forthcoming. But the drive to maintain good standards for the schools was aided by the generosity of private benefactors, notably former Governor Redfield Proctor and Miss Emily Dutton Proctor, who offered annual prizes to the rural school in each county that showed the greatest improvement between March and September. The drive to standardize the schools was quite successful. In 1920-21, a survey of Vermont schools had revealed no satisfactory school facilities in the state. By 1922, there were 16 standard and 8 superior schools; by 1924, 60 standard schools and 41 superior schools. Four years later, 242 schools were in the standard and superior categories (44).

Commissioner Dempsey's achievements in the face of a general mood of public indifference were impressive, and it seemed in 1930 that the tide was about to turn in his favor, when he ran into trouble. Apparently an influential legislator had a daughter who was interested in being a teacher. The girl was not qualified, and Commissioner Dempsey refused to certify her to teach in Vermont. The result was that the legislator, lobbying among his colleagues, managed to get enough votes to pass a bill cutting Dempsey's salary. As soon as the salary cut was passed in June 1931, Dempsey resigned to take a job as superintendent of schools in Arlington, Massachusetts, at a considerably higher salary (45).

**REORGANIZATION AND REFORM IN THE 1930's**

Meeting in Rutland, Vermont, in September 1931, the State Board of Education elected Francis L. Bailey as commissioner of education. One of 42 candidates the board interviewed, Bailey had recently taken a doctorate at Teachers College, Columbia University, and was recommended by the faculty at Teachers College. Although Bailey was young enough to be called the "boy commissioner" by his fellow superintendents at national and regional conferences, he brought an interesting and varied educational experience to his new position in Vermont. Born and reared in Michigan, Bailey had studied at the University of Michigan, receiving his B.A. in 1921. On graduation he accepted a position as high school principal at Harbor Springs, Michigan. After 3 years in this position, he returned to study for a master's degree at the University of Michigan.

In the spring of 1924, one of Bailey's professors asked for a volunteer to go to hear "that great American educator, Carleton Washburne," who was speaking in a nearby community. Bailey volunteered and, impressed with Washburne's account of his educational experiments in the Winnetka, Illinois, school system (46), talked with Washburne after the meeting. Washburne, app. lently impressed with the young man, offered him a job with the Winnetka school system. As head of the science department, Bailey involved himself deeply in Winnetka's plan of individualized instruction and found the system to his liking. In 1928, Bailey returned to graduate work at the University of Chicago and then at Teachers College. After 2 years at Teachers College, he accepted the state commissioner's position in Vermont (47).

The state board welcomed the young man, and Bailey found the members of the board to be "very cordial and cooperative." Despite the spirit of cordiality, Bailey's work was complicated by Vermont educators' struggle to maintain reasonable standards of education despite a desperate shortage of funds produced by Vermont's determination to survive the Depression by severe austerity measures. Bailey had the unpleasant task of telling the local schools that the state could not help them weather the financial crisis, which the state board blamed on Franklin Roosevelt's "bank holiday." Bailey, himself, was forced to accept a 20-percent cut in his salary. It is a tribute to his energy and skill that anything at all was accomplished during the
depths of the Depression, when it was a day-to-day question whether the schools could remain open for the requisite number of weeks (48).

Shortly after Bailey took office, the board authorized him to make a study of the status of teaching in Vermont schools. The board also discussed the educational recommendations of the Vermont Commission on Country Life, which had been published in 1931 (49). Two of the more interesting sections of the report dealt with state aid to education and state supervision of education (50). The commission had suggested that state aid to education would be spent far more efficiently if the Legislature could be persuaded to return to the more consistent school supervision procedures of the pre-1923 period. Thus the state could cut down administrative expenses in the name of reform.

In the spring of 1933, Governor Wilson appointed Mortimer Proctor and Howard Rice, chairman of the appropriations committees of the House and Senate respectively, to a committee to study Vermont education. The Proctor Committee was instructed to economize on state aid to education. The committee, which turned much of its work over to a retired educator, Don C. Bliss, studied the reports of the Vermont Commission on Country Life, talked with high school principals around the state, and decided that a threefold reform program was necessary. First, the state should grant an immediate increase of 50 percent for state aid to education; second, a more efficient system of school supervision should be established for Vermont's schools, returning them to a system similar to that which had existed prior to 1923; third, the Legislature should approve the establishment in the state department of a number of positions that would contribute to the increased professionalization of Vermont school administration. Among the new positions recommended by the committee were a director of guidance and research, a director of health and physical education, a state supervisor for high schools, and additional state helping teachers. These recommendations—coming but a year after the Governor had talked with leading educators about the possible necessity of closing some of Vermont's schools—revealed that Vermonters were willing to tackle their educational problems even during the Depression.

The Legislature of 1935 received the committee's recommendations favorably, enacting them into law virtually unchanged. One recommendation called for the redistricting of the state into more efficient supervisory units. The state passed the legislation in the early spring and charged Commissioner Bailey with carrying the redistricting by July 1, 1935, but provided no instructions on how it should be done (51).

Commissioner Bailey, who carried out the redistricting with Carl Batchelder, his deputy commissioner, remembers the spring of 1935 as one of almost continuous meetings at which he was charged with the delicate chore of persuading reluctant school committees to hire qualified superintendents to replace the existing supervising principals. Bailey, a gentle man with firm convictions, was convinced that replacing casual supervision with professional supervision was an absolute prerequisite for improving Vermont schools. He was faced with hostile principals who resented the "autocratic" power the Legislature had placed in the hands of the commissioner, whom some of them nicknamed "Emperor" Bailey.

Bailey often achieved his objectives by exhausting the opposition. He remembers one particularly long and arduous session in Bennington that did not get down to business until midnight and then only resolved on a superintendent when dawn was approaching. Bailey also brought candidates for the superintendency to these meetings, so that the instant the school committee decided it would have a superintendent, they could get down to selecting a man for the position (52).

By June 1936, Bailey could proudly report that the number of supervisory units had been cut from 88 to 62. There were only nine supervisory principals remaining. That 79 school committees were persuaded to join supervisory unions testifies to the energy and determination of the commissioner. Bailey also reported that the average union district consisted of five towns and an average of 47 teachers.

The other important part of the legislation of 1935 provided for a dramatic increase in state aid to education. In calling for increased aid, the Proctor Committee's report insisted on the principle that the state had an obligation to maintain equal educational facilities throughout the state, just as it had an obligation to construct highways and provide for common defense (53).

In attempting to equalize the schools, the state board was simply recognizing that local districts varied widely in their ability to support their schools. The new law on state aid to education guaranteed that poorer districts, defined as those with a tax list of $10,000 or less, would receive sufficient state money to provide $15 per pupil. The law also provided that richer districts, those having a tax list greater than $10,000, would have their percentage of state aid reduced (54). As a result of the new law, Commissioner Bailey was able to report that "the new method of computing state aid has resulted in a much fairer distribution than formerly, and it is now possible to increase materially the aid to the poorer districts and to do much to lessen their load" (55).

Bailey saw a number of other significant changes in the state department during his tenure. He was authorized, for example, to appoint a director of secondary and vocational education, a position which its first occupant, Ralph E. Noble, less pretentiously called "high-school supervisor." Bailey later recalled that Noble did "a marvelous job," setting up committees throughout the state that revised,
updated, and improved high school curriculums. In conjunction with Deputy Commissioner Batchelder and Noble, Bailey also extensively revised qualifications of superintendents, principals, and teachers. Throughout, the intention of the board and the commissioner was to upgrade and improve the quality of both administration and instruction in Vermont schools. For the first time, for example, superintendents were required to be college graduates with a minimum of 24 hours of professional education courses and 5 years of secondary school teaching experience. This forced “the lot of superintendents who were farmers’ wives” out of the superintendencies that they held and contributed to the increased professionalization of Vermont schools.

In line with these other changes, Bailey’s office began to spearhead a drive to make the state normal schools 4-year colleges. Bailey saw that Vermont faced an acute teacher shortage that could not be met by stopgap measures but required a comprehensive study of Vermont’s teacher needs. Much of the information and evidence needed to provide a comprehensive picture was obtained by Bailey himself in the course of preparing his book, *A Planned Supply of Teachers for Vermont*, which was published by Columbia University in 1939. He discovered that by 1936-37, it had become necessary to employ approximately one-third of all beginning teachers from outside the state. He was convinced that it was impossible for Vermont to continue to obtain teachers this way. Thus, during his commissionership, he had an excellent understanding of the state normal schools became once again a live issue—one which was still very much alive in 1968.

Another development during Bailey’s term of office was a relatively constant expansion of the state department staff. When Bailey took office in 1931, the commissioner was assisted by an executive clerk, two deputy commissioners (56), a secretary, and a certification clerk. By 1938, the staff had been expanded to include a director of secondary and vocational education, a director of educational research and guidance, a director of vocational rehabilitation, two state helping teachers, seven state supervisors (57), an executive clerk, a draftsman, and three stenographers. While part of this expansion was due to Vermont’s recovery from the Depression, it also undoubtedly reflected the increasing demands made on the department and its increasingly professionalized response to these demands.

During his commissionership, Bailey also moved to break down the isolation that had traditionally characterized Vermont towns. Under his prodding, four regional state school director’s groups were formed in 1935. These groups had two objectives. First, through conversations and professional meetings, superintendents and principals were encouraged to think of themselves as channels through which educational suggestions could be offered to the Legislature. Second, the groups were regarded as agencies for improving state and local cooperation. The commissioner clearly realized that if a sense of shared goals and purposes existed, state and local officials would cooperate with one another far more readily.

From the perspective of a quarter century, former Commissioner Bailey is pleased with his work in Vermont. What he remembers are the pleasant associations and the congenial conversations and the lasting friendships. By 1939, however, Bailey was growing weary of the unending round of conferences, state principals meetings, visits to schools, school boards, and PTA’s and talks with teachers. When officials of Gorham State Teachers College in Maine offered him the presidency of that school, he accepted, welcoming the opportunity to spend more time at home with his wife and son.

**INNOVATION AND INCREASED RESPONSIBILITIES**

When the board asked Bailey about candidates to succeed him, he unhappily recommended his supervisor of high schools, Ralph E. Noble, who had just been appointed superintendent in Springfield, Vermont. In September 1940, Noble became commissioner of education. Noble had entered the state department in August 1935, after resigning as superintendent of schools in Barre, Vermont, and had been actively involved in efforts to upgrade the quality of high school instruction in the state. Since he had been with the department for 5 years prior to assuming the commissionership, he had an excellent understanding of the workings of both the board and the department.

Noble also had been one of the most important figures in one of Bailey’s chief innovations. As supervisor of high schools, Noble had been charged with drawing up a directory of approved academies and high schools, a traditional function of the department. To this, he added the regular collection of annual data on the high schools: statistics on enrollments, different kinds of students, grade distribution, number of teachers, and the number of students they were responsible for. This reasonably sophisticated data collection was an essential prerequisite for the state-wide planning with which the state department had become increasingly involved.

Noble’s term as commissioner was one of consolidation. He conceived of his role as executive and administrative head of the state board, whose role was legislative and advisory. In Noble’s mind, the only question that was likely to become critical was that of money, and, as Judge Horatio Luce, a member of the board, once remarked in his presence, “Ralph always has the money to do what he wants” (58). Despite his knowledge of the intricacies of board politics and his concept of the commissioner as chief executive, Noble’s administration accomplished little of the kind of innovation that had taken place during Bailey’s term (59).
Noble's administration was not without its excitement, however. When the schools opened in 1940, America faced a strained and foreboding outside world. Another war in Europe was imminent. Out of this uneasiness and tension arose a controversy over the use of the textbooks of Harold O. Rugg in Vermont's schools. The opening salvo of the controversy was fired in the fall of 1940 by the *Burlington Free Press*, which accused Rugg of arguing "that the American way of life is obsolete and should be scrapped in favor of a new social order of a collectivistic type patterned after Marxian socialism" (60). As public concern over the *Free Press* accusations deepened, Noble found himself under pressure to act against the use of the Rugg texts in Vermont schools. Noble told inquirers, "I personally should be very much opposed to a state adoption of textbooks since I think that is just the sort of undemocratic procedure to which we are all opposed. The governments of totalitarian states tell their communities what instructional material to use" (61). Fortunately, Vermont tradition upheld Noble, and in October 1940, the State Board of Education announced its policy to the newspapers:

Since 1833, one hundred and seven years ago, when the first Board of Education was legislated out of office for prescribing textbooks, for the public schools throughout the state, no Vermont State Board of Education or Commissioner of Education has had jurisdiction over the selection of books to be used in any schools (62).

The Rugg textbook controversy raged intermittently for the next 13 years, but the state board did not waver in its conviction that textbook selection was a matter for local determination.

Noble was convinced that the state had an obligation to increase its support for education. In October 1940, the board reported its opinion "that no money could be appropriated to better advantage than that for increasing 'state support' for education, in view of the fact that it not only would further extend equal educational opportunities, but also help to relieve the tax burden in some towns" (63).

The commissioner's term of office was adversely affected by the outbreak of World War II. In Vermont, as elsewhere across the nation, educational innovations, whether in new school construction or in the introduction of new programs, came to a virtual halt. Commissioner Noble spent a great deal of his time during the war years trying to cope with a desperate teacher shortage, when thousands of Vermont men left the state to fight, and many women left teaching to go into defense plants. Noble was forced to adopt the expedient of granting special war emergency certificates to teachers who were, for a variety of reasons, no longer eligible for regular certification in Vermont (64). The department also was forced to employ upper-class students from the three state normal schools to teach regular classes in the schools. It was only through efforts of this sort that Vermonters were able to keep many of their schools open at all. One major complicating factor was teachers' salaries, which were increasingly unattractive in a period of rising prices and rising wages (65).

Commissioner Noble, acting under instructions from Governor William H. Wills, also turned his attention to the problems of planning for postwar schools. Politicians and educators alike were aware that peace would bring formidable problems when veterans who had interrupted their education would return to finish it. Given the initial shortage of teachers that confronted him daily, it is not surprising that Commissioner Noble emphasized teacher training and recruitment in his analysis of the problems Vermont education might face after the war. To get a sufficient number of good teachers, Vermont needed a wage comparable to that offered in other fields of endeavor. Noble called for "the establishment of a minimum salary of not less than $1,000 per year for the elementary teachers." Without something of this sort, Noble suggested, "the children of our state are bound to lose their just right to a good education" (66). In addition to raising teachers' salaries, he also suggested that the state department actively recruit teachers by visiting secondary schools. Noble saw the task of recruiting teachers as the duty of society—clubs, parent-teacher organizations, and individuals interested in the schools.

The growth in the department continued during the postwar years. The state normal schools at Johnson, Castleton, and Lyndon were made state teachers colleges in 1947.

The war and the U.S. Army's widespread use of training films persuaded many of the educational value of films; in April 1947, the board approved a visual education plan which created a Vermont Film Pool "to supply visual education films and instructional help to the schools" (67).

Also in the immediate postwar years, the board began to function as an accrediting agency for all state schools. This authority was conferred on the board in 1940 by the secretary of state but was little exercised during the war years, when standards of accreditation were stretched to include any school that could stay open. After the war, however, the board evolved a policy toward accredited institutions. The board's requirements for accreditation were such that the "lower courses" of study in the normal schools had to be eliminated. In 1948, the board decided that "with the fall of 1949 no teachers college students could be enrolled for less than the full four years course . . ." (68).

After the war, Vermonters became increasingly concerned about federal aid to education. The hot lunch program and aid to vocational education, the latter provided to the states under the Smith-Hughes Act, had been accepted in Vermont and were generally regarded as smooth operations. There existed, however, widespread conviction that federal aid would bring about federal control of the
education, Vermont and the state board were faced with a concern of government. Yet, as the federal government began to reach easily: He formulated it and wrote the statement, "It believes strongly however that federal aid distinctly designed to aid the process of education itself should be confined to the development of a system of tax-supported public schools to which this nation has long been committed—a nation which is still in a process of struggling to overcome the economic barriers which still hinder the achievement of a free and equal educational opportunity for all children wherever they may live (71). Commissioner Noble remembers that this policy was reached easily: He formulated it and wrote the statement, and the board approved it. These principles governed Vermont's attitudes toward federal aid in the late forties, and, despite heavy incursions caused by massive doses of post-Sputnik federal aid, Vermonters still maintain a firm devotion to the independence of their schools.

Noble also was one of the leaders in the postwar establishment of the Vermont Higher Education Council, which has served as a valuable evaluator, critic, and friend of higher education in Vermont.

In May 1948, Dr. Noble submitted his resignation in order to become president of Vermont Junior College in Montpelier. His tenure of office had been during a rocky period for Vermont education. His achievements, in view of the obstacles he faced, were impressive.

Unlike Bailey, who had urged Noble's appointment to succeed him, Noble remained aloof from the board's search for his successor. The leading candidate was John C. Huden, president of Castleton State Teachers College, longtime Vermont educator, and author of The Development of State School Administration in Vermont (72), a valuable contribution to the history of education in Vermont. Huden, however, was clearly identified with the existing educational establishment in Vermont, and those who advocated educational innovation cast about for a different candidate. Huden's chief opposition came from A. John Holden, Jr., longtime career educator, a Vermonter, who was then in the Department of Education at Geneseo State Teachers College in New York State. Huden also was unpopular with the proponents of local schools. In his book, Huden spends a good bit of time castigating proponents of localism in Vermont education who failed to see the virtue of centralized administration for the state. Holden, while certainly every bit as strong an advocate of an efficient central education for Vermont schools, had been less conspicuously outspoken on the subject than John Huden.

The board interviewed both candidates in October 1948 and the next day offered the commissionership to Dr. Holden, who accepted. Holden brought an impressive educational background to the commissionership. An engineering student at Harvard, he had taught in Vermont elementary schools, spent a year abroad studying European systems of education, had been a superintendent of schools in Danville, Vermont, for 7 years, and had, after receiving his Ed.D. from Teachers College, Columbia University, in 1943, served as a professor of education at Middlebury College and as a member of Middlebury's school board. He had moved to Geneseo in 1947, just 2 years before he became commissioner of education for Vermont.

Dr. Holden spent just over sixteen years in the commissioner's office—from 1948 to 1965. Under his leadership, both the quantity and kind of services required from the State Department of Education were expanded, especially in the area of planning, curriculum development, and information gathering. The kind of contributions that the department would be asked to make in the years to come were suggested in an administrative reorganization of the department, which took place shortly after Dr. Holden took office. Directorships of health and physical education and educational planning were established. The latter post, to which Winn L. Taglin was appointed, is the significant one; it was not long enough for the state department to administer and care for the existing educational structure; it now also had the specific responsibility for planning Vermont's educational future. This high regard for planning grounded in reasonably sophisticated information was also reflected in Holden's conviction regarding school construction that "good business dictates that no building should be erected until a careful study has been made as nearly as
possible (of) the probable educational program that building should have twenty years in the future" (73).

This matter-of-fact devotion to planning characterizes Holden's administration. Rather than proceeding from preconceived educational theories, the commissioner tried to build an empirical case and then decide what was likely to be the best move for the educational future of Vermont.

As Vermont approached midcentury, it was becoming increasingly evident that it had not been keeping pace with its educational needs and that Holden's talents for planning and proceeding empirically would be useful. Population growth, which had been relatively static up to World War II, had begun to accelerate. The total population, which had actually decreased slightly during the decade 1930-40, began to climb upward.

Also, Vermont's population began to take on a new character. It was no longer true that "Vermont was 51 percent Republican and 49 percent cows, and both Republicans and cows live in the country or in small towns" (74). Vermont's large towns were getting larger while the small towns dwindled. This meant, as Commissioner Holden pointed out, "that life in Vermont is more varied than it was fifty years ago, that there are more different kinds of people with more different kinds of occupations and many more different kinds of educational needs" (75). This change held a threat for Vermont schools.

The state obviously needed new school facilities to accommodate increasing numbers of students. Between September 1945 and September 1949, Vermont's first-grade population increased significantly, and estimates of future growth predicted that the increase in population would continue. This meant that Vermont towns would increasingly face the pressure of an expanding school population with an educational system that was barely adequate to meet present needs.

Vermonters faced the challenge to build more schools. The Legislature in 1949 had granted the state board the authority to "accept, use, disburse and account for" federal funds for building construction. Also, under the terms of this act, the state board had been authorized to make a survey of Vermont's school needs. The School Housing Survey of 1950 estimated that the state would need to construct 106 new school buildings between 1950 and 1962 and to renovate and modernize 150 more. This, the survey estimated, would cost close to $25 million. Faced with this staggering task, Vermonters once again became concerned with their schools. Education in the 1950's became a live public issue.

Responding directly to the problem, groups of citizens and educators from 43 towns began to study the possibility of more effective and more economical education through their combined efforts. They were encouraged in these efforts by the School Survey of 1950, which reported that the average per-pupil cost in high schools of less than 100 was $242.89, and in schools over 200, $207.68 (76). Yet it was not only a question of dollars and cents. Travel, especially in the winter months, is difficult in Vermont. Many parents objected to having small children carried several miles to school each day. Also, neighborhoods were often fearful that closing the neighborhood school would result in a diminished social life for the community.

Despite the fact that most Vermonters wanted to move ahead, they also felt a comparatively intense wish to conserve "that face-to-face human feeling which Vermonters so justly cherish" (77). The state board was obviously feeling the public pulse when it announced in September 1949:

The State Board of Education is definitely and unanimously of the opinion that no one pattern of local school organization—consolidation or decentralization—would under the present conditions be good for the State of Vermont as a whole. But though no one pattern may be good for the whole state, each locality is faced with the necessity of working out its own pattern of school organization (78).

To help Vermonters plan for their schools, the state department offered itself as a resource for information, planning assistance, and educational guidance. It published a pamphlet entitled "A Guide of Citizens Action for the Public Schools" to help "local citizens to improve their schools while keeping them the people's schools" (79).

The Vermont assembly took action on the question of school construction with Act No. 256 of the 1953 Legislature, by which the state authorized state aid for school building construction. During the first year of operation, the state spent $303,811 for new construction in 20 districts and $1,430,927 in "retroactive" aid to 55 districts out of the total 1953 appropriation of $7,880,000 (80). This amount, despite an additional increase of $1,800,000 in 1957, was by 1958 clearly not sufficient. In fact, an estimate in that year suggested that Vermont would have to spend at least another $8 million on state aid for school construction. Although school construction did not go as rapidly as many would have liked, by 1960, significant progress had been made and the state was "definitely gaining in its effort to provide safe, healthful and educationally efficient buildings for all Vermont school children and their teachers" (81).

Like his predecessor, Holden faced considerable problems in getting and keeping enough teachers to staff Vermont schools. Despite the effectiveness of Commissioner Noble's efforts to attract students for Vermont's teachers colleges (82), Vermont still faced a severe shortage of teachers, particularly on the elementary level. Part of this shortage was due to increasing enrollment; part was due to low salaries; another part was due to poor facilities at the state teachers colleges.
Holden reported:
The young prospective teachers want and are entitled to colleges which can compare favorably in program and facilities with other colleges. Not one of our teachers colleges has a trained librarian. Not one of our teachers colleges has a gymnasium. The new dormitory at Castleton is a step, but a very small one, in the direction of supplying facilities worthy of a college. It must be followed up by further planned improvement at Castleton and at any other colleges which are designated for development as permanent teachers colleges (83).

By 1957, the board had decided that future needs would demand that all three facilities be kept open and, in early 1957, recommended that—

It should be the policy of the state to develop improved facilities at all three teachers colleges and introduce more varied programs in order to help to provide opportunity for education beyond the high school to the greatly increased number of young people who will be seeking it within the next few years (84).

The Legislature approved this policy by voting funds for expansion and staff increases. Vermont's commitment to the state teachers colleges, which had been wavering for 50 years, was now solid. Concern over the fate of the teachers colleges did not end with the 1957 legislation, however. It took another direction, and increasingly the Legislature was pressured to take control of the state colleges away from the board and vest it in the hands of a separately constituted body. This drive ended only in 1961, when the Legislature established the Vermont State College Corporation to govern the state colleges. Direction of, and consequently the future of, the state colleges is an issue which has dotted the pages of Vermont newspapers in recent years.

Slow progress was made toward providing Vermont with an adequate supply of teachers during the fifties. The most effective device for encouraging men and women to teach in Vermont was, naturally, raising the minimum salary, which was consistently increased through the fifties and into the sixties. Vermont, however, still pays teachers poorly. The 1966 Biennial Report of the state department suggests: "Teacher recruitment is an area that needs urgent attention. The shortage of qualified teachers and educational specialists appears to grow more serious each year" (85).

Another significant development in Vermont's efforts to meet the challenge to education in the middle of the twentieth century was the drive to establish union or consolidated schools. The School Facilities Survey of 1951 had revealed that larger schools were more efficient in terms of pupil cost. But the building, organization, and supervision of the larger schools posed problems in state and local relations. The state board therefore felt obliged to go slowly. Commissioner Holden, who was very much aware that he could not be "high-handed in his dealings with local school officials," was, however, deeply committed to the principle that "the education of all of the children of the state is the responsibility of all the people of the state" (86). But he also wisely recognized that all the people of the state could not be coerced into educating all the children. Therefore, Holden proceeded by persuasion and argument; in area after area, the state department provided information, consultation, and guidance to citizens groups seeking means of consolidation. The department also provided guidelines for the establishment of union schools and for the kinds of services that the union schools should provide.

In many ways, Vermont had the nucleus of a union high school system before the establishment of the first union high school district in Bennington in 1952. Very few of Vermont's high schools were strictly home-town schools: the vast majority educated tuition pupils from other communities. Most Vermont high schools were regional schools in the sense that they served not one town but a group of towns. Existing informally, however, this system had two distinct disadvantages. The people who sent their children to high school in another town had no voice in the policies and operation of the school. The town that maintained the school operated at a disadvantage because it could not appeal to the other towns or to the state for help with the cost of additional construction.

The State Board of Education sought in the early fifties to take advantage of the spirit of cooperation that existed in many regions of Vermont to create union schools that would better meet changing educational needs. This has not always been an easy task; local interests have prevented the formation of some union schools, while other attempts have bogged down in a financial and bureaucratic morass. The trend toward union high schools has been supported by the State Department of Education and the Legislature. Since the basic law governing the establishment of union school districts was enacted in 1953 (amended in 1955 and 1961), 16 union districts have been established in Vermont. Commissioner Holden reported in 1964 that the evidence indicated that they were successful in providing a broader and more effective range of opportunity for young people of secondary school age. Presumably, the success of existing union schools will make the formation of new ones more desirable.

Another significant modern development in Vermont education has been the diminishing effect of Vermont's rural isolation. Better highways, improved communication facilities, increasing numbers of what Vermonters are fond of describing as "permanent summer residents," and a variety of other factors have contributed to a more widespread willingness of Vermont communities to consider themselves part of the state and nation. A factor that has also contributed to this increasing cosmopolitanism, at least in education, has been the active drive of the board and the department to encourage citizens of Vermont to find out what is going on in their schools.
One of the most interesting contributions made by Holden to publicizing Vermont's educational progress and problems was his experiment "Operation Listen." Operation Listen consisted of 13 meetings, held throughout the state, at which various members of the board met with local citizens to exchange views and information on Vermont education. These meetings were a success. The discussions were vocal, excited, and tremendously educational both for the public and for members of the state board, the commissioner, and his staff. As Holden reported in a memorandum to the board: "It was clear at most of these meetings that people wanted to know more about the state's educational system, its status and its problems" (87). Also, Commissioner Holden and the board were able to learn what concerned the public and what they wanted done. Chief among the concerns of the public were educational standards, curriculum development, local supervision, and state aid to education. As a result of Operation Listen, the state department intensified its efforts in these areas.

While Operation Listen has not been repeated, it did have valuable effects on both professional educators and the citizens of Vermont. One of the interesting developments resulting was a mimeographed newsletter entitled "Vermont Future," which dealt with educational developments in Vermont and was a conscious effort on the part of Holden to keep the public informed. The newsletter later had to be abandoned for lack of staff and funds. It was Commissioner Holden's personal vehicle from the beginning; he wrote most of the articles and edited the newsletter. This alone was a formidable task which was made more burdensome by the fact that every word of the newsletter had to be approved by the State Board of Education (88). Ultimately, "Vermont Future" became just too time-consuming, and Holden had to give it up despite its obvious educational value.

**RECENT DEVELOPMENTS**

Dr. Holden retired in September 1965. His successor was a young educator from Pennsylvania, Richard A. Gibboney. Dr. Gibboney regarded himself as an innovator and immediately took steps to increase the tempo of educational change in Vermont.

Gibboney's innovation plans for Vermont education were aided by the passage of the federal government's Elementary and Secondary Education Act of 1965 (ESEA). The state department, under Gibboney's direction, quickly took advantage of the federal government's offer of money: in 1965, the department sponsored two Title V projects. The first of these was a study of audiovisual education in Vermont. The second was a Student Advisory Conference, at which high school students throughout the state aired their views on education.

In 1966, Gibboney's initiative sparked work on a Title III project entitled "Planning for Education Innovation in a Rural State." This project became a model for a systematic study of Vermont teachers and classrooms. The project's goals were, of course, improving instruction. This project came to maturity in January 1968, when the federal government provided funds for three Regional Action Centers in Vermont. Two more centers were approved in April 1968 and were operating by that summer, thus completing the statewide plan for the systematic improvement of instruction in Vermont. The plan will be carried out by action center personnel working in cooperation with local school superintendents, and the program will be financed in part by ESEA Title III funds and in part by funds from participating local school districts.

Gibboney also reorganized the state department on the basis of plans drawn up by Arthur D. Little and Company of Boston. Reorganization included establishing a research and development unit, hiring a program coordinator to do liaison work among branches of the department, and a number of other administrative changes.

The atmosphere of Gibboney's administration was one of action. The Montpelier Times Argus reported just before Commissioner Gibboney's resignation that the state department was involved in over 135 separate major educational programs. Not all Vermonter, however, were convinced that the sense of motion around the commissioner's office was purposive or necessary. Rumbles appeared in the press about "change for its own sake." Finally, Gibboney, recognizing what one board member called an unresolvable impasse which inhibited the leadership he could bring to education in Vermont, submitted his resignation in July 1967.

Gibboney's deputy commissioner, Daniel G. O'Connor, was named acting commissioner of education and served competently in this capacity until Harvey B. Scribner of Teaneck, New Jersey, was appointed commissioner in December 1967.

Increasingly in this century, Vermont has become convinced of the truth of what educators had long argued—that "our educational system has become the most important public function of our nation and our state. It is in our Vermont schoolrooms and in the schoolrooms all over our country ... that the future of our country and our world will be determined" (89). In 1968, prodded by the post-Sputnik national controversy over education, stimulated by increasing amounts of federal aid to education, and more conscious of public interest in their schools, Vermont educators faced a challenging future. Most of the foundations for a truly excellent educational system existed in Vermont in 1968. The problem was to build on them. As the State Board of Education commented in 1966,

These are exciting days in education. Never has there been as great an opportunity to continue past efforts in
the slow progress of renewing our schools to meet today's needs while carefully beginning new efforts for improvement so that youngsters now in school may compete successfully in the unknown and somewhat frightening world of the twenty-first century—now only half a life time away (90).

FOOTNOTES

1. Dorothy Canfield Fisher, "Let the Bridges Fall Down" (unpublished manuscript in the Wilbur Collection, Bailey Library, University of Vermont).

3. Within the framework of Vermont's revenues, the state has done reasonably well by its educational system. The reader should also bear in mind that "education is only one service of government. If state expenditures for non-educational services, say highways or welfare, are inordinately high because of special circumstances, should the state be blamed for spending less on education than other states in which non-educational expenditures are lower?" This qualification, raised by Stephen K. Bailey, et al., Schoolmen and Politics: A Study of State Aid to Education in the Northeast (Syracuse, N.Y.: Syracuse University Press, 1962), p. 17, should be remembered. It also should be remembered that local taxes in Vermont, which go in large measure to the schools, have been high. Vermont's per-capita expenditure on education is above the national average now and has been close to the national average throughout the century.

4. From 1900 to 1950, Vermont registered a population increase of only 9.9 percent, compared to New Hampshire's 29.6-percent increase and the national increase of 98.3 percent. Six of Vermont's counties showed a population increase while the remaining eight declined. The rural population declined by 27,675.

50. The committee on education had been headed by Katherine M. Cook of the U.S. Office of Education. Her committee criticized Vermont’s reliance on local taxation to support the schools and demonstrated the virtual impossibility of smaller towns’ effectively providing for education without substantial state aid designated to equalize the schools. Her committee also was critical of the lack of staff resources in the State Department of Education and dismayed at the ineptitude of large numbers of Vermont’s town superintendents and supervising principals.
51. Vermont, Public Act No. 86 (1935), sec. 7. This act provided that “The State Board of Education through the Commissioner of Education, acting as the executive officer of the Board, shall as soon as possible combine the several school districts of the State into supervisory unions each approximating fifty teachers with districts grouped in the interest of convenience and efficiency . . . .”
52. Interview with Francis L. Bailey, November 26, 1967.
53. Board of Education, Biennial Report (1936), p. 8. In accepting the “foundation formula” that state aid to education was primarily concerned with supporting “public education at a level deemed essential to children in all parts of the State,” Vermonters had recognized the “creative work” of a small group of professors from Teachers College, Columbia University, who had since World War I tried “to devise a means of superseding a hodge-podge of patently inequitable state quota grants, and for using state resources to upgrade generally the quality of public education — especially in rural areas.” For a good discussion of this point, see Stephen K. Bailey, op. cit., pp. 17-19.
55. Ibid., p. 14. It should be noted, however, that the State Board of Education had no authority to determine the amount of its tax dollar a local district could spend on its schools, and consequently disparate school systems continued to develop. This crucial question of local willingness to pay was not a real consideration in 1934.
56. In 1933, Bailey was deprived of one of the deputy commissionerships—a position not reestablished until World War II. Board of Education, Biennial Report (1936).
57. State supervisors included one for health and physical education, two for agriculture, two for home economics, and one for trade and industries. Board of Education, Biennial Report (1938).
58. Dr. Noble, at least, remembers it this way. He also commented that Commissioner Bailey had had “some tough fights” and that his own tenure of office was a good bit smoother. Interview with Ralph E. Noble, November 16, 1967.

73. Board of Education, Minutes of the September 15, 1949, meeting.
78. Board of Education, Minutes of the September 15, 1949, meeting.
80. Board of Education, Biennial Report (1954), p. 8. Since the act gave the state board the authority to approve of “new construction for wards of state assistance,” the board from this point on was greatly involved with resolving questions about what district should get what money and when. Also, this authority gave the board considerable leverage in its drive to standardize at least the physical quality of Vermont schools.
82. Enrollment in Vermont’s teachers college increased 26.9 percent between 1948 and 1949, compared to a national increase of 8.5 percent.
88. Former Commissioner Holden reports that the board was generally very fair-minded but that occasionally the meticulousness of its criticisms could be irksome. In one instance, the board insisted that he revise the phrase instructional anarchy to read instructional chaos. Holden remembers in this instance that he meant anarchy; he did not mean chaos, and to a sensitive reader the words have different connotations.

BACKGROUND AND BEGINNING, 1607-1900

The Virginia Colony, established at Jamestown in 1607, was a commercial enterprise of the London Company. Unlike the Pilgrims, who fled to the New World to escape an autocratic church and state, the Virginia colonists sought to extend English rule in America. Whereas the settlers at Plymouth voluntarily agreed to govern by vote of the majority, those at Jamestown followed the less democratic practices of England. A majority of the first settlers were members of the English aristocracy. The system of land grants favored this group, which emerged as a strong upper class, holding most of the land and political and economic power for generations. Large numbers of immigrant laborers, indentured servants, slaves, and artisans followed to make up a second social class, which was markedly lower. A strong middle class did not develop for nearly two centuries.

Large plantations held by the aristocracy were the centers of an agrarian economy. The plantation order was mainly a decentralized society, for roads were poor and distances between plantations were relatively great.

Beginnings of Education

The colonists' institutions (political, religious, social, and educational) generally paralleled those of England. The values, ideals, and ambitions of the two peoples were similar. The colonial belief that education was a private rather than a governmental function corresponded to the English system. Governor William Berkeley characterized this educational policy as "the same course that is taken in England...every man according to his ability instructing his children" (1). The gentry could afford private tutors; the only "public" schooling was in the form of charitable aid for orphans and indigents.

Since the first settlers in Virginia were all adults, the colonists had no need for any sort of schooling prior to 1619. In that year, 100 orphans from England arrived with the stipulation that their masters should teach them a trade. This development influenced the pattern of education in Virginia for more than two centuries. Apprenticeship laws enacted in 1643, 1646, and 1672 paralleled the famous apprenticeship and poor laws of England and attempted to provide some vocational, educational, and religious training for orphans, indigent children, and other minors without guardians. Emphasis was on trade apprenticeship, and academic training generally was limited to learning to read and write. A general law of 1705 provided that masters were to be "compelled" to teach orphans in their charge to read and write. This is believed to be the first legislative requirement that reading and writing be taught in the New World (2).

Early Schools

Virginia's first schools were established to aid the colony's sizable group of orphaned and needy children and to supplement the rudimentary educational provisions of the apprenticeship legislation. A short-lived "free school" was established at Charles City in 1620, primarily because of the efforts of Patrick Copeland, a ship's captain. A second school of this type, believed to be the first effective provision for free education in America, was established in 1634 in Elizabeth City County (now the city of Hampton) by the will of Benjamin Symms, a wealthy landowner. Symms bequeathed "200 acres of land and the milk and the increase from eight cows" for the support of this school (3). Other similar schools followed. By 1671, when Governor Berkeley uttered the now famous words, "I thank God that there are no free schools in Virginia," there were in fact several such schools being operated in the colony as a result of endowments (4).

Community/private schools were established during the colonial period, usually as cooperative ventures among neighbors. They were often known as "Old Field" schools, because they were frequently located in fields which were no longer used for farming. Tuition fees, agreed on by the teacher and parents, financed these schools. In some cases, however, schools were organized and begun by teachers, many of whom were clergymen attempting to supplement their incomes. Other teachers were semi-itinerants who relocated frequently, often because of financial uncertainty or lack of community acceptance. Thus, the quality of
schools and teachers was uneven. The community schools generally were local, private, free-enterprise operations.

For the most part, the planters, merchants, and other well-to-do people employed private tutors for their children. In the beginning, these tutors, mostly local clergymen, gave the church a marked influence on instruction. But this influence waned when most of the clergy returned to England at the start of the Revolution. In general, the private tutors were more competent and learned men than were the teachers in community and free schools.

Grammar schools and academies, patronized by the gentry, constituted the other principal types of early schools in Virginia. These were primarily private secondary schools that often included elementary and college level programs. The College of William and Mary, founded in 1693, was the center for higher education.

The pattern established by Virginia's early schools continued to 1860 with few major changes. The academies flourished and formed the backbone of a strong private school system. Free schools, aided after 1820 by the Literary Fund, were charity institutions.

Jefferson's Plan for Public Education

Thomas Jefferson held that public education was vital to democratic government and essential for an informed electorate. He expressed this view in a letter to George Washington: "It is an axiom in my mind that our liberty can never be safe except in the hands of the people themselves and that too with the people of a certain degree of instruction. This is the business of the state to effect and on a general plan" (5).

In 1779, Jefferson introduced in the Legislature "A Bill for the More General Diffusion of Knowledge." The proposal called for a vertical state system of elementary schools, secondary schools, and colleges, crowned by a state university. All white boys and girls would attend free elementary schools for 3 years of 10 months each. Such schools would be located in each ward or "hundred" of every county and would be supported by local taxation. The most able students who completed elementary school would be selected to attend a secondary school at public expense. And the outstanding boys who completed the secondary program could continue for 3 years in one of nine colleges. Boys not selected for education at public expense could continue their schooling if their parents bore the cost.

The Legislature enacted portions of the law, including a clause providing for election of local aldermen, to initiate the plan in each county. However, county courts were made responsible for holding elections of aldermen, and this they failed to do in every instance.

In 1796, the Legislature established a system of primary schools as outlined by Jefferson. Again, however, the county courts were required to take the first steps. Of the outcome, Jefferson said in 1816:

"The experience of twenty years has proved that no court will ever begin it. The reason is obvious. The members of the court are the wealthy members of the counties, and as the expenses of the schools are to be defrayed by a contribution proportioned to the aggregate of other taxes which everyone pays, they consider it a plan to educate the poor at the expense of the rich." (6).

Jefferson was to achieve only part of his plan—that of founding the state university. For nearly half a century, he attempted to establish a state public school system. The failure of his efforts was due partly to the fact that too much was left to local initiative with too little centralization of authority at the state level. Probably this was a result of Jefferson's well-known distrust of a strong central government.

The Literary Fund

When the General Assembly created the Literary Fund in 1810, it established a basis for supporting free public schools. Control of the fund was assigned to a corporate body consisting of the Governor, lieutenant governor, treasurer, president of the court of appeals, and their successors. Initial financial support was provided by "escheats, confiscations, fines, penalties and forfeitures, and all rights accruing to the state as derelict." The principal was invested with income to be used for "providing schools for the poor in any county of the State" (7). Disbursements were to be made only after the fund's income reached $45,000 annually, and they were to be distributed on the basis of population in the counties. The fund was increased considerably in 1816, when it was assigned $1,210,550 repaid by the federal government for money borrowed from Virginia during the War of 1812.

In the beginning, the Literary Fund was used to support higher education, such as tuition scholarships to private schools and aid in establishing the University of Virginia. It was 1822 before disbursements were made for the original purpose—providing primary schooling for those unable to afford a private school education. A total of 8,531 poor white children attended the supported schools in 1823, at an average annual cost of $5.12 per child; 14,169 attended in 1829, at an average yearly cost of $2.82; and 47,320 attended in 1840, at a cost of $1.51.

The fund's local operation was assigned to commissioners appointed by the courts. The commissioners sought out indigent children, aided in organizing the schools (often in abandoned buildings), and disbursed funds for their operation. Use of the moneys for buildings or equipment was not allowed until the Legislature passed the District School Law of 1829. This act empowered the school commissioners to establish district free schools and made local residents responsible for 60 percent of the building costs.
and 50 percent of teachers' salaries, with the balance chargeable to the Literary Fund. However, the maximum rate available from the fund was 4¢ per pupil for each day of school attendance.

Major efforts to strengthen the system were made in 1846, 1851, and 1853. In 1846, the General Assembly provided for the establishment of a local school system under a county superintendent, with commissioners from each district constituting a county school board. This act attempted to build on the existing local school commissioner system; however, it left the matter of local tax support entirely to local initiative and, for this reason, was slow and uneven in becoming effective. In 1851, the assembly added 50 percent of the capitation tax to the Literary Fund; in 1853, it earmarked the entire tax proceeds for this purpose.

These acts established the principle of direct tax support for public education. The fund's effectiveness, however, was hampered for many years because public school disbursements were limited to $45,000 annually. Also, moneys were periodically diverted to colleges and academies. Despite these handicaps, attendance rose from 50,000 in 1850 to 85,455 in 1860.

In 1860-61, the principal of the Literary Fund was $1,877,365, an increase of $316,666 that year, with $298,870 spent primarily for operating a system of primary schools for indigent children. The total expenditures did not include local funds. By 1861, each of the 149 counties had a superintendent and a local board of school commissioners.

The Legislature diverted income from the fund to the defense of the state in 1861, and part of the principal was invested in Confederate bonds. This loss, together with other investment losses since 1810, amounted to $440,837. In 1871, the fund totaled $1,596,069.

Although the Literary Fund was a limited and inadequate basis for a public school system, it did provide educational opportunity for many children and was the only state assistance for education prior to 1871. It established the principle of public money for public schools, provided a rudimentary public school system, and aided in developing the concept of education as a state responsibility. Unfortunately, the fund reinforced the existing idea that public schools were for the needy, and the negative implications of "schools for the poor" persisted. The concept of the public school as a charitable institution was slow to die in Virginia.

The Underwood Constitution of 1869

A state public school system, differing in detail but similar in spirit to one first proposed by Jefferson a century earlier, was established with ratification of the Underwood Constitution in 1869. This Reconstruction measure aroused vigorous opposition, much of which centered on the provisions establishing a public school system. The state had been a battlefield for 4 years; people were weary. Social and commercial institutions had collapsed, and property resources were severely depleted. Many people felt that the cost of a public school system, which would also serve the newly liberated Negroes, comprising about 30 percent of the population, was an unwarranted, unrealistic, and probably unbearable financial burden. Further, many thought that the convention was not representative of the people, since a majority of the members were either Negroes or natives of other states or foreign countries. Convening under the authority of a military government, the convention was not without elements of duress, both implied and real.

The Underwood Constitution provided for a state superintendent of public instruction to be elected by the General Assembly. It also set up a State Board of Education, consisting of the Governor, attorney general, and chief state school officer, that would have the authority to appoint and to remove county superintendents and district school trustees, to manage the school funds, and to regulate all matters involving the administration of the school system. The General Assembly was authorized to adopt compulsory attendance laws and to levy taxes for the support of schools.

Following the convention's adjournment, an anti-constitutional or conservative party formed to advocate rejection of the constitution by the electorate. In a heated campaign the conservative forces were defeated; the constitution was ratified in July 1869 and remained in effect for 30 years.

Beginning of the Public School System

Following ratification of the Underwood Constitution, the General Assembly moved promptly to elect the first state superintendent of public instruction. William H. Ruffner, who had the support of General Robert E. Lee, was chosen from 15 applicants. He was a son of Henry Ruffner, former president of Washington College (now Washington and Lee University), who had long struggled to establish an adequate public school system.

The constitution required the state superintendent to submit a plan for the organization of the state's public school system within 30 days. Aware that any plan for public schools would cause bitter opposition in eastern Virginia, Dr. Ruffner moved rapidly, completing his task within 25 days. His plan outlined in general the duties of the superintendent of public instruction in relation to other officers of the public school system, and the duties of the county superintendent and the district trustees. It also stipulated that the cost of the system should be paid by funds from the state treasury, the county treasuries, and taxes levied by the school districts. It further required the public schools to provide free education to all persons between 5 and 21 years of age.
With few modifications, the plan was approved by the Legislature on July 11, 1870, described by Ruffner as "a day which marks an epoch in the history of Virginia" (8). The State Board of Education began appointing school officials to operate the system and in 3 months had appointed the necessary 1,400 county superintendents and district trustees. These officials now had to provide buildings, take the school census, select teachers, and organize for work. Dr. Ruffner was anxious to begin at least a few schools in each county as soon as possible; consequently, public schools were open in all counties in November 1870. At the close of the school year, 130,000 pupils were attending 2,900 schools, with 3,000 teachers. The beginning, although long delayed, was an auspicious one.

The system Ruffner had conceived survived strong opposition and the severe financial burdens of Reconstruction for 30 years, until the more favorably received Constitution of 1902 reaffirmed the principle of a state-supported public school system.

William H. Ruffner's Administration

The state was indeed fortunate to have Dr. Ruffner as the first state superintendent. A man of integrity, energy, and ability, he was completely devoted to the cause of education. He attacked the problems with enthusiasm, noting in January 1871 that "the public school work moves on with a vigor which is surprising in view of the fact that not a dollar of the public money has yet become available for the support of the system" (9).

Dr. Ruffner was determined that the people would have better schools than ever before. With this in mind, his communications to superintendents placed great emphasis on the importance of employing capable teachers. In his second annual report he wrote: "As is the teacher, so is the school. School laws, taxes, offices, buildings, apparatus, books, grading, are all in vain without good teachers" (10).

He also used his office to enhance the leadership role of the superintendency. In this connection he said: "This officer has charge of the entire school interest within his territory. His supervision extends over every subject . . . . His cares are boundless, his labors unending. He is the principal of the whole set of schools and the patron of education in his county or city" (11).

During the early years of his administration, Ruffner faced two major problems—winning acceptance and support for the public school system, and preventing funds earmarked in the constitution for public schools from being diverted to other purposes. Early in Ruffner's administration, the state auditor found the state income insufficient to maintain the government, support the schools, and pay interest on the public debt. Consequently, from 1870 through 1879, amounts ranging from $12,000 to $238,000 annually were diverted from the school funds to those other needs (16).

Dr. Ruffner vigorously opposed this practice. In his 1878 annual report, he devoted 72 pages to attacking it and marshaling his facts against it. His eloquent statement covers the place of education in the development of a free people and its relationship to culture, morals, religion, crime, pauperism, and property.

Although opposed by Governor James L. Kemper, Dr. Ruffner's cause was aided in 1877 by the election of a Legislature pledged to restore the school funds. Finally, 2 years later, the Legislature passed the Henkel Bill, setting up a plan requiring the auditor to set apart for the use of the schools those funds required for this purpose under the constitution. Over a period of years, all diverted funds were restored to the schools.

In view of these difficulties, the achievements of Ruffner—sometimes referred to as the "Horace Mann of the

Fearing a mixture "of the children of the decent and the children of the vile," alarmed by the extreme poverty of the state following the Civil War, and opposed to an institution that had its origin in the North, Dabney and his colleagues sought to sow the seeds of dissension in all sections of the state (13).

As one observer said,

Surely, it took a great heart and a persistent determination to face the old time combination of political, social and religious agitators who had thwarted Jefferson's most favorite contention, that had beaten to the wall for more than a century a system of state education, and that was ready to deal the fatal blow to Ruffner's cherished plan (14).

Ruffner, however, was a formidable opponent. Armed with sound logic and knowledge of political economy, he successfully refuted the claims of his opponents. His biographer stated:

From 1876 he became the leading educator in his state. He had risen as the champion of education, he had borne every kind of insult, he had braved the fury of his opponents, he had conquered; and now, when the significance of his work had become apparent throughout the state, he was heralded with epithets far different from those with which he was greeted only a few years before. The Virginia free school system was recognized as a permanent affair, and, whatever had been its deficiencies in the past, it had a promising future (15).

Perhaps even more difficult than winning acceptance and support for the public school system was retaining funds earmarked in the constitution for public schools from being diverted to other purposes. Early in Ruffner's administration, the state auditor found the state income insufficient to maintain the government, support the schools, and pay interest on the public debt. Consequently, from 1870 through 1879, amounts ranging from $12,000 to $238,000 annually were diverted from the school funds to those other needs (16).

Dr. Ruffner vigorously opposed this practice. In his 1878 annual report, he devoted 72 pages to attacking it and marshaling his facts against it. His eloquent statement covers the place of education in the development of a free people and its relationship to culture, morals, religion, crime, pauperism, and property.

Although opposed by Governor James L. Kemper, Dr. Ruffner's cause was aided in 1877 by the election of a Legislature pledged to restore the school funds. Finally, 2 years later, the Legislature passed the Henkel Bill, setting up a plan requiring the auditor to set apart for the use of the schools those funds required for this purpose under the constitution. Over a period of years, all diverted funds were restored to the schools.

In view of these difficulties, the achievements of Ruffner—sometimes referred to as the "Horace Mann of the
South"—in establishing the public school system in Virginia and in guiding it successfully during its first 12 years are little short of phenomenal.

Farr, Buchanan, and Massey

R. R. Farr succeeded Ruffner as state superintendent (1882-86). John L. Buchanan followed (1886-90), and then John E. Massey (1890-98). During these administrations, the number of pupils and teachers increased, and the patrons and citizens developed greater confidence in the system. Acceptance of the public school system became well established during their administrations, and there was gradual growth without major innovations or difficulties. In 1880, 220,730 pupils were taught by 4,873 teachers, expenditures totaled $1,086,718, and school property was valued at $1,177,544. By 1900, 370,595 pupils were taught by 8,954 teachers, expenditures totaled $1,942,531, and school property was valued at $3,536,293.

The major developments between the close of Dr. Ruffner's administration and the end of the nineteenth century were the addition of programs of instruction in the upper grades and the development of normal school programs for training teachers. The farsighted recommendations made by Superintendent Massey included establishment of a State Board of Examiners. The Constitution of 1902 gave a mandate for public education by providing that "the General Assembly of Virginia shall establish and maintain an efficient system of public free schools throughout the State."

While the Constitution of 1902 retained the existing structure of public education, it made several significant revisions. For instance, it expanded the State Board of Education to include (in addition to the Governor, attorney general, and chief state school officer) three experienced educators elected by the Senate and two division superintendents selected by the board. Thus, it created an eight-member board. The new constitution also changed the method of selecting the state superintendent of public instruction by transferring his election from the General Assembly to the people. It stipulated that he must be an experienced educator. Further, the constitution authorized the board to divide the state into school divisions, each to contain not less than one county or city; the magisterial districts within the counties retained their separate school boards.

The "May Campaign" of 1905

The leadership and foresight exhibited by Southall before and during the constitutional convention of 1902 were reflected in other developments during his term. The highlight of his administration was the May Campaign of 1905. A series of conferences aimed at improving the South's public education stimulated an already growing interest. Distinguished educators from both the North and the South participated in these meetings, three of which were held at Capon Springs, West Virginia. Among the participants were Edwin A. Alderman, later president of the University of Virginia; J. L. M. Curry of the Peabody Fund; George Foster Peabody of New York; and Samuel C. Mitchell of Richmond College.

The state's division superintendents held a 3-day conference in Richmond in January 1902, which was financed by the General Education Board. The 110 superintendents who attended (out of 117) discussed such topics as taxation, consolidation and transportation, industrial training for Negro schools, Negro education, preparation and selection of teachers, compulsory education laws, and

AN EDUCATIONAL AWAKENING, 1900-18

After enduring the severe burdens of Reconstruction, the people of Virginia began to take more interest in public affairs, including those related to education. Between 1900 and 1918, a number of significant developments shaped the growth and influenced the direction of public education in the state. Chief among these were the adoption of the Constitution of 1902, the celebrated "May Campaign" of 1905, and the movement to establish high schools.

Constitution of 1902

By 1900, Virginians were ready to consider a new constitution to replace the unpopular Underwood Constitution of 1869. The disillusionment which followed the Civil War had been replaced by a keen interest in education and government, due in large measure to a group of public-spirited men and women who conducted a vigorous statewide campaign to bring about a constitutional convention.
supervision in rural schools. Dr. Southall concluded that "it was the opinion of all who attended this conference that it was the most important educational meeting they had ever known to be held in Virginia, and its stimulating effects have been visible in almost every department of school work" (17).

The General Assembly, the State Board of Education, the University of Virginia, and leading business, civic, and educational associations invited the Sixth Annual Conference for Education in the South to hold its 1903 meeting in Richmond. Scholars and philanthropists from the New England, Middle Atlantic, South Atlantic, and Gulf states participated in the discussions, which embraced all branches of school work from the kindergarten to the university.

Superintendent Southall stated:

"It is impossible to overestimate the value and influence of such meetings on the educational, social and material interests of the country, Mr. Robert C. Ogden, the wise and large-hearted president of the conference, deserves well of the entire country for the able and unselfish service he had given to make this organization a power for good in the restoration of fraternal relations between the once estranged sections and in the upbuilding of the educational interests of the southern states (18).

These conferences and meetings continued to build interest and spark action, culminating in the May Campaign. Summarizing the impact of the campaign, Southall said:

In assuming the duties of this office, now nearly eight years ago, I emphasized the importance of waging an educational campaign for the improvement of our public schools. Funds for this purpose were not then available, but the formation of local educational associations and later of the Virginia Cooperative Education Commission made this dream capable of realization, and finally issued in the splendid movement known as the May Campaign of 1905, in which more than a hundred of the leading citizens of Virginia delivered educational addresses in nearly every city and county of the Commonwealth. More than this, the pulpit, the press, and all other agencies that make for the common good have been enlisted in the noble work ... intended to improve our public schools, and thus afford the children of the Commonwealth better preparation for the active duties of life .... That we have at last waked up to the importance of this truth is illustrated by the fact that in the recent campaign for State officers and members of the General Assembly such matters as the improvement of the public schools and the public highways were the chief issues at stake. When public discussion begins to play freely around things that need improvement or reform, the day of improvement and reform is in sight (19).

The whole state was involved in the cause of education. At 100 meetings, Governor A. J. Montague and other leading public figures delivered 300 addresses. They distributed more than 200,000 pages of educational literature and organized 50 citizen groups, all within 30 days! This increased public interest in education laid the groundwork for constructive measures adopted during the administration of Southall's successor, Joseph D. Eggleston, the first elected superintendent.

In 1903, Governor Montague, Hollis B. Frisell, head of Hampton Institute, Samuel C. Mitchell of Richmond College, Robert B. Frazer of Warrenton, and Eggleston met in Richmond "to perfect an organization that would carry forward some definite plan by which the people of Virginia would realize the necessity for more democracy in education" (20). Thus, they organized the Cooperative Education Association, one of the important groups that campaigned for better schools.

The association's 1904 platform consisted of eight planks: 9 months of schooling for every child; high schools within reasonable distance of every child; well-trained teachers; agricultural and industrial training; efficient supervision; promotion of libraries; schools for the defective and dependent; and a citizens education association in every county and city.

The May Campaign resulted in far-reaching legislation during the administration of Joseph D. Eggleston, including part of that advocated by the Cooperative Education Association. For instance, the Mann High School Bill, passed in 1906 after a struggle and close vote in the Legislature, authorized funds for high school programs where the localities furnished adequate buildings and teachers' salaries. The Legislature increased the appropriation of $50,000 to $126,000 in 1909, and to $133,000 in 1910.

The Strode Bill of 1908, combining several educational programs into one act, authorized new state normal schools at Harrisonburg and Radford; permitted localities to increase salaries of division superintendents; appropriated $25,000 to encourage the replacement of one-room schools with graded elementary schools; established construction requirements for school buildings to provide more adequate space, light, ventilation, and sanitary facilities; and required that pupils' sight and hearing be tested.

The Legislature also enacted the Williams Loan Fund Bill in 1908, permitting district boards to borrow from the Literary Fund for school building construction if the department approved the plans. This requirement was extended later to all public school buildings.

Development of High Schools

Before 1900, opportunities for high school education were severely limited. Most of the private academies (for which the state had been noted before 1860) did not survive the Civil War and Reconstruction. Although the
exact number of high schools in 1900 is not known, Superintendent Massey reported 60 in 1897, which probably included limited high school programs offered in elementary schools. Only 10,210 white students and 1,031 Negro students, representing 4 percent of the whites and seventen-ths of 1 percent of the Negroes enrolled in the public schools, were studying "the higher branches" (21).

Early in his administration, Superintendent Southall urged the establishment of more county or district high schools:

We need these high schools to articulate the common schools with the University of Virginia and the other higher institutions of learning. We need them also to prepare teachers for the common schools. The proportion of college and normal school graduates who are teaching in the public schools is very small (22).

