The historical development to 1967 of the 50 state departments of education and the central school agencies of Puerto Rico, American Samoa, Guam, the Panama Canal Zone, and the Virgin Islands is presented in this massive reference. Each chapter, dealing with a separate state or territory, was written independently; however, topics in common to most chapters include educational change or reform, early history, problems of the depression and postwar years as related to education, teacher certification, special educational programs, vocational education, educational finance, teacher education, school accreditation, pupil transportation, minority group education and problems, board structure and present status, future plans, and federal, state, and local interrelations. Each chapter is supplemented by a bibliography, a list of the chief school officers, and an organizational chart. (EDUCATION IN THE STATES: NATIONWIDE DEVELOPMENT SINCE 1900, SP 003 035, is a related document.) (SM)
Education in the States: Historical Development and Outlook is the only comprehensive and detailed history of state departments of education available. In it you will find countless facts about the state departments of education of each state and five outlying areas, ranging from descriptions of the relatively simple activities of the early superintendents to complex current staff organization charts. You can identify weaknesses and strengths and directions for future development.

You will find also on these pages, intertwined with the history of state departments of education, a wealth of information about many other aspects of the development of education in the states, ranging from highlights of a report by Booker T. Washington to the Alabama state superintendent in 1900 to the average expenditure per pupil in the Virgin Islands in 1985.

And if you wish to explore any particular topic in greater depth, you will find a valuable bibliography at the end of each chapter listing unpublished as well as published sources.

Although this monumental reference deals primarily with the period since 1900, it includes brief descriptions of the beginnings of public education and the establishment of the chief state school agency in each state as early as they occurred.
THE EDITORS

JIM BERRY PEARSON, coeditor and project director of Education in the States, is associate professor of history and professor of education at the University of Texas, Austin. He was awarded his doctorate in American History by the University in 1955. In 1984 he received the Outstanding Teacher Award from the University of Texas Student Assembly.

Dr. Pearson has served as chairman of the American Historical Association’s Committee on Teaching and as consultant to a number of agencies, including the U.S. Office of Education, the Texas Education Agency, the Oregon State System of Higher Education, the University of North Carolina, and many Texas public school systems.

EDGAR FULLER, executive secretary emeritus of the Council of Chief State School Officers, administered the project that produced Education in the States. He also served as coeditor of the two-volume report. Prior to his retirement in 1969, Dr. Fuller served for 21 years as executive secretary of the Council of Chief State School Officers. In that capacity he was an influential writer, speaker, consultant, and advocate on matters related to educational legislation, law, and administration. His experience in education also includes a state superintendency, college teaching and administration, and public school teaching and administration. Dr. Fuller holds a doctor of law degree from the University of Chicago as well as a doctor of education degree from Harvard University.
Foreword

 Provision of education of broad scope and high quality to serve all the people is a major responsibility of the states. Standing in a strategic position between the local school agencies on the one hand and the federal government on the other, the state department of education is an important factor in making such educational opportunities available in each state.

 This is the first of two volumes reporting a nationwide study of state departments of education, a project conducted since June 1966 by the Council of Chief State School Officers and financed in part under a contract with the U.S. Office of Education. It traces the historical development since 1900 of each of the 50 state departments of education and the central school agencies of Puerto Rico, American Samoa, Guam, the Panama Canal Zone, and the Virgin Islands. The second volume of this report, *Education in the States: Nationwide Development Since 1900*, deals with 16 areas of educational concern to all state departments of education. Both volumes fill voids in existing literature in education as related to the state level.

 Each state chapter was written independently, dealing with whatever phases of departmental development the author may have selected for his own state. Most chapters reflect distinctive characteristics of the environments in which their respective state departments operate. The authors go far to explain present practices and often clarify promising lines for future development.

 Perceptive readers of several state chapters will be able to compare departments in terms such as size, structure, functions, policy directions, and rate of development. Much can be inferred about each department's situation in regard to its responsibility to the people, its position within the state government, and its relationships within the educational community. Questions may occur: Do a department's basic structure and internal organization appear to operate in ways that facilitate achievement of its purposes? Do its working relationships within the state capitol and throughout the state reinforce its effectiveness? and, Are the legislative policies of the state concerning education clear and appropriate for our times?

 Readers who evaluate the historical development and current status of several departments in such terms may discover implications for constructive improvements in their own state department of education. Such purposeful readers could well include members of legislatures and state boards of education, chief state school officers, departmental staff leaders, other officers of the state government, and numerous citizens who support effective state leadership in education. The most obvious function of these publications will be their nationwide use by teachers, administrators, scholars, and students, for whom they will be resources for study and research at the state level of education not heretofore available.

 February 15, 1969

 Jim B. Pearson, *Project Director*

 Edgar Fuller, *Project Administrator*
Acknowledgments

A large number of organizations and individuals have contributed generously to the project. We shall first identify the organizations, and then name many of the individuals. We gratefully acknowledge the encouragement and assistance of all.

The U.S. Office of Education

Approximately one-half the total financing of the project—originally scheduled for 18 months but which required a period of more than 2 years—was supplied by the U.S. Office of Education. The project would not have been launched without this substantial contribution of funds, nor would it have proceeded so well without the helpful encouragement and splendid cooperation of the Office of Education personnel.

The Project Advisory Committee

This committee held only a small number of meetings, but these were extremely helpful in giving direction to the project in its early development.

The Chief State School Officers and Their Council

The chief state school officers directly or indirectly supplied almost one-half the financial support for the project and in numerous ways ensured its successful completion. The Study Commission of the Council of Chief State School Officers contributed its 1966 annual workshop to the early development of the state histories, and the authors of 28 chapters were drawn from the Commission’s membership. These and other authors within the departments were generously supported by their respective chiefs in developing their chapters. Resource materials also were made available to authors outside the state agencies. The officers and directors of the Council appropriated substantial funds and authorized their Washington office to spend the necessary staff time and resources. We recognize especially the work of Assistant Executive Secretary Blanche E. Crippen in coordinating the preparation and organization of the materials of both volumes prior to publication.

The Publications Division of the National Education Association

The two volumes of the project report have been published and distributed on a nationwide basis by this division of the National Education Association. Its assumption of responsibility for these services makes certain that the results of the project will be made available nationwide and abroad. We gratefully acknowledge the perfect cooperation and generous contributions made by Director Sidney Dorros and his colleagues in the NEA Publications Division.

EARLY PERIOD TO THE 1920'S

The Beginning

Any education of historical importance evolves out of the reactions of people to their environment over a period of time. The cultural and political aspects of the Renaissance were carefully nurtured like seedlings in a rich garden plot in northern Italy for two centuries before being carried northward across the Alps in 1475 to enrich the lives of all the people it touched (1). Learning started long before then, but its revival after the Dark Ages prompted refinements in economic, social, and political criteria from which we greatly benefit to this day.

Cur own immediate beginning was rooted in the explorations, colonizations, and trade of some of the most enlightened leaders in the world who represented three of the most celebrated royal houses in history (2). In 1540, while Charles I was king of Spain, Hernando de Soto led a band of Spanish noblemen across the Alabama Country in search for gold. Later, Spain colonized part of the Gulf Coast-Mobile area eastward, from whence Spanish Fort in Baldwin County on Mobile Bay gets its name.

In 1702, the French, led by Bienville in the reign of Louis XIV, started colonizing Mobile to be their capital of half a continent reaching from the Gulf of Mexico to the Great Lakes and beyond. Their names adorn public parks, streets, and waters: Bierville Square, with its giant oaks; Dauphin Street, with its famous Protestant churches; Dauphin Island, with Fort Gaines; and Bon Secour River, the French name for good succor and the home of the Bon Secour oyster. The early French influence on public education was indirect. In the 1763 Treaty of Paris, during the reign of George III, the British won the French possessions in America, and the Alabama Country was made a royal colony subject to the rule of the king and his royal privy council.

While under the French and Spanish influences, education in the Alabama territory was dominated by the Catholic policy of church schools rather than public schools. The British influence favored private tutoring and private schools or laissez-faire. Out of this background of royalty, monarchy, aristocracy, Catholicism with its chants and foreign tongues, Protestantism from the English with songs set to be sung by all, nature-loving tribes of savage Indians, and American pioneers from adjacent states evolved the State of Alabama in 1819.

For the first half of the nineteenth century the people of Alabama maintained the ideas they brought with them about the type of schools they wanted, without any state leadership or state school system. There was no county or local school system except the Mobile County school system, which started legally in 1826. Apparently the non-Catholic citizens of Mobile County saw the need for uniting to provide public schools comparable to the Catholic church-controlled education in that area.

In 1854, the state public school system was established, with a state superintendent of education to be elected by the voters of the state to be the chief state school officer. However, during the last half of the nineteenth century education below the college level continued to be primarily a private matter because substantial provisions were not made for financing public schools.

From the time of the early settlements in the state until 1900, cotton was the main money crop, and the population was overwhelmingly rural. Until recently cotton was produced by manpower and horsepower and was harvested by manpower. Mass education was not considered necessary to the economy of the times. In 1856, out of a total school census of 171,073, only 89,160 pupils were enrolled in public schools. Available state public school funds in 1856 were $267,690, and they did not reach $1 million until the twentieth century. The assessed valuation of property of the state increased from $110,992,000 in 1856 to only $270,408,000 in 1901 (3).

The tragic era of the pyramided catastrophes of the Civil War and Reconstruction left the state devastated economically, destitute of school building facilities, and with newly freed homeless citizens who had been sold as slaves previously by slave traders. Out of this lost cause, the loss of many of its men, 4 years of war devastation, 7 years of Reconstruction, the state was left alone to rehabilitate itself economically, educationally, and spiritually.

Through all of this difficult time the state superintendent crusaded to develop sentiment for mass education. He published annual or biennial reports on school funds,
Despite these limitations, he was placed on all public state enrollment, and school conditions and needs, except for the years 1859 through 1868—the Civil War and Reconstruction era. The superintendent was a one-man department with little or no clerical assistance and no professional staff. Despite these limitations, he was placed on all public state education boards including those of the University of Alabama, which opened in 1831, Auburn University, which opened in 1872 as the “Agricultural and Mechanical College,” and the State Board of Education that existed during the Reconstruction era of 1868-75.

The state board of the Reconstruction era established a state normal school at Florence in 1872; a state normal school and university for Negroes in 1873 at Marion, which was later moved to Montgomery by the General Assembly; and the Alabama Agricultural and Mechanical College near Huntsville as a normal school in 1873.

The Reconstruction state board had legislative authority on educational matters, and the state superintendent, under authority of the board, appointed all of the county superintendents of schools. The university and other colleges were placed under the state board. Although the state superintendent was not given any assistance for professional services, he was furnished clerical assistance to record laws passed while the board was in legislative session. The one-man department continued to publicize the need for better schools and to make annual reports, but that was not enough.

Throughout the century Alabama produced many highly educated citizens through private tutoring, private schools, and the state colleges. One of the U.S. Commissioners of Education, N. H. R. Dawson, appointed in 1885, had lived in Selma. William Rufus King, also from Selma, was Vice-President of the United States. J. L. M. Curry of Talledega won national fame in directing the Peabody Educational Funds, and he was one of the three cofounders of the public school system created in 1854. None of these or of the other highly educated citizens succeeded in ensuring adequate state educational leadership for public schools.

This left the state without the leadership necessary to lead the people into taking steps to either establish or operate public schools for the masses. Economic conditions were no better than public school conditions. In 1899, only half the children of school census age were enrolled in school, and the total assessed valuation of the state was only $260,201,000 (4). Poor economic conditions accompanied poor education then as now. One man just could not do the school job. In the language of his many farmer constituents, the state superintendent had “a tough row to hoe.”

The One-Man Department Turns the Twentieth Century

John W. Abercrombie, who became state superintendent of education in 1898, launched a new tide of public sentiment for public schools through his many speeches, his outstanding printed annual reports, and his notable success in getting the Legislature to levy a 1-mill state school property tax. His report of September 1900 states that he had made addresses in more than 50 of the 66 (now 67) counties of the state in 2 years, while simultaneously attending state, Southern, and national educational gatherings to keep abreast of the times. He believed that great interest in the cause of public education had been aroused and, further, that hope had replaced discouragement, concluding, only partially correctly, that indifference among the people had vanished. Dr. Abercrombie stated that it was impossible to do the work satisfactorily without a stenographer, an assistant to the chief clerk, a typewriter, and postage. He further reported the Department of Education as “fast becoming recognized as the most important department in the government, and the State cannot afford any longer to refuse such assistance as is necessary to properly conduct the affairs of the Department” (5).

Dr. Abercrombie included in his 1900 report short, informative narratives and pertinent statistics from county superintendents and each normal school. A lengthy report was included from Booker T. Washington, president of Tuskegee Normal and Industrial Institute, which noted the visit of the Alabama Legislature and its unanimous high commendation of the work at the institute. Booker T. Washington also reported the gift of 25,000 acres of land by Congress, philanthropic gifts from 16 donors in amounts ranging from $500 to $24,000, and an increase in the annual appropriation from the John F. Slater Fund from $8,000 to $10,000. Dr. Abercrombie knew that local reports of progress and needs would support his own exhortations for public education and for the Legislature to levy a 1-mill state school tax. He persuaded county superintendents and township trustees to increase the public school term from 3 to 4 months and requested extension to four and a half months for the next year because of the additional revenue from the state 1-mill school tax. He made 27 specific recommendations to the Legislature for educational improvement. The new State Constitution of 1901 expanded the state 1-mill school tax to 3 mills and authorized the voters in each county to levy a 1-mill school tax. Dr. Abercrombie's leadership was so outstanding that he was appointed president of the University of Alabama before his term expired, but he returned to the state superintendent in 1920.

Dr. Abercrombie's successors continued to publish annual reports containing state and local school finance and enrollment statistics, as well as narrative statements from state and local public school officials. Issac W. Hill, state superintendent of education from 1903 to 1907, reported in 1906 that he had spoken for education in 65 counties and that the Peabody Board had provided funds for the employment of a full-time experienced teacher to work with the State Federation of Women's Clubs in assisting him in the task of organizing the state counties and districts
into school improvement associations. The one-man department received no funds from the state for professional assistants but obtained philanthropic financing of one assistant for a specific school organizational project. Hill’s 1906 report is noteworthy partly because he recommended financing a system of high schools with at least one in each county (6).

In 1910, the Department of Education published the first course of study for the public elementary schools of Alabama, which was widely used by elementary teachers. Although there was no law authorizing such a manual and no provision for a course of study committee, the state superintendent of education secured the services of leading educators in its preparation. The materials were edited and arranged for publication by professors of education at Auburn Polytechnic Institute and the University of Alabama.

The first decade of the twentieth century ended with improvement in specific phases of public education, and department reports indicated an increasing statewide sentiment for public schools. However, there still was no vigorous, unified, organized state effort for education.

Unified Public School Action Begins 40 Years After Reconstruction

In 1915, a brilliant, energetic, and forceful state superintendent of education, William F. (Bill) Feagan, drafted and sponsored through the Legislature 15 bills that revolutionized the public school structure of the state. He had served 6 years as chief clerk in the department when he was appointed superintendent in 1913 to complete the unexpired term of Henry J. Willingham, who resigned to become president of Florence State Normal School. Feagan was elected to succeed himself. He used his 2 appointive years and his knowledge gained as chief clerk to plan and build strong county and local school improvement associations throughout the state. The community organization revolved around observance of 4 special days in which school patrons of each school were urged to attend. Feagan designated the school days to be as follows:

- School Improvement Day – October 30, 1914
- Good Roads Day – January 15, 1915
- Health Day – February 12, 1915
- Better Farming Day – March 12, 1915.

He gave suitable observance programs to the teachers for each special day so that they could hold successful meetings. Feagan knew that the four different type meetings would bring people of all interests to the school and that, by being better informed and a part of the school-community organization, they would help him get his bills ratified by the Legislature and his two constitutional amendments ratified by the voters at the polls. Two of his 15 bills would authorize constitutional amendments to levy property ad valorem school taxes. These had to be ratified first by a statewide vote; second, by a majority vote in each county for a 3-mill county tax; and after that, by the voters in each school district for the 3-mill district school tax. Because of his careful preparation, he was successful on all counts.

Feagan later called members of county boards of education to meet with him at the capital in December 1916, at which time he emphasized their legal duty to appoint the county superintendent of education along with other duties. Feagan resigned a year before his term expired to accept the superintendency of Montgomery County, Alabama, and the Governor appointed one of his chief assistants, Spright Dowell, to succeed him.

Another outstanding educational achievement of this decade was a comprehensive survey in 1919 of all education in the state, which was recommended by Spright Dowell and authorized by the Legislature with an appropriation therefor. Under legislative authority, the Governor appointed a five-man commission empowered to employ assistants to make the survey (7). The commission contracted with the U.S. Commissioner of Education, P. P. Claxton, for the U.S. Bureau of Education to make the study and report back to the commission. The Bureau of Education detailed 16 of its foremost men and women and procured the services of eminent specialists from other states to make the study. Federal relations in education are of such national and local concern that it is important to note here that Spright Dowell included in his 1919 annual report the opinion that the value of the survey service of the U.S. Bureau of Education to the state exceeded any other service to the state in its entire history.

Following the 1919 survey recommendations, the State Board of Education was created to include the Governor as chairman, the state superintendent of education as executive officer and secretary, and six other members appointed by the Governor and approved by the Senate. The state board, on the recommendations of the state superintendent of education, established policies for the department and public schools.

Ten divisions, with a head of each division and a suitable number of assistants, were provided as follows:

1. Executive and business management
2. Teacher training, certification, and placement
3. Statistics
4. Rural schools
5. Elementary schools
6. Secondary education
7. Physical education
8. Vocational education
9. Exceptional education
10. School and community betterment.

After 100 years of statehood, Alabama created a full department to furnish leadership, consultative services,
adequate reporting of school progress and needs, and statistics on school finance and attendance. During the decade, the one-man department had increased first to two field assistants; then up to nine under Feagan, including Spright Dowell as chief clerk and later as director of institutes; and finally up to 10 divisions.

The department first furnished leadership under Feagan in developing local community organizations to support educational progress, and then under Dowell in providing a comprehensive, scientific, educational survey of all education in the state. The state superintendent served as chairman of the vocational education state board, appointed by the Governor in 1917; and he proceeded to wisely use the federal funds under the 1917 Smith-Hughes Law for vocational education. Dowell appointed J. B. Hobdy as vocational education director and appointed an agriculture, home economics, and trade and industrial education supervisor. Spright Dowell was elected to succeed himself for a 4-year term beginning in January 1919, but he resigned 3 years before expiration of his term to accept the presidency of Alabama Polytechnic Institute (now Auburn University).

**Departmental Organization and Functions in the Twenties**

In 1920, John W. Abercrombie returned to the state superintendent to serve 7 years—3 years by appointment of the Governor and 4 by election. During the 18-year interim he had served as president of the University of Alabama and a term in Congress. He inherited an expanded and reorganized department professional staff, which he proceeded to further expand and direct. He made R. E. Tidwell assistant state superintendent and kept him on as teacher-training director. Seven years later, Tidwell succeeded Dr. Abercrombie to become a great state superintendent also. Dr. Abercrombie recruited the best educational talent in the nation to round out the department as it had been recommended in the U.S. Office of Education 1919 survey.

A new periodic bulletin, "Alabama School Progress," was prepared by the department and published by the Alabama Education Association first as its official organ, and later as part of the *Alabama State Journal* that was mailed to all teachers belonging to AEA. Dr. Abercrombie reported that the bulletin was being used as an example of progressive educational propaganda at Columbia Teachers College, Harvard University, and Chicago University.

The 1920 annual report of the Alabama Department of Education presented the "Index Number Study of Rural Elementary Schools" by counties, with white and Negro schools considered separately, and an effective chart showing the rank of the counties in descending order according to ranking score on 10 items. The eight most important items were school-holding power, length of school term, literacy from 10 to 21 years of age, grade of teaching certificates held by teachers, teachers' salaries, value of teaching equipment per teacher, percent of available school taxes (7 mills) levied locally, and percent of schools consolidated. This gave department field staff people a new medium for encouraging adequate provisions for quality education. The 1921 annual report carried the conclusion, measured by the Ayer's number for state school systems, that Alabama's public schools gained 74 percent as many points from 1918 to 1921 as previously gained from 1890 to 1918. A table in the report portrayed what Alabama had to do to meet the national average of 1918 on Ayer's 10 index components (8). The department continued thereafter to inform the teachers and the public, through the *AEA Journal*, of school achievements, school needs, and how these needs might be met.

Dr. Abercrombie continued to use his outstanding ability to encourage the people to make maximum efforts for education. He had able support from the department employees. In his 1926 annual report he urged expanding the state revolving fund of $100,000 into an "Equalization Fund" of $2.5 million to $3 million. He started educational exhibits at the Alabama State Fair representing the work of the 10 divisions in the department. He reported that the visitors at the state fair were so impressed with the exhibits that many of them called at the department to express their approval. His annual reports included narrative and statistical reports by the directors of the divisions. All of this helped develop public opinion favorable to school improvement.

The department produced and published a Course of Study for Elementary Schools in 1921 and a revised issue in 1924 for which the demand was so great that it was reprinted in 1926. The 1924 revision presented a plan for meeting the state law to expand from 11 to 12 grades in 1924-25 (9). The 7-4 state plan was reorganized into the 6-3-3 plan. The Course of Study was furnished to each school official, supervisor, and teacher. It proved to be a remarkable guide to teachers, for it included detailed suggestions for planning the first day of school; a review of the school laws to be observed by the teacher; the program for each subject in each grade as related to general aims for the grade; specific aims for the subject; suggestions for attaining the aims; textbooks and reference books; results to be attained; and requirements for promotion. Tentative suggestions were given for short-term schools.

This *Course of Study* was a great aid to the growing number of new teachers required for the increasing enrollment, many of whom lacked a college education. R. E. Tidwell, director of institutes, and Spright Dowell reported in 1919 that of 9,495 teachers attending institutes that fall, 2,049 held 2-year normal school diplomas, 854 were college graduates, 3,940 were high school graduates only, leaving 2,652 teachers who had not finished high school.

In the elections of 1926 the people moved ahead on all fronts and elected Bibb Graves as Governor and R. E.
Tidwell as state superintendent of education. This excellent team developed the 1927 educational equalization program for all the children of all the people. This program was modeled after the Paul Mort plan of equalization, except that the teacher unit was used as a factor of need instead of the weighted pupil factor used by Mort. It provided a 7-month minimum school term with provisions for teachers' salaries, school transportation, and other current expenses. This was a new beginning—the beginning of state responsibility for financing a minimum educational offering for all children. Dr. Tidwell's 7 years of experience as assistant state superintendent paid the people rich dividends through his creative educational planning and through the cooperation he gained from the Governor and the Legislature. The minimum program included provisions for county supervisors of instruction and county joint school attendance-child welfare supervisors. Outstanding elementary educators were employed as state instructional supervisors and stationed at the normal schools located in southeast, northeast, northwest, and west-central Alabama. They were assigned to work with the county and city supervisors in the school systems served by the normal schools and to assist in updating teacher training in the institutions.

Dr. Tidwell created a new and outstanding department service beginning in 1928—a comprehensive educational survey of county and city school systems, with a 10-year plan for economy and efficiency in school operation. He created the administration division to direct the survey service and placed it under the direction of A. F. Harman, who was later state superintendent of education and, after that, president of Alabama College.

Tidwell created a research and information division of which Dale S. Young, a brilliant Ph.D. from Columbia University, was made director in July 1927. Young had studied under Paul Mort and developed the 1927 state equalization program regulations that were later expanded into the 1935 state minimum program.

Dr. Tidwell filled his former position of director of teacher training and certification with B. L. Parkinson, who later became president of Mississippi State College for Women. Clyde Pearson, employed first as architectural draftsman, later became the chief state school architect. Norma Smith, a supervisor of instruction, was appointed first as director of school and community organization and later to direct elementary supervision. N. R. Baker, who had served as high school supervisor at one time and had been superintendent of the Jefferson County school system for several years, was employed to head the state program for improving junior high schools.

The department was staffed with able, well-educated, professional people who wielded great influence in promoting progress in education through the twenties and until partially cut down by the Depression.

THE DEPARTMENT AND THE DEPRESSION

The department entered the Depression under the leadership of one of its most courageous chief state school officers, A. F. Harman. He was an outstanding scholar with administrative qualities, and he marshaled all of his ability and strength to keep schools going.

The first local uniform school child accounting system was developed and installed in 1930 by Austin R. Meadows, who was appointed as a member of the department in November 1929. In 1930, the department, under Dr. Harman, published and distributed an outstanding state course of study for elementary grades that was started under Dr. Tidwell.

Dr. Harman led his staff to work with WPA and PWA during the Depression to keep schools running on federal relief funds. The 1931 Legislature cut educational appropriations and did nothing to prevent heavy proration of appropriations to the department and to other educational needs. In July 1931, Senator Harlan, an elderly distinguished physician, stated that the 1931 Legislature was the worst since Reconstruction (10). Department appropriations were cut 22 percent in 1932-33.

Dr. Harman kept the school survey service going in full force with the collaboration of the University of Alabama College of Education under Dean John R. McLure in furnishing survey field staff people to assist in the school surveys without cost to the department. The General Education Board of the Rockefeller Foundation financed the divisions of research and Negro education for a time, but the research division was lost finally. The administration division was eliminated because of lack of funds.

In 1934, the voters turned again to Bibb Graves for Governor and elected J. A. Keller as state superintendent of education. The two worked with department personnel to get a 1.5-percent gross receipt tax, later changed to a 2-percent sales tax, levied and earmarked for public education, except for the first one-fourth of the proceeds and finally $1,700,000. This restored the 1927 equalization program under the name of the minimum program. The 1935 minimum program continued the teacher-unit as the basic factor in calculating the need except for transportation. The teacher-unit factor for calculating the state minimum program was not originated or developed by either Paul Mort, Edgar L. Morphet, or R. L. Johns. Johns directed the development of a crude and difficult local effort formula in the minimum program but included freezing assessed valuation of property at the 1938 level in determining the total amount of local effort. This practically destroyed local effort in the minimum program because the freezing factor decreased local effort to 1.1 mills instead of the original 5 mills.
Local effort was, in 1967, 2.58 percent of the total state minimum program, and this percentage will decrease as state aid increases. The freezing of the assessed valuation of property taxes to the 1938 level is depriving the state minimum program of at least $16 million annually, which would be enough to provide a 10-percent increase in allotments for teachers' salaries. Morphet and Johns each contributed much to state education in Alabama; but they also learned much from the 1927 state equalization program and the state survey program, which were already in successful operation before they came into the department—Morphet in 1934 and Johns in 1936. They both took to Florida successful working equalization and survey programs about which they had learned much in Alabama. One of the fascinating developments of public education in America has been the innovations developed by state and local school systems based on programs originated in other places.

Morphet, as administration and finance director under Keller, calculated the state minimum program needs for legislative consideration in 1935. But when Keller presented the figures to the State Senate Finance and Taxation Committee, the committee requested a re-calculation and the elimination of $800,000 calculated in the program for school nurses. Meadows proposed to Keller the recalculation of the program on the basis of current and defensible data rather than data used by Morphet, who was in Atlantic City attending an educational convention. The new program, re-calculated with the help of Audrey Brown and 14 other assistants, used current number of teachers employed, and current expenses and capital outlay were calculated on the basis of average expenditures for the state as a whole during the 4 Depression years. The recalculated program eliminated the $800,000 for nurses but increased the budget request by $900,000. Keller counseled with his professional staff, and they unanimously endorsed the recalculated budget.

In the Senate committee rehearing the chairman asked Keller what kind of finance he was proposing for an increase of $900,000 when he was asked to reduce the appropriation request by $800,000. Keller replied that the recalculated program was his program rather than the previous program, which he had inherited. Three times the chairman asked Keller to reduce his request. Each time Keller stated that he would do the best he could with what the Legislature gave him, but that it would not do the job the Legislature wanted done nor the job that needed to be done. Finally, the chairman, the late Senator Shelby Fletcher, a millionaire, said, "Keller, I am not going to try to beat you down on your figures anymore: I am going to help you get this appropriation." And he did. This recalculated program was what justified Governor Bibb Graves and the Legislature's levying a 2-percent sales tax in 1937 with the first three-fourths of the tax and later all but $1,700,000 earmarked for education.

This is reported in detail because progress in education has often hinged on a stalwart educator like Keller and a defensible department calculation of educational needs. Not a single legislator asked Keller to reduce his request below the current teachers' salaries and the 4-year Depression average expenditures for other items. Keller put through a school budget act, designed to prevent local school budget deficits in the future, and a School Warrant (bond) Act that enabled local school boards to secure long-term bonds at the lowest interest rate in the nation. His administrative ability prompted the state board to make him president of Florence State College before his term as superintendent expired.

After 1935, the department, through official action of the state superintendent, approved all local school budgets before they could receive state funds. Approval, however, was limited to prohibiting estimated expenditure from exceeding estimated revenue and requiring state minimum program allotments for teachers' salaries to be budgeted as allotted in order to be received. A school system was penalized in state funds one-fourth of any excess of current expenditures over the approved estimated receipts. The state superintendent was required to approve all issues of school warrants (bonds) of indebtedness of local school systems before they could be sold. But his approval was limited to ascertaining that the annual schedule of payment of principal and interest neither jeopardized the state minimum program nor exceeded 80 percent of the estimated annual revenue of the tax pledged, and further that the use of such funds was to be spent at survey-approved school centers or on school buses meeting state specifications.

This combination of budget control, issuance of school warrants of indebtedness, and capital outlay investments only at survey-approved school centers enabled local school boards to get the best possible interest rates on long-term indebtedness and prevented waste of school funds on school centers that would otherwise be abandoned because they would be either too small or not located in or near the centers of the school population to be served. The school survey service advanced from recommending a minimum of three teachers or more for a permanent school center to a minimum six-teacher school. Department staff members presented survey findings to local school boards and, with their approval, to citizen groups in the school system. In this way school consolidation was accelerated.

County-wide action was possible because of a newly developed plan of school board ownership and operation of school buses based on research by Meadows in fulfillment of the partial requirement for a Ph.D. degree at Columbia University (11). Meadows developed the first Alabama state uniform school financial accounting system. The department furnished research findings which were used by the 1939 National School Bus Conference of department representatives from the 48 states in which national school bus specifications were adopted. The research findings included
data by health officers from Indiana and Alabama that gave
the average dimensions of school-age children. From this
information bus body width and length could be deter-
dined for a given number of passengers. National school
bus bodies permitted mass production of safe
and economical school buses. The contribution of the
Alabama department to the 1939 Conference on School
Bus Specification Standards contributed to safety and econ-
omy in school bus transportation throughout the United
States. It also enabled Alabama local school systems to
change over from unsafe, dilapidated school bus firetraps to
all-steel school buses with forward-facing seats because of
the lower prices secured through mass production of school
bus bodies.

The department, with approval of the State Board of
Education, developed a formula for allocating state mini-
mum program funds for school transportation to local school
systems. This was based on cost of transportation
per pupil per day of the previous year by density of trans-
portable pupils, using 11 density groupings. Johns, as direc-
tor of administration and finance, developed this formula.

The federal PWA officials were persuaded by the de-
partment to follow the school survey recommendations on
school centers after having made the mistake of approving
constructing a small building in Morgan County that was
later abandoned because of its smallness and proximity to a
survey-approved permanent school center. Under Keller the
department director positions in elementary education
stationed at Troy, Jacksonville, Florence, and Livingston
State Colleges were eliminated, as were the high school
supervisor positions at Auburn, University of Alabama, and
Alabama College.

In 1939 state employees were placed under a separate
state personnel board for employment, tenure, and salary
schedules, including the professional staff of the depart-
ment. Albert Collins, as state superintendent of education,
and Meadows vigorously opposed placing professional staff
members of the department who were college graduates
under the state personnel board. The state personnel board
procedures continued to be a handicap in the selection of
outstanding educators and especially of young, promising
educators, in that they limited recruitment of professional
educators, and especially young, promising educators who
lacked statistical measures of experience to push them up
to the top priority list of applicants.

Governor Bibb Graves appointed A. H. Collins to
succeed Keller. Collins had been an able department con-
sultant in secondary education and was elected for a full
term as superintendent without opposition. He resigned
after all legislation had been completed to become director
of the office of price administration, and E. B. Norton was
appointed to succeed him. Dr. Norton was elected without
opposition for a full term, but he in turn resigned 7 months
before his term expired to become U.S. Deputy Com-
missioner of Education in 1946.

THE DEPARTMENT IN DEFENSE OF THE NATION

The Narrative Report 1937-1942 declared that it was
always wartime for public education—

Because public education from its very beginning has
been engaged in a pitched battle with ignorance, injustice,
intolerance, selfishness, poverty, crime, and all of
their allies. . . . Public education did not wait for the
Atlantic Charter to join in the battle for the “four free-
doms” because those four freedoms have been a part of
the basic philosophy of American public education since
the days of Horace Mann. On Sunday, December 7,
1941, our Nation was attacked by the armed forces of
its enemies. On Monday, December 8, 1941, one million
school teachers and thirty million school children dedi-
cated themselves anew to the defense of their country
with a unanimity of spirit unparalleled in any other seg-
ment of the American people. It did not take an act of
Congress or a plea from the President to enlist this sup-
port. Our public schools are local institutions not legally
subject to Federal control. Nevertheless, the leadership
of public education immediately recognized the emer-
gency needs of the Nation as of paramount import-
ance (12).

Paul V. McNutt, Director of National Mobilization
for World War II, in 1942 declared Alabama to be the best
balanced war state in the Union; certainly the department
did everything possible to help the state merit this commen-
dation. It provided leadership and workable plans to local
school systems for selective service registration, rationing
registration, civilian defense training, control of inflation,
sales of war stamps and bonds, collection of scrap, con-
servation programs, school transportation to meet wartime
needs, consumer education, the building of public morale,
and many other phases of the war effort.

The Alabama School of Trades, under the direction
of the department, converted to a program especially for
the Air Force and trained students from propeller special-
ists to airplane mechanics. Daily school schedules were
modified in order to fit into wartime schedules. School
buses were used to transport defense workers. By the end
of 1944, 296,255 individuals had received war production
training, including supplementary courses, preemployment
courses, and food production war training administered
under the supervision of the vocational education division.

The department met with federal officials and de-
veloped cooperative plans for providing school facilities for
pupils in national defense areas in the state. This involved
getting representatives of the Army, the Air Force, and the
maritime agencies to approve needed construction in the
defense areas for the influx of school population. This
service included meeting with U.S. Office of Education offi-
cials and local school officials to develop and execute plans
toward applications for federal funds for school building
construction and school operation. The cooperation between the U.S. Office of Education and the department was excellent. Alabama's war effort was increased by the willingness of employees to move into the war centers when assured they would have schools for their children.

School transportation, a serious problem in wartime, was aided by the cooperative efforts of representatives of 15 state education departments; a representative of the U.S. Office of Education; representatives of other federal agencies; representatives of the American Automobile Association, Automotive Safety Foundation, National Education Association, National Safety Council; Frank W. Cyr of Teachers College, Columbia University; and Amos E. Neyhart of Pennsylvania State College. The Alabama Department of Education furnished the representative who had published the research study on Safety and Economy in School Bus Transportation for the work conferences at Yale University and in Washington, D.C., in which a special handbook was developed, entitled School Transportation in Wartime (13).

The production of the handbook was preceded by a meeting of Meadows of Alabama, Morphet of Florida, and Henry F. Alves of the U.S. Office of Education with Joseph B. Eastman, Director of the U.S. Office of Defense Transportation, and his assistant, C. D. Hutchins. A policy was approved at this time to route all school transportation, wartime applications and regulations relating thereto through each state education department. The handbook was approved by the National Council of Chief State School Officers and carried a letter from Joseph B. Eastman, "To those interested in wartime uses of school buses," stating that--

National Council of Chief State School Officers and those associated in the preparation of this handbook have made a notable contribution... and I urge that all concerned work vigorously and effectively toward attaining these objectives as a patriotic part of the total war effort (14).

John Studebaker, U.S. Commissioner of Education, included in the handbook a letter to all school authorities responsible for school transportation urging that the handbook procedures be followed and pledging that the U.S. Office of Education would lend every possible assistance to state departments of education in planning and executing this urgently needed program.

The cooperative efforts on School Transportation in Wartime, as published in 1942, and the minimum standard for school buses developed by the 48 states with the assistance of Frank W. Cyr, professor of education at Teachers College, Columbia University, in 1939 are reported in some detail because these two developments of national significance were made with the complete cooperation of state education departments, the U.S. Office of Education, other federal agencies concerned, and private enterprise. Moreover, effective action was taken with a minimum of red tape, no waste of funds, and in a manner which engendered the finest possible respect and appreciation for all individuals and agencies concerned.

The entire program of School Transportation in Wartime, involving the daily transportation of over four million children to and from school and approximately 93,000 school buses in daily service, was cleared and approved by the relatively small staff of the school bus transportation section of the Office of Defense Transportation. This pattern of local, state, and national cooperation for the greatest possible national efforts proves that the same type pattern could be operated successfully in any peacetime operation.

There was practically no school building construction during this period except in national-defense-connected school systems. Because of the federal spending program in Alabama, a surplus of over $12 million was collected in the educational trust fund, which was appropriated to education for capital outlay. The Legislature created a State Building Commission, with the superintendent of education as one of its members along with the Governor, the state health officer, and legislative members elected by the Legislature. The state superintendent, as executive secretary of the State Board of Education, directed department staff members to check requests for building construction and to submit them for his approval in terms of approved survey school centers and state school building regulations. The department supervised the letting of school construction contracts on bids and made final inspection on all contracts before contractors received complete payment for both the public schools and all educational institutions under the supervision of the state board. The department followed a similar procedure with all WPA and FWA school building projects.

The department assumed full responsibility for state administration policy formulation and administration of the national school lunch program of assistance to local schools. It scheduled regional workshops for lunchroom managers in the local schools, presenting the best recommendations and procedures for school lunches to offer adequate nutrition for one meal, maximum educational values, and all within a framework of economy.

Veterans education was administered at the national level by the Veterans Administration, and on the state level through the department. The administration and finance division and the vocational education division were those specifically involved. The department organized and developed the plan of education of veterans by local school systems and reimbursed local school systems for the total cost of veterans education. In the fall of 1946, the department held an official meeting, called by Meadows, with all county and city superintendents of education and worked out an agreement for the local officials to expand the program of educating veterans.
which they had started. It was understood that the department would speed up the reimbursement of federal funds by installing data-processing equipment to expedite the statistical work involved in checking the 26 items required on each veteran at that time. This was done. In 1949, 48,429 veterans cleared through the department for on-the-job training in industry and agriculture and continuation schools.

The department, by working through local school officials, equipped veterans with enough knowledge to continue full time on the jobs in which they were training or to get new jobs immediately after World War II. This economic pump priming enabled Alabama to make the greatest percentage increase in per-capita income from 1950 to 1960 of any state in the Union (15). Federal funds financed the necessary increase in department personnel to adequately develop and administer the veterans program. As the department expanded its services through increased employees, the economic welfare of the people expanded. People were ready to invest more in public education through public taxes.

Superintendent E. B. Norton joined the other chief state school officials in creating a Study Commission, and within that a Planning Committee, the former consisting of a member from each state education department to make studies and recommendations to their chiefs. Meadows served 2 years during wartime (1943-44) as chairman of the Planning Committee, which recommended that an office be established in Washington by the chief state school officers. In 1947, the National Council of Chief State School Officers was incorporated under the leadership of its executive committee, secured a grant from the General Education Board of the Rockefeller Foundation to assist in financing its central office, and appointed E. B. Norton as its first executive secretary.

Norton had contributed greatly to the establishment of the office and took charge when it was established in July 1948. He resigned in December 1948, however, to assume the presidency of Alabama State Teachers College at Florence and was succeeded on the same day by Edgar Fuller, former New Hampshire Commissioner of Education and director of the Division of School Administration of the U.S. Office of Education.

THE DEPARTMENT IN THE IMMEDIATE POSTWAR PERIOD

A new and entirely different state political figure arrived on the scene in 1947 to greatly affect the department and all education in Alabama. James E. Folsom was elected Governor in 1946 on a platform of providing a minimum teacher's salary of $1,800 annually and a constitutional convention to write a new constitution. Meadows was appointed June 1946 by Governor Chauncey M. Sparks to complete the unexpired term of Norton and was elected for a 4-year term without opposition in the special 1946 Democratic primary. Meadows worked with outgoing Governor Sparks in securing a 5-percent increase in teachers' salaries for 1946-47. He then worked out a compromise with the Governor-Elect to support an educational program of 9 months as the minimum school term and an average teacher salary of $1,800 rather than a minimum salary of $1,800 including untrained teachers. The actual salary requested by the department, which the Legislature made possible, ranged from $1,200 for the lowest certificated teacher with 1 year of college training or none, with $300 allotment for each additional year of college training, to $2,400 for the highest trained teacher. The average annual salary was actually increased from $1,239 in 1946 to $2,127 in 1950-51, but it was the Governor who set the stage for the increase in his campaign for the minimum of $1,800.

Appropriation bills were submitted by the department to include funds for teachers' salaries on the sliding scale outlined above, with the explanation that such a salary schedule would encourage high school graduates and teachers to continue their college education in order to receive higher salaries. It was clearly pointed out that this plan would cost the state more money every year but that the taxpayers would be obtaining better educated teachers in return for their tax dollar. This program met the overwhelming approval of the Legislature.

The Legislature was so enthusiastic about the proposed new program that it agreed to recess early in the regular session so that Governor Folsom might call a special session for the purpose of raising revenue to finance the educational program. The Legislature created a Joint House and Senate Educational Committee under the chairmanship of the late Edward Miller, representative from Etowah County, and cochairmanship of the late Senator Albert L. Patterson. The joint committee, with department representatives, visited representative counties, cities, and institutions of higher learning to get facts firsthand. This committee, working with the department, became a tremendous driving force in creating the educational program which followed. The Legislature recessed and was called back into special session. It met for 5 consecutive days and authorized a constitutional amendment, which was submitted to the voters of Alabama, to earmark for teachers' salaries future state income tax collections in excess of the amount specified in the state 6.5-mill ad valorem tax on homesteads assessed up to $2,000.

Meadows worked closely with the state Parent-Teacher Association, under the leadership of Mrs. Ellen Walker as president, and with the Alabama Citizens Committee for Schools under its president, Milton Fies, in getting the State Citizens Committee to sponsor the campaign for the passage of the state income tax amendment. The department, working with the PTA, the late C. B.
Gilmore, and Karl Harrison of the State Citizens Committee, raised funds to finance the campaign. Organizations were set up in the counties of the state to campaign for the amendment. The Governor wanted part of the tax earmarked for old-age pensions, but he did not campaign against the amendment. The amendment passed by over 2 to 1 majority, whereas a similar amendment for general purposes rather than for teachers' salaries had failed by over 2 to 1 during the previous administration. Leaders of the opposition to the amendment congratulated the department on the victory and on the fine manner in which the campaign was waged (16).

The 1947 Legislature reconvened after the 90 days required for passage of the state income tax constitutional amendment. It then passed the appropriations sponsored by the department for the first minimum 9-month school term in the state and for a salary schedule that prompted teachers to continue their college education. More than 95 percent of Alabama's teachers have at least a bachelor's degree today.

In 1950, the department published a new course of study for grades 1-12 (17), which presented education in a democracy from the national viewpoint as well as the state viewpoint. Educational purposes were clearly stated. The best references available at that time were given in the extensive bibliography. Suggested high school programs were presented in terms of the state accreditation requirements.

W. J. Terry, the incoming superintendent in 1951, divided the instruction division into the elementary and secondary education divisions, which had been consolidated in 1935. In 1954, he published a new course of study (18). Terry had never served in any position of state leadership before being elected superintendent of education. For 50 years prior to that time, superintendents, before beginning an elective 4-year term, had either served in the department or in a position of state service, with the exception of Issac W. Hill. Terry's executive actions disturbed the professional educators in the department. C. P. Nelson, director of the administration and finance division, resigned in 1951. Terry forced N. F. Greenhill out of the department, where he had done an outstanding job under Norton and Meadows in supervising the textbook program. The centennial of the establishment of the public school system in 1854 was ignored by this administration, but the incoming administration joined the AEA in proper observance of it in 1955.

Teachers received a small bonus in state funds during the last 2 years of this administration, but no regular salary increase. The statewide TV program was started, but the department was eliminated from the administration or coordination of the programs.

James E. Folsom as Governor and Meadows as superintendent of education were returned by the voters of the state and to the

consolidated under the secondary education division in 1955, and J. C. Blair was made director. N. F. Greenhill was made director of the administration and finance division. Frank R. Stewart was made administrative assistant to the state superintendent of education and was later elected as state superintendent of education.

A new division was created by combining the sections of rehabilitation and crippled children in 1955, and O. F. Wise was appointed director, in which position he has made an outstanding contribution both to the state and to the nation. Later, another able educator, R. B. Bagley, was made assistant director of the division, in charge of the crippled children section, and George M. Hudson became assistant director in rehabilitation.

The department organized and developed an annual workshop of school administrators, with local school superintendents serving as chairmen and recorders of committees and with the other superintendents selecting the committee of their choice for program development. During the workshop, local teacher salary schedules were developed, and procedures were developed for improving school administration. The workshop program was later continued in some degree by the state organization of school administrators. The department led educational leaders to join together in a unified legislative program with success, and there was an era of good feeling throughout the state.

The 1954 U.S. Supreme Court decision reversed the previous 1898 decision of equal but separate educational facilities for the races. In 1955, the State Legislature passed the pupil placement law recommended by the department. This law gives local school officials full and final authority to place pupils in the schools in terms of available school facilities and nearness to school centers with available facilities. This was followed in 1956 by the constitutional amendment providing freedom of choice of pupils to attend school with certain limitations. The principle of freedom of choice was established in the minds of the people as a beginning for meeting the 1954 U.S. Supreme Court decision outlawing equal but separate provisions for the races.

In 1958, the State Board of Education approved the department state plan, which was later approved by federal officials for state participation in the National Defense Education Act. In 1959, the Alabama department developed, organized, and processed statewide testing of all pupils in the eighth, ninth, and eleventh grades. The department contracted with the University of Alabama to machine-score the test answers and rank by percentiles over 140,000 pupils in the spring of 1959. After that, the testing program was applied to the eighth and eleventh grades with tests given in October and scored by the department. A guidance counselor was employed in the department to assist with the counseling and testing program. One score card for each pupil in the seventy-fifth percentile or above in the eleventh grade is furnished to each college in the state, and a score
card for each eleventh-grade pupil in the fiftieth percentile or above is furnished to the trade school that serves the area in which the pupil lives. The scoring, the tests, and the score cards are provided by the department.

Under Title III of the NDEA, personnel were employed to develop and take all possible advantage of the acquisition of equipment for the subjects covered in the act and for counseling with local school personnel engaged in teaching subjects included in the act.

The NDEA department consultants were decentralized. One of the science consultants was stationed at Jacksonville State College. A mathematics consultant was stationed at the University Center in Birmingham. Another consultant was stationed at Florence State College, and another consultant was stationed at Jacksonville State College. A mathematics consultant was stationed at the University Center in Birmingham.

**THE DEPARTMENT IN THE SOARING SIXTIES**

The department entered the soaring sixties under a heavy proration of state appropriations to all education totaling $11,608,825 in 1959-60 and $19,791,255 in 1960-61. This heavy proration was due to the failure of the Legislature to provide the revenue for the appropriations which they unaniomously voted as needed and justified. When the Legislature met in the second regular session in 1961, trust fund appropriations to education were reduced $13,113,932 below the 1960-61 appropriations in spite of anticipated school enrollment increases. The total accumulated reduction for 3 years was $44,514,013 below what the Legislature voted as needed in 1960-61. The department, through courageous Superintendent Frank R. Stewart, prevailed upon the state board not to pass a resolution proposed by the Governor to cut the annual minimum program allotment of teachers' salaries 10 percent after the teachers had taught approximately 7 months of the school term. School terms were completed on local deficits and by curtailment of other needed current expenses.

During proration the Alabama Society for Crippled Children increased its allotments to the department for adult rehabilitation and for crippled children, which were used to match increased federal funds for the two services and to expand the services to the crippled children and crippled adults in the state. State appropriation and local donations were not adequate to match all of the federal funds for these two services.

The state had for many years overmatched federal funds for vocational education, and the increased federal appropriations during the proration period were used to provide additional services in this field. Expansions were made in the state staff in agriculture, home economics, and trade and industrial education.

The **1963-65 Breakthrough Programs**

In 1962, Meadows, the incoming state superintendent of education, prior to taking office in January 1963, recommended a breakthrough program which was approved by a unified agreement of officials of the public schools, the trade schools, the state-supported colleges, the Alabama Education Association, and the state Parent-Teacher Association. Meadows was elected without opposition after the May Democratic primary on a platform to increase teachers' salaries to the national average and to improve education at all levels.

After the 1962 Democratic party nomination, the Alabama Congress of Parents and Teachers scheduled Meadows to meet with parent-teacher representatives in eight district meetings attended by 1,000 parents representing 225,000 PTA members to explain the breakthrough program. All eight district PTA meetings approved the program. Members returned to their respective districts and developed the greatest roadbed of public opinion for this program that had ever been developed for any educational program. After taking office, in company with Frank Rose, president of the University of Alabama, Ralph Draughon, president of Auburn University, and C. P. Nelson, executive secretary of the AEA, Meadows informed the Governor of the tremendous roadbed of public opinion developed by the members of the Alabama Congress of Parents and Teachers through their representatives for the breakthrough program. Governor Wallace agreed to adopt the program.

The department presented the program in appropriation bills to the Legislature. Governor Wallace and legislative administrative leaders put through bills which reduced the appropriations requested below those agreed on by the Department of Education, the AEA, and the PTA, but the appropriations were increased enough to justify being classified as a breakthrough program. Teacher salary allotments were increased 53.9 percent; appropriations to education were increased 95 percent; the annual teacher salary allocation was increased an average of 42.7 percent per teacher; the pending proration inherited from the previous administration was circumvented by tax levies; state capital outlay school bond revenue totaling $146,000,000 was provided; and a $23,217,000 cushion was created in the educational trust fund for the next administration.

During this administration 14 new state junior colleges and 26 state trade schools were in operation with publicly owned school buses routed to blanket the state with free transportation to either a junior college or a trade school. The junior college-trade school programs covering the entire state, together with the remainder of the breakthrough program if continued, could be the means of placing Alabama among the leading states in the nation economically. As a result of its studies, the department recommended the location of all of the new trade schools, except Walker County, and all of the 14 state junior
colleges. Alabama is the only state in the Union that offers free transportation for all qualified pupils to attend either a trade school or a junior college.

In 1965, on the recommendation of the state superintendent of education and data furnished by the department, Governor Wallace successfully sponsored legislative appropriations for furnishing state-owned textbooks through all 12 grades for the first time in the history of the state. Under legislative authority, usable, secondhand, state-adopted textbooks were bought from parents for half price or less, and the procedures and reimbursement for such purchases were processed by the department. All requisitions, bids to furnish state-owned textbooks, and contracts for purchasing them were processed by the department. By action of the department through the state superintendent of education, all textbook companies furnished state-owned textbooks for the opening of schools for the scholastic year beginning July 1, 1965, with the understanding that state purchase orders under the law would necessarily have to be dated October 1, 1965, or thereafter. The cooperation of all the textbook publishing companies with the department in getting the books delivered to the local schools in time for their opening was one of the greatest examples of cooperation of private enterprise with a public agency in the history of the state. Another notable example, in 1959, was that of the California Testing Bureau's furnishing all the testing materials through the department by requisitions without state purchase orders in time to test over 142,000 pupils for mental maturity and achievement.

Through the 1965 signing of the required federal compliance agreement by Meadows as state superintendent of education and approved plans for eligibility for federal funds, the department handled $69,207,000 in federal funds for public education for the scholastic year beginning July 1, 1965, that would not have been received otherwise. This included $40,551,274 from Title I, Public Law 89-10, for elementary and high schools. The State Board of Education held in abeyance any action on the federal compliance agreement pending federal court action on the Bessemer school system court case (19). Commissioner Francis Keppel accepted the compliance agreement signed by the state superintendent charged under the state constitution as being responsible for the supervision of the public schools. Alabama was the only state in the Union so accepted. The agreement was signed on the basis of freedom of choice of pupil enrollment in schools where classrooms and other school facilities were available for the grade to be attended. The department fulfilled the requirement of the compliance agreement, and all schools opened and operated effectively in 1965.

Harold Howe, who succeeded Keppel as U.S. Commissioner of Education, insisted on quota and/or percentage enrollment of pupils instead of freedom of choice. He scheduled and held four regional meetings with local school officials without the approval of state educational authorities and changed the local compliance agreement accordingly. The department believed Howe usurped its authority by taking over the state regulatory functions and duties regarding federal funds to be received by the state, including vocational funds that the department had administered for half a century.

SERVICES OF DEPARTMENT DIVISIONS

There were no divisions of the department, as such, listed in the annual reports of the Alabama Department of Education until 1919-20. In 1920-21, Abercrombie reported 10 divisions. In 1925-26, teacher training, certification, and placement were consolidated with elementary education, leaving only nine divisions. In 1928-29, the new school administration division and the Negro education division were created, making 11 divisions. In 1932-33, the school administration division was consolidated with the research and information division, leaving only 10 divisions. In 1933-34, the exceptional education division was abolished, leaving only nine divisions.

In 1935, Keller reorganized the department into four divisions. The school administration division was reinstated under administration and finance, which also included research, rural schools, and/or schoolhouse planning and business management. Elementary education, secondary education, and teacher certification and placement were consolidated into the instruction division. The vocational education and Negro education divisions remained unchanged.

Rehabilitation and Crippled Children

Rehabilitation and crippled children were a part of the vocational division before being organized as a separate division. Key personnel in the overall administration of these programs, together with clerical assistants, originally were stationed in the central office. The services and personnel therefore greatly expanded, and the assistant personnel have been decentralized through 15 district offices.

The state appropriations have not been sufficient to match available federal funds for rehabilitation, and the Alabama Society for Crippled Children has donated many thousands of dollars to match federal funds. The Society has cooperated with the department in agreeing on legislative budget requests and in acquainting legislators with the advantages of the program economically for the state and individually for the clients.

One of the outstanding phases of the department program for rehabilitation and crippled children has been through clinic services by outstanding surgeons and orthopedic doctors who have served on stipends that amounted to little more than actual travel expense. The state advisory medical staff met periodically with the state superintendent of education, the director of rehabilitation, and the head of
the crippled children section in planning clinics, supervision of hospitals used for clinical work, and rehabilitative work with reference to policies for admitting and discharging clients. Three eminent surgeons, Dr. John D. Sherrill of Birmingham, the late Dr. Marcus Skinner of Selma, and Dr. W. C. Hannon of Mobile, combined, served over one hundred years in holding periodic clinics, in which crippled children were diagnosed for remedial treatment, and in state meetings as a committee. Dr. H. E. Conwell of Birmingham early became a fourth member of the famous staff. Other doctors were added later to meet the demands. The department personnel make arrangements for scheduling the clinics, transportation of children to the clinics, office space for the examinations, and personnel to assist the examining doctor. A copy of the complete record of each crippled child and adult is filed either with the state central office or with the office for the district in which the child resides. The department has had good working relations with federal officials connected with this service.

Division of Administration and Finance

The Division of Administration and Finance services all other divisions on all financial matters for the department. All budgets are reviewed and recommended for revision or approval by the director of this division. All department requisition purchase orders must clear through this division before they are used. All county and city school budgets and annual reports must be reviewed by this division before being approved by the superintendent. The quadrennial school census made by the local school systems is processed through this division. It also compiles and edits the annual statistical report of the department, which gives child/teacher personnel, and financial accounting by school systems. The issuance of all local school warrants (bonds) of long-term indebtedness are processed by the division for approval by the superintendent.

The number of different funds handled by the department through the finance division increased from 22 in 1940-41, totaling $15,815,593, to 60 in 1965-66, totaling $266,900,160—the largest being the state minimum program fund of $164,466,870.

This division calculates the teacher units, the transportation formula by density of transportable pupils, and the other factors that make up the state minimum program allocation to each local school system.

Vocational Education

Vocational education in the department operated from its inception with the director and section heads of home economics and vocational agriculture stationed in the central office, and with other staff members stationed at the college approved for teacher training for each section. The vocational agriculture field staff was located at Alabama Polytechnic Institute, Auburn, in the east-central part of the state. The home economics staff was located at Alabama College, Montevallo, which is in the center of the state. Trade and industrial education staff members and section heads were located at the University of Alabama in the west-central part of the state at first, but later the head of the section was stationed at the central office. Staff members for vocational agriculture, home economics, and trade and industrial education also were stationed later at Tuskegee Institute, as well as at A & M, near Huntsville, for agriculture. The department contracted with respective colleges to pay salaries and travel of such employees and to furnish office facilities just as if they were employed by the college. The teacher trainers were employed by the colleges.

Division of Elementary Education

The Division of Elementary Education has always functioned primarily through consultants working with groups of teachers and school officials, rather than on an individual school visitation schedule. The concept of the elementary education division has always been to help teachers and school officials in the full development of the well-rounded pupil. This division did outstanding work in helping to plan the education of elementary teachers in the state normal schools, which later became state teachers colleges. The late George D. Strayer commented that the Alabama teachers colleges "made brick without straw," but did an outstanding job in teacher education (20). This division did an equally fine job in assisting in the development of courses of study and in in-service education to use them to the fullest advantage.

Except for short periods, this division has processed state certification of teachers since 1924. Recently the division started the accreditation of elementary schools. In the Alabama statewide annual testing program, started in the spring of 1959, the department found that eighth-grade pupils were equal to or above the national norms, except in spelling. Much of this can be attributed to the state teachers colleges and the services of the elementary division, starting with the leadership of Tidwell, who came to the department with superintendency experience in administering the well-staffed and well-equipped elementary schools provided by the Tennessee Coal and Iron Company in the Birmingham area.

Division of Secondary Education

The Division of Secondary Education, which started in 1920 with major emphasis on the development of high schools and their accreditation on the basis of academic education to meet college entrance requirements, has expanded in recent years into education for the maximum development of all pupils.
After the junior high schools were established in 1924-25, this division broadened its emphasis to include the practical arts and exploratory courses for grades 7, 8, and 9, which were never adequately developed because of lack of funds to provide the necessary facilities. The junior high schools meeting state standards were approved but were not accredited until recently, except where they were included as a part of the senior high school.

In a staff meeting, some consultants expressed concern that one of the largest senior high schools in the state was using an 1898 edition of a physiology textbook instead of a modern textbook. T. W. Smith, a philosopher and former county superintendent, replied that he was far more concerned about high school pupils having to put up with an outdated teacher who would require the use of such an outdated textbook than he was with the textbook itself. All of the consultants except Smith were discontinued by Keller when he consolidated the division with the elementary education division in 1935. The division was reinstated in 1951. J. C. Blair, the director from 1955 to the present time, has done an outstanding job in working with high school principals in the annual workshop on plans to improve education, in helping to improve the high school course of study, in processing applications for out-of-state aid to Negro college students, in encouraging state participation in the regional compact for college education, and in developing programs to eliminate high school dropouts.

**Division of Instruction**

The Division of Instruction was created by consolidation in 1935 and remained until 1951. The consolidation was justified for the purpose of broadening the viewpoint on secondary education with new leadership and for coordinating elementary and secondary education. The instruction division promoted the educational viewpoint that had always been held by the elementary division. Consultants of the division worked with supervisors and principals in organizing curriculum workshop programs at Peabody College during the summer and at the state institutions of higher learning.

C. B. Smith directed the newly created division until he was made president of Troy State College in 1937. He was followed by Morrison W. McCall, who became a national authority on teacher certification and teacher education.

**Research Division**

The Research Division was established in 1927 with Dale S. Young as director until January 1934. Young, a native of Illinois, who studied for his doctorate under Mort at Columbia University, revamped the statistical report of the department and greatly improved information service on all education in the state. He was followed as director by Edgar L. Morphet, who served until the division was consolidated with the division of administration and finance in 1935. The division was financed by the General Education Board of the Rockefeller Foundation up to 1935, but it was not continued because of the Depression and resulting lack of state funds.

The division was reinstated in 1965 through the use of Public Law 89-10, Title V, federal funds.

**Executive Division**

The Executive Division had existed as a section under the title of chief clerk or clerk; but it was not organized into a division until 1920, when it was listed under executive and business management, with a chief clerk, a filing clerk, two bookkeepers, and a stenographer. This division has expanded by the addition of sections placed in charge of new and developing programs.

**NDEA—Title III Section.** This section was created in 1959 and operates in terms of the purposes of Title III. One of the consultants is stationed in Huntsville, one at Jacksonville State College, and one in Birmingham. The section performed a valuable service, including processing the acquisition of equipment and the services of consultants in holding regional or district workshops with teachers in science, mathematics, modern foreign language throughout the state, and in working with teacher groups in county and city school systems.

**English Consultative Section.** The English section was really started by one consultant in 1965 and was thereafter expanded into a section. This section has done an outstanding job in holding English workshops at the state-supported colleges in Alabama during the summer. The workshops were rated as highly successful by English teachers and colleges throughout the state.

**Exceptional Education.** Exceptional education was reinstated by state law in 1955, and Mrs. Alpha Brown started directing the services in 1956. Mrs. Brown, who has earned national prominence in her field, has formulated quality standards and given creative supervision to the program through annual workshops with teachers of exceptional children and consultations with individual teachers. Two psychologists and a consultant have been added to the staff to help meet the great demand for this type of service.

**Adult Basic Education.** The adult basic education section includes much of the work done by the illiteracy division that existed in the twenties. It is financed by a state appropriation of $100,000, matching federal funds on the ratio of 1 state dollar to 9 federal dollars. Under the assistant state superintendent of education, it has made a fine contribution in developing standards and in processing
applications for adult basic education classes. The local program is channeled through county and city school systems.

**School Library Section.** This section was created through the use of Public Law 89-10, Title II, federal funds, with the chief educational consultant stationed at the University of South Alabama in Mobile and another consultant stationed at Florence State College. This program has been most helpful toward meeting Alabama's great deficit in school libraries, especially in elementary school libraries. Maximum use has been made of federal funds for this program, which is channeled through local county and city school systems.

**Civil Defense Section.** This section was started in 1963 through the use of federal funds in the beginning, which were later matched by a small state appropriation. It has a staff of four consultants and two clerical assistants. The consultants teach classes approved by county and city superintendents of education.

**International Education.** This program operates as a part of the Texas State Education Department project financed entirely from federal funds. It is operated in accordance with the purpose of the program and by working with a state committee in the planning of the Alabama program.

**Higher Education.** The program of this section, operated entirely from federal funds, has been of great help in securing money for urgently needed buildings for private and public colleges. The program has been of special help to the junior colleges that qualified for federal funds.

**Textbook Section.** This section, as the name implies, processes all applications for state-owned textbooks, keeps records, and reports on all state matters dealing with textbooks and textbook needs.

### DEPARTMENT PIONEERS IN SCHOOL BUS TRANSPORTATION

The department, through surveys and observations from 1935 to 1944, found that the overwhelming majority of Alabama school buses were dilapidated, potential firetraps, with side-facing seats on homemade wooden bodies mounted on trucks. At that time the department was recommending consolidating schools, which meant more transportation without safe school bus standards. As compulsory education required transportable children to ride the school buses, the department assumed responsibility for developing a state plan for safe and economical transportation.

In 1938, Meadows joined representatives from two bordering states in going to the nationally known school bus body manufacturing companies in Indiana and Ohio to persuade them to construct lightweight, all-steel school bus bodies with forward-facing seats and with gas tanks vented outside the bus. The Wayne Works in Richmond, Indiana, constructed such a bus at a reasonable price, and other companies met this competition.

The department, through the cooperation of the state director of finance, submitted invitations to all of the chassis manufacturing companies in the United States to bid on school buses by wheelbase length and common specifications. The bids were satisfactory, and the school buses were purchased at the state price. Local school systems reimbursed the state or paid the manufacturing company directly for the chassis to be delivered to the body manufacturing company chosen by the local school board. On the fleet-purchase basis the state bought the chassis at $100 per unit cheaper than what the local state dealer or distributor paid for the same unit. The state then set up a test case in 1939 for chassis bids to the state one day and to Fayette County on a local basis the next day for the same wheelbase length and the same specifications. The bids were actually lower to Fayette County than to the state. Thereafter, state bids were continued in order to safeguard counties that could not get favorable local bids.

The 48-seating-capacity bus body mounted on a 191-inch wheelbase chassis with dual rear wheels and tires meeting state specifications was bought at an approximate cost of $1,250 per unit price for the complete bus. The entire state started rapidly changing to county-owned buses meeting state specifications. North Carolina, in emerging from the Depression, set up a system of state purchase and ownership of school buses; but Alabama secured the same advantages through department leadership in securing state bids with local school board ownership. Local school board ownership encourages local initiative and local responsibility for the pupils transported. A department representative attended all of the bids for school buses, and bids were submitted on forms approved by the department.

The state created an adjustment board, which was used to compensate individuals who were injured or suffered property damages in school bus collisions in which the school bus driver or school bus was at fault, thereby eliminating premium payments to insurance companies. The department furnishes accident report forms, processes all applications for damages, and recommends that payments be made or not paid, according to evidence available.

The department conducted special courses whereby local school bus driver instructors were trained to teach individuals who were to be employed as bus drivers to drive the buses safely, economically, and efficiently. Many high school students were trained and employed to drive school buses.
TEXTBOOKS

In 1924, Dr. Abercrombie reported that since 1903 the state had maintained uniform textbook requirements for all public schools and that the Governor and state superintendent of education were ex officio members of the textbook committees. He further reported that the 1919 law required the State Board of Education, upon the recommendation of the state superintendent, to appoint not more than seven well-known educators engaged in public school work to select uniform textbooks for the state in the elementary schools and in all high schools, except those located in cities and towns of 2,000 or more population.

The department, under policies adopted by the state board, developed forms for publishers to bid on textbooks and processed textbook contracts to be approved by the state board.

In 1935, the department presented to Governor Bibb Graves a study directed by Meadows outlining progress of pupils through the grades. It showed that over 60 percent of the rural schoolchildren made slow progress through the first six grades and were overage according to national standards. When the Governor wanted to know the major causes of this situation, Superintendent J. A. Keller advised him that much of the difficulty lay in the failure of pupils to have textbooks in the lower grades because too many parents spent money for other things, including snuff and tobacco. The Governor successfully sponsored a tax on snuff for state-owned textbooks. The state staggered the state-owned textbooks by purchasing books for the first grade for the first year, for the second grade for the second year, and for the third grade for the third year, and on through the first six grades. The department prepared the statistics and the plan for purchasing and distributing the state-owned textbooks.

In 1965, the Legislature passed a law and appropriations for state-owned textbooks through the 12 grades, to be allocated and processed by the department under policies approved by the state board.

STATE COURSES OF STUDY AND THE DEPARTMENT

Through its elementary and secondary divisions, the department made great contributions to the public schools, particularly the elementary schools, by giving leadership in developing, publishing, and distributing state courses of study. Although they were designed as guides, with suggestions and recommendations, they also included legal requirements that governed the schools.

The department generated the development of a state course of study, which it had printed and distributed in 1910. Special subject materials were developed either by or through the leadership of the department. One of the outstanding department bulletins was the 1931 Course of Study in Physical and Health Education, which was reprinted in 1934 and again in 1935.

The 1950 and 1954 state courses of study have already been detailed to some extent.

In the 1963-67 administration, the following state courses of study were developed:

The high school course of study is one of the most complete handbooks ever developed and incorporates accreditation requirements. The course of study for home economics has received a “dress parade review” by the Montgomery Advertiser society editor, Madera Spencer.

Valuable bulletins in science, mathematics, and modern foreign languages have been developed by the department through National Defense Education Act funds. Recently special bulletins have been developed in the communicative arts by the English section of the department (21).

Superior course of study materials have been repeatedly developed and published under the direction of Mrs. Alpha Brown, educational consultant and supervisor of exceptional children and youth, who is recognized as a national authority.

Guideline materials for adult education, along with statements of state and federal regulations, were developed by W. Bemon Lyon, assistant state superintendent of education succeeding Ben A. Forrester, who was appointed president of the junior college at Enterprise, Alabama.

Outstanding guideline materials were developed in testing and counseling from the beginning, and this service
is now functioning through Clifton Nash, guidance consultant, and J. C. Blair, secondary education director.

The vocational education division has produced excellent materials for vocational teachers since the beginning of federal aid for that purpose in 1917. The materials have included plans for successful functioning of FFA and FHA programs.

LONG-TERM PLANS FOR LOCAL SCHOOLS

In 1928, the state board approved comprehensive educational surveys of county and city school systems by the department. The division of research and information and the division of schoolhouse planning cooperated with the division of educational administration in the surveys. The field studies division of the University of Alabama College of Education under its dean, John R. McLure, collaborated with the department from the beginning in this service.

The comprehensive educational survey not only provides a 10-year plan for educational development, but also furnishes the school administrator and the local board of education with defensible data to justify to the public the policies adopted in accordance with the survey. Maps are used to show recommended school centers by exact locations, recommended school bus routes, and pupil residence locations. The local superintendent displays the maps so that inquiring parents and citizens can see the plans for future school centers and school transportation.

The survey serves as a stimulant to county officials to consolidate schools. The one-teacher schools were consolidated, and local school officials said they had the most harmonious school program throughout the county that had ever existed. The school survey was the catalyst for courageous, progressive educational action.

The department assisted the Florida department in setting up county school survey services. Moe Stone and Joe Hall, then of the Florida department, worked with Meadows on the survey of an Alabama county school system. Johns and Meadows then assisted in the survey of two Florida county school systems in 1939.

One of the outstanding contributions growing out of the survey was the research study developed by J. W. Letson of the department, and now superintendent of Atlanta city school system. This bulletin, entitled Better School Buildings for Alabama (22), was published and distributed by the department to provide specific guides for planning and financing a school building program.

The state survey service tied in with the issuance of county and city capital outlay building warrants (bonds) in that proceeds from sales of such warrants could be used only at approved centers where schools could be expected to remain in operation beyond the term of the indebtedness. These and other safeguards permitted bonds to be sold at par value as low as 1.25-percent annual interest. The double economy of low interest rates on school bonds and construction at permanent school centers made the Alabama school construction dollar purchase the maximum benefits for taxpayers and schoolchildren.

Television

In July 1952, when the Federal Communications Commission allotted 268 TV channels exclusively for educational purposes, it granted 7 to Alabama. One year later, the Legislature established the Alabama Educational Television Commission and appropriated $500,000 to get the program under way. The Alabama ETV network, the nation's first large-scale, state-owned and operated ETV network, was soon utilized by the state's leading educators to improve the quality of instruction in the public schools.

The organized in-school ETV program went on the air in September 1957 with only 48 schools pledged to use it.

J. H. Hadley, assistant state superintendent of education, was elected chairman of the ETV Project's executive committee in 1957, and Meadows furnished free office space for the coordinator. The state board authorized the use of certain high school TV courses for credit, and the ETV program grew steadily.

In 1960, the department took over the coordination and general supervision of the in-school ETV program. It also assumed responsibility for publishing the ETV program schedule in booklet form and continues to carry out this responsibility. This booklet, now called the Instructional Television Teacher's Guide, has developed into a teacher's handbook and is distributed at the annual meetings of the AEA and the Alabama State Teachers Association.

It appears that the major weakness in the state ETV network at the present time is the absence of any agency with final authority for the program. More effective use of the network potentialities could be realized if the department had administrative authority and responsibility for the public school programs. Because of vested interests, however, it has been impossible to get the necessary legislative action to clear up this problem.

THE DEPARTMENT AS A WHOLE IN ACTION

The 1934 annual report, quoting from a survey by the Brookings Institution on the organization and administration of Alabama's state government, states:

The Department of Education is staffed with qualified professional men and women; it appears on the whole to be functioning efficiently; the morale of the personnel seems notably high. The various divisions are well coordinated; the direction and supervision exercised by the Superintendent and Assistant Superintendent are adequate and effective.
The most satisfactory accounts kept anywhere in the county are those of the county superintendent of education, who is guided by uniform accounting instructions, forms, and report blanks prescribed by the State Department of Education under the authority of Section 43 of the School Code (23).

All state educational surveys have appraised the department as meeting its responsibilities in a highly successful manner. Since the turn of the century, it has had to fight for legislative support for education on two fronts—one front for public schools and higher education, and the other front for appropriations to adequately staff itself to meet the state responsibility for education. The department has always placed major emphasis on the first front and in so doing has never been able to secure adequate appropriations for itself.

The salary of the state superintendent of education has been notoriously low. The department entered the Depression with the salary of the superintendent at $6,000 annually, but the Legislature cut the salary of the next superintendent to $3,600. And in 1946 the salary was increased to $5,400, with part of it paid from federal funds.

In 1947, at the request of Meadows, the salary of the state superintendent was paid entirely from state funds, rather than partly from federal funds, so the position would not be subject to federal control on the basis of the old adage, "The agent that pays the fiddler calls the tune." Under constitutional provisions the salary of constitutional officers cannot be raised during the term of office, but the salary was raised to $10,000 annually starting with 1955. In 1965, Meadows sponsored a bill to set the salary of the incoming superintendent at $22,000, but it was cut to $18,000 in the House and to $15,000 in the Senate before final passage. The maximum salary range in the department in 1965 was $12,000, which was far below the salaries of deans in the state-supported colleges and much less than many county and city superintendents of education in the state serving under the supervision of the state department. The chief state school officer is responsible for the supervision of the public schools, which in 1965-66 enrolled 862,041 pupils and carried on their payroll approximately 40,000 employees, including 30,433 teachers, and for 571 department employees.

The state superintendent of education's annual salary of $15,000 is ridiculously low by any measure of responsibility for either the $275 million plus spent annually for education, the 40,000 employees for 889,570 public school and college students, or the 571-plus employees of the department in 1965-66.

Every state survey has recommended the following: The head of the State Department of Education as a chief state school officer should be appointed by a State Board of Education. The professional personnel of the department should be removed from the state personnel board jurisdiction and placed under the state board on salary schedules comparable to professional positions of equal responsibilities in the colleges. Divisional directors should be paid as much as college deans. Clerical assistants might well remain under the state personnel board, provided adequate compensation is given to meet competition from federal employees and private enterprise.

Such salaries now do not compete with salaries for federal personnel for similar type positions and do not begin to compete with private enterprise.

During the last 70 years all state superintendents of education except Hill, Gunnels, Terry, Harman, and Meadows have resigned because of nonsuccession in office and to accept better-paying positions before their elective terms expired. Alabama should ensure that its education department to meet current and anticipated future needs and should authorize the legal structure to make possible necessary changes for the future. The department must be the bulwark against encroachment by federal agencies, either judicial or executive, that would destroy state and local control of public education. The department must lead in developing vigorous education to ward off destructive deterioration from within. The Legislature and the people of Alabama should make sure that this state has a strong, able State Department of Education dedicated to serve all the children and all the people.

The major developments that have been discussed have helped education, but they are not enough to enable Alabama's potential human resources to make maximum use of its natural resources.

INTRODUCTION

If a map of Alaska were superimposed on a map of the United States, Ketchikan, in Southeast Alaska, would be located in Florida; the extreme western portion of the Aleutians would be in the southern part of California; Point Barrow, in the extreme north, would be located in Minnesota near the Canadian border; the island chain at its nearest point to the mainland of Alaska would be extended down below the panhandle in Texas.

This land, formerly owned by the Russians and purchased by the United States in 1867, is not, contrary to popular belief, a land of continuous ice and snow. It does have nearly insurmountable mountain ranges that impede travel to the interior, and it is a land of thousands of miles of rugged coastline with narrow fjords that are fed by glacial streams flowing down steep mountainsides. Many of the mountain ranges rise directly from the sea to heights of thousands of feet, and travel between the various localities is restricted to sea and air.

The people, dependent as they were on sea transportation, located their villages along the shoreline and devised relatively efficient craft for traveling the waters. The ocean and streams not only provided means for transportation, they also were a main source of food and economic support. Fish, clam, crab, walrus, seal, whale, and fur-bearing animals were abundant in the waters. At the time of the purchase, nearly every village in Alaska was located near the water's edge, whether on a bay, an ocean, a river, or a lake.

Before the coming of the Russians, four distinct ethnic groups inhabited the country the Russians chose to call Russian-America. Each group had separate languages, characteristics, and customs. There were, however, many dialects that provided some commonality of language.

In the north and west lived the Eskimo. Theirs was a somewhat common language, for they traveled widely and communicated freely in their search for subsistence; weather was often severe and nearly every activity was of a life-preserving nature. The Aleuts on the island chain fared much better because of a more temperate climate and a more abundant food supply. It was this group that the cruel, barbaric, Russian Promyshleniki encountered as they searched for furs in the late 1700's.

The last group to experience the influence of the white man was the Athabascan Indians of central Alaska. A nomadic, poverty-stricken people, in continuous search of food that was mainly migrating salmon or caribou, they roved through the interior.

The Indians of the southern coast and the southeastern panhandle were mostly Thlingit or Koloshes, as the Russians called them. They had permanently located villages, a highly developed form of art, a complex political-social-cultural system, and an abundant food supply. However, they were divided into various clans, and as there were other small tribes in the area, a warlike atmosphere prevailed.

While no accurate census was taken in the 1800's, it was estimated in 1887 that there were 5,000 to 6,000 children of school age in a total population of over 35,000. In the area westward of Kodiak Island, a reported 25,000 lived, with about 4,000 being Aleuts and people of mixed blood having a highly civilized and educated society. Southeastern Alaska held an Indian population of 7,000 to 8,000 and a Caucasian group of 2,000 residing principally at Sitka, Juneau, Douglas Island, Wrangell, and Killisnoo.

HISTORICAL BACKGROUND

Despotism drove many Cossacks and Russians from their homes in the sixteenth century and started them across the Siberian wastes on a journey that was ultimately to terminate in what is now Alaska. They reached the shores of the Pacific and founded Okhotsk in 1638. In the next half-century, the Kamchatka Peninsula was discovered, and expeditions to the North American continent were launched. Under the sponsorship of Peter the Great, Vitus Bering explored eastward, discovering St. Lawrence Island and the Bering Strait. Further expeditions by Bering and Alexei Chirikof established the principal discoveries on which Russia based her claim to Alaska.

Actual colonization was not begun until 1783, when Grigor Ivanovich Shelikof established a settlement on Kodiak Island. The land in which colonization was thus started was eventually to comprise an area of approximately 586,000 square miles, one-fifth the size of the
contiguous United States, extending 1,400 miles from north to south, 2,500 miles from east to west, and having a coastline of 25,000 miles. The climate ranged from temperate to frigid; waters were uncharted; the native population was widely scattered and uncivilized. The central government in Russia was 10,000 miles from the local capital, established at Sitka, with the vast Siberian wastes intervening. Under such conditions, the work accomplished by the Russians is in striking contrast to the first century of American administration.

Education in the Russian Period

Prior to the coming of the Russians, we may only conjecture concerning education in Alaska. That there was some attention given to this subject, as is the case with all aboriginal people, is doubtlessly true. The accumulated knowledge of the race--its traditional heritage, the provision of food and shelter, the practice of native arts, the observance of laws and customs regarding marriage, religion, and the general conduct of the individual in his relation to society as a whole--was, without doubt, transmitted from one generation to another by means of an informal and yet more or less definite system of education.

As a result of the temporary settlements founded by the pioneer Russian fur traders and explorers on the Aleutian Islands and the inevitable fraternization with native population, the number of children of mixed blood gradually increased until a need for formal education was recognized. Consequently, Shelikof established the first school in Alaska at Three Saints Bay (Kodiak) in 1785 and personally provided instruction in language, arithmetic, and religion. His work, and that of Fathers Juvenal and German, marked the beginning of the educational activities of the Graeco-Russian Church, which terminated only with the close of the two orphanages for boys at Sitka and Unalaska in 1911 and of the girls' boarding school at Kodiak in 1916. The other agency responsible for the conduct of education in Russian-America was the Russian-American Company, organized under imperial charter in 1799 to become Russia's agent for the government of the province. By the terms of its charter, the company was required to establish schools in conjunction with its trading posts. Such schools, the most notable of which was located at Sitka and known as the Colonial Academy. Creole girls also were trained to be householders and frequently married the minor employees.

The Russian-American Company, while ostensibly complying fully with the requirements of its charter, apparently arranged all educational facilities offered to the natives of Alaska with the sole object of benefiting itself. Graduates from some of the more advanced courses were required to remain in the service of the company for a period of 15 years. In view of the vast expanse of the Siberian waste and the stretch of tempestuous sea that separated the company from the home base, it is not remarkable that an effort was made to serve its own interest and provide employees who were not only familiar with the country, but also bound to it by ties of home and family. Many competent clerks, copyists, bookkeepers, shipbuilders, and navigators were trained in the company schools, the most notable of which was located at Sitka and known as the Colonial Academy. Creole girls also were trained to be householders and frequently married the minor employees.

Although some years prior to the transfer of Alaska to the United States, the Russian-American Company discontinued its schools as a result of increasing expenses and diminishing income, during the height of company activity Sitka was the center of education in Alaska with five schools in session: two elementary schools conducted for the benefit of the children of minor employees; one boarding school for girls, maintained by the colonial government; one for the children of company officials; and a theological seminary.

Some concept of the magnitude of educational work of the Graeco-Russian Church may be obtained by noting that in 1887, 17 schools were in operation, 11 of which were taught by the clergy and 6 by secular teachers. The church expended $40,000 annually for church work and $20,000 for schools.

First American Schools

For a time after the purchase of Alaska, education languished. There was danger that even the few traces of enlightenment that the Russians had left behind would be obliterated in the reign of disorder that followed their departure. The military rule organized in 1867, which continued for 10 years, was not conducive to educational progress.

Since it was apparent that nothing was being done, the residents of Sitka, then by far the largest and most important city in Alaska, took matters in their own hands; in 1867, they organized a city government, elected two trustees, and made the mayor ex officio chairman of the school board. This government lasted 6 stormy years and was then discontinued, the school expiring with it.

During the first decade of American sovereignty, two other American schools were maintained. These, on the Pribilofs, were more a continuation of Russian policy than any great desire of the government to provide educational
facilities for the residents of Alaska. Furthermore, the operation of the schools was without cost to the government for in 1870 a contract was entered into between the United States and the Alaska Commercial Company whereby the latter received certain concessions in the Pribilof Islands. Schools were established on St. Paul and St. George Islands in 1870.

Mission Schools

By 1888, educational efforts had expanded so that there were 13 government schools, 2 Alaska Commercial Company schools, and 17 Graeco-Russian and 11 other church schools.

The Presbyterian denomination was first to establish an American church school, setting up a boarding and industrial school for natives at Wrangell in 1877. Others followed at Sitka in 1878, and later at Haines, Jackson, Hoonah, and Point Barrow. Of these, the most important was the Sheldon Jackson School at Sitka. While many of the others had been transferred to the Bureau of Education, Sheldon Jackson High School was still operating in 1965, with 134 students. In addition, a junior college had been established at the same location.

The Moravians established schools at Bethel, Carmel, and Inigillingok. These schools were eventually taken over by the Bureau of Education, although the State Department of Education now operates the Bethel school with an enrollment of nearly 700 students.

The educational work of the Roman Catholic Church began in 1886 with the establishment of a school for white children at Juneau. In 1896, a school for white children was set up in Douglas, only to close in 1920. Other schools were opened at Nome, Holy Cross, Akularek, Nulato, and Hot Springs.

The educational work of the Protestant Episcopal Church was confined entirely to schools established for the natives of Alaska. Among these were St. Thomas at Point Hope, Fortella Hall at Nenana, St. John's-in-the-Wilderness at Allakaket, St. John's at Ketchikan, St. James's at Tanana, St. Stephen's at Fort Yukon, and St. Paul's at Eagle. Others were located at Anvik, Circle City, Tanana Crossing, Salchaket, and Chena. All these schools were established between 1887 and 1900.

The Methodist Episcopal Church established schools on the Seward Peninsula and at Unalaska. The church by 1920 also maintained an orphanage, the Jesse Lee Home, with the children attending the government school at Anchorage. An early site at Sinuk was abandoned and reestablished at Nome.

Other denominations establishing schools included the Friends' Society and the Swedish Evangelical Church. The former set up a school in Douglas, while the latter operated one at Yakutat and one at Unalakleet, which was taken over by the Bureau of Education.

One of the most important missionary enterprises in Alaska was undertaken in 1887 by William Duncan, an independent working among the Tsimsean Indians of British Columbia. Father Duncan, who had formerly been connected with the Church of England, became dissatisfied and brought between 800 and 1,000 Indians from the old town of Metlakatla in British Columbia to Annette Island in Alaska, where he established the new town of Metlakatla. Within a short time, a thriving community was developed, with Father Duncan as teacher, guide, and counselor of young and old.

By legislative act in 1891, Congress set aside Annette Island for the use and occupancy of the Father Duncan colony of natives under such rules and regulations and subject to such restrictions as might be prescribed from time to time by the Secretary of the Interior. In 1913, the Bureau of Education established a school at Metlakatla and operated it until the State Department of Education assumed control in the early 1960's.

Federal Schools

For 17 years after the purchase of Alaska from Russia, the United States made no provision for education there through either appropriation of funds or enactment of legislation that would permit residents to help themselves. Such a condition prevailed, despite the fact that many interested persons laid the problem before Congress and the heads of various departments.

Much credit is due the Reverend Sheldon Jackson, superintendent of Presbyterian Missions in Alaska, for stirring the federal government to action. His close acquaintance with Commissioner of Education John Eaton produced more activity than otherwise might have been expected. During the winters of the years 1877 through 1883, Dr. Jackson delivered a series of lectures on Alaska in most of the larger cities throughout the United States. He also enlisted the aid of the National Education Association, state teacher associations, the Baptist, Methodist, and Presbyterian Mission Boards, and he appeared before the Forty-Sixth, Forty-Seventh, and Forty-Eighth Congresses.

Finally, in 1884, the Harrison Bill, known as the "Organic Act," was passed by Congress, providing a civil government for Alaska. In the next year the commissioner of education was assigned to carry out provisions of the legislation affecting education.

The task was one of great magnitude and beset with many difficulties. The schools to be established would be 4,000 to 6,000 miles from Washington; of the 36,000 people in Alaska, not more than 2,000 could speak English—and these were mainly in the three settlements of Juneau, Sitka, and Wrangell. In addition to the three "R's," it was necessary that children be taught the basic principles of health, dwelling improvements, housekeeping, as well as a means of living in the newly established civil order. To
construct and equip schoolhouses, it would be necessary to ship materials from 1,500 to 4,500 miles. Further, teachers must be found who would be willing to exile themselves from society and to render services for the limited remuneration it would be possible to give them.

In 1885, the Reverend Sheldon Jackson was appointed to be general agent of education in Alaska. The work of establishing schools began in the southeastern region, since that was the only area then readily accessible. The school service was extended to the North Pacific and Aleutian regions in 1886 by means of a chartered schooner.

The plan of making contracts with the various missionary societies for schools in the vicinity of their stations was adopted early. Under this arrangement, it was possible to extend the educational system much more rapidly. The practice was discontinued in 1895.

A code of rules and regulations for the conduct of schools in Alaska was approved by the U.S. Commissioner in 1887. The code created a territorial board of education, consisting of the Governor, the judge of the U.S. District Court, and the general agent. Two more members were added in 1888, but because of the difficulties of communication, the central board was abolished, and local school communities were established. By 1903, experience indicated that the most effective type of supervision could be exercised by the district superintendent, and the local communities were discontinued.

The activities of the Bureau of Education included the formal education of native children; social services in native villages; medical services in the villages; establishment and maintenance of cooperative stores; and the reindeer service, which provided a stable supply of meat and made it possible to establish a more permanent settlement of natives, from which the government could dispense its services.

Up to the year 1890, only two schools for nonnative children had been established, and these were not considered adequate by the nonnative population. The population influx prompted by the discovery of gold and the increase in numbers of white children further complicated the situation. Although there were 10,000 more people in the area by 1898, the annual school appropriation was still only $30,000. Governor Brady in 1899 suggested that legislation be passed to allow larger communities to organize a municipal government and support their own schools. Congress accordingly passed such legislation in 1900 and provided that 50 percent of the license money collected within the corporate limits of such communities could be used for school purposes.

Juneau and Skagway were the first communities to incorporate and maintain their own schools for nonnative children under the legislation, doing so in 1900. Ketchikan and Treadwell followed in 1902; Douglas, Eagle, Valdez, and Wrangell in 1908; Cordova in 1909; Haines and Petersburg in 1910; Iditarod in 1911; Tanana in 1912; Anchorage and Sitka in 1920. Some idea of the importance of the legislation may be gathered from the fact that Juneau and Skagway each had revenues of $15,000 annually for the support of schools; the combined amount was equal to the total sum available to the bureau for the rest of Alaska.

In 1903, Senator Knute Nelson of Minnesota visited Alaska and became interested in the cause of education in the territory. Due to his interest Congress passed the "Nelson School Law" in 1905, under which any community outside incorporated towns having a school population of 20 white children and "children of mixed blood who lead a civilized life" could petition the clerk of the court and secure establishment of a school district. Revenue for the support was provided by 25 percent of the money derived from liquor licenses and occupation or trade licenses outside incorporated towns. This legislation, plus that of 1900 mentioned above, relieved the bureau of the responsibility for education of other than natives of Alaska.

Summary

The four stages of education development in Alaska prior to 1917 may be summarized as follows:

1. The period of Russian control, from 1785 to 1867.
2. The period of governmental neglect, extending from 1867 to 1885. During that time, the various churches, including the Graeco-Russian, were responsible for whatever educational work was accomplished.
3. The period of cooperative effort between the government and the various religious denominations, which began in 1885 and terminated in 1895, when the Bureau of Education discontinued the practice of granting contracts to church organizations for the maintenance of schools.
4. The period during which local control of schools for nonnative children was provided, and assistance to such schools was definitely established; this period began with the 1900 legislation permitting the incorporation of towns and providing for school revenues, and culminated in 1905, when the Nelson Act, with its provision for schools for nonnative children in communities outside incorporated towns, was passed.

A fifth distinctive period is that beginning in 1917, when Congress removed the restrictions formerly placed around the Territorial Legislature and permitted the people of Alaska to control their own schools. It was in that year that the Alaska Department of Education was established.

THE UNIQUE STRUCTURE OF EDUCATION IN ALASKA

Establishment of the Department

Alaska was without a delegate to Congress until 1906. The first delegate, Frank Waskey, was elected in August 1906.
and served until March 1907. Although he had no vote, he had the right to speak before Congressional committees, was entitled to membership on House committees, and could bring the affairs of Alaska to the attention of various officials. This representation resulted in greater attention to Alaska's needs.

In August 1912, delegate James Wickersham secured the enactment of Congressional legislation making provision for an Alaskan Territorial Legislature, which held its first session in Juneau in March 1913. After that date, sessions were convened biennially until the change to an annual session was made following statehood. The Territorial Legislature, by the terms of the "Organic Act" creating it, was prohibited from passing any laws affecting schools insofar as their establishment and maintenance were concerned and from appropriating territorial money for the support of schools. That restriction was removed through an act approved in March 1917 authorizing the Legislature of Alaska to establish and maintain schools.

The third session of the Legislature convened in March 1917 and, among its many actions, passed the Uniform School Act. The principal provision of this legislation was the activation of the Territorial Board of Education, consisting of the Governor and the four senior Senators, one from each judicial division. The board's main duties included the appointment of a commissioner of education at an annual salary not to exceed $4,000; the appointment of clerks and other office employees on the recommendation of the commissioner; and the exercise of general supervision over the policies of the commissioner. The latter was invested with broad powers for the general supervision of all territorial education institutions, the preparation of general rules and regulations regarding the conduct of schools, formulation of courses of study, examination and certification of teachers, authorization of all school expenditures, auditing of the accounts of all school boards, and general responsibility for standardization and coordination of educational activities in the territory (1).

Changing Structure of the Department

When the commissioner of education assumed charge of the Territorial Department of Education in May 1917, the department existed in name only. At that time, schools were maintained in 15 incorporated towns and in 40 communities outside incorporated towns. Schools were scattered from Kiana and Eagle, in the north, to Unga and Ketchikan, on the southern coast. Information regarding the schools was confined to the rather limited statistics appearing in the reports of the Governor. The matter of securing further information was the work of months because of the inadequate mail service in some parts of the territory and the great distances involved. Several school boards had no knowledge of the appointment of a commissioner until he visited them in September and October of that year. Slow and uncertain transportation facilities made the inspection of schools difficult and resulted in considerable wasted time. It was nearly impossible for one official, with a limited travel allowance, a very limited office staff, and a field embracing 586,000 square miles, to visit the various schools more than once in 2 or 3 years. These conditions resulted in supervision of an indirect type, still provided in many of the schools throughout Alaska.

When the department was created and Commissioner Lester D. Henderson took office, he had one secretary to help him. During the 1921-22 school year, he gained a stenographer, and the staff remained the same size for 12 years until a clerk was added. By 1935-36, vocational education had forced an organizational addition, and a supervisor and an assistant in that area were added (2). In 1939-40, vocational education per se was dropped by the department, although it was to be added again in later years. However, a deputy commissioner was employed in 1935-36, and it is assumed that the deputy took over many of the supervisory responsibilities vacated.

Commissioner James C. Ryan initiated the Superintendent's Advisory Commission in the period between 1941 and 1951. The commission began the work that resulted in establishment of the tobacco tax, dedicated to school construction and revision of the administrative manual.

By 1945-46, a health education position had been created, and the supply function became a specific position. The functions covered by the staff included instruction supervision; child accounting; records and reports: correspondence study; filing, clerical, and stenographic work; school inspection and visitation; school plant construction and repairs; finance; transportation; purchasing; accounting; research; and public relations (3). From this point, the same functions were to be carried on, but with an ever-increasing staff.

The organizational pattern by 1951-52 showed two education supervisors, a study coordinator, and a development that had begun in 1946—the on-base school operating program, which was a separate division with its own accounting and secretarial services. A divisional unit for administrative services was also set up and included bookkeeping, vouchering, purchasing, and clerical services (4).

By 1957-58, the pattern of organization had altered considerably, with new units in curriculum and instruction, secretarial services, accounting, and vocational education (5).

Commissioner Don M. Dafoe had continued the practice of utilizing the superintendents' commission to originate and comment on legislation during his 6-year tenure from 1953 to 1959.

The organizational structure had changed to show assistant commissioners by 1959-60—one in instruction and one in administration. The positions of director of
vocational education and the director of the Anchorage field office had been set up, and the on-base schools system was a unit in its own right. Further actions were taken in succeeding years to establish various directorships and divisions to parallel functions assumed by department personnel. The organizational pattern is shown for the middle of 1966, as it was the subject of much work in the 2 years before its implementation (6).

The State Board of Education

Under the legislation establishing the Territorial Board of Education, the board consisted of the Governor as ex officio president, plus the four senior Senators, one from each judicial division. It was empowered to make its own rules and regulations and to assign and direct the commissioner of education in the performance of his duties.

There are three major high points in the history of the territorial and state boards. The first came with the establishment of the territorial board; the second, in 1933, concerned the creation of a new type of board by the Legislature. The new law provided for a continuous board consisting of five members, one from each judicial division and one at large, appointed by the Governor and approved by the Legislature. The members held office for 6 years, and no more than two were new at any time. The board met twice each year.

Under the old law, the members were not selected because of their particular fitness for serving the educational needs of the territory. The Governor, appointed by the President of the United States, was sometimes from one of the states and knew little about the educational needs of Alaska; or, if he were an Alaskan, he was not selected because of his interest in education. The other members were elected as Senators because of their fitness. The only time they met was during sessions of the Legislature, and then they were busy on other matters.

The third major change occurred with the creation of the State of Alaska. Article VII, Section 1, of the state constitution established a system of public schools, and the 1959 state organization act established the State Department of Education. A six-member Board of Education was created to confirm programing actions of the commissioner and to approve all rules and regulations. However, the board was given no administrative, budgeting, or fiscal powers, and the commissioner became the administrator of the education program (7).

Functions and Responsibilities of the Department

In administering the duties delegated to it under law, the Alaska Department of Education serves a threefold purpose. It is a leadership-regulatory agency for the state system of public education; it is a governing agency for specific programs operated on a statewide basis; and a third duty assigned covers the actual operation and administration of School District No. 1 (state-operated schools).

Leadership and Regulatory Functions. Effective leadership contributes significantly to the improvement of state and local education programs. Each program conducted by the department must have the resources needed to provide leadership throughout the state. Leadership activities and services provided include planning, research, consultation, public relations, demonstration, in-service training, and dissemination of information.

In the Alaska department, leadership in development of elementary and secondary programs lies with the Division of Instructional Services, which is responsible for ensuring a continuing program of curriculum revision and development. Activity in this area may include stimulation of curriculum study groups or preparation of guides, bulletins, and journals. All such efforts are designed to improve the efficiency of classroom instruction in all schools of the state. General supervision is concerned with improving not only instruction, but also those practices within school organization and administration that make better teaching possible. Consultative services to local school districts are provided to aid administrators and teachers in planning programs, organizing materials of instruction, improving instruction, and evaluating pupil and teacher progress through study groups, conferences, workshops, and discussion groups.

In addition to these two main responsibilities, the division works to promote the use of instructional facilities and materials including laboratories, shops, audiovisual aids, textbooks, educational media, and school library services. The division offers services to local programs to promote growth and adjustment of the child in closely related programs of instruction and guidance. Although the classroom teacher is the key to operation of guidance programs at the elementary level and is of vital importance in guidance work in secondary schools, specially trained resource people and counselors also are necessary. The division also provides consultative services in the selection of textbooks to promote a well-rounded program of instruction.

Regulatory responsibilities are a direct consequence of state authority for education. The establishment of standards and the accompanying power to enforce compliance with them are commonly termed the regulatory function. In the instruction division, the accreditation and licensing of public and private schools, as well as the approval of programs for the education of school personnel in preparation programs, constitute a specific function. The certification of local school personnel and attempts to increase such personnel resources become part of the cooperative effort with higher education institutions. These programs include preparation of teacher training requirements, promotion of in-service activities, and the advancement of statewide practices in personnel selection.
Operational programs in the instructional services division include responsibility for institution of federally funded programs, correspondence study for students in isolated areas having no elementary or secondary schools, and adult and preschool programs.

The Division of Administrative Services is involved in the leadership function by its responsibility for finance and business administration, pupil transportation, school attendance, and census. The division's involvement includes development and administration of a financial plan ensuring an adequate foundation program for support of education in the state, development of plans and procedures for promoting economy and efficiency, and establishment of prudential safeguards for educational funds.

The division provides such services in pupil transportation as can best be performed at the state level and those of most assistance to local schools in the development of an efficient, economical, and safe system of school bus operation.

Many aspects of the education program utilize the information obtained through child accounting procedures and the school census. These data supply the basic information for projecting future educational needs. The statistical services section of administrative services is responsible for these functions.

Two major functions of the division are those of internal management and supporting services. Internal management encompasses the activities in personnel management, budget development and execution, and program management. Supporting services include research, statistical services, state museum, printing and publications, and such supporting services as mail, central files, and space allocations.

The instructional and administrative services divisions form, with the immediate functions of the commissioner's office, the staff level of the State Department of Education in Alaska. In addition to these are two other main divisions with leadership and regulatory responsibilities. The divisions of vocational education and vocational rehabilitation are mentioned here as operating programs because of their more specific program functions. Each has responsibility for development and supervision of statewide programs of a highly skilled, technical, or scientific nature.