An act passed at the extra session of the General Assembly in 1903 reaffirmed the 1875 law providing for secondary education under regulations prescribed by the State Board of Education. A fee, not exceeding $2.50 per month per pupil, could be required. The state board established minimum requirements for the course of study and for teachers in high schools in 1904, the first step in developing standards for high school accreditation.

A comprehensive program of high school accreditation began in 1912 when the Southern Association of Colleges and Secondary Schools established a Virginia Commission on Accredited Schools, with which the public instruction department issued annual joint reports on high schools from the 1912-13 school year until 1929. In his introduction to the first report, Superintendent R.C. Stearnes (1913-18) referred to the accreditation program as—

The first serious effort to apply some definite and uniform standard of measurement to the work of all the secondary schools of the State. On the part of the State Inspectors, including the Secretary of the State Board of Education, this has meant several months of careful investigation and days crowded with painstaking efforts to secure accurate reports. . . . The division superintendents have given material aid both in securing good reports and in reinforcing thevisitorial work of the State Officers (23).

The Department of Public Instruction issued a new course of study for high schools in 1915, superseding the rudimentary first course published in 1910. It consisted mainly of college preparatory work but included subjects in business, agriculture, and homemaking. Aided by the Smith-Hughes Act (passed by Congress in 1917) vocational education programs were expanded still further. Instead of being limited primarily to agriculture, emphasis was now given to trade and industry, business, home economics, and other areas of instruction.

Further efforts to strengthen the secondary education program in 1917 included establishing requirements for a standard 4-year high school, including organization, teaching staff, and program of studies. The number of schools increased rapidly, and by the 1917-18 school year, there were 522 high schools enrolling 27,107 students.

Other Developments

In 1904, the General Assembly authorized the State Board of Education to appoint a board to examine teachers and inspect schools on a statewide basis. A board of five members was appointed the following year with the examination of teachers as the first task on its agenda. Although uniform examinations had been introduced in 1891 to reduce the multiplicity of examinations, each superintendent had continued to grade the examinations taken by teachers in his division, so that considerable variation in grading standards continued. The State Board of Examiners took full charge of certificating teachers and organizing a grading system which applied uniform standards to all examination papers.

The Board of Examiners' second major function was to inspect schools. Each member was made responsible for approximately 15 counties. Although their primary duty was to visit and inspect schools, the staff soon expanded their work to include other activities. In cooperation with local officials, teachers, and patrons, they helped plan school buildings, consolidate schools, train teachers, and secure additional support for the schools.

In 1908, the General Assembly appropriated $2,500 to match local contributions for establishing school libraries. It increased the appropriation periodically and thus developed a statewide library program which continues today.

Several private philanthropic organizations made noteworthy contributions to public education during this period. The Anna T. Jeannes Foundation, established in 1908, contributed funds for local school boards to employ Negro supervisors and improve instruction in Negro schools. The Jeannes supervisors aided in making shopwork, homemaking, and other vocational skills an integral part of the curriculum in the schools for Negro children. Their efforts were appreciated, and this program continued successfully for 40 years to become a Virginia tradition. The John F. Slater Fund, established before 1900, aided Virginia to develop facilities for Negroes. The Julius Rosenwald Fund, established in 1917, contributed substantially to the erection of better schools for Negroes. Two other private philanthropic organizations making major continuing contributions to public education in Virginia were the General Education Board, which administered funds provided by John D. Rockefeller, Sr., and the George Peabody Fund.

During its 1916 session, the General Assembly passed legislation authorizing the State Board of Education to
establish educational qualifications for division superintendents. The regulations that the state board adopted required the superintendents to participate in educational work for 10 years prior to their appointments and specified that they be college graduates with at least two 3-hour college courses in education or 3 years additional experience as a teacher, principal, or supervisor. This established professional standards for division superintendents and helped considerably in upgrading the quality of school administration in the state.

During this period, the first course of study for elementary schools was published in 1907, and a revised edition was issued in 1909. High school courses of study were published in 1906 and 1910. The latter publication listed minimum requirements in subjects and units for three grades of high schools: first, second, and third. Requirements for first-grade high schools included 12 required units: English, 4 units; mathematics, 3 units; history, 3 units; and science, 2 units. Five elective units were to be selected from the following subjects: Latin, German, French, Spanish, history, physical geography, agriculture, manual arts, botany and zoology, physics, chemistry, and mathematics. The development of these early courses of study indicated a trend toward state-level leadership and guidance in improving classroom instruction.

GROWTH AND DEVELOPMENT, 1918-31

In 1918, Harris H. Hart succeeded Stearns as state superintendent. Elected by popular vote, he possessed outstanding qualifications for his high office. The Governor had appointed him to the State Board of Examiners when it was established in 1905. He had served as a teacher, principal, superintendent of Roanoke, and member of the State Board of Education.

During Hart's superintendency, from 1918 to 1931 (the longest term to the present date), public education made considerable progress. His administration abolished the cumbersome district system, conducted two major statewide educational surveys, reorganized the structure of public education, improved teacher certification procedures, expanded and strengthened the department, and established a fund for equalizing educational opportunity. It was indeed a period of growth and development.

Dr. Hart, a man of unusual administrative ability, was able to identify the most important problems and to isolate factors necessary for their solution. While many of these problems were not subject to terminal solution (indeed, some remain quite relevant today), he brought them into focus and initiated improvements.

Progressive Measures

During his first year in office, Superintendent Hart initiated a campaign to strengthen the public school system by (a) eliminating the district system, (b) enacting a statewide compulsory school attendance law, and (c) providing free textbooks.

In his first annual report, Dr. Hart discussed these measures:

It is of the highest importance . . . for the machinery of local administration to be much simplified and made more responsive to intelligent public demands. You are aware of the fact that in each county there is a trustee electoral board, composed of the county school superintendent, the Commonwealth's Attorney, and a citizen appointed by the court. This board has the dual function of appointing school trustees for each school district, and also of hearing cases appealed from the local board of trustees. Each local district board is organized with a chairman and a clerk; is a corporate body, and under the laws of the state operates the schools of the district unit. This gives the State of Virginia five hundred twenty-three separate units of operation. In my opinion the first serious step to take in producing uniform efficiency in the school system of Virginia is to establish at once county uniformity. To my mind, the schools should unquestionably be operated on the basis of the county rather than the district unit with a county school board composed of one member elected from each magisterial district. The number of school trustees would be reduced by sixty-six and two-thirds percent. The school affairs of the county would be viewed in the light of a common unified undertaking. Purely artificial differences in terms, teachers salaries, etc., which now prevail inside of many of our counties, would naturally give place to uniform endeavor.

If the schools fulfill their real function in the State, they must reach all of the boys and girls and provide adequate facilities for their training. The number of children in Virginia who are now not attending school at all, and the number who are attending school with such irregularity as to make proper training impossible, form an alarming percent of the total number of children . . . . Nothing short of compulsory education and adequate facilities for its proper execution will make the schools thoroughly effective.

A necessary adjunct to compulsory education is to furnish textbooks free to pupils as soon as the State's finances will justify . . . . Several considerations point to the wisdom of having the State purchase textbooks at wholesale prices and lend them to pupils rather than continue the present arrangement of having pupils purchase their own books at retail prices (24).

Two of Dr. Hart's recommendations were adopted in 1922, when the General Assembly enacted the county unit law and a statewide compulsory attendance law. Although free textbooks were not approved, the assembly passed a
new textbook law permitting local school boards to purchase directly from publishers at wholesale prices.

The county unit law was the greatest single administrative improvement since the establishment of the public school system in 1870. It made the county the unit of administration, rather than the district, with each county school board replacing several independent district boards. During the first year of operation, the law reduced the administrative units from about 700 to approximately 150; it reduced the number of local school board members and school officials from about 2,000 to less than 500. This resulted in greater administrative efficiency, simplified action, and achieved more uniformity in policy and method. It also encouraged school consolidation and larger enrollments. Dr. Hart, who was responsible for this far-reaching improvement, may well have been the first superintendent to recognize its importance; certainly he was the first to campaign strongly for it.

The compulsory attendance law served to reduce illiteracy, increase attendance, and strengthen the public school system. The Legislature repealed this law in 1959 during the desegregation crisis, but it was reenacted in 1968.

Statewide School Surveys

Two major statewide surveys were conducted during Superintendent Hart’s administration. The first was initiated in 1918, when the General Assembly appointed a commission to “study the educational affairs of the State.” Superintendent Hart served as commission chairman, and Alexander Inglis of Harvard directed the study, aided by an outstanding professional staff and consultants. One of the first state studies of its kind, the Inglis survey of 1918-19, which conducted a comprehensive pupil-testing program, was notable for its scope and thoroughness as well as for the professional stature of the participants.

The commission not only recommended the three measures emphasized by Hart in his initial program, but also made other recommendations for: a revision of the State Board of Education; the appointment of the state superintendent of public institution; changes in the distribution of state school funds and the levying of local school taxes; a longer school term; lowering of the school entrance age from 7 to 6 years; strengthening of teacher-training programs; raising of qualifications and salaries of division superintendents; and increase of funds for high schools and rural schools. Perhaps the strongest recommendation was for increased financial support, both state and local, with particular emphasis on the need for higher teachers’ salaries.

The 1927 General Assembly appointed another statewide survey commission as a part of Governor Harry F. Byrd’s “short ballot” program to simplify state government. M.V. O’Shea of the University of Wisconsin directed this survey aided by a staff of 28 persons, including prominent educators and experts in public finance. Although the staff had only 4 months in which to complete its work, it issued a comprehensive report containing recommendations concerning the entire structure of public education in Virginia.

The Inglis and O’Shea surveys were valuable objective analyses of education in Virginia and influenced important constitutional revisions in 1928. One of these provided for a State Board of Education of seven members, appointed by the Governor for 4-year staggered terms, subject to confirmation by the General Assembly. Another called for the Governor to appoint the state superintendent of public instruction for a 4-year term. Also, responsibility for selecting and appointing division superintendents was transferred from the state board to the local school boards. Superintendents were, however, to be chosen from a list of professionally qualified candidates maintained by the state board. These procedures of appointment have continued with only slight change to the present time.

Teacher Certifications

In his 1927 study, “Certification of Teachers,” Thomas D. Eason identifies four periods in the history of teacher certification in Virginia. Division superintendents handled teacher examination and certification from 1870 to 1905; the State Board of Examiners, from 1905 to 1911; and a state school inspector, from 1911 to 1918. The fourth or modern period began with Superintendent Hart’s administration.

In 1919, the State Board of Education made major revisions in teacher certification practices by replacing the existing 28 types of certificates with 7 new classifications: collegiate professional, collegiate, special (for high school subjects), normal professional (for junior high school subjects and elementary school), elementary, first grade, and second grade. At the same time, it established professional standards for the renewal of certificates. These revisions simplified certification and raised the standards.

Further efforts to strengthen the certification program were undertaken during Hart’s administration. Certification on the basis of examination was discontinued in 1925. First-grade certificates were not issued after 1926; holders were required to earn higher certificates by 1931 or lose their licenses to teach. The special certificate was not issued after 1929, and the second-grade and elementary certificates were discontinued in 1931. Thus, the 28 types of certificates available in 1918 were reduced by 1931 to three types: collegiate professional, collegiate, and normal professional. Local permits, which authorized schools to employ uncertificated teachers when conditions required it, continued in use although the Hart administration issued them reluctantly and reduced the numbers significantly. Requirements for renewing normal professional certificates
were raised, and collegiate certificates were made non-renewable; holders were required to earn a collegiate professional certificate within 4 years.

In summary, the teacher certification system was reorganized, simplified, and strengthened during Hart's administration. Standards were raised from a level where applicants who had completed only the eighth grade could be certificated to teach by passing an examination to one where no applicant who had completed less than 2 years of college could be certificated. This was the beginning of Virginia's modern period of teacher certification, and the system which was developed at that time has required few changes to the present.

Attempt To Measure Efficiency

In his report for the 1918-20 biennium, Dr. Hart described a plan “to ascertain as nearly as can be the ratio between the efficiency of the school work and the financial investment; and... to discover the relative position of each county and city with reference to certain aspects of educational work” (25).

Patterned after the Ayer’s Index plan for comparing state school systems, Hart’s scheme included five “financial” and five “academic” factors. By designating a rating of 100 as satisfactory, the various counties and cities could be ranked in the order of their efficiency according to these 10 factors.

The “academic” factors used were percentage attendance of school-age population (100 percent as the goal); percent of teachers holding first-grade and higher certificates (100 percent as the goal); length of term in days times one-half (200 days as the considered goal); percent of total enrollment in high school times 10 (10 percent as the goal); percent of all pupils in grades represented by seventh grade times 10 (10 percent as the goal).

The “financial” factors were average annual salary of teachers times one-tenth ($1,000 as the goal); percent of local funds for teachers’ salaries times 2 (50 percent as the goal); total cost per room times one-fifteenth ($33.33 as the goal); per-capita cost of instruction based on enrollment times 3 ($25 as the goal); total per-capita cost of maintenance and instruction times 4 ($33.33 as the goal).

Dr. Hart’s annual report for the 1919-20 school year ranked the counties and cities on the index scale. The low for the counties was 36; the high, 85. The low for the cities was 73.5; the high, 117. The average for the counties was 61, and for the cities, 92. The comparative ranking continued to be reported through the 1927-28 school year.

Although Hart recognized the shortcomings of his plan in measuring “the quality of instruction,” the plan did help local school authorities to point up the greatest weaknesses in their systems. It also underscored the great diversity in the adequacy of the state’s educational program.

First Equalization Fund

The educational disparities in the counties and cities revealed by Dr. Hart’s “efficiency” ratings pointed up the need for equalizing educational opportunity throughout the state. Dr. Hart made the first attempt to initiate such a program. In his 1928-29 annual report, Dr. Hart pointed out:

It is now pretty well agreed that some form of equalization of educational opportunity should be established in Virginia, although there appears to be some division of opinion as to the method of approach. It is urged on one hand that a large equalization fund of, say, a million dollars should be set up for the proper assistance of those counties not economically able to support an adequate system of training. A second plan is to use the entire State appropriation for the purpose of guaranteeing minimum basic educational facilities all over the State using a relatively small equalization fund to supplement the local appropriations in certain counties for this purpose. It appears that in the present circumstances in Virginia the latter method gives promise of better results (26).

Contrary to Dr. Hart’s recommendation, the General Assembly adopted the first plan for “a large equalization fund” when it appropriated $500,000 as an equalization fund for 1930-31. Fortunately, the state board was given wide latitude in distributing the fund. According to Hart, the distribution plan agreed upon required an 8-month term and used a “sliding scale of appropriation from the State based upon the qualifications of the teachers employed by the county, with the amount to be paid by the county remaining a constant sum” (27). The plan did not adequately take into account the factors of local ability and effort, probably because such data were not available at the time; however, the poorer counties received the larger part of the fund.

Strengthening the Department of Education

The title “Department of Education” replaced that of “Department of Public Instruction” during the first year of Hart’s administration. In some respects, this change was symbolic of the forthcoming development of a modern state education department.

At that time, the department consisted of the chief state school officer, secretary to the state board, eight state school supervisors, an auditor-statistician, six stenographers, and a shipping clerk. The supervisory function developed gradually from the original State Board of Examiners and inspectors, which had assumed such responsibilities over the years, to the creation of supervisory positions in the department. During 1918-19, the department’s efforts centered on adopting accreditation standards.
for institutions of higher learning, establishing new minimum standards for accrediting high schools, developing vocational education programs under the Smith-Hughes Act, and measuring educational efficiency in the county and city school divisions.

The department added a director of a teachers bureau in 1919-20. The following year, for the first time, Dr. Hart listed in his annual report nine supervisory staff members by specific assignments: home economics, agriculture, secondary education (two), teacher training, Negro education, physical education, rural education, and trade and industrial education. The department also initiated a program for rehabilitating the physically handicapped by assigning a supervisor this responsibility.

The department continued to expand to meet increasing needs. It increased the staff to 13 supervisors in 1921-22 and added new services in textbooks, school libraries, and school buildings. The school buildings service developed standard plans which were widely used, aided in selecting sites, and supervised school construction. Departmental services continued to emphasize field work and supervisory assistance to localities.

When the county unit law of 1922 prompted the consolidation of districts, Hart turned his attention to consolidating the many small high schools established under the district system. In 1923, he cited data showing that per-pupil cost was much higher in the small high school, often requiring a diversion of funds needed in the elementary program. Although significant progress in school consolidation awaited the development of improved highways and pupil transportation, a beginning was made at this time.

The department's staff increased to 16 by 1925-26, including 1 member in a new research service. The following year, the department established a research and surveys division. Its initial activities included conducting school surveys, giving experimental tests to high school seniors in selected counties, making statistical studies, and preparing reports on acceleration and retardation.

The department's supervisory services were listed by classifications for the first time in the annual report for 1928-29. Including 19 professional staff members, these classifications were accounting and statistics, agricultural education, civilian rehabilitation, home economics education, Negro education, physical education, research and surveys, rural education, school buildings, school libraries and textbooks, secondary education, teacher training and certification, and trade and industrial education. The following year, a program in vocational and educational guidance was established so that the schools might "give more serious attention to the study of pupils rather than devote time almost exclusively to the study of subject matter" (28).

This period was one of the truly significant eras in public education in Virginia. Under Dr. Hart's dynamic leadership, notable achievements were made which provided a foundation for future improvements.

A DECADE OF CURRICULUM REVISION, 1931-41

Sidney B. Hall succeeded Hart in January 1931. A young man with a broad background in educational theory and practice, Dr. Hall had been a high school principal, state supervisor of secondary education, and professor of secondary education at George Peabody College for Teachers. He also had observed and studied education in Europe.

Hall's appointment coincided with the Depression of the 1930's, which had serious repercussions on public education. The state's overall financial position at the beginning of the Depression had been favorable, since its predominantly agrarian economy was less affected at first than the economy of the more highly industrialized states. Tax income from both state and local sources declined sharply, however.

In spite of decreased state and local revenue, which resulted in curtailed budgets, Hall reported that most of the counties and cities maintained 8-month school terms during 1932-33. In his annual report, he explained:

It should be pointed out that the full term was realized, not because there was sufficient money, but, because, when the money which was available was exhausted, the teachers in the various school systems volunteered their service in order that the schools might not have to close and thus deny to the children of the State the educational opportunity that was theirs. Too much credit cannot be attributed to the teaching force...for this type of loyalty. When it is pointed out that the teachers of the State have suffered a reduction in salary to the extent of 21 per cent, and when it is realized that, in addition to this reduction, they have actually given many weeks of their service free of charge, it is not too much to say that a comparable situation in any other vocation or profession is almost not to be found (29).

In 1933-34, the Governor, with authorization from the General Assembly, reduced state school appropriations 30 percent. This sharp cut was reflected in the average annual salary of teachers, which declined from $909 in 1930-31 to $692 in 1933-34. Hall estimated early in the year that even with this salary reduction, approximately $655,000 would be needed for 62 counties to maintain a normal and legal school term. After Hall's figures were questioned and sharply criticized, Governor John Garland Pollard instituted a separate study. The Governor's study concluded that only $165,000 would be needed. But at the end of the year, the state superintendent's figures were vindicated when it was found that it had been necessary to secure $710,000 in federal aid to enable 72 counties to operate 8-month terms.

Despite the serious problems, Hall pointed to sustained teacher morale, increased enrollments, school consolidations, and advances in teacher preparation, which he attributed to "the sacrificial services of the teachers, principals, and superintendents..." (30).
Curriculum Revision

At the beginning of his administration, Hall was disturbed to find that many children of school age were not enrolled in school and that the average daily attendance for the state was only 83 percent. He envisioned the need for an intensive program to improve instruction, chiefly through curriculum revision. The goal was to provide children with "enriched and more meaningful experiences in the classroom" (31), thereby increasing enrollment and attendance and improving the "holding power" of the schools.

To carry out and coordinate an improved program, Superintendent Hall reorganized the department into six divisions—research and finance, higher education, instruction, vocational education, school buildings, and school libraries and textbooks. The agency also was enlarged to include a total of 28 staff members. The newly created Division of Instruction unified the supervision of secondary education, elementary education, Negro education, and health and physical education under the leadership of a director of instruction. The superintendent assigned this division primary responsibility for initiating and developing a program to improve instruction.

The department directed its initial efforts toward a broad concept of curriculum revision (see Appendix C). In an organizational bulletin issued in March 1932, the department defined the curriculum as "all the experiences which children have at school under the guidance of their teachers" (32). The bulletin stressed the teacher's role in planning such a curriculum:

"It becomes obvious from this concept of the curriculum that teachers and pupils together actually make the curriculum, and that all teachers in the State of Virginia are engaged in curriculum construction whether or not they recognize it as such. The State Curriculum Program then is undertaking to assist teachers to develop a more adequate curriculum to the end that the instruction which children receive will be improved (33).

Within the next 2 years, more than 10,000 of the state's 17,000 teachers participated in curriculum planning workshops and seminar groups, for which state and local supervisors served as advisors and discussion leaders. In carrying out their leadership roles, the department's staff stressed the need for cooperation with local lay and professional groups and respected local freedom and responsibility, while attempting to stimulate initiative. The department appointed an additional staff member to strengthen its elementary education supervisory services.

In 1934, the department published a new course of study for elementary schools that included a variety of experiences, activities, and projects intended to stimulate learning. The program challenged the teacher to involve the pupils in selecting and planning experiences best suited to their interests, abilities, and needs. The courses were not organized into fixed patterns or units, but were designed to promote a flexible learning environment.

In secondary education, the department centered its efforts on developing a core curriculum plan to supplant the traditional, strictly academic program of required subjects with courses of study emphasizing problem solving and the development of needed skills and appreciations. It stressed the need for imaginative and ingenious teaching methods to implement such programs. Like the new elementary program, it avoided rigid organization of subject matter. The department issued core curriculum courses of study for the eighth grade in 1934 and for each of the four high school grades from 1937 to 1941. It issued a manual of administration for high schools in 1937.

An important part of the program's philosophy emphasized the need to consider curriculum revision as a continuing process of improvement and expansion. During 1937-47, the department made frequent appraisals of the program and conducted major evaluations from 1939 to 1941. These evaluations included 27 regional conferences and many additional meetings for study and discussion, involving an estimated 20,000 participants.

In his study of curriculum development programs, J. Galen Saylor described the Virginia program as follows:

"The program is evolutionary rather than revolutionary. It is a continuous widespread effort with one dominating purpose—the improvement of instruction in the classrooms of the State. The program is a cooperative undertaking with all the educational forces of the State, teachers, supervisors, principals, superintendents, staffs of teacher training institutions, members of the State Department and the lay public participating. Widespread participation prevails. Participation is entirely voluntary even to use of courses of study.

The program is comprehensive, covering all levels of school organization and being concerned with all major factors related to instruction, such as teacher pre-service and in-service training, books and supplies, materials to guide curriculum development, evaluation of the outcomes of instruction, teaching procedures, and the like. An enlightened supervisory program, guided and directed by the State Department, constitutes the chief method of carrying forward the program from a State standpoint (34)."

The enthusiasm the program aroused outside Virginia was matched by opposition from some of the leading educators within the state. The most frequent criticisms were that the fundamental skills of reading, writing, and arithmetic were not sufficiently emphasized, that too much attention was given to the "whims" rather than the "needs" of students, that achievement standards were ignored, and that the program was indefinite in its aims and not explicit in its content. In 1955, reaction against certain aspects of the new curriculum caused Governor Thomas B. Stanley to order its withdrawal from use.
With the exception of curriculum revision, the Depression years were not noted for major changes or innovations. This does not mean, however, that no significant advances were made during this period. For example, Virginia effectively used federal funds from the Public Works Administration and the Works Progress Administration to provide needed school housing.

The department conducted special studies, including school building surveys in many counties, to identify the most critical housing needs and to suggest long-term building programs. It made efforts to use federal funds, largely to consolidate high schools into larger centers and to reduce the number of one- and two-room elementary schools.

The 1935-36 annual report revealed that there were approximately 400 accredited high schools in the counties, and an additional 100 offering 1 or more years of high school work. Each of the 400 schools served an area of approximately 100 square miles. The report suggested that a high school could serve an area of at least 200 square miles without subjecting students to unreasonable travel distances on school buses. It called attention to the advantages of the large high school from the standpoint of program offering and per-pupil costs.

The state spent approximately $17.5 million on new school buildings between 1930-31 and 1940-41. During the same period, the value of buildings increased from $62 million to $80 million. The total number of buildings decreased from 5,618 to 4,892, and the one-room schools decreased from 2,764 to 1,923.

Progress continued throughout the Depression years. In 1934-35, the requirements for division superintendents were raised to include the master's degree, training in administration and finance, and a minimum of 3 years experience as supervisor or principal. Three years later, the department initiated a state music program with a supervisor of music. In 1938-39, the department established a Division of Rehabilitation and Special and Adult Education which was to have far-reaching effects on the state's educational program. The division included a director and four supervisors of rehabilitation education, two supervisors of special education, and a supervisor of adult education.

In 1940-41, a supervisor of distributive education was assigned to the Division of Vocational Education, and a supervisor of audiovisual education was added to the Division of Libraries and Textbooks. The department's expansion during the late 1930's and early 1940's reflected improvements in the economy.

THE WAR AND POSTWAR YEARS, 1941-57

The period from 1941 to 1957 was marked by many educational problems growing largely out of the war and postwar years. A serious shortage of teachers developed at the beginning of the war and remains an unresolved problem today in certain rural areas. The gap between building needs and new construction widened as a result of materials shortages, building restrictions, and inflation. The U.S. Supreme Court decision in the desegregation case of 1954 caused uncertainty as to the future of public education itself.

Three state superintendents served during this period: Dabney S. Lancaster (1941-46), G. Tyler Miller (1946-49), and Dowell J. Howard (1949-57). Dr. Lancaster had served previously as state supervisor of agricultural education, secretary to the State Board of Education, and dean of students at the University of Alabama. Dr. Miller had been a division superintendent of schools in Warren and Rappahannock counties and in the city of Charlottesville. Dr. Howard had served as supervisor of agricultural education and as assistant superintendent of public instruction.

World War II

The department was expanded during 1941-42 with the appointment of an assistant superintendent of public instruction and the establishment of a defense training division, responsible for preparing defense industry workers. During the next 3 years, more than 77,000 people received such training.

In addition to continuing the regular school program during the war years, the department emphasized physical fitness, war production, conservation and distribution of essential goods and services, skills in mathematics and science, effects of inflation, air-mindedness, international relations, and mobilization of students and teachers. It provided child-care centers for children of working mothers before and after school hours and during vacation periods. It gave special attention to health and physical fitness, emotional stability, and home-school-community relationships. To help in the war effort, children collected scrap metal, worked in victory gardens, and bought and sold savings bonds and stamps.

As the war progressed, its impact was reflected in declining enrollments as students were inducted into the armed forces or found jobs in industry. Teachers added to their work load by participating in ratonning, Selective Service registration, Civil Defense, and other war-related activities. As war activities increased in Virginia, many teachers left their classrooms to work in war production plants. Even more distressing was the fact that the number of students preparing for the teaching profession decreased by almost 50 percent between 1940 and 1945.

Despite the handicaps caused by the war, some forward steps were taken during this period. The department initiated visiting-teacher and conservation education programs, increased emphasis on guidance, and started a statewide testing program. The state appropriated in 1945 approximately $1 million to help local school systems.
purchase audiovisual equipment. It made considerable progress toward equalizing the salaries of white and Negro teachers, and it attained equal salary scales for elementary and high school teachers in nearly all divisions. A special appropriation in 1944 provided for employing school principals for 12 months rather than the customary 9 or 10 months. There was a gradual transition from an 11-year to a 12-year school program, which became statewide when Nelson County added the twelfth year in 1960.

The Teacher Shortage

The shortage of qualified teachers that developed at the outbreak of World War II became increasingly severe, and by the end of the war it was critical. "Drastic action is needed," State Superintendent Lancaster said in 1946, "to hold fast to our best teachers and to fill the ranks with the ablest minds and finest characters that the Commonwealth produces" (35).

Lancaster called attention to the fact that approximately 3,000 teachers with less than 2 years of college training were employed in public schools, as compared with 1,000 in 1941. "Relatively few young people are preparing to teach and it seems clear that in spite of all the gains of recent years, Virginia faces a critical teacher situation" (36), he said.

The widely held belief that most of the absentees would resume teaching after the war proved to be a false hope, for the number returning was insignificant compared to the serious deficiency. Inflation continued into the post-war period and pay increases voted by the General Assembly did not make teacher salaries competitive with those in other states or with those paid by private industry. Recruitment of new teachers became increasingly difficult as enrollments in teacher-training colleges declined.

Several new developments served to accentuate the need for more teachers. These included the increased birthrate following the war, improved holding power of the schools, and the change to a 12-year system. Broader curriculum offerings and the need to readjust the heavy pupil loads carried by teachers during the war further aggravated the situation.

To combat the teacher shortage, the state initiated a scholarship program in 1947, providing loans up to $300 per year for undergraduates preparing to teach. It made scholarships not exceeding $100 per summer session available to teachers who were not fully qualified. Although these scholarship loans bore interest at the rate of 3 percent, both principal and interest could be canceled by teaching in the state's public school. Undergraduate participation was limited initially to juniors and seniors taking preparatory courses to teach in the elementary schools. In 1948, however, the General Assembly extended eligibility to students in all 4 years of college as well as to those preparing to teach high school subjects for which qualified teachers were not available. During the first year of the program, 205 undergraduate students received scholarships, as did 111 teachers taking summer work. By 1957, 7,139 undergraduates and 8,590 teachers had benefited from the program. This plan which has been expanded and liberalized periodically, continues to play a major role in preparing teachers for the public schools.

To make the profession more attractive to prospective teachers, the state established in 1942 an actuarially sound retirement system for teachers and other state employees, and 6 years later it appropriated funds for a sick leave plan for teachers. The 1952 session of the General Assembly appropriated $19.5 million to increase teachers' salaries and establish a statewide minimum salary scale, ranging from $2,000 to $3,200 for college graduates.

Legislative Studies

Beginning in 1944, the General Assembly conducted an extensive 7-year appraisal of public education. Major studies were made by five separate groups: the Denny Commission (1944), the McCue Committee (1946), the Moses Commission (1947), the Gray Commission (1948), and the Moore Commission (1951). In no period in the state's history was more time given to the study of the school system. The basic problems centered on the need for sufficient funds to attract and hold competent teachers and to provide buildings and other facilities.

The Denny Commission, headed by George H. Denny, was instructed to study all facets of the school program, including curriculum, training of teachers, and other matters deemed essential to the improvement of the public school system. It held meetings throughout the state to give citizens the opportunity to express their views. The consensus expressed at these meetings included dissatisfaction with the standing of Virginia's schools compared with other states; the need for greater emphasis on the three R's and vocational education; higher salaries for teachers; stricter enforcement of the compulsory attendance law; and a desire to bring the management of the schools closer to the people.

The Denny Commission's recommendations, many of which were never implemented, covered all areas of the school programs. Included were recommendations that the governing body in the counties be elected at a time different from that of other county officials and on the basis of an educational platform, that free textbooks be provided, and that a sound equalization program be established. Other recommendations called attention to the need for greater emphasis on the three R's, consolidation of schools, improvements in Negro education, strengthening of teacher-training programs in state institutions, and increased efforts to improve home-community relationships. Recommendations were adopted to increase state
in view of the unpredictability of "the course of economic events" and was not feasible. The committee recommended that scholarships of $300, available previously only to college juniors and seniors, be extended to selected freshmen and sophomores who were preparing to teach, that the number of scholarships awarded annually be increased, and that sick leave be extended to teachers as well as to other state employees. These recommendations were adopted. The committee opposed the idea of establishing minimum salaries for teachers, stating that it "would tend to destroy flexibility in the handling of personnel problems" and was not feasible in view of the unpredictability of "the course of economic events" (37). The report blamed the State Department of Education for the teacher shortage and other problems and recommended that a full-time paid chairman of the State Board of Education take over the management of the business affairs handled by the state superintendent of public instruction. This recommendation was not adopted.

The Moses Commission, headed by State Senator Charles T. Moses, made a thorough study of school needs and held five public meetings throughout the state. It recommended higher teacher salaries, more money for needy counties, expanded vocational programs, transportation improvements, liberalized retirement benefits, and sick leave for teachers. It also estimated that the recommended programs would cost an additional $39 million, a large part of which was appropriated by the General Assembly.

A commission on state and local revenues and expenditures, of which State Senator Garland Gray was chairman, was directed by the General Assembly to make a thorough examination and study of all state and local taxes and revenue, and the propriety thereof and the sources from which the revenues are or may be derived (38).

The Gray Commission recommended the appointment of school board members in the counties by the boards of supervisors, a statewide testing program, increased equalization moneys for the poorer counties, greater financial aid for the localities, modification of school building regulations, continued emphasis on the fundamental subjects, and other measures.

A commission under the chairmanship of Delegate E. Blackburn Moore issued a report in 1951 entitled "A Foundation Education Program for Virginia." It found that the state board and the state superintendent of public instruction were giving increased emphasis to the teaching of the fundamental subjects as recommended by previous studies, that the greatest impediments to effective teaching were an insufficient number of properly trained teachers in the elementary grades and too heavy teacher loads, and that methods of financing had not equalized educational opportunities in the school systems of the state. This commission recommended increasing the number and amount of teacher-training scholarships, eliminating salary differentials between elementary and high school teachers, delaying further curriculum expansion until the present program was adequately financed, and making additional funds contingent on reducing class size and equalizing educational opportunity in the school systems.

The "Battle Fund" for School Construction

The state entered the war and postwar period with a tremendous backlog of school building needs, for the Depression had created a serious gap between needs and construction despite increased construction for several years prior to 1941. War priorities allocated manpower and materials to the defense program and forced a suspension of new school construction "for the duration." Also, much of the normal maintenance, repair, and improvement of school plants was deferred. Thus, these years of hard use shortened the life of the buildings, many of which were already outmoded in design.

Postwar efforts to meet the critical shortage of buildings encountered serious difficulties. Residential, commercial, and industrial construction needs also had been deferred during the war, resulting in postwar competition for labor and materials, as well as soaring costs. Not only did the schools suffer from inflation, but the availability of materials and equipment often was uncertain, and delays in construction were common. Rising interest rates and inaccurate cost estimates added to the difficulties. And all of this occurred at a time when additional classrooms were needed to accommodate rapidly increasing enrollments during the early 1950's.

A department study in 1948, utilizing data from the division superintendents to project the state's school building needs for the next 10 years, estimated the cost of needed facilities to be $401 million. A private accounting firm, authorized by the General Assembly to make a similar study, estimated construction needs at $279.5 million. Subsequent developments proved both estimates too low.

The 1950 session of the General Assembly convened after one of the most closely contested gubernatorial elections in the state's history. Public education was a major issue in the campaign, and the candidates made strong commitments to improve the public schools. Shortly after his election, Governor John S. Battle carried out his campaign promise by recommending that $75 million in
state aid be given to localities for school construction. The General Assembly approved his proposal; in addition, it transferred $11 million from the sinking fund to the Literary Fund for school construction loans to localities.

Consolidation of Schools

Beginning with the administration of Superintendent Hart, greater attention has been given to establishing consolidated schools of sufficient size to offer comprehensive education programs at reasonable per-capita cost. Progress, which has depended on the development of improved highways and pupil transportation, has been made during the tenure of each succeeding superintendent.

Consolidation was accelerated during World War II and the postwar years. In 1942, the Legislature provided $500,000 to aid local school divisions in meeting the cost of pupil transportation, and it increased this appropriation to more than $3.5 million in 1950. A pupil transportation service was established in the department in 1946 with the appointment of a supervisor and an assistant. These efforts culminated in dramatic gains in consolidation as shown by the following data: In 1940, there were 340 high schools with fewer than seven teachers; in 1950 there were 173. In 1940, there were 284 high schools with seven or more teachers; in 1950 there were 383. In 1940, a total of 624 high schools enrolled 122,073 pupils; by 1950, 556 high schools enrolled 148,389 pupils. In 1957, a total of 417 high schools enrolled 227,314 pupils, and only 39 of these schools had fewer than 7 teachers. The trend toward fewer schools and larger enrollments has continued to the present time.

The Gray Commission

In August 1954, Governor Thomas B. Stanley appointed a legislative commission on public education, composed of 32 members of the General Assembly, to determine the effect on public education of the 1954 U.S. Supreme Court decision in the school segregation cases. Senator Garland Gray was selected to serve as chairman. Following two interim reports, the commission gave its full report in November 1955.

The plan developed by the Gray Commission attempted to prevent extensive school closings and at the same time avoid compulsory integration. It recommended a tuition grant program to permit pupils to attend non-sectarian private schools and public schools outside the locality where they resided, the state paying a maximum of $125 per school year for a pupil attending an elementary school and a maximum of $150 for a pupil attending a high school.

Although the voters approved the tuition grant program, the plan was shelved during a period of "massive resistance" to the desegregation decision. However, its main provisions were revived in 1959 following recommendations of the Perrow Commission during the administration of Governor J. Lindsay Almond, Jr.

QUALITY EDUCATION FOR THE SPACE AGE, 1957-68

Although many factors affected the course of public education in the decade beginning in 1957, two major developments cast their shadows over the public school system during this period. One grew out of the U.S. Supreme Court decision on school desegregation, and the other out of the launching of Sputnik by the Russians in 1957.

Davis Y. Paschall, who became superintendent of public instruction in March 1957, called his first full year in office "a year of crisis in public education" and referred to "the explosive series of events related to integration suits emanating from the Supreme Court decision of 1954, and the birth pangs of a space age that turned critically to education as a determiner in the sudden warfare of ideologies for the capture of the minds of men" (39).

Commission on Public Education

The 1958 General Assembly, reflecting the public concern generated by Sputnik, enacted legislation providing for a commission to evaluate the curriculum, teacher training and certification, "and related matters" in the public schools in Virginia.

The commission, headed by State (now U.S.) Senator William B. Spong, Jr., endorsed the state department's efforts to strengthen teacher education and the high school curriculum. Its report also emphasized the need for improving the quality of teaching in the following statement:

No matter how fine the buildings or how broad the scope of the curriculum, in the final analysis the excellence of education is primarily dependent upon the quality of teaching .... We are acutely aware that the higher curriculum requirements adopted by the State Board of Education cannot be effective if they are beyond the present capabilities of our teachers (40).

The report stressed the necessity of strengthening program offerings in science, mathematics, foreign languages, and English. But at the same time, it recommended a balanced curriculum in the following terms:

Although we are stressing the teaching of science in high school, it is vital that the curriculum be kept in balance as science is only one of the fields in which children need to be educated ... the scientist lacking skills in the communication arts cannot transmit his knowledge effectively ... This Commonwealth, the birthplace of Washington, Jefferson, Madison, and the other founders
of the Republic, cannot overlook the humanities and thus turn her back upon our great heritage (41).

To upgrade the quality of public education, the General Assembly appropriated funds for various special programs to be administered by the state department. These included teacher institutes in mathematics, science, foreign languages, guidance, and U.S. and Virginia government, with emphasis on the relationship of basic principles to our economic way of life; state aid on a matching basis for the purchase of mathematics, science, and foreign language equipment; state aid for the employment of guidance counselors in high schools; and a general scholarship and loan program for needy but able Virginia students attending state institutions of higher learning.

The Desegregation Crisis

Dr. Paschall, who had broad experience in public school work and who had held the position of director of elementary and special education before he became superintendent of public instruction, found the state confronted with a major crisis that had been building up since the desegregation decision of the U.S. Supreme Court in 1954. White high schools were closed in Norfolk, Front Royal, Charlottesville, and Prince Edward County following the federal court order to desegregate. The city schools reopened during 1958, but schools in Prince Edward County remained closed until the fall of 1964. During the controversy involving the state's public school system, Paschall reminded Virginians that—

Unprecedented tides of recurring crises have swept the shores of public education in this Commonwealth during the past three and one-half years. Its survival and advances have been due to the great faith of the people and the superb leadership of those who possessed a deep sense of educational stewardship (42).

Caught between the federal court decisions on the one hand and the state's laws against integration on the other, Governor J. Lindsay Almond, Jr., appointed in 1958 a special commission on public education to recommend to the General Assembly the steps the state should take to deal with the school crisis. Mosby G. Perrow, Jr., of Lynchburg, at the time a member of the State Senate and later president of the State Board of Education, was named chairman of the commission, which presented its recommendations to the General Assembly the following year. Two of the key proposals approved by the Legislature were repeal of the state's compulsory attendance law in favor of a "local option" statute, and a tuition grant program to make state funds available for parents of children attending private nonsectarian schools or public schools in localities other than those in which they normally would be enrolled. The local option statute existed until early in 1968, when the General Assembly passed a statewide compulsory attendance law.

Moving to strengthen public education in this period of turmoil, the State Board of Education approved major changes in the high school curriculum. A "Statement of Policy for High Schools," which became effective in September 1959, increased the number of units required for graduation from 16 to 20, based on a 5-year high school program. Qualified eighth-graders were encouraged to earn credits in Latin or a modern foreign language, algebra, and advanced science. During Paschall's administration, the state board also upgraded certification regulations for teachers, revised requirements for school building construction in order to give more flexibility to the localities, and made changes designed to strength accreditation standards for high schools.

When Paschall resigned as state superintendent in August 1960 to become president of the College of William and Mary, he left behind a record of progress in public education during an extremely difficult period.

Paschall's successor, Woodrow W. Wilkerson, also was selected from the State Department of Education, where he had served as director of secondary education immediately before his appointment as superintendent. During the administration of Dr. Wilkerson, a man of energy, vision, and determination, the rate of progress in public education has been accelerated.

As the State Board of Education stepped up its improvement efforts, it asked to be relieved of the responsibility for serving as the governing board for Longwood, Madison, and Virginia State Colleges, and for the vocational rehabilitation program. The General Assembly approved the board's request and passed legislation to provide separate governing boards for the three institutions and for the rehabilitation program, effective July 1, 1964. The Virginia State School at Hampton, the last of the institutions left under the board's control by the 1964 Legislature, was placed under a separate board in 1966.

In order that the state superintendent might devote his full energies to his work as chief executive of the public school system, the General Assembly upon recommendation of the Governor relieved him of the responsibility of serving as ex officio member on the boards of the state-supported educational institutions.

Instructional Emphasis on the American Form of Government and Economic Way of Life

The development of materials and guidelines for instruction in economic education began in 1959, when the state board authorized the superintendent of public instruction to appoint a committee to work with the Division of Secondary Education to develop a unit on basic principles of the American form of government and economic way of life.

An outline for the unit was prepared for incorporation in the senior high school course in Virginia and U.S. government and was distributed to school divisions during the 1960-61 school year. As a further step in
strengthening economic instruction, the board requested the preparation of materials contrasting communism and the American system of freedom under law.

During 1962-63, a guide entitled *Communism in Contrast with the Principles of American Freedom* was distributed, and regional meetings were held throughout the state to discuss its use.

A third publication, *An Instructional Guide for Virginia and United States Government*, was issued in November 1964 to give teachers suggestions for selecting, organizing, and presenting content to further the study of the American political and economic system in contrast with totalitarianism, especially communism.

“This publication,” Dr. Wilkerson said, “is unique in its extensive incorporation of an instructional emphasis on the basic principles and beliefs undergirding our economic system and the contrast in depth of the American system of freedom under law with communism” (43).

Upon recommendation of the state superintendent and with the board's approval, the program was refined and expanded to include a guide for the required course in Virginia and U.S. history, a guide for the elective course in civics in grades 8 and 9, a guide to stress economic education in the elementary grades, and revisions of teacher certification regulations to provide a stronger background in economics education.

A 33-member State Advisory Council, composed of lawyers, businessmen, industrialists, Virginia legislators, and educators, was appointed by Wilkerson in April 1965 to serve in an advisory role in the continued planning and development of the economic education program.

A guide entitled *Elementary School Economics*, which offers teaching suggestions in the areas of natural and human resources; production, distribution, and consumption of goods and services; money; taxes; and free enterprise economy, is being used by teachers in grades 1 through 7 in the public schools.

Work also has been completed on a guide for high school teachers of Virginia and U.S. history.

New certification standards for teachers, which became effective July 1, 1968, require that an applicant seeking endorsement in elementary education must complete a course in basic economics and that an applicant seeking endorsement in history, geography, government, or sociology at the secondary level also must complete a course in basic economics.

At the request of the State Board of Education, the 1966 General Assembly substantially increased the funds available for in-service education of teachers. The state board directed that top priority be given to in-service courses in basic economics.

**Vocational Education**

The decade beginning in 1957 was a period of growth for vocational and technical education programs for high school students and for adults, reflecting Virginia’s rapid industrial development. Enrollment in vocational classes doubled during this period, and new programs were initiated. This increasing interest culminated in a study made by a legislative commission appointed in 1962.

After an extensive review of Virginia's vocational needs, the commission made broad recommendations for improving vocational and technical education in the public schools and at the post-high school level. As a result of these recommendations, the 1964 General Assembly made a special appropriation of $3 million for vocational and technical education for the biennium beginning in July 1964 to establish new programs and to expand and upgrade existing programs. It gave special attention to experimental programs for youth with special needs, upgrading technical institutes and area vocational-technical schools, vocational guidance institutes, vocational training centers for high school youth and adults, and establishment of a program of technical education to be administered by a new technical education board.

Progress in this field continued as Virginia inaugurated the Manpower Training Program in 1963 and established an additional service in the department's Division of Vocational Education to coordinate and plan construction of local vocational centers. New vocational facilities have been constructed and equipped in both rural and urban areas. Fourteen vocational centers (five in the Appalachian region) have been completed to provide facilities for educating high school youth and adults in business and office occupations, industrial and technical occupations, agriculture, distributive occupations, and wage-earning occupations in home economics.

**Increased Federal Aid**

Two new federal programs—the Vocational Education Act of 1963 and the Elementary and Secondary Education Act of 1965—substantially increased federal aid for public schools in the state. The Vocational Education Act has provided approximately $6 million annually for construction of area vocational schools; for purchase of equipment for high school and adult programs; for programs for persons with special needs; and for ancillary services, such as teacher training, development of instructional materials, innovative programs, and research.

The Elementary and Secondary Education Act has channeled approximately $35 million annually into the state for programs for disadvantaged children, library resources, innovative programs in education, and for strengthening the state department. In 1966-67, more than 180,000 children in 1,177 target schools participated in Title I classes conducted during the regular or summer sessions.

The increased federal funds came at a time when some school divisions were engaged in a controversy with
the Department of Health, Education, and Welfare (HEW) over certain features of the civil rights program. Controversy centered on two major aspects of HEW’s school desegregation policies. Some school administrators contended that HEW was unlawfully requiring “racial balance” in public schools and that in promoting staff and faculty desegregation the federal agency was exceeding its authority in the area of employment practices. Because of differences over the Civil Rights Act, funds administered through HEW were cut off for seven counties and one city and deferred for new federal programs in five other counties.

Nine-Point Program

In an effort to improve the quality of education in Virginia, Dr. Wilkerson recommended and the state board approved a nine-point plan in 1965. This plan called for (1) upgrading the minimum qualification requirements for teachers, (2) upgrading the salary schedule, (3) providing more teaching scholarships (recruitment program), (4) expanding the in-service training program, (5) improving library services and materials, (6) expanding special education, (7) establishing a uniform reimbursement rate for all state aid positions, (8) encouraging extended use of educational television, and (9) providing more time for teachers to devote to planning instructional activities. The 1966 General Assembly made record appropriations for public education, approving those proposals of the board that required additional funds.

The General Assembly inaugurated in 1966 a new era in public education when it adopted a 2-percent state sales tax and provided that one-half the gross revenue produced by the tax be returned to the localities to be used for public school purposes. An additional 1-percent tax became effective in 1968. The sales tax bill also empowered the cities and counties in the state to levy a 1-percent sales tax for their own use.

The 1966 General Assembly also appropriated money for the first time to help localities conduct summer school programs. This aid made it possible for more students to take courses they could not schedule during regular school terms and enabled more students to move toward graduation on an accelerated basis.

Kindergarten Education

The State Board of Education in 1966 recorded its support for state aid for kindergarten classes operated as part of the public school program in Virginia.

In the same year, the General Assembly approved the principle of state aid for public school kindergartens. Two years later, it appropriated $15 million for the 1968-70 biennium to aid localities operating kindergartens as part of their public school programs.

In preparation for the full-scale operation of kindergartens, the State Board of Education, upon recommendation of the superintendent of public instruction, adopted in 1967 the first regulations in the state’s history governing the operation of public school kindergartens. These regulations established standards for certification of kindergarten teachers, length of the school day, and size of classrooms. In-service education regulations were amended by the board to make it possible for applicants recommended by division superintendents to take courses leading to an endorsement in kindergarten education.

In January 1968, a curriculum guide for kindergarten education was approved by the board. This guide was prepared by a committee, appointed by the state superintendent, composed of kindergarten teachers, college teachers of early childhood education, superintendents, principals, a director of elementary education, a consultant of the National Education Association, and members of the elementary education service of the State Department of Education.

Accreditation of Elementary Schools

As a major step in the program to improve public education, the state superintendent recommended in January 1967 that the accreditation program be expanded to include elementary as well as high schools. In requesting state board approval for appointment of a committee to make a study and, if feasible, to prepare a plan for accrediting elementary schools, Wilkerson noted that the development of standards for the elementary schools was directly related to efforts to raise the level of public education in the state.

The state board gave its approval for the study, and in May 1967, an 18-member committee was named by the state superintendent to carry out this assignment which he described as “one of the most significant ever taken in the field of elementary education in Virginia” (44).

Teacher Certification

To upgrade the quality of teaching in the public schools, the certification requirements for teachers were revised in 1960 and again in 1968. This action was taken in both instances after many months of intensive study by committees representing the public and private schools of the state, teacher-training institutions, and the department.

The 1960 standards reflected greater emphasis on excellence in scholarship and a broad, basic education of all teachers as an essential part of their preparation. The requirements in basic education for high school teachers were increased from 36 to 48 semester hours, and for elementary teachers from 36 to 59 semester hours. Substantial increases in semester hours were required for those preparing to teach the following basic subjects in high
school: English, mathematics, biology, chemistry, physics, general science, history and social science, and foreign languages. In addition, specific content in several fields, including mathematics and science, was established for elementary teachers.

The 1968 standards represent a further increase in the depth and range of subject matter required for certification in each teaching field. Following are some of the major changes:

The collegiate professional certificate will be issued initially for a period of 5 years from the date of qualification and is renewable for 5 years. (This certificate was previously issued for a period of 10 years and was renewable for 10 years.)

General education requirements provide that all applicants must possess a baccalaureate degree with a background of 48 semester hours in general education, including a minimum of 12 semester hours of humanities courses, 12 hours of social science, 12 hours of laboratory science and mathematics, and 4 hours of health and physical education. The remaining 8 hours must be from the humanities, social science, and laboratory science and mathematics. (The revised regulations also recommend that all teachers take a course in speech and in basic economics to satisfy in part the general education requirements.)

Not less than 120 clock hours of student teaching are required with a minimum of at least 90 clock hours given to actual teaching.

For an endorsement in elementary education, grades 1-7, the applicant must complete a total of 60 semester hours in specific subjects, including a required course in American history and a course in basic economics.

The revised regulations increase the number of semester hours required for an endorsement in art, distributive education, driver education, English and speech, English and journalism, English and dramatics, foreign languages, health and physical education, history and social science, mathematics, music, science, and special education. (An applicant for endorsement in history, geography, or sociology is required to complete a course in basic economics.)

A new industrial education certificate will be issued to qualified applicants in vocational industrial education. This certificate will be based in part on successful work experience and in part on college credit courses.

Raising the Quality of Public Education

Governor Mills E. Godwin, Jr., sounded the keynote of his administration in his inaugural address in 1966 when he said:

"We can take no rest until all our public schools—not just some—will compare with any in the nation; until all our colleges and universities—not just some—can hold up their heads in any company; until all our sons and daughters—not just some—have the same chance to train their minds and their skills to the utmost (45).

Following through on this theme, the Governor called a statewide Conference on Education in Richmond in October 1966. This historic meeting was attended by 1,900 people, who heard the state's chief executive and other leading Virginians call for more rapid improvements in education at all levels, and especially the elimination of disparities between public school programs in different sections of Virginia. The Governor said:

This [conference] is not a time nor a place for looking back for it is the future we are concerned with here.

It is a time instead to examine education as we never have before, to find its weakness and its strength, to assess its needs in the light of the Virginia which is taking shape around us, and of her place in a nation speeding to new heights.

It is time to look within ourselves, to ask what we really mean when we say that education must come first among our public and our private obligations (46).

Backed by prominent citizens and educators, the campaign was carried throughout the state in a series of regional and local conferences, focusing attention on the most critical needs in each locality of the state.

Dr. Wilkerson acclaimed the Governor's statewide conference and the regional conferences as epoch-making events for education at all levels.

Meanwhile, the State Board of Education attacked the "quality education" problem on another front. In 1967, the board authorized the state superintendent of public instruction to appoint a committee to develop a plan to effect substantial improvements in public education, particularly in those localities where the needs are greatest. The 15-member committee, headed by William M. Turner of Petersburg, consisted of school superintendents, school board members, state legislators, locally elected officials, and state department personnel. Its attention was concentrated on staff and in-service education, curriculum and instruction, instructional aids and services, buildings, financial support, and evaluation. Its final report was presented to the board in April 1967, and some of its recommendations were put into effect almost immediately.

The Board of Education's 1968-70 budget requests reflected other recommendations. A key proposal contained in the report and approved by the board was the recommendation that visiting teams be assigned to evaluate programs for school divisions having the greatest educational needs. These teams work with superintendents, school board members, and members of local governing bodies to formulate plans for effecting substantial educational improvements. This program became effective in July 1968.
The committee on raising the level of public education made several other major proposals. For instance, it recommended that the department determine those localities in greatest need of fully certified teachers and give top priority to provide money for adequate in-service training. It suggested giving priority to applicants for loans from the Literary Fund to those school divisions needing improved physical facilities the most. It further recommended that the department assist in planning and conducting special education programs on a regional basis in those localities having the greatest need.

The committee also recommended a study of "ways and means" to effect the consolidation of small school divisions and a study of the formula for distributing state aid to public schools. Special legislative commissions were to make both studies.

Strengthening the State Department of Education

Between 1957 and 1968, the leadership and supervisory responsibilities of the State Department of Education were expanded to improve the public school program throughout Virginia.

Impetus was given to this effort by the report of the commission on public education in 1960, which recommended the employment of subject supervisors in English, science, foreign languages, mathematics, and social studies (history, government, geography, economics) to assist in improving instructional programs, particularly in the smaller high schools. Following the commission's recommendations, subject supervisors were added to the staff of the Division of Secondary Education. This supervisory program is being extended to include subject field supervisors in the Division of Elementary and Special Education.

Funds from Title V of the Elementary and Secondary Education Act of 1965 have been used for the employment of additional professional personnel to strengthen programs in elementary and secondary education, research, special education, and other areas. The position of special assistant for federal programs was established in the department in July 1965. Consultants also have been employed for seminars and workshops for department personnel.

In an effort to better acquaint the people of the state with progress, needs, and problems in public education, a public information service was established in 1959. As a further step in this direction, the department began publication in 1965 of a quarterly news magazine which is distributed to public school personnel, representatives of business and industry, school boards and local governing bodies, and various organizations interested in public education.

A Division of Educational Research was established in 1963, with these major functions: to conduct research studies requested by the state board and the state superintendent of public instruction; to encourage and assist local school divisions in designing and conducting pilot studies; to coordinate educational research in the state; and to provide a two-way flow of educational data between local school systems and the state department.

Data-processing procedures, involving a computer and other electronic equipment, are being used by the department to increase its capacity to collect, process, and disseminate information more rapidly and efficiently. This program provides a reservoir of basic information about public education. These data constitute a framework for decisions aimed at improving the quality of public education in the state.

The department's central office staff was reorganized in 1967 to relieve the state superintendent of numerous administrative responsibilities and enable him to devote more time to major needs and problems of the public school system. The state board established new positions of deputy superintendent (formerly assistant superintendent), assistant superintendent for finance, assistant superintendent for instruction, and special assistant for evaluation and planning.

The discharge of citizenship responsibilities in an extremely complex era, the unprecedented expansion of knowledge, the increasing selectivity of college admission requirements, the impact of advances in technology on education and job opportunities, the high priority accorded education by business and industry, and, finally, the aspirations of parents for their children—all underscore the urgency of constant efforts to further strengthen the public school program.

Public interest in improving educational opportunities for youth and adults has reached new heights. This upsurge of interest and the quickened pace in pursuit of excellence in education hold great promise for the future of the public schools in the Commonwealth of Virginia.

TERRITORIAL DEVELOPMENTS

First Schools

Fur trappers and missionaries began moving into northern Oregon, as Washington was then known, in the 1830's. But it was not until after the Oregon Treaty of 1846, whereby Great Britain relinquished its interest south of the forty-ninth parallel, that a steady stream of settlers began moving into the territory. An unofficial census in 1849 found 304 people north and west of the Columbia River, and a year later the official census listed a population of 1,049. In addition to the school operated at the Hudson Bay Company's Fort Vancouver headquarters since 1832, three more had been established. The census did not show the school that Spokane Garry, later chief of the tribe from which he took his first name, had started around 1830 on the site of present-day Spokane; and there is no mention of the missionary schools that opened in eastern Washington during the 1840's.

These pioneers had little use for the officials who governed them from the territorial capitol at Salem. The feeling was shared by the longtime settlers of Oregon's Willamette Valley, who considered their northern neighbors a lot of rowdies. By mutual agreement, the Washington Territory was created from the Oregon Territory by President Fillmore's signature in March 1853. In establishing the Oregon Territory, Congress had for the first time granted two sections of every township, rather than one, for the support of education. In framing the Organic Code, which served as the new territory's constitution for 36 years, Congress was as generous to Washington as it had been to Oregon. Thus, even in the beginning, Washington's schools benefited from federal expenditures to a greater degree than most states, just as the state's economy in later years can trace much of its development to federal involvement in electric power production, agricultural development, military bases, and aircraft production.

The school lands were of little use during the territorial days. Surveying was a time-consuming task; but, more important, the land commissioner ruled that funds from any sales would not be available until statehood. Nevertheless, the people were interested in building a school system for their children. Governor Isaac I. Stevens, in his first message to the Territorial Legislature, strongly supported education:

The subject of education already occupies the minds and hearts of the citizens of this Territory, and I feel confident that they will aim at nothing less than to provide for a system which shall place within the means of all the full development of the capacities with which each has been endowed. Let every youth, however limited his opportunities, find his place in the school, the college, the university, if God has given him the necessary gifts. Congress has made liberal appropriations of land for the support of the schools, and I would recommend that a special commission be instituted to report on the whole system of schools (1).

Early Laws

In April 1854, the Territorial Assembly passed an act establishing a common school system. It was similar in many respects to the Oregon law, developed through an evolutionary process from Iowa, which in turn owed a lot to Michigan law, which was based on New England law. There was one unfortunate difference between the Oregon and Washington school laws: Washington lawmakers, sensitive to their constituents' pioneer distrust of central authority, decided not to provide for a territorial superintendent or any other form of centralization.

The Law of 1854 called for the proceeds of the land donated by the government to go into a permanent school fund, with the interest only to be used for education. The schools were to receive money for teachers' salaries from a 2-mill tax levied by the county commissioners on the county's taxable property. Fines for breach of the penal code were to go to the schools. School districts were required to match the county fund through tax levies or otherwise. The law empowered school districts to vote additional taxes to raise buildings, repair them, and buy books and equipment. This arrangement, with periodical
increases in the maximum levy, financed the schools until 1895.

The 1854 law also provided for the election of a county superintendent for a term of 3 years. He was to set district boundaries, examine teachers, issue certificates, visit all schools annually, apportion school funds to districts on the basis of the number of children from 4 to 21, and make an annual report. For this he was to receive no less than $25 a year; but if the county commissioners thought he deserved it, they could pay him as much as $500. The law further provided for three school directors for 3-year terms. Except for slight modifications, this law remained largely intact until 1877.

The Dark Era

The lack of central authority made the schools a system in name only. Few county superintendents were seriously interested in their jobs; the difficulties of travel prevented many from making the required annual visits, and few submitted annual reports. The records of this period are nearly nonexistent. Many children attended private schools, some good, some not. One educational historian has called these first 20 years of the territorial period the “dark era” in education (2).

Although they were interested in education, the settlers had many other serious concerns, such as a series of Indian wars and the Civil War. Further, D. R. Bigelow, framer of the Law of 1854 and later Thurston county superintendent of schools, pointed out:

They [the settlers of New England] came to make homes and surrounded them with all that make homes desirable; whereas in our case, a majority of our citizens, who have been best able, both in talents and money, to build up the country’s moral and educative interests, have been adventurers; their citizenship in the Territory depending on some contingency; and consequently they have not felt that interest in the education of the country, either of the present or future generations as to induce them to make any adequate effort to accomplish it (3).

First Superintendent

The schools languished until 1861, when the Legislature established the Office of Territorial Superintendent of Schools. Reverend B. C. Lippincott, a Methodist minister and president of Puget Sound Institute of Olympia, was appointed the first superintendent by the Legislature. Charged with reporting annually to the Legislature and recommending improvements, Superintendent Lippincott requested in first report in 1862 that the county superintendents be required to report to his office annually and that his office be allowed to issue teacher certificates good in any county. Unfortunately, he also devoted much of his report to questioning the need for the new territorial university—opened in November 1861—when the common schools were in such poor straits. He boldly stated his opinion that there was not a single youth in the territory capable of passing the college entrance examination. As the university had considerably more friends than enemies in the Legislature, it was voted to abolish the Office of Territorial Superintendent. So the common schools struggled through the dark era for another 10 years.

The Legislature reestablished the office in January 1872 and appointed Nelson Rounds as territorial superintendent. His salary of $300, one-tenth of the Governor’s, was also to cover office rent, stationery, printing, travel, and incidentals. The law did not prohibit the superintendents from moonlighting, and at least one operated a newspaper throughout his term. This was made easier because there was no requirement that the superintendent’s office be located in the territorial capital at Olympia, only that he reside where there was a post office. So the seat of territorial education shifted from Olympia to such towns as Goldendale, Waitsburg, Garfield, and Port Townsend.

Dr. Rounds, a Methodist minister and president of Willamette University before assuming the superintendency, presented in January 1873 the first statistical data on education in the territory. They showed that there were 144 schoolhouses, 222 school districts, 157 schools in operation, and 3,828 children attending out of 8,290 of school age (4).

Beginnings of a System

John P. Judson, the third territorial superintendent, deserves much of the credit for leading the schools out of the frontier era and welding them into a system. Judson was responsible for the Law of 1877, which developed from his unique method of organizing the first territory-wide teachers institutes. Judson held three such meetings to write the 1877 law. This method established a precedent, so that for many years Washington’s school law was largely the result of professional educators’ deliberations.

The 1877 law established a Territorial Board of Education and empowered it to adopt uniform textbooks, issue teacher certificates, prepare examination questions for county superintendents, and set the rules for governing the schools. The law expanded the duties of the territorial superintendent, requiring him to visit schools, address the public on educational matters, hold annual territorial teacher institutes, and help establish county institutes. To compensate for these extra duties, the superintendent’s salary was doubled to $600 per year, plus up to $300 more for expenses. With the approval of the Legislative Council, the Governor would appoint the superintendent for a 2-year term.

The new law stimulated the growth of grade schools by permitting single districts to establish them, and two or
more districts to set up a union or grade school by vote of the residents affected. Children from 8 to 16 in towns with a population of over 400 were required to attend school for at least 6 months each year. The county tax levy was raised to a minimum of 3 and a maximum of 6 mills. County boards were established to conduct semiannual examinations of potential teachers. The law also ensured adequate statistical reports by stipulating that county superintendents would forfeit $100 of their increased salaries for failure to report to the territorial superintendent as required.

The Board of Education

The newly established Board of Education consisted of two laymen, one from each judicial district, and the territorial superintendent serving as the ex officio president (5). In its first year of operation, the board established regulations for governing the common schools and examining teachers. It complied with the new law requiring uniform textbooks by selecting A. S. Barnes and Company's "Independent Series of Standard Textbooks" for the specified 5-year period, thus ending the "promiscuous use of all kinds of text books" (6), one of the territorial school system's major problems. The board adopted a complete course of study for the graded schools and for 2 years of high school, although the legality of high schools remained in doubt for several years. The senior year curriculum included "geometry and history throughout the year. Botany and the Constitution of the United States, first half; chemistry and astronomy, second half. Rhetorical exercises throughout the high school course" (7).

When Judson's outstanding administration ended in 1880, Washington was entering its greatest period of change. The completion of a transcontinental railroad terminating in Tacoma in 1883 signaled the start of a 14-year boom that saw the territory achieve the nation's highest growth rate for the decade. Between 1887 and 1889 alone, 95,000 people settled in Washington, a figure higher than the total population in the previous census. No outstanding changes were instituted in the schools throughout the remainder of the territorial period; for the most part, Judson's successors built and expanded on the foundation he had provided.

Jonathan S. Houghton, who took office following Judson, noted that between 1878 and his 1881 report the number of school districts had doubled in some eastern parts of the territory. He lobbied for greater appropriations because of the travel required to visit these districts. Dr. Houghton traveled 4,000 miles and held three territorial institutes during his 2-year term, partly in an effort to raise teachers' professional standards.

Last Territorial Superintendents

Superintendent Charles W. Wheeler, who took office in 1882, was concerned about the professional training of Washington teachers. Wheeler succeeded in getting the Legislature to amend the law to require all teachers to attend annual institutes in counties having more than 10 districts. He was probably the first superintendent to advocate a territorial normal school. The schools were expanding, and the territory needed more teachers. For instance, during the biennium from 1884 to 1886, Superintendent R. C. Kerr reported that 189 schoolhouses were built, 267 new districts were formed, the graded schools increased from 15 to 24, and the number of teachers increased from 490 to 1,040.

John C. Lawrence, who served as superintendent from 1886 to 1888, continued Wheeler's demands for a state normal school and emphasized teacher institutes. He was successful in getting a course of study adopted for ungraded schools. Lawrence was probably the first superintendent to recommend free textbooks. He favored statehood for Washington so that the school lands could be sold to the highest bidder, estimating that they would bring $5 million. How surprised he would be to learn that today timber sales from these lands contribute more than $7 million annually to the common school fund.

The last territorial superintendent, J. H. Morgan, concluded that the greatest need was for more efficient teachers. As the territorial era closed, there were 1,161 school districts in Washington, 1,944 schoolhouses, 49 graded schools, 46,751 children enrolled out of 72,723 of school age, and 1,349 teachers. The 536 male teachers were earning an average of $47.66 per month, while 813 female teachers averaged $39.67, teaching an average school year of 4.6 months. Morgan pointed to considerable progress during the past 50 years and was confident about the future prospects for the schools under statehood, because more money was expected from the school lands to increase teachers' pay, to build better schools, and to obtain better furniture, more apparatus, and school libraries.

STATEHOOD

Legal Foundations

Western settlers had long chafed under the "colonialism" of territorial government, and pressure grew through the 1880's as the railroads brought more and more people to the Western states. The Omnibus Bill, or Enabling Act, signed by President Cleveland on Washington's Birthday, 1889, paved the way for statehood for Washington, Montana, and the two Dakotas.

The act required Washington to provide a system of public education open to all children and free of sectarian control. Sections 16 and 36 of each township were again set aside for the common schools, with a provision that these lands would not be sold for less than $10 an acre. Revenue from the sales was to become part of the permanent school
fund, and only the interest could be spent for school support. Five percent of all public land sales in the state was to go into the school fund. The act confirmed the 1854 grant of 90,000 acres for the university and set aside 90,000 acres for an agricultural college, 100,000 acres for a scientific school, 100,000 acres for support of state normal schools, and 200,000 acres for charitable, penal, and reformatory institutions. Congress again had provided well for education and for the state.

The 1889 Constitution. The constitutional convention of 1889 included among its 75 delegates 11 who had been connected with education in some way. Perhaps they were in part responsible for including the following:

- It is the paramount duty of the state to make ample provision for the education of all children residing within its borders, without distinction or preference on account of race, color, caste or sex.

- The legislature shall provide for a general and uniform system of public schools. The public school system shall include common schools, and such high schools, normal schools, and technical schools as may hereafter be established. But the entire revenue derived from the common school fund and the state tax for common schools shall be exclusively applied to the support of the common schools (8).

These statements continue today to be the foundation of Washington's school system. They provide the impetus to equalize financial support for all of the state's children—an elusive goal which state superintendents have strived to reach ever since. The constitution stipulates that the principal of the common school fund shall remain permanent and irreducible. It specifies the sources of the fund as well as the manner in which lands may be sold and restricts the method of investing the fund.

The constitution designated the superintendent of public instruction a member of the executive department; like all members of the executive, he is elected popularly every 4 years without restriction as to the number of terms. His duties are to supervise all matters pertaining to public schools and perform other duties as prescribed by law. The constitution also set the superintendent's salary at $2,000—half the Governor's—to a maximum of $4,000 (9). The constitution did not provide for a State Board of Education, an oversight that was to cause some difficulty over half a century later.

First State Superintendent. In the election of October 1889, Washington voters ratified the constitution and elected Robert Bruce Bryan the first state superintendent of public instruction. He was elected for three terms in all, 1889 to 1892 and 1900 to 1908, but he died in the last year of his final term. Born in Ohio in 1842, Bryan was wounded in the Battles of the Wilderness and Spottsylvania during the Civil War. After the war, he took teacher training, taught in Kansas, and worked on a newspaper before coming West. He was superintendent of schools in Montesano, Washington, from 1886 until his election to the state superintendency. He drafted the state's first code of public instruction and was working on a revision at the time of his death.

Superintendent Bryan observed that the new Legislature repealed the old school law and adopted a new one without radical change. In his first term Bryan was mainly concerned with two problems: The average daily attendance was but 42 percent of the school census, and Washington lagged behind other states in the average length of its school year. These problems were principally rural and due in large measure to the inequalities of school financing. The superintendent pointed out that the county commissioners provided funds ranging from $15.54 per child in Clallam County down to $3.50 in Skamania County because of variations in the value of taxable property and the rate of levy. He was convinced that a state tax should be enacted which, when added to the income from the permanent school fund, would yield not less than $10 per pupil annually.

Barefoot Schoolboy Law. Bryan's concern for school support was taken up by his successor, Charles W. Bean, former superintendent of Whitman County. John R. Rogers of Puyallup, later to become Governor, introduced the legislation for a state school tax in 1895. The act became Washington's famed Barefoot Schoolboy Law. It provided for a state levy of up to 4 mills annually which, when added to the income from the permanent school fund, would produce $6 for each child between 5 and 21. This law introduced into American education the new principle that it was the state's responsibility to guarantee every child a basic education.

The new tax vindicated Superintendent Bryan's insistence that it would help solve the problems of low enrollment and a short school year. By 1898, enrollment had jumped to over 82 percent of the census, and the average school year had increased by more than a month. But the law did not provide equality of school support throughout the state; today's administrators continue to wrestle with the problem.

High Schools. During Superintendent Bean's administration the Legislature clarified the legal status of high schools for the first time. The constitution appeared to exclude high schools from the proceeds of the common school fund; some statutes seemed to provide for them, others did not. Seattle neatly ducked the issue in 1893 by "abolishing" its high school and renaming it the senior grammar school. The 1895 Legislature took care of the matter by empowering the State Board of Education "to provide a
course or courses of study for the primary, grammar and high school departments of the common schools" (10).

Despite their questionable status, high schools had grown. A private school in Olympia taught high school subjects as early as 1856. The territorial university, more high school than university for several years, offered secondary courses from 1861 to 1895. But the first formal public high school probably was the one opened by Dayton in 1880. Twelve years later, the state had five 3-year high schools, four 3-year high schools, and one 2-year course. The 1895 legislation stimulated their growth, and by 1900 there were 47 high schools.

Bean presented to the Legislature a number of constructive recommendations on school support, certification, free textbooks, unification of curriculum, district organization, and qualifications for county superintendents.

Law of 1897. In 1896, Frank J. Browne was elected state superintendent. Born in Ohio, Browne had taught in Tacoma, been superintendent of the Port Townsend schools, and principal of Columbia City (now part of Seattle) schools. Browne's annual reports marked depart from custom by containing few recommendations and consisting almost entirely of state board reports, examination questions, statistics, the board's new course of study for common schools, and manuals of exercises for observing special days—including the gala Washington's First Bicentennial Day.

During his first year, Superintendent Browne's principal contribution was the School Law of 1897, which legislators of the day considered the nation's best. For the first time state aid was apportioned on the basis of total days' attendance, with each district given a minimum credit of 2,000 days. Previously apportionment had been according to the number of children residing in the district. Two years later, following Browne's recommendation, the Legislature raised state aid from $6 to $8 per child and provided for a 5-mill limit.

The 1897 Legislature reorganized the State Board of Education to consist of the superintendent of public instruction and four persons appointed by the Governor, two of whom were to be active teachers holding life certificates. The 1897 school law vested the state board with the total authority to grant teacher certificates; county superintendents retained only the responsibility for conducting examinations. The Legislature also created a State Board of Higher Education consisting of the State Board of Education and the heads of the five state institutions of higher learning. The operations of the two boards confused high school accreditation for the next 12 years.

Bryan's Return

Robert Bryan returned to office for his second term in 1900. Both he and his successor, Henry B. Dewey, gave outstanding leadership in a period when the schools were expanding their horizons and, as Dewey noted, "the people as a whole are taking a more sustained interest in the welfare of the boys and girls of the state" (11). During the first decade of the twentieth century, the number of children enrolled in school doubled, the number of high school graduates quadrupled, and the average school year increased from 6 to 7.7 months.

To encourage the growth of union high schools, the 1901 Legislature passed an act to have the superintendent give a $100 bonus for each grade above the grammar grades maintained by a union district. Bryan pointed to a number of imperfections in the law—mostly relating to the means by which certain districts were circumventing its intent to obtain the bonus. The 1903 Legislature closed these loopholes to Bryan's satisfaction.

Bryan, regarded as the father of education in Washington, appeared to his deputy, Henry Dewey, as "a man of strong convictions, untiring energy and forceful personality" (12). However, at times he showed a somewhat sarcastic sense of humor. For instance, in his 1904 report, he stated:

The idea bored itself into the brains of a few leading educational people in this state, that the whole school system is being damned by the fact that the state superintendent and all county superintendents are elected in just the same manner that all other state and county officers are elected. It had not occurred to me before this excitement sprang up; but I am now astonished to think that I have not felt mortified and chagrined to think that I was elected by practically the same process that Wm. McKinley was elected, and by exactly the same process by which my colleagues in the State Capitol building were elected. I am now happy to think that I now have a good and sufficient reason for being unhappy during the remainder of my life, and it should be a sufficient and just cause to make all county superintendents in this state wretched, to reflect upon the fact that they, too, were nominated and elected in the same manner as were their associate county officers (13).

Code of 1909. Undoubtedly Bryan's greatest contribution to education was the Code of 1909, a complete recodification of the first state law of 1897, which he had also drafted. The 1907 Legislature appointed the code commission, which contained among its membership three state superintendents: Bryan, Dewey (after Bryan's death), and Noah D. Showalter, who would become superintendent in 1928. When Bryan died in 1907 while still working on the revision, Governor Mead appointed Dewey to fill the unexpired 9-month term, and Dewey directed the completion of the code commission's report.

The code commission responded to Superintendent Dewey's request that an additional assistant superintendent
position be authorized, bringing the staff to two assistant superintendents; one deputy, who doubled as inspector of schools; a stenographer; and the Board of Examiners, who served part-time. Dewey, the first superintendent to refer to the budget and staffing of his office, based his request for the additional staff members on the “numerous and important duties” that had been added, such as certification, inspection of schools, eighth-grade examinations, and the requirement that the superintendent attend school directors annual meetings in every county.

The Code of 1909 contained nearly all the prescribed duties of the state superintendent as they exist today. In addition to the constitutional authority to supervise all matters pertaining to the public schools, they included (a) writing the biennial report to the Governor; (b) arranging for the preparation and distribution of blanks, forms, registers, courses of study, rules and regulations for the government of common schools, examination questions for teachers, and all else necessary for teachers and officials to discharge their administrative duties; (c) attending education meetings, visiting schools, and consulting county superintendents and other school officers; (d) providing the state auditor a monthly statement of travel expenses; (e) printing and distributing to school officials forms and instructions for execution of the laws relating to public schools; (f) acting as ex officio president of the State Board of Education; (g) holding an annual convention of the county superintendents; (h) filing all papers, reports, and public documents transmitted to him by school officers; (i) obtaining an annual report from the president, manager, or principal of every educational institution in the state; (j) keeping in his office a directory of all boards of regents and trustees of state educational institutions, their faculties, and all teachers receiving certificates to teach in the common schools; (k) issuing certificates as provided by law; (l) keeping records of his office’s business and the meetings of the state board; (m) deciding all points of law submitted by county superintendents and appeals of their decisions; (n) administering oaths and affirmations; (o) delivering all records, books, maps, documents, and papers of his office to his successor; (p) preparing and revising from time to time a state manual; and (q) performing such other duties as might be prescribed by law.

The 1909 law abolished the State Board of Higher Education and restructured the State Board of Education to consist of the superintendents of public instruction, the presidents of the state university and the state college, the principal of one of the normal schools, a superintendent of a first-class district, a county superintendent, and the principal of a fully accredited 4-year high school. This settled a controversy of several years as to whether the education board, and later the higher education board, or the state college and university were to accredit high schools. Sole authority to accredit high schools was assigned to the State Board of Education by the 1909 law.

The Law of 1909 required the county commissioners to levy a tax sufficient to produce the sum of $10 for each school-age child residing in the county, up to a limit of 5 mills. This brought the county fund into equality with the state fund. County support remained at this level until 1933.

The 1909 code included a new certification law. With its elaborate system of certificates it remained the basic law for many years, and elements of today’s law trace back to it.

Henry B. Dewey

Henry B. Dewey, appointed Bryan’s deputy superintendent in 1905 and superintendent on Bryan’s death, won the office himself for the 1908-12 term. A graduate of the University of Michigan in 1890, he had served as superintendent of Shiawassee County, Michigan, and Pierce County, Washington. An enthusiastic booster of Washington education, Dewey was one of the ablest officers in the state’s service. His reports, lively and interesting, were the first to contain details on physical education, athletics, and the need for playgrounds. To encourage standardization, he advocated employing a high school inspector, which the 1911 Legislature authorized.

Most of Dewey’s major concerns would hardly seem out of place today. He centered his department’s activities on expanding vocational training, adopting a flexible course of study, and giving more attention to civic and moral instruction. He also advocated greater cooperation among teachers, parents, and the public (he approved of the rapid growth of the PTA movement), and more use of the school plant by the community. He probably is best remembered for his contributions to the progress of rural education.

In his last biennial report, Dewey highlighted accomplishments of his administration. He had appointed a rural school expert as deputy superintendent, instituted sex hygiene instruction in state normal schools, and required industrial training in grammar school grades and agriculture in the eighth grade. He and the department had given increased attention to the needs and capacity of individual students. Night school, first authorized in 1907, had increased dramatically. Moving pictures were more generally used; there was widespread use of the Victrola and a variety of musical instruments; warm lunches were served in many rural and city schools; and the State Board of Health abolished the common drinking cup from public schools (14).

In 1921, the Republican party nominated Dewey to run for one of two newly created congressional at-large seats. Although he finished second in the primary, two Progressives, who had not run in the primary, won in the general election, with Dewey a close third among six candidates. Houghton Mifflin Company hired him as a representative, and he later became their managing editor.
The Preston Era

Washington experienced another boom during World War I. From 1914 to 1919, the number of wage earners doubled; Seattle's work force jumped from 11,000 to over 40,000. After the postwar depression, growth resumed, but less spectacularly. Nevertheless, during Mrs. Josephine Corliss Preston's superintendency, from 1912 to 1928, secondary schools and colleges increased almost 400 percent, high school graduates increased from 2,512 to 21,587, and the cost of schools tripled to $33 million (15).

Mrs. Preston received her education and initial teaching experience in Minnesota, but for the 9 years prior to her election as state superintendent, she had served as superintendent of Walla Walla County schools. A member of the War Emergency Education Commission, one of seven division chairmen of the first World Conference on Education, and national president of both the National Education Association and the Council of State Superintendents and Commissioners of Education, she achieved national prominence during her four terms as state superintendent. In Washington she endeared herself to multitudes of parents and children by sending personal letters of congratulation, signed in her own handwriting, to every child promoted from eighth grade. A large, positive person, with an approach to people and problems bordering on the puritanical, she was known (behind her back, to be sure) among staff members as the Duchess.

Rural Problems. Mrs. Preston's chief concern as state superintendent was the quality of rural education and the welfare of rural teachers. In 1924, she wrote:

Rural education is the greatest problem in American education today . . . . The greatest need is for teachers with initiative, leadership, high ideals, strong character, broad sympathy and superior professional training and education who are willing to go into the country to teach (16).

She believed that most rural teachers were quitting because they had to room and board with families whose children they were teaching all day. Her solution was to convince the Legislature to provide teachers' cottages.

The 1913 Legislature passed an act authorizing school directors to make school property more available for community purposes. This cleared the way for two of Superintendent Preston's favorite causes: It encouraged schools to become centers of community social and intellectual life, and it authorized directors to provide suitable dwellings and accommodations for teachers, supervisors, and their ascendants. Thus, by 1924, she could proudly announce that more than 400 teachers' cottages had been erected in Washington, and this move to improve living conditions for teachers was sweeping the country (17).

Even before she succeeded in obtaining rural teacher housing, Mrs. Preston had made considerable progress in upgrading rural education. In 1917, in an effort to standardize rural schools, she printed the first standard rating cards. She also continued the department's support for the standardized rural school plans and specifications Dewey had instituted in 1911. In describing the benefits, she stated:

It is no uncommon thing to be traveling along a road right through the forests in the western part of the state and to come suddenly upon a modern one-room school house, with ample playground and well-kept out-buildings; or in the eastern part of the state to come upon such a building in traveling through the rural districts. It is hard to measure the valuable results which have come from the supplying of plans and specifications by this department for one, two, and three-room school buildings (18).

Mrs. Preston gave considerable attention to consolidation and transportation as means of improving rural education. In 1922, she advocated enlarging school districts to coincide with "natural" neighborhood centers, which she believed would reduce the number of districts from 2,400 to 600. The "natural" units consisted of communities and the surrounding rural areas which were tied to the community economically and socially as well as educationally. Her financial advisor, L. D. Burris, prepared a map based on a study of 800 "natural" community units. Mrs. Preston was convinced that this was in keeping with the national trend toward larger school units but would not deprive Washington's citizens of their cherished local control. She believed local control would suffer if the state adopted the county unit plan then in vogue and recommended by Governor Hart's 1921 code commission.

Neither Mrs. Preston's community center plan nor the county unit plan was adopted, but the consolidation movement did progress carefully and intelligently. Before the end of her last term as state superintendent, the number of consolidated districts increased from 130 to 400. But the State of Washington has not yet succeeded in achieving what educators consider a satisfactory school district organization.

School Support. School support was no less of a problem to Superintendent Preston than it has been to every superintendent. She continually sought better pay for county superintendents and teachers. In 1920, considering the shortage of teachers a crisis, she pushed through a special legislative session the so-called 20-10 law, which increased state aid from $10 to $20 per census child but retained the $10 county aid. Two years later, however, Mrs. Preston found herself in the unhappy position of having to oppose
an initiative measure to raise state aid another $10 per child. She stated:

I regret to find myself differing from many people who are sincerely interested in education, but I feel that much of sentiment in favor of the bill is based on a misunderstanding of its real effect. Any unselfish person will know that as Superintendent of Public Instruction I am deeply and unselfishly interested in the civic and school welfare of the children of this state. It is my business to be interested if I had no other urge or impulse. My experience and contact with our schools convinced me that the 30-10 measure will not be for the best interests of education (19).

She did not believe that there was an emergency demanding such a change, and she felt that the proposed changes in the distribution of funds—in the name of equalization—would be harmful. Although convinced that true equalization could never be achieved through a general distribution system, as early as 1922 she advocated a state equalization fund to give special help to certain one-room and needy grade schools. Both Houses of the Legislature passed an equalization fund measure by more than four to one in 1928, but the Governor vetoed it.

Despite these financial problems, Washington's teacher standards continued to progress, enabling the state to maintain its high rank in certification. Mrs. Preston noted that beginning in 1917 all candidates for certificates had to graduate from high school and complete 9 weeks of training in a normal school. A decade later, 2 years of normal training was the minimum. From 1913 to 1924, teachers with diplomas and certificates from the state's five institutions of higher learning increased from 563 to 5,000.

**Vocational Education.** Vitally interested in vocational education, Mrs. Preston formed a vocational education commission and an advisory board in 1914. When the 1917 Smith-Hughes Act provided federal aid for vocational education, the Legislature designated the State Board of Education as the State Board for Vocational Education and named the superintendent as its chief executive officer. She appointed a director of vocational education in 1917 and a supervisor of agricultural education the following year.

Vocational education accounted for part of the increase in the superintendent's staff during Mrs. Preston's tenure. In her 1916 report, she noted that the office had grown from territorial days, when the superintendent virtually carried it around in his pocket, to a staff consisting of nine regular assistants, a State Board of Examiners, associate assistants, and additional stenographers part of the time. By 1924, four staff members were assigned to vocational education alone.

By 1928, the staff of the superintendent's office numbered 2½, plus the Board of Examiners. The superintendent's duties had been increased by law to include ex officio membership on the Country Life Commission, State Humane Bureau, State Library Committee, Archives Committee, Voting Machine Committee, and designation as president of the board of trustees of the State Teachers' Retirement Fund (enacted in 1922). Despite the greater responsibilities and increased staff, the State Bureau of Inspection testified that the office was most efficient and reflected much credit on Mrs. Preston's business ability.

Mrs. Preston helped create much of Washington's present system of education. In 1917, the Legislature authorized kindergartens, with the provision that appropriations were to be paid out of state funds. Hot school lunches became a widespread practice, and the school transportation system took on major proportions. She encouraged the development of junior high schools, and the first junior college was opened in 1925. To crown her many years of service to Washington education, the April 1926 issue of the *American School Board Journal* announced that "Dr. Frank Phillips, Chief Statistician of the U.S. Bureau of Education and Professor in George Washington University, ranks Washington first on his ten point scale for the school year of 1923-24."

He ranked all the states on the following 10 points: (1) percentage of illiteracy among the 10 years of age and over in 1920; (2) ratio of number of children in average daily attendance to number of children aged 5-17, inclusive; (3) percent of enrollment in high school; (4) average number of days attended by each child enrolled; (5) average number of days schools were in session; (6) ratio of number of students taking teacher-preparing courses to number of teachers employed; (7) percentage of high school graduates continuing education next year; (8) total cost, excluding salaries, per pupil in average daily attendance; (9) average annual salary of teachers, principals, and supervisors; and (10) total amount expended per child of school age (20).

Washington voters, however, are not noted for rewarding long service by public officials, meritorious or otherwise. In the only upset in the 1928 Republican primary, Mrs. Preston was defeated by Noah D. Showalter. Since no Democrat filed for the office, Showalter was essentially elected in the primary.

**THE DEPRESSION YEARS**

Noah D. Showalter

Noah D. Showalter was already highly regarded in Washington education circles when he was elected state superintendent. A graduate of Lewiston (Idaho) State Normal School, he had been a summer student at Columbia and Stanford and had earned B.A. and M.A. degrees at Washington-State. In 1920, the College of Puget Sound conferred on him the honorary doctor of laws degree.
Showalter had been a teacher, county superintendent, and head of the rural department of the State Normal School at Cheney before being named principal (later called president) of that institution in 1910. He had been a member of the state code commission in 1907-1908, and as principal of Cheney he had served a term on the State Board of Education. During the 17 years Showalter headed the Cheney Normal School, he raised standards, organized the curriculum, collected a more capable faculty, and met the demand for better trained teachers. He resigned in 1926 because the Governor vetoed an appropriation he believed necessary to conduct an effective program.

N.D., as he was called by close friends, was a gentleman and a scholar in the true meaning of the words. Lincolnesque in appearance, he is remembered by those who knew him as a man well informed on any subject and highly respected across the state. A specialist in rural education, in 1920 he wrote *A Handbook for Rural Officers* (21) and was credited with being the first Northwest educator to establish rural demonstration schools.

**Effects of Depression.** The Northwest suffered more severely in the early years of the Depression than some other regions, and education was not spared. The number of pupils in average daily attendance dropped for the first time in the state's history. The number of teachers employed fell from 12,022 in 1931 to 10,990 in 1934, and their average salaries declined from $1,525 to $1,217. An obvious reminder that Showalter's 8-year incumbency encompassed the Depression period is the fact that he published only one report (1936) to cover the four biennia.

Showalter was convinced that the state should assume half the operating cost of the schools if they were to continue doing an adequate job. In the face of lower tax collections and mounting costs, he sponsored a program to provide 25¢ a day in state aid for each pupil in attendance. The bill failed to pass the 1929 Legislature, so he proposed a similar program in 1931. This plan included his recommendations for a county unit organization, with a county superintendent appointed by an elective county board of education. Governor Hartley, advocating retrenchment and administration. The position of high school inspector was dropped, but he added two high school supervisors, a junior high school supervisor, and an elementary supervisor.

**The Showalter Bill.** For 2 years, school finances grew steadily worse. The 1933 Legislature, recognizing the need for more state support, finally passed the Showalter Bill or New Barefoot School Measure. This established the principle of basic state support of 25¢ a day per pupil in attendance.

But Showalter and the schools still were not out of the woods, because the previous year the voters, by initiative, had imposed a 40-mill limit on property taxes. To bail them out of sure disaster, the same Legislature (1931) enacted a business tax to provide at least $6 million of emergency revenue for the schools. It actually only raised two-thirds of the money needed to meet the 25¢-a-day level, so the 1935 Legislature enacted a revised business and occupation tax, a 2-percent retail sales tax, and a series of taxes on public utilities, admissions, cigarettes, fuel oil, and other services and commodities. For the moment the schools were saved, but the 40-mill limit and the patchwork of taxation of the 1930's has become the plague of the schools in the 1960's.

**Junior High Arrives.** The 1933 Showalter Act also legalized junior high schools and ensured their support by allowing them 30¢ of state aid per day per pupil. Mrs. Preston had encouraged their development, and the state board had set some standards for them in 1930, but until 1933 the junior high schools existed mainly as departments of elementary schools.

The junior high schools were organized on the 6-3-3 plan. The state board set up a curriculum of core courses for the 3-year period, which included health, English, social science, mathematics, and science in grades 7 and 8, and electives from these subjects in grade 9. Time was provided for guidance, auditorium, club, and homeroom activities. By 1936, two-thirds of the state's 56 fully accredited junior high schools were in separate buildings; but in smaller districts, laboratories, auditoriums, gymnasiums, and cafeterias were used in common. There were 29,572 children attending these schools in 1936.

**Transportation.** School transportation also benefited from the 1933 Showalter Act by a provision whereby the state agreed to pay approximately half the cost. Since the turn of the century, school directors had been authorized to provide and pay for students' transportation to and from school. In 1911, when Superintendent Dewey published the first report on school transportation, 62 districts were furnishing transportation to 1,855 students. The typical “school bus” was a lumber wagon with board seats and a canvas top. A few luxury models had springs and coke-fired foot warmers. By 1933, 840 districts were transporting 67,500 students over 2,448 route miles at a cost of over $1.3 million a year.

**Expansion.** Showalter completely reorganized the Office of Superintendent of Public Instruction during his administration. He established a director of research and statistics and appointed L. D. Burris, the only holdover from Mrs. Preston's administration. The position of high school inspector was dropped, but he added two high school supervisors, a junior high school supervisor, and an elementary supervisor.

The Showalter Bill and federal aid available through the George-Reed Act of 1929, the George-Elzey Act of 1934, and the George-Deen Act of 1936 enabled vocational education to increase its staff to nine members, and a separate division was established. When federal matching
funds were offered for vocational rehabilitation in 1933, three more were added to the division.

A new Division of Indian Education, with a three-man staff, was created. This partially resulted from the belated bestowal of American citizenship on the Indian, thus obligating the state to provide for his education. It resulted in part from the 1934 Johnson-O'Malley Act, which permitted the Secretary of the Interior to enter into a single contract with a state for the education of all its Indian students. Previously, individual superintendents of Indian agencies contracted with local school districts.

Rise of the Individual

Perhaps Showalter's most significant contribution to Washington education was in shifting emphasis from standardization to recognition of the individual. The superintendents during territorial and early statehood days were trying to organize the struggling and widely scattered elements of pioneer education to build a solidly based system of public schools. This could best be accomplished by standardizing textbooks, plans for buildings, rules for students' and teachers' behavior, and curriculums.

By the time Superintendent Showalter took office, the common school system had been firmly established, and he could turn to the more intellectual aspects of education. He proclaimed this modern philosophy:

Just as individuals vary in mentality, they vary in interests, in abilities, and in emotional life. Children and adults work most effectively and with the greatest satisfaction when motivated by their own interests. When skillfully aroused, these furnish tremendous driving power. It becomes the responsibility of the school to locate and direct these interests . . . .

Time was when the teacher was a classroom performer and occupied the center of the stage. Classroom activities represented the interests and purposes of the teacher; pupils were expected only to memorize and absorb knowledge. Today's pupil is encouraged to discover his own problems, and to set about solving them . . . .

Curriculum content should be centered about child interests under adult guidance . . . . Subject matter should be introduced to develop and broaden experience. Attitudes, habits and skills should be woven into the total pattern and developed simultaneously with the solution of problems (22).

Showalter criticized the 1930 curriculum as "a subject-matter curriculum." Under his leadership, the state board appointed a statewide curriculum commission of 16 members to work steadily on revision. The 1937 Legislature was urged to provide an adequate budget to continue the work.

School Library

In line with his belief in the individualization of instruction, Showalter emphatically endorsed school libraries. Although the first territorial board enacted a uniform system of textbooks, even at that early date a few dissenters urged that there be less textbook teaching and more instruction based on a variety of books. But the first published biennial report of 1879, under the brave heading The Number of Libraries, found only one each in Jefferson and Mason Counties.

School libraries grew, however, and in 1930, the state board established minimum standards: 500 books and a teacher-librarian with at least 7 quarter hours of training in library science for schools with enrollments under 100. It set higher requirements for larger schools. The requirements prescribed library credentials for all teacher-librarians after 1934, and the same year the board adopted minimum library standards for elementary schools. By 1936, Showalter was able to state:

Today a well-organized, well-equipped, properly housed library is as essential to educational progress as the electric motor is to industry or the automobile to transportation. Next in importance to the employment of an enthusiastic, well-qualified, thoroughly successful teaching staff in a well-managed school is the provision of an adequate library. The most efficient teacher can give only meager service when she has to work with inadequate tools (23).

The last year state superintendents were elected on a partisan basis was 1936. Had the Legislature acted earlier or later, Showalter might have extended his illustrious career longer than two terms. Despite the high regard of Washingtonians for Showalter, he was a Republican, and no Republican survived the 1936 Roosevelt landslide.

When the victorious candidate, Stanley F. Atwood, publically announced that he was going to clean out the office, Showalter found jobs for every member of his staff before relinquishing office in January 1937. Atwood assumed an empty office. The new superintendent then tried to discharge the vocational education staff so he could appoint people of his choice. But he could make appointments as chief executive officer of the State Board for Vocational Education only with the board's approval. The board refused its approval, and the staff remained. The 1939 Legislature then gave the vocational board the right to select its own chairman and appoint its own executive officer.

Stanley F. Atwood

Superintendent Atwood was graduated from the State Normal School at Ellensburg and the University of Washington, served as teacher and principal at several schools, and
was teaching history at West Seattle High School when elected. Very liberal in his politics, he served only one term. He published two reports—one covering the first biennium and the second covering his entire term.

Atwood was beset with financial problems immediately on assuming office. The 1933 Showalter Bill had gradually increased school revenues to a 1936-37 high of $29,211,579. The following year, they declined by over $1 million. The state's income enabled payment of only 22.35¢ a day per pupil in 1937-38 and 20¢ the next year. The 1937 Legislature finally passed an equalization bill to provide funds for poor districts, as recommended in 1922 by Mrs. Preston; but because of shrinking tax receipts and miscalculation, only $600,000 was appropriated out of $4 million needed.

The 1939 Legislature rescued the schools by appropriating enough money to raise state aid back to 25¢ a day. The superintendent reported that for the 1939-40 school year, the schools would receive $29.5 million, the state providing 61 percent and county and local sources the remainder. The federal government would provide an additional $350,000 to $400,000 for vocational and Indian education.

But Superintendent Atwood continued to press for a better equalization formula. Like previous superintendents, he pointed out that the state continued to violate its constitution by discriminating against children who lived in counties with poor taxable resources. He proposed to form a single fund from the amount all districts could raise by a 10-mill tax, the income from a maximum county tax levy and county equalization, and the legislative appropriations. The state would then distribute the funds according to attendance by "classroom units." The measure was not adopted.

Federal Building Funds

Though federal assistance in school operations had been felt only in Indian education and vocational education, it was becoming a factor in school construction. In his quadrennial report, Atwood stated:

Through the help of the Public Works Administration, the Works Progress Administration, and the State Department of Social Security, an unusually large number of new buildings have been erected. . . . The buildings constructed have generally been of high quality and most of them of the more permanent types of construction.

The generosity of the Federal government in its work-creating activities has given the school systems of the state of Washington approximately $13 million worth of new buildings at a comparatively small cost to the school districts. Very few of these buildings involved any bond issues on the part of the school districts (24).

Included in this construction were a number of new high schools. On Washington's fiftieth anniversary, Atwood reviewed the "phenomenal growth" of high schools during that period: Attendance had grown from 320 to over 105,000—from 1 student for every 1,100 inhabitants to 1 for every 15. He stated that in proportion to total school enrollment, the state enjoyed the largest high school enrollment in the nation. This growth no longer permitted adequate inspection by the superintendent's small staff. Atwood instituted a new program of self-evaluation, which the state superintendent's office continues to recommend today.

Curriculum Change

The high school curriculum changed during Atwood's term. In his report, he commented:

Gradually, although tardily, the curriculum is being modified! to minister to the needs of the pupil and the welfare of the state. The narrow confines of the college preparatory courses, which served a very limited number and favorite few, are giving way to a broader and more functional program (25).

Atwood attempted to speed the progress by installing a curriculum director, but the position was not created until later. The state curriculum commission, recommended by his predecessor and approved by the state board, did not receive support from the Legislature. But the Washington Education Association, which helped create the commission, convinced the school districts to finance it through subscription.

For the first time, classroom teachers became involved in curriculum study along with administrators. The Washington Curriculum Journal, first published in May 1937, became the clearinghouse for their experiments and studies. This became the Washington State Curriculum Journal and was published by the superintendent of public instruction beginning in 1941.

Certification

During his first 2 years in office, Atwood appears to have been at considerable odds with the state board over teacher certification. Backed by a number of opinions rendered by the attorney general, he stated:

In assuming the powers as indicated in this article, the State Board of Education has not only set aside every legal provision in regard to the certification of teachers and set itself up as a legislative board in excess of authority delegated to it by the Legislature, it has by its actions also attempted to repeal or amend section 4542, Remington's Compiled Statutes, which prescribes the requirements for the certificates to be issued by the teachers’ colleges; section 4557, Remington's Compiled
Statutes, which among other items grants to the regents of the University of Washington the right to issue teachers' diplomas according to certain specified requirements; and section 4599, Remington's Compiled Statutes, which grants to the regents of the State College of Washington the authority to issue teachers' diplomas according to standards defined by law (26).

Atwood recommended repealing the certification standards, setting up new ones, and designating the state department as the authority for determining types and kinds of certificates. Two years later, he attacked the inconsistency of the laws which permitted a high school graduate with 3 years of normal schooling to teach at the elementary level but prohibited a 4- or 5-year education graduate of the state college or university from doing so until he had completed an additional year of normal training. Quite logically, he pointed out that this oddity in the law robbed the schools of many potentially excellent teachers from inside and outside the state.

On the teachers' behalf, Atwood fought a move to repeal the minimum teacher salary law enacted by the 1937 Legislature and lobbied for teacher tenure. Tenure for Washington teachers had failed to pass in 1929, 1935, and 1937, although it was in effect in about half the states.

The 1937 Legislature provided for special education classes for the physically and mentally handicapped in second- and third-class school districts and gave the state board authority to develop details for operating these schools. Previously, special education had been limited to first-class districts. On the state board's recommendation, the University of Washington pioneered the training of teachers for remedial programs.

Atwood, for the first time, encouraged the use of radio in education. In 1939, the department organized and sponsored a round-table program entitled "What People Think," which was carried by stations in Seattle, Spokane, and Wenatchee.

In Washington, a prime requisite for election to the state superintendency is usually the support of the educational "fraternity." Atwood apparently lacked this essential in sufficient quantity for, in 1940, a group of school superintendents met in Seattle's Meany Hotel to decide on a new candidate. They concluded that the best vote-getter would be Pearl A. Wanamaker, who had proven her political acumen in three terms as a State Representative and two as a State Senator. The superintendents organized a caravan of 50 cars and drove to her home to persuade her to run.

At 41, Pearl Wanamaker was a small, attractive woman with platinum hair (later to become a distinguished white) and bright blue eyes. An educator of considerable experience, she had served as an elementary school teacher, principal, high school teacher, and county superintendent. Possessed of an informal charm, she was to become famous as the toughest legislative fighter the state education system had ever seen. A national magazine called her ruthless whenever a penny-pinching Legislature tried to cut her school budget or short-change the children. One discomfited Senator complained: "She drives right into your home town and tells your constituents you're voting against their kids" (27). In keeping with the new nonpartisan status of her office, Superintendent Wanamaker stated: "I have been accused of playing politics. I have. But I absolutely will not play partisan politics" (28).

During the campaign, a caravan terminated in an informal potlatch where Mrs. Wanamaker sat on a log with her two small children and discussed issues and answered questions (29). In the Roosevelt landslide of 1940, she defeated Stanley Atwood 462,145 to 322,123 and began the first of four terms. Atwood's staff had vacated by the time she took office.

**THE WANAMAKER ERA**

During her administration, Superintendent Pearl A. Wanamaker became a national and international figure. She was elected president of the National Education Association and the Council of Chief State School Officers, and first vice-president of the American Association of School Administrators. She received the Matrix Table Award, the National Press Woman Award, and the American Education Award. She was one of 27 educators selected to advise General Douglas MacArthur on overhauling Japan's schools, and one of five sent back in 1950 to see how the system operated.

Throughout her superintendency she fought for higher teacher salaries, better teacher training, improved certification, more support for schools and construction, and school district reorganization. Certainly, they were needed. During the last 10 years of her incumbency, school population rose 50 percent while the total population increased only 19 percent.

**World War II**

Educational adjustments to World War II faced Mrs. Wanamaker almost immediately. School dates and schedules had to be changed to accommodate young laborers, particularly those in agriculture. Emergency certification and statewide in-service training programs had to be instituted to combat the teacher shortage. School transportation had to be curtailed because of the equipment and fuel shortage.

The state department undertook many programs to aid the war effort. For instance, the schools agreed to provide over 12,000 aircraft recognition models for the Navy. They acted as registration agencies to inaugurate food and gasoline rationing programs. With aid from federal
funds, the department established an extensive nursery school program and conducted scrap and war savings drives.

New federal programs greatly boosted vocational education. Nearly 11,500 students were enrolled in the Food Production War Training Program, and over 300,000 people were trained under the War Production Training Program. Citizenship training for aliens took on a new importance, forcing a great expansion in the department's responsibilities for adult education. Where 15,848 were enrolled in night schools in 1936-37, 58,902 attended in 1941-42—not including vocational students.

As the war came to a close and emergency programs were no longer necessary, others rose to take their place. War production training gave way to veteran education. The superintendent had to set up administrative machinery for acquiring surplus property.

Many of the war-born problems remained to plague the state's school system, particularly those stemming from the population increase and inflation. Mrs. Wanamaker summed up the situation:

The postwar period for which we had planned was suddenly upon us. But we soon learned that America could not shift quickly to a peacetime economy and many of our problems have become more acute since the end of the war.

There is no prospect of relieving the acute teacher shortage for several years. A substantial part of the population influx of the war years has remained in the state since the close of the war. The annual number of births during recent years has been more than double the number of births in 1933. Enrollment increases in the elementary schools are reflecting these basic population trends.

School building construction was curtailed sharply during the depression years and was limited to the most urgent conditions in war industry areas during the war years. Hence, a large accumulated deficiency in school housing exists. Relatively, the ability of local school systems to finance the rehabilitation of school plants has been reduced by fifty per cent. The return of war veterans to our schools has seriously overcrowded facilities at the institutions of higher learning, the public junior colleges and vocational training schools.

### School Construction

From 1933 to 1941, state and federal funds appropriated for makework programs were used to build schools; the need for the buildings was not a primary factor. The 1941 Legislature, for the first time, voted state aid for construction as a distinct program. Applications were to be submitted to the state superintendent of public instruction, who approved them if he decided there was a need for the building.

The 1947 Legislature established the principle of state matching funds for construction with a sliding scale of support, depending on the local district's ability to pay. The law designated the state board as the agency for allocating grants and setting rules for administering them. The act required the superintendent to conduct studies to determine the need for facilities, recommend action on the applications, and guide local districts as to design, maintenance, operation, and planning of building projects.

Between 1941 and 1947, the Legislature appropriated nearly $15 million in state aid for school construction. It authorized a $20-million bond issue for emergency construction in 1947 and established a School Emergency Construction Board consisting of the state superintendent, a member of the State Board of Education, and three persons appointed by the Governor. From 1947 to 1957, over $15 million in state aid was allotted for school construction, and the voters approved $90 million in state-wide bond issues for emergency construction. One of Mrs. Wanamaker's major accomplishments was the construction of 875 school buildings during her administration.

The state had received federal assistance for school construction since the Depression. However, Public Law 815, which took effect in 1951, was the first comprehensive program for determining the impact of federal activities on local schools and an equitable distribution of funds for building. Within a year and a half, over $20 million was allocated for state school construction under Public Law 815.

### Operating Funds

As enrollment increases outstripped population gains, the demand for more operating funds became as important as the need for construction funds, and Mrs. Wanamaker constantly battled for more school support. From the beginning of statehood, school districts had been permitted to raise a 10-mill tax without a vote of the people; she was able to get the limit raised to 14 mills. But since local tax sources were inhibited by the 40-mill limit, she gained increases in state aid until the state was financing 70 percent of school operating costs in 1946.

State funds were apportioned on the basis of attendance at the time Mrs. Wanamaker took office. To bring about a reduction in teacher loads, she obtained a major change so that state aid would be apportioned partly on the basis of the number of certificated employees. She succeeded in raising basic state support from 25¢ to 40¢ per day per pupil, plus $1,190 for each certificated employee. She obtained increases in equalized county support from 5¢ to 17¢, and in equalized local support from 15¢ to 43¢ per day. The transportation reimbursement was raised from 50 percent to a maximum of 90 percent of the cost. Special credits were employed to encourage the development of libraries, guidance, health, and remedial programs.
By the end of her administration, Mrs. Wanamaker was probably the first Washington state superintendent who could say: "Washington has made marked advances in providing equalized educational opportunities for all children" (31). School district receipts had increased from over $38 million to nearly $185 million. The average teacher salary jumped from $1,669 in 1940 to $4,467 in 1956. She noted, however, that Washington’s rank among the states in regard to teachers’ salaries, which had risen from fourteenth to third highest during the war, had fallen to thirteenth by 1956.

Not only did she attempt to raise salaries, but she also constantly worked to improve teacher education and certification in her efforts to solve the war-born teacher shortage. The most important change in education and certification came in 1949, when the Legislature authorized all five state institutions of higher learning to train teachers for any “grade, level, department or position of the public schools of the state, provided that the courses offered in all of the aforesaid training are approved by the state board of education” (32). Previously, elementary teacher training had been delegated to the normal schools (now state colleges) and secondary education to the state college and university.

Following the legislative action, the state board made Washington the first state to adopt the general certificate, which permitted a professionally competent teacher to teach any grade from 1 to 12. The new program required all teachers to complete 4 years of college or university education, followed by 1 year of carefully supervised teaching, and then a fifth year of college or university work.

Federal Aid

During World War II, as the influx of war workers forced a number of school districts to hire additional teachers, Congress appropriated funds to assist the schools. Federal aid grew substantially, from less than 1 percent of school district total receipts in 1940—when federal funds were limited to Indian and vocational education—to nearly 5 percent in 1956.

Many state schools were already serving hot lunches to students in 1943 when the National School Lunch Act was passed. Under the state superintendent’s direction, 326 school districts were soon taking part in the new hot lunch program. By 1956, Washington was receiving $755,242 from the government for school lunches, $1,605,879 in donated commodities, and $822,023 for the new Federal Special School Milk Fund.

As stated above, federal funds had bolstered Washington’s school construction programs—particularly after the enactment of Public Law 815 in 1950. Public Law 874, a companion measure to Public Law 815, brought order to federal grants for school maintenance and operations. Second in the nation in the number of federal projects within its boundaries, Washington has fared well from these laws. Over $7 million in federal aid was received under the two acts during Mrs. Wanamaker’s last year in office.

Vocational rehabilitation began to outstrip vocational education in the receipt of federal finances during these years. By 1956, both were accounting for around $5 million in government funds. All of these, together with $315,898 for Indian education, brought Washington State nearly $27 million from Washington, D.C., during Mrs. Wanamaker’s last biennium.

Organization

Under permissive rulings, school districts had been gradually reduced from a high of around 2,700 in 1910 to 1,609 in 1937. A 1937 reorganization act reduced the number to 1,523 by 1941. Between 1941 and 1946, as a result of 1941 legislation, the number dropped to 672. But Mrs. Wanamaker still did not consider the situation satisfactory. She called for the “enactment of a new, comprehensive, and forward looking school district organization law to replace existing statutes governing the formation of new districts and the alteration of boundaries of existing districts” (33). The Legislature responded by passing new laws in 1947, 1953, and 1955. Under these acts, the number of districts was reduced to 498.

Curriculum

In 1942, Mrs. Wanamaker appointed a state director of curriculum to coordinate the work of the various agencies involved in curriculum improvement, thus establishing a new division. The department had the previous year taken over publication of the Washington State Curriculum Journal, and in 1942, the superintendent’s office assumed the sponsorship of the state curriculum commission. In the following 2 years, the department published a number of curriculum guides; with a few exceptions, none had been published since 1930.

Under Mrs. Wanamaker’s direction the supervisory program developed its present form. The department staff attempted to assist local administrators and teachers in building an educational program to meet the needs of the individual child in the community. State supervisors visited classrooms, met with individual teachers, and took part in faculty meetings. The staff supplemented these visits with statewide and regional teacher conferences.

The superintendent’s instructional staff worked with committees of teachers and school administrators in preparing study guides and developing curriculum, the curriculum commission acting in an advisory capacity. The department’s professional and curriculum library made materials available to educators throughout the state. An instructional materials service was established, and Mrs. Wanamaker employed a consultant to assist local districts. Curriculum and instruction were major topics of a series of
Mrs. Wanamaker expanded the curriculum in many ways. In addition to reading, writing, arithmetic, history, science, art, music, and citizenship, increasing emphasis was given to health and physical education, safety education, recreation, and guidance. The department sponsored a driver training workshop and sought ways to extend driver training to all eligible students. A number of schools began maintaining forest plots, and in 1955, the superintendent encouraged others to follow suit by establishing an advisory committee on conservation education. Washington became one of the leading states in developing programs for conservation and outdoor education.

Superintendent Wanamaker gave special emphasis to the education of handicapped children during her administration. She held the controversial view that they should be educated alongside normal children so they could better adjust to the normal world in which they would live. She said that placing the handicapped in institutions was "just another kind of segregation" (34). Between 1942 and 1956, the number of children receiving special education increased from 5,824 to over 25,000 with more than 77 percent enrolled in regular elementary and secondary classes.

Junior Colleges

In 1941, the Legislature made the junior colleges, which had been founded by individual communities, public institutions and provided them with state aid. During the 1942-43 school year, the eight junior colleges had a combined enrollment of 1,056. In 1945, they became an official part of the public school system, and the state board assumed responsibility for their curriculum. At the same time, the 1945 law permitted junior colleges to provide a 2-year general program of post-high school study in addition to terminal vocational education and college preparatory courses. By 1956, 22,000 students were enrolled full or part time in the state's 10 junior colleges.

Superintendent's Staff

In 1952, the Legislature placed the professional and non-professional employees of both the superintendent of public instruction and the State Board for Vocational Education under Civil Service. At this time, the department staff numbered 52 and was organized in four divisions: administration and finance, teachers' education and certification, central services, and instruction. The 49-man vocational education staff was subdivided as follows: vocational agriculture, trades and industries, vocational rehabilitation, distributive education, and home economics.

Lay State Board

Acting on Mrs. Wanamaker's recommendation, the 1947 Legislature reorganized the State Board of Education into its present-day form of two directors from each congressional district elected by local school district directors. Board members are elected for 6-year terms, staggered so that two terms expire each year. The Legislature prescribed the duties for the new lay board to include preparing courses for study in the common schools and approving programs for preparing teachers. It was made responsible for certifying teachers, accrediting all secondary schools, and accrediting colleges and universities preparing teachers for certification. The state board also was made responsible for classifying high school districts and non-high school districts and for establishing standards, rules, and regulations governing apportionment of the current state school fund, state school building funds, and funds for special services. It approves preparatory requirements for admission to the state-supported institutions of higher learning. The board decides appeals by teachers from the state superintendent's decisions on the revocation of certificates. It prescribes rules for the general government of the common schools, and it districts the state.

Like most superintendents in recent years, Mrs. Wanamaker recommended that the state board appoint the state superintendent, but this recommendation has not been accepted.

Libel from the Right Wing

Late in 1955, radio commentator Fulton Lewis, Jr., in an attack on the White House Conference on Education, broadcast that close relatives of Mrs. Wanamaker were associated with communism. He then admitted the charges were not true and broadcast a retraction 3 days later. Mrs. Wanamaker filed a libel suit against Lewis and won judgments totaling $25,000 in Washington and Oklahoma. A third trial in Baltimore resulted in a deadlocked jury. She and Lewis then agreed that the case should be settled for all states and the District of Columbia in the Federal District Court for the District of Columbia. In 1959, this trial brought a ruling of libel per se by the judge and a jury verdict of $145,000 for Mrs. Wanamaker. The judge later set the verdict aside as excessive, but by agreement of both parties the final amount of the settlement was not made public (35).

As pointed out previously, Washington's voters are noted for their reluctance to maintain office holders for numerous terms. Governors are usually limited to two terms; one made it three times, but not consecutively. The record for state superintendents thus far is four terms.

Without a doubt, Mrs. Wanamaker had been the state's most illustrious superintendent; the schools were consistently ranked among the nation's best. In her zeal to
get the best for Washington's children, however, she made enemies—particularly in the Legislature. It was rumored that she might run for the Office of Governor, but she chose to seek reelection to the office she had held longer than any person except Mrs. Preston.

In the 1956 primary, Mrs. Wanamaker received the most votes; but in the general election, Lloyd Andrews apparently received the votes that had gone to a third primary candidate. To the dismay of the state's educators, he defeated Mrs. Wanamaker by nearly 160,000 votes. Today she remains active in education as the Northwest regional representative of Scholastic magazine.

THE SPUTNIK ERA

Lloyd Andrews

Superintendent Lloyd Andrews had been graduated from Washington State College, served as a State Senator, and taught high school before entering the Navy in World War II. Since he had operated a successful apple orchard and shipping business near Spokane after the war, educators did not consider him a member of the fraternity. He was not popular with them, particularly in the first years of his term.

Like Superintendent Atwood in 1937, Andrews soon ran into conflicts in authority between the superintendent and the state board that had evolved over the years. Authority of the state superintendent rests in the State Constitution, that of the Board of Education does not. The Legislature had assigned various duties and responsibilities to the board, both policy making and administrative, and had empowered the board to employ assistants to carry them out. At one point the State Supreme Court even ruled that a member of the board was an executive officer of the state with certain legal executive functions.

When Andrews took office, the board passed a resolution to make clear that its 12-man staff would carry out the duties the Legislature had assigned to the Board of Education. This made it impossible for the superintendent to remove the board's staff members and appoint others responsible to him. In fact, separate budget requests were prepared by the state board and the state superintendent.