The State Department as an Operating School District. In some states the department of education operates certain special schools, classes, or programs of direct service to individuals or groups. These direct governing functions are quite different in character from leadership-regulatory functions. When a state department of education exercises the leadership-regulatory function, it deals with another agency which is charged with the operation of a particular institution or program. When exercising the governing function, the department is the agency charged with operating the institution or program. In the one instance there is an agency between the department and the program of operation. In the other there is no such agency. In Alaska, the department acts in its leadership-regulatory functions through local educational agencies. However, it also has the governmental function over what is referred to as State School District No. 1: the schools outside incorporated areas, the schools on military bases, regional-vocational schools, regional groupings of schools, and those operated under special contracts, as is the instance in the Pribilofs, where a contract exists with the Bureau of Commercial Fisheries.

In past years, such schools have been operated by staff members of the instructional and administrative services divisions, usually at the expense of the leadership and regulatory functions. Commencing in 1965, the organizational pattern was altered to support a balanced concept among the functions of leadership, regulation, and operation. Such a reorganization will provide for clearer lines of responsibility and an increased ability to meet new programs. In many cases, personnel in the past were less effective because of the many different types of responsibilities being assigned to a single individual. Operation thus received the greatest percentage of effort with a resultant lessening of time devoted to the other two functions (8).

The Dual System

In 1905, with the passage of the Nelson Act, Alaska joined the U.S. Bureau of Education in the task of operating schools in the unorganized areas. Each, by 1965, operated some 80 schools, varying from large boarding schools to small one-room schools. This two-headed enterprise has come to be known as the “Dual System.”

Background of the System. The beginning of a dual system in Alaska came about unofficially as resentment grew among the relatively few whites over emphasis on education for natives and a belief that integrated schools would provide only inferior education. In such towns as Juneau and Sitka, where there were proportionately greater white populations, separate schools were established. With the increased population resulting from the Gold Rush in the late 1890's, agitation grew for the establishment of a separate system of schools for the nonnative. In 1900, Congress provided for the establishment of independent schools for whites within incorporated towns. The Nelson Act of 1905 clarified this previous legislation and extended it to rural areas.

The Nelson Act was an important point in the history of education in Alaska. The territorial government was to be responsible for the education of white children and children of mixed blood who lived “civilized lives” in the areas outside of town, and for the education of white children in towns. The Bureau of Education (or Bureau of Indian Affairs, as it came to be known) was to be
responsible for the education of all other natives. It is important to note, however, that the Nelson Act did extend to the territorial government responsibility for natives of mixed blood. As the years passed, more and more children of mixed and sometimes full native blood have come into the territorial and state schools. Actually, the Territory of Alaska, for the decade preceding statehood, was responsible for the education of more native children than the Bureau of Indian Affairs (BIA).

For nearly 30 years following the 1905 act, little consideration was given to unification of the two systems. Some officials openly discouraged it on the grounds that there would be friction between the two races and that the natives were irregular in attendance, were unable to conform to white standards in matters of health and sanitation, and generally would represent an unfair cost to the territory.

During the 1930's, territorial officials began to recognize the need for unification of the systems. This recognition may have been, in part, stimulated by the reaction of some native leaders against the paternalism of the BIA in the 1920's. A review of correspondence does indicate that some overtures were made by the education department, but with a clear emphasis on the need for increased federal funds. The BIA attitude, as shown in the correspondence, reflected a paternalistic policy and doubted the ability of the department to meet the native needs.

Since World War II, the BIA has shown a departure from its previous paternalistic attitude and has adopted a policy of gradual elimination of its educational functions in Alaska, as well as in the United States proper. The Eighty-Third Congress gave specific recognition to this policy in 1953 in Concurrent Resolution 108. In Alaska, implementation of this policy is based on a recognition of population shifts and cultural transition. The increased acceptance of the native population was evidenced by the passage of antidiscrimination laws in the territory in 1945 and by increased participation of native peoples in governmental affairs.

It is evident that the territory was showing increased willingness to take over functions that are traditionally those of state governments. Although neither the Statehood Act nor the Omnibus Bill mentioned the transfer of school functions from the BIA, there was a strong feeling in Alaskan governmental circles that, with statehood, attention was to be given to unification of the two systems, or that the alternative might be a natural withdrawal from school operations by the BIA regardless of Alaskan consent.

Some progress was made, particularly after 1945. The unification of school operations in communities where there were separate schools is one example. Between 1945 and 1955, a number of communities of predominantly native population incorporated as cities and thereby also became school districts. This incorporation was protested on grounds that it shifted financial burdens to territorial funds for school support purposes. Others argued that their villages were not ready for incorporation from the standpoint of either taxable wealth or willingness to tax themselves. This latter contention was borne out in the early 1950's when several of these communities were involved in financial difficulties.

The Department of Education also contended that these districts should be given financial assistance under the Johnson-O'Malley Act, but the BIA refused to consider this. There was a feeling on the part of the department that this refusal was being used as a lever to force the territory into an overall Johnson-O'Malley plan that would speed up the transfer of all schools to the department. In the case of two villages incorporated in the 1950’s, Angoon and Hydaburg, the BIA did enter into modified JOM agreements and did assume some financial responsibility. The territory itself, however, cannot disclaim responsibility for the failure of some villages since the territory had no agency to give assistance in organizing local governments or tax programs. One of the favorable features of the Organization Act for the new state was the provision for a local affairs agency to render such service.

An Overall Educational Plan for Rural Alaska. The concept of two systems of education clearly is inconsistent with the tenets of democracy. More specifically, it is in conflict with the state constitution, which places responsibility for education with the state. However, with little tax base in the rural areas and the high costs involved in educating a scattered population, assuming complete control of all schools now under the BIA would create a financial burden that the state cannot support at present.

The continued operation of two school systems creates a very real danger that differing educational programs and a disparate philosophy will result in further obstacles to consolidation. With full recognition of this danger, a joint meeting of officials of the BIA, the State of Alaska, the University of Alaska, and the U.S. Office of Education was held in Washington, D.C., in March 1962. An agreement was developed commissioning the State of Alaska to formulate an overall plan with local participation for expansion of secondary school facilities and transfer of bureau-operated schools to state management and operation.

Following the Washington agreement, Governor William A. Egan appointed a state education committee comprised of the area director of BIA, the secretary of state, the commissioner of education, the dean of the College of Behavioral Sciences at the University of Alaska, and a member of the State Board of Education. The committee was directed to prepare an overall plan for rural school operation and ultimate consolidation of the two systems.
A document entitled “An Overall Education Plan for Rural Alaska” was developed by the committee. It included the elements of long-range planning for rural education, a schedule for gradual consolidation of schools operated by the two agencies, and provisions for continued study and revision so that the plan might be adjusted to changing conditions.

The Continuing Committee on Education. As a result of the early meetings of the committee, a continuing committee was established to review and suggest modifications of agency procedures, to direct further research and investigations, and to make recommendations to the two agencies. The following recommendations were developed and continue to be the basis of action on the part of the two agencies:

1. The criteria set forth for establishing new schools should be adhered to as closely as possible.

2. Every effort should be made to provide an elementary and secondary school education for all Alaska’s children through local schools and boarding high schools, or by placement of children in approved homes where schools are located.

3. The highest priority should be given to establishing and improving elementary schools where adequate education is not now being provided, with the second priority being given to the construction of local high schools in communities that can support them. Third priority should go to regional boarding schools to accommodate students for whom a high school program is not available locally.

4. The Alaska Department of Education and the BIA should jointly determine where additional high school facilities can and should be established for eligible pupils and should investigate the feasibility of providing strong junior high schools in locations where enrollment does not justify a full high school program.

5. The Alaska Department and BIA should cooperate closely in developing emergency and long-range plans to educate all children in the state. This includes those students for whom boarding school space in local high schools is not available and students needing special education.

6. Adequacy of educational programs in the local and boarding schools should be under continuous review. In particular, the department should investigate the adequacy of educational programs in very small high schools and compare the achievement and adjustment of their students with that of boarding high school students.

7. Careful studies should be made of per pupil costs at the boarding schools. The possibility of increasing enrollments should be investigated as an alternative to establishing new boarding schools.

8. Where possible the state should carry out a continuing program of prevocational and occupationally oriented education that will realistically take into account the availability of job opportunities in Alaska.

9. A coordinating committee should be organized to develop joint state-federal and village planning prior to relocation of villages. All requests for assistance from such villages should be referred to the coordinating committee.

10. Postgraduate technical or vocational training at high school sites, particularly at the boarding school locations, should be considered.

11. The possibility of assisting uneducated youth and adults through additional education and training should be explored.

12. The state and BIA should continue to arrange for an orderly transfer of BIA schools to state administration on a region-by-region basis under Johnson-O’Malley contracts.

13. Transfer of BIA schools to state operation should be effected as quickly as practicable, supplementary financial support for operation of schools by the state to be obtained under applicable federal laws.

14. The state, through its political subdivisions, should assume the financial burden of all elementary and secondary day schools when the areas in which these schools are located are incorporated into boroughs.

15. The possibility of locating suitable living accommodations in cities for students who cannot attend local or regional boarding high schools should be explored.

Local School Agencies

In addition to the efforts of the state and the Bureau of Indian Affairs, there are two other major units of school operational authority through which the department is called upon for services. Twenty-seven borough and city school districts currently (1965-66) serve 53,872 students. There are 2,132 professional personnel in these local education agencies. The department exercises leadership and regulatory functions and provides financial support under the foundation program.

Statutes and regulations also invest certain supervisory and regulatory powers in the state department with reference to private and denominational schools. Some supervision and coordination is necessary to maintain some comparability of educational standards and to ensure good working relationships among all educational institutions in the state. Statistics gathered in the department indicate that there were 28 private and denominational schools, serving 2,439 students, in 1965-66 (9).

CONDITIONS INFLUENCING EDUCATION IN ALASKA

The States of Maine and Hawaii are the only others whose operational procedures approach the unique situation of
education in Alaska. The State Department of Education in Maine operates some schools in isolated sections of its northern area; all of Hawaii’s schools are operated by its state department. Alaska’s department, however, must exercise its leadership and regulatory functions with the local district and private schools (where there are specific regulatory responsibilities); must cooperate with the Bureau of Indian Affairs system; and, in addition, must operate a large number of schools in isolated rural areas spread over 586,000 square miles, as well as serve relatively large systems on military bases.

Growth and Costs of Alaskan Schools

The student population in Alaska during the 1965-66 school year in the four major systems of the Alaskan educational structure totaled 69,628 (10). In comparing growth, enrollments, and costs, attention is drawn to the much more rapid growth in city and borough school districts than in the unincorporated areas. Although the cost per pupil in average daily attendance for the year 1917-18 indicates that city districts were spending $102 per pupil, those schools outside incorporated areas were spending only slightly more. By 1965-66, however, the per-pupil expenditure in rural areas was much higher. In that year, nearly 54,000 students were in city or borough districts, with only 5,000 in rural areas (ignoring for the moment approximately 10,000 pupils in schools on military bases); small numbers, high shipping costs, low pupil/teacher ratios, and high operational costs all contributed to the disparity in per-pupil expenditures.

The military on-base school system had its beginning in 1946-47 with four schools and had doubled in number by 1965-66. The total enrollment grew from 158 to over 10,000 in a 20-year period (11).

Problems of Alaskan Rural Schools

The native student of today who returns to his village home finds little in the way of common discussion grounds with his parents, for they had little opportunity for education in earlier years. The policy of both the state and BIA is to establish an elementary school only when sufficient numbers of students are present in a location to make it economically feasible. The state uses a minimum figure of 10, while the BIA uses 12. Otherwise, the children must use correspondence courses (Calvert courses in earlier years, but now the state has developed its own). The compulsory education law was nearly impossible to enforce in rural areas, and, in any case, those who lived more than 2 miles from the schools were not required to attend.

Education can be a determining factor in the process of acculturation, but the high incidence of dropout must be lowered if it is to do so. Problems of home background, especially bilingualism, contribute to the dropout rate, as well as lack of materials and instructional techniques adapted to the environmental and cultural handicaps of the student.

The level of education is gradually rising in the villages, but it has been a very slow process. The mixing of the two cultures is necessary to improve the ability of village people to compete with those of the dominant culture. Contrastingly, the two worlds the villagers face are that of the majority—urbanized, Western European, English-speaking peoples—and their own minority—isolated village, Eskimo-Indian, dialect-speaking groups.

Of paramount importance to the department in its operation of schools, then, is the problem inherent in the existence of two cultures, both of which impinge on the student daily as he faces one at home and the other at school. Villages will form and grow where an economic base is present to supply resources to meet the needs and wants of the people. Others, where the economic base has shifted or vanished, exist mainly through welfare support and tend to be static or may eventually disappear. Educators must consider these factors and provide the means whereby children may gain an education that will enable them to compete in the modern world, whether the village remains or disappears or whether the children eventually end up in urban or rural areas.

The following points represent some of the major problems that must be considered by the Department of Education in the establishment of a meaningful program of education for rural peoples:

1. It has been said that the typical Alaskan village family consists of the mother, the father, one grandparent, six children, and one anthropologist. Many specialists from educational, economic, governmental, and social institutions could appear in one village to answer one plea for help. The forces available should coordinate their efforts to avoid duplication and waste.

2. It has been assumed that what is good for one group may also be good for another. The problems in education of the village people are not limited to the concept of the majority versus the minority culture. Rather, the problem is of many subgroups within any one group.

3. The primary point of attack should be the insufficient background of language and reading skills.

4. Some variations must be allowed for the teaching of English as a second language, whereas now promotion is based on the individual’s ability in the English language only.

5. Most of the existing instructional materials, designed for Midwestern, middle class, English-speaking children, are not appropriate for use in remote Alaskan villages.

6. Evaluation techniques, testing programs, and psychological services need to be improved and adapted. In testing across cultural lines, tests must be revised to take into account nonverbal skills.
7. There is inadequate motivation to pursue long-range educational careers because of the failure to recognize the peculiar characteristics of the village populations.

8. Many village students have a poor self-concept when mixed with nonvillage groups. Sullivan’s “Mirror Effect,” as well as the school’s lack of provision for individual success, may contribute to the problem. A restructuring of grade-placement systems is needed to provide for the variation in student abilities. There is also a lack of an “educational tradition” in the home.

9. Health problems are common, especially those of the eye and ear. In some areas the numbers of students affected are estimated at 50 percent.

10. Over past years inadequate opportunities have been provided for education of students beyond the eighth-grade level. A program of adult education is necessary.

11. Teacher attitudes toward the minority culture, their lack of specialized training in the problems of teaching in village schools, large classes, and excessive teacher responsibilities contribute to the many problems. The lack of adequate staff housing in many villages does not aid in the attraction of competent, highly skilled teachers.

12. Costs of school facilities in rural areas are far higher than any place else in the country. Some years ago it cost nearly $27 per square foot to build in the southeastern area, $35 in the central, $55 in the northern. Costs have risen since then.

To overcome these problems, Alaskan educators must prepare students by increasing their perceptivity, reasoning ability, knowledge, understanding, and respect for the heritage of their own people and others. Motivation may then be increased toward the attainment of appropriate objectives and goals.

Anthropologists, sociologists, economists, and educators must combine to effect change in the villages and in educational programs, for the largest problems to be faced are cultural in nature.

It should be pointed out that the most urgent need lies in defining desirable ultimate goals for native children and youth and the development of immediate curriculum objectives that will lead toward those ultimate goals.

A third need which must be fulfilled is the development of appropriate Alaska-adapted instructional materials. Above all else, the teaching of English as a second language, especially in the primary years, through the medium of an oral situational approach should be developed and implemented through in-service training programs.

Fourth, techniques for recruitment and selection of teachers for the village schools must be improved. Face-to-face contacts (rather than mail selection) are a costly process, and the state Legislature must be convinced of the need to obtain qualified personnel before they will fund such recruitment programs. Once contracted, instructional and administrative personnel must be involved in a continual in-service program.

Charles K. Ray, dean at the University of Alaska, directed a study during the years immediately before and after statehood. The following two paragraphs set forth his comments relative to planning programs for the village people:

Regardless of the rate of development of the Alaskan economy, the native people are committed to the task of finding their way in a new culture in a new way of life which will involve the development of new values and the dropping of many vestiges of their own culture. Such a process must be a voluntary one; still, there are myriad evidences to support the claim that the people themselves desire the change. No longer do these people want to settle for a lower standard of living than is maintained by the average citizen, nor do they wish to be wards of the government. The desire on the part of the people for prestige, self-respect, and economic independence has been demonstrated in numerous intangible, yet emphatic ways.

Education can serve as one vital influencing force designed to increase the differences in attainment and opportunity which exist at the present time between native and nonnative groups. Therefore, the long-range objectives of the schools must be pointed toward an eventual common education for all, regardless of race. Yet the immediate instructional program must be planned to account for the enormous differences in the background, values, and orientation of the native students in the diverse regions of the territory. An intelligent understanding by the teachers of the problems faced by those “caught between two worlds” is essential (12).

Problems of Education in the Boroughs

The Borough Act of 1961 (13), as amended, restructured the grouping of schools in Alaska to borough-operated, city-operated, and state-operated. At that time, about 62 percent of the 60,000 schoolchildren in the state were enrolled in borough schools.

On January 1, 1964, there were nine boroughs in the state. One of these, Bristol Bay, assumed control over three state schools within its boundaries. The other eight acceded to all powers over former city independent school districts and state-operated schools within these boundaries. Each such borough was thus made a school district; first- and second-class boroughs were required to establish, maintain, and operate a system of public schools on an area-wide basis. The borough assembly could, by ordinance, require that all school money be deposited in a central treasury.
with all other borough money; the borough chairman then would have custody of all money in the centralized treasury. The borough assembly could, however, with the consent of the borough school board, delegate to the borough school board responsibility for a decentralized treasury. One major change through this legislation required the borough assembly to review the school budget and approve the total amount—only appropriating, however, the local share.

In matter of school buildings the borough assembly was to determine such sites from the recommendations of the borough school board. The latter had responsibility for the design of school buildings, but again this was with the approval of the assembly. The board provides custodial services and routine maintenance; the assembly provides for all major rehabilitation and construction. In the years since the passage of the Borough Act and its implementation in 1964, a number of arguments have grown over the centralized treasury, budget review and approval by the assembly, design and construction of school buildings, and bonding procedures. Undoubtedly some will be settled through legal interpretations, either by opinions from the office of the attorney general, or by final resort to the courts.

DEVELOPMENT OF THE SCHOOL SUPPORT SYSTEM

Early Basis for Support

Commencing in 1919, 75 percent of the total amount expended for the maintenance of schools within the limits of incorporated towns, cities, or school districts was refunded by the territory. No money was included for construction, and not more than 10 percent of the total amount could be used for repairs or improvements. No district was to receive more than $15,000 during any school year.

Total refund amounts at the 75 percent level were raised to $20,000 in 1921 and remained there until 1931, when a new refund schedule was set up according to the number of pupils in school. With less than 150 pupils, 80 percent was refunded; with 150 to 300, 75 percent; with 300 pupils and over, 70 percent. In 1955 this was changed to the following: 0 to 200 pupils, 85 percent; 200 to 500, 80 percent; and 500 and over, 75 percent.

The commissioner received the budget prior to January 1. He then designated those expenditures acceptable for refund; his decision was final.

Taxation for School Purposes

In 1919 a $5 school tax was levied on each male person between 21 and 50 years of age, excluding military personnel and paupers. In 1943 the age was changed to 21 to 55, and in 1960 to 19 years and up. The amount rose to $7.50 in 1955, and to $10 in 1957. In 1960 the tax ceased to be dedicated for school purposes and went to the general fund.

In 1951, an act was passed allowing the assessment, levying, and collection of a tax for school and municipal purposes not to exceed 3 percent of the assessed valuation of all real or personal property. An exemption was provided for those below $200 in property holdings, and for property held by religious, educational, or charitable institutions and by nonprofit organizations.

Revenue collected from the tobacco tax, passed by the Legislature in 1951, was to go into a territorial "school fund" to be used for rehabilitation, construction, insurance, and repairs of facilities.

A consumers sales tax was authorized in 1953 and allowed school districts, on approval by referendum, to levy a tax not to exceed 2 percent of all retail sales, rents, and services within the district.

In 1960, the bonding capacity of the districts was set at 10 percent of the aggregate value of the real and personal property subject to taxation. Such funds could be used to construct, improve, repair, reconstruct, acquire, and operate any and all types of public utilities, school buildings, and facilities connected to such authority.

The Public School Foundation Program

The present program of school support began in 1962 with the establishment of a foundation program that recognized a level of "basic need" and then equalized this according to the taxing resources of the district. Three elements of support are used: (a) a per-pupil allotment of $140, $150, or $160 (depending on geographic area); (b) a teacher unit allowance based on average daily membership and the state minimum salary scale; and (c) $1,000 for each attendance center. The sum of these allowances constitutes the "basic need." From this is subtracted an amount equivalent to that which would be raised by a 3.5-mill levy on the full value of all real and personal property in the district, and one-half of the P.L. 874 entitlement for the preceding year. This subtractive element is called the "required local effort."

A special education schedule for teacher units was set up in 1963, establishing one teacher unit for the first 5 to 10 students, and adding one teacher for each 10 students.

The foundation program provides basic support for education in grades 1 through 12 (14).

Importance of Federal Aid

Chapter 27, Session Laws of Alaska, 1959, assented to federal aid to education in the state under the National Defense Education Act of 1958. The commissioner of education was authorized to cooperate with the federal
government and to participate under that act or any acts amendatory or supplementary to it, subject to prior concurrence of the Governor.

From 1959 to the present, the percentage of federal funds in total expenditures has varied only slightly (15). Amounts have certainly changed and show an increase well over 150 percent between 1959 and 1965, from over $6 million to nearly $15 million.

CHANGES IN EDUCATION THROUGH LEGISLATION

The following material is an attempt to describe the more important legislation which has changed education in Alaska since the inception of the department (16). Due to limited space and previous discussions of legislation, only a few major topics have been chosen.

School Boards and District Organization

In 1919, power to establish a school district was awarded to the clerk of the district court for those areas where resided 10 children of white or mixed blood leading a "civilized life" and between the ages of 6 and 17 years. For the clerk to perform this act eight adult citizens of the United States had to file a petition. After approval, the voters of the district were allowed to vote on a three-member board. The board was empowered to build or rent the necessary facilities and equipment, provide utilities, employ teachers, and do anything else necessary for the maintenance of public schools.

Independent school districts were authorized by legislation in 1947 but were limited to a total of 1,000 square miles of territory in 1953. The limitation of territory was removed in 1964, when the borough system was implemented.

Where the Territorial Board of Education operated schools, it could discontinue such operation when the average daily membership in the district reached 100 students and the community was able to provide local school support in accordance with territorial law; such a decision was at the board's discretion. Following such action, the territory was to pay for the support of the schools up to 100 percent for the first 2 fiscal years; 90 percent for the third; for the fourth and successive years, the schools were to be placed in the appropriate reimbursement group.

A 1960 act provided that there were to be five members of local boards in independent districts with average daily membership of less than 5,000 students. Over that number, a board of seven members was provided. Officers were to include a president, treasurer, and clerk. The board could appoint an assessor and place an assessed evaluation on all real and personal property outside the city and within the district so long as it was comparable to valuations of similar property within the city.

Legislation in 1960 established advisory school boards of three members in each community served by a rural school operated by the State Department of Education. Powers of such boards were limited to advising and assisting the state board and the department.

In 1963, advisory boards in rural areas were set at three members if the average membership was less than 250 pupils; beyond that figure a board of five members was created. In both instances, the term of office was 3 years.

Compulsory Attendance

In Alaska, attendance at school is compulsory for children between the ages of 7 and 16 years or until the child has completed the twelfth grade. School age is defined as being 6 years of age on or before November 2 of the school year, being under 20, and not having completed the twelfth grade. Such children may attend public school without payment of tuition in the district of which they are residents. A person over school age may be admitted at the discretion of the governing body of the district, but he may be charged tuition. A child under school age may be admitted at the discretion of the governing body if he meets minimum standards prescribed by the board related to his mental, physical, and emotional capacity.

A child 5 years of age on or before November 2 following the beginning of the school year, and who is under school age, may enter a public kindergarten. A child under school age shall be admitted to school in the district of which he is a resident if immediately before he became a resident he was legally enrolled in the public schools of another district or state.

If a physician is available, a physical examination is required of every child upon entrance to school and thereafter at regular intervals considered advisable by the governing body of the district. Where no physician is available, an examination is required at the earliest date possible.

Accreditation and Approval of Secondary Schools

In 1929, a section of the statutes defined accredited high schools as those equal to the standards set by the commissioner of education, who was to be guided by the practices employed by the University of Washington in accrediting State of Washington secondary schools. In later years, the Northwest Association of Secondary and Higher Education has become the accrediting agency for Alaskan schools. The three-member state committee processes applications in advance of association meetings.

The education department is presently considering standards for approval of secondary and elementary schools on a state basis.
Transportation

The department provides for the transportation of all pupils who reside more than 1.5 miles from established schools. It may require districts to enter into contracts with the department for administration, supervision, operation, or subcontracting of transportation systems. An annual report is required, including a financial statement and operational data. Each district is entitled to receive full reimbursement from the state for such operations.

Although made ineffective by a court decision in 1959, it is notable that legislation once provided for transportation of nonpublic school students at public expense. Where children, in order to reach nonpublic schools, had to travel distances comparable with, and over routes the same as, the distances and routes over which children attending public schools were transported, this legislation allowed for such combined service.

Vocational Education

Legislation in 1935 established the territory's right to carry out the provisions of acts relating to vocational education from the federal level. The act provided for the promotion of vocational education and for cooperation with states in promotion of educational programs in agriculture, home economics, and trades and industries. Section 3 of the act gave the territorial board full and complete authority and power to cooperate with federal units in vocational education and in administration of the provisions of the acts of Congress. In 1935, $30,000 was appropriated for the 1935-37 biennium.

Vocational Rehabilitation

The Alaska Board of Education, by legislation of 1960, was directed to act as the Board of Vocational Rehabilitation and to administer its program. It was empowered to cooperate with federal agencies as required by federal statutes.

The board appoints a director who serves as the executive officer of the board. All rules and regulations for the operation of the vocational rehabilitation unit originate with the commissioner of education and become effective when approved by a majority of the board.

State Textbook Commission

Legislation in 1919 created a Textbook Commission consisting of the commissioner of education and two legally qualified teachers to be appointed by him, with the advice and consent of the Governor. Members were to serve for 4 years, or until successors were appointed. It was the duty of the commission to select and adopt a uniform set of textbooks for use in all branches of study in the elementary school and for each of the subjects in the high school. Adoptions were made for a period of 4 years and required a majority vote of the members of the commission.

The membership of the commission was changed periodically and had reached seven by 1965-66. Districts were required to follow the adoptions unless special approval for variation was received from the commissioner. Any other variation was required to be funded from local district sources (17).

Provisions for Exceptional Children

Competent special services for exceptional children in Alaska between the ages of 5 and 18 for whom regular school facilities are inadequate or not available was the subject of Chapter 120, SLA 1959. The term special services was interpreted to include transportation, special teaching in the curriculum, corrective teaching, and provision of special books, teaching supplies, and equipment required for the education of physically handicapped and mentally retarded children. Section 8 gave the commissioner the right to appoint a supervisor or to delegate duties to an existing staff member.

An act in 1965 made it mandatory that special education be established in a district for each classification of exceptional children represented by not less than five children living in the area served by the program. A program could be offered at local expense for less than the five.

The Department of Health and Welfare was directed in 1965 to establish by regulation certain standards for the evaluation and classification of exceptional children. This legislation augmented the provisions of Chapter 70, SLA 1963, which increased the allowable number of teacher units allowed for special education in the school foundation program.

Teacher Welfare Legislation

Salary. A minimum schedule for teachers was established in 1939 setting salaries in the first division at $1,800, the third division at $1,980, and the second and fourth divisions at $2,100. Local districts could pay higher salaries, but state reimbursement was based on the established minimums.

In 1946, legislation established a superintendents salary scale by divisions: in the first, $3,000 to $4,000; in the third, $3,300 to $4,300; in the second and fourth, $3,500 to $4,500. By 1957, an act was passed providing for the setting of salaries, qualifications, and numbers of teachers, principals, vice-principals, head-teachers, teachers-in-charge, and superintendents allowed to schools in the
Salary scales were set for 3 years' training, a bachelor's degree, and a master's degree. The department was allowed to pay salaries above the scale. In 1961, the department was directed to pay a salary not less than $500 above the scale.

The state minimum scale was changed to an index system in 1963, with yearly increments of 0.04 percent. Superintendents' salaries were set at 20 percent above teacher scales in schools with an average daily membership of less than 500 and at 25 percent for 500 or more. Principals drew 15 percent above base, and vice-principals 10 percent.

Retirement. A retirement system for Alaskan teachers was first established in 1929 although it was repealed 4 years later when it was found to be actuarially unsound. Reactivated in 1945, it was subsequently changed several times. At present, benefits are computed on an average of the highest 3 years of salary earned within the last 10 years prior to leaving service. A 10 percent cost of living is added if a retired teacher resides in Alaska. A disability provision and survivor's benefit are included in the plan.

The commissioner of administration is responsible for the administration of the retirement system, with an advisory board meeting annually to review investments of the fund.

Tenure. Although a form of tenure existed earlier, a law passed in 1960 granted tenure to those who had been employed 2 years or more in a school system and were holders of standard teaching certificates; it specifically excluded all temporary certificates. Causes for nonretention were listed as incompetency, immorality, or substantial noncompliance with school laws of the state, regulations of the department, or other governmental agency. Necessary reduction of staff occasioned by a decrease in school attendance also could warrant nonretention. In any of these instances hearings were to be provided within 10 days if requested.

Contracts could be issued at any time after January 1, but teachers were required to be notified of nonretention in writing, on or before March 15. The section on notification was added by the 1957 Legislature. In 1965, tenure was further defined, and a section was added providing that such rights could be forfeited upon transfer from a district. Approved leaves of absence were not considered a break in service for tenure or retirement purposes.

Sabbatical Leave. There have been several variations in the sabbatical leave laws passed by the Legislature, primarily in the numbers of teachers who could be on leave at any one time. In 1962, eight leaves at state expense were authorized, and the department was directed to develop rules and regulations for selecting participants. A teacher was eligible to apply for leave after 7 consecutive years of service to a single district and, if selected, receive half his base salary. A proviso was included requiring a teacher to serve at least 1 full year after his return, unless his inability to complete the year was attributable to sickness, injury, or death.

A teacher must submit information regarding his qualifications and educational plans to be eligible. Only one year is allowable, and it may be approved for educational purposes only.

Right To Criticize. An act prohibiting restriction on the right of a teacher to comment or criticize public officials and employees was passed in 1965. Thus, a teacher has the right to engage in comment and criticism, outside school hours, of school administrators, members of the governing body of the district or any other public official, or any school employee.

GROUPS AND INDIVIDUALS INFLUENTIAL IN EDUCATIONAL CHANGE

Three groups will be discussed in this section: the Department of Education, including commissioners and their Superintendents' Advisory Commission; the Alaska Education Association; and the Alaska School Boards Association.

Comments from those who were district superintendents during the 1940's and 1950's indicate that these groups worked well together in those years. It is probably due to this spirit of cooperation that the era produced much significant legislation.

Individual legislators, powerful in their own right and interested in education, have contributed a measure of influence on educational legislation. However, lack of documentation makes it difficult to establish the degree of such influence.

The Department of Education and the Superintendents' Advisory Commission

As the commissioner's staff has grown through the years, he has had access to more and more professional advice in specific areas of education. Perhaps the most important source of aid, however, has been obtained through judicious use of advisory groups, particularly the Superintendents' Advisory Commission. It appears that the most productive periods, in terms of educational advance through legislation, occurred when the office of the commissioner was filled by strong individuals, who in turn made wide use of the advisory commission; and there was a high degree of cooperation between these and the State or Territorial Board of Education. When these efforts converged, a greater degree of unity was apparent to legislators, who
then became more amenable to changes in educational legislation.

Two names were presented to the writer by interviewers as being the strongest commissioners from 1917 to present: James C. Ryan, who is credited as the initiator of the advisory commission and who later moved to the superintendency at Fairbanks; and Don M. Dafoe, who assumed the office after service at Anchorage and later returned there as superintendent. All persons interviewed indicated that these two made most effective use of the advisory commission and thus involved more people in the process of educational change.

Also among those reported as influential through the 1940's, 1950's, and into the 1960's were Theron J. Cole of Sitka, Sterling Sears of Juneau (now at Kenai), Lester Wingard at Petersburg, A. W. Morgan of Anchorage, and J. E. Danielson of Ketchikan.

L. R. Joy of Fairbanks and Keith Lesh of Anchorage were pointed out as having been influential members of the Alaska School Boards Association. Both served as board members over a period of many years and were members of the White House Conference on Education in 1956.

The State Activities Association also provided opportunities for meetings of administrators. Athletic events, music festivals, or some other activity where students were involved in sponsored travel usually offered an opportunity to get together. Since such travel was costly in terms of school time and money, administrators usually took full advantage of it to hold their meetings. Individual superintendents became somewhat influential due to their holding officeships in the Activities group.

The Alaska Education Association

The association began its activities in 1922 and endorsed national legislation in 1924-25 calling for a cabinet post in education at the federal level as well as federal aid to education. These two points were within the program of the National Education Association, with which the AEA became affiliated. The meetings of the AEA were generally held in conjunction with the teacher institutes until 1926, when the latter were discontinued. Thereafter, meetings were scattered and poorly attended due to the cost and difficulty of travel until the middle 1950's (18).

In 1941, when George V. Beck and Lester L. Wingard were elected president and secretary-treasurer, respectively, a policy was begun which has continued to the present—that both offices be from the same locality so that each could reinforce the other. Slow mail service and travel problems enhanced the arrangement.

Commencing in 1939, the AEA has worked primarily for legislation in two teacher benefit areas: salary increases and a strong retirement program. These were first presented to the Legislature in 1941. Although not successful, they marked the first active effort on the part of the AEA to influence legislation. The names of Beck, Wingard, Ryan, Marjorie Tillotson of Juneau, and A. B. Philips, superintendent at Juneau, were especially influential in the education of legislators relative to the need for strong programs in the two areas.

Following these first efforts, the leadership of the AEA has been very active in securing changes in the retirement program, salary increases, provision of adequate funds for support of territorial and state schools, fiscal independence for school boards, activation and reactivation of the vocational education program, provisions for a stronger professional organization, and provisions for protection of the state department from political influence.

From 1922 to 1950, the AEA officers were school administrators and were probably more effective due to the combination of offices with those positions on the Superintendents' Advisory Commission. One person interviewed indicated that superintendents (until the 1950's) and the commissioner saw themselves as responsible for teacher welfare programs. With the growth of the AEA, this function was assumed by that group, and leadership in the organization was gradually taken over by teachers. The 1950 election of Marjorie Tillotson, a classroom teacher from Juneau, as president marked the transfer of power from administrator-officers to teacher-officers.

When Everett R. Erickson became commissioner in 1951, he requested the removal of the position from the executive committee of the AEA, reasoning that a conflict of interest was possible should the Board of Education and the association disagree.

By the later 1950's, the AEA became capable of supporting an executive secretary and formulating a legislative program acceptable to its membership. Prior to this time only a few members had carried on the work, but with the establishment of the delegate assembly in 1956 (the last such representative group to be established in the various states and territories), the working basis was broadened to include teacher representatives from the various communities throughout Alaska.

John M. Poling was appointed the first executive secretary and took up his duties in 1957. He was followed in office by Haze Bergeron, Frank Darnell, and Robert Van Houle, the latter still serving.

The Alaska School Boards Association

This association appears to have been gaining in influence over the past few years. Organized in 1954-55, the group early provided moral support as it worked with the commissioners and the Superintendents' Advisory Commission. Some interviewers expressed the opinion that the ASBA
could be much more influential if, following their meetings, individual members would work more closely with their area legislators. However, it was also pointed out that the main strength lay in being an organized body.

**FOOTNOTES**

1. The terms of office and the names of the various commissioners are set forth in Appendix A.
2. See Appendix B, Chart I, for organization by 1935-36.
3. See Appendix B, Chart II, for organization by 1945-46.
4. See Appendix B, Chart III, for organization by 1951-52.
5. See Appendix B, Chart IV, for organization by 1957-58.
6. For graphic presentation of the organizational structure of the department from 1959 to 1966, see Appendix B, Charts V, VI, and VII.
7. A fourth major change was made by the 1967 Legislature when it created a Board of Education of seven members to head the department. As mentioned above, the commissioner had been responsible for initiating rules and regulations in accordance with the political belief that a strong central administration should control each department. With the advent of the new board structure, control over approval of the rules and regulations and the appointment of the commissioner will lie with the board. The Governor will appoint the board members, with approving authority over the board's choice for commissioner. Terms of office for members will be 5 years, overlapping; one member will be from each of the four judicial districts; the board selects its own chairman; all members serve at the pleasure of the Governor. See Appendix B, Chart VIII.
8. Chart VII, Appendix B, indicates the reorganization of April 1966, completed in conjunction with these statements. That effort resulted in the addition of more personnel to provide consultative services, an emphasis on curriculum development and revision, and the setting out of the division of state-operated schools as a third major division of the commissioner's staff. It effectively divided the three functions and provided the balanced concept discussed previously.
9. See Appendix C, Table 1, for a chart of the multiagency educational system in Alaska.
10. Also see Appendix C, Table 1, for a comparison of the student enrollments, sources of funding, and numbers of schools in the various types of schools.
11. See Appendix C, Table 2, for a statistical comparison of the various types of schools in a cost and growth summary.

15. See Appendix C, Tables 3 and 4, for comparison of federal-state fund sources and expenditures.
17. Under the revised Education Code of 1966, districts were freed to choose their own textbooks, and the commission adoptions were for state-operated schools only.

APPENDIX A—ARIZONA CHIEF STATE SCHOOL OFFICIALS 76

APPENDIX B—ORGANIZATION CHARTS 76
Public education in Arizona first received formal attention in 1864, when Governor John N. Goodwin apprised the first Legislative Assembly of the importance of providing for public elementary, secondary, and college education. However, the problems of a post-Civil War period, ravaging Indian attacks, and organization for a vast, sparsely settled area being foremost in the minds of the legislators, they decided that it was not yet time to establish a system of schools for the territory. Still, appropriations were made for education grants of $250 each to the towns of Prescott, Mohave, and La Paz. A $500 grant was provided for Tucson, and $250 was pledged to the San Xavier Mission School “as a fitting compliment to the first school opened in Arizona” (1). In order to receive the funds as provided, the towns were required to raise an equal amount. It was further stipulated for the Tucson grant that English was to be the language used for instruction.

Unfortunately, this first legislation offered little motivation for the establishment of public schools, and Prescott was the only town to take advantage of the grant. The 1867 Assembly made provisions for towns to establish tax-supported schools, but no real progress in public education was accomplished until 1871, when Governor Anson Peacely Killen Safford, “The Father of Arizona’s Public Schools” (2), began his dedicated effort to establish a system of schools.

Safford was a warm and humane person, a thinker, a statesman, and a gentleman. Born in New England, he grew up in Illinois under impoverished conditions and went to California during the Gold Rush. There he worked in mining camps and began a political career when he was elected to the California Legislature at the age of 26. After spending some time in Nevada, both in business and politics, Safford was appointed by President Grant as Governor of the Arizona Territory in 1869.

The situation in Arizona at the time demanded a strong administrator. Civil officers were neglecting their duties; citizens were refusing to pay taxes; it was claimed that the Legislature just previous to Safford’s coming was illegally convened; the Apaches were on the rampage; and the territory had no public schools.

Safford’s personal education having been mainly self-acquired, he particularly sensed the need for a public school system. Finding that little effort had been given to organizing educational opportunities for the nearly 2,000 school-age children then residing in the territory, he set about to secure enactment of school legislation by the 1871 Territorial Legislative Assembly.

Safford drafted a bill that proposed territorial and county cooperation in the support of public schools. This bill, approved as presented except for some of the important fiscal clauses, created a framework within which Safford could begin an organizational program on a territory-wide basis.

The 1871 school law made provision for a territorial superintendent of public instruction, which position the Governor served ex officio. A Territorial Board of Education, composed of the superintendent, the territorial treasurer, and the secretary of the territory, was created to serve as the highest authority in implementing the law. Since the Governor appointed the treasurer of the territory and the probate judges who served as ex officio county superintendents, Safford indirectly had complete control of school matters. Because of his extreme dedication to education, this arrangement proved to be most advantageous during the time he was attempting to organize schools.

The 1871 law also prescribed some of the duties of the superintendent and levied a territorial tax of 10¢ per $100 of assessed valuation. The proceeds of this tax were to be apportioned first to the schools through the counties according to the number of resident children between the ages of 6 and 21 and subsequently distributed on the basis of attendance. The duties of the superintendent were to prescribe forms and registers, appoint boards of examiners to test applicants for teacher’s certificates, provide a budget estimate detailing anticipated revenues from the territorial fund, visit each county, and prescribe and cause to be adopted a uniform series of texts.

Local control of education was vested in boards of trustees to serve as bodies corporate. A county tax levy of 50¢ per $100 of assessed valuation for the support of schools, a school census, and a minimum school term of 3 months per year were requirements made on the local agency. The intent to provide a nonsectarian education was
clearly set forth: no tracts, papers, or instruction of a religious nature were to be used in the schools, and no public funds were to go to schools organized for religious purposes. This stipulation seems especially noteworthy in view of the fact that the territory's first act of support of schools was a grant to the San Xavier Mission School. But the battle to keep the public schools free from sectarian influence was not over. Safford and other officials were to again be confronted with the issue in 1875.

Safford was not paid for his work as superintendent, but a small appropriation of $500 for expenses was provided. Notwithstanding the lack of financial support, he traveled extensively to discuss education with citizens throughout the territory. In performing what today would be called public relations, he promoted widespread enthusiasm for schools among citizens. As a result, schools were established, legislators became conscious of popular support for education, and later legislative sessions worked in a climate conducive to progress.

In 1873, the Legislature considerably increased fiscal support for education. The new legislation provided for a territorial tax of 25¢ per $100 of assessed valuation and a uniform county tax of the same amount. Safford apparently was pleased that schools would have adequate financial backing; but he could hardly have been heartened by the repeal of parts of the 1871 law which stipulated that territorial funds would be distributed, after the first apportionment, on the basis of attendance.

Even after 4 years of administering the government affairs of the new territory, Safford continued to hold education in the most prominent position. His recommendations for strengthening the school laws were more closely followed by the 1875 Legislature. This assembly again apportioned school funds on the basis of attendance beginning in 1876, enacted a compulsory attendance law, returned authority for textbook adoption to the superintendent's office, and established easier procedures for creating or changing school districts.

The 1875 Legislature was also the scene of a struggle to provide funds for parochial schools. That Safford was successful in thwarting this movement is an example of his influence on this Legislature. The forces to be met were strong. Many prominent settlers were in sympathy with the movement; the population of the territory was then about three-fifths Mexican, and the Catholic Church itself was exerting its power. Although the issue was great, its settlement in that session ended the vigorous activities of sectarian groups seeking control of public education.

Not the least of Safford's many contributions to Arizona's early schools was his effort to secure good teachers. He made attempts to recruit competent female teachers. Although he was briefly successful, the bride shortage much impeded his teacher-recruitment endeavor. Two men of the profession who came to Arizona during Safford's tenure were W. B. Horton and Moses H. Sherman, each of whom later served as superintendent of public instruction. Sherman came from Vermont in 1873 to head the school at Prescott, and Horton arrived in 1875 to serve as principal of the Tucson public school. Both towns were then the leaders in developing schools.

Secretary of the Territory John P. Hoyt became Acting Governor in 1877 on the resignation of Governor Safford. Hoyt had little time to fulfill the duties of superintendent, and neither he nor the next Governor, John C. Frémont, gave much attention to education. The chief contribution of Frémont was his appointment of Moses Sherman to serve as superintendent beginning in 1878 (3). By such action, coordination of territorial schools became the responsibility of a professional educator. Although Sherman remained in his post with the Prescott schools throughout most of his tenure as superintendent and was thus unable to give as much of his time as might have been desired, his appointment to some degree filled the void created by Governor Safford's resignation.

The 1879 Legislative Assembly enacted a new school law which separated the positions of Governor and superintendent of public instruction. The superintendent was to be appointed by the Governor for a 2-year term beginning in 1879 and was to be elected in 1880 for a term beginning in 1881. The composition of the Territorial Board of Education was changed so that the Governor, the superintendent, and the territorial treasurer were members, and the superintendent was president and secretary of the board.

Sherman was reappointed by Governor Frémont for the term 1879-81 and was subsequently elected for another 2-year period. During his tenure the schools were growing rapidly and needed greater fiscal support. The Legislature gave some consideration to the problems of school finance in 1879 but developed no real solutions. A new law did place more support of schools at the county level by requiring of the counties a tax of not less than 50¢ nor more than 80¢ per $100 of assessed valuation. A territorial lottery scheme was approved which was to use 10 percent of all prizes for the territorial school fund (4). The salary of the superintendent was set at $1,000, and salaries of ex officio county superintendents, the probate judges, were $250. It is somewhat uncertain what compensation Sherman received as superintendent before the 1879 Legislature approved the $1,000 amount, but he apparently was paid the $500 authorized for expenses.

In 1881, the lottery was discontinued while, at the same time, the salaries of the superintendent and probate judges were increased. The superintendent was now paid $2,000 a year, and salaries varying from $250 to $1,000 were approved for the probate judges.

Sherman resigned as head of the Prescott school shortly before the end of his third term as superintendent. Thus, for a brief period, in addition to being the first superintendent other than a governor, he was also the first full-time superintendent.
It is difficult to evaluate Sherman's contributions to Arizona education. He, like others to follow him, occupied the office during a period of great economic and cultural expansion in the territory. Thus the growth of the schools cannot be attributed to his leadership in the same way that Safford may be given credit for his organizational work. One historian is quite reserved in giving Sherman credit as a strong leader, stating that his most important contribution was to select the two townships of land by which Congress endowed the university. Another, writing at a later date, noted that Arizona had, in 1882, uniform textbooks, uniform examinations for teachers, and a manual of schoolwork. He accords Sherman with having been an effective superintendent. "Indeed, the progress, which was soon apparent, following the appointment of Sherman, seems to prove that there was at least some supervision, for the slump of 1876-77 was soon overcome . . ." (5).

Sherman was succeeded by William B. Horton, who served only one term. Horton's concern for the educational program rather than his own political status or financial welfare made him an able administrator. He was the first man willing and able to give his full energies to the office. Although the 2-year term did not allow time either for Horton to develop a great program or for his influence to be directly realized, it appears that his work and the favorable attitude of Governor Frederick A. Tritle had some effect on the passage of strong school legislation by the 1885 Legislative Assembly.

In 1885, R. L. Long assumed the office for a 2-year term, the first of three periods he served. Long, another of the true professionals to serve the position, generally devoted much time to drafting a new or amended school code. From these efforts came the School Law of 1885, which continued as the basic framework for education in Arizona during its remaining time as a territory.

Governor Tritle challenged the authority of the Legislature to have made the office of superintendent elective. He asserted his authority by appointing the elected Long. From that time until statehood the superintendent remained an appointed position. This situation created much difficulty in 1889 when two men claimed the office. Charles M. Strauss was elected and appointed for the 1887-89 term and had again been elected for the 1889 term. However, Governor Lewis Woffley appointed George W. Cheyney, who also claimed the office (6). The resultant muddle was such that the problems of the schools were almost completely neglected during the 1889-91 term.

The frequently changing political scene had its effects on the superintendent. One education historian states that "the last year of Long's administration seems to mark the crest of the wave of progress; with the incoming of Strauss retrogression became more and more marked . . ." (7). Despite this confusion, the school system continued to grow, the territorial board adopted policies for the operation of schools, and progress was not retarded for the full period that was characterized as one of "retrogression and advance, reaction and progress" (8).

The Rules and Regulations for the Government of Public Schools in Arizona, as adopted by the board in 1887, were the most comprehensive directions from the territorial office to that date. These rules covered such subjects as schedule of hours, discipline, classroom physical environment, instructional materials, vandalism, teacher reports, and instructional methods. Two areas were covered in very modern fashion: Preparation and instruction were to be characterized by motivation, animation, and in such a manner "as not to be constantly confined to the textbook" (9); corporal punishment was specifically prohibited. This latter rule apparently received much criticism and was removed in 1890. Then, in 1893, a new regulation required that if a teacher were to administer corporal punishment, a parent and one member of the board of trustees must be invited, 24 hours in advance, to witness the act. This restriction was again removed in 1896, and the subject has not been directly covered by policy or statute.

With R. L. Long's return to the superintendency in 1898, the office again achieved a measure of stability. For the most part, Long resumed the job about where it was interrupted in 1887. He began anew to develop effective courses of study, better examinations for teacher certification, and systematic organization of the office. In addition, he and the board were involved in the many details of textbook adoptions, apportionment of funds, and certification.

Although Arizona had not yet attained a great degree of centralization in its school system, the board exerted its authority on occasion through its power to revoke certificates. An example was the charge against I. Ruthrauff, supervising principal of the Tucson schools, for failing to use prescribed texts and for using unauthorized supplementary books. Ruthrauff defended his actions on the ground that he was attempting to provide a program to meet local needs; but he agreed to comply with the board's direction when it threatened to revoke his certificate.

The superintendent had no clerical or other assistance until 1911, when the board finally authorized the employment of a secretary and a part-time assistant to help with textbooks.

The pattern of education constructed during the territorial period was the foundation on which the state's program was to be built. Progress was achieved as the result of actions by legislators, superintendents, governors, territorial boards, and individuals throughout the territory; all played some role which either directly or indirectly affected the system. Retrogression caused reaction; reaction sooner or later resulted in positive movements; and Arizona, on reaching statehood, had developed a reasonably strong educational program.
THE DEPARTMENT DURING STATEHOOD, 1912 TO 1967

In the words of Charles O. Case, first state superintendent of public instruction, "the old Territorial trail, picturesque and appealing in the dim light of pioneer campfires, comes to an end, and the trail of Statehood, crowded and dramatic with action, begins" (10). It is somewhat disappointing after over a half century of statehood that this "action" has not been more "dramatic" and successful in the organization of the State Department of Public Instruction. Perhaps the fact that Case held the state superintendency for 19 years without exerting any great influence on the development of a strong department had some bearing on the matter. But the legal framework of the system, the ever-present political maneuverings, and the problems of general state growth have been primarily responsible for the less-than-optimum maturation.

The functions of the state board and state superintendent did not differ greatly from that of the territorial board and superintendent. An examination of board minutes shows hardly any evidence of change. Although the office of superintendent became elective rather than appointive, its powers and duties were not outlined in any greater detail. The composition of the board was changed to five ex officio and three appointed members: the Governor, the state superintendent, presidents of the three state institutions of higher education, a city superintendent, a county superintendent, and a principal of a high school. Thus, the state board was a professional unit until changed by constitutional amendment in 1965.

Despite Case's indifferent record, described as "everlasting performance of duties assigned" (11), his political skill enabled him to hold the office for a long period and to provide some continuity previously unknown. Born in Illinois, the son of a preacher-teacher, he was orphaned while young. After graduating from Hillsdale College in Michigan, he came to Arizona in 1889, where he became acquainted with George W. P. Hunt while teaching in Globe. Possibly from this association with Hunt, who was acquainted with George W. P. Hunt while teaching in Globe, Case was elected superintendent for the term 1912-1914. During his tenure the issue of an appointive superintendent first came to a vote. In the last days of the session, the 1921 Legislature approved a constitutional amendment to be placed on the ballot in the general election of 1922. But the same Legislature changed its mind—the records do not reveal why—and voted to repeal it during a special session the following April. The State Teachers Association then spearheaded a drive to place it on the ballot by an initiative petition. Essentially, its amendment differed from the legislative amendment in the provisions for controlling the University of Arizona and educational programs in penal institutions. The State Teachers Association's measure, providing for a state board of seven members who would in turn appoint the superintendent, did pass on the ballot and was defeated.

Miss Toles was credited with changing the state superintendent from an office of clerical and certification responsibilities to one of educational leadership (13). Having previously served as a county superintendent and a member of the state board, she was in a position to see some of the state's educational needs. She established an office of research and took a statistical survey of the state school system. Her administration also developed a long-range program for teacher certification and conducted teachers institutes. Not until her term did the board have enough authority to take these actions. In her biennial report, Miss Toles said that the most pressing problem was the need for attention to the long-neglected rural schools. But neither she nor her successors accomplished much in this regard until some four decades later.

Case was reelected to succeed Miss Toles in 1923. By this time the department had a staff of six. It is difficult to follow the organization of the department into divisions, but Case's report for the biennium ending in 1924 mentions a division of certification, a division of free textbooks, and a statistical and accounting division. The department of vocational education had attained some autonomy by 1923.

The state made a renewed effort to provide Americanization and night school classes, since the Legislature had made a more adequate appropriation. Case's report for the period ending in 1926, however, refers to this problem as one definite need. In 1923, a survey of the Arizona school system was begun by C. Ralph Tupper. This survey was reported to the board in 1925 with several
recommendations for more efficient organization of the department. The board went on record as supporting these recommendations, but they were not implemented. The standards for teacher certification that had been developed in 1921 were revised and adopted in 1925, to become effective in 1929. Essentially, these revisions ended the issuance of certificates on the basis of examinations or previously held certificates; they would now be awarded on the basis of training and institutional recommendation.

The Board of Education passed a resolution in 1929 calling for improvements in the compulsory teaching of the effects of alcohol and narcotics. This action was the result of an appearance by a committee from the Women's Christian Temperance Union. In the same year, the board heard from other lay groups that sought endorsement and implementation of their proposals. The Laymen's Civic League of Arizona requested a program of released time for religious instruction. A committee of The American Legion, which had previously been interested in the physical education program, began to agitate for the employment of a state director. The disposal of these and other matters indicates that the board was beginning to function in a rather independent manner.

Case's biennial reports give attention to proposed legislation and review of the Legislature's enactments. Because of his political power, Case was reasonably influential in this realm of his responsibility as a state officer. That he could have exerted greater influence in the matter of school legislation had he not considered the "political angle" is certainly doubtful. It is probably a valid generalization that state superintendents and state departments are not notably effective in such an endeavor.

Case was well beyond retirement age when he was succeeded by H.E. Hendrix in 1933. Hendrix was born in Germany, grew up in Minnesota, and came to Arizona in 1917. Before being elected, he had been superintendent within the state at Miami and Mesa. Although not holding such strong political ties as his predecessor, Hendrix was well known in political circles, and it has been said that "in choosing his staff and in organizing his office, Dr. Hendrix used good political judgment..." (14).

The Depression had forced the state to reduce drastically appropriations for education at both the state and county levels. Teachers were unable to secure renewal credit for certification, so 1-year extensions were granted. Compulsory attendance laws were hard to enforce, and a general lack of public enthusiasm was evident. Perhaps because of these conditions, but also because he had a message to convey, Hendrix conducted a successful program of public relations through various media. In the early part of 1934, he divided his staff into two groups that toured the state to meet with civic organizations and to discuss the educational situation. In later years Hendrix used newspapers and radio to present his educational picture. Thus, he renewed interest in education, and as the economy improved, so did the schools.

By 1934, the department had divisions of curriculum, certification, research, and tests and measurements; a statistician; and a textbook depository. This structure generally followed previous plans but gave more emphasis to testing. Hendrix, aware of the growing testing movement, presented a different approach to testing. He felt that the eighth-grade tests then being used primarily for promotion should more properly be considered as indicators of the quality of the instructional program. A statewide plan for achievement testing was therefore instituted.

Other evidences of Hendrix' instructional leadership were his proposal for using radio in the classroom, his promotion of audiovisual education through the purchase of a small library of films, and his efforts to cover every high school subject by a revised or new course of study. During his administration modern ideas were at least considered, even if their ultimate implementation was not to come until later.

In the Depression years and continuing through World War II, the department continued to grow. The budget administered through the state superintendent's office more than doubled, and more employees were added. At the close of the war, the teacher shortage that had been felt for several years became more acute. Superintendent E.D. Ring reported that it was the exception rather than the rule to find a high school in the state without one or more teachers who failed to meet the requirements for teaching in high school. He suggested that housing facilities might be provided in the more isolated areas to attract teachers to such positions. The inadequate supply of teachers was to persist through 1953, at which time it was reported that "from all indications the future supply of available teachers is exhausted. Shortages are imminent" (15). Fortunately, this difficulty was shortly overcome, except in the more remote areas, by attractive salaries and the lure of the land.

Notwithstanding a general trend of progress and improvement, the department's activities during the forties and fifties were no more dramatic or earthshaking than during earlier years. In 1946, a Curriculum Coordinating Committee was appointed to assist in the development of courses of study and the evaluation of textbooks. This committee, while important for the state's instructional program, was subject to considerable change in membership and reorganization.

Superintendent N.D. Pulliam, who resigned in 1947 to accept a position with the U.S. Office of Education, had proposed an organizational scheme of three divisions: education, vocational education, and vocational rehabilitation. He sought to establish vacation and sick-leave policies for departmental employees, and after some delay these were completed. Pulliam suggested that an assistant superintendent might be appointed on a 10-month basis, thereby
making it possible to secure a professionally expert person who could supplement his income by summer school teaching in a college or university.

L. D. Klemmedson was appointed to serve Pulliam's unexpired term. Klemmedson criticized the outmoded method of adoption and purchase of textbooks in 1948. The next year, a motion before the board that the curriculum committee be authorized to make a complete evaluation of the method for book adoptions was lost for want of a second. Klemmedson had been mainly interested in securing multiple adoptions, but it was not until 1960 that this was achieved.

Klemmedson's successor, M. L. Brooks, reorganized the curriculum committee to include 16 members who would serve staggered 4-year terms. He also issued an organization order for the department which called for three assistant superintendents, each of whom was to head divisions. The office of comptroller was created to handle all accounting procedures. This innovation did not meet with favor from vocational education, so the accounting duties of that department were removed from the responsibilities of the comptroller. Brooks's reports reflect the tremendous increase in school population due to emigration to Arizona and the postwar birth rate. These reports were begun on an annual basis in 1953, due in part to improvements in accounting and statistics.

In 1949, the Special Legislative Committee on State Operations commissioned a comprehensive survey of the public school system by Griffenhagen and Associates. This study was reported in great detail in 1952 and clearly stated areas of weakness (16). Neither the Department of Education nor the Legislature paid much heed to this accurate and critical analysis of existing problems.

The Griffenhagen report did have some influence on another move to change the method of selection of the superintendent and the composition of the board. The 1953 Legislature passed a law abolishing the office of superintendent and the state board with companion legislation to establish a department of public schools, a commissioner of education, and a new board. These measures required an amendment of the constitution, which the voters defeated at the polls. An editorial urging defeat of the proposal, appearing in the Arizona Daily Star, listed some factors that voters may have considered. The editorial claimed that support for the amendment by the Arizona school administrators implied some intent to remove control of the schools from the general public. It further asserted that the Arizona Education Association had sponsored legislation to create a separate teachers' certification board and had thereby shown its distrust of the new plan (17). A later editorial in the same paper opposed the plan on the ground that it created two boards to do the job that one was then performing in a satisfactory manner (18).

C. L. Harkins served one term as superintendent between the third and fourth terms of Brooks. Under Harkins, the department was organized under two divisions—administration and instruction. Harkins was much concerned about the political atmosphere and the problems of securing and maintaining a good staff. He noted that the professional staff had dropped from six to three since 1939 and that salaries were inadequate. After the attorney general ruled that the board and the superintendent had the authority and responsibility for regulating private schools, Harkins said that the departmental staff was inadequate to do such supervision.

After Brooks's fourth term, W. W. Dick assumed the post for three terms. Dick's experience as a former teacher, principal, and county superintendent showed more promise than was realized. Perhaps the political influences that continued to hold sway were too restrictive. Dick strongly supported electing the superintendent. He was quoted as saying: "An appointed superintendent could become a dictator if extremists get control of the board. The board and superintendent ought to answer to somebody" (19).

His awareness of the political nature of the position likely retarded the development of educational opportunities. In 1960, when appearing before the Senate Appropriations Committee, Dick refused to take a stand on a budget item for the state's participation in Title III of the National Defense Education Act (20). Even though it cannot be definitely stated that the advantages of Title III could have then been realized had Dick strongly supported the budget item, this incident is a good example of the reluctance of state superintendents to push for programs that might be somewhat controversial.

It is interesting to note that when the state's plan for Title III was approved in 1964, quite an issue was raised over technicalities involved in the board's approval of the plan. In May 1964, in order to get quick approval for long-delayed action on Title III, Dick arranged a telephone conference which did not include Governor Fannin or board member Sarah Folsom. The plan was approved by the participants in the phone conference but was protested by Mrs. Folsom in the October meeting of the board. Her objection was based on the legality of the telephone meeting and the status of the Title III situation wherein local schools had already encumbered funds. The earlier action was ratified by the board, and the question of telephone conferences was directed to the attorney general (21). Mrs. Folsom, who defeated Dick in his bid for a fourth term, stated in the annual report for 1964-65 that the Title III program was approved in May 1964 and implemented in July 1964.

Sarah Folsom's ascendency to the office of state superintendent in 1965 was accompanied by a new state board. A constitutional amendment approved by the voters had changed the composition of the board and had increased the number of members to nine. Under the new plan, membership included laymen, and the Governor no longer was a member.
Mrs. Folsom’s experience prior to election as state superintendent included being a county superintendent and member of the state board. She was elected on a platform stressing the “3 R’s” and equal opportunities for all children. She also had indicated that the political atmosphere in the department would be lessened.

After more than 2 years in office, Mrs. Folsom’s leadership is encouraging. A handbook for departmental employees has been prepared, federal programs have been approved and staffed, great effort has been expended to secure state aid for kindergarten, and there has been a creditable fulfillment of campaign promises.

Other areas of growth have been noted in the employment of specialists in the fields of music, health and physical education, foreign languages, guidance, vocational education, science, audiovisual media, and reading. These people have aided the local school districts, as well as the county school offices, in the development of educational programs. State, county, and regional workshops dealing with the many facets of the educational programs have been held as a result of these improvements within the structure of the state department. The development of several outstanding teacher guides in several areas of education and the strong emphasis on the dissemination of information have improved the overall status of the department. Love of country, respect for law and order, and patriotism have received a fair share of attention from the present superintendent. Curriculum guides, attorney general’s opinions dealing with the pledge of allegiance, and other facets dealing with patriotism have been strongly advocated by Mrs. Folsom.

From an overall point of view, the development of the department during the 1960’s suggests a definite forward movement. The increasing complexity of its organization, its new affiliations with federal projects, the installation of a computer and data-processing equipment, and the activities of divisional offices all indicate a more prominent agency.

FRAMEWORK FOR ARIZONA EDUCATION

The Arizona constitution provides that the conduct and supervision of the state public school system shall be vested in a State Board of Education, a state superintendent of public instruction, county superintendents, and such governing boards for the state’s educational institutions as provided by law. The arrangements for local control of schools depend on the statutes.

The State Board of Education

Since 1965 the board has had nine members: the state superintendent, the president of a state university or state college, three lay members, a member of the state junior college board, a superintendent of a high school district, a classroom teacher, and a county superintendent. Each member other than the state superintendent is appointed by the Governor with the advice and consent of the senate. Appointed members serve staggered terms of 4 years. The member who is a president of an institution of higher learning cannot succeed himself. Members serve without compensation although their expenses are reimbursed.

The powers and duties of the board are generally ministerial and supervisory. The most important powers are lodged in the board’s authority to prescribe courses of study, to adopt textbooks, and to control the certification of teachers. The general authority to “exercise general supervision over and regulate the conduct of the public school system” (22) implies more power than actually exists, since the real authority rests with the Legislature.

The State Superintendent of Public Instruction

The superintendent is one of the six members of the executive department and is fourth in succession to the Governor. He is elected for a 2-year term on a partisan ballot to “superintend the public schools of the state” (23). His civic qualifications for office are that he must be at least 25 years of age, an American citizen of at least 10 years’ standing, and a legal resident of Arizona for the 5 years immediately prior to election. His salary is fixed by statute. The present annual salary is $13,000 plus travel expenses. The powers and duties of the superintendent are poorly defined by statute. The laws mostly detail his reporting duties and the clerical aspects of the office. The power lies in his authority as executive officer of the board and in his voting membership in it.

The County Superintendent

The county superintendent of schools is primarily a clerical manager for the schools in each county. He is elected to office under the same civic qualifications as other county officers, but with the additional requirement that he must hold a regular certificate to teach in the schools of Arizona. Perhaps the most important functions of the office are the details of finance. School funds are apportioned through this office in accordance with the budgetary and apportionment measures for the various school districts. Vouchers for claims and salaries are paid by his warrant drawn on the county treasurer and charged to the appropriate school fund. His other clerical functions include maintaining records of teachers’ certificates and teachers’ health examinations.

Local School Districts

The state’s schools are organized into local elementary and high school districts. The control of these local units is vested in boards of trustees elected by the voters. In areas
where the elementary and high school districts are cotermi-
nous, the same board serves both districts. In union high
school districts—those composed of more than one ele-
mentary school district—a separate board of trustees is
organized, and members of the boards of trustees of the
component districts are ineligible for the high school board.
Within statutory limitations and controls of the state
board, local boards are granted rather broad powers. School
districts may hire professional administrators, provide funds
for the operation and maintenance of schools, provide free
textbooks to elementary students, provide school trans-
portation, expel students for misconduct, and perform
other duties.

Teachers

In addition to holding the proper certificates, a teacher in
Arizona must pass a physical examination, must take a
loyalty oath, and must be able to pass an examination in
United States and Arizona Constitutions after no more than
1 year’s service in the state schools. A teacher is granted
tenure as a continuing teacher on signing his fourth con-
secutive contract. Under penalty of suspension or revoca-
tion of certification, a teacher may not resign after signing a
contract without permission of the local board. Teachers
are covered by a combination Social Security and state
retirement plan to which contributions are made by both
the teacher and the state. Salaries of teachers are fixed by
the local district.

School Attendance

Arizona’s public schools are open to children between the
ages of 6 and 21. Compulsory attendance is required of
children between the ages of 8 and 16.

Textbooks

The adoption of textbooks and the furnishing of free text-
books to elementary students have been major responsi-
bilities of the state. Originally, single-text adoptions were
made and the books were purchased by the state. Later
developments have placed the purchasing responsibility at
the local level and have increased the number of adoptions.
No free textbooks are provided for high school students.

School Finance

Since 1871, fiscal support of the Arizona public schools has
been borne primarily by property taxation. Federal aid,
income from state lands, and other state revenues provide
some support of local schools, but the problem of paying
for public education is basically that of the property
owners.

The local school district prepares an annual budget
based on estimated expenditures. This budget is funded by
a special school district levy made by the county super-
visors for the school district, by state funds, and by a
county levy. From the beginnings of the public school
system to the present, the territory or state has participated
in the financing of schools with varying degrees of assis-
tance. The earliest plans called for a fixed tax levy, the
proceeds of which were to be apportioned to each county
on an equal basis. Later, revenue from the fixed levy was
apportioned on the basis of attendance. Further progress
resulted in the state’s making an appropriation equal to the
product of a per-pupil figure times the number of students
in average daily attendance. A tax sufficient to raise this
total appropriation was then levied. This system of state
taxation has provided some equalization throughout the
state, although assessments have been described as grossly
inequitable.

Arizona does not have an abundance of industry, and
it is one of the states in which a high percentage of the land
is under public ownership. In 1960, only 12 percent of the
total acreage was privately owned (24). Fortunately, the
area of the state is large, the population is small, and the
effect is not as severe as it might be. Also, federal aid for
Indian education and for education in federally impacted
areas helps the financial picture.

The income from school lands is relatively insignifi-
cant when taken as a percentage of the total cost of
schools. The territorial superintendents and legislators had
attempted to sell public lands to endow a permanent com-
mon school fund. Congress did not approve the requests for
sale of the lands but granted permission shortly before the
turn of the century to lease them. Despite evidence of
mismangement of the public lands, receipts for state
schools were approximately $22 million between 1912 and
1960.

The state appropriations for public schools, the earn-
ings from the permanent school fund, and all other receipts
for the benefit of the public schools are placed in the state
school fund. This money, except for the expenses of the
department, is subsequently apportioned to the school dis-
tricts through the counties. Thus the department is quite
involved in school finance through its distributive func-
tions.

At this writing, the Legislature is in special session
considering tax reforms, especially with reference to school
finance. A reevaluation of the entire state has been com-
pleted by the division of appraisal and assessment standards
of the State Tax Commission. Changes are expected in the
levels of assessment and the structure of school finance.

Junior Colleges

Between 1927 and 1960, junior colleges were under the
supervision of the State Board of Education. In 1927, the
Legislature enacted provisions for school districts of sufficient size to establish junior colleges. The state provided financial aid beginning in 1935. The level of state support has increased through the years and has been distributed according to various formulas. Concurrently, the state pays $115 per student in equivalent full-time attendance. Also the state participates in capital outlay to the extent of 50 percent or a maximum of $500,000 after approval of the college's plan by the Legislature.

Due to the increasing interest in and need for junior colleges, a board of directors separate from the state board was created in 1960. This board consists of 17 members: one from each of the 14 counties, a representative from the Board of Regents, the director of vocational education, and the superintendent of public instruction.

Higher Education

The University of Arizona at Tucson, Arizona State University at Tempe, and Northern Arizona University at Flagstaff are the three state institutions for higher education. All three are under the jurisdiction of one Board of Regents composed of eight appointive members, the Governor, and the state superintendent. Tempe and Flagstaff have laboratory schools for the training of teachers. These schools are considered a branch of the public school system but are controlled by the Board of Regents.

A FUNCTIONAL VIEW OF THE DEPARTMENT

Since the Arizona Department of Public Instruction is not provided for in the statutes, its organization has been at the discretion of the superintendents and has not followed any definite evolutionary process.

Certification of Teachers

The examination and licensing of teachers was the duty solely of county boards of examiners in 1871. By the time of Superintendent Horton's administration, the Territorial Board of Education was issuing diplomas which were valid in any county and was giving close supervision to the work of the boards of examiners. In 1885, a Territorial Board of Examiners was created to supervise the county boards and to issue territorial certificates on the basis of examinations and/or credentials. Shortly thereafter, all territorial certificates were recalled in a general housecleaning. This action resulted in some improvement, but evidence of the use of incompetent teachers necessitated another recall in 1893. From these early beginnings until 1921, the method of certifying teachers was essentially the same. During this period refinements were made, professional training was recognized, and the Legislature empowered the board to handle certification.

By 1921, the first definite and specific rules for teacher certification were adopted by the board. These rules were revised in 1925, and in 1928, the requirement of 3 years of post-high school training was added. In 1936, all teachers holding valid certificates were given until 1946 to qualify under new regulations that required a bachelor's degree for elementary certificates and a master's degree for the equivalent for high school teaching. Special certificates for administrators were first required in 1933.

Recent years have seen numerous technical changes and specialization, and the completion of 5 years' training has become the minimum requirement for standard certification. The recommendations of state teacher training institutions are followed for the issuance of certificates to their graduates. Out-of-state applicants are granted certificates according to comparable levels of training on review of their credentials by the division of teacher certification. Permanent or life certificates are not issued.

Elementary Education

The Division of Elementary Education has participated in statewide curriculum development for the elementary schools. Through its diverse activities the department has provided a measure of coordination for curriculum development projects being conducted by local schools. Some of the division's specific activities are disseminating information on changing curriculums, revising policies for textbook adoption, visiting local school districts, developing a curriculum materials center, planning statewide workshops, and supervising the basic education program for the inmates of the state prison.

Secondary Education

The first high school was authorized by the Territorial Board of Education in 1888. From that time until the present, much endeavor has been directed toward the development of strong courses of study. In 1909, the board developed a minimum course of study for high school graduation, and in 1915, the unit of credit was specifically defined as a requirement for high school records.

Considering all the effort made by the state to develop strong high school programs, it is rather surprising to note that a request of one school to include Latin and modern foreign language in its program was denied in 1907. The board's concern over foreign influence evidently was the reason for the denial.

The director of the Division of Secondary Education is an ex officio member of the State Committee on Accreditation. This committee evaluates and classifies the high schools. Other functions of the division of secondary education are curriculum development activities, supervision of the high school equivalency certificate program, and
coordination of consultant services for high school subject areas.

Special Education

The territorial board made arrangements to educate deaf and blind students at institutions outside the state. An Arizona school for the deaf and blind was established in 1929. Initially, this school was a part of the University of Arizona, but it later became a separate institution with its own governing board.

Provisions for the education of crippled children were made in 1947. In 1949, the Arizona Children’s Colony was established to provide care and training for mentally deficient children. Aid for the instruction of homebound students was approved in 1951. Comprehensive legislation for the education of educable and trainable mentally retarded children was enacted in 1961. This legislation inaugurated financial aid to local districts that have approved programs of special education and established by statute a division of special education.

Adult Education

Adult education in Arizona had its beginnings prior to 1920 under the terms of the Smith-Hughes Act and the state’s own program of Americanization classes. Through the years, and especially in the 1960’s, offerings in adult education have increased, and the department has shown some definite leadership in this area. At the present, Civil Defense adult education is administered under one division, and adult basic education under a separate division of the department. Adult programs of vocational education and vocational rehabilitation are the responsibilities of those divisions.

Indian Education

The distribution of funds to the public schools under the terms of the Johnson-O’Malley Act is the responsibility of the Division of Indian Education. The funds are made available for Indian children who live on reservations and attend public schools. The amount to which each district is entitled is equal to what the local share of educational costs for such children would be if they were living on private property.

Vocational Education

High school programs in vocational education have been authorized since statehood, but these programs were rather insignificant until the Smith-Hughes Act made substantial federal support available. Under the Arizona plan to qualify for federal aid, the state board also served as the State Board for Control of Vocational Education. The state superintendent was assigned the responsibility for administering the program by being named executive officer for vocational education. The state board was reluctant to employ a director and to pay such an officer from state funds. However, after an attorney general’s opinion that the board could legally make such an appointment, Professor I. Colodny was appointed as the first director of vocational education in 1918.

Within a few months, Colodny had implemented the program to the point that he reported 15 of the 30 high schools in the state were establishing programs under the vocational act. There was then, as there is now, the problem of hiring competent vocational education instructors. The director’s position was subject to the effects of political patronage. Colodny was not reappointed in 1919 and was succeeded by R. H. Blome, whose tenure was also of short length.

In 1920, the director’s salary was increased from $3,000 to $3,600, which may have had some bearing on the fact that the office of director was abolished in 1921. It is more likely, however, that the change in superintendents was responsible for the reorganization. The new plan called for the superintendent to serve as director of vocational education and for the supervisor of trade and industrial education to serve as assistant director.

When C. O. Case returned to office in 1923, he effected an almost complete turnover in the vocational staff. The state having made arrangements to participate in the federal Industrial Rehabilitation Act, Case appointed A. M. Davis as acting director of vocational education and director of vocational rehabilitation, research, and Americanization. Friction between Case and Davis occurred over the relative authority of each’s position, so much so that the chairman of the House Committee on Education appeared at a state board meeting requesting the board to harmonize the relationship between the director of vocational education and the Department of Public Instruction. The strained relationship continued for some time, particularly since some budgets included a director’s salary higher than that of the superintendent. By 1928, the differences were apparently resolved; at least, Davis and seven other members of his staff were reappointed on the recommendation of Case.

The next year, 1929, when the Governor requested that a new director be appointed, Davis needed more than the support Case could give, and he lost his position. The position of director was again relegated to a part-time office. Halbert W. Miller was hired as part-time director and as supervisor of agricultural education. In 1930, the board decided to increase the director’s and supervisor’s terms from 1 year to 2 years. Case opposed this decision and submitted a letter to the attorney general requesting an opinion as to the board’s authority to make appointments for a 2-year period. The opinion stated that the board could legally contract for the extended period and that the
superintendent, although also an executive officer, had no more authority than any other member of the board.

On Miller's resignation in 1931, Davis was again made director until his resignation was requested 2 years later. For the next 7 years, the superintendent served as vocational director. In 1940, Superintendent Hendrix recommended that a director be appointed.

At the close of World War II, vocational education was designated as the agency to handle the distribution of surplus property. In this function the department incurred some notoriety after a federal and state investigation into fraudulent handling of surplus property.

There was further controversy about the authority of the superintendent in vocational matters during the administration of M. L. Brooks. Brooks reported in 1949 that he had been unable to get cooperation from the vocational department in carrying out the operations which he, as executive officer, considered to be the intent of the board. It was the consensus of board members that the superintendent-executive officer was the one through whom recommendations should come to the board and who would be responsible for the functioning of the Department of Vocational Education. This situation was primarily one of conflicting personalities, and some reconciliation was later achieved. It was necessary, however, 10 years later, for the board to reaffirm the authority of the executive officer.

Notwithstanding the several incidents of friction and the organizational problems, the need for a state plan that was acceptable to the federal government appears to have resulted in the creation of a unit successful in carrying out the attended purposes of vocational education. The department's efforts in helping schools establish programs, in supervising these programs, and in working in the area of teacher training deserve commendation. Currently, the vocational education department exists as a unit separate from the Department of Public Instruction, but its activities are coordinated through the superintendent and board.

Vocational Rehabilitation

The Department of Vocational Rehabilitation has developed under somewhat less stormy conditions than the vocational education department. Beginning in 1923, the department has grown to one which was, in late 1966, handling approximately 1,500 active cases and administering a budget of over $2 million. This department also exists separately under the board and superintendent.

Recent Federal Programs

The full benefits of the National Defense Education Act (NDEA) were not fully available in Arizona until 1964, when the long-delayed Title III plan was approved. Earlier participation in Title V was administered through the vocational education department until recently when a separate division in the Department of Public Instruction was created.

Nothing has been more helpful to the state department than the Elementary and Secondary Education Act of 1965 (ESEA). Although the effects of this assistance have not yet been fully realized, the department is now being strengthened through the implementation of Title V.

Some delay occurred in getting approval for local schools' projects under Title I because of staff shortages in the department. These problems were overcome, however, and local agencies were able to use almost the entire state allocation of over $10 million for the first year.

Title II, providing funds for library and instructional materials, has been directed by the department's library division. The activities of this division in implementing Title II have produced marked improvement in many school libraries.

Various experimental projects funded by Title III have been undertaken by the state's school districts. Some cooperative projects among districts were organized, but the legality of such ventures was challenged. Legislative effort has permitted these projects to continue but has restricted further cooperative plans.

Research and Finance

The activities of the research and finance division have, for the most part, been statistical and clerical. The research function has not been highly developed to date. This division handles fiscal procedures and student accounting for the department, except for the accounting details handled by the Indian education division and the school lunch division.

School Lunch

School lunch has been a function of the department since 1947, and the duties in this matter have been discharged by a division of school lunch. The statutes permit using tax funds for the support of lunch programs, but not directly for the purchase of food.

Western States Small Schools Project

The Western States Small Schools Project was established in 1962 as the result of a $105,000 grant from the Ford Foundation to study improvement practices in small schools. Initially funded for the period 1962 to 1965, it has since been extended through 1968. This project supports teacher in-service education programs, publications, workshops, and consultations.

Designing Education for the Future

A cooperative eight-state project, funded by Title V, ESEA, works as a division within the department. The purpose of
this project is to anticipate educational needs for the next 10 or 15 years and to plan programs to fulfill the expected needs.

PROBLEMS THAT HAVE AFFECTED THE DEPARTMENT

The department's failure to be a strong and vital force in Arizona education is not necessarily the fault of those who have headed it. Rather, it would appear that the legal structure has restricted the department's influence. Through the years, various individuals and groups have surveyed the work of the department and have submitted recommendations for improvements. Even though these efforts may have had some effect, very little change resulting in a stronger department has occurred.

In 1917, a survey of education in Arizona criticized the state school system as being too decentralized and suggested a constitutional amendment making the state superintendency an appointive position. It was also recommended that the Legislature enlarge and clearly define the functions of the board and the superintendent.

The survey by Tupper, in 1925, recommended an appointive superintendent, a lay board, and reorganization of the department to include directors for each of several functions.

A combined report of the Arizona Lay Advisory Council and the Arizona Professional Advisory Council, in 1949, noted a very apparent need for reorganization of the department. It further stated that the department was "handicapped by an unsuitable framework within which the central educational enterprise has been forced to operate." These groups believed that the board was too much involved with such things as certification and textbook adoption details. The organization of separate vocational education and vocational rehabilitation departments, for which state plans were approved that eliminated such detail, was given as an example of a more efficient arrangement. The composition of the board and the method of selecting the superintendent were judged to be definite shortcomings. The report even said that budgetary limitations were evidence that the Legislature had lost confidence in the board and superintendent. What appeared to have been votes against education was actually discontent with an ex officio professional board and a politically elected superintendent.

The comprehensive Griffenhagen report also proposed an appointive superintendent and lay board. This report expressed the need for greater financial support to enable the department to give statewide leadership. It recommended that the department provide better interpretation of its needs and school problems to the Legislature. The state should become, through the department, more active in pupil transportation, perhaps by establishing a central agency for procurement of buses and in providing financial aid for transportation.

Such were the findings of some of the professionals who took a close look at the school system and the Department of Public Instruction. In addition to these professional groups, lay organizations have reviewed the problems and have made similar proposals, especially concerning the board and superintendent.

The ex officio duties of the state superintendent have necessitated his spending much time on matters not directly connected to the functions of the department. The first Legislature created a board of pardons and parole which was composed of the attorney general, the state superintendent, and one other member appointed by these two. Because of the nature of the duties and because these duties were not related to education, state superintendents repeatedly advocated changes in the composition of this board. It was not until 1966 that the Legislature made the changes and discharged the superintendent from this responsibility. His service on other boards as an ex officio member relates more directly to education.

Having the superintendent on the State Board of Education may not be administratively sound. Since the superintendent serves as executive officer of the board, it might be better if he were not a voting member but were given sufficient administrative authority to perform broader duties.

The problems of inadequate salaries and political atmosphere as they affect the departmental staff have been mentioned previously. The present $13,000 annual salary of the superintendent, although not mandating lower salaries for other professional employees, has the practical effect of limiting all salaries. The most recent increase in the superintendent's salary was in 1962, when it was raised from $12,000. The superintendent's pay seems unrealistic when compared to salaries of teachers and public school administrators.

Working under the handicap of not being able to offer appointees high salaries and job security, the superintendents have nevertheless been able to hire highly competent people for staff positions. If these two problems could be eliminated, the efficiency of the department would surely increase, and more and better people would consider future appointments.

Aside from a few incidents of personality conflict on issues or how best to organize the department, most of the operational problems have been of structural origin. The department often has been hampered by lack of authority, insufficient funds, or both. For example, the superintendent has little authority to require reports or to demand accuracy in the reports of county superintendents. Also, the board has not had the authority to determine the classification of students for ADA distribution. Funds have not been adequate to provide leadership in school transportation, schoolhouse planning services, and consultants in the many areas of curriculum.
Through ESEA, the department's advisory capacities will improve. But the problems of proper authority and adequate funds must be solved by the Legislature. The solutions do not seem to be immediately forthcoming.

Some citizens argue that limitations on the authority of the board and the superintendent are as they should be—that control of the schools should rest with the Legislature. This premise is easily accepted. However, it would seem to follow that the limitations and powers should be more specifically outlined in the statutes. The department would then have sufficient authority to fulfill whatever duties the Legislature expects to be performed.

**FOOTNOTES**

3. According to McCrea, Sherman was appointed in 1878 to fulfill the duties of superintendent which were actually the responsibility of the Governor until the positions were separated in 1879. Therefore, Sherman is not listed as superintendent until 1879.

4. It may be assumed that the lottery provisions were more of an effort to legalize gambling than to support schools. Some of the proceeds were also to be used for the construction of a capitol.

6. Ibid., p. 61. This situation was further complicated by the fact that the location of the office was left to the discretion of the superintendent, the only requirement being that it must be located where there was a post office. Strauss held the records and seal, refusing to return them over to the board or to Cheyney. He finally released the records and relinquished claim to the office in 1890.

BEFORE 1900

Establishing a Public School System

Arkansas was so sparsely populated during territorial days and early statehood that schools were organized only with difficulty. Many pupils rode horseback, while others walked 8 or 10 miles, to poorly constructed log cabins without heating or lighting. Books were scarce, accommodations few, and the schools offered only an elementary curriculum: reading, writing, arithmetic, spelling, geography, and history. Teachers' salaries were meager, and many teachers had to accept produce for part of their pay and take turns at boarding with their pupils (1).

In 1829, the Territorial Legislature passed the first law on public education by requiring county judges to appoint a trustee for the sixteenth section of land in each township granted to Arkansas when the territory was organized in 1819. At the same time, each township was to select three trustees responsible for maintaining a school building and for hiring a teacher. The teacher was expected to know everything, to have a good reputation, and to be able to discipline the students as well as develop their character. Children who could afford it were to pay tuition—or subscription, as it was called—to attend schools that were run at least 5 months of the year. The trustees were required to visit the schools once a month.

In 1836, the year Arkansas was admitted into the Union, Congress passed an act presenting to Arkansas' General Assembly the sixteenth section of each township for educational purposes. The act also granted 72 sections of so-called Saline Lands and 72 sections (two townships) known as the Seminary Lands. The Saline Lands were areas set aside by the federal government because salt springs were located on these lands; the Seminary Lands were sections granted by Congress to Arkansas in 1827 for the purpose of establishing a seminary or university. Ten years later, Congress modified the Seminary Land Grant by authorizing the General Assembly to add these 72 sections to the section 16 lands for use by the public schools (2).

County and State Administration

From 1829 to 1853, the Legislature left with the county courts (county judges) the general jurisdiction, supervision, and control of all matters concerning the public schools. But a definite trend toward centralization arose during this period. For instance, in 1851 the Legislature attempted to unify and simplify the school system by providing for a township organization, but with some county supervision (3). Two years later the Legislature passed a school act creating the office of county common school commissioner to further unify the schools, establishing a pattern for the county school official that has existed in one form or another until present day, despite seven changes in the title itself (4). The duties and responsibilities of this official remained similar during each of the major turning points in the history of the office.

Following the Civil War, Governor Isaac Murphy, a former school teacher from Madison County, urged the Legislature to make education a responsibility of the state. As a result of Murphy's untiring efforts, the 1867 Legislature passed an act providing for a 2-mill state tax for the public schools. The act also created the office of state superintendent of public instruction, to be elected first by the General Assembly, but later by qualified electors. His duties were specifically outlined. The act further required the elected county school commissioners to examine all persons applying for teaching positions and made it illegal for anyone to teach without a license.

The 1867 Legislature also enacted other school laws. One stipulated that a tax of 20¢ on each $100 worth of taxable property should be levied to support schools for white children. The school districts would be coterminous with the political township. Another law required the trustees to operate a school in each district at least 3 months a year and warned that if they failed to do so they would forfeit their state revenues. Many people associated free schools with pauper schools, but the first state superintendent of public instruction, Thomas Smith, attempted to change this attitude with slogans such as "schools free to all," "equal rights and privileges to all," and "separate schools for whites and blacks" (5).

At the end of 1867 the carpetbaggers began an effective campaign to gain control of the state government. They had already begun to educate the Negroes and then used Negroes to help them elect Powell Clayton Governor in 1868. From 1868 to 1874, when the carpetbaggers reigned in Arkansas, they appointed many Negroes to offices for
which they were not qualified. This was particularly true of J. C. Corbin, a Negro from Ohio, who became state superintendent in 1873 and was serving when the office was abolished the following year (6).

The carpetbag government vested general control of educational affairs in a State Board of Education in 1868. This same year, 10 district or circuit superintendencies were established, and under this system all of the Permanent School Fund was squandered or lost. In 1874, after a hard, bitter struggle, the Democrats regained control of the government by electing Augustus H. Garland as Governor. Shortly after taking office, Governor Garland said: “There is not enough money in the treasury to buy sufficient firewood to build a fire in the Governor’s office” (7). Disenchanted by the Reconstruction experience, the state turned against school centralization. When the new constitution was written in 1874, it abolished the office of state superintendent of public instruction, and Arkansas was without a state superintendent for more than a year.

The local township system had worked well when most townships had only one settlement or neighborhood, but as soon as additional communities were founded, they began to demand local school districts to correspond to them. This led directly to the adoption of the common school district system in 1874 (8). Under this system, there was no uniformity in the number of pupils in each district, the size of the districts, or the quality or scope of the available educational program.

As communities grew, the people found that these school districts were incapable of meeting educational needs. Frequently, citizens sought membership on district school boards for selfish purposes. Too often they merely wanted to secure a place for a friend or hoped to escape working on the roads and highways (a school board member was not required to work on the roads), and they spent little time or thought on school matters. In many instances, the directors needed education as much as the children. Not until each district could elect a better-qualified school board and hire a well-qualified school superintendent and a dedicated teaching staff could the state provide adequate schools for its children.

In 1875, the Legislature abolished the office of circuit superintendent and created an elective county superintendency. Two years later this office was eliminated, and the county court established the office of county examiner, whose duties were to conduct teacher examinations and issue teachers’ licenses, conduct teacher institutes, and make statistical reports to the state superintendent of public instruction.

To give the schools financial stability, the 1899 General Assembly created a Permanent School Fund by consolidating the three separate funds derived from lands: the Sixteenth Section Fund, the Seminary Land Fund, and the Saline Land Fund. The General Assembly increased this permanent fund in 1919 and passed an act directing that all money derived from the sale of state lands be credited to the common school fund. Only the interest could be spent.

REORGANIZATION AND FINANCE

Early Attempts To Consolidate

At the turn of the century, the schools were so widely scattered that it was necessary for each local district to exercise as much authority as possible. The incumbent superintendent of public instruction, J. J. Doyne, advocated, however, that a county office be created that would exercise stronger control over the school districts. The importance he attached to this office is evident in his annual report for 1900:

The claims of intelligent supervision are so pronounced that they need no comments. In all lines of activity where system, progress, and well-defined results are sought, it has proven indispensable. . . . The patrons, the director, the teacher, all have a common end in view. . . . the culture and development of the child. . . . yet as long as there is no one to see that, notwithstanding the diversity of influence, there shall be a unity of purpose, the work of these will be more or less faulty. . . . The State has gone into the business of educating children; . . . educate the children, says the State, and yet it leaves to the school directors and the teachers the privilege of directing this important work according to any plan or no plan, as the importance of the same may impress them. In other words, instead of having at the head of the system in each county a person whose business it shall be to see that well thought out plans shall be executed in every classroom and every director shall have the benefit of such aid and counsel as the importance of the work demands, who shall be under the direction of the State Department of Education and receive in general such instruction from the same as may be necessary to render most efficient the provisions of the school law, thus forming a well organized and effective school system, we have each board of directors exercising its own pleasure in all school matters, and each teacher having the same privilege, so long as he is able to keep on good terms with his board. The saving of the . . . expenses of the district, the increased efficiency of the teacher, the gradation and advancement of the pupil will more than compensate for the expense attached to such office (9).

It was 1907 before the people were given the option of voting in an annual school election whether or not they wanted an elective county superintendent of schools. The number of counties taking advantage of this plan increased steadily until 1919. In that year the Legislature provided each county with a board of education composed of five
members elected by popular vote in the annual school election, which then appointed the county superintendent of schools.

As new communities continued to spring up throughout the state, the number of school districts increased from slightly less than 1,500 in 1874 to 5,118 by 1920. A growing demand arose for highway and road improvements to connect these schools, as each community sought to benefit from relations with its neighboring towns. Immediately after World War I, local improvement districts financed the building of highways in many sections of the state. The state assumed the debts of local districts in 1927 and at the same time began financing highway and secondary road building. The expanding network of highways and roads made the people increasingly aware of the advantages of larger school districts and led to numerous consolidations.

Another important factor that prompted school districts to reorganize was the increasing demand for public high schools. At the turn of the century, only the city special school districts had the legal power to maintain public high schools; most secondary education was offered by private academies. In 1899, the state had six 4-year public high schools, and in 1909 there were still only 31. But in 1911, the General Assembly made the high school a part of the public school system. By 1915, the number had increased to 116, with a total enrollment of 8,948 pupils. During the next decade, the number of high schools rose to 290, with an enrollment of 27,255.

During these early years no reorganization plan existed. With the local boards and county superintendents in charge of the schools, what little consolidation did take place resulted from expediency and local whims. The Consolidated District Act, passed by the General Assembly in 1911, did provide for districts to include parts or all of two or more counties, and to form common, consolidated, or special school districts by election. It was this act that made the high school a part of the public school system and resulted in a rapid increase in the number of new high schools. It provided an annual appropriation of $40,000 for state aid to high schools. Another act in 1919 provided for rural special school districts with the same powers as those granted incorporated cities and towns. This also aided the rapid establishment and growth of educational programs for grades 1 through 12.

**Governor McRae Creates Financial Stability**

When Thomas C. McRae was elected Governor in 1921, the state's finances were in a muddle. World War I had brought the construction of new school buildings to a standstill. The quality of educational programs had been greatly reduced, the better-qualified teachers had left the schoolrooms to serve in the armed forces or work in the plants producing war materials, and the school terms were cut short. The schools suffered in particular from inadequate financial support. From 1874 to 1922, the schools were financed by revenues from state and local general property taxes. In 1906, a constitutional amendment increased the state property tax rate from 1 mill to 3 mills and the permissive local district tax rate from 5 mills to 7 mills. Ten years later the local rate limit was increased to 12 mills, and again to 18 mills in 1926. In 1947 the General Assembly proposed an amendment to the state constitution, which was approved by voters at the polls in the general election in November 1948. This amendment, among other things, removed the ceiling on the local school millage levy and left it to the local school district to determine the number of mills needed. If the voters approved the proposed rate at a regular school election, it became the rate on which local school taxes would be collected. If the proposed tax rate failed to pass, taxes were to be collected at the rate approved in the preceding annual school election. Unfortunately, many of the local laws considerably handicapped the State Legislature.

Governor McRae called two extra sessions of the Legislature, but a crisis developed between the Governor and the Senate. C. P. Newton, the Governor's administrative assistant, described it as follows:

The Senate refused to function further unless and until Governor McRae agreed to "roll logs" to some political bargaining. . . . The Senate could obstruct measures and refuse to confirm appointments made by the Governor. They indicated a determination to stop the Chief Executive's Program, midstream, if he would not "play ball." The Governor managed to make his answer clear. It was to the effect that the days of such collusion between the Legislature and the Governor were over . . . for the period of his stewardship.

In the second session, the Governor advocated an income tax and a privilege or franchise tax to provide better financial support for the schools. Big businessmen induced the farmers to line up against the proposal, and it was defeated. The Governor finally persuaded the Legislature to pass a cigar and cigarette tax, but the State Supreme Court declared it unconstitutional on a technicality. As soon as the court's decision reached Governor McRae, he made the boldest move of his administration: He called the Legislature for a third extraordinary session to correct the flaws the court had found in the cigar and cigarette law. This call came as a bolt out of the blue to both the public and the legislators. Rumors spread that the Legislature would ignore the call. However, it did meet and, under the Governor's leadership, passed an educational program that attracted the attention of leading educators throughout the nation.

Governor McRae was one of the public schools' greatest friends up to this time. His program strengthened the compulsory school attendance law, established a free library service, and deserves praise for the businesslike
manner in which he managed the entangled state finances. His motto was: "Make no appropriation until funds are in sight to meet it." When he retired from office in 1926, there was a cash balance in every fund, and the public school system had been reorganized and strengthened.

The Legislature again attempted to improve the Arkansas schools in 1927 by enacting a law permitting counties having 75,000 or more population to organize all schools—exclusive of first-class city schools—into county school districts if the majority of the citizens voted to do so. This law actually applied only to Pulaski County, which did vote to organize a county district. In 1929 the General Assembly enacted an optional county-unit law under which the people, by a majority vote, could form a county school district under the county board of education and the county superintendent. It further provided—

That every school district except those in which there is a city of not less than 10,000 inhabitants as aforesaid, whether created by County Courts, County Boards of Education or by special Act of the Legislature, shall cease to exist when a County School District as herein provided for has been created. Said district shall be a special, single school district with all the powers and responsibilities of a Special District organized in cities of the first class (12).

Because this act exempted two counties and one special district, the State Supreme Court invalidated it on grounds that it contravened a constitutional amendment prohibiting local legislation.

In keeping with the trend in other states, the Arkansas Legislature passed a State Equalizing Fund Law (Act 28) in 1927 to assist in equalizing educational opportunities in the public schools by authorizing the State Board of Education to grant aid to needy districts. The board determined the approximate amount of money each district needed and then forwarded requisitions to the State Debt Board. The debt board sold the number of state bonds necessary to build an equalizing fund sufficient to do the job. Since there was an immediate need for new buildings and other facilities, the board of education was permitted to borrow money and issue negotiable coupon bonds.

Survey for Reorganization

To get the best results from this school financing plan, the State Board of Education decided to determine the kind of school that could give adequate service at the lowest cost. A preliminary study showed the need for larger schools and a larger local tax unit. In fact, the state's experience with consolidated schools, established in a more or less haphazard manner during the preceding decade, proved that most were quite satisfactory, particularly in providing a more adequate high school program.

Unfortunately, evidence showed that some campaigns for reorganization had been carried out by overenthusiastic supporters who exaggerated the advantages and quality of such a program, thus selling a number of people on the idea that a larger unit could be operated at considerable savings to the taxpayers. In communities where the citizens failed to provide adequate funds for operating the newly created school districts, the consolidation movement was condemned as a failure. In a few cases where two or more districts had formed a new district, they secured special legislation permitting them to revert back to their original organization. These experiences indicated a need to avoid superconsolidations and to plan a school system that would consider the needs of all the children in every area and community in the state.

In 1928, the State Department of Education made extensive surveys to outline for each of the 75 counties a program of reorganization and consolidation. With the approval of the State Board of Education and a financial grant from the General Education Board, a research staff was placed under the direction of the department's division of research and surveys (13). The survey staff worked closely with the director of school plant services, other members of the department, and four graduate students in education administration from Peabody College in making its study.

The state department also cooperated with its survey staff in determining reorganization standards for the county schools. The school system was to be organized on the basis of a 6-year elementary school leading to a 6-year high school or a 3-year junior high school and a 3-year senior high school. These schools would be planned for a minimum number of pupils in the elementary school and 150 in the 6-year high schools, or 100 each in the junior and senior high schools if maintained separately. Larger school districts would be planned where feasible, but smaller school districts would be proposed where transport conditions, community life, or strong neighborhood ties seemed to justify doing so. The survey staff established the pupil-teacher ratios and agreed that transportation should be provided for all pupils living more than 2 miles from the school and that no pupil should spend more than 2 hours per day traveling to and from school.

The survey team agreed that school districts should be planned to provide 12 years of instruction. The boundary of each district would be determined by the area from which pupils would attend the senior high school, but the district would have as many elementary schools as the neighborhood structure demanded. A local board of education would be in charge of all schools in the district. The county board of education and the county superintendent of schools would then constitute an intermediary between the local district and the state department. The program for each county would be planned so that it might legally reorganize on a county-unit basis without relocating any
As stated above, the State Equalizing Fund established by the Legislature under Act 28 of 1927 provided the new district sufficient funds to operate the schools in accord with state standards. Whenever the estimated revenue from customary state sources and from the 18-mill local property tax was insufficient to maintain these standards (including pupil transportation), the district received the difference between this revenue and the cost from the equalizing fund. The State Board of Education would aid only those districts that conformed to its regulations and to certain requirements stated in the law. Thus, the state board gave first—although not exclusive—consideration to reorganized districts set up according to the countywide plan.