In 1959, the state board resolved the conflict by designating the superintendent its chief executive officer and giving him the responsibility to carry out its decisions and supervise its staff. The Legislature helped by making one appropriation for both the superintendent and the board.

Sputnik. In 1957, the year Superintendent Andrews assumed office, the Russians launched Sputnik. This resulted in American education's becoming a critical public issue. Subject matter and teaching methods came under increasing scrutiny. The state superintendent gave particular attention to curriculum studies. Staff members worked with various teachers committees in preparing and distributing new curriculum guides for all basic subject areas from grade 1 through 12. They gave more attention to science and mathematics and to special courses for gifted, average, and slow learners.

The department launched a research study on educational opportunities for the gifted and conducted other studies on junior and senior high school instruction. Staff members undertook a study of audiovisual materials, equipment, and services in local districts and county offices, which resulted in the selection of a statewide committee to prepare administrative procedures for strengthening the program. Superintendent Andrews employed a part-time staff member to make special studies on the possibilities of extending the school year, on teacher-pupil and administrator-pupil ratios, and on the use of school buildings.

Andrews' business background served him well in matters of administration and finance. He directed a complete revision of school accounting procedures; and with the assistance of the state auditor, educational administrators, and business people, he published a school accounting guide. The publication followed closely the pattern set forth by the U.S. Office of Education and made possible a better system of accounting for local districts. He conducted short- and long-range studies of school building costs, maintenance, and use in an effort to stretch construction dollars in the face of rising building costs.

Merit Pay. In 1958, Superintendent Andrews appointed five teachers and school administrators and six lay people to study the feasibility of a teachers merit pay system. The committee concluded that, ideally, able teachers should receive additional pay so long as such an incentive program would be reflected in a larger rather than a smaller salary budget. It advised that a valid measurement of teacher competence and classroom performance posed difficult problems. The committee found that adopting a statewide merit pay system would not be feasible without a revision of school support laws and regulations. Thus, merit pay programs in Washington have continued to be matters for local determination.

Andrews asked the state board to revise and strengthen the regulations for establishing extended secondary programs and adult evening courses in high schools. The board did issue new regulations to prevent unnecessary duplication of these programs and to encourage economic development and operation of postgraduate programs offered in the high schools.

The superintendent also reported that the state board had conducted a study of the organization and operation of the state's junior colleges in hopes of establishing uniformity in their finances and operations. Andrews declared this would make it possible to draw conclusions about the
cost of junior college programs and the most effective way to operate them. He pointed out that there was increasing pressure to establish more junior colleges—especially in the urban counties of King, Pierce, and Spokane.

The enactment of the National Defense Education Act by the Eighty-Fifth Congress brought nearly $650,000 to Washington in the 1959-60 school year and enabled the state superintendent to add more staff.

In 1960, the state's Republican party was determined to unseat Democratic Governor Albert D. Rosellini. Recalling Superintendent Andrews' sound defeat of Mrs. Wana- maker, a proven vote-getter, the Republicans backed him as their candidate for Governor. Andrews and Rosellini engaged in the newly popular sport of televised debates; although Andrews was technically the better speaker, he apparently could not get his message across to the independent voter. The election was close, but Rosellini retained his office.

Louis Bruno and the 1960's

Meanwhile, a group of school officials had approached Superintendent Louis Bruno of Pullman and, because of his experience at all levels of education, asked him to run for state superintendent. "Really, it didn't make much sense, me running," Bruno recalled later. "I was making more money in Pullman than I could as state superintendent" (36). But he agreed to run.

The first truly nonpartisan candidate for the state superintendency, Republican or Democrat, Bruno called on both party headquarters whenever he campaigned in a new town. He won handily.

Bruno was not unfamiliar with Olympia; he had served a term on the State Board of Education prior to World War II and a year and a half on the state superintendent's staff before beginning his 12-year stint at Pullman. The son of immigrant parents who prized the education they had been denied, Bruno worked his way through Washington State to an education degree. He taught at Raymond High School, then served as its principal from 1931 to 1941.

Tall and impressive in appearance, he commands respect naturally. Yet his warm, informal manner, his friendly smile, and his genuine interest in each individual have made him greatly admired by his staff. Clerks and division heads, alike, have become accustomed to having the superintendent pop into their offices for a few pleasantries. Bruno has been known to express concern that the rapid growth of the superintendent's office has made it impossible for him to know every member of the staff by first name within the first few days of employment.

A tireless speaker on education, Bruno drives nearly 50,000 miles a year to meet with educators, businessmen, and taxpayers. Perhaps his popularity with Washington citizens can be explained in part by his distaste for the faculty words so dear to many educators. The superintendent's public information officer claims to be under threat of instant dismissal should words such as "in-depth," "overview," or "paraprofessional" creep into a departmental release or publication. A firm believer in communication, Bruno installed the department's first full-scale public information program.

Bruno was the only state superintendent appointed by President Johnson to the National Advisory Council on Education of Disadvantaged Children. He has served as a member of the board of the Council of Chief State School Officers. In 1966, Seattle Pacific College awarded him an honorary doctor of laws degree.

Age of Education. Superintendent Bruno assumed office in time to preside over a revolution in education—the dawn of what he calls the Age of Education. Vast changes in curriculum and methods were made to enable the schools to meet the challenge of a runaway technology. The problems of urban education, the dropout, and the disadvantaged assumed major proportions. Students were tasting a new independence. Population growth and shifts brought new dimensions to the ever-present problem of school support.

Against this onslaught of change, Bruno has continually reminded his constituents to keep social and technical revolution in proper perspective:

Does it ever occur to you that the schools are the only agency to which the government can turn in the face of these monumental emergencies? Or that the community colleges, the 4-year colleges, and the universities comprise the one indispensable source for trained leadership for almost every segment of society?

Technological and scientific advances are fascinating, but intrinsically they are meaningless unless man becomes their master instead of their slave. I would like to suggest that in my opinion the mightiest achievement of the next hundred years will be man's ability to place technology in its proper relationship to his universe (37).

To ensure that this will happen, Bruno urges the schools to teach children to learn how to learn. Rote memorization will not provide the foundation youngsters will need to cope with the future, he says, because half the jobs they will fill as adults haven't been invented yet.

Bruno believes the state's schools are meeting their responsibilities, and he gives much of the credit to Washington's teachers. "Since 1949, no state in the nation has had higher requirements for teacher certification than the State of Washington," he proclaims, "but we also have, in our classrooms, some of the finest teachers anywhere" (38).

Federal Relations. Superintendent Bruno does not expect the federal government to do the job of the state and community in providing for education. Whatever position is taken on state-federal-local relationships, he declares, the
debate about federal aid to education is now as outdated as last year's hemline. He realizes that the federal government wants a job done, will insist that it can be done, and if necessary will establish the machinery to do it. Therefore, he feels that it is the responsibility of the State Office of Public Instruction to obviate any criticism by the federal government that the State of Washington is not doing its job.

Bruno does express concern that a national testing program conducted by the federal government could lead to a national curriculum at the expense of local interests and regional problems. He has spoken out against federal legislation that tends to bypass state and local educational agencies to deal directly with local institutions. However, he credits such federal legislation as the Vocational Education Act of 1963 and the National Defense Education Act of 1958 with considerable success in specific areas of curriculum.

Curriculum Change. Superintendent Bruno has stated that despite considerable talk about curriculum change for the past 30 years, until recently we have been doing business on much the same old basis. He points out, however, that since the early sixties fantastic changes have occurred in curriculum content and methods that will result in curriculum improvement. He says research shows that curriculum change in Washington schools occurred four times faster in 1965 than in 1958.

Bruno thinks the state has made good progress in introducing new courses in science education that emphasize the student as an active participant rather than a spectator. In fact, Washington has attained one of the nation's highest ratings for introducing new science curriculums; but Superintendent Bruno wants more improvement at the elementary and junior high school levels. He estimates that 50 to 70 percent of the elementary schools and 60 to 80 percent of the high schools have introduced new mathematics curriculums. In a different area he is particularly proud of a project he sponsored in cooperation with the Northwest and Joint Councils for Economics Education which has resulted in economics study at all grade levels.

Taking note of the general dissatisfaction with present programs in English, Superintendent Bruno looks for a major breakthrough in reading, writing, spelling, and composition. Foreign languages, he insists, must be learned well enough to communicate. Washington's vigorous language program now employs 1,000 instructors who are teaching 10 different languages in grades 7 through 12.

He is concerned with spotty developments in health and physical education courses, noting that some parts of the state have fine programs while others have none at all. The superintendent believes that the state can never be truly successful until every boy and girl has the finest program of physical education and health available from kindergarten through high school.

Bruno has also given strong support to vocational education. Although Washington ranks first among the 50 states in the percentage of people enrolled in vocational programs, he wants better programs with greater emphasis on the importance of technical training. He realizes that enrolling in a strictly vocational program appears to have some sort of stigma, but he believes that better guidance programs can do much to assist students in making wise choices relating to their interests, abilities, and capabilities. The superintendent has instituted one of the nation's most ambitious programs for elementary school guidance counseling in the hope that learning problems can be detected and remedied early.

Office of Public Instruction. To keep up with the vast changes that have characterized society and education in the sixties, the Office of Public Instruction has undoubtedly undergone its greatest change under Bruno's direction. On assuming office, he consolidated the services available to the state's schools and established six divisions under assistant superintendents for curriculum and instruction, administration and finance, teacher education and certification, community colleges and adult education, vocational education, and vocational rehabilitation. This organization remained largely intact until the 1967 Legislature created a separate board for community colleges and a coordinating council for vocational education and rehabilitation.

At Bruno's request, the 1961 Legislature provided for a research director and a statewide research program. The staff has conducted studies in such areas as dropouts in the metropolitan Seattle area, the 12-month school program, new teaching methods, use of remote computer facilities, preparation of teachers, and a variety of programs in curriculum. At the same time the research office was created, the department established its educational data-processing center.

The National Defense Education Act has enabled the department to create new supervisory positions in science, mathematics, foreign language, guidance and counseling, libraries, and audiovisual services. Title V of the Elementary and Secondary Education Act is providing funds for a learning resources center and laboratory. (With a staff of 217, the Office of Public Instruction now operates with a budget in excess of $2.5 million a year.) But the explosive changes in public schooling which have brought about the transformation of the superintendent's staff have continued to plague him with the problem of finding more resources to keep up quality education.

School Support. In discussing the taxpayer's obligation to the children of the state, Superintendent Bruno points out that—

Economic studies have shown that for each dollar invested in tangible capital, a 5-percent rate of return to
society can be expected. On the other hand, each dollar invested in the education of its citizens brings a rate of return to the state of over 10 percent (39).

In answering those who ask if the taxpayer receives his dollar's worth for school support, he points out that while Washington enjoys a school system consistently among the nation's best, the state ranks eighteenth in per-pupil expenditure. He is concerned that the state has slipped to eighteenth among the states in educational expenditure, and he warns that the effects of lagging investment in education will be felt for years.

Superintendent Bruno expresses alarm at the dangerous trend of legislatures to reduce the state's share and increase the local share of school support. State support has dropped to 55 percent. With the state's constitutional prohibition on income tax and the 40-mill limit on property tax, school people must depend on "special" levies to raise local taxes above the 40-mill limit and meet increasing school maintenance and operating costs. Most first-class districts ask for an annual "special" levy for up to 25 percent of their operating funds. Originally intended to meet emergencies, the levy is an unreliable source of funds because of the limitation requiring a 60-percent yes vote from 40 percent of the turnout in the previous general election. It is also expensive and inhibits effective planning. The superintendent, the Governor, civic groups, and countless citizens have fought to reform the state's patchwork tax structure and establish a positive school finance program, but state legislators continue to duck this responsibility.

Post-High School Education. The chief reason for the rising cost of Washington schools has been the growing demand for post-high school education. In 11 years, from 1955 to 1966, the number of juniors and seniors desiring education beyond high school jumped from 35 to 90 percent. During Bruno's administration, the number of community colleges built or authorized has doubled. Full-time enrollment jumped 70 percent in a 3-year period and at the same time enrollment in the state's seven vocational technical institutes increased by 3,000. These factors, plus retraining, rehabilitation, and greater interest in general adult education, have in large measure increased school appropriations from $435,300 in the 1961-63 biennium to $626,700 in the 1965-67 biennium.

The state has had to construct 500 to 700 new classroom each year to house annual enrollment increases of 20,000 to 30,000 children. A 1966 constitutional amendment facilitated construction financing by allowing the interest and income from the permanent school fund to be used for amortizing school construction bonds. About three-fourths of the original school lands remained unsold in 1957, when the state adopted the policy of retaining them and managing the property for maximum income. The permanent school fund is now over $108 million, and the interest accounts for more than $3.5 million a year.

Washington has come a long way since 1887, when Superintendent John C. Lawrence expressed the fervent hope that the territory would soon become a state, since the sale of school land would bring $5 million which, at a "low" interest of about 7 percent per annum, would yield $350,000 for school purposes.

Ranked Number One

In a national index of education strengths and weaknesses, Superintendent Bruno can proudly point to Washington's rank as number one in the nation with the lowest failure rate among those taking the Armed Forces Mental Qualifications Test in 1966. Washington ranks among the leaders in the median number of school years completed by persons 25 years or over, low illiteracy rate, and low dropout rate between the high school freshmen and senior years (40).

This is the kind of school system Washington pioneers anticipated in writing a constitution that made paramount the state's duty to provide ample education for every child. It is the kind of system that could not have happened without strong central leadership. The pioneers learned this lesson through the trials and errors of territorial days and provided constitutionally for a state superintendent who would be truly a leader and not a record keeper. It is the kind of system that has evolved through the cumulative efforts of a succession of strong and dedicated superintendents.

In a dynamic era, it is a system of schools that must continue to improve. As Superintendent Bruno says,

"We must try to provide every class with a good teacher, a good library and good guidance. If we do that, maybe my fondest wish could be a reality—to make sure every child had an equal chance for an education that would fit his personal needs. Right now, we are simply not reaching every boy and girl. No state system is. We have much work left to do (41)."

This is the challenge for tomorrow's chief state school officer.

APPENDIX A--WEST VIRGINIA CHIEF STATE
SCHOOL OFFICERS 1367
APPENDIX B--ORGANIZATION CHARTS 1368
Colonial Virginia limited its control of education to certain provisions for orphan and indigent children and to the certification of teachers. Tutors employed by the wealthy planters often taught the children of the overseers and artisans and in some instances the children from neighboring plantations. On many plantations, school buildings were provided. Following these plantation schools, private schools and common schools—later called Old Field Schools—developed. The latter, usually “subscription schools,” existed in the West Virginia territory as early as 1748, and they expanded due to a spirit of cooperation among the German and Scotch-Irish frontiersmen.

Dislocations caused by the Indian and Revolutionary Wars coupled with the state’s sparse population kept many communities from forming schools, and, where they did exist, the quality of education was at a low level.

In 1817, Virginia enacted a measure dividing the state into districts with sole responsibility for establishing and supporting public schools, except for state allocations for educating poor children. However, the districts failed to implement the act. Thus, in 1829, the General Assembly passed a district free school act authorizing state subsidies to district schools, yet permitting a major degree of local authority. That same year, the first free public school in Western Virginia was established under the act in Monroe County. Despite this beginning, the act was not generally effective in either the eastern or the western parts of Virginia.

In 1841, the General Assembly called upon the members of its Literary Fund to present a plan for a reorganized school system. The result was a series of educational conventions throughout the Commonwealth. The convention at Clarksburg placed the western counties firmly on the side of free schools of higher quality for all white youth, local levies to supplement state and federal subsidies, more centralization through a state superintendent, and other reforms. Legislation embodying some of these features, but retaining “moderate tuition fees” and rejecting uniformity and educational quality for sparsely settled areas, failed to pass the following year, and the western counties lost their most effectively planned campaign and much of their momentum.

One of the “Twin Acts” of 1846 provided for districting counties and for electing a county superintendent but retained the indigent tuition feature. The second provided for free schools for white children following a favorable two-thirds vote by the district. Later acts removed most of the barriers to free district schools by 1850.

During the following 13 years, only three counties actually founded free district schools. This was due in large measure to a sparsity of population in large areas of the state. But perhaps of equal importance, the ministers and editors who had formerly led the fight to establish free schools became more conservative.

Statehood, 1863-1900

Of the issues on which the eastern and western counties of Virginia strongly disagreed before the formation of West Virginia in 1863, that of “free schools” was prominent. Strong pleas for improved free schools by western delegates had been unsuccessful in the constitutional conventions of 1829-30 and 1851, although the assembly had made some progress. But the first West Virginia Constitution, ratified in March 1863, mandated a thorough and efficient system of free schools. It also created an invested fund to provide income to supplement the moneys from both state general taxes and local property taxes to establish and support the schools. The constitution further provided for county school superintendents and township school officials and, at the state level, for the election of a general superintendent of free schools.

The Legislature convened on June 20, 1863, the day the State of West Virginia came into existence. Six months later, in conformity with the provisions of the constitution, it established a system of free schools and constituted every township a school district; it provided for the election of a general superintendent by the joint vote of the two Houses of the Legislature for a term of 2 years at a salary of $1,500 per year. The superintendent’s duties included disbursing
school funds by signing requisitions for the auditor to approve for payment to the county treasurers for the free schools which were entitled to receive them.

The history of the Department of Schools for the next 37 years was very much the history of the activities of one man—the state superintendent. During this entire period he had no professional assistants. In fact, the first superintendents had no assistants of any kind—later ones were able to employ a clerk, or clerks, and stenographers.

The reports of the state superintendents are significant in depicting the status of the free school system at this early period in West Virginia. In 1866, for example, the state superintendent stated:

School houses are "few and far between." Some of the buildings called by that name are almost in ruins, others are cheerless and comfortless log structures, prisons to both teacher and pupils. . . . The people exhibit a willingness to shoulder the burden, heavy as it is, of displacing these relics of an effete social and political era by such buildings as should be an index of their appreciation of education. . . . The people are clamoring for schools and school houses. . . . The small number of teachers is not commensurate with the educational wants of the state—indeed the demand largely exceeds the supply. A special condition of their demand is a hopeful sign—the call for good teachers. . . . The present mode of granting certificates is subject to several objections. There is no uniform standard of merit (1).

The number of schoolhouses reported by the superintendent in 1870 was as follows (2):

<table>
<thead>
<tr>
<th>Type of Building</th>
<th>Total</th>
<th>Increase over last year</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frame buildings</td>
<td>1,124</td>
<td>188</td>
</tr>
<tr>
<td>Stone buildings</td>
<td>17</td>
<td>7</td>
</tr>
<tr>
<td>Brick buildings</td>
<td>68</td>
<td>10</td>

<tr>
<td>Log buildings</td>
<td>904</td>
<td>290</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>2,113</strong></td>
<td><strong>495</strong></td>
</tr>
</tbody>
</table>

Also included in the superintendent's report of 1870 were these comments:

This great increase of log houses indicates that the system is gaining firmer foothold than it has heretofore had in the back counties, where but a few other houses are built and where the system has met with the strongest opposition. . . .

The General Superintendent is now required to do office work without a clerk, and also to travel in the state at large—rather difficult things to be done at the same time by one person. . . . The question arises, whether the Superintendent should not have a clerk, relieving his duties of the incongruity and enabling more and better service to be performed (3).

By 1870, a political realignment in the state resulted in the call for a new constitutional convention to be held in 1872. Although it was feared the convention might do away with the requirement that the state establish and maintain a free school system, this did not materialize. A strong effort to eliminate the requirement for a state superintendent of schools was defeated, but he was made a part of the executive branch. No professional qualifications were listed for either the county or state superintendents.

The second West Virginia Constitution, passed by the convention in April 1872, and ratified by popular vote in August 1872, contained the following statement in Section 1 of Article XII; "The Legislature shall provide, by general law, for a thorough and efficient system of free schools"(4). In Section 2, it stipulated that "the State Superintendent of Free Schools shall have a general supervision of free schools and perform such other duties in relation thereto as may be prescribed by law"(5). His travel expenses were limited to $500 per year. Although the state superintendent also served as adjutant general and quarter master general from 1871 to 1877, he was able to devote his primary attention to schools.

Section 4 of the new constitution continued the school fund created by the Constitution of 1863 and established the Board of School Fund, composed of the Governor, state superintendent, auditor, and treasurer. Section 6 continued the same school districts. Except for the creation of independent school districts, the magisterial school districts remained until 1933, when the county became the school district.

The 1872-73 Legislature amended the school law by providing for the election of the state superintendent for a term of 4 years and charged him with the supervision of all county superintendents and free schools of the state. It also created the General School Fund for the support of free schools, including the salary of the state superintendent and the expenses of his office, and specified its sources of revenue.

A review of the superintendent's reports from 1863 to 1900 indicates that the problems confronting the state superintendent and the public school system were not notably different from those at present: school finances, school building, teachers, teacher certification, textbooks, county and district supervision, courses of study, libraries, and high schools. These early superintendents gave considerable attention to teachers institutes, teachers reading circles, examinations, and Arbor Day. Even though by 1900 the state department consisted only of the state superintendent, one or two clerks, and a stenographer, it had exerted considerable influence in developing West Virginia's public school system.

**Teacher Preparation and Certification**

By 1864, the problem of obtaining properly trained teachers had resulted in holding various kinds of county
institutes. A meeting called in 1865 by State Superintendent William R. White emphasized this form of teacher preparation. Their immediate success prompted White to encourage more county institutes and to provide an organizational format.

This leadership resulted in White's election as president of the state teachers organization in 1865 and established a precedent for electing the state superintendent to this position until 1904. This, in turn, placed the state superintendent in the editorship and proprietorship of the *West Virginia Journal of Education* from 1881 to 1904. Since the *Journal* was considered to be the property of each state superintendent, he established it as the official publication of his office as well as that of the teachers organization. Each state superintendent sold the publication to his successor until Thomas C. Miller, for unspecified reasons, discontinued the state superintendent's role as president of the statewide organization and owner-editor of the *Journal*. This ended an era in which the state superintendent had been the principal voice and direct leader of the teachers of the state as well as the officially elected head of the state school system.

In 1873, the Legislature provided for five grades of a 1-year certificate to be issued by a county board of examiners as normal school certificates. At the same time, it established a board consisting of the state superintendent and two teachers appointed by the Governor to examine teachers and issue professional or life certificates. In 1879, it reduced the grades of certificates obtainable by examination to three, and examinations for holders of professional and normal certificates were made optional with local boards of education. Two years later, the Legislature further diminished the quality of certification by eliminating the normal school certificates.

In 1887, the State Board of Examiners was created, along with grades of state certificates for 6 and 12 years. Four years later, in 1891, the Legislature again discontinued the professional certificate. In 1903, by a uniform examinations act, it transferred the preparation of questions, grading of tests, and granting of certificates to the state superintendent, although the county and state examining boards were retained. The act authorized three grades of certificates, with the stipulation that the lowest grade could be issued only once to a person.

County and state meetings, usually called institutes and organized largely for teacher-training purposes, continued to increase. Local organizations for other purposes, centering around regional round tables, originated about 1899 and predominated until formation of the county unit system in 1933. (These are still represented in the seven regional organizations of administrators sponsored by the education department.) These meetings—especially the statewide ones—usually gave some attention to legislative and other major issues but rarely were effective. They confined their action for the most part to responding to attacks on education.

**Summer Normals**

From 1880 to 1910, the summer normal, a sort of nondescript institution offering both elementary and secondary courses, provided educational opportunity for many who could not afford to go to college or even to a state normal school. Many of these normals were taught by county superintendents with the aid of one or both of the other members of the county examining boards. A legislative act of 1910 forbade this practice and thus dealt the summer normals an all but fatal blow.

The normal offered five courses. The preparatory course covered the common school branches except bookkeeping, civil government, and general history. The other four included a teacher-training course; a business course with instruction in bookkeeping, shorthand, etc.; music for beginners; and a liberal education course for college preparation. Although the average summer normal was little more than a "cramming" institution to help teachers pass written examinations, these schools served a useful purpose in the transitional period between the academy and the development of the high schools.

The summer normals were not progressive, and by 1909, teachers were beginning to desert them for more professional training. In other words, teaching was becoming a profession.

**County Institutes**

The teachers county institute was, at best, an extended normal providing information, enthusiasm, and a smattering of professional training. In fact, as an itinerate teacher-training institution, it provided about all of the professional training teachers received. At its worst, it was a compulsory five-day ordeal.

Although all active teachers, beginning in 1877, were required to attend at least one county institute annually, prior to 1879 the Legislature made no appropriation to maintain them. Between 1879 and 1895, their total annual state allowance amounted to only $500. As this was wholly inadequate, county institutes would have been abandoned but for aid from the Peabody Fund, which, prior to 1879, financed them entirely. In an effort to improve the quality of the personnel, they were gradually supplemented by Peabody institutes concerned primarily with the training of institute instructors and financed entirely by the Peabody Fund.

The Legislature increased the annual allowance to $1,000 in 1895 and to $3,000 in 1899. After 1895, however, the Peabody Fund gave decreasing sums, and beginning in 1903 this money was used by the state superintendent largely as a reserve to pay special lecturers.
Compensation tended to be standardized at $25 per week for each instructor, and the total cost for any county was limited to $100.

Following an 1877 act abolishing district institutes, the teachers county institute entered its heyday and remained highly popular where county superintendents and institute instructors were zealous and capable. The annual attendance increased from 4,410 in 1881 to a peak of 9,936 in 1899.

"The graded course of institute work," covering a 2-year period in both academic and professional subjects, was almost as important as the institute itself. Under an 1879 act, the state superintendent was required to prescribe a course of study for all institutes. It was mainly academic for the first dozen years, but in 1891, the Legislature prescribed that it be a professional course embracing "history of education, school management, methods of teaching, and educational psychology." This, seemingly, put the legislators and the politicians in advance of the educators in this respect.

By the turn of the century, a number of factors were contributing to the declining influence of the county institute. Most important, there was a scarcity of both instructors and a high quality of instruction. Reflecting a national trend, teachers wanted instruction that was more specialized and readily transferable to their classrooms. They also objected to institutes held in midsummer. In 1901, the Legislature passed an act that not only required county superintendents to organize and conduct district institutes, but also paid teachers to attend them. A number of counties began organizing district institutes during the 1901-1902 school year, and these, supplemented by round tables, were increasingly favored.

Curriculum

Since instruction was organized primarily around textbooks, their selection was of great importance. From 1863 to 1865, elementary school textbook selection was the responsibility of the county superintendent, who was required to obtain uniformity "as far as practicable." This proved to be most difficult, however, and criticisms of constant changes in textbooks and the resulting expense prompted the Legislature to require the state superintendent to "prescribe a series of textbooks to be used in the free schools." Superintendent White complied, but too often local schools ignored the statute. An attempt to make noncompliance a misdemeanor was rejected as interference with parental authority.

In 1873, the Legislature itself prescribed a uniform series of textbooks. Six years later, it modified the act to authorize the state superintendent to contract for the prescribed list for 5 years and to ensure that the quality and cost would be maintained. The basic features of this act are still in force. In 1882, maximum prices were fixed for some textbooks, and in 1885, school boards were required to purchase and keep available a reasonable supply of textbooks.

In 1895, the practice of supplying textbooks through local merchants was replaced by a statewide depository system. Under provisions of this act, the Governor appointed a commission to select and contract for needed texts when no acceptable contracts with publishers could be made. Unfortunately, this resulted in such confusion that it strengthened the hand of those who favored adoption by local units. Two years later, in 1897, textbook selection was returned to a bipartisan board appointed by the county court, consisting of the county superintendent, three active teachers, and four nonteaching freeholders. This system also proved to be fallible as charges of favoritism and corruption became prevalent.

County Superintendent Alexander L. Wade of Monongalia County published a graded course of study and graduating system for county schools in book form in 1881, and, with modifications, it was adopted immediately by many states as well as by several counties in West Virginia. It was not, however, authorized on a statewide basis in West Virginia until 10 years later. This 1891 legislative act required the state superintendent to prescribe "a manual and graded course of primary instruction" for county and village schools, to arrange the order of study of the several branches and the time to be devoted to each, and to provide for the advancement of pupils from grade to grade and their graduation upon the successful completion of the course. At the same time, the law required bookkeeping and civil government to be taught after July 1892, along with courses in orthography, reading, penmanship, arithmetic, English grammar, U.S. history, general history, state history, and physiology and hygiene.

State Superintendent Virgil A. Lewis, in his efforts to establish a state system as contemplated in the constitution, put the new system into effect with zeal and resourcefulness. Despite the fact that the free public schools had functioned for more than a quarter century, no effort had been made to standardize them except through the use of common textbooks. Thus, there had developed about as many different practices as there were teachers. Superintendent Lewis attempted to remedy this in part by publishing in 1894 a Manual and Graded Course of Study for County and Village Schools. It was immediately popular and in general use by 1896.

Uniformity was achieved in part by extending the school term and requiring attendance. The school month, which had varied from 20 to 22 days, was standardized at 20 days in 1887. Eight years later, in 1895, the 4-month minimum school term was raised to 5 months, although local voters could elect to have a longer term.

The state's first compulsory attendance law, enacted in 1879, proved disappointing. Not only did it contain
inadequate definitions, but since the law could be suspended by 60 percent of the voters of any school unit, considerable overt resistance nullified it in many areas.

High Schools

In 1865, the Legislature gave boards of education authority to establish graded schools offering courses of study equivalent to those of the best high schools. This law was considerably strengthened in 1873 when the Legislature gave district boards of education specific authority, with the approval of three-fifths of the voters, to establish high schools and lay special levies not to exceed 30¢ on each $100 valuation for their support and maintenance. This authority was extended in 1889 to include a provision which permitted joint high schools to be established, gave more authority to boards of education in respect to high schools, and required county superintendents to report any information about them as requested by the state superintendent.

Despite these efforts, the high school, officially considered to be in 1885 “a factor of transcendent importance in the education of the people” and described as “the crown and completion of the free school system”(6), was lagging in growth behind that of many surrounding states.

In 1897, West Virginia had only 24 “so-called high schools” and was “one of the very few states without a first class high school” in the amount of work offered (7). By 1906, the number had increased “in name” to 50 or more, but in reality the few that were operating properly were in the larger towns and cities, thus perpetuating the inequalities that existed on the lower levels. Unfortunately, there were enough high schools and state-maintained secondary schools to all but kill off the old-time academies in the state, thus placing West Virginia in a worse position with respect to secondary education than other Southern states, particularly Virginia and North Carolina.

Inasmuch as high schools were then generally admitted to be the sine qua non of educational progress, reasons for their failure to develop in West Virginia are fundamental to an understanding of the state’s educational history. Perhaps most important was a traditional aversion by the people to higher education, going back to a time when it was considered a patriotic duty to oppose such a system financed by them in eastern Virginia for “nabobs.”

Although the growing industrialization stimulated the growth of high schools in many areas of the country, the immediate impact was just the opposite in West Virginia. Instead of completing high school, the boys accepted positions which the new economic order made available.

Undoubtedly, the graded schools contributed to the retardation. In 1904, there were more than 600, offering courses which may have extended from the kindergarten through the twelfth grade. After 1891, the required use of the graded course of study brought a degree of uniformity in the primary and elementary work, and the additional offerings, except in a few places, were considered by local citizens and boards to meet their needs and abilities. For a public accustomed to mistaking form for substance the so-called high schools were good enough.

West Virginia contained six state normals, which for the most part were only academies, and three preparatory schools for the state university. Each county had one or more private or select schools taught in the summer by the county superintendent or by persons preparing teachers for examinations, and other private schools operating actively during the school year. These schools tended to bypass the high schools and thus contributed to the failure to establish high schools which resulted in retarding the state’s educational progress.

Financing secondary education was a continual problem. Before the school fund was limited and rededicated to the primary and elementary schools in 1902, its annual increments offered a possible means for constructing and maintaining high schools. By the time this source was eliminated, high schools had won increasing favor with the county providing their support. When the counties failed, the people began turning to the district units, but the financial problem remained unsolved. Whether the proposed high schools should be financed entirely by local units or be subsidized in part by the state continued to be a hotly debated question.

Summary

Throughout the nineteenth century, leadership was shifting to persons educated by public free schools, and legislative experimenting to adjust them to a society wracked by Civil War and its aftermaths culminated in a somewhat distinctive system. Under the leadership of State Superintendent William R. White and County Superintendent Alexander L. Wade, in some respects, the new state led the entire country in educational progress during Reconstruction. In 1900, Thomas C. Miller, a schoolman with a professional viewpoint and purpose, was elected to the state superintendency. Therefore, failure to keep the state in the forefront of educational progress was not due primarily to a lack of interest in popular education. More than anything else perhaps, it was a maladjustment to the Industrial Revolution. During this industrialization, progress was largely a matter of corporate initiative and control with chief interest in material gain. Unfortunately for the state’s educational interests, the corporate control of its industrial economy was largely nonresident. In only a few instances did the leaders, either resident or nonresident, oppose public free schools, but the schools were of secondary rather than primary interest, as in the pre-Civil War and Reconstruction periods.

In the period beginning about 1890, there was a change in the character and technique of those who took
over control of the schools. For the most part they had all been born after the Civil War, and many were followers of N. M. Butler and John Dewey. Generally, they believed that good teachers were not born to their profession and could be trained. Admittedly, natural aptitude was helpful, but it was not, as in the former period, a sine qua non. With few exceptions, their common goal was a state educational system embracing all public-supported institutions. Taking their cues from the business world, the new leaders generally believed that education could and should be administered and financed scientifically. The greatest difficulty was that it was not an immediate and obvious dividend-paying investment.

Shortly after 1880, unification of the state educational system became a common objective among the leaders. Although such a system was implied in the constitution, attainment was first proposed by State Superintendent Benjamin S. Morgan. As the absence of secondary schools was generally conceded to be the weakest link in the system, his plan included establishing public high schools throughout the state and a strong academic department in each of the state normal schools, thus temporarily forfeiting the legal right of the latter to become either teacher-training institutions or colleges.

As a result of the discussions on unification and teacher-training programs, two schools of thought developed: One called for a “new education”; and the other, the old school, claimed to be based on the lessons of experience. The old school generally held that teachers were born, whereas the new school believed that they could be made, even out of fishermen. In other words, the old school emphasized knowledge and aptitude, whereas the new school emphasized knowledge and teacher training. The pros and cons of each occupied the major portion of the educational journals and divided teachers and administrators into two semihostile camps. Although the old school dominated at the end of this period, the new school had gained a secure foothold.

Legislation to prevent the employment of children under 12 years of age in mines, factories, workshops, or in agriculture during the regular school session, first requested in 1887, went unheeded for two decades. In 1907, boys under 12 years of age in mines, factories, workshops, or in agriculture during the regular school session, first requested in 1887, went unheeded for two decades. In 1907, boys under 12 years of age; and girls of any age were forbidden to work in coal mines. There was a growing realization of the need for vocational education and kindergartens. In 1899 the Legislature authorized towns and villages of 1,000 or more population to establish kindergartens without the approval of the voters. Of some significance is the fact that by 1900 the number of Negro women teachers exceeded the number of men; and five years later white women teachers exceeded the number of men.

At the turn of the century, Wheeling, with 38,878 inhabitants, was the only city in West Virginia having a population more than 25,000, and 11 communities were over 4,000. Out of a state population of 958,800, 753,099 were classified as rural, 94,662 as semirural, and 111,039 as urban (defined as living in a community of over 4,000) (8). With over 75 percent of the population patronizing rural schools, it is easy to understand why there was an emphasis on agriculture education during the early 1900’s.

In March 1901, at the time A. B. White succeeded George Wesley Atkinson as Governor, Thomas C. Miller replaced James Russell Trotter to become the twelfth state superintendent of free schools. In his first biennial report, he pointed out that of 312,124 youth in the state, only 235,191 were enrolled in the schools, and the average daily attendance was 150,017. There were 5,854 single-room schools, 262 graded schools, and 40 high schools, of which 5,510 were frame, 309 log, and 176 brick and stone (9).

THE DEPARTMENT'S CHANGING STRUCTURE 1900 TO 1965

The State Superintendent, 1900-19

Although the Legislature did not give the state superintendent express authority to employ assistants and other employees until 1919, he did hire a few such persons. By the end of 1904, the state department consisted of the state superintendent, two clerks, and one stenographer (10). The following year, the Legislature created a State Board of Examiners of four members, appointed by the state superintendent, to hold examinations and issue teacher certificates. He was further assisted when in 1908 the Legislature replaced this board with a State Board of Education. This board, which was composed of the state superintendent and five persons engaged in educational work, not only performed the examining duties of the State Board of Examiners, but also prescribed courses of study for the public schools.

The number of persons in the state department remained almost constant during the first decade despite the growing number of schools. In 1910, however, with help from the Rockefeller Foundation, the Southern Education Board, and the Legislature, the state department reorganized and established new divisions of high schools, rural schools, examinations, publications, and institutes. At the same time, an assistant state superintendent was added to the staff.

The Southern Education Board provided the funds to employ the first rural school supervisor, L. J. Hanifan, who commenced his duties in July 1910 (11). For the next several years, this division concerned itself with problems of consolidation, standardization of rural schools through the use of an “efficiency score card,” and district supervision. It published manuals and conducted conferences and workshops for teachers.

The Rockefeller Foundation paid the salary and expenses of the supervisor of high schools from 1910 to...
1925. At the beginning of this period, there were forty 4-year high schools, twenty 3-year high schools, twelve 2-year high schools, and nine schools offering 1 year of secondary work (12).

In 1911, the Legislature divided the high schools into three classes. The law stated that it “shall be the duty of the state superintendent of schools to classify all of the high schools of the state in accordance with the provisions of the act”(13). The high schools division assumed the responsibility for making the classifications.

This division’s responsibilities increased dramatically in 1926, when West Virginia’s colleges and secondary schools affiliated with the North Central Association of Colleges and Secondary Schools. The inspections, correspondence, reports, and general supervision required to bring the schools to association standards involved considerable work.

When the National Vocational Education Act (Smith-Hughes) was passed in 1917, the Legislature immediately accepted its provisions and designated the State Board of Regents to be in charge of this program. This board, created in 1909 to exercise full control over the educational departments of several state institutions, appointed an administrative and supervisory staff to incorporate vocational programs into the educational system.

The 1919 Reorganization

In 1919, the Legislature passed an act which had a tremendous impact on both the State Department of Education and the public schools. The law specifically provided for assistants by stating:

For carrying into effect the provision of this chapter the State Superintendent of Schools shall maintain a department of public schools at his office in the State Capitol, and shall have authority to employ assistants and such other employees as may be necessary, including a state supervisor of colored schools (14).

The 1919 law required the state superintendent to prescribe and print forms necessary for carrying out the details of the school systems and distribute them to school officers. He was to prepare and publish course of study manuals and to see that minimum standards were maintained in the several grades of the public schools. He was made responsible for preparing and publishing a list of books suitable for school libraries, copies of the school law, as well as those reports, circulars, and bulletins that he believed would promote the best interest of the schools. Since the Legislature met every 2 years, the state superintendent was to report to the Governor—and thus to the Legislature—biennially (15).

The Act of 1919 abolished the State Board of Regents, the State Board of Education, and the State School Book Commission, and it created a seven-member Board of Education, with the state superintendent a member ex officio and its chief executive officer. The other six members were appointed by the Governor.

The Department’s Growth, 1920-68

By 1920, the state department consisted of the state superintendent, assistant state superintendent, supervisor of rural schools, supervisor of high schools, assistant supervisor of high schools, supervisor of Negro schools, supervisor of examinations, director of vocational education, supervisor of vocational agriculture, supervisor of home economics, supervisor of trade and industrial education, and supervisor of mining education, along with essential clerical staff. Because the Legislature had not provided state funds for administering and supervising vocational education, the secretary of the state board served as director of vocational education, and the four supervisors were “borrowed” from the faculty of the West Virginia University (16).

During the following decade, the state department added the following staff: supervisor of physical education, supervisor of certification, supervisor of teacher training, director of educational research, statistician, assistant director of vocational education, supervisor of vocational agriculture, assistant supervisor of vocational agriculture, supervisor of home economics, and supervisor of trade and industrial education. After 1938, instead of being listed by title only, the members were listed by divisions. The divisions in 1940 included general administration, high schools, elementary schools (until 1933, rural schools), certification, research, Negro schools, vocational education, and vocational rehabilitation. By 1950, divisions had been added in school transportation, school plant planning, school lunch, and veterans education and training.

The 1933 Legislature enacted one of the most far-reaching laws in the history of West Virginia education when it established the county unit plan of organization. The school law was amended to read: “A school district shall include all the territory in one county. Existing magisterial school districts and sub-districts and independent districts are abolished”(17). These two sentences of the amendment abolished 54 independent school districts and 344 magisterial school districts, replacing them with 55 county school districts—one for each county in the state.

Beginning in 1952, the state inaugurated an extensive study of the educational program and its relation to the people in three pilot counties—Greenbrier, Marion, and Mercer. With a limited grant from the W. K. Kellogg Foundation, the study was conducted under the auspices of the West Virginia Association of School Superintendents and the West Virginia Committee of the Cooperative Program in Educational Administration, the latter composed of representatives from the state department, the institutions of higher education, and the state’s professional
associations. The Southern States Cooperative Program in Educational Administration and the boards of education of the three counties involved supplied the consultative services.

At the end of 5 years, the West Virginia Continuing Program in Educational Leadership assumed all projects being conducted by the West Virginia Cooperative Program in Educational Administration. Supported by a second grant from the W. K. Kellogg Foundation, the state committee, together with the state department, continued to sponsor the study.

In June 1955, the West Virginia Department of Education entered into an agreement with the Kellogg Foundation whereby the state superintendent would serve as the executive officer to receive grants from the Kellogg Foundation, which, in turn, would provide him with an office and a secretary for the director. The grants received were to be distributed under the direction and supervision of the West Virginia Executive Committee for the Cooperative Program in Educational Leadership.

A change of major and far-reaching significance occurred in the state superintendent's office in 1958, when an amendment to the constitution provided that—

The general supervision of the free schools of the state shall be vested in the West Virginia Board of Education which shall perform such duties as may be prescribed by law. The Board shall consist of nine members to be appointed by the Governor by and with the advice and consent of the Senate (18).

The State Board of Education was given the responsibility of appointing the state superintendent of free schools, and he was removed as a member of the board. He did, however, retain his membership on the Board of Public Works. This amendment helped to ensure that future state superintendents would be professionally qualified and would be partially insulated from political pressures. It also reduced the opportunity for conflict between the state superintendent and the state board.

Financing Education

The first West Virginia Constitution, ratified in 1863, provided for a School Fund to be set aside from all money accruing to the state from the proceeds of forfeited and delinquent lands; lands sold for taxes; grants, devices, and bequests; corporate taxes; money paid as exemption from military duty; and sums appropriated by the Legislature. Under regulations prescribed by law, this fund was to be invested in interest-bearing securities of the United States and West Virginia; this interest was to be used for no other purpose than the support of the free schools.

Under a new constitution ratified in August 1872, the 1872-73 Legislature created a Board of the School Fund, composed of the Governor, the state superintendent of free schools, the auditor, and the treasurer, to administer the fund. This board was given the responsibility for investing the money in bonds, but if such securities were not available it could purchase other solvent interest-bearing securities. By 1900, the School Fund was receiving annually from $45,000 to $56,000.

A constitutional amendment ratified in 1902 limited the School Fund to $1 million, which remained the limitation in 1965. During the Depression years of the 1930's, there were losses in the fund due to bankruptcy, but it was built back to the $1 million mark in later years. In the 1965-66 school year, the fund received $55,700, which was transferred to the General School Fund.

The 1872-73 Legislature also created the General School Fund as an added source of revenue for the public schools. Its money was derived from a state tax of 10c on each $100 valuation of all real and personal property of the state, interest on the invested School Fund, confiscations and fines accruing to the state, the proceeds from the annual capitation tax, and interest on investments in U.S. bonds. In subsequent years, funds from many other sources were deposited in the General School Fund, including those allotted by the federal government to the state for educational purposes.

The General School Fund supplied the salary and other expenses of the state superintendent, as well as other sums he found necessary to expend. After these deductions, the state auditor certified the net amount to the state superintendent, who in turn annually distributed these moneys to the cities and counties on the basis of school enumeration.

Along with the School Fund and General School Fund, the schools were supported by local levies voted by boards of education of magisterial and independent school districts, which went into separate accounts referred to as the Teachers Fund and the Building Fund. In 1908, the Legislature authorized the Board of Public Works to divert $50,000 of the General School Fund to supplement the salaries of teachers in districts which could not maintain minimum terms under the existing maximum levies. The following year, it increased this supplementary fund to $75,000 for teachers and $15,000 for buildings. To cover these items, together with additional expenditures of the State Department of Education and a contemplated increase in the county superintendents' salaries in 1909, the Legislature fixed the General School Fund at $750,000. At the same time, it directed the Board of Public Works to transfer the necessary state funds to keep it at that figure.

The General School Fund remained at this level during the next decade, although the Legislature added about $75,000 in case of need. The $75,000 supplementary aid to teachers and the $15,000 supplementary aid to the Building Fund did not change. However, the demands for additional funds for teachers' salaries, district supervision,
and standard schools prompted the 1921 Legislature to add $1 million to the General School Fund.

From 1921 to 1931, the General School Fund ranged from $2 million to $2.5 million. It was used to pay the expenses of the state department and the salaries of the county superintendents, to supplement teachers' funds and maintenance funds in districts unable to meet the minimum requirements with their maximum levies, to aid the high maintenance funds in districts unable to meet the minimum county superintendents, to supplement teachers' expenses of the state department and the salaries of from $2 million to $2.5 million. It was used to pay the $1 million to the General School Fund.

The loss of local revenues after 1933, thegin of the Depression, forced the state to increase itsaid to county boards from the Virginia. The distribution of state aid was managed by the Board of School Finance as it was responsible for identifying schools and distributing state aid.

Prior to the tax limitation amendment in 1933, the distributable amounts paid to local school boards from the General School Fund provided about 5 percent of the total cost of elementary and secondary education in West Virginia. The heart of the Depression, forced the state to increase its aid to county boards of education. The state continued to assume an ever-increasing share of the public school costs, so that by 1965, it was providing approximately 53 percent of the total.

**VARIOUS DEPARTMENTAL FUNCTIONS**

**Teacher Certification**

Legislation relating to uniform examinations for teachers enacted by the 1903 session of the Legislature had placed the responsibility for preparing and grading examinations and granting certificates with the state superintendent. To discharge this function the state department established a Division of Examinations in 1910, primarily to conduct the uniform examinations for teachers, grade the manuscripts, and issue certificates. That year, there were 12,792 applicants for these examinations. Of this number, 280 were issued No. 1 certificates, 2,143 were issued No. 2 certificates, 2,833 were issued No. 3 certificates, and 327 certificates were renewed. This means that 5,970 failed and 1,239 were not issued. The state superintendent also issued 251 uniform certificates to graduates of the state normal schools and the state university. The three types of certificates were based on the scores made on the uniform examinations with those making scores in the upper bracket receiving the No. 1 certificate, those in the next bracket receiving the No. 2 certificate, and those receiving scores in the lowest passing bracket receiving the No. 3 certificates.

At the end of the following decade, in 1920, out of 4,710 applicants in the uniform examinations, 3,475 received certificates. At the same time, 568 received certificates upon graduation from schools maintaining approved normal school courses, of which 295 were from state schools, 55 from private and denominational schools, and 218 from teacher-training high schools.

In 1924, the Division of Examinations became the Division of Teacher Training. Two years later, it was changed to the Division of Certification, as it was now mainly concerned with certifying teachers based on graduation from approved schools and raising the professional standards for teaching. By 1930, only 977 certificates were issued through the uniform examination.

During the period from 1930 to 1940, teacher preparation programs were generally based on course and semester hour requirements. Courses were required which were generally thought to provide certain competencies essential for teaching success. The relationship between teacher preparation and teacher certification was not clearly defined, and teacher certification was often regarded as a mere counting of courses and credit hours. In 1941-45, the department participated in a study of standards for teacher preparation and certification. Other participants in this study were representatives of the state's institutions of higher education and of the public schools. The study resulted in new minimum standards for teacher preparation and certification adopted by the State Board of Education in 1945. These standards were generally limited to the completion of a prescribed number of semester hours in an approved college or university with a minimum number of hours specified in general education, professional education, and subject or area specializations.

One of the distinctive developments resulting from this study was the creation of a so-called "single curriculum" for teachers in grades 1 through 12. However, as the institutions of higher education were not generally enthusiastic about this concept, it did not enjoy widespread use. This study resulted also in a clearer understanding of the relationship of teacher preparation to teacher certification, and the two functions were consequently combined in the Division of Teacher Preparation and Professional Standards.

During the decade 1950-60, consideration was given to reducing the number of types of teaching certificates. The result was the adoption of the professional certificate with endorsement appropriate to a particular level or area of specialization consistent with the program completed.

The standards developed in the 1941-45 study, with certain modifications, remained in effect until a new study was undertaken under the leadership of the Division of Teacher Preparation and Professional Standards in 1960. This latter study resulted in an "approved programs" approach to teacher preparation and certification. This pattern called for the adoption by the state board of minimum standards for institutional training programs; the development of programs by institutions approved by the state department; the development of standards for the preparation of teachers; and the establishment of a Board of Certification of Teachers as an instrument for monitoring the quality of education provided by these programs.
state board; and institutional recommendation of candidates for certification. By 1965, practically all the colleges and universities in the state were approved under such programs, and the others were in the process of preparing programs eligible for state board approval.

The approved programs approach placed greater emphasis on a close working relationship between the department in its teacher preparation function and the preparing institutions. It proved difficult for one person to administer the certification process and have adequate time to work effectively with the colleges and universities. The Division of Teacher Preparation and Professional Standards was, therefore, divided in 1968 into two divisions—the Division of Teacher Preparation and the Division of Teacher Certification. Both divisions remained in the Bureau of Instruction, but, in view of the volume and importance of their work, consideration was being given to the creation of a separate bureau composed of these divisions.

Textbooks

"The fifty-fifth section of our school law prescribes a fixed series of school books to be used in the free public schools in the state—and a particular textbook is prescribed for each branch of study to the exclusion of all others"(19). Thus it was from the inception of the public school system in 1863 until the selection of textbooks by the county adoption system, enacted in 1897. So much criticism arose that in 1904 the state superintendent reported a strong trend in favor of state uniformity. It was 1909, however, before the Legislature created a State Textbook Commission, consisting of the state superintendent and eight citizens, five of whom were required to be active educators. The commission was authorized to adopt one book or a series of books for each subject to be used for 5-year periods. The independent districts or towns of 3,500 or more population were granted the right to make their own selections. In 1919, the commission's duties were transferred to the state board.

Despite earlier experiences, the West Virginia Education Association had pressed, for several years prior to legislative approval, for resumption of local adoptions on the grounds that no one textbook was appropriate for all counties. It believed that state adoption of a multiple list of textbooks would ensure quality as well as diversity at the local level.

The profession finally prevailed, and the law was changed in 1953. With subsequent slight modifications, this is the procedure in effect today (20). State committees of educators recommend the books to be included on the multiple list for each subject to the state board, and, after adoption, county committees of teachers select their texts from the state list. The books are adopted for 4 years on a rotating plan, which results in some subjects' being considered each year.

County boards of education in West Virginia have been authorized to supply free textbooks since 1903. In 1935, Governor H. Guy Kump placed $1 million in the biennial budget for publicly owned textbooks written by persons employed by the state, but the funds were diverted by the Legislature for teachers' salaries and school maintenance.

Since 1939, county boards have been required to supply free textbooks to public schools for pupils whose parents cannot afford to purchase them, and they may supply state-adopted textbooks for pupils in private schools under similar circumstances. At the same time these statutes were enacted, the Legislature established an appropriation of $150,000.

Interest in a free textbook program has not been maintained at the state level as the appropriation has generally been unchanged. There is now a growing belief that the program is an integral part of a free school system, but implementation of this concern has been left to the counties.

Pupil Transportation and Driver Education

Although the state department collected data from county school systems, such as the number of pupils transported, the number of buses in use, and transportation costs, it was not until the 1936-37 school year that state supervision was provided. The department revised standards, established regulations, and sent out report forms. It commenced holding county conferences on the organization and administration of pupil transportation and checking all bids submitted to county boards for the purchase of buses.

In the 1942-44 biennium, the first full-time state supervisor of school transportation was appointed. At the same time, safety was given a special emphasis. The State Board of Education adopted new minimum standards for design and equipment of school buses which became effective the following year. These standards were revised in 1961 and again in 1965. In recent years, emphasis of the Division of School Transportation has been directed toward improvement in uniformity of transportation practices and equipment; relief of overloads on buses; safety practices; improved scheduling for equalizing the school day for transported pupils; and training of drivers and supervisory personnel.

During the early 1940's, the Department of Education cooperated with the Department of Public Safety in encouraging and promoting driver education in the public schools. In 1945, the two departments presented A Course of Study in Driver Education for Secondary Schools (21), and interest continued to grow. By 1948 the program justified employing a full-time director.

Under the leadership of the state director, the first statewide conference on driver education was held at Jackson's Mill in April 1950. This resulted in a revision of
the earlier Course of Study. At a workshop conference in 1957, the course was again revised as A Course of Study in Driver and Traffic Safety Education for West Virginia High Schools (22).

Research and Surveys

From 1900, the department had staff members responsible for carrying on educational research, collecting and tabulating school statistics, and publishing the results. The name of the section changed at different times, but it was officially established as the Division of Investigation and Statistics in July 1926. The General Education Board of the Rockefeller Foundation paid the salary of the director, his traveling expenses, and the expense of a stenographer for a period of 7 years.

In 1927, the Legislature appropriated $20,000 to employ experts in various educational fields to make the first survey of West Virginia’s public schools. Under the direction of L. V. Cavins, a member of the state department, the survey was conducted during 1928 and 1929. The results, published in four volumes, covered organization, administration, and finance; educational achievements; school buildings; and institutions of higher education (23).

State department staff members have not been involved directly with the remaining three surveys, but they have provided statistics and other information the survey staffs have needed. George D. Strayer directed a survey published in 1945 as A Report of a Survey of Public Education in the State of West Virginia (24). Under Project Director E. L. Lindman, the Division of Surveys and Field Services of George Peabody College for Teachers conducted a survey in 1956 (25), and E. K. Feaster directed another survey that was published the following year (26).

Since the above studies dealt with different facets of the state’s educational enterprise, recommendations resulting from them showed varying emphases. Some of the more significant recommendations which emerged from one or more of the studies advocated further school consolidation, added emphasis on vocational education, initiation of a state-supported system of kindergartens, more adequate guidance services in the high schools and junior high schools, better physical facilities, and allocation of functions among the higher education institutions of the state through a reorganization of the administrative structure.

The regular session of the Legislature in 1955 authorized a survey of higher education which was conducted under the direction of John E. Brewton at the invitation of the Joint Committee on Government and Finance, Commission on Interstate Cooperation, and the Citizens Advisory Committee. Published in 1956 under the title Public Higher Education in West Virginia, this study related principally to the organization and control of higher education, enrollment projections, teacher education, and financing public higher education in the state.

The 1966 session of the Legislature authorized a study of higher education to emphasize the allocation of functions among the various colleges and universities to be made by a Committee on Higher Education composed of the membership of the State Board of Education, the Board of Governors of West Virginia University, and the State Association of College and University Presidents. This committee reported its recommendations to the Legislature in late 1966, recommending a complete reorganization of higher education under a board of regents. Bills embodying these recommendations were introduced to the 1967 session of the Legislature but were not enacted, and further study of the organization of higher education is continuing.

Publications

Since the nineteenth century, the state department has published materials that have had an impact on the schools either directly or through the Legislature. Some have been required by law, such as the reports of the state superintendent mentioned earlier. The state law also required the state superintendent to print copies of the school law in sufficient quantities for distribution to school officials and other citizens. State Superintendent Thomas C. Miller printed the first copies in 1903.

In 1904, a History of Education (27) was prepared under the direction of the state superintendent for distribution at the Louisiana Purchase Exposition at St. Louis, Missouri, and throughout the state, particularly to the school libraries. A revised edition was issued in 1907, when 2,500 copies were published for distribution at the Jamestown, Virginia, Exposition.

From time to time the state department issued bulletins on particular subjects. In 1934, it began the monthly publication of an educational bulletin. The first three numbers were mimeographed, but subsequent issues were printed. Once each year a special statistical number was issued, and other “specials” have appeared from time to time. The department terminated the regular monthly or bimonthly publication of this bulletin in 1958.

The state department has published courses of study for high schools, junior high schools, elementary schools, and one- and two-room rural schools. It has issued requirements for certifying school personnel, administrators, supervisors, and teachers; rules and regulations of the state board regarding school transportation and schoolhouse construction; and standards for classifying schools. It also has published handbooks and songbooks for teachers institutes and source books for teachers in most subjects at the various grade levels.

The department has issued school directories up to the present, listing the state and county school personnel. Although earlier ones did not list persons below principals,
later ones list all administrators, supervisors, and teaching personnel employed by boards of education. Probably the most significant current publication of the department is the annual report of the state superintendent.

In the last decade, the work of the publications office has shown a dramatic increase in volume. It would be impractical to attempt to list all of these publications, but reference to some of them is made in other sections. Much of this volume had consisted of curriculum guides for use by local school systems. Typical of these publications are curriculum guides in science, mathematics, music, and foreign languages (28).

The School Lunch Program

In the early 1930's, a few West Virginia schools established school lunch programs. Later, with aid from the Food Distribution Administration and supervision by the Works Progress Administration after 1935, these school lunch programs expanded considerably. The WPA even took over the supervision of the programs of gardening and canning along with the school lunches, while the Food Distribution Administration provided the surplus food for the lunches.

In March 1942, the WPA relinquished supervision of all projects. To assist counties in continuing these programs after the WPA's withdrawal, the state department obtained an appropriation of $18,000 from the Legislature for the remainder of the fiscal year. For the following year, 1944-45, the Legislature appropriated $100,000 to aid the counties and $6,500 for the state department to employ a state supervisor of school lunch and to pay other expenses for a new School Lunch Division.

In June 1946, Congress passed Public Law 396, which appropriated funds to help schools maintain school lunch programs. The funds allotted to West Virginia were channeled through the state department. As the responsibilities of the School Lunch Division increased, the state appropriation increased until it was able to take over the complete supervision of the lunch programs in 1947-48. By this time, the division had four assistant supervisors and additional clerical help.

In 1954, following an act by Congress making federal funds available to the states for promoting the use of whole milk in the public schools, this special program became an important phase of the West Virginia school lunch program. The state school lunch staff was responsible for its promotion.