At this time the state department was confronted with a serious financial problem. The majority of the 4,734 school districts were heavily in debt; most of them had issued bonds for constructing new buildings and for purchasing equipment. In many instances nearly all the current annual revenue of these districts was required to pay the principal and interest on the bonds already outstanding, and their buildings and equipment were already antiquated and in a bad state of repair.

In March 1927 the General Assembly passed Act 119, creating a Revolving Loan Fund to further relieve the needy school districts. The act directed the State Debt Board to make the assets of the Permanent School Fund available to the revolving fund so that it could make loans to various school districts for repairing, erecting, or equipping the school buildings, and to pay off the outstanding indebtedness already incurred. The State Debt Board could authorize the funds to be transferred from the Permanent School Fund to the Revolving Loan Fund as the cash balance accumulated.

This Permanent School Fund has been developed over a period of many years from revenues received from the sale of the federal land grants. As mentioned earlier, it is loaned to various state agencies, chief of which is the Revolving Loan Fund, which in turn provides income for the State Common School Fund. The State Common School Fund, the general school fund for Arkansas, is distributed quarterly to the various counties on the basis of the school census (enumeration) after the funds have been appropriated and certain deductions have been made.

Probably no other legislation has been more beneficial to Arkansas' school system than the Revolving Loan Fund. All payments are current, and there have been no defaults. The state board consistently refused, as in the case of the equalizing funds, to lend money for constructing buildings that did not conform in location and type to the countywide plan of school reorganization.

The equalizing fund reserved 25 percent of its money for new school buildings. If a district that could not pay for a state-standard plan approved by the director of the department's division of schoolhouse planning borrowed enough money to equal 7 percent of the assessed valuation of its taxable property, the state board could grant the additional amount needed.
The proposal, for the state as a whole, called for establishing 307 local administrative units, an average of four districts per county. Each district was to have a senior high school, one or more junior high schools (or a junior-senior high school), and one or more elementary schools. In all, the plan called for 1,784 elementary schools, 270 of which were to be isolated eight-grade schools; 560 separate junior high schools; and 307 senior or junior-senior high schools, a large majority to be the latter. The surveys did not try in all cases to make a final recommendation on the exact type of organization. The plan called for the number of one-teacher schools to be reduced from 2,495 to 473, two-teacher schools from 920 to 478, and three- and four-teacher schools from 371 to 256; the number of schools having five or more teachers was to be increased from 412 to 577. The equalizing fund would provide about $2.8 million annually to finance the new program, but the estimated enrollment expansion called for an additional $3,666,000 annually.

From the 1927-28 to the 1931-32 school years, more than 350 consolidated districts were formed, 173 in 1929-30 alone. These new districts provided 660 school centers with new, improved facilities. The number of districts decreased from 4,711 in 1926-27 to 3,086 in 1932-33—a total reduction of 1,625. The major reductions occurred in 1929-30 (664) and 1930-31 (591). The number of one-teacher schools for white pupils decreased during this same period from 3,106 to 1,990. This brought corresponding increases in the number of pupils transported to schools: 3,136 in 1926; 9,694 in 1928; 25,563 in 1930; and 52,654 in 1932.

Both enrollments and size of the high schools increased immediately following the reorganization program. In 1926, the high schools enrolled approximately 31,000 students; by 1931 they had 47,274. The surveys indicated that the average enrollment would increase to 153 pupils per high school, with only two senior high schools in the entire state having fewer than 40 pupils.

Impact of the Depression

As in other states, the Depression hit Arkansas schools hard, and the decline in both state and local revenues contributed heavily to bringing the entire reorganization program to a halt. In 1931, the General Assembly changed the reorganization law to require a majority vote or a petition signed by the majority of the electors in each district—rather than a majority in the proposed district—in order to consolidate two or more districts. This change was not the result of an all-out movement against reorganization, but was rather an innocent-looking bill that was hotly contested. The General Assembly also abolished the distinction between the various types of school districts and declared all districts to have the same powers and privileges as the city special districts. (In 1937, as a result of another reorganization study financed by the Works Progress Administration, districts were classified according to size in order to determine the number of board members each should have.)

Despite this legislation, which effectively stopped district reorganization, the state school system was strengthened by another act passed by the 1931 Legislature. Governor Harvey Parnell persuaded the legislators that the State Department of Education could function more efficiently if the elective office of state superintendent were abolished and the State Board of Education empowered to select a commissioner of education. This act enabled the board to organize and control the state department, and it has gradually strengthened its power and expanded its duties. As a result, the state board’s prestige has increased tremendously.

In 1941, the General Assembly passed Act 127, which reorganized both the State Board of Education and the State Department of Education. It required the state board to be composed of nine members appointed by the Governor, subject to the confirmation of the Senate, one from each congressional district and the remainder at large. The Governor was given the power to remove members of the board for sufficient reasons after a formal hearing and a majority vote by the board. This enabled the board and the department staff to reach a high degree of professional standards and stability.

The General Assembly also attempted to provide stability to the schools by passing an act in 1941 earmarking for the Common School Fund 50 percent of the net returns from a 2-percent sales tax. Another piece of legislation gave to this fund 39.2 percent of the net proceeds from an excise tax of $2.50 per thousand on the sale of cigarettes.

Prior to 1945, when the General Assembly enacted the Revenue Stabilization Law sponsored by Governor Ben Laney, deficit spending was permitted under certain circumstances, and each assembly was faced with the problem of taking care of the resulting debts. Under this law, certain revenues, including sales tax, income tax, cigarette tax, and taxes on alcoholic beverages, were grouped into a category designated as General Revenues. It is from this General Revenue Fund that the public school funds were appropriated.

One major source of revenue for supporting the schools was lost when the General Assembly abolished the state ad valorem property tax, a 6.5-mill levy that
produced an average of $4 million annually for the General Revenue Fund. The 1947 Legislature reenacted this levy for 1948, but only on sand and gravel (17). The citizens voted down a proposed amendment to the State Constitution which would have removed the state permanently from the property tax field; however, an amendment proposed by the General Assembly and accepted by the voters at the general election in November 1958 prohibits the General Assembly from levying an ad valorem tax on property.

An amendment was added to the constitution in 1949 which removed the ceiling on the local tax rate, providing that—

The Board of Directors shall prepare, approve, and make public, not less than sixty days in advance of the annual school election, a proposed Budget of expenditures deemed necessary to provide for the foregoing purposes, together with a rate of tax levy sufficient to provide the funds therefor, including the rate under any continuing levy for the retirement of indebtedness. If a majority of qualified electors in the district voting in the annual school election shall approve a proposed tax rate, then the tax on the proposed tax rate shall be collected. In the event a majority shall disapprove the proposed tax rate, then the tax shall be collected at the rate approved in the preceding annual school election (18).

**AEA's Reorganizational Efforts**

The reorganization problem was always closely connected with the efforts to finance the schools. The Arkansas Education Association, with the support of the State Department of Education, initiated a proposal under the initiative and referendum amendment to the state constitution providing for the dissolution of all districts having fewer than 350 residents between the ages of 6 and 17, inclusive. It also called for these districts to be organized into county rural school districts under the superintendency of the county school supervisors. The county boards of education could annex the territory of their county school districts to other districts if the latter's boards also consented. The proposal, submitted to the electors of the state in the November general election of 1946, was defeated by a narrow margin of 1,301 votes (19).

Two years later, the AEA and the State Department of Education placed a similar measure, known as the School District Reorganization Bill, on the ballot. Initiated Act No. 1 of 1948 was approved by the voters by a margin of about three to one. Under its provisions, the number of school districts was immediately reduced to 426, and has gradually decreased to only 395 in 1967 (20).

In 1965, when the Arkansas Education Association proposed another initiated act, it aroused aggressive opposition from a group known as the Arkansas Rural Education Association (AP EA). Although its officers represented the smaller rural school districts, its membership was drawn from medium and even larger school districts as well. It slowly gained strength so that later in 1965, when the AEA introduced this proposed initiated act to further reorganize the school districts by abolishing all having fewer than 400 pupils, the AREA was able to offer formidable opposition. The battle lines were so tightly drawn that the AEA's Council on Education amended the original proposal to read that all districts with less than 2,000 pupils would be dissolved and annexed to other existing districts.

The council sent letters to each delegate asking how many petitions he wanted and how many signatures he could secure. Of those who responded, an overwhelming majority objected to the 2,000 provision. The executive committee of the AEA unanimously voted to drop this figure, and a few days later the original 400 proposal was revived by Joshua K. Shepherd, a Little Rock insurance executive and a long-time friend of public education. He organized a statewide committee and personally raised the money to cover the expenses of initiating a petition for the proposed act.

By early July the petitions had a sufficient number of signatures to get the proposal on the ballot. When the Council on Education held a special meeting on October 1, it voted to endorse this plan. Despite all these efforts, the plan was overwhelmingly defeated at the general election in November 1966.

**TEACHER EDUCATION, CERTIFICATION, AND INSTRUCTIONAL SERVICES**

**Teacher Certification**

Junius Jordon, the state superintendent of public instruction from 1894 to 1898, described the improvements in the competence and proficiency of Arkansas teachers due to the Peabody Fund as "fantastic." He stated:

The trustees of the Peabody Fund still continue their beneficent donations annually in favor of Summer Normal Schools. In addition to this, they gave to this State seventeen free scholarships to the Peabody Normal University at Nashville, Tennessee. The benefits that have accrued to all will be a perpetual monument to the memory of Mr. Peabody who has enabled Arkansas to arouse the pride and improve the professional power of every teacher within the borders (21).

Dr. Jordon persuaded the Legislature to pass an act providing for teacher institutes to run 4 months each year, but it was an appropriation by the Peabody Board in 1891—91 year after Jordon had left office—that made these institutes possible. By 1900, 53 institutes were providing professional training for 2,034 students. At this time, the
county examiner administered the teacher examination quarterly, based on the following requirements:

Nothing below fifty per cent to be considered; for a first grade certificate, eighty-five per cent of the examination must be passed; for a second grade, seventy-five per cent; and for a third grade, sixty per cent. The examination included tests in written arithmetic, mental arithmetic, grammar, and orthography. An average of the above percentages must be made upon all of the other tests combined (22).

All teachers who passed the examination received county certificates classified as third-grade county licenses good for 6 months, second-grade county licenses valid for 1 year, or first-grade county licenses good for 2 years.

In 1900, the Legislature invested the state superintendent with power to grant a state certificate valid for life. The law stated: "Applicants for State Certificates must bear in mind that the school law, section 6974, requires an examination. The statute does not recognize diplomas from colleges, normals, or universities" (23). The act required the applicants to be examined in the same subjects as for county licenses: algebra, geometry, physics, rhetoric, mental philosophy, history, Latin, the Constitutions of the United States and Arkansas, natural history, and the theory and art of teaching.

There were no changes in the certification laws until 1941, when the Arkansas Legislature delegated sole certificating authority to the State Board of Education. The law stipulated that to be eligible for a teacher's license, the applicant had to be at least 18 years of age and not over 72, to be of good moral character, and believe in a supreme being (24). Although an applicant could now receive a certificate by submitting a college transcript, the 1941 Legislature continued the policy of allowing individuals desiring to teach in a particular county to be certified by passing an examination given twice each year by the county supervisor. However, the county supervisor could issue only one type of county certificate: the state board county certificate. Holders of county second- and third-grade certificates were required to convert these to state board county certificates on or before September 1, 1941. Holders of county first-grade certificates could retain them or convert them to statewide certificates.

In its 1941 reorganization of the certification laws, the Legislature stipulated that an administrator's certificate valid for 6 years could be issued to a person holding a bachelor's degree from an approved institution. This was changed in 1946 to a minimum of a master's degree in an approved institution, with at least 14 semester hours in education, including 8 semester hours in graduate work in school administration.

The law also stated that to earn the 6-year high school certificate, an applicant had to be a graduate from an approved 4-year college with certain minimum requirements. A 4-year junior high school certificate would be issued on a minimum of 60 semester hours from an approved college if this included specific areas of study. The 6-year elementary certificate required a bachelor's degree, but a 4-year elementary certificate would be issued to a person who had completed 2 years of college, and a 3-year elementary certificate could be issued after 1 year of college work.

These legal requirements were not changed during the Depression or World War II. But during these periods of national turmoil, the requirements were not strictly enforced.

In 1956, Commissioner A. W. Ford appointed a subcommittee of seven from the Arkansas Advisory Council on Teacher Education and Certification to initiate the most comprehensive study ever made in the state on the board's responsibility for certification. The council specifically directed that this study should include the role of the colleges. With the state department's assistant commissioner for instructional services as chairman (25), the Committee of Seven in representing public and private schools, the University of Arkansas, the public schools, and the State Department of Education spent more than 3 years researching, analyzing, and writing recommendations.

On the basis of the subcommittee's report, the state board wrote new requirements for certification, to become effective September 1, 1963. The 6-year superintendent certificate now required a master's degree with a minimum of 20 semester hours of graduate education courses in at least five areas. The 6-year secondary school principal certificate required a master's degree with a minimum of 20 semester hours of graduate credit in administration and supervision of secondary schools, and at least five 3-hour courses in specified areas. The 6-year elementary school principal certificate required a master's degree, including at least 18 semester hours of graduate credit in administration and supervision of elementary education in a minimum of four specified areas.

A person desiring a 6-year high school certificate according to the new certification requirements should have a bachelor's degree with 18 hours in education, along with certain courses in the various teaching fields. A 5-year high school permit could be issued to a candidate with 90 credit hours, if 15 hours were in education and the total included special requirements in the teaching fields. The board allowed a 4-year high school permit to be issued on 60 semester hours, including specified work in the teaching fields and 12 hours in education. Similar prerequisites applied to 5-year and 4-year elementary certificates.

The State Department of Education, following the recommendations of the Committee of Seven and its own staff, adopted a regulation requiring all beginning teachers to possess certificates based on a minimum of a bachelor's degree after September 1, 1963. It no longer allowed permits to be issued, and teachers holding such permits were
works closely with the colleges and universities to plan and present, less than 3 percent of Arkansas' teachers have less than a bachelor's degree.

The Department of Education's certification division, which is a part of the instructional services division, not only analyzes transcripts and issues proper certificates, but works closely with the colleges and universities to plan and develop teacher education programs. At present, it has approved teacher training programs in 18 institutions of higher education.

School Accreditation

In 1909, when V. W. Tarryson joined the faculty of the State University of Arkansas at Fayetteville, he became the first professor of secondary education in the state. From his office in the State Department of Education, he led a movement to standardize the state's high schools. This resulted in the General Assembly's passing legislation making the high schools a part of the public school system and providing for a system of supervision by the department staff, which developed the criteria for minimum standards. This first attempt to accredit high schools according to A, B, or C ratings ended with 20 A's, 44 B's, and 10 C-rated high schools in 1909. Within a decade there were 84 A's, 38 B's, and 38 C's.

From 1909 to 1924, a number of high schools were accredited by the Southern Association. In 1924, 28 Arkansas high schools, all members of the Southern Association, transferred their membership to the North Central Association of Secondary Colleges (NCA). By the 1966-67 school term, NCA had granted membership to 156 schools in the state, and there were 187 high schools with an A rating, 95 with a B rating, and 51 with a C rating.

With the great emphasis on the secondary schools, Arkansas' elementary schools suffered. Receiving little attention and less help, they grew around the high schools instead of into them. Weaker teachers were assigned to the elementary grades, classrooms were crowded, and the schools were almost completely lacking in libraries and equipment. As educators and the public alike finally realized that the school system's ultimate success depended in large measure on the efficiency of the elementary schools, a movement to improve them gradually gained ground. In 1931, the assembly authorized the State Department of Education to standardize the elementary schools.

To provide proper supervision for standardizing all the schools, the department began to employ more elementary and high school supervisors and add supervisors of special programs such as agriculture, home economics, and guidance. The department coordinated these services so that it could influence the total educational program. Although it has maintained its special program supervisors, in 1945, the department changed the duties of its elementary and high school supervisors by making each responsible for both elementary and secondary schools in his particular supervisory area.

In 1954, Commissioner A. W. Ford reorganized the State Department of Education to give more emphasis to supervising special programs such as speech therapy, special education, and vocational education. Federal programs, such as the National Defense Education Act of 1958 (NDEA) and the Elementary and Secondary Education Act of 1965 (ESEA), have accelerated this trend toward specialized supervision.

Supervisors in the instructional services division have a multiplicity of duties and responsibilities. Each general supervisor is assigned to the elementary and secondary council or to one area, such as English, health and physical education, science, dramatics, social studies, library science, economics, modern foreign language, reading, general education, and economic education. Special education has become a full-time assignment.

The supervisor represents the department in upholding standards and reports on conditions and progress in the schools. But much more important than his regulatory function is his leadership role in developing understanding and a genuine desire to improve instructional programs. This requires him to have considerable information on all phases of the school program and to be tactful, persuasive, sincere, and dedicated. Real leadership cannot be imposed—the supervisor must earn the local school people's respect and admiration.

The associate commissioner in charge of the instructional services division is chairman of the North Central Association's state committee. Each supervisor is a member of the State Accreditation Committee and thus participates in the annual review and accreditation of schools. After reviewing the annual report of each North Central Association secondary school, the general supervisor abstracts his findings for the state committee. Following the state committee's session, he makes separate abstracts for each school and attaches one to the report for the annual meeting in Chicago. Each general supervisor recommends the secondary schools that are to conduct self-evaluations during the year, and he is responsible for these plans and preparations. A self-evaluation of each NCA member high school must be made at least every 7 years.

Accreditation of the elementary and secondary schools also is required by the law, which says: "The State Board of Education shall have general supervision of the Public Schools of the State to qualify and standardize public schools of the State" (26). The Division of Instructional Services has prepared a set of policies, regulations, and criteria, which the board has adopted, outlining the minimum standards a school must meet before it can be accredited. The policies are guiding principles followed by the department; the regulations are the minimum requirements for accreditation; the criteria are guideposts pointing
to goals of excellence. The extent to which a school conforms to the policies, regulations, and criteria determines whether it will be accredited as a Class A, Class B, or Class C elementary or secondary school.

Adult Education

The Division of Instructional Services is responsible for a general adult education program initiated by the department in 1961. Its purpose is to raise the educational level of adults at both the elementary and secondary levels and to provide dropouts the opportunity to earn a high school diploma or a certificate of equivalency. Any Arkansas resident 18 years or older who has less than a high school education and who has been out of school 6 months or longer may enroll in a variety of courses (27) including language, arts, mathematics, social studies, science, and foreign languages.

A local or county board is eligible to sponsor classes in adult education. School districts participating in the program are then reimbursed 100 percent of the amount paid to teachers. With the financial assistance now available through Titles I and II of ESEA, Public Law 89-10, nearly all the schools in the state are strengthening their programs by adding teachers, teacher aides, counselors, librarians, remedial teachers in various subject areas, and many other specialists whom they could not afford in the past.

The Department of Education established a General Educational Development (GED) testing program in 1945 for young men drafted out of high school during World War II. When the general adult education program began during the 1961-62 school year, nonveteran adults who had completed a minimum of 120 hours of instruction in an approved general adult education program were eligible to take these tests to earn the equivalency of a high school diploma, but veterans with 90 or more days of military service were exempt from this requirement.

At present, the education department can issue certificates of equivalency of high school graduation to both veterans and nonveterans 20 years of age or older who have successfully completed the GED test. However, if an employer writes the assistant commissioner of instructional services stating that he will employ an applicant if he passes the GED test, the applicant will not be required to complete the 120 hours of instruction in adult classes. During the 1965-66 school year, 1,790 GED applicants were processed, including 630 who had taken the general adult education program, 700 who had completed U.S. Armed Forces Institute courses, 260 veterans not required to take the 120 hours of instruction, and 200 nonveterans tested for employment (28).

The associate commissioner for instructional services also administers an adult basic education program authorized under the federal Economic Opportunity Act of 1964. Its objectives are to raise the educational level of adults 18 years or older who have less than a sixth-grade education and need more training or retraining to secure jobs commensurate with their ability, and to make them less dependent on others.

Handicapped Children

The Division of Educational Personnel Training of the U.S. Office of Education has general responsibility for operating and financing a program for handicapped children under the terms of Public Law 85-926. This program awards grants to institutions of higher education and to state education agencies for preparing persons to teach handicapped children and to be supervisors of teachers, speech therapists, and other specialists. The program is administered by the special education supervisors of the state agency.

This program is expanding due to the additional funds made available under the provisions of Public Law 88-164, which supplements the state appropriation for this program. Public Law 88-164 provides funds for the preparation of professional personnel in the education of the handicapped. This program is also being supplemented by a planning grant under the provisions of Title VI of ESEA, Public Law 89-10.

The director of this program provides leadership and consultative services to the public school, the Children's Colony, and similar institutions and agencies of the state.

PROGRAMS IN VOCATIONAL AND REHABILITATION EDUCATION

In 1917, Congress passed the Smith-Hughes Act, which appropriated funds for promoting vocational education in agriculture, trades and industry, and home economics, and for training teachers in these fields. The law required the State Department of Education to allocate these federal funds to local school districts to defray as much as 50 percent of their instructional costs. The George-Reed Act of 1929 extended the provisions of the act by authorizing more funds for vocational agriculture and home economics. The George-Deen Act of 1936, the George-Elizay Act of 1934, and the George-Barden Act of 1946 all provided additional federal financial support and widened the scope of these programs. By 1947, federal funds were providing a high percentage of the costs of these programs.

Within 11 days after Congress approved the Smith-Hughes Act, the Arkansas Legislature enacted legislation to qualify the state for federal aid and set up a program of vocational education. A. B. Hill (29), the first state director of vocational education, worked with community leaders to organize vocational training schools that would prepare every individual in the state to enter the world of work and advance in his chosen occupation.
Agriculture

The vocational agriculture programs were organized primarily for boys 14 years of age or older in rural areas who were enrolled in regular high school subjects or who had reached the ninth grade. Each student was required to enroll in a supervised farming program in addition to his regular agricultural classes, all under the direct supervision of the regular vocational agriculture teacher. Each of these vocational agriculture teachers conducted at least two classes for adults—each consisting of boys who had completed or dropped out of school and were becoming established in farming, and the other for adults who had already become farmers.

In 1923, the vocational agriculture pupils at Bruno High School organized the Lincoln Aggie Club, believed to be the first organization of its kind in the nation (30). When the National Future Farmers of America was organized in 1928, Arkansas received the second FFA charter (31). The Danville chapter was the first chapter in the state (32). Throughout the history of the FFA, Arkansas chapters and members have been active at all levels; John Haid of Siloam Springs served as national president during the 1956-57 school year.

The State Department of Education employed two specialists in 1959, one to supervise and assist high schools in developing a program of livestock improvement, and one to assist high schools in teaching the selection, operation, and maintenance of farm facilities and equipment.

Technical and Industrial Education

World War I not only revealed the need to improve techniques in agriculture, but brought an increasing demand for industrial products, requiring thousands of new industrial workers. One of the major purposes of the 1917 Smith-Hughes Act was to prepare youth and adults for industry and help those already employed gain advancement.

In 1918 the trade and industrial program in Arkansas consisted only of a drafting class for adults at Little Rock High School and a high school printing class at Hot Springs. It was 1927 before the General Assembly implemented this part of the Smith-Hughes Act and provided for establishing and maintaining public school vocational training. The state was divided into four districts, each authorized to establish two state vocational schools. The Governor appointed a three-man board of trustees charged with selecting the locations of the schools. A community wishing to be considered as a site for one of these vocational schools was required to donate land, buildings, and equipment, and raise at least $15,000. The only two state vocational schools established under this act, one at Huntsville in Madison County and the other at Clinton in Van Buren County, continued to operate until the Legislature discontinued them in 1955.

Governor Orval E. Faubus worked untiringly to organize the Arkansas Industrial Development Commission in 1955. Under the leadership of its chairman, Winthrop Rockefeller, this commission attempted to sell the advantages of Arkansas to industrialists looking for sites for new industry or to expand their present business. It was evident to the members of the commission that to attract industry—especially new industry—Arkansas would have to supply technically trained employees. Faubus convinced the 1957 Legislature of the real need for Act 328, authorizing the State Board for Vocational Education to create vocational-technical schools for persons 16 years of age and over.

The first plant constructed with state funds was the Pines Vocational-Technical School at Pine Bluff. The Petit Jean Vocational-Technical School, also constructed from state funds, opened at Morrilton in 1963. At present, additional classroom and shop space has been provided at both the Pine Bluff and Morrilton Schools. In September 1966, schools opened at Ozark, Searcy, Hope, and Burdett to provide students constructed with federal-state matching funds, and schools were under construction at Harrison, Marked Tree, Forrest City, and El Dorado.

The state's objective is to make vocational and technical courses available to all its citizens 16 years of age or older, and to provide new industry and industrial development with skilled workers. The courses offered by the 10 vocational-technical schools include welding, tailoring, sheet-metal fabrication, masonry, horticulture and landscaping, forestry, cabinetmaking, air conditioning, auto mechanics, body repair, cooking, machine shop, office practice, practical nursing, radio-television service, cosmetology, electronics, and data processing. In addition to these resident courses, mobile units move into areas where such training is needed. When the federal Vocational Education Act of 1963 was passed, business and office education was added to the program. Neither the resident nor the mobile units give high school or college credit.

Distributive Education

Arkansas also has a distributive education program for high school students in grades 11 and 12. Little Rock Senior High School (now Little Rock Central High School) started a program known as "retail selling" in 1929, 7 years prior to the passage of the George-Deen Act in 1936. Arkansas is a charter member of Distributive Education Clubs of America, organized in 1947, composed of students enrolled in distributive education and trade and industrial subjects. In 1966, the future tradesmen disbanded, and the club adopted the name "Arkansas Association of DECA."

Twenty-seven high schools offer distributive education programs, employing coordinators who teach the students two periods per day and work with them in their employing firms in the afternoon. The distributive
education section also maintains three programs at the state level for adults, including retail selling, petroleum industry training, commercial food service, management training, human relations, and tourist service.

The trade and industry division offers preparatory courses for specific occupations to students at least 16 years of age, including on-the-job training, applied mathematics, science, and blueprint reading. It offers extension courses to those who cannot attend organized classes and provides supervised training in how to train employees on the job, employee relationships, and safety; it conducts regional schools for firemen in cooperation with local fire departments. This division also offers free employment training for new industries.

Home Economics

The home economics program offers courses in foods and nutrition, clothing selection and sewing, child care and development, personal and family relationships, housing equipment, and home furnishings, as well as home management to the students in grades 8 through 12 enrolled in a regularly organized high school. Adult education is an integral part of the vocational homemaking program. It informs homemakers about new trends, developments, and techniques. The first high school programs established on a continuing basis were initiated in the 1920-21 school year at Newport, Hazen, Hope, Dermott, and Arkadelphia.

In 1945, representatives from Arkansas attended the organizational meeting of the Future Homemakers of America in Chicago. A group organized an Arkansas affiliate the same year and at the same time chartered the New Homemakers of America for Negro girls. The home economics teachers served as advisors to the local chapters, which were affiliated with state and national associations. The Future Homemakers of America and the New Homemakers of America were merged July 15, 1965, to be known as the Arkansas Association, Future Homemakers of America.

In 1959, the state department employed a clothing specialist to work with teachers and adult homemakers through workshops, conferences, and visits to local schools.

Nursing Education

In 1947, the Legislature passed the Nurse Practice Act, which stipulated that persons engaged in nursing without a license would have to submit proof of their qualifications and register for a license by waiver before May 1, 1948. Approximately 1,400 women without formal training were licensed in this way. In 1948, the state department's vocational division allocated funds to employ a registered nurse to conduct extension courses for women who had no formal training, and 655 licensed practical nurses enrolled in the first course. After the waiver period had elapsed, it was evident that schools were still needed to train practical nurses. Since the law required practical nurses to graduate from an approved school and successfully complete a state board examination before they could obtain a license, the Division of Vocational Education set aside funds for a practical nursing school, which opened in Little Rock in 1948. Four years later, the Kellogg Foundation provided funds to purchase equipment and hire three additional registered nurses. At the same time, the number of instruction hours was increased to 150.

The success of the Little Rock School prompted the Kellogg Foundation to open other schools. Under its plan, the new schools were financed by Kellogg fully the first year, two-thirds the second year, and one-third the third year. After this, the Kellogg Foundation support was terminated, and the vocational education funds had to provide full support. The department's vocational division now administers 16 practical nurse education schools using 46 affiliated hospitals for clinical experiences, all approved by the Arkansas State Board of Nursing and State Board of Education (33). After completing a year of instruction, the graduates are eligible to take the examination for a license as practical nurses.

The vocational division now receives federal funds under the Vocational Education Act of 1963 for practical nurse education programs and other health occupation education. It offers courses in practical nursing, organized in local school districts for adults between the ages of 19 and 50. It also has programs at the secondary level for health occupations, adult classes for continuing education, and postsecondary level programs for medical laboratory assistants and dental assistants. These classes run for 1 year. They include instruction in theory and practice and provide hospital-learning experiences under the supervision of a graduate nurse.

After a thorough study of occupational needs, the employment security division recommended training medical assistants. The Metropolitan High School in Little Rock started such a course for eleventh- and twelfth-grade girls and boys in 1965, consisting of techniques in nursing, the terminology of health occupations, background, medical aid, health record keeping, and field trips. The students are also required to learn office practices and typing. After completing the course, the students are prepared to become medical assistants in doctors' offices or hospitals, or to enter the regular training programs in hospitals. It is the only course of its kind offered in the Arkansas public high schools.

In the first year the public schools offered training under the Smith-Hughes Act, they included training only in agriculture, home economics, printing, and mechanical drawing. In the 1966-67 school year, preemployment instruction was provided in almost 100 occupational classifications. The Arkansas program includes 297 agricultural departments, 384 home economics departments, 27
distributive education programs, 13 office occupations programs, 15 practical nursing programs, 70 high school trade and industrial programs, and 10 area vocational-technical schools operated by the State Board for Vocational Education.

Rehabilitation Education

The federal Vocational Rehabilitation Act of 1954, Public Law 565, allotted funds to the state agencies for establishing and operating centers, workshops, small-business enterprises, and other facilities which could be integral parts or supplements to a regular program of rehabilitation. In 1955, the Arkansas Legislature authorized the state to participate. However, it was not until Congress gave the Army-Navy Hospital at Hot Springs to the state that the state Board for Vocational Education was able to administer such a center. The Legislature passed an act in 1959 making the Rehabilitation Center an integral part of the Arkansas Rehabilitation Service, although the business and financial operations are separate from the regular program. It provides medical, psychological, social, and vocational evaluation and services needed by the disabled—particularly the severely disabled.

The Rehabilitation Center provides basic services for medical evaluation and supervision, physical therapy, occupational therapy, and speech therapy. The emphasis is on building up physical tolerance and developing muscles, strength, and coordination, and in fitting and using protheses. It is staffed by psychologists, social workers, and counselors to provide services relating to student personnel activities. It employs a number of doctors on a part-time consultative basis and maintains a staff of physical therapists, occupational therapists, speech therapists, nurses, aids, and attendant and student trainees. The center has approximately 50 beds for individuals who need active nursing care.

The center provides high-quality vocational evaluation, as well as training in 20 or more trades or vocations in which handicapped persons can find employment. The vocations are selected from a survey of the industrial needs of Arkansas and the Southwest, and there is space for training 300 or more persons at one time. The center directs workshops in other activities in which clients are evaluated for employment in particular work situations, and they are trained in acceptable work habits as well as motivation for work. The latter two are particularly useful for persons handicapped by social and emotional factors which have destroyed their motivation or adjustment for work.

An integral part of the total project is research, demonstration, and experimentation in problems of rehabilitation. The center engages in special projects to solve these problems, and it has become a principal research facility, engaging in projects in which other states are interested. At full capacity, it can serve 500 persons at one time in the basic program, and approximately 100 persons can be employed in the workshops and 50 in the work evaluation and training programs. The Rehabilitation Center's services are available to clients of the rehabilitation agencies of other states, public and private agencies and organizations, labor unions, and insurance companies. The fees charged for these services defray most of the operating expenses.

In 1959, the Legislature turned over the Rehabilitation Service duties connected with the Disability Determination Bureau of Old Age and Assistance Insurance, which deals with persons who are disabled and covered by Social Security. The Rehabilitation Service, by state law, is also the sole agency to administer services to the blind. The service operates programs for other public agencies, such as the rehabilitation facilities of the State Hospital, the State Sanatorium, the McRae Sanatorium, the School for the Deaf, the School for the Blind, and the Training School for Girls. In cooperation with private agencies, it also operates a vending stand program for the blind and sheltered workshops in the homebound industries program.

The trend in rehabilitation services in recent years has been more and more for health and welfare services. Educational services remain as a function of the agency, but they no longer constitute the major phase of its work. The cooperative arrangements of the Arkansas Rehabilitation Service with other institutions or agencies have increased personnel and services. Such arrangements supplement the programs of the various institutions and agencies, but the State Board for Vocational Education in no way interferes with the administration of the institutions concerned (34). For example, although it assists the School for the Deaf, the School for the Blind, the State Tuberculosis Sanatorium, and others, the Rehabilitation Service has no control over their operations.

SERVICES TO THE SCHOOLS

School Lunch Program

The first school lunch programs in Arkansas, as in most other states, were started by dedicated teachers who cooked the food brought in by children to make hot soup or stew as a supplement to the cold lunches they brought from home. The Depression provided the impetus that firmly established school lunches. As early as 1932 surplus foods were distributed on a limited basis for free lunches. In 1935, Congress provided a permanent annual appropriation to the Department of Agriculture, enabling it to institute a direct purchase and distribution program to help farmers with the surplus problem, and the nonprofit school lunch program received a portion of these commodities. At the same time, when the Works Progress Administration was created in 1936, it provided funds to employ cooks and servers in schools throughout the United States. Arkansas
schools immediately took advantage of both of these programs and began feeding children with improvised equipment provided by local Parent-Teachers Associations.

In 1939, the Department of Agriculture announced an expanded lunch program to distribute surplus foods on the basis of the number of needy children served. Gradually the initial relief aspect of the program blended into one with a twofold objective: improving the children's health and encouraging an increased consumption of surplus agricultural commodities. Most of the Arkansas schools were happy to participate in the WPA program. The cash reimbursement program, which paid for part of the food purchased locally by schools, was begun in the spring of 1943. The following year, Congress authorized a specific amount for operating the school lunch and penny milk programs, permitting them to operate whether or not foods were at a surplus.

In 1945, Congress appropriated funds for a school lunch program and specified for the first time the conditions under which it could be provided. This act served as a basic authority for the present National School Lunch Program, passed in 1946. The Legislature gave the State Department of Education the authority to administer the funds under the National School Lunch Act, and the state board created this service in its vocational division in July 1947. The staff, under an agreement between the State Department of Education and the U.S. Department of Agriculture, was made responsible for distributing federal funds to local school districts based on the number of lunches served. The department's supervisory staff was then responsible for reviewing the program to determine if the lunches met the Secretary of Agriculture's minimum requirements. During these reviews, the department could provide consultative services in management, equipment, menu planning, food purchasing, food preparation, and record keeping. The administration of this program is now under the vocational education services division.

The auditors carry out audits on approximately 20 percent of the programs in operation during each fiscal year, not only to account for the federal funds, but also to determine whether they have been used in accordance with the regulations. The staff processes the school lunch claims made by local districts on a monthly basis. During the 1946-47 school year, the state received $271,257 in federal funds to assist the local districts in purchasing school lunch equipment. The Special School Milk Program was authorized by the Agriculture Act of 1954 and was initiated in Arkansas in 1955 by 888 schools. During its years of operation, this program has increased to the point where 1,034 schools are operating special milk programs.

In the 1965-66 school year, Arkansas schoolchildren consumed 30,916,413 type A lunches. A great increase in the number of children participating during the last half of the 1965-66 school year has been due to the special attention given to the disadvantaged children with funds provided by ESEA, Public Law 89-10, and the provision in the 1966 appropriation implementing Section 11 of the National School Lunch Act. Many schools in low-income areas are now able to construct school lunch facilities, purchase equipment, and provide free meals with funds available through Title I of Public Law 89-10. In 1964-65, Arkansas ranked ninth with 51 percent of its public elementary and secondary school enrollment participating in the School Lunch Program.

Under the provisions of Public Law 89-642, the Child Nutrition Act of 1966, several schools are participating in the Breakfast Program, which is designed primarily for underprivileged schoolchildren.

Guidance and Counseling

The State Department of Education took its first step in developing a guidance program for public schools in July 1942 by appointing Dolph Camp as the first state supervisor of occupational information and guidance services in the department's vocational education division (35). The emphasis was on vocational preparation and job placement, but it was based on the idea that each teacher in a school would do some counseling, with advice and assistance from the state supervisor. This plan was soon abandoned, as it became evident that counseling should be done by a trained counselor who could devote full time to his duties. No funds were available for reimbursing the local guidance programs at first, but the vocational division pledged some federal funds for the operating expenses of the guidance program in 1943.

Congress passed the George-Barden Act August 1, 1946, allotting state departments of education funds for guidance. These funds could be used to support local guidance programs and to encourage counselor training. Since the program developed because educators and businessmen became convinced that more effective job placement and occupational training should be developed, the term vocational guidance was generally used. With $75,000 from state vocational funds, 28 schools operated programs during the 1945-46 school year. The following year, the state's plan stipulated that 5 percent of the federal vocational funds and 5 percent of the state vocational funds would be devoted to the guidance program.

Under the new state program, the colleges were entitled to half salaries for counselor trainers, with the state paying travel expenses. In 1946, Henderson State Teachers College employed the first counselor trainer, and three other state-supported colleges had followed by 1951. A committee composed of the state supervisor of occupational information and guidance services and at least two counselor trainers spent two days in each school having a guidance program from January 1952 to December 1954. Although the committee's purpose was to evaluate the state's programs, perhaps the most important result was
that the visits provided in-service training for the staff, students, school board members, and parents. When the state department was reorganized in 1954, the state board withdrew its support for counselor training, and the program ended the following year. However, institutions that had employed counselors on a half-time basis continued to offer the courses in guidance counseling.

In 1958, in order to participate in Title V of NDEA, the State Department of Education made the guidance services independent of the vocational division. Since then, the director of guidance has added two supervisors to his staff—one to assist the elementary schools and the other to work with the secondary schools. By 1960, 91 of the 151 counselors serving in reimbursed guidance programs held master's degrees, 52 held bachelor's degrees, 69 had more than 15 hours (a semester) in guidance, 31 had 15 hours in guidance, and only 51 had less than 15 hours. Those not certified were allowed 1 year to meet the state's requirements. By 1966-67, there were 240 counselors.

When the state department was reorganized in 1966, this service area was placed in the instructional services division.

Budgets and Loans

In 1931, the peak of the Depression, the Legislature authorized all school districts to borrow money and issue negotiable coupon bonds for building and equipping school buildings, making additions and repairs, purchasing sites, and funding any indebtedness for these purposes. It further stipulated that no bonds should be issued that would make the total outstanding indebtedness of a district exceed 7 percent of the assessed valuation (36). This law required any district desiring to borrow money or issue bonds to furnish the commissioner of education a statement of the amount and the maturity of indebtedness, a description of the property to be mortgaged, a financial statement, and a certificate from the county clerk showing the assessed valuation of the district's real and personal property. The district was required to sell the bonds to the highest bidder (lowest rate of interest) at a public sale advertised in at least one of the county's newspapers. A 1953 law authorized the school districts to borrow money from the State Revolving Loan Fund and set up the procedures for securing such loans. The department processes all loans with the prior approval of the State Board of Education.

The budgets and loans division, founded by an act passed in 1949 (37), was required to make an annual report on the public schools' outstanding indebtedness, showing the nature of the debts and the borrowing power of each district. It also computes the legal 40 percent of local revenue (based on the assessed valuation and the millage voted in each district) retained by each school district. In the meantime, the local districts must publish their budget and tax rates, along with the required procedures for holding the annual school election. The division prepares the bulletins and forms each district must use for these purposes.

One of the division's primary responsibilities is to determine the amount of state aid to be distributed to each local school district. This minimum foundation program aid was based on the level of professional training of the teachers employed for the 1951-52 school year (38). The number of teachers was determined by dividing by 28 the average daily attendance for grades 1 through 6 for the 1950-51 year, and dividing by 24 the average daily attendance grades 7 through 12. One additional teacher was allowed for a total of the remainders above 14 but less than 33. Two teachers were allowed if the total of these remainders was 34 or more.

The laws of 1949 and 1951 established a schedule of teacher salaries based on the type of certificate multiplied by the number of teachers employed, but not exceeding the teacher units allowed. The schedule is as follows: emergency certificate issued on less than 30 semester hours, $1,050; certificates issued on 30 semester hours or more, $1,260; certificates issued on 60 semester hours or more, $1,470; certificates issued on 90 semester hours or more, $1,750; certificates issued on bachelor's degrees, $2,100; and certificates issued on master's degrees or higher, $2,540.

In 1957, the Legislature provided a new method for distributing state public school funds to the districts. The formula was now based on the weighted average daily attendance in a school district, the elementary schools being weighted from 1.0 to 1.5 and the secondary schools weighted from 1.2 to 1.7. The formula took into account the county ability index, which was based on two-sevenths of the county's proportion of the total sales tax return, two-sevenths of its proportion of the state's gainfully employed workers, and one-seventh times its proportion of the state's total assessed valuation of public utilities. The local school district's contribution was then determined by its ability index times the state's total contributions, one-third of the amount it received from the National Forest Reserve Fund, and one-third of its receipts from the severance tax.

Under this 1957 law, the state's contribution to the minimum foundation program was determined by the product of the state's total number of weighted average daily attendance units times $114, minus the local district's contribution. This amount could not be less than 165 percent of the minimum foundation program aid received the previous year nor more than 230 percent of it. The budgets and loans division processes all applications for minimum foundation law aid. Act 153 of 1955 has been responsible for reappraising all property (personal and real estate) and assessing it at 20 percent of its market value. A penalty is assessed against any school district whose county assessment ratio is less than 18 percent of true and market value.
The personnel of the budgets and loans division work on school district budgets and county board budgets, applications for state financial aid, state district audits, statistical reports, and fiscal planning and reporting. They do not budget school money, but check local budgets for compliance with various laws and act as a clearinghouse for local school district budgets. This enables the department to offer professional counseling services, but the division has no authority to plan or control school district budgets except that granted by the Legislature—these are the responsibility of the local school boards. Nor does the division issue funds to the local districts; it merely certifies to the Division of Disbursement and Accounting that certain funds should be allocated to the local school districts of the state.

As the General Assembly approved additional legislation requiring more statistics to be collected, the duties of the budgets and loans division expanded. In 1957, a school census law called for an enumeration every other year (Act 103 of 1967 amends Section 1 of Act 217 of 1957 to permit school districts to make an enumeration every 2 years or every 5 years at the option of each local board of education), the reports from the county school supervisor's office to be filed with the division and compiled into a state report. The Classroom Teacher Minimum Salary Law of 1957 placed additional responsibilities on the division. A 1965 act provided for a minimum beginning salary of $3,600 for a teacher with a bachelor's degree, and $4,000 for a teacher with a master's degree, with an increase of $400 per biennium for each.

When Congress passed NDEA in 1958, the State Department of Education created a statistical service subdivision to the budgets and loans division under Title X. The subdivision developed a complete new set of accounting forms for the local districts in compliance with the U.S. Office of Education's regulations. It has developed many other forms to conform with the requirements for electronic data processing. In fact, an evaluation program continuously determines what reports should be eliminated or revised.

The division performs an important service in providing consultative and technical assistance on financial accounting procedures to beginning superintendents and their staffs. The school audit division of the state comptroller's office is responsible for auditing the local school districts, but districts may employ approved certified public accounting firms to audit their accounts if they wish. In either case, the state department receives a copy of the audit, which is reviewed and analyzed by the budget and loans division (now the Division of Administrative Services). It then uses these audits as a basis for giving professional counsel in budget planning to the local school authorities. Practically all the districts use the services of the comptroller's school audit division, although 10 or 12 of the larger school districts use public accounting firms, primarily because they can make a more detailed breakdown of expenditures.

Disbursements and Accounting

The State Board of Education established a division of disbursements and accounting to centralize its payments. The division functions very much like a comptroller's office, accounting to the commissioner and the various federal and state agencies that audit the department's books. The commissioner of education is given the authority to designate one or more purchasing agents, the funds are allocated by the various divisions of the department, and the invoices are then submitted to the director. Thus, a system of checks and balances is maintained by the department before requisitions go to the comptroller's office for approval of expenditures or disbursements to local school districts.

The department classifies its moneys as cash funds, state-appropriated funds, and federal funds. The State Public School Fund, the largest of these, is used for administering the department of education, for audiovisual services, handicapped children services, textbooks, transportation aid, county board budgets, state apportionment, minimum foundation program aid, vocational education aid, vocational-technical schools, school lunch commodity distributions, vocational rehabilitation, the library commission, Social Security and state employees' retirement, and teacher retirement matching programs. All these purposes are defined by the legislative appropriations.

Previously, federal receipts were deposited in the state treasury and disbursed to local districts according to the state and federal laws and state plans. This procedure has now been replaced by the use of a letter of credit. The federal receipts include vocational education aid, NDEA aid, the Forest Reserve Fund, the Flood Control Fund, the Mineral Lease Fund, and public domain land sales. Beginning in 1965, they included funds from ESEA, Public Law 89-10. The 1966 reorganization changed the name of this division to the Division of Finance.

Instructional Materials

When an overwhelming majority of the people approved Initiated Act No. 1 in 1936, the state was obligated to furnish free textbooks to all public schools for grades 1 through 8. The department immediately created an instructional materials division to carry out this responsibility. From the beginning, the division did not have enough money to furnish free textbooks for each pupil. The director of the program had to secure the cooperation of local school administrators in collecting and redistributing usable textbooks that had been purchased previously by the pupils themselves.

The 1936 act did not provide specific procedures for purchasing and distributing free textbooks, but left this to
the discretion of the state board. In 1951, the Legislature established procedures for selecting, purchasing, and distributing the textbooks, but for the most part allowed the state board to administer the programs with its own regulations.

At its March quarterly meeting (39), the board calls for written bids from all publishers listed with the state department (40). The office of instructional materials examines these bids to see that the prices meet the regulations, and they are presented to the board at its June meeting. These bids and sample textbooks are referred to selecting committees composed of five teachers or supervisors of elementary subjects in which the adoption is to be made. The 1966 reorganization of the state department placed this service in the instructional services division.

The members of the selecting committees must have had 4 years of college training before they can be nominated by the commissioner. The board approves them at its June meeting for only one adoption. The selecting committees examine the samples of the textbooks and interview the publishers' representatives at a state hearing in Little Rock during the latter part of August. At this time, the committees decide on the series of books—a minimum of four or a maximum of six series—that will be recommended to the State Board of Education. The law directs that the board must execute contracts with all publishers recommended by the selecting committees.

The local schools make adoptions only in basal subjects. Local selecting committees composed of three teachers or supervisors in the elementary grades are appointed by local administrators subject to the approval of the local boards of directors. These local selecting committees have until December 20 to adopt textbooks from the state's multiple list. On the other hand, there are no state adoption of high school textbooks or regulations governing adoption or prices. The superintendents and their boards of education have full authority to adopt high school textbooks whenever they need to do so.

The 1951 Arkansas Textbook Law requires publishers having state contracts to maintain a depository in Little Rock at their own expense. The state owns no textbooks in the depository; it purchases textbooks only on requisitions from schools.

The textbook budget depends on the average number of pupils reported annually by the county school supervisors. Approximately $35,000 is deducted from the total textbook appropriation to take care of emergency budgets and office expense. The balance is then divided by the total average number of pupils to determine the per-capita allotment. In general, there has been little modification of these procedures in selecting, purchasing, and distributing free textbooks since the beginning of the program.

Act 334 of 1967 permits the state to provide free textbooks in all basic subjects for pupils attending public schools of this state in grades 9 through 12, as funds are available therefor—as determined by the State Board of Education.

The state initiated an audiovisual program in July 1947 with funds the Legislature appropriated to the department's vocational education division. The division operated on a small budget for 2 years, but in 1949 the Legislature appropriated $150,000 to the program as a line item in the public school fund budget. Subsequent appropriations have varied, however, dropping to a low of $60,000 in 1961.

In 1949, a series of film libraries were set up in the eight state-supported colleges and the University of Arkansas, primarily for teacher education. Although this program was discontinued in 1953, 6 years later the board authorized the establishment of five county film or filmstrip centers. These centers were located in the offices of the county school supervisor. If proven valuable, the centers were to be increased to meet the needs of the entire state.

Thus far, the film experimental centers have failed, mainly because of a lack of funds at both the state and county levels. Several centers have continued to operate on funds available through Title III of NDEA. The audiovisual program is now operating on a state appropriation of $80,000, supplemented by funds from Title III to provide a total of approximately $140,000 annually.

Research indicates that students show a 55 percent increase in learning when audiovisual materials are properly used in the instructional program (41). Since the success of the program depends in a large measure on the teacher's judgment in wisely selecting materials, the state department attempts to encourage wise selection among the schools.

Educational Television

In 1961, the Legislature created an agency known as the Arkansas Educational Television Commission, composed of seven members appointed by the Governor with the consent of the Senate. This commission attempts to help educators and laymen understand the benefits of educational television (ETV) and promote its use. It is responsible for surveying, studying, and appraising the need for an overall plan for using TV facilities available for noncommercial use. It also is charged with controlling and supervising the channels reserved by the Federal Communications Commission to Arkansas for noncommercial educational use.

The Legislature reorganized the Educational Television Commission in 1963 and increased its membership to eight. A station was opened at Conway after Arkansas State Teachers College gave the commission a 99-year lease on a 3-acre site and the Conway Chamber of Commerce donated $61,000. The commission is now operating on a full-time basis, licensed by the FCC, with a director and 30 full-time employees. Act 5 of 1967 changed the name of Arkansas State Teachers College to State College of Arkansas.
ETV in Arkansas is still in its infancy, but the department is considering plans for expansion. A survey completed by Jansky and Bailey, a division of the Atlantic Research Corporation in Washington, D.C., found that it will take at least four additional ETV stations, plus several translators, to completely cover the state. Three additional production studios will be necessary in addition to the one now located at Conway. The transmitter at Bay with the production studio at Jonesboro will reach the northeast part of the state as well as part of Missouri.

A director of instructional materials coordinates the activities of the Educational Television Commission with the department's instructional programs. In this capacity he is a liaison among the ETV Commission, the State Department of Education, and the local school districts.

School Plant

The 1931 General Assembly made the State Department of Education responsible for school plant services. A section of the Arkansas laws, as recodified in 1957, states:

The Board shall have general supervision of the schools of the state; prepare and distribute plans and specifications for the construction and equipment of school buildings, and approve plans and expenditures of public school funds for all new school buildings; ... take such other action as it may deem necessary to promote the physical welfare of school children and promote the organization and increase the efficiency of the Public Schools of the state; ... (42).

Given this authority, the state board established the Division of School Plant Services.

At the request of local school authorities, the division makes local school building surveys and studies enrollment trends and the development of long-range housing programs. These studies and surveys are always made in cooperation with other department sections that might be concerned, such as the instructional services, accounting disbursements, and budgets and loans divisions, and the school lunch services. The plans and specifications for all local school buildings are reviewed cooperatively to assist the local schools and architectural firms to secure the most desirable facilities for the money spent. When the State Department of Education was reorganized in 1966, this area of service was placed in the administrative services division.

The division also organizes and conducts, in cooperation with other agencies, workshops on the proper care and maintenance of school facilities for local school plant personnel.

Transportation

The Arkansas General Assembly gave the school districts the legal authority to provide transportation in 1919.

In 1927, the General Assembly ordered the State Board of Education to develop a formula for distributing state aid for school transportation based on the number of pupils transported, the number and size of school buses, and the size of the school district. The Division of School Plant Services was also given responsibility for seeing that all the safety laws and regulations pertaining to the standards are enforced. This division passes on all applications for transportation aid; conducts training programs for local personnel, drivers, and mechanics; and supervises the annual school bus inspection. It also assists the local schools in purchasing buses, setting up routes, and establishing safety programs.

The reorganization of the State Department of Education placed pupil transportation service in the administrative services division.

Surplus Property

In 1949, the Eighty-First Congress passed Public Law 152, the Federal Property and Administrative Services Act, making available certain federal properties to eligible health, educational, and Civil Defense units. The Arkansas General Assembly passed an act in 1951 placing full responsibility on the State Board of Education for handling the properties. The board has distributed this surplus property to 700 claimants. The average cost of these properties to the federal government was over $2 million per year, while the average cost to the receiving units has been approximately 6.8 percent of this original cost, including moving, storing, and securing them.

The state department's disbursing officer handles the physical aspects of this surplus property program. All accounts are subject to audit by the State Legislative Audit Committees and by appropriate federal authorities.

The administration of the surplus property program was placed in the finance division when the state department was reorganized in 1966.

EDUCATION IN THE STATES: HISTORICAL DEVELOPMENT AND OUTLOOK
Federally Affected Areas

Congress passed Public Law 815 in 1950 providing for construction assistance to local school districts that experience a 3.5-percent non-federal increase per year in the number of children in their schools where the number of federally connected children is equal to 5 percent or more of the total school enrollment. The amount of funds varies in accordance with the average state cost of school facilities. The amount allowed is established for each child whose parents both work and live on federal property; one-half of this amount is allowed per child whose parents live off but work on federal property.

Public Law 874, also passed in 1950, provides assistance to school districts where federally connected students account for at least 3 percent of the total average daily attendance. Payments under this program vary from an established amount per child for those whose parents both live and work on federal property to one-half that amount per child for those whose parents live off but work on federally owned property.

Under these laws the federal government makes payments directly to the school districts concerned, but applications for this aid must be reviewed, processed, and approved by the State Department of Education. The Arkansas schools have received an average of approximately $1 million per year in maintenance and operating aid under Public Law 874 since 1950, and a total of approximately $13 million in construction aid during this same period.

This service has been in the Division of Administrative Services since the state department reorganization in 1966.

Fire Safety

In 1948, the State Department of Education joined with other agencies concerned with school safety to start a junior fire marshall training program. In 1959, the General Assembly made a fire prevention program mandatory in every school district in the state. The department was given full responsibility to see that the necessary checks are maintained. The junior fire marshall program is being expanded so as to include every local school district. The program, under the provisions of Act 61 of 1959, is being expanded to make full participation by every school district mandatory. State board policies implementing this act place the full responsibility for compliance upon the local superintendents, with the penalty of a forfeit of state aid if a satisfactory monthly report showing full compliance is not received.

This program is a cooperative program which includes many agencies of the state (44).

SUMMARY

The Arkansas public schools have made notable progress since 1900. At the beginning of the twentieth century the state had very few public high schools. From 1900 to 1925 the department's major tasks were founding and developing good elementary schools and high schools; but since 1925 there has been a marked trend for all communities to look on the public schools as a unitary system including grades 1 through 12. Some of the improvements in the public school programs are as follows (45):

1. At the beginning of the century, there were 4,903 school districts; these have been reduced to 395 in 1967.
2. School buses and public transportation of pupils to school centers were practically unknown in 1900. Now, almost every school district in the state provides free bus transportation.
3. In 1900, most school districts did not envisage serving school lunches. Now, nearly all school systems have well-equipped lunchrooms and employ staffs to prepare hot lunches as well as to administer a special milk program for the students.
4. At the turn of the century, public school buildings and equipment were crude and very poorly adapted. During recent years the people have spent millions of dollars building school plants and installing equipment that compare favorably with the best in the nation.
5. The instructional program has been greatly enriched to meet the needs of the students. There are marked improvements in library facilities, better textbooks, and free textbooks for the first eight grades. Radio, television, recordings, and an array of other audiovisual aids are also available. On the secondary level the offerings have been expanded to include vocational agriculture, home economics, business education, shop, industrial arts, mechanics or trade training, training for sales service jobs, and guidance and counseling.
6. In music, the school programs include band, orchestra, public school music, choral work, and music appreciation. While little was done in public school art in 1900, today it is considered an integral part of the elementary and secondary curriculum. Physical education, virtually unknown in 1900, is now a state requirement. The State Department of Education provides two supervising specialists in this area.
7. In 1900, no school district was permitted to vote a levy in excess of 5 mills for public school support. The limit was set at 18 mills in 1926, and in 1949 the ceiling was removed, so that each district may vote whatever levy it needs to maintain a satisfactory program. At present, a school district must levy a minimum of 18 mills to qualify for state minimum foundation program aid and transportation aid. At least one school district levies only 18
mills and at least one levies 60 mills. The average for the state is 42.8 mills.

8. In 1900, the total assessed valuation of the state was $201,908,783; in 1966, it was $1,802,265,097.

9. The average length of the school term has increased from 69 days in 1900 to 175 days in 1965. A minimum term of 9 months for all children was attained by all districts for the first time in the 1958-59 school year and has been maintained ever since.

10. The number of classroom teachers has increased from 6,959 in 1900 to 19,098 in 1967-68; the average salary for the classroom teacher has increased from $166 to $5,580 during this same period.

11. In 1900, the amount of state revenue for public elementary and secondary programs was $446,558, compared to $96,142,955 in 1967-68; the amount of local revenue for all the public schools was $988,089, compared to $77,907,604 in 1967-68.

12. The total current expenditure by the local school districts in 1967-68 amounted to $157,527,154 compared to $1,124,497 in 1900; this represented an average expenditure per pupil of $441 compared to $6 in 1900.

Looking Ahead

The State Department of Education is in a process of self-analysis and adjustment as a result of recent developments, including the expanding role of the federal government. There are an increasing emphasis on programs for the disadvantaged and community junior colleges, plans for establishment of a kindergarten program, and an ever-increasing demand for vocational-technical schools. There is also an intense interest in experimental and innovative programs in the local schools. These developments, coupled with the department's efforts to improve its internal operations, have created new complexities, but at the same time have begun to point in new directions.

The state's educational advancement continues to be characterized by cooperation between local school personnel and department staff members. The ultimate results will be measured in terms of how they affect the work and achievement of the teachers and pupils. Progress is being made in developing an adequate educational data-processing system, which, when fully implemented, should provide valid and timely data on professional staff, pupils, curriculums, facilities, and finance.

The department must develop various decision-making mechanisms and ways of analyzing problems to keep abreast with rapid advancements in almost all aspects of life. The challenges of poverty and totalitarianism, and the difficult, complex, and courageous decisions necessary for urban and rural development must be dealt with if the department is to promote education toward the moral and humanistic values that are fundamental to democracy and freedom. The state's and the nation's greatness, their near greatness, or their mediocrity will depend upon how well the Department of Education meets these challenges.

FOOTNOTES

1. For more information on these early schools, see O. E. McKnight and Boyd W. Johnson, The Arkansas Story (Oklahoma City: Harlow Publishing Corp., 1956), p. 144.
4. The changes in the title of county common school officials are as follows:
   1853-68 Common school commissioner
   1868-73 Circuit superintendent
   1873-75 County superintendent
   1875-1907 County examiner
   1907-19 Optional country superintendent and county examiner
   1919-33 County superintendent
   1933-41 County examiner
   1941 to date County school supervisor
5. McKnight and Johnson, op. cit. p. 236.
9. Ibid., pp. 11-12.
13. Howard A. Dawson was the director of the division of research and surveys.
15. This was evident by the fact that the present commissioner, A. W. Ford, has served continuously since 1953.
16. The Legislature appropriated $74,650,000 from this fund for the public schools in the 1965-66 school year.

17. This tax on sand and gravel is still in effect, but it produces less than $14,000 annually.

20. The number of school districts dropped from 1,600 in 1948 to 423 in 1949, the first year Initiated Act No. 1 went into effect, and to 410 in 1965.

22. Ibid., p. 121.

24. A 1943 act requires members of the teacher retirement system to automatically retire on July 1 following their seventy-second birthday.

25. Ed McCuiston was the chairman of the subcommittee and the assistant commissioner for instructional services.

27. These adult courses do not include commercial and vocational subjects.

28. Approximately two-thirds of the applicants passed the test.

29. Hill is still a resident of Little Rock, Arkansas.

30. J. B. Ewart, the local teacher who helped organize the club, later served as the supervisor of vocational agriculture in the State Department of Education.

31. Virginia received the first.

32. J. W. Hull, now president of Arkansas Polytechnic College at Russellville, was the local teacher.

33. All but four were administered by the area vocational-technical schools.

34. The term vocational has been deleted from the Arkansas law. It is still a part of the federal law, but the term is interpreted to include mental deficiencies and maladjustments of various kinds. Such an interpretation has vastly broadened the scope of the agency.

36. This has been raised to 15 percent at present.

37. The budgets and loans division was a part of the school finance division from 1949 until 1954, when Commissioner A. W. Ford reorganized the department.

38. The type of valid certification held by these teachers on September 1, 1951, was recorded in the certification division.

39. The state board meets the second Monday of March each year.

40. The contracts expire July 1 of the following year. A request for bids is issued approximately 15 months prior to the expiration of the contracts, and publishers are given until May 15 to file bids.

43. These figures are from the transportation division's records.

44. This program is a cooperative program including the following agencies: Office of the Governor, State Department of Education, Fire Marshall's Division, State Police Department, Fire Prevention Division, Arkansas Inspection and Rating Bureau, Arkansas State Fire Prevention Association, Boiler Safety, Inspection Division, State Department of Labor, State Firemen's Association, Arkansas Association of Insurance Agents, Arkansas Fire Chiefs' Association, and Arkansas Junior Chamber of Commerce.

APPENDIX A—CALIFORNIA CHIEF STATE SCHOOL OFFICERS 141

APPENDIX B—ORGANIZATION CHART 142
INTRODUCTION

The California State Department of Education is the agency through which the public school system—except the state university, the junior colleges, and the state colleges—is regulated and controlled at the state level as required by law. The department is governed by the State Board of Education whose 10 members are appointed by the Governor to serve 4-year terms. It is administered by the superintendent of public instruction, elected for a 4-year term, who acts as director of education. The department is located in Sacramento, but maintains an office in Los Angeles which provides services required by the public schools in the southern part of the state.

The superintendent of public instruction is assisted by a cabinet composed of two deputy superintendents, two associate superintendents, one assistant superintendent, and one director. Each member of his cabinet also serves as the chief administrative officer of a division or office of the department. And each of these divisions or offices provides certain services required for the department to carry out the provisions of legislation pertaining to the public schools, to further educational policies and regulations of the State Board of Education, and to provide the educational guidance and leadership needed to keep the public school education program modern, functioning as necessary to meet existing needs, and geared to meet new needs promptly and effectively.

The State Department of Education was established in 1921. However, the public school system and a state officer to supervise the schools were provided for in the state's first Constitution of 1849. For many years no very large or complex system of state administration for public schools was needed. But since 1921, rapid growth and change have brought increasingly heavy and diverse responsibilities upon the department.

As in all states, the administration of education at the state level has been under pressures other than population growth and shifting urban-rural patterns. The Depression, two world wars, and the expanding role of the United States in international affairs have brought about substantial changes. The influence of educational leaders with vision and purpose has had impact. Professional personnel in the State Department of Education have fostered progress in particular fields. Federal planning and assistance have materially influenced state educational agencies.

In response to these many pressures and influences on education, many commissions have been appointed over the years by the Legislature, by the department, and by educational organizations to assess the operation of the public school system and the State Department of Education. Certain studies made by these groups brought about significant changes in the organization of the state's educational administration. These studies can be used as dividing lines for the chronicle that follows.

THE DEPARTMENT OF PUBLIC INSTRUCTION

BEFORE 1921

A trend toward centralized responsibility for education at the state level characterized legislation in California from the beginning. This trend was reversed abruptly, but not for long, when the second state constitution, adopted in 1879, returned to school district governing boards such duties as selection of textbooks and certification of teachers, previously performed by the state agency. But an amendment in 1884 established the first constitutional State Board of Education and began another movement for increased state responsibility. This tendency toward central control agreed with the thinking of progressive educators throughout the nation. Efforts in this direction culminated in the establishment in 1921 of a State Department of Education to perform the many functions that had previously been assigned by the Legislature and by the State Board of Education to the superintendent of public instruction and his staff.

Early Legal Provisions for Education

Neither Spain nor Mexico provided public schools in California, although scattered attempts had been made to educate Indian children in the missions, and a few short-lived private and parochial schools were established. The first American settlers, therefore, were confronted with many of the same school problems their fellow citizens
faced in wilderness territories elsewhere in America. In 1849 the writers of California's first constitution provided for a superintendent of public instruction, so that school districts could be organized, school trustees elected, schoolhouses built, and teachers hired. The superintendent was to be elected for a term of 3 years and was directed to be head of the state school system.

The first state constitution also provided for state school support. The second section of the article on education reads as follows:

The Legislature shall encourage, by all suitable means, the promotion of intellectual, scientific, moral, and agricultural improvement. The proceeds of all land that may be granted by the United States to this State for the support of schools, which may be sold or disposed of, and the five hundred thousand acres of land granted to the new States, under an act of Congress, distributing the proceeds to the public lands among the several States of the Union, approved A.D. 1841; and all estates of deceased persons who may have died without leaving a will, or heir; and also such per cent, as may be granted by Congress on the sale of lands in this State, shall be and remain a perpetual fund, the interest of which, together with all the rents of the unsold lands, and such other means as the Legislature may provide, shall be inviolably appropriated to the support of common schools throughout the state (1).

Another section established and safeguarded a permanent fund for the support of a state university and its branches. However, the University of California was not established until 1868.

Despite these constitutional provisions, the first session of the Legislature refused to provide for free public schools. John Swett, fourth state superintendent of public instruction and historian of the school system, reports that—

Near the close of the first session of the Legislature, 1849-50, Mr. Corey, from the Committee on Education, reported that the taxes laid on the people for State, county, and municipal purposes were so heavy the committee did not consider it advisable to report a bill to tax the people still further for the support of public schools, and accordingly, the school bill, of which no record remains, was indefinitely postponed. While the school bill, thus defeated, has been forgotten, the reason advanced by Mr. [Assemblyman Benjamin] Corey has been the standing argument against every school bill which has contained any provision for maintaining by taxation a system of public schools (2).

In 1852 the Legislature adopted the first real school law. It reenacted provisions of 1851 for the organization of school districts to be governed by three trustees and created a State Board of Education to consist of the Governor, the superintendent of public instruction, and the surveyor general.

As John Swett tells us,

The Surveyor General was included because the law originally proposed to entrust the board with the sales of school lands. This, however, was not done; and the state board remained . . . without powers or duties, except to apportion, annually the state school moneys (3).

First Superintendents of Public Instruction

The first two men elected as superintendent of public instruction, John Marvin (1851-53) and Paul K. Hubbs (1854-56), were lawyers. Besides being unfamiliar with teaching, both had to cope with an apathetic public and legislature. Nevertheless, both men took their responsibilities seriously and helped establish the basis for a school system. Interest on the meager State School Fund was distributed to counties on the basis of the "census child"—that is, the number of children between the ages of 5 and 17 living in the county. Half a century passed before the basis for apportionment changed to average daily attendance. A law of 1855 stipulated that the state money was to be used exclusively for teachers' salaries.

Andrew J. Moulder, third superintendent of public instruction, had been a teacher. He took an aggressive stand during his two terms of office (1857-62) for better public support of the schools. In his annual report of 1858, he declared that three-fourths of the children in the state were not in school and that if the Legislature failed to take instant and effective means to remedy the situation, these children would "grow up into 29,347 benighted men and women; a number nearly sufficient, at ordinary times, to control the vote of the State, and, in consequence, to shape its legislation and destiny!" (4).

Progressive legislation passed during Moulder's terms of office provided for an increase in county school taxes. The superintendent of public instruction was authorized to hold an annual state teachers convention, and $3,000 was appropriated for that purpose. He was authorized to appoint a State Board of Examination, to grant state teachers' certificates. The State Board of Education was authorized to adopt series of textbooks and to compel their adoption. A law was passed by which nearly 200,000 acres of school land were sold and the proceeds applied to the State School Fund. A state normal school was provided for; the members of the State Board of Education were to be members of the new Board of Trustees for the Normal School of the State of California. In 1860 the Legislature established a school for the education of indigent deaf, dumb, and blind children in San Francisco. In 1865, that body appropriated funds to educate blind children and established a combined school for the deaf and blind in Berkeley.
John Swett was the most outstanding and colorful superintendent of public instruction to serve before 1900. Having taught in a "shanty" school in San Francisco, he was warmly enthusiastic about free public education. Many of the schools were not "free" when he took office; parents customarily paid tuition. Facilities were very poor, supplies were inadequate, and teachers' salaries were pitifully small. During his tenure (1863-67) John Swett substantially increased state support. In his report for 1866-67, he stated that—

The school year ending June 30, 1867, marks the transition period of California from rate bill common schools to an American free school system.

For the first time in the history of the State, every public school was made entirely free for every child to enter.

One objective sought by Superintendent Swett was raising standards of professional teaching. He advocated the use of county funds to enable teachers to attend institutes. He saw that the professional journal, the California Teacher, was distributed to school trustees and school libraries. He was partially responsible for legislation that provided for life diplomas to teachers, recognized normal diplomas of other states, and required that city, county, and state boards of examination should be composed of professional teachers. Through the teachers institutions and other professional contacts, Swett widely influenced educational thought and progress in California.

Known as the "father of the state school system," Swett built the permanent structure of California's free public school system. By the end of his term, he had won his objectives: free schools for California's children, school funds to meet the greatest need, and examination and certification of teachers by teachers alone.

Each superintendent served with but one clerk until 1875, when a deputy was authorized. In 1890 the staff consisted of the superintendent, a deputy, a statistical clerk, a textbook editor, a textbook clerk, and a porter. With no more assistance than this, the superintendent supervised the schools and several educational agencies, state asylums, and orphanages; prepared forms for school records and gathered information and statistics on public education; apportioned state school funds; made biennial reports to the Governor; and published the school laws. He also attended educators conventions and made addresses at county institutes. As executive officer of the State Board of Education, he carried out the board's policies in regard to textbooks, teacher certification, and investigation of teacher-training institutions.

First State Boards of Education

From 1852 to 1864 the state board consisted of the Governor, the superintendent of public instruction, and the surveyor general. In 1864 the board was changed to include the superintendents of schools of San Francisco, Sacramento, and San Joaquin counties; the surveyor general was dropped. The board was given authority in the same year to adopt textbooks, require a uniform course of study, and make regulations for the schools. In 1866, on the recommendation of John Swett, the Legislature enlarged the State Board of Education to nine—adding the principal of the state normal school, the Santa Clara county superintendent of schools, and two teachers nominated by the state superintendent. The board also was authorized to provide a list of books for school libraries, make regulations for teachers examinations, and grant life diplomas. In 1870 the superintendents of schools of Alameda and Sonoma counties were added; in 1872 the two teachers were omitted.

In 1879, the delegates at a new constitutional convention felt that the danger of graft and corruption was too great regarding attempts to influence the State Board of Education's selection of textbooks and to wrest information from the State Board of Examination. They wanted to shift responsibility from the state to the local level. The second constitution, adopted that year, permitted the county boards of education to select textbooks, certify teachers, prescribe courses of study, and make regulations for the schools. It made no mention of the Board of Education or the Board of Examination.

In 1880 the sections of the Political Code concerning the State Board of Examination were repealed, and that board passed out of existence. The State Board of Education, stripped of most of its powers because of the constitutional shifts, was continued by the amended code; but its membership was reduced to the Governor, the state superintendent of instruction, and the principal of the state normal school. As new normal schools in the state were established, their principals became board members.

The tide turned in 1884, when the State Board of Education was written into the constitution by an amendment. The board's chief duty was to provide textbooks. The system of each county adopting its own had proved inefficient and expensive and was disliked both by the teachers and by the public. The board was therefore given authority "to compile, or cause to be compiled" a uniform series of textbooks, to have them printed at the State Printing Office, and to distribute and sell them at cost. In 1894, another amendment to the constitution added to the board's membership the president and the professor of pedagogy at the University of California.

Until 1912, the State Board of Education was a professional advisory council to the superintendent of public instruction. But instead of advising on general policies, selecting professionals, approving expenditures, and authorizing new programs, the board concerned itself with work that could have been entrusted to professional employees, such as revision and management of the state
textbook series. It also issued state diplomas to graduates of normal schools and life diplomas to teachers.

Educators of the time favored a board composed wholly of laymen, rather than a board of professional educators and officeholders. In 1913, Ellwood P. Cubberley, writing for the *Cyclopedia of Education*, said:

The tendency of legislation, and particularly of the recommendations of the many recent state educational commissions, has been clearly toward the creation of a state board of education, with some powers of supervision and control, and the assignment to this body of the appointment of its expert executive officers. . . . There should be a State Board of Education, neither too large nor too small, composed of citizens of the state, and appointed by the Governor, for reasonably long terms. A board of seven or nine is both small and large enough, and the terms should be arranged so that but one new appointment is to be made each year (6).

In November 1912, another constitutional amendment abolished the ex officio professional State Board of Education and instructed the Legislature to provide for the appointment or election of a State Board of Education. Accordingly, the Legislature of 1913 provided that the Governor should appoint a state board of seven members, none of whom should be actively engaged in educational work. The term of office was to be 4 years, since a section of the constitution prohibited the longer term favored by experts. Because the members of this new board had terms of the same length as the Governor’s and because they were appointed by the Governor without any check whatever, it became possible from this time on for the Governor to regard the State Board of Education as he might regard any other executive commission. This made possible the reflection in the state school system of the political attitudes of the Governor’s office.

The potential for conflict between the elected superintendent of public instruction and the appointed Board of Education was recognized at the time, but no effort was made to clarify the position of the superintendent. On the one hand, he was charged with carrying out the policies of the board; on the other, he was responsible to the people who elected him. The difficulty of requiring a policy-making board to have its policies carried out by and through an individual elected by the people has been pointed out again and again, but the system has never been changed.

Commissioners of Education

The 1913 Legislature empowered the State Board of Education to employ three commissioners—one for elementary schools, one for secondary schools, and one for vocational education—responsible directly to the board. The first meeting of the board was held in September 1913; after considering many candidates, it appointed the three.

Each commissioner was required to submit a biennial report. Much of each officer’s time was occupied with visiting schools, preparing recommendations to legislative committees on education and to the state board, making public addresses, attending educators conferences, and working with other state agencies.

The first commissioners of elementary schools were women. Margaret Schallenberger, long interested in rural education, served from 1913 until 1922. Mrs. Grace Chandler Stanley succeeded her. When Mrs. Stanley resigned in 1925, she was followed by Mamie B. Lang, who died shortly afterward. Helen Heffernan served in this position until 1927, when she became chief of the department’s rural education division. Duties assigned to the commissioner of elementary schools were outlined in the Political Code: to visit the elementary day and evening schools and investigate the course of study; to enforce the use of the state textbooks; to make recommendations to the State Board of Education; and to perform any other duties assigned by the superintendent of public instruction, under the direction of the board.

The first commissioner of secondary schools was Will C. Wood, an educator well known for his interest in the state high schools. His first report to the State Board of Education states very well the principal basis for the creation of such a commission:

The office was created in order that the state department might undertake a closer supervision of the secondary schools, which have increased in number until they have reached a total of two hundred and fifty-seven. When the constitution of 1879 was adopted, provision was made for the Superintendent of Public Instruction and the various county superintendents of schools. At that time the high school was not fully recognized as an integral part of the state school system. There were a few public institutions of secondary grade, but these were supported entirely by district taxation. Owing to the fact that they were locally supported, the inspection of high schools by county superintendents was only casual and perfunctory. Since that time the growth of the elementary schools has been so great that the county superintendent has been kept busy supervising the work of the grades (7).

Wood was interested also in the rapidly growing junior college movement. A 1911 act of the Legislature enabled school boards to prescribe postgraduate courses of study approximating the studies that had been prescribed for the first 2 years of university courses. By March 1914, public junior colleges had been established in nine cities with an enrollment of 722 students. Including those students taking postgraduate courses in high schools, the total was 1,331.
Edwin Snyder, the first commissioner of industrial and vocational education, had to define his own duties. One of his first acts was to make a statistical survey of manual, domestic, and vocational arts in the public schools of the state. And then the Smith-Hughes Act, providing federal funds to support vocational education, was passed in 1917. At once state legislation was passed designating the State Board of Education as the Board of Vocational Education required by the federal act and providing for apportionments to school districts by the state so that they could participate in the federal program.

The Smith-Hughes Act and the beginning of World War I stimulated much interest in industrial and vocational education. Hundreds of new classes were added, teacher training in vocational fields increased in colleges and normal schools, and many part-time and cooperative plans were set up in California schools. The commissioner of industrial and vocational education's office was reorganized, and three supervisors were added—one for agricultural instruction, one for teacher-training courses in home economics, and one for trade and industrial instruction.

The Staff and Increasing Responsibilities

From an early date the superintendent of public instruction and the State Board of Education had referred to the "Department of Public Instruction," though in fact no such department existed. Increasing responsibilities and activities of the superintendent, commissioners, and other members of the educational staff, however, called for some type of state-level organization to handle the state's educational business. A few developments of this period deserve brief mention.

Certification and Retirement of Teachers. In 1913, a new state-controlled system of retirement salaries for teachers was set up, and the State Board of Education constituted the Teachers' Retirement Salary Fund Board. Certification of teachers tended to become once again centralized in the state agency. In 1917, the state board was authorized by the Legislature to establish a Commission of Credentials, consisting of three commissioners of education, who were to consider applications for regular and special credentials and arrange for examinations of candidates.

Development of Normal Schools. The San Jose Normal School was the first state educational institution to be established in California. Opened as a normal school in San Francisco in 1862, it was moved to San Jose in 1871. Following the adoption of the 1879 Constitution, other normal schools were opened throughout the state: in Chico (1889), San Diego (1898), San Francisco (1899), Santa Barbara (1909), Fresno (1911), and Arcata (Humboldt Normal School, 1914). A branch of the San Jose Normal School established in Los Angeles in 1882 became the Los Angeles Normal School in 1887, which operated as an independent normal school until 1919 when it became the southern branch of the University of California. In 1921 the Legislature changed the state normal schools to state teachers colleges and centralized their control, formerly under local boards of trustees, under the state board and the state director of education.

Beginning of the Polytechnic School. Before the turn of the century, sentiment had been growing among educators for a school, state-sponsored if necessary, that would train young people for trades, industries, agriculture, and other occupations. In 1901, the Legislature provided for the establishment of a polytechnic school, and in 1903, the California Polytechnic School was opened at San Luis Obispo.

Early Publications. One of the superintendent of public instruction's duties was to supply school districts with the necessary books, forms, and report sheets. As time went on, more publications were added, including the biennial reports of the superintendent, the commissioners, and the state board. The California Teacher, published by the Department of Public Instruction, appeared from 1863 to 1876. This was followed by the Pacific School and Home Journal, described as an "Organ of the Department of Instruction," published from 1877 to 1883. Other journals followed, sometimes functioning as official publications of the department and at other times as private ventures. Edward Hyatt, superintendent of public instruction from 1907 to 1918, issued small pamphlets called "Blue Bulletins"; these were circulated to school people at irregular intervals from 1911 to 1914. From 1915 to 1921 the California Blue Bulletin was issued quarterly; it was edited by the superintendent of public instruction and the three commissioners of education and was sent to teachers, school clerks, superintendents, and others.

Staff Leadership and Development. Edward Hyatt, who served as state superintendent from 1907 to 1918, was greatly concerned with the schools under his care and how they could be best served. An unusual facet of Hyatt's tenure was that he was constantly traveling up and down the state on friendly visits to principals, teachers, and students.

In 1917, a State Board of Education office was established in Los Angeles. In the same year California became the second state in the Union to establish state supervision of physical education and the seventh to make physical education compulsory. In the spring of 1920, three assistant supervisors of physical education were employed by the board.

In 1918, Will C. Wood, having served as commissioner of secondary schools for 5 years, was elected state superintendent of public instruction. His practical experience stood him well. He formed an unofficial body known as
the cabinet, consisting of himself and the three commissioners. He also reorganized the entire staff (that is, the employees of the board) to prevent overlapping of functions and duplication of efforts. In 1920, he secured the cooperation of the state commissioner of immigration and housing to supply the services of an assistant superintendent of public instruction in charge of Americanization. Similarly, when he needed a school attendance agent and funds were short, he arranged to have the Industrial Welfare Commission pay half the salary for the attendance officer. Because of Wood's tireless efforts, the Department of Education began to operate as a unified organization.

Vigorous leadership by Superintendent Wood, activities of the war years, and rapid growth of the state and its schools focused increasing attention on problems of public education in California. In 1919, the Legislature provided, by means of Senate Concurrent Resolution No. 21, for a legislative investigation of the problem of meeting the needs and furnishing support for the state schools and educational institutions.

THE JONES REPORT AND THE DEPARTMENT OF EDUCATION, 1921-27

On the basis of the 1919 legislation, the Special Legislative Committee on Education held meetings on California education. Every effort was made to have representatives of taxpayers associations, labor union personnel, laymen, and people directly interested in public education attend these meetings. The final report was drafted by Ellwood P. Cubberley, dean of the School of Education, Stanford University, and published by the Legislature in 1920 as the Report of the Special Legislative Committee on Education; it was referred to as the Jones Report because of the chairmanship of Senator Herbert C. Jones. Particularly pertinent here are the views of the committee on "State Educational Organization," Chapter I of the report.

The report criticized the vulnerable "doubleheaded" system, uncorrected in 1913 when a lay board of education succeeded the ex officio professional board. Any breach between the superintendent and the board could cripple the work of both. The report recommended that the present California educational organization be superseded at the earliest opportunity by a more rational form of state educational organization (9).

As evidence of a lack of logical, efficiently planned organization in the state agency, the report enumerated a number of "more or less unrelated boards, commissions, and other agencies having charge of some part of the educational work of the state" (10). In supervision and control, educational work was scattered among 23 boards and commissions, with a membership of about 160 persons; these agencies acted with little or no relation to one another.

Reasons for such a lack of sensible organization were found in the long-standing principle of decentralization and in the old pre-1913 State Board of Education, composed of busy men, hardly able to organize an educational department.

Committee Recommendations on Organization

The committee recommended, first, a constitutional amendment to abolish the election of a superintendent of public instruction and provide, rather, for the State Board of Education to appoint a commissioner of education to act as the chief executive officer of the board.

Second, the committee recommended that educational functions being exercised elsewhere should gradually be reassigned to the new State Department of Education.

The committee listed 16 divisions to be included in the new Department of Education. Seven already existed, while nine either would be considered new divisions or would be the result of transferring responsibilities and defining new functions. Those in operation were: (1) a business division—to keep books and records, make purchases, pay bills, apportion school funds, and act as secretary to the State Board of Education; (2) a publication, information, and statistical division—to collect statistics, prepare forms and registers, prepare the biennial report and other publications, and answer public inquiries; (3) an examining, certificating, and pensioning division—to have charge of examinations for teacher certification (such certification to be a uniform state function); (4) a vocational education division—to add to its duties supervision of the California Polytechnic School and the State Nautical School, and to include, possibly, a new rehabilitation division; (5) a secondary education division—to take over from the University of California the inspection and accrediting of high schools and to supervise junior colleges; (6) an elementary education division—to supervise elementary schools, including kindergartens; and (7) a health and physical welfare division—to take on the duties of supervising health instruction and making studies of the health, physical welfare, nutrition, and abnormalities of schoolchildren.

The additional nine divisions and their duties were suggested as follows:

1. A legal division, headed by an attorney well versed in school law, to edit and publish a school code, advise the Legislature as to needed legislation, and interpret school laws.

2. A research division to act as a center for the dissemination of educational information and supply or sell educational tests and scales.

3. A teacher-training division to supervise the teacher-training work in all state institutions and possibly for a time combined with the examining, certificating, and pensioning division.
4. A buildings and sanitation division to study the needs and suggest plans for improving schoolhouse construction and sanitation, prepare plans to be loaned to school corporations, approve plans for new school buildings, and assist counties in making sanitary surveys of school buildings.

5. A special education division to supervise and conduct studies to improve education for the blind, deaf and dumb, feebleminded and mentally defective, truant and incorrigible, and dependent and delinquent children. It was to supervise educational work in charitable, penal, and reformatory institutions and orphan asylums supported by the state.

6. A rehabilitation division to take over from the Industrial Accident Commission work provided for by the Legislature of 1919 to rehabilitate persons crippled in industry and to become the agent of the federal government for such work. Education of crippled children would also come under the jurisdiction of this division.

7. An adult education division to have charge of immigrant education, Americanization, and other adult education. This had already begun under the State Commission on Immigration and Housing. Combined with this division would be certain responsibilities in visual education.

8. An art and music division to study the needs of the state in pure and applied art and in music to improve the instruction in these fields.

9. A library division could be formed, mainly to improve county library work.

Organization of the State Department of Education

In May 1921, the Legislature created a State Department of Education under the control of an executive officer to be known as the director of education; the superintendent of public instruction was to be ex officio director. Powers and duties of the boards of trustees of the normal schools, henceforth to be called "state teachers colleges," were transferred to the new department. Similarly, the department took over the powers and duties of the board of trustees of the California Polytechnic School and of the board of directors of the School for the Deaf and Blind.

Formation of the department was in line with recommendations of the Jones Report. However, other sections of the law of May 1921 continued the anomalous organizational features the report had objected to. The State Board of Education was continued, along with its previous responsibilities. One new division of the department—textbooks, certification, and trust funds—would be under the state board. The new normal and special schools division would be under the director of education, although the appointment of principals and faculty members was subject to approval by the board, which also could enact regulations for these schools. The three commissioners of education were unaffected by the new legislation and were to continue with the status of assistant superintendents, appointed by and responsible to the state board.

Several positions were added: A deputy director of education to represent the director of education in the Division of Normal and Special Schools. The statistician became an assistant superintendent, with general research duties added to his former responsibilities. Provisions of the Federal Vocational Rehabilitation Act were accepted by the Legislature in 1921, and a supervisor of vocational rehabilitation and an assistant in rehabilitation were added to the office of commissioner of industrial and vocational education.

Although the offices constituting the new department were based on the functions of the superintendent's office or on appointment by the state board, Superintendent Wood organized the department into a remarkably unified body considering the double-headed nature of the agency.

With a real State Department of Education in Sacramento, education became more centralized. School people were encountering increasingly complex problems, and they brought to the state department their questions about school law, federal vocational education, compulsory attendance, compulsory physical education, and education of immigrants. The three commissioners of education closely supervised the schools. Courses in elementary and secondary schools had to be approved by the department. The department published the state series of elementary school textbooks and the official list of approved high school textbooks. The department also directly influenced the conduct of the teachers colleges.

The department's leadership was in part due to the cooperative spirit and long experience of several persons in key positions. Will C. Wood had served the department for 5 years as commissioner of secondary schools before his election to two terms as superintendent of public instruction. Edwin Snyder, commissioner of vocational education, served for 10 years. Job Wood, Jr., who was statistician for 20 years, served as deputy superintendent from 1919 to 1923. Helen Heffernan, commissioner of elementary schools, served the department for 40 years.

Political Action and Educational Change

In 1923, Will C. Wood began his second term of office as superintendent of public instruction, and Friend W. Richardson began his term as Governor. Richardson was a conservative who denounced extravagance in education. His policies were immediately criticized by educational associations, but were endorsed by taxpayers associations.

Meanwhile, important changes were taking place in the state department. In 1924, the title of assistant superintendent in charge of "immigrant" education was changed to "adult." In 1925, Superintendent Wood appointed Mrs. Mabel Gifford to be the first assistant superintendent of
public instruction in charge of speech correction. The appointment was made possible through a grant of funds from the California Speech Foundation.

On the darker side, because of severe cutbacks in appropriations, the 51 positions in Wood’s department had been reduced to 39 by 1925. A disparate salary situation came about when the salaries of the assistant superintendents employed by the state board were increased to $5,000, while the salaries of assistant superintendents in the Office of the Superintendent of Public Instruction remained at $3,000. The superintendent was still paid $5,000.

The situation foreseen by the Jones Report became a reality in 1926 when a majority of the State Board of Education, appointed by Richardson, sided with the Governor in opposition to the superintendent of public instruction, refusing to confirm the superintendent’s appointments of the presidents of the San Jose and San Francisco state teachers colleges. The resulting impasse, lasting several years, dramatically pointed up the shortcomings of the existing organization. In his last biennial report, Wood recommended legislation to define the powers of the board—to be legislative and regulatory—and those of the superintendent—to be executive and supervisory.

During this period the California Teachers Association’s Committee on Duties and Functions of Public School Administrative Authorities studied the organization of other state boards of education. In a second study it traced the trends in organization of such boards and recommended a constitutional amendment to change the California State Board of Education. The committee recommended a larger board, its members to be elected by the people; it defined the board’s functions and recommended that the agency’s professional work be done by professionally trained persons.

Superintendent Wood made several legislative recommendations affecting the Board of Education and the Department of Education. One was to create a division of school planning, for which he had long felt the need; another, to establish a state curriculum commission to “adopt minimum standards for elementary school courses of study” and “succeed to the powers of the State Board of Education in reference to approved courses of study in high schools and junior high schools…”; still another, to codify school laws. He also urged legislation to provide better education for physically handicapped children.

The 1927 Legislature took note of Wood’s suggestions and those of the California Teachers Association. Legislation affecting the organization of the State Department of Education was introduced, and much of it was passed.

**CHANGE AND GROWTH THROUGH THE DEPRESSION AND WAR, 1927 TO 1945**

Because Clement C. Young, elected governor in 1926, regarded education quite differently than did Richardson, new educational legislation prepared by Superintendent Wood and others had a friendly reception. In 1927, Senator H. C. Jones introduced a bill to unify the state department with members of the state board appointed to 10-year terms, and an appointive director of education who would take over the duties, powers, and responsibilities of the superintendent of public instruction. This bill was approved overwhelmingly by the Legislature, but it required an amendment to the constitution, which failed to pass in the general election of 1928. However, changes in the Political Code provided for a new state board and a reorganized state department. Despite the continuance of the old double-headed responsibility, the newly organized department served satisfactorily through the trying days of the Depression and World War II.

Amendments to the Political Code, effective July 29, 1927, launched the following changes: (a) creation of a new State Board of Education of 10 members, appointed by the Governor with Senate approval; (b) abolishment of the three commissionerships established in 1913; (c) full power for the board “to establish upon recommendation of the Superintendent, such divisions in the State Department of Education as appear advisable for the efficient transaction of the business”; and (d) election of the chiefs of these divisions by the board, nomination of the superintendent.

**Reorganization of the Department of Education**

Governor Young immediately appointed the 10 new members of the State Board of Education for 4-year terms—three expiring in 1928, two in 1929, three in 1930, and two in 1931. The board met in August 1927 and, acting on the recommendation of the superintendent, established 10 divisions in the State Department of Education:

1. Rural Education provided administrative and supervisory services to the rural schools, both elementary and secondary.
2. City Secondary Schools administered city high schools and junior colleges. Its chief concern was to supervise vocational education, except agriculture (which was under the rural schools division).
3. Adult Education promoted adult education in high schools and junior colleges, carrying out research and developing courses in parent education and child study, and education of immigrants.
5. Special Education supervised programs for the education of physically handicapped, mentally retarded, and otherwise exceptional children, and mental hygiene.
6. Research and Statistics was to compile statistics; draft official records and report forms; conduct educational research; and apportion state school funds.
7. Teacher Training and Certification supervised teacher training in institutions approved by the state department and issued teachers' certificates.

8. Publications and Textbooks was responsible for editorial and clerical activities in connection with all publications compiled, listed, or distributed by the department.

9. Schoolhouse Planning, created to give advice concerning planning and construction of school buildings, had the responsibility for establishing standards, conducting surveys, and checking and approving plans and specifications for new buildings.

10. Libraries was created by special legislation that brought the State Library (established in 1850) into the Department of Education. It performed library services for the people of the state, the schools, and school officials, and supervised the county library system and libraries of the state teachers colleges.

Acting on recommendations of the superintendent, the State Board of Education appointed chiefs for all divisions except two. All state officers, including the three commissioners of education, were appointed to appropriate positions in the new organizational structure, with the result that there was little or no disruption.

Although reelected superintendent of public instruction in 1926, Wood resigned in 1927 to become state superintendent of banks. Governor Young appointed William J. Cooper to fill out Wood's unexpired term. Cooper, then, became responsible for inaugurating the legislative changes.

In his first report to the Governor in 1928, Cooper spoke of the smoothness with which the changes had been effected and expressed appreciation for the work of the members of the state department, who "have given themselves wholeheartedly to the service of the State" (14).

Departmental Changes, 1927 to 1931

Reorganization of the department and other educational legislation brought about further changes in the following years. A Curriculum Commission, set up in July 1927, had been earlier recommended after a thorough study of the public schools' instructional program. Under a subvention of the Commonwealth Fund of New York, the study was begun in 1923 and its results published in 1926 under the title, The California Curriculum Study (15). After its publication, only 12 subjects were prescribed by law for elementary schools instead of 32. The Curriculum Commission was a second result of the study. It was to outline minimum courses for use in elementary and secondary schools and to study textbooks in elementary subjects before they were adopted. The commission soon expanded its activities to include preparation of guides for teachers.

A School Code was enacted by the Legislature in 1929 to unify the provisions of the several codes and general laws relative to public education. An expanded publications program followed the appointment, in 1931, of a chief of the textbooks and publications division. Even before, a monthly educational journal, California Schools, had been inaugurated as an official organ of the department. In January 1932, a numbered series known as the Department of Education "Bulletin" replaced the division or bureau publications. In 1932 the department began publishing the California Journal of Elementary Education.

In 1929, the Legislature established the California Nautical School (later renamed the California Maritime Academy) which began operation in 1931. The legislation was based on an act of Congress in 1911 which provided that, on request of the governor of a state, the U.S. Navy would furnish a ship for training officers for the merchant marine. A board of governors for the school, created within the state department, consisted of the superintendent of public instruction and four other members to be appointed by the Governor.

In August 1927, the State Board of Education became the trustees of the California State Historical Association. It was administered by a part-time director. In 1928 a new home for the State Library, the Library and Courts Building, was completed, and the State Department of Education moved its headquarters there.

Depression and Earthquake

Governor Young's annual message to the Legislature in January 1929 included recommendations for a comprehensive survey of the school system. But Young's successor, Governor James Rolph, who took office in 1931, showed little interest in the schools. One reason, of course, was the Depression. Governor Rolph asked the Legislature to cut costs everywhere, and specifically to amend the constitution to reduce the fixed sums for schools. Although this was not done, it did cut drastically the budget for the schools and the state department.

School districts felt the Depression keenly; they cut educational services to the bone. In March 1933, Vierling Kersey, then superintendent of public instruction, published an article entitled "Shall Public Schools in California Be Closed?" (16) in which he pointed out that demands for tax relief, strengthened by local taxpayers associations, resulted in a decrease of almost $10 million in public school spending for 1931-32 compared with the previous year.

The total reduction for 1932-33 was a staggering $49 million. This, said the superintendent, would make it impossible for many districts to maintain schools through the year. In hundreds of other districts, children would receive very little schooling. Kersey called for the restoration of funds insofar as possible, and also for a radical revision of the state tax system.

The Legislature slashed the superintendent's budget and tried to reduce the department's services. But Kersey handled his meager funds so astutely that he was able to continue all the services which the Legislature had hoped to eliminate.
At the time that Kersey's pleas for support to keep the schools open were being presented, a disaster further increased the financial burden of the schools—the Long Beach earthquake of March 1933. School buildings were destroyed, and others so damaged as to be unsafe. Fortunately, school was not in session at the time of the earthquake, but the frightening prospect of a recurrence focused attention on the safety of school buildings throughout the state. The Field Act, passed as an emergency measure, provided that school construction be supervised by the state. The federal Reconstruction Finance Corporation loaned funds to impoverished school districts that suffered building losses in the earthquake.

In June 1933, the voters passed a constitutional amendment which radically changed the method of financing public schools. Compulsory county school taxes for school support were eliminated, and the amounts previously required to be raised by county taxes were provided as apportionments from the State General Fund.

Recovery of the Schools

The federal government, through the Federal Emergency Education Program, gave much assistance to the schools through the Depression years. Starting January 1934, a certain portion of the federal relief funds was earmarked for educational purposes (17).

Under the Civil Works Administration, and later under the Federal Emergency Relief Administration and the Works Project Administration, money was allocated nationwide to provide employment to unemployed teachers; to restore normal school facilities in the areas of greatest depression; and to supplement existing school facilities, especially in the field of adult education. In California, where state and district support was adequate to maintain the public schools (although with curtailed services), federal funds were utilized to supplement ordinary activities. Under the WPA program several thousand teachers and allied workers who could find no other work were employed as teachers of special adult education classes, of classes for the retraining of unemployed workers, and of children in nursery schools. Public schools also were improved through development of radio programs, provision for school health services, extension of library facilities, promotion of museum projects and visual instruction aids, and construction and rehabilitation of school plants and equipment (18).

By 1936, with the help of state and federal agencies, school districts were recovering from the effects of the Depression. Superintendent Kersey was able to report that—

In spite of all evils resulting from the depression, at least one benefit resulted. This benefit, which applies to education as well as to other social agencies, came from the reexamination of purpose and procedures which took place in all fields of social planning during this period, and gave immediate promise of more efficient planning for the future (19).

Superintendent Kersey resigned in 1937. During his term of office, no additional divisions were created in the state department, but the vocational education bureaus were placed under the Commission for Vocational Education, independent of the city secondary schools division. A few additions were made to the administrative staff, including an assistant superintendent in Los Angeles, but several administrative staff offices were discontinued. The Commission for Special Education was organized; its members were the superintendent and the chiefs of bureaus of the education of the blind, education of the deaf, correction of speech defects, mental hygiene, and vocational rehabilitation.

State teachers colleges became state colleges and were thus legalized as regional 4-year collegiate institutions not limited to teacher training. A Public School Teachers Retirement Investment Board was established to invest the funds of the teachers retirement system.

In 1937, Governor Frank F. Merriam appointed Walter Dexter superintendent of public instruction. The Governor was friendly to education, and his lieutenant governor, Georg. J. Hatfield, strongly supported the schools. Hatfield said: “I prefer to spend thousands today for better education . . . than to spend millions tomorrow for bigger prisons, . . . and bigger pensions for unemployed persons” (20). The 1937 Legislature voted for a minimum salary of $1,320 per year for teachers in public schools; this action meant a substantial raise for almost every rural teacher. In 1939, bonus funds were provided for educating physically handicapped children, and an additional appropriation allowed spastic children to enter school at age 3.

A conscientious man with a warm personality, Dexter had served as president of Whittier College and as executive secretary to Governor Merriam before being appointed superintendent. He found that soaring enrollments were straining the capacity of the department to provide adequate services. Obviously the department's obsolete structure needed overhauling. Under Dexter's leadership a committee drew up a constitutional amendment, later approved by the voters, which called for reshaping the department.

**Influence of World War II on the Schools**

World War II was first felt by the schools in California by an enormous increase in demands for vocational training. The federal government increased its help, which created some anxiety that the public schools would be unduly controlled by Washington.

By November 1940, the schools began to feel the pressure to teach technical skills needed in defense industries and other types of training demanded by the national emergency. In 1941, National Defense Training
courses were established with federal funds under the State Department of Education's Commission for Vocational Education. By July, 118,920 students were enrolled in these classes. Rural schools had classes in farm machinery repair and vocational agriculture.

A proliferation of state and federal agencies, designed to supplement the work of the schools, led Assistant Superintendent Aubrey A. Douglass to remind these agencies of their obligations to the department and to the schools of California: (a) they should cooperate with the department in carrying out their programs; and (b) they should not interfere with the programs and administration of the schools (21).

The State Board of Education took note of the problem of federal-state relations and in its meeting of October 1941 provided that each federal agency should "submit to the State Department of Education a statement of the policies under which it operates, a description of its program, and contemplated developments," and that "a member of the State Department of Education shall be assigned to act as a liaison officer between the Department and each of the federal agencies," who shall be aware of questions of jurisdiction "so that there may be no violation of law and no assumption by the schools or by the federal agency of functions recognized as belonging to the other" (22).

Despite difficulties encountered during the war in teacher shortages, postponement of building programs, loss of young people who dropped out of school to enter the defense industries, and shortages of material of all kinds, the schools contributed greatly to the war effort. The state director of vocational training for war production workers, John C. Beswick, was credited with having developed the largest program of vocational training for essential war industries in the United States (23).

Postwar Problems and Solutions

When the war ended, numerous school facilities were needed. The need was also great for retraining workers for peacetime pursuits and aiding veterans and school dropouts to complete their education. A shortage of trained teachers still existed; thousands of teachers held only emergency credentials. In addition, many people had come into the state during the war; few of them left when the war was over.

In 1944, several influential groups of school administrators called upon the State Department of Education to recommend various changes in the school system.

At a meeting in Sacramento in January 1944, the State Education Council reconstituted itself as the state superintendent's Advisory Council. The council defined its purposes: (a) to advise the superintendent of public instruction on matters he may wish to refer to the council and to interpret and present to him problems or conditions concerning the proper functioning of the state's school system; (b) to coordinate the work of the divisions of the State Department of Education, the various state professional organizations and lay groups concerned with educational problems, practices, and support; (c) to assist in implementing the programs of the department and other organizations; and (d) to carry out research needed by the superintendent and his staff.

This group set up committees to consider the following problems: (a) rehabilitation of disabled veterans of the military forces; (b) study of legislative proposals; (c) teacher selection and training; (d) audiovisual education; (e) standards for school buildings and equipment; and (f) post-high school education (24). Each of these committees in turn made specific recommendations.

The Association of California County Superintendents of Schools met in January 1944 and went on record as being strongly in favor of federal aid to equalize educational opportunity and of state aid for more suitable financing of education. The group suggested certain changes in the state department, such as adding an audiovisual division, starting a committee on radio services in education, and making a survey of county library services. It recommended that the department certify teachers in cooperation with county superintendents of schools and repeal the authority of county boards to grant elementary school certificates. The association suggested legislation for more effective school organization and administration, and for better equalization of educational opportunities and costs. It also suggested that the department exercise leadership in developing post-war building plans (25).

Meeting in April 1944, the Association of California Secondary School Principals adopted resolutions touching on the work of the State Department of Education. Among them were a resolution favoring more personnel in the department and the creation of a division of educational research. It also passed resolutions requesting a survey and evaluation of junior high schools and favoring high standards for regular credentials.

The State Board of Education established a Division of Audiovisual Education in April 1944, and a Division of Readjustment Education for the education of veterans in August.

A special legislative session was called in June 1944 to consider educational needs. One bill provided $4.5 million for elementary schools, to be spent on teachers' salaries and school supplies. A teachers' retirement bill was passed; $20,000 was allocated to the State Reconstruction and Reemployment Commission to study the administration, organization, and financial support of the public school system. George D. Strayer, professor emeritus of education, Teachers College, Columbia University, was employed as consultant. Subgroups worked on various aspects: how to equalize the burden of education among the school districts; supply and demand for teachers; and reorganization of district administration. J. N. Mills, head of a firm of
management consultants, made an analysis of the organization and administration of the State Department of Education. The Mills study, presented in December 1944, and the Strayer study, in February 1945, resulted in far-reaching changes in the State Department of Education.

THE STRAYER REPORT AND THE REORGANIZATION OF THE DEPARTMENT, 1945 TO 1963

The Strayer Report was a masterly summary of the California public school system, with specific recommendations for solving many of its problems (26). After pointing out the need for overall expansion, the report touched on Department of Education leadership:

Even a rough sketch of the problems confronting education in California in the postwar period indicates the desirability of taking action now to provide for the best possible organization, administration, and financing of the program of education. The highest type of leadership on the state level will demand the professionalization of the office of the State Superintendent of Public Instruction. This means the need for a constitutional amendment that will provide for the selection of this official by a lay board rather than by popular vote.

There will most certainly be required an expansion of the staff of the State Department of Education in order that significant leadership and general supervision of the expanded program may be furnished. The State office must be in a position to guarantee that whatever program of education is mandated by the State is actually carried out in all local school districts (27).

Recommendations of the Strayer Report

The Strayer Report's first recommendation was that the Governor appoint a State Board of Education consisting of 10 laymen, each with overlapping terms of 10 years, and that the board select an outstanding educator as superintendent of public instruction. Other recommendations called for an expanded and reorganized State Department of Education: hiring specialists for the divisions of elementary and secondary education and appointing a deputy superintendent, an associate commissioner of education, and an associate superintendent in charge of business and administrative services. The report then listed 28 more appointments to the professional staff and recommended employing at least 25 additional stenographic, clerical, and statistical workers.

Aside from the reorganization of the State Department of Education, Strayer proposed that the State Board of Education determine qualifications for the office of county superintendent of schools, and the creation of a state commission on local school districts. He also recommended setting up a bureau to forecast teacher supply and demand and a committee on coordinated teacher training. Strayer believed that kindergartens should be included in the state aid program. And he proposed that state support be distributed to schools on an equalization basis and that state aid be made available to impoverished districts for capital outlay.

Finally, the Strayer Report suggested that the State Department of Education have its own building. In 1945, the department was scattered about the capital city in some six or seven buildings in addition to the main headquarters in the Library and Courts Building. In 8 years it had grown so much that the need for more adequate facilities had become critical. Therefore, in 1953, the State Department of Education moved into its present home, the State Education Building at 721 Capitol Mall in Sacramento.

The Mills Report

A firm of management consultants, J. N. Mills & Company, conducted the departmental study, as required by the 1944 Legislature. Its findings were, briefly, that the department was greatly understaffed, underpaid, and overworked, and that there was general looseness of the management structure within the department. It found many ambiguities in the various sections of the Education Code defining the duties and responsibilities of the superintendent of public instruction, the director of education, and the State Board of Education.

It would appear appropriate...that the problem be called to the attention of the legislature so that it may, if it deems it proper, clarify the Code sections relative to the respective powers, duties, and functions of the State Board of Education, the State Director of Education, the Superintendent of Public Instruction, and the State Department of Education . . . .

If it be the intent of the Legislature to establish a Board of Education as the governing and policy making body of the State Department of Education, the functioning of the Board should be confined strictly to such purpose, and the execution of such policies as may be laid down by the Board should be left to the Director of Education, without further participation or interference by the Board (28).

Legislative Changes

Drafts of three proposed constitutional amendments and bills were included in the Strayer Report as appendices. One of the amendments pertained to the appointment of the superintendent of public instruction and of the members of the State Board of Education; the second, to qualifications of county superintendents; and the third, to appointment of a deputy superintendent of public instruction and three associate superintendents, all of whom would be exempt from Civil Service.
The first bill set forth a comprehensive system of equalization of state aid for support of elementary schools; the second, supervision of instruction in elementary schools; and the third, optional unification of state aid for support districts by vote of electors.

All of these measures were introduced in the assembly in January 1945. The three bills were passed and signed by the Governor. The first amendment to the constitution, calling for the appointment of the superintendent of public instruction, was defeated; however, the other two passed. Other education bills passed by this Legislature established schools and training centers for spastic children and permitted admission of children with speech disorders and blind children to special schools established for handicapped children. The Legislature also appropriated $388,680 to augment the support of the state department.

Department Reorganization

After the Strayer and Mills studies were started, the superintendent of public instruction also appointed a committee to study the organization of the State Department of Education. The committee presented its report to the State Board of Education in October 1945, and the board approved the plan for reorganization drawn up in the report.

After Superintendent Walter Dexter died in October 1945, his successor, Roy E. Simpson, continued the work of reorganization. In November 1946, the voters approved the constitutional amendment allowing for the appointment of a deputy and three associate superintendents, thus clearing the way for the new organization to be completed.

The department was reorganized into six divisions: departmental administration, instruction, public school administration, special schools and services, state colleges and teacher education, and libraries. In addition, seven groups not considered part of the administrative structure of the department were closely connected with the state educational system: the Board of Examiners for Vocational Teachers; the Board of Governors of the State Nautical School; the Commission for Vocational Education; the Commission of Credentials; the Retirement Investment Board; the State Curriculum Commission; and the Teachers' Retirement Board. With but a few changes, this departmental organization is essentially the same today.

During the ensuing years other proposals were made to change the relationship between the State Board of Education and the superintendent of public instruction. In 1955, the Hardesty Report advocated that the superintendent be appointed by the board. It recommended that the board be composed of nine members, one member per year to be nominated by the California School Boards Association and elected by the school districts. In 1958, Proposition 13, to amend the constitution to provide an appointive superintendent, was roundly defeated. Although the Department of Education had vigorously upheld the “grass-roots” philosophy of selection of the superintendent, Roy E. Simpson, superintendent of public instruction from 1945 to 1962, proposed in 1959 that the superintendent be appointed by the board, who should have the power to determine the term of office and salary. He suggested an 11-member board, appointed by the Governor with Senate approval, but without results.

School District Organization Changes

The Strayer Report concluded that the California schools were good, but improvements were necessary. In some communities, the survey team found schools that might have been models for the nation; other schools provided unacceptable education. The chief reasons for this wide variance—that there were too many school districts, and too many were small and had a low tax base—had long been apparent to the department. Efforts to consolidate districts, however, had met much local resistance. Passage in 1945 of the school district bill drafted by the State Reconstruction and Reemployment Commission was a great step toward remedying the situation.

A Commission on School Districts was empowered to conduct surveys throughout the state and make recommendations for school district reorganization. The people might, by majority vote, accept or reject these recommendations. Studies made by the commission focused on district reorganization and brought about a remarkable degree of public understanding regarding problems of school administration. The law stipulated that the commission be discontinued in 1949 and its responsibilities turned over to the State Board of Education. County committees were to carry on the work of district organization. A bureau of school district organization was established in the Department of Education as an advisory group within the public school administration division. When the commission began its work, 2,568 school districts were maintaining schools in the state. By 1950, they were reduced to 2,111; and they have since steadily decreased.

Financial Support for Districts

In addition to unifying school districts, equalizing support by the state had often been suggested as a means of solving problems of the rural districts and the less wealthy urban school districts. Proponents of equalization aid recalled Horace Mann's views on taxing property where it is and spending money where the children are. However, as of 1944, school districts were financed almost wholly in terms of the number of pupils in average daily attendance, with no regard to the need of the school. A variation affecting a relatively small number of school districts was made in
providing a teacher or classroom quota for very small schools. According to the Strayer Report,

The system of state aid represents a piece-meal accumulation of changes, based upon conditions and needs which have arisen during the past fifty years. The process has been one of accretion, and a consideration of separate parts of the total program, rather than a complete and overall review of the basic problem concerning the State's policy in the support of schools (29).

Constitutional amendments were adopted in 1944, 1946, and 1952, increasing and equalizing the state’s support of the schools. In 1952, the people mandated that the contributions to the State School Fund from the General Fund, together with annual income from the Permanent School Fund (consisting of lands granted to the state, bonds bought with proceeds of land sold, and oil and mineral royalties) should be not less than $180 per unit of average daily attendance in the public schools for the preceding year. Subsequent legislation increased this to $201.36.

Apportionments are made from the State School Fund for basic aid (at $125 per unit of average daily attendance [ADA] or $2,400, whichever is greater), plus equalization aid, based on the concept of a foundation program. This guarantees that each district will have a specified amount available, provided a specified rate of tax is levied in the district. If the amount of district aid computed by the tax rate, when added to basic aid, is less than the foundation program, the state provides an additional amount equal to the difference.

Apportionments for special aid programs were added from time to time by the Legislature until by 1963 they included (a) excess costs of educating physically and mentally handicapped and mentally gifted minors, and excess costs of transportation of such minors; (b) reimbursement of the costs of home-to-school transportation of pupils; (c) a growth allowance which supplements the initial apportionment due to increase of the current ADA over that of the previous year; (d) excess costs of providing behind-the-wheel driving instruction; and (e) certain costs of operation of offices of county superintendents of schools.

The federal government made funds available for certain programs, such as vocational education, vocational rehabilitation, education of veterans, school food service, and child care centers. Beginning with Public Law 874 in 1950-51, it gave support to local educational agencies to operate and maintain schools where federal activities created serious school problems. Public Law 815, passed in 1950, provided for construction of school buildings in such areas.

Role of the Department in Schoolhouse Planning

School districts had a legally limited ability (5 percent of assessed valuation) to finance needed school facilities. A survey of schoolhousing after the 1933 earthquake showed over 400 small districts, many with very old buildings, that had a legal bonding capacity less than would be required to replace the old buildings. Several later surveys convinced the department that many districts were unable, however willing, to finance adequate facilities.

Efforts to bring about state aid for school construction were successful in 1947 when the Legislature appropriated $20 million for outright grants to impoverished school districts for capital outlay. The well-documented requests by school districts to participate in the program provided decisive evidence of the magnitude of the problem, and the voters have approved bond issues ever since to implement a state-controlled loan and grant program for school construction in financially distressed school districts.

The bureau of school planning had some control over the plans for buildings to qualify for state apportionments, and it was thus able to influence the type of facilities being built. It was instrumental in changing the design of schoolhouses in line with changes in educational programs.

The National Defense Education Act of 1958

In 1957, when the Russians succeeded in orbiting the first satellite, critics of schools complained that children were not being taught enough mathematics and science. As a response to the "emergency," Congress passed the National Defense Education Act (NDEA). The federal government authorized aid of more than $1 billion to education over a 4-year period. The California State Department of Education administered three parts of the act that directly affected the schools: Title III, for strengthening science, mathematics, and modern foreign language instruction; Title V, for guidance, counseling, and testing in secondary schools; and Title VIII, for vocational education. The department administered the funds, for the most part, through a new bureau called the Bureau of NDEA Administration.

In the first 3 years of the program's operation under Title III, the department approved projects to 887 California school districts, which had 81.1 percent of the total average daily attendance of the state. More than half of the approved projects were in science; 24 percent in modern foreign languages; and 14 percent in mathematics. In addition to funds for instruction, schools received funds to buy equipment for minor remodeling and to improve supervisory and related services. Over 65 percent of the expenditures were for specialized equipment and materials of instruction. The greatest change was in science. Increased emphasis was placed on mastering basic scientific relationships and learning laboratory methods. Less change was seen in mathematics, the school districts adopting a "wait and see" attitude in reference to adoption of the "new
math." Improvement in teaching skills and in pupil achievement was directly attributable to the new programs.

An assessment of the value of the Title V was made in 1967 after the program had been in operation for 7 years. The difficulty of evaluating programs, particularly in the field of guidance and counseling, made the study rather inconclusive.

Title VIII of the NDEA amended the George-Barden Act of 1946 relating to the training of skilled technicians in California. During the 1962-63 school year, California districts participated in 94 projects under Title VIII at a cost of $1,329,937. Local industrial needs were largely met through the technical education programs.

Vocational Education

Additional federal aid was given to California's already strong vocational education programs by Public Law 87-415, the Manpower Development and Training Act (MDTA). This provided for training unemployed persons so they could take their place in the nation's economy. The law directed that whenever appropriate, the programs should be conducted in the public schools. The State Department of Employment selects and places trainees under the act, and the Department of Education supervises the training through the regional offices of the vocational education section. By the end of October 1963, in the first year of the program's operation, California had 8,255 trainees.

Vocational Rehabilitation

California began to rehabilitate the disabled in 1919 when the Legislature set aside funds for the Industrial Accident Commission to reeducate persons crippled in industry. In 1921, the program was placed under the administration of the State Board of Education to qualify for federal funds. Federal support was expanded until, by 1954, it included assistance to establish rehabilitation facilities, workshops, and business enterprise programs. The scope of the program was widened; state funds were contributed to include persons who needed retraining because of changes in occupational demands. In October 1963, the vocational rehabilitation section "graduated" from the division of special schools and services to become the new State Department of Rehabilitation. Also included were other units providing educational and rehabilitation for blind adults.

Special Education

In 1947, a great deal of legislation relating to handicapped children was passed. One bill made it mandatory for school districts and county school superintendents to maintain classes for mentally retarded minors. In 1951, permissive programs for trainable mentally retarded children were established by the Legislature, and were made mandatory in 1964. In 1961, special programs for intellectually gifted children were established. In that year the bureau of special education was transferred from the Division of Instruction to the Division of Special Schools and Services. In 1963, special programs for the educationally handicapped (children with neurological and behavioral disorders) were established.

Educating outstanding children has been one of the state's most rapidly growing programs during the past 15 years, costing about $65 million in 1967-68.

Higher Education

Since July 1961, the state colleges have been administered by the trustees of the State College System, including the superintendent of public instruction. This change resulted from a study of higher education made by the Liaison Committee of the State Board of Education and the Regents of the University of California. The basic issues studied were the roles of the junior colleges, state colleges, and the University of California in the state's tripartite system and how the three segments should be governed and coordinated to avoid unnecessary duplication.

As one result of the study, A Master Plan for Higher Education was published in 1960 (30). In that year the Legislature adopted some recommendations in the plan. The Donahoe Higher Education Act, in addition to placing the state colleges under a board of trustees, defined the California system of higher education as consisting of all public junior colleges, all state colleges, and branches of the University of California. Junior colleges remained under the state board. The University, under the Board of Regents, was defined as the primary state-supported academic agency for research and given sole authority in public education to grant doctoral degrees. The Coordinating Council for Higher Education was created to include three representatives from the University of California, the State College System, the public junior colleges, the private colleges and universities of the state, and the general public. Its primary responsibility was to advise governing boards and state officials in the review of annual budgets and capital outlay requests of the University of California and state colleges. It also was charged with developing plans for the orderly growth of higher education and making recommendations regarding needed facilities and programs.

Certification of Teachers

An important change in teacher training and certification took place in 1964. The Licensing of Certificated Personnel Law of 1961, popularly known as the Fisher bill, made it mandatory for teachers to have an academic major before they could be granted a teaching credential. This change
resulted from many studies of the basic certification structure in the state. By 1950, about 60 different types of credentials were used to authorize public school service. Credentials could be granted by the state on any of three bases: direct application, formal recommendation by a teacher training institution, or informal institutional recommendation. Various proposals for remediating this confused system, combined with criticisms of courses in professional education, resulted in the Fisher bill.

Teaching certificates could not be granted by county boards of education after 1945. Emergency credentials, first granted during the war, were discontinued in 1954. But “provisional credentials” have been issued since 1947 on the basis of a statement of need by the employing district. Since 1942, the demand for teachers in California has been greater than the supply, and no solution for the problem of ensuring enough well-qualified teachers is yet in sight.

Time for a Change

In 1962, for the first time in 43 years, an incumbent superintendent of public instruction did not stand for re-election, and a vigorous contest developed among nine candidates. In the general election two candidates carried on a series of public debates, with candidate Max Rafferty finally winning and selecting one of the primary candidates, Everett 1. Calvert, as his chief deputy to help implement his program. One result of Dr. Rafferty’s first term in office was a public airing of the powers and functions of both the State Board of Education and the superintendent of public instruction. Two bills introduced in the 1963 Legislature to eliminate the superintendent of public instruction suffered the fate of all previous measures to this effect.

Shortly after he took office, Dr. Rafferty asked that the State Department of Education be surveyed to determine how it should be reorganized to provide the required services with maximum efficiency. The State Board of Education also wanted a survey of the department, and in 1963, it appointed a Committee on Department Survey. In laying the groundwork for the survey, the State Board of Education posed the following questions:

Although the Department has a long history of effectively providing educational services to the State, the question arises: Are the present purposes, goals, and functions most appropriate to provide and render adequate, imaginative, stimulating, and optimum educational services to the State in the 1960’s and the decades to follow? Also, is the Department best organized and equipped, or following the best practices, to provide these educational services? (31)

The committee recommended that a management firm, Arthur D. Little, Inc., conduct the survey.

A second major study of the department, “the Governor’s Survey on Efficiency and Cost Control,” was subsequently made by the Governor’s Task Force in 1967 upon the election of Ronald Reagan as Governor. This task force was made up of many outstanding business and professional people.

THE LITTLE SURVEYS, 1963 TO 1967

The results of the first phase of the Little Survey were made available in 1964 (32). It concentrated on examining the role and functions of the State Department of Education and possible changes in department services.

The second phase of this survey was conducted in 1966, and results were published the following year (33). It emphasized a new organization for the state’s education administration. While this and other surveys were being made—from approximately 1963 through 1967—the department did make organizational changes, and others are under consideration.

Today’s climate for organizational change in California was summarized in the report of the second phase of the Little Survey. It pointed out that America’s investment in education is second only to defense in proportion to gross national product and that public interest in education has increased dramatically. This enterprise has become an important instrument of national and state policy in social and economic improvement. Compounding the demands on education in all states are the impact of Sputnik on our instructional programs; new federal support of education; the “knowledge explosion” that is outdating much of what is being taught; research and experimentation in education; burgeoning population; “big city blight”; and increasing costs of education. The educational system of California is regarded as one of the best in the nation. However, educators and the public recognize that improvements can be made.

The Little Report, Phase One

In its 1963-64 study the Arthur D. Little team reached 17 key conclusions. For instance, it stated that California lacks the coordinated leadership needed to solve increasingly serious educational problems. School districts lack the resources necessary to move ahead in educational development. The team also suggested that the State Board of Education and the State Department of Education cooperate in educational planning. It concluded that the state department needs major revamping and should extend its services regionally to help districts plan education development (34).

These conclusions were reached after the survey team interviewed school administrators and their staffs and consulted many persons in and out of the educational professions. The investigators found significant changes taking place in the school. And this alone indicated that the
State Department of Education must change its role to meet the needs of the schools adequately. The survey team found that, even in the smallest and most remote districts, progress was being made in the use of radically new programs, but the most significant changes were being developed for the schools, rather than by them. Many of the new courses originated in large-scale, heavily financed projects financed by the National Science Foundation, other foundations, or textbook publishers.

The Legislature's increasing interest in the curriculum was another factor in speeding up change. But many administrators also pointed out that much of the curriculum mandated and controlled at the state level restricted innovation and flexibility.

Conferences with administrators revealed growth in programs for the gifted, mentally retarded, culturally deprived, and physically handicapped; remedial programs; and experiments with multitrack and nongraded programs to meet needs of special groups. Special facilities and equipment and specialized personnel also were increased. Administrators stressed that they needed unbiased information on which they could depend to make wise decisions.

Interviews with administrators also revealed a need for an overall plan to identify national and state educational goals for consideration in local planning. A second need was for information based on careful research to help in planning. Schools will continue to need financial support and general assistance from both state and federal sources to implement plans. The state administration was considered extremely helpful in some areas, less helpful and even old-fashioned in others, and unnecessarily burdensome in the required paper work.

The report recommended that the State Department of Education strengthen its ability to plan and implement educational growth; that project teams be employed on a short-term basis to help the department develop this ability; and that the instruction division coordinate research and communication in curriculum and teaching development. The study also concluded that the department can contribute most effectively by focusing sharply on functions that support constructive change and by withdrawing from attempts at direct consultation with school districts. The office of the county superintendent of schools or another intermediate unit would be the logical level at which to collaborate with local districts on matters of planning and implementing constructive change.

Some form of intermediate administrative unit, such as the office of the county superintendent of schools, should take over many of the tasks of direct collaboration with districts, the report concluded. In this role it should be made more explicitly an extension of the State Department of Education and should maintain services (e.g., instructional materials centers and educational television) small districts cannot provide for themselves. The intermediate unit would plan area programs and coordinate and implement fiscal procedures. The intermediate unit would also serve as a communication link between the State Department of Education and school districts in interpreting or enforcing policies, laws, and regulations.

The Little Report, Phase Two

In 1966, the Arthur D. Little firm proceeded with the second phase of its study. Certain areas of concern to school administrators that affected the recommended changes were mentioned: need to improve business administration in school districts; confusing and overlapping regulations in the Education Code; slow adoption of new but reasonably proven educational developments; and need for better management of human resources, such as attracting better teachers, using talent more effectively, and maintaining an adequate supply of qualified teachers and administrators.

The study recommended that the state department adopt as its major responsibility "sensing the emerging needs for educational development in the state and for related changes in the state's educational system." The department should assign priorities and allocate resources among areas of need. Three new instruments were suggested: (1) a long-range master plan for public education in California; (2) a comprehensive annual report of recent educational activities in the state; and (3) a state plan for specific actions to be taken in the immediate future. These plans are to clearly state the philosophy of the State Board of Education to justify their adoption by the Legislature as the educational goals of the state.

Other responsibilities concern developing new instructional programs and services and include (a) design, (b) evaluation, (c) informing the public about them, (d) encouraging and supporting their adoption, and (e) seeking to improve their quality.

Specific reorganizational changes at the top of the state-level system and in all units of the state department also were recommended.

As with all studies of California's state education agency, the Little Report recommended fundamental changes in selecting the State Board of Education and the superintendent of public instruction. Unless the present conflicting organization is changed, the report stated, California will continue to lack an effective educational administration in Sacramento. It called for a board of 10 members, nominated by the Legislature and appointed by the Governor, to serve overlapping terms of 10 years. It also recommended that the board appoint the superintendent to serve as its executive officer and secretary and as the chief administration officer of the state department, the board to set his term of employment and pay. And it spelled out in detail the duties of the board, the superintendent, and his cabinet.
The Little Report recommended that the personnel and functions of the department be reassigned to four divisions related to educational programs and three offices related to educational services. Junior colleges would be a separate agency. (In 1966, the State Board of Education called for the creation of a separate community college administrative agency, reporting directly to the state board and headed by its own chancellor.) The recommended units and their assignments are as follows:

1. A Division of General Education to administer elementary and secondary education, as differentiated from special education (such as vocational education) and education for special pupils (such as the handicapped). It would include adult education, counseling services, readjustment education, industrial arts education, as well as consultants on various subjects in the school curriculum.

2. A Division of Vocational Education to identify needs and update the state plan for precollege vocational education, design and guide programs, and do research. It would strengthen intermediate units, help local units, recruit and train instructors, and satisfy requirements for programs under federal funding.

3. A Division of Special Education to ensure that all physically, mentally, educationally handicapped, and otherwise exceptional children could enroll in public schools, get education appropriate to their needs, and be taught by qualified teachers.

4. A Division of Fiscal and Business Management to absorb the present responsibilities for budgeting, accounting, school planning, textbooks, surplus property, and transportation now mainly performed by the Division of Public School Administration.

5. An office of state education personnel to certify teachers, accredit schools, and handle other personnel work within the Department of Education. The office would work closely with the State Personnel Board.

6. An office of educational information to combine data processing and education research.

7. An office of departmental supporting services to include mailing and shipping, supplies, editing, art work, duplicating, handling office space and equipment, and cashiering.

The reorganizational details suggested by the report, however, are less important and less innovative than its general approach to the department’s proper functioning as the head and heart of a comprehensive, efficient state-level information system for public education in California. In the words of the report, the department should be regarded as a “collector, compiler, synthesizer, interpreter, disseminator, stimulator, and facilitator of the use of new knowledge” (35).

Study by the Governor’s Task Force

In 1967, the Governor’s Survey on Efficiency and Cost Control, also known as the Governor’s Task Force, after spending hundreds of hours in an intensive study of the State Department of Education over a period of several months, made its report and recommendations. Many of these recommendations were different and perhaps more practical than those in the Little Report. The purposes of the task force were to recommend improvements by which immediate savings could be accomplished by administrative order; to identify areas where further savings could probably be realized after more thorough study; and to make long-term recommendations to the executive and legislative branches of the state government.

The Governor’s Task Force made almost 200 recommendations for improving nearly every aspect of departmental organization and operations, including a number of recommendations that would aid the department to further its role of leader, innovator, and disseminator of useful information.

New Directions

When Max Rafferty took office as superintendent of public instruction in January 1963, he headed the largest public school system in the nation, enrolling over 4.5 million pupils. A strong believer in greater autonomy for local districts, Dr. Rafferty made it his business to develop two-way communication with the governing boards of school districts and to respond to what he interpreted as a mandate from the people to change certain educational practices. He announced an end of “life adjustment” and the substitution of “education in depth” as the department’s philosophy. He advocated a more thorough grounding in reading skills through the use of phonics in teaching primary pupils and that all pupils be given a better understanding of their American heritage through basic courses in history, geography, civics, and economics. He encouraged the schools to emphasize the harmful effects of alcohol, drugs, and tobacco. He favored stronger school library services, use of children’s classics for supplementary reading, and wider use of closed-circuit educational television. In his concern for teachers, he advocated the use of data processing to minimize their clerical work; faster service in issuing credentials; merit pay for outstanding performance; and smaller classes. As one result, legislation passed in 1964 requires that the enrollments in classes in grades 1, 2, and 3 be no more than 30 by the beginning of the 1968-69 school year.

Believing that school districts should have wider choice of teaching materials, Dr. Rafferty favored a wider selection of textbooks for elementary schools. In response, the Curriculum Commission recommended multiple adoptions in certain subjects and gave districts an opportunity to select books for different levels of ability. It also insisted on a more accurate portrayal of minority groups in books submitted by textbook companies.
The following portion of a speech delivered in Sacramento in 1964 is one example of Max Rafferty's strong convictions about education:

The schools of America are the hope of America—the "last, best hope of men on earth." To those of us in education...the great, soul-shaking opportunity has been given to assist, with God's grace, in the saving of our country. For almost two centuries, the teachers of the United States have kept the American heritage intact, passing it from one generation to another as a rich legacy. What we have done before we can do again (36).

A major responsibility of the superintendent of public instruction is to inform the Legislature about the schools' financial situation. This has involved him and his staff in a constant struggle to find a balance between state and local support. In spite of an ever-increasing amount of state aid (about 10 percent a year in dollars), steady growth of school population has meant a decreasing proportion of state support.

Through the superintendent's efforts, the State Department of Education was reorganized and strengthened, based on the Little studies, a Department of Finance survey, and a Department of Education study.

The junior college staff was reorganized, and the Legislature established a separate governing board for public junior colleges (renamed "community colleges"), effective January 1, 1968.

Editorial staffs and facilities of the department were combined to form a bureau of publications to bring about greater efficiency in producing department publications suggested by a 1963 study (37).

The Bureau of Special Education was reorganized into three bureaus: physically exceptional children; educationally handicapped and mentally exceptional children; and program development and evaluation, special education. A central clearinghouse-depository for the visually handicapped became a reality in December 1964. This agency loans to schools books in Braille and large print, as well as other materials, apparatus, and equipment specifically designed for the visually handicapped.

A regional data-processing center to serve 300,000 students in Northern California opened in Sacramento in July 1964. This was the first of an anticipated network of as many as 10 such centers to be established throughout California. It will minimize clerical work and will also serve as a training center for students in data processing. At the same time, the department enlarged its Los Angeles office and improved its services to Southern California.

To secure maximum coordination the department combined kindergarten through grade 12, the services formerly provided by two bureaus, in the single Bureau of Elementary and Secondary Education.

The McAteer Act, passed in 1963, provided for a 2-year pilot project to determine the most effective way to help children handicapped by lingual, cultural, and economic disadvantages remain in school. In 1965 the Legislature established the position of director of compensatory education to oversee the spending of $73 million in federal funds (under Title I of ESEA) and $1 million in state funds allocated to educating culturally disadvantaged children.

In November 1964, a Bureau of Intergroup Relations was established as the staff for the Commission on Equal Opportunities in Education. Established in 1958 (as the Commission on Equal Employment Opportunity for Teachers), this office was, in 1963, given responsibility to assist and advise schools in problems of de facto segregation. This assignment brought it into action in the summer of 1964, when a boycott was planned to protest segregation in Oakland schools, where 59 percent of the enrollment was made up of minority groups. The boycott was forestalled, partly as a result of timely intervention by the commission. The Bureau of Intergroup Relations later became a unit in the Office of Compensatory Education.

Dr. Rafferty was the first superintendent of public instruction to appoint members of minority groups to top-level cabinet positions. His appointments included two Negroes—one as an associate superintendent, one as the director of compensatory education—and a Mexican-American, first appointed assistant superintendent in charge of the department's Los Angeles office and later as associate superintendent and chief of the Division of Instruction. Many other positions in the department, at all levels, are held by members of minority racial and ethnic groups.

The Future

The studies made by Arthur D. Little, Inc., and by the Governor's Task Force produced numerous recommendations as to how the department should be organized to meet its responsibilities proficiently, effectively, and economically (38). Many of the recommendations in one study were unlike those in the other, and neither provided a detailed outline of how the recommendations might be best implemented. Therefore, the State Board of Education employed a consultant to coordinate and appraise all the recommendations and to present to the board an organizational plan. This consultant, who was employed early in 1968, has worked with the professional staff of the department and with the State Board of Education to secure the best possible appraisal and interpretation of the recommendations presented. The results are reflected in the organization chart in Appendix B. This plan, which has been approved by the State Board of Education, sets the pattern that will be employed in reorganizing the department. Certain phases of the reorganization will be effected at once; however, others must be postponed until the Legislature makes the necessary legal and financial provisions.

APPENDIX C—TABLES 176
THE STATE DEPARTMENT OF EDUCATION BEFORE 1900 (1)

Except for widely scattered Spanish and Mexican settlements in the southern part, the first permanent settlers of Colorado were miners and others supporting mining enterprises. Among these people, rugged individualism and self-reliance were highly valued characteristics. As a consequence, education was for many years viewed as primarily a local concern. Although this point of view prevailed in all states in their early history, it received exaggerated emphasis in Colorado. A prime educational problem, therefore, has been to establish the concept of a wider responsibility for education than that of the local district or even of the county.

In a 1963 study, the Denver Research Institute divides Colorado's economic growth into three periods: (1) the era of mining, from 1880 to 1900; (2) the era of agriculture, from 1900 to 1940; and (3) the era of defense, from 1940 to 1960 (2). In 1880, mining accounted for 20 percent of Colorado's employment and 26 percent of the state's personal income. Manufacturing, agriculture, and the railroads were developed principally to serve the mining industry. The population of the state increased from 194,000 in 1880 to 540,000 in 1900.

During the second period, agriculture and food-processing industries dominated the economy. Agricultural employment reached its peak in the 1920's and began to recede substantially by 1940. In 1920, agriculture contributed 20 percent of Colorado's income, as compared to 14 percent nationally. During these two decades, the food-processing industries accounted for two-thirds of manufacturing employment. During the same period, mining employment declined from 540,000 to 16,000; and the population increased from 939,629 in 1920 to 1,123,196 — a natural increase, in contrast to the influx of workers during the mining era.

The picture began to change by 1940. In particular, World War II influenced Colorado's economic development. Spending for defense continued to grow, until by 1960 it accounted for 18 percent of the state's manufacturing employment, against 7.3 percent for the country as a whole. Meanwhile, employment in mining and in agriculture continued to decline.

This increase in manufacturing resulted in concentrating much of the state's population in areas suited to industry, particularly around Denver and along the eastern slope of the Rocky Mountains. Obviously, Colorado was emerging from a predominantly rural economy into a business and industrial one.

Before and During the Territorial Period

Little was known of the general geographic area that included Colorado prior to 1859. "A very large portion of the country was, as late as 1840, described in the school atlases of the day as the Great American Desert" (3). A few fur traders visited the area, and Pike, Long, Bonneville, and Frémont explored it. Spanish-speaking people visited the southern and southwestern part of the state from time to time. Some historians claim that soldiers and explorers were in the San Luis Valley of southern Colorado prior to 1700. Spanish explorers did enter the San Luis and Arkansas River Valleys around 1700, as did a few French explorers some years later (4). It is known that pioneer Mexican settlers of Spanish descent were in the San Luis Valley around 1820.

In 1859, the year following the discovery of gold in the Denver area, thousands of adventurers trekked across the plains in search of the precious metal. Although many intended to make their fortunes and then return to their homes, within 3 years a stable population was developing, consisting principally of miners with profitable claims and of tradesmen who catered to the needs of the miners.

The Territory of Colorado was organized in February 1861. In one of its first acts the Territorial Council passed a set of school laws, modeled after those of Illinois, which provided for a territorial superintendent of common schools. Governor William Gilpin appointed W. J. Curtice as the first superintendent, at an annual salary of $500.

An amendment to the school law in 1865 transferred the superintendent's duties to the state treasurer, who was allowed $100 per year for this added responsibility. Two years later, Columbus Nuckrolls, the first treasurer serving in
that capacity to issue a state school report, emphasized the difficulty in realizing operating funds from "school mining claims," the predecessor of federally provided public school lands. This was the first in a long series of references by state school officers to inadequacies in funds derived from public school lands.

The Territorial Council of 1870 reestablished an independent state school officer with the title of superintendent of public instruction, who was appointed by the Governor at a salary of $1,000 annually.

**The Mining Era, 1876-1900**

Settlers who had come to Colorado in search of gold instead of homes had left the gold fields after missing their "strikes," and many had settled in this beautiful part of the country. The major Indian wars had been won by 1868, and railways began to make the region accessible to people from other parts of the country. While the nation was suffering the Panic of '73, Colorado was faring somewhat better with its mining and agricultural wealth, rapidly developing business centers, and new rail ties to the East.

In the meantime, although some schools closed down when mining communities became ghost towns, new strikes and the developing industry and agriculture brought others. In 1873, Denver turned out to hear speeches, watch parades, and attend various other ceremonies which took place during the dedication of its first high school, the Arapahoe School. The Arapahoe School was unusual for its place during the dedication of its first high school, the Arapahoe School. The Arapahoe School was unusual for its time in that boys and girls attended classes together, which many considered questionable educational procedure at the time. The school also housed a library, which was open daily to the general public.

Despite these advances, school facilities across the territory were poor, and the average salary for a teacher was $20 per month. There were virtually no standards for teachers or for education. But Colorado was on the brink of progress and prosperity.

The superintendent of public instruction was Horace M. Hale, the son of a New England manufacturer and inventor, who had first come to Colorado for his health. A graduate of Union College, New York, he had held a number of teaching assignments and had been admitted to the bar in Michigan. At one time he had held four jobs at once: regent of the University of Colorado, superintendent of schools at Gilpin County, mayor of Central City, and principal of the public schools in Central City. Concerned about the state of education in Colorado, Superintendent Hale called for the teachers to meet at the Arapahoe School in Denver during the Christmas vacation of 1875. The 58 men and 41 women who attended the meeting organized a Colorado Teachers Association and elected Horace Hale as the first president.

In the meantime, the way had already been paved for Colorado to attain statehood. Territorial Governor John L. Routt called for a constitutional convention to meet in December 1875, almost coinciding with the first meeting of the CTA. In fact, the teachers appointed a committee of seven members, with Hale as chairman, to work with the convention and the Legislature in writing the laws. The constitution was ratified by the people in July 1876, and President Grant proclaimed Colorado a state a month later. John L. Routt was then elected as the first state Governor.

Colorado's new constitution provided for a state superintendent of public instruction to be elected in the general elections every 2 years (5). It also established an ex officio State Board of Education, consisting of the state superintendent, the secretary of state, and the attorney general, with the superintendent designated as chairman. The Legislature set the salary for the state superintendent at $2,000 annually.

Joseph C. Shattuck was elected superintendent of public instruction in the first state election in 1876. Born and educated in Marlborough, New Hampshire, he attended Wesleyan University and then went to Missouri to teach. Later, in Greeley, Colorado, he organized the first grade school. Shattuck was seriously interested in educational development and progress in his adopted state and was elected the third president of the Colorado Teachers Association. In his presidential address in January 1878, he came out strongly against compulsory education laws, preferring instead to make education more readily available to American youth so that there would be schools enough for all.

Shattuck was reelected twice as state superintendent. He was later elected dean of the academic department of the University of Denver in 1885, and thus became head of all the business affairs for the university.

The superintendent during these years usually (but not always) had one clerical assistant; but he had no professional staff until 1895, when an assistant superintendent was added. The responsibilities of the superintendent's office were relatively simple and principally regulatory and operational. "Its earliest functions were primarily to gather and report financial and statistical data" (6). The superintendent also was required to visit and inspect schools, but since he received little or no travel appropriation, these visits frequently were made possible through the courtesy of the railroads (7).

Throughout this period, the state superintendents were continually concerned with the problem of getting adequate financial support for the schools. Several complained that not enough funds were derived from the state school lands and that even this amount was poorly managed. Most of the support at this time, and in the early 1900's, came from county and district levels. By 1889, superintendents were recommending a state tax for the support of schools, but it was to be many years before these recommendations were carried out.
During this entire period, the state superintendents gave considerable attention to county and state teachers examinations; the questions used were fully published in biennial reports. The superintendents frequently criticized the qualifications of members of local boards of education and the services they rendered and sometimes charged misuse or misappropriation of funds. For example, in 1885 the superintendent of public instruction stated:

A well-known citizen and banker, who has been the treasurer of his county for a number of terms, tells me he has repeatedly seen three district officers come to his office, and, after receiving the district funds from the county treasurer, divide the money between themselves before leaving the room, making no pretense of accounting for it. This is, of course, an extreme case, but every year money was lost to the schools, at different points (8).

And the superintendent, in his Ninth Biennial Report (for 1893-94), makes the following recommendation:

It is high time the legislature should appoint a committee to examine into the results of our present district school system, regarding the acts of school boards, and see if some methods of control cannot be devised by which existing evils can be remedied (9).

When county and regional normal training institutes became popular, the state superintendents vigorously supported them. They were quite concerned about the quality of the programs offered in the numerous ungraded schools, and some reported efforts to improve these schools by providing statewide courses of study (10).

These early superintendents were industrious and were dedicated to the services of education, with special attention to the local school districts. However, they depended to a great extent on county superintendents for statistical and financial information about the schools. Further, subject to election every 2 years, they complained of a lack of continuity in the office, and at least one recommended to the General Assembly that the method of selection be changed to appointment by the Governor for a 4-year term. Although they demonstrated leadership on occasion, they had neither the time nor the means to extend their duties much beyond the merely regulatory and operational.

By the turn of the century, Colorado's educational progress was remarkable. Its education association (CEA) was host to the National Education Association in 1895, when the latter had only 1,000 members, and again in 1909, when its membership was around 6,000.

THE STATE DEPARTMENT FROM 1900 TO 1965

The Agricultural Era, 1900 to 1940

There is no dividing line to distinguish the Colorado State Department of Public Instruction before and after 1900. Until the Colorado State Board of Education and the department were reorganized by the constitutional amendment of 1948, only a very slight and gradual change is evident. The department from 1900 to 1948 had a limited staff headed by a politically chosen state superintendent. But choosing the superintendent every 2 years by popular vote and delegating to him duties and responsibilities that were essentially operational and custodial fitted the state's economic and social pattern during this period.

From 1900 to 1940, state services, and in particular those from the office of the state superintendent, were developed for a rural economy. Small rural school districts dominated the educational scene, except for Denver and a few other metropolitan areas, and the county superintendents were expected to provide most of the leadership for the local schools. Since secondary school programs were comparatively slow in developing, the state superintendent gave a major emphasis to standardization of rural schools and courses of study adapted to their needs.

The state department's staff reflected this predominately rural economy. In 1900, it consisted of three persons in addition to the superintendent—an assistant superintendent, an assistant state librarian (then as now, the superintendent served as state librarian, ex officio), and a clerk. By 1910, the only change was the addition of two clerks. A decade later, in 1920, the department added a state supervisor of rural schools, a teacher of the adult blind, and an educational statistician. As Chart I of Appendix B shows, even as late as 1940 the total staff consisted of only 15, including 8 clerks.

Although state superintendents were elected every 2 years, only six different persons occupied the office from 1900 to 1940. One of these, Inez Johnson Lewis, won election five times in a row during this period. Another person, Mary C. C. Bradford, was elected to the office six times. (She was also elected president of NEA in 1918.) Katherine L. Craig was elected five times. Despite considerable continuity in office during this time, there is some question as to whether the superintendents could give continuous attention to their duties when they had to campaign every 2 years.

All those who filled the office during this period were women, usually former county superintendents. The state superintendents frequently recommended in their biennial reports that the salary, which continued to be $3,000 annually, be increased to a level on par with that of the chief state school officers in other states. One superintendent presented her case in these strong terms:

I recommend for the fifth time what every state superintendent for the past sixteen years has recommended, an increase in the salary of the superintendent . . . . The salary . . . has not been increased since that office was created in 1876. That one of the six Executive Constitutional officers of the Commonwealth should receive a
The recommendations, however, were apparently ignored. Superintendents were aware of the need for a larger professional staff, particularly supervisors of elementary and secondary schools. Especially interested in upgrading rural schools, one superintendent recommended the addition to the department staff of "no less than three, or as many as six" rural school supervisors (12). However, the General Assembly was slow in providing for such services.

Certification of Teachers. From its inception, one of the state department's principal responsibilities was certification of teachers. It issued state diplomas for teaching, on the basis of both an examination and a "distinguished service" record. At the same time, county superintendents also had the authority to examine prospective teachers. But by 1900, the county examination questions were prepared by the state department and sent to county superintendents, who in turn administered them on previously announced dates. They required only limited preparation. The law stated that—

The county superintendent shall meet all persons, of not less than eighteen years of age, desirous of passing an examination as teachers, at which time he shall examine all such applicants in orthography, reading, writing, arithmetic, English grammar, geography, history and Constitution of the United States and the Constitution of Colorado, civil government, physiology and the natural sciences, theory and practice of teaching and the school law of the state ...(13).

The state superintendents' biennial reports published the examination questions in full until the eighteenth report (for 1911-12). The county examinations continued until the assembly abolished them by law in 1937 and at the same time gave the state department complete authority for granting certificates, with the exception of those issued by the state teachers colleges.

School Consolidation. As early as 1900, educators realized that many of the numerous small school districts were inadequate and inefficient. The state superintendent at that time remarked that "the chief evils of our country schools are unequal taxation, short and unequal terms, unequal equipment, untrained and poorly paid teachers, small schools, lax supervision." She went on to recommend that "a method of administration patterned as clearly as practicable after that of the city would result in some measure of relief" (14). In conclusion, she recommended the county as a unit of school administration.

For a number of years, the state department promoted school district consolidation. In 1919, the superintendent reported that "the twenty-one consolidated schools of two years ago have grown to the encouraging number of sixty-six..." (15). In the next report (1919-20), the superintendent was able to claim that there were now 130 centralized and consolidated schools. The 1927-28 report referred to the "large number of consolidated schools" (16), and the next reported that the consolidation process was continuing. Of course, urbanization prompted much of this consolidation, but the reports do show the state educational officials' interest in the formation of districts sufficiently large to maintain adequate school programs.

In the 1930-32 biennial report, this problem is best summarized as follows:

It is generally conceded that we are burdened with too many school districts in the various counties of the state. The Legislature can render a great service to education, from the standpoint of efficiency and economy, if it will pass a comprehensive statute under which the number of school districts in the state will be greatly reduced.

It is sometimes contended that the maintenance of schools is the exclusive responsibility of local districts. This is not in accordance with the spirit of either the Constitution of the United States or the Constitution of the State of Colorado (17).

The difficulty in providing efficiently organized school districts continued to plague the state superintendents and has not been completely solved to this day.

Standardizing Schools. Superintendent of Public Instruction Mary C. C. Bradford gained a wide reputation, extending outside the state, for her program of school standardization.

On June 18, 1914, she sent out the first Standardization Proclamation, laying her plan of scoring the schools of Colorado before the county superintendents. At the next meeting of the State Association of County Superintendents, the plan, as outlined by her, was formally adopted... and christened by her as the "Colorado Plan of Standardization." This has been called by various school authorities throughout the nation the sanest and most practical plan of standardization yet adopted in the country (18).

In her report for 1915-16, Mrs. Bradford claimed that the Colorado Plan of Standardization had already made history, earning the compliment of imitation in seven other states since its adoption. As in other states, this plan of developing levels of standardized schools through inspection and grading made a very substantial contribution to the upgrading of elementary schools. The state department continued to provide leadership for standardization.

Superintendent Bradford had been a county superintendent for 6 years before becoming state superintendent in 1913. She held office in many organizations and was an ardent supporter of women's suffrage.
The Normal Institutes. For many years the state department exercised leadership in organizing normal institutes for training teachers in the summer. By 1900, these institutes were being conducted in 13 regions of the state. The department appropriated $50 to each region to help defray the expenses, but the General Assembly had never actually earmarked money for the institutes. In 1901, the assembly passed a special act stipulating that candidates taking the county teachers examination pay a $1 fee and that the money collected be apportioned equally among the 13 regional normal institutes.

At this time, normal institutes were apparently the principal means for stimulating and upgrading teachers. One superintendent explained:

The purpose of these institutes is not to cram applicants for a teachers certificate, but to present by high class educators such matters in such form as will inspire the common school teacher with high ideals and noble purposes, and to instruct him in the methods whereby such ideals may be approached and such purposes attained. It may safely be said that no single line of endeavour is doing more to professionalize the vocation of the common school teacher than the effort put forth in the direction of the normal institute (19).

The state superintendents reported regularly on these institutes and continually stressed the need to improve them. By 1928, normal institutes were still held in the 13 regions, and, in addition to money collected from teachers examinations, they were supported by registration fees and appropriations from county commissioners. Nevertheless, in the next (1929) legislative session, the General Assembly repealed the law providing for normal institutes. The subsequent reports contain nothing further about them.

The Depression. The biennial reports for the postwar period 1918 to 1921 do not indicate any serious disruptions of the state department services or any major increase in educational problems. This was not true, however, during the Depression of the thirties. Schools were hard pressed to continue operating, and the department was forced to curtail its staff. The State Library would have had to close had it not received assistance from the federally supported Works Projects Administration. In fact, it did close for a short time in 1938.

The state superintendent reported for 1930-32 that the schools had shortened their terms and reduced teachers' salaries. In many districts teachers were unable to cash school warrants, and some teachers had not been paid at all. Despite these setbacks, the superintendent summed up the situation as follows:

Due to the careful planning of the boards of education in charge of our schools, to the attitude of our people toward public schools, and in many cases, to the personal sacrifice of both our citizens and our public school teachers, the wholesale discontinuance of schools has not yet occurred in Colorado. The future is not clear, but with the careful consideration of constructive measures by the Governor and the Legislature, I believe the united efforts of state, county and school districts, we may be able to protect, during these trying times, the educational interests of the growing children of our State (20).

In the succeeding biennial report, the effects of the Depression were evident. The superintendent lamented that "at no other time within the history of Colorado has the administration of educational affairs been attended by such precarious situations in regard to its finances" (21).

In both reports, she made strong pleas for more adequate state support for the schools.

The Defense Era, 1940 to 1960

Prior to 1940, a number of state superintendents were aware of the need to increase the state department’s services. Gradually, several superintendents, various groups, and educational leaders concluded that only by completely reorganizing the department, including the State Board of Education, could it provide the leadership needed for a twentieth-century educational system.

As it stood, the board was composed of the state superintendent, the attorney general, and the secretary of state. Although such ex officio state boards were common, there was a national trend to change to a board of laymen, chosen by popular election. In 1928, the Colorado Education Association, with the support of the Colorado Parent-Teachers Association, spearheaded a drive to establish an elective State Board of Education with the authority to appoint a state commissioner of education. They argued that such a board would eliminate the necessity for a chief state school officer to engage in a political campaign every 2 years and would be more likely to provide professional leadership in solving educational problems. When this proposal was submitted to the people at the general election, however, it received only 35 percent of the vote.

The CEA, backed by the PTA, submitted a similar proposal as a constitutional amendment in 1930, but it only received 32 percent of the vote. The Colorado School Journal charged that the proposal was defeated because the powers of the proposed board were not specific enough, and that a board appointed by the Governor would not eliminate politics. It also stated that the onset of the economic crisis had created a strong reaction, and some people feared that education would be dominated by professional educators. In fact, some people even expressed the fear that if the amendment passed, Colorado’s educational system would be dominated by the Teachers College of Columbia University (22).

The educational programs of the Depression years and World War II so absorbed the state’s time and effort...
that scant attention was given to reorganization. But shortly after the war, the CEA and the PTA, joined by the Colorado School Board Association and the Colorado County Superintendents Association, began to plan more carefully an effort to reorganize the educational structure. These associations also had the support of Governor W. Lee Knous and State Superintendent Nettie S. Freed.

In her successful campaign of 1946, Mrs. Freed had definitely committed her support to such an amendment. In addition, she promised to step aside after the amendment passed to permit the board to select a new commissioner of education. A large majority of the state’s school leaders favored this reorganization and worked actively in her campaign and later for the amendment. The following statement sums up their attitude toward the reorganization of the state department.

The organizational structure . . . in its extreme weakness has so limited the possibilities of the state department that the legislature has not seen fit to delegate adequate responsibility nor funds which would allow significant activities beyond those of teacher certification, record keeping, the distribution of state funds, the interpretation of school laws, miscellaneous advisory activities and an extra curricular type of educational leadership between election campaigns (23).

Such a large number of educators and leading lay people supported the amendment that it is not surprising that both political parties endorsed it. Both the House and Senate, by a practically unanimous vote, placed it on the general election ballot as amendment number 1. This time, in 1948, the people approved the amendment.

The new amendment provided for a State Board of Education to consist of one member from each congressional district, and one additional member to be elected at large if there were an even number of districts. A state commissioner of education, appointed by the state board, replaced the state superintendent of instruction. The amendment specifically excluded the commissioner from the state’s Civil Service.

Following the amendment’s adoption, the Legislature enacted a law to clarify and implement it. Subsequent legislation provided for board members to be nominated and elected for 6-year terms in the same manner as Colorado Representatives to Congress—they were to be political party nominees. The law stipulated that the board would appoint a commissioner of education, formulate policies for the department, adopt rules and regulations for supervising the public schools, and distribute funds to the schools. It also authorized the board to approve newly created divisions, appraise the work of the commissioner and the department, approve salary schedules, and submit the department’s biennial budget request to the General Assembly.

The law stated that the commissioner of education was to be the “administrative and executive head” of the Department of Education, but he would serve at the pleasure of the Board of Education at a salary determined by the board. In brief, his duties were to act as executive officer of the board, to keep the board advised concerning the public schools, to keep financial and statistical records, and to provide a program of research. He was to prescribe the financial and statistical forms, distribute state and federal funds, direct the preparation of courses of study and recommend their use, evaluate qualifications and issue teachers certificates, and render technical and expert assistance in school building construction. He was also required to submit to the Governor and General Assembly a biennial report, prepare and execute—with the board’s approval—a budget for the department, and establish and maintain a system of personnel administration. He was directed to carry out other legal duties and responsibilities, including those of state librarian.

This reorganization of the state board and the department marked a high point in the history of Colorado’s State Department of Education. However, setting up the constitution and legal background were merely enabling actions. Implementing these provisions and redirecting the policies and procedures provided a great challenge to the board, the appointed commissioners, the department’s personnel, and the state’s educational and lay leaders.

Staffing and Reorganization, 1940 to 1955

By 1942, there were 26 persons on the staff of the department, including the State Library (see Appendix B, Chart II). These employees were organized by areas of service: general office, accounting and records, elementary education and curriculum, certification, and bureau of home and school services. Employees of the Colorado State Board for Vocational Education and the State Historical Society were listed on the departmental chart, but only as subsidiary agencies of the state department. By law they were designated as belonging to the department, but in practice their relationship was tenuous. Until the 1962-63 school year, the vocational education board was identified as one of the three “offices” of the department, but this was a purely voluntary arrangement that broke down in practice. Actually, the vocational education board was entirely separate from the state board, and almost completely autonomous in its relation to the latter.

When the constitutional amendment on reorganization was adopted in 1948, the department’s staff, in addition to the positions listed above, included four employees in the school lunch program and a finance and research director. The state superintendent exercised administrative control with the assistance of a deputy superintendent in charge of internal office management.

The transition from the old to the reorganized state department began when the first commissioner of education was appointed in January 1951. Mrs. Nettie S. Freed,
elected to a second term as state superintendent in 1948, continued at the end of her term to hold the office in order to give the new State Board of Education time to select a new commissioner. The board finally selected J. Burton Vasche, and the new commissioner was inducted into office that July.

Vasche served as commissioner for approximately a year before leaving to accept a position in California. After an interim of 9 months, the board chose H. Grant Vest, but he held the position only until November 1959. After another interim, Byron W. Hansford was appointed commissioner and holds the office at present.

One of the new State Board of Education's first acts was to authorize a study of the proposed reorganization of the department. Under the leadership of Dr. Vest, an intensive study was conducted for 3 years, with both the board and the commissioner fully aware of its significance. It finally reported:

Three years of conscientious study of this problem by the members of the State Board of Education has clearly revealed the need for fundamental improvements in departmental organization and administration. These needs were anticipated in the legislation which brought the board into existence. In arriving at this conclusion, the board members have received and studied the suggestions of its staff. The help of leaders in the educational profession of the state and of leaders in the Colleges and Universities of the state has been solicited. The help of the Colorado Expenditures Council has been most significant. Members of the board have visited in other states observing and studying their programs. Out-of-state leaders have been consulted. The board collaborated with surrounding states in sponsoring a study of the emerging role of state departments of education (24).

The board declared that it was imperative to secure the Legislature's support in its 1954 session—particularly financial support for new positions. It recommended above all other improvements the merger of vocational education with the state department. It pointed out the "obvious limitations" in the instructional services program, especially in the supervision and leadership in elementary education. Having four people involved in the hot lunch program and only two in special education seemed to indicate an imbalance. Similarly, secondary education had only one supervisor, but vocational education had seven. The report also pointed to other areas of insufficient staffing and services.

The General Assembly did not give its support to these proposals immediately, but in the regular session of 1955, it did vote a sufficient special appropriation for reorganization to enable the department to expand considerably. During 1955, the commissioner was able to add two assistant commissioners (as proposed) and two people each in elementary and secondary education. He also was able to secure additional personnel in eight new areas of service: school plant, transportation, district organization, conservation education, audiovisual instruction, adult education, guidance services, and publications.

At this time, as the department was being reorganized and its services expanded, efforts were made in two principal directions. First, the department exerted leadership in assisting the schools to meet the challenge of the "atomic age." It stated: "The main problems which challenge us in this mid-century decade are those of adjusting our educational system and programs to the needs of a new kind of civilization based upon technology, automation and atomic energy . . ." (25). Second, the department had to awaken the citizens of the state to the importance of education in general, and to the leadership role of the state department in particular: "There is also a need for a rebirth of citizen understanding of the role and importance of education to society. If our civilization is to endure, it must use the united insights and judgments of our people collectively" (26).

During the next several years, the Department of Education directed considerable attention to lay citizen participation in educational planning. It worked closely with the White House Conference on Education, the Colorado Congress of Parents and Teachers, the Citizens Council for Public Schools, the Colorado Association of School Boards, the Colorado Education Association, and the High School Activities Association.

The general plan of the White House Conference on Education, provided for by Public Law 530 of the Eighty-Third Congress in 1955, was to hold a national conference on education, preceded by local and state conferences. Reflecting general criticism and unrest, the basic assumption was that critical problems faced the nation's schools and needed attention. Preceding the national conference, held in Washington, D.C., from November 30 to December 2, 1955, Colorado carried on a yearlong program.

The Governor appointed a committee of 60 distinguished citizens to work with the state department in planning and conducting local conferences and a statewide conference. This committee developed plans to encourage the local communities to share in the program, and to follow these local meetings with five regional meetings. At the final state conference, the deliberations of local and regional conferences were summarized and a state report prepared.

A Decade of Growing Services, 1955-65

The substantial expansion of department personnel and services inaugurated in 1955 continued throughout the decade. Further impetus was given by the National Defense Education Act of 1958 (IDEA) and the Elementary and Secondary Education Act of 1965 (ESEA). Thus, the
Colorado State Department of Education has developed into a strikingly different agency since its reorganization in 1949.

Differences are evident in the number of employees and in the organization of the education department. The number of employees increased from 30 in 1948 to 149 in 1965. The organization developed into a threefold pattern: (a) office of administrative services; (b) office of instructional services; and (c) divisions responsible directly to the commissioner. The department was offering new and timely services with the addition of consultants for automatic data processing, urban educational affairs, and designing education for the future in the Rocky Mountain Area States Project.

The department expanded services in the instructional areas in general, and in all its divisions. With the assistance of federal funds, it expanded considerably the library and school lunch programs. Federal funds also supported expansion of services in science, mathematics, and modern foreign languages under Title III of NDEA, and in guidance and counseling under its Title V. NDEA's Title X gave financial support to stimulate services in research and statistical programs.

Several special projects undertaken during the decade helped thrust the department into an increasingly important educational leadership role. A high-level group made up of selected education leaders from both in and outside the state were named to the Colorado Council on Instruction. This advisory group was charged with the responsibility of advising the department and the state board on all matters relating to curriculum and instruction in the state's public schools. It has functioned well, and one of its most valuable contributions was the development in 1962 of the publication *Goals for Education in Colorado*.

During this decade, the department also initiated a regional approach to instructional improvement. The state was divided into multicounty, multischool-district regions, represented by cooperative associations, whose purpose was to share ideas and pursue solutions to common problems in instruction. At the same time, the Rocky Mountain Area States Project, designed to give special help to small, rural, isolated schools, and supported by the Ford Foundation, expanded into the Western States Small Schools Project, which was also supported by grants from the Ford Foundation. This multistate effort, under the leadership of the chief state school officers of five participating states, has become nationally known for its new approaches to rural education.

The department also undertook the recodification of the school laws, and this was largely implemented by the General Assembly during the 1963, 1964, and 1965 sessions. Stimulated by Commissioner Hansford, a project was undertaken to study the role of state departments of education. Funded under Title V of ESEA, it eventually resulted in an eight-state project, titled "Designing Education for the Future."

The department found it difficult to attract able personnel and establish status because of the uncertainty concerning the classification of professional personnel. The State Civil Service Commission exerted considerable effort to bring them under Civil Service classification. As the result of a test case, the Colorado Supreme Court ruled in 1960 that the State Department of Education was in effect an educational institution. Therefore, its professional personnel were employees of an educational institution, comparable to employees of state colleges and universities, and thus were exempt from Civil Service.

The state board and the commissioner immediately set about raising the salaries of those positions exempted from Civil Service classification. In addition to raising and maintaining competitive salaries for the professional staff, the commissioner began to upgrade its quality by hiring relatively young and aggressive people, many holding earned doctorates.

One of the significant undertakings of the early 1960's was "Project School Child," cooperatively sponsored by the Colorado Association of School Boards, the Colorado Congress of Parents and Teachers, the Colorado Education Association, and the State Department of Education. During the first 5 months of 1964, more than 20,000 Colorado citizens participated in discussions on the schools. They displayed an intense interest in securing more information about public education and expressed opinions that may be useful in future years. Of particular significance, lay persons directed and guided all phases of the project, with occasional assistance from state and local educators, and this was one of its basic purposes—to involve many citizens at the local level in finding facts; in discussing goals, programs, facilities, and finances; and in making known their wishes regarding future educational planning.

A variety of activities undertaken by the department contributed to a major breakthrough in state-level financing of Colorado public education in the 1960's. These activities included special reports describing the financial condition of the schools and numerous regional and statewide meetings to call the attention of citizens, educators, and legislators to the financial plight of the local systems. Through such activities the department was able to increase state support by more than $20 million.

Perhaps one of the most significant pieces of legislation was the handicapped children's law passed in 1953. Primarily, through the leadership of department staff members, the proportion of public school enrollment receiving special education services increased from 2.9 percent in 1959 to 4.7 percent in 1965.

Other significant accomplishments include the creation of the research and development division to encourage research at the local level, the Teacher Certification Act of 1961, and the reduction in the number of school districts
from 478 in 1960 to 184 in 1965. There was increasing recognition on the part of the state board and the commissioner of their major responsibilities in the areas of urban education. Legislation also was passed to establish boards of cooperative services. These accomplishments all contributed to greater prestige and leadership by the Colorado State Department of Education.

THE DEPARTMENT ORGANIZED FOR SERVICE

The Department's Basic Design

From its beginning, the State Department of Public Instruction, later to become known as the State Department of Education, attempted to render a limited service to the Colorado schools that was typical of what state departments of education offered in the early 1900's. Superintendents visited school districts, issued reports, and rendered semilegal decisions. The department issued teaching certificates and initiated a system of standardization of school districts. By means of biennial reports and personal conferences, the superintendents and the department presented the interests of the schools to the Governor and the Legislature. Moneys from the public school income fund were distributed. Despite these efforts, it cannot truly be said that these leadership and service functions covered all that is implied in the accepted concept of the state's ultimate responsibility for education.

Early Colorado superintendents, aware of the need to extend more adequate services to the schools, called for additional professional staffing, particularly for supervisors in elementary and secondary education. They pointed out the need to organize school districts more adequately to meet the growing demands of American education. But they could not have conceived of the many programs and kinds of services provided today by modern state departments of education.

As already stated, change was evident in the early 1940's; there was an increase in the staff, and the department provided a few specialized services (see Appendix B, Chart II). Nevertheless, there was no wholehearted effort to exercise leadership through such services until about 1951, after the state department reorganization. In fact, it was about 1955 before adequate legislative support for increased appropriations enabled the department to effectively offer these services.

The new basic design of the Colorado State Department of Education consisted of having two principal "offices," each composed of divisions and sections. (The Office of Vocational Education was a part of the department for only a brief period.) The Office of Administrative Services (27) established in 1955, initially included only one formally organized division—that of finance and research. Consultants, rather than division directors, had rendered other services (28). In 1955, divisions were formally organized for school district organization, school plant and transportation, legal services, and school lunch. Four years later the teacher education and certification division was created. In 1964, the department placed school district organization and school plant and transportation in the new organization and management division and changed the finance and research division to the finance and statistics division.

The Office of Administrative Services served the schools in both a consultative and an initiatory capacity. It provided consultative services to local school boards and administrators and provided leadership in developing certain education topics. It conducted workshops and individual visits to help local schools institute new and desirable practices. The office offered direct services in finance and legislation to the local agencies and served as the legislative liaison between the department and the Colorado General Assembly.

In the summer of 1955, the department established the Office of Instructional Services to implement the new instructional services program. Following the appointment of Leo P. Black as assistant commissioner in charge (29), the office organized a staff of consultants in elementary education, secondary education, and accreditation and appointed a director and a consultant in special education. During the next few months, four directors were employed to direct divisions of curriculum development, elementary education, guidance services, and junior colleges and adult education (initially financed by private funds). The following year, the department appointed a director of secondary education and a director of mental health and state institutions. Concerned with improving instruction from kindergarten through junior college and in the broad area of adult education as well, the Office of Instructional Services finally included nine divisions, including the State Library for a time.

In 1957, the Office of Instructional Services was reorganized. The State Library was withdrawn to report directly to the commissioner of education, who, legally, is the state librarian. The divisions of elementary education, secondary education, and curriculum development consolidated to form a new elementary and secondary education division, and the divisions of special education and of mental health and state institutions consolidated into a new special education division.

Both the staff and services received an impetus for expansion when Congress passed the National Defense Education Act in 1958. The department organized a new section for Title III in the elementary and secondary education division to strengthen instruction in science, mathematics, and modern foreign languages. Title V-A (guidance, counseling, and testing) prompted the addition of several staff members to the guidance services division.
The Colorado State Department of Education had used advisory committees composed of educators and lay leaders even before the reorganization of the State Board of Education. Before 1955, there were state advisory committees working on school health services and on problems of special education for handicapped children. After 1955, many such advisory groups were organized, but two of the principal ones were (1) the Colorado Council on Instruction, charged with advising the board and the department on problems relating to curriculum development and instructional improvement, and (2) the Colorado Council on Educational Research, which had a comparably broad responsibility in research. During succeeding years, the department appointed numerous subject matter advisory bodies, as well as advisory committees to assist in operating programs, such as those under Title III and Title V-A of the NDEA.

Since the instructional services staff was relatively small, wherever possible it worked with the school districts on a regional basis. In the midfifties, one successful experience of this kind involved the department's participation in the Cooperative Project on Educational Administration program, funded by the Kellogg Foundation. In the 1960-61 school year, the department organized several regional instructional improvement associations. That fall (1961), the Colorado Council on Instruction developed a statewide plan entitled the Colorado Instructional Improvement Program. One of its major facets involved developing more regional associations for improving instruction—to facilitate sharing ideas and experiences and to utilize more effectively the department's leadership. Subsequently, it organized about two new regional associations each year.

After the state board reorganization, it was generally understood that the department no longer would attempt to develop courses of study except in emerging areas, such as driver education. This policy was based on the premise that the schools needed various instructional guides to assist teachers and supervisors but which would not necessarily outline the course content.

Colorado's constitution makes it impossible for the State Board of Education or the Legislature to prescribe textbooks for the schools. Thus, the state has never had a state adoption program or selected any instructional materials. The department does, however, assist local schools in making selections by suggesting ways of evaluating materials and even by preparing suggested lists of instructional materials in certain areas.

From 1955 to 1965, about every other spring the department sponsored a series of regional conferences emphasizing "Problems of Instructional Improvement." This enabled the department's representatives to contact the instructional leaders throughout the state and inform them of trends, major problems, and issues, and of some of the means for improving curriculum development and instruction (30).

After the 1955 reorganization, certain divisions were established or maintained outside the two principal "offices" described above because of their unique relationship to the state commissioner or the state board. It has already been mentioned that in 1957 the library services division was again made directly responsible to the commissioner. The departmental administration division, which served as the center for internal management, was left directly responsible to the commissioner. The publications and public information division was so directly involved in serving the entire department that, after a period in the Office of Instructional Services, it also was placed directly under the commissioner. The adult education division, set up in 1955 as part of the Office of Instructional Services, became the education beyond high school division in 1962 and was placed in the commissioner's area of responsibility by legislative edict.

**Internal Management**

During the early history of the State Department of Education, the state superintendent was principally responsible for managing the business and budgetary matters. By 1942, however, internal management had become the responsibility of a newly established deputy superintendent (see Appendix B, Chart II). The departmental administration division was then established as part of the state department after the 1948 reorganization, and a professional educator was appointed as commissioner. The assistant commissioner no longer had time for the "housekeeping" duties, so a division director (previously a deputy superintendent), Helen H. Downing, was appointed to supervise the division. Mrs. Downing has continued to serve in this capacity through 1965.

When the department decided that the division director should be a professional staff member and not fall under the classified Civil Service, the Civil Service Commission protested. The dispute finally was resolved in the Colorado Supreme Court in favor of the Department of Education.

In 1965, the Legislature specifically wrote the legal authority for this division's functions into law in the following terms: "(d) to prepare and submit to the state board a budget for the department and to properly execute the approved budget in accordance with appropriations; (e) to establish and maintain a system of personnel administration within the department" (31).

The Division of Departmental Administration was made responsible for all business activities and for preparing the annual budget for presentation to the Governor and the Legislature. Purchase orders and vouchers must originate in the division, which maintains the records of such transactions. The division also was made responsible for keeping records of appropriations and other funds available to the
department and of expenditures. The law required all departmental and accounting records to be reconciled with records in the State Division of Accounts and Controls.

The division also is responsible for preparing periodic reports, maintaining and furnishing operating supplies for other divisions, maintaining the department's stock of publications, and providing a mailing service for the department. The division is responsible for administering the department's personnel, and it maintains the records of all employees. It also has responsibility for administering and interpreting Civil Service rules and regulations and for recruiting and assigning support personnel. In addition, it purchases equipment, maintains a comprehensive inventory of all departmental property, and is in charge of two emeritus retirement programs: one for public school teachers and one for personnel from institutions of higher learning.

The influx of federal funds for various programs greatly increased the need for more detailed fiscal accounting and for inventories of the department's property. The large numbers of new employees in all areas of the department increased the division's paper work. Thus, the division's staff increased from 6 in 1952 to 15 in 1965, but its activity increased many more times in the same period (32).

**Instructional Services in Elementary and Secondary Education**

The Colorado Department of Public Instruction gave early attention to the need for particular supervisory service by adding to its staff supervisors of rural schools or elementary schools and, somewhat later, supervisors of secondary schools. During the 1940's, the department staff included a supervisor of elementary education and curriculum and a supervisor of secondary education (see Appendix B, Chart III). The division of curriculum improvement and that of elementary education were among the first divisions established after the 1955 reorganization. The following year the department added a secondary education division.

In 1957, these three divisions were combined into a single Division of Elementary and Secondary Education under Clifford Bebell. The division consisted of these six sections: elementary education; secondary education; Title III, National Defense Education Act; Western States Small Schools Project; migrant education; and conservation education. In 1964, the Western States Small Schools Project and migrant education were transferred to the new research and development division, and Raymond A. McGuire became the division director. At the same time, Title III of the NDEA was expanded to include, in addition to its services in mathematics, science, and modern foreign languages, services in English, reading, and the social studies.

Obviously, the Division of Elementary and Secondary Education provided services basic to the schools' instructional program. In a sense, these services in the various subject matter areas constituted the focus of the state's entire educational endeavor. In recognition of this situation, reorganization gradually evolved a pattern of services of significantly broad scope in this departmental division which reflected a statewide, evolving program in the state's public schools.

With state department leadership and cooperation, subject matter programs continued to develop. In his forty-fourth biennial report (for 1962-64), the state commissioner mentioned advances in individual reading, spelling, and English; developmental reading in secondary schools; and team teaching in high school English. He pointed to the organization of the Colorado Language Arts Society, as well as to the Language Arts Advisory Committee, which would assist the department. In social studies, he reported that a Social Studies Advisory Committee was giving attention to a statement of goals for a K-12 program. This committee also prepared a position statement, "Teaching About Controversial Issues," for distribution in 1964.

Schools participated in experimental mathematics programs of local design, as well as in programs developed by the National Science Foundation and some of the colleges and universities. "Twenty percent of Colorado pupils study SMSG (School Mathematics Study Group) secondary mathematics; 6 percent study UICSM (University of Illinois Committee on School Mathematics); and about 1 percent studies programmed mathematics" (33).

In science, the state department fostered the use of such programs as the physical science study committee physics, biological sciences curriculum study, chemical education materials study, and chemical band approach chemistry, all developed by national groups and sponsored by the National Science Foundation. The department initiated a "science guide" for use in grades 1 through 6, utilizing a child-centered approach. For several years the department operated a "Science Lab-Mobile" to help improve the science programs.

From 1958 to 1964, total high school enrollments increased by 40 percent, while students taking foreign languages in Colorado's public secondary schools increased by 88 percent. This was in part due to the state department's leadership in implementing Title III of the National Defense Education Act. At the same time, there were increased enrollments in foreign languages in elementary schools.

Some progress was reported in physical education and health instruction. A State Advisory Committee on Physical Education prepared a statement on teacher certification for physical education teachers, as well as a pamphlet titled "Competition in the Elementary Schools." The State
Advisory Committee on School Health prepared a statement on the "Effects of Smoking."

The Division of Elementary and Secondary Education has provided instructional leadership through conferences, visitations, and consultations in art education, conservation education, and driver education. It has directed considerable attention to kindergarten education, the use of the "continuous progress school," individual instruction, computer scheduling, and "electronic learning laboratories."

While these activities indicate that the state department gradually geared itself for effective leadership and service to the elementary and secondary schools, it is recognized that these steps are only beginnings and much remains to be done. The National Defense Education Act has rendered strong support to many of the programs. But perhaps it is fair to say that the department is effectively organized to keep pace with the ever-increasing demands of the "atomic" educational age.

Finance

From the beginning of Colorado's history as a state, the responsibility for apportioning money from the state school fund--later known as the Public School Income Fund--was assigned to the state superintendent of public instruction. This function has continued to be a departmental responsibility to the present. Among the powers and duties of the reorganized State Board of Education (1949), it was directed "to make and adopt such rules and regulations as are necessary . . . for the equitable distribution of funds as are available to the State Department of Education for distribution . . ." (34).

Until 1935, state support for local schools was limited to the Public School Income Fund, derived from state-owned school lands. Major school support, up to this time, came from local property taxes, although the General Assembly made a small appropriation in 1917 to match the federal funds available under the Smith-Hughes Act, "an act to provide for the promotion of vocational education" (35).

In 1935, the General Assembly made a token appropriation of $500 to replace local and county property taxes for school support, and as a test case to determine whether or not the state had constitutional authority to finance the public schools. In a 1937 decision, the Colorado Supreme Court ruled: "We hold that the establishment and financial maintenance of the public schools of the state is the carrying out of a state, and not a local or municipal purpose . . ." (36).

In November 1936, the state's voters approved at a general election a constitutional amendment permitting the General Assembly to levy either graduated or proportioned income taxes "for the support of the State, or any political subdivision thereof, or for the public schools" (37). The amendment's main purpose was to provide support for the public schools, but after a year the income tax funds were used for a variety of purposes. The first allocation under the amendment, amounting to approximately $878,000, was used to replace county and local property taxes. But the principle of state financing had been established, and state appropriations for the public schools increased steadily. By 1945, approximately $3,000,000 (including $800,000 from the Public School Income Fund) was being distributed to the public schools annually. By 1950, the amount had increased to approximately $10,000,000" (38).

By the 1946-47 school year, state support amounted to about 19 percent of Colorado's total school costs. Following the report of a Governor's Committee, appointed in 1950 to study school finances, the assembly enacted the 1952 Public School Finance Act. This law established classroom units as the basis for school support and defined a classroom unit as 25 pupils in average daily attendance for a school year of 172 days. Amendments to the act in 1953 and 1955 placed the distribution of funds on an average daily attendance basis.

The Public School Foundation Act, passed in 1957, incorporated the 1955-56 Legislative Council's recommendations. Classroom unit values were increased to $4,500 for nongraduates and $5,200 for graduates. Average daily attendance was continued as a basis for the method of distribution, and an objectionable "sparsity factor," which favored small schools, was eliminated. The assembly amended the Foundation Act in 1960 to include a "sales ratio factor," the ratio of assessed valuation to the actual sales price of a piece of property. Again, in 1961 and 1962, it added an "adjusted gross income factor," or amount of personal income reported to the state revenue office after withholdings. The adjusted gross income factor was added to the assessed valuation to compute a part of the Foundation Act formula until the sales ratio factor was eliminated in 1963. The assembly approved legislation establishing a "Property Tax Relief Fund" in 1965 to provide an appropriation for the relief of "school district general fund property taxes" (39).

During the fiscal year 1965-66, total state aid amounted to a little more than $69,500,000--approximately 29 percent of the total operating costs of local schools, contrasted with about 40 percent nationally (40).

Just as the assembly increased financial support to the schools, its appropriations for the state department grew from $7,750 in 1901 to $994,100 in 1965. Undoubtedly, some of this increase was due to rising costs and inflation, but most of it came through the expansion of the department's services. As Appendix C, Table I, shows, there was a steady increase in moneys available to the department, decade by decade, until the sharp jump from 1941 to 1951. This reflects the increase in departmental responsibilities. The increase was even more striking from 1951 to 1961,
principally because of the General Assembly's appropriations for the 1955 reorganization. This increase clearly reveals the citizens' recognition of the department's educational leadership.

Until 1935, when the Legislature first appropriated funds for distribution to local school districts, the Public School Income Fund provided the only state money available to the schools. Throughout the early years, the superintendent of public instruction easily discharged this duty with the assistance of whatever clerical help he had. It was not until the early 1940's that the department appointed a director of finance and research. Charles E. Hathaway, employed as director in 1947, continued by that title until the 1550-51 reorganization. Hathaway made substantial contributions to the development of records and controls for the distribution of state school funds during this period. In 1964, the division was reorganized as the finance and statistics division with Charles L. Bostrom as director.

Teacher Certification

In common with many states during the early period, Colorado relied on the counties to issue teaching certificates. In 1879, the assembly passed a law authorizing county superintendents to certificate teachers who successfully passed county examinations in prescribed subjects. In 1887, it created the State Board of Examiners to issue state diplomas (teaching certificates) based on written examination and on an "honorary basis"(41). It defined the honorary basis as "good moral character," "scholarly attainment," and "rendering eminent service" in the state for at least 6 years. However, they were sometimes issued at least partially on the basis of political expediency. Two years later, legislation authorized state colleges to certificate their own graduates.

The General Assembly modified the State Board of Examiners several times, and in 1961 changed it to the State Board of Teacher Certification. At present, it consists of the state commissioner of education as chairman and 10 persons appointed by the State Board of Education, 2 representing educational institutions, 2 lay persons, 1 superintendent of schools, and 5 classroom teachers.

Beginning in 1881, the department prepared teacher examinations and distributed them to county superintendents. The questions were subsequently published in the state superintendent's biennial reports.

In 1917, Colorado's first-class districts were authorized to prescribe their own requirements and certificate vocational, music, and art teachers. Thus, at this time there were four certifying agencies in Colorado: county superintendents, state educational institutions, the large first-class districts, and the State Department of Education.

The department's certification personnel were first mentioned in the biennial report for 1921-22 under the title, "Secretary of Certification." Apparently, the State Board of Examiners and state department personnel cooperated in issuing certificates, as the report states that "all the work of the State Board of Education, State Board of Examiners, . . . is done in this office, including . . . issuance of certificates"(42). The 1923-24 biennial report lists a "supervisor of certification," and a certification stenographer had been added by the next biennial report.

In 1923, the General Assembly passed a state certification law authorizing the State Department of Education to issue certificates on the basis of the State Board of Examiners' recommendations. The entire certification procedure also was overhauled in 1923, to give Colorado one of its biggest steps forward in the history of certification. Long-sought reforms in county certification were finally enacted, but the law did permit persons holding county certificates to continue using them. The law established academic requirements for persons wishing to renew their certificates and was so designed that it required an elementary teacher to continue working toward a permanent elementary certificate, based on 2 years of college education. The law allowed only professionally trained graduates to teach in the secondary schools.

Although the 1923 law phased out county superintendents, thus ending some of the confusion caused by four different certifying agencies, many problems still remained. The situation was further confounded by the necessity to issue "war emergency" and "dire emergency" certificates during World War II and shortly thereafter, because of the shortage of qualified teachers. The state had to lower the standards for certifying both elementary and secondary teachers.

The state law under which the State Department of Education was reorganized in 1948 stated that the "State Board of Education shall make and adopt rules and regulations . . . for the proper certification of all school personnel "(43). Rules and regulations were formulated and adopted in 1953 for certifying teachers of exceptional children, school psychologists, and speech correctionists; and in 1960 for school nurses. Certification of school administrators was established in 1957.

In 1961, the General Assembly passed an act effecting a sweeping reorganization of certification in Colorado. This law placed all certification exclusively in the hands of the state department. It was at this time that the State Board of Examiners became the State Board of Teacher Certification, responsible for examining and approving teacher preparation programs in institutions of higher learning, subject to review by the State Board of Education.

This 1961 act raised considerably the standards for teacher certification. The bachelor's degree, with the proper professional preparation, became the minimum basis for certifying elementary as well as secondary teachers. The life certificates were discontinued in favor of "professional certificates" based on at least 3 years of teaching experience and "one or more years of study and preparation
beyond the bachelor's degree . . . ." The law provided various types of "special services certificates" and provided for endorsements showing proficiencies in certain specialized areas. Similarly, the act set out the procedures for annul-ling, suspending, and revoking certificates for cause.

Otto G. Ruff became director of the Division of Teacher Education and Certification in 1959, but his assistant, Eleanor Casebolt, has served the division in a professional capacity since January 1950. The division examines credentials and issues certificates, and it works closely with the teacher training institutions in assisting the State Board of Teacher Certification in "examining and approving teacher preparation programs."

School Accreditation

Prior to 1952, the University of Colorado, like many other state universities, accredited high schools, mainly to uphold the standards of students who would enroll in the university. In 1952, at the request of the university, the state department assumed responsibility for accreditation. In its policy statement that August, the state board declared:

The State Board of Education in assuming the state program of accreditation anticipates no major change in the program in the immediate future. The policies contained in this bulletin (on accreditation) are tentative criteria to be used during the interim in which plans are being developed for a program of broadened services to entire school systems (44).

The board took a step toward broadening the program in 1955 when "it passed a resolution to the effect that the programs in the elementary grades must measure up to reasonable standards if the high schools are to be accredited" (45). Following this, it decided to make a general evaluation of elementary programs when new high schools were added to the accredited list.

In 1958, the superintendent appointed an advisory committee on accreditation, composed of 17 persons representing schools, colleges, and some of the major educational organizations of the state "to assist the state department in the expansion and further development of the accreditation program" (46). It was expected to make recommendations concerning the accreditation status of all the schools in the state.

The staff of the Division of Accreditation hoped to visit annually as many schools as possible, but definitely hoped to visit each school district every other year. These visitations were considered necessary, since the reports were inadequate.

In 1964, the accredited list included 1,172 schools, 164 unified school districts, 1 county high school district, 2 special public schools, and 25 nonpublic schools. Only 19 unified public school districts were not accredited.

District Organization and Reorganization

From the beginning of statehood, Colorado placed the responsibility for organizing school districts on the local communities. The Constitution of 1876 stated that "the General Assembly shall, by law, provide for organization of school districts of convenient size, in each of which shall be established a board of education, to consist of three or more directors to be elected by the qualified electors of the district" (47).

In 1877, the first Colorado General Assembly then delegated this responsibility to the people in the scattered neighborhoods of the raw, undeveloped wilderness. The law states that—

For the purpose of organizing a new district, the parents of at least ten children of school age residing within the limits of the proposed new district shall petition the county superintendent in writing . . . that a meeting shall be held . . . to determine the question of such organization (48).

The early settlers of Colorado were quite eager to establish schools for their children. By 1880, there were over 800 school districts in the state, and by 1935, there were more than 2,200 districts. In many instances, mining and agricultural communities developed, thrived, and declined in a few years or a decade. As a result, schools were founded, grew to considerable size, and were abandoned, leaving the districts with no schools or very small schools supported by a limited population.

Although the people recognized the need for education in the high school grades, it was very difficult to maintain grades 9 through 12 in the small rural schools. A number of the small districts found it necessary to combine to offer high school work. The law authorized "union high school districts" to organize in 1889 and "county high school districts" in 1909. These were established in numerous areas. Union high school districts, in contrast to high schools organized on a countywide basis, were formed by cooperating districts in smaller area. By 1957, there were 41 of these special high school districts in the state.

The situation was further confused by numerous but separate legislative provisions, governing boundary changes, dissolution and annexation of districts, organization of unorganized territory, and reorganization of districts. The state established a system of classifying districts into first, second, and third class, according to the pupil population.

By the 1940's, there was a general awareness that the state's district organization was chaotic and unplanned. A number of bills were introduced in the General Assembly to correct the problem. In 1947, a "county unit" bill passed the Senate but failed in the House. Two years later, the assembly passed a sweeping reorganization act providing for the election of county committees to study district
organization and recommend plans for reorganization. Vigorous opposition to the law by the Colorado School Protective Association and affiliated rural groups finally prompted the 1951 Legislature to amend it to such an extent that it was made virtually inoperative. In the meantime, at least 29 counties had reorganized.

The continuing need for more instructionally effective administrative units made it impossible to let the matter rest. In 1957 a new reorganization bill was introduced in the General Assembly. Despite opposition so strong that deadlock nearly resulted, the bill eventually was passed and provided the basis for reorganizing districts throughout the state. By the end of 1965, the total number of districts had been reduced to 184, as indicated in Appendix C, Table 2. There are still many districts too small to offer effective programs, but the state has made much progress.

Both reorganization acts of 1949 and 1957 required the department to exercise leadership. Although the responsibility for planning and implementing reorganization rested in the hands of local county committees, the organization and management division provided consultation and encouragement. The state department had a direct responsibility in only one respect: the law required all reorganization plans to be submitted to the commissioner for his approval before elections to consider them could be held.

Guidance Services

The State Board for Vocational Education initiated state guidance services in Colorado for a brief period in 1945 and 1946, when it employed a supervisor of vocational guidance, partially supported by federal funds available under the George-Barden Act.

The position then lapsed until 1949. The new supervisor changed the emphasis from vocational guidance to guidance services in general. Only a small number of schools—no more than 30 outside of Denver—employed counselors, and few of those assigned were qualified by special training.

By establishing a vigorous program of visitation and consultation, the supervisor and his staff contacted nearly all high schools within a 3-year period. He conducted regional conferences and commenced publishing the Colorado Guidance Newsletter. In cooperation with the state's teacher training institutions, an in-service training program was taken to the high schools. At the same time, George-Barden funds were used to provide a limited number of pilot programs. Progress in developing formal guidance programs in the high schools was slow, but steady.

In 1955, by agreement with the vocational education board, the state department assumed responsibility for guidance services. The transfer was based on the assumption that guidance services should continue to be broader than helping students with vocational choices and that these services logically belonged with the newly reorganized Department of Education's instructional services. H. Edgar Williams, supervisor since 1949, was transferred along with the services and continued as director of the Division of Guidance Services until his retirement in 1966.

Following the transfer, the vocational education board continued to use George-Barden funds for 2 years to support an in-service training program directed by Clarence W. Failor, a staff member of the University of Colorado.

Until 1958, guidance services continued essentially as they were before the transfer, the division consisting of the director and one clerical assistant. With the enactment of NDEA, these services expanded substantially, and the staff increased to five professional and four clerical persons. A plan was inaugurated for apportioning Title V-A, NDEA, funds to approved school guidance programs. These approved programs were selected according to standards written into the state plan and after personal visitation and inspection. Beginning with 25 approved programs, the plan expanded to a total of 60 in 1965. At the same time, stimulated by NDEA, teacher education institutions expanded their counselor preparation programs, and the number of qualified counselors increased rapidly.

In 1951, there were less than 100 secondary school counselors in Colorado. By 1965, there were more than a thousand in Colorado high schools; of this number, 600 held counseling certificates. The overall ratio of qualified counselors to pupils was 1 counselor to each 408 pupils.

A unique feature of the department's guidance program is a test-scoring service. Initiated with funds under the National Defense Education Act, the department purchased a test-scoring machine and offered its services to all of the state's schools.

Although marked progress is evident from 1958 to 1965, a number of problems have had to be overcome, such as that of finding an adequate supply of trained counselors and developing programs of guidance services in elementary schools. Particularly, it was difficult to serve the small school systems, where qualified counselors were seldom available—

While in districts with enrollments of 5,000 or more, 97 per cent of secondary school students were enrolled in schools with counselors (in 1964) ... only 21 per cent were enrolled in schools with counselors in districts with secondary enrollments of less than 300 (49).

Special Education

Special education services now provided in the State Department of Education's Division of Special Education Services are a continuation of earlier state efforts that began formally when the State Child Welfare Bureau was established in 1919. This "Act To create and establish a
Child Welfare Bureau” was designed to carry out the provisions of the Sheppard-Towner Act, passed by Congress in 1921. These state-federal matching funds “enabled the bureau to carry out a generalized public health nursing program, traveling health clinics, etc., from 1922 to 1929” (50).

The Sheppard-Towner funds were withdrawn in 1929, but a limited state appropriation continued to maintain the Bureau through 1932. In 1936, following Congress’ enactment of the Social Security Act, the State Department of Public Welfare created a Division of Child Welfare. In the same year, at an extraordinary session, the General Assembly passed a law changing the Child Welfare Bureau to the Bureau of Home and School Services and placing it as a division in the State Department of Education.

The functions of the bureau did not change significantly. It continued to be primarily concerned with educating the physically handicapped children, but it also stressed parent and safety education. In 1937, the first school for crippled children, St. Anthony’s Neighborhood House, was begun in Denver under the auspices of the State Department of Education. In 1945, the General Assembly increased appropriations for physically handicapped children. In 1948, the Evans School in Denver began two classes for mentally handicapped children. The following year, mainly through the efforts of legislator Betty Pellett, the General Assembly passed another enabling act strengthening special education by reimbursing for mentally handicapped as well as physically handicapped.

In 1953, the assembly reached a high point in its efforts to improve special education in Colorado by passing House Bill 108. This law provided "for reimbursement to local districts for excess cost of special education classes and for reimbursement of 80 per cent of the salaries of speech correctionists” (51). At that time, the assembly voted an annual appropriation of $200,000 for special education.

In particular, Mrs. Dorothy Craig Tynar, first a consultant and in 1950 the head of the new special education services division, deserves special mention for her many years of yeoman service in stimulating special education programs in the state. Miss Carey J. Downing, supervisor of the division, pioneered survey work on the need for special education. The Division of Mental Health and Institutions combined with the Division of Special Education in 1958. E. Ellis Graham, the director, provided strong leadership in expanding the services and in securing increasing legislative support for special education (see Appendix C, Table 3).

While special education appropriations have climbed steadily during recent years, they have not been sufficient to keep pace with the state’s needs, according to the claims submitted by local districts. John A. Ogden, who became director of the division in 1964, stressed this need:

But we have a long way to go. The total of 18,412 children served by some kind of special education program during the 1963-64 school year constitutes only 4.05 per cent of the approximately 500,000 children enrolled in public schools last year. Only 84 of the operating school districts in Colorado provided some kind of special education. Twenty-three of the 63 counties in the state provided no service whatever. The $1,200,000 appropriations last year allowed the state to reimburse only 53.7 per cent of the total claims of $2,230,601.41 (52).

In 1965, the General Assembly, in recodifying the school laws, wrote the Handicapped Children’s Education Act. This law effected two major changes: (1) it added the “educationally handicapped” as another category of handicapped children; and (2) it specified that reimbursement from the state would be 80 percent of the salaries paid approved personnel. The educationally handicapped, defined as those children “emotionally handicapped or perceptually handicapped, or both,” was the one large group of handicapped children not being served, so this was considered a major breakthrough. The change in the reimbursement procedures from excess costs to 80 percent of the salaries facilitated less complicated administrative procedures.

School Lunch Program

For 4 years prior to the enactment of the National School Lunch Act by Congress in 1946, the Colorado office of the U.S. Department of Agriculture’s Division of Food Distribution contracted directly with school districts for operating the food services in about 250 schools. Immediately following the federal legislation, the Colorado State Department of Education signed an agreement with the U.S. Department of Agriculture to administer the school lunch program. The department then established in October 1946 a School Lunch Division. The following year, the General Assembly passed an enabling act to allow the state to participate in the new program (53).

When the state department took over the school lunch program from the State Office of Food Distribution in the fall of 1946, 206 schools were serving an average of 24,824 Type A lunches; by 1948, 257 schools were in the program. The school food service continued to expand as more new schools included food service facilities, and many older schools either provided makeshift facilities or added to the old.

In 1965, 936 participating schools served 189,628 Type A lunches daily. At this time, all but three districts were participating, and these three were mountain districts with very few students.

Although federal appropriations for the National School Lunch Act increased from approximately $62 million to $165 million in 1965, federal cash assistance did not keep pace with the program’s growth. Thus, the federal per-pupil contribution in Colorado decreased from 9¢ to
less than 4¢ during this period. In addition to cash assistance, the Department of Agriculture donated commodities to schools, and these commodities constituted approximately 20 percent of the total food costs for the Type A lunch.

**Adult Education**

As in many other states, the Colorado adult education programs began in a few public school districts. The most notable was organized in 1916 at the Emily Griffith Opportunity School, the public school adult education unit for the Denver public schools.

Prior to World War II, the elected state superintendents did not feel that the department had any responsibility for educating adults in public schools. But shortly after the war, Marguerite Juchem, a consultant in secondary education, was charged with the task of relating the work of the department to adult education. However, her duties tended to be limited to writing reports relating to the activities of the Council of Adult Education and the Adult Education Council of Denver.

In the early 1950's, the staff of the State Board for Vocational Education, which already handled federally subsidized programs in trade and industry, was interested in promoting adult education in homemaking, but there was little contact with the Department of Education in its operation. There was also little or no participation by the department in the state's largest adult education program, administered by the Cooperative Extension Service of Colorado State College of Agriculture and Mechanical Arts at Ft. Collins. The University of Denver offered the only graduate program for preparing professional adult educators, except for one or two courses available at the University of Colorado and the Agriculture and Mechanical Arts College.

When H. Grant Vest became commissioner of education, he secured approval from the state board to study the adult education programs in Colorado and get the opinions of educational and civic leaders concerning the development of adult education programs sponsored by the public schools. At his suggestion, the board appointed an Adult Education Committee to conduct the study. Upon this committee's recommendation, the state board acquired the services of two University of Denver doctoral students to work under the direction of Roy B. Minnis, professor of adult education.

Dr. Minnis and the students collected the field data for the state committee, which in turn recommended to the state board and the commissioner that they establish a division of adult education and secure a professional staff. In 1955, the Colorado State Department of Education then became the first recipient of a National Association for Public School Adult Education (NAPSAE) grant, funded by the Ford Foundation to create a position in adult education. That same year the state board hired Dr. Minnis to be director of adult education.

The state received another grant from NAPSAE to provide moneys to local institutions for innovative projects in adult education. Among the projects approved was one for community development in Cortez, a great decisions discussion in international understanding at Mesa Junior College in Grand Junction, and a community problems and social issues discussion program at Limon. The grant also sponsored a survey of adult education needs in Lamar, community involvements for adult education programs in the newly organized Cherry Creek district, and a two-county adult education service project at Otero Junior College at La Junta.

In the midfifties, the department of education began collecting statistical data on the kinds of programs and the number of adults engaged in continuing education offered by the public schools. It was found that the school districts providing such services increased substantially, and the number of persons participating tripled or quadrupled.

During the same period, the Colorado Education Association organized the very active Adult Education Committee. It, in turn, helped develop a state organization known as the Colorado Association for Public School Adult Education, an affiliate of the National Association for Public School Adult Education.

Dr. Minnis accepted a position in adult education with the U.S. Office of Education in 1958, and the supervisor of the junior college section doubled as consultant in adult education until 1962, when Calvin Orr was appointed section head for adult education in the newly organized Division of Education Beyond High School. Orr was instrumental in obtaining funds from the U.S. Office of Education in the spring of 1964 for a cooperative research project, involving Texas, Colorado, Arizona, and New Mexico, to assess the educational needs of agricultural migrants. The staff would then make recommendations to meet the educational needs of these workers.

In 1964, the Economic Opportunity Act provided moneys to state departments of education for conducting adult basic education. In March 1965, the department developed the Colorado State Plan for Adult Basic Education, enabling the state to participate in these funds (54).

**State Library**

Since territorial days, the Colorado State Library has been considered part of the Department of Education. In 1861, the Territorial Legislature designated the territorial superintendent of common schools as ex officio state librarian (55). And, except for a period from 1865 to 1877, the chief state school officer has continued to hold this title. Actually, no state library was established until Colorado became a state in 1877, and, at this time—
It did not offer traditional public library services. Its small staff was engaged in the collection and processing of local, state, and federal documents, and in the distribution of Colorado publications to public agencies...outside the state and to offices of government, both local and state, within Colorado (56).

The General Assembly created a State Board of Library Commissioners in 1899, to strengthen and stimulate library service throughout Colorado. The commissioners, appointed by the Governor for 5-year terms, were responsible for providing counseling services to "all free libraries," helping establish new libraries, assisting in library management and control, and reporting biennially to the Governor. All libraries supported by public funds were required to report to the commission.

Through the influence of the State Federation Women's Clubs, in 1903, the General Assembly passed a law establishing a Colorado Traveling Library Commission to make, for the first time, quantity book loans. The 1929 General Assembly merged the library commissioners with the Colorado Traveling Library Commission to form the Colorado Library Commission. In 1933, however, when a new administrative code went into effect, this commission's functions were transferred to the Colorado State Library. This code also extended the State Library program to include general and extension library services.