Beginning in 1947, the division inaugurated a series of workshops for county supervisors, teachers, cooks, and other county personnel working in the program. These workshops became an annual activity. In-service and preservice training programs designed to improve the professional level of all school food service personnel were developed in cooperation with county boards of education during the period 1960-65. During the 1966-67 school year, the school lunch branch worked with the Bureau of Vocational Education in developing and initiating adult education programs for school food service personnel (29).

School Plant Planning

During the 1942-44 biennium, the state department employed John E. Marshall as supervisor in the Division of Surveys and Schoolhouse Planning. By the next biennium, he was director of the Division of Research and Schoolhouse Planning, which in 1949 was divided into research and school plant planning. A publication entitled Standards for Schoolhouse Construction (30) was published in 1945 and revised for distribution in January 1951.

The state department did not have a specialist in school plant planning from 1955 to 1958, when the National Defense Education Act enabled it to employ a director in this capacity.

In 1960, the state department published the Handbook on Planning School Facilities (31). In 1962, the division cooperated in a federally sponsored inventory of the state's school facilities. The data gathered by this study formed the basis for a perpetual inventory of school plant property which has since been maintained.

During the school year 1966-67, the division renewed its participation in the annual Interstate Building Conference conducted by George Peabody College for Teachers.

As required by state law, the division continues to approve plans for school building, construction, and repair throughout the state. The extent of this work is reflected in the fact that during 1966-67, 97 sets of plans and specifications for new construction, additions, or renovations were reviewed and approved.

Surplus Property

In July 1945, the state department created a Division of Surplus Property to locate and obtain surplus property from the armed forces for the state's schools. During the following biennium, the division secured surplus property valued at $1,718,000 for the vocational and high schools in 55 counties, the colleges, and other eligible organizations.

The Legislature enacted a law, effective in June 1949, designating the State Department of Purchases as the sole agency in West Virginia authorized to receive and distribute property available for educational purposes. Thus, in June 1950, the Division of Surplus Property ceased to exist. But during the period from July 1945 to June 1950, the division had distributed surplus property valued at nearly $4 million.
VOCATIONAL EDUCATION

In February 1917, President Woodrow Wilson approved the first National Vocational Education Act (Smith-Hughes), and in May 1917, the West Virginia Legislature passed an act accepting its provisions and benefits. The acceptance act designated the Board of Regents—after 1919, the Board of Education—as the State Vocational Board to carry out the Smith-Hughes Act in West Virginia.

From 1900 to 1946, the state superintendent served as president of the State Vocational Board; after 1946, he was a member of the board and its executive officer. Thus, from the beginning, there was a legal connection between the state board and the state department through the state superintendent. This connection was not always a close one, depending on how the state superintendent, the board, or the vocational personnel viewed the association.

The Smith-Hughes Act appropriated funds to enable the states to promote the study of agriculture, home economics, trade and industrial education, and for training teachers in these fields. Subsequent additional appropriations by Congress for vocational education, such as the George-Barden Act of 1946 which added distributive education, resulted in considerable expansion of vocational education programs. Thus, the state board appointed a director of vocational education, supervisors in the different fields, and office personnel to help it carry out its responsibilities.

The first allotment of federal funds to West Virginia, $21,722, came in the 1917-18 school year. Four members of the West Virginia University faculty agreed to help the state board inaugurate classes for adult farmers, tradesmen, homemakers, and other adults.

Beginning in the year 1921-22, the Legislature appropriated $25,000 for vocational education and increased the amount until it was $970,067 for 1964-65, including $500,000 for the area vocational education program.

As more federal and state funds for vocational education became available, the duties and responsibilities of the Division of Vocational Education increased proportionately. From time to time, special funds became available—adding to the personnel's work load—for food preservation, training war production workers, and various training programs for World War II and Korean veterans.

The George-Barden Act of 1946 added distributive education as an area qualifying for federal support. The most significant recent development in vocational education resulted from the National Vocational Act of 1963. This act focused attention on the needs of individuals such as (a) the unemployed youth, (b) the high school dropout, (c) the disadvantaged individual, and (d) the displaced worker.

By 1964, vocational education was administered by the Bureau of Vocational, Technical, and Adult Education, reflecting the Vocational Education Act of 1963. In addition to the bureau head, this bureau also employed supervisors of trade and industrial education, technical education, vocational agriculture, vocational home economics, and distributive education as well as supervisors of area vocational programs and area redevelopment training.

The 1967 Legislature authorized a study of vocational, technical, and adult education by the Joint Committee on Government and Finance. This study was prepared under the direction of the Bureau of Vocational Education and Joseph T. Nerden of the Department of Industrial and Technical Education of North Carolina State University. The report was completed in 1968 for presentation to the 1969 session of the Legislature. It projected the need for vocational education throughout the state and recommended, among other things, a considerable expansion of vocational education at the secondary school level; occupational education for post-high school youth; creation of a coordinating council for all aspects of vocational education in the state which would be advisory to the West Virginia Board of Education; an increase in adult basic education programs; and additional emphasis on the development of a statewide system of area vocational and technical schools (32).

Vocational Rehabilitation

In April 1921, the Legislature provided for cooperation with the U.S. government in the vocational rehabilitation of the physically disabled citizens of the state. The law authorized the state board to organize a Division of Rehabilitation. The following year, in 1922, the division was organized within the State Department of Education with State Director J. F. Marsh assisted by five special agents.

From 1922 to 1933, Marsh served as director, being replaced in that year by the assistant state superintendent of schools, who remained in that position until 1945 when the Legislature passed a vocational rehabilitation act making the organization a separate unit of the state board instead of a division of the state department.

Veterans Education

During the 1944-46 biennium, the state department established a Division of Veterans Education with H. L. Duncan as director. It was charged with the responsibility of assisting school administrators, supervisors, and teachers in organizing their programs to give maximum opportunity to returning veterans who wanted additional education and training. It also was required to approve establishments offering on-the-job training to returning veterans.
In 1946, 16 field representatives were employed to handle the inspection, approval, and supervision of on-the-job training. In the same year, D. F. Cronin became state supervisor of the program.

The education and training program for World War II veterans ended July 1956. However, in 1952, the Korean GI Bill had been enacted by Congress, and, as in preceding years, the Division of Veterans Education and Training was the approval agency under contract with the Veterans Administration.

The work of this division increased dramatically under the impact of the Vietnam conflict, which resulted in the passage by Congress of Public Law 90-77 relating to education of veterans of this war. In 1968, the Division of Veterans Education and Training, in addition to the director, was employing three field representatives to supervise the education of Vietnam veterans.

Special Education

The state department inaugurated a program of teaching homebound crippled children in 1941. The Legislature appropriated $22,500 for 106 teachers to care for 320 children in 32 counties. By the end of 1946, the number of homebound children taught was 278, and in 1951 it was 530, including a small group of mentally handicapped. There were then 19 full-time and 176 part-time teachers employed in 40 counties, and the state appropriation of $60,000 was insufficient to meet the demand.

The 1955 Legislature appropriated $100,000, including the salary of a state supervisor of special education, for programs for exceptional children. The programs initiated or continued during the years immediately following included the physically handicapped and mentally retarded children placed in special classes and home instruction services for children too handicapped to attend classes. The department, in 1956, held a series of workshops for teachers of the deaf and blind, the physically handicapped, and for the mentally retarded. By 1960, 48 counties were participating in special education programs. Programs provided included psychological evaluations, special class programs organized according to need, home instruction programs, a telephone instruction program, a program for the blind and visually handicapped, and an excess cost program which provided special equipment not ordinarily found in regular classrooms.

Title I of the Elementary and Secondary Education Act, which was implemented in the state in 1966, provided additional funds for special education. During that year, 32 new special classes for mentally retarded were added to those already in operation under other funding. In addition to programs previously mentioned, county systems were providing 17 speech and hearing therapists or correctionists, and the department was administering a grant program for preparation of professional personnel in the education of handicapped children under the provisions of Public Law 85-926 and Public Law 88-164.

The Comprehensive Educational Program

During the period 1955-1960, the department designed a proposal to encourage local school systems to go beyond minimum requirements in the provision and operation of educational programs. This proposal, designed to stimulate greater financial effort by the counties and referred to as the "Incentive Plan," was presented in a report to the Governor and Legislature in 1958. The basic feature of this plan provided for state matching of local funds raised for education over and above those which could be secured by applying the regular levy rates to existing valuations. The proposal sought to stimulate higher property valuations. To qualify, a local educational agency would be required to present a 5-year plan of program improvement contemplated with these added funds. Implementation of the proposal required a legislative appropriation of $12 million in addition to the regular appropriation of school aid under the formula then in effect.

Although the Incentive Plan was never implemented by the Legislature, the incentive concept remained very much alive. State department personnel, as well as many county school administrators, were convinced of the necessity for some such approach of raising the quality of local educational programs. With the enthusiastic support of the county school superintendents, the department designed a somewhat similar proposal known as the Comprehensive Educational Program, which was submitted to the 1965 Legislature.

This proposal received a more favorable reception. The 1965 Legislature amended the code by adding a new section relating to a comprehensive educational program and providing financial support for it. Essentially, this was an innovative incentive program providing funds of $1 million for upgrading, diversifying, and broadening county educational programs beyond minimum requirements. The law stated the following:

The State Board of Education, through the State Superintendent of Schools, shall establish standards and criteria especially designed to guide the development of plans for a comprehensive educational program, or programs; to provide for their evaluation and approval; and for the allocation and distribution of State funds which may be appropriated to assist county school systems to meet additional costs of development and operation of such programs.

The law further required the state superintendent to provide assistance to counties in developing and preparing their plans for a comprehensive education program to ensure that every county would have the opportunity to
fully participate and receive its maximum share of the available funds.

The state department assigned this program its top priority to fulfill the responsibility placed upon it by the law. By 1966, 65 subject or service area plans had been approved or were on file in the state department committing counties to progress toward the Comprehensive Educational Program goals. Much of the state department's work was in helping local administrators and teachers implement their plans.

The department continued to request greater financial support to permit complete implementation of the Comprehensive Educational Program, but through 1968 the level of funding remained at $1 million annually.

EMERGING ROLES OF THE DEPARTMENT

Administration—Services—Leadership

The preceding sections indicate that the West Virginia Department of Education has evolved from a one-man operation to an organization large enough to be divided into a number of divisions, each with a professional staff consistent with its responsibilities. While this evolution has occupied approximately a century, it has accelerated rapidly in recent years. For example, the professional members of the department numbered 19 in 1946 (35); by 1961, members had been added requiring a reorganization into bureaus (36); and by 1966, the department listed 86 professional positions, although some of them were vacant (37). A number of factors are responsible for this transition, among them an increase in school population, the consolidation of school districts in 1933, and the rapid shift in financial support for education from the local district to the state level. This shift stemmed largely from a constitutional amendment voted in 1932 which limited the tax rate that could be levied on all classes of property.

It is probable, however, that the most significant developments in the department have resulted from changes in philosophy as to the role which the department should play in the overall educational operation of the state.

In general, the department, during the first 50 years of its existence, was concerned with discharging administrative and regulatory functions. These included such activities as collecting data for the state superintendent's annual report, distributing state funds which were negligible when compared to current state financial support, certifying teachers, interpreting legislative acts and state board regulations, and making sure that local school agencies complied with them.

It was not until the period from 1920 to 1930 that the department began to devote significant amounts of time to the service function. In this period, teacher certification by examination showed a rapid decline, and the department began working much more closely with the colleges in developing procedures for certificating their graduates. In this decade also, the first broad survey of public education was conducted by the department. In the decade 1930-40, supervisory services from the state level were provided in the school lunch and pupil transportation programs, and the first regular department bulletins were issued. Departmental services in the areas of school plant planning and surplus property administration were not initiated until after 1940.

Although the department gradually devoted an increasing proportion of its time and energy to service activities, it continued to discharge its administrative and regulatory functions. This assumption of an expanding service role naturally resulted in the addition of departmental personnel and some revisions in departmental structure which are reflected in the personnel listed for the department in the reports of the state superintendent from about 1925 to 1950.

Even while the service function was assuming a dominant position in the work of the department, a third category of departmental activities was beginning to emerge. Naturally, from its inception the department had been discharging some functions which involved leadership, but real emphasis on the assumption of a leadership role is not apparent until about 1950. The first actual evidence that the department recognized leadership as a major rather than an incidental function appeared in the 1961 report of the state superintendent (38). Recent developments indicate that the department, while continuing to discharge its administrative and regulatory functions and to assume an increasing load of service responsibilities, now considers its primary role to be that of educational leadership. This recognition may be illustrated best by recent trends in selected departmental activities such as regional organization, supervision and curriculum development, administration of federal programs, and educational planning.

Regional Organization

To ensure closer contact with the counties, the department encouraged county superintendents and their staffs to meet in regional groups which would facilitate the maintenance of a face-to-face relationship with department members. This movement began to operate on a somewhat informal basis in the decade 1930-40. By 1948, county supervisors of instruction were meeting in six regional groups (39); and by 1951, secondary school principals also were beginning to meet on a regional basis (40).

About 1958, the department, the state-supported colleges and universities, and the county superintendents agreed on a regional organization based on seven regions, each of which would include at least one of the state-supported colleges. Each of these regions was provided with a coordinator whose salary was paid jointly by the institution and by the department (41). This plan was not completely
implemented in the first 2 or 3 years of its existence because of the difficulty in attracting properly qualified personnel.

These coordinators provided liaison among the department, the colleges, and the public schools and were particularly concerned with in-service education of teachers and project planning with emphasis on federally supported programs. Working with the coordinator in each region after 1965 was a specialist for projects under Title I of the Elementary and Secondary Education Act.

**Supervision and Curriculum Development**

A survey of reports of the state superintendent indicates that the department has been concerned over a long period of time with supervision and curriculum development. As counties employed additional staff to provide supervisory services, the department initiated two statewide workshops per year to give in-service experiences for such personnel. One of the products of these workshops, which began about 1945, was the establishment of standards for graduate preparation for supervisors. These workshops also devoted considerable time to curriculum development. Emphasis during this period was on the concept of a grade 1-12 continuum, and the curriculum materials developed reflected this concept.

During this period, the department did not have adequate staff to provide more than nominal supervision from the state level. Significant supervisory services by the department did not materialize prior to 1958, when the National Defense Education Act was passed by Congress. Title III of this act financed supervisory services for science, mathematics, and foreign languages.

The Comprehensive Educational Program previously referred to, which became effective in 1965, along with the Elementary and Secondary Education Act enacted in the same year, provided opportunities to expand supervisory services at both the state and local levels. Although subject area specialists had been employed on a limited basis as early as 1958, the number of such personnel expanded substantially after 1965, until the services of 12 such specialists were available on a statewide basis in 1968. A list of the curriculum materials prepared and distributed in any one of a number of recent years reflects the contribution of federal support to the supervisory services offered by the department.

**Administration of Federal Aid to Education**

Reference was made in a preceding section to the significant impact of the National Defense Education Act on instruction in science, mathematics, and foreign languages under Title III of the act. Title V provided for expanded guidance and testing services, and the department took full advantage of these provisions. At the end of the first year of operation under this title, 1960, two assistant supervisors had been added to assist the guidance director. Staff activities during that year included the implementation of county plans for guidance services, publication of professional materials, coordination of a statewide testing program, and conducting of college orientation and related programs.

Title X of NDEA was concerned with the development and improvement of statistical services in state departments. Financed by state funds and by federal funds available under Title X, a study of statistical services of the department was authorized in 1956 and completed in 1961. This study was conducted by the Bureau of Educational Field Services of Miami (Ohio) University. As an outgrowth of this study, a Division of Data Processing was organized and a supervisor employed in 1961. This division was concerned initially with teacher education and a certified list of teachers, and the high school testing program. The department secured a computer in 1966 and initiated a 5-year plan to establish a broad educational data base to meet the demand for information required for effective planning and decision making.

The Elementary and Secondary Education Act was implemented by the department in 1966. It was found necessary to expand the staff significantly to administer Titles I, II, and III, the last of which was on a regional basis under a state department director. The categorical nature of these titles required extensive leadership and direction by department staff in the development of acceptable programs by local agencies and in the approval of educational materials to be purchased. Directors for Titles I, II, and III were employed in the school year 1966-67. A director for Title VI was hired in 1968.

Some of the more significant developments in the department resulting from the Elementary and Secondary Education Act were made possible by Title V, which had as one of its purposes the strengthening of state departments. Under the provisions of this title, three new staff positions, responsible directly to the state superintendent, were created. These were a director of educational planning, director of educational research, and coordinator of higher education and public schools. A fourth new position, responsible to the assistant superintendent for instruction, a coordinator of student teaching programs, also was financed under Title V. In addition to these new positions, staff or equipment was added to strengthen the school plant planning, data processing, publications, educational television, audiovisual education, and professional library services divisions.

**Educational Planning**

The Office of Educational Planning, which was created and staffed in 1966, was given as its first assignment an examination of the structure of the department in relation to its administrative, service, and leadership roles. During
the initial year of its operation, this office carried out this assignment and, with the help of all units in the department, produced a plan for departmental organization, administration, and services. This tentative plan was discussed in detail by members of the planning office with administrators in selected counties, and their reactions to the work of the department were noted. These reactions became the basis for recommendations to the state superintendent relating to changes in departmental structure and activities.

The planning office in 1967 participated in a multi-state study (administered by the state department of Utah) of comprehensive educational planning by state departments and produced a model structure for the planning process. During the same year, the Governor appointed a statewide planning committee, and the Office of Educational Planning participated in the work of this committee, especially with respect to educational planning.

The department, under the leadership of the planning office, initiated in 1967 a study of educational goals for the state. This study resulted in the formulation of a list of 23 general goals. To assess the present status of the state in regard to each goal, the office contracted with the Human Resources Research Institute of West Virginia University to reduce these general goals to their component parts in performance terms. It was expected that this process would require some months but, once completed, would provide the framework for much of the functioning of the data-processing division. The department regarded an accurate assessment of the present status as essential for long-range planning of programs in general and for state administration of Title III of the Elementary and Secondary Education Act and of the Education Professions Development Act in particular.

On the basis of the educational goals established, the self-evaluation of the department, the reactions of the county administrative staffs, and the assessment of status, the department in 1968 prepared a series of proposals to be presented to the 1969 session of the Legislature.

A FORWARD LOOK

Seen in historical perspective, the present status of the State Department of Education seems to make it reasonably certain that the work and structure of the department will continue to experience change although not necessarily at the accelerated rate of recent years. It is much more difficult to judge the nature and direction of changes which the future may bring. But discernible trends which show no sign of abating make certain predictions reasonably safe. Other developments may occur because of economic and sociological pressures even though no trend has been established. Some of the areas in which future developments seem most likely to affect the work of the department are (a) size of administrative units, (b) relationship with other governmental agencies, (c) span of the individual’s life for which educators must plan, (d) the nature and organization of the curriculum, (e) the impact of federal participation, and (f) staff administration.

Size of Administrative Units

The fact that there are only 55 school districts in West Virginia has enabled the state to provide programs and services not available to many students before the adoption of the county as the unit of school administration. Yet, the fact remains that there are too many small schools operating in the state to permit the most effective programs. The political boundaries represented by county lines are not consistent with economic boundaries and often inhibit desirable school consolidation and the improved educational programs which larger units make possible.

It was to provide better services to counties that the state department encouraged the voluntary cooperation of county school systems through regional centers. In many respects, these regional operations have proved quite satisfactory, yet there is a limit to what can be accomplished on a voluntary basis, and legal restrictions make the financing of regional projects quite complex.

Some responsible public figures have gone so far as to advocate the amalgamation of county school units into one state-financed and state-controlled system. In view of the traditional attitude favoring local control of and participation in educational policy making, it is not likely that a statewide system will develop in the foreseeable future. Yet, there seems to be a growing sentiment for legislation which would create larger units, and the department has consistently encouraged this concept. When and if such a development occurs, the department will need to exert strong leadership in the development of programs appropriate to the larger units.

Relationship with Other Governmental Agencies

The necessity for a closer working relationship with other governmental agencies has become increasingly apparent. One of the key words in education today is “planning.” Effective educational planning cannot take place in isolation: It requires information in regard to projected economic developments, demographic studies, public health figures, and communications data. Not only must educational plans consider developments in these areas, they will be affected and conditioned by them and predicated upon them. Even now, it is difficult to distinguish between education and public welfare in the administration of Title I of the ESEA or between education and public health in the administration of Title VI.
Another factor which will necessitate a closer working relationship with other agencies of government is the rising cost of public services. The tax dollar can be stretched only so far, and educators must keep an open mind toward duplication of services where such duplication can be effectively and economically eliminated. The sharing of facilities, equipment, and even personnel is a possibility which the various agencies cannot afford to ignore and which must be considered in long-range planning.

Span of the Individual's Life for Which Educators Must Plan

The traditional concern of the department has been limited primarily to programs for grades 1-12. There has been increasing public interest in state-financed programs for preschool children, and there is good reason to believe that the next Legislature will endorse at least pilot preschool programs in each county of the state.

At the other end of the continuum, programs of adult basic education are being expanded, as are programs of vocational, technical, and adult education for the non-college-bound person, and the schools are increasingly accepting responsibility for retraining the unemployed.

These developments have tremendous implications for the department in regard to developing programs for training teachers for preschool and adult education programs, for supplying adequate supervision, and especially in regard to the effect that financial support of these added segments will have on the support available for the more traditional grades 1-12 programs.

The Nature and Organization of the Curriculum

While curriculum studies seem to be in operation almost continuously, the number of basic curricular changes scarcely seems proportionate to the volume of such studies or the time and effort which have been involved. The projected development of preschool education programs will doubtless call for some curricular revision. But the major changes will probably concern the somewhat unbalanced relationship between general or cultural education on the one hand and vocational education on the other. Studies already conducted indicate the desirability of more vocational offerings at the high school level in view of the percentage of high school graduates who do not enter college.

The organization of the curriculum is also being questioned on many fronts. Few educators have been satisfied with the product of the junior high school, and such deviations as the middle school are being studied. There is also much difference of opinion as to the most desirable organization of post-high school programs. Some favor state-supported junior colleges, some advocate state-supported area vocational schools, and others feel that the operation of thirteenth- and fourteenth-year programs as a part of the county school system is the best approach. This is an area in which hard decisions have been postponed, and the department will need to give leadership when the day of decision arrives.

The Impact of Federal Participation

Participation in state and local educational programs by the federal government through the provisions of the National Defense Education Act, the Elementary and Secondary Education Act, and the National Vocational Education Act has already produced significant changes in state department administration. The categorical nature of these acts has doubtless served worthy purposes which were concerns of Congress, but it has resulted in a heavy work load for state departments in the preparation of state plans and projects and in the financial accounting required.

There is little question that federal aid to education is here to stay. The real questions for the future relate to the nature of federal programs and the extent to which Congress may be willing to underwrite them. While there has been considerable expression from school administrators in favor of general rather than categorical federal support, belief in the philosophy of categorical aid is strong in the minds of many Congressmen. There is much reason to believe that the federal aid of the future may be based on a combination of general and categorical programs. Either approach will require the services of a substantial segment of the department's staff, but the categorical approach may hold more promise of financial support for departmental operation.

Staff Administration

The tendency of the state department staff to expand, which has been particularly strong since the advent of large-scale federal aid programs, is likely to continue. Continued growth will demand a more sophisticated system of staff administration than has been necessary in the past.

It is likely that a separate bureau or division of personnel administration will eventuate. This unit will find it necessary to anticipate personnel needs in the light of developing programs and to engage in an aggressive and systematic program of recruitment. The unit also must be concerned with in-service training programs consistent with the administrative, service, and leadership roles of the department.

The personnel administration unit naturally will be concerned with the establishment and maintenance of personnel standards, staff organization, promotion policies, and the whole field of staff welfare and benefits. It goes without saying that the staff of this personnel unit must be trained and experienced in personnel administration.

APPENDIX A—WISCONSIN CHIEF STATE
SCHOOL OFFICERS 1388
APPENDIX B—ORGANIZATION CHARTS 1389
APPENDIX C—TABLES 1392
The first legislation to affect education in what later became Wisconsin was the Ordinance of 1787, passed by Congress to guide the establishment of the new Northwest Territory. The document contained the now famous statement: “Religion and knowledge being necessary for good government and the happiness of mankind, schools and the means of education shall be forever encouraged”(1). Actually, education was already important to the people who settled in Wisconsin; even before the Northwest Territory was formally organized, the pioneers had built schools in several communities scattered throughout the region.

These early attempts to provide education for Wisconsin’s youngsters were entirely local and reached only a small number. Anyone who could be induced to teach was pressed into service. The buildings can only be described as rustic; they usually were constructed of logs, though a few were built of brick or stone. Curtain less windows frequently were placed so high that only the teacher could see out—at least eliminating one source of distraction for the pupils. State Superintendent Azel P. Ladd described the typical schools of 1853 as—

Mean murderous things. Often I have found them located in close proximity to a swamp or marsh, where the children, in the summer session, could recreate themselves in the two-fold and interesting employment of catching tadpoles and the fever and ague (2).

The Wisconsin Territorial Legislature enacted in 1839 the first law relating specifically to the organization of common or elementary schools in Wisconsin, patterning it after the school laws of Michigan. Wisconsin had been part of the Michigan Territory until 1836, and when Michigan entered the Union, the new Territory of Wisconsin kept many of the provisions that had been in effect in Michigan. As the territory’s population grew, chiefly as a result of the discovery of valuable lead deposits in the southwest, a patchwork quilt of local autonomous schools developed. The need for some kind of supervision and coordination among these independent schools was obvious. The Territorial Assembly discussed the possibility of creating a central board of education to solve this problem, and a bill was finally introduced “to establish a state board of education and the office of state superintendent of public instruction and to prescribe their duties”(3). It passed the lower House but was defeated in the Council (the upper House) by a single vote.

Michael Frank, the assemblyman who had introduced the bill, still hoped to establish a free public educational system for the entire territory and asked the Legislature to allow him to try out the idea in Southport, his home community. In 1845, the Legislature authorized the village of Southport—now the city of Racine—to collect taxes for the support of a public school, provided the citizens of the community voted in favor of the plan. In an effort to defeat Frank’s proposal, the antipublic-school forces, especially the large property owners in the Legislature who favored private schools and academies, persuaded the Legislature to set the date of the election only 2 months ahead. Frank fought back, working diligently to convince his Southport neighbors that the school was needed. He editorialized in his paper, the Telegraph; he wrote and distributed pamphlets; he made speech after speech. In the end, his dedication and work paid off: The referendum passed in April 1845 by 11 votes, and the territory had its first free public school (4).

Three years later in 1848, when Wisconsin entered the Union as the thirtieth state, its new constitution stipulated:

The supervision of public instruction shall be vested in a state superintendent and such other officers as the legislature may direct. The state superintendent shall be chosen by the qualified electors of the state in such manner as the legislature shall provide. His powers, duties, and compensation shall be prescribed by law. Provided, that his compensation shall not exceed $1,200 annually (5).

Although the constitution did not deal specifically with the question of a statewide board of education, its requirement that the state superintendent be elected by the citizens reflected the people’s basic conservatism in matters of
education, arising in large measure from a history of nearly 200 years of independent and locally controlled schools.

When the first State Legislature convened, it decided that the state superintendent should be elected on a partisan basis for a 2-year term at a salary of $1,000 per year, should have general supervision over the common schools, and should apportion financial aid to the various schools. The responsibility for distributing funds grew in the twentieth century to be one of the superintendent's most important powers, for as education became more elaborate and expensive, schools needed more money to improve their offerings. By 1900, various laws allotting state aid to education made the granting of such aid conditional on whether the school's expenditures met the requirements of the state superintendent. All Wisconsin laws passed since 1910 bearing on educational programs or financial aid to schools have tied the allotment of aid to the superintendent's approval of a school's program. Thus, by controlling the purse strings, the state superintendents have played a decisive role in inducing Wisconsin's schools to improve themselves.

The public schools in Wisconsin initially were supported by a common school fund sustained by the proceeds from land sales. According to an act of Congress in 1825, the sixteenth section of each township was set aside when a state entered the Union and the money realized from its sale used to support the public schools. This netted Wisconsin 66,731 acres in 1848 when it became a state. In addition, the federal government had granted over 700,000 acres of land to the state in 1840 and 1841, making a total of nearly 2 million acres. The income from this fund was distributed to the towns and cities "in just proportion to the number of children and youth residing therein between the ages of four and twenty years." In turn, the communities were required to collect taxes equal to the amounts they received from the common school fund.

Unfortunately, the administration of the school finance program had many failings. Because of greed, graft, mismanagement, and simple ignorance, in many years the amount available for distribution was less than 50¢ per child. However, in the early 1850's, each pupil could be educated for only $2.26 per year, according to the state superintendent's financial report for 1855. The common school fund still exists today, and the interest from it is used to buy books and supplies for the public school libraries.

From the time of statehood until 1900, the state superintendents gradually gained influence and became more effective in dealing with the schools. The office also accumulated a professional staff, which comprised the State Department of Public Instruction, to help handle the myriad problems that developed during these 50 years.

Town superintendents originally were entrusted with the task of certificating teachers, but by a law passed in 1861, the Legislature turned this responsibility over to the county superintendents. This resulted in a certain amount of centralized authority over the quality of teaching, but the trend did not continue to a point where certification became efficient. The state had 71 counties, none of which accepted a certificate issued in any other county. Since the requirements for certification varied at the discretion of the county superintendent and generally were far from rigorous, the problem of differing requirements also plagued teacher training. Thus, despite the change from local to county certificating, teacher certification was still unwieldy and confusing.

The Legislature passed an act in 1875 authorizing public high schools to be established with aid from the state up to a maximum of $500 per year. The result was a rapid increase in the number of high schools throughout the state. Unfortunately, standards for certificating high school teachers had not been set, and in some counties it was possible for a person with no more than an eighth-grade education to teach high school students. By 1900, the situation had improved somewhat, for the state superintendent had been given the power to deny state aid to schools that employed a principal or an assistant principal who did not have a state certificate or a diploma from a college, university, or normal school. But teachers in the high schools still were not required to hold such diplomas or certificates.

Furthermore, no provisions had been made for supervising the high schools. Although the responsibility for inspecting the schools and determining which ones were entitled to state aid fell to the state superintendent, the Legislature refused to allot sufficient funds to enable him to do the job. However, the lawmakers finally stipulated that the superintendent could "call to his assistance a man to the vacant position, but it realized the advantages of being able to supervise state high schools and quickly named a man to the vacant professorship. The university continued to inspect, supervise, and accredit high schools until 1913, even after funds had been appropriated for the superintendent to employ a high school inspector in his department.

In addition to the problems of building quality schools and training qualified teachers, the state faced several special situations before the turn of the century. One of these was the question of sectarian instruction in the public schools. It had been the custom ever since territorial days to read portions of the Bible as a regular part of the daily program. A problem arose when the parents of several Catholic children in the town of Edgerton objected to use of the King James version of the Bible on the grounds that it was sectarian education. The case eventually came before the State Supreme Court, which decided that Bible reading as it was being practiced at that time was in violation of the constitutional provision for
separation of church and state—no matter what version of the Bible was used.

Another area of concern was education for handicapped children. As early as 1885, the Legislature gave the state superintendent power to authorize any village or city board of education to set up and maintain a school for handicapped children. At the same time, a private school board of education to set up and maintain a school for capped children. As early as 1885, the Legislature gave the Bible was used.

separation of church and stateno matter what version of education.

have sufficient time to develop programs and to leave the only 2 years. Now, once elected, the superintendent would provided that the state superintendent should be chosen at the spring election on a nonpartisan basis for a 4-year term. The turnover in men holding the office of state superintendent indicates the difference in these two periods. During the first 53 years, 16 different men held the office; during the following 62 years, only 4 served as superintendent. The change resulted from an amendment to the state constitution, ratified by the voters in 1902, that completely revised the section dealing with education. This amendment provided that the state superintendent should be chosen at the spring election on a nonpartisan basis for a 4-year term. Previously the office was a partisan one, and the term was only 2 years. Now, once elected, the superintendent would have sufficient time to develop programs and to leave the imprint of his philosophy and personality on the state's education.

The amendment also directed the Legislature to prescribe the superintendent's powers and duties and define his qualifications. Another important provision gave the Legislature the authority to determine the superintendent's salary—which had remained for 50 years at $1,200 per year, the level fixed in the constitution (9). This placed the emphasis on talented educators rather than talented politicians and allowed the state to offer a salary competitive enough to attract leading educators to the office.

L. D. Harvey, a forceful leader first elected state superintendent in 1898, was the person most responsible for the constitutional amendment. He was primarily interested in bringing some order and efficiency to the vast number of independent schools and school districts scattered randomly throughout the state. Harvey tried to consolidate school districts, but he was greatly handicapped by the meager funds allotted the department. In fact, his entire staff in 1900 consisted of four professional workers, a chief clerk, and a library clerk. Consequently, he was severely limited in establishing a working relationship with educators in all parts of the state. For the most part, he had to restrict his interchanges to the section in the Wisconsin Journal of Education set aside for the state superintendent to express his views. The Legislature had at least consigned sufficient funds to send one copy of this journal to each school district, in this way enabling Harvey to explain his program to the schools.

Superintendent Harvey seized every opportunity to promote a greater uniformity in Wisconsin's school systems. When the Legislature appropriated $14,000 in 1901 for the county school superintendents to improve their summer teacher-training institutes, Harvey saw his opportunity. He called the 191 institute directors to Madison for 5 days of instruction, thus ensuring some similarity in the way each county conducted its summer program. In addition, the 1901 Legislature finally granted the funds Harvey had requested for his small department to develop a statewide course of study for all the public schools in Wisconsin.

The 1901 Legislature also passed the first important legislation encouraging school districts to combine into multiteacher schools. Harvey had fought hard for this law, which stipulated that any school with two teachers would get an extra $200 in state aid, and each school with three or more teachers would receive $300.

Encouraged by the support he was now receiving from the lawmakers, Superintendent Harvey declared war on the one-room schools. He stated his case in a report to the 1902 Legislature:

This age is rightly termed the age of progress. We see evidence of it on every side. In rural communities the crude log houses have given way to comfortable and commodious dwellings. The ramshackle buildings in cities have been replaced by stately stone mansions and towering edifices filled with offices and stores. The self-binder and reaper have taken the place of the sickle and scythe. Steam and electricity are annihilating distances and bringing to our doors the favorite products of other countries and other climes.

In education, also, the last few decades have witnessed great progress. The high school, the people's college, is firmly entrenched in the hearts of the American people. Today we have 222 free high schools in Wisconsin. In this one phase of education alone, progress has not kept pace with the improvements in other directions. I refer to the district school. While improved conditions exist as to books, apparatus, and to some extent in buildings, yet on the whole, the rural school ranks very much lower in comparison with other educational institutions than it did 30 years ago (10).

Unfortunately, battles are not won with words alone, and since the superintendent was ahead of his time, he made only slight gains in consolidation.

Harvey's accomplishments reached a climax when his fellow citizens ratified the far-reaching constitutional amendment he had sponsored at the general election in
November 1902. At the same time, they voted for a state superintendent of schools under the old provisions of the constitution, and it is ironic that Harvey was not on the ballot; he had failed to get his party's nomination.

YEARS OF CONFLICT

C. P. Cary, the most colorful and controversial man ever to hold the office, won the election and became the new superintendent of schools. A fighter, he was engaged in stormy conflict during most of the 18 years he served, and several of these battles had considerable influence on later events in education. Even before his first term ended in 1905, Cary had provoked a number of people and had gained several enemies. Many people urged Harvey to run for state superintendent once again, but he declined, saying: "I am sure that if I am a candidate, powerful influences will be brought to bear through political organizations to control the action of voters at the polls" (11). Harvey added that he felt it was more important to establish the principle of a nonpartisan superintendency than for him to be again elected to the office.

Although Cary was not especially concerned with consolidation, which had been Harvey's prime objective, he did support during his term a bill offering state aid to school districts that closed their schools and transported pupils to other districts. Wisconsin needed to expand and develop its high schools from 1900 to 1920, so Cary found it necessary to devote considerable time and effort to this problem. The first real controversy erupted in 1909 following the introduction of a bill designed to give the state superintendent exclusive jurisdiction over the supervision of the state's high schools. Cary was strongly opposed to the University of Wisconsin's role in supervising and accrediting high schools, and he actively backed the bill. But the Legislature refused to accede to his wishes—perhaps in part because one of the legislators most enthusiastic about the proposal died before it could even be voted out of committee.

Undaunted by this setback, Cary continued to question the right of the university to exercise jurisdiction over the high schools. His perseverance and unrelenting pressure were finally rewarded in 1913, when the Legislature appropriated funds for Cary to employ sufficient personnel to supervise the schools adequately. His biennial report for the 1914-16 period states:

The [high] schools have fought themselves free, to a large extent, from college and university domination so that they are now able to study their own needs and to operate the schools as to be of largest benefit to the largest number, instead of making the one end and aim of the school preparation for college and university (12).

In the meantime, while Cary concentrated on gaining supervision over the high schools, another problem was developing. Although the number of high schools was increasing rapidly, a compulsory attendance law passed in 1907 gave them a great spurt in enrollment. Youth who had little desire for higher education and could never hope to attend college were now forced to attend high schools catering to the entrance requirements and dominated by the shadow of the University of Wisconsin. Educators and laymen joined to demand a better education for the vocationally inclined. As a result, manual training, home economics, and commercial subjects were introduced into the curriculum (13), and pressure from both business and labor leaders prompted the Legislature to pass a law allowing cities to establish trade schools. Milwaukee promptly took over a private trade school and became the first city in the nation to offer public vocational training.

By 1909, there was even a greater need for a more adequate industrial education program, so the Legislature appointed a study commission to recommend improvements in its legislation. Two years later, the commission presented its report, and it was written into a bill. Since the bill would create a separate State Board of Industrial Education, Superintendent Cary was seriously disturbed by it and managed to influence the form in which it finally passed. The compromise version gave the state superintendent the authority to appoint the director of the board, and the wily Cary designated one of the assistants in his own office as the director, thereby remaining in control of the state's vocational education program (14).

The industrial education board and Cary constantly fought until finally, in 1917, the Legislature amended the law to allow the members of the board to select their own director and set their own policies. This only added fuel to the fire, and the incessant struggle set the stage for the dual system of public education that exists in Wisconsin today. Cary was particularly vitriolic in his statements concerning the board: "America is not ready for a peasant class of schools, or for separate and independent schools for laboring classes. ... They [the board] want a caste system" (15). He elaborated his views before the National Society for the Promotion of Industrial Education in 1919:

"I have always contended that a board of education in anything larger than a city ... is entirely incompetent and inadequate to deal with the situation" (16). He claimed the members of the industrial education board "did not know whether they were afoot or on horseback" (17).

Since Cary's day, the type of student enrolling in the vocational schools has changed greatly, but the schools have remained under the supervision of an independent board of adult, technical, and vocational education.

Meanwhile, Cary had found a new opponent. In 1915, the Legislature created the State Board of Education to control the financial affairs of all state educational agencies. Cary recognized the threat this board posed to the
superintendent’s traditional control over the state’s educational purse strings. He took the position that it had no jurisdiction over the state superintendent, a constitutional officer, and refused to comply with any of the board’s requests for information.

This lack of cooperation between the state superintendent and the secretary of the state board was particularly unsettling. When the secretary, Edward Fitzpatrick, wrote to Cary asking for “long-range suggestions for the educational program in Wisconsin” (18), Cary refused to furnish any details and replied: “When the proper time comes I shall be glad to give such support as lies in my power to any proposed legislation by the State Board of Education that seems to me at that time to be worthwhile” (19). The differences that developed between these two men were one of the reasons Cary was defeated for reelection in 1921, but he did not suffer his loss of prestige alone—the state board itself was abolished 2 years later (20).

Cary had used the statewide curriculum initiated by Harvey as a tool to strengthen the superintendent’s control over the schools of the state. Since all legislative acts after 1910 that dealt with curricular offerings or state funds made the receipt of aid dependent on whether the school met requirements outlined by the state superintendent, a school that wanted to receive financial assistance would have to comply with the guidelines set up by the state department.

But there were other problems. In 1899, a law had been passed establishing county normal schools to train elementary teachers. A few years later, the Legislature enacted a law that offered aid to school boards in counties without normal schools to create teacher-training courses in the high schools on approval of the state superintendent. So by 1913, Wisconsin had state normal schools, county normal schools, and high school teacher-training departments, all preparing students to be elementary teachers. It was clearly a case of furnishing quantity rather than quality, especially for the one-room rural schools. The courses of study in these state and county normals and in the high school training departments varied greatly, each school appearing to be a law unto itself. With such diversity, supervision and coordination of teacher preparation were badly needed.

In 1915, Cary’s staff included only five elementary supervisors—two assigned to inspect state graded schools (21), two to supervise city schools, and one to inspect rural schools. Comfortable classrooms were still in the future, and the supervisors had to emphasize the importance of such physical and tangible aspects of the school as heating, lighting, sanitary conditions, water supply, and adherence to the course of study prepared by the department. But as early as 1917, evidence appeared of a change in emphasis toward more intangible factors influencing teaching and learning when the department issued a bulletin entitled Agencies of Supervision, intended as a guide for local administrators and supervisors in carrying out effective administrative programs.

In 1915, the Legislature passed a law that set the stage for marked improvement of education in the rural and village schools of Wisconsin. It provided for a statewide system of county supervising teachers and required each county superintendent of schools to employ a supervising teacher. The state agreed to reimburse the county for this teacher’s total salary and travel expenses.

In spite of the conflicts that characterized Cary’s tenure as state superintendent, the department was stronger, more effective, and more influential when he left than when he assumed office. The department consisted of only 4 professional workers when Cary was first elected; it numbered 23 when he was defeated (22). His regime had seen the enactment of the first teachers retirement and pension system in the nation, and the department had been placed on a formal budget for the first time in its history.

BEGINNINGS OF CONSOLIDATION

Cary’s years in office came to an ironical end—even as had his predecessor’s. The man elected superintendent in 1921 was John Callahan, Cary’s old nemesis, the former director of the vocational education board. In spite of the personal animosities that might have continued as a result of the Cary-Callahan differences, the department ran smoothly under its new leader. All members of the department’s staff except the superintendent and his deputy are Civil Service employees.

Civil Service has been in effect in Wisconsin since 1905, one of many progressive acts initiated between 1901 and 1906, when Robert M. LaFollette, Sr., was Governor. A department head is often at a disadvantage in competing for able personnel under this system because the salary he can offer cannot exceed the limits approved by the Legislature. But there are advantages as well. The Civil Service is free from political influence or control, and it ensures continuity in the department’s work; there is no complete personnel turnover when a new state superintendent takes office.

Since Superintendent Callahan had spent 3 turbulent years as director of vocational education, he was particularly anxious to develop harmonious relations between the Board of Vocational and Adult Education (as it was then called) and his department. It is to his credit that he accomplished this and much more.

In 1924, Callahan issued a report based on exhaustive surveys of the inequalities in wealth among school districts throughout the state (23). The report, presented to the Legislature, was largely responsible for the lawmakers’ enactment of the Equalization Law of 1927, which came to be called the Callahan Equalization Law. At the time the
Legislature passed this bill, it apportioned the common school fund simply on the basis of school population, and although many amendments have been made to the 1927 law, its basic principle has been retained. For districts that had an equalized valuation of at least $250,000 per teacher employed, the state gave a flat grant based on the number of teachers in the district. For those districts having valuations of less than $250,000 per teacher, the state furnished equalization aid based on a formula that provided increasing amounts for the poorer districts. The money paid to low valuation districts was considered equalization money, and as such, no conditions or limitations on its use were to apply. It was the first such law to be passed by any state.

Despite Superintendent Harvey's efforts, after 1900, the state made little progress in reorganizing school districts. In fact, the situation actually deteriorated. Clever legislators recognized that since the equalization law gave every school district $250 in state aid and each received $250 in county aid—whether it operated school in the district or not—there was nothing to prevent a local board from subdividing its district. The newly formed districts would then send its children to the same school they had been attending all along, but both the new and old districts would be eligible for the grants. Local school officials were quick to take advantage of this loophole and created many nonoperating districts. The equalization law actually subsidized inefficiency and encouraged a proliferation of the already numerous school districts. The problem grew even worse when the rurally dominated Legislature authorized portions of any district outside the corporate limits of a village or city to withdraw and form one or more separate districts. By 1938, the state had 7,408 school districts, 5,809 of which operated one-room country schools.

It was 1939 before the political balance had shifted enough to enable the Legislature to pass bills favoring district reorganization. One such law denied districts the right to operate one-room schools averaging a daily attendance of less than 10 and still receive the equalization aid available to other low valuation districts. It actually provided for all regular state and county aid to the schools to be prorated on the basis of average daily attendance. A second act gave the state superintendent the power to attach districts with less than $100,000 assessed valuations to contiguous districts. Callahan immediately reduced the number of school districts to about 6,600 by this method, but he met stiff opposition at every step.

When the 1941 Legislature held public hearings on bills opposing district reorganization, hundreds of people from all parts of the state flocked to the capitol to express their views. During one of the hearings—conducted before an overflow crowd in the assembly chamber—the speakers, rallying to the support of the "little red schoolhouse," leveled vicious abuse at Callahan. Callahan waited until both sides had been heard before rising to speak. Hisses and catcalls greeted him as he walked to the microphone. He calmly laid his pipe on the rostrum, looked at the audience, and said in a soft and subdued tone, "You folks have called me some nasty names. You called me a 'dictator,' a 'Hitler,' and said other rather unpleasant things about me. Now, my fellow citizens, you know that ain't so." He went on to defend the legislators for enacting the laws encouraging reorganization and pointed out how these bills would provide better education for the children of Wisconsin. He even warned his opponents that he considered the legislation which had already been passed "only the beginning." And when he had finished, he was given a good round of applause. It was the beginning of the end for rural domination of the Legislature and the schools.

The state superintendent continued to emphasize the need for more school district reorganization. He presented facts both to the public and to the Legislature, showing the presence of a definite relationship between the size of a high school and the richness of its curricular offering. Through it all, he kept his sense of humor and the proper perspective. The joining of three districts by their own boards aroused considerable opposition, and an appeal was filed with the office of the superintendent. Callahan ordered a referendum, and the overall area favored consolidation; but one of the high school districts voted against the merger 100 to 1. Callahan accepted the total vote to create a new high school for the combined district.

Residents of the district that had opposed the proposition requested that the superintendent meet with them so they could register their protests. Callahan agreed, and about a dozen persons traveled to Madison to present some rather pertinent arguments against the merger. After all the representatives had spoken, Callahan told them that they were to be commended for their pride in their local high school, "I am sure that if I were a citizen of your community I would be sitting on the other side of this table," he said. "But I am the state superintendent of schools and it is my responsibility to do all I can to assure that all boys and girls of the state have a chance for a good education. My answer to you is no." The spokesman for the group got up and said, "Well, we rather expected that. Come along, John, and have dinner with us." (25).

While the state superintendent was fighting for consolidation and reorganization of school districts, equally important but less dramatic changes were taking place. As part of a program to help local schools improve their instructional methods, the department published 31 pamphlets between 1924 and 1926. These publications, such as Reading Difficulties in Arithmetic and Study of Children's Interests, were due in large measure to the efforts of C. J. Anderson, Callahan's able assistant.

Evolution also took place in the technique of supervising schools. More attention was being given to small
conferences of administrators and selected teachers than to statewide meetings and general plans. During 1928, one of the department's publications, *The Teaching of English*, was used as a basis for many of the department's discussions with teachers and administrators (26). The questions listed for the conferences indicate that the department was attempting to stimulate original and creative thought, a radical departure from its previous stance, when it had encouraged all schools in the state to use a centrally prepared and prescribed course of study. No doubt the courses of study and teachers' manuals put out by the department had served a good purpose as long as teachers—especially on the elementary level—had very little professional training. But by 1929, under the influence of county teacher-training institutes and county supervising teachers, the quality of teachers was noticeably improved on all levels, and the prescribed study guides were obsolete.

While this trend to liberalize the schools was taking place, an old bugaboo reared its head: In 1929, the assembly's education committee proposed the creation of a State Board of Education. This was the year of the crash which ushered in our Depression, and although the cost of education remained constant, the money available to the state began dwindling. Forced to find new ways to cut expenses, the Legislature turned to organization of the school system. Cary's shadow still loomed over the proceedings, however, and the bill to create a state board was defeated. But before the 1929 session ended, the lawmakers appointed an Interim Committee on Education to thoroughly study the educational problems facing the state. The committee, composed of three senators and four assemblymen, took the job seriously. They met for 80 full-day sessions, conferred with education officials from Ohio, Pennsylvania, Virginia, Maryland, New York, Connecticut, and Massachusetts, and held discussions with several authorities from Columbia University and with the U.S. Commissioner of Education.

In 1931, the committee presented its report to the Legislature (27). It advocated condensing the lines of educational authority by creating a State Board of Education to replace eight existing major boards and four minor ones, and recommended changes in the appointing powers of some 30 other boards and commissions. Although the committee's suggestions were not then put into effect, the report did focus attention on Wisconsin's educational problems and exercised considerable influence on later legislation.

In 1937, one of the committee's recommendations was heeded when the separate state schools for the blind and the deaf were transferred to the State Department of Public Instruction by executive order. Shortly afterward, they were placed in the department's newly organized bureau for handicapped children. This enabled the state to coordinate and improve its efforts to provide education for all handicapped children, regardless of their disability.

Streamlining was also needed in another area: A truly chaotic condition had developed in teacher preparation and certification. In 1939, the Legislature granted the state superintendent of schools exclusive authority to certificate teachers and the responsibility for setting up certification standards. Not only were the city and county school superintendents stripped of their power to certificate teachers, but this act brought a semblance of order to the teacher-training programs offered by numerous state institutions.

With his new authority to establish qualifications for certification, Superintendent Callahan began reviewing teacher-training courses in all institutions. Those offering programs approved by the department could guarantee their graduates certification, while those offering training without approval could give no such assurances. Thus Callahan and his department applied all possible pressure to force the teacher-training institutions to comply with the standards.

Along with these efforts to upgrade teacher training, a new concept of curriculum planning emerged emphasizing local and regional initiative and control. This trend began in 1939 under the leadership of J. F. Waddell, one of Callahan's assistant superintendents. Waddell and his staff arranged many curriculum conferences and formed study committees, all involving both educational and lay leaders from throughout Wisconsin.

The most extensive and far-reaching of these grassroots programs started in 1943. Known as the Wisconsin Cooperative Curriculum Planning Program, it was under the direction of Professor Gordon MacKenzie of the University of Wisconsin School of Education. In order to finance the various committees' traveling expenses, the Wisconsin Education Association appropriated $7,500 for the first year and $11,500 for the second. The department's supervisory staff, specialists from the university, faculty members from the state universities, and teachers, supervisors, and administrators from all parts of the state participated on the committees organized to look into the problems of curriculum planning.

By 1947, 20 committees had completed reports, which were published and distributed to the schools. The titles of some of their bulletins, indicative of the scope of the studies, included *The Task of the School, Cooperation in the School and Community, and Art in the Total School Program*. Meanwhile, several other committees were preparing bulletins using the problems approach to curriculum planning, and they turned out such publications as *Guidance to Curriculum Building* for both kindergarten and junior high school levels (28).

It is difficult to point to any one event or year as being responsible for the change in the state's attitude that resulted in an increased permissiveness and more local autonomy. Its educational philosophy was influenced by a number of factors: an increase in the professional training
of teachers, supervisors, and administrators; the liberalizing influences of the state teacher-training institutions, especially the University of Wisconsin; and the success of the annual curriculum workshops and institutes and the broad participation of teachers on curriculum planning committees.

Another significant development was the introduction of team supervision, which was in extensive use by 1947. Elementary and secondary supervisors began visiting schools jointly, often accompanied by specialists in music, physical education, or libraries, making it possible to work with the total school program at one time. The visits were scheduled in advance so that local teachers and administrators could prepare the discussions and conferences. At the conclusion of their tour, the supervisors presented the school with a written evaluation, which included reports on the staff, school philosophy, administration, curriculum, and school plant.

Pressure exerted by leading educators of the state and by several members of the state department during the midforties finally prompted Callahan to overhaul the department in 1947. The department had become strong and active and enjoyed considerable influence and control over the state's educational establishment. The superintendent's office, with its staff of 37 professional workers, was now responsible for completely supervising the elementary and secondary schools, certificating teachers, setting standards for teacher-training courses, educating handicapped children, and dispensing state funds to the educational institutions of Wisconsin.

CONSOLIDATION CARRIED THROUGH

G. E. Watson succeeded Callahan in the superintendency in 1949. Both Watson and his first assistant, Russell F. Lewis, were able educators and administrators, and the department's effectiveness and leadership increased during the 12 years Watson held office. As a result of this steady growth and strong leadership, the department finally developed into a truly efficient agent for molding public education.

Superintendent Watson decided the time was ripe to launch an aggressive program to enlarge and consolidate school districts into more manageable administrative units. He judged correctly. Perhaps his single greatest achievement as superintendent resulted from his tireless effort to develop a favorable attitude on the part of Wisconsin's citizens toward reorganizing and enlarging school districts. He personally sparked an all-out campaign against the one-room schools.

In the fall of 1950, Watson scheduled a series of meetings in various sections of the state to discuss plans for reorganizing school districts. They were well attended by persons cognizant of the many educational advantages of reorganization, but the audiences also included officers and members of the State Rural School Boards Association, a conservative group firmly opposed to all consolidation on the grounds that the one-room school was the last refuge of freedom and democracy in America.

At a meeting in Waupaca County, during the few minutes left for questions following Watson's address, the president of the Rural School Boards Association stood up and in a very sarcastic tone asked whether he was correct in interpreting the superintendent's statement to mean that he was opposed to the one-room school. Watson retorted:

Yes, you understood me correctly, but let me repeat that you interpreted my statement as I had intended, and so that there will be no misunderstanding by anyone in the audience, I again say to you that this is one time when you are absolutely right. I am launching a movement which I hope will eliminate the one-room school and the small high school (29).

The factor that helped Watson most in his campaign was a revision of the state aid program the year before he was elected that provided for an annual classification of school districts into two categories. Districts offering an improved curriculum and services were given an "integrated" status and were rewarded with a higher level of state aid; districts not having an acceptable program were designated "basic" and received a lower level of aid. The desire for more state money induced the districts to form administrative units having more students and a greater tax base, as only then could they afford to provide a program which would qualify as "integrated." Also, since the supervisory division of the state superintendent's office assigned the classifications (on the basis of compliance to standards established under the new law), the department's consultative services were more effective and in greater demand. In all, the law was a real stimulus to school district reorganization and greater educational efficiency.

A study of one-room schools initiated by Watson also stimulated the reorganization movement. The Legislature found this firsthand information most useful during the sessions, when school district reorganization was a hot issue. One section of the report of the study stated:

An interesting finding in one county was that a redistribution of pupils so that each teacher would have 25 pupils would have resulted in the need for 42 fewer teachers! At an average salary of $3,000, this would have resulted in a saving of $126,000 (30).

The report revealed that many one-room schools had pitifully inadequate physical facilities; too frequently they lacked indoor plumbing, running water, dictionaries, encyclopedias, atlases, and other reference works. The conditions uncovered by the study shocked many legislators and educators, and the superintendent capitalized on this surprise and dismay to push his cause.

Watson's campaign received another important boost from James B. Conant, one of the nation's most respected
educators. In November 1958, in a speech at Madison sponsored jointly by the Wisconsin Association of School Boards, the University of Wisconsin, and the department, Dr. Conant declared to the state's school officials and administrators that in order to provide the variety and quality of education necessary to meet the challenges of the twentieth century, a high school should have at least 500 pupils. Smaller schools, in his opinion, were doomed to providing inadequate education simply because they were small. Résumés of Dr. Conant's speech were widely distributed, and the impact on the educational community was overwhelming. Watson received the backing he needed to complete his efforts to eliminate the small high school.

During the fifties, districts continued to be reorganized, leaving only as many elementary schools as were needed within a single administrative unit administered by a board of education, taught by one staff, and financed by a uniform tax. Most of these reorganizations can be attributed to Superintendent Watson's forceful personality and determination. He appeared personally at practically every legislative hearing on bills dealing with any phase of school district reorganization. He also addressed county boards, county school board conventions, PTAs, and many other groups to stress the benefits that would accrue to boys and girls as a result of larger schools. His dedication spurred every member of the department to help the superintendent attain his objectives.

Watson's efforts were rewarded when the 1959 Legislature passed a bill allowing two or more counties to join and share the services of a single county superintendent of schools and authorizing the state superintendent to initiate such jointure whenever a vacancy in a county superintendency occurred. Within 3 years, half the counties had taken advantage of this law. Additional action by the 1959 Legislature required the entire state to be divided into high school districts by 1962, and although some work remains to be done in eliminating the small, inefficient high schools, steps in this direction are being taken (31).

Although reorganization was certainly the most important objective of Watson's administration, the department made headway on other fronts as well. Taking over where Callahan had left off, Russell F. Lewis, the deputy state superintendent, attempted to achieve a closer integration between teacher preparation and teacher certification. Over a 2-year period, members of the department visited all of the teacher-training institutions in the state. The conferences and discussions following these visits resulted in revision of curriculums in the colleges as well as changes in the department's certification requirements.

Problems arose periodically concerning religion in education, particularly over the question of furnishing state aid and raising local taxes to support schools taught by nuns. This issue came to a head in 1951 in the Lima Consolidated School District. This district operated two schools: an eight-teacher school run by nuns and a one-room school to which most of the Protestant families sent their children. When the local school board closed the one-room school, several parents refused to let their youngsters attend the Lima Consolidated School and were brought into court by the county sheriff for violating the state truancy law. The court directed the state superintendent to testify about the status of the school. After a thorough investigation, Watson declared that the nuns were giving sectarian instruction, and it could not be considered a public school.

This Lima School decision put an end to the practice of offering state funds to schools taught by members of religious sects (32), but the line between public and private education was not precisely defined, and legal problems continued to arise. In 1962, the Legislature passed a bill legalizing the transportation of pupils to private and parochial schools at public expense, but in the same year the Wisconsin Supreme Court declared the law unconstitutional.

Watson's administration also made tremendous strides in increased services to children with special educational needs. New laws were passed which broadened the existing programs and increased the state's financial support to local districts for special education. In part, this exceptional progress was due to new attitudes toward handicapped children that were just emerging. The fields of genetics and psychiatry were clarifying the causes of handicaps. Understanding and sympathy were replacing fear and stigma. But part of the credit for increased educational opportunities for exceptional children must go to Governor Walter J. Kohler. Intensely interested in these children, the Governor used his influence with the Legislature to promote these measures. In 1947, the Legislature increased the money available to local schools for children enrolled in special classes from $55,000 to $325,000. Reimbursement was changed to a "cost-of-service" basis, which was sufficiently flexible to allow for variations among communities and among individuals in the same community.

The National Defense Education Act of 1958, passed during the nation's awakened concern over education after the Russian Sputnik, had wide repercussions in Wisconsin. The program was designed to help schools acquire facilities for science, mathematics, and language courses, and for testing and guidance services. But considerable opposition to the act was raised among educators, local school boards, and legislators who feared that the use of federal funds would lead to federal control of the schools. During the first year the NDEA program was in operation, many schools refused to participate. Objections gradually disappeared, and today only a handful of districts still decline federal funds.

NDEA is aimed specifically at certain subject matter areas, while over the years the department's policy had evolved toward more general and overall supervision. It is still too early to determine exactly what effect NDEA will
have on Wisconsin’s philosophy of school supervision. The federal funds have already had a considerable impact in many areas. They enabled the department to increase its personnel substantially (by 1962 the staff included 81 professionals) and to apply data-processing techniques to teacher certification.

Since the end of the feud between Cary and the University of Wisconsin, the relations between the department and the university have been cordial. In 1960, the department and the School of Education at the university initiated a teacher intern plan, one of their most important cooperative projects. It was agreed that teachers in training would become paid members of the public schools’ teaching staff so they could participate directly and meaningfully in classroom experiences. Watson’s assistant, Russell Lewis, in a move that would have been unthinkable during Cary’s term 50 years before, left the department to join the university and take charge of the intern program.

During the early sixties, the department took steps to revise the social studies curriculum. By the end of 1961, more than 25 educators, representing all segments of the public school system, had agreed to serve on a study committee for this purpose. The complete results have not yet been reported.

THE DEPARTMENT TODAY

Most of the programs initiated by Superintendent Watson were continued by his successor, Angus B. Rothwell. Rothwell took office in July 1961 and appointed William C. Kahl as his deputy. With federal and foundation grants, the department was able to increase its staff to 128 by the end of Rothwell’s term in 1966. During these years, foundation grants became increasingly important for conducting experimental programs and procedures. Many of these programs, such as developing a film for use in conservation education, were considered worthwhile but had been difficult to finance out of regular departmental budgets.

Until 1963, every attempt to persuade the Legislature to require 4 years of training for all elementary teachers met defeat. In that year, due to Superintendent Rothwell’s influence, legislation did pass stipulating that a prospective teacher must have 4 years of preparation to obtain a license (33).

A trend which had been developing for more than 100 years finally culminated under Rothwell’s leadership. The county superintendent of public education, one of the earliest and, for many years, one of the most important figures in Wisconsin public education, was becoming obsolete. Originally granted considerable power in making decisions concerning the schools, the county superintendent’s authority had gradually eroded. In 1863, the Legislature had enacted a law that allowed cities to set up superintendent of an English-Language Arts Curriculum Study Project. The department sponsored this study in collaboration with the Wisconsin Council of English Teachers and the University of Wisconsin, with funds provided by the U.S. Office of Education. The project was directed by Robert C. Pooley of the University of Wisconsin, one of the most highly respected authorities in the teaching of English in the United States. School systems throughout the state were invited to participate by adopting the experimental programs devised by the curriculum committees. In this way, the project leaders received a feedback to their proposals and reactions from the grass roots. The three bulletins published by the English-Language Arts Curriculum Study Project—Teaching Literature in Wisconsin, Teaching Speaking and Writing in
Wisconsin, and Teaching the English Language in Wisconsin—all have won national acclaim (34).

Rothwell again had to deal with the old problem of the state's relations to the parochial schools. A law which authorized parochial and private pupils to ride on public school buses had been declared unconstitutional by the State Supreme Court in 1962, so the only way to provide such transportation was to change the constitution itself. A bill was introduced in the Legislature, and the voters approved the amendment to the state constitution in April 1967. State-financed transportation of pupils to private and parochial schools is now permissible.

Superintendent Rothwell's administration continued to develop the vocational schools, which had been gradually adjusting their programs to meet the demands of a changing society. At present, 2 (in Madison and Milwaukee) of the 40 local vocational, technical, and adult schools have developed 2-year college programs, and both are approved by the North Central Association of Colleges and Secondary Schools. Since the state plans to establish technical institutes over the entire state through its vocational school system, it does not anticipate developing the community or junior college plan for post-high school education. The 1965 Legislature passed a bill requiring all areas of the state to be placed in a district operating a vocational, technical, and adult school. This parallels the history of elementary and high school education and perhaps foreshadows the availability of higher education for all Wisconsin students.

The 1965 Legislature also made the Coordinating Committee for Higher Education permanent by appropriating funds for a director and his staff. This committee, established 10 years earlier to oversee all post-high school educational programs and institutions, had never been able to function properly. Now it could implement its plans.

Superintendent Rothwell was reelected to a second term, but upon the completion of the first year, resigned to become the first executive secretary of the newly rejuvenated coordinating committee. The appointment gave recognition to his ability and his understanding of Wisconsin's major educational problems, as well as to his experience as a teacher and school administrator.

When William C. Kahl succeeded Rothwell in 1966, the state had an excellent base and organizational pattern for its educational program. All phases of elementary and secondary education were under the supervision of a mature state department which had adapted and grown strong enough to meet the challenges of the future.

NOTE:
The first legislative act authorizing pupil transportation in Wisconsin was enacted in 1897. In 1927-28 only 1 out of 40 pupils was transported, but in 1962-63 more than 1 out of every 3 pupils was transported—an increase of more than 1,000 percent in about 35 years.
Historians have identified 1840 as the beginning of the era of immigration in America. Soon after that year, the Western trails were heavy with the traffic of immigrants bound for new lives in Oregon, California, or Utah. The most heavily traveled trail followed the North Platte River to Fort Laramie, situated at the junction of the North Platte and Laramie Rivers. A trading post had been established at that point in 1834, and it became an army post in 1849. The trail continued along the North Platte to the site of present-day Casper, where it then followed the Sweetwater River to the South Pass of the Continental Divide. From that point, the trail separated into several alternate routes. Many travelers preferred to continue southwestward to Fort Bridger, a trading post erected in 1842-43 by Jim Bridger, one of the much-written-about mountain men.

Few of these immigrants showed any desire to settle in the vast region that was later to be Wyoming, and most of them spent less than a month crossing the area enroute to other destinations. According to the census of 1860, there were about 400 permanent settlers in the area. Fort Laramie and Fort Bridger each had close to 150 residing in or near the forts. With the exception of a few wandering prospectors and trappers, the remaining population could be found on a few isolated ranches along the valley of the North Platte in what are now Platte and Goshen Counties.

Fort Laramie was the site of the first school in the area, which was established during the 1850's by the Reverend William Vaux. According to a letter reported to have been written by an army major at the post, Vaux was considered to be not only a poor teacher but a poor chaplain as well (1). It is believed that the children around Fort Bridger fared a bit better in their education. As early as 1860, William A. Carter, the sutler of the post, employed a teacher for his own children and invited the other children in the area to attend the private school.

In 1863, while Wyoming was still a part of Dakota Territory, statutes provided that in every school district should be taught orthography (spelling), reading, writing, English grammar (Latinized, no doubt), geography, and arithmetic. Early programs were dominated by literary and classical interests.

Population changed little from 1860 for the next 7 years. In July 1867, a party of nine settled at the site of present-day Cheyenne. The Union Pacific Railroad had been laying track at a feverish pace in its race with the Central Pacific to complete a rail line connecting the East and West. In early July, the tracklayers had progressed to a point approximately 75 miles west of North Platte, Nebraska. By the time the rails reached Cheyenne on November 13, 1867, the town had grown to a community with an estimated 200 business buildings and a population of 4,000 people (2).

Other towns continued to spring up ahead of the rail crews. The Union Pacific was responsible for the creation of a dozen towns across southern Wyoming, among which to survive were Cheyenne, Laramie, Green River, Rawlins, Rock Springs, and Evanston. As new towns were created, schools were soon provided. Cheyenne, by February 1868, had 114 children enrolled in school, with an average daily attendance of 86 (3).

Wyoming became a territory in July 1868, and little time elapsed before the need for an educational system was recognized. Provisions were made in the first session of the Territorial Assembly for the regulation and maintenance of education.

The Office of Superintendent of Public Instruction was created to be held in conjunction with other territorial offices. The territorial auditor, for example, was appointed as ex officio superintendent of public instruction in 1869, with his stipend for this service set at $500 per year. His duties included general supervision of the schools, distribution of school funds, recommendations relating to textbooks, and reports to the Legislative Assembly on the condition of the schools (4).

Elective county superintendents were provided and charged with dividing the settled areas into school districts, apportioning the county school tax, examining and certifying teachers, and generally supervising the schools. Each school was to be visited at least twice each term by the county superintendents.

District school boards also were created by the first Territorial Legislature. Each board was to have a chairman,
a clerk, and a treasurer. District meetings were authorized in May and October to determine the number of schools needed, the length of the school year, the location of school sites, the courses to be taught, and other business required for the operation of the schools. In addition, the district boards were responsible for setting the district school tax, subject to the approval of the county commissioners. One power given the district boards was never enforced: In districts where 15 or more Negro children reside, separate schools could be established; no segregated schools were ever opened.

The territorial auditor's responsibilities in supervising education were short-lived, for he was relieved of his ex officio duties as superintendent of public instruction in 1871. Although the reason was never clearly indicated, disagreement seemed to center around a disparity in the length of school terms among the various schools and the inability to persuade the county superintendents to file reports relating to the condition of the schools.

The office of territorial superintendent was abolished for a time, and provisions were made for the county superintendents to make their annual reports directly to the Territorial Governor (5). This arrangement lasted about a year.

The last territorial auditor to serve as superintendent of public instruction was J. H. Hayford of Laramie, who in 1871, prior to the abolishment of the office, submitted the first report on public instruction. Dr. Hayford noted that good schools could be found in Albany and Laramie Counties, fair schools in Uinta and Carbon Counties, and neither superintendent nor schools in Sweetwater County (6). Records indicate that although the schools in existence at the time of the report were grade schools, plans were entertained to add high school departments to the Territorial Governor (5). This arrangement lasted about a year.

During that session, the whole matter of education was reviewed and generally resulted in the repeal of the provisions established in 1869. In addition, more explicit regulations governing the operation and control of schools emerged from that session. Further action saw the territorial librarian (an office created in 1871) made ex officio superintendent of public instruction, an alignment that continued until statehood was achieved in 1890. His duties were summarized as follows:

The filing of all papers, reports, and public documents transmitted by school officers of the several counties.

The general supervision of all the district schools in the state.

Putting all schools into uniform operation.

Preparing and printing suitable forms for all reports.

Making a report to the legislative assembly the first day of each regular session on the condition of the schools.

Placing one copy of all books, maps, charts, or school apparatus received from publishers, inventors, or manufacturers in the public library of the Territory.

Granting certificates of qualification to teachers of proper learning and ability to teach. Regulating the grade of county certificates (8).

Much of the time of the territorial superintendent was devoted to the preparation of teacher institutes, which were provided for by the Education Act of 1873. These institutes were to be held in the county seats of each county in existence, with no less than 4 days nor more than 10 days to be devoted to the instruction and advancement of teachers. In 1883, $1,500 was appropriated to pay the travel expenses of teachers who attended such institutes. By 1887, teacher attendance was made mandatory by law (9).

Participants in the institutes devoted much of their time to designing curricular offerings for the territorial schools. Legislative attempts to influence the curriculum were not felt until 1886, at which time the Territorial Assembly provided that physiology and hygiene, especially the effects of alcohol and narcotics, be taught in all schools above the primary second grade and in all educational institutions supported wholly or in part by the territory (10).

The decade preceding statehood was one of rapid population growth in Wyoming. According to reports from the county superintendents, the number of schoolhouses increased from 39 in 1883 to 198 in 1890; the number of teachers grew from 89 to 259, with an average salary of $61.67 per month; school enrollment jumped from 3,352 to 7,875. However, the cost per pupil per month dropped from $2.87 to $2.78 during this period (11). With such rapid growth in such a short period, it is little wonder that schools were conducted in such places as a log building with a dirt roof, the upper room of a railroad section house, a rented building, the spare room of a ranch, the vacant office of a mining company, a blacksmith's shop, the basement of the town hall, and a sheep wagon (12).

An educational venture that received very little publicity during this period was the establishment in 1889 of the first school for the Indian children of Wyoming. Only 12 years earlier, federal troops had chased the last of the hostile Indian bands from Wyoming. By the fall of 1877, the last remaining Indians had been herded onto the Shoshonis' Wind River Reservation. For several years, the Reverend John Roberts, an Episcopal missionary, had been
Indians at work doing what he could to improve the lot of the Indians. In the middle 1880's, Reverend Roberts approached the Commissioner of Indian Affairs with a proposition. After explaining the need for a school for Indian children, he suggested that if the federal government would construct a school, the Episcopal Church would maintain and operate it at no further costs to the government. The proposition was accepted, and a school was erected at Fort Washakie in 1889.

The Roman Catholic Church extended a similar offer in an attempt to establish a school near present-day Riverton, Wyoming, but the federal government did not see fit to finance the construction of another such school. However, this did not deter the Catholic missionaries. At church expense, St. Stephen's Mission School for Indian children was built and has remained in operation to this time.

The remaining years of the nineteenth century provided even more expression of the value of education. In 1886, Mrs. F. D. M. Bratten formed the Magic City Kindergarten in Cheyenne, charging a tuition fee of $4 per month. During the next 10 years, a number of other communities established kindergartens—all of which were privately owned. In 1895, the Legislature empowered the local trustees to establish free kindergartens for children between 4 and 5 years of age. The were to be supported from the special school fund, and only graduates of approved kindergarten training schools were to be employed as teachers. Records do not indicate the location of these training schools.

Other private ventures in education included the Wyoming Institute, a Baptist secondary school founded in 1870 by Reverend D. J. Pierce at Laramie. Within 2 years, its staff included four instructors—a man and three women. St. Mary's School, a Roman Catholic institution, was established in 1870 in the city of Laramie. Its growth was slow, but by 1881, it had 4 teachers, all women, and 73 pupils. The next year, the enrollment jumped to 110 pupils. In 1885, St. Mary's gave place to a larger and better Catholic school established at Cheyenne by the Society of the Holy Child Jesus. A large school building and convent were erected in 1885-86. At this time, there were also two branches of St. John's parochial school at Cheyenne, with about 250 pupils.

The Wyoming Collegiate Institute at Big Horn, a Congregational school, was started in 1894-95 with 3 teachers (2 men and 1 woman) and 56 pupils (34 boys and 22 girls).

After Sheridan High School started in 1893, the Wyoming Collegiate Institute declined and soon succumbed. By 1898, the enrollment dropped to 23 pupils. Sheridan College was founded in 1899 with 5 faculty members and an enrollment of 60 pupils. It soon suffered a decline which terminated in extinction.

Attention also was given to the need for higher education during this period. The Territorial Assembly created the university in March of 1886, with a tax of one-fourth of a mill on all taxable property established for its maintenance. In 1891, this was reduced to one-eighth of a mill in compliance with the Morrill and Hatch Acts. Although as early as 1893 reference can be found to accredited high schools whose graduates could enter the university without examination, the impact of the institution was slow in coming. According to Dean Justice F. Soule, "During the first twenty-five years, we never knew whether we should be there or not the next year".

When Wyoming was admitted to the Union as a state in 1890, the sixteenth and thirty-sixth sections of land in each township were set aside for education. This was known as the Oregon-type land grant. The sale of these lands and the income from federal prospecting constituted the State Permanent School Fund. The earnings from invested funds, agricultural and grazing leases, and certain mineral prospecting leases on unsold school lands were placed in what is known as the Land Income Fund, which was to be distributed to the various school districts of the state on the basis of the school census, covering children from 6 through 20 years of age. In 1892, the Permanent School Fund amounted to $4,400, and the Land Income Fund was $3,141,842, or $30.48 per census child.

From the beginning of statehood, schools were supported by a general county school tax which guaranteed $300 per teacher and driver of a transportation vehicle; in some cases the transportation driver was to receive $450—but this tax was not to exceed 3 mills. In addition, districts levied taxes on their assessed valuations for the support of schools. The state support was the proceeds of the Land Income Fund distributed to the districts.

Stephen H. Farwell was elected the new state's first superintendent of public instruction. During his 4 years in office, much time was devoted to the need for a system of free textbooks. Schools had been required to use state-adopted textbooks under the provisions of the Session Laws of 1888 (Chapter 72, Schools, Chapter 4, Section 3, page 163). New adoptions were required each 5 years and were the responsibility of a group composed of the several county and city superintendents. As the State Constitution stipulated that "neither the Legislature nor the Superintendent of Public Instruction shall have power to prescribe textbooks to be used in public schools" (19), Farwell was apprehensive of calling the textbook selection group together, believing that such action may have been in conflict with the provisions of the constitution. Numerous letters to the attorney general requested legal opinions concerning this issue. The final opinion of the attorney general suggested that a legislative session was so close at hand that
the Legislature should be requested to review the problem and enact a law in harmony with the constitution.

A great deal of time also was devoted to preparing an exhibit of Wyoming's educational system for display at the World's Columbian Exposition held in Chicago in 1893. Examples of pupils' class work, pictures of Wyoming schools, courses of study, as well as charts showing funds and revenues, school enrollment and attendance data, were collected for inclusion in the exhibit.

Although the state superintendent was responsible by law for teacher certification, Superintendent Farwell ducked the issue by referring to Section 3908 of the Revised Statutes, 1887. The law provided that the county superintendents examine all persons desirous of teaching in the public schools; if in their opinion such persons were qualified, a certificate was issued authorizing them to teach. The state superintendent considered issuance of certificates by his office as being superfluous.

Superintendent Farwell made three major recommendations to the Legislature. One called for a law providing for a school census to be made in January by the clerks of each school district and to be submitted to the state superintendent for compilation. It would then be the duty of the state auditor to compute a prorated list of funds to be distributed to the counties. The state treasurer would then prepare and transmit warrants to each of the county treasurers, who in turn would distribute the funds to the individual school districts. The state superintendent believed such a law was needed if there were to be any effective adherence to Article VII, Section 8, of the State Constitution, which dictated that "provisions shall be made by general law for the equitable distribution" of the income derived from the school lands "among the several counties according to the number of children of school age in each." (20). Section 3949 of the Revised Statutes defined school age as between the ages of 7 and 20 years inclusive.

A second recommendation called for creation of a commission of not less than five persons to revise the school laws of that day. Superintendent Farwell admonished that new laws "should not be such as will disturb, more than need be, existing laws." (21). His third major recommendation was for adoption of a state system of free textbooks.

All school laws presented for consideration by the first and second Legislatures failed to pass.

Farwell's successor was Mrs. Estelle Reel, who served during 1895-96. She immediately supported her predecessor's recommendation for free textbooks. During her administration, Mrs. Reel spent most of her time visiting teacher institutes, summer schools, and other meetings concerned with education. At every opportunity, she expressed the need for preparation of a standard course of study that would be suitable for all rural schools in the state. In support of her plan, she argued that it would systemize the work of the teachers and county superintendents and provide more equal schooling for the children. She also was a strong advocate of the importance of school libraries.

Elected to the state superintendency in 1897 was C. H. Parmelee, who served only 2 years. Records do not indicate accomplishments of much significance during this period. He, too, recommended revision of the school code and free textbooks. In his biennial report to the Governor, Superintendent Parmelee admitted that he did not have time to learn much about school problems during his 2 years of office.

Thomas T. Tynan, who had the honor of being the last state superintendent of the nineteenth century and the first of the twentieth, served from 1899 to 1907. Although many educators have criticized high schools for being too oriented for the college-bound, not many have been as critical of high schools as T. T. Tynan, when he commented:

As statistics show that the great majority of pupils in our public schools do not go any further than the seventh and eighth grades, I believe that more attention should be given to the primary and intermediate departments of our schools. It is more important to have sufficient room and good teachers for the primary and intermediate classes than to have expensive high schools.

In his appraisal of the high schools, he stated, "The present system tends toward making the pupils' work superficial, and introduces that very obnoxious system called cramming." (22).

It is doubtful that the superintendent's evaluation of high schools was based on fact. By his own admission, he visited only two counties his first year in office. In 1900, he visited nine counties and spent a total of only 1 day in each. With this limited opportunity to observe schools in operation, it is difficult to assess his comments as valid. He attributed his lack of visits to limited funds.

The Legislature of 1889 enacted a law establishing a state system of free textbooks. Superintendent Tynan probably cannot be credited with the success of the legislation since he had been in office less than 60 days at time of its passage. Other legislation in 1889 included the creation of a State Board of Examiners to administer the program of examination of persons for the purpose of teacher certification. The board members were charged with preparing the test to be administered and grading the tests after they were received from the county superintendents. The state superintendent of public instruction granted certificates to those qualified by test scores.

The last decade of the nineteenth century was one of rapid growth for education in Wyoming. School buildings increased from 198 in 1890 to 372 in 1900. Enrollment rose from 7,875 to 14,512, teachers from 259 to 570. Teacher salaries, however, saw no increase. As a matter of
fact, salaries declined from an average of $61.67 per month in 1890 to $48.09 per month at the close of the century (23).

THE LEGAL AND FINANCIAL FRAMEWORK FOR WYOMING EDUCATION

In November 1889, the people of the Wyoming Territory accepted a constitution drafted by the state constitutional convention. Admission to the Union followed in July 1890. The constitution and the first State Legislature virtually accepted the system of education in vogue during territorial days.

The State Superintendent of Public Instruction

The position of state superintendent of public instruction was one of the five top elective positions created by the State Constitution, and its duties, according to the constitution, were to be prescribed by law. Even today, a host of responsibilities outside the area of education make the job a difficult one and absorb approximately one-fourth of the state superintendent’s time.

To enjoy tenure in office, the person filling the position must be politically as well as educationally oriented. Campaigning for reelection also detracts from the time needed to administer the state educational programs. As early as 1915, it was suggested that the chief state school officer be appointed rather than be elected by the people (24). Although the recommendation is still being voiced, reluctance to the change still continues. Several persons interviewed expressed the feeling that the main reason for not removing the position from partisan politics is that this office is authorized in the constitution as well as the statutes. Not only would it be extremely difficult to amend both the constitution and the statutes, but it would necessitate a subsequent addition of another elected official to keep the number of the executive council at five—thereby precluding split decisions in government policy action.

Several other reasons are given for not wanting the position removed from politics. People say that they are concerned about the direction and policy of education and that as long as education spends most of their tax dollars they want the opportunity to vote out of office the administrator who does not do a good job. Apparently, no thought is given to the possibility that an appointee to the position could be removed more quickly than the time required to wait until the next election rolls around. But even more significantly, the line of reasoning indicates the misconception that so often surrounds the authority and responsibility of the state superintendent. The fact is that he is directly responsible only for moneys spent in the state department—a small percentage of the tax dollars spent on education. It is the Legislature that determines the amount of money for education and how it is spent. The other education agencies (i.e., the university, the community colleges, and the local school districts) are directly responsible for their expenditures, and these represent by far the greatest amounts of expenditures on education by the state.

One can only marvel that constructive educational programs have emerged at all amidst the many pressures directed toward the state superintendent of public instruction. However, there are 21 other states that elect their chief state school officer on a partisan, political basis.

We find early reports of superintendents concentrating on county school reports, discussions and price lists of textbooks, the state university, and opinions of the attorney general relating to the powers of the state superintendent. Around the turn of the century, however, appeared reports containing such subjects as pupil enrollment, qualifications of teachers, assessed valuations of counties and mill levies, values of school properties, and records of state disbursements.

T. T. Tynan discovered soon after the turn of the century that the office of state superintendent enjoyed no immunity from pressure. His failure to submit a biennial report to the Governor and the Legislature for the years 1903-1904 did nothing to endear him to that group. The following is an excerpt from his biennial report for 1905-1906:

You will also find appended the biennial report of said office for the two years prior, 1903-1904. Unfortunately I was unable to gather data and statistics of sufficient accuracy as to warrant the filing of said report two years ago in accordance with and at the time required by law, and deemed it best not to file a report under such circumstances, meekly submitting to the humility attending the dereliction of an officer to his superior and the consequent reporting of such offense by that officer in his message to the Legislature (25).

It was evident that the legislators did not agree with his decision, for in 1905 they reduced his contingency funds below what had been appropriated for a number of years. Tynan retaliated by calling their actions “malicious and in violation of their oath of office” (26). Apparently, he did not consider his failure to report a violation of his oath. Considering the friction that developed between the state superintendent and the Legislature, the results of the next election were not a surprise: A. D. Cook was elected to the post.

During Cook’s administration, the Legislature of 1907 enacted a compulsory education law setting the compulsory school age as between 7 and 14 years inclusive (27). The Legislature also amended the law governing the State Board of Examiners, giving it the power to examine teachers for purposes of certification, which
had been the responsibility of the county superintendents (28).

Cook's short tenure in office resulted more from economic conditions in the state than from the nature of his accomplishments. After the financial panic in October 1907, the state underwent a brief recession that extended into 1908. Although the economy of the state improved rapidly, many became disenchanted with the Republican party. The Democrats, feeling they had no one strong enough to defeat the Republican candidate for Governor, offered their nomination to Joseph M. Carey, a lifelong Republican. Carey, who had served as U.S. Senator from Wyoming and was abandoned by the Republicans when he sought reelection in 1895, accepted the Democratic nomination. His popularity resulted in his election, and he carried with him to victory two Democratic candidates: Frank L. Houx as secretary of state, and Rose A. Bird as superintendent of public instruction. These were the first state offices won by the Democrats since 1892.

Governor Carey proved to be one of the most progressive chief executives in Wyoming history. His success in mustering support for reform legislation in both the 1911 and 1913 sessions of the Legislature was astonishing, for in neither case did the Democrats have a majority in either House.

In 1913, the Legislature provided several pieces of legislation which helped strengthen the state school system. Provisions were made for transmittal of public funds for school support on a businesslike basis (29). Prior to 1913, school funds were distributed by the county superintendents and county treasurers to the district treasurers, with little concern for accurate record keeping. In most cases, the only records of transmittal were kept by the county officials. The new law required that duplicate remittance slips be issued with each remittal of funds. County officials were directed to send one copy to the district treasurer and one copy to the district clerk.

The quality of teacher-training institutes also received legislative attention. Most institutes had been conducted by the county superintendents and usually were considered to be of little value. Chapter 44 of the 1913 Session Laws provided that two or more districts could pool their funds to support joint institutes conducted by qualified instructors and lecturers. To provide adequate funding for the procurement of top-quality people, the Legislature directed each county to appropriate funds to defray the costs. The amount per county varied according to assessed valuation.

Chapter 52 of the Session Laws of 1913 was enacted to provide a fairer distribution of taxes to rural districts for support of their schools. Earlier apportionment of county funds had been according to the number of pupils in a district. The new law provided for the division of funds on the basis of the number of teachers employed for a period of at least 6 months.

Attention also was given to improving the elementary school curriculum. A law was enacted directing the state superintendent to prepare a uniform course of study for the elementary schools of the state (30). The law specified the subjects to be taught and charged the county superintendent with ensuring that all schools under his supervision followed the prescribed course of study. Schools with more than three teachers were permitted to adapt the curriculum to the environment of the local area.

An awareness of the problems that past state superintendents had encountered in gathering reports from school officials prompted the 1913 Legislature to enact a law in the hopes of correcting the situation (31). Stipulations were made that any school wishing to receive state funds had to maintain accurate records and submit reports when necessary. Failure to submit reports as requested would result in a fine against the school official responsible.

In her biennial report to the Governor in 1912, Superintendent Bird recommended that the power to establish or alter district boundary lines be removed as a responsibility of the county superintendent. Numerous incidents had been reported of district boundary changes being made during school terms with no provisions for tax support for the newly formed districts. Many times, boundary disputes became so intense that the county commissioners and the state superintendent were called upon to resolve them. The Legislature, acting on the state superintendent’s recommendation, enacted legislation providing for the establishment of district boundary boards composed of the county superintendents of schools and the boards of county commissioners (32). Although creation of the boards removed some of the pressure from the county superintendents, it did not eliminate disputes over boundary changes. Protests persist until this time and are emotionally charged as they were prior to 1913. Perhaps the Legislature will have to assume the responsibility for such changes.

Under the leadership of Governor Carey, a number of solutions to Wyoming’s educational problems were considered. T. A. Larson, in his History of Wyoming, appraised the administration of Carey as follows:

One sees a frugal, well informed capable Progressive who was often unhorsed by the fractious majority Republicans. Nationally in this era, Progressives worked for political, humanitarian, and economic reforms. In comparison with other Progressive leaders, Carey was primarily interested in reforms designed to purify the political system, secondarily in humanitarian reforms, and scarcely at all in reforms calculated to circumscribe big business. Carey’s accomplishments were noteworthy. When one considers the political circumstances, one must credit him with no mean achievement (33).

Governor Carey did not seek reelection in 1914 but chose to campaign for the Democratic candidate for
Governor, John B. Kendrick, a Sheridan County rancher. Kendrick was victorious, but all other Democratic candidates for the five top state offices were defeated, with the exception of the secretary of state. Mrs. Edith K. O. Clark was elected to the post of state superintendent of public instruction.

In 1915, at the request of the Legislature, Governor Kendrick appointed a school code committee to study the school system of the state and recommend new legislation relating to education. Further request was submitted to the Bureau of Education, a division of the U.S. Department of the Interior, for help in conducting the study. The bureau assigned A. C. Monahan, a specialist in agricultural education and rural school administration, and Katherine M. Cook, an assistant in rural education, to help make the study. Upon completion of their investigations, the committee, with help from the federal consultants, offered the following recommendations:

1. Provision for a State Board of Education as the responsible head of the educational system, the executive officer of the board to be the superintendent of public instruction.

2. Reorganization of the State Department of Instruction by...clearly defining the duties of the state superintendent by legislative enactment...relieving the state superintendent from service on boards and commissions not connected with education...making the position appointive instead of elective...adding at least two efficient field agents to inspect secondary, vocational, and special schools receiving state aid...providing an annual state appropriation to be expended by the State Board of Education on the recommendations of the state superintendent...for purposes that may be authorized by law.

3. Nonpolitical school officers.

4. Provision for expert supervision of rural schools.

5. A County Board of Education.

6. Independent supervision of city districts.

7. A more equitable distribution of the burden of the support of education.

8. Requirements for a higher standard of general and professional education for teachers.

10. Reorganization of the plan of certification of teachers.

12. Control of special state institutions by the state board (34).

The State Board of Education was created by the Legislature in 1917 (35). The composition of the board, the method of selection, and its relationship to the state superintendent of public instruction have been under constant attack from the start. The law provided for a seven-man board, which would include the state superintendent of public instruction as an ex officio member with voting rights. The six additional members were appointed by the state superintendent, with the approval of the Governor. No more than four of the members could be from the same political party. Two were supposed to be actively engaged in educational work. Critics, in most cases, have expressed the belief that such procedures of selection have placed the state board in the position of being nothing more than a tool of the chief state school officer.

Criticism concerning the system has never been confined to any particular group or groups but has emerged from all quarters. There was never any definite display of support for the method of selection after its initiation. The delay in change stemmed mainly from the inability of critics to combine their efforts in drafting legislation to effect the change. Not until the legislative session of 1967 were constructive efforts successful and the method of selection and composition of the board altered (36).

A second creation of the Legislature in 1917 was the provision for a commissioner of education to be appointed by the State Board of Education (37). The legislators of that day viewed the increased responsibilities of education as more than one man could cope with and a commissioner was to have provided assistance to the state superintendent. J. O. Creager, the first commissioner of education, served from 1917 through 1919. Critics have stated that in truth the commissioner was installed to run the education programs and to partially free the superintendent to accommodate the inherent political and state governmental responsibilities which are necessary to hold that position.

Perhaps a more honest appraisal of the reason for creating the post of commissioner centers around the noneducational responsibilities of the state superintendent. Wyoming has a unique government structure. All five of the elective state officers serve as an executive council. In the absence of the Governor, the other state officers, according to a prescribed order, serve in an acting capacity as Governor. In addition, the five state officers serve on a number of state boards and commissions. Article 18, Section 3, of the State Constitution stipulated that "the governor, secretary of state, state treasurer, state auditor, and superintendent of public instruction shall constitute a board of land commissioners." The constitution also provided for their service on a State School Land Board, and on a State Board of Charities and Reform.

Chapter 62, Article 1, of the 1927 Statutes broadened such responsibilities of elected officials. The law stated:
The five elective state officers of the State of Wyoming shall comprise the membership of all state boards and commissions upon which two or more such officers are now serving by a provision of statutory law; provided, the terms hereof shall not apply to the board of university trustees.

However, the first Legislature after statehood placed the state superintendent of public instruction on the board of trustees of the university (38). At the latest count, the state superintendent serves on 16 different boards and commissions. The first week of each month is devoted to his fulfilling the duties of these extra responsibilities. These factors give strong support to the need for a commissioner.

The election of 1918 saw the son of former Governor Carey victorious in the gubernatorial race. Robert D. Carey was the Republican candidate, with the full support of his father, who had ended his feud with Francis E. Warren, longtime head of the Republican party.

Mrs. Katharine A. Morton, also a Republican, was elected as state superintendent. Mrs. Morton enjoyed the longest tenure in office of all holding the position before or after her election. Her years of service extended from 1919 to 1935.

By 1920, the state had grown, and the complexity of the state superintendent's job continued to increase. The 1919 Legislature indicated an awareness of the problem by passage of an act providing for additional staff, equipment, and space. Four new professional staff positions were immediately created. Assisting the state superintendent, in addition to the commissioner of education, were a state director of vocational education (receiving one-half his salary from federal funds), a state supervisor of vocational-agricultural education, a state supervisor of the Smith-Hughes Act home economics program (these two likewise partially paid by federal funds), and a state director of special education. All of these were ultimately responsible to the State Board of Education.

Federal funds for support of vocational education were provided by the Smith-Hughes Act. One of the conditions of the act called for the state to match each federal dollar with a dollar from state funds. In 1917, $15,000 federal money was allotted to Wyoming, but as the Legislature appropriated only $3,000 for matching purposes, a major portion of the federal funds was lost to the state. In 1918, the state appropriation still matched only one-fifth of the $15,000 available. Beginning with 1919, the federal allotment for Wyoming was increased to $20,000 per year, until 1923 when it was to rise to $30,000 annually. The 1919 Legislature, instead of improving the situation, reduced the state appropriation to $2,000 per year for the curriculum. The following figures indicate the unfavorable support of vocational education in Wyoming in 1919, as compared with its neighboring states (39).

Because of the limited funds available, the Division of Vocational Education extended its services to only a few schools. This was done in the hope that each might receive enough to be of material benefit. Initially, vocational agriculture was given major emphasis. However, classes in industrial education increased from 2 in 1919 to 32 in 1922 (40). These were evening classes designed to improve the skills of workers already in industry and to provide them with new skills qualifying them for advancement. Practically nothing was done in the area of home economics until the Legislature increased the level of support. Prior to that time, no more than $2,000 per year was available from federal sources, and the Legislature had not seen fit to match even that small amount (41).

Although the first 10 years were extremely difficult for those involved with vocational education, perseverance of a few dedicated professionals established a base for what was later to become one of the most effective divisions of the state department.

Public interest for special training facilities for handicapped children had begun to mount about 1909 (42). Within 10 years, the pressure of interested citizens resulted in the passage of House Bill No. 92 in February 1919, which provided for the education and training of children afflicted with physical or mental handicaps. A Division of Special Education was created to administer the law, and $10,000 was appropriated for the first year's operation.

Interest continued to grow in support of special education. The 1920 Legislature increased the appropriation for development of such programs to $25,000 (43). Funds continued to increase as long as lay interest remained high. However, as citizen support for vocational education reached the point of effectiveness, interest in special education started to wane, and funds for its support began to diminish.

At no time during the 1920's was there sufficient money to support the size staff needed adequately to administer the new programs of the state department. In 1924, the department had the smallest administrative staff of any Western state (44). However, a professional staff was initiated.

Although the Depression resulted in overall cutbacks in funds for education, a Division for the Industrial and Educational Supervision of the Deaf and Blind was created in 1930 to implement a bill enacted by the 1929 Legislature. Chapter 160 of the Session Laws of Wyoming, 1929, was passed after much prodding of the Legislature by
the Lion's Clubs of the state. The law called for accommodation of the needs of those not of school age who were deaf and blind.

Also added to the staff in the early 1930's were an assistant director for special education and a deputy state superintendent. Although the latter position was authorized by the 1899 Legislature, earlier state superintendents apparently did not see a need for an assistant other than the commissioner of education.

In 1930, the beginning of State Superintendent Morton's last term in office, much attention was directed toward the problems of school finance. Governor Emerson, serving his second term in office, called a meeting to study the problems of the financing and evaluation of Wyoming schools. Fortunately, the Governor had at his disposal two of the nation's most capable authorities in the area of school finance and evaluation: Paul Mort of Columbia University had been collaborating with Walter Reuss of the University of Wyoming in a pilot program of school evaluation. These two capable leaders were instrumental in developing a study that showed the need and the procedure for the distribution of state funds to school districts on the basis of equalization of educational opportunity and equalization of school support (45). Governor Emerson did not live to see the results of the study he proposed. During the 1931 legislative session, he died of pneumonia at the age of 48.

The Democrats made a clean sweep in the election of 1934, winning all five top elective positions and, for the first time in state history, a majority in both Houses of the Legislature. Jack R. Gage was elected state superintendent. In Professor Larson's words, "Best vote getter of all was Jack Gage, whose principal political stock in trade was a steady stream of jokes, mainly directed at himself"(46).

A state sales tax was adopted by the 1935 Legislature in preference to an income tax. Labor opposition to a sales tax was particularly strong in the House of Representatives, and only after a personal plea by Governor Miller was sufficient support mustered to ensure its passage (47).

The first equalization law also was passed by the Legislature in 1935, and $187,000 was set aside for equalization purposes from the newly enacted state sales tax (48). The equalization law provided for the computation of teaching units, for the determination of a minimum foundation program level, and for a local qualifying tax levy. Only somewhere between 25 and 30 percent of the school districts received equalization aid.

With Gage having been the top vote-getter in the election of 1934 and his own party in control of both Houses, one might have expected support for school legislation. However, the passage of the equalization law in 1935 was the last piece of school legislation of any significance during the 1930's. Party bickering destroyed the Democrats' chance of victory in the election of 1938. Control of both Houses of the Legislature was regained by the Republicans, along with the offices of Governor, state treasurer, and superintendent of public instruction. Esther L. Anderson won election as state superintendent and served in that position through 1946.

The 8 years under Mrs. Anderson's administration could best be described as a replay of the previous 8 years. Vocational education and vocational rehabilitation continued as the major thrust of the State Department of Education. Of the five new positions created during this period, four were additions to the vocational staff: a research specialist, two assistants in vocational rehabilitation, and a state fiscal agent for defense training programs.

Installation of a fiscal agent can be credited more to hindsight than foresight. In August 1941, Frank M. Treat, director of vocational education, presented two vouchers for approval to the state superintendent. Mrs. Anderson refused to approve the vouchers, which were payable to a Roy C. Conover, on the grounds that the class for which Mr. Conover was being paid had been closed since February 1941. An extensive investigation revealed that Mr. Conover had been relieved of his duties as a part-time instructor of trade and industry in 1932 but that Treat had kept Conover's name on the payroll and continued submitting vouchers for payment of his salary. Over a period of 13 years, Treat had cashed a total of 203 warrants after forging the names of the payees and signing his own name as endorsee. The total loss to the state was $45,805.15. The attorney general advised that in his judgment no one in the three previous administrations or in Mrs. Anderson's, other than Treat, was involved in the fraudulent scheme. Treat was tried and pleaded guilty (49). After this event, the hiring of a fiscal agent seemed a wise move.

In 1943, the Legislature established the Wyoming Teacher Retirement System (50). An executive secretary was employed to administer the program, and the education board was authorized to sit as the official teacher retirement board.

From all evidence, the major emphasis of the state department during the war years was directed toward the war effort. Many programs were initiated for the training of "Out-of-School Rural Youth," provided for by an act of Congress in 1940. Courses were offered in the operation and care of tractors, trucks, and automobiles; metalwork; woodworking; and elementary electricity. The courses were designed to provide preliminary training for defense industries, including agriculture.

Had it not been for an action by the State Board of Education in 1945, it would seem no schooling other than vocational any longer existed in Wyoming. In April 1945, the board created a Division of Elementary and Special Education (51), which 4 years later was to be renamed the Division of Elementary Education and Education of Handicapped Children. The action by the state board in 1945 was a promising sign. For 16 years, the state department had
provided little leadership throughout the state except in the vocational area. What contacts were made with local districts placed the department in the role of inspector.

With the election of Edna B. Stolt in 1948 and the end of 16 years of national emergency—first economic and then war—Wyoming entered a new era in education. The change was not dramatic but the prosperity of the 1950's resulted in an almost continuous improvement in the services rendered by the state department.

In 1954, the Wyoming Citizens Committee on Educational Problems recommended that Wyoming should embark on a plan of state and local support of public schools based on a good foundation program of education made possible in all districts (52). A state-guaranteed program of education for every child, it was in a sense a minimum educational program for it allowed a local school district to exceed the minimum program to the extent that its constituents might desire and were able to support.

Such a plan was submitted to the 1955 Legislature and was passed with overwhelming support. The legislation provided the core and the framework for Wyoming's financing of its schools. It was recognized, even in 1955, that as times and educational needs changed, the foundation program also would need to be modified. The program has served Wyoming education well during the past years. Even though some improvements have been made, there is a continuous need to modernize it both in relation to program and to dollar value of the costs. Yet it represents a solid basis on which to finance the schools of today as well as those of tomorrow.

The demand for school construction, more teachers, higher salaries, and increased services all contributed to the rising costs of education during this period. As costs continued to mount, more and more demands were voiced for greater state support.

In the election of 1954, the Democratic candidate for state superintendent of public instruction, Velma Linford, emerged victorious. During her first 4 years in office, Superintendent Linford offered several ideas for improving the state department, one of which was that the position of commissioner of education no longer was needed. The statutory position was eliminated by the Legislature in 1959. A complete administrative reorganization of the department followed.

The new organizational structure included the State Board of Education, the state superintendent, the deputy superintendent, and three divisions, each under an assistant superintendent: administration, instruction, and vocational rehabilitation divisions. The several activities and services of the entire department were placed under one or another of these divisions. Under Miss Linford's leadership, the state department became better known throughout the state, and many of her ideas for improvement of Wyoming education were of merit. The revision of the procedures for the accreditation of schools should be recognized as one of her noteworthy contributions. Moreover, a program was designed to encourage continuous improvement of local school programs through a combination of self-analysis and committee evaluation. An evaluative instrument was prepared which identified the basic characteristics of good school programs in all areas of operation, and copies were distributed to local districts to guide them in their efforts at analyzing their individual programs. After the self-evaluation by the local districts, a team of state department personnel and professionals in the field visited each district to assist in developing plans for improvement. Under the new procedures, schools were not compared and rated against each other but were evaluated on the basis of the characteristics and needs of each individual community.

The year 1962 proved to be a good one for the Republicans as they swept all five of the state's elective officers, and Miss Linford was defeated by Cecil M. Shaw of Casper, Wyoming.

During the school year 1962-63, the department was again reorganized, this time into six divisions, each headed by an assistant superintendent: administration, business and finance, vocational education, vocational rehabilitation, special education, and instruction. In July 1965, a research division was added; soon afterwards, special education was transferred from the Division of Vocational Rehabilitation to the Division of Instruction. These divisions were envisioned as major areas of service carried on by the state department personnel, with each service placed in its appropriate division. The door was left open to future adjustment as experience indicated a need.

In 1966, there were 61 professional staff positions in the State Department of Education, including 32 in vocational rehabilitation, plus a substantial number in charge of administering federally financed programs. But more qualified service personnel were needed if the various programs necessary to meet the educational needs of the state were to be provided. Limited appropriations, of course, placed restrictions on addition of personnel.

**PROBLEMS FACED BY THE STATE DEPARTMENT**

**Curriculum**

At the heart of all education lies the curriculum; in a dynamic society, the curriculum must be in a state of perpetual flux, or it fails to meet the needs of the pupils pursuing it. Perhaps at no time in the past have demands for curricular progress been so urgent as they are today. A glance at the broader changes in curricular offerings throughout Wyoming's educational history will hint at what lies ahead.

Some expansion of curriculum took place after the turn of the century. However, until 1921, high schools...
generally confined themselves to a college preparatory program and one with a commercial emphasis. The curriculums were heavily weighted in favor of the college-bound, although only a small percentage of students ever attended college. Statements of many interested persons of the time reveal a concern with the segment of the student body not interested in attending college. Implementation of the Smith-Hughes Act by the Legislature in 1917 started the ball rolling in agriculture and to some extent in home economics.

The year 1921 saw considerable expansion of curricular offerings in larger schools, which was fostered in part by a ruling of the state board that required schools to submit their programs of study to the commissioner of education before accreditation could be granted. Some leading schools offered college preparatory, general, stenographic training, bookkeeping, home economics, mechanical arts, and normal training courses. Size, then as now, naturally played an important part in this. Although curricular offerings were considered for accreditation in 1921, they represented only a small segment of the evaluative criteria.

Schools were rated on the basis of a 100-point scale. Points were awarded on the following basis:

I. The school plant
   a. Accommodation for teachers .......... 8 points
   b. Location ................................ 3 points
   c. Outbuildings ............................... 3 points
   d. School buildings ......................... 15 points
   e. Heating .................................... 2 points
   f. Equipment and supplies .................. 9 points

II. School efficiency ............................ 60 points
   a. Community activities ..................... 12 points
   b. Organization .............................. 15 points
   c. The teacher ............................... 15 points
   d. Educational progress .................... 18 points

Elementary-level curriculums were receiving attention as well. In 1913, the Legislature provided an elementary school course of study which tended to make for more uniform instruction. Prior to this, Wyoming had been using curriculums from other states. A new rural curriculum adopted in 1924-26 streamlined and improved the course of study and better provided for pupil needs by reducing the number of classes taught by each teacher from 35 to 14.

But curricular study and development are not static. Curriculum revisions, additions, and studies have been the order of the day almost since the inception of education in Wyoming. Curriculum has had to keep pace with the demands of a changing world. In 1940-42, for example, Wyoming high schools adjusted their educational programs to the needs of the war emergency program, with 32 high schools offering preflight aeronautics; some taught radio communications; and nearly all of them expanded programs in physical education, science, mathematics, and vocational education (53). Revision of curriculums in elementary mathematics was accomplished in 1949 and 1950 through teacher-principal workshops at the University of Wyoming. Driver education classes were introduced into high schools in 1951-52. Later, distributive education classes were added to certain high school curriculums. Within the state, workshops continue in all subject fields into the present day. In 1965, English teachers, working with university specialists in cooperation with the state department, wrote the first English curriculum guide in Wyoming history, and this, too, will need continuing attention and revision. So the story goes, in English, social studies, physical education, music, reading, conservation, the elementary field—all of these programs are currently receiving attention. Originally written by state department personnel or by one or two individuals, curriculum studies are now done cooperatively by teachers, administrators, and expert consultants in curriculum workshops.

Division of Vocational Education

Records and information relating to vocational education in Wyoming began with the passage of the Smith-Hughes Act of 1917, allocating federal money for the promotion and development of vocational home economics, agriculture, trades, and industry. The provisions of the Smith-Hughes Act were accepted by the 1917 Legislature, and an appropriation of $3,000 was made for administrative expenses (54).

In January 1918, J. R. Coxen was selected as half-time state director and half-time teacher-trainer in trades and industry. He served as state director of vocational education until 1925 and was succeeded by F. M. Treat, who held that position until 1941. Sam Hitchcock, state supervisor of agricultural education from 1935 to 1941, was named state director in 1941 and served in that capacity until his retirement in 1961. In the past 6 years, five persons have served short terms as state director.

Turnover of state supervisors has been slight. Only five persons have held the position of head state supervisor of home economics education, one of whom served 32 years. Prior to 1962, assistant state staff for home economics education were employed on a part-time or full-time basis for 22 years. Only eight persons have served as supervisor of agricultural education during the 50 years from 1917 to 1967. Assistant state agricultural education staff have been employed intermittently.

Wyoming, being a rural state, has concentrated on programs related to ranching and farming to a greater extent than it has to trade and industry occupations. Youth organizations designed to develop leadership and good citizenship have been an integral part of vocational education in home economics and agriculture for some 40 years.
A full-time state supervisor of trades and industry education was not employed by the state until 1967. Until that time, those responsibilities were assumed by staff members with other administrative responsibilities. Up to the present, five high school trades and industry programs have been developed, plus two postsecondary programs.

With the passage of the George-Deen Act in 1936, federal funds were available for distributive education. Records and information for this area are incomplete, but it is believed that approximately ten different persons have been designated to give state leadership to the programs intermittently. Since 1964, high schools conducting distributive education programs have increased from 4 to 12. One postsecondary program has been initiated, and a youth organization also has functioned in this area.

For several years prior to 1955, a full-time staff member was employed as supervisor of research and occupational information. Eight years later, in 1963, this position was staffed on a part-time basis to direct vocational guidance.

Quotes from the biennial report of the state superintendent, 1926-28, indicate that the goals for vocational education were much the same as they are today.

The prime aim of vocational education is to train in habits of thinking and doing. It is especially for those who do not plan to go on with higher educational work. The courses in vocational education are so offered as to give actual experience to those partaking. Vocational education becomes a part of the experiences of any individual whereby he trains to carry on successfully any gainful occupation (55).

The Vocational Act of 1963 allocates federal funds to promote and develop programs to prepare and upgrade all persons, youth and adults, to achieve and maintain skills for occupations requiring less than a college degree. Additional professional leadership personnel at the state level has been limited. Since 1962, staff members have been added to direct the federal programs of research, manpower development training, and adult basic education. Business and office, health, and women's occupations responsibilities were handled by the directors of distributive education, trade and industry, and home economics. State funds for vocational education, appropriated by the Legislature in 1967, have doubled—but they are still much less than is needed.

The status, needs, and challenges for increased vocational-technical education were reviewed in 1967 by a Governor's Committee on Vocational-Technical Education. Its findings and recommendations will give the people of Wyoming an opportunity to evaluate efforts toward meeting the rapidly changing employment conditions that exist today and those that are likely to take place in the near future.

Division of Vocational Rehabilitation

A story of apocryphal origin relates that two men were debating the merits of a mutual federal-state effort in the rehabilitation of physically and mentally handicapped when one of them, in an effort to carry the day, exclaimed, "Well, then, are we our brother's keeper?" "No," answered the other. "We are our brother's brother." This story expresses well the function and the record of federal-state cooperation in Wyoming. From tax consumers to taxpayers, the participants in Wyoming's rehabilitation programs find new usefulness, new independence, and new hope.

In June 1920, Wyoming, through its legislative authority, accepted the provisions and benefits of an act of Congress entitled "An Act To Provide for the Promotion of Vocational Rehabilitation of Persons Disabled in Industry, or Otherwise and Their Return to Civil Employment" (56). The State Board of Education was designated as the state board responsible for cooperating with the federal government in carrying out the provisions and purposes of this federal act.

The program that was carried on for the first 23 years was primarily educational. Accomplishments up to 1943 clearly fell far short of the needs of eligible vocationally handicapped persons because the existing law had a number of limitations that made a well-rounded vocational rehabilitation program impossible.

There was a statutory limit on the amount of funds available for state grants-in-aid; no physical restoration services, except prosthetic appliances, were included; no special services for the blind were provided; until 1939, federal funds could not be used to provide maintenance during rehabilitation. The services were limited for the most part to vocational counseling, vocational training, obtaining artificial appliances, and placement services. Experiences throughout these years proved beyond a doubt that under proper conditions handicapped men and women compete on an equal basis with so-called normal workers. Experience also showed that many vocationally handicapped persons were being declared ineligible because the provisions of the regulations pertaining to expenditure of funds limited the extent of services for which moneys could be expended for rehabilitation purposes. Realizing the inadequacies of this program, the Seventy-Eighth Congress passed Public Law 113, which made it possible to greatly expand the scope of the program.

Recognizing the value of this legislation, in 1945, Wyoming accepted the provisions of this law. The staffing of the program began with a meager number of dedicated individuals and has expanded to the present staff, in excess of 60. In addition to the regular rehabilitation districts, the agency is also represented in all of the state institutions (Wyoming State Training School, Wyoming Girls' School,
Wyoming Industrial Institute, and Wyoming State Penitentiary). A number of innovative projects have been initiated by the Division of Vocational Rehabilitation through the Division of Services for the Visually Handicapped, and these have become an integral part of the total rehabilitation program.

Today, vocational rehabilitation is limited only by lack of financial means to operate a program extensive enough to provide complete rehabilitation services to all eligible vocationally handicapped men and women in Wyoming.

Division of Certification and Placement

The state board is authorized to establish rules and regulations for administering the laws governing the certification of teachers (57). This has become an increasingly greater responsibility with the growth in the number of teachers and the raising of standards for certification. At one time, a graduate satisfactorily completing the high school "normal" training course could be certified to teach. In 1962, the bachelor's degree became mandatory as a requirement for the standard certificate. Issuance of certificates increased from 960 in 1935-36 to 1,898 in 1965-66. The approximate number of certified teachers in 1966 was 5,000.

Involved in the certification process are the collection of personal data and credentials for candidates and the evaluation of these data in terms of standards, rules, and regulations.

The law passed by the Thirteenth Legislature, 1917, provides for the following classes of certificates: (1) elementary city school certificates; (2) rural school certificates; (3) high school certificates; (4) administrative certificates; (5) special certificates (58).

In 1948-50, 21 classes of certificates were recognized. The Wyoming Teacher Certification Regulations, January 1, 1965, provide for three basic certificates: the initial certificate, the standard certificate, and the professional certificate.

Closely related to the certification process is a placement service which was provided by statute in 1919 and operates without charge for the benefit of superintendents and trustees who desire to engage teachers. This service includes the collection and evaluation of reliable data concerning the qualifications of candidates for employment in the schools of the state.

Another related activity is the Wyoming Legislative Scholarship Program, created in 1959 and designed to stimulate and encourage interest in preparation for the teaching profession among high school graduates and undergraduate college students.

The state department staff responsible for performing the sundry and related certification and placement activities has, of course, varied from time to time. The staffing of the present Division of Certification and Placement includes the director and four highly trained assistants. The first assistant directs the general flow of all communications, including applications for certification and the processing of the certificates, and also handles the correspondence and other clerical work related to the legislative scholarships. A certification assistant carries the major responsibility for evaluating college transcripts and assists in handling personal inquiries relating to certification. A placement assistant handles all correspondence with applicants for employment, making a preliminary evaluation of personal credentials, contacting references, and handling referrals to prospective employing superintendents and school boards. A fourth assistant has primary responsibility for setting up folios for applicants for certification, for accumulating the necessary credentials materials, and notifying applicants of any additional materials needed. All assistants have joint responsibilities for general office routine, including preparation and processing of correspondence, processing of certificates, and filing of credentials and related records.

School District Reorganization

There is evidence of a desire to improve the quality of the public schools' educational program in Wyoming through the continued development of high standards for certification and placement of teachers. Present regulations provide for recognition of specialized preparation. The present staff is dedicated to the efficient processing of credentials, uniform and consistent interpretation of rules and regulations, and impartial application of the personnel requirements. The early elimination of all substandard permits is a goal.

At the outset of its educational history, Wyoming had a problem quite opposite to the one which was to plague it later: It had too few school districts! When Wyoming Territory was organized in 1869, it had five counties, each of which consisted of a common school district extending the width of the Territory. This vast size compelled change; and the first Territorial Assembly gave the county superintendents power to divide settled parts of counties into school districts and to alter and change boundaries as conditions required. But even this authority did little to avoid the formidable distances between school districts.

Districts began to multiply; by 1892, there were 190; by 1900, 205; and by 1910, 303. In 1913, legislation was passed creating district boundary boards which were composed of the county commissioners and the county superintendent. A standardization movement was begun to encourage upgrading of schools. This movement fostered some consolidation of school districts. After a high of 415 districts was reached in 1930, the number declined to 382 in 1940.
Many districts had consolidated, but many others found themselves unable to support a proper educational program. Educational opportunities needed to be made equal in all districts; public funds needed to be used more judiciously. The 1947 Legislature, made aware of this need, appointed committees to study and recommend reorganization plans and in 1949 established criteria to govern organization of school districts. In essence, these stipulated that (a) the district should be large enough to organize a school program from kindergarten through twelfth grade; (b) the district should be large enough to hold desirable administrative and teaching personnel and have a large enough number of pupils to make progress possible and reasonable; (c) the district should be small enough in area and population that people would be able to participate effectively in support and control, and in the social affairs of the schools; (d) the districts could, if necessary, transcend county lines; and (e) the reorganization of the school district does not have to mean consolidation or abolition of neighborhood schools, and the district should have sufficient wealth to carry its program adequately with state and local funds. This legislation helped, for consolidation of districts accelerated. From 382 in 1940, the number slid to 312 in 1950, and to 200 in 1963.

The 1960-62 biennial report of the state superintendent stated that only about 30 percent of Wyoming's districts met the minimum standard for the kind of district organization that could produce quality schools; that is, that a good district is organized to operate a K-12 program in which meaningful integration of the curriculum can be achieved.

The same report stressed great differences in the abilities of districts in Wyoming to raise funds because of variations of valuations for each child. And with regard to qualified personnel, the report states that only 95 of Wyoming's 204 districts employed fully qualified superintendents, that 89 employed no superintendent or principal, and that 20 employed a fully qualified principal or head teacher. Only 26 of the districts could provide guidance services, either full or part time, and only 15 of the districts having sufficient population to provide for the mentally handicapped in special education classes were doing so.

Education of Indian Children

There is little evidence indicating concern at the state level for the problems of educating Indian children during the first half of the twentieth century. There seemed to be a general willingness to leave such problems to the mission schools and to the Bureau of Indian Affairs. The schools operated by the Episcopal and Catholic churches were originally maintained as boarding schools. In the early 1930's, with some financial help from the federal government, provisions were made for day-school pupils.