New legislation in 1947 repealed all previous library statutes and provided for modern library services. Subsequent amendments merely changed the financing of county libraries and dealt with the State Library's advisory and financial assistance to local programs. An amendment in 1961 specifically provided bookmobile services for distributing materials. Later in the same year the assembly appropriated $100,000 for public library grants to be distributed to qualifying local units.

The services of the State Library increased substantially from 1955 to 1965 and, although not adequate in all areas, made a marked contribution to the libraries of Colorado. For instance, the State Library loaned materials to public libraries and public schools, contracted with libraries for services in specific areas, rendered reference and advisory assistance to state institutions, and offered services to state officials and departments. However, the staff considered its "consultation and advice to schools, public and state-supported libraries, and to individuals or groups of persons desiring to establish libraries...the most important service available from the State Library" (57).

Mobile units, for both service and demonstration, constituted one of the State Library's important contributions to the state, beginning with one improvised unit shortly after World War II. A unit was added in 1955, and within 5 years four units were in use throughout the state. The use of these mobile units resulted in regional and multicounty units operating their own.

The Library Services Act, passed by Congress in 1956 to promote public libraries in rural areas, greatly influenced the State Library's activities. Colorado initiated its program in April 1957, and the State Library attempted to secure personnel and facilities to serve libraries in rural areas all over the state. Involvement in the federal program did force it to make some curtailments in its services to schools and libraries in communities with populations in excess of 10,000. Although the gains are difficult to assess statistically, on the whole, the program met with substantial success with its on-the-job training, conferences and institutes, and intensive work with local and state officials.

Publications and Public Information

Throughout its history, the Colorado State Department of Education attempted to inform the public through letters, announcements, and releases to news media. Prior to the reorganization movement in the early 1950's, most of its publications were mimeographed aids and reports. No one was specifically assigned to oversee the editing and production of these materials. For many years, the superintendent undertook these publications chores personally, usually with limited clerical assistance. Later, they were performed by personnel in the various divisions.

In 1952, the department published its first newsletter, called "ADES." The brainchild of Mrs. Helen Downing, administrative assistant to the commissioner, "ADES" first appeared in mimeographed form, but was commercially printed the next year. Following closely the department's reorganization in 1951, the newsletter helped show the need to disseminate more news to the state's school districts.

Marcus Eimas, employed part time in May 1955 to assist with publications, was the department's first person in this field. The position became full time that July, and the following March, Ray E. Petersen, an Ohio newspaper reporter, replaced Eimas with the title "supervisor of publications." His duties were as follows:

Public relations and news releases are the responsibility of the Commissioner, but he is being assisted at his discretion by the supervisor of publications and others, so that educational information is more timely and complete in reaching the several news media in the state...Departmental publications have mounted in stature and significance, and the supervisor of publications has developed into a fulltime job for the preparation and assembling of copy, editing, proofreading, and layouts necessary to put materials into printed form (58).

When E. Dean Coon succeeded Petersen in 1961, he became director of the new Division of Publications and Public Information. Four years later, funds from the Elementary and Secondary Education Act enabled the division to employ another professional person, K. Douglas Bassett.
As the division developed, it assumed broader responsibilities: facilitating communication between the department and public schools, and using a variety of media to inform the general public of the status and needs of the public schools. These functions, discharged through publications of instructional guides, statistical reports, and periodicals, are designed to improve the schools' educational program.

The division assists and instructs department staff members and administrators in planning, writing, and editing materials. Its staff also handles printing jobs, edits a biweekly newspaper, and writes news and feature articles. In addition, the staff also assumes some responsibility for helping school people improve publications and public information, and tries to inform journalism teachers of trends, current practices, innovations, and curriculum materials in the field (59).

Research and Development

The state department first used the word research for a staff title in 1945, when it employed a director of finance and research. In 1954, following the reorganization, a Division of School Finance was created, but research did not share in the title. The Division of Research was officially established 2 years later, but its work was almost entirely statistical. Three years later, a department reorganization resulted in a Division of Research and Statistics.

By 1955, educational leaders were expressing a concern for improved educational research. Representatives of institutions of higher education, school administrators, school boards, teachers, and the state department discussed the matter and finally agreed that some kind of cooperative research council should be organized. It was 4 years later, however, before a committee representing these groups met with the State Board of Education to propose that such an educational research council be established through the initiative of the Department of Education, which would serve as its official home. The committee further recommended that the department's research and statistics division be expanded to engage in more statewide educational research. The board agreed to consider the matter fully.

By April 1960, the committee formally drafted a proposal calling for the establishment of a Colorado Council on Educational Research to be "an official organization, the members of which will be appointed by the State Board of Education to serve as an advisory committee to the State Department of Education on matters relating to educational research" (60). Appointments to the council were made from a list of persons nominated by agencies, institutions, and professional organizations interested in educational research, including all institutions of higher learning, all legitimate professional groups, certain school districts, and appropriate state agencies. In the same month, the state board agreed to appoint members to the council upon receipt of nominations from groups planning to participate.

Four years later, the functions of research and statistics were separated and the research and development division established. Two cooperative research projects and the Western States Small Schools Project were assigned to this division. At the same time, the Colorado Council on Educational Research was disbanded, and a Research and Development Advisory Committee was established.

The Division of Research and Development assumed more and more tasks. Following the enactment of the Elementary and Secondary Education Act in 1965, it became responsible for the administration of Titles III and IV. It also became responsible for stimulating state research activity in all areas of education, helping determine the areas in which research was needed, and encouraging local districts and teachers to undertake research and experimental activities. It encourages statewide coordination and cooperation with all educational agencies. Division members write research proposals and assist others in doing so, seek funds for research, present proposals to the U.S. Office of Education and to foundations, analyze and evaluate educational research, and disseminate its findings (61).

Legal Functions

State superintendents have always been expected to give answers to legal questions about educational matters. Since the attorney general was a member ex officio of the state board in its early history, involved legal questions were referred to his office, and the same is true today. However, the state superintendent was specifically designated to answer legal questions, and more often he personally handled them during the early days of the department.

The Division of Legal Services was created in 1932, when Lucy C. Auld joined the department as deputy superintendent of instruction. Mrs. Auld, later administrative assistant to the commissioner, handled these problems for the commissioner and in 1958 became director of school legal services.

The legal division was created to provide information found in the statutes, in case law, and in administrative rulings to any person or entity requiring it. This division also interprets the law.

The legal division gives information and advice by letter or telephone, and indirectly through department personnel, school district and county offices, and publications. Its staff also assists other department personnel to serve school districts. In addition, the division compiles educational legislation annually and assists with legislation in which the department is interested (62).

State-Federal Relations

The federal government's increasing participation in education has had marked effects on the Colorado State Department of Education. While the department recognized the
great need for statewide leadership in curriculum development and in instructional improvement, sufficient state funds were not available. Furthermore, the overwhelming need for district reorganization from 1945 to 1965 overshadowed these curricular and instructional needs. But funds under the National Defense Education Act enabled the department to employ staff specialists in critical subject areas, in guidance and counseling, and in statistical services. With increasing momentum, the department became a leader in curriculum reform and was able to assist local school districts in their instruction.

The Library Services and Construction Act enabled the State Library to give more help to public libraries and local school districts in developing comprehensive library programs.

The unique history of the state, with particular reference to its intense commitment to independence and individualism, caused many of its citizens to question the increasing participation of the federal government in education. The need for a clarification and understanding of the proper roles of local, state, and federal agencies was pointed out by State Commissioner of Education Byron W. Hansford as follows:

We need a true partnership of local, state, and national interests to bring about the dramatic improvements that are urgently needed in American education; but this partnership must be based on mutual respect and goodwill. The partnership must not be dominated by one level (63).

ORIGIN AND EARLY DEVELOPMENT OF PUBLIC SCHOOL EDUCATION

For the better training up of youth in this towne, that through God's blessings they may be fitted for publicque service hereafter, either in church or comonweale, it is ordered, that a free schoole be set up, & the magistrates, with the teaching elders are entreated to consider what rules & orders are meete to be observed & what allowance may be convenient for the scholarers care & paynes, wch shalbe paid out of the townes stocks (1).

Thus the New Haven Colony Records of 1641 describe the origin of the first free school in America. The Hartford Colony took similar action soon after.

In 1650, this “town” action was followed by “state” action when the Connecticut Colony adopted provisions for education as follows:

Forasmuch as the good Education of ChAdren is of singular behoofe and benefitt to any Common wealth, and whereas many parents and masters are too indulgent and negligent of their duty in that kinde; It is therefore ordered by this Courte and Authority thereof That the Selectmen of every Towne, in the several precincts and quarters where they dwell, shall have a vigilant eye over their brethren and neighbours, to see first, that none of them shall suffer so much Barbarisme in any of their families as not to endeavor to teach by themselves or others there Children and Apprentices so much Learning as may enable them perfectly to read the English toungue, and knowledge of the Capitall Lawes, uppon penalty of twenty shillings for each neglect therein;... (2).

The order continued with the stipulation that each town with 50 or more families should establish an “elementary” (common) school and that towns with 100 or more families should add a “secondary” (grammar) school.

By 1700, the system of public instruction embraced these elements:

a tax of “forty shillings on every thousand pounds of the lists of estates” was collected in every town with the annual tax of the Colony, and payable proportionately to those towns only which should keep their schools according to law;

A school in every town having over seventy families, kept eleven months in the year, and in every town with less than seventy families, kept for at least six months in the year,

A grammar school in each of the four ‘head county towns’ to fit youth for college, two of which grammar schools must be free, and

A collegiate school toward which the General Court made an annual appropriation (3).

The evolution of the school district is interesting to trace during the next century and a half. Schools were established, provided for, and regulated by town governments until 1712. Parishes or societies were then recognized, but only as subdivisions or virtually school districts of the towns. In 1750, societies and towns were given almost equal powers in conducting school affairs. By the close of the century, the school societies superseded the towns and took entire charge of the schools. In 1856, the societies were abolished and the towns (as school districts) restored to their original place in the school system. Thus, school districts existed for all practical purposes as early as 1725 but were not recognized by law until 1766. They were given corporate existence in 1794 but were not fully endowed as bodies corporate until 1839.

The earliest mention of state supervision appears in a committee report to the House of Representatives in 1826. It stated:

With a view to invigorate and improve the system, the committee recommends the appointment of a superintendent of Common Schools, whose duty it shall be to recommend suitable books to the adoption of school visitors, and such modes of instruction and government as he may deem most expedient; and from the reports of the several school societies, to prepare and present to the Legislature, annually, a report, so far as he may obtain information, showing the actual condition of every common school in the State, together with his proceedings for the year (4).
But 12 years elapsed before such a provision became a reality. In 1838, the General Assembly passed “An Act for the Better Supervision of Common Schools,” creating a “Board of Commissioners of Common Schools”—in effect, the first state board of education, but not so designated until 1865. The act had been introduced by a 26-year-old member of the assembly, Henry Barnard, who supported it with brilliant speeches based upon firsthand information. Authorized to appoint its own secretary, who was to be in fact the state commissioner of education, the board selected Barnard. The wisdom of this choice is now legend in Connecticut, in the United States, and, indeed, in much of the civilized world.

In his new job, he worked without letup—especially in his search for facts. His first report to the Legislature in 1839 was based on inspections of more than 200 schools, attendance at school conventions of every county in the state, and correspondence or interviews with two-thirds of the state’s teachers. The report itself gave a depressing picture of conditions—including poor schoolhouses, short school terms, low pay scale for teachers, no fixed courses of study, and poor supervision of teachers. As the need for reforms became apparent, town after town upgraded its school system. Connecticut began to gain attention as a state interested in educational improvement, and Henry Barnard became known throughout the land as a crusader for popular education. He and Horace Mann of Massachusetts (1796-1859) share the credit for laying the foundation of the public school system.

However, the trial-and-error period which characterized the board’s early years antagonized a great many people. After 4 years, a reactionary state legislature abolished the board and the office of secretary. No board existed for 23 years. Barnard moved into Rhode Island and a better job as state commissioner of public schools. For the next 5 years he performed the most concentrated work of his life, holding more than 1,100 meetings, making over 1,500 speeches, and organizing numerous training institutes for teachers.

In 1845, the need for state leadership became so apparent in Connecticut that the position of superintendent of common schools was created to exercise general supervision over the common schools, to collect information from “school visitors” (5) and other sources, to prepare and submit an annual report to the General Assembly about the condition of the common schools, to plan and make suggestions for improving the common schools, and to handle all matters relating to the interest of education. The statute provided for the position to be held by the commissioner of the school fund, an office established in 1795.

Meanwhile, Barnard’s labors in Rhode Island had not passed unnoticed in Connecticut. When he resigned in 1849 after working himself to the brink of collapse, Connecticut offered him two jobs—as state superintendent of schools and as principal of the new state normal school in New Britain. Barnard accepted readily. His own state now seemed ripe for some real educational reforms, and the normal school had been one of his long-time dreams. He had recommended its establishment in his report to the Legislature in 1841.

During his second tour of duty on the educational firing line in Connecticut, this compelling orator, whose keen intellect was backed by a formidable arsenal of facts based on firsthand study of school conditions, launched the most extensive drive that had yet been made for the betterment of public education in his state. He spoke out for kindergartens, a radical idea at the time. He pushed for reforms that gave the educational profession new stature and urged the consolidation of school districts.

In 1855, Barnard resigned as state superintendent to found and edit the American Journal of Education, a periodical designed to offer the best educational thought, both past and present. He had established a pattern that kept his successors busy, so busy, in fact, that it was difficult for the principal of the state normal school to continue as superintendent of common schools, the heavy duties limiting the efficiency of both. Dissatisfaction became so widespread by 1865 that the General Assembly, in effect, re-created the board of commissioners, calling it the Board of Education, and provided for the appointment of its own secretary as in the original 1838 statute. The assembly also reenacted the board’s policy-making power.

While changes in the number and method of selecting its members have occurred over the years, the board has existed continuously since that time, and its scope of activity has widened to include such responsibilities as the selection of personnel necessary for administering its programs (6). The board’s broad duties as described in the statutes today reflect the committee report of 1826:

Sec. 10-4. Duties of board. Reports. Said board shall have general supervision and control of the interests of the state in elementary and secondary education; may direct what books shall be used in all of its schools, but shall not direct any book to be changed oftener than once in five years, all prescribe the form of registers to be kept in said schools and the form of blanks and inquiries for the returns to be made by the various boards of education; shall keep informed as to the condition and progress of said schools and shall seek to improve the methods and promote the efficiency of teaching therein by holding at convenient places in the state, meetings of teachers and school officers for the purpose of instructing in the best modes of administering, governing and teaching public schools and by such other means as it deems appropriate and shall perform such other duties as are specifically imposed upon it by law. Said board shall submit to the governor, as provided in section 4-60, a report containing an abstract of the returns made to it by the various boards of education, a
detailed statement of the doings of the board and an account of the condition of the public schools and of the amount and quality of instruction therein and such other information as will apprise the general assembly of the true condition, progress and needs of elementary and secondary public education, and may publish such reports and information concerning the educational interests of the state within its jurisdiction as it deems advisable.

Early decisions have had a profound effect on the way public education evolved in this century. Because the schools were established for all children, greatly increased enrollments have been accepted without serious challenge. Even the establishment of new programs and the extension of the privilege of free education to older youth have been accomplished within the original philosophy of education in a democracy. Also, the provision for both state and local responsibility has strengthened the system.

Local control of education, a policy established in the colonial period, has been both salutary and harmful. It has encouraged support and initiative by keeping education close to the people. Also, curriculum by statute has been avoided largely because of this concept. On the other hand, lack of local vision has resulted in the rejection or delay of many desirable innovations. Connecticut’s relatively low rank among the states in state financial support of the schools is due in no small measure to the tradition of local autonomy. Only in recent years has the state share of the cost increased to any considerable amount. Likewise, state accreditation of elementary and secondary schools, both public and private, has never become mandatory; the State Board of Education has established standards, but their use is entirely voluntary. This, too, is a reflection of the independence of the people.

Other such effects of early decisions on the educational scene are still to be found on every hand. To a considerable extent, they condition the policies of the state board and the activities of its staff.

PATTERNS OF ORGANIZATION

The State Board of Education supervises a complex State Department of Education, composed of 5 administrative divisions and 13 bureaus, and employing a full-time staff of 1,555 persons. The board operates 14 high-school-level vocational-technical schools and 4 college-level technical institutes, with a combined enrollment of 9,000 full-time students, as well as a school for the deaf.

Through these facilities and staff, the board provides educational services to the state’s public schools, which currently enroll 600,000 elementary and secondary school youngsters. This was not always the case, however. In 1900, when the total public school enrollment was only 155,000 students, the board had much more limited functions. The report made by the secretary of the board to the Governor in 1900 dealt with statistics, attendance, law enforcement, teacher certification, elements of a common school education, normal schools, high schools, kindergartens, school libraries, town management of schools, eyesight tests, conveyance of children, and free textbooks.

No complete roster of employees has been found, but documents refer to seven “agents,” known legally as “compelling officers,” whose principal duty was to enforce the compulsory attendance law. Although probably not listed as such in a pattern of organization, at least four departmental units were operating under the secretary’s supervision: attendance; county homes; normal schools at New Britain, Willimantic, and New Haven; and public libraries. By the end of the decade, responsibility for teacher certification and for the New Britain and Bridgeport trade schools had been added.

The records indicate a new pattern after 1920 (8). The board organized its functions and services into larger units, such as elementary and secondary education, and added others not listed earlier: Americanization, transportation, employment certificates, vocational agriculture, and finance. It also created new titles, such as director and inspector, and employed 23 supervisors for specialized services. A more refined structure was apparent by 1930, and, as the charts in Appendix B indicate (9), by the end of the next 10 years the state board and its secretary were clearly attempting to develop a functional organization. There was a definite division between administration and instruction. When the Council of Chief State School Officers published in 1952 The State Department of Education, “a statement of some guiding principles for its legal status, its functions and the organization of its service areas” (10), Connecticut’s department used it as a guide to effect a major reorganization the following year. In most cases, it designated broad responsibility areas as divisions, subdividing these into bureaus. It substantiated the position of deputy commissioner (assistant secretary of the state board) authorized by an earlier statute but not filled until 1946, and it listed technical institutes which were formed as early as 1946 in response to demands from World War II veterans.

Changes in the professional titles clearly indicate that the reorganization also recognized the shift in emphasis from regulation to advice or consultation which had taken place from 1940 to 1953. For instance, titles such as senior supervisor, junior supervisor, and interviewer were replaced by consultant, associate consultant, and service specialist, respectively. Bureau heads became chiefs, and division heads became directors (11).

By 1960, the reorganization had been refined to include most of the recommendations in the Chief State School Officers’ bulletin. Vocational rehabilitation still retained its bureau status, but had been separated from vocational education. The Mystic Oral School for the Deaf,
transferred to the state board in 1959, is listed in the organization chart as a separate unit, not as a division or bureau. The divisions created in 1953 still operate, but the bureaus within them had been modernized, new bureaus added, and a number of names changed. For instance, the administrative services division now consisted of a school buildings bureau, a federal-state-local relations bureau, a research, statistics, and finance bureau, and a rural services bureau.

The General Assembly enacted laws in 1965 affecting the department in a major way. It transferred the jurisdiction of the state colleges from the Board of Education to a newly created Board of Trustees of State Colleges under a new Commission for Higher Education. It also transferred the Public Library Service to the State Library Committee and elevated the Bureau of Vocational Rehabilitation to division status. At the same time, it appropriated $10 million for a 2-year period for the education of disadvantaged children. One significant change resulting from this new organization was the creation of an Office of Program Development to administer the state act for disadvantaged children and Titles I and III of Public Law 89-10, the Elementary and Secondary Education Act of 1965.

During the many years that the four state colleges were under the jurisdiction of the state board and department, they had grown remarkably, their enrollment topping 9,000 full-time students by 1965. All had started as normal schools, later became teachers colleges, and finally were transformed by the 1959 General Assembly into state colleges with liberal arts programs. In creating a new agency to coordinate all public higher education activities, the General Assembly of 1965 followed the recommendations of a U.S. Office of Education study team which suggested that Connecticut conform to the practices of other states, such as Arkansas, California, Illinois, Missouri, Pennsylvania, and South Carolina, which had in recent years set up organizational structures apart from their departments of education to coordinate higher education. With these changes, the department took on a new look, as revealed in Appendix B.

**STATE PROGRAMS AND SERVICES**

Many activities have characterized the work of the department in this century. Some of the early programs diminished in importance, some expanded dramatically, many new ones have been added. The following brief descriptions of the individual programs, the department’s contributions to strengthening public education, reflect these changes. They are arranged by the major categories of administrative services, instructional services, vocational education, and vocational rehabilitation.

**Division of Administrative Services**

**Interpretation of Statutes.** In an era when there was little financial assistance from the state, communities determined their own school policies, adjusted curriculum to the extent of their own resources, expanded as they were able, and gave little attention to the Legislature or its regulatory arm. With the increase in state support, the expansion of population, the growing classroom shortage, the increasing need for more transportation in consolidated districts, rising costs, and greater curriculum demands by parents, people became increasingly aware of legislative activities. Pressure groups, unwilling to accept sterile, conventional patterns of schooling, sought state support for expanded and expensive services. Youth, compelled by law to stay in school, found the ordinary college entrance programs ill adapted to their requirements.

Mass education and the development of group testing pointed to many deficiencies in the pre-1910 selective schooling. Slow to catch on, the schools were forced by the Depression of the 1930’s to reappraise their whole outlook and practice. World War II gave an awakened and disillusioned GI the determination to make a place for himself and his children in the new technical civilization. The laissez-faire attitude of the community was forced to give way before unprecedented pressures. The hortatory statements of commissioners and other departmental leaders appear to have resulted in legal citations that evidenced more direction but little compulsion. Also, in the 1940’s and early 1950’s, there were actual legal opinions reflecting not only the law but the position of the courts.

Increasing financial support by the State Legislature forced more attention to the local boards’ legal duties and powers and relations to their municipal governments, especially to the finance committees. Legal questions were raised as teachers sought support from the state in their efforts to exercise more influence. Legal considerations also were involved as the state began subsidizing and exercising more and more authority for school buildings. Adult education became a legal problem rather than a matter of family cooperation. Nonpublic schools found federal court rulings troublesome.

The commissioners’ writings, succeeded by the legal opinions of department members competent to give them, were replaced by reports of experts in school administration who “interpreted” the statutes, searched and relayed the court judgments, and advised on practices where the law was not specific. More commonly in the last 15 years, a state assistant attorney general has been assigned to legal questions reflecting more and more authority for school buildings. Adult education was involved as the state began subsidizing and exercising more and more authority for school buildings. Adult education became a legal problem rather than a matter of family cooperation. Nonpublic schools found federal court rulings troublesome.

**Educational Finance.** The enumeration grant, established in 1871 when all towns were paid 50 cents per enumerated child, applied to all towns generally and has had the longest
operation span of any, continuing into recent times. The amount was originally set at $2.25 per child, and it remained at this figure until 1945 when it was increased substantially. The teachers' salaries grant, instituted in 1903, was probably the most important during the early 1900's. Until discontinued in 1947, it was related to the fiscal condition of the town as measured by its assessed property valuation. The pattern of state aid for pupil transportation is noteworthy in that the present provisions are very much the same as they were in the early years of this century. In general, the state has provided one-half the transportation cost within certain specified limits.

The modern history of the state's aid to education began in 1947. Nine of the old specific grants were abolished, and a new general one established, based on a sliding scale from $110 per pupil for the first 100 to $30 per pupil in excess of 750. The significance of this new act is reflected in an increased cost for the first year of nearly 70 percent.

Numerous changes have been made since the aid formula was first adopted, and the amount per child expanded dramatically. For example, the 1965 General Assembly set up a formula under which each town received $170 for each of the first 300 pupils in average daily membership, $150 for each of the second 300 pupils, and $120 for each pupil above 600. Concern for the plight of "bedroom towns," where heavy growth in school enrollments resulted in unusual increases in school costs, prompted legislators to add a new factor to the formula: an extra grant for the growth in school enrollments during a 10-year period. As a result, the state aid, which ran to about $11 million in 1947, was up to $75 million by 1965.

There has been considerable discussion—but so far no definite action—about a system of state aid related to the fiscal resources of the individual school districts. In 1907, 1927, and 1954, commissions were appointed to draw up such a plan, and the State Board of Education and legislative committees have undertaken several studies. The department's 1963 proposal to tie major support for local education to an equalized grand list failed for a variety of reasons. For one thing, it referred to public school pupils only, and, in large cities where some 30 percent of the pupils are in nonpublic schools, the grand list for public schools was inflated. Furthermore, while larger towns were providing a variety of costly municipal services, smaller towns were not, thereby enabling the latter to devote their property taxes largely to education. Towns with any type of fiscal advantage were fearful that the equalized grand list concept would be extended to other services. And lastly, the plan was part of an omnibus state support bill, which meant that opponents of any part took aim at the whole bill.

In recent years, the trend has been to bring the upper and lower limits of the grant formula closer together while increasing the amounts. The 1965 action, creating no more than three pupil categories and a difference of only $55 between the top and bottom amounts, illustrates this. Support for educating exceptional children has grown extensively as the General Assembly has continued to place new responsibilities on the towns. Local boards must now provide opportunities for physically handicapped and mentally retarded children and, beginning in 1967, be required to do so for children who are emotionally or socially handicapped. The grant for the physically handicapped amounts to two-thirds of the cost, and for the other categories the school district is paid an additional 150 percent of the established grant.

Research and Statistics. A new research unit was established in 1930, staffed by a director and a research associate. Up until 1938, research was actually considered a minor function in the department and was assigned to the office of finance and research since most of it was statistical. When the department was reorganized in 1955, the administrative services division included a research bureau. Four years later, a reorganization broadened the bureau to include statistics and finance.

The department's services in research increased when federal funds became available. This money made it possible to use data processing for more extensive activities, and by 1965 the professional staff had grown to four. The department's research is supplemented by research related to vocational agriculture conducted by a division of vocational services which established such a unit in 1953.

School Buildings. In the early 1900's the state board maintained a bureau of building construction and maintenance, whose chief concern appears to have been matters of health and safety. An inspector checked on lighting and heating arrangements for schoolhouses and made sure they were sanitary. The law provided that when further or different sanitary provisions, or means of lighting or ventilation, were required, they may be achieved "without unreasonable expense," and the state board may have the local health authority order the necessary changes.

In its 1924 annual report, the state board noted that the majority of towns were anxious to cooperate with it and that sanitary conditions showed marked improvement. The board was attempting to furnish leadership by working with the school districts on a voluntary basis through its survey unit, which studied local school systems, considered school building needs, and encouraged some towns to make plans for new buildings. Progress was rather slow, however, as indicated in the board's 1928 report: "As a result of the constant urging of this bureau (building construction and maintenance) we have a new school in Niantic. In this case we have labored for ten years. The result is good" (13).

The law provided that no new schoolhouse could be built except according to a plan approved by the board of school visitors and by the district's building committee, the
state board having no authority to require state approval. It was amended in 1931, however, to require that a copy of plans and specifications for any new construction be filed and approved by the state board, thus necessitating the employment of a supervisor of school buildings. In 1941, a building code was adopted. In the foreword to the code, the director of supervision bureau noted: "Not only have requirements for approval been included but also many suggestions concerning desirable practices. The department regards its activities under this law as primarily a service rather than as a regulatory function" (14).

Although responsibility for supervising construction remained with the state board until 1949, when the General Assembly initiated a system of state aid for school buildings 4 years earlier, it created a separate agency, the Public School Building Commission, to handle it. From 1945 until 1953, therefore, new construction had to be approved by both this commission and the state board.

Finding it cumbersome for two state agencies to share responsibility, the assembly abolished the Public School Building Commission in 1953 and transferred its functions to the board. Six years later it passed a law establishing a School Construction Economy Service to work with a board-appointed advisory committee in providing districts more services designed to promote economy and efficiency in constructing new school buildings. This law also required that the board establish standards, review the plans and specifications in the light of these standards, and then report directly to the districts.

School building grants were substantially increased during this period, reaching their highest point in 1965 when, based on building capacity, per-pupil grants were set at $700 in the elementary school and at $1,100 in the secondary school. In the 20 years following passage of the first school construction aid law in 1945, over 1,300 school building projects were completed at a cost, exclusive of sites, of nearly $600 million, the state assuming a liability of more than $200 million.

Public School Transportation. Connecticut has transported students to its schools at public expense for over 70 years, the first act in 1893 stating that when a school was discontinued, the school visitors might provide transportation of children to and from another school. Ten years later, the Legislature put teeth into the law by setting age limits and approving the phrase "illegally and unreasonably deprived of schooling." The law also established appeal machinery, making this phrase the basis for an appeal to the State Board of Education. After the board eliminated the limitation to discontinued schools in 1909 and applied the law to all schools, the transportation statutes remained virtually unchanged until 1931. In that year, the age limit was lowered from "over seven" to "over six" to accommodate 6-year-olds for whom the local board was required to provide an educational program, the "over seven" conforming to the compulsory school age (15). At the same time, the law allowed the superior courts to receive appeals from the state board’s findings.

During World War II, the state board responded to an Office of Defense Transportation order to conserve mileage and gasoline by ruling that in hearing appeals for school transportation it would require 1.5 miles for grades 1 through 8 and 2 miles for grades 9 through 12 as reasonable walking distances. When the war ended, this ruling was terminated, and each case is now considered individually.

Prior to 1957, the board issued findings in transportation hearings based on distance only, but since that date it has ruled that the element of hazard must be taken into consideration. Under Public Act 547, the General Assembly enacted legislation in 1957 wherein by referendum any municipality or school district could provide transportation for children attending private schools. Electors in several towns have voted on this issue and in most cases have approved it.

Teacher Certification. Prior to 1923, local school boards examined, licensed, and employed teachers, giving certificates (later recognized by law) valid only in the districts issuing them. In an era of local control and largely immobile population, this had been acceptable; but schools became ingrown, teaching parochial, standards lax, and school board practices capricious if not chaotic. There were many arguments for greater state control to improve the schools by centralizing the certification of teachers. Finally impressed, the Legislature cited a law in the early 1920's with a basic normal school standard of education as the criterion for professional preparation and efficiency.

A teacher surplus during the Depression created an excellent excuse to raise standards, and many predicted that in the near future the bachelor of arts degree would be required of all public school teachers. Normal schools were rapidly becoming teachers colleges. Proponents of a college degree for teachers continued to gain strength, so that by 1940 such a requirement had been added to the certification standards. Following World War II, during a period of teacher shortage, there were efforts to reduce standards, but education interest groups stoutly maintained pressures to keep them at a high level. The administration of these regulations enabled the state to attract more good teachers than would have been the case if lower standards had been adopted.

The original legislation requiring the state board to establish rules for teacher certification is essentially unchanged, but the regulations have developed both to provide leadership and to reflect improvements in teacher preparation and the needs of local schools. As patterns of preparation and school usages become more complex in our modern society, regulations need a continuing study revision and proper administration in order for the state to enable professional personnel to perform a high caliber of work in good schools.
School Lunch Program. In reflecting on his childhood, Mark Twain concluded with perfect childish delight that the best part of his school day was the lunch recess. Whether his lunch recess had any educational values may be open to question, but Twain has no trouble stimulating the reader's nostalgia, and we withhold any condemnation of the good ol’ days.

The prices of foodstuff rose during the First World War; farmers opened vast new lands to feed our own troops and to support our allies, and Hoover was able to rescue millions in Europe and the Near East from starvation. This “war boom” so expanded the capacity for agricultural production that surpluses accumulated. In the aftermath of the war and following the 1921 depression, the country began a long era of prosperity.

While city children lived only a few blocks from school and walked home for lunch, children in the country were watching their “consolidated schools” rising some distance from their farms, diminishing the customary conveniences of the old local schools. As more and more children went to school by bus, toting a sandwich and apple became a familiar practice. As the central schools grew larger, children came to them from greater distances, the hours spent away from home were longer, and the time from breakfast to lunch became a matter of considerable importance to the appetites and health of growing children.

The public’s growing concern for the nutritional needs of rural schoolchildren was not lost on the Legislature, which not only looked at the conditions in the schools, but also kept in mind the agriculture surpluses. Among the laws passed in 1923, one empowered the local boards of education to provide “lunches for school teachers and children.” Ironically, the cities took advantage of this to a greater extent than the rural areas.

Connecticut did not employ a state lunch supervisor until 1943, but was still one of the first states to prepare for the inevitable National School Lunch Program 3 years later. From an initial 125 programs, the number increased to 350 by 1948, requiring the employment of an assistant supervisor. Within 7 years, the state board published a notable guide specifying directions, menu suggestions, accounting procedures, and a broad suggestion that this growing business was not for amateurs (16). The number of programs had doubled by 1965.

The spring following Congress’ enacting of the 1955 Special Milk Program, Connecticut began an experimental program to study the effect of price on participation. It decided to take part, and this project has grown until there are nearly 1,200 of the special milk programs in operation. During the past quarter century, the department has attempted to upgrade food-service workers, train leaders, systemize accounting and reporting, and has conducted experiments in group purchasing. It is developing automatic data processing, menus are continually revised, food-service rooms and equipment are being improved, and the program continues to expand with no end in sight.

Public Information. In the 1930’s an editor was employed and attached to the office of the commissioner to assist in the secretarial work and publish a monthly newsletter of four to eight pages, entitled “The Board of Education.” A publicist, mainly concerned with the preparation of news releases, was added in 1949. Although the department did not have a program broad enough to respond to the great increase in public interest in education, it did develop a news service, publications, and a general informational service.

When Title V of the Elementary and Secondary Education Act of 1965 provided funds for improving services in communications, the department established an Office of Communications with a staff of four persons. This unit developed a planned, continuing method for supplying news on education to the newspapers throughout the state and improved the format of the department’s publications. Procedures are under way to assist staff members to produce more effective publications. Title V also has enabled the department to purchase large quantities of equipment to assist in developing stronger communication among the staff, local school systems, and the public.

Teacher-Board of Education Mediation. The department’s mediation activities originated about 1946 when the commissioner intervened in several salary disputes between teachers organizations and local boards, some involving strikes or threatened strikes. The Connecticut Supreme Court of Errors, in the case of Norwalk Teachers Association v. Board of Education of the City of Norwalk, ruled in 1951 that teachers as well as other public employees could not strike (17). A committee was appointed to study the working relationships between boards and teachers organizations. This committee issued a preliminary report in 1952, which was approved by the State Board of Education 5 years later after several revisions. It established principles and procedures for dealing with situations where teachers and boards could not reach agreements (originally referred to as “impasses” and later as “persistent disagreements”).

The General Assembly approved Public Act 298 in 1965, requiring boards to negotiate with individuals chosen by teachers to be their exclusive representatives, naming the commissioner as the mediator, and calling for nonbinding arbitration if the issue could not be resolved any other way (18). During the school year 1962-63, teacher organizations sought recognition under the law in 101 of the 177 districts, 76 being “designated” by action of the board of education, 25 by means of a referendum. The secretary also received requests and mediated in 16 cases. This developing function of state boards of education may become a significant force in teacher-board relations.
Rural Supervisory Services. The state board has provided special administrative and supervisory services to local boards for many years. As early as 1903, the General Assembly authorized supervising agents (superintendents of schools) for districts of two or more towns employing not more than 25 teachers each. They were paid by the state, but subject to direction from the local board. At first, there were only four superintendents to visit eight towns, but by 1910, 33 superintendents served 73 towns enrolling 17,000 students. The high point came in 1920, with a staff of 35 superintendents and an enrollment of 25,000 students in 97 towns. The following year, the department began providing elementary supervisors as well as supervising agents.

By sharply reducing the number of towns and slightly reducing the number of teachers, the consolidation movement enabled the board to employ the same number of superintendents in 1965, 12, to cover 42 districts and five regional high schools that it had assigned to 90 districts and one regional high school 25 years earlier. The first 10 years the department was responsible for these services, its staff developed a curriculum that received statewide adoption and exercised considerable influence. It continued to develop and promote curriculum materials, resulting in a uniformly high-quality program of studies.

Division of Instructional Services

Elementary and Secondary Education. Concern for elementary and secondary education at the state level is focused through the Bureau of Elementary and Secondary Education, established following a departmental reorganization in 1955. The bureau began with a professional staff consisting of a bureau chief and 10 consultants; today there are 19 consultants, 1 each for early childhood, elementary, business and driver education; English and reading; foreign languages; industrial arts; mathematics; school libraries; science; social studies; art; and music; with 2 consultants each for health and physical education, school library services, and school administration (19). Each consultant is concerned with the entire educational program and, as a specialist, deals with his particular area from the time it is introduced in the elementary school through the senior high school.

The staff is mainly involved in assisting local school personnel to improve their educational programs by identifying the significant problems, developing ways of solving them, and evaluating them in terms of the objectives. Implicit in this approach is the necessity for consultants to be abreast of all new developments and to have close working relationships with groups and individuals affecting school programs. In particular, there is an effort to design programs in terms of the future.

The state board authorized curriculum guides to be prepared in 1957 for the various subject areas, but lack of funds, staff, and time has made it possible to develop only a few, and, with the exception of art, for grades 7 through 12 only. Federal funds are beginning to help this effort.

Although the bureau itself is of recent origin, its functions have been carried on for many years despite a tradition of strong local autonomy. Actually, the school districts are empowered by the General Assembly to build and operate elementary and secondary schools without the state board's approval. To enable school districts without high schools to acquire public funds to send their students to those in nearby towns on a tuition basis, the state board does approve high schools for tuition purposes. This approval, however, is based on the fact that they operate according to law and does not involve an evaluation of their programs.

The department initiated a program of high school evaluation in 1949 in connection with a cooperative study of secondary school standards. Closely following the procedures and "evaluative criteria" prepared and distributed by the National Study of Secondary School Evaluations, each senior high school is evaluated every 10 years. A few junior high schools have been examined on a similar basis.

Since 1900, two legal provisions—one calling for the approval of pupils and tuitions from towns without high schools, and the other pointing to "duties of parents" in securing public school instruction or the equivalent for their children—have empowered the state board to approve academic private schools. In 1941, the licensing of private schools that give trade instruction also became the board's responsibility.

With little attention from the state, local schools began giving high school equivalency tests in 1925. Finally, on the basis of a law passed in 1905, providing for a "qualifying academic certificate" determined by examination rather than other academic records for professional preparation (including high school completion), the department did assume responsibilities for both tests and a state diploma in 1947, and drew up regulations for each.

Historically, developments in elementary education and secondary education have been somewhat different. Reference has been made earlier to the Rural Supervisory Service established in 1903. This was an exclusive service to elementary schools, although in recent years a few regional secondary schools came under its aegis. Three persons have served as elementary education consultants, the first being employed in 1923. Each has worked mainly with elementary schools not under the rural service.

In earlier years, the department was a mosaic of rather separate and discrete specialists, each going his own way without too much interest in his colleagues' activities. This situation, which undoubtedly reflected the extreme degree of local control that has had a long and strong history in the state, has, however, been changing over the years. As a reflection of the times and what is happening locally, more effort is being spent attempting to develop a comprehensive, consistent, unified approach to education.
Many school districts are joining forces to secure programs and services they cannot achieve alone. It seems apparent that there will be much more agreement and cooperation on a statewide basis in the future, which in turn will set the pattern for many of the Bureau of Elementary and Secondary Education's activities.

Pupil Personnel and Special Educational Services. In 1915, Connecticut became the first state to have a school psychologist appointed to its education department. Although the directory listed the position as dealing with "defective and deficient" children, the needs of both the handicapped and the gifted were given attention from the beginning. Although 23 classes were established for the retarded and 7 for the physically handicapped in 1919, the need for 125 such classes was reported.

A legislative commission on child welfare appointed in 1919 resulted in legislation 2 years later requiring the state board to appoint a "director of special education and standards." This law established the principle of both the public schools' and the board's responsibility for educating exceptional children, including those in institutions. With major attention given to surveying the number of children requiring special education and to demonstrating projects for training them, much of the staff's time during the 1920's was spent in testing for special educational placement and operating clinics in various parts of the state. By 1930, there were six persons employed in special education and psychological testing.

Specialists in various aspects of this work have been appointed on a full-time basis over the years. Connecticut scoring a "first" in employing a health supervisor in 1921, a guidance consultant in 1940, and a school social work consultant in 1949. Other consultants have been added from 1940-65, including those dealing with guidance, the physically handicapped, the handicapped in speech and hearing, emotionally maladjusted, the perceptually handicapped, the mentally retarded, school social work, the socially and emotionally maladjusted, the perceptually handicapped, and the gifted (20). Also, a project was started in 1965 to demonstrate vocational rehabilitation counseling of retarded children in the public secondary schools. At first the staff included only a project director and 3 counselors, but both state and federal legislation made possible an increase to 20 by the end of the year. It represents one of the department's fastest growing service areas.

The emphasis on particular services has changed from time to time, reflecting in part the national trend. For example, during World War II, there was much emphasis on guidance, particularly to prepare young men for the armed services as well as for employment and work experiences. The publications reflect a concern for the total community organization of guidance and its related services. Guidance has been particularly involved in the dropout problem. Perhaps at first, this "looking toward guidance" reflected a failure to appreciate the complex nature of the problem, which more recently has involved many aspects of both curriculum and special services as well as other community effort. When the State Scholarship Commission was established in 1963, guidance consultants assumed a major role as sources of information on scholarships and assisted in administering the state scholarship program until it was transferred to the Commission on Higher Education.

School social work has been closely identified with special efforts in dealing with delinquents and school attendance problems, as well as with special services for the socially and emotionally maladjusted. It was an interest in these problems that prompted the employment of a school social worker. Along with the guidance and psychological personnel, the social workers have attempted to resolve some of the interprofessional problems interfering with the effectiveness of these services at the local level during the early 1950's. They published a bulletin entitled "The Team Approach in Pupil Personnel Services" (21) and, when this attracted nationwide attention, followed it with other publications which have been favorably received in other states.

Connecticut has led in the development of certification requirements in several special fields. The 1922 regulations covered teachers of exceptional children, including the retarded, blind, and deaf. Three years later, the board began certifying school nurses. By 1934, regulations also included certification for vocational guidance instructors, teachers of the slow-normal, visiting teachers, school nurses, and dental hygienists. In the early 1940's, the state separated the classification for elementary and secondary special education and adopted regulations for certifying school psychologists and psychological examiners. Connecticut was among the first in the nation to require the professional master's degree for school social workers and school counselors, and a doctorate for school psychologists' permanent certificates in 1955.

Adult Education. Connecticut began its public school adult education program well before 1900 by establishing evening schools for students over 14, and including literacy and Americanization courses. Legislation in 1930 provided for supervisors, classes, rooms, personnel, and financial support. A full-time professional supervisor had been employed since 1920; from 1929 to 1951 he was given a full-time assistant. The basic adult education program, supported by federal funds, is increasing its scope at a rapid rate.

Veteran education became the board's responsibility after 1944 when several federal laws provided for educating veterans. This program has been ably administered, and regardless of the level of education approved, no breath of scandal has been associated with it.

After experimenting for 3 years in a small but increasing number of states, the U.S. Office of Education initiated Civil Defense education. By 1952, all states were encouraged to conduct such programs; Connecticut's plan was approved that year, requiring a full-time professional...
staff member from 1952 to 1957. At that time, it ended as an experiment and became the responsibility of the local public schools, requiring little if any attention from the department thereafter.

The basic education provisions of the Economic Opportunity Act of 1964 introduced a new factor in adult education by making funds available through local boards to improve adults' "communicational and occupational skills" to at least the eighth-grade level. The state department designed a state plan and supervised its implementation, employing a full-time director in 1965.

Manufacturers were required by the child labor laws dating back to 1813 to file working papers showing that they were providing some schooling for the children they employed. At the beginning of the twentieth century, persons hiring boys under 16 in any mechanical, mercantile, or manufacturing establishment had to file papers proving the boys were not under 14. The basic present law was passed in 1911, requiring an agent of the state board to sign certificates for minor employees showing them to be over 18, literate, and in "apparent" good health. By numerous amendments, the law now requires certificates for leaving school and gives detailed regulations for employment in agriculture, manufacturing, mechanical, and mercantile establishments. In 1957, the Legislature delegated this responsibility for issuing certificates to school superintendents under supervision of the State Board of Education.

Audiovisual Services. During the late 1920's and early 1930's, the department's art consultant spent much time attempting to interest teachers in using visual aids. But in 1952, when the audiovisual program was integrated with the vocational education program (because its consultants were particularly interested), only two cities reported full-time audiovisual directors. Two years later, the department appointed an audiovisual consultant and began collecting a film library, which now serves a majority of the school systems and is one of its major activities. The consultant's responsibilities were expanded in 1945 to implement a plan "to extend the program of audiovisual aids ... to cover all schools in the state to an effective depth." A second consultant was added in 1949, and an extensive survey of the state's audiovisual education was conducted the following year.

During the years following the audiovisual consultant's recommendation in 1951 for a study of educational television, there was a marked interest in its development. Within 2 years, Bloomfield and Danbury were demonstrating closed-circuit television, and the state board had received permission from the Federal Communications Commission to construct three stations. But following a report by a Governor's Commission on Educational Television in 1954 (22), the state board rejected its plan for a separate agency, and there was a period of uncertainty as to how Connecticut would develop educational television. The Legislature established the Connecticut Educational Television Corporation in 1959, and 2 years later, the state board created a Telecast Council to recommend educational TV programs for the schools. The state's first station (WEDH) went on the air in October 1962. The department's staff has used commercial television for several series in fields of guidance, elementary education, and Far Eastern cultures, as well as for lectures on topics of current interest.

Federal legislation created an increased demand for consultant services in the field. The department is developing an educational media laboratory and is attempting to broaden its staff's professional interest to include many types of educational media.

Public Libraries. Following legislative action in 1893, the State Board of Education appointed the Public Library Committee to assist in developing the state's free public libraries. Approved public libraries were granted $100 annually after 1895, and additional grants of $200 were available for several years to encourage communities to found new ones. Both grants were paid in the form of approved books purchased by the state. The committee's report, published until 1918, reveal that its original activities were mainly to make book loans to clubs and small public libraries, to provide a traveling book collection to different parts of the state, and (with Works Progress Administration aid) to sponsor a bookmobile to serve several eastern Connecticut towns from 1939 to 1942. The Legislature empowered the board to assume the committee's duties in 1947, and it became an agency within the libraries bureau.

Although the board employed its first professional—the visitor and inspector of libraries—as early as 1902, it was 1947 before regional library services were authorized. Eight years were to elapse before the establishment of the Regional Library Service Center in Middletown to serve the public libraries in Middlesex County. Four years later, the board opened another center in Willimantic for the public libraries in Windham and Tolland Counties.

Another state agency, the State Library Committee, charged with administering the State Library, was created in 1854. The State Library has been concerned chiefly with legislative reference, law reference, Connecticut history and genealogy, archives, and museum activities. With the increase in federal aid, gradually a feeling developed that administratively it made sense to combine this agency and the libraries bureau. This was done by the Legislature in 1965 under a new State Library Committee appointed by the Governor.

Higher Education. The Board of Education's first concern for higher education other than normal schools began when the Legislature passed an act in 1931 requiring licenses for
higher education to the administration in 1965 limiting the
and 1950, but set up a new Commission for Higher Educa-
tion in 1965 limiting the department’s responsibilities in
higher education to the administration of the state tech-
nical institutes, to high school educational guidance, and to
teacher education programs leading to certification (23).
Teacher education had become a state function in the
early nineteenth century. The New Britain Normal School,
the first in Connecticut and the sixth in the United States,
was established in 1849, and three similar institutions were
founded at Danbury, New Haven, and Willimantic at later
dates, all operated by the State Board of Education (24).
The New Britain Normal School became the Teachers
College of Connecticut in 1933, granting its first baccala-
ureate degrees to some sixty graduates the following year.
A few years later, the other normal schools became 4-year
colleges.

Because of an acute shortage of teachers after World
War II, the four colleges developed a program to prepare
and certify graduates of liberal arts colleges to become ele-
mentary teachers. It was started in the summer of 1949
with an enrollment of about 150 students. A plan for
graduate work was approved in January 1954, and the
following summer, it was initiated with a total enrollment
of 310. Over 6,000 students have been admitted to these
graduate programs, comprising almost one-third of the
teachers in Connecticut.

The General Assembly enacted a statute in 1959 re-
quiring the state colleges to offer baccalaureate degree pro-
grams in the liberal arts, and these were launched in the fall
of 1961. By the fall of 1965, there were over 9,000 full-
time students in the various programs offered by the col-
leges. As pointed out earlier, the General Assembly in 1965
created a Commission for Higher Education to coordinate
all public higher education activities. As a part of the legis-
lation, a new Board of Trustees was charged with the opera-
tion of the state colleges. The long and fruitful stewardship
of the state colleges by the State Board of Education came
to an end.

Mystic Oral School. In 1921, the state purchased the Mystic
Oral School, a private residential school for deaf children
established at the turn of the century. Until it was trans-
ferred to the State Board of Education in 1959, it operated
as a separate state agency with its own board of trustees.
The board, although responsible for implementing a 1959
law allowing it to send aphasic children to out-of-state
schools, decided that Connecticut should inaugurate its
own program for these children through its newly acquired
school. Because of a dearth of teachers, the board found it
necessary to sponsor teacher preparation in this field and
secured scholarship aid from the Legislature in 1961 for all
prospective teachers of deaf and aphasic children. The fol-
lowing year, it enrolled pupils in this program. By the close
of 1965, a total of 169 deaf and aphasic children, age 2 to
20, were enrolled.

Division of Vocational Education

Trade and Industrial Education. The state’s interest in trade
and industrial education dates back to 1808 when a com-
piation of statutes included one pertaining to apprentice-
ship. The pattern for establishing schools for trade educa-
tion and training, however, was not set by the General
Assembly until 100 years later, 1907, when it enacted legis-
lation for founding two trade schools, one in New Britain
and the other in Bridgeport. Under the direction of the
state board, they began operating 3 years later as state trade
education shops, later to be known as state trade schools.

The first trade education shops emphasized industrial
apprenticeship training—the teaching of shop skills.
Students were admitted at any time during the year and
graduated individually upon completing 4,800 hours of
satisfactory work, receiving a “trade apprentice certificate.”
The school operated 6 days a week, 9 hours a day except
on Saturday, the school year consisting of 50 weeks. The
success of these first two schools provided the foundation
upon which Connecticut built 14 state-operated, regional
vocational-technical schools.

A major change in trade and industrial education
evolved by 1944, when the state and industry recognized
the need for a “more balanced training program” to meet
the requirements of the rapidly changing technical
Economy. The trend was toward the general high school
pattern, but the main objective continued to be preparing
youth for immediate employment as advanced apprentices
in skilled trades. By 1965, there were more than 30 of-
ferings, ranging from a minimum of 7 in all schools to 18 in
the larger schools. Connecticut took another step forward
in 1947 when the Legislature passed a multimillion-dollar
10-year construction program to erect 14 modern buildings
on new, spacious sites to give youth a high school education
with an emphasis on trade skills.

Stimulated by federal and state legislation, another
new direction was taken in 1965 to meet industry’s demand
for semiskilled and operative-type workers. For the first
time, industrial educational programs on the “less than
career” level were introduced and developed in local public
high schools to prepare youth for immediate employment
in occupations not generally classified as professional, tech-
nical, or skilled trade.

The vocational-technical schools began offering pro-
fessional counseling when the department appointed a con-
sultant in 1940; the large schools immediately employed
full-time counselors. This phase of the program developed
substantially in high schools and state-operated vocational-
technical schools, with students being channeled through
their own counseling services in their local districts in re-
gional vocational-technical schools. This counseling, along
with research, in-service teacher education, and curriculum development, have all been integral parts of the growth in the vocational education programs.

**Agricultural Education.** The year 1906 marked the beginning of vocational agriculture when the Manual Training School, a private institution which became known as the Chapman Technical Institute and later the New London High School, added agriculture to its curriculum. The New Milford High School organized the first public school agriculture program on an experimental basis in 1912, supporting it entirely from local funds.

The Smith-Hughes Act of 1917, allocating federal funds for promoting vocational education, related agriculture to “meeting the needs of persons over fourteen years of age who have entered or who are preparing to enter upon the work of the farm or farm home” (25). The state adopted a plan whereby it paid the salary of agriculture teachers, and the towns contributed the facilities, necessary equipment, and supplies. From 1917 through 1956, nearly all of the agriculture programs followed this plan. They were not completely satisfactory, however, as the local centers were serving only a limited area with inadequate facilities and little or no equipment.

In 1954, a statewide Vocational Agriculture Consulting Committee proposed that regional vocational agriculture centers be formed to give training to any student who might find it profitable. The Legislature appropriated state funds in 1955 to local school boards for constructing such centers. Since Woodrow Wilson High School at Middletown opened the first regional center in 1956, 11 additional centers have been constructed.

**Distributive Education.** With support from the George-Barden Act, distributive education was introduced in 1942 in Middletown, Meriden, Norwich, and Waterbury, to an enrollment of 72 students. At the same time, 18 towns began offering adult education courses for upgrading retail store personnel.

During the next decade, seven high schools offering distributive education programs enrolled 187 pupils. By 1960, the curriculum had expanded and improved, youth clubs had been organized, and specific certification standards had been established for distributive education coordinators. Five years later, 29 high schools offered programs for 1,600 students. A group of businessmen, interested in giving both advisory and financial assistance, established the Distributive Education Foundation of Connecticut. It is anticipated that within the next decade every secondary school will offer this program as well as adult courses.

**Home Economics Education.** Hartford High School first introduced home economics in 1898, but 8 years passed before another school, New London’s Manual Training School, became interested in such courses. Then, in 1916, New Britain introduced domestic science for its students. Most of these early courses concentrated on sewing, and it was not until 1920 that the elementary programs added cooking.

With impetus from the Smith-Hughes Act in 1917, it was possible to expand the curriculum, to include courses in foods, nutrition, clothing, and textiles. The scope was further broadened in the next 30 years to encompass interior decorating, home nursing, consumer education, and home management. The Home Economics Education Service issued resource units in eight areas from 1947 to 1962, the entire program from the seventh to the twelfth grades providing a sequence of instruction designed to meet the needs of students.

The Vocational Education Act of 1963 placed new emphasis on programs leading to gainful employment, which in turn has led to new courses in food services and child care. Five-year agreements worked out with local schools have pointed to the need for better physical facilities, changes in curriculum, and materials for instruction.

Adult home economics education has flourished since 1945. In the beginning, the emphasis was on homemaking skills, but before long there were courses in child development, parental interest, and training occupations such as food care and child service. The program has attracted many disadvantaged persons and is providing them with essential skills and understandings.

**Vocational Health Services Programs.** The State Board of Education and the Board of Examiners for Nursing instituted a 1-year trained-attendant course in the fall of 1942. Offered at the trade school in New Britain, it consisted of 3 months of classroom instruction and 9 months of clinical experience at two cooperating hospitals. Fourteen students completed the course, successfully passing the examination for licensure a year later. In 1953, the original title of trained attendant was officially changed to licensed practical nurse. This program, offered by 9 vocational-technical schools and 16 affiliated hospitals, graduates 400 nurses annually. The state also initiated a dental assistant program in 1960, and two additional programs are planned for the immediate future. Several junior and senior high schools are offering nurse’s aide training under the Vocational Education Act of 1963; additional ones are in the developmental stage.

**State Technical Institutes.** As Connecticut’s industry expanded rapidly after World War II, incorporating the technical advances stimulated by war, the demand for employees with technical education beyond high school level grew rapidly. In March 1946, the state board authorized the Hartford Trade School to offer 2-year, postsecondary education to fill the widening gap between the skilled craftsman and the graduate engineer, thus inaugurating the
The Engineering Council for Professional Development recognized the excellence of Connecticut's vocational rehabilitation services, disability determinations, and community and institutional services, was established in 1965. At various times from 1954 to 1965, Congress enacted legislation to protect the old age and survivors insurance benefits of persons covered by Social Security who became disabled for long periods. These programs were administered through the disability determination bureau, comprising a chief, a service specialist, and 10 counselors. With increased state and federal funds, there is every promise that greatly expanded services will be available for the handicapped.

Vocational Rehabilitation

The Legislature accepted the Vocational Rehabilitation Act in 1929 and appropriated a small amount to initiate the program. It functioned as a one-man operation until temporary emergency funds from the federal government enabled it to employ five counselors in 1934. By the end of the following year, however, these funds were no longer available, and it returned to its one-man status.

In 1935, Connecticut inaugurated the first program in the nation to rehabilitate tuberculosis patients with funds from the federal government pooled with money collected from the sale of Christmas seals. One supervisor was immediately employed, and another was added in 1940. The following year, the vocational rehabilitation bureau pioneered the “team approach” which led to the inauguration of the Rehabilitation Clinic, widely known as the Mav-Salvage Clinic.

Funds were gradually increased during the next 3 years, and rehabilitation offices were opened in New Haven, Bridgeport, Hartford, Norwich, and Waterbury. When the vocational rehabilitation bureau celebrated its twenty-fifth anniversary in 1955, it had rehabilitated 14,000 patients; the annual number of handicapped served had increased from 50 in 1930 to 3,400; and eight local offices were operating in the state’s key communities.

Congress increased the allotments to the states in 1956, adding more funds by enacting the Social Security Freeze and Cash Benefits Program, enabling Connecticut to expand its activities. The General Assembly gave the program further impetus by passing an act the following year requiring that services provided by the vocational rehabilitation unit include mentally handicapped as well as physically handicapped individuals and provide for workshops (27).

A Division of Vocational Rehabilitation, consisting of the bureaus of rehabilitation services, disability determination services, and community and institutional services, was established in 1965. At various times from 1954 to 1965, Congress enacted legislation to protect the old age and survivors insurance benefits of persons covered by Social Security who became disabled for long periods. These programs were administered through the disability determination bureau, comprising a chief, a service specialist, and 10 counselors. With increased state and federal funds, there is every promise that greatly expanded services will be available for the handicapped.

RELATIONSHIPS WITH OTHER AGENCIES

Through the years, the effectiveness of the department has been increased materially by a close working relationship with other state government units. Similarly, through this cooperative approach to common problems, the department has attempted to be of assistance to other groups. Moreover, it has provided opportunities for private citizens to offer advice and give assistance. For example, the department organized regional citizen councils in 1938, and effective dialogue ensued until interrupted by World War II; beginning in 1948, the department sponsored annual citizens’ conferences on education to deal with a wide variety of topics representing current concerns (28).

The department-sponsored Connecticut Council on Education began meeting in 1945 to serve as a sounding board for new ideas and help secure progressive legislation. Its membership consisted of representatives from 20 statewide lay and professional organizations with major interests in education. Specifically, the department hoped to bring to these member organizations a broader understanding of its problems and encourage more participation by lay citizens in public education. The Council was dissolved in 1960 because its objectives had been adopted by other organizations.

The department has always had a close working relationship with the Parent-Teachers Association of Connecticut.
Its staff serves on the board of managers; the deputy commissioner has been a member since 1960. Occasionally, joint studies have been made and published. At the local level, hundreds of PTA groups have been served by department personnel.

Among the several interdepartmental state committees, the most active are those involving health, development, welfare, labor, and mental health. The Division of Vocational Education would find it difficult to function without cooperating closely with the labor department, and much the same feeling exists within other divisions in their relations with other departments.

From time to time, temporary state commissions are created, such as the commissions on state government formed in 1929 and 1949. In the latter year, the Governor's Fact-Finding Commission on Education probed the state's responsibility to education in considerable depth, and again by a State Personnel Study Commission created in 1965. In these and all other studies, the department has been an active participant.

Since 1945, a great deal of effort has been directed to coordinating the department's work with that of the University of Connecticut. A subcommittee of the state board and the university trustees formed in 1949, known as the Liaison Committee after 1953, concerned itself with preventing unnecessary duplication of services and planning an orderly growth in public higher education. It held regular meetings, issued reports, and made an official study of higher education at the Governor's request in 1955. It did stellar work in coordinating many of the programs, particularly the preparation of teachers and administrators, until the board's responsibilities in higher education were transferred in 1965. The department created two other groups—the Council on Higher Education and the Council on Teacher Education—which complemented the work of the Liaison Committee. Composed of members designated by the department and one representative for each higher education institution, they will continue to meet despite the department's new relationship to higher education.

The department attempts to demonstrate the effectiveness of this cooperative approach in meeting educational problems in its relations with local school systems. Since 1940, the emphasis has been on leadership rather than regulation. Requests for advice, consultation, and direct service come from every town in the state. The department's orientation programs, offered for many years to new school board members, have given hundreds of these interested citizens a better grasp of educational problems and a clearer understanding of their duties and responsibilities. In more recent years, the Connecticut Association of Boards of Education has cooperated with the department in conducting this activity. And, as mentioned earlier, the department cooperates with the attorney general's staff in assisting boards to interpret the school laws.

Evidence of mutual confidence and professional respect can be found in the many requests from school staffs for assistance in organizing and carrying on local educational studies and research. Dozens of high schools request and receive aid in evaluating their programs and resources. In addition, there is a constant demand from local school systems for materials for self-surveys; some communities have requested the department to conduct complete educational surveys. The department's consultants are always available to assist in locally sponsored group conferences, and they respond to calls from classroom teacher groups, from principals and supervisors, and from school superintendents. They participate in workshops and serve as speakers, striving always to maintain wholesome working relationships and to offer a superior professional service.

The department has tried to utilize to the fullest all educational resources of the state, public and private, in solving problems. Its units—such as the teachers colleges and bureaus in the central office—have constantly cooperated through committees and research projects with teachers and administrators organizations in developing and evaluating programs. Staff members meet regularly with regional groups of superintendents and work with such organizations as the secondary school principals, the elementary school principals, the elementary school supervisors, and organized groups in special subject areas. In recent years, curriculum consultants have led in organizing statewide specialized curriculum groups.

For nearly 20 years, the chief state school officers of New England, New York, and New Jersey have held regular meetings to develop programs of common interest and seek ways and means of increasing cooperation and reciprocity. In recent years, Pennsylvania has been added to the group. Committees from several special areas within each state have worked together to develop common standards in such areas as teacher certification, accreditation of institutions, citizenship education, and improvement of vocational schools.

Increasingly, states have become involved with many federal agencies in discharging their functions, starting with almost no involvement in 1900 and reaching a climax with the adoption of Public Law 89-10, Elementary and Secondary Education Act of 1965. Although the U.S. Office of Education and the Social and Rehabilitation Service remain the agencies the department deals with most frequently, it also has dealings with other federal agencies, such as the Department of Agriculture, the Department of Labor, the Public Health Service, and the National Science Foundation. The department also maintains a liaison with Washington through other channels, among them the Council of Chief State School Officers, the American Council on Education, the Joint Council on Educational Television, the American Association of School Administrators, and the National Education Association.
MAJOR EFFORTS AND ACCOMPLISHMENTS

The time was when the suggestion that schools could do no more than they are doing was met with incredulity, with denial, and often with personal abuse. That they can do more has been repeated, in some cases tried, and in others illustrated and proved, so that now many people believe it and even teachers admit it (29).

This conviction that "schools can do more," found in the annual report of the secretary of the state board at the beginning of this century, has been the keystone to the progress which has been made since it was written. To prove the point, the State Board of Education declared in its 1900 report to the Governor that certain improvements in public education were desperately needed: the introduction of skilled supervision, the substitution of complete town for small district management, a change in high school education, and a required standard of teaching qualifications. It also pointed out that it was necessary to adjust and balance the studies so as to form a well-founded and planned whole, extending throughout the entire period of school life. It called for an examination of the educational values of different subjects, the introduction of well-defined usefulness into all schoolwork, and an adaptation of instruction to people's needs, such as elementary technical education.

That these goals were taken seriously is illustrated by the action taken on many of them in the ensuing years. For instance, a state system of supervision and administration for rural schools was established in 1903 and continues to this day. The obsolete, small school districts existing in 1900 within larger towns and numbering more than 1,000 were abolished in all but a few large towns and cities in 1909. By 1965, with only 179 districts remaining, the transition was complete, and small town districts had extended the concept by agreeing to combine for specific purposes, such as secondary education. State teaching certificates representing certain minimum qualifications were required by statute in 1923. Although "adjustment and balance of studies" is broad and fundamental as a concept, it has characterized the majority of changes introduced during this 65-year period as education has been extended throughout the entire period of school life. The affluence of the 1920's, the depression of the thirties, the war during the forties, and the scientific revolution of the fifties and sixties all profoundly affected education. Thus, the board's responsibilities, as in other states, expanded rapidly after the first quarter of the twentieth century in response to society's demands. For one thing, financing education gradually shifted from a legal responsibility to encompass both the state and federal governments, with the Department of Education playing an ever more important role. Research became necessary, and the public information function grew increasingly important. Vocational education, vocational rehabilitation, and teacher education, all major responsibilities of the board, expanded tremendously. Public libraries needed help and received marked attention from the department until the General Assembly transferred this function to the State Library Commission in 1965. As mentioned earlier, it also transferred the operation of the state colleges to the newly created Board of Trustees. Both transfers were due mainly to the heavy and divergent duties assumed by the rapidly expanding state board, which made it seem best to shift these responsibilities elsewhere.

The expansion of curriculum and specialized pupil services characterizes this period, with the greatest advances taking place in the last decade. The most dramatic change among the services occurred in guidance and among the instructional areas in science and mathematics, both inspired by federal funds available under the National Defense Education Act of 1958.

The popular designation of Connecticut as the Constitution State is one of which its citizens are justly proud. John Fiske stated that the Fundamental Orders of 1638-39 was "the first written constitution known to history that created a government and it marked the beginning of American democracy" (31). Students of education regret that this document made no reference to the function of public education in specific terms, but since it referred to the guidance and government of civil affairs, it can be assumed that education was considered one of these.

Assembly helped to alleviate some unhealthy practices. One statute stated:

No certificate of age (working paper) . . . shall be given to any child under 16 years of age unless such child shall be able to read with facility, to write legibly simple sentences in the English language, and to perform the operations of the fundamental rules of arithmetic up to and including fractions; . . . (30).

This law's enforcement, particularly the compulsory attendance section, occupied the department's attention in a major way. Indeed, the 1920 records state that achievement of universal education was one of the greatest contributions of state leadership since the turn of the century. Having succeeded in this, more attention could now be directed toward the solution of other problems.

The affluence of the 1920's,ruled out the idea that this document made no reference to the function of public education in specific terms, since it referred to the guidance and government of civil affairs, it can be assumed that education was considered one of these.
Public education fared better, but only slightly so, in the next constitution adopted in 1818. Reference was made to the school fund which shall be used perpetually for "the support and encouragement of the public, or common schools throughout the state, and for the equal benefit of all the people thereof" (32). To be sure, this is an oblique way to effect the constitutionality of public schools, but the provision was never challenged. It should be recorded to the everlasting credit of the citizens of Connecticut that by statute, and with meager support from the constitution, they have fashioned a strong, effective system of public education. A new constitution was adopted in December 1965, and progress for education can be noted in the addition of two new sections (33):

Sec. 1. There shall always be free public elementary and secondary schools in the state. The general assembly shall implement this principle by appropriate legislation.

Sec. 2. The state shall maintain a system of higher education including The University of Connecticut, which shall be dedicated to excellence in higher education. The general assembly shall determine the size, number, terms and methods of appointment of the governing boards of The University of Connecticut and of such constituent units or coordinating bodies in the system as from time to time may be established.

Connecticut, the land of steady habits, persists; and Connecticut, the Constitution State, endures.

CONNECUT
INTRODUCTION

Delaware is at the upper end of the Del-Mar-Va Peninsula, which separates the Delaware and Chesapeake Bays. The state is not quite 100 miles long and, at its widest point, is 35 miles across. Its land area of 1,965 square miles makes Delaware next to the smallest state in size. Its 1965 population was 514,000, ranking it forty-sixth among the states (1). Delaware has but three counties, each of which extends the entire width of the state; from north to south they are New Castle, Kent, and Sussex. Because of its shape Delaware is called the Diamond State. The first of the 13 original colonies to ratify the federal Constitution, it is also known as the First State.

The Dutch, thought to be the first Europeans to arrive in what is now Delaware, settled in the southeastern area near Lewes in 1625 (2). The Swedes arrived a decade later, followed by the English in 1666. The English ruled the region from the time of their arrival until the American Revolution. During the nineteenth century, Delaware was mostly agricultural, and the people held a conservative philosophy of government. Located on a peninsula, they were undisturbed by east-to-west migration and were involved but little in urbanization. During the Civil War, Delaware, as a border state, was divided, the north being loyal to the Union and the south loyal to the Rebels. Since the state accepted slavery, it was slow to ratify the Thirteenth, Fourteenth, and Fifteenth Amendments. Negroes remained politically subjugated well into the twentieth century.

Although largely rural before the Civil War, Delaware slowly acquired industry and urban characteristics thereafter. Following World War I, it changed from an agricultural to an urban society. These economic and social changes are reflected in Delaware's evolving system of education.

EDUCATION BEFORE 1917

Although the Dutch were on the banks of the Delaware River earlier, in 1638 the Swedes and a few Finns founded the first permanent settlement when they erected Christina Fort near the mouth of Christina Creek. At this time, since Sweden had no public education, it depended on the church and the home to educate the children. The church was a state institution and thus was able to control education. The duties of ministers and schoolmasters were frequently combined, or the schoolmaster held a position in the church in addition to his teaching duties. This was the educational system Sweden transplanted to its settlements.

The church congregation at Christina established the first school in Delaware when in October 1699 it engaged Swen Colsberg to act as both bellringer and schoolmaster. Since the Swedes regarded education as very important, as the settlers founded other communities they organized more new schools. The church usually served as the schoolhouse and the minister as the schoolmaster, although a few nonministerial schoolmasters came over from time to time, and private homes sometimes served as schoolhouses. These schools emphasized reading and arithmetic.

The Dutch, who began to found their own settlements in 1656, sent schoolmaster Evert Pietersen from Amsterdam to organize a school in what is now New Castle, Delaware. As in Holland, the church served as a schoolhouse and the minister as schoolmaster. The English began moving into Delaware in 1664, and they soon outnumbered the earlier settlers. They brought with them from England a system of education that can hardly be called public or universal, since their schools were private and admitted few who were not wealthy. William Penn laid plans for universal education, but they were not carried out. In fact, the English did very little to further education other than to grant charters to a few schools and in 1683 to enact legislation enabling certain religious societies to hold property and to raise funds by lottery for school purposes.

As the English settlers became more numerous, the Swedes elected English-speaking clergymen to preach to them and began abandoning their own tongue. Gradually the children began to learn the English language before Swedish. By the Revolution, the distinctive Swedish and Dutch schools were abandoned and merged with those operated by the Lutheran and Episcopal churches.
From 1638 to 1776, the history of Delaware was closely identified with that of Pennsylvania (3). In fact, from 1703 to 1776, Delaware and Pennsylvania had the same governor, although Delaware was considered a separate colony. William Penn and the Friends Society were intelligent and aggressive, and made their imprint on Delaware society. The legislative provisions Penn presented to the colonists included the establishment of public schools. However, it was 1748 before the Friends organized a school at Wilmington.

Universal education was still far away, in Delaware, but there was an increasing interest. Delaware's first constitution in 1776 failed to mention education, but the Constitution of 1792 stated: "The legislature shall, as soon as conveniently may be, provide by law...for establishing schools, and promoting arts and sciences" (4).

Acting on constitutional authority, in 1792, the state Legislature passed a school fund law which became the basis of financing a public school system. This law stipulated that money accruing from marriage and tavern licenses, gifts, donations, and bequests should be placed in a special fund for establishing schools in Delaware. The act designated the state treasurer as the trustee for the fund, and he was authorized to invest the income in shares of various bank stocks until they were needed for school purposes.

In 1817, the Legislature appropriated the first money for public education in the history of Delaware by providing for the education of poor children. Undoubtedly, the act was a mistake as it delayed the development of effective, universal public education by providing only for paupers, thus identifying public education as a pauper system. Citizens did not relish the idea of the pauper schools; they believed free education to be of little worth and only for those who could not help themselves.

Most property owners in early Delaware did not favor public education because they did not like the necessary taxation. Despite this opposition, in 1821 the Legislature passed an act to support Sunday schools for teaching reading, writing, and morality.

It was only through the persistence of Judge Willard Hall that the state progressed in creating free public schools. Hall, a lawyer from Massachusetts, came to Delaware in 1803 and devoted half a century to public education. He served as secretary of state, a member of the state Senate, and later as a federal judge. Through his efforts the Governor and finally the Legislature were persuaded to support a bill in 1829 providing free schools for all children.

This school law provided for the funds to come in part from the state school fund and in part from private, local contributions. School districts were to extend for a radius of 2 miles from the centers of population, with an adequate number of pupils the sole criterion for creating a new district. The law required the state to provide as much money for each school district as was raised by private contributions. The following year the law was amended to permit local school districts to levy taxes by a vote of the majority of taxpayers and protected the taxpayers by limiting the amount each district could raise to $300. The $300 in turn was matched by a state contribution.

The school law of 1830 provided for the voters of a district to have full control of the schools. They were to hold meetings to determine their schools' operation and could decide how much money they would raise to support schools. In 1833, 133 school districts were drawing state aid; 61 districts in New Castle County, 36 in Kent, and 36 in Sussex.

Judge Hall's ideas on democracy, incorporated in the school laws of 1829 and 1830, influenced Delaware's education for the next half century. As he feared central government, the legislation permitted local school districts to do as they pleased, but it also allowed them to do nothing if they so desired. The schools were too loosely organized, and depended too much on private contributions, to meet their costs. Hall wanted to see education as a voluntary activity with no state compulsion and with little or no state supervision. But the two school laws proved unsatisfactory because poor families, who would benefit most, refused to vote in favor of school taxes, and the districts had to depend on private contributions to meet their costs. As a result, teachers were poorly paid and poorly prepared.

From 1829 to 1875, two forces developed representing the conservative and liberal elements among the citizens. The liberals, known as the "friends of education," were increasingly dissatisfied and sought at least a minimum of central control. In 1861, they were influential in revising the school law of 1829 to overcome some of the negative effects of centralization by requiring school districts to levy a minimum tax for school purposes. The law provided that each district could vote increases in this minimum requirement. Six years later, after the Legislature failed to provide for a state superintendent of education, the "friends of education" planned a campaign for greater state control.

The "friends," under the leadership of J.B.Clawson and supported by groups of teachers, continued to point out the weaknesses in the educational system and the need for state leadership. Again, in 1875, they were influential in getting the Legislature to pass a free school law. This act created the position of state superintendent of Delaware Free Schools and a State Board of Education, consisting of the president of Delaware College, the secretary of state, the state auditor, and the state superintendent.

The Governor appointed James H. Groves as the first state superintendent for a 1-year term in 1875. Although he was empowered to visit schools and examine and certify
teachers, the law gave him little other authority to administer the public schools Subject to appointment by the Governor on a yearly basis, his position was considerably weakened. Local taxpayers continued to have the final say as to the extent they would support education, and for the most part they refused to tax themselves enough to develop a strong system.

Taxpayers' opposition to more authority in the hands of the state superintendent was supported by the growing independence of the incorporated towns, particularly Wilmington and New Castle. New Castle's influence grew to the point that in 1879 they were able to persuade the Legislature to exempt schools in incorporated towns and cities from the authority of the state superintendent and state board.

Thomas N. Williams succeeded State Superintendent Groves in 1883, only to face a legislature growing increasingly hostile to state control. The "local control" forces gained enough power by 1887 to abolish the office of state superintendent and return to the county system of education. The State Board of Education now consisted of the secretary of state, the president of Delaware College, and three county superintendents. The state board had little authority, however, and three county boards of education administered the school system. Each county board administered its system independently, with separate, parallel systems operating for Negro and poor white pupils. Within each county, certain independent school districts were not required to operate under the laws of the county unless they so desired and made "special requests."

Conditions in the schools became increasingly chaotic. Within a decade it became clear that this completely decentralized system was unworkable. Many of the local districts contained small, uneconomical units with wide variations in length of school years. Teacher certification also varied greatly among school districts, and there was a rapid teacher turnover. Very few statistical records were kept, and these lacked uniformity.

There appeared to be less hostility toward taxation for schools; more revenues were raised than spent. But it was even more evident that the views held in the Constitutions of 1792 and 1831 were outdated and that better administration was necessary. When the state decided to write a new constitution, there was an effort to incorporate more modern concepts for education. The Constitution of 1897 required the Legislature to establish and maintain a general and efficient school system. It continued to allow separate schools for white and nonwhite pupils, but it generally required all children to attend.

The Constitution of 1897 also provided a financial basis for public education, designating the public school fund for educational purposes only. It also stipulated that the state would provide a minimum of $100,000 for the public schools from any available source. These funds were to be allocated to white and Negro pupils separately, but on the same proportional basis. Also, they could not be used for nonpublic school purposes.

The following year, the Legislature changed the school laws to give the state board authority to control the white and nonwhite schools in each county. The Governor appointed county commissions of three members to 3-year terms, and a county superintendent for a 2-year term. The 1898 school law charged the county commissions with direct supervision of the schools; the commissioners would examine the county superintendents' reports and investigate operation of the school systems.

The 1898 law also reorganized the Board of Education. When the new board first met, it found such a lack of educational data that it decided its most important task was to compile reliable statistics. It sent out questionnaires and collected data for a report, finally printed in 1900.

One problem, caused in part by the poor statistics and in part by political considerations, was the inequitable distribution of school funds. The new state board learned that certain districts were getting twice as much financial aid as others in proportion to the number of pupils. To remedy the situation, it recommended, and in 1901 the Legislature enacted into law, a requirement that these funds be distributed according to the number of teachers employed for a minimum of 140 days the previous year. The Constitution of 1897 required attendance of physically able pupils, but since it gave no further details, pupils attended school more or less on a voluntary basis. Attendance varied widely among the districts, as did the length of the school year. In 1907, the Legislature enacted a law requiring compulsory attendance for at least 5 months of the year, with penalties for those who failed to comply.

Another problem centered on the composition of the board itself and the administration of its responsibilities. Since senior members of the county school commissions made up part of the board's membership, continuity of the board's action was broken because they were able to serve only for 1 year. This deprived the board of experienced members. The board itself recommended a change, and the 1911 Legislature abolished the old Board of Education and created a new one composed of seven members, appointed by the Governor for staggered terms of 7 years each.

The new Board of Education faced such problems as a lack of graded schools, little or no supervision of teachers, no uniformity in teacher certification, and poor school housing. The board, composed of laymen, quickly realized that it needed professional leadership. With the support of the Governor, it persuaded the 1913 Legislature to permit the Governor to appoint a state commissioner of education, who would serve for a 2-year term. The law required the new commissioner to be a graduate of a
reputable college or normal school and have 5 years teaching experience. But when the Governor appointed Charles W. Wagner, Ph.D., to be the first commissioner, there was considerable opposition from people who still felt that this was merely another useless state office and a waste of taxpayers' money.

EDUCATIONAL CHANGE, 1917 TO 1925

From 1917 to 1925, Delaware experienced a greater change in education than at any other time in its history. This was due to a number of forces, but the impetus stemmed from a group of lay leaders, educational organizations, and parent-teacher groups who wanted to bring about better education. They were in large measure responsible for the School Codes of 1919 and 1921 and the subsequent reorganization of the public school system.

The Service Citizens of Delaware

In 1914, a group of citizens organized the General Service Board to study and publicize social conditions in Delaware. A little later, they combined with another organization known as the Council for Defense. In 1918, under the guidance of Pierre S. duPont, the combined groups organized the Service Citizens of Delaware to bring together men and women interested in improving social conditions in the state. The group was incorporated for 5 years—later extended to 9 years—with duPont as the elected president.

DuPont, president of E. I. duPont de Nemours and Company and chairman of the board of directors of the General Motors Corporation, had recently been appointed by Governor John G. Townsend to the State Board of Education. From his personal fortune, duPont donated to the Service Citizens an annual working fund of $90,000. The association elected the most competent and experienced men and women in the state to the board of managers, which in turn appointed Joseph H. Odell as director. The organization then set about collecting reliable information, disseminating the facts to the people, and conducting demonstrations which hopefully would lead to improved conditions. It brought to Delaware the country’s most experienced advisers to survey the school buildings, public health, taxation, and many other aspects of the economy and society. Thus, it was able to piece together a scientific description of conditions in the state.

Particularly interested in education, the Service Citizens joined forces with local boards of education. Made up largely of people who thought in statewide terms, this group also worked closely with top administrators and official policy-building groups, including the State Board of Education.

Along with the efforts of duPont and the Service Citizens, the U.S. Bureau of Education played a positive role in creating a climate for educational change. In line with his policy of cooperating with state agencies requesting help, the U.S. Commissioner of Education requested a Bureau of Education staff member, Stephen B. Weeks, to study the condition of education in Delaware. In 1917, Weeks published his study, entitled The History of Public Education in Delaware, and it proved to be most effective in further arousing the citizenry concerning educational deficiencies.

Weeks encouraged State Commissioner of Education Wagner to use his influence in working for changes he recommended. Wagner inaugurated a statewide campaign with the support of leading educational and social organizations and, with assistance from the press, the pulpit, and a variety of public forums, vigorously insisted that something be done.

This widespread interest in education prompted the 1917 Legislature to appoint a survey commission of five members to make its own study. In turn, the commission delegated to the General Education Board, founded in New York by John D. Rockefeller, the authority to conduct the survey. The results exposed “to public view a motley collection of laws which had been accumulating, haphazardly, for more than a century” (5). It further revealed that those responsible for developing schools had been given “plenty of nominal power but little or no means of implementing it” (6).

The General Education Board survey found some of the same deficiencies that the Service Citizens of Delaware had pointed up in their studies: poor condition of school buildings; lack of uniformity in teacher certification, supervision, and curriculum; poorly defined administrative authority; and too little financial assistance. It concluded that—

On the whole, therefore, public education in Delaware is at a low ebb. Public opinion is unaroused; professional standards are as yet unformed; the state organization, despite certain good features, is ill-jointed, and ineffective. The laws need to be rounded out, so as to give the state an organization, the various parts of which play into each other effectively; policies must be framed on larger lines; cooperation between the state and the county unit must be brought out; proper provisions for teacher training must be made; the state, the county and the local community must join in raising the larger sums required to sustain creditable schools, adapted to the needs, capacity, and opportunities of the school children of Delaware (7).

The reports were distributed throughout the state, newspapers presented the findings, and speakers explained and discussed the report before many lay groups.

The Delaware State Education Association agreed wholeheartedly with the General Education Board’s recommendations for a central program. Teachers were
particularly concerned with the problems of inadequate buildings and one-room schools, malnutrition among the pupils, reading problems, and teacher qualifications. The association had been trying to improve the training and certification of teachers, as well as teacher benefits such as salaries, tenure, and pensions. Thus, the important educational surveys, with support from lay and professional groups, created an excellent climate for legislative change in Delaware’s education.

校委1919和1921

The commission appointed by the Legislature to study school conditions accepted the General Education Board's report as a basis for proposing drastic changes in the School Code. In 1919, the Legislature adopted a new code vesting administrative authority for operating the school system in the State Board of Education, with a commissioner of education as its executive officer. This was in sharp contrast to the previous system where local school districts still operated completely independent of each other with limited central authority.

The 1919 School Code also provided for boards and superintendents for Delaware's three counties. County boards were authorized to raise taxes, appoint teachers, supervise instruction, standardize teacher certification, and increase teacher salaries. They were responsible for providing transportation for elementary school pupils living over 2 miles from a school and for high school pupils living over 3 miles from a school. They could require pupils up to the eighth grade and under 16 to attend school for 180 days per year, and they were authorized to consolidate schools upon the recommendation of the county superintendents. The law eliminated the elected local school officials in the rural schools, but the school officials of Wilmington and 13 of the largest communities continued to operate their systems independently of the 1919 School Code.

The code was passed with considerable opposition, mainly centering around the loss of local control and centralization of authority, the longer school year, and higher real estate taxes. Most of this opposition came from the downstate rural elements of Kent and Sussex Counties where the schools were small and attendance irregular. Two years later, in 1921, the opposition finally succeeded in persuading the Legislature to enact a modified school code.

The School Code of 1921 eliminated the county system of education and replaced the county boards and superintendents with local boards authorized to appoint their own teachers. At the same time, it strengthened the State Board of Education by assigning to it some of the county boards' functions, such as budget making and teacher supervision. The state board also would make budget requests to the Legislature for Wilmington, the special school districts, and the rural school districts.

As a compromise to the rural areas, the 1921 Legislature reduced compulsory school attendance from 180 to 160 days. It compromised with property owners, particularly farmers, by introducing a graduated income tax, ranging from 1 to 3 percent of net income, as a replacement for the high tax on real estate. It did continue a modest real estate tax to be levied by the state, and it permitted the state to provide further funds by levying corporation franchise and corporation income taxes. The schools were to receive additional revenue from the state school fund and occasional appropriations from the Legislature.

州教育委员会。1921年的学校法令授权州教育委员会管理特拉华州的公立学校。州长任命州教育委员会的主席及行政管理人，任期1年，但可以续任。该委员会拥有制定政策的权力，与当地学校委员会、学校官员和教育政策协调。它将咨询和协助教育政策委员会，作为州教育系统的执行秘书。其要求的州学校董事会将与地方学校委员会、学校官员和教育政策委员会合作，以便执行其政策，并执行其政策。该委员会有责任指定州教育委员会的州长和首席行政官员。

The law made the board responsible for submitting to the Governor and General Assembly a state budget indicating the nature and amount of expenditures for operating the total centralized state school system. Instructional spending was to include the basic teacher salary schedule and other such costs. Matching funds were established for vocational education. The board also would establish spending for school construction, particularly to encourage consolidation of small schools. It also would make expenditures for debt services and for maintaining a state school tax department. The law required the board to submit to the Governor an annual report covering its operation, conditions, and progress.

部门的公共教育。公共教育部门作为执行政策的行政组织，负责执行教育政策。该部门的首席官员。
the Legislature created the office of state superintendent in 1921, the board appointed H. V. Holloway to the position. Dr. Holloway stated that his philosophy was in keeping with the "cardinal principles" of education, which had as general objectives character development, command of fundamental processes, health and physical efficiency, good citizenship, training for worthy home membership, vocational efficiency, worthy use of leisure, and general mental efficiency.

During 1921, in addition to the state superintendent, the department included a professional staff with the following titles: assistant superintendent of elementary education, assistant superintendent of secondary education, business manager, director of research, director of vocational education, director of adult education and Americanization, supervisor of agriculture, supervisor of home economics, and supervisor of trades and industries. There were seven rural supervisors, four visiting teachers, and three supervisors of handicrafts to work with Negro schools. Fourteen of these 23 professional staff members were working closely with local rural school districts and consequently cannot be considered part of the central administration. In other words, during this first year the department created positions that met special needs.

When the State Department of Public Instruction was organized, there were already divisions of elementary and secondary education. These were each headed by an assistant superintendent, whose chief responsibilities were curriculum development, teacher improvement and certification, and enforcement of laws pertaining to elementary and secondary education. At this time, 1921, four supervisors worked with the assistant superintendent for elementary education and three with the assistant superintendent for secondary education.

Trend Toward Centralization

During the period of reorganization, 1917 to 1925, when Delaware was searching for a system of education that would offer the greatest benefits, the Legislature decided to move toward a centralized, state-financed system. Paul Mort described the trend as follows:

Delaware embarked upon a fiscal policy for public education that diverged markedly from the plan generally followed in the United States. It moved from the plan of local fiscal responsibility, supplemented in some degree by state aid, to all but complete state fiscal responsibility for operating expenses. It did not remove, however, the legal arrangements by which individual communities could provide supplemental financing. (f).

In determining the type of system to be developed, educators and laymen alike were determined that all children should have an equal opportunity for education. Superintendent H. V. Holloway expressed this concern in his report on "One Hundred Years of Public Education in Delaware," when he stated: "No equalization of educational opportunity is possible in a State when educational opportunity is in the hands of the local school district. Democracy defeats itself when small, remote local committees must determine and wholly finance their improvements" (9).

Enactment of the school laws of 1921 acknowledged the principle that education was a function of state government. As mentioned above, county boards were eliminated and a state department of education created. Also created was a state school tax department "to collect the revenue needed for the schools, and all funds for the use of (State Board Unit Districts) were placed in the custody of the state treasurer" (10). This principle of government was also reflected in the fact that the Legislature provided a means of developing a well-organized system of school administration with a professionally trained staff to plan and administer an effective program of education. In other words, although the Constitution of 1897 required the Legislature to provide for this additional system (11), it was not until 1921 that the constitutional mandate was taken seriously.

Pierre S. duPont

In addition to his leadership in obtaining the school laws of 1921, Pierre S. duPont continued to make significant contributions in school construction and finance. Although he was an industrial leader with heavy responsibilities, he nevertheless devoted much of his time to public education and from 1918 to 1937 served as a member of the State Board of Education and the Service Citizens of Delaware, and as state tax commissioner.

DuPont and his Service Citizens were responsible for the General Education Board's study of Delaware's public education in 1917, and a part of the study was a survey of school buildings. When it revealed that they were in unsatisfactory condition, he felt compelled to initiate a statewide program of construction. To carry out the program, in 1919, he organized the Delaware School Auxiliary Association and personally contributed $2 million to start the construction.

From 1919 to 1944, the Delaware School Auxiliary Association assumed major responsibility for school construction. For instance, with a personal contribution from duPont it erected and equipped 89 school buildings, equal to those for the white pupils, which housed the entire Negro enrollment of 8,000. DuPont also assisted in time and money to construct and equip 81 school buildings for white pupils. In brief, he was instrumental in reconstructing the entire system of school buildings in Delaware, with a total of 170 buildings to house 44,000 pupils.
DuPont was the driving force in building consolidated schools and eliminating one-room buildings. By 1944, the number of schools had been reduced from over 400 to 188, and the one-room schools decreased from 294 to 74. DuPont accepted the position of state tax commissioner at the request of the Governor in 1925, to establish a sound state tax structure. The school laws of 1921 stipulated that the schools' cost should be paid by state taxes. The funds, distributed on a per-pupil basis, were to provide enough money both to operate the schools and to pay for a building program to be carried out in cooperation with the Delaware School Auxiliary Association. Three years later, the Board of Education became aware that the taxes were yielding very little revenue.

DuPont investigated and found that only a small portion of taxes was collected because the Legislature did not provide enough personnel and equipment. For instance, he discovered that only about half the taxpayers owing income tax actually paid it. DuPont reorganized the tax office, collected all back taxes, and reported a surplus for the following 2 years. By the time he left the position in 1937, the state had collected over $63 million for public education, and of this amount $45 million was spent for operating the schools, $15 million was for new buildings, and $3 million remained as a surplus in the school fund (12).

THE DEPARTMENT FROM 1926 TO 1965

The Department of Public Instruction's development from 1926 to 1965 can be divided into two periods: one of slow growth and one of rapid growth. The first extended from about 1926 to 1949 and includes the years of the Depression and World War II. Pupil enrollments remained almost constant and even declined slightly during World War II, while the number of teachers increased very slowly, with salaries at a low level.

The second period extends from 1950 to 1965. During 1950 to 1959, pupil enrollments for grades 1 through 12 increased 71 percent, and by 1965 increased another 37 percent. This rapid growth in pupil enrollment posed serious problems, particularly for the state's financial structure (13).

Elementary and Secondary Education

Art. From 1921 to 1929, art was taught by regular classroom teachers only in the elementary schools, but art education had been provided for adults by the division of adult education. This enabled parents to better understand the art expressions of their children, and also gave impetus for more art education in the public schools. The department appointed a director of art in 1929 and then employed a supervisor and four teachers to develop a program for the state. Two years later, art was introduced as an elective subject in the high schools.

In 1933, the Legislature tried to remove "fads and frills" from education and hotly debated a bill to drop art, music, and physical education from the curriculum. School patrons objected so strenuously that the bill was withdrawn. By 1936, most school districts containing both elementary and secondary schools employed art teachers, but schools with fewer than three teachers depended on the traveling teachers.

In 1940, county supervisors replaced the traveling art teachers. From 1941 to 1945, the schools sponsored "war-inspired" art. Delaware pupils contributed work to a metropolitan exhibition of "Children's Paintings and the War" at the Museum of Modern Art in New York City and to an exhibition sent to several South American republics, titled "Portrait of the U.S.A. by Its Children."

Since World War II, local school districts have gradually taken over art education and receive less direct supervision from the state. In 1967, the department employed only one supervisor for art education.

Music. The Department of Public Instruction did not recognize music as a school subject until 1930, when the state superintendent appointed a director and supervisor of music. Several large schools had begun a variety of musical programming, but this marked the beginning of the music education division on the state level.

A visit to the schools by the director and supervisor showed that there was much to be done. Within a year, the department increased its music staff to include a supervisor for each county, in addition to a number of traveling teachers. Not only did the supervisors help establish programs, they furnished materials to the schools and occasionally taught classes.

The supervisor of music also made an important contribution by organizing an all-state orchestra and chorus, which since 1951 has met in Dover at the Delaware Music Camp on the Campus of Wesley College every summer to study and perform for a statewide audience. The students have received some of the finest instruction available in the East. Districts gradually accepted responsibility for a music program, and the department cut its supervisory staff to two in 1957. By 1960, it was reduced to one, and it continues at this level today.

Health. Health services were initiated in the state for public school pupils in 1919, in keeping with the legal mandate that the state agency encourage medical inspection of schoolchildren. To initiate such a program, it requested $50,000, but the Legislature refused to make the appropriation. The Service Citizens of Delaware stepped in and donated the necessary funds.

In cooperation with the State Board of Health, in March 1920, the Department of Public Instruction...
cooperated in inaugurating physical examinations in the schools. The following year, the Delaware School Auxiliary Association financed a dental unit. Then in 1924, all secondary schools in the state required pupils to take noncredit courses in health education two or three periods per week for 4 years.

Health education did not become a part of the education department until 1927, when it was combined with physical education. Two years later the Legislature enacted a law requiring all elementary and high school pupils to take courses in physiology and hygiene, with special focus on the effects of alcoholic drinks, stimulants, and narcotics.

Since 1932, Delaware schools have kept both health and medical records on each pupil, and these forms have been improved through the years. The education department and the health board cooperated in 1937 in screening and examining crippled children. And in 1949, the state superintendent recommended to the Board of Education that all school personnel should have chest X-rays beginning with the following year.

Although the schools have offered nursing services since the early twenties, it was 1949 before the state adopted a salary schedule and certification standards for school nurses. The following year, a state committee composed of members of the Department of Public Instruction, State Board of Health personnel, school nurses, and administrators prepared a school nurses guide entitled "The School Nurse—Her Duties and Responsibilities."

Driver Education. In 1934, the Delaware Safety Council inaugurated driver education by offering classroom instruction in several schools. An automobile dealer made available eight cars, and the following school year behind-the-wheel instruction was introduced for the first time in the United States. This traffic safety program continued from that time with both classroom and road instruction. By 1945, 555 pupils from 17 Delaware high schools were enrolled in driver education. A study of 300 drivers, one-half having completed the training, revealed that the 150 nontrained drivers were charged with 46 percent more violations (14).

In 1947, with 94 percent of the state's high schools offering driver education, the Legislature appropriated $50,000 to help the state board expand the program. The superintendent appointed a State Driver Education Advisory Committee and held a 1-week conference for teachers. The program continued to expand, and 2 years later the first adult driver education course was conducted at Newark for 34 enrollees. By this time the department had expanded to seven full-time teachers and one supervisor.

Delaware's driver education program continued to gain prestige and expand. In 1954, a staff member conducted a study revealing that individuals having driver education had, statistically, a significantly superior performance over those who had not. By 1967, every public high school in the state offered a course in driver education, with 45 full-time teachers handling 6,300 pupils.

Modern Foreign Languages. Although educational directories of Delaware schools reveal that Latin, French, and Spanish were taught in 1921, it was not until 1959, under impetus of the National Defense Education Act, Title III, that the state board approved the creation of a position of supervisor of modern foreign languages.

The first supervisor, appointed in 1960, provided leadership in conducting workshops and conferences to train teachers of modern foreign languages. Courses were improved, in part, through installation of electronically equipped classrooms. From 1959 to 1964, enrollments in French, Spanish, German, and Russian doubled from 6,889 to 13,581 (15).

Science. Supervision of science teaching benefited from federal funds from the National Defense Education Act of 1958. Before this, Delaware had not provided funds to the state agency for this service. With federal aid, the state board employed a supervisor in 1960 for the first time. At the same time, federal and state dollars were matched to upgrade science laboratory equipment.

The science supervisor has cooperated with the University of Delaware in establishing in-service training programs for teachers in science education. A major focus in training is on the Biological Science Curriculum Study (BSCS). Other trends in training and in teaching are increases in use of the Physical Science Study Committee (PSSC) physics courses, the Chemical Education Materials Study (CHEM), and the Chemical Bond Approach (CBA). Junior high schools are teaching life science and earth science. Elementary schools are initiating programs with use of materials from the American Association for the Advancement of Science, K-3 Science Program, and the Science Curriculum Improvement Study.

Adult Education

In 1919, through the efforts of the Service Citizens of Delaware and with the leadership and financial assistance of Pierre S. duPont, a bureau was established to serve the foreign-born population. These citizenship classes formalized adult education for the first time. Today, adult education consists of six divisions: adult basic education, education for foreign born, general education, high school extension, Civil Defense education, and manpower development and training.

Basic Education. Citizenship education, offered in the cities since about 1900, developed into adult basic education. In 1910, 17,000 foreign-born persons were living in the state, with about two-thirds from non-English-speaking countries.
Immigration, particularly heavy from 1910 to 1915, concentrated around Wilmington. In 1919, the Service Citizens of Delaware took over the Delaware State Council of Defense's Americanization program and created a service bureau to assume the task of financing and developing it until public funds could be appropriated. At least the Service Citizens demonstrated the value of preparing foreign-born persons for participation in American life.

After World War I, literacy classes were established for native as well as foreign-born soldiers returning to Delaware, and this program became an important part of the state's overall adult education program. The Department of Public Instruction accepted responsibility for native as well as foreign-born persons for participation in American life.

In the meantime, the state reduced its appropriations to the Service Bureau to assume the task of financing and developing it. The department's supervisor of adult education, Pierre S. duPont, member of the State Board of Education (1917-21) made up the state's share of the matching funds so the program could begin. At the same time, the Delaware Manufacturers Association donated funds and equipment to initiate a strong program to train in Civil Defense education, of whom 980 were trained in personal and family survival and 45 were trained in radiological monitoring.

Manpower Development and Training. The Manpower Development and Training Act, enacted by Congress in 1962, provided the impetus to institute a multitraining program in Wilmington, sponsored by the Department of Public Instruction (16). Three years later the program enrolled 368 trainees, 257 being trained in Wilmington and 111 in downstate Delaware. Training was provided in auto body repair, building maintenance, clerk-typist, nurse's aide, salesclerk, service station attendant, farm mechanic, and welder.

Vocational Education

The Smith-Hughes Act of 1917 gave an impetus to vocational education in Delaware. The 1919 Legislature accepted the federal terms and designated the State Board of Education to administer the act. The department created supervisory positions in agriculture, home economics, and trades and industries. To implement the program, the department got the approval of the state and federal boards for a state plan calling for vocational training in agriculture, trades and industries, and home economics; vocational rehabilitation of the physically handicapped; and service and distributive occupations. The plan specified the physical facilities, courses of study, teaching methods and materials, and teacher qualifications.

Under the law, the state was supposed to match the $30,000 in federal funds given annually to Delaware, but the Legislature failed to vote a sufficient appropriation. Consequently, Pierre S. duPont, member of the State Board of Vocational Education (1917-21) made up the state's share of the matching funds. At the same time, the Delaware Manufacturers Association donated funds and equipment to initiate a strong program in trades and industries.