As financial support began to dwindle, the educational programs for the Indian children began to deteriorate. Both of the Episcopal schools (Robert's Mission and St. Michael's) were forced to close in the middle fifties because of the lack of funds. The St. Stephen's school continued to operate, but it was forced to discontinue its high school program in 1965.

At the closing of the federally supported day schools, the Indian children in the Wind River Reservation area were integrated into the public schools. It was soon apparent that the public school teachers lacked the training necessary to cope with the special problems inherent in the education of Indian children.

In 1958, a contract was negotiated by the Bureau of Indian Affairs with the State Department of Education. Under the terms of the contract, the department was to provide guidance services and other assistance to the local districts in improving their programs to educate Indian children. Funds were made available by the Johnson-O'Malley Act and the contractual period extended from 1959 through 1963.

A guidance counselor was employed by the state department and based in Fremont County, where a majority of the Indian children attended school. The counselor spent the first 3 years working with the children, parents, and teachers, attempting to provide them with a better understanding of the necessity for and problems of getting an education. A great deal of time was devoted to testing to identify the extent of each child's ability and to determine those pupils most in need of placement into classes for the educable retarded.

Although high school attendance improved during the first 3 years of the contract, there appeared little evidence that school programs had been significantly improved. A decision was made to change the emphasis from direct guidance services to consultative services in guidance and instruction during the last 2 years of the contract.

The services of the Johnson-O'Malley special counselor were discontinued in 1965, and funds for support of Indian education were made available to the local schools through Public Law 874. The local districts now have total responsibility for the education of Indian children, and their relationship with the state department is the same as in other districts.

FEDERAL-STATE RELATIONSHIPS

During the 1950's, there was considerable opposition to accepting additional federal financial aid that would involve matching funds by the state for the support of public elementary and secondary education—but such opposition did not extend to the university or community college. The thought of accepting federal funds (to which strings might
be attached) had for many years created controversy within the state.

Congress enacted the National Defense Education Act of 1958, and the issue was focused in Wyoming in the 1959 Legislature. That Legislature enacted a bill which stipulated that NDEA funds could be accepted providing the federal budget was in balance and funds were not available elsewhere.

Such a situation arose in 1960, when Superintendent Linford received official notice from the federal government that its budget was in balance. Through action of the state board, the state superintendent and the board went on record as having ascertained that funds were not otherwise available for certain educational efforts. The state board then decided to accept NDEA funds. However, the jubilation of the advocates of federal aid was short-lived.

Political opposition began to brew among some legislators who viewed with disfavor the actions of the state board and state superintendent. Opponents of federal aid to the public and elementary schools mustered their forces; and in February 1961, the Legislature enacted legislation to repeal the law it had passed in 1959 and to further prohibit the acceptance of such matching funds. By May, as a result of this legislation, Wyoming again became a nonparticipant in NDEA funds for the public elementary and secondary schools.

The fight over acceptance of federal funds for education continued in the 1960's. There was, however, a complete change of thinking by the 1965 Legislature, when it enacted legislation that permitted Wyoming to participate without qualification in the NDEA and subsequent federal legislation for education. The reasons behind this reversal are several:

1. The state was suffering economically; and outside money—including federal money—would stimulate the economy.
2. People realized that the university and the community colleges had benefited from such legislation and that the educational program of the schools could also benefit.
3. There was a general recognition that federal financial aid for schools was "a fact of life" and that Wyoming might as well use its own tax money rather than have another state use it.

Therefore, at long last, Wyoming became a full-fledged participant. As the last of the 50 states to enter the program, the state now was faced with staffing and other changes which accompany increased responsibilities. The first year's operation could perhaps be described as hectic, partially because local districts had little time to plan before application deadlines were upon them. The enactment of Public Law 89-10, the Elementary and Secondary Education Act of 1965, provided more problems for the still understaffed state department as well as for the local districts.

Considering the frustrations of the district superintendents faced with the flood of paperwork that was required for participation, interest throughout the state increased at a rapid rate in acquiring the federal funds. There was soon a definite recognition that many of the constructive programs that were developed would have never been possible without federal assistance.

Perhaps the greatest change in state department functions has been in the areas of instruction and planning. New staff have been added in a number of subject areas, thereby making it possible for the first time for attention to be given to the nonvocational subjects. One example of the emerging planning function—long-range planning—is that of a Title V, Section 505, project which has received much attention in the state and may perhaps point the direction of educational change for the future. This project, "Designing Education for the Future: An Eight-State Project," has drawn much support from both lay and educational leaders.

While some of the districts in the state still had refused up to 1965 to accept federal funds, the great majority have done much to improve their programs through funds available under NDEA Title III. Since the passage of the Elementary and Secondary Education Act of 1965, great strides have been made in improving educational opportunities for the disadvantaged through Title I funds. Many creative projects have resulted from participation in Title III, including a planetarium at Casper which has drawn nationwide attention.

The controversy in federal financial aid for Wyoming education has not died down completely. Discussion now seems to be centering around categorical aid versus general aid—not over the accepting or rejecting of federal funds.

Changes have indeed been made in Wyoming.

Early Developments

Historical Background (1)

The origin of the first Samoan settlers has been lost in antiquity, although anthropologists agree that they landed more than 2,000 years ago. The islands were probably first discovered by Europeans when the Dutch explorer Jacob Roggeveen visited them in 1792. The United States’ interests were first represented when an American explorer, Charles Wilkes, surveyed the islands in 1839. Great Britain appointed representatives to Samoa in 1847; the United States, in 1853; and Germany, in 1861.

After several years of disputes over possessions, Germany and the United States divided the archipelago in 1900, the portion of Samoa east of longitude 170° coming under U.S. jurisdiction. The Department of the Navy administered the territory until 1951; the Department of the Interior took over that year and continues to administer Samoa today.

1900 to 1911

The Navy was given the responsibility of administering these islands because it had maintained a coaling station in the Pago Harbor for a number of years. This adversely affected the development of Samoa’s educational system, for despite the desire to do a good job, the Navy was not equipped or staffed for such a task. Moreover, it had to start from scratch, as the islands had only five schools worthy of the name. The London Missionary Society operated two well-established schools for boys at Fagalele and Ta’u in Manu’a, and a girls’ school at Ataloma. The Roman Catholics ran a girls’ school in Leone, and the Latter-Day Saints had an agricultural school at Mapusaga. All were private religious institutions, open only to very restricted groups of students and staff, and offering limited facilities and a narrow curriculum to a few students under unfavorable conditions. Even where teachers were qualified, their isolation and inability to keep up with the changes in the outside world soon diminished their effectiveness.

The London Missionary Society did maintain a large number of “pastor’s schools” in connection with its churches. Taught by village clergymen whose educational experience scarcely qualified them as teachers, the schools were almost totally without equipment. But children did learn a little arithmetic and how to read and write in Samoan. There were no public schools, nor did the social structure provide for them.

Commander B. F. Tilley, commandant of the naval station at Tutuila and the island’s ranking officer, regarded the missionary efforts as encouraging. But he realized that literacy in the Samoan language, desirable as it might be, would not prepare the people for the problems they would face as the new century increasingly made its way into the islands. With great foresight, Tilley saw that the Samoans needed an international language to bridge the technical and social barriers. They needed practical courses that would provide them with the ability to understand the world into which they were moving. Thus, he proposed that government-sponsored manual training schools be established at Tutuila and in the Manu’a group, and that domestic science courses for girls be offered in Tutuila. In all of these schools, learning English would take precedence over everything else.

After surveying the problems, Tilley’s executive officer, E. J. Dorn, wrote to the Department of the Navy, suggesting that the commissioner of education, then a functionary of the Interior Department, be given the task of inaugurating an educational system for American Samoa. The Navy assented, and the commissioner surveyed the educational situation. He recommended that $347.50 be made available immediately for school equipment, especially for a number of new McGuffey’s Readers. Despite the modesty of his proposal, which was the first request for federal funds for education in Samoa, the money was not immediately available, and the letter and recommendations were filed for future reference.

Tilley felt a strong sense of frustration. He could not achieve the objectives he felt were necessary with the 57 inefficient, church-operated village schools spread throughout the islands (3). Both Tilley and his successor made additional unsuccessful requests for funds. Finally, with the help of Father Bellwaldt of the Catholic Church and a subsidy from the territorial funds, a nonsectarian boys’
school was established near Leone, the government's first venture in education.

In the following year, 1903, the government actually organized its first school, which consisted of one Samoan teacher and was located in Ta'u, Manu'a. At the same time, a number of non-Samoan residents clamored for a school in the Pago Bay area. A study revealed the advantage of having such a school, and, with a $1,000 appropriation from the Copra Fund, the second school was opened in Fagatogo in 1904 with two stateside teachers. These two instructors, along with the one in Manu'a, were the first public school teachers in Samoa. During the next 2 years, despite the evident need for schools and the requests for funds, naval authorities were unable to provide any additional help. Districts were forced to raise their own money and create schools, as did the people of Leone, who organized a boys' school in 1906. The school in Ta'u, Manu'a, was closed in 1906 when the teacher decided to leave the island.

First Efforts To Organize a System

Long before the Americans took over at Tutuila, intense rivalry had developed between the various missionary groups. Antagonisms carried over into the educational programs, and the subsidy granted the Catholics in 1903 aggravated the situation. By 1911, the atmosphere was tense, with little hope for improvement. The schools were uniformly deficient in many respects, including goals for the students, and showed little desire to cooperate to correct the deficiencies. Education was almost entirely dependent on agencies not subject to government regulation, and efforts to work through these agencies only increased the ill will and the failures.

The new commandant and Governor, W. M. Crose, greatly perturbed over these conditions, attempted a two-pronged attack. First, he invited all outlander teachers to a conference (only the Catholics did not attend) which passed a resolution calling for compulsory education. This in turn resulted in a new directive prepared by Crose entitled Regulation To Enforce the Educational Right of Children, to be put into effect in February 1912. Crose's second step entailed a complete survey of the territory's educational needs and deficiencies. He pointed to the inability of the island's economy to finance solutions to the serious educational problems he uncovered, and he requested federal aid. Submitted first to the Secretary of the Navy, the request was then turned over to the Department of the Interior, and finally to the U.S. Commissioner of Education, P. P. Claxton. The commissioner suggested that the size of the schools be increased and the number of schools reduced for more efficiency. He proposed an annual education budget of $20,000, which would include matching funds from the territory. He also recommended that a Department of Education be established with an American director and assistants and that a normal school to train Samoan teachers be founded. Exhilarated by the possibilities, Crose immediately obtained the $10,000 in territorial funds required, and it appeared that an adequate, publicly supervised system of education would emerge in the islands. He was severely disappointed when the federal funds were again denied.

The government's efforts were not completely wasted, for they created a new educational atmosphere in Samoa. Not only was Crose backed by a cooperative spirit among the residents, but he now had an organization through which to work; although purely voluntary, it was far better than anything thus far. Despite a lack of specific power to do so, he did name a school board to bring some order to the process of learning in the territory.

During the next 5 years, there was a settling down after the early excitement, and little improvement took place in the educational system. The Ta'u school acquired a statewide principal in 1914, but it was destroyed by a hurricane the following year and was not reopened until 5 years later. With the schools at Leone and Fagatogo (now called the Poyer School), which had moved into new buildings at the head of Pago Bay, there were still only three public schools operating at the end of the decade.

In summary, during the period from 1900 to 1920, the inability of the territorial government effectively to present its educational difficulties and needs to Washington, which was half the world away physically and even further culturally, defeated the hopes of several farsighted commandants. Some important steps had been taken, however. The three public schools could only care for a small proportion of the students, but this was a start. The Samoans, supporting the schools entirely from limited local funds, had demonstrated their desire for education. The Board of Education had been able to develop minimum standards, which were now accepted by the majority of educational institutions, and a gradually developing spirit of harmony laid the foundation for a real system.

THE BEGINNING OF A SYSTEM

The revolution in Samoan education began when Captain Waldo Evans became commandant to the new Office of Superintendent of Education, establishing a practice maintained for the duration of naval stewardship of the territory. He then appointed a new Board of Education to replace the group formed by Crose and divided American Samoa into 15 school districts.

When the Samoan Legislature, the Fono, met in 1921, it followed the Governor's lead and imposed a school tax of $2 on each taxpayer, which was, however, not nearly enough to support a satisfactory system. To meet the appalling shortage of qualified teachers, the Fono immediately inaugurated 6-week training courses or summer
workshops. By the end of the year, six government elementary schools were operating. Although the school system had doubled its facilities, it still needed funds from the federal government, which did not fully understand the situation and remained unconvinced that a large investment in education for the Samoans would be of value.

Throughout the decade, growth was slow, the school budget increasing only from $9,000 in 1921 to $20,000 in 1930. Student enrollment in the six schools climbed from 737 in 1921 to 2,118 students in 24 schools by 1932, with formal education now extended through the ninth grade. In 1932, the Frederick Duclos Barstow Foundation for American Samoa provided Samoan education a new impetus. Young Barstow had spent considerable time in the islands; when he died, his parents established the foundation in his name for the people he had learned to love. At the foundation's expense, the University of Hawaii surveyed the territory's educational needs, finally recommending that the foundation build one good school so Samoans could see what quality education meant. The Feleti School, the nickname given to Barstow by the Samoans, opened in 1933 with Gordon Brown as its first director.

The Feleti School provided a fine model, but the other schools could not come up to its standards without more money. They were still below state-side standards, and conditions were deteriorating. When Benjamin O. Wist of the University of Hawaii was appointed advisor of public education for Samoa in 1935, he found approximately 2,000 students in the government schools struggling to learn the English language. It was not until 1938 that the first textbooks designed specifically for use in Samoa were printed.

World War II had an adverse effect on the already stagnant educational situation. As might be expected, little attention was paid to the schools during the war, the enrollment remaining about 2,000 in 1944, the same as a decade earlier (4). But immediately following the peace, a new emphasis was placed on education. For the first time, the Navy sent an officer with training and experience to act as director of education. Under his leadership, a high school was opened in October 1946, the first to provide an education for general public use beyond elementary school. The first principal, Harrison Matsinger, his wife, and three Samoan teachers had the responsibility of developing the curriculum from the ground up. They soon discovered, however, that their 108 pupils' earlier education had not prepared them to meet state-side high school standards. Though more effort and money for Samoan education first flowed into the high school, the trend was reversed by 1950, so that more was now spent improving elementary facilities.

The Department of Education gradually ceased to be the stepchild of the territorial government and began to take a definite form. In 1949, the system was placed under the control of an eight-member Board of Education consisting of three Samoans, the island's chief justice, and four naval officers. The chaplain still served as director of education, but a professional educator was employed as superintendent of instruction. All children from 7 to 15, inclusive, were required to attend school. The high school, now approved for veterans' training, enrolled more than 200 students. Perhaps more important, the aims of education had changed during these years. Basically, the schools had been organized to teach English to Samoans and to promote "Americanization," but these goals were no longer sufficient. The Fono expressed regret and concern that young people were losing respect and appreciation for Samoan customs. The native culture was losing ground because of the schools' philosophy, and this prompted many to want education deemphasized in Samoa.

From 1929 on, schools were concerned not so much with "Americanization" as with trying to fit into the pattern of Samoan life, reflect the natural socioeconomic environment, and train the people to deal with Samoan problems. When the general aims for education were established in 1935, they merely stated that the schools would attempt to preserve the best of the Samoan culture and, at the same time, provide the people with the necessary intellectual and social tools to meet the world into which they were moving. But stating aims and organizing schools to achieve them proved to be two different things; although the system had many accomplishments to its credit by 1951, neither of these general goals had been fulfilled. Only a few tools were available. These were elementary schools, still housed in fales (open, thatched huts), several junior highs, and a high school, all using Western-style structures, equipment, and supplies. Each village was responsible for its own elementary school. Samoan supervisors were visiting the schools and checking on the equipment and the teachers; the vocational training school provided job training for veterans; and in 1952, the Feleti School had been turned into a teacher-training institution. Progress had been achieved, but the total picture was still one of inadequacy.

THE MODERN ERA

In July 1951, the administrative jurisdiction of American Samoa was taken over by the Department of the Interior after 51 years of naval administration (5). Civilians replaced naval personnel in governmental positions, including those within the Department of Education. The director of education, the head of the department, was directly responsible to the Governor. The assistant to the director was placed in charge of personnel, buildings, and equipment for all junior high schools. Superintendents were placed in elementary and secondary schools, the vocational training program, and the teacher-training program.
The new government provided a stability unobtainable previously, but old problems continued to plague the system. A high birthrate produced an increasing number of students, threatening to overwhelm existing facilities. During 1952, 14 new schools were completed along with living quarters for 12 teachers, making a total of 51 public schools, including 4 junior highs and 1 high school. Of the 5,116 students in the territory, 3,861 were enrolled in the public school system. It was still difficult to obtain federal funds, and the local districts could not finance quality education. Like the Navy, the new civilian officials were forced to do their best with limited resources.

Early in 1952, the director of elementary education assumed control over the teacher-training program to coordinate it more closely with the actual operation of the schools. Since 156 teachers in the system were not nearly enough, it was necessary to fill the training program with high school seniors. They still represented an enormous improvement over the teachers in the field at the time. To further meet this teaching shortage, the director of education decided to change the Feleti School into the Feleti Memorial Teacher-Training School.

Gradually, the new civilian administrators adopted the official objectives for education which had been stated as early as 1933. In 1955, the department stated officially that the purpose of the curriculum would be to teach (a) both Samoan and English in the elementary schools; (b) the fundamental processes of reading, writing, and arithmetic; (c) science and health; (d) the social sciences; (e) vocational preparation; and (f) avocational pursuits. It declared that it would teach exclusively in English in the village elementary schools and the junior high schools. It would operate senior high schools for a select group of junior high graduates and offer college preparatory, commercial, and teacher training in 1-year postgraduate courses (6). The board resolved to continue the long-established practice of compulsory education for students age 7 to age 15, inclusive. It also hoped to provide scholarships and special training for qualified students in needed fields. The Governor reported:

It shall be the policy to upgrade the entire school system as soon as possible, with initial emphasis being placed in the five junior high schools which feed into the high school and into the community a better trained group of young people at an early date (7).

Although the director of the Department of Education and his two assistants were from the United States, the administrative assistant, a consultant, a chief supervisor, and the eight supervisors responsible for general instruction were all Samoans. The assistant principal of the high school was a Samoan, as were 50 junior high and elementary principals. The director was responsible for the supervision and coordination of the school system, curriculum, organization, buildings, facilities, training programs, scholarships, budget submissions, and accreditation and certification.

The department itself consisted of a Division of Elementary Education responsible for grades 1 through 9, and a Division of Secondary Education responsible for grades 10 through 12 and for the teacher training, vocational training, and adult educational testing programs.

Operating the island's educational system was extremely frustrating. True, there were advances, such as the dependents' school for children of stateside employees, the Feleti School for prospective teachers, the book rental agency for various Samoan communities, and a Samoan culture program concentrating primarily on writing books for the schools on Samoan culture and customs. But the teacher-training programs still had to depend on the Barstow Foundation for financing. The elementary schools of the open fale type were taught mainly by teachers who had little opportunity for schooling beyond the elementary level. Most of the junior high buildings, never adequate anyway, were deteriorating rapidly; the high school was still very selective, admitting only about 105 students each year, which allowed only 30 percent of the junior high graduates to attend high school. The adult education program was limited to providing information, when it should have been engaged in creative academic activities. It was small wonder that the 1959 budget of $323,211 fell far short of meeting the schools' real needs.

THE TURNING POINT

In 1961, when the Committee on Interior and Insular Affairs presented a report entitled "The Study Mission to Eastern (American) Samoa," a complete analysis of the island's economic needs and a survey of the conditions of the school system, Congress became thoroughly aware of Samoa's educational problems. The committee reported that educational standards were lower in Samoa than in any other territory under U.S. jurisdiction. It charged that the untrained, poorly equipped, and underpaid teaching force labored in unequipped, inadequate buildings which would be unrecognizable as schools in the States. It did praise the efforts of both Samoans and stateside administrators, giving them credit for the situation's being no worse than it was. The report pointed out a single truth: There had been a lack of resources to finance an adequate education system.

The committee found a prominent flaw to be the contradictory philosophy of education. It hailed the admirable attempts to preserve old Samoan traditions but concluded that they were not being adjusted to changing conditions. A desire for full citizenship was growing among Samoans, and the culture itself had drawn more and more toward the American way of life. Samoans were finding new opportunities to travel to the United States, and an ever-increasing number of people were moving into the islands, diminishing the influence of local traditions and customs.
The committee had little trouble finding prominent examples to reinforce its conclusions. The island had been fragmented into a number of inefficient, tiny districts. For instance, in the Leone area seven elementary schools operated within a radius of 1 mile, most of them within sight of the others. Poorer areas failed completely to provide schools, and their children received no formal instruction. The fales, housing half of Samoa's public schools, were open to the elements, had inadequate lighting—if any at all—and the meager equipment was usually makeshift and outmoded. The elementary schools had no libraries and little audiovisual equipment. The entire system operated on a shoestring, spending less than $50 per child per year, including teacher salaries, which were by far the largest item in the budget, low as they were. Only $5,000 had been allotted in the 1960 and 1961 budgets for teaching aids, and $4,800 for equipment.

The committee recommended that the village schools be consolidated into new, larger buildings and that salaries be increased to attract qualified state-side teachers. Real direction was needed to solve the contradiction of teaching the traditional Samoan culture while striving for a state-side standard program. But leadership depended as much on the Governor as on the Department of Education. The community's wishes were supposedly reflected by the Board of Education appointed by the Governor, but the board's powers had fluctuated through the years, at times being completely removed, and it now acted only in an advisory capacity. The history of change and conflicting ideas had left little in the way of policy, and now it was very difficult to implement long-range planning.

When Governor H. Rex Lee assumed office in 1961, he was appalled at the territory's educational structure. Armed with the committee's report, he spent the early part of 1962 outlining a 3-year rehabilitation program, a full, effective analysis that enlisted the strong support of the Department of Education. Congress and the Administration backed his proposals and appropriated $9.5 million in October 1962.

With enough money, things happened quickly. The University of California at Berkeley helped recruit 40 new teachers. Three new high school buildings were constructed, and, for the first time, 100 percent of the junior high school graduates were able to enroll. But the Governor was still dissatisfied. Untrained teachers still staffed most of the elementary schools, and nothing had been done for the adults. Lee wanted to raise the entire educational level of the territory as rapidly and dramatically as possible.

After a great deal of deliberation, the Governor proposed that a dozen or so outstanding teachers bring the best in education to students in 300 classrooms through educational television. This would also provide adults with classes in everything from health to self-government. The Secretary of the Interior supported the proposal, and Congress appropriated funds for a survey to determine if it would be feasible. Under the direction of the National Association of Educational Broadcasters, a team headed by Vernon Bronson concluded its study with a strong recommendation for ETV. By the end of 1963, workers were constructing housing for new state-side personnel, erecting the transmitter and antenna, extending the capacity of the power plant, and installing power and TV equipment in the remote villages. At the same time, the department began working on a plan that would set up 26 consolidated elementary schools.

The new studio, christened the Michael J. Kirwan Educational Television Center, began broadcasting to the elementary students the next year and by 1965 carried complete secondary school programming. Using six channels, it presented materials in every subject area to all grade levels from 1 to 12. Presenting television as the core of a teaching program rather than as a supplement attracted worldwide attention. Visiting teams of educational experts flew in to study this revolutionary concept in action. It is still too early to make a final evaluation of its effectiveness, but there is general consensus that Samoan students are learning faster and better than ever before.

ADMINISTRATION AND SUPERVISION OF EDUCATION

From 1900 to 1965, the administration of the school system fluctuated mainly according to the different approaches of the various Governors. The Department of Education did not develop a firm pattern of functions and administrative responsibilities until the Navy's authority ended in 1951. From 1961 to present, the changes have been mainly sequential, growing naturally out of expansion and progress. Undoubtedly, gaps will continue to appear as the system develops, but the present organization seems to allow for expansion and problem solving (8). Because of the unique structure of the educational process as it evolved in Samoa, each of the organization's functions will be briefly described (9).

Director of Education

The director is responsible for the entire system of education, the only person qualified to answer the questions and requests of the Governor. He serves as ex officio chairman of the elementary curriculum advisory committee, the secondary curriculum advisory committee, and of the joint committee for the articulation of subject matter. Since the Department of Education performs one of the major functions of the territorial government and the director serves as a member of the Governor's board, he occupies a position of great responsibility in the government as a member of these committees.
The department has five assistant directors in the following areas: (1) the assistant director for administration, who is responsible for all department records, including budget and personnel records, for assigning housing, and for maintaining contractual obligations; (2) the assistant director for engineering services, who is a qualified, licensed TV engineer in charge of installing, maintaining, repairing, and replacing all technical equipment associated with television; (3) the assistant director for management of the Instructional Resource Center, who operates the center and coordinates its various activities; (4) the assistant director for elementary instruction, who supervises the TV teachers, research teachers, teacher training, and all other aspects of education in the elementary schools; and (5) the assistant director for secondary instruction, who supervises the TV teachers, research teachers, classroom instruction supervisors, the vocational and skills program, and all other aspects of education in the secondary schools.

The Department of Education has announced the following objectives (10): (a) To improve the technical and subject matter competency of the native Samoan teachers; (b) to prepare the great majority of Samoan children to live, work, and make better lives for themselves in Samoa; (c) to offer equality of educational opportunity to all the children in all the villages in all the islands in American Samoa; (d) to increase competency in the use of English to the point where language is no barrier to educational development; (e) to raise the level of learning opportunities to the point where those Samoan children who desire to go beyond high school may obtain a sound educational base to enable them to enter American colleges and universities and compete on an equal level with other American students; (f) to develop such manual skills and functional arts as will contribute to a better economic and social structure; (g) to provide opportunities for adults and out-of-school youth in language competencies, civic understanding, and vocational skills; and (h) to train native Samoan teachers and technicians to fill all positions within the department.

True universal secondary education for the children of Samoa, which began in 1964, brought about several changes in the educational system. Supplanting the traditional classroom situation with an imaginative system using television as the basic tool brought about modifications in class schedules, a substitution of large classes for the small ones, and new approaches to study. The new consolidated high schools included rooms designed to serve classes that could be supervised, directed, and motivated by a single teacher. Built especially for televised lessons, they have a maximum flexibility to accommodate individual study or small, special, intermediate classes without affecting the efficiency of regular instruction. In turn, they influenced the organization of the staff and faculty, as reflected in the Department of Education’s new positions.

In the new system of cooperative instruction by television, an instructional team composed of the classroom teachers and those responsible for the televised presentations develops the scope, sequence, and goals of each course, subjecting them continually to criticism and modification. The role of the classroom teacher necessarily changes as he amplifies, relates, and reinforces the concepts presented on the screen. The actual operation of the cooperative team is depicted in the chart on the next page.

Schools

Basically, two types of elementary schools operate in the territory. In the least accessible villages, such as in Fagali’i and Asu, the old, open, fale-type structures still exist. These will be replaced in the near future by the other type, the new consolidated schools designed to fit the Samoan environment while providing the best instruction possible by television. Architecturally, the new buildings are similar to the oval Samoan fale but are built of concrete and supplied with all the materials and equipment usually identified with classrooms. The roofs are shingled to harmonize with the surrounding environment, and the grounds are attractively landscaped. Each school consists of approximately six buildings, each containing two classrooms with an appropriate number of TV receivers, desks, blackboards, and storage cabinets. One building is occupied by the principal’s office, the cafeteria, and the teachers’ room. A home for the stateside principal is built in each complex. The elementary schools have four regular levels of instruction, each encompassing two grades, and a fifth level equivalent to the eighth and ninth grades. At present, 5,053 students are enrolled in the 22 new consolidated elementary schools.

The territory has three high schools in operation, one on the site of the old High School of American Samoa in Utulei, another at Leone, and a third just opened in Manu’a. A new high school is being built on the eastern end of Tutuila. These new schools consist of groups of buildings of circular design, making possible the greatest utilization of space and televised instruction. They contain large classrooms, areas for individual study, and special instruction rooms, quite adequate for the present enrollment of 2,800 students.

The Dependents School, located at Utulei, is open to children of all contract employees as well as qualified Samoan children. It offers a standard stateside program of instruction for grades 1-12 and serves approximately 280 students.

Today, the teacher-training program is a 2-year course that includes classwork in methods and content, observation, and practice teaching. Occupying a portion of the Feleti Memorial Library in Utulei, it also offers a college preparatory program for high school graduates. Presently,
40 students are in teacher training and 20 in the post-scholarship program.

Other Department Functions

To upgrade the educational level of all the people, the islands need a strong adult education program. This is achieved partly through cultural, academic, and social programs on evening television. Also, the Instructional Resource Center and several schools offer regular academic programs for adults.

The Department of Education maintains its own publications department at the resource center in Utulei. Thus, it is able to furnish all printed materials for each lesson, as well as specially prepared books, readers, and other materials to supplement its programs.

The department supervises the Territorial Library, which provides professional services to the schools and the community. The library has 14,000 volumes in general circulation at present, in addition to an extensive reserve section.

The department also supervises the selection of students for the mainland scholarship program, at present giving 85 Samoans an opportunity to attend colleges and universities in the United States.

FOOTNOTES

3. In 1902, the churches sponsored the following number of schools: London Missionary Society, 40; Catholic, 13; Mormon, 3; Wesleyan, 1.

5. U.S. President, Harry S. Truman, “Transfer of Administration of American Samoa from the Secretary of the Navy to the Secretary of the Interior,” Executive Order No. 10264, effective July 1, 1951.

6. Nurses were trained in the hospital, and medical or dental practitioners were trained at the Central Medical School in Fiji.

8. There were 210 teachers in the system.

9. Appendix B outlines the entire organization of administrative functions.

53 Guam DEPARTMENT OF EDUCATION
Harley G. Jones
Trubee Joy Jones
INTRODUCTION

The actual history of the Department of Education of the Government of Guam may be considered as dating only from the passage by Congress in 1950 of the Organic Act of Guam. This act, which established Guam's governmental structure, provided for most of the island's present legislative self-government as an organized but unincorporated territory of the United States. Previously, what was called the Department of Education was merely an arm of the Naval Governor's administration and could not correctly be considered a State (or Territorial) Department of Education in the sense that it is today. Nevertheless, the post-1950 history of the department must be viewed in its relationship not only to the previous U.S. administration, but also to the unique historical background of the island, going back far earlier than when the United States took it over in 1898. Since Guam's Department of Education embraces both territorial and local agencies, the roles of individual schools and events not directly in the department's jurisdiction assume a greater importance in the department's development than might otherwise be the case.

Guam is the largest and southernmost of the Mariana Islands, located 5,100 miles west of San Francisco. In June 1966, 45,877 permanent residents and about 40,000 military personnel and dependents lived in this 225-square-mile area, which is 30 miles long and 4 to 9 miles wide (1). The entire island is surrounded by coral reef 20 to 700 yards wide. The climate is warm and humid, with temperatures ranging from 80 to 90 degrees. The average annual rainfall is 83 inches, but the weather pattern is punctuated from time to time by severe typhoons which do considerable damage. The farmers raise corn, sweet potatoes, taro, and cassava, as well as chickens, pigs, and cattle. The majority of Guamanians are Roman Catholic, but a number belong to various Protestant denominations.

Grateful acknowledgment is made to all who have generously assisted in the preparation of this history. Among those people are Ivan Ward Lasher, the former director of education, Government of Guam; Teresita Salas, assistant superintendent for curriculum and instruction, Department of Education; Scott Wilson, professor of anthropology at the College of Guam; and Emily Johnston.

THE SPANISH PERIOD

The island was left unclaimed by the West after Magellan's visit in 1521, until 1668 when the first Spanish colony arrived—Jesuits, led by Padre Diego Luis de Sanvitores (2). Christianity was introduced to the Chamorro people, and the first educational instruction was given. The hundred years following the landing of these first missionaries were years of turmoil and saw the end of the Chamorro people as a race. The Chamorros received the Jesuits with friendliness and courtesy at first but in time grew restive as their old ways of life were threatened by the new religion (3).

Spanish colonization continued, and the priests kept on with their work, interrupted by church burnings and ambushes by the now hostile Chamorros. The College of San Juan de Letran, started earlier and then closed because of wars between the Spaniards and the Chamorros, was reopened, as was a girl's school in Agana. In less than a century, Guam's old culture had been nearly wiped out by suppressive military Governors and by the new religion, Christianity. A new people was emerging to which the present-day Guamanians owe their origins. In spite of the turmoil of the seventeenth century, roads had been built and permanent sites for towns and villages established. Agana became the capital of the Marianas, and the religious education of the people was stubbornly continued.

During the eighteenth century, Guam became a nearly forgotten Spanish colony. The Jesuits were ordered out of the islands by the Spanish monarchy in 1769 and
were replaced by members of the Order of Saint Augustine. The College of San Juan de Letran and the useful handicrafts and fine ranches were neglected, cattle ran wild, and the people deteriorated into a state of near poverty.

In 1771, a new Governor, Don Mariano Tobias, arrived. He reintroduced animal husbandry and established two public schools (one for boys and one for girls) that emphasized reading, writing, arithmetic, and music. The nineteenth century saw little improvement in Guam's economic or educational situation. The Treaty of Paris in 1898 ended the Spanish-American War and ceded Guam, among other territories, to the United States.

Although this short review of Guam's pre-American history includes very little about the organization of the education of Guam, it does bear direct relationship to the Guamanians' attitude toward education and the fact that modern education is still in its infancy here. During the 300 years of Spanish rule, very little was done to educate Guam's people. Whatever was accomplished up to 1900 was done by the Jesuits and, to some extent, the Augustinians. This was mostly religious training, however. Education for the masses was limited to a speaking knowledge of Spanish. Little writing was taught. Also, what was taught in the schools seldom carried over to the home. (Guam's present-day educators still cite this as the major language-teaching problem, for English is used only within class at school, and it does not usually carry over into the home. English is always a second language for these children, as was Spanish under Spain's rule.) The minute school is out, Guamanians to Chamorro. Among the students there is always a second language for these children, as was Spanish under Spain's rule.) The minute school is out, Guamanians to Chamorro. Among the students there is really no interest in English except as a convenience at school.

Most children receiving education during the Spanish rule were from well-to-do homes. Even this training was rudimentary—elementary arithmetic, reading, writing, and Spanish. Many of the ruling people felt that too much education of the masses would lead to trouble. (Later, even some American Governors were of this opinion, a lamentable problem of the ruled and ruling throughout history.)

However, the Roman Catholic Church had established schools in all the large towns and villages throughout the island by the time of the American takeover, including intermediate grades for boys and girls at the College of San Juan de Letran and the College of Las Ninfas.

THE AMERICAN PERIOD

Thus education stood when Guam became a possession of the United States in 1898. The first specific American recommendation for the establishment of public schools on Guam is in a report prepared for the government by Lieutenant Vincendon L. Cottman, USN. Cottman's report indicated that almost everything would have to be done for Guam to get it on its feet. He wrote, "Establish Public Schools and compel all children to go to school and teach them English, having male teachers for the boys and women teachers for the girls" (4).

Because all of Guam was declared to be a naval station, its Governors were appointed by the Secretary of the Navy and commissioned by the President. The Governors were in complete charge of island life, which meant that, as under the Spanish, patterns of government changed with each new Governor. Still, the problems themselves remained the same, and paramount among them was education.

Lieutenant William Edwin Safford, USN, taught the first English class in Guam in 1899. He reported as follows:

I myself have started a night school for teaching English three nights a week. I have about fifty pupils, ranging from the age of five to fifty years. Among them, besides the natives, are a number of bondsmen (Italians) and Chinese servants of the officers' mess. I usually begin by pointing to various objects and pronouncing the corresponding English names. My pupils repeat the words after me; then I teach a few adjectives, such as long, short, thin, thick, hard, soft, illustrating the meaning by having these attributes; then a few verbs, such as walk, sit, stand, fall, catch, see, hear, speak. Most of my pupils do pretty well but the youngest do the best (5).

Navy officers were placed in all positions of authority in the government. In spite of domestic problems, Captain Richard P. Leary, the first Naval Governor, and Lieutenant Safford succeeded in organizing public offices to such a degree that it was possible to see a pattern developing which could be set on paper. Among the new departments was the Department of Education, headed by the Governor.

In addition to the existing Spanish Catholic schools, three private schools were started in 1900 and 1901 for the teaching of English. Rose Custino, daughter of a Guamanian whaler, had earlier opened the first in 1900. Lieutenant Albert Moritz, chief engineer of the station ship USS Yosemite, began an English class; the first Protestant missionaries, under the auspices of the American Board of Missions, also began a school.

Lieutenant Safford found that most of the people could not even write their names, so the first compulsory education order was issued, called "General Order No. 13, requiring every adult resident of the island to learn to read, write and speak the English language." (6).

A general order issued by Captain Leary in January 1900 included these stipulations:

1. All necessary expenses for the maintenance of the public schools will be defrayed by the Government.
2. Religious instruction in favor of any particular church or creed is prohibited . . . .
3. All children between the ages of eight and fourteen years must attend school, unless excused therefrom by competent authority for good reasons that interfere with their attendance.

4. Instruction in the English language will be introduced in the public schools as soon as suitable teachers can be provided.

Commander Seaton Schroeder relieved Leary in July 1900. Schroeder, at least, had something more than a beginning from which to work. Among his first concerns was, of course, education, but the cost of rebuilding after a devastating typhoon hit the island in November 1900 reduced the small island treasury to almost nothing.

In spite of this, by October 1901, three schools with English instruction were started in Agana under the supervision of H. H. Hiatt, a graduate of Iowa State University, who was assisted by his wife and daughter. English and arithmetic were the principal subjects. Guamanians were so eager to obtain this education that the schools became overcrowded immediately, another problem unsolved to this day. Hiatt was able to stay only until 1902, when funds to pay his salary ran out. In September of that year, a severe earthquake almost totally destroyed Agana, including the schools. With the exception of a short-lived effort to restore one of the schools, all remained closed for the next 2 years. There were no funds to rebuild them.

Commander G. L. Dyer, the next Governor, reopened the schools in June 1904. His staff of teachers included three Guamanian girls, two American clerks, and a marine. Dyer had opened eight schools by the end of his administration. The enrollment, 297 students in Agana and 26 in Asan when he began his term, had grown to 1,592. Dyer asked, in his annual report for 1906, for $49,140 from the Navy to operate these schools. His request was denied.

Dyer was succeeded by Captain E. J. Dom in December 1907. From his arrival, Dom improved the schools considerably. Four more were opened, including Dom Hall.

Yigo (pronounced Gee'-go) school was built in 1913. In 1914, a permanent school building went up in Umatac, and an intermediate school—called a high school—was built on the hill overlooking Agana near the present Governor's house. In 1915, a 53-pupil school was built at Yona (J6-nya). In 1919, Saturday morning normal classes began for teachers; they studied mathematics, history, and other subjects. Emphasis was still on reading and speaking English, and educational supervision was still under the Navy.

The Governor delegated responsibility for education to his aide, and in the Governor's report for 1917, this officer is first officially referred to as a "head" of the Department of Education. After 1919, the Navy chaplains were required to administer the department. The duties of chaplain, along with the total welfare of Guam's educational system including an annual report to the Governor, presented an almost Herculean task. The chaplain was assisted by a trained American educator who acted as superintendent of public instruction. In 1933, this office was officially designated superintendent of schools, and assistant superintendencies were established in 1946. The title of superintendent was changed to director of education in 1952.

A Board of Education

A Board of Education was established in 1938. Members consisted of the head of the Department of Education and one elected representative each from the Guam Teachers Association, the Parent-Teachers Association, the House Council of the Guam Congress, and the House of Assembly of the Guam Congress. Members were chosen for a term of 2 years.

However, the people did not have an effective share in the control of education; their board's function was purely advisory, and its only power was to set its own time for meetings, draw up its own rules of procedure, and keep minutes of its meetings and activities. As far as teachers themselves were concerned, absolute obedience and uniformity of instruction were demanded of them, with the central office, under the Navy, in control.

Briefly, the growth of the schools from 1921 to 1931 was as follows (8):

<table>

In 1924, a special normal school was opened to train Guamanians as teachers.

Good health practices were strictly enforced in the schools, including vaccination, inoculation, and worm checkups. Practical classes in fishnetmaking, weaving, cooking, and sewing were established and continued up to 1941. The 4-H Club became popular.

Thomas Collins, appointed superintendent of schools in 1922, adapted the California school curriculum to the local system. In 1924, he reorganized the school system, tested and regraded the children, and began a new program for children from grades 1 through 8. He encouraged children to contribute through their schools to the Guam Recorder, as an incentive to increasing local interest in reading. Boys went to school in the morning and girls in the afternoon; a double session was instituted in 1939 because of overcrowding. The practice of holding a grand program for the closing day of school was inaugurated, with the closing days staggered in order that leading government officials might attend the different schools to observe the festivities.
Collins also directed the first teacher summer session, beginning in June 1932. He established a 2-year normal school with instruction in college-level subjects. “Attendance was compulsory for all teachers and candidates for teaching positions. The summer teacher’s institute, as it was later called, has been a part of the inservice training of Guamanian teachers since that time” (10). These summer institutes were held until 1951.

Three days after Pearl Harbor was attacked (December 10, 1941), Guam fell to the Japanese, and for the first time an American possession was held by an enemy power. During the occupation all education came under Japanese control. The Japanese zealously built new schools and forced the attendance of the children during the day and adults at night. Reading, writing, arithmetic, Japanese history, and simple Japanese language were taught, patriotic songs and games were learned, and a rigid calisthenics program followed.

Because of shortages in the teaching staff, young Guamanian men and women were chosen as “volunteers” to attend Japanese training schools. From these they went into the school system as interpreters, assistants, and supervisors in agricultural projects. However, in spite of subjugation, Guam remained loyal to the United States.

During the 2 years following the Americans’ return in 1944, Guam was under military rule. Nothing was left of the old island school system, and over a year passed before schools began to resemble anything like what they had been before the war. Again, the schools taught basic subjects and began to educate the people in practical and industrial arts. Under a welfare and education department, supervised by a Lt. Commander Votow, the schools slowly recovered. Simon A. Sanchez, superintendent of schools before the war, helped the department, and all those who formerly had had anything to do with education were assembled. By October 1944, five schools had been started.

Everything was makeshift. The pupils brought with them what they could. Classes often were held outside under the coconut palms. Chalk, paper, and pencils were supposed to be furnished, but one veteran teacher of this period recalls using all boards painted black on which writing was done with bits of broken pottery (11). When possible, materials were mimeographed, and every school book surviving the war was added to the meager libraries.

As new villages were begun and old ones rebuilt, temporary village schools also were built, and by 1946, 21 schools were in operation, with an enrollment of 7,150. School population soared with the natural increase of the native Guamanians, the influx of new military and civilian personnel, by a program inaugurated to bring Trust Territory students to the high schools, and by a Filipino colony. For example, the Department of Education's annual report for 1955 showed an enrollment of 8,726 pupils in grades 1-8 and 22 schools in operation (12).

The first postwar junior high school was opened in 1953. It was located in Agana; Pedro C. Sanchez was principal. The school served children in the seventh and eighth grades, with a ninth grade being added in 1954. By 1960, Agat and Inarajan also had junior high schools.

The first high school education in Guam began in 1917, when courses were offered in the Armesen Building, located beside the Governor's palace in Agana and taught by naval officers and a civilian, John A. Pearson (13).

In 1923, the first real high school was organized. Its enrollment was nine students. The school was discontinued in 1924, to be replaced by the Guam Evening High School. In 1928, the evening school graduated its first class of seven members; its graduates are among the leading citizens of Guam today.

The Seaton Schroeder Junior High School, Guam's first modern junior high, was opened in 1930, with Mrs. Agueda I. Johnston (sometimes called “the first lady of Guam”) as principal. In 1931, 17 students comprised the first Schroeder graduating class.

In 1936, George Washington High School was opened. Mrs. Johnston became its principal. A standard high school curriculum was used, and Stanford achievement tests were given to those applying for admission to the seventh grade; from thirty to fifty-five new students were admitted each year. Two classes graduated before the war, but the third class was interrupted by the Japanese occupation and could not complete its courses until 1945. Even before the war, overcrowding forced the schools to hold double sessions in a school year running from July to March.

At the end of the 1946 school year, Mrs. Johnston was transferred to the Department of Education, and most of the teachers who had started high school with her resigned for better positions or left teaching. Norbert Tabery became the new principal, with a staff of new teachers, including a number from the mainland. Tabery was principal for only 1 year and then assumed the position of director of education, the job of principal going to Christian P. Zeien, who held this position from 1948 to 1952. While Tabery was director, the high schools' curriculum expanded from a strictly academic program to include home economics and physical education, as well as teacher training.

With the continuing increase in enrollment and the awareness by the island people of the importance of education, the Guam Legislature appropriated $500,000 for a new, permanent high school. Various problems delayed construction until 1957, when the appropriation was increased to $1,500,000. Tumon Junior-Senior High School began operation in September 1957. Its name was changed to John F. Kennedy High School after President Kennedy's assassination. Albert Fain was principal of the new high
school, which had 1,300 students, 55 teachers, and 6 administrative staff members. Tumon was accredited its first year (14).

Administration by Department of the Interior

In 1949, President Truman transferred Guam’s administration from the Navy to the Department of the Interior and appointed Carlton S. Skinner as Governor of Guam, ending 50 years of Navy administration. In February 1949, “A Bill To Provide Civil Government for Guam and for Other Purposes” (arising out of the complicated matter of land claims on Guam) was introduced in Congress. It was passed by the House in May 1950 and by the Senate in July. In August 1950, the Organic Act of Guam was signed by President Truman, who declared it to be effective as of July 21, 1944, the date of the liberation of Guam in World War II. It granted the inhabitants of Guam the privileges of U.S. citizenship and a larger measure of self-government.

Certain sections of the Organic Act pertained to the education department of Guam. Executive authority was vested in the Governor, who was given responsibility for supervision of and control over all executive departments and agencies of the government. The Governor was empowered to appoint, with the advice and consent of the Legislature, the heads of all departments. In making such appointments, he was required by law to give preference to qualified Guamanians. He also could, in general, remove from office all department and agency heads. His appointment was for 4 years, and a Secretary of Guam, carrying with him full powers of the Governor in case of a vacancy in that office, was appointed to serve in place of the Governor when he was “off island” and to assist him when he was in his office.

Ford Q. Elvidge was the second civilian Governor of Guam, following Skinner. During his term he tried to improve the island’s school system. However, his efforts were not met with great cooperation from the Territorial Legislature, and he resigned in April 1953. Still, according to Carano and Sanchez, The Guam legislature consistently approved Department of Education requests for funds and in some instances actually increased the budget requests. The budget for fiscal year 1957, however, was an exception. That year, after public hearings, the legislature’s Committee on Taxation and Finance recommended cuts of over $180,000. The proposed cuts were opposed by a group of legislators composed of Congresswoman Cynthia J. Torres and Lagrimas L. G. Untalan. All were veteran educators of both the prewar and the immediate postwar periods. After lengthy and heated debate on the floor of the legislature, most of the proposed cuts were restored (15).

Although sporadic attempts at adult education had been made before World War II, the majority of Guamanian adults had not had much opportunity for educational advancement. The few adult schools were evening schools, taught by interested military and civilian personnel, but constant changes in staff plus economic problems discouraged any real planned program. However, in January 1952, the Department of Education, realizing the vocational needs of the islanders, opened the Guam Evening Vocational School. Such courses as business English, shorthand, cabinetmaking, radio repair, appliance repair, motor repair, accounting, blueprint reading, bookkeeping, clerkenography, and office management were offered. Vocational training had been stressed from the time of the first American occupation in 1899, most of the Naval Governors realizing the need for more independent skills for the Guamanians. By 1930, agriculture had become an integral part of the public school system, and by 1941, vocational education had become equally important.

After the war, emphasis on vocational training was continued. Tabery, while principal of George Washington High School, introduced on-the-job training and later, as director of education, appointed Paul Carano vocational coordinator. Carano “supervised the apprenticeship training of 432 students in military, government, and civilian business establishments” (16). Attempts to get federal aid for this program were unsuccessful until 1958, when President Eisenhower signed into law an omnibus bill passed by Congress bringing aid to the program. George Washington High School established a regular vocational department in 1951 and recruited industrial arts teachers from the mainland. They worked under the supervision of Robert Moran, vocational consultant in the Department of Education.

Since then, educational opportunities for adults have increased rapidly, with an apprentice school at the naval station opened by the U.S. Navy in 1956, a trade school opened by the Government of Guam, and a night school program begun in 1960.

With the coming of the free, compulsory 12-grade school programs following World War II, the islanders wanted education. The 12th-grade graduate was a person of stature on the island, but for those with the ambition to continue their education, there was no place to go. Until the Organic Act of 1950, Guamanians were not free to travel off the island at will. Besides, most of them could not afford to. A few young Guamanians had been sent to the States for advanced training before the war, but even so, not many Guamanians held college degrees. By 1940, only two Guamanian teachers held degrees, and these teachers were employed part time. The first professionally trained Guamanian teacher in Guam’s schools was Pedro C. Sanchez, hired in 1949 (17).

An attempt to start a normal school in 1946 at Adelup Point failed for lack of students. Following this, the University of Hawaii, during the summers of 1946, 1947,
and 1948, sent as many as five instructors to Guam to conduct basic college preparation courses. No summer session was held in 1949 because of misunderstandings over housing and transportation.

At the Guamanians' request, the University of Hawaii considered starting a full-fledged college program for the territory. The financial uncertainties of such a venture caused university officials to decide against it, however.

The Guam Legislature authorized establishment of a territorial college in 1952. José R. Palomo, the first Guamanian director of education, contacted various educational institutions in the States to obtain advice on beginning a junior college. Ohio State University was willing to help. Palomo appointed Pedro C. Sanchez the first Guamanian dean of the college. Buildings went up at Mangilao, and in June 1952, the first session of the Territorial College of Guam began. The emphasis was on teacher training; 192 enrolled—110 regular students, the rest elementary school teachers taking in-service training.

John S. Haitema was director of education during the college's second year, and the emphasis continued to be on teacher training and the community college concept.

The college continued to grow, adding secretarial training, junior accountant training, junior college 2-year training for those wishing to continue toward a degree at some other college, government employee in-service training, and noncollege credit courses for adults.

In 1959, the Western College Association accredited the college for a 3-year period. In August 1961, with the passage of Public Law 6-40, the Territorial College became the College of Guam, a 4-year institution awarding the baccalaureate.

Dr. Sanchez was named its first president, and the college moved to its permanent location overlooking Pago Bay and the Pacific Ocean. Today, the college is separate from the Department of Education and is governed by a board of regents. It offers several 2-year technical courses, such as nursing, in addition to degree programs. Looking to the future, it plans to offer graduate degrees at the university level.

During the 1950's, members of the Legislature continually expressed great concern over education on the island. In July 1960, the Legislature passed a generous scholarship bill, authorizing more than 150 scholarships—

For students wishing to study in mainland colleges and universities. Other scholarships were authorized for use in the Territorial College of Guam. The law on the free use of textbooks was amended so as to enable students attending private schools to benefit from the act. At the close of the first session in 1960 several congressmen showed concern over the matter of teachers' salaries. Two bills were introduced providing for salary increases for educational employees.

Guam's young population is swelling at an alarming pace, putting a great strain on the educational system. There is a great need for—

Skilled, technical, and professional labor from within the local resident population while at the same time preparing our students for competition with those who are the products of other educational systems. The aims and purposes of education on the island today do not differ greatly from those of prewar Guam, with the exception that less emphasis is now being placed on agriculture.

Guam's greatest educational problem is developing students' proficiency in the English language. There is a subtle resistance toward English, principally among the older Guamanians. Chamorro is often spoken in government offices and in businesses, in spite of "Speak English" signs. And Chamorro is still the language of the home. This naturally causes a problem in communication and is the basis for much misunderstanding, not only on the part of the statesider who expects to be able to transact his business in English, but on the part of the Guamanian, who is sensitive to criticism concerning his language.

Much effort has been made recently to supplement the teaching of English in the classroom, doubtless impaired because of little carryover into private life. In March 1964, the Board of Education adopted the ungraded primary, to be used in place of grades 1, 2, and 3. Under this plan, each child's rate of learning is studied, his progress is recognized, and teaching is adjusted to give the child as much time as he needs. Both the slow learner and the gifted child are profiting from this.

Operation Head Start was inaugurated in Guam in 1965. Local educators hope that through Head Start and the ungraded primary, younger children will find English a more usable language and will carry their learning into the home.

The Brodie Memorial School for Exceptional Children, with a new school and all new facilities as of 1966, is increasingly able to care for the specialized needs of exceptional children. For older handicapped persons, the Division of Vocational Rehabilitation has a well-planned and improving program. Guam's high schools lost their accreditation in 1965, and additional consultants were added to the department, including one in audiovisual, in the start of the department's commitment to expand and develop its educational media resources. This was probably one of the department's most significant postwar decisions, in terms of its long-range impact on education.

Great strides have been made in recent years in adult education. Guam now has an excellent program, conducted mainly in the evening, and taught by trained teachers and vocational instructors.

To further advance the education of adult Guamanians, the College of Guam conducts night courses, not
only at the college, but on the military bases. Scholarships are available for students to continue their higher education at the College of Guam and in the United States.

Many people have been involved in shaping the educational philosophy of Guam. H. H. Hiatt served as superintendent of schools from 1901 to 1913. Jacques Schnabel, an American resident and one of Guam's early teachers, took his place until 1922, when Thomas Collins replaced him, to be succeeded by Alice V. Wall in 1925. Following was Mrs. Esther M. Riddle. In 1927, Simon A. Sanchez became superintendent. He held the office until June 1939, when he retired. After Sanchez came, successively, Oscar L. Musgrave, Edwin Battiste, and Richard Tennessen. Teresita Salas served in an acting capacity at various times between appointments of superintendents.

The Directors of Education

George V. Hall, in 1947, began to reshape the department. However, the tenure of the directors of education was too short to allow them to carry out long-range plans. From 1947 to 1953, four directors and three acting directors served. In 1952, Dr. Hailema took office and served until July 1957, when John R. Trace of Ohio replaced him. Trace resigned in July 1962, to be replaced by Eric Dennis.

Because the Department of Education was under the complete control of the Governor, the Guamanians themselves had little voice until 1938, when the first Board of Education was formed. However, even this was controlled by the Governor, who appointed the members to 2-year terms and limited the board's power to "strictly advisory function to matters pertaining to buildings and grounds, material, equipment, new school districts, sessions and socioeconomic conditions affecting the school program." (20).

After the war, the board was reestablished by the Governor, with changes, and in 1949, the Guam Congress made further changes. The board was now composed of one member from each of the two Houses of the Guam Congress; three members elected at large; three representatives of the armed forces, appointed by the Governor; and one representative from temporary residents not members of the armed forces, also appointed by the Governor. The director of education and the superintendent of schools were ex officio members, without voting power. The board was still largely advisory until the passage of the Education Code by the first Guam Legislature in 1952. This code gave the board the power it needed to become a policy-making body, which helped improve the relations between the educational system and the legislative and executive branches.

Each year more tax moneys are needed to supplement the federal aid programs, placing greater strain on the people themselves. No end is in sight, as the birthrate soars and more and more schools, textbooks, and educational facilities are needed. Since no educational tax structure exists as yet, politics enter into the enacting and allotting of appropriations via the Governor's office and the Legislature, causing at times great delays in starting desirable education programs. Guamanians in general are not sophisticated enough in political matters to follow the maze of political maneuvering which must, as a matter of course, accompany this type of arrangement. Federal appropriations and tax revenues are beyond their understanding. They are apt to be indifferent to school board meetings and legislative hearings. They need more education in civic responsibility to become aware of the needs of their educational system and their potential contribution to it.

Guam's strategic importance today makes it vital that its children be well educated. It is inevitable that the future will bring more youth programs and more schools, both academic and vocational. More consistency and stability will be needed in administrative areas and school administrative areas, and school administrators will require more mainland training in order to keep Guam abreast of modern educational advances.

The policy of importing qualified teachers from off-island must be changed to an upgrading of Guamanian teachers themselves, thereby lessening the great teacher turnover each year. The cost of living on Guam is high. An urgent need of the moment, one on which the Department of Education is constantly working, is to increase salaries to such a point that island teachers will wish to return to Guam after leaving the island for their advanced degrees on the mainland.

On Guam, the challenge and possibility of fulfillment present themselves to any educator undertaking the task of teaching its youth. Guam's past, present, and future combine to make it a unique area where the educator can see the evolution of social change before his very eyes. Guam has the opportunity of meeting this challenge today and, for the first time, coming out on top; for it has, in the history of its educational endeavors, ably demonstrated that it has learned well the virtue of patience and the value of persistence.

FOOTNOTES

1. Agana is the capital with a population of 1,204, but Sinajana has a population of 4,246, Tamuning has 2,842, and Agana Heights has 2,304.

BEFORE THE "BIG DITCH"

During the time when the French were attempting to construct the Panama Canal, little effort was made to organize a system of public schools. The children were instructed usually at home or in private schools. But when the United States gained control of the Canal Zone in 1904, although President Theodore Roosevelt's major concern was to "make the dirt fly," the Isthmian Canal Commission authorized the establishment of a public school system. The following June, William Howard Taft, Roosevelt's Secretary of War, approved spending $30,000 for this purpose.

The first school in the Canal Zone opened at Corozal in January 1906, using borrowed tables and chairs, a few sample textbooks, and some other supplies collected on the isthmus. The Corozal school and those that followed were first supervised by the Collector of Revenues, but in May 1906 they were turned over to the Bureau of Municipalities. The Canal Zone's five municipalities immediately enacted ordinances making every person having legal charge or control of children between 6 and 14 years of age responsible for their attendance at the public schools for regularly prescribed terms. The ordinances stipulated that persons violating them would pay a $5 fine for the first offense and $10 for subsequent offenses (1).

Seven months later, the educational system had so expanded that it was made a separate division under the Department of Law and Government. David O'Connor, head of the department, was appointed the Canal Zone's first superintendent of schools. In 1907, schools for white children were opened at La Boca, Ancon, Pedro Miguel, Paraiso, Culebra, Empire, Cristobal, and Colon. The teachers for these schools were carefully selected from numerous applicants, with preference given to those with normal school training and previous experience in the United States. In fact, 14 of the 18 chosen were experienced teachers. But it proved difficult to hire colored teachers, so there was a delay in opening the schools for colored children at La Boca, Las Sabanas, Paraiso, Culebra, Empire, Gatun, Cristobal, and Playa de Flor. This continued to be a problem for several years.