Agriculture programs were designed not only for high school students, but for young out-of-school and adult farmers as well. From 1918 to the present, the basic course continues to center on crop and livestock production. However, to meet the changing needs of the state's agriculture, current emphasis is on management ornamental horticulture, and agriculture business; a county vocational-technical high school offers specialized programs.

By the end of the first year, 1918, the department employed a supervisor in home economics, and five high schools offered the first home economics classes in Delaware. The following year, the Legislature required that the subject be a part of the state curriculum. Most of these early classes were taught in makeshift facilities, including churches, school basements, fire halls, and large halls, with
the cooking done on two-burner gas plates and kerosene ranges.

Since the late thirties, food rooms have been constructed with kitchens closely resembling those in the home, laundry areas have been added, and most departments contain a family living area. Sewing machines are now electric, and even electric shears are used by more advanced pupils. While the early courses were centered around the family's producing its own food and clothing—with courses in preserving, preparing, and serving foods or constructing garments—today, the emphasis is on the study of foods and clothing available in the stores.

Each time the home economics curriculum has been revised, committees of teachers have worked with state supervisors and consultants. In 1965, the University of Delaware and the Department of Public Instruction sponsored a new curriculum project in five subjects: foods and nutrition; clothing and textiles; housing, home furnishing, and household equipment; management and family economics; and human development. The Vocational Act of 1963 provided funds for teaching occupations using home economics skills. Today there is a course for training child care workers at the Camp County Vocational-Technical Center where students study and work with children aged 3 to 6 in a well-equipped nursery-classroom. Enrollment has increased to the point that two full-time teachers were needed in 1968.

With the aid of cash and equipment donated by the Delaware Manufacturers Association, trade classes were organized in 1919 under the provisions of the Smith-Hughes Act. The Wilmington High School conducted day and evening and part-time classes for industrial apprentices.

In 1921, all children between 14 and 16 had to have work permits issued by the department's vocational division before being employed to attend continuation school 4 hours per week. Within a short time, 500 boys and girls were attending continuation school.

In 1926, Wilmington High School's commercial department was placed on a vocational basis, and cooperative, part-time instruction in the senior year was subsidized under the part-time continuation program until 1950. At the same time, in 1926, the classes in five different trades held for 120 pupils in the attic of Wilmington High School were transferred to an old school renamed the Wilmington Trade School. It was 1938 before the Brown Vocational School was opened in Wilmington, built by private funds at no cost to the taxpayers, to offer a program of 12 skill trades and occupations.

In 1940, the war production program pressed new responsibilities on the vocational education division. With the department's director of trades and industries in charge, within 2 weeks several classes were organized, and enrollment increased so rapidly that the school was forced to operate on a 24-hour a day schedule, 7 days a week, until all unemployed persons in the area were in training. When the enrollment grew beyond the capacity of the school, extra classes were organized in the plants. When the program ended in 1945, it had enrolled 38,766 men and women in 45 courses. The federal government paid the entire cost of $1,727,464.

Gradually, the state agency's responsibilities in trade and industrial education increased, and it added supervisors for training of foremen, apprentices, trade extension students, teachers, and in other occupations. By 1950, there were 31 trade and industrial education classes, of which 27 were in Wilmington. It was not until 1957 that the Legislature decided to provide trade and industrial education for Kent and Sussex Counties. The Sussex County Vocational-Technical Center opened in 1961 and was followed by the Kent County Vocational-Technical Center in 1965.

Distributive Education. Although the Smith-Hughes Act provided cooperative state and federal efforts for vocational education, it was not until Congress passed the George-Deen Act of 1937 and the George-Barden Act of 1946 that the law provided specifically for those employed in distributive occupations. The department appointed the first supervisor of distributive education in 1938, with responsibilities for supervising business education as well. It was not until a decade later, in 1949, that cooperative programs in distributive education had been established in six local high schools for 143 students. A year later, four centers were opened to offer evening programs for adults in supervision, management, and merchandising. During the 1950's, the Delaware Association of Distributive Education Clubs of America affiliated with the National DECA movement, thus giving the state's students chance to participate in an organized program conducted on local, state, and national levels.

The department appointed a full-time state supervisor in 1960 to be solely responsible for development, promotion, and supervision of all distributive education. The program doubled in size over the next 4 years; student enrollment in secondary classes numbered 150, and adult classes went well beyond 1,000.

With passage of the Vocational Education Act of 1963, Delaware immediately reorganized its curriculum and concentrated on the secondary programs for unemployed persons of high school age. The program continued to grow, again doubling student enrollment in the secondary programs. It has been a tremendous success, reflected in the large number of graduates who are enjoying successful careers in marketing, merchandising, and management.

Vocational Rehabilitation. The Department of Public Instruction accepted responsibility for vocational
rehabilitation in 1939. When the Legislature refused to appropriate enough funds to match the federal appropriations, H. Fletcher Brown, a former member of the State Board of Vocational Education, contributed the money to initiate the program. Since 1941, the Legislature has appropriated the matching funds, and the program continues to grow.

The vocational rehabilitation division provides a variety of services to physically and mentally disabled persons, to prepare them for employment. This is a joint state-federal program, including diagnosis, surgery, treatment, prosthetic appliances, hospitalization, training, maintenance, and transportation.

In the 1965-66 fiscal year, over $497,000 was spent for vocational rehabilitation in Delaware, of which $270,000 came from federal funds. Case service costs amounted to $321,000 including physical rehabilitation and training. Guidance and placement costs amounted to $153,000. In the fiscal year ending June 30, 1966, 640 disabled persons were rehabilitated, and 1,226 others received services from the program.

Occupational Information and Career Services. In 1964, the department created the position of supervisor of occupational information and career services, to determine employment opportunities for young people. The supervisor, employed in 1965, also was expected to make recommendations for necessary training programs, plan them, and see that they operated.

The supervisor has emphasized vocational training in all of the state's educational plans. He has been in large measure responsible for the program's growth, so that at present adult high schools have vocational courses as part of their curriculum. Sussex and Kent programs have been enlarged to serve 1,600 youth, and in 1967 the New Castle County Vocational-Technical High School was under construction.

Planning and Research in Vocational Education. Under provisions of the Vocational Act of 1963, the Legislature created a position of planning and research in 1965, emphasizing pilot and experimental programs, curriculum research, in-service education, new types of occupational programs, and programs to serve persons with special needs. The office develops state plans and reports for the various programs under vocational-technical education and the extended services.

Also in 1965, the University of Delaware, in cooperation with the department's vocational-technical division, offered an Institute for Teachers of Rural Low-Achieving Disadvantaged Junior High School Youth under a grant from the U.S. Office of Education. The Institute developed 10 occupational booklets and prepared a detailed report. These materials have been circulated to all states by the Office of Education.

Migrant Education

The migrant education program began in 1961, when the state superintendent assigned two staff members to develop a pilot summer school program. The Council of Churches agreed to cooperate. The program was conducted cooperatively with a day care program under the auspices of the Migrant Ministry of the State, with $5,000 in private funds.

The first class began in the summer of 1962 in Dover with 33 pupils. It met 5 days a week for 6 weeks. Hot lunches were served, and reading, writing, music, and art were taught by a master teacher and an assistant teacher.

In 1965, the Office of Economic Opportunity (OEO) granted some $95,000 for a cooperative interagency program for migrant children. In the same year, another federal grant of $11,500 was provided to train 21 seasonal welfare workers in an intensive day care course to prepare them for work in the migrant program as day care attendants. In 1967, elementary education was added with funds from Title I, ESEA. The elementary education program was in addition to the existing OEO-funded preschool program consisting of day care, nursery school, and auxiliary services.

Education for Handicapped Children

Although the Legislature had made special appropriations to educate physically handicapped children as early as 1841, it was not until 1932 that legislation was passed to establish a special division within the Department of Public Instruction to serve such children. Unfortunately, the 1932 Legislature failed to grant funds.

Three years later, private agencies donated money to establish this program in the public school system. For instance, the Women's Club of the Trinity Episcopal Church of Wilmington made it possible to employ the first audiometrician. The Delaware Citizens Association enabled the department to employ a psychological examiner in 1935, particularly to set up classes for mentally retarded children. Eight years later, a program in lip reading was initiated and an additional psychological examiner and audiometrician employed.

It was 1953 before the Legislature modified the School Code to provide more funds to educate handicapped children. Following this act, the Wilmington School District established classes for a wide variety of handicapped children. Other school districts, such as Alfred I. duPont, Middletown, Stanton, Caeser Rodney, Smyrna, and Seaford, offered programs for the trainable mentally retarded. The orthopedically handicapped are educated in De La Warr and Dover, in addition to Wilmington. Classes for mentally retarded are provided in most public school districts having grades 1 through 12.
Pupil Transportation

Shortly after World War I, when the department became interested in consolidating small schools, it became involved in transportation problems. The annual report of 1926 pointed out that Delaware was the only state in which transportation was paid entirely from state funds. The state board either arranged for transportation or contracted with railroads, trolleys, or buses. In 1931, the department employed a supervisor of transportation and placed him under the direction of the business manager.

The state agency has continued to administer pupil transportation. The supervisor arranges for contracting of all schoolbuses operated by private contractors and for employing drivers to operate state-owned buses. He organizes and lays out the routes, supervises the operation of the buses, and has developed a set of regulations on safety education. His schedule is becoming increasingly difficult as the number of pupils eligible for transportation rapidly increases. In recent years, however, several larger school districts have assumed the responsibility for: routing buses.

School Lunch Program

As early as 1912, Wilmington pupils were able to obtain lunches at the schools, and 6 years later Wilmington opened the first cafeteria. Although there was usually a small charge for lunches, the Kiwanis Club, American Legion, student councils, and other organizations donated funds for free meals. The state agency became involved in 1929 when several home economics rooms began serving lunches.

The program developed slowly, however, until Congress passed the National School Lunch Act, and the Legislature authorized the state agency to employ a supervisor of school lunches. The program then developed so rapidly that all school districts and nearly all schools in the state were participating in the special milk and type A school lunch programs. Average daily participation today is about 40 percent; 2 percent of the school lunches are served free to needy pupils (17).

Research

When the Department of Public Instruction was reorganized in 1921, it created a position of director of research primarily to gather statistics, particularly for the state superintendent's annual report. He was also responsible for preparing forms, supervising attendance, supervising visiting teachers, directing publicity, and supervising athletics. A decade later, he became responsible for the state testing program.

From 1940 to 1960, the research office assumed the responsibility for gathering educational statistics and publishing the department's reports. In recent years, this office has employed staff personnel in data processing and has moved toward a more detailed analysis of educational data. It also plans, designs, and evaluates research projects, which affect nearly all divisions.

School Construction

Although the research division and several of the other professional staff members have been involved for many years in planning for school construction, it was not until 1964 that the agency created a separate school construction division. Since the Delaware School Auxiliary Association headed by duPont provided personnel and finances for supervising school construction, the agency itself simply didn't need to become involved until this date.

Departmental Organization in 1965

From 1963 to 1965, the state agency reorganized, mainly by regrouping and expanding the number of positions. At present, the state superintendent and five professional staff members—an administrative assistant, a section for research and publication, and a section for public information—comprise one division. The assistant superintendent for administrative services has 12 professional staff members, responsible for school finance, school construction, state-federal programs, pupil transportation, school lunch, and data processing. The assistant superintendent for instructional services and his 33 professional staff members are responsible for all phases of the instructional program except vocational-technical education. This division includes services for libraries, audiovisual education, and certain federal programs.

The assistant superintendent for vocational-technical education heads a division with 23 professional staff members. It is responsible for certain types of adult education, Civil Defense education, education of the foreign born, vocational rehabilitation, migrant education, and vocational research. The director of educational television, appointed in 1965, has a staff of 41 professional and technical persons responsible for a schedule of closed-circuit programs transmitted to every school district in the state. The state superintendent is the chief administrative officer.

IMPORTANT ISSUES

Negro Education

Before the Civil War, Delaware did little to educate its Negroes. But in 1867, several philanthropists formed the Delaware Association for the Moral Improvement and Education of the Colored People. They contributed funds
to organize 15 schools for Negroes—7 in New Castle County, 4 in Kent, and 4 in Sussex. The association supervised these schools and dedicated heavily to their operation, but it did receive voluntary subscriptions from other sources.

In 1869, Wilmington established the Howard School as the first elementary school for Negroes in Delaware. It developed into a 3-year high school in 1888, but it was 23 years before it added a fourth year to its high school program. Not only did it have a course in normal training, but it included a normal department for educating Negro teachers.

By 1875, the association was supervising 28 Negro schools without financial support from the state. In that year, however, the Legislature enacted a law taxing the citizens for educating Negroes, but stipulated that the association would administer the revenues. The taxes proved to be insufficient, and the Negroes themselves gave the additional support necessary. Within 6 years, 1881, state financial aid amounted to $2,400 annually. Two years later, the Legislature delegated supervision of the Negro schools to the state superintendent, but in 1887 it decided to turn the operation over to the county superintendents. At the same time, it provided a legal basis for separating the races in the public schools and established a parallel system for Negro pupils, with both state and county officials responsible for each system.

Although the law levied a uniform tax for each system, independently incorporated schools could still receive state funds directly from the state treasury.

In the mid-eighties, few schoolhouses for Negroes existed, and the children usually were taught in private houses, churches, and society halls. In 1889, the state provided $500 to help erect a schoolhouse in Lewes. Two years later, the Legislature increased the annual appropriation for Negro schools from $6,000 to $9,000 and directed that $500 be used to repair schoolhouses if the local citizens contributed half as much as the state (18).

In 1895, the Legislature recognized the legal existence of separate school districts for Negroes and stipulated that these separate schools would be based on financial equality with the schools for white pupils. At this time, there were 25 districts for Negro schools in New Castle County, 32 in Kent, and 33 in Sussex. There were about 3,400 pupils, nearly all enrolled in elementary one-teacher schools.

All Negro pupils were taught by Negro teachers, although after 1895 the county superintendents exercised general supervision. In 1891, the Legislature initiated teacher training for Negroes by chartering and financing a state college for Negro students at Dover.

When public school systems were reorganized under the school laws of 1919 and 1921, the Legislature instituted a system of full state support for education. It eliminated the separate tax on Negro property and appropriated funds to Negro schools on the basis of net enrollments, in the same manner as schools for white pupils.

In 1919, duPont and the Service Citizens of Delaware sponsored a number of surveys, with particular attention given to the condition of the buildings. Two years later, they concluded that Negro pupils could be served better by constructing one- and two-room schools throughout the state. The Department of Public Instruction accepted this as a recommendation, and in 1926 duPont personally financed the construction of 86 school buildings for Negro pupils. The survey committee on school buildings further recommended constructing a high school for Negroes at Dover, pointing out that enrollments were increasing on the secondary level, and it would be impossible to establish a high school for Negro pupils in each county.

It was 1948, over 20 years later, before another survey focused on Negro education. At this time, the American Council on Education pointed out that in the 1945-46 school year there were over 60 schools for Negro pupils, most very small, with few Negro administrative and supervisory personnel. Thirty-four were one-teacher schools, and few Negro pupils outside Wilmington had access to a school with a 12-year program. However, it did point out that in 1947 the Legislature had appropriated funds so that Negro pupils could either board or be transported to high schools in Wilmington or to the State College High School near Dover.

Among other things, the survey committee recommended that small schools be eliminated by consolidation and Negro children be given the opportunity to attend a 12-year program. It further recommended that the state establish a centrally located junior and senior high school in New Castle County, that the Department of Public Instruction add a Negro staff member to interpret the needs of Negro schools, and that the state organize a parents program for Negroes. It recommended medical services and standards to encourage Negro pupils to graduate instead of dropping out of school.

As a result of the commission’s recommendations, the Legislature voted to construct high schools for Negroes. By 1950, three—one for each county—were completed: the L. L. Redding Comprehensive High School for New Castle, the William Henry Comprehensive High School for Kent, and the William Jason High School for Sussex. Thus, with the Howard High School in Wilmington, there were four Negro high schools in the state.

The concept of separate but equal schools for white and Negro pupils remained unchallenged in Delaware until 1947, when Negro students sought admission to the University of Delaware. They contended that the instructional program at Delaware State College, which had been established for Negroes, was inadequate and did not meet the equal protection provisions of the Fourteenth Amendment to the federal Constitution. Trustees of the
University of Delaware then passed a resolution admitting Negroes to the university if they met the admission requirements and wished to pursue a program of study not offered in the state's Negro college.

In 1950, a number of students once again demanded the right to attend the University of Delaware, with proper qualifications, regardless of whether Delaware State College offered courses they desired. Although their demands were challenged by the university, they were upheld by the state's courts. As a result of this court decision to end segregation in higher education, a number of civic associations started a movement to remove segregation from the public schools at both the elementary and secondary levels.

The move for desegregation immediately expanded. By 1952, the parents of several Negro pupils at Claymont and Hockessin Elementary Schools challenged the dual system of education, contending that educational facilities available to their children were not equal to white facilities. After a series of appeals from state to federal courts, in 1954 the U. S. Supreme Court declared segregation to be unconstitutional. The Court ruled that where separate educational facilities were provided for Negroes, the education was not equal to that for white pupils.

Following the 1954 Supreme Court decision, the State Board of Education developed a plan for integrating Negro and white pupils at the rate of one grade per year, commencing in 1957. However, in 1961, the U. S. District Court set aside the grade-a-year plan on the basis that it would not accomplish integration rapidly enough. Thus, in February 1965, the state board adopted a resolution to end segregation of the races in the public schools by voluntary agreements on the part of the school boards of Negro school districts to dissolve and close their schools. At the same time, school boards of the neighboring white districts were to voluntarily agree to accept the pupils from these closed districts. The state board was prepared to cut off state aid for any school district that failed to reach a voluntary agreement or refused to comply (19).

As a final step to force complete integration, the state board was prepared to seek further legislation. However, the voluntary system worked. The boards did close all the school districts for Negro pupils and integrated with the neighboring white school districts. Twenty-three elementary schools were closed in 1965. At the end of the 1965-66 school year, the high schools for Negroes in New Castle and Kent Counties were closed, and the Sussex County High School was closed at the end of the following year. By June 30, 1967, all Negro high schools in Delaware were phased out: 26 Negro schools were closed, 307 Negro teachers were transferred to school districts for white pupils, and 8,912 Negro pupils integrated in the white schools.

Reorganization

By 1919, out of 450 school districts in Delaware 300 were one-teacher schools. In that year, the school laws created "special school districts" in the urban areas, requiring them to maintain schools for elementary and high school pupils and permitting them to establish from local revenues kindergartens, schools for handicapped children, evening schools, and vocational schools. All other school districts were designated as "state board districts" in 1921. These districts, usually small and in the rural areas, depended on the Department of Public Instruction for supervision of instruction, preparation of budgets, hiring of teachers, and other assistance. Gradually, the state board districts increased in enrollments and became more independent of the state agency for services, until today there is very little distinction between the state board districts and special districts.

In addition to the special and state board districts, the Legislature created two area high school districts, each comprising several elementary districts, and one area vocational school district for each of the three counties. Two are already operating area vocational high schools, and the third county is preparing to do so at present.

The state superintendents raised the question of school district reorganization from time to time and occasionally mentioned it in their annual reports. In 1946, a school survey recommended redistricting (20), and this prompted the first comprehensive study and report on reorganization since 1921. This report, issued in 1951, recommended that 12 administrative units replace the existing 117 districts (21). Although these recommendations were not followed, there has been a gradual reduction in the number of school districts through consolidation.

In 1965, the Governor's Committee on Education inaugurated another study, with considerable emphasis on reorganization. In its first report, issued the following October, it recommended a reduction from the present 51 school districts to 25 (including vocational districts), as well as changes in staffing and financing.

Teacher Certification and Education

Securing well-trained teachers for Delaware schools has long been a problem, but it has become critical as pupil enrollments have rapidly increased. Since 1950, Delaware has had to recruit four out of five new teachers from other states.

Certification. Delaware passed, in 1829, its first law concerning certification to provide for a county superintendent, who would serve without remuneration and issue teacher certificates on examination. No professional
qualifications were written into the law itself. It was 1880 before the Legislature enacted a law requiring teachers to attend the County Institute for Teachers and established three grades of certificates for candidates taking examinations: first grade, second grade, and third grade. The kind of certificate a candidate received depended on his examination grade. Applicants for first-grade or life certificates had to make a grade of 90 percent, have 10 years teaching experience, and furnish five testimonials of good moral character.

After the state adopted the Constitution of 1897, the Legislature enacted a law providing for one set of examinations for white teachers, another for Negro teachers, and a third for teachers in certain “graded schools” (22). In 1903, the law authorized the county superintendent to grant any person holding a diploma or certificate of graduation from a respectable normal school or college a certificate to teach in any of the free schools of the county in which the superintendent held office, without requiring him to take an examination. The certificate was to be good for 1 year only. In 1911, the law was amended to create a board of seven members to establish rules and regulations and determine when and how the county superintendents should issue these certificates.

The School Code of 1919 permitted the State Board of Education to require a certificate of “good health and of sound physical condition.” It also stated that 1 year’s teaching experience would be considered equivalent to practice teaching and agreed to accept other states’ certificates if the qualifications were equal to or superior to Delaware’s. Standard certificates were granted to normal school, college, and university graduates without examination, if their credentials were satisfactory. The certificates were renewable if the teacher completed a successful year of experience and had the proper professional “spirit.” The regulations also provided for examinations for second- and third-grade certificates for teaching in the elementary school.

From the reorganization in 1921 to 1957, the state superintendent certified teachers. Before this, the Department of Public Instruction had only one special secretary to the state superintendent responsible for evaluating credentials for teacher certification. Since there was no one else working on teacher education, the secretary was called the state supervisor of certification from 1947.

In 1957, the state board approved establishing a teacher education and professional standards division with a director and supervisor. It was now possible to begin a comprehensive study of certification regulations. In 1961, over 200 people, representing all levels and areas of teaching and various lay and professional organizations, participated in this 3-year study. The result was an increased emphasis on general education, increased requirements in the subject matter areas, a 60-hour graduate program for superintendents, a broadened reciprocity policy, and expansion of special education. At the same time, a State Advisory Committee on Teacher Education and Professional Standards was organized to be responsible for finally reviewing all certification policies and major program changes or new courses in programs of teacher education.

Four years later, in 1965, representatives of the 1961 committee were called back to review the earlier regulations and in particular study reciprocity and certification. Since Delaware must import 80 percent of its new teachers, this is most important. The immediate outcome is that, although reciprocity is accepted as a matter of principle, it is still necessary to study credentials and count course credits before granting certification.

**Teacher Education.** Prior to 1921, state and county boards of education were directly responsible for training teachers through the summer county institutes, which were tied to certification. Once the University of Delaware and Delaware State College developed programs of teacher education, the state agency stopped training teachers. However, in the 1921 school laws, the state board was charged with the responsibility of approving all their courses of teacher education. For many years the state board approved the teacher education programs informally. In fact, the only state control was the requirement that these college and university programs meet state certification requirements. In 1957, with the creation of the teacher education and professional standards division, there was a renewed effort to coordinate all phases of teacher education. Both Delaware State College and the University of Delaware have been involved in all phases of the work relating to both certification and teacher education.

In 1957, Delaware initiated a state in-service program and developed guidelines for setting up local and state in-service projects, in preparation for a time when this training could be counted toward salary increments. Progress has been made in coordinating these projects with the university extension program and the state educational television network’s in-service offerings to avoid overlapping and to ensure a balanced state program.

**Finance.**

Delaware’s financial history dates back to 1796 when the Legislature enacted a law stating that all money received by the state treasurer for tavern and marriage licenses should be set apart to provide for a school fund. The revenues accumulating in the fund were unused until 1817, when the Legislature appropriated $80,000 to $100,000 from the fund to each of Delaware’s three counties and directed that this money be used for instructing the children of poor parents in reading, writing, and arithmetic.
In 1829, the first free school law stipulated that voters should determine how much money was to be raised for education in their own districts during the year. The schools would then be able to spend the money raised locally, plus an equal amount provided by the state from the school fund. In 1861, the Legislature amended the law of 1829 to require each school district to raise a minimum sum from local assessment for education. Fourteen years later, the law set a fixed tax to be raised annually in each district. Those in New Castle and Kent Counties were to raise $100, and each Sussex County district was to raise $75.

In 1897, the constitution required the Legislature to contribute to the cost of public education and the General Assembly to appropriate for the schools the income from the investments of the public school fund. The Legislature also was to appropriate at least $100,000 for such costs as teacher salaries and textbooks. It was not until 1921, however, that it actually required that the state school fund revenues be used for public schools. At that time, all revenues derived from personal income taxes, corporation income and franchise taxes, real estate taxes, and other appropriations were required to be used for maintenance and support of public schools.

State Support. After the reorganization of 1921, Delaware developed a state-supported system of education in which the major portion of the revenue is derived from the state government. Pierre S. duPont implemented this system by organizing and placing in operation a state tax department. The Delaware system is unique—no other state has this type of educational organization to obtain financial support for the schools. The Legislature appropriates moneys biennially for the schools. The Legislature appropriates moneys biennially for all school districts, although additional revenues are raised by local taxation. Even if local districts depend on the state, they do have a fair degree of local autonomy, and there is a definite feeling of local responsibility and authority. In 1965, the state contributed 75 percent of the revenues for current expenses of the public school system, local school districts 16.5 percent, and the federal government 8.5 percent.

Although duPont contributed much of his time and money to organize public education for Delaware, he apparently had no desire to relieve the citizens of their responsibility in this connection. It was through his efforts that thousands of individuals were placed on the tax rolls and additional millions were collected in personal income taxes. Delaware continues to be one of the high income tax states, with 37.7 percent of state revenues for education. The state's permanent budget commission, consisting of the Governor, the secretary of state, the auditor of accounts, the state treasurer, and the state tax commissioner. The Governor serves as chairman, and since he appoints the secretary of state and the tax commissioner, he controls the commission. The budget commission requires all state agencies to submit statements of estimated expenditures for the coming biennium. It then investigates and holds hearings and makes suggestions for modifications. The Governor, upon receipt of the commission's report, may make additional changes before he submits the budget to the Legislature.

When the Governor submits copies of his proposed appropriation measures to the Legislature, this budget appropriation bill is referred to a joint legislative finance committee, consisting of five members of the house appropriations committee and five members of the state finance committee. But the main task is to move the budget through the legislative process, as pointed out by one authority on Delaware state government:

The Joint Finance Committee usually has full responsibility for legislative action upon the governor's budget. At times, rather drastic changes are made by it in the executive proposals, but if the governor stands firm, he will generally prevail.

The power of the governor arises, in part, from his item veto. If the legislature has added to the budget he may cut out certain of the items in the appropriation. On the other hand, if his estimates have been drastically reduced by the lawmakers, he may effect retaliation by use of the regular veto on some measure that they want.
enacted. Inasmuch as most of the appropriation bills reach his desk toward the end of the legislative session, he has great opportunity to bring much of the spending into line with his own desires (25).

Due to the difficulty in accurately estimating all financial requirements for a biennium, there is a frequent need for supplementary appropriations. In fact, this type of legislation has been enacted with such frequency that it alters to some extent the purposes of the original budget bill.

Sources of Revenue. As stated previously, the state government provides about 75 percent of the revenue for public education. In 1965, the sources of this revenue were: personal income tax, 35 percent; corporation franchise tax, 12 percent; motor fuel tax, 10 percent; corporation income tax, 8.4 percent; motor vehicle registration, 4 percent; parimutual, 4 percent; alcoholic beverage tax, 2 percent; cigarette tax, 3 per cent; inheritance and estate tax, 14 percent; other taxes, 8 percent (26).

The 16.5 percent of the revenue provided by local taxes comes from real estate and capitations. From 1921 to 1950, local taxation for public education was used primarily for debt service, but since 1950 an increasing number of districts have levied taxes to increase the salaries beyond the minimum state schedule and to buy educational supplies, equipment, and other services beyond those provided by the state. Before a local tax is levied, it must be authorized by a voter referendum.

Federal Programs. The fact that Delaware is a small state has enabled the state agency to operate largely in the manner characteristic of the "horse and buggy" days until the end of World War II. With such a small staff the department could not specialize its efforts.

Since World War II, school population has nearly tripled. The rapid increase in pupil enrollments and the demand for quality education have placed tremendous strains on the public education system, particularly on the state education agency. Although its staff had increased from 1921 to 1960, the rate of growth was far too slow to keep pace with the rate of growth in school population and the demands for state leadership.

Since 1960, federal funds, particularly under NDEA's Title X and ESEA's Title V, have aided in strengthening the department's efforts in planning. A program of automatic data processing, initiated in 1960 under Title X of NDEA, has made a noticeable impact in providing timely, accurate, and detailed information. A growing need for more complete and speedy dissemination of information has been aided by funds under Title V of ESEA. A public information division, created in 1965, has operated under the office of the state superintendent in close cooperation with the research and publications division. Federal funds also have made possible improvement and expansion of publications by the state agency.

Administration of federal programs by the state agency has been facilitated by employing a coordinator of federal funds in 1963 and a supervisor of federal programs the following year. The agency employed a coordinator of Title I, ESEA, programs and a supervisor of finance. The state superintendent appointed a deputy superintendent as of July 1, 1968.

The state agency's instructional programs area has been augmented and strengthened in a variety of ways. In 1960, under provision of NDEA's Title III, supervisory positions were created in mathematics, science, and modern foreign languages; a supervisory position for testing programs was created under Title V-A. Supervisory positions were filled in English in 1963, in social studies in 1964, and in reading in 1965 under Title III, NDEA. Other federally financed positions within the state agency created in 1963 were supervisors for Civil Defense education, occupational information, and manpower training. This addition of supervisory personnel has resulted in upgrading the level of instruction through in-service training programs and conferences, improved curriculum, and more equipment and instructional aids.

The impact of federal aid has speeded the tempo of educational change in Delaware, especially the increasing leadership role afforded the state agency. Specific areas of thrust are better collection, analysis, and dissemination of education data; a training program of greater scope and depth for education personnel; extensive planning to provide more effective administrative services and better programs of instruction; and increasing use of evaluation techniques.

13. After a brief survey of the state agency's growth from 1926 to 1965, a few of these problems will be treated separately.
14. Robert A. Massaferi, "Driver and Safety Education" (unpublished manuscript, Department of Public Instruction, Dover, 1967).
22. Apparently, considerable flexibility was permitted for county superintendents to select teachers according to the type of school involved. Requirements for the "graded schools" were the most severe.
23. Office of the Budget Director, General Fund Revenue and Disbursements for Fiscal Year 1966 (Dover: The Director, 1966).
24. The basis for unit allocation of handicapped pupils is as follows: educable mentally retarded, one unit for 15 pupils; trainable mentally handicapped, 6 pupils; socially and emotionally maladjusted, 10 pupils; partially sighted, 10 pupils; orthopedically handicapped, 10 pupils; partially deaf or hard of hearing, 8 pupils; and blind, 8 pupils. The pupils in vocational programs are counted once as secondary pupils on the basis of one unit for every 20 pupils, plus an extra unit for every 30 pupils in the vocational program.

Supplement 2. — CHRONOLOGICAL FACT SHEET

1792 The second constitution of Delaware provided for the establishment of public schools and the promotion of arts and sciences.

1796 A public school fund was created, and the first fees were received from marriage and tavern licenses.

1817 The first appropriation by the Legislature was made for the education of poor children, and the funds were received from state and county revenues.

1821 The first tax law for education provided public funds for the support of Sunday schools and was used for the teaching of reading, writing, and religious morals.

1829 Free education was provided for all children by law. School districts and school boards were created by law.

1843 First State Educational Convention was held in Dover.

1861 The Legislature mandated that school districts levy a minimum tax for education, with voter option to go beyond the minimum.

1867 The Delaware Association for the Moral Improvement and Education of the Colored People was formed for the purpose of organizing a program of Negro education in the state.

1875 The position of State Superintendent of Education was created by law. The State Board of Education was established by law. The State Teachers' Association was organized at a meeting held in Wilmington. Teacher certification was required by law.

1881 First state aid was extended to Negro schools.

1891 Free textbooks were provided by law.

1897 A new state constitution was adopted in which detailed provisions were made for the financing of public education.

1898 State funds were provided for the education of Negroes on an equal basis with white pupils.

1901 A State Library Commission was created to provide for school libraries, and the law required that the state pay for one-half of the cost.

1907 The first compulsory attendance law was enacted.

1919 The State Department of Immigrant Education, which later became a part of the State Department of Public Instruction, was created by an act of the Legislature. A program of vocational education was inaugurated in the areas of agriculture, home economics, and trades and industries. Special school districts were created by law. The School Code provided for the transportation of elementary pupils living more than 2 miles from school and for high school pupils living over 3 miles from school. The Delaware School Auxiliary Association was organized for the purpose of constructing new school buildings. Pierre S. du Pont provided an initial contribution of $2 million to start this program.

1921 The revised school law eliminated the county system of education and authorized the State Board of Education, as a board, to assume the functions of the county board, which included financial budgeting and supervision of instruction. The State Board of Education was required by law to maintain separate schools for white and Negro children and to make both types of schools equally effective.

1935 The first area high school was created and known as the Henry C. Conrad School District.

1936 Standard high schools were established under the rules and regulations of the State Board of Education.

1941 A school construction formula was established wherein the state was to contribute 60 percent and the local school district 40 percent for the construction of school buildings.

1945 Teacher pension system was established by the Legislature.

1947 A uniform state-supported salary schedule and classification for teachers and other educational personnel was authorized by the Legislature. Legislation dealing with delayed repairs to school buildings was authorized.

1949 The unit allocation law which provided the basis for financing public education in Delaware was enacted to become effective July 1, 1951. The unit allocation law provided that appropriations should be based on units of 20 secondary pupils, 25 elementary pupils, and varying figures for special categories. A school construction act was passed which appropriated money for said purposes, authorized the issuance of bonds of the state and by contributions from school districts. Redistricting: The General Assembly of 1949 took an important step in school district reorganization by passing a consolidation enabling act.

1952 Measures enacted by the Legislature provided an increase in age of compulsory school attendance from 14 to 16 years of age.

1953 The Legislature modified the unit allotment system for calculating the number of units of pupils classified as exceptional, or handicapped, providing smaller classes for handicapped pupils than for normal pupils. The Educational Code was revised providing clarification of legal purposes and providing a ready reference and index to educational status.

1957 The 1957 General Assembly provided funds for the construction of vocational facilities in Kent and Sussex Counties.

1960 A school construction formula was adopted by members of the Department of Public Instruction.

1964 The State Board of Education passed a resolution which resulted in the consolidation of 26 Negro schools with adjoining districts for white pupils, thus abolishing segregation in the state. An Educational Television Board was created by the Legislature, with authorization to establish and maintain an educational TV network.

APPENDIX A—FLORIDA CHIEF STATE SCHOOL OFFICERS 252
APPENDIX B—ORGANIZATION CHARTS 253
THE HISTORICAL BACKGROUND

Florida was officially transferred from Spain to the United States in ceremonies at Pensacola on July 17, 1821, and was recognized as a territory by Congress the following March. That same year, 1822, the federal government established the basis for a permanent state school fund by reserving the income from every sixteenth section of land specifically for this purpose. Five years later, Congress turned the control of these school lands over to the Governor and the Territorial Legislature. In 1828, the Legislature authorized the Governor and legislative council to appoint three trustees of school lands in each county. Although the law remained in force for 4 years, the school land rents netted only $101.50 during this time.

The Territorial Legislature passed a law in 1832 empowering the people in each township to elect three commissioners to take charge of the public school lands of the county. Two years later, the Legislature changed the law to authorize the county judges to appoint two commissioners of school lands for each county. However, little attention was given to this law, so the Legislature in 1835 authorized the register of the state land office to supervise all school lands. The following February, it transferred this supervision to the territorial treasurer. As the territory grew, the treasurer could not give sufficient time to the school lands, so little or nothing was accomplished except to lend an element of centralization that had been lacking.

In 1839, the Legislature again enacted a law providing for the election of three trustees in each township to be responsible for leasing school lands and using the proceeds to establish and support the common schools. This act directed each county tax assessor to prepare a census of the orphans in his county, and it made the county judge responsible for supervising the school fund expenditures.

The officials responsible for education and controlling school money continued to change rapidly. In 1843, the Legislature directed the county sheriffs to take charge of the school lands and arrange for educating the poor children. This lasted only 1 year, when the electors were again empowered to elect three trustees and a treasurer to carry out this responsibility. Two years later, the Legislature designated each county judge as the county superintendent of common schools. At the same time, the trustees of each county were required to report to the judge, who would then write a county school report. In other words, the Legislature delegated some of the responsibilities and duties of the present-day county superintendent of public instruction to the county judge, and the secretary of the territory served somewhat in the capacity of a state superintendent.

Florida was admitted into the Union as a state in March 1845. Two years later, control of the school lands again passed into the hands of the state registrar of public lands. In 1848, for the first time, rather than only lease the lands as in the past, the state was authorized to sell them and establish a permanent state school fund. With this financial source, the new state passed a law the next year providing for a state system of public education open to all white children between the ages of 5 and 19. This law also directed the registrar of the land office to act as state superintendent of schools, the county probate judges to serve as county superintendents, and the taxpayers of the various districts to elect the local board of trustees.

In 1851, the Legislature attempted to further strengthen the state educational system by starting an equalization program of state support. This law stated that in all counties where interest on the school fund did not provide at least $2 per child per year, the state would make up the deficiency from state funds. The eligibility for this state aid was calculated on the number of children required to attend school at least 3 months the previous year.

Since the income from the state's school fund was so small, when the Legislature established the equalization program, it authorized the counties, for the first time, to levy a tax on real and personal property "not to exceed four dollars for each child of school age". As only two counties—Franklin and Monroe—supplemented school funds from the general county treasury, the 1853 Legislature attempted to increase school receipts by authorizing the county commissioners “to add to the sum apportioned to the county by the State any sum which they may deem proper to be paid out of the county treasury” (3). No limit was put on the commissioners' discretion; they could make the county school fund as large as they desired. At the same time, the law attempted to strengthen county organization...
by designating the commissioners in each county as the board of education. The probate judge continued to be the county superintendent and served as president of the board. Unfortunately, during the 1850's, there was apparently little general interest in public education, and only meager sums were voted to support it. The fault was not with the law; if any child was deprived of the opportunity to attend a good common school, the fault was almost entirely with the school officers, especially the probate judges and county commissioners on whom the welfare of the public school system primarily depended. David S. Walker, the first aggressive state superintendent of schools (4), stated in his 1853-54 report: "Hitherto, the judges of probate and county commissioners have not, I fear, given to this subject the consideration it deserves..." (5). The evidence indicates that during this period most of the money received from public funds was used in many counties to subsidize favored private schools already in operation rather than to establish public schools.

Virtually no provision was made for the support of the public schools other than revenue from federal land grants. Of even greater significance, the state had not really provided for a centralized administration and state direction of the public system. This is understandable in view of the great distances between population centers and the lack of communication and transportation facilities in the early 1800's. The present system of public schools in Florida was made possible by the State Constitution of 1868 and the state school law of 1869.

Under the Constitution of 1868 and the school law enacted the following year, the state superintendent was no longer the registrar of the land office, but a separate state officer appointed by the Governor. The state superintendent, the secretary of state, and the attorney general comprised an ex officio State Board of Education.

The new laws also stipulated that the Governor would appoint the superintendent of public instruction in each county, a practice that prevailed until the constitution was revised in 1885. Appointment by the Governor did open the office to abuses during the Reconstruction period, and this may account in part for a great deal of the difficulty Florida's public school system had in winning the support of the general public. The people, often with good cause, had little confidence in local and state officials appointed by the carpetbag regime (6). Secretary of State Samuel B. McLin, who served as acting state superintendent from August 1874 to March 1875, commented on the county superintendents in general in his 1873-74 report:

While a few of our county superintendents are in every way worthy, qualified, and efficient officers, a large majority of them are notoriously unfit for the position, and utterly incapable of performing their duties. The literary qualifications of some of them, if we may be permitted to judge from the letters and annual reports sent to this office, are of a very primitive type, and some of them are so indolent, incompetent, or uninterested, as to omit the making of an annual report at all. The truth is that this and all other offices in any way connected with the educational interests of the State must be entirely and forever divorced from party politics. Too frequently has the county superintendency fallen into the hands of men who have prostituted it to their political advancement, or made use of it for the pecuniary gain it brought. This should not be (7).

This analysis of the county superintendents by McLin is particularly interesting, because he was one of the "hateful imports" then in the control of the state government. He had succeeded Jonathan C. Gibbs, Florida's only Negro state superintendent, and was referring to the appointees of his own party. Superintendent Gibbs served as secretary of state in the same administration and presumably had considerable influence in appointing the county superintendents—at least, a number of "conservatives" (Democrats) were removed from office when he was appointed state superintendent.

Superintendent Gibbs, an 1852 graduate of Dartmouth College, moved from Pennsylvania to Florida in 1866 during the Reconstruction period. He was appointed state superintendent in January 1873 but died suddenly in August 1874. A later state superintendent wrote about his administration:

While it is regarded as exceedingly unfortunate that a Negro should have been put at the head of educational affairs in a Southern State at that particular juncture, when the system needed above everything else popularizing with the white population, and their cooperation to make it a success—it is folly to undertake to force the prejudices of any people, especially of a Florida "Cracker"—still justice must be done Mr. Gibbs, without regard to his color, his politics, or his birthplace. He is reputed to have been a man of integrity, culture, an orator, and quite a gentleman. He was generally conceded to be far superior in all that constitutes a man of worth to the great majority of his white parishioners who held office in the State at that time (8).

During this period, from June 1868 to January 1877, when the government was in the hands of a political party that was neither elected nor favored by the majority of the intelligent voters and property-owning people, there was little continuity in the offices of the superintendent of schools at either the state or county levels. State and county superintendents were appointed by the Governor, who was tempted to play politics at the expense of the schools. Too often, men were chosen, not on the basis of fitness for service, but according to their party affiliation. A number of Florida's citizens did not cooperate to improve education as they would have had they been in sympathy with the party in power. The result was disaster for the education of the state's youth.
From 1870 to 1876, five state superintendents held office, and from 1871 to 1874, only five counties did not have a turnover in county superintendents. From the beginning of the administration of Governor George F. Drew in 1877, the first “conservative” Governor after the Civil War, the public school system made increasing progress. Governor Drew removed or accepted the resignations of well over half of the county superintendents appointed by his Republican predecessor. He restored these offices to the party representing the majority of the people, who began to show evidence of greater interest in the schools (9). The Constitution of 1885, which went into effect in January 1887, provided for the state superintendent to be elected and for each county to elect its own county superintendent. This constitution placed the schools under a county-unit organization and authorized a district school tax to be added to the county school tax for their administration. Between 1884 and 1892, the Governor and state treasurer were added to the state board.

By 1884, a few high schools and more than 1,500 common schools had been established, serving about 42 percent of the school population of the state. By 1901, approximately 2,500 schools were operating, with almost 112,000 pupils attending average terms of 96 days. Almost 3,000 teachers taught in the schools of the state, some in more than one school during the year. The average monthly salary for teachers was approximately $35, ranging from a high of $150 (for principals) to a low of $15. The state's school property was valued at $970,815, and the total expenditures for schools in 1901 amounted to $774,870 (10).

PERSONNEL AND ORGANIZATION OF THE STATE DEPARTMENT (11)

At the turn of the century, the Department of Public Instruction consisted of three people: the state superintendent, a clerk, and a typewriter-stenographer. By the end of the 1904-1906 biennium, the clerk was designated as a chief clerk and had an assistant chief clerk to help him with his duties. Superintendent W. N. Sheats attempted to get the Legislature to provide a state high school inspector. But the $1,500 in salary and appropriation for travel was eliminated by a penny-wise and pound-foolish policy. Sheats reported that—

The labor of inspection was assigned to the State Superintendent, an office with more duties than he could well discharge. After trial, it was demonstrated that the State Superintendent could not find the time to visit and properly inspect all of these schools and perform the other duties placed upon him by law (12).

The need for a high school inspector increased, but no further expansion took place until 1908, when the

General Education Board of New York employed a professor of secondary education to inspect and supervise high schools under the joint authority of the state university at Gainesville and the state superintendent. The inspector was not paid by the state, but from his headquarters in Gainesville he performed a valuable service to Florida high school teachers.

The Southern Education Board, a philanthropic foundation organized to help Southern states improve education, provided Florida with an elementary rural school inspector in 1911, with duties and responsibilities similar to those of the high school inspector. Within 3 years, the elementary rural school inspector’s services had proven so valuable that the Legislature passed an act providing for two rural school inspectors to be appointed by the Governor on the state superintendent’s nomination. They were to work directly under the state superintendent (13).

Except for the addition of a clerk in 1916, the department staff did not grow until 1919, when the General Education Board, founded by John D. Rockefeller in 1902, agreed to pay the entire expense for a state supervisor of Negro schools. The following year, Congress appropriated money for Florida to employ three vocational education supervisors—one for agriculture, one for trades and industries, one for home economies—under the Smith-Hughes Act, passed by Congress in 1917 to promote vocational education. Also, the General Education Board placed a full-time high school supervisor in the field in 1920 with the explicit understanding that its appropriation for this work would be discontinued in 1925. The Legislature agreed to continue the two rural school inspectors at increased salaries and created a new position—state supervisor of elementary schools. The General Education Board contributed $1,250 to defray the traveling expenses of one state rural school inspector, in addition to the $5,300 for salary and traveling expenses it had donated for the supervisor of Negro schools. Thus, by 1920 the department’s staff had expanded to include a three-man state board of examiners for teacher education and 14 full-time staff members.

Only minor changes occurred in the department’s staff until 1926, though a few titles changed. For example, the high school supervisor now was called the state supervisor of high schools. The clerical staff had expanded, so that some were performing semiprofessional duties. Superintendent W. S. Cawthon (14) described his staff in his 1926 biennial report:

There are now nine supervisory positions, four of them being maintained by the general revenue fund of the State, three by the joint appropriations of the State and Federal Governments, one by the Florida Public Health Association, and one by the General Education Board. The incumbents of all these positions except the
Supervisor of Negro Education now have their offices in that part of the Capitol allotted to the State Department of Education. The intimate relationship existing between any phase of education and every other phase of it renders this arrangement highly desirable; and the benefits resulting from the consolidation are already being noted (15).

By 1932, Florida, along with the rest of the nation, was in the throes of the Depression. The department found it difficult to hold the ground it had gained, much less expand its services. In 1933, the Legislature abolished several positions and authorized a reorganization, but it did not appropriate sufficient funds to carry it out. Even though the financial picture was even darker in 1934, the state board did add a state director of instruction and a state director of school finance. By the end of 1934, the department was composed of 21 persons.

The period between 1934 and 1938 was a trying one for education in Florida. Superintendent W. S. Cawthon, who served from 1922 to 1937, worked under the handicap of severely limited funds and an insufficient staff. He devoted his energies primarily to carrying out the administrative rather than the instructional leadership functions of his office. His role was more one of carrying out the legislative mandates than promoting educational progress. His conception of democracy was that of the idealist: Everything was supposed to be done by the book.

Superintendent Cawthon took great pride in the fact that he had never asked anyone to vote for him, and, in spite of this, he was elected three times after his original appointment. His son stated:

He refused to spend any money campaigning and screamed to high heaven about the injustice of the qualifying fee. It really hurt him to dig down every four years for the $250 or $300, as the case might be. When he ran in 1936 and was faced with a second primary, some of his friends persuaded him to change his attitude about campaigning and he did; but I think he always regretted it.

As I recall, the State Superintendent was paid $5,000 a year when he took office and when the question of a raise came up, he refused to join the rest of the Cabinet in requesting it, saying, "I knew what the job paid when I took it."

He did not fall in with the demands of the teachers in the latter part of his administration for more pay even though I think he knew that they deserved it. He always thought that the local governmental body should bear the larger part of the school expense (16).

Superintendent Cawthon was almost miserly in the conduct of his office. He believed that a man with an expense account should only eat and sleep as well as he did at home and that was all—no luxuries. He always stayed at the Aragon Hotel in Jacksonville for $2 a night, although most of the members of his staff refused to join in this sacrificial gesture. The fact that the U. S. government owed so much money always frightened him. When his son suggested that he keep a more accurate account of his medical expenses so that he could deduct them from his income tax, he took a dim view, saying: "They need it worse than I do. They owe a hundred billion dollars and I don't owe a damn cent . . ." (17).

Florida not only suffered from the Depression but had the additional problem of recovering from the shock caused by the collapse of a "land boom." During the late 1920's, extravagant advertising and wild land speculation lured large numbers of new residents to Florida, and most were unable to leave when tropical storms sent prices plummeting and the Depression followed 2 years later. Many schools were operating curtailed terms, teachers were paid in script, and counties were defaulting on school building bond payments.

The change in population, plus a general dissatisfaction with the school system, combined to create a public demand for change. The agitation was particularly evident at the county level, especially among the county school superintendents. In response to this general feeling of dissatisfaction, in January 1936 Governor David Sholtz appointed a special committee, the Florida School Code Committee, to examine the entire field of education and make recommendations to ensure better planning and direction. The committee was composed of state officials, university personnel, board members, county officials, and representatives from organizations such as labor, women's clubs, The American Legion, the state bar association, chambers of commerce, and the Parent-Teachers Association. Although this effort was initiated by laymen rather than the education department, the department's staff did play an active role in the committee's work.

In March 1937, the committee completed a very extensive 220-page report covering almost every phase of education in Florida. It recognized the State Department of Public Instruction (which was renamed the State Department of Education in 1938) as an important agency for maintaining a liberal system of public schools, and that it was "probably desirable for this Department to be created and recognized directly in the school code" (18). The report further stated that the department, operating under the direction of the state superintendent, should—

Assist the Superintendent in carrying out the policies, procedure, and powers authorized by law or by regulation of the State Board of Education; in assembling, explaining and making available data for the intelligent appraisal and operation of the state system of public education; in formulating, revising and executing plans and programs for the system of public education; in arranging, in interpreting and publishing the laws and regulations for the organization and management of the educational system.
schools and educational institutions; in providing professional leadership, guidance, stimulation, for the public school personnel; and in promulgating educational information for the people of the state (19).

In the 1936 election for state superintendent, Colin English, a former county superintendent from Lee leave. The two state universities, the University of Florida in January 1937. He served 12 years take a more active and dynamic role in promoting education in Florida. The electors agreed, and English took office in January 1937. He served 12 years before resigning to run unsuccessfully for governor.

The period from 1940 to 1946 was a trying one for the department, with six regular staff members on military leave. The two state universities, the University of Florida at Gainesville and the Florida State College for Women at Tallahassee (now Florida State University), did provide part-time assistance to the department. The staff members' assignments were doubled, and despite the fact that a considerable number of employees were new to the department, assignments were made on the basis of their personalities and talents rather than following a formal pattern. For example, the director of the division of instruction also served as supervisor of teacher certification and consultant in physical and health education. Travel had to be curtailed due to wartime restrictions and rationing, materials were in short supply, and some services had to be curtailed.

Besides the personnel shortages and travel restrictions, the war presented other problems. Large numbers of recruits were sent to the many military posts and bases located in the state, and whole communities grew up around them. Schools had to be built, staffed, and equipped at a time when materials, labor, and equipment were in short supply. Families with diverse educational backgrounds moved into Florida from all over the country, and pupils were constantly moving from place to place in and out of the state. At the same time, the curriculum had to keep up with new needs and demands.

In 1946, the department was reorganized to better handle the problems brought about by the war and the influx of people by placing its staff members in functional areas. There remained the two primary divisions: the administration and finance division, and the instruction division. However, separate sections or subdivisions had developed under the instruction division, such as veteran education, vocational services, and Negro education, each with its own director.

The vocational rehabilitation services, formerly a part of the vocational services section, expanded so dramatically that it was designated a separate section in 1948. While agricultural education, home economics, and trade and industrial education also emerged as separate sections, they were nominally part of the instruction division, although each operated with a considerable degree of autonomy, reporting directly to the state superintendent on many matters.

By the end of the 1948-50 biennium, the department had added a deputy superintendent to relieve the state superintendent of some of his time-consuming administrative functions. The new deputy superintendent, J. K. Chapman, a former principal and state department consultant, assumed responsibility for much of the internal management, enabling his chief to devote much more time to educational leadership.

When Superintendent Thomas D. Bailey took office in January 1949, new residents were still pouring into Florida from all over the nation, bringing thousands of pupils to swell the schools. This was the beginning of Florida's greatest growth, and the department was truly forced to develop its leadership and expand its services. County school officials were increasingly turning to the department for guidance and help in such areas as curriculum development, budget control, in-service education, school construction, transportation, research, and school law. Rendering these services required the department to add additional personnel. Superintendent Bailey explained this new role of the Department of Education in an address to the Chief State School Officers at Sault Ste. Marie, Michigan, on June 21, 1955:

Only a few years ago it was commonly believed that the chief functions of the state department of education were to gather and disseminate data; to enforce regulations; to inspect and accredit schools; and to issue certificates. These are still, for the most part, functions and responsibilities of state departments of education, but they are no longer matters of primary importance. They have been reduced to established routines, and the energies of staffs at the state level have been channeled into new directions . . .

State school administration must be based upon the generally approved policy of cooperation between local, state, and federal authorities, with the responsibility shared in terms of (1) local operation, (2) state responsibility, and (3) federal assistance. The most desirable situation is one in which there is a maximum of local freedom and initiative, aided and supported by extensive and intelligent state services. It should be noted here that state services should be of such character that local leadership will be encouraged and developed rather than discouraged and usurped . . .

Quality in a state department staff is much more to be sought after than quantity—and is regarded by many as the essential ingredient in the development of a successful state department of education . . . (20).
By 1952, the department was much more efficiently organized. The instruction division was divided to create a new instructional field services division. Textbooks, formerly the responsibility of the administration and finance division, were now under a new publications and textbook services division. But it was 1954 before the major reorganization was completed. No longer was the department's structure dictated primarily by the strengths and abilities of individual staff members—now there was a formal classification of responsibilities. A special executive services unit headed by the deputy superintendent, similar in many ways to an operating division, not only exercised general business control over the department's internal operations, but it also included the managers of central services, purchasing, duplicating, mail, supply, and the editor of the Florida School Bulletin. The school lunch section was transferred from the instruction division to this unit.

The administration and finance division changed very little under the reorganization. It had added considerably more personnel, especially in school plant services and school survey services. While somewhat informally organized, it comprised the following sections: capital outlay and debt service, finance, records and reports, research and statistics, school law and information, school plant, survey, and transportation. These sections worked closely together, with some overlapping of duties and responsibilities.

The former instruction division was abandoned entirely, and the following divisions were created or continued: teacher certification and accreditation; vocational rehabilitation; vocational and adult education; instructional field services; and publications and textbook services. Thus, by 1954 the department had six operating divisions and a special executive services unit. The vocational and adult education division now contained all of the adult and vocational programs in a unified division, eliminating some overlapping and duplication of effort and services that had occurred in the independent sections.

Minor expansion continued to occur. By the end of 1956, the department added consultants in music education and driver education to the instructional field services division and employed a full-time curriculum consultant and a curriculum librarian. The central services branch was moved from special executive services to directly under the state superintendent. By the biennium ending in 1958, the publications and textbooks services division had been abolished when its director retired and the functions transferred to the special executive services unit.

The teacher education, certification, and accreditation division had added a research section, and the vocational rehabilitation division had added a substantial number of counselors to its district offices. At the same time, since Florida's rapidly expanding junior college system needed supervising, regulating, and coordinating, a community junior colleges division was created. This later proved to be one of the greatest forward steps taken by Superintendent Bailey's administration.

The administration and finance division, which had remained virtually unchanged since its establishment in the mid-thirties, had been divided into three separate divisions. By January 1963, the department's organization consisted of eight operating divisions, each under a director (21), with a clear delineation of duties and responsibilities.

During the next 2 years, the coordinator of the National Defense Education Act (NDEA) was moved from the special executive services branch to work directly under the state superintendent. Federal legislation made it necessary to add the higher education facilities program to the administration division. The former school plant section was divided into two sections—school plant management and school plant planning. The vocational and adult education division was renamed the vocational, technical, and adult education division, a more appropriate title since the work had expanded in the technical education areas. Within this division, the division services section was expanded to include manpower development and training, and business education was added to the old distribution and cooperative education section. Technical education was separated from industrial education and made into a new section.

Later in 1965, as a result of the increasing number of new federal programs, a legal aide, an accountant, and a coordinator of federal-state relations were added to the special executive services branch. The department also appointed a fiscal administrator of federal programs to promote a more uniform approach to the solution of accounting problems, both for the county school systems and for the reports required by the U.S. Office of Education. Superintendent Bailey resigned in October 1965 after working for 17 years to give every child in Florida an adequate educational opportunity. One newspaper stated that he had "become a legend in his time..." (22). He received the plaudits of educators, politicians, newspapers, and the public in general. One editorial stated:

Bailey has devoted much of his time to correct inequities in the educational system of the state, so much, that today the child in the smallest county of the state has equal educational opportunities with one residing in the largest county in Florida.

All of this and much more has been made possible through the inspirational leadership of Thomas D. Bailey and his own dedication to his highly responsible position.

Tom refuses to take all the credit for the accomplishments he has brought to education in Florida. Being the humble man he is, he turns and states the news media of Florida deserve as much credit as does he for the
tremendous stride the state has made in education in the past decade and a half. He says the same of educators with whom he has rubbed elbows over the years.

Tom Bailey is a man who will be sorely missed by the people of Florida when he walks out of his office for the last time next Thursday. The people of this sunshine paradise owe him a debt only true thanks can repay.

Farewells are always sad, but they border on the tragic when they are said to a great man and a distinguished citizen and educator (23).

The Florida Education Association also paid high tribute to Bailey; he had been the director of its public relations when he was asked to take the state superintendent's job. In fact, he had been tagged to succeed James Richards as the full-time FEA executive secretary. He had served as president of the organization and held life memberships in the FEA, the NEA, and the Florida Congress of Parents and Teachers. He had won many awards for his distinguished service, plus a national reputation as president of the Council of Chief State School Officers. He also served as chairman of the council's legislative committee, a member of its board of directors, and a council representative to the National Council for Accreditation of Teacher Education.

Educators were particularly proud of his battle against the "overly zealous do-gooders who, for a short time, stirred the state (and the nation) with the battle cry to 'burn the books and clean the library shelves'" (24). He was a real champion of academic freedom. He left the school systems in the hands of the county superintendents and principals, but helped direct legislative action which made teaching in Florida a legally recognized profession. One man states that in the 20 years he had known and worked with Bailey, he had never known him to be malicious, vindictive, jealous, or to lose his temper.

He often questioned the judgement of state politicians, and he sparred verbally on dozens of occasions with governors and Cabinet members when he felt the welfare of Florida's school children was at stake. But he always came away with respect and appreciation for the talents of those with whom he had to work (25).

Present Activities

Effective July 1, 1966, the board appointed an associate superintendent of public instruction to coordinate instructional activities as part of a two-man team with the deputy superintendent, who continues to coordinate administrative and fiscal functions. The Elementary and Secondary Education Act of 1965 (ESEA) prompted the department to add substantially to its staff, particularly since the beginning of 1966. The department has studied the organization and assignment of duties during 1966, and a new organization is now in effect.

IMPORTANT ISSUES FACED BY THE DEPARTMENT

Problems in the Early 1900's

A great many problems faced by the state department—and the entire public school system—in 1900 have been solved, some are no longer important, and still others are unresolved after 65 years. Many evoked heated controversies and political battles. For instance, considerable difference of opinion existed among educators regarding the need for a statewide compulsory attendance law in the early 1900's. Some county officials felt that it was impractical, while others doubted if teachers and classroom space could be provided. Those who spoke in favor of such a law generally felt that it should be reasonable and moderate. It is apparent from his reports that State Superintendent William N. Sheats, who served from 1893 to 1905, was a man of positive opinions, and he did not hesitate to make his position known in forthright and colorful terms (26). Sheats not only spoke for the state department—for all practical purposes he was the department. He stated:

It would seem that the compulsory attendance is a natural concomitant of the public school system. All of the people are forced to pay taxes to build houses and pay teachers, then why haggle at compelling a few of the people to give their children the benefit of that which is provided for them? (27)

Superintendent Sheats was very critical of the unequal preparation of students applying for admittance to the state colleges and normal schools. He charged that these institutions were dissipating their efforts because of this deficient preparation. The difficulty, he explained, arose because more than 80 percent of Florida's youth were taught in rural schools. They passed into the so-called high schools and were taught by incompetent teachers for short terms with completely inadequate curriculums. But even with these shortcomings, the high schools were far too demanding for the preparation most of the pupils had received in the elementary grades. To make matters worse, the rural elementary schools depended on these high schools for teachers. Thus, Superintendent Sheats argued that a standard grade of high school instruction should be mandatory in at least one school in every county for a minimum of 8 months each year.

In his biennial report of 1902, Superintendent Sheats stated that numerous investigations and experiments pointed to greater support than ever before for solving the rural school problem by concentrating the numerous small schools into fewer and better ones. This would be accomplished by transporting pupils in wagons from their homes to the central schools. He declared that it had been shown conclusively that all small schools within a radius of 5 or 6 miles could be concentrated into one central school, usually with an actual saving in cost and certainly with a marked improvement in structural facilities, attendance, health,
moral influence, and safety. He added: "In this State where the rural pupils of so many sections are compelled to go miles through forests frequented only by nomadic Negroes, their protection is an especially strong argument in favor of transportation" (28).

The state superintendent realized that if these schools were to improve, the teaching and administrative staffs would have to be upgraded. Teacher examinations were conducted at the county level with the many abuses such a system invited. Although opinion was divided, most county superintendents seemed to favor the local examination despite Superintendent Sheats' opposition. He charged that numerous fraudulent examinations had been reported to his office, and his personal investigations of them in one or more counties completely convinced him that in many instances they were worse than farcical—they were criminal. He added that they plainly indicated either the utter want of ability on the part of the officers holding the examinations or a conspiracy between the examiner and the examinees to bring the law into contempt.

At the turn of the century many county superintendents argued for uniformity of textbooks throughout the state. On the other hand, Sheats countered that it was "a most undemocratic and offensive proposition to mold all the minds of the State by means of the state textbooks, and it passes my comprehension how it is expected to crush a trust by creating a state monopoly" (29). He claimed that his own investigations clearly revealed no advantage in state uniformity comparable to the disadvantages and dangers. He reported that this was the opinion of the educational experts, including the U.S. Commissioner of Education and practically all of the educators of Florida and elsewhere who had expressed themselves on it. He said he found it difficult to understand why this perennial agitation for state uniformity of textbooks should receive any consideration at the hands of the Legislature.

Although a majority of school people recognized the necessity of providing free textbooks to children if the state required attendance, Sheats contended that they should not be furnished at the expense of other parts of the educational program. Since the average school term was only 94 days, he seriously questioned the wisdom of reducing this "ruinously short term" to gain the benefits of free books. In other words, if the cost of the books were to be taken from the already inadequate funds, this would reduce this term by an average of at least 10 days—considerably more in some counties. Sheats added:

Whether or not I would favor free textbooks depends almost wholly upon the size of the school fund, whether the maximum county levy is to be raised, and the school term, now far too short, is to be still further shortened (30).

On the other hand, Superintendent Sheats supported the mothers' and women's clubs in their campaign for free public kindergartens in Florida. Interest in public kindergartens had revived around the beginning of the century, and a strong demand for them cropped up in many parts of the state, stimulated in part by the success of private kindergartens. Sheats explained to the Legislature that children properly taught in kindergarten were better prepared to pursue the second-year course in the public schools than those spending 1 year in the ordinary schools. They also continued to show the advantages of their kindergarten training in other grades.

Changing the School Laws

Almost every recent session of the Legislature has appointed committees or indicated the need for reforms in school law in one field or another. In fact, this desire to update and clarify the school laws has been prevalent since the early 1900's, when Superintendent Sheats called attention to a number of defects in them. He believed that the general outline of the laws was admirable but that parts were not always in harmony nor always connected and explicit. In other words, they represented too many patchwork efforts that had left many parts vague, meaningless, superfluous, or obsolete, and he recommended to the Legislature that they be "recast, perfected, codified, and enacted as one whole . . ." (31).

Sheats stated that a commission of wise men was needed to formulate such legislation—not only to cope with the complexities involved, but to give it weight so that it would pass both houses. He realized that it would be cast aside without due consideration unless it received a strong endorsement but that each branch of the Legislature had men who were familiar with its purpose in every detail and who could explain and defend the measure. He stated:

Too much school legislation has been attempted by novices, often at the instigation of persons whose range of vision in educational affairs was circumscribed, and oftener under the incitement of those with a personal axe to grind, little caring who was injured so that a present personal advantage was gained. To the latter class belong those seeking the right to teach by special legislation, or by retrograde laws prescribing long terms and small qualifications for low grade licenses (32).

Traditionally, Florida's educators have made full use of the energies, talents, and interests of lay citizens. Many of the most progressive ideas resulted directly from lay participation in educational affairs. For instance, in September 1909, county superintendents, school boards, principals, college presidents, and other "friends of education" organized to inaugurate an effective educational campaign to inspire the public to raise more money for the schools. County school boards contributed from $25 to
$100, for a total of $1,220, and the Southern Education Board contributed $1,000, so the campaign fund had a total of $2,220 available. The first meeting was held at Mariana in October 1909, and the last was held at Leesburg in February 1910. After the close of the regular campaign, however, special meetings were held at Plant City, Tampa, St. Petersburg, Clearwater, Dover, Sopchoppy, Altha, Bristol, Blountstown, and Umatilla. The campaigners covered 3,500 miles by rail, 200 by automobile, and 40 by horse and buggy to hold 196 meetings in 46 of the state's 47 counties. Levy County was omitted only because of a measles-diphtheria epidemic.

According to Superintendent W. M. Holloway, the campaign resulted in increasing the millage assessments in 40 of the counties. In fact, only one county failed to assess a tax of less than 6 mills. More than 60,000 persons attended the rallies, and the campaign aroused enough public interest that 50 School Improvement Associations were organized with memberships totaling more than 10,000. All members pledged to use their influence to get the Legislature to pass a compulsory education law and establish at least one high school in each county. At its state convention in August 1910, the powerful Farmers' Union, representing over 30,000 farmers, unanimously adopted a resolution to endorse the same program.

School Financing

Financing, as in all states, has been one of the most important issues educators have faced in Florida. In 1910, Superintendent Holloway complained that the $500 appropriated for travel in 1909 had not been increased in 25 years and that he had to spend one-fifth of his $2,500 annual salary in representing the interests of education (33). In 1918, when the department again called on the county boards of public instruction to help develop a state course of study, the Legislature failed to appropriate the funds to carry it out. Finally, at the request of the Conference of County Superintendents, State Superintendent Sheats solicited contributions from the county boards of public instruction. Fifty-three of the 54 boards responded, and with the $990 donated, the commission was to prepare a course of study and distribute 5,000 copies before the 1918-19 school term opened.

During the early 1920's, the special-tax school districts, organized in an effort to raise sorely needed funds for the schools, threatened the existing school organization when they attempted to move toward full control of the local schools. In his 1920-22 biennial report to the Legislature, Superintendent Cawthon pointed out that Florida had about the purest county system of administration in the Union and should jealously preserve it. He admitted that the development of districts had been a prominent and effective factor in the great educational progress of the past 20 years. The special-tax school districts, now numbering nearly 1,000, covered almost the entire state and were growing stronger. As these districts realized their increasing importance, they inevitably tended to exercise greater influence and control. He considered it dangerous that they might, either legally or by political pressure, gradually take over many of the counties' powers and thus impair the simple but forceful county management. In fact, he observed that something like this had already occurred in some of the counties. He concluded:

These districts are doubtless proper, vital, and very valuable units, and the people of the districts, through their trustees, should have a voice in district measures. Perhaps our law is approximately or quite correct in this. We merely suggest the advisability of closely adhering to the law and to the principles indicated by it. We believe the boards of trustees, and county boards also, do well to leave the selection of teachers and many other matters largely to the superintendents... (34).

Enriching Instruction

When the 1917 Legislature failed to pass a bill providing for a state course of study as recommended by the state superintendent, the county superintendents, high school principals, and other school officers adopted resolutions at their Gainesville conference in May 1918, requesting the state superintendent to prepare as speedily as possible a state course of study for both elementary and high schools. Superintendent Sheats, as directed by the conference, requested voluntary contributions from each board to raise $1,000 to meet the expenses involved. By prorating this amount among the boards on the basis of their county's assessable property, he was able to raise $990—only one county failed to contribute—and appointed a commission of leading educators to begin work. The commission met in Tallahassee late in June and prepared the Course of Study for Elementary and High Schools in Florida in time to distribute 5,000 copies to the schools during the 1918-19 school year.

The course developed in 1918 proved to be of great value, but by the middle of the 1920's it needed to be revised. Again, the initiative for rewriting the state course of study came from the field—a joint resolution voted in April 1929 by a conference of high school principals and elementary supervisors. The state was divided into districts, and committees of teachers were appointed to prepare courses of study in their subject fields. Actual production was under way by the 1930-31 school year. The General Education Board granted the project $7,300 for expenses in the spring of 1931, enabling the state superintendent to appoint a director. The new state course of study was completed during the 1931-32 school year.
During the 1920's, most of the schools lacked well-trained teachers. In 1925, the Legislature tried to solve the problem in part by creating teacher training departments in the high schools. Students flocked into these departments because, as graduates, they were virtually assured of jobs as teachers. The program did help to meet the teacher shortage, but, at the same time, it tended to "dry up" the regular high schools in some counties and at least held back their development in others.

Toward the end of the decade, the state also tried to improve instruction by changing the concept of the supervisor. Originally, supervision was synonymous with inspection rather than improvement of instruction, and this conception of the state department's function as one of inspection found its way into the Florida laws. The department now, however, made an effort to have the schools think of the supervisor's duties not as inspectoral, but as cooperative and helpful.

As the state department attempted to change its philosophy, functions, and image, it also was forced to wrestle with problems created by the Depression which followed the crash of 1929. Logically, it turned its attention to school business management. In 1933, the Legislature required the county boards to adopt a uniform system of accounting, budgets, audits, and reports, which would then be reviewed by the state superintendent. The submission of county school budgets to the state superintendent was an important milestone in school business relations in Florida. The state auditor and his assistants, representatives of the office of the state comptroller, the state department, and the county boards formed a committee to develop the uniform accounting system. The state board employed a number of special accountants to help the auditor and his men install the new system, and by January 1934, practically every county in the state had adopted the new procedures.

During World War II, the department faced many problems of an emergency nature, such as work-experience programs for youth, Americanization programs, general adult education, vocational and occupational retraining programs, nursery schools and kindergartens, and recreation and physical education programs. Florida's entire educational program was in a period of transition, and important decisions had to be made regarding it. At the same time, the schools found it necessary to employ thousands of unqualified emergency teachers to remain open.

It was evident by the end of the war that Florida was on the threshold of the era of its greatest growth, and the schools faced a crisis. Former teachers returning from the services and new prospects alike found salaries so low they would not accept positions. The school buildings were in poor repair because of the wartime shortage of materials and skilled workmen.

With the approval of the 1945 Legislature, the Governor appointed a Florida Citizen's Committee on Education to make an intensive study of the schools. Its 2-year study recognized at the outset that "Florida has made a great many improvements in its educational program during recent years, and some features of this program compare very favorably with corresponding features found in other states" (35). The final report, however, pointed out the deficiencies and problems, such as great differences in the level of support among counties, inadequate school buildings, low salaries for teachers, lack of instructional materials, and need for more school buses.

Minimum Foundation Program

As a result of the Citizen's Committee's important study and leadership and pressure exerted by outstanding Florida lay and educational leaders, the 1947 Legislature enacted a comprehensive school plan: a minimum foundation program. The credit for this significant forward step must go to many people. Edgar Morphet of the Florida State Department of Education and R.L. Johns, now on the faculty of the University of Florida, provided the technical leadership. LeRoy Collins, then Senator and later Governor, helped steer the bills through the Legislature with only one dissenting vote.

The minimum foundation program adopted in 1947 was much more complex than the legislators who voted for it realized. Actually, it was based on the premise that each child in Florida, regardless of the wealth of his county, deserves an equal opportunity for an adequate education and that the state and county have a joint responsibility to provide this opportunity. The plan had built-in flexibility: It varied the state financial support according to the school population, the professional training levels of instructional personnel, and the breadth of the program maintained by the county—such as vocational education, adult education, kindergartens, summer programs, classes for exceptional children, supervision, junior colleges, and length of employment.

Governor Millard Caldwell insisted that if money was to be collected from where it could be found in the state and spent on children wherever they were to be found, the same philosophy had to be followed at the county level. At this time the state was operating under a county system. The Governor insisted that the Legislature eliminate all district lines, which it then did. This meant that all local money raised at the county level could be expended for all the children in the county irrespective of the former school districts. The entire county's wealth could be placed behind all of its children. Thomas D. Bailey, who took over the state superintendency in January 1949, stated:

I doubt if it is matched anywhere in the United States, when a Governor insisted, in spite of great opposition from the Legislature, that if they didn't want him to veto the foundation program, these districts had to be eliminated so that all local money could be expended for
all the children in the respective counties. This, I think, is to his credit (36).

The schools were in a financial dilemma 2 years later. When the minimum foundation program was enacted in 1947, Governor Caldwell had tried to persuade the Legislature to increase taxes to take care of the necessary increased spending. But since the state treasury had surplus funds, this money was used for the program, and no new taxes were enacted. The surplus was gone by 1949, when Fuller Warren became Governor.

The 1949 Legislature passed an act giving the cigarette tax to the cities and cutting off this source of funds to the general revenue without replacing it. Because of Governor Warren's stand against new taxes, none was passed. The budget commission (state cabinet) found itself in a dilemma: The state had appropriations to be financed and insufficient funds to do the job. The only possible solution the budget commission could reach, since there was no constitutional provision for the state to incur indebtedness for current operating expenses, was to reduce the appropriations for all state agencies by 25 percent for the first quarter of the new fiscal year beginning July 1, 1949, and 10 percent each subsequent quarter.

During this economy move, the Legislature eliminated support for kindergartens, driver education, summer enrichment programs, and financial support for additional junior colleges. Superintendent Bailey used his influence with Governor Warren to get him to veto removal of these items so that they were retained as a part of the foundation program. In only a few years, great strides were made in developing each of these particular programs, and additional money was appropriated.

At the end of June, Superintendent Bailey appealed to the budget commission for additional funds on the grounds that contracts had been entered into with teachers by their respective county school boards, school bus drivers had been given legal contracts, and it was imperative that funds be provided to meet these obligations. Superintendent Bailey stated:

As a result of my pleadings, the Budget Commission agreed to do some fast bookkeeping and released all of the money that had been withheld from the public schools in June of that year so that the funds would not be lost permanently. With the beginning of the new fiscal year, July 1, this money was again withheld from the schools in June of that year so that the funds would not be lost permanently. With the beginning of the new fiscal year, July 1, this money was again withheld from the schools in the new fiscal year for the next quarter. I have at least saved the schools from losing their money on a permanent basis (37).

In the meantime, Governor Warren found it necessary to call a special session of the Legislature to increase taxes to support the state government and the public schools. The Legislature enacted a limited sales tax program—including some provisions to which the Governor objected. The tax money, which began to come into the state treasury fairly early the following year, began accumulating in the treasury, enabling the schools to meet all of their obligations in the latter part of the year. Other state agencies suffered a 10-percent reduction for the fiscal year, but at least the public schools received the funds that had been definitely appropriated to them and were saved great embarrassment. Superintendent Bailey concluded:

This experience was one of the great virtues of our Cabinet system of government, where five members of the Budget Commission compose the State Board of Education. I realize that in some quarters where the Cabinet system of government in Florida is not understood, this type of ex-officio board of education is not considered as in the best interests of education. In Florida, particularly, the experts have never recommended, in every White House Conference we held, that the state superintendent be appointed or that the state board of education be other than the type of board that we have at the present time. Because of the involvement in the State Cabinet system where we wear different hats on the different boards, I am confident that by reason of a majority of the seven members of the Cabinet being on the state board of education, we were able to save the public schools that particular year from financial embarrassment and a great crisis (38).

The Legislature improved the Minimum Foundation Program Law in almost every subsequent session, largely as a result of the state department's and the professional education associations' determined and coordinated efforts. At the same time, due to the urgings of Superintendent Bailey, the Legislature advanced the educational program with other legislation. For example, in 1952, a constitutional amendment strengthened the provision for capital outlay and debt service by guaranteeing the allocation of motor vehicle license revenues to these purposes and authorizing the State Board of Education to issue bonds on behalf of the counties to build school buildings. The following year, the Legislature increased the allocation per transportation unit from $1,100 to $1,250. Again, in 1955, the Legislature increased the allocation for operating costs from $300 per instruction unit to $325. At the same time, it initiated a program in driver education which was later extended to all public secondary schools in the state.

In 1957, the Legislature passed several significant measures affecting education. It began by providing $200 for each additional pupil in average daily attendance per year to be matched by sums from the counties' funds for capital outlay. It also liberalized the minimum foundation program teacher allocations and started a program of rebating part of the state tax collections to the counties in proportion to the number of instruction units.

Following an intensive 2-year study by the Community College Council, the Legislature in 1957 embarked on a full-scale statewide plan for community junior
colleges. Superintendent Bailey stated on numerous occasions that the development of the state-supported junior colleges afforded him the greatest satisfaction of any educational endeavor during his 47 years in education. The program attempted to bring the advantages of higher education and the opportunities of terminal and technical education to the doorsteps of all youth and adults in Florida.

Florida also experimented with four-quarter, year-round schools, with staggered pupil attendance. When the Department of Education studied the results in 1957, it found that they failed principally because starting new groups of pupils each 3 months created the equivalent of four small schools within each school. Such a division sacrificed almost all the benefits of large school attendance units. It would have reversed the results of decades of rapid consolidation of both school districts and attendance units, which made possible the complete programs required by modern conditions.

The state department’s study revealed that only a few of the largest attendance units could remain educationally efficient with these four staggered schedules. The elementary schools would need 24 more teachers, junior high schools would require 50 or more teachers, and senior high schools 80 or more, before they could be scheduled without sacrificing the offerings.

By 1957, Florida had 205 elementary schools in 35 counties that were not large enough to use this plan, although there was none in the other 32 counties. Only 22 junior high schools in 7 counties were of the necessary size, along with 10 senior high schools in 5 of the 67 counties. The principal proponents of this plan hoped to save money, but a careful analysis showed that it would seriously reduce educational opportunities and increase costs if it were installed in all Florida schools (39).

The Future

Many problems remain to be solved, and not all will be met successfully in the immediate future. Among these are the need for extending a statewide kindergarten program, increased salaries for teachers, the impact of integration on the public school system, curriculum revision, vocational education, and the improvement of instruction. In any growing educational system there will always be problems—such as raising enough money. There must be an adequate supply of teachers, and the curriculum must change to meet new conditions. If these overall problems were ever solved, there would no longer be a need for a state department of education staff—only a few clerks and bookkeepers.

The Florida school system and state department are facing up to these issues. Floyd T. Christian, who assumed the office of state superintendent of public instruction when Superintendent Thomas D. Bailey retired in October 1965, recently stated: “The climate for education is progress. The technique is innovation. The dedication is to provide an educational program which meets the individual needs of each individual student. The watchword is quality” (40).

INTERAGENCY RELATIONS

Traditionally, the Florida State Department of Education has exhibited a willingness and desire to cooperate with other agencies—local, state, and national—in programs and activities designed to improve the public schools. In 1872, the state took advantage of the Morrill (Land-Grant) Act of 1862. In 1891, it received money from the Hatch Act to establish agricultural experiment stations as a department of the Florida Agricultural College. As mentioned earlier, the state cooperated fully with the General Education Board of New York and the Southern Education Board in providing supervision of common schools, and with the Peabody Educational Fund for maintaining summer schools for teachers and erecting and equipping a building for the Teachers College and Normal School at the University of Florida in Gainesville.

The Florida Legislature moved promptly in 1914 to participate in the Smith-Lever Act, which provided for cooperative agricultural extension work. Again, in 1917, the Legislature quickly authorized the state to take full advantage of the provisions of the Smith-Hughes Act, enacted by Congress to promote vocational education. At the time Superintendent Cawthron wrote his 1920-22 biennial report, he discussed Florida’s attitude toward federal aid:

The largest unit is the nation. It is fortunate that we southerners are overcoming our squeamishness toward federal revenue for public school,—that we have begun to reconcile our cherished doctrine of state’s rights with some practical basis upon which the nation, as such, may be permitted to contribute to public education. The justice of this lies in admitting to the children and youth benefits a right to which is inherent in their citizenship in the nation, whose burdens they will be called upon to bear in adult life. The profit to the nation lies in the consequent preparation of these young people for bearing ably those burdens. The rural schools, more than any others, need national aid, because they get least financial support from local taxation (41).

Actually, as Superintendent Colin English pointed out, federal funds originally were indirectly used as practically the sole source of support for the state’s school system. For instance, when Florida was admitted to the Union, the state and federal governments set aside section 16 in each township for public school purposes, and this constituted approximately one-thirty-sixth of the land area of each township. Due to inadequate records, lack of attention, and occasional mismanagement, the proceeds
from these federal land grants did not meet expectations. The funds were rapidly dissipated and were inadequate to support the schools, even though there were very few public free schools.

Although these funds have been derived from federal land grants to aid the schools during the entire history of Florida, federal funds as such were not directly appropriated for public elementary and high schools until 1918. Since that time, appropriation has been greatly increased and expanded until, in the 1937-38 school year, $240,764 was received from federal sources. The federal appropriations for vocational education, supplemented by the state and local funds, were now sufficient to provide vocational training in most secondary schools. In fact, this phase of the program had been developing and expanding even more rapidly than many other phases.

During the 1940's, the department cooperated with the federal government to meet needs resulting from the war effort. The department assigned a staff member to direct the development of materials to assist teachers in preparing students for work in defense and war projects. Special courses were introduced at the senior high school level to prepare people for the defense industries.

The National School Lunch Program of 1946 (amended in 1954) had a considerable impact on the lunch programs in Florida, as well as serving its original purpose of encouraging the consumption of surplus agricultural commodities. At the federal level, the program was administered by the U.S. Department of Agriculture rather than the U.S. Office of Education. Although federal-state cooperation in administering the program has generally been quite successful, the state has found a primary problem in the year-to-year appropriation rather than in any unduly restrictive regulation.

In the years following World War II, the federal government moved to provide categorical aid in many areas. The Florida department cooperated to the fullest extent possible with these programs, a few of which will be mentioned.

In September 1950, the Eighty-First Congress enacted Public Laws 815 and 874 to help school districts provide facilities and operating costs for systems having excessive increase in pupils as a result of federal activities within or near their boundaries (42). The philosophy behind the two laws was that the federal government has removed lands from the tax rolls, and its activities had brought an increase in the number of pupils in school. Therefore, it was deemed only right that it should assume the role of a taxpayer within the state and assist in constructing buildings and operating the school system. The laws made substantial contributions to education in many Florida counties. Neither of the programs has proven to be unduly restrictive, and the school systems have made effective use of the federal funds—probably more so than in any other federal aid program.

Congress passed the National Defense Education Act (NDEA) in 1958 and amended and extended it in 1963, 1964, and 1965. The state department incorporated this program into its structure so that it could be carried out essentially by the divisions and sections already operating, but an NDEA coordinator and a few additional personnel were added. Four advisory committees were formed to assist in planning and coordination. Admittedly, some problems developed in implementing NDEA. In a desire to move ahead quickly, the department made commitments in some cases prior to receiving written regulations; under such circumstances, as can be expected, misunderstandings and misinterpretations developed. When the written regulations were finally promulgated, they did not always agree with what had been anticipated from oral communications between the department and U.S. Office of Education. This caused confusion and expensive backtracking in several instances to provide supporting documentation for expenditures already made. Still, the funds provided under the NDEA materially improved the program of instruction in Florida's schools at a time when such help was badly needed.

Some school people, legislators, and members of the business community have feared a developing specter of federal control over public schools, despite assurances to the contrary by federal aid proponents. Some of the developments in federal-state relations have done little to lay the fears to rest. The report "A Federal Agency for the Future," published in 1961 by the Office of Education's Committee on Mission and Organization, added no reassurances.

In June 1965, Superintendent Bailey expressed to his fellow chief state school officers meeting in Washington his concern about some of the U.S. government reports:

After two days of considering regulations and guidelines implementing the Federal Acts of Education, I feel somewhat indisposed this morning. I have diagnosed my affliction as "Feducationitis." The symptoms which have led me to this diagnosis can best be described as "Creeping Paralysis of Conscience on Basic Educational Philosophy." This organization has policy statements on the Church-State issue and State responsibility and local control of education which leave no doubt about intent or allow for no variance in interpretation. In the Federal Acts we have discussed the past two days it is obvious that our policy positions will be as many idle words in the administration of these acts of Congress. Large sums of money will be available for education and for expanding state departments of education. With restrictions of law, regulations and administrative decrees the trend appears that state departments of education may well become administrative arms of the Federal government.

We cannot afford to discard our fundamental beliefs for a price in the form of large sums of money, however
worthy the objective may appear on the surface. We are the leaders of American education in our respective states and territories. Let us not fail to act the part of leaders in representing our citizens and public education as our conscience dictates . . . (43).

In Superintendent Bailey's last official address to the county superintendents in Gainesville, Florida, in September 1965, he again warned that the federal government was usurping the strength of the states. He quoted David Brinkley, the National Broadcasting Company news commentator, who was reported in the press to have told Ohio University students that July: "The decline and fall of the fifty state governments will be completed within our lifetime. The movement of political power from state capitals to Washington, D.C., is inevitable and unstoppable, whether we like it or not" (44).

Bailey particularly criticized the categorical character of the aid provided, which tended to give the federal government considerable influence over the educational policies and programs of the states. He agreed with James E. Allen, Jr., the New York State commissioner of education, who said: "In no small degree, educational policy in America today is being shaped by the Federal government" (45). He predicted that increased federal financing of education would make possible increased federal control—these two influences being inseparable. Thus, federal control in large measure would continue to increase with the federal government's financing education through piecemeal legislation as opposed to general aid, and he felt this was being deliberately done. He saw a declining influence of elected state and local officials in the administration of public education, and he lamented that a number of people had lost faith in the local and state governments.

What is not possible to accomplish by national legislation is being readily facilitated by administrative decrees with regulations from the U.S. Office of Education. Whoever controls public education in the world of tomorrow will control, for the most part, the affairs of men. Public education has been and should continue to be the people's main tool of freedom. Therefore, if we want people to govern themselves in the long stretch ahead, we must be willing for the people themselves to control public education. The American traditions of education are based on this valid assumption. Although I am willing to accept change when justified by fact, logic, and reason, I do not wish to be a party to changes which will undermine the basic foundations of American culture (46).

The Elementary and Secondary Education Act of 1965 (ESEA) introduced massive federal aid to the states for the first time. It brought along with it some onerous problems as well as solutions to educational needs, and these problems still have not all been resolved. In spite of the political and social climate which, in some communities, did not allow the schools to change as fast as others, the state had committed itself to eliminating the dual school system in full compliance with the Civil Rights Act. The Department of Education held conferences throughout the state to help the school systems interpret the guidelines and prepare compliance plans. It invited USOE consultants to participate in conferences for superintendents and school board members. An in-service training program for county personnel engaged in education for the disadvantaged was held in Jacksonville in the spring of 1966, and regional meetings were organized throughout the state during the fall on the theme "Education for All."

During the summer of 1966, the U.S. Office of Education sent teams to Florida to discuss the plans of compliance which several counties had filed. The state department did not know the teams were coming until the news appeared in the newspapers. In all cases, the county superintendents called the state department to ask the staff to attend the meetings and to give them assistance.

Superintendent Christian stated in a report to the Florida congressional delegation in August 1966 that he was sure the U.S. Office of Education faced a shortage of personnel and had little choice, but he added:

I speak now not critically, but a little sadly. Because to send into a Florida county, as the U.S. Office did last week in north Florida, four young men and women with a total school experience for the four of them of one year in second grade teaching, is not to give us the kind of help we need.

These four youngsters—and that's what they are, youngsters, the oldest being 26—are obviously not prepared or qualified by experience to understand or to appreciate the economic and political and social problems of the communities in which they are working. Frankly, I don't think youngsters with such little training and background have had enough experience to recognize the progress which is being made in the counties they visited (47).

Christian went on to say that this team told the superintendents and the school board what they had to do to comply with the guidelines on staff desegregation.

Christian also pointed to similar experiences in other counties—specifically Taylor, Columbia, and Gadsden. In Gadsden, the team left two college sophomores to discuss this highly sensitive issue with the county superintendent and his representatives. Christian charged that in every case these young people had "overstepped their authority and acted contrary to the assurances given to us by the Commissioner of Education that the guidelines were just that—guidelines—and not rigid and unbending formulas to be applied indiscriminately and without reason."

The state superintendent chided the U.S. Office of Education for attempting to measure the good faith of the
school system by numbers or the progress of desegregation in a community by arbitrary percentages. He stated that it was wrong to apply the same yardstick in every situation or to hold the public schools accountable for parental or community attitudes beyond their control. He explained to the congressional delegates that a majority of the state's people were proud of the law-abiding and honorable manner in which the schools had worked to meet the requirements of the Civil Rights Act and that every responsible public official had lent his support and endorsement to it. But he felt that the recent contracts between USOE personnel and some of the counties, and the lack of communication with responsible state authorities, made it increasingly difficult for the counties to continue to work in the same spirit of cooperation they had shown in the past. He added:

Frankly, they feel they are being frustrated by arbitrary and unfeeling decisions which ignore both the problems and the progress. I fear that, if this continues, many of them may just throw up their hands and quit. More and more of them will turn toward resistance...

Christian pointed out that USOE dealt directly with county superintendents, bypassing the Department of Education. The county superintendents looked to the state department for advice and recommendations—the department and the superintendents had a good working relationship—but the state was not informed about many matters except indirectly. Christian also was concerned about federal officials' wanting fiscal audits so detailed and exhaustive as to provide an evaluation of programs' effectiveness, whereby he felt that program evaluations should be done by program-approving personnel familiar with their objectives. He also called attention to Washington program administrators' changing signals in midyear, keeping the local school people in a state of uncertainty as to the direction the program would take.

There were many other problems disturbing to Superintendent Christian; one was the difficulty of obtaining positive answers to direct questions. The arbitrary administrative decisions that seemed to go beyond the language of the law itself have led many Florida educators to believe that the national welfare of the child has been neglected in the interest of forcing social change. The state superintendent said that, for the first time, he felt the county school systems of Florida had been placed in the position of being "guilty" regardless of what they did and what progress they made. But he still asserted that the Florida department desired to maintain a cooperative relationship with the U.S. Office of Education and other federal agencies. He ended his report by saying:

The foregoing statement is not meant to be unduly critical of the U.S. Office of Education. It is a candid appraisal of some of the problems being faced. With improved communication and a willingness to reason together, these problems can be resolved as have others in the past (49).

4. Officially, his title was Register of the Land Office.

6. A carpetbagger was a Northerner in the South after the War Between the States, seeking private gain under the Reconstruction government.

8. *Biennial Report of the Superintendent of Public Instruction*, 1892-1894, pp. 14-16. W. N. Sheats served as county superintendent of schools in Alachua County from 1881 to 1893 at which time he became state superintendent. He served as state superintendent from 1893 to 1905, and again from 1913 until his death on July 19, 1922.

11. The data for this part are derived primarily from the state superintendent's biennial reports. The narrative sections were discontinued with the 1940-42 report; after this they became purely statistical.

13. Thus, by 1912, the staff of the State Department of Public Instruction was composed of the state superintendent, the chief clerk, an assistant chief clerk, a typewriter-stenographer, a part-time high school inspector, and a full-time elementary rural school inspector, both of the latter being paid from other than state funds.

14. Cawthon served as state high school inspector for 6 years prior to becoming state superintendent in 1922. He had been a member of the faculty at the old East Florida Seminary in Lake City and the University of Florida in Gainesville, and school principal at Quincy, Madison, De Funiak Springs, and Pensacola.

- DIVISIONS -
EDUCATION IN GEORGIA PRIOR TO 1900

Georgia's first constitution in 1777 mentioned schools to be built in each county and supported by appropriations from the State Legislature. But the Legislature did not provide adequate funds, and the few communities that were able to establish free common schools had to struggle to maintain them. And although several religious denominations displayed considerably more interest in setting up schools, academies, and colleges, most suffered from a lack of both funds and capable teachers.

In 1820, a group of liberal legislators, frustrated in their efforts to create common schools, pushed through an appropriation for educating the children of the poor. The law required the justices of the peace to report the names of all children whose parents or estates did not pay a tax of at least $1 but not more than the poll tax (1). The plan failed because (a) not more than three-fourths of the children were reported, (b) only a little more than half of these were sent to school, and (c) they attended no more than 4 months in the year (2). The plan also was handicapped by the stigma of "poor people" attached to these children attending schools supported by the "poor-school" funds.

During the 1830's, a number of religious and educational leaders contended that the mind influenced the body and physical condition affected the mind and that, therefore, the body and mind should be educated together. Since manual labor would furnish natural exercise, equip students with practical knowledge, make education less expensive, and work to break down class distinctions, they advocated using these poor-school funds to establish manual labor schools. Their plan called for each county to attach a work-shop or farm to each county academy.

The manual labor school idea spread, in large measure due to its support by the major religious denominations. (The Presbyterians, Methodists, and Baptists founded manual labor schools that eventually developed into Oglethorpe University, Mercer University, and Emory University, respectively.) Eventually, this interest--and pressure--led to the Legislature's voting state support for agricultural and mechanical schools in each of the 12 congressional districts. However, public funds were no longer used in developing manual labor schools on the common-school level after 1900.

As early as 1831, a group of educators organized the Teachers Society and Board of Education of the State. Despite the implications in the title, this was no legal board of education in any sense, and the organization lasted only 3 years. Four years later, the Methodists and Baptists joined the Presbyterians in the Georgia Education Society, which the latter had created in 1823 to promote better education. Although it was also short-lived, many of its leaders became active in the Georgia Teachers' Association, organized in Atlanta in August 1867 by 25 educators from various colleges and private schools (3). The association changed its name in 1900 to the Georgia Educational Association and again in 1922 to the Georgia Education Association.

At the time the state's leading educators were organizing a teachers association, Georgia was culturally, economically, and socially devastated. Not only had the Civil War destroyed its resources and freed its slaves, but a new generation of illiterates was growing up throughout the South. Funds appropriated for the schools were being used to pay other state expenses. The state was under military law, and most of the carpetbaggers running the state made few efforts to establish a state school system. Public confidence in the future of education was badly shaken.

When George Peabody granted money in 1867 for a study of the state's educational needs, the Georgia Teachers' Association formed a committee to work with the George Peabody Fund trustees to develop a state system of public schools. After working diligently for more than 2 years, the committee presented a sound report, and the Georgia Teachers' Association proposed that it be drafted into law.

The association's bill, containing its committee's recommendations, passed on October 13, 1870. That same day, the Governor carried out one provision of the act by appointing the first state school commissioner. But since this was a carpetbag administration, Georgians were considerably hostile toward its officials, and this undoubtedly presented a serious obstacle in developing a state system. The superintendent was further hampered by having a staff consisting of only one clerk employed for 10
The law provided for a State Board of Education, but the board lacked the authority to do a proper job.

The 1870 law did not provide for local taxation; cities and towns could levy taxes for schools, but counties could not do so without special legislation. A few populous counties that enjoyed able leadership convinced the Legislature that they could support their own schools and secured the legal authority to levy school taxes. Chatham, Bibb, Richmond, and Glynn Counties provide outstanding examples of counties where this local option worked.

The major portion of the schools' state funds came from rentals paid by the state-owned Western and Atlantic Railroad. In 1878, the Legislature added the liquor tax revenues to the state school fund (4). For the most part, these funds, appropriated for school purposes, were handled in an irresponsible manner, and many communities were unable to open their schools.

When Georgia adopted a new State Constitution in 1877, it limited public education to the elementary levels of education. In other words, the common schools could teach only basic courses, such as reading, writing, arithmetic, grammar, and spelling. The constitution made the rentals from the Western and Atlantic Railroad part of the public school support plan and specifically prohibited any of this money to be used for teaching courses beyond the elementary level. Secondary schools in the state were privately owned, and the new laws protected the owners in their monopoly of secondary education.

Numerous Georgia educators had long recognized the need to establish teacher-training institutes throughout the state, and with assistance from the George Peabody Fund the effort was gaining momentum by 1887. Institutes were established in 1888 at Salt Spring; in 1889 at Milledgeville, Lithia Springs, and Waycross; in 1892 at Athens, Savannah, and Americus; and in 1893 at Marietta and Thomasville. The state superintendent and his three associates spent a considerable portion of their time and efforts in working to establish these institutes. As new teachers were graduated, the public schools expanded to the point that by 1900 a number of private schools had closed.

As the public schools increased, so did the duties of the state school superintendent. To help him carry out these new tasks, the Legislature approved an act in 1893 directing him to appoint three state school supervisors and authorizing him to hire additional staff as he deemed necessary.

EDUCATION IN GEORGIA, 1900-65

In the 1890's, the Grange and the Farmers' Alliance developed a serious interest in promoting public education and found an ally in the Georgia Teachers' Association. Together these groups inaugurated a campaign to increase the state's support of all education. As a result, in 1903 the Legislature passed a tax measure, called the McMichael Bill after a former teacher-legislator, which was to be submitted to the people as a constitutional amendment. Though limited to a tax of 1 mill, this was the first legislation to authorize local taxation throughout the state for school purposes. Unfortunately, it contained a weakness—it permitted county boards of education to map out local tax districts within the counties. Thus, the richer parts of a county were often gerrymandered into separate school districts, leaving poorer sections with meager tax resources.

Before 1900, although Georgia provided limited state support for its elementary schools and colleges, the academies and high schools supported privately in the urban centers offered the only secondary school program in the state. Numerous attempts had been made to get the General Assembly to pass legislation permitting local communities to support high schools, but these had been defeated. Not until 1912 did the assembly finally pass a constitutional amendment deleting the limitation of support to elementary education alone, thereby opening the door to permissive support for public secondary schools. Based on a study conducted by the University of Georgia on the need for high school accreditation, the Legislature passed a bill in 1925 authorizing the superintendent to appoint a state high school supervisor.

During the years just prior to World War I, educators were joined by both the city and rural press in urging the assembly to write a new school code and uniform tax laws. Editorializing on a survey of the Tattnall County schools by State School Supervisor M. L. Duggan, the Tattnall Journal, a rural weekly paper, pointed out that local financial support for schools usually came from such sources as box suppers and other forms of entertainment. The editor concluded: "The survey points out that a different method of maintaining the schools must be adopted if greater efficiency is to be had and suggests local taxation for this purpose" (5). In an article 2 years later, the Tattnall Journal reported that a principal had resigned his position because there was no tax money to repair the Reidsville School's sanitary facilities, damaged by freezing weather the preceding winter. The editor argued that local tax money was necessary for maintaining and operating the rural schools.

One of the men most aware of the needs of Georgia schools was a vigorous young attorney practicing in Tattnall County, Herschel Elders, who had served several terms in the General Assembly. In 1919, he was chairman of the Senate Education Committee and the administration floor leader for Governor Hugh Dorsey. With his thorough, first-hand knowledge of school needs, and perhaps prompted by the Journal's editorials, Elders sponsored an education reform bill.