The Canal Zone schools were divided into eight grades to conform to similar organization of elementary schools in the United States. The curriculum included reading, writing, spelling, grammar, geography, elementary physiology, and free-hand drawing. In addition, the English-speaking children were taught Spanish and the Spanish-speaking taught English. For American children who were too advanced for the elementary grades, high school classes were organized at Culebra and Cristobal, teaching algebra, geometry, Latin, Spanish, botany, physical geography, general history, rhetoric, and biology. All children of parents employed by the Isthmian Canal Commission could attend free, but children of parents who were not residents of the Canal Zone were required to pay a tuition fee of $2 per month for the elementary grades and $4 per month for the high school grades.

In 1908, Professor Henry Lester Smith, a graduate of Indiana State University and the supervising principal in Indianapolis, succeeded David O'Connor as superintendent of schools. During the first year of his administration, a new white school was constructed at Gorgona, and new colored schools were built at Cruces, San Pablo, and Mount Hope. A new school for white children was authorized at Corozal to replace the small, temporary school, that had been the Canal Zone's first. One half the 36 white teachers hired for the following year were graduated from university or normal schools in the United States. Twelve had B.A. degrees, and 11 held certificates from normal schools—all had 2 or more years of experience in the States or the Canal Zone.

As the students progressed through the grades, there was an increasing demand for high school classes. At the end of October 1908, 20 students were enrolled in the two high schools, 11 at Culebra, and 9 at Cristobal. The following year, high school courses were offered at Gatun. This was the only time in the Canal Zone's history that three white high schools existed.

The high school students usually carried four subjects, but if first- or second-year students had excellent marks, they were given permission to carry an additional subject. These students attended two terms of 4.5 months.
each for 4 years to earn a total of 32 credits. Eight credits were required in Latin, eight in mathematics, four in history, one in civil government, three in physical science, and eight in English. An optional course in Spanish was open to all students. Courses in French and German also were available to students capable of carrying an increased load, and because of a shortage of Latin books a number of students took German to avoid any delay. The schools attempted to set standards that would enable the students to enter American colleges or universities without difficulty—they were being prepared for the entrance examinations at Harvard and Vassar.

To overcome the disadvantage of requiring teachers to instruct in all departments, and to establish a good working library, the three high schools were consolidated at Cristobal at the end of the 1909 school year. School spirit increased immediately. Every student joined the school association or one of the two literary societies. The boys interested in baseball and basketball organized an athletic association; the girls reported once a week for baseball and calisthenics.

In July 1910, a consolidation plan for the elementary public schools for white children combined the schools at Colón Beach and Cristobal into one school at Cristobal. Las Cascadas was consolidated with the school at Empire, and the Empire school was doubled in size. The Paraiso school merged with the one at Pedro Miguel, and the Corozal school combined with the school at Ancon. A second floor was added to the building at Ancon, and it was decided that the students residing in Corozal and Balboa would be brought to the Ancon school for the first-year high school courses as a branch of the Cristobal High School, rather than getting a separate school. Finally, in 1910, the superintendent moved the new Cristobal High School to Gatun, so that the students would have less distance to travel from points along the railroad line running the 50 miles from Panama City.

The school at Cruces, 4 miles above the railroad bridge at Gamboa, was first held in an old church badly in need of repair. In 1910, it was decided to construct a new building. The new building had to be framed at Bas Obispo, transported on a flatcar to the dynamite storehouse near the Gamboa bridge, then moved about 150 feet to the river where the 24- by 36-foot frame was loaded onto a raft and towed upstream to Cruces (2).

There were constant checks on the children's health, and the teachers were instructed to detect and prevent communicable diseases. To ensure proper lighting and ventilation, recommendations by an inspection team of medical officers resulted in lowering the outer wall of many school buildings to within 5 feet of the floor and eliminating the screen verandas. Individual water cups were ordered for all schools, and the public drinking glass on railroad trains was abolished. The medical inspection team found health problems in 409 (46 percent) of the 887 children examined.

In June 1911, the chief justice of the Canal Zone Supreme Court delivered an address at a baccalaureate service at Gatun in honor of the first graduating class of a Canal Zone high school. The commencement exercises were held June 30 at the same location. Two students graduated: Blanche Marguerite Stevens of Gorgona and Maria Elise Johnson of Gatun.

By March 1912, 75 students were enrolled in the high school (3). These students had previously traveled an aggregate of 1.5 million miles to and from school without an accident, but to reduce operating costs and minimize this railroad travel, the superintendent of schools agreed to a reorganization in March 1912. The first- and second-year students at Gorgona, Culebra, and intermediate points were directed to attend the school at Empire. The first- and second-year students south of Culebra and all third- and fourth-year students in the Canal Zone were to attend the consolidated school at Ancon. Two new white schools for first, second, and third grades were opened at Toro Point. The upper-grade school at Culebra was discontinued, and the children in the fifth, sixth, seventh, and eighth grades were transported to Empire.

Thirteen of the 75 teachers employed in 1912 held degrees from colleges and universities, 19 held diplomas from standard normal schools, and 12 had at least 2 years of normal school teaching and training. During January and February 1913, the Division of Schools received an average of five applications daily for positions as teachers in the white schools. Over 1,500 applications were on file during March, and 500 were from teachers with at least 2 years experience, all highly recommended. The conditions afforded unusual opportunities for selecting and appointing only those who possessed the highest qualifications.

**WORLD WAR I AND THE TWENTIES**

As the canal neared completion, areas that had once been villages and townsites were flooded, forcing constant changes in the location of the schools. By the end of 1914, grades 1-12 were offered at Balboa Heights and grades 1-10 at Cristobal. Ancon, Corozó, Culebra, Las Cascadas, and Gatun offered grades 1-8, while Pedro Miguel offered grades 1-7 and Paraiso grades 1-4. Grades 1-8 for colored children, most of whom were dependents of West Indians who had come to the Canal Zone to work during the construction period, were opened at La Boca, Ancon, Paraiso, Gatun, Mount Hope, and Cristobal. However, the Mount Hope school for colored children was closed in December 1915. Due to a shortage of funds, it was decided that children of employees who were not citizens of the United States and
not living in Colón or Panama could not be granted pre-
school privileges or entitled to attend the Canal Zone
schools. This closed the Ancon colored school, and it was
relocated in Panama City under new boundary jurisdictions.

When the "big ditch" was finally completed in 1914, the
Division of Schools became a part of the executive
department. The direct responsibility for administering
the Canal Zone schools now rested with the superintendent
of schools, who reported to the executive secretary of the
Panama Canal. The Governor appointed Albert R. Lang
superintendent of schools in 1913, and he served until
1922.

When the Corozal school closed in 1915, the few
children had to be transported to the Balboa school. In
fact, 1 out of every 10 white children and 1 in every 63
colored children were transported by train to school each
day. These pupils traveled an aggregate of 2,400 miles per
month-five-eights of a cent per mile. Seventeen stations
were located along the railroad line, but only Cristobal,
Paraiso, Empire, Gatun, Balboa, Pedro Miguel, and Ancon
had sufficient population to justify establishing schools.

The distances between the schools resulted in the
Zone's first athletic meet's, held in 1914, being performed
on the respective schools' grounds and the results tele-
phoned. By 1916, track meets were becoming popular, and
the "telephone meet" was discontinued. For the second
meet, a loving cup for the victor was ordered from the
States by the editor of a Panama newspaper, but before it
arrived, the Corozal school was closed, the physical educa-
tion director in charge of the meet had returned to the
United States, and the editor had died. No one would pay
the express charges on the cup, and it was in the Colón
express office when it burned to the ground in April 1915.
To eliminate a recurrence, the Division of Schools decided
to present a banner as a permanent trophy, which would be
transferred each year to the winning school.

In 1910, 30 students in the Empire school for colored
children had been given tools to cultivate a plot of ground
12 by 20 feet to discover the horticultural possibilities of
the Canal Zone soil for giving the students training. The
project was directed by a graduate of the Agricultural
College of Kingston, Jamaica, whose major aim was to find
out what fruits and vegetables could be raised at a profit.
The original plan was to confine the gardening to boys, but
the girls showed such an intense desire that permission was
given to them to enter the classes.

In May 1917, the U.S. Commissioner of Education
initiated a movement to have every boy and girl over 9
years of age cultivate a garden to alleviate the food shortage
caused by World War I. Since the school gardens for colored
children had been very successful, the Canal Zone schools
had a head start on such a project. With cooperation from
the supply department, the schools received the necessary
seeds and commenced the first plowing. The produce was
then sold by commissaries at the current price, and the
profits were used to purchase pianos, victrolas, books, and
pictures.

The war made it difficult for the schools to keep their
buildings in proper repair, both in the Canal Zone and in
the United States. The U.S. Commissioner of Education
urged the schools to try to maintain their standards during
the war and keep up regular attendance by the pupils. In a
letter of May 1917 to the superintendents of schools, he
said:

Everywhere there seems to be fear lest our schools of all
kinds and grades, and especially the public schools, will
suffer this year because of conditions growing out of our
entrance into the war. On the other hand, both for the
present defense and for future welfare of our country, as
well as for the individual benefits of the children, it is of
the greatest importance that the schools shall be main-
tained in their full efficiency, both as to standards of work
and attendance of children (4).

To provide the benefits mentioned in the letter, the
supervisor of industrial training conducted a vacation
school at the Balboa school shop during the summer of
1917. Morning sessions were attended by boys from the
Balboa area, while the afternoon sessions admitted students
who lived out of town. The 52 boys, ranging from sixth-
graders to seniors in high school, needed little motivation,
and the output of articles-ranging from library tables to tie
racks—for the 3 months equaled that for an entire school
year with only one-eighth as many class sections.

In 1918, night-school classes were opened for all U.S.
citizens. The schools offered a commercial course, including
typing, bookkeeping, and shorthand; a mathematics course,
including algebra and geometry; and courses in Spanish and
English. The participants paid $4 per month for each
subject and attended two nights a week for 2 hours. Classes
to accommodate those working night shifts were scheduled
on Saturday afternoons.

The colored schools did not advance as rapidly as the
white schools. The buildings were overcrowded, there was a
waiting list of those wanting to enter, the equipment was
inadequate, and the teachers were required to care for more
children than they could possibly instruct. New schools at
Cristobal and Gatun and the addition of seven new
schools in 1923 helped solve some of the problems, but schools
were still overcrowded and often lacked textbooks. But
when the Otis Classification Test was given to the sixth-,
seventh-, and eighth-grade colored students, the results were
considered below those of students in the white schools
and those in corresponding grades in the States. The results
of the 1926 Otis Classification Test indicated that the
average achievement of pupils in the white schools was
decidedly superior to that in the corresponding grades in
the States.
The white schools gradually increased in average daily attendance each year from 1915 to 1932, except for 1922 and 1928, while the colored school attendance fluctuated from year to year (5). The teacher-pupil ratio for the colored schools at times was 1 to 50, and in 1926 several hundred students did not receive any education. In 1928, over 1,000 students between the ages of 6 and 16 had no facilities. The superintendent of schools made an effort to secure needed facilities for the colored students, but the funds appropriated by Congress were insufficient for this purpose. Congress did appropriate additional funds in 1927 to employ 13 more teachers and allow over 600 more colored pupils to attend school. Eight new classrooms were constructed at Silver City and Cristobal, and six additional rooms were constructed at Gatun. To relieve some of the congestion and improve the standards of work in the colored schools, the superintendent approved a 12-month school year for the 1927-28 fiscal year and added manual training to supplement the courses in the eighth grade. In 1929, the facilities were still not adequate for the colored children, so 22 rooms were added to the schools, and new eight-room wooden buildings were constructed at Silver City, Red Tank, and Paraiso. With all the inadequacies, the 1932 expenditures were still 15 times the $30,000 first appropriated in 1905.

In 1930, the superintendent of schools initiated a survey of the Canal Zone schools. It was conducted by N. L. Englehardt of Teachers College, Columbia University. His report revealed that the white children were well above the standards existing in the States, but it did criticize the lack of breadth and enrichment in the academic subjects. As a result, the Balboa High School revised its curriculum to include biology, Latin American history, theory of music, fine arts, and advanced courses in household arts. The Cristobal school added chemistry, theory of music, fine arts, and a year of advanced mechanical drawing. The Cristobal mathematics requirement was increased to one-half year of algebra and one-half year of trigonometry, giving its students the same full 4-year course in mathematics as offered at Balboa. The survey also resulted in four new supervisory positions being established, including a director of research, a supervisor of art, and special teachers in art and music.

DEPRESSION YEARS TO REORGANIZATION, 1933-54

During the Depression, studies revealed that the professional fields were overcrowded but that semiprofessional positions, such as shop foremen, mechanics, accountants, draftsmen, and medical technicians, were open for young people with the proper vocational training. The bleak economic picture prevented many students from finishing regular 4-year college courses. The junior college movement was already popular in the United States, and during the twenties, some residents had begun advocating one for the Canal Zone. During the early thirties, there was an increasing demand that students be given access to a comparatively inexpensive college education.

The liberal local newspapers started a campaign to establish a junior college, contending that jobs were nonexistent in the Canal Zone and that further education was an economic impossibility for most students. But the official consideration of the junior college proposal hinged on finances. The administration was willing to start the college if the funds could be found, even though Balboa High School was underequipped and overcrowded, an equally pressing and important problem.

A detailed study of the feasibility of founding a junior college was started in 1932, but the necessary deliberations did not proceed fast enough to suit the public. An organization called the Pacific Civil Council devised a slogan for a junior college campaign: "A Junior College for the Canal Zone by October 1, 1932." Governor Harry Burgess voiced the administration's skepticism in a memorandum to the council's executive secretary: "I do not believe Congress will authorize the junior college until the United States' finances are in very much better shape than they are likely to be in the next two years" (6).

With Congress in a miserly mood and the Budget Bureau holding tight to the purse strings, it was decided to charge tuition for a junior college's operating expenses rather than risk a request for additional appropriations. The $50,000 necessary for a frame building to be built next to Balboa High School and for laboratory equipment, furniture, books, and other items came from funds saved on the La Boca school and the new school at Cristobal.

In September 1933, the junior college opened on the third floor of the high school building with 65 students. Before the end of its first year, the new junior college was recognized by the American Association of Junior Colleges (7). The following year, its new quarters were ready. By 1935, the Canal Zone Junior College had graduated 24 students, and 17 of these wanted to continue their training. A study 2 years later showed that 55 students who had attended the junior college during the first 3 years were employed by the Panama Canal Company or the Panama Railroad.

In 1935, the Canal Zone again expanded its opportunities for higher education by opening a normal school to train teachers for the colored schools in the town of La Boca. Only about one-eighth of the applicants were accepted, but 37 of the original students completed a 4-year course and received diplomas. At the same time, the Canal Zone Junior College added extension courses in accounting, business, English, shorthand, typing, Spanish, mathematics, and industrial lubrication. Over 600 students enrolled for these courses.

In 1936, the Division of Schools took over the Panama Canal Astronomical Observatory adjacent to the
Miraflores Locks to provide training in astronomy (8). Instruction has continued at the observatory, and it is very popular during the dry season. Lectures are held two evenings a week, and average attendance is usually 75, not counting the lectures for special groups on other nights.

During the 1940’s, many Army and Navy personnel returned to the United States, causing a decline in the school enrollments. The table in Appendix C reveals the fluctuation in the average daily attendance caused by the Depression, the entrance into the war, and the end of the war “baby boom.”

When the second wartime school year (1942-43) opened, the superintendent made plans to adapt the secondary school curriculums and activities to meet the war needs. Preinduction courses were introduced in a number of fields, including electricity, automotive mechanics, and aeronautics. A Victory Corps, organized in the high school to assist in such things as bond drives and Civil Defense, served as a focus for student activities. Two special 1-year curriculums in commerce and engineering were established in the Canal Zone Junior College, but the Selective Service Act and many opportunities for wartime employment kept the junior college enrollments at a low figure.

The postwar baby boom prompted the construction of a 27-room elementary school at Fort Kobbe to take care of the children residing at Fort Kobbe, Howard Field, Fanfan, Lacona, Rousseau, Rodman, and the Naval Ammunition Depot. The Bureau of Clubs and Playgrounds had started kindergartens, but in 1940 they became a part of the school program. A new kindergarten opened at Ancon in 1950. All sixth-grade pupils were transferred to the Balboa school when the administrative offices of the schools division were transferred from the third floor of the Balboa Elementary School to the Civil Affairs Building, thus adding four new rooms to accommodate the new students.

In addition to operating its normal school facilities, the Division of Schools operated an apprentice school for young American and Panamanian men who had won appointments to craft apprenticeships in the Panama Canal organization. Only a limited number of appointments were made each year, based on a competitive exam open to high school graduates. This program was administered under the direction of the apprentice committee appointed by the Governor and the superintendent of schools, who as a member of this committee was especially responsible for its overall management. The apprentice school was transferred in 1953 to the Electrical Division of the Panama Canal Company, which now has complete control of the program.

REORGANIZATION TO 1966

In 1954, following the demands from both individuals and groups within the Republic of Panama and the Canal Zone, the superintendent completed plans to reorganize the colored schools into Latin American schools, which would use a Spanish-language curriculum in place of the English offered previously. The conversion plan was based on the sound educational principle that the schools should be primarily concerned with preparing the child for an environment in which he would spend his adult life. An intensive training period was provided for all teachers not proficient in Spanish.

The change took effect from kindergarten through grade 6 when the schools opened in August 1954, with the conversion of the secondary grades planned for the 1955-56 school year. Since most of the older children had at least 3 or 4 years of Spanish-language classes, the change was smooth and efficient. Lower-grade children had no experience in Spanish, however, until the schools offered it in the fall of 1954. A difficulty arose over a lack of textbooks in Spanish. This was corrected, and the curriculum was soon patterned after the schools in Panama. Spanish was later incorporated into the curriculum of the American schools in grades 1, 2, and 3 providing a continuous Spanish program from grades 1 to 8. The entire changeover was completed by 1956, and the Latin American schools are now functioning normally.

In March 1954, an evaluation team for the Middle States Association of Colleges and Secondary Schools was favorably impressed with the schools and indicated that the system was intelligently administered for the welfare of the boys and girls. Its report further stated that the administration was responsible for two school systems: the American schools and the Latin American schools. Even though the community itself had no control over the administration of these schools, the evaluating team felt that everyone, from the Governor to the professional members of the staff, was sensitive to the needs of Canal Zone pupils.

The survey team recommended that the schools use audiovisual aids, pay more attention to health services, gradually give the students more responsibility for choosing their own programs, and establish similar programs jointly prepared by the pupils and teachers to use the abilities and skills of a great many students. It suggested that the superintendent install a follow-up program for students in college and in the world of work. It also pointed out the need for in-service training for the staff members, particularly since the Canal Zone was so far from the great centers of intellectual life.

Cristobal High School was praised for its varied and extensive program of studies despite its small enrollment. The student body possessed an average mental ability higher than that of schools of the United States, and 46 percent of its graduates attended institutions of higher learning. The ROTC and the English department received excellent ratings. It was recommended, however, that
Cristobal High School use extensive audiovisual aids and develop an art course.

The 220 teachers employed by the schools division in 1956 had received undergraduate training from 148 different colleges, universities, and institutions located in 38 states and the District of Columbia. Thirty-eight percent of these teachers received their education in the Eastern and Western North Central states, 24 percent in the Middle Atlantic states, 17 percent in the Eastern and Western South Central states, and 9 percent in the Mountain states. Nineteen were from Minnesota, the most from any single state.

Enrollments continued to increase, making it necessary to add new school facilities. A new Paraiso High School was officially opened in June 1956, constructed from a shell of a building used as a storehouse by the locks division. The classrooms and facilities, rivaling any of the American schools in the Zone, cost $125,000 and contained 10 regular classrooms, physical science and biology rooms, and a library. The library was designed to be used by the people in the community of Paraiso as well as by the students. The La Boca Elementary and Junior High Schools were vacated and their classes transferred to the more modern La Boca High School. The Latin American Junior College at La Boca also was discontinued, and the students who would have attended now enrolled at the University of Panama.

Handicapped children requiring special help had been permitted to attend regular classes if their presence did not unduly distract the other students and their mothers volunteered to work as orderlies and training assistants. At least the students benefited from social contact with other students. But in 1956, with 200 or more children in the Canal Zone needing special schooling because of physical or mental handicaps, the need for special training was brought to the attention of Governor William E. Potter. He responded:

It is only reasonable that the Government should provide adequate educational facilities for the handicapped in this remote location, where no municipal or charitable institution, research center or private school or clinic is available to our Canal Zone population (9).

The staff for the handicapped program was carefully selected: Thirteen members of the Canal Zone school system were scattered from New York to California to take special training for teaching and working with the deaf, blind, or otherwise handicapped. These teachers received a regular salary while attending school, but all summer school expenses were their own responsibility.

The program for the handicapped began in 1958 for children suffering from cerebral palsy, postpolio effects, heart ailments, and handicaps in motor control. The students were given a series of standardized and informal tasks, and a differentiated program was then designed for each pupil. Five children with physical handicaps were organized as a special class at Gorgas Hospital. They were given a regular first-grade curriculum as well as special activities, such as changing the date on the calendar—a real ceremony each morning—and learning to tell the time from a cardboard clock.

Speech and hearing difficulties were most prevalent at the outset of the special program. A survey revealed that 970 pupils in the U.S. schools and 796 in the Latin American schools—about 10 percent—were found urgently in need of speech therapy. Three trained speech correctionists worked with children who stuttered, had difficulty with articulation, or simply possessed unpleasant voices. Three children had speech defects due to cleft palates, and a few were cerebral-palsied children whose speech problems stemmed from lack of muscular control.

A new world was opened to blind children through the use of braille. Sight-saving classes also were started under this program. The rooms were gaily decorated to reflect as much light as possible, and large easels were used for fingerpainting so that the children could relax and be expressive despite their impaired vision. During the next school year, 1958-59, the special education program was expanded to the Latin American schools, and a remedial reading program was inaugurated at all schools. A new special education room was constructed at Paraiso.

All of the schools continued to expand, so that by 1959 there were 11,000 students in the U.S. and Latin American Canal Zone schools (10). The schools included 12 kindergartens, 15 elementary schools, five junior high schools, four high schools, and the Canal Zone Junior College. They employed 400 teachers and principals. A number of new buildings had been added and older classrooms remodeled or added to.

Scholarships in varying amounts were available to graduates of the Canal Zone high schools and college. Some were offered by the colleges to students who wished to attend, and various fraternal and community groups, such as the Elks, the Order of Eastern Star, and the Lion's Club helped finance college educations. The Canal Zone's two college clubs offered scholarships and others were available through the National Science Foundation and the ROTC. The military academies also offered appointments. At the beginning of the 1959 school year nearly 50 students were attending colleges in the States on scholarships.

During the 1960-61 school year, the schools division was modernized, and two independent functional branches were established, one for the U.S. schools and the other for the Latin American schools. An assistant superintendent headed each branch and reported directly to the superintendent of schools, who was responsible for the overall administration.

There has been no set pattern for recruiting superintendents; several have been appointed from within the system while others have been appointed from outside.
The Canal Zone's Latin American schools were established to orient the student to his native Panama and to prepare him for his eventual obligations as a Panamanian citizen. By 1962, this objective had been accomplished to the point that the Latin American schools coincided closely to those of Panama. Spanish was the major language, with English listed only as a subject in the curriculum. The Panamanian teachers and professors were well qualified, with degrees from the University of Panama and the universities of other countries. The enrollment in the Canal Zone Latin American schools in Rainbow City, Paraiso, Santa Cruz, and Pedro Miguel totaled 3,886 students; the staff, 154.

Curundu Junior High School has just been completed on a 25-acre site with room for softball and baseball diamonds, a football field, and a track. The two academic buildings house 48 classrooms, 2 study halls, and 24 laboratories for general science, chemistry, art, language, household arts, and shop. There is an administrative suite between the two academic buildings with teachers lounges, two audiovisual rooms, and eight standard classrooms. The new school provides education for grades 7, 8, and 9; previously, grade 9 had attended Balboa High School. A geodesic cafetorium seats 700 students for dining and 1,450 students for assemblies. The Canal Zone schools have come of age in every respect.

FOOTNOTES

1. After a superintendent of schools was appointed, he was empowered to consider exceptions to the compulsory school attendance ordinance if the child was physically incapacitated or lived a distance more than 2 miles from the nearest school and had no free transportation.

2. In its early years, this school did not meet with much success because an English-speaking teacher was hired to instruct students who spoke only Spanish. In 1910, a Spanish male teacher from Peru was hired.

3. Students were enrolled from all states except Arizona, Montana, Oregon, South Carolina, South Dakota, and Wyoming.

4. Letter from the U.S. Commissioner of Education to all superintendents of schools in May 1917.

5. See Appendix C.

6. Memorandum from Governor Harry Burgess to the executive secretary of the Pacific Civil Council in February 1932.

7. Since November 1941, it has been accredited by the Middle States Association of Colleges and Secondary Schools.

8. The Panama Canal Astronomical Observatory was founded in 1930.

9. Statement made by Governor William E. Potter to a committee of parents interested in special education programs, Balboa, Canal Zone, in October 1956.

10. Only 400 of the 11,000 students were tuition students from Panama.

SCHOOL OFFICERS 1474
APPENDIX B—ORGANIZATION CHART 1475
Columbus discovered the Virgin Islands on his second voyage to the New World in 1493 and named them "St. Ursula and the 11,000 Virgins," presumably because of the number of islands, islets, cays, and rocks he found. Danish, English, Dutch, and French voyagers visited the islands during the seventeenth century, but the English and the Dutch made the first recorded settlement on the island of St. Croix in 1625 (1). The Danes settled St. Thomas in 1666 and took possession 5 years later. In 1684, the Danes settled St. John and claimed it for the crown in 1717.

In 1685, the Danish West India and Guinea Company authorized a company of Brandenburgers to establish themselves in St. Thomas to carry on commerce—particularly the transportation and sale of African slaves. From that year to 1733, when the Danes purchased St. Croix from the French and organized the islands as the Danish West Indies, the number of slaves increased so rapidly that the European settlers became alarmed for their safety. To keep the slaves more docile, the whites decided to bring in Moravian missionaries to teach and preach to them, and the first of these landed in St. Thomas in December 1732.

As early as 1736, a missionary, Friedrich Martin, attempted to start a school for slave children. Over the following years, interest continued to grow in establishing an educational system in the Danish West Indies.

Several Lutheran missionaries arrived from Denmark to teach the slaves Danish and religion in 1756 and 1757, in hopes that they would eventually join the Danish-speaking congregation. But this idea was abandoned in 1771, and a separate Lutheran missionary congregation using the Creole language was established (2).

In 1781, the able and energetic Governor Peter Clausen issued a publication on the education of the youth, and that December a rescript called for selecting four of the best free Negroes from the Lutheran congregation to become schoolmasters and sextons. Children of poor slaves were admitted free to these Lutheran schools, but children of slaves who had accumulated property, free colored people, and other congregations paid a tuition.

In February 1785, King Christian VII resolved that free schools for white children should be established—one in St. Thomas and two in St. Croix at Christiansted and Frederiksted.

It was the Moravian Brethren, however, who brought free compulsory education to the islands. In 1774, King Christian VII had issued a special edict in their favor, which reduced the opposition to their work with the slaves and gained the cooperation of many planters. It was 1839, however, before Governor General Peter von Scholten signed an agreement in Germany with the authorities of the Moravian Church entrusting the church with the responsibility of starting free and compulsory education in St. Croix (3). The first school opened 2 years later at Estate la Grande Princesse, and within a year's time, with liberal contributions from the planters, seven other rural schools were started.

The instruction in these schools was first and foremost designed to improve the children's moral character and religious life. Spelling was taught principally with words found in the Bible, and reading consisted mainly of Biblical sentences. Lessons focused on incidents described in the Bible, and the morals were explained to influence the children's conduct.

At first, this free compulsory education did not extend beyond the child's eighth birthday. The obvious shortcomings of such a brief education were immediately recognized, and 2 years later a royal decree extended Saturday schools for children aged 8 to 11, and Sunday school for those from 10 to 14 years. A regulation issued in 1847 made the estate managers answerable for the school attendance of the children and liable to fines for non-compliance (4).

These schools were controlled by a school commission composed of the captains of the island's nine quarters and the judges of the Christiansted and Frederiksted jurisdictions. The director of education attended the board meetings and presided at required monthly teachers meetings (5).

The teaching staff was a combination of Europeans in key positions and British West Indians trained at the teachers training college founded by the Mico Charity in
Antigua, British West Indies. Promising students selected from each school assisted the appointed teacher by instructing younger children under the general supervision of the principal. The early teachers were all foreign men, but soon native men and women were sent by the government to Mico Institute and later to the Moravian Training College for Ladies, founded in Spring Garden, Antigua, in 1840. The first woman teacher began work in 1871.

The general outline of the system described above persisted well into the twentieth century. The only change worthy of note occurred in 1872, when the Moravian supervision of schools ended. In that year, the government assumed the right to appoint the school inspector.

In 1910, the last inspector, O. Rubner Petersen, was appointed. His tenure ended when the Danish West Indies were transferred to the United States in 1917 (6). Petersen attempted to break the system from its strong English tradition. Before taking up his duties, he visited Hampton and Tuskegee Institutes in the United States, and during his term he tried to introduce manual training and gardening for boys and housework for girls. Unfortunately, lack of funds prevented his plans from getting any further than the School Ordinance of 1912. Thus, little was accomplished to improve public education in the Danish West Indies from the turn of the century to the transfer of the islands in 1917.

**GROWTH OF THE DEPARTMENT, 1917-65**

When the United States assumed control of the Virgin Islands, the Navy was given the responsibility for administering them. In his annual report for 1917, the Governor, Rear Admiral James H. Oliver, declared: "The existing system of public education in these islands leaves about everything in the way of an adequate system to be desired" (7). He pointed out that more than anything else, the inhabitants needed instruction in the use of their hands, and this was not available. Not only was there no school where children could learn the trades and agriculture, but there were no normal schools in the islands, and since the natives were too poor to send their children to the United States for advanced instruction, they could not become school instructors even if they displayed natural abilities.

One of Governor Oliver’s first steps to improve public education was to appoint Daniel R. Nase as director of education and Arthur E. Lindborg as assistant director. According to the School Law of 1921, Director Nase was empowered to “appoint clerks, messengers, etc. at such salaries as may be provided by budget” (8). The law placed all schools under the education department, outlined the director’s duties and powers, and established a board of review for each of the two municipalities, St. Thomas—St. John and St. Croix.

In fiscal year 1929, the Colonial Council of the municipality of St. Thomas-St. John adopted legislation to convert its review board into a Board of Education with much broader powers. In one of its first acts, the Board of Education reclassified the public school teachers and extended summer vacations by one month. It also placed greater emphasis on instruction in mechanical arts, home economics, stenography, bookkeeping, practical agriculture, poultry raising, and beekeeping. It recommended that a Boy Scout movement be inaugurated and a scoutmaster be appointed to the staff of the Department of Education.

The Navy Department turned over the territory’s administration to the Department of the Interior in March 1931, and Paul M. Pearson was appointed the first civilian Governor. Three years later, he reported that “the valuable recommendations made by the Hampton Survey Commission, in their Report of the Educational Survey of the Virgin Islands issued in 1929, have formed the basic principles of the administration’s educational program” (9).

When the civil administration took over in 1931, George H. Ivins was appointed director of education (the Education Law of 1940 changed that title to superintendent of education). Throughout this period, there was considerable progress. In his 1937 report, Governor Cramer stated:

> Efforts were continued, but so far without success, to secure action by the local legislatures for the enactment of revised school laws based on the findings of a comprehensive survey of education undertaken in fiscal year 1936 ... In accordance with familiar American procedure [these revised school laws would allow] the election of school boards whose membership may be expected to create increasing local interest in and support for public educational activities. Clear and fixed standards of teacher training and promotion are established in them (10).

The 1939-40 Legislative Assembly enacted a new school law which superseded some portions of the Education Law of 1921, but though the law produced many positive results, the Legislature had not faced some of the territory’s serious educational problems. For instance, the law did not provide for automatic increases in teachers’ salaries based on length of service and satisfactory performance. It had no provisions for pensioning older teachers whose usefulness had declined. It did establish school boards with certain duties and responsibilities in line with the generally accepted practice of democratizing the control and direction of public education. Not until 2 years later did the municipality of St. Thomas-St. John adopt a standard for teachers’ salaries and for the promotion of teachers on the basis of training and service.

The education department continued to expand. It hired an assistant superintendent and six supervising teachers in 1942. The next year, it added administrative and supervisory assistants in physical education, art, music, attendance, adult education, vocational training, preschool child development, and teacher training.
In 1951, an Insular Board for Vocational Education was created, and it immediately hired qualified personnel for each of the major fields of operation: trade and industry, home economics, and vocational guidance. Later in the year, a vocational agriculture program was started on St. Croix.

In July 1955, the Governor's Executive Order No. 9 abolished the education department for the two municipalities and created the Virgin Islands Department of Education under the direction of a commissioner of education (11). Control was vested in the Virgin Islands Board of Education, composed of seven members appointed by the Governor: three residents each of St. Thomas and St. Croix, and one of St. John. To run the islands' 31 schools, the Department of Education was divided into four divisions as follows: elementary school, including kindergarten; secondary school and college, including adult education; auxiliary services responsible for buildings, grounds, transportation, procurement, school lunch, and business; and vocational education and rehabilitation. The department also had three bureaus: recreation, which included playgrounds, parks, and beaches; library and museums; and special activities, which included out-of-school activities, testing, scholarships, certification, census, and attendance. The department changed its four divisions in 1960-61 to include administration, educational programs, community services, and miscellaneous grants.

The commissioner was aided by an assistant commissioner and 23 administrators, including directors, chiefs, supervisors, coordinators, and administrative assistants. In a reorganization during 1961-62, new positions were created for a deputy commissioner for St. Croix, a deputy commissioner for curriculum and instruction, a deputy commissioner for business and auxiliary services, three new directors, a coordinator of educational statistics, and an education officer for St. John. Other positions were added in subsequent years, but the recreation bureau was placed under the Department of Agriculture in 1965-66.

The Department of Education continues to grow, adding staff for additional services as the need becomes apparent and the money is available. The department is somewhat unique in that its functions are analogous to those of a state education department yet they include those that are performed by city or county agencies and local districts on the mainland (12).

DEVELOPMENT OF CURRICULUMS

The islands' school system was organized on a 6-3-3 plan by 1921. The primary and elementary schools used the courses of study developed for New Mexico's schools in 1919, and the junior high schools based their course of study on that developed by Utah.

The School Law of 1921 empowered the director of education to "establish, maintain and direct, when funds are available, in addition to the rural and urban graded schools, such special schools as night schools, industrial schools, high schools, reform schools, and kindergarten schools" (13). However, no public secondary education was available on the islands until instruction was extended to the eighth grade in 1920. In 1922, instruction was extended to the tenth grade, 2 years later to the eleventh, and in 1931 it was available through the twelfth grade and a class of four high school seniors graduated.

The Bureau of Efficiency sent a committee to the islands in 1921 and in its report to Congress, the bureau chief, Herbert D. Brown, recommended that full emphasis be given in the first 6 years to manual training for boys and home economics for girls. The committee believed that the seventh, eighth, and ninth grades should be organized as an agricultural and industrial school under a junior high school department. Waldo H. Evans, the last naval Governor, disagreed with the committee's recommendation that the last 3 years of high school be eliminated. He pointed out that stenographic and bookkeeping courses in the high schools helped supply the business personnel for the large commercial institutions and government departments. When Dr. Pearson became the first civilian Governor 2 years later, he stated to the Secretary of the Interior:

An imperative need of the schools is that they should be modernized and made to meet the needs of the islands by training children to do and to become interested in what they can find to do in the islands. To accomplish this, the building up of an agricultural high school recommended by the Bureau of Efficiency is much needed. This school must be developed through the curriculum in the lower grades. The program of development must begin with the teacher. In order that the teacher may know what and how to teach these subjects, means must be found for bringing all teachers into a summer school, the only normal instruction available to them. For that purpose I plan to bring to the islands the most experienced and efficient instructors for a summer school and a new Director of Education (George H. Ivins) who is in sympathy with the plans and experienced in promoting them (14).

This disagreement as to which type of education was best for the children was reflected in the islands' two municipal councils and separate boards of education. A vocational institute established on St. Croix in 1932 for the next few years placed an emphasis on agriculture and the trades. St. Thomas High School also gave an increasing amount of time to cooking, sewing, and home economics in general, and to carpentry, cabinetmaking, and other manual arts. It offered courses in rug making and basketry to assist these growing island industries. More vocational courses were added during the Depression.

In 1933, the National Recovery Act provided funds for a very successful program in adult education whic...
trained the natives to work in the nursery schools it established in three large towns. The following year, St. Thomas High School introduced commercial courses in bookkeeping, shorthand, and typing; it established a vocational division in 1940.

The trend of adding commercial courses, arts, crafts, dressmaking, dramatics, foods, industrial work for girls, apprenticeships for boys in automobile mechanics, cabinetmaking, and printing continued through the 1940's. St. Thomas started evening school credits in vocational courses in 1947.

On St. Croix, the Department of Education cooperated with business establishments to place seniors in jobs for working experience during the morning hours. In 1948, the department established a veterans program in elementary and secondary subjects that enrolled nearly 300 veterans. The following year, vocational courses were added in automobile mechanics, electricity, wood-working, plumbing, and pipefitting. The veterans program on St. Croix also offered courses in masonry, carpentry, mechanical drawing, mechanics, and other related sciences.

When Congress passed a bill in 1950 extending to the islands the provisions of the Vocational Education Act of 1946, they became eligible for a maximum grant of $40,000 per year on a 50-percent matching basis. This immediately enabled St. Croix to add agriculture to its high school curriculum. In 1952, St. Croix added a trades and industry program and a course in plumbing, and it extended its agricultural program to adults.

In 1960, the principals and department heads of the islands' high schools met to develop curriculum materials, course outlines, and study guides. During the year, there was a definite improvement in instruction and curriculum on the elementary level, in part due to the equipment, materials, and reference books obtained with National Defense Education Act (NDEA) funds. These funds also strengthened secondary instruction in science, mathematics, and foreign languages and enabled the schools to offer guidance programs to the majority of students. By 1962, three types of vocational education training programs were available: the in-school program, the adult all-day program, and an evening-school program. With funds from Public Laws 85-864 and 85-874, the two high schools installed speech laboratories for foreign languages. Title V of NDEA provided funds for starting a guidance and testing center, and the number of counselors was increased from two to four.

As a result of the department's reorganization in 1962, the curriculum and instruction division began holding regular meetings to plan, study, and evaluate curriculum changes. Teachers, supervisors, and principals on all three islands developed teaching aids and outlines for language arts in the elementary grades. On the secondary level, following a visit by a committee from the Secondary Commission of the Middle States Association of Secondary Schools and Colleges, the staff worked together to develop a comprehensive curriculum, standardize textbooks, and adopt uniform requirements for graduation. St. Thomas' Charlotte Amalie High School and Christiansted High School were accredited in 1964.

The department continued to expand its activities and staff. With federal assistance in 1965, it engaged in plans for operating Head Start programs for preschool children, a cultural enrichment program for educationally deprived children, a Neighborhood Youth Corps for potential dropouts, and an adult basic education program.

In particular, the vocational education program expanded. The Julius E. Sprauve School on St. John offered practical arts and home economics, including courses in carpentry, agriculture, masonry, electronics, auto mechanics, electricity, plumbing, practical nursing, hotel and restaurant training, mechanical drawing, sewing, and fancy needlecraft. The department rewrote the vocational education state plan to qualify for additional federal funds under the Vocational Education Act of 1963.

**PLANNING FOR ADEQUATE CLASSROOMS**

In 1917, Denmark turned over to the United States 20 schoolhouses of various sizes to accommodate the 2,267 students. Although the number of pupils increased 50 percent, to a total of 3,411, during the first 16 years of U.S. sovereignty, no new buildings were erected and no major repairs were made. Two buildings that formerly housed U.S. marines and a former residence were turned into schools to accommodate the increase, but there was still much overcrowding. During the 1934-35 school year, in the midst of the Depression, seven new buildings were completed, and the others received extensive repairs (15).

The Governor's report to the Secretary of the Interior for the 1944-45 school year stated:

The need of a new high school and certain elementary schools, in addition to the remodeling of certain existing schools, continue to be the greatest handicap to the program of education in this municipality (St. Thomas and St. John). Present limitations of space have required the application of measures to restrict high school enrollment within the limits of the maximum capacity of classroom space . . . . The municipality of St. Croix, like the municipality of St. Thomas and St. John, is handicapped by the lack of suitable school buildings and equipment (16).

At the end of the 1948-49 school year, the Governor reported: "Enrollment in the public schools has increased over 30 percent in the last 10 years (to 4,401), but no additional accommodations have been provided" (17).

With federal funds available under Public Law 510 during the 1951-52 school year, plans were made to build two new high schools, an elementary school, and a new one-room rural school. Orme Lewis, the assistant secretary
of the Department of the Interior, was the principal speaker at the groundbreaking ceremonies in 1953 for the new Charlotte Amalie High School and the one at Christiansted. He later stated that the significance could be "sensed only by those aware of the fact that at present with the exception of a few smaller units, schools are housed entirely in makeshift buildings never intended for school use." (18). The two new schools were in operation in school year 1954-55.

The department also planned for new elementary schools. Contracts were awarded, and by the 1953-54 school year, new elementary schools opened at Cruz Bay (subsequently named the Julius E. Sprauve School), at John's Folly on St. John, and at Christiansted on St. Croix. Consolidated schools were approved for Frederiksted and King's Hill, St. Croix, and these were ready in 1958. The former was named the Claude O. Markoe School, and the latter, the Charles H. Emanuel School—after two veteran educators.

Three years after the consolidated schools opened on St. Croix, 42 new elementary classrooms were ready on St. Thomas, the first since the mid-1950's: eight in the Nisky area, two in Frenchtown, and a large 32-classroom building on a 10-acre tract in the Sugar Estate area. This school was named the Lockhart Elementary School after the St. Thomas merchant philanthropist, Herbert E. Lockhart.

Three new buildings did not solve all the space problems. At the request of Governor Ralph M. Paiewonsky, the Legislature appropriated over $1.5 million for construction during the 1961-62 session. Two new three-classroom primary buildings were built the following year by Peace Corps volunteers as a part of the group's technical training for building similar schools in Africa. One was constructed on the site of the Charles H. Emanuel School, and the other at the Nisky School. By the end of the year, an additional three new elementary classrooms and nine vocational classrooms were nearly completed on St. Thomas. Plans also were completed for an eight-room elementary school at Estate Grove Place, St. Croix, and contracts were awarded for three gymnasiums, a music suite (band room and choral rooms), shops, and additional classrooms at several other schools.

During the period when the islands were acquiring additional high school and elementary space, the kindergartens were not neglected. A class in carpentry in St. Thomas built a kindergarten at Polyberg. The Paul M. Pearson Gardens Kindergarten opened in September 1957, and the Jane E. Tutu School, named after a veteran educator and acting commissioner of education, opened later in the year at Savan, St. Thomas, for grades K-4.

In 1961, a kindergarten also was opened at Frenchtown.

Despite the rapid construction that had marked the previous years, the 1964-65 Legislature decided that a crash school construction program was necessary. It earmarked $4.2 million from a newly authorized bond issue to construct 130 classrooms: 45 for a new St. Croix Central High School, 40 for the new St. Thomas Wayne Aspinal Junior High School, 10 additional classrooms at the Charles Emanuel School, 10 for a new elementary school at Estate Tutu, St. Thomas, 10 for a new elementary school at Bourne Field, and an additional 5 classrooms, a new library, a teachers lounge, and a principal's office for the Julius E. Sprauve School. Most were expected to be ready by September 1966 to accommodate the 10,453 students enrolled at the end of 1965 (19).

TEACHERS—PREPARATION AND SALARIES

Summer Schools and In-Service Training

The Rules and Regulations effective November 1, 1921, for the Virgin Islands Department of Education said that any U.S. citizen in the Virgin Islands over 16 years of age known to be of good moral character and sound physical health was eligible to take the examinations to obtain a license as an assistant graded teacher, a graded teacher, or a principal teacher. "Special Teachers' certificates or licenses will be granted to those persons who possess diplomas from recognized normal schools, colleges, or universities, or who are specially fitted to teach some vocational or commercial subject." (20).

In the early 1920's, the department attempted to improve the quality of teachers by in-service training programs and summer schools. These continued through the 1930's, despite the Depression. In 1933, instructors from the Progressive Education Association came to the islands to conduct a summer demonstration school. The Teachers' Association of St. Thomas began a summer institute in 1936, which allowed teachers to earn subject credits. In the 1940's, generous gifts from the Carnegie Corporation made it possible for a number of teachers to attend the University of Puerto Rico.

In 1943, the St. Thomas Teachers' Institute began in-service training courses for teachers during the spring as well as the summer. Two years later, the Polytechnic Institute of Puerto Rico conducted extension courses on St. Croix enabling teachers to earn college credits. St. Thomas Teachers' Institute observed its tenth anniversary in the 1947-48 school year by sponsoring four extension courses offered by Polytechnic. New York University conducted a workshop in anthropology during the summer of 1950 for local teachers and 60 students from all over the United States.

Financed by the Fund for the Advancement of Education, the Hampton Institute-on-Island program offered four courses during the summer of 1955 and two during the school year. It held its 1957 summer sessions on St. Croix and then held classes in college algebra and tests and measurements during the school year. In the 1959-60
school years, its summer program was keyed mainly for elementary school teachers. During that summer, new branches of the Catholic University operating in the islands' Catholic high schools offered college-level courses.

Scholarships

By the early 1930's, several universities in the United States were granting scholarships to promising students and teachers who pledged to return to the islands to teach. Eleven scholarship students were on the mainland in 1934, and within 2 years nine had completed their training and had returned to the island's public school system. Not only did the schools themselves offer scholarships, but in 1936, the municipality of St. Thomas-St. John enacted an ordinance establishing a scholarship fund to assist two or three of the best qualified local high school graduates in going to college in the United States.

By 1940, both municipalities were providing scholarships so that teachers could attend summer school sessions at the University of Puerto Rico and regular sessions on the mainland. Governor Lawrence W. Cramer, in his report for the fiscal year ending June 1940, stated:

With only a few exceptions all the teachers in the municipal school system are natives of the islands. The improvement in the educational status of teachers has been accomplished in part by the establishment of municipal scholarship funds created by ordinance in each municipality under which cash grants or loans are made to teachers or students who desire to go to the continental United States for higher education (21).

By the end of World War II, the municipality of St. Thomas-St. John adopted a plan whereby four teachers would be released annually to study on scholarships in the United States and Puerto Rico. In 1952, Alonzo Moron, a native of St. Thomas and president of Hampton Institute, proposed a plan whereby his institution would participate in a three-phase program involving teacher-training scholarships for graduate and undergraduate study, in-service courses for teachers on the islands, and leadership in studying education in the islands as proposed by a committee of consultants from the U.S. Office of Education in 1950.

The Department of Education put considerable emphasis on in-service training programs during the 1961-62 school year but still processed 135 applications for loans and financial assistance for students to attend colleges and universities throughout the United States. It entered into a contract with New York University to upgrade educational standards (22).

The in-service training programs and institutes, the summer extension courses, and scholarships improved the quality of teachers in the Virgin Islands. By 1942, 76 percent of all teachers of both municipalities held a high school diploma or certificate. Up to 1936, the median level of all teachers was the completion of the ninth grade, but by 1950, the level was completion of high school. By the spring of 1956—the first year under the reorganized Department of Education—of the 188 teachers employed, 62 were college graduates, 36 had 2 years or more of college work, 75 had completed 2 years of college, and 15 had other training. Five years later, 63 percent of the elementary classroom teachers still did not possess academic degrees, but 129 of the 255 teachers in the department were college graduates, 66 had completed 2 or more years of college, 23 had less than 2 years of college, and only 37 had no collegiate training.

During school year 1965-66, the department employed 454 professionals: 396 teachers and 58 administrators. Of this number, 74 were non-degree holders; 44 had been equated to the bachelor's level after serving 15 years or more; 246 held a bachelor's degree; 89 had earned a master's degree; and 2 had earned a doctorate.

Salaries

The Rules and Regulations of 1921 stipulated that an assistant graded teacher was to receive from $10 to $25 per month, a graded teacher from $25 to $50, and a principal teacher from $50 to $75. The special teacher's salary was left to the discretion of the director of education. From 1918 to 1934, the average monthly salary of teachers rose from $16.23 to $48.24, and the number of teachers from 81 to 119. By the end of World War II, the average yearly salary of teachers in St. Thomas was $1,200 and in St. Croix $899.69. The elementary school teachers were being paid $2,569.27 and high school teachers $3,705.65 by 1956.

Salaries continued to increase, so that by 1960, the average salary for elementary teachers was $3,138.24 and that of high school teachers $3,997.80. Governor Paiewonsky recommended and the 1963 Legislature approved a new pay plan increasing salaries an average of $849 per person. The minimum for those holding a bachelor's degree rose from $4,000 to $4,600, while those holding a master's degree started at $5,400 instead of $4,800. The pay scale was again revised effective the following year, so that of the 454 professionals employed during the 1965-66 school year, those with a bachelor's degree received a base salary increase to $5,400 and those with a master's degree to $6,000.

Increases in Per-Capita Expenditures for Public Education

Connected with the increase in teachers' salaries was the amount of money the people in the islands were willing to pay for education. The lack of funds had prevented School Inspector Rubner Petersen from improving education in the Danish West Indies under the School Ordinance of 1912.
The government had budgeted only $15,637 Danish West Indian dollars (DWI) for education. In 1921, the amount set aside for education rose to $53,967 DWI dollars, a little over 28.5 DWI dollars for each of the 2,671 children enrolled in the public schools. The enrollment rose to 3,083 pupils in the 1926-27 school year, and only 27.12 DWI dollars were spent on each pupil. At the end of the Depression decade in 1940, the average was $33.73 per pupil (23).

By the end of World War II, the total budget for both municipalities rose to a high of $250,000. Since each municipality controlled its own fiscal affairs until the formation of a single Virgin Islands Department of Education in 1955-56, there was a difference in the average annual expenditure per child—$66.50 on St. Thomas-St. John and $52.40 on St. Croix. Eight years later, for the first time, St. Thomas-St. John spent over $100 annually ($105.12) to educate each child, while St. Croix was only slightly behind with $97.13.

During the first year of operation of the Virgin Islands Department of Education, the average annual expenditure amounted to $141 for each of the 5,886 pupils in the public schools. Three years later, the figure was $216.97, but, as dramatic as was this increase, the average for the 50 states on the mainland was $360 for the same period. In the spring of 1965, 9,399 pupils were enrolled in the public schools, and $4,689,33 in local funds were appropriated to give an average expenditure per pupil of $495 compared to $483 in the 50 states.

INTERAGENCY RELATIONSHIPS

The Department of Education has cooperated with and depended on many other agencies and institutions throughout its history. From the very beginning, the church and the state cooperated in getting public education started in the islands, and until 1872, the church administered the schools. Since 1917, agencies of the federal and local governments and colleges and universities outside the islands have cooperated in developing the system of public education through surveys, institutes, training programs, and scholarship grants. As stated above, Hampton Institute conducted the first important survey of education, and its findings, published in 1929, established the department's basic principles for the next few years (24). Jeanes teachers, supported by the Jeanes Fund to upgrade rural Negro schools, performed a valuable service in the estate villages of St. Croix during the Depression, and in 1935 the Carnegie Foundation gave $7,500 to the Slater Fund to maintain a Jeanes teacher on St. Thomas.

Funds contributed by the Golden Rule Foundation enabled the department to serve hot lunches to the needy children on St. Thomas. The health and education departments cooperated with the schools by conducting medical and dental examinations, treatments, and health training to correct unhealthy practices and diet.

From the beginning, the department has worked closely with the federal government. The Public Works Administration enabled the islands to repair and remodel schoolhouses, and funds from the National Recovery Act were used to inaugurate a program in adult education and a nursery school program. The hot lunch program, the precursor of the school lunch program, was largely financed by the Works Progress Administration, with the Agricultural Marketing Administration contributing free commodities. During the 1946-47 school year, the U.S. Department of Agriculture furnished cash grants and foodstuffs without charge to enable the department to serve 501,978 lunches. The National Youth Administration gave funds for education and training of youth.

Following World War II, the local government collaborated with the Veterans' Administration to establish educational programs. The federal government made over $100,000 available to local education for the 1948-49 school year, chiefly to support the veterans education program.

By 1955-56, the federal government was contributing $132,116 to public education in the islands. Three years later, the Department of Education acquired materials through NDEA and secured financial aid for federally affected areas under the provisions of Public Laws 85-874 and 85-815. During the 1960-61 school year, the U.S. Office of Education sponsored institutes and conferences on the mainland in foreign languages, mathematics, and science. Federal moneys were received from Public Laws 85-864 and 85-874 and Titles III, V, and X of the NDEA, as well as from federal programs for vocational education, rural libraries, school lunch, and vocational rehabilitation.

During the 1961-62 school year, Arthur A. Richards, the present commissioner of education, was selected, along with 19 other educators, by the U.S. Department of State to participate in an international seminar in Europe under a Fulbright program. Educators from the islands participated, for the first time, in the evaluation of mainland high schools for accreditation by the Middle States Association of Secondary Schools and Colleges. At the invitation of the commissioner, the association sent three teams in March 1963 to evaluate the islands' secondary schools.

In 1965, the department received $419,466 from the federal government, including funds from the NDEA, Titles III, V, and X; vocational education and rural library extension programs; school lunch; a special federal grant, Public Law 85-874; vocational rehabilitation; and manpower development and training. The local government contributed $4,679,633 to public education to make the total public school education budget $5,109,099. At the same time, the department sponsored three projects approved by the Economic Opportunity Act: Operation Head Start, a work training program to assist potential dropouts, and an adult basic education program.
During May 1965, the Christiansted High School Band performed at the New York World's Fair, playing everything from classics to calypso—including the new "Virgin Islands March."

The schools not only match the states in salaries, but can now take their regular part in all activities and be evaluated on the same basis as the stateside schools. They have truly come of age.

FOOTNOTES

1. The English drove out the Dutch in 1645; they were themselves ousted by the Spanish in 1650, who, in turn, were replaced by the French in 1651.

2. For further information, see Kay Black Fjeldsoe, "Education in the Danish West Indies, Especially St. Thomas and St. Jan," quoted in The Teachers' Voice, I No. 6 (February 12, 1917), 1.

3. It was Governor von Scholten who issued the famous Emancipation Proclamation in 1848.

4. For further information, see R.C. Forster, "One Hundred Years of Compulsory Education, St. Croix, V.I.," Christiansted, St. Croix, 1941. (Mimeographed.)

5. During the decade following the establishment of free compulsory schools in St. Croix, similar schools were started in St. Thomas, and what has been said of the St. Croix schools applies there also.

6. The United States began negotiation to buy the islands from Denmark shortly after the Civil War. Secretary of State Seward visited St. Thomas in 1866 and the following year offered $7.5 million for St. Thomas and St. Jan (St. John). The United States again tried to purchase the islands in 1902, 1911, and 1912. The formal transfer of the islands occurred on March 31, 1917.

7. Governor, Annual Report (1917), as quoted in Governor, Annual Report to the Secretary of the Interior (1940), p. 34.

9. The commission, composed of Thomas H. Dickinson and W. Carson Ryan, Jr., of Swarthmore College, W.T.B. Williams of Tuskegee Institute, and C.D. Stevenson of Hampton Institute, recommended improving the qualifications and salaries of teachers, improving the curriculum, improving school buildings, conducting an adult education program, conducting a nursery school program, and providing health and welfare work through the schools.

12. See Appendix B for the department's 1965 organization chart.

15. The public works department did the work, financed by PWA grants under the National Recovery Program. Governor, Annual Report to the Secretary of the Interior (1935), pp. 7-12.

19. Due to construction delays, it was school year 1967-68 before Central High, Aspinal Junior High, and Tutu schools opened their doors.

22. The New York University—Virgin Islands project came into being in 1962-63, following a comprehensive survey of public school education by the university. Among other things, the university agreed to furnish executive training for six officials of the department and to conduct courses and workshops for principals, supervisors, and teachers. The project was successfully concluded in 1966.

23. The Danish West Indian dollar was pegged at $1.05 U.S. In 1934, U.S. money became the official currency in the islands.

Education in the States is the largest single publishing contribution to educational scholarship in the history of the National Education Association. It is the result of more than two years of intensive work by scores of researchers, writers, and editors. Each of the 95 writers for Education in the States was selected for his special knowledge of educational development in his state or field of education. The two-volume reference was developed as a project of the Council of Chief State-School Officers, an independent organization, and financed in part under a contract with the U.S. Office of Education. The project was directed by a professional historian and administered by an experienced educator and expert in the fields of educational administration and law.

Education in the States: Historical Development and Outlook, the first volume, traces in 1,475 large, fact-filled pages the historical development since 1900 of each of the 50 state departments of education and the central school agencies of Puerto Rico, American Samoa, Guam, the Panama Canal Zone, and the Virgin Islands.

Each state chapter was written independently, thereby reflecting the distinctive characteristics of the environment in which the state department operates. The authors go far to explain present practices and often point out promising lines for future development.

Perceptive readers of several state chapters will be able to analyze departments in terms such as size, structure, functions, policy directions, and rate of development. Much can be inferred about each department’s situation in regard to its responsibility to the people, its position within the state government, and its relationships within the educational community.

Readers who evaluate the historical development and current status of several departments in such terms may discover implications for constructive improvements in their own state department of education. Such purposeful readers could well include members of legislatures and state boards of education, chief state school officers, departmental staff leaders, other officers of state governments, and numerous citizens who support effective state leadership in education.

Education in the States: Nationwide Development Since 1900, the second volume of the report, deals on a nationwide basis with 16 areas of educational concern to all states. This smaller-size, 772-page book is designed for use as a university text and research reference in the fields of educational administration, supervision, and history, as well as for use by schoolboard members, legislators, educational administrators and supervisors, association leaders, teachers, and other citizens. The 16 chapters deal with the basic organization and financing of public education, curriculum and supporting areas related to instruction, federal participation in education, and relationships between state departments of education, the teaching profession, institutions of higher education, and the general public.