In the lower House, George Carswell of Wilkinson County took the lead in writing the new education proposals. Carswell had served several years on the Wilkinson
The state's leading educators and legislators, who favored stronger education bills, had long been frustrated in their efforts to secure the adoption of a new school code and faced in this session the usual opposition against a new tax. Nevertheless, they had high hopes that the Elders-Carswell Bills would alleviate many school problems, so they gave them their support. The state superintendent, M. L. Brittain, speaking before the General Assembly in favor of this new school code, said:

The importance of this legislation is seen in view of the fact that there has never been a school code in the state. In consequence, there are dozens of laws interfering with each other. Some of them partially overlap laws passed years ago; others nullify some parts of the law and leave in force others, and again legislation has passed occasionally which left other conflicting laws on the subject still in force. Such, for instance, is the case with the State Board of Education. The regular state code of general laws prepared in 1914 shows in one place the professional State Board of Education provided by the laws of 1911 and in another the old ex-officio board which served prior to that time.

Besides correcting old troubles and making a code which superintendents, boards, and parents may definitely understand, the new school code makes needed suggestions and recommendations as required by law. For instance, the recommendation is made by the codifying committee that the compulsory education law be amended by the employment of an attendance officer to secure the attendance of pupils from 8 to 14 years. There has never been proper enforcement of compulsory laws without an official. This legislation is further strengthened by the recommendation of six months instead of four months attendance, requiring completion of the seventh instead of the fourth grade.

The suggestion is made that appropriations to the public schools shall be made on a definite scale of 3½ mills and providing that it shall never be less than $3,500,000 per annum. This gives stability and certainty instead of leaving it to the uncertainty of legislative passing yearly.

The right to establish junior high schools of vocational or other character is given to boards of education where there are sufficient local funds to provide same.

The construction of public school buildings no matter how small must be approved by the county and city school authorities.

Changes in the laws are also made so that the state law will not conflict with the use of the Smith-Hughes funds for vocational education. This is needed because there is no provision for part time and evening schools at present.

There are many other helpful suggestions in this new code besides the elimination of laws which are no longer in force and impossible of enforcement under present circumstances.

The code is the result of careful preparation by the Committee. For the good of the schools and those interested in education, it is hoped that it will pass without delay (8).

The county school superintendents had worked diligently for years to secure the type of legislation proposed in the new school code. On July 17, at a meeting held at the University of Georgia, they agreed to send the Legislature the following resolutions:

Resolved: That we fully endorse and urge the speedy passage of the Elders-Carswell Bill, providing for statewide local taxation for public schools.

That we especially urge the importance of the adoption by passing legislation of a school code, which will give to us and the general public the school laws of the state in such logical order as will make them clear and definite, instead of the present confused and confusing shape.

That we ask the strengthening of the compulsory attendance laws in order that we may properly enforce the same.

That we would welcome and encourage legislation to facilitate the consolidation of schools.

That the salary of the State School Superintendent be increased.

That the number of School Supervisors be increased—three is too few (9).

People throughout the state were studying the bill and voicing their opinions. While the Legislature was still considering the measure, 100 Negroes appeared before the State Board of Education to request consideration of the following items: (a) larger salaries for Negro teachers, (b) longer school terms, (c) better school buildings, (d) help in securing a normal school for training Negro teachers, (e) more district agricultural schools for Negroes, (f) a more equitable share for Negroes of federal funds coming to Georgia, (g) a Negro to be assistant state supervisor of Negro schools, and (h) appropriations for training Negro teachers in summer schools (10).

The Elders-Carswell Bills, the most far-reaching laws for education enacted in Georgia up to this time, passed overwhelmingly. They provided for levying local taxes to maintain and operate schools and for issuing schoolhouse
bonds, defined the duties of local boards of education, and placed the licensing of teachers in the hands of the state board.

While the 1919 acts corrected many educational problems, they still lacked several provisions necessary for a good school system. The maximum of 5 mills the laws allowed the counties to levy pointed up dramatically the inequality existing in the state's 160 counties. True, many of the cities operated fairly adequate public schools in grades 1 through 11, but too many were poorly supported.

One of the most important of several studies concerning this inequality of education was conducted by Gordon G. Singleton of Columbia University's Teachers College. In 1925, he analyzed the tax support programs in Georgia and concluded that, despite a permissive 5-mill tax levy, property in various counties was not assessed uniformly. For example, teachers' average salaries in the 160 counties, comprising about 80 percent of the state's total educational cost, ranged from $292 to $1,418 annually. To provide a minimum program, he advocated an equalization plan that would require the following:

1. That every county levy a uniform tax to provide its contribution to the minimum offering on equalized valuation;
2. That the amount of this tax rate be determined by the tax rate it would be necessary for the wealthiest county in the state to levy in order to provide the minimum educational offering the state agrees to equalize;
3. That the state supply the difference between the amount thus raised by each county and the total amount necessary to finance the minimum offering;
4. That the state set up administrative conditions for participation in the state fund which will provide adequate information for the accurate determination of the state's financial responsibility, and (b) insure economical expenditure of all funds necessary to provide the minimum offering the state assumes to equalize. These elements... are accepted as the elements of the proposed plan of school support for Georgia.

On the basis of Dr. Singleton's recommendations, an equalization bill was presented to the Legislature. The Georgia Education Association, the state school superintendent, and Governor Clifford Walker all backed it vigorously. There was no apparent organized opposition to the bill. The Equalization Act, finally passed in March 1926, earmarked certain gasoline taxes to equalize educational opportunities in the poor districts and made it the state board's responsibility to develop the formula by which these funds would be distributed.

Despite progress under these important school laws, college professors, school superintendents, public school teachers, the Georgia Education Association, the Georgia Press Association, The American Legion, and the Georgia Laymen's Educational Convention continued to work on plans to improve the state's educational structure. Many interested business and professional leaders in these groups held a Georgia Educational Convention in Macon in April 1934. They proposed that the Legislature adopt laws to ensure (a) a state-supported minimum 9-month school term, (b) the proper minimum preparation of teachers, (c) a state minimum salary schedule for teachers, and (d) a sound taxation program for the schools.

When the General Assembly convened in 1935, it was faced with conflicting information. Governor Eugene Talmadge, in his State of the State address, indicated that he anticipated a substantial reduction in revenue and directed all department heads to reduce their budget requests by 20 percent. However, the state auditor's report showed a greater balance in the treasury than at any other time in the state's history. Less than 2 months later, the Governor again cautioned legislators to go slow in spending the money, warning: "Heads of the common school system, the university system and the eleemosynary system agreed they could operate on funds recommended by the budget committee. To increase funds would encourage extravagance and affect other departments." (15).

Although the Depression forced all government officials to proceed with caution in projecting their future needs, the 1935 session, famous as the "no appropriation session," did pass a series of education bills sponsored by House Speaker E. D. Rivers embodying the provisions of the resolutions drafted at the Macon convention the previous year. The Governor vetoed the first bill, stating: "This bill appropriates no funds for free textbooks. It would put an idle gesture on the statute books" (16). In a bill designed to let the state superintendent fix the salary schedule for teachers (which could be supplemented by local pay if money was available), the Governor stated his opposition to a uniform school term: "It proposes to change the law. The superintendent of schools would draw a warrant on the treasury and disburse instead of the governor drawing the warrant" (17).

When Rivers became Governor in 1937, he supported another bill similar to the 1935 bill Governor Talmadge had vetoed. Again, the assembly passed it, and the act, this time known both as "The Seven-Months School Law" and the "Equalization of Educational Opportunities Law," was signed by the Governor. It required all schools to have a 7-month term with provisions for this to be extended by counties, independent school systems, or local tax districts with local tax funds. It set a minimum state salary for teachers, with provisions for local units' paying supplements. The state agreed to pay a given number of teachers in each system from state funds, based on a formula involving the average daily attendance of pupils and the pupil-density ratio. The law also provided for free textbooks for...
all students, state support for pupil transportation services, minimum courses of study, and revision of the curriculum.

During the 1940's, a number of lay groups, such as the Georgia Congress of Parents and Teachers, the Lion's Club, the Georgia Federation of Women's Clubs, and the Georgia Farm Bureau, assisted the Georgia Education Association in drawing up legislation to increase the standards for public education and provide additional state support. In particular, the Farm Bureau campaigned for a 3-percent sales tax in every county where it had a chapter, arguing that this was the only way a minimum program could be financed throughout the state.

In its 1946 session, the Legislature authorized a special committee to study Georgia's educational needs. The committee submitted its report, "A Survey of Public Education of Less Than College Grade in Georgia," to the Legislature in January, 1947. State Superintendent M. D. Collins coordinated the efforts of all lay and professional groups to press for the enactment of the Georgia Minimum Foundation Act it recommended. The proposal finally passed 2 years later but was not put into action until 1951 because the state lacked the necessary funds.

The Minimum Foundation Act of 1949 contained many improvements over previous laws. For instance, it increased the minimum school term to 9 months, liberalized the teacher allotment plan, and established standards for school transportation. It also improved and strengthened the federal programs and provided a plan for determining the minimum amount of local financial support for each school system. It forced the State Department of Education to reorganize in order to provide all of the services needed to operate the schools.

In its 1951 session, the General Assembly adopted the Farm Bureau's 3-percent sales tax proposal to finance its minimum foundation program. At the same time, the Legislature passed an act establishing the state school building authority. Since the foundation law provided for the state board to allocate funds for capital outlay purposes, this authority was now established to finance capital improvements in the school systems on a long-term basis.

It was 1963 before the Legislature again authorized a special committee, the Governor's Commission on Education, to study Georgia's public education. All of its recommendations to the Governor and the state board were included in a bill which the Legislature enacted in 1964.

With authorization from the new law, the state board, in consultation with the state school superintendent, completely reorganized the state department in 1964 (18). The law itself, called a new "foundation program for education," required an adjusted tax digest for determining the local effort. It contained a more liberal plan for allotting teachers and other professional personnel and used an index for establishing a teacher salary schedule. It set up a state-supported sick-leave plan for teachers and bus drivers, furnished state money for purchasing instructional materials, appropriated funds for a statewide educational TV network, expanded the state support for capital outlay, and provided state support for a 12-month school program. The new law also included money for a Governor's Honors Program for gifted students, state support for school lunch programs, an expansion of vocational education, new area vocational-technical schools, schools operating within correctional institutions, a budget audit and a financial review section of local school systems, and an educational research division. It gave permission for students to cross school system lines to attend school.

STRENGTHENING INSTRUCTION

Teacher Education

During the nineteenth century and the early part of the twentieth, certification of teachers was almost completely in the hands of the county and city school superintendents. Wide differences existed in the standards required by the various local systems, some localities securing highly qualified teachers while others saved money by employing poorly prepared teachers. Educators were becoming more and more insistent that the state establish some sort of control over standards. In 1911, the State Board of Education designated, for the first time, various teacher classifications based on examinations.

The movement for higher standards continued to gain momentum and finally influenced the Legislature to pass a law in 1919 requiring the state board to certificate teachers. Almost immediately, the colleges, the public schools, and the state department became more concerned with the standards for certification. It was not long, however, before Georgians began to assume that the 1919 school code had solved the problem, and only moderate progress was made in improving teacher qualifications during the next few years—save for summer and Saturday teachers institutes. The various colleges were allowed to take the responsibility for training teachers according to their own philosophies and concepts with little interference from the state. A number of leading educators, however, recognized that many students were being deprived of an adequate education because of poorly trained teachers, and although at first these leaders were voices in the wilderness, they gradually gained influence. By 1924, they were able to institute state certification of teachers based on a 4-year college program.

Some of Georgia's educational leaders were as dissatisfied with the school curriculum as with the caliber of teachers, but for the most part they were unheeded until the early thirties. State Superintendent M. D. Collins and Philip Weltner, chancellor of the University of Georgia, took the lead in a movement to develop clear-cut ideas of school objectives and the program needed to train teachers
on the job to obtain these objectives. They assumed that the movement's progress would require the cooperative effort of many lay people concerned with the quality of public education.

Their efforts bore first fruit in 1932 when the requirement for a 4-year teaching certificate was changed to include a college degree based on more functional courses than previously. But more important, in December of the following year, they secured the cooperation of the Georgia Education Association in holding a conference which started the movement to develop a statewide public school curriculum. L. M. Lester was designated as director of the curriculum program, and Paul Morrow of the University of Georgia was named the curriculum advisor. Nine persons representing the public schools and the public and private colleges formed a committee to serve in an advisory capacity. In turn, they formed the Georgia Council on Teacher Education, which was expected to develop a Georgia program for improving instruction (19).

Study groups of classroom teachers and parents throughout the state began considering ways of providing curriculum improvements on the local level. Approximately 3,000 of Georgia's 20,000 teachers in 1934-35 voluntarily enrolled in these study groups. The movement subsequently expanded until approximately 8,000 persons—parents, teachers, members of civic clubs, and representatives of the press—were participating in one way or another, devoting many hours to educational study and planning. The groups also wrote several guides that were of great importance.

The State Department of Education published Bulletin No. 1, "Organization and Conduct of Teacher Study Groups," in September 1935. At the same time, the Georgia Congress of Parents and Teachers published "Parent Cooperation in the Georgia Program for the Improvement of Instruction in the Public Schools."

By 1937, the study groups were ready to recommend a curriculum designed for all the public schools of Georgia, and the state department published this as Bulletin No. 2, the "Georgia Program for the Improvement of Instruction," more commonly known as the "Red Book." Although an interest in improving the curriculum had inspired the organization of these white and Negro teacher councils, it is obvious that the leaders developed the feeling that the key to curriculum improvement was teacher education.

In 1938, M. E. Thompson, director of the teacher education and certification division, formally organized the State Advisory Committee on Teacher Education and Curriculum. This committee originally consisted of one member from each junior and senior college, the seven state school supervisors, the secretary of the Georgia Education Association, the university high school inspector (a position since abolished), and three public school supervisors.

From 1938 to 1940, the National Commission on Teacher Education, an ad hoc commission of the American Council on Education, operated a project that worked with and gave financial assistance to selected state programs for improving teacher education. In January 1940, the Georgia Advisory Committee requested that the state be admitted as one of the units in the commission's project. Michigan and New York had already been accepted, and Georgia was approved as the third state, with the understanding that the white and Negro councils would operate separately, but that the commission's work would concern itself with both the white and Negro activities.

The commission's consultative and financial help during the period 1940 to 1943 was interrupted for a short time in 1941 due to political interference. Governor Eugene Talmadge and the University System Board of Regents were critical of some individuals in the university system connected with teacher training. They withdrew financial support until these men were removed. Commission help to Georgia resumed the same year, this time with an increased emphasis on in-service teacher education in both the white and Negro councils. The Georgia Advisory Committee (white) reorganized in July 1943 as the Georgia Council on Teacher Education, with an official membership of 17 persons. The steering committee became the executive committee, each member serving from 1 to 4 years on a staggered basis; later it was composed of representatives from the state department and the larger teacher education institutions. The following January, the Georgia Advisory Council (Negro) modified its structure and took the name, Georgia Committee on Cooperation in Teacher Education.

Although the council's major emphasis continued until 1946 to be on details of certification and in-service education, the group did give some attention to other aspects of the school program. In February 1946, L. M. Lester prepared a summary of the council's activities in which he wrote that it had clarified the goals of education and had unified both the teacher preparation and school programs. It had helped teachers with their problems, especially those who had been recruited after their retirement for the war emergency, and had ensured an adequate supply of new teachers to replace those leaving the profession. It also had developed leadership on the local and state levels (20).

The first National Clinic on Teacher Education was held in Georgia in November 1946. Sponsored by the National Council on Cooperation in Teacher Education, it was attended by representatives from 34 states. Its chief value to Georgia was in modifying points of view and creating greater understanding of the state's educational problems. The Georgia council's committees made significant contributions to teacher education, particularly after 1946. The council, in its fall meeting that year, classified its work into four general areas: teacher recruitment selection, pre-service education, in-service education, and leadership education.

Perhaps the most important result of the council's efforts in preservice education was the development of a
new certification plan, which the state board subsequently approved (21). The new plan for certificating teachers required each teacher education institution to plan its own preservice program to conform with criteria developed by the state councils. These programs were then evaluated by a visiting committee appointed by the director of the teacher education and certification division and approved by the state board. This new plan was approved by the state board in February 1948 and became effective in September 1950.

Since the beginning, the in-service education committee has been concerned with finding better ways to help teachers. After considerable experimentation, it developed two effective instruments: the "educational clinic" or planning conference, where attention is focused on problems in improving instruction, and the "school system workshop," which provides an opportunity for group study of curriculum and other aspects of school improvement.

When the new certification plan became effective in 1950, the council again concentrated its efforts on a study of the preservice education of teachers. In addition to the work of its regular standing committees, the council organized other committees to study preparation programs for the preschool and primary level, the middle grades (4-9), and selected special fields programs of the upper secondary level. All of these committees worked within an overall special fields committee.

In the fall of 1953, the council appointed a committee on criteria for the teaching fields to review studies made by former committees and to develop guides for preparing teachers in different fields. As a result, specific criteria were agreed on for evaluating programs in health, music, and art, and for preparing supervising teachers. Other committee reports offered recommendations or general criteria for developing and evaluating programs in elementary education, science, mathematics, English, social studies, homemaking, industrial arts, and business education.

Emphasis on preservice training focused on student teaching. Since colleges were not equipped to provide facilities for this training, many public schools were selected as off-campus centers. The colleges helped train a number of outstanding teachers as supervising teachers, and the state department supplemented their salaries.

In addition to the committees' work on current problems in teacher education, from 1955 to 1957 the council was concerned with its own organization and function. It found that it needed to keep better records of its activities and establish more effective communication with its member institutions and agencies. Although the council had had a very constructive impact on Georgia schools, its program also had some shortcomings. For instance, the personnel of the council and its committees changed too often to ensure adequate continuity; separate white and Negro organizations caused too much duplication of time and effort; the political interruption in 1941 discouraged many participants who might have served for longer periods; and research was either lacking or weak during the early years of its studies.

On the positive side, the teacher education council had stimulated the state department and teacher-training institutions to develop 6-year specialist and doctoral programs, not only for classroom teachers but also for leadership personnel, such as administrators, curriculum directors, visiting teachers, librarians, counselors, and school psychologists. The state minimum salary schedules now provided wider differentials between professional and provisional certificates. (While higher certificates warrant higher salaries, it is also evident that the higher salaries do affect certification [22].)

**Training of Instructional Supervisors**

In 1936, Marvin S. Pittman, president of South Georgia Teachers College, received a grant from the Rosenwald Foundation to begin a program for training instructional supervisors on the undergraduate level. He named Jane Franseth and Kate Hauk directors of the training program and recruited several excellent teachers by paying them a small stipend with Rosenwald Foundation funds while they were enrolled.

It was apparent that appropriate training to meet technical certification requirements could best be obtained on the graduate level. Since South Georgia Teachers College did not have a graduate school at the time, it was agreed that the University of Georgia would assume responsibility for training these instructional supervisors in 1939-40. Dr. Franseth and Dr. Hauk moved to the University of Georgia to continue the program (23).

The Rosenwald Fund continued to contribute to the program after the move to the University of Georgia, but after some years it discontinued the stipend for trainees. Recruitment and screening became the program's important features, and John Cook of the Department of Education became the coordinator of recruitment, selection, and training, and cooperated closely with the staff at the University of Georgia. The state department encouraged school systems to employ instructional supervisors by allotting additional teacher units to those who did and by paying a state supplement to personnel certificated by the state department.

This program received wide recognition, mainly due to the intense recruitment and screening process, the state-directed specialized training program, and the state support for certificated personnel.

In summary it may be said that the Georgia program for the education of supervisors attempts to prepare the prospective supervisors for the kind of work which they will be expected to do by giving them as much of it to do in their education program as possible. The program at-
Visiting Teacher Services

The Georgia Education Association played a vital role in developing the Georgia Association of Visiting Teachers from an idea first presented in 1944 into an effective compulsory school attendance law. J. Harold Saxon, former executive secretary of the Georgia Education Association, states:

A committee was appointed by the Georgia Education Association Board of Directors in 1944, for the purpose of making research on the need for a compulsory (school) attendance law in Georgia. This committee met many times during the year and made the necessary research for the basis for writing the preliminary draft of the Compulsory Attendance Bill. This preliminary Bill was cleared through the Georgia Education Association Legislative Committee and approved by the Georgia Education Association Board of Directors before being introduced in the Legislature.

The only vocal opposition to compulsory school attendance came from those who felt it might hurt the labor market and thereby affect the war effort. One legislator even introduced a resolution asking that it not be rigidly enforced; the resolution did not pass.

When the new compulsory school attendance law passed in 1945, it provided that each school system would employ a visiting teacher "whose duty it shall be to act as attendance officer to enforce the compulsory school attendance laws of the State and to discharge such other duties as are usually performed by, or delegated to, visiting teacher (sic)" (27).

Georgia presents a good example of a statewide program based on legislation motivated by concern over the state's high illiteracy rate. This legislation differed from that of most states because it provided for a compulsory statewide program that had to be set up immediately in each school system. State funds were allotted to the school superintendents for the salaries of these visiting teachers, one visiting teacher to each system having a minimum of 75 state-paid classroom teachers, and the cost of travel was shared by both state and local authorities on a matching basis. When the minimum foundation program for education was started in 1950, the state assumed full responsibility for travel expenses. Some school systems employed additional workers at their own expense.

Claude Purcell, the state department's assistant director of administration, was mainly responsible for recognizing the need for a social work approach to removing the causes of nonattendance. Although he had the strong support of both State School Superintendent M. D. Collins and Assistant Superintendent John I. Allman, it was Dr. Purcell's understanding and foresight that was the deciding factor in shaping the visiting teacher services as an integral part of the school program. The initial focus of the services was on the enrollment of all children. As this goal was accomplished, it became evident that many children were unable to use the school effectively, so the visiting teacher's function expanded to not only getting the children to school but helping them make the maximum use of school experiences.

Training for the visiting teacher position included from the beginning a graduate program with a professional 4-year college certificate as a prerequisite. The education department staff worked with the University of Georgia in developing the training and certification procedures for these visiting teachers. Fortunately, the local school systems usually selected experienced classroom teachers for this training.

Many economy-minded legislators have attempted to reduce or eliminate the visiting teacher program, but schoolmen have prevented reductions thus far. In fact, the school acts of 1964 provided for special allotments to school systems to improve the services. The state department employed a full-time coordinator of visiting teacher work in 1954 to assist visiting teachers, colleges, and school administrators in promoting better services. The coordinator worked in the administration and finance division for 10 years, but the reorganization of the department in 1964 placed him in the instruction division under the pupil personnel services unit. At present, approximately 90 percent of the school systems in the state use visiting teacher services.

Guidance, Counseling, and Testing Services

In 1944, the state department established a program of vocational guidance in the vocational education division. When the first minimum foundation program was established in 1951, this service was transferred to the instruction division and was enlarged to provide some testing services. Four years later, a state appropriation permitted allotments to school systems for testing materials.

The National Defense Education Act of 1958 provided federal funds to supplement the state funds in this area. The state's staff for guidance, counseling, and testing now consists of six professionals (one program coordinator, five consultants) and seven stenographic and clerical staff members. For the 1964-65 school year, 530 schools had
approved guidance and counseling programs handling approximately 339,000 students. At present Georgia has 446 counselors, 108 of whom work at counseling more than half but less than full time, 103 half time, and 41 less than half time. This is 50 more counselors than the 396 reported in the 1964-65 school year, and plans are under way to extend the elementary guidance programs. New programs have been started for training additional counselors to meet the growing needs of both elementary and secondary schools throughout the state, and statewide in-service conferences are being conducted for those already in the field.

The state department's guidance and counseling service has published books, brochures, and material on professional consultative services and program improvement at local and state levels. These have been distributed to schools throughout the state. It also has conducted statistical studies on the activities of ninth-grade students, seniors, high school graduates, and dropouts.

**BETTER FACILITIES AND ENRICHED CURRICULUM**

**Accrediting Service**

In July 1903, on the recommendation of Chancellor Walter B. Hill, the University of Georgia undertook a program of cooperating with the high schools to promote secondary education throughout the state. With financial assistance from George Foster Peabody of New York, the university engaged Joseph S. Stewart as professor of secondary education (29). Professor Stewart stated in his first address at the university's summer school:

> It will be our duties to study the education conditions in the several counties, to encourage the establishment of high schools by local support, to bring these courses into some system and relate these to the common schools and to the institutions of higher learning above. . . . By a system of accredited schools, passed upon after examination, having approved courses of study, suitable laboratories, libraries and skilled teachers, we may hope in a few years to see a system of high schools established (30).

From 1904 to 1929, authority for school accreditation was vested in the University of Georgia Committee on Accrediting, with the State Department of Education represented by a state high school supervisor. The name of the committee was changed to the Georgia Accrediting Commission in 1929, with its headquarters still at the university. Despite the state's financial woes during the Depression, when the 1937 school laws were enacted and accreditation became more important in the plans for improving schools, the number of state school supervisors was increased.

The commission's staff continually requested that consideration be given to moving its headquarters from the university to the state department. The constitution was amended to include the president and secretary of the Georgia High School Association on the commission, but it was 1941 before the office of the commission's secretary was transferred to the State Department of Education in Atlanta.

In 1944, the accrediting commission's constitution was changed again to give it authority to accredit elementary schools and to increase the membership of the commission by two representatives from the Georgia Education Association's department of elementary principals. The chairman of the Georgia Committee of the Southern Association, an advisory group composed of school personnel appointed by the Southern Association of Colleges and Secondary Schools, was designated as an ex officio member. The constitution was subsequently amended to provide for an additional representative in the Department of Education, two representatives from the High School Principals' Association, and one from the Georgia Association of Independent Schools. It also designated the Georgia High School Association representatives as elected rather than ex officio members. In 1958, the constitution was again amended to authorize an increase in the commission membership to include two representatives from the Georgia Education Association's department of classroom teachers and two from the Georgia Association of School Administrators.

Though unique in organization, this plan of making accreditation the responsibility of an independent body has permitted school accreditation to be conducted on a professional basis, free from political pressures, legislative statutes, and government interference. The state department has always worked closely with the Georgia Accrediting Commission and continues to do so.

**Transportation Service**

Despite the fact that the department operated during most of the years prior to 1937 on the theory that its functions were primarily regulatory, it did offer several services to the local school systems (21). The state department's thirtieth annual report (1901) to the General Assembly contained a very interesting but crude statement on the subject of school transportation. In describing the process of providing transportation for the students of Jefferson County, the report said:

> We had some difficulty in getting somebody to furnish the horse. They said you furnish the wagon, and now you furnish the horse. We told them, no, sir, that we would give it out by contract to any man who would bring the children for five cents a day. We had to change
one of these wagons three times. The two-horse wagon is successfully run now by a widow lady, who keeps a horse to plow her garden and go visiting. When we asked her to let her children go to the school, she said, "No, sir, they might fall out and break their necks." She was so well pleased with the wagon that when the man who had been running it quit, she said, "I'll run it." She is very much pleased with the job, and says she will never give it up (32).

The school law of 1919 specifically permitted districts to provide school transportation, and a law in 1926 referred to pupil transportation, but not until the assembly enacted the Seven Month School Law in 1937 were state funds earmarked for this service. Since school consolidations were gaining momentum, transportation was becoming one of the most important local administrative problems.

During the following years, the service became important enough for school bus drivers (mostly white male adults) to form a state association to strengthen their welfare and bargaining position. Although they did not affiliate with a labor union, they exercised influence in political campaigns on impending legislation.

The 1946 General Assembly authorized its committee on education to conduct the first major study of school transportation service. In its report, the committee pointed to a comprehensive analysis of the transportation system completed 2 years earlier by the Agricultural and Industrial Development Board's education panel, and then went on to say: "The transportation program has grown to such an extent that it can no longer be considered a local function of the schools .... The committee recommends a state-owned and operated system ..." (33). However, the assembly refused to act on the recommendation.

During the early 1950's, a $632 million school program gave considerable impetus to the school consolidation movement. As the state's 3,906 schools were consolidated into 1,800 schools, more and more pupils were forced to ride buses. Correspondingly, both the state board and the state department exercised more positive leadership in developing adequate transportation facilities. For instance, the state board began calculating allotments to school systems on the basis of the county-owned buses' operating costs, producing a decided trend toward county-owned buses.

Through close cooperation over the years among the Governors, legislatures, the state board, and the school bus drivers association, pupil transportation services advanced to the point where there is competitive bidding on equipment purchases, construction specifications on equipment, state regulations on bus routes and schedules, and periodic surveys for determining needs and costs. The department holds statewide clinics for transportation personnel and pays the basic salaries of certificated supervisory personnel. It provides bus drivers with annual medical examinations, a state minimum salary, Social Security coverage, and a sick-leave plan.

**School Plant Services**

The state first stepped into the area of school plant services when the 1919 Legislature enacted legislation authorizing the sale of schoolhouse bonds. School buildings throughout the state were obsolete or in a dismal condition by the end of World War I, especially in the rural areas. Many educators—particularly Negroes—were calling for assistance to provide better buildings.

The Chief State School Officers and State Agents for Negro Education in the South, meeting at Gulfport, Mississippi, in January 1925 under the auspices of the General Education Board, asked for help from either the board or the Julius Rosenwald Fund to establish divisions of schoolhouse planning under trained directors. The general board officials responded by agreeing to consider the state's applications for funds to set up such a division over a 5-year period. It was agreed that the state directors would be carefully selected and sent to Peabody College for at least a year of graduate work in school plant problems on scholarships given by both the General Education Board and the Julius Rosenwald Fund.

Georgia took advantage of this opportunity to establish an office of school plant services. The unit now has 10 staff members, consisting of 2 secretaries, 3 maintenance consultants, 2 architects, 2 engineers, and the unit head. It is responsible for school plant surveys and offers consultative services to school architects.

When the foundation program was established in 1951, it included a State School Building Authority, an agency for constructing school buildings on a lease-purchase plan, and an appropriation for capital-outlay funds for constructing buildings in each of the state's school systems. The State Board of Education developed firm policies concerning the rules and regulations for allotting these funds. The State Board of Education has 10 staff members, consisting of 2 secretaries, 3 maintenance consultants, 2 architects, 2 engineers, and the unit head. It is responsible for school plant surveys and offers consultative services to school architects.

Through cooperation over the years among the Governors, legislatures, the state board, and the school bus drivers association, pupil transportation services advanced to the point where there is competitive bidding on equipment purchases, construction specifications on equipment, state regulations on bus routes and schedules, and periodic surveys for determining needs and costs. The department holds statewide clinics for transportation personnel and pays the basic salaries of certificated supervisory personnel. It provides bus drivers with annual medical examinations, a state minimum salary, Social Security coverage, and a sick-leave plan.

**School Plant Services**

The state first stepped into the area of school plant services when the 1919 Legislature enacted legislation authorizing the sale of schoolhouse bonds. School buildings throughout the state were obsolete or in a dismal condition by the end of World War I, especially in the rural areas. Many educators—particularly Negroes—were calling for assistance to provide better buildings.

The Chief State School Officers and State Agents for Negro Education in the South, meeting at Gulfport, Mississippi, in January 1925 under the auspices of the General Education Board, asked for help from either the board or the Julius Rosenwald Fund to establish divisions of schoolhouse planning under trained directors. The general board officials responded by agreeing to consider the state's applications for funds to set up such a division over a 5-year period. It was agreed that the state directors would be carefully selected and sent to Peabody College for at least a year of graduate work in school plant problems on scholarships given by both the General Education Board and the Julius Rosenwald Fund.

Georgia took advantage of this opportunity to establish an office of school plant services. The unit now has 10 staff members, consisting of 2 secretaries, 3 maintenance consultants, 2 architects, 2 engineers, and the unit head. It is responsible for school plant surveys and offers consultative services to school architects.

When the foundation program was established in 1951, it included a State School Building Authority, an agency for constructing school buildings on a lease-purchase plan, and an appropriation for capital-outlay funds for constructing buildings in each of the state's school systems. The State Board of Education developed firm policies concerning the rules and regulations for allotting these funds. Through this building authority, Georgia has embarked on a long-range financing plan based on bonds; the state appropriates the funds as needed. These bonds are issued by the authority, to be retired eventually by lease; whereby the school systems pay a stipulated rent on the projects built. The school plant services office, working closely with the education department and the building authority, has assisted in planning over $300 million worth of buildings financed by the state (34).

**Library Services**

**School Libraries.** The State Board of Education approved a program to expand and improve Georgia's school library services in 1937 and employed a library supervisor. The Legislature had already passed a law in 1935 stating that the revenue derived from a tax on beer and wine would be
used for purchasing textbooks. The attorney general ruled in 1938 that libraries could be defined as instructional materials and that it was legal to spend this textbook money for library books. Early in 1939, the board made the first state funds available to elementary schools for expanding their libraries. This first state aid, amounting to $50,000, was allotted to the systems on a matching basis according to the state-paid teacher allotment. The following year, when high schools were made eligible to participate, the amount was increased to a total of $100,000.

The Legislature continued this state aid for purchasing school library materials by writing it into the first minimum foundation law (35). State aid to libraries again was included in the new minimum foundation law of 1964 (36), but this time it was changed so that the funds were sent directly to the systems to pay their bills instead of the state department's handling the accounts. The law also changed the allocation from a per-teacher to a per-pupil basis and changed the matching proportion from two-thirds state and one-third local to the same formula by which local participation was calculated for other educational expenditures.

The figures for the amounts spent were either non-existent or inaccurate during the early years of the program. Almost no elementary schools had libraries, and those that did used mainly branches of the public libraries in the cities. By the 1953-54 school year, all of the high schools and more than a quarter of the elementary schools had centralized libraries. The number of elementary libraries continued to grow, and 1,198 schools (88.5 percent) had libraries by 1966.

The number of certificated school librarians increased from 436 in 1954 to 1,217 in 1966, not including supervisors or additional professional staff members. The state had only two system-wide library supervisors in 1944, but by 1966, 15 systems had library supervisors. The professional staff at the state level increased from one person in 1937 to three in 1948; it has not increased since that time.

The School Building Authority regulations included libraries as one of its eligible areas, and the agency deserves commendation for its fine job in improving library facilities. But the growth of collections and the implementation of new instructional programs have made it necessary to replan and expand many of the existing school libraries.

Despite these important improvements, more money, more personnel, and expanded facilities are still needed at all levels if the school library program in Georgia is to meet the needs of schools moving toward excellence in education.

Library for the Blind. In 1936, an independent agency, the Kreighshaber Memorial Library, was established in Atlanta to serve the blind with reading materials. Although supported by public subscriptions, it had some connection with the Atlanta Carnegie Library. The State Department of Education had become responsible for managing this school for the blind by the time the state superintendent made his 1951 report. It still serves all visually impaired readers in Georgia and Florida with talking books (books on records), books in braille, tapes, and small portable record players.

Over 3,000 readers use the talking-book service today, and 342 are reading braille and listening to the tapes. The library staff sponsors a summer reading program for blind students in Georgia and Florida that usually attracts over 200 participants. The staff, composed of a librarian, a secretary, two clerks, and two men in the mailing department, takes care of about 50,000 readers each month.

Public Library Services. The Georgia Library Commission operated as an independent state agency under a law passed by the General Assembly in 1933. However, in 1943, the assembly repealed the act creating the commission and, through subsequent legislation in the same session, placed this public library service under the State Board of Education. The department operated the unit of public library services as a part of a textbook and library services division from 1943 to 1964. When the department was reorganized that year, the unit was placed under the administrative services division.

The Library Services and Construction Act, passed in 1963, allocated $714,375 to the state in 1964 and $680,700 in 1965. These funds have been matched by $1,620,000 in local funds. It is evident from the data in the table below that Georgia has made considerable progress in its public library program.

Curriculum Development

A state committee has been concerned with curriculum revision continuously since 1933. As mentioned previously, under the leadership of L. M. Lester, director of curriculum, M. E. Thompson, director of certification, and Paul Morrow, the Georgia Council on Teacher Education and the education department organized curriculum study groups throughout the state (37). The interest aroused by the groups prompted the 1937 Legislature to pass a law entitled “Rules and Regulations Prescribing Courses of Study; Curriculum Revision; Administration of School Funds.” In part, it reads as follows:

The State Board of Education shall provide rules and regulations prescribing a course of study for all common and high schools receiving State aid and may, in their discretion, approve additional courses of study set up by the local units of administration; provide for curriculum revisions and for the classification and certification of teachers. They shall make such rules and regulations as may be necessary for the administration of the common school fund (38).

In keeping with the law, the state board in 1938 adopted the curriculum designed for Georgia by the study groups and published by the department, commonly known as the “Red Book.”

The state department continued to give attention to curriculum improvement and organized an economy and efficiency committee in 1939 to consider other revisions. Special committees of this kind did most of the work rather than the director of teacher education and curriculum development, because the director was primarily concerned with teacher education. The teacher shortage during World War II curtailed consistent progress in curriculum development. However, in many instances curriculum offerings were altered to meet the needs of the war effort where qualified staff was available.

When the 1947 Legislature passed a law permitting the state board to spend state money for the twelfth grade, the department attempted to give leadership to local systems making the transition from 11- to 12-grade schools. In actual practice, this again led to the establishment of a revision committee concerned with curriculum development, and the committee became an official part of the department when the latter was reorganized in 1953. This committee’s recommendations, published as a “Curriculum Framework for Georgia Schools,” was distributed throughout the state and was finally adopted by the state board. It has been amended several times, the first major change occurring in 1958 when the state department’s curriculum unit recommended additional requirements in line with the national trend to provide more depth and dimension to public school offerings. The state board raised the graduation requirements from 16 Carnegie units to 18 and required all public high schools to offer foreign languages, physics, chemistry, human biology, and 2 years of vocational education, in addition to its previous offerings.

The curriculum unit staff works closely with the local superintendents in developing curriculum, and they have participated in all of the elementary and secondary school evaluations. The surveys to determine school plant needs have used the curriculum unit’s standard of educational adequacy as a major criterion. The movement has had a constructive impact throughout Georgia.

Vocational Education

The Federal Program in Georgia. Vocational education in Georgia had its real beginning when the Sixty-Fourth Congress approved the Smith-Hughes Act in 1917, providing grants to the states for promoting vocational training in agriculture, home economics, and trade and industrial education. It received another impetus when Congress approved the Vocational Education Act of 1946 (the George-Barden Act), technically an amendment to the George-Deen Act, broadening the offerings of the previous legislation and authorizing additional funds.

The programs in Georgia were again stimulated by Title II of the George-Barden Act, enacted in August 1956. Known as the Health Amendments Act, it specifically authorized the training of practical nurses and has since been extended and made permanent. Two years later, NDEA appropriated funds for turning out highly skilled technicians in occupations necessary to the national defense. The Manpower Development and Training Act, approved by Congress in 1962, provided essentially new methods of federal assistance for vocational education, enabling this training to be offered in all occupational service areas in cooperation with the Department of Labor. It even paid students subsistence allowances while in training.

The Vocational Education Act of 1963 granted additional funds to the states and emphasized vocational training as an area concept, as well as providing funds for construction and equipment. Georgia took full advantage of
these funds; the Legislature immediately passed an act authorizing the establishment of area trade, vocational, and industrial schools. The program developed quickly, the citizens eagerly accepting the area idea. By the end of 1966, the state had 23 of these vocational schools in operation. Additional area schools will be developed in the near future. Enrollment in vocational training increased from 2,541 in 1918 to 197,517 in 1965. The Division of Vocational Education now has a staff of 113, and the Department of Education expects the staff will have to be increased to maintain and extend its supervisory and leadership role in Georgia's vocational education.

Area Technical Schools. Since 1946, the Georgia Department of Education has operated two residential vocational-technical schools, one in the northern part of the state at Clarkesville and the other in the south at Americus. Within a few years after their opening, it became evident that these could not serve the state adequately and that drive-in schools were badly needed. It was 1957 before the Legislature appropriated funds for this purpose, but within 4 years 17 new area vocational-technical schools had been completed and 11 more were under contract. By 1965, 359 teachers were training over 12,000 students in more than 50 occupations, including every major technical skilled occupation existing in the state. It is estimated that by 1970 these schools will enroll more than 43,000 students.

Vocational Rehabilitation Service

When Congress passed an act initiating the vocational rehabilitation program for the nation in 1920, Georgia passed an enabling act the same year in order to participate. The state program did not grow much prior to 1940, but it has expanded constantly since that time, primarily due to the passage of Public Law 113 by the Seventy-Eighth Congress in 1943, Public Law 565 in 1954 by the Eighty-Third Congress, and Public Law 333 by the Eighty-Ninth Congress in 1965.

For 5 consecutive years, from 1956 to 1960, Georgia led the nation in the number of persons rehabilitated per capita. For 3 consecutive years and 1 other, Georgia led the nation in absolute total number of persons rehabilitated, and for approximately 20 years, from 1947 to 1966, it was never lower than fourth in the total number of disabled citizens rehabilitated for employment.

Georgia's excellent record in providing vocational rehabilitation services had been due principally to the Legislature's willingness to appropriate 100 percent of the money required to match all federal funds. The state has enjoyed the complete cooperation of related agencies and the medical profession. Since 1940, the program has increased to approximately 700 staff members, and such excellent service could not have been provided without a high caliber of personnel.

At present, the vocational rehabilitation program is administered through the State Board of Education. It operates under the Georgia Vocational Rehabilitation Laws, which first passed the assembly in 1951 and were amended in 1956, 1957, and 1959.

Health Education

In the late thirties and early forties, the nationwide trend in health education had an impact on the curriculum of many states, including Georgia (39). The Department of Education and the Georgia Education Association cooperated in a 3-year project to study health education needs throughout the Southern states. Their report indicated that revisions were needed in teaching methods, concepts, and the scope of health education if the program was to meet the needs of the people (40).

In the spring of 1944, representatives from the state departments of education and health of nine Southern states met in Atlanta under the sponsorship of the U.S. Office of Education and the U.S. Public Health Service to discuss possibilities for closer cooperation, particularly through the schools. Following this meeting, the Georgia education and health departments held a similar conference. The local public school and public health officials and representatives from the university system who participated formed a Joint Health Education Committee composed of three members from each of the two departments and the university system.

Through the efforts of this joint committee, the education department secured grants for 1945, 1946, and 1947 from the W. K. Kellogg Foundation of Battle Creek, Michigan, to sponsor and promote special health projects in four counties. The department employed both a coordinator of health education to work with the committee and a Negro health educator to serve the Negro schools. Approximately 80 teachers, half of them Negroes, from Cobb, Crisp, Spalding, and Walton Counties attended health education workshops for 6 weeks to receive instruction in creating a healthful school-community environment. These workshops also presented instruction in nutrition, physical education, recreation, safety, dental hygiene, social hygiene, and health habits. Participants were taught to use the services offered by public health workers, dentists, private physicians, and agencies having educational programs with special emphasis on the public health services. The program attempted to cover the whole personality—physical, mental, emotional, and social—and was adapted to the abilities, needs, and interests of the learners. It was considered a vital part of the total school program, not merely an addition to it. Since the participants assumed leadership in their own county-wide health education programs, the programs placed the department in a leadership role in promoting better health education programs in all the school systems (41).
The improvements in health education point up a need for temperance or alcohol education. The Women's Christian Temperance Union, working closely with several church groups, sought legislation to require this instruction in all public schools. The Legislature finally passed a bill in 1951 authorizing the state board to set up a program in alcohol education. Nothing was done, however, until Governor Talmadge, who had often publicly advocated the need for an alcohol education program in the public schools, made $25,000 available to the department 2 years later. The department employed a full-time person in September 1953 to promote the program.

In the summer of 1954, the department conducted two workshops to train teachers in the correct method of presenting alcohol education, a highly controversial subject in Georgia. Each subsequent summer, similar workshops have been held for teachers in different subject matter areas at different grade levels, attending from all parts of the state. In turn, these teachers have inaugurated alcohol education programs in their respective schools.

### SPACE-AGE EDUCATION—NEW SERVICES IN THE SIXTIES

**Financial Review Service**

The Department of Education established a school financial review section in September 1964 as a result of Senate Bill 180, which the General Assembly passed that January. This section's staff has spent about 75 percent of its time instructing local school officials in using the *Georgia Handbook for Local School Systems*. The other 25 percent of their time has been devoted to auditing and reviewing the financial operations of the local systems.

A great deal of progress has been made in establishing uniform systems and training people in financial responsibility. Most of the local fiscal operations now comply with the state board's policies and the state department's audit regulations. In fact, school systems failing to meet these legal requirements can lose their state funds.

At present, the department's staff is preparing additional handbook materials as well as sample ledgers, cash books, and various other forms for use by the local schools. The present staff, consisting of a chief budget analyst, three auditors, and three clerks, has the responsibility of reviewing local systems having difficulty with deficit financing or their required local foundation support.

**Educational Television**

The Georgia education department participated in the 1956 Southern States Work Conference, which assessed the potentialities and problems of educational television. By 1960, the department had accumulated sufficient data to begin broadcasting courses on a regular basis from commercial stations and station WGT television, owned by the University of Georgia. To expand its telecourses, the department secured a construction permit from the Federal Communications Commission to erect a station, WXFA-TV, at Waycross. The station began its first broadcast in the summer of 1961.

The department has continued to study ways in which ETV can be used in the state. In 1963, the Governor's Commission To Improve Education recommended that the department establish sufficient in-school ETV programming to involve all of the state's public schools. The General Assembly accepted the commission's recommendations and passed an act in 1964 which designated the state board as Georgia's ETV authority. This act empowered the board to own and operate the state's ETV and all related facilities and required the board to furnish schedules, consultative services, and teacher aids, as well as to perform all other tasks necessary in programing, producing, and transmitting TV programs to Georgia's citizens. It designated the state board as the proper state agency to receive all federal funds and any other funds that might be appropriated, granted, or made available to the state for ETV at all levels, and to use or distribute these funds in accordance with their intent.

The state board is now operating five TV stations and has five more under construction to complete its statewide network. The department has adequate personnel consisting of 92 professionals and technicians and will continue to add more as they are needed.

**Operation Bootstrap**

Claude Purcell, the state department's assistant director of administration, advocated a program whereby local superintendents could improve their professional competence while on the job and at the same time earn college credit for intensive work in specific fields. In 1961, Dr. Purcell arranged the first conference for local superintendents at the state FFA-FHA Camp. It was so successful that the University of Georgia and the state department have since jointly sponsored three "Operation Bootstrap" conferences.

The conferences usually devote 2 or 3 days each to professional studies in the areas of instruction, school laws, proposed legislation, school plant construction, school finance, and innovations in education. Nationally known consultants, including college professors, U.S. Office of Education staff, representatives of other state departments, and professionals in other fields have been invited to participate in this unique project. A special feature of all sessions is a question-and-answer period in which the consultants are interrogated closely by a panel of superintendents and others who wish to enter the discussions. The department and the university, as well as the superintendents, have concluded that one of the project's best
participated, with about 60 percent enrolled for college. Approximately 150 of the 195 local superintendents have met with its work sessions devoted entirely to self-improvement. Approximately 150 of the 195 local superintendents have participated, with about 60 percent enrolled for college credit.

**Governor’s Honors Program**

Several members of the state department wanted summer residential programs organized for Georgia’s gifted and talented students. Their hopes were fulfilled when Governor Carl E. Sanders personally requested that provisions for a summer honors program be written into Georgia’s Minimum Foundation Program of Education bill in 1964. Section 51 authorized the state board to establish such a program for pupils in public high schools who show exceptional ability, unique potential, or who have attained exceptional academic achievement. The first Governor’s Honors Program, an 8-week summer residential program for 400 highly gifted secondary students, was held on the Wesleyan College Campus in Macon in the summer of 1964.

The purpose of this program has been to provide students with an opportunity to participate in educational experiences not usually available in the regular school year. It attempts to assist students in realizing both their potential and their role in society. The state’s public school teachers nominate students in any of eight major areas of instruction where the students have shown an intense interest as well as exceptional ability.

In addition to supplying academic instruction and direction, the specially selected faculty and staff for the honors program provide additional experiences for the students by conducting seminars on contemporary issues and ideas, a physical education program, a series of special events, and special-interest study and counseling services. Thus, the entire program not only extends each student’s awareness in his particular area of interest, but also provides knowledge in other fields.

The Governor’s Honors Program, now in its third year of operation, has created an increased interest in the education of the gifted and the need for special programming. This has resulted in the addition of a second staff member in the area of the gifted within the division for exceptional children. It has also increased the number of summer honors programs operated by public school systems and by private schools, increased the number of gifted secondary students who enter college a year early, and has heightened the interest of the teacher education personnel in the colleges. It seems evident from the number of students nominated in these academic areas and those who qualify for consideration by the final selection committee that the public school personnel are now better able to identify gifted students. In 1964, the Governor’s Honors Program staff included 41 professional and nonprofessional people and was increased to 52 in 1965.

**Public Information Services**

Prior to the implementation of the first minimum foundation program, the Georgia education department did not have a department-wide unit for public information services. The vocational education division employed two staff members for public relations, and the vocational rehabilitation division had its own unit. The directors of other divisions assumed some responsibility for public information. But the arrangement did not prove very satisfactory for the department as a whole.

When the department was reorganized in 1951, the state board and the state superintendent decided to create a public information unit to serve the entire department. It operated for some time under the assistant state superintendent for staff services but in 1961 was placed under the direction of the state school superintendent, where it has operated ever since.

**The Present**

The State Board of Education is responsible for developing policies, rules, and regulations for implementing the many services specified by the Legislature. Therefore, with the advice and consultation of the state superintendent, the state board organizes and develops the staff that performs the duties designated by law. Since 1900, the state funds for education have increased from $1,440,642 to $233,786,836 in 1965.

When the Legislature enacted the 1964 Foundation Law, the state board assigned the George Peabody College division of surveys and fields services the responsibility of studying the public schools in Georgia and developing the criteria that should be applied throughout the state. It also directed the Department of Education to establish and enforce minimum standards for operating all phases of public education in Georgia.

The Peabody report in 1965 stated that dissatisfaction with the status quo had been the key to Georgia’s progress (42). It contained sweeping recommendations for school district reorganization. Even though the state reduced the number of the districts in 1945 from 1,454 to 197, the report stated that the state needed no more than 50 school districts, each with a minimum of 10,000 students. While these recommendations have not yet been implemented, their publication has had a dramatic impact on Georgians.

The application of minimum standards in all schools by the department is excellent evidence that the quality of
education has been upgraded. From its beginning, this movement has shown unusual potential. Most Georgians agree with Governor Carl E. Sanders' speech of October 11, 1966, when he dedicated the state's fifth educational TV station:

The single most important job of State and local government is the education of our children. Georgia can have splendid highways, ultra-modern physical and mental health services, unlimited natural resources, and a stubborn determination to improve, yet unless our children receive the finest education obtainable, then our State will founder in a quagmire of failure and despair (43).

Hawaii

DEPARTMENT OF EDUCATION
James R. Hunt
INTRODUCTION

A brief history of education in Hawaii is a formidable task. In any consideration of Hawaii's educational history, one must trace its centralization from the days of the monarchy to the present, when Hawaii is a sovereign state of the United States of America. The approach taken in this paper has been to review the accomplishments of the various administrators under the monarchy, the 18 territorial superintendents of education, and the 5 superintendents since Hawaii achieved statehood (see Appendix A). In some cases, the acting superintendents have been included when they continued an administration's policies so that they are essentially and historically one.

THE MONARCHICAL PERIOD

Beginnings of Public Education

Christian missionaries initiated in 1820 the first attempts to bring formal education to the people of Hawaii. The missionaries possessed an unbounded zeal for education, the primary goal of which, they believed, was to serve God. They worked diligently and produced the first textbook with a Hawaiian alphabet in 1822. “Four years later, there were 400 native teachers, and by 1830, one third of the population was enrolled in schools” (1). Formal public education in Hawaii in terms of codified law had been launched.

The period from 1820 to 1840 was one of a loosely organized school system operated by the missionaries, but none the less a school system. After much development and refinement, it provided the basis for the statewide school system. Hawaii is and has been unique, and it follows that its institutions are and have been unique. Thus, the central administering of schools in the entire kingdom was the result “of the slow building upon foundations already laid by the American Protestant missionaries” (2).

The islands of Hawaii have been a monarchy, a republic, a territory, and a state, each with a highly centralized form of government. Formal educational policies and practices were directed and disseminated from the central hub of government. Although local educationists have influenced the central authority, the existence of a highly centralized administration of schools and the educational enterprise is a basic consideration in understanding the uniqueness of educational institutions in Hawaii.

The fact of central administration and control did not diminish the growth and development of democratic education in Hawaii. In fact, it created a school system which provides a high degree of equal opportunity for education and an integration that has not been achieved by any of the other states. While local educational interests are indistinct at one period of educational history and quite distinct at another, no attempt has been made to separate state issues from local issues because the constitution was adopted many decades later. Before 1840, all laws, including school laws, were enacted somewhat informally in the main by the missionaries and ruling chiefs. The king and the nobles enacted the fundamental law of Hawaii, but these were not formally codified. The first laws printed in the Hawaiian language appeared in 1822 and related to the harbor of Honolulu. Other laws, relating to murder, theft, and other crimes, were published in 1824.

The period from 1840 to 1845 saw the beginning of formal public education in Hawaii in terms of codified laws. In October 1840, King Kamehameha III enacted the first public school laws. The previous year, on June 7, the king and nobles approved a general law which included a section on schools under the title of “The Business of Females,” but this law was simply an expression that it was the business of females to teach children to read, understand, and write, and to teach other subjects to guide children in good behavior. This expression was later incorporated into the law as reenacted in November 1840 as follows:

This is the appropriate business of all the females of these islands; to teach the children to read, cipher, and write, and other branches of learnings, to subject the children to good parental and school laws, to guide the children to right behavior, and place them in schools, that they may do better than their parents. But if the parents do not understand reading, then let them commit the instruction of their children to those who do understand it, and let the parents support the teacher, inasmuch as they feel an interest in their children, let them feel an
interest in the teacher too. But if any woman do not conduct according to the requirements of this section, then let her return to the labor of her landlord as in former times, to such labor however as is appropriate to women. The tax officers will look to and manage this business (3).

The missionaries, in a further effort to give a firmer base to education, urged the king to adopt a constitution for the kingdom. This would not only provide the foundation for a stabilized political society, but would include educational laws as part of the social and political framework. The first public school laws of October 1840, which followed the Constitution of 1840, imposed compulsory attendance on all children through the age of 14 years. This provided the basis for a modern statewide school system—an American school system established long before many existed on the mainland. An "extraordinary feature of the Hawaiian educational plan is that in a land far removed in the Pacific it did become typically American and the transformation was achieved even before the islands themselves became American soil" (4).

The public school laws of 1840 further provided that a school was to be established in any village where there were 15 or more children. "Each community was to select a school committee of three, which would act with the local missionary—interpreted by officials as Protestant—and the tax collector in the selection of a suitable teacher" (5). The committee was given the authority to set the teachers' salaries and establish the tax in the community to support the school. Land was to be set aside, and the teachers and parents would work this land to meet the taxes required. "Parents failing to meet their obligations were to be fined. Attendance was made compulsory for children from four to fourteen years of age. Dismissal of a teacher was the prerogative of the school committee and the missionary" (6).

The public school law enacted in May 1841 repealed the provisions of the school laws enacted in October 1840, preserving some of the original sections but rewriting others. For instance, the law continued to require villages with 15 or more children to procure a teacher and inaugurate a school. If there were less than 15 children in the village, the law required their fathers to unite with another company nearby.

To select the teacher for a school, the parents of a village were to choose a committee of three from their number. The law was not definitive as to how many teachers would be selected, stating that if there were but "few" children, there would be one; if "more," then two teachers; and if the children were "numerous," there should be three or more teachers as the committee "should think best."

The committee was responsible for negotiating with the teacher the wages to be paid. The teacher could be given land instead of wages or to supplement his wages, but he was to have use of it only as long as he remained on the job. When he ceased to serve as teacher, the land reverted to the government. If he did receive additional support, it was to be paid from the yearly tax, but not from the poll tax.

The 1841 law further provided for the Legislature to appoint annually "certain men of intelligence" as general school agents, one for Hawaii, one for Maui, one for Molokai, one for Oahu, one for Kauai, and one superintendent of the whole. It was the general school agent's responsibility to certify the teachers. The criteria were specified as follows:

Furthermore, it shall not be proper for the general school agent to give the teacher's certificate to ignorant persons, nor to persons known to be vicious or immoral. If a man can read, write and understands geography and arithmetic, and is a quiet and moral man, and desires a teacher's certificate, it shall be the duty of the school agent to give him one, and not refuse (7).

Comparing the 1840 and 1841 laws, Wist says that "the word 'missionary' was replaced by the word 'school agent.' Employment and dismissal of teachers were hereafter to be the responsibility of the school committee and the school agent. Teachers' certificates were to be issued by the agent instead of by Lahainaluna" (8).

The role and responsibility of the school agent was in a very real way the forerunner of the inspector general of the schools and the district superintendents, who were to appear later. Amendments made to the basic school laws in 1842 restated the philosophy of the kingdom regarding education:

In the estimation of the Nobles and of the Representative Body, schools for the instruction of children in letters are of vast importance. We are firmly determined to give protection to the schools, and also to teachers of good character, and also to treat with great severity all those who oppose schools, or throw hindrances in the way of that business (9).

These amendments gave the school agents additional authority in securing land and regulating the schools, and exhorted that more care be given to administering the school laws of 1841.

These first school laws laid the basis for a superintendent of schools who was to become both the state and local authority. A system of public education had been established in the kingdom that permitted the community to support two types of common schools: one for Protestant children and one for Catholic children.

Actually, when supervision did exist in a school, it was provided somewhat extralegally by the Protestant missionary or the Catholic priest. Besides the three R's, the curriculum included geography and considerable time for religious instruction. The schoolhouses generally were ordinary grass huts, with little or no equipment, and the pupils sat on mats spread over the earthen floor. The tools of learning consisted of a small number of slates and a few books from the mission press (10).
THE SUPERINTENDENCY

In May 1841, under an amendment to the school laws passed the previous year, the Legislature appointed David Malo school agent for Maui and superintendent for the kingdom. A colorful and versatile Hawaiian, Malo was the first to serve as head of the central educational authority. Although he proved to be an excellent school agent and brought about rapid improvement in the schools of Maui, his leadership as a general superintendent was not conspicuous. The school laws gave him "little opportunity for service beyond receiving reports from other agents and making reports annually to the legislature" (11).

By 1842, the school system had been shaped by additional laws. In conjunction with the previous laws, it had established certain basic characteristics, such as the concept of universal education as essential to the well-being of the state, the right of government to legislate for local school organization, and a tax structure to support education. The system acknowledged the right of the state to appoint educational officers and parental responsibility for educating their children. It provided for overall state and district control and supervision of schools. The school system required compulsory school attendance for children. At the same time, it asserted the right of the state to certificate teachers and the right of the state to require an accounting for the educational program. It also acknowledged the right of the state to punish those who do not comply with educational laws, and defined education as a requirement for marriage and holding certain public offices.

The Organic Law, passed in October 1845, established the minister of public instruction as one of five major departments of government. William Richards, who held this position for only 1 year due to his untimely death, was the first appointed to the position. In the first annual report, read before His Majesty to the Hawaiian Legislature, August 1, 1846, Richards summarized the educational effort from 1822 to August 1, 1846. The following chart shows the number of students out of the total population who were enrolled in the schools, although Richards admitted it was based on imperfect returns.

In the various Catholic schools throughout the islands, according to returns furnished by the Reverend Abbé Maigret, there were 1,800 readers, 1,000 additional learners, and 600 enrolled not attending school, making in the whole 3,400 (12).

In his report to the king the following year, 1847, Richards pointed to the Organic Act of 1846, which took effect the previous September and organized the department (see Appendix D). The act conferred on the minister of public instruction the power to administer oaths and to "superintend the moral and intellectual well being of all who reside within the jurisdiction of this kingdom, and in an especial manner of all children within the age of legal majority" (13). He was appointed the guardian and protector of the youth and pupils attending the legalized schools, and charged with seeing that they enjoyed all of the privileges under the laws. He also was made responsible for seeing that parents and guardians performed certain duties prescribed in regard to education and good morals. He was to inform those guilty of improprieties set forth in the law that they might be punished as prescribed by the criminal code.

The Organic Act specifically forbade the minister from interfering in the religious beliefs or mode of Christian worship of individuals in the kingdom. He was directed to avoid official interference with the parents or guardians in relation to the doctrinal opinions of the children. He could not show "official partiality towards one denomination of Christians to the prejudice of another in the conferring of offices or of licenses to teach" (14). However, Section VI stated:

The religion of our Lord and Saviour Jesus Christ shall continue to be the established national religion of the Hawaiian Islands. The laws of Kamehameha III, orally proclaimed, abolishing all idol worship and ancient heathen customs are hereby continued in force, and said worship and customs are forbidden to be practiced in this kingdom upon the pains and penalties to be prescribed in the criminal code (15).

Chapter III of the Organic Act provided for dividing the Hawaiian Islands into school districts and for the appointment of general district superintendents, and it established certification of teachers by these district superintendents. The minister of public instruction was to recommend to His Majesty an individual for appointment as a general superintendent of schools. It further provided for 24 subagents to supervise the public and private schools. Parents were to participate in the selection of the subagents by making their wishes known to the minister of public instruction, who was directed to consider them (16).

The section of the Organic Act dealing with certification of teachers was the first legal provision for certification of teachers in Hawaii. The law empowered the superintendents to license teachers within their districts, after they had been examined on the principles and branches of education, and according to the rules established by the council. But the law conferred on the minister of public
instruction the power to disallow the licenses for good cause, and to order them revoked. Section IV of the law gave the precise form to be followed:

TEACHER'S CERTIFICATE

Island of ________

District No. ______ Hawaiian Islands.

_______ having exhibited evidence of good moral character, and having been duly examined and found to be versed in the rudiments of general education, and particularly versed in (here insert the particular branches in which he is versed) I do hereby license him to teach any of said branches of education within this district so long as he conforms to the requirements of the law and observes the general rules laid down by the minister of public instruction.

Given under my hand this ___ day of ___, 18__

General superintendent for the district No. ___ (17).

Since this law was so detailed and was to provide legal precedents for education in years to come, the remaining sections, dealing with finances, school building (repair and maintenance), and supervision, are included in Appendix D.

In reviewing the administration of the law in his annual report of 1847, Richards pointed out that the general superintendents had appointed their subagents, according to law, and the schools had been "organized under the direction of these agents and under newly licensed teachers" (18). He reported the enrollment of students, according to law, and the schools had been "organized under the direction of these agents and under newly licensed teachers" (18). He reported the enrollment of students, according to law, and the schools had been "organized under the direction of these agents and under newly licensed teachers" (18).

William Richards died in November 1847, and Keoni Ana (John Young, Jr.) became the acting minister of public instruction the following April. Another missionary, Richard Armstrong, who had assisted Keoni Ana, accepted appointment as the new minister in May 1848. In his report in 1850 to the Hawaiian Legislative Council, he asserted that it was important that the head of the department be neutral and "have as little to do as possible, with the general politics of the nation, standing aloof from party strife, should any exist, and devoting his whole time to the one great, good, and noble cause of moral, physical, and intellectual education" (20).

Armstrong reported that in 1849 the Hawaiian school system cost $21,989. Each teacher taught an average of 164 days for an average salary of $31.57, or an average daily wage of slightly over 13¢. "Computing from the same data the average cost of education of each scholar in the common schools was $1.37-1/2 for the year 1849" (21). This amounted to about 8 mills per day for teaching 15,620 native children in the common schools. (See Appendix C for costs of education from 1846 to 1967.)

Armstrong was particularly pleased with the efforts to connect manual labor with the schools. For instance, he pointed out to the legislators that a coffee planter on Kauai, G. Rhodes, Esq., had expressed his gratitude for the minister's request to employ schoolchildren in the gathering of coffee. A letter from Rhodes, dated December 17, 1849, stated that these children had been employed for several hours each day, and had earned a considerable sum of money, which he divided equally among them. Rhodes was particularly pleased that due to the employment of the children, the old coffee pickers, who had struck for higher wages, had all returned (22).

Armstrong continued to encourage this combination of labor and scholarship. He focused on the advantages of this program in his addresses to parents, in instructions to both superintendents and teachers, and in talking to students. Premiums were granted to the most deserving scholars.

The program worked extremely well. In the high schools at Lahainaluna, Hilo, and Waioli, Kauai, and Kohala, students devoted time to labor, thus earning a large portion of their support. Armstrong's pride in the program was evident. When an epidemic of measles, whooping cough, and influenza struck, killing many people, the minister credited the lack of deaths in the schools to the regular daily labor, wholesome food, and rugged constitutions of these students.

Armstrong admitted, however, that the task of inculcating industrious habits in native children was slow and difficult. Unfortunately, the parents did not appreciate industry, and training their children in love of labor proved doubly difficult and necessarily slow. He added, however, that he did not feel discouraged, as his greatest interest was in this field, and he was convinced that, with the help of God, he would persevere (23).
When Richard Armstrong took the census in January 1849 and 1850, he listed the total population of the Islands as 84,165. He stated that "the sum total of the population in January 1849 was 3,861 less than in January 1850" (24).

Armstrong reported in May 1851 that instruction in the Islands was still in the Hawaiian language. But he was responsible for introducing English as the medium of instruction in public education. English schools were established in 1854 under an act of August 10, 1854. Armstrong spoke with pride of the new era in Hawaii's educational history. He was confident that the introduction of the English language to the native race would be one of the distinguishing glories of His Majesty's reign. He reported that "the progress of English schools, under the new Act, has been quite equal if not greater, than the highest expectations of its friends . . ." (25).

In 1855, the ministry of education was abolished and the Board of Education established as the governing body. A Reorganization Act of 1855 gave the Board of Education complete responsibility for the Hawaiian Department of Public Instruction. The act designated the minister of the interior as the chief official through whom reports were to be made to the Legislature and placed education in a subordinate position to other governmental functions. The new board was to be composed of three members—a president and two directors. Richard Armstrong was appointed president of the board, which was to make its own bylaws under its own authority. The powers formerly given to the minister of public instruction and certain powers of the district superintendent were conferred on the new department. The board also was granted the right to fix the salaries of the superintendents, which had formerly been the right of the Legislature.

The Reorganization Act of 1855 set new precedents for education in Hawaii. It separated education from other functions of government, and it established the Board of Education and gave it certain responsibilities that had been vested in the Legislature and to subordinate officials in education. The act provided for a dual board and overall superintendents. One danger inherent in the new organizational structure was that it did not always guarantee professional leadership in the presidency of the board.

In particular, the Reorganization Act empowered the president of the board to report the department's actions to the Legislature each year, through the minister of interior. He was responsible for keeping an office of business at the seat of government, signing all official documents of the board, and employing a clerk. The president promoted the interests of education and morality in the Islands and the general objects of the department (26).

Four years after passing the Reorganization Act, in 1859, the Legislature again made important changes in the codified laws. For one thing, the Legislature itself assumed the right to determine the content of curriculum and took a step toward establishing secondary schools. The codification of the laws in 1859 also included the first codification of education laws. Although previous education laws were repealed, the Legislature provided for most of them to be reenacted, including the administrative reorganization accomplished by the Reorganization Act of 1855.

By 1856, 10,076 scholars were attending the Hawaiian schools. The new Board of Education entered at once upon its duties, held weekly meetings, and, according to Armstrong, "imposed no trifling task upon my colleagues, who are sufficiently burdened by the cares of their respective departments" (27). For one thing, the department expected to begin immediate publication of Hae Hawaii (Hawaiian Banner)"devoted to news, politics, moral literature and especially to agriculture" (28), but this was delayed until March 1856.

Armstrong, who continued in the office as minister of education and president of the Board of Education until 1860, earned the title of "Father of American Education in Hawaii." His 12 years of service ended with his death in September 1860.

King Kamehameha V, who had been a member of the three-man Board of Education since its origin in 1855, appointed his father, Mataio Kekuanaoa, as the new president of the Board of Education. Although a man of character and ability, he was an unfortunate choice. Kekuanaoa was handicapped in dealing with the issues because he knew little English, and the pro-British king was able to dominate the board. The lack of professional leadership hindered progress in the public schools (29).

Four years after assuming office, Kekuanaoa advocated that the Legislature establish an inspector general for the school system, who would also serve as chief clerk to the Department of Public Instruction. Kekuanaoa's plan called for this officer to be a practical person, well acquainted with the public schools, who would personally inspect the schools throughout the kingdom. He would assume the president's duties, such as examining teachers, and recommend for certification those whose qualifications met the standard required by the board. In other words, the inspector general of schools would superintend the system under the direction of the Board of Education. The board would remain the same: a president and two honorary members, appointed by the king (30).

This request, and a general realization that the system needed stronger leadership, resulted in the passage of the Reorganization Act of 1865. This act created a Bureau of Public Instruction in place of the Department of Public Instruction, increased the Board of Education from three to five members, reorganized school districts to correspond to taxation divisions, and empowered the Board of Education to appoint a school agent for each district. However, the most important feature of the act permitted the appointment of a professional educator as inspector general of schools.
Kekuanaoa remained as president of the board for 3 more years, but in 1865, Abraham Fornander was appointed as the first inspector general of schools. Fornander, an excellent historian and journalist, did not have the qualifications to be a professional educator. The result was vacillation and little progress. A reformatory school was established at Kapalama, and by 1868, 51 boys and 4 girls had attended.

Period of Transition, 1865 to 1894

The period from 1865 to 1894 was a transitional period in which Hawaii's education system established precedents which made it a truly American system.

In 1869, William P. Kamakau succeeded Kekuanaoa as president of the board, and the board appointed H. Rexford Hitchcock to the position of inspector general of schools. After little progress, Kamakau was replaced by Charles R. Bishop as president of the board in 1872. Bishop, a man imbued with ideals of service, believed in Hawaii and in public education as a means of promoting its social and economic welfare. He held the confidence of both the native Hawaiian and the leading industrialists. While not belonging to the missionary group, he was in no way inimical to its purposes.

Hitchcock was an educator, primarily interested in the improvement of the public school program. In his first official act, he thoroughly investigated the educational system and reported some glaring deficiencies. Particularly, he attacked the inefficiency of the school personnel and the resulting weakness in classroom procedures. He issued a manual of directions to the staff and revived the conventions of Armstrong's time to improve the background and instructional methods of teachers. Under the leadership of these two men, Bishop and Hitchcock, public education in Hawaii, so ably planned and begun by Richard Armstrong, again took on new life.

When Hitchcock accepted the principalship of Lahainaluna in 1877, D. Dwight Baldwin, an Island-born educator, succeeded him as inspector general. Like Hitchcock, he deplored the incompetency of the teachers and the difficulties in recruiting able ones, poor attendance, the inadequate supervision, and the indifference of parents—factors which had virtually doomed the manual labor program. He was particularly interested in improving the program of work in the public schools and Americanizing the entire program.

Baldwin visited the United States to familiarize himself with modern educational practices. He substituted American textbooks for those published by the Board of Education in Hawaii. As English became more and more the basic school language, American books naturally replaced the materials in Hawaiian. And during the 1880's, the people began to develop a greater appreciation of the importance of education.

Unfortunately, in 1883, Charles R. Bishop was forced to resign from the Board of Education by political pressures, and the education system again began to lag. He returned as president 4 years later at the same time Alatau T. Atkinson, the former principal of St. Albans College and editor of the Honolulu Star, became inspector general. Atkinson proved to be an excellent organizer, and he and Bishop began bringing order to the schools.

In 1887, the Hawaiian system was legally set up with some similarity to American patterns. The law established a lay board of five members, selected at large. The board members, who were to serve without pay, were charged with the responsibility for setting policy and employing an executive officer as the professional head of the system.

By 1890, the Legislature had eliminated the tuition in the public English language schools. This was in part responsible for an increase of 1,236 pupils during the following 2 years, but it also resulted from better accommodations and the growth in number of children of school age.

One of the big problems still facing the schools was the shortage of able teachers, particularly in the English language. Bishop, as president of the board, pointed out in his report of 1890 that as English became more commonly used, the difficulties of learning it would diminish. But out of the many who would be fairly well educated in it, only a few would be competent and willing to teach. A knowledge that might well serve in the shop, plantation, or ranch would not be adequate for a teacher.

The work of the inspector had increased as the schools improved. The president's 1890 report included a plea for a deputy inspector. He stated:

The improvement in the schools during the last two years is apparent to anyone having a knowledge of the facts, and is owing to several causes; better facilities for teaching in the new and well furnished schoolhouses; a larger proportion of competent teachers; and, I think, very largely, if not mainly, to the frequent visits and thorough work of the Inspector. At no time since the reorganization of the Bureau of Education in 1865, has the Inspector made so many visits to, and spent so large a part of his time in the schoolrooms.

It is almost, if not quite impossible for one man to visit all the schools of the Kingdom twice in each year, and give the necessary attention to them. I am of the opinion that provision for a Deputy Inspector, so that the schools could be visited at least three times a year, either by the chief or the deputy, would be money wisely spent. The visits could be longer, and more time given to inspection of schools and of school property than is possible without such additional help.

The president of the Board of Education's 1892 biennial report was the last one made during the kingdom,
as political events sounded the death knell for the monarchy. The period from 1890 to 1900, one of the most dramatic periods in Hawaiian history, witnessed the overthrow of the monarchy in 1893 and the Islands' annexation as a territory by the United States 5 years later.

The precise American character of public education undoubtedly contributed to these events. The public school system had changed its instruction from the Hawaiian language to an almost complete adoption of English. American ideals in government, taught from the very beginning, eventually contributed to the annexation on August 12, 1898.

The Legislature reorganized the Board of Education by an act passed in January 1894, and the board was commissioned the following month. In its first report to the president and members of the executive and advisory councils of the Provisional Government of the Hawaiian Islands in 1894, the board noted that “pupils in both Government and Independent schools increased from 8,770 to 11,307” (34).

**THE INTERIM OF THE REPUBLIC**

During the existence of the republic—from January 17, 1893, when the Hawaiian monarchy came to an end, until President McKinley approved the Organic Act on April 30, 1900, which designated the Hawaiian Islands as a Territory—the basic educational system which had existed since 1865 continued. Its basic structure consisted of a board of control comprised of five appointed laymen who selected the professional executive officer and a centralized system subject to the board. There were, however, two significant changes. As a result of a provision in the Constitution of 1894, no public aid could be appropriated to sectarian or private schools after the end of 1895 (25).

Second, the Legislature passed an act in 1896 placing the public schools under the direction of an executive department, with the minister of public instruction a member of the cabinet. It thus nullified that part of the reorganization of 1855 whereby the Department of Public Instruction had been made subordinate to the Department of the Interior.

It is not clear from the reports and other records why the republic restored education to its earlier status. Probably, the local leaders regarded this in accordance with American precedents. At any rate, as part of the cabinet, the Department of Public Instruction (re-created by the act) had intimate relations with the general government. The act did not provide for a separate official to serve as minister of public instruction; the minister of interior was given the new portfolio, ex officio, and served as president of the board, consisting of six commissioners of education appointed for 3-year terms. Henry E. Cooper served in the dual ministerial capacity from 1896 to 1899, followed by Ernest A. Mott-Smith (36).

Another important provision of the 1896 School Act was that English be the required language of instruction.

Francis M. Damon, the founder of Mills School, a private school, introduced the kindergarten movement to Hawaii in 1892, when he established the first one in connection with the Chinese Mission under his charge. While the kindergarten movement was not adopted by the public educational system at this time, it did influence the primary-grade program. Alatau T. Atkinson, inspector general of schools, reported in 1894 that “this is not carried on by the Board of Education, though many of the kindergarten methods are used in the primary rooms . . . .” He further stated that “it is a question at present whether the Board would be justified in using funds in this direction” (37).

Atkinson, who had replaced D. D. Baldwin as inspector general of schools in 1886, continued in this office until 1896. He was known as an educational formalist but also as a competent administrator. With the help of his associates, he revised the curriculum of the common schools but did not materially enrich the courses of study.

Henry S. Townsend succeeded Alatau Atkinson as inspector general of schools in 1896. Townsend, a man of bursting energies, was not always understood. Often referred to as Hawaii's first progressive educator, Townsend believed in education that was experience centered. Indeed, Townsend was ahead of his times and aroused the ire of his predecessor, who decried the reforms in his Honolulu Star. Nevertheless, Townsend's administration was responsible for such notable firsts as starting a periodical called The Progressive Educator, opening the first evening school in Honolulu, holding the first summer school for teachers (John Dewey was invited to conduct a session in 1899), and providing the schools a systemized course of study. There was increased attention to the various branches of vocational education and to art and music.

It was under Townsend's administration that a committee of 12, appointed by the National Education Association in 1895, studied the condition of rural schools. Its report prompted Townsend to request that five deputy inspector general positions be created to help supervise the 344 teachers “whose work ought to be inspected and supervised” (38).

On April 27, 1900, the Congress of the United States passed the Organic Act formally approving of Hawaii's status as a territory and containing the legal basis for this relationship. Section 27 stated “that there shall be a superintendent of public instruction who shall have the powers and perform the duties conferred upon and required of the minister of public instruction by the laws of Hawaii as amended by this Act, and subject to modification by the legislature” (39).

Townsend expected to be appointed the first superintendent of public instruction as soon as the territorial government was established. But Atkinson, who had a
considerable following among the businessmen and other nonteaching groups, was also eager for the appointment.

The majority of the board found Townsend too advanced, and Atkinson stepped into the office.

THE TERRITORIAL PERIOD

Alatau Atkinson, the veteran Hawaiian educator now serving as superintendent of the public schools, was assisted by Thomas H. Gibson, the deputy superintendent, who received the title of inspector general of schools. Gibson's service to education dated back to the 1880's, and, like Atkinson, he well understood the need for improving the quality of teaching.

The reports of the superintendent and inspector general throw considerable light on the public school situation at the turn of the century. Atkinson cited the great need for better supervision of teaching and in one of his first acts established positions for three normal instructors. He assigned each to a supervisory district with the task of improving the quality of teaching. These were the forerunners of the supervising principals.

Atkinson also recommended a uniform salary schedule. This had been requested by previous administrators but had never been implemented. The Legislature adopted the uniform salary schedule, and Atkinson reported in 1902 that it had worked in a fairly satisfactory manner.

James C. Davis, ultraconservative and cautious, succeeded Atkinson on an interim basis in 1905, remaining less than a year before Winifred H. Babbitt replaced him as the new superintendent. In his first report, Babbitt noted that enrollment in the schools had increased by 1,828, for a total of 16,651. He also pointed to the congestion in new schoolhouses, advising that “the practice of building one and two room schools should be discouraged as far as practicable” (40). Babbitt urged adoption of a policy of consolidation “whereby several schools could be merged in one and the Department provide transportation” (41).

Babbitt also reported that there was a definite need for medical examination every 2 years because of the prevalence of sore eyes, skin diseases, and other physical defects in public school children. He is credited with the initial planning that led to the establishment of a state school for the blind and the deaf. At the same time, he inaugurated a policy of medical inspections in cooperation with the Board of Health.

Willis T. Pope, who succeeded Babbitt in 1910, found that during the period from 1908 to 1910, there was a great reduction in the more common diseases among public school children. Pope, who served as superintendent until 1913, was particularly concerned about the short supply of teachers, due mainly to the increase in public school enrollments.

In reviewing Pope's reports, his problems do not seem unlike those that beset superintendents of schools today. The normal school was unable to train sufficient teachers to meet the shortage, and recruitment trips to the mainland failed to supply the demand. Pope was also plagued with the necessity of using uncertificated teachers. Summer schools were devised to upgrade teachers but “there was little of professional emphasis in the courses pursued” (42).

Summer schools for teachers continued until 1922, when the normal school began its first collegiate summer session. Although Atkinson had appointed normal instructors to supervisory districts, it was Pope's administration that established the position of supervising principal. Principals of larger schools, centrally located, were designated as supervising principals. Modification of the original plan took place until 18 supervising principals were operating by 1912.

This expansion of supervising principals resulted partly because enrollment continued to increase rapidly during Pope's administration; in December 1912, public school enrollment reached 24,993, an increase of 4,738 over the 20,245 of December 31, 1910. The total school population—public and private—of the entire territory was 32,300, “or about 16% of the entire population,” Pope reported, and “the last census taken (1910) gives the population of the territory as 191,909” (43). Pope's report for 1910-12 also mentioned, for the first time, a “cost of living” increase for teachers.

The inspector general of schools' title was shortened to inspector of schools in September 1910, replacing the normal inspectors instituted previously.

The duties and responsibilities of the supervising principals were prescribed in the Rules and Regulations published in 1911. Pope stated in his report that the schools are “pursuing a comparatively uniform system of instruction which makes the work of both pupils and teachers fare more satisfactory” (44) because of the supervision system.

Pope's administration was responsible for starting the Hawaii Educational Review, a territorial school journal published under the auspices of the Hawaii Education Association “for the comprehensive treatment of Hawaii's very creditable educational institutions and progress” (45).

Inspector of Schools Thomas Gibson followed Pope in 1913 as an interim appointment of 1 year. Henry Walsworth Kinney succeeded Gibson as the new superintendent of public instruction in 1914, shortly before the outbreak of World War I. The appointment of Kinney, a newspaper editor, was unusual, although he had been "one of the severest critics of public educational practices, using his newspaper to that end" (46). Despite his lack of professional experience, he went to work with a will. He made a valiant effort to purify the curriculum by emphasizing simplicity—the three R's. Kinney's educational philosophy was based on a complete understanding and mastery of the fundamental tools of learning.
Despite many mistakes, there were some notable beginnings during his tenure which have since become sound educational practice. For instance, he was interested in a supported development of school cafeterias. He prepared the citizens of Hawaii to accept the Smith-Hughes Act and its federal aid for vocational education. He made a definite place in the curriculum for shop and agricultural classes and gave his firm support to vocational education. He also recommended establishing a trade school.

Kinney established two new public high schools on Maui and Kauai and developed a bungalow style of building as a prototype of school building to relieve the shortage of classrooms. He introduced the practice of requiring teachers to first gain experience in rural schools before being appointed to teaching positions in Honolulu, a practice that endured until 1964. Kinney established a school for the deaf, dumb, and blind children, which also served as a school for mentally defective. He also recommended transferring the responsibility for reform schools to an independent board. Kinney remained in office until 1919, when he was replaced by Vaughan MacCaughey, professor of botany and horticulture - at the College of Hawaii. MacCaughey opposed the formalism characteristic of the Kinney regime which, except for Townsend's brief attempts, had marked Hawaiian education for many years. Although MacCaughey was an extreme liberal, he was not a progressive educator as we understand today. But Wist concludes that "the extreme, but disassociated and disorganized liberalism of the MacCaughey regime was in no small part necessary as a prelude to clearer thinking and more productive results later on" (47).

Superintendent MacCaughey immediately eliminated the examination-grading procedure instituted under Kinney and relaxed the letter-of-the-law interpretation of the regulatory provisions. He attempted to develop a new curriculum, but it failed somewhat because he did not take into consideration the teachers' lack of preparation for their new freedom. "Neither his training nor his experience had given him real insight into the purposes and workings of a dynamic school curriculum. His tendencies, however, were pragmatic, and he almost leaned over backwards in his zeal to be democratic" (48).

Perhaps the most significant event during MacCaughey's administration was the survey of the Hawaiian schools conducted by the Bureau of Education of the federal Department of the Interior. The results were published in 1920, and the major recommendations included lengthening the school day from 7 to 8 hours; abolishing all foreign language schools; appointing county boards of education; organizing junior high schools; providing better supervision of private schools (excluding foreign language schools); reorganizing the Territorial Normal School; and organizing kindergarten classes in every public school. These recommendations eventually had a definite impact on education in Hawaii.

Willard E. Givens succeeded Vaughan MacCaughey in 1923. Givens, the principal of Kamehameha Boys' School and former principal of McKinley High School, was primarily interested in the field of secondary education. His administration did, however, see notable developments in the retirement system and in the establishment of the so-called English standard schools.

In 1916, the Legislature had established provisions for an expanded and actuarially sound pension plan as the Hawaii Retirement System. As first established, however, it was not compulsory; its members were but a small portion of the total teachers, and the retirement allowance was very small. But this was a first step toward a more inclusive system. In 1926, it was made compulsory and applied not to teachers alone, but to all government employees. After a decade of work and pressure, the Legislature adopted a system that was nationally recognized as one of the best in the country (49).

The second development, the English standard schools, stemmed from the department's policy of designating certain schools as such where admission was based on a child's ability to use and to speak the English language. This was in part precipitated by the federal survey conducted in 1920 under the MacCaughey administration. One historian stated that "the suggestion made in the federal survey to segregate pupils in the public schools according to their ability to use English correctly reminded old timers of the effort made toward the close of the century to establish separate public schools for children of Chinese ancestry" (50).

The English standard schools existed until 1947, when the Department of Public Instruction decided to phase them out. From the time that Lincoln School became the first English standard school in 1928 until they were phased out in 1947, the schools of Hawaii had become completely integrated.

Givens' tenure as superintendent ended in 1925, and Will C. Crawford began one of the longest and most difficult administrations. The Depression struck Hawaii in 1929, along with the rest of the nation, and the birthrate in the Islands dropped drastically from 41.57 to 27.4 per thousand in Crawford's last year in office. Nevertheless, during this period, junior high schools, begun as a result of the federal survey's recommendations under MacCaughey, continued to expand until 1930 there were 15, with nearly 10,000 students.

Like the rest of the nation, Hawaii experienced a reduction in occupational opportunity and employment for its senior high school graduates. Governor Lawrence M. Judd appointed an advisory committee to conduct a survey "to suggest policies and recommend changes which it believes will improve the service that the schools are rendering to the Territory and thereby contribute more to the welfare of all the youth of Hawaii" (51).
In its 1931 report, the committee recommended that the Legislature set up a strong lay board of education with full power and authority to administer the Department of Public Instruction. Since the territory's financial resources were at a low ebb, it suggested that the schools be financed on a basis showing the total amount of money involved, but without sacrificing the advantages of the salary schedule as fixed by law. At the same time, it recommended that the program of instruction in the elementary schools be modified and expanded. It also recommended that a director of health education be created in the department.

The committee showed a definite interest in preparing young people for the world of work. For instance, it called for expanding prevocational and vocational training, particularly in agriculture, in the elementary and junior high schools. It would limit to the present figure for 5 years the enrollment in, and expenditure for, full-time academic courses in the senior high schools; but at the same time, it would provide funds for the creation of courses in part-time and continuation schooling for employed youth. The committee called upon the employers of the territory to organize placement bureaus to place the maturing youth of Hawaii in available employments in industry.

In its concern for higher education, the committee concluded that the enrollment of candidates for the bachelor's degree in the University of Hawaii should be limited for 5 years to the present number, and the construction of new buildings should be restricted to a minimum. It further recommended that the Legislature merge the Territorial Normal School into the School of Education of the University of Hawaii and require a bachelor's degree for all elementary school teachers. It then added that the addition of kindergartens to the public school system should be postponed until more urgent educational needs had been satisfied.

The survey utilized several committees operating under one general advisory committee, but some educators felt that the committee had been stacked by forces wanting to control and restrict educational authority, seeing an ulterior motive in the recommendation to strengthen the Board of Education, perhaps aimed at Superintendent Crawford. They defeated this change, except for the addition of one person to the board, but many of the recommendations did result in action.

One impact of the survey was that textbooks were utilized to better achieve the aims of the curriculum. School libraries were developed to a greater degree than in the past. The recommendation concerning the appointment of a director of health education was implemented. A better atmosphere and attitude between educators and leaders in industry developed. It is obvious now that the recommendation concerning the limiting of high school enrollment was the result of the hysteria of industrial leaders who were frighten at the prospect of seeing all of Hawaii's youth educated. Fortunately, contrary to the committee's recommendations, high schools were established in rural areas.

Oren E. Long, who became superintendent in 1934, enjoyed the longest tenure of any educational leader in Hawaii; he continues to hold this distinction today. President Truman appointed Long Governor of the territory in May 1951, and he won election as U.S. Senator in 1960.

Under Long's guidance, from 1934 to 1946, the schools of Hawaii increased both in number and in quality. The Department of Education, both at the central administrative level and at the local level, was greatly expanded. During Long's 12 years as superintendent, school costs, including capital outlay, increased from $4,905,519 (including $154,664 for capital outlay) to $12,700,930 (including $36,420 for capital outlay).

Long can be credited with leading the school system in Hawaii to a place of excellence it had not achieved before. In his report to the Legislature in 1935, he stated:

For a period of almost a century, Hawaii has had a public school tradition. The organized educational effort had its origin in the days of the Monarchy, received new emphasis at the time of the Republic and has been a major interest since the beginning of the Territory. It has been based on the concept that enlightenment is basic in government and that progress is possible only with an educated citizenry.

Enrollment increased by 3,487 to 83,961 during the 1933-34 school year, the lowest increase in 20 years. But Long pointed out to the Legislature that the ideal of equal opportunity for all children was not being realized; children, at their own expense, had to travel as much as 8 to 10 miles to attend school. True, the curriculum had been enriched, but spoken English remained one of the major problems.

During Long's first years in office, the commissioners authorized the publication of a school code. Additional sites for schools were acquired, new schools were established in rural areas, and additional benefits for teachers were implemented. Thus, by the 1935-36 school year, Long was able to point to the general survey completed under MacCaughey's administration and assert that "every major recommendation of the committee has been carried out. There is general agreement that the survey was of unusual value to the schools."

In reviewing the educational needs and objectives in 1936, Long requested repeal of the 1933 Emergency Tuition Law, adoption of a single salary schedule, extension of the compulsory school age to the fifteenth or sixteenth birthday, extension of the vocational education program, and extension of the guidance and placement program. He called for the attainment of--

The public school ideal as defined by the Commissioners in their statement of educational policy: namely that of providing "for every normal child such free
education as well as prepare him to perform his duties as a citizen and to live usefully and wholesomely under the conditions of life in these Islands” (56).

In 1938, Long reported that the total number of children actually in schools was more than ever before—a total of 88,885.

Only a few years ago schooling above the eighth grade was confined to Honolulu and Hilo and few other communities. There are now thirty-four rural districts where work above the eighth grade is offered. Ten of these are senior high schools. Fourteen others are intermediate schools. Under present plans at least five of these will become high schools within the next two years (57).

Long stated that outlook for education in 1938 was “practical” in that—

Hawaii is committed to the principle of education that the schools, as far as possible, should fit boys and girls for the professional or vocational careers of their choice. It is especially important that they have an educational background and an understanding of occupational opportunities that will enable them to choose wisely. On the basis of varying interests and abilities, they will elect to spend their lives as teachers, preachers, lawyers, physicians, engineers, plumbers, carpenters, electricians, mill hands, workers of the soil or in other occupations. They should have received in school the educational foundations, ideals of living and specific training required to enable them to achieve success and render a worth while service in the work of their choice.

Much of the basis for attaining this ideal is found in the general program of the school. In a specific way, it is furthered by the work of the Vocational Division which offers classes in homemaking, agriculture and the trades. Obviously, a great majority of youth in this community or any other American community must find their life work in agriculture and the trades rather than in the professions. All school girls are potential housewives and will either do the work in the home or will direct it. Regardless of what the boy or the girl may ultimately do, experiences offered in the vocational courses have sound educational values... (58).

The Senate of the 1939 Territorial Legislature created a Holdover Committee of the Legislature to survey the schools, and Long reported in 1940 that the survey was not an investigation of the schools but “a study of the educational problems which the school and the community face together” (59). Assistance was given to the Holdover Committee by a special Committee on Education of the Chamber of Commerce and the Department of Public Instruction. The study was completed in March 1941 and was published as the Community Survey of Education in Hawaii (60). Long notes in his annual report of 1941 that—

Some of the most important immediate results of the survey are:

1. A wider community interest in the schools and an understanding of their efficiencies and deficiencies, of what they are accomplishing and what they should accomplish.

2. An increased awareness on the part of teachers and principals of existing problems and a realization that the lay public desires to cooperate in improving the schools.

3. An excellent analysis of the problems and needs of the schools. Some of the improvements recommended can be realized only through enlarged appropriations. Until economic conditions make these possible, there is a disposition to find those points at which improvements can be made with appropriations and equipment now available and to work for those improvements.

4. A better basis for evaluating the work of the schools. Judgment must be based on facts, with sympathetic understanding, appreciation and tolerance. The findings of the Survey Committee are above hearsay and opinion. They represent constructive criticism and afford a basis for cooperative effort in preserving all that is good in the present program and in bringing about improvements (61).

Long remained at the helm of education during the difficult years of World War II, and his report of 1941 reflects concerns and problems created by the conflict. It was during 1941 that Hawaii was notified that the Department of Public Instruction could participate in the Adult National Defense Program. Hawaii was granted $81,794 for carrying on a national defense program under Public Law 812. The department cooperated with a Defense Training Advisory Committee of 20 men named by the chairman of the Territorial Board of Vocational Education.

The many challenges presented to education in Hawaii are a recurrent theme in Long’s reports of 1942 and 1943. In 1942, Long stated that “the adjustments and readjustments made necessary by conditions in a battle zone of the war have been made in a satisfactory way” (62). The impact of the war on school enrollment was substantial. In June 1942, the enrollment decreased by 10,801 from the 91,121 reported in June 1941.

However, even under war conditions advances were being made.

Long reports that in 1943—

The opening of twelve kindergarten centers as a regular part of the public school program was authorized by the 1943 Session of the Legislature. The understanding is
that additional centers will be established each biennium until every community in the Territory is served. This development is viewed as one of the most important in the entire history of public school education in Hawaii.

It should have an important bearing on the problem of speech, the formation of proper health habits and the progress of social growth (63). Also in 1943, the Legislature enacted a law (Act 7) which directed the department to establish a division of pupil guidance. A new program known as “Business Education” was planned in cooperation with the U.S. Office of Education. A program administered by the Vocational Division of the U.S. Office of Education, titled “Occupational Information and Guidance,” was also planned.

In his last report to the Legislature, Long reviewed the impact of World War II on the Hawaii school system and strongly urged that after victory had been won, those in education become acutely aware of the “new age of transport, of television, and of freezing units...” (64).

W. Harold Loper replaced Long as superintendent in 1946. He used as a guide, in general, the recommendations of two surveys conducted during the Long administration: Community Survey of Education in Hawaii, previously mentioned as completed in 1941, and Hawaiian Schools: A Curriculum Survey 1944-45, completed in 1946 (65). This second study is sometimes referred to as the Draper-Hayden Survey.

In the first biennial report under his signature, Loper claimed considerable progress had been made in reorganizing the school system according to the recommendations of the surveys and reports. For instance, the department’s plan had grouped all educational services represented in the personnel of the central office into four divisions, each headed by a deputy superintendent. It had reduced the number of school districts to provide for one district in each county under the direction of a district superintendent and a staff of field assistants. And it had added specialized personnel in each school district and in the central office.

The recommended reduction in the number of school districts is nearly complete, but only a beginning has been made in the addition of Field Assistants. On the Island of Hawaii, the number of districts has been reduced from three to two; for the County of Maui, we now have one district instead of two; and on Oahu, the single school district plan has been inaugurated. Kauai has always been organized as a single school district (66).

Post-World War II

Loper continued to complete the reorganization measures started under Long’s administration. In his 1947 report to the Legislature, he asserted that further reorganization had been carried out to implement the Community Survey and the Draper-Hayden Survey. An assistant superintendent had been appointed to work directly under the superintendent (67).

The matter of spoken English and its influence on the curriculum and organization of the schools remained a major educational problem during Loper’s administration. “Pidgin” English was still the common tongue of a great portion of the populace. Marked increases in enrollment and the concomitant need for additional teachers were of great concern. And there was a continuing demand for expansion in the vocational educational program by organized labor, students, parents, and employees.

An important achievement during Loper’s administration was the publication in 1946 of A Handbook for Elementary Teachers in Hawaii. The Handbook comprised three separate volumes and dealt with general directions for elementary school teachers and specific directions for teachers in the areas of social studies, English, and mathematics. The Handbook was the product of the tremendous efforts of professional educators of the department and lay advisors. A newly established position called the director of elementary education was charged with directing the production of the Handbook.

Loper and his staff continued to lay a well-stated program for curriculum development during the next several years. His biennial report for 1947-48 reflects achievements of the department in areas that were the result of “public demand for new services and of a better understanding of conditions affecting the learning process.”

In 1948, a Guidance Service Committee was organized to coordinate the work of pupil guidance and vocational guidance, which operated as two separate divisions. The implementation of this coordination was strongly supported by the work of the chief of the occupational information and guidance services of the U.S. Office of Education.

Because of great public interest in kindergartens in every community, the kindergarten program was greatly expanded in 1948-51. Funds were appropriated by the Legislature to establish 136 new kindergarten teachers during this period. Vocational education programs also continued to increase, particularly on the neighbor islands.

In 1951, a school building services division was established, which qualified the department to apply for and receive federal aid under Public Laws 815 and 874.

Also under Loper, work was begun with mentally handicapped children in 1952, and efforts were made to combat a growing narcotics menace. The adult education program, which had begun operation in 1946 with an enrollment of 3,000, had increased to 11,228 by 1950. The curriculum expanded considerably in other areas as well to “provide experiences for children and youth that will help them develop into the kinds of young citizens most parents and teachers would like them to be.” Loper added: “This important task is not that of the school alone. It is shared..."
with homes, churches and the communities in which children live and play" (68).

Following Loper's resignation in 1952, Clayton J. Chamberlin accepted the superintendency and faced the same questions and problems that had plagued Loper. A shortage of teachers and of school buildings was of major concern, followed by the need for a curriculum that would meet the student needs for the contemporary world.

Chamberlin had served as deputy superintendent in charge of the special services division. When he assumed the leadership of the department, four deputy superintendents administered the programs under divisions of instruction, special services, vocational education, and administrative affairs. In addition, there was an administrator of schools' personnel, and the assistant superintendent served as the second man under the superintendent. The territory was organized in five administrative districts, each headed by a district superintendent.

Chamberlin directed the Department of Education under a seven-man board, serving as an ex officio member, until the "eve" of statehood. He strongly emphasized in-service training for teachers and principals during his term of office. Increasing enrollments still plagued the department, along with the resulting shortage of classrooms. A Governor's Conference on Education attempted to involve citizens in a discussion of these problems and other needs of education.

By 1957, the department had been expanded both at the central administrative level and at the local level. The administrator of schools' personnel became a deputy superintendent in 1954, and a deputy superintendent of school building services was added 3 years later.

The department contracted for a comprehensive survey of the administrative organization and operation of the Hawaiian public school system in July 1956. Conducted by William R. Odell and Associates of Stanford University, it was the fifth education survey since 1920. Completed in June 1957, the survey gives, perhaps, one of the most succinct statements of Hawaii's education growth. It summarized the past, pointing out that government support of the schools began in 1849, but it was not until 1888 that the public schools were "free." The report continued:

During the period of 175 years, the Islands have changed even more dramatically than the United States. From a primitive Polynesian society, through a feudalistic monarchy, they have emerged as a modern democracy. From a hand-labor economy to a highly mechanized industrial society, and from a single culture, through a pluralistic society as waves of Chinese, Japanese, Koreans, Portuguese, Scotch and Filipinos have immigrated the Islands, it is today an international culture of an order that seems to anticipate the world of tomorrow (69).

On the eve of statehood, expansion in education continued to be made. In 1958, because of the recurring problem of obtaining qualified teachers for Hawaii's public schools, Superintendent Chamberlin appointed a committee to study teachers' salaries. A program for gifted students was begun on a pilot basis, and a new foundation program for public secondary schools was established that required a minimum of 2 years of math and science. James McConnell of Stanford University held a workshop on educational specifications, out of which grew the document called Educational Specifications for Public School Buildings in Hawaii, published by the department in 1959 (70).

During Chamberlin's tenure, considerable increases in federal funds under Public Laws 815 and 874 continued to be an important factor in the expansion of schools. For example, total federal funds received by the department for the 3-year period 1956-58 are as follows:

- Fiscal period ending June 30, 1956 ............$2,702,931
- Fiscal period ending June 30, 1957 ............4,974,106
- Fiscal period ending June 30, 1958 ............3,252,588

STATEHOOD

Chamberlin resigned in late 1958, to be replaced by Walton M. Gordon the following January, 6 months before Hawaii became a state. Thus, Gordon, the first superintendent of education of the State of Hawaii, was in office during the transition on August 21, 1959.

The new state immediately implemented a new constitution, which had been drawn up in 1950. The constitutional provision for education in Article IX, Section I, states:

The State shall provide for the establishment, support and control of a statewide system of public schools free from sectarian control, a state university, public libraries and such other educational institutions as may be deemed desirable, including physical facilities therefor. There shall be no segregation in public educational institutions because of race, religion or ancestry; nor shall public funds be appropriated for the support or benefit of any sectarian or private educational institution (71).

Hawaii's legislators began studying the needs of the new state government, and this resulted in the Reorganization Act of 1959—which in turn was implemented by executive orders in 1960 and 1961. At this time, the Department of Public Instruction became the Department of Education, and the superintendent of public instruction became the superintendent of education.

Five superintendents of education have occupied the top position of educational leadership under the Reorganization Act. Gordon continued to occupy the superintendency, and his first annual report issued after June 1959 notes that Hawaii is a state, although the department is still referred to as the Department of Public Instruction.
Gordon reports that Educational Specifications for Public School Buildings in Hawaii has been issued and that—

While most mainland building specifications are designed for a single school in a specific community, those for Hawaii were developed as a guide for architects, school staffs and lay people planning school construction anywhere in the islands.

The Guide points out the importance of planning for facilities in terms of the curriculum and suggests the relationship of classrooms to playgrounds, library, cafeteria, administrative units, etc. (72).

He also indicates that Hawaii had begun to participate in receiving federal aid under the National Defense Education Act. Federal funds for the fiscal year ending June 30, 1959, are reported as $5,452,953, out of a total budget of $40,819,117.

In the first annual report of the department issued by the newly created State Department of Education for the year 1960-61, Gordon states that further reorganization of the department was taking place. The report, issued under the title of “Our Island Schools,” notes that experiments were begun in team teaching and that better library services and audiovisual education were instituted. Experiments in educational television were also begun during 1960-61.

It was at this time that several studies for the reorganization and management of the government of Hawaii were completed by the firm of Booz, Allen and Hamilton, Inc. These studies had many implications for the state department. The most significant of the reports and studies was the Report on Survey of Organization Structure submitted to the Governor in February 1961. The report made recommendations for implementing the Reorganization Act of 1959 which recast the entire executive branch of the state government of Hawaii into 18 branches of which the Department of Education was one.

The Hawaii State Government Reorganization Act was passed as Act I by the First State Legislature, Second Special Session, in 1959. It was approved in November 1959. Under Section 18 of the act, the Department of Education was to be headed by an executive board, and under policies established by the board the superintendent would administer the functions of the former department of public instruction which were transferred to the new Department of Education. Vocational rehabilitation programs were to be transferred to the Department of Social Services as soon as the transfer could be made without jeopardizing any federal aid, and some other adjustments were made, such as the transfer of the library of Hawaii and certain other libraries to the new Department of Education. (For the text of the law, see Appendix E.)

The constitution required that local school advisory councils be established by law and that the superintendent of public instruction be appointed by the state board and serve as an ex officio voting member. It is interesting to note that the superintendent was also made an ex officio member of the Board of Regents of the University of Hawaii under the constitution. (For text of constitutional provisions, see Appendix E.) Some of the basic functions of the department were to be changed in the next few years, however.

Gordon did not remain to see the reorganization of the department completed. In his annual report for 1961-62, he referred to the great progress that has been made because of reorganization and cited the expansion of the programs for the gifted, foreign languages, school counseling, and the mentally retarded. He noted that great stimulation was given to the foreign language program by the National Defense Education Act passed by Congress in 1959. He emphasized the need for flexible scheduling and evinced strong belief in the importance of educational television. In September 1962, Gordon was succeeded by R. Burl Yarberry.

Yarberry's tenure began what might be called the transition period of the sixties. The educational structure has undergone tremendous change during the past 6 years. This change continued during Lowell Jackson's tenure as interim superintendent, February 1966 to January 1967, and is still ongoing under the direction of Ralph H. Kiyosaki, who became superintendent on June 1, 1967.

The directions in which the department has been going during this 6-year period is, in the minds of many, a sound one. It is difficult to assess the impact of change as it relates to directions since the writer is intimately involved in these directions. For the reader it may suffice to simply summarize the structure of the Department of Education at the present time.

SUMMARY, 1968

At this writing, and in summary, the State Department of Education administers programs of public educational services to the children, youth, and adults of the state and renders statewide library services. The department continues its unique state system-one system concept.

The state is divided into seven school administrative districts. There are four districts on the island of Oahu, and one each on the islands of Hawaii, Kauai, and Maui. The division of library services provides statewide library service in each of the counties through the Oahu Public Library in the City and County of Honolulu, and the Hawaii, Kauai, and Maui county libraries. In addition, there are several divisions or offices within the department: business administration; personnel; research, statistics, and data processing; curriculum, instruction, and guidance; and library services. The vocational rehabilitation division was transferred to the Department of Social Services by Act 274, approved June 1967, and the Board of Regents
assumed the responsibility for vocational education under Act 716, effective May 1968. This act transferred the University of Hawaii responsibility for the administration of that part of the Manpower Development and Training Act of 1962 formerly administered by the Department of Education. It should be noted that by Act 39, approved April 1964, the Board of Regents also has the responsibility for administering the community college program.

Board of Education

The State Department of Education is headed by an executive Board of Education which formulates policy and exercises control over the public school system through its executive officer, the superintendent of education.

Formerly the members of the Board of Education were appointed by the Governor, by and with the consent of the Senate, from panels submitted by the local school advisory councils. However, at the 1964 elections, an amendment to Section 2, Article IX, of the constitution, providing for an elective rather than appointive Board of Education, was approved by the electorate. Act 50, Session Laws of Hawaii 1966, implemented the amendment and provided for an 11-member board to be elected from school board districts and at large as follows: first school board district (Hawaii County), two members; second school board district (Maui County), one member; third school board district (Honolulu), one member; fourth school board district (Central Oahu), one member; fifth school board district (Leeward Oahu), one member; sixth school board district (Windward Oahu), one member; seventh school board district (Kauai County), one member; and one at-large district (Oahu - City and County of Honolulu), three members. Each member must be a registered voter of the school board district or at-large district from which he seeks election and is prohibited from holding public office under state or county governments. Members of the Board of Education serve for 4 years. Vacancies on the board are filled by the Governor, and the appointee must be of the same political party as the person he succeeds.

The elected Board of Education succeeds to all rights and powers exercised and all duties and obligations incurred by the previously appointed Board of Education.

District School Advisory Councils

With the ratification of the constitutional amendment providing for an elective Board of Education by the electorate in 1964 and the subsequent enactment of Act 50, Session Laws of Hawaii 1966, the elective local school advisory councils were replaced by appointive district school advisory councils. There is a district school advisory council for each school board district, and the size of membership of each council is as follows: first school board district (Hawaii County), seven members; second school board district (Maui County), five members; third school board district (Honolulu), five members; fourth school board district (Central Oahu), five members; fifth school board district (Leeward Oahu), five members; sixth school board district (Windward Oahu), five members; and seventh school board district (Kauai County), five members. The members of the school advisory council are appointed by the Governor and serve for terms commencing upon their appointment and ending upon the expiration of the term of office of the Governor. Not more than a bare majority of the members of each district school advisory council may belong to the same political party or shall be nonpartisan. Each councillor appointed by the Governor must be a registered voter of his school board district. Each member of the Board of Education is an ex officio, nonvoting member of the district school advisory council of his board district, provided that all of the at-large members of Oahu shall be ex officio, nonvoting members of each of the district school advisory councils on Oahu. The district school advisory councils serve in an advisory capacity to the Board of Education and to its board district member or an at-large district member, if any.

Library Advisory Commissions

There is a Library Advisory Commission in each of the four counties. Each commission consists of not less than 7 nor more than 11 members appointed for 4-year terms by the Governor with the advice and consent of the Senate. The commissions sit in an advisory capacity to the Board of Education on matters relating to public library services in their respective county.

The Future

Education in Hawaii faces a brilliant future. There is no government official—Governor, legislator, or citizen—who does not seem to be vitally interested in its progress. This interest currently is manifesting itself in increased appropriations for both operating and capital improvement budgets. In addition, the impact of federal legislation has permitted growth and expansion in many areas of the educational structure. Our people have high hopes that this interest will remain at this level to propel Hawaii at an even faster rate into the twenty-first century. Hawaii is and has been unique in its educational organization. Its simplicity of organization gives it a great advantage—an advantage of moving quickly and expeditiously to see that our children will be the best educated in the world.

bIncludes public libraries for first time.
Appendix D

ORGANIC ACT OF 1846

Section V. No person shall be so licensed to teach without having first exhibited satisfactory evidence of good moral character and qualifications to instruct, particularly in the rudiments of reading, writing, arithmetic and geography; and no person having been so licensed shall be entitled to the benefits of the law relating to the support of schools after having exhibited a want of aptitude to teach or a want of that industry and faithfulness necessary to the successful discharge of his duties, nor after having become of immoral character or habits. Neither shall a license granted in one district qualify nor authorize the holder to teach in another, without new examination, although it may be considered by every other general superintendent as prima facie evidence of the holder's qualifications.

Section VI. The general superintendent of each school district in concert with the sub-agent of any sub-division, shall have full power to erect, alter, modify and repair school houses, also to contract with and employ teachers, and to this end he may require of the tax gatherer and overseers of the labor tax any amount of labor, or in lieu thereof, the commutation therefor in money or in property. When labor is so required by the superintendent of schools, he shall always indicate the place and manner in which it shall be performed. Whenever the labor tax or its avails prove inadequate to the support of any school established by the general superintendent or by any of his sub-agents, it shall then be lawful for the agent or the superintendent who has pledged such support, to draw on the tax gatherer of the district in accordance with instructions from the department of public instruction for the payment of the residue in any government property in his hands, other than the poll tax. Said general superintendent shall also have power to allot land, not otherwise appropriated, to the teachers and to the schools of their respective districts. Such lands shall not however be allotted to the use of any teacher of youth not duly licensed by the general superintendent of the district in which he designs to teach, as herein provided. Neither shall any land set apart by the general superintendent of the district, in concert with the sub-agents thereof, be considered validly appropriated to that object until the said general superintendent shall have notified the same, in location, quality and quantity to the minister of public instruction, and received from said minister the certificate of the minister of the interior to that effect. When any portion of such land so set apart, or any part thereof, who only while continuing to hold the teacher's license, and to teach statedly in the district sub-division, shall have the private use, occupancy and usufruct of such land. When for any cause he is dismissed, or voluntarily retires or dies, the land shall pass to his successor in said school, with all the tenements erected thereon, unless erected from his own private means, with the written approbation of the minister of public instruction.

Section VII. The sub-agents of the several districts, as far as practicable, shall on the first day of January in each year report to the general superintendent for their respective districts the number of schools established therein, the number of families residing in their sub-divisions, the number of children between the ages of four and fourteen years, the number of children actually scholars in the schools of their districts, the number of children dependent upon adoption or guardianship, and the number of parents dependent upon filial support.

Section VIII. It shall be the duty of the several general superintendents of districts, annually, on the first day of January in each year, to report in like manner to the minister of public instruction the aggregate of the statistics in the last section required for their respective districts, and the number of teachers by them respectively licensed, also the number of school houses established in the district, how and at what expense supported.

Section IX. The general superintendent of each district shall, under the minister of public instruction, have the nominal ownership and be the trustee of all school property for his district. He shall have power to sue and be sued on account of the same in any court of this kingdom. He, in concert with the local sub-agent, shall, under direction of said minister, indicate the site for all school houses in his district. The sub-agent may, under this direction, superintend the erection thereof, and may make contracts for that purpose. The buildings so erected shall be under his immediate guardianship. He shall preserve them from decay and deterioration, and when requisite in his opinion, shall cause them to be repaired or altered at the expense of the district, giving due notice of all his acts to the minister of public instruction for approval.

Section X. The labor tax imposed by article third of chapter second of the third part of this act shall be specially devoted, so far as need be, to the support of schools established on the foundation of this part and to the maintenance
and support of teachers licensed and teaching in some district pursuant to the provisions thereof: Provided that the several superintendents shall annually account to the minister of the public instruction for the manner in which it has been appropriated by them, and the minister of public instruction shall certify to the king, through the minister of finance, what deficit ought to appear in the tax gatherer's reports for each taxation district.

Section XI. The minister of public instruction from time to time, as the wants of the district may require, shall furnish to the respective superintendents any requisite amount and kind of books and stationery which, in his opinion, may be needed by the district to be paid on audit by special appropriation from the resources of the labor or other taxes set apart for the support of schools: Provided, however, that such books and stationery shall, when practicable, be sold at cost in the districts.

Section XII. The minister of public instruction, in concert with the minister of the interior and with the approbation of His Majesty in privy council, shall have power to set apart for the use of specific schools attached to the respective districts or to the endowment of select schools or seminaries of learning, incorporated as hereinbefore provided, any quantity of the unappropriated land which being rented or otherwise rendered productive, under his instruction by the general superintendent of the district, if set apart for district schools, or of the trustee of the select school or seminary, if set apart to select school purposes, shall be applied to their support in the manner to be by said minister indicated in each case.

Section XIII. The minister of public instruction shall, from time to time, make a tour of the respective islands to inquire into the condition of the public schools, when it shall be his duty to hold public examinations of the pupils attached thereto, and when in his estimation the merits of any pupil will warrant it, he shall have power, by way of special encouragement, to give a certification of honor to such pupil, which may in his discretion, with the after ratification of His Majesty, extend to exemption from future taxes of any particular kind therein to be specified, or to a general teacher's license to employment in the government service, if found by His Majesty otherwise qualified: Provided, however, that in case of immorality, subsequent to the date of said certificate, it shall be considered as no longer of any force or value.

Section XIV. The general superintendent of schools for the district, upon complaint that a designated pupil is refractory or disorderly to the detriment of the school, shall have power to suspend such pupil from the school, and report the same to the minister of public instruction, who may confirm or revoke the order of suspension at his discretion, and such pupil, being over the age of twelve years, shall, while so suspended, be liable to the labor tax and to the other taxes for the support of government, and be liable to impressment into the public service as a vagrant.

Section XV. It shall be lawful for any licensed teacher in actual employment in any sub-division of any of said districts to administer correctional punishment to the pupils of his school when, in his judgment, necessary, and the teacher so acting shall not be in any way amenable therefor: Provided such correctional punishment shall in no case exceed reasonable flagellation; and provided that in case a pupil shall be immoderately or unreasonably or cruelly beaten by his teacher, or wounded or maimed, the teacher shall be liable in private damages to the parent, adopter or guardian of such pupil, and may, on complaint and satisfactory proof to the general superintendent of the district, be deprived of his license to teach: Provided that such teacher may at any time appeal from the decision of the general superintendent to the minister of public instruction who may affirm or reverse the sentence of suspension.
CONSTITUTION • STATE OF HAWAII

ARTICLE IX

EDUCATION

Public Education Section 1. The State shall provide for the establishment, support and control of a statewide system of public schools free from sectarian control, a state university, public libraries and such other educational institutions as may be deemed desirable, including physical facilities therefor. There shall be no segregation in public educational institutions because of race, religion or ancestry; nor shall public funds be appropriated for the support or benefit of any sectarian or private educational institution.

Section 2. There shall be a board of education, the members of which shall be nominated and, by and with the advice and consent of the senate, appointed by the governor from panels submitted by local school advisory councils to be established by law. At least part of the membership of the board shall represent geographic subdivisions of the State.

Section 3. The board of education shall have power, in accordance with law, to formulate policy, and to exercise control over the public school system through its executive officer, the superintendent of public instruction, who shall be appointed by the board and shall be ex officio a voting member thereof.

University of Hawaii Section 4. The University of Hawaii is hereby established as the state university and constituted a body corporate. It shall have title to all the real and personal property now or hereafter set aside or conveyed to it, which shall be held in public trust for its purposes, to be administered and disposed of according to law.

Board of Regents; Powers Section 5. There shall be a board of regents of the University of Hawaii, the members of which shall be nominated and, by and with the advice and consent of the senate, appointed by the governor. At least part of the membership of the board shall represent geographic subdivisions of the State. The president of the university and the superintendent of public instruction shall be ex officio voting members of the board. The board shall have power, in accordance with law, to formulate policy, and to exercise control over the university through its executive officer, the president of the university, who shall be appointed by the board.
Appendix F

HAWAII STATE GOVERNMENT REORGANIZATION ACT OF 1959

ACT I

Section 18. Department of education. The department of education shall be headed by an executive board to be known as the board of education.

Under policies established by the board, the superintendent shall administer programs of education and public instruction throughout the state, including education at the pre-school, primary and secondary school levels, post high school vocational and adult education, library services, vocational rehabilitation (subject to the proviso herinafter set forth), health education and instruction (not including dental health treatment transferred to the department of health), and such other programs as may be established by law.

The function of vocational rehabilitation shall be transferred to the department of social services as soon as such transfer may be made without jeopardizing any federal aid.

The functions and authority heretofore exercised by the department of public instruction (except dental health treatment transferred to the department of health), library of Hawaii, Hawaii county library and Maui county library as heretofore constituted are hereby transferred to the department of education established by this Act.

The management contract between the board of supervisors of the county of Kauai and the Kauai public library association entered into under the provisions of section 45-13 of the Revised Laws of Hawaii 1955, as amended, shall be terminated at the earliest time after the effective date of this Act permissible under the terms of such contract and the provisions of this paragraph shall constitute notice of such termination, and the functions and authority heretofore exercised by the Kauai county library as heretofore constituted and the Kauai public library association over the public libraries in the county of Kauai shall thereupon be transferred to the department of education established by this Act.

The management contracts between the trustees of the library of Hawaii and the friends of the library of Hawaii entered into under the provisions of section 45-1 of the Revised Laws of Hawaii 1955, as amended, and between the library of Hawaii and the Hilo library and reading room association entered into under the provisions of section 45-11 of the Revised Laws of Hawaii 1955, as amended, shall be terminated at the earliest time after the effective date of this Act permissible under the terms of such contracts, and the provisions of this paragraph shall constitute notice of such termination.

Upon the termination of such contracts, the state or the counties shall not enter into any library management contracts with any private association; provided, that in providing library services the board of education may enter into contracts approved by the governor for the use of lands, buildings, equipment and facilities owned by any private association.

There shall be within the department of education a commission in each county to be known as the library advisory commission for such county which shall in each case sit in an advisory capacity to the board of education on matters relating to public library services in the respective county. Each commission shall consist of not less than seven and no more than eleven members.
THE TERRITORIAL PERIOD, 1863 TO 1890

Establishing the Territorial Schools

Some time after 1825, three young Nez Perce Indians attended the Red River Mission School in Canada. Their experiences so impressed the tribe's elders that they decided to send representatives to St. Louis in 1831 to request help from the Governor, General William Clark, in receiving more instruction of this kind. The story, slightly distorted, excited the Eastern religious press (1). Reverend Jason W. Lee journeyed to the “Oregon Country” in 1834 to establish an Indian school. When he reached Fort Hall in the southern part of what became Idaho Territory, he delivered a sermon to the trappers—probably the first sermon in the Northwest area west of the Rocky Mountains.

Two years after Lee, Dr. Marcus Whitman and Reverend H. H. Spaulding, a Presbyterian minister, followed for the same purpose. A year after he arrived, in 1837, the Reverend Spaulding established Idaho's first school near the junction of Lapwai Creek and the Clearwater River. Except for a few missions set up for the Indians by passing missionaries, the only other school on record prior to Idaho's becoming a territory was established for white children at Franklin, Idaho, in 1860 by the Latter-Day Saints.

These missions opened the heavy immigration to Oregon during the next decade, though most of the people who settled in the Idaho Territory were lured by the discovery of minerals. The communities developed around mining properties. The Chinese, who did a little truck farming near the mining camps, were the only settlers interested in agriculture. Florence, a thriving mining town, established in 1864 the first common school in the territory with six pupils and a teacher, Mrs. Statira Robinson, the wife of a pioneer from Ohio. Other communities followed suit.

Since the majority of the early settlers came from California, where the public school system was fairly well established, there was a strong sentiment for public education. In 1863, when Idaho was organized as a separate territory, laws passed in the first Legislative Assembly provided for a territorial superintendent of public instruction.

When the second Legislative Assembly met the following year, it adopted a complete school code modeled after the California code as the legal basis for the territory's public school system (2).

The first Territorial Board of Education consisted of the superintendent, acting as president; the territorial auditor, acting as secretary; and the territorial treasurer. In its second session, the Territorial Legislature changed the board so that it was composed of the Governor, the superintendent of public instruction, and the territorial controller. The board's duties were not stipulated, but the territorial superintendent was charged with preparing instruction and forms for subordinate divisions; apportioning school money; exercising general supervision over the schools; reporting educational conditions and his official actions, together with suggestions relating to construction of schoolhouses, improvement and better management of common schools, qualification of teachers, and ways and means for raising funds; and having to “disseminate intelligence among the people in relation to the method and value of education” (3).

In 1864, J. R. Chittenden took office as the first territorial superintendent. In his first report, he showed that by the close of 1865 the territory had 12 schools, 4 private and 8 public, to educate 427 white children out of the 1,239 between 5 and 21 years of age estimated to be in the territory (4). The private schools mentioned in the superintendent's report were in reality pseudopublic schools or “subscription schools,” such as existed in all pioneer territories. They were financed by fixed sums (subscriptions), assessed by the citizens—usually the parents—to maintain schools in the mining camps. An early Lewiston pioneer described the first subscription school, established in Lewiston in 1863:

Late in the fall of 1863 a middle-aged man of professional appearance and quiet demeanor appeared in Lewiston and proceeded to organize a small school. He wore a tall silk hat, a suit of blackest broadcloth, and a white tie, all bearing unmistakable signs of long usage and giving the impression that their proprietor was a broken down sport. They did not belie him, as events proved, but for the time the ability of the man was all
that was inquired into. After diligent canvassing, he
secured a few pupils and opened his school. Everything
progressed satisfactorily until the teacher drew his first
month's pay, whereupon the sporting proclivities of the
pedagogue manifested themselves. He set out to double
his money at the gambling table, but, unfortunately for
him, the fickle Dame played him false at the most crit-
ical juncture, and his wages passed into other hands. Not
desiring to remain longer in Lewiston in face of his
ignominious downfall he quietly departed whence he
came and the school was left teacherless (5).

Conditions of the Territorial Schools

Conditions in the new territory were not favorable to estab-
lishing a dynamic school system. The first white inhabitants
were miners who followed the gold rushes and men without
families who did not stay long. But on their heels came
farmers, stockmen, and small businessmen who required
some kind of schooling for their families. The people were
ordinary pioneers, poor in purse and education, acustomed
to the hard toil necessary to clear the wilderness, and
though most believed in education for their children, they
were too hard pressed providing themselves with a meager
living to give schooling considerable attention. Except for
an occasional temporary private school in the more popu-
lous centers, only the traditional American "district"
schools were established to serve students within designated
areas.

School Buildings. The territorial laws did not provide for
constructing school buildings, and these were rare in the
early history. Only three buildings were constructed by
1865, all financed by subscription. Until the school code
was revised in 1879 to provide for construction, classes
were held in private homes, old store buildings, dance halls,
church buildings, or any place where sufficient room could
be found. One county superintendent reported in 1882:

The first school houses erected are unworthy of the
name, and as yet there are but a few in the county that
deserve the title of school house. Heretofore there has
been entire disregard of everything except ventilation,
which is applied as freely as the wind that blows (6).

The rapidly growing towns found the revised School
Code of 1879 inadequate to provide funds for building and
maintaining their schools. Boise and Lewiston in 1881 and
Emmetsville in 1883 secured charters from the Territorial
Legislature granting their districts and school authorities
complete independence from the school code. The mining
town of Bellevue did not secure a special charter, but it did
get the 1885 Legislative Assembly to permit it to sell bonds
to erect "a brick structure at a cost not to exceed eight
thousand dollars" (7).

Despite these difficulties, by 1889, Idaho had 386
school districts and 296 schoolhouses, attended by 12,457
children an average of 4.4 months each year. A law enacted
2 years earlier required parents to send children from 8 to
14 years of age to school at least 12 weeks each year, 8 of
them consecutive. Some of the children could get education
beyond the eighth grade: Boise established its first high
school in 1881, and a few of the populated districts fol-
lowed suit.

Teacher Qualifications. In 1864, the second Territorial
Legislature permitted school trustees to issue teacher cer-
cificates, and these were changed six times by 1885. Until
1880, all certificates were issued through examinations by
trustees and county superintendents, the laws allowing the
local school boards or districts to set the qualifications.
After 1880, the examinations were prepared by the state
superintendent or a person designated as superintendent
when the office was not filled.

Although the teachers in the territory represented
varying degrees of preparation, many were from Yale,
Princeton, the University of Maine, and Bowdoin. Perhaps
these men were better equipped mentally than morally;
because it was not uncommon for them to be "tippers" and
card players, whose love of adventure or some mis-
fortune inspired them to "go West." In 1874, Superin-
tendent Joseph Perrault reported that "almost every day
complaints are made that our teachers are incom-
petent" (8). Two years later he declared:

One cause of so many incompetent teachers in Idaho is
the mistaken policy of letting the contract of school
keeping to the lowest bidder . . . Another cause is the ab-

ence, in most cases, of any competent and responsible
authority for the examination of those offering to teach.
The present law authorizes the trustees of the school
districts to examine and employ teachers. The first
person who comes along wanting a situation, who can
gain the good will of the trustees, and guardians, need
entertain no fears from any trying ordeal in the shape of
an examination; more especially, if he or she is willing to
enter upon the task for a salary so low as to defy com-
petition (9).

These complaints about the quality of teachers continued
throughout the territorial period.

Financial Problems

During the early territorial period, funds were so scarce
that the schools ran an average of only 2 months per year.
Private property was respected and almost immune from
invasion by a law officer, so the bridge and ferry tax of 1
percent of income was often not collected. Five percent of
the taxes collected on county assessed valuation was pro-
vided for schools by law, but little of it was set aside for the
schools. Since the county superintendent's salary was paid from the county school fund rather than from the county general funds, as was the case with other county officers, this reduced the money available for schools. The county superintendent's salary did not become a county fund, as was the case with other county industries, from the county school fund rather than to general funds. When the Legislature attempted to reduce expenditures, it received little money—scarcely enough to print the required forms. When the Legislature attempted to reduce expenditures in 1868, it dropped the superintendent as an officer and transferred his duties to the controller. In 1887, it once again designated the superintendent of public instruction as a territorial officer and assigned him the following new duties: to decide disputed points of law; to visit counties during 3 months of the year in order to inspect the schools, consult with county superintendents, and perfect titles to school property; to hold teachers examinations for territorial certificates; and to deliver lectures to institutes.

School superintendents constantly complained about the "selfishness and ignorance" of the territory's settlers. Isolated and lacking culture, these were generally indifferent to education; homes, better means of travel and communication, and public buildings had priority over schoolhouses and playgrounds. Legislators and county commissioners heeded the taxpayers' demands for economy in public expenditures. Although Governors as well as superintendents argued that the infancy of a new society was the time for the general government to give a special lift to the schools, they had little success in arousing interest.

The first "Act To Establish a Common School System" set up a territorial school fund composed of (a) the "principal of all moneys accruing to this Territory from the sale of land heretofore given, or which may be given by Congress for school purposes," and (b) legacies. This fund was declared to be "irreducible and indivisible," the interest on its investment to be divided among common school districts "proportionally to the number of children in each, between the ages of four to twenty-one years" (10).

Teritorial Legislatures never established machinery for selling the 3.5 million acres of land in sections 16 and 36, and apparently the legacies were never received. The second legislative session made escheated estates part of the fund, but the total amounted to only $12,464. The last Territorial Legislature finally passed in 1889 an act for investing the money in the territorial general fund. The controller was authorized to draw warrants on the general school fund to pay for the care of prisoners, but there was no provision for him to use the funds to operate the schools. To enable the schools to operate immediately, the Legislature passed an act in 1864 stipulating that 5 percent of the tax money received by the county treasurer should be apportioned to the school districts on the per-capita principles stated in the previous act. The same Legislature passed another act giving the schools 1 percent of the gross receipts of toll roads, bridges, and ferries—the only public utilities at the time—and all of the fines and forfeitures for breach of penal laws.

In place of the 5 percent of tax collections, the third Legislature authorized a county school levy of 1.5 to 2 mills and provided for district levies for general support. This county levy was fixed at 4 to 10 mills in 1883, while it remained for a decade. This same year, the limit on special school district levies was placed at 10 mills, and it remained so until statehood. The law limited the right to vote on district taxes to actual resident taxpayers, but widows or unmarried women age 21 or more who resided in, held, or owned property subject to the special tax were entitled to vote. County commissioners did not make full use of their levying powers, and in general the assessments were approximately one-third of true valuations.

The apportionment of funds to school districts was proportional to the number of children of school age until 1871, when the law was changed to require that two-thirds of the fund be divided equally among the school districts and one-third by the per-capita principle. In the same session, the Legislature amended this act to read that one-half would be divided evenly among the districts and one-half according to per capita. Later Legislatures made some variations among counties, but the revised statutes of 1887 made the 50-50 division uniform throughout the territory, and it remained so until statehood.

The distribution of available resources among districts was essentially inequitable during the territorial period. Superintendent Silas W. Moody reported to Governor Edward A. Stevenson in 1886:

Some system should be devised for the assistance of poor and thinly populated districts. Under the present laws one-half of the school money is distributed per capita and "to him that hat shall be given" finds a practical illustration in the method. The feeble districts are forced to be content with but a few months' school (11).

Some years later, Moody's successor, Charles C. Stevensen, referring to the small, crude, and overcrowded schoolhouses, stated:

I would suggest that the proceeds of the General School Fund, with what may be added to it from time to time, be used largely for the purpose of building and equipping proper school-houses for the smaller and poorer districts. The wealthier districts can look out for themselves more properly for in this free land of ours the poor man's child is as much entitled to a common school education as the rich man's (12).

Since the general school fund consisted almost entirely of the proceeds from the escheated estates and was irreducible and indivisible, with only the interest usable,
Records indicate that the Territorial Legislature paid scant attention to the requests of school officials. The maximum levy by counties was gradually increased, and since trustees of local districts were in complete control of the school systems, any advances the schools made were directly related to their progressive thinking.

EARLY STATEHOOD, 1890 TO 1913

Organizing a State Department of Education

The people of Idaho greeted statehood in 1890 with great expectations—especially educators and those interested in education for their children. In January 1891, the first State Legislature met in Boise and adopted a complete school code. It established a State Board of Public Instruction composed of the state superintendent, who served as president; the secretary of state; and the attorney general. The state superintendent was given equal status with other state officials.

When the first state superintendent, Joseph Harroun, took office in 1891, the Department of Education came into existence. By the end of the decade it consisted of the superintendent, one staff member, and a part-time secretary. The superintendent and his staff were responsible for summarizing reports from 21 county superintendents, granting state certificates and life diplomas for teachers who passed the state examinations or otherwise qualified, and preparing examination questions for the first-, second-, and third-grade certificates. The 1891 law also required the superintendent to meet with the county superintendents, print lists of textbooks adopted by the Board of Textbook Commissioners and regulations for textbook care, distribute income from the state school fund to the county superintendents, and prepare a course of study in all public schools. The superintendent assumed general supervision of the county superintendents and the state's public schools. Not only did he serve as president of the State Board of Education, but also as a member of the Board of Trustees of the Lewiston and Albion normal schools and the State Library Commission.

Since the state superintendent and his staff had neither the funds nor the professional assistance to carry out all of these duties, his work mainly consisted of inspecting the schools and collecting meager statistics. The boards of trustees of the independent school districts had the right, by law, to determine the number and qualifications of teachers they employed; many hired teachers who did not hold certificates or diplomas. Although districts were supposed to use textbooks listed for use by a State Textbook Commission established in 1899, many did not, much to the chagrin of professional people, county superintendents, and common schools who did not have this right. Superintendent PermeI French requested the state attorney general to render an opinion on this practice, and in May 1900, he ruled that all districts would have to employ teachers with certificates and use books selected by the textbook commission.

This ruling settled another problem. The law said that the school board should have the power to determine the number and qualifications of its teachers, but the independent school district trustees were employing teachers who did not hold certificates from either the state or the county superintendent. When the attorney general ruled that all school districts must employ teachers with certificates, most of these certificates were issued only by the superintendent at the county level. In 1905, the Legislature changed the law so that the certificates could be issued to graduates of state normal schools and chartered colleges empowered to grant degrees.

The problems of education in Idaho were no different from those in other states during their early history, but they were made more acute by its topography, sparse population, and great distances, magnified by the lack of transportation and other communication facilities. In 1898, the superintendent reported:

A general view of the Idaho system shows at once its strength and weakness. The county district schools, the independent district schools, the normal schools and the State University are the component parts of the State system. Some of these parts taken separately are doing strong and efficient work, but the weakness of the system is manifest when we come to study the articulation of its elements. The country schools are not in touch with the graded schools of the independent districts, nor are the graded schools yet in touch with the University. ...The teachers of the State have worked well, but each in his separate field with hardly a definite idea as to the general condition of the schools round about him and with hardly a thought as to his relation to the general trend of education in the State or his place in the State system. After two years' time taken to survey the educational field in the State it is my opinion that the best lines of progress possible for our schools lie in an effort tending to centralize and unify the educational forces of the State (13).

At this time, the superintendent was working with the new state university, founded at Moscow in 1889, on a plan of unity. The president of the university outlined the plan as a set of uniform examinations for admission to the university. The university would then issue a report card certifying the branches the student could enter.

The plan failed because the two normal schools, established by the Legislature in 1893 at Lewiston and
Albion, had adjusted their courses to appeal to more students and meet the needs of graduates from both public and private schools. The normal schools and the districts having high schools were against having the University of Idaho determine who could attend the university and what course offerings there could be. The Legislature, as well as the people, were against the "university plan," and this accounts in part for the failure of the state superintendent in his bid for reelection.

The schools continued to grow, however, and by 1900 there were 722 districts. Schools operated an average of 5.5 months each year for 35,329 students, out of a total of 54,839 children between the ages of 5 and 21. The 1,067 teachers received an average monthly salary of slightly over $48. Despite an expenditure of $499,839 in the 1899-1900 school year, 99 of the 756 school buildings were without suitable outhouses.

**Setting the Stage for Progress**

**Rivalry Among Schools.** At the end of the first decade of the twentieth century, much to the distress of most educators, the higher institutions were fighting over shares of the tax dollar. Long after the need ceased to exist, the normal schools continued to maintain large preparatory programs and duplicated the offerings of the university. The institutions' separate programs and duplications of most educational institutions and public school systems had developed considerable time at legislative sessions lobbying for appropriations.

Not only did the relationships with the colleges fail to improve, but rivalry also sprang up between the state department and the city schools. Since the city school systems had developed independent of the state department, the department's relations to them were extended only through the various county superintendents. Students transferring from one school to another or coming from outside the state were caught in a "web of distrust," and they usually found they had fewer credits than they had been led to believe, or they had to repeat courses after they transferred. The situation was compounded because the law provided for the organization of independent school districts, and the state superintendent was unable to get support for controlling laws from a state board whose members were extremely busy with their regular duties as elected state officials.

**The "Idaho Plan."** In 1911, Governor James H. Hawley outlined the major problems to the Legislature. He then recommended that the Legislature levy a fixed tax to put the higher educational institutions on a more stable financial basis. His second recommendation, which eventually laid the foundation for Idaho's educational structure, called for the creation of a single governing body responsible for the general supervision of the state's schools. The Legislature supported these recommendations and submitted the following constitutional amendment to the electors at the next general election:

> "Shall Section 2 of Article 9 of the Constitution of the State of Idaho be so amended that the general supervision of the educational institutions and public school system of the State of Idaho shall be vested in a State Board of Education, the membership, powers and duties of which shall be prescribed by law?" The State Superintendent of Public Instruction shall be ex-officio member of said Board (14).

Both political parties accepted the single-board concept and included it in their platforms. The amendment carried by a wide majority—33,045 to 14,796—and set the stage for newly elected Governor John M. Haines to carry out the mandate of the people.

On Governor Haines's recommendations, the 1913 Legislature established one board to be in charge of all phases of public education and prescribed its membership, power, and duties. Officially titled the State Board of Education and Board of Regents of the University of Idaho, it was also later designated as the State Board for Vocational Education. The law stipulated that this single governing body was to be composed of six members, five to be appointed by the Governor, with the state superintendent of public instruction as an ex officio member (15). The law provided for 5-year terms for each of the appointed members, the first terms staggered from 1 to 5 years so that one expired annually. To counteract the existing animosities, the law forbade any person who had been a board member of a higher educational institution or connected with a state educational institution, either as an instructor or a student, to be appointed to the State Board of Education. Members were to be selected by ability, without reference to locality, occupation, party affiliation, or religion.

The law also empowered the board to appoint a commissioner of education, his term and salary to be set by the board, which could terminate the appointment by a two-thirds vote. It further provided for the appointment of "specialists, assistants, clerks or other executive officers . . . upon recommendation of the Commissioner of Education" (16). This established the legal basis for the State Department of Education.

The "Idaho Plan" placed the state's entire school system under the direction of the State Board of Education and the Board of Regents of the University of Idaho, with the commissioner of education serving as an adviser to the board. The state superintendent acted as the assistant to the commissioner of education except when performing his duties as a member of the State Land Board.

Thus, Idaho was in a unique position as it set the stage for educational progress. The superintendent's biennial report for 1913-14 stated: "Several states have undertaken to unify their education system, but none have gone
so far as the new law in Idaho. The best educational authorities have approved the Idaho plan, however, and are watching its operation with interest" (17).

As the governing authority for the state's educational institutions, the new board was responsible for the efficient operation of 1,278 school districts located in 33 counties. These districts employed 3,144 teachers to instruct 92,437 pupils, with 392 of the teachers responsible for 6,105 students enrolled in high schools. These districts were under the jurisdiction of 4,236 school trustees. Thus, in the rural schools the ratio of trustees to teachers was almost three to one.

A PERIOD OF GROWTH, 1913 TO 1933

In April 1913, the new State Board of Education assumed the task of directing the affairs of the six state institutions and the public schools. The board selected E. O. Sisson as commissioner of education to work with public school administrators and heads of the higher educational institutions in making the transition from the old system to what became known as the "Idaho System."

Progress Under the Commissioners of Education

After organizing his staff, Dr. Sisson conducted a survey of the public schools to determine the conditions and revenue. His reports prompted the state board to standardize the high schools in 1915 and the Legislature to enact a law requiring free high school instruction for pupils in home districts without high schools. The Legislature also raised the limit of the levy from 5 mills to 10 mills. In 1915, it also enacted the first comprehensive certification law. In addition to county certificates, which were limited to the elementary grades, the law created "state" certificates valid in all grades and for secondary subjects. They were based on certain minimum requirements and could be renewed and converted to "life" certificates.

State Superintendent Grace M. Shepherd launched a vigorous campaign to bring about school consolidation. The commissioner's survey had revealed inequities and inefficiency in the operation of the schools, and Miss Shepherd recommended the county unit for school government. Miss Shepherd made a good argument for consolidation by pointing to the rural communities, where the problems were worse and where there were more trustees than teachers. But the state board opposed any law making the county unit compulsory, so no bill was introduced. Miss Shepherd decided not to seek reelection.

Bemice McCoy, assistant to Miss Shepherd, was elected state superintendent on a platform of eliminating the duplicate offices and responsibilities. In April 1915, she presented the state board with a resolution, which it accepted unanimously, requesting the Legislature to give the people an opportunity to eliminate the constitutional office of state superintendent of public instruction. The Legislature submitted such a constitutional amendment to the people, but they rejected it.

During his years of service to the state board, Commissioner Sisson instituted many changes. When he resigned in 1917, the school laws had been consolidated, simplified, and clarified by the Legislature; the apportionment of school funds from the state land earnings had been simplified; and there was more flexibility and simplification of teacher certification. The school term had been increased from 5 to 7 months. The department had released many publications, including pamphlets. Some were designed to help rural teachers or to improve purchasing procedures. One outlined the study of Idaho history, and others assisted in organizing and planning high school programs of instruction to comply with standards adopted by the state board. The state board adopted standard methods for gathering statistical data from the schools, and those statistics were used frequently in presentations to the Legislature. In fact, the education committee of the Legislature met in the commissioner's office, where the information was readily available.

Enoch A. Bryan, retired president of the State College of Washington, was appointed to succeed Dr. Sisson in July 1917. He continued ongoing activities and broadened them. The state board had the responsibility for prescribing a minimum course of study for schools and determining how and under what regulation textbooks were to be adopted. The commissioner appointed advisory committees, and identical sets of textbooks were adopted for use in all districts except Class A independent districts. A course of study covering the minimum 7 months of school was adopted and published.

In the meantime, Superintendent McCoy, as a member of the Board of Land Commissioners, spent considerable time studying the school accounts. Income from the state lands was deposited in the general fund, and this money, when invested, drew interest to the general fund. The money invested from the sale of lands did not go into the school fund, thus it could earn no profit for the schools. The State Supreme Court ruled in 1918 that the funds should be kept separate and that the interest earned be credited to the school fund.

Until 1918, the state department conducted its many duties with three principal staff members. The commissioner was head of the department, the state superintendent served as his assistant, and a business agent supervised the business of the department, the state institutions, and the public schools.

The commissioner's duties were expanded as a result of the Smith-Hughes Act, passed by Congress in February 1917. A bill was immediately introduced in the Idaho Legislature to accept the provisions; it passed the House unanimously, but the Senate overlooked it. However,
Congress amended the bill to authorize the Governor to accept the provisions of the act on behalf of the state, and Idaho was permitted to participate. The Governor designated the State Board of Education as the State Board for Vocational Education. The board appointed the commissioner of education as director of vocational education. The Legislature appropriated the matching funds for operating the program in 1919, and by July a state director and three supervisors were operating the program under the direction of the commissioner of education.

As a result of the 1921 Depression, the Legislature in 1923 decided to economize by eliminating the appropriation for a commissioner from the state board's budget. Dr. Bryan resigned, but the department's administrative staff remained at three persons, and a director and two supervisors administered the vocational education programs. The elected state superintendent and the appointed director of vocational education assumed the duties of the business manager. The following year in November, the State Board of Education requested the Legislature to renew the appropriation for a commissioner of education. The Legislature granted the request, and in 1925, Idaho once more had a dual administration in the Department of Education.

Upgrading the High Schools

When the Legislature created the State Board of Education in 1913, it directed the board to "grade and classify" high schools and to "adopt and publish standards and requirements" for their operation. Moving promptly, at its June meeting the Legislature provided for four classes of high schools based on the number of years of work offered to meet the needs of a pioneer state with a wide variation in the maturity of its communities. Class I schools were those offering 4 years and 15 units, Class II were schools of 3 years and 12 units, Class III were schools of 2 years and 8 units, and Class IV schools offered 1 year and 4 units.

The state board also recognized as early as 1913 the need for inspecting the high schools. It postponed action in the interest of economy until July 1915, when the state board approved such a recommendation by the commissioner of education. The inspection was to be performed by a team consisting of the commissioner, state superintendent, and representatives from the four state schools. Although the standards adopted in 1915 to assist the inspectors have been revised a number of times, they still contain some of the elements in the original draft.

In 1923, the state board approved a resolution providing for cooperation with the University of Idaho to inspect the high schools. A university instructor was charged with inspecting as many of the schools as possible during a 5-month period each year. This arrangement continued until 1941, when the state department was given responsibility for inspecting the high schools.

Under the laws, every child in Idaho was entitled to a free high school education, and in those districts where it was not available, the districts were to pay tuition to a school outside the home district. Only accredited or approved high schools were permitted to collect tuition. The accredited high schools were the responsibility of the high school inspector. The approved high schools, usually those offering less than 4 years of high school, were under the county superintendents, who recommended their approval to the state superintendent. These approved schools could be accredited when they offered 4 years of high school work and met the requirements for accreditation, which closely followed the Northwest Accreditation Association standards.

Teacher Certification

Establishing the Idaho Professional Association. Prior to 1918, graduation from high school was not a prerequisite for certification, but 3 years later, with the exception of provisional and county certificates, Idaho ranked with three other states at the top of the list in the professional preparation of its teachers. The new law, enacted in 1921, discontinued the many forms of state certificates and provided for those previously issued to be converted into 5-year state elementary and state high school certificates. Teachers had to graduate from a 4-year high school and take professional courses varying from 6 weeks to 1 year. The county superintendent and the higher education institutions did continue to issue certificates, and most of these issued as state certificates were endorsements of out-of-state certificates.

Despite the profession's efforts to increase the standards over the years, too often the Legislature tended to block the raised requirements just when it appeared that progress was being made. The repeated recommendations by state superintendents frequently had little effect.

In 1919, a teachers organization was established to form a closer liaison among teachers and between the teachers and the Department of Education. When the seventeenth session of the Legislature used the excuse of a teacher shortage to lower the standards for teacher certification, the association protested vigorously. In 1924, experienced teachers could not secure teaching positions, so the state superintendent urged the Legislature to restore the former standards.

The deep concern among teachers gave life to the organization. It commenced publishing The Idaho Teacher to mold its 3,800 members—about 88 percent of the state's teachers—into a tighter organization. In July 1926, the association employed an executive secretary and established its headquarters in Boise. It worked closely with the state board and pledged its support to make the Idaho system effective in all divisions of public education. It promised to promote the general educational welfare of the state, to
advance the educational standards, to encourage and develop the educational field, to cooperate with other organizations, and to bring the people of Idaho to an understanding and appreciation of the state's education system.

Upgrading Teaching Qualifications

Despite the efforts of the teachers association, there was an extensive teacher turnover in Idaho schools. In her 1923-24 report, State Superintendent Elizabeth Russum estimated the average turnover to be nearly 50 percent. She found that only 50 percent of the state's teachers had been employed in Idaho the previous year. The schools lacked adequate accommodations, and the communities gave little recognition for good service, so the teachers shifted within the state and moved out in large numbers. The state superintendent solicited help from the school trustees and the Parent-Teachers Association to secure annual salary increases for the teachers, and she suggested to the Legislature that it enact an effective teacher retirement law. She received no support from the legislators.

Superintendent Russum also pointed out that most of Idaho's undertrained teachers were in the rural schools, and they had little supervision. In 1927, the Legislature raised the requirements for a teaching certificate to not less than 2 years of professional training, with the provision that no person could teach in the Idaho schools after September 1929 who had not received this training. The following year, only 60 county certificates were issued compared to 409 during the previous 4 years.

In 1933, the state board decided to grant state certificates to applicants who held comparable certificates from states in which they received their training. It also stimulated 6 semester hours of practice teaching for the elementary certificates and required all out-of-state applicants to attend an Idaho school for at least a summer term to receive elementary or secondary certificates. By 1933, only 10 county certificates were issued.

Elected Superintendent Becomes Chief State School Officer

Considerable duplication existed between the offices of the state superintendent of public instruction and the commissioner of education, and there was a lack of harmony between the offices. Perhaps this was due in large measure to the appointment of State Superintendent Ethel E. Redfield to the office of commissioner of education when the Legislature restored the funds to operate the latter office in 1925.

W. D. Vincent, superintendent of the Industrial Training School, replaced Miss Redfield as commissioner. Mrs. Myrtle R. Davis, the assistant state superintendent, was elected state superintendent in 1928. Idaho Attorney General Bert Miller commented on the relationship:

It is a known fact that during the existence of the office of said commissioner and the personnel thereof, the constitutional office of State Superintendent of Public Instruction was relegated to the point of innocuous desuetude (18).

After 2 years in office, Superintendent Davis appealed to Governor H. C. Baldridge to eliminate duplication in the state's school office. She pointed out that although many people wanted a single state board, the Legislature had established the commissioner of education and named him secretary of the state board. She stated that the tendency of the state board had been to delegate more power to the commissioner by taking duties from the state superintendent until the commissioner assumed authority and control over public education.

Superintendent Davis also pointed to other problems. Idaho ranked third highest in the salaries it paid its two executive officers, but eighth lowest in total pupil enrollment and teachers employed. There were no specialists in either elementary or secondary education and no unification of educational programming. She claimed that the budget she proposed would provide for two assistants to supervise elementary and secondary schools, a business manager, a certification clerk, and three secretaries, and that the budget would still save over $17,000 per biennium, an amount equal to over 24 percent of the total requested for each office. The Governor and the 1931 Legislature did not heed her request, but the groundwork had been laid. In the following session, the Legislature eliminated the office of commissioner of education and in 1933 named the state superintendent as the executive secretary of the State Board of Education. For the first time the state superintendent was in a key position with respect to the total educational program in Idaho.

THE DEPRESSION AND WORLD WAR II, 1933 TO 1947

Idaho, like other states, struggled in the early thirties to free itself from the grip of the Depression. While many states were closing their schools for lack of funds, Idaho was fortunate in not having to shut down any school for this reason after 1932. This was partially due to better payment of taxes—people did not want their property to be put into the hands of county officials because of nonpayment. But local school boards deserved a great deal of credit for their close attention to financial accounting. Although most school districts paid with warrants, and in many places teachers were forced to take discounts for cashing the warrants, the schools continued to operate.

Idaho's First Foundation Program

In 1933, the Legislature passed a bill providing for a more equitable distribution of state funds to the school districts that took into consideration the varying ability of the
districts to finance education. For the first time the state recognized an obligation to contribute to the schools' operations from its general fund. This money, although meager in the beginning, was eventually to be combined with the public land investment earnings and forest funds and be distributed by an adopted formula. The Legislature also taxed beer and chain stores more than $155,000 and combined this sum with $556,417 earned by the endowment funds to help the schools during the 1933-34 terms. This state aid enabled nearly 80 percent of the school districts to operate on a cash basis.

The new equalization formula was actually the product of years of work by educators and interested citizens. Various proposals had been presented as early as 1927, but it was difficult to reach an agreement on all parts of the formula. The final compromises established a formula based on classroom units determined by student average daily attendance, with the high school units weighted. School districts making a 3-mill levy would receive state funds appropriated by the Legislature, and the balance needed for a "minimum program" would come from a flexible county levy. School districts deciding to offer more than the "minimum program" could raise the funds needed by levying a special district tax.

During the first year under the new school formula, the county levies ranged from a low of 2.65 mills to a high of 14.97 mills. The assessed valuation of county wealth for each classroom unit ranged from $54,055 to $182,959. The districts' special levies for funds above the minimum ranged from 5 mills to 12 mills. When the valuation of the districts decreased the next year, the counties raised the levies to make up the difference in funds available from the state and district minimum levies.

Education Improvement

State Superintendent John W. Condie labeled the biennial 1935-36 as one of real educational accomplishment. Enrollments in both the elementary and high schools increased, and the higher education institutions grew beyond predictions. Many schools found it difficult to provide adequate facilities.

Economies forced by the Depression, such as the elimination of four rural supervisors from the state normal schools' budgets, placed an added burden on the county superintendents and the education department. Condie, who had served as executive secretary of the Idaho Education Association prior to his election, did secure the cooperation of the public schools, the higher institutions, and county superintendents in maintaining standards. For instance, the University of Idaho held a 2-week training session for county superintendents to assist them in assuming the responsibilities of the elementary supervisors. The regional teacher institutions assisted classroom teachers.

The department also took on other activities. The federal government apportioned emergency education funds to provide part-time jobs for college students, emergency employment of teachers in nursery schools and adult education, and assistance to the rural school districts that needed funds or whose warrants were impaired. In the fall of 1933, the department assumed the entire supervision of these projects for Idaho. The following year, the state board appointed a director of emergency education and employed a supervisor for each of the adult education and nursery school programs. This gave the department eight persons to fulfill its responsibilities and offer services to the public schools.

In 1934, the department, to improve classroom instruction, held a curriculum conference to which invited teachers, administrators, and representatives from institutions of higher education. Paul R. Hanna of Stanford University and Edgar M. Draper of the University of Washington were visiting participants. The conference resulted in a request to the Legislature for funds to continue a study of the state's education needs, but the request was not granted.

The department also conducted surveys to determine how many different textbooks were used by the state's 195 high schools and whether there should be more uniformity. It made a statewide library survey to chart standards for elementary and high school libraries and to compare Idaho school libraries with those in other states. In cooperation with institutions of higher education, the department conducted curriculum studies that resulted in revisions and the production of numerous subject guides and curriculum bulletins. With a grant from the federal government and the assistance of WPA personnel, the state department supervised a complete survey of school district organization and finance.

The information from these studies enabled Superintendent Condie to make many recommendations to educators, the general public, and the Legislature. He called attention to the school districts' outdated financial reporting and accounting system. Since some schools carried no insurance, he recommended that school property be evaluated, the actual need for insurance coverage be determined, and this information be made available to the public. Specifically, he recommended—

1. Increased state support for schools to pay the total of the minimum program to achieve equalization of educational opportunity.
2. A plan for more economical and efficient organization of school districts with the hint that the Legislature should require, rather than permit, consolidation of districts.
3. A careful investigation of small schools before allowing any of them to continue to operate.
4. Replacement of rural high schools by independent districts encompassing a number of the present rural organizations.
5. Rejection of a county unit plan of reorganization of schools (19).

Condie also urged giving considerable attention to transportation. He described the conditions:

School children are being transported to school in any sort of conveyance from a trailer, an open 'pickup' body or a sod sleigh, to the most modern trucks with safety school bus bodies. The cost per child per year ranges from $11.00 to over $100.00. The distances traveled per day range from 3 to 90 miles. The conditions of buses are in many cases unsafe under normal conditions and absolutely hazardous under other circumstances. By this we mean such conditions as noted in the following incomplete list:

1. Poor brakes  
2. Poor lights  
3. Poor tires  
4. Loose drivers' seats  
5. Wooden framework  
6. Breakable glass  
7. Only one small door in the front of a closed bus (20).

Condie recommended that the state establish minimum transportation standards and qualifications for bus drivers and special bus driving rules.

Financial Problems Emerge

During the 1936-37 school year, revenue from the endowment earnings; the taxes on beer, chain stores, and liquor; and the sales tax provided only 30 percent of the minimum program. To make matters worse, the sales tax was discontinued by a referendum in 1936 and did not provide funds the following year. A mine profits tax, which had been before the courts for 4 years, was added to provide some funds, but since it was estimated that it would bring in only about 50 percent of the sales tax revenues, it was a poor replacement.

In the meantime, with the state paying more, the county levies decreased to less than half the mill levies for the first year of operation under the new school formula. The distribution formula was not changed, and, as the county levies decreased and school costs rose, the need for greater local district levies caused a number of legislators to question the effectiveness of the formula. Districts were paying the total costs for more than 500 teachers who were not part of the formula's minimum program classroom unit allowance. In fact, the minimum program provided only 50 percent of the total funds spent by the public schools. State Superintendent Condie recommended a reduction in the average daily attendance of students, which determined the classroom units for both elementary and high schools. This would decrease the district support, increase the county support, and spend the money available from the state.

The Legislature did not accept the superintendent's recommendation. In 1939, the revenue from different taxes used for the public school fund—with the exception of the endowment earnings—was deposited in the general fund. To replace the revenue lost by education, the Legislature placed an ad valorem tax on the assessed valuation of the state to raise $1 million a year for distribution to the schools. County levies increased, state funds decreased, classroom size increased, and average teacher salaries increased only slightly.

Despite the growing problems faced by the schools, the 1939 Legislature turned a deaf ear to Superintendent Condie's recommendations for increasing state funds, consolidating school districts, regulating transportation, and improving curriculum. Condie again emphasized the need to consider the problems of finance, reorganization, teacher salaries, transportation, insurance, and upgrading of the schools and instructional offerings in his recommendations to the 1941 Legislature.

The curriculum committees busied themselves updating guides and bulletins. The department continued to administer and account for the Works Progress Administration programs. When the Legislature passed laws which permitted the two private junior colleges at Coeur d'Alene and Boise to become public junior colleges, they were placed under the jurisdiction of the state board. The department also established adult education classes at the state penitentiary and correspondence courses for enrollees in the Civilian Conservation Corps. Although the department's work load increased, the staff remained constant, except for personnel added under the federally financed vocational education and rehabilitation services (21).

Superintendent Condie, whose 8-year tenure exceeded all other continuous terms of elected state superintendents, decided not to run for reelection and was succeeded by his assistant, C. E. Roberts. Roberts appointed Condie state high school inspector, thus removing this position from the University of Idaho and placing it in the state department. By 1942, the department's administrative staff consisted of an assistant state superintendent, a high school supervisor (the name was changed from inspector), a supervisor of elementary education, an accountant-auditor, a certification clerk, and an insurance clerk.

World War II

Gearing for the War Effort. It was invaluable for the department to have a state superintendent with Roberts' experience to cope with the mounting problems during World War II. In addition to the regular vocational education program, the department used federal funds to
train over 14,000 workers for defense industries, agriculture, and technical fields serving the military. Both the state board and Superintendent Roberts emphasized the need for continuing this vocational educational training—both terminal vocational training and vocational retraining for adjustment—once peace was achieved. Roberts pointed out that such a program would be impossible without the help of wise legislative planning and action (22).

In his report to the Governor and the 1943 Legislature, Superintendent Roberts called attention to earlier recommendations by Condie and presented statistical information to emphasize the critical problems facing the schools. The $2.5 million appropriated by the Legislature for the 1941-42 year fell short in meeting financial needs, and the county tax again paid the largest share for the minimum program. As people left Idaho for war industry employment, student enrollments decreased, and additional state funds provided during the second year of the biennium caused state support to exceed county support. Even so, state funds provided less than 25 percent of the current expenditures; the greatest contribution came from the local school districts.

Groups Organized for Education. The 1943 legislative session was disappointing to education. School district trustees from all parts of the state came to the capital to support regular and emergency appropriations to prevent a continuing exodus of teachers from Idaho. Their requests were not heeded, but their trip to Boise was not entirely futile. While there, they perfected the organization of the Idaho State Trustees Association under the able leadership of Charles T. Whittaker of Rupert.

The association immediately launched a statewide campaign for education and joined others in calling for a second extraordinary session of the Legislature. The Legislature responded, but the acts passed to provide emergency aid for teachers’ salaries were declared unconstitutional in the Canyon County District Court (23). The laws were corrected early in the 1945 regular session and made retroactive for the 1944-45 school year to protect the districts that had already provided funds under the act.

Representatives of the Idaho Education Association, the state’s Chamber of Commerce, and the State Department of Education met with the presidents of the Idaho Congress of Parents and Teachers and the Idaho State Trustees Association in the summer of 1943. They became the nucleus of a new organization known as the Idaho Education Council, which also included the state’s Junior Chamber of Commerce, Federated Women’s Clubs, State Federation of Labor, American Legion, County Superintendents Association, and the Idaho State Grange and Idaho State Farm Bureau. The Governor’s Interim School Committee, appointed after the second extraordinary legislative session in 1944, participated in the council’s meetings.

In March 1944, State Superintendent C. E. Roberts resigned to devote full time to this newly formed council. Because of his knowledge of the problems and his insistence on reliable statistical data, he provided the council with ideal leadership for developing plans to present to the Legislature.

By the fall of 1944, the Idaho Education Council had developed two major recommendations for the Legislature’s consideration: a plan for reorganizing school districts and a school finance program. State Superintendent Acel H. Chatburn, appointed by Governor C. A. Bottolfson to complete Roberts’ term, outlined both proposals to the Governor. The State Board of Education supported the plan and actively assisted in its presentation to the Legislature.

The finance program recommended by the council called for an increase in the minimum program by (a) reducing the size of the classroom unit for both elementary and high schools, (b) increasing the financial allowance for elementary and high school units, (c) providing a minimum transportation program, (d) increasing the minimum district levy, and (e) increasing the minimum county levy. The council estimated that this program would require approximately $1.5 million above the previous appropriation, but the Legislature appropriated only $3,025,000, an increase of only $525,000.

The plan for reorganization proposed a minimum size for districts and suggested that the Governor appoint a state school reorganization commission of seven members, which would include the state superintendent and a state board member. The commission, which would be empowered to appoint a director and staff, would pass on reorganization plans. Each county would establish a seven-member committee to develop and present plans to the state reorganization committee. The superintendent asked the Legislature to appropriate $60,000 to operate the study commission the first 2 years. Despite strong support for the measures, the 1945 Legislature postponed the problem by providing $50,000 for a commission to conduct a complete study of the state’s schools. Peabody College agreed to make this survey.

After turning down the state superintendent’s recommendations, the Legislature ordered the state board to initiate programs that had not been requested. In 1943, the Legislature enabled the state board to employ staff to supervise a program on the harmful effects of narcotics and stimulants. In 1945, it appropriated funds, separate from the department’s budget, to hire personnel to develop a program in guidance and to distribute occupational information.

The state superintendent made no recommendations in his 1945-46 biennial report, but Ascher B. Wilson, member of the state board and chairman of the Idaho Education Survey Commission, presented the results of the “Peabody Survey” and its recommendations to the 1947 Legislature (24). The study’s recommendations for school district
reorganization were nearly identical to those made earlier by Superintendent C. E. Roberts and in 1944 by the Idaho Education Council. The survey committee praised the accomplishments that had been made, particularly the 12-month salary schedule for teachers, the 9-month school term, the method of selecting text books, the minimum program principles, and the increased holding power of the schools.

The survey did recommend that the state increase the minimum program by taking into consideration (a) a teacher salary allotment, (b) a transportation allotment, and (c) other current expenses based on classroom units. It would equalize the ability to finance school facilities by providing variable state support and would increase the support for school operation from the counties as well as the state. It pointed to a need for competent school plant consulting services with prior approval of school construction plans, an up-to-date transportation code with transportation supervision, and an increase in the requirements for teacher preparation with a minimum teacher salary schedule. It further recommended that the school curriculum be upgraded through studies of the needs of students relative to the subject matter content, vocational training, and a unified program of curriculum development.

The Peabody Survey also recommended raising the qualifications and salary of an appointed state superintendent, who would serve as executive secretary of the board of education. It recommended that the law recognize and establish officially the State Department of Education. The department, organized into divisions with staff salaries comparable to those paid for similar positions in the public schools, would be expected to expand its services.

The stage was set for the Legislature to perform a great educational service to the state. Educators, organizations, and citizens who had been close to educational problems for the past 5 years had every reason to believe that this was to be the year of accomplishment.

THE PRESENT ERA, 1947 TO 1966

Legislative Action on the Peabody Recommendations

The year 1947 did herald a new era in education for Idaho. The Legislature enacted into law over 30 educational bills, including many of the major and some of the minor Peabody Survey recommendations. One act based the minimum program payments on five factors, including an allowance for teacher training and experience. Another upgraded teacher qualifications through a new certification program. A new transportation code was established with provisions for the state board to provide standards for equipment. The Legislature adopted a minimum salary schedule for teachers, provided for sick leave, and required all instructional personnel to have health examinations. One act charged the state board with administration of the school lunch program.

The new legislation also affected higher education. The 2-year school at Pocatello was permitted to become a 4-year liberal arts school and was renamed Idaho State College. The two normal schools were renamed and their offerings expanded so they could grant bachelor degrees in both elementary and secondary education. The appropriations for both public schools and the higher educational institutions were quite liberal compared to previous appropriations.

The job of initiating these new programs was tremendous, and the state board, State Superintendent Alton B. Jones, and the department’s staff faced the task with the addition of only one person: a school lunch accountant. The Legislature had neglected to increase the department’s budget adequately; it added a mere $7,500 to help operate the entire school lunch program.

School Lunch Program

The school lunch program came under the jurisdiction of the education department when Congress passed the National School Lunch Act in 1946. Until the Legislature appropriated $7,500 for a clerk, the department administered the program with its regular staff and absorbed these costs. The Department of Health cooperated by providing sanitarians for inspections, and the Department of Public Assistance distributed commodities. The education department was able to assume the entire operation of the program in July 1949 after the Legislature appropriated enough money to pay most of its administration.

Organization other than the district boards of trustees sponsored over 50 percent of the 272 lunch programs operated in the schools, with the Parent-Teachers Associations the most active in various communities. But the basic responsibility for the programs rested with the individual boards of trustees, even though this was not finally assumed by the districts until 1965, when the state board ruled that only local boards could sign the agreements. The department’s efficient operation has made the school lunch program easily available to the districts and has increased participation from 30 percent at the beginning to 40 percent of the students attending schools in 1965-66.

School Reorganization

The new reorganization law provided for a nine-member state reorganization committee appointed by the state board and composed of a state board member and four persons from each of the two congressional districts, with no more than three of the appointed persons actively engaged in education. The committee selected Kenneth F. Dean, a school superintendent, as director of school reorganization, and he worked tirelessly for the program.
The department faced a particularly thorny task in attempting to combine the state's 1,082 school districts into workable consolidated units. Many communities had built all of their social activities around their small school, and they were sentimentally attached to the "little red schoolhouse." Furthermore, many people believed that "what was good enough for me is good enough for my child." The reorganization committee therefore held 35 meetings during its first 18 months of existence to explain and sell the program to the people.

Asher B. Wilson, chairman of the State Board of Education, personally accepted the responsibility for the state board to reorganize school districts. He attended most of the reorganization committee's meetings and did not hesitate to speak out for better education. He became well-known throughout the state for his "God, country, and motherhood" speeches. Wilson's dedication and personal appeal to the people to accept this program—so necessary to achieve the goals for Idaho's children set by the school survey and the Legislature—made him the cherished friend of all educators.

As required by law, the county committees were selected by July 1, 1947, and 2 weeks later they held their first organizational meeting. Each county committee was required to submit to the state committee a comprehensive plan for reorganizing its districts and unorganized territory into the classes created by the Legislature. The state committee would either approve or disapprove each plan and send the program to the people.

Defeated proposals could be voted on again after 60 days. If a component district had a majority, it carried the proposal. If a component district had a majority of the total votes, then a single majority could carry the proposal. If a component district had a majority, two favorable majorities were required—one in the district having the majority and another in the remaining area. Defeated proposals could be voted on again after 60 days.

Dean developed procedural guides for the state committee and prepared a bulletin outlining procedures for county committees. He also provided the counties with statistical information from state records showing pupil enrollment by schools, pupil costs, assessed valuations, and other information.

The first reorganization election, held in October 1947, resulted in a county unit district. By the end of the year, 11 reorganized districts—5 of them county units—had been created. By September 1950, the 1,082 districts had been reduced to 301 by consolidating 781 districts into 85 reorganized districts. Only 2 of the state's 45 counties had not participated in reorganization; 13 counties had formed county unit plans. These reorganized districts contained 87.2 percent of the school population and 82.04 percent of the state's land area (25).

The term of the state committee expired in July 1951, and its functions were transferred to the State Board of Education. Staff members within the department now were responsible for carrying out the reorganization program, and within the first 6 months the number of districts was reduced from 301 to 276. By the end of 1952, all counties had approved a reorganization proposal, and by the following July the number of districts had been reduced to 190. In 1954, 96 percent of the pupils attended schools in reorganized districts, and 30 of the 44 counties were completely reorganized. Since legislative amendments delayed reorganization, by 1956 there were 162 school districts, including 12 nonoperating districts and 109 reorganized ones. After 12 years of agonizing compromise, final reorganization was completed with 116 school districts.

Since 1961, several districts have combined and others have divided, so that in 1966 there were 117 school districts. An amendment to the state foundation program in 1965 called for a reduction in funds to adjacent school districts maintaining schools within 10 miles of each other by all-weather roads. Thus, districts with a small number of students in school will lose funds and will be forced to reorganize. However, many educators believe this is not a correct approach, because schools losing funds must reduce their educational offerings, and this affects the children's opportunity for learning. The Legislature agreed with educators and eliminated this requirement in 1967.

School Transportation

The reorganization program required more attention to school transportation. The 1947 Legislature passed a school transportation act requiring school districts to furnish transportation to every pupil living over 1.5 miles from a school. Although the county board of education approved the routes established by the local districts, the state department, with the state board's approval, established the school bus rules, regulations, and purchase procedures. The law also established specifications for buses and provided for safety inspection of all buses by law enforcement officials.

The Legislature did not provide funds for a school bus supervisor, so this responsibility was first assumed by the state superintendent. The job was then turned over in November 1947 to the director of guidance, who had a budget separate from the department's funds. It remained in the director's office until he resigned from the department in March 1951. The staff person in charge of school reorganization was then named school bus supervisor 3 months later.

Under the 1947 law, the state assisted the districts with funds based on the average per-pupil cost for the students they transported. In 1951, on the basis of transportation costs maintained for 4 years, the state board adopted a formula which included in the minimum education program...
65 percent of the actual cost of district transportation. It also adopted the national school bus standards and required liability insurance. The department staff inaugurated conferences for school bus drivers and sponsored driver schools.

Although the transportation formula has been changed a number of times, it has remained a part of the school foundation program; thus, it does not take funds from the actual education program. The districts transport nearly half the students enrolled each year, and buses travel over 60,000 miles daily at an annual cost of $3.5 million. The ratio of accidents to miles traveled is small, and only one student death by bus accident was recorded from 1964 to 1966.

**Teacher Certification**

Prior to 1947, teacher certification remained a prerogative of the Legislature. The law required a minimum base training of 4 years for certification, but provisional certificates could be issued in an emergency. The act also set three general requirements for a teacher: citizenship, minimum age of 18, and graduation from a 4-year high school. In 1945, the Legislature gave the state board responsibility for setting the specific minimum prerequisites for a certificate within this framework.

Under the direction of Executive Secretary John Booth, the Idaho Education Association had studied certification requirements for a number of years. When it finally presented a program, the state board adopted it, thus greatly assisting the department in getting the program under way. The requirements recommended by the state board became effective in January 1948.

Rising school enrollments placed an increasing load on the department's teacher certification section. Although the department issued over 2,000 certificates and 2,400 emergency permits during 1947 and 1948—more than any other previous period—teacher preparation was not adequate. Over half the authorizations were granted to teachers who could not meet the minimum requirements for state certificates, and the state certificate requirements were lower than in a number of other states. Thus, Idaho attracted many persons not qualified to teach in other states.

It was assumed that the principal reason for the large number of temporary permits issued was the increase in certification requirements from 2 years of training to a B.A. degree for elementary teachers. A survey showed, however, that 678 elementary permits were issued in 1946-47 and 780 in 1947-48, while in the year following the increased requirements, 1948-49, there were only 716 elementary permits issued. The number dropped to 671 the following year. The percentage of permit teachers dropped from 29 percent of the total number of teachers in 1947-48 to 22 percent between July 1948 and June 1950, even though more certificates and permits were issued. Many of the teachers had completed the 4 years of training but had not completed the minimum teacher-training requirements.

In July 1954, the State Board of Education modified the certification requirements according to recommendations by members of the State Trustee Association, State Congress of PTA, and the Idaho Education Association. This practice of using an advisory committee composed of educators, lay people, and the department's director of certification continued and resulted in minor changes from 1954 to 1961. The board adopted a major revision in 1961, effective the following September.

In 1965, the teacher certification program expanded to include teacher education. A permanent professional standards board representing professional and lay groups was appointed to replace the advisory committee. This board not only advises but also assists the higher education institutions in planning programs in teacher education. At the same time, the State Employment Agency assumed responsibility for the department's teacher placement program to avoid a duplication of services.

The education department's teacher certification section is within the instructional services division. It issues new certificates to applicants with the proper credentials, issues renewals, and determines if the teachers employed are properly certificated so the districts can be approved for state funds. It consults with teacher-training institutions regarding curriculums, advises applicants on how to meet the requirements, assembles statistical data, cooperates with other states in endorsing or revoking certificates, and maintains records of certificates issued. It also furnishes each school district with a list of its teachers and when their certificates will lapse.

Reorganization has helped, but staffing the smaller and more isolated schools continues to be a basic problem in most of Idaho's districts because they cannot compete financially for qualified teachers.

**Curriculum Development**

In 1949, the state board created the State Curriculum Development and Textbook Committee as an advisory body to evaluate textbooks, improve both curriculums and classroom instruction, and develop materials and guides. The Legislature appropriated $50,000 and employed as director an Idaho State University professor, Bradford F. Minor. Actually, this continued officially the program that Superintendent John Condie had started in the early 1930's—without a legal requirement or special appropriation—and that had been interrupted by World War II.

Minor organized the advisory committee, appointed subcommittees to develop guides for each subject area, and inaugurated a study of textbook adoptions on a 5-year cycle. By 1950, over 1,500 educators were working on these guides and courses. They completed their findings and
recommendations in workshops sponsored during the summer months at Idaho's higher education institutions. Many of these guides and their revisions received national recognition from educators, colleges, and departments of education.

In 1953, the budget for the curriculum development program was incorporated into that of the education department, and the program was placed under the instruction division, thus ensuring better continuity and a greater uniformity in the base schools' offerings and enabling students transferring within or outside the state to find classes similar to those previously attended.

The launching of the Russian Sputnik prompted Idaho, like other states, to evaluate its programs of education. Superintendent Alton B. Jones organized the Idaho Task Force Conference on the Educational Implications of Sputnik and presided over its meeting in Boise in January 1958. The participants recommended to the state board that the course content for high school graduation be strengthened, stressed the importance of guidance and counseling programs, requested more emphasis on education for a democracy, and suggested that the schools provide programs for the exceptional child. Three months later, a Governor's Conference on Education reached the same conclusions but also stressed the need for a high school multitrack program, improved school facilities, ability grouping, and a greater emphasis on fundamentals.

The state board acted on these recommendations by establishing local school textbook and instruction committees, adopting a wide range of foreign language textbooks in high schools, and urging the elementary schools to offer foreign language courses. It also established a committee to examine the mathematics and science program for the first grade through college, raised graduation requirements for high schools, and sponsored a conference for teachers of migrant children.

Since Sputnik seemed to result in greater focus on secondary education programs, the elementary supervisors battled for more attention to their schools. Gertrude Eastman, one of Idaho's most respected and loved elementary supervisors, warned:

"We should continue to alert ourselves, however, to the danger that the critics may destroy the very strength of American Education—an education for all children. The assignment to schools is clear. We develop the potentialities in all children, emphasizing the talents in every child."

We must resist the trend to educate children for the immediate national goals, rather than for the contributions of individuals (26).

Such influence did much to strengthen the total program of education in the public schools.

By 1963, the tasks of writing new study guides, revising adopted guides, and establishing the scope and sequence of subject areas were being accomplished by the director of curriculum, the department's supervisors, and specially appointed committees from public schools and higher institutions of learning. The state textbook and improvement of instruction committee worked primarily on textbook adoption and recommended to the state board studies to be performed by the department.

Funds from Title V of the Elementary and Secondary Education Act, approved by Congress in 1965, have enabled the department to employ competent supervisors in all major subject areas. The curriculum program is up-to-date in nearly all areas, and Idaho has led the way in developing revisions in some of the new programs—especially in mathematics. The in-service teacher-training programs have been very successful in updating instructional methods using new media, techniques of new subjects instruction, and knowledge of subject areas. There is an emphasis on developing excellent library services in both the elementary and secondary schools.

The Department's Growth and Reorganization

Alton B. Jones, elected state superintendent for a 4-year term in November 1946, took office the following January. In 1947, the big legislative year for Idaho education, the department had eight staff members (27). With the addition of the curriculum construction and reorganization programs, the staff increased to 10 in 1950 and to 13 by 1954; it dropped to 9 in 1956, but was up to 10 by 1958.

The changes in the staff from 1948 to 1958 directly reflect the Legislature's acceptance of the state superintendents' budget requests. Jones, a Republican, serving with Republican Governors and a Republican Legislature, was quite conservative and never spent all of his appropriations, so the succeeding Legislatures reduced his request by an amount approximating what had been returned to the general fund at the end of the biennial period.

By 1958, Jones had completed three terms (12 years), a longer period of continual service than any other chief state school officer in Idaho up to that time. He chose not to run in 1958, and Delbert F. Engeling was elected to the position. Jones brought his successor into the department soon after his election in November so he could present recommendations to the Legislature in January.

Superintendent Jones sponsored one last conference at Pocatello, Idaho, soon after the passage of the National Defense Education Act of 1958, for the state departments of the northern Rocky Mountain states and the U.S. Office of Education. This conference gave the departments firsthand information about the act and enabled them to develop state plans. They became among the first to receive funds and to participate in the programs for the public schools.

During the Jones term of office, the Legislature appropriated $8 million to public schools in 1947,
liable amounts of two factors, called for the Legislature to appropriate $22 million.

**Departmental Changes Under Superintendent Delbert F. Engelking**

At the time Superintendent Engelking assumed office, it was obvious that the foundation program was a limiting factor in providing funds from the state. Since the formula had not been studied sufficiently to give an accurate estimate of how the adjustments would affect particular schools, Engelking recommended that such a study be made. The Legislature granted his request. The study resulted in a new formula, which used a weighted average daily attendance in relation to school size and permitted an allowance per average daily attendance in relation to funds available from state, county, and local sources.

The new formula brought the state appropriations to $28 million in 1959, $33 million in 1961, $40 million in 1963, and over $57 million in 1965. In 1965, an “average increase” and a “floor” allowance were added to the formula to satisfy particular school districts and provide a favorable atmosphere for passage of a sales tax. This special provision granted funds from the state appropriation to certain school districts when they (a) had an above-normal assessed valuation increase and/or (b) received no increase in state funds for each pupil. Funds received by qualifying districts for each student were greater than in many other districts, and the 1967 Legislature discontinued this program because they thought it unfair.

The federal programs available to the states in 1959 required the new superintendent to reorganize and expand his staff. The National Defense Education Act required five additional persons, and increased activities in finance and curriculum added two more. By 1960, for the first time since the beginning of the state's vocational education and vocational rehabilitation programs, the department had a larger staff than those departments.

In the early 1960's, the department added personnel for programs in Civil Defense education, driver education, special education, and junior high supervision. The lay organizations interested in education, special-interest groups, school administrators, and trustees all were demanding these additional services. The Elementary and Secondary Education Act required four more persons, so that by 1966 the department totaled 26, not counting those who retired during the fiscal year. However, it was the following year, when personnel became available for employment under the Elementary and Secondary Education Act, that the department enjoyed its greatest single increase. By the end of fiscal 1967, the department numbered 74-36 staff persons and 38 secretaries, clerks, bookkeepers, and keypunch operators.

Finding space to house the department's many activities posed problems. Although it was necessary to rent space outside of the State House, no state funds were available to pay for rent. Personnel working in federal programs had to be stationed away from the department's headquarters office. Lacking space large enough to hold a meeting for all regular staff members, Superintendent Engelking meets regularly with the division heads to keep all personnel informed. A state office building large enough to house the entire department is now on the drawing board.

When Engelking first became superintendent, he organized the department into five divisions: curriculum, finance, certification, school lunch, and state-federal programs. This proved to be quite cumbersome for the department's size and resulted in overlapping services. In 1964, he combined the services and established three divisions: finance and administration, instruction, and general services. Two years later he divided each of these into two sections, one for consultative services and the other for program services. Each division operates federal programs, and all programs and services are coordinated by the assistant state superintendent (28).

The 1965 Legislature presented a joint resolution to again provide the people an opportunity to eliminate the state superintendent as a constitutional officer, elected on a partisan ticket. The House approved the measure, but the Senate Democrats rejected it on a partisan vote. A bill was then passed changing the state board membership from five to seven, all still appointed by the Governor to 5-year terms. The bill also provided for the appointment by the board of an executive director of the State Board of Education, who also would be an ex officio member of the University of Idaho Board of Regents. His duties were confined to supervising and administering all state institutions having instruction above the twelfth grade.

Under the law, the state superintendent remained an ex officio member of the State Board of Education but was removed as ex officio member of the Board of Regents and as the executive officer of the regents. His duties changed to the enforcement of the rules and regulations of the state board only as they related to public schools.

This is the first time the state superintendent's duties have been removed by legislative action. However, the single state board provides an opportunity to coordinate the programs of public elementary and secondary schools, junior colleges, and the higher institutions of education. The state superintendent now has more time to devote to the elementary and secondary schools and is better able to live up to his commitment to serve the people of the state through enlightening its youngest citizens.
State Superintendent Engelking repeatedly requested larger appropriations than the Legislature granted, as the chart below indicates.

Although the superintendent attempted to get the Legislature to study the financial needs, both the 1963 and 1965 Legislatures refused. With limited funds available from all sources, the public school education program approaches a crisis.

The local school trustees are limited to a 30-mill levy for their operations. Since any additional levy has to be approved by two-thirds vote of the people, it is almost impossible to secure. Despite repeated requests, the Legislature has not permitted the local boards of trustees to levy beyond the 30 mills, nor can such a levy be passed by a majority vote of the people. The people have thus been “saved from themselves” by their representatives, and Idaho children are losing improved educational offerings. The silent prayer of neighboring states, “thank God for Idaho,” is poor consolation for the school districts that are losing their experienced teachers as well as their best trained young teachers or instructors.

State-Federal Relations

Idaho used federal funds early in its history when it was endowed with public lands. The Morrill Land Grant Act of 1862 provided public land for the University of Idaho. The state received funds for vocational education under the Smith-Hughes Act in 1917 and vocational rehabilitation funds in 1921. A school survey conducted in the early thirties used federal funds, and the school districts received assistance from the federal government for school construction during the Depression years. The department accepted school lunch funds in 1946, for the Indian education program in 1949, and the following year, Public Laws 817 and 874 granted funds to Idaho for school construction and school operation in federally impacted areas.

In 1959, the Legislature voted for the school districts and the State Department of Education to participate in the programs under the National Defense Education Act, but it did not approve the request for matching the funds available to the school districts. Instead, it left to each local district the decision whether or not to participate in the funds available for guidance counseling and the purchase of equipment in science, mathematics, and modern foreign languages. Only 64 percent of the high school districts participated in the Title III program during the 1959-60 school year. The money available to Idaho was not completely used—in part because school districts rejected the federal funds for specific program areas or because there was no adequate planning for the expenditure. In fact, until the 1965-66 school year, school districts did not fully use federal funds available to Idaho.

The 1959 Legislature appropriated matching funds for administering the NDEA programs, but in 1961, 1963, and 1965, it failed to provide the state funds requested. Without these matching funds, federal funds still were not completely used.

Without the money, the department could not offer the services or employ the personnel it needed. It had to operate the entire Title V-A program of NDEA with only one person from 1959 to 1965. The department was unable to initiate data-processing programs with federal funds under Title X of NDEA; less than 50 percent of Title X funds available have been matched by state funds in any fiscal year since 1959.

The careful operation of NDEA Titles III and V programs has done much to eliminate Idahoans' reluctance to use federal funds for general programs. Even though school trustees and responsible citizens never really opposed the use of federal funds for vocational education programs, they did view with suspicion what they considered to be a federal invasion of their public school general program. As school trustees used the Title III funds and participated in the reviews before the payments were made, their fear of federal controls gradually disappeared. Prior to 1960, the Idaho School Trustees Association passed resolutions against federal funds for programs in school subject areas, and beginning in 1960, it passed resolutions opposing general federal aid. But, since 1965, its attitude has again

a Required to request an amount to provide for formula.
changed. Its resolutions do not suggest federal aid, but they
do approve general aid programs if the state education
agency operates and has jurisdiction over these programs.

The principal opposition to federal support for
schools had disappeared by the time Congress passed the
Elementary and Secondary Education Act in 1965. Since
Idaho's Legislature holds its regular sessions every 2 years,
there was no opportunity to approve the state's participa-
tion in this act's programs. On Superintendent Engelking's
request, however, Governor Robert E. Smylie granted
permission for the state board and state department to
participate. Thus, the state was able to operate many excel-
 lent programs under Title I during the 1965-66 school year.
School districts were able to plan for spending all Title II
funds available, and the department strengthened its ser-
 vices to the public schools through five projects under Title
V—including a program of data processing. School districts
were quite active in the Title III program. By 1966, the
department was operating all programs available to the
public schools and the state agency (29).

The Idaho Department of Education and the State
Board of Education have had to face several problems in
connection with the federal programs. They are deeply con-
cerned about the tendency of Congress to appropriate
funds after the beginning of a fiscal year. The Legislature
approves departmental budgets on a biennial basis. The de-
partment's quarterly operation funds (6 months) are sub-
mitted to the Board of Examiners 45 days prior to the
beginning of a quarterly period. Program needs are not
known, and the estimates are often not too realistic in
terms of the final maximum appropriations possible within
the programs. Budget planning by the school districts also
becomes little more than a very rough estimate. School
personnel are usually employed before or during the first 2
months of a fiscal year, and not knowing what funds are
available prohibits effective planning.

One other practice disturbing to the department is
Congress' failure to approve program extensions prior to
their expiration date, thus prohibiting prior planning. For
example, Public Law 815, which provides federal funds for
public school construction in federally impacted areas,
expired for single connected students. The school districts
cannot make applications for these students without an
extension. Because of this, one Idaho district will be on
double shifts in the lower grades in 1967.

The Idaho department also is greatly concerned about
the separate accounting it and the school districts must
keep when using federal funds. These detailed reports re-
quire a great amount of personnel time that could other-
wise be spent on more effective planning. At the end of
fiscal year 1966, the department was keeping 29 separate
accounts, including the commodity program and the sepa-
rate administration funds for the different programs. The
department is willing to do it this way but believes that it
should be possible to combine the accounting of some pro-
grams.

The Idaho Department of Education has become
critical of the U.S. Office of Education's attitude in recent
years concerning some federal funds and programs. Any
program that bypasses the state agency without its approval
arouses the suspicions of local educational agencies and
provides an opportunity for criticism by citizens who do
not approve of the program. The authority and responsibil-
ity for education lies with the state, and the state delegates
specific responsibilities to the local school districts.

The department is in full accord with the principle of
federal support for education. State Superintendent Engel-
king has remarked favorably on the federal government as a
junior partner in education, but he is determined that the
junior partner shall not take the role of the senior partner—
the state. Education within a state will be only as strong as
the strength of the state educational agency. Thus, it must
be kept strong, and efforts to bypass it are injustices to all
education.

The school established by the Latter Day Saints at
Franklin in 1860 had evidently closed by this time. Tera
torial Superintendent of Public Instruction, Biennial Report (1865).

21. The vocational education and rehabilitation services increased the department's personnel from 5 to 8 persons in 1940 and to 11 in 1942.

23. District Court Records, Canyon County (1944). The bills were declared unconstitutional because they provided funds for teachers' salaries only, and not for the operation of schools, as stated in the Governor's proclamation for calling the Legislature. E. N. Hanson v. T. M. Dercousey, 8766 Idaho Book 19, p. 365 (1944). Idaho, *Journal of the State Senate*, 2d extraord. sess., 27th leg., 1944, p. 3.

24. These findings and recommendations made by Peabody College were completed and accepted by the Idaho Education Survey Commission in October 1946. *Public Education in Idaho: A Report of the Idaho Education Survey Commission* (Nashville, Tenn.: George Peabody College for Teachers, 1946), pp. 70-76.

25. Board of Education, *Nineteenth Biennial Report* (1950), pp. G5-G9. After completing the major portion of the district reorganization, Kenneth Dean resigned as director to accept the superintendency of a county unit which needed consolidation within the district and a major building program. The state board then appointed George Denman, a veteran educator, to replace Dean as director.

27. For many years, the Department of Education's duties had been in the hands of the superintendent, an assistant superintendent, an auditor, and a teacher certification clerk. When the two normal schools received budget cuts during the Depression, eliminating four elementary supervisors, the department added an elementary supervisor. When the University of Idaho discontinued the inspection of secondary schools, the Department of Education added a high school supervisor. Another staff member was added when the 1943 Legislature required the public schools to teach the harmful effects of stimulating narcotics, and another in 1945 when the department assumed the school lunch payments. A field supervisor was added later, and when the Legislature required guidance supervision in 1945, the department employed a director and assistant director of guidance.

28. See Appendix B for the organization of the department in 1966.

29. On the state superintendent's suggestion, the state board approved the Department of Education's operating the following programs: (a) school lunch programs—commodity distribution, special milk, and equipment purchases; (b) Indian education; (c) Public Laws 874 and 815; (d) Title III, Title V-A, and Title X of the NDEA; (e) Civil Defense Adult Education; (f) Adult Basic Education; (g) training program for teachers in special education; (h) Head Start (program discontinued when the department was informed that no project would be approved by the Kansas City Office); (i) Higher Education Facilities Act; and (j) Titles I, II, III, IV, and V of ESEA.

<tr>
<td>1945</td>
<td>The Idaho Education Survey Commission, more commonly known as the Peabody Survey, was created.</td>
</tr>
<tr>
<td>1946</td>
<td>The Idaho teacher retirement law was enacted. The direct appropriation to public schools for 1946-47 was $2,174,000.</td>
</tr>
<tr>
<td>1947</td>
<td>In March, the School Reorganization Act became law. The State Board of Education revised the certification standards for teachers and authorized the issuance of administrator's certificates.</td>
</tr>
<tr>
<td>1949</td>
<td>All Indian schools in the state were closed, and the State Board of Education entered into a contract with the federal government for the provision of education of Indian children in the public schools.</td>
</tr>
</tbody>
</table>
1951 The Legislature prohibited the sale of public school lands for less than $10 per acre. The Legislature approved permissive programs for handicapped children.

1953 Legislation providing that all school board meetings be public was enacted. County boards of education were abolished, as was the office of county superintendent in all counties where reorganization was completed.

1955 The Legislature increased the bonding limits for school districts.

1957 The State Board of Education adopted a new manual of regulations and recommendations for school buildings constructed in the state. The 1957-58 direct appropriation to the public schools was $11,903,474. The Legislature authorized the inclusion of teachers for coverage under the Federal Social Security Act. Handicapped education laws were strengthened.

1959 Biennial appropriation to the public school income fund was $27,000,000. Education laws for the handicapped were amended to obligate school districts to provide this type of education program.

1961 The Legislature enacted into law provisions for absentee voting in school elections. The Legislature provided for the recodification of all school laws. Driver education program was established.

1963 Provision was established for the creation and regulation of library districts. Property tax exemption was given certain products manufactured and in transit (free-port provisions).

1965 School foundation program was amended with an appropriation of $55,300,000 to the public schools for the 1965-67 biennium.

1967 Teacher retirement system was discontinued and all teachers transferred to the State Employee Retirement Program.

STATEWIDE INVOLVEMENT

One manifestation of the widespread involvement of citizens in Illinois education is found in the 50 councils and committees which in 1965 advised the superintendent of public instruction. Additional evidence of extensive public participation in improving educational opportunities for all children is revealed by discussion of organized bodies. The efforts of the State Legislature, the School Problems Commission, and the Task Force on Education to improve education provide further evidence of public participation. Certain mandates of the people before 1900 show that Illinoisans have long been concerned with educational matters.

The First Free School Law, 1825

Less than 7 years after attaining statehood, influential leaders with an intense interest in education brought about the enactment of the first Free School Law in Illinois. One hundred years later, Superintendent Francis G. Blair called this law “the most advanced and forward looking law on public education which had ever been presented in any of the commonwealths” (1). Superintendent Blair was disappointed that the Fifty-Fourth General Assembly had not made provisions for a centennial observance of the law. He invited every public official to do all within his power “to arouse an appreciation of the heroic, courageous efforts of the men who were responsible for this law” (2). Evidently, the new law was too advanced for its time; the succeeding General Assembly repealed all the law’s main provisions. Despite repeal, the law and those who had vigorously supported it had made an indelible impression upon the course of education in the state.

In 1777, when Illinois was a county of Virginia, Thomas Jefferson presented to the Virginia House of Burgesses a bill on free schools that he had worked out in great detail. Despite limited reception of Jefferson’s plan, he persisted and presented a similar bill to the Virginia lawmakers in 1824. Illinois was now a separate state, and although its Free School Law was not patterned after Virginia law, it probably was influenced by Jefferson’s thinking. Jefferson also was influential in selling the land, now Illinois, to the federal government and including this land in the ordinances of 1785 and 1787, which provided that the sixteenth section in each township be set aside for the benefit of the public schools.

Other persons also deserve credit for their roles in shaping Illinois attitudes toward public education. Nathaniel Pope, territorial delegate in 1818, was largely responsible for two acts that helped make possible the Free School Law. Originally, the northern boundary of Illinois was on a line running east and west through the southernmost tip of Lake Michigan. Pope managed to get this northern boundary extended 60 miles up the west coast of the lake. He argued that Illinois would in this manner be joined with all the Middle Atlantic and New England states through the Great Lakes, and to the south through a canal and the Mississippi River, and that “when the war between the North and South shall come, Illinois will help to hold the Union together” (3). Pope’s move attracted many Easterners who brought high standards of education to Illinois and helped establish and maintain public schools. The area
added to the state includes practically all of the 14 north-ernmost counties, including Chicago; in 1965, approximate-
ly 65 percent of the state’s population lived in this area. 
Twenty years after Illinois attained statehood, Abraham 
Lincoln raised his voice to protect Pope’s contribution. 
While Lincoln was serving his fourth term as a state legis-
lator, he joined with the Whigs and Democrats and, by a vote 
of 70 to 11 in the Twelfth General Assembly, defeated a 
bill to return the 14 counties to the Territory of Wisconsin. 
Thus, Illinois kept in its borders the vital and growing Great 
Lakes port of Chicago.

Pope’s second contribution was equally unusual and 
provided a financial impetus to establish free public 
schools. Congress granted Indiana 5 percent of the proceeds 
from the sale of public lands for building roads. Pope ar-
gued that Illinois imperatively needed education and urged 
that 3 of the 5 percent should be given to Illinois for public 
schools. Congress made such a provision in the Enabling 
Act.

Edward Coles, who had come to Illinois from Vir-
ginia, was elected Governor in 1822. He contended that 
universal education was essential to perpetual freedom. 
Although his first educational message to the General 
Assembly caused little legislative response, in 1824 he had 
more success—Senator Joseph Duncan responded to his 
message and worked enthusiastically for passage of a free 
school bill. Largely through his efforts, the Legislature, in 
January 1825, enacted Illinois’ first Free School Law.

The General Assembly, 1854

The second Illinois constitution, in 1848, was remarkable 
because of the powers it entrusted to the people, both in 
the election of officers and in the decision making left to 
the localities. In 1854, the General Assembly created the 
Office of Superintendent of Public Instruction and pro-
vided that the superintendent be elected by the people in 
a general election.

The first superintendent, however, was not an elected 
oficial. Ninian W. Edwards, who was appointed by the 
Governor to serve in the interim until the election could be 
held, served longer than the assembly had anticipated. 
There was no general election in 1855, so Edwards had well 
over 2 years to work on the backlog of educational matters 
which had prompted the Legislature to provide for the posi-
tion.

William H. Powell, member of the newly organized 
Republican party, was the first elected superintendent. He 
won office in the general election of 1856 and assumed his 
duties in January 1857.

Since superintendents have always been elected on a 
partisan basis, they usually have held strategic positions 
of educational leadership and exerted much political influence 
on the course of education in Illinois.

During the 112-year period through 1968, 9 of the 14 
Illinois superintendents have been Republicans, serving a 
total of 83 years; 5 were Democrats, serving a total of 26 
years. The tenure of the Republican Superintendent Francis 
G. Blair exceeded the combined tenures of all the Demo-
crats.

Today, 22 states still elect their superintendent. But 
Illinois has never had a state board of education, although 
48 states do. It may be that the Illinois state education 
agency has more freedom and flexibility than the boards of 
education of other states to interact in the dynamic field of 
education with the various elements of its working environ-
ment. One measure of the effectiveness of any state educa-
tion agency is its ability to work effectively, not only with 
its own organization, but with local school authorities, the 
Governor, legislators, special advisory councils, universities, 
and professional and political organizations, including those 
at the federal level.

To understand the role and function of the Illinois 
state education agency, one must study the scope and 
depth of its relationships with other agencies, such as the 
School Problems Commission, which may have resulted 
from the absence of a state board.

The Constitution of 1870

Illinois’ present constitution, its third, has been in force 
since August 1870. Justifiable praise has been accorded this 
document, which encompasses the best features of the 
Constitution of 1818, the Constitution of 1848, and certain 
recommendations in the 1860’s of the third and fourth 
constitutional conventions. Despite rejection by the voters 
in 1862, the contributions of the third constitutional con-
vention should not be minimized; much serious considera-
tion was given to investigations of the branches of govern-
ment, and many of the proposals were incorporated into the 
document presented in May 1870 by the fourth constitu-
tional convention.

The present constitution further enhanced the 
stature and prestige of the superintendent of public instruc-
tion by elevating him to the position of a state official in 
the executive branch of government. The constitution 
maintained the provision that the superintendent be elected 
to a 4-year term in a general election. A precedent for the 
extended term was established earlier; Newton Bateman had 
served three 2-year terms and then was elected in 1866 to 
the first 4-year term.

The first seven articles in the constitution refer to 
boundaries, a bill of rights, distribution of powers, the 
legislative department, the executive department, the judi-
cial department, and suffrage. By devoting the eighth article 
to education, members of the constitutional conventions 
served notice that their enthusiasm for education was equal 
to that of the leaders who had preceded them. Section I of 
Article VIII, entitled “Free Schools,” contains a mandate
that the General Assembly shall provide an efficient system of free schools in which all children of this state may receive a good common school education.

**Structures for Interaction**

**The State Legislature.** The constitutional mandate concerning schools has been taken so seriously by the Legislature that, in one sense, the Legislature itself may be viewed as a very large state board of education elected by the people. A lively dialogue has endured between the Legislature and the superintendent since the early day of Superintendent Powell (4). In addition to the efforts of the individual legislators and the internal legislative committees to deal with educational matters, the General Assembly also has created numerous commissions to improve education in the state. The research staff of the School Finance and Tax Commission found that between 1907 and 1947 no less than 14 governmental commissions had dealt with this important subject.

The relationship between the special legislative commissions and the state education agency is best illustrated by the creation in 1907 of the Educational Commission, consisting of seven members: the state superintendent, as ex officio chairman, and six appointed by the Governor. Superintendent Bayliss had recommended establishing such a commission in his last biennial report. The Governor included this recommendation in his message of 1907, and it received the support of the State Teachers Association. Perhaps the commission made its most significant contribution in codifying the school laws, which were approved by the General Assembly in 1909.

From the time it created the office in 1854, the Legislature has dealt directly with the state superintendent by specifying his powers and duties. They have continued to expand. Thus, in 1901, Superintendent Bayliss was guided by 18 duties and 9 powers; by 1965 there were 34 (5).

Superintendent Blair, in 1907, had 19 duties. Where Bayliss had one duty, to address circular letters to the county superintendents advising them on school matters, Blair had two: to be the general adviser of the county superintendents and to address circulars to county superintendents, giving advice on matters including, among others, school construction. Perhaps it was this second duty which prompted Blair in 1908 to address the builders and janitors on the matter of safety with a scare approach. He referred to children struggling, fighting, gasping, dying on crowded, crumbling stairways and to writhing, strangling children piled high against the doors. As a result, an item was added to the school code making the superintendent responsible for preparing building specifications. Blair continued his efforts in the 1920's; however, this mandate was "regally ineffective until George Wilkins became superintendent in 1958. One of Wilkins' campaign pledges was to enforce the law, but even before he took office, a tragic fire swept through a parochial school in Chicago, killing 92 children and 3 nuns. Though the code did not apply to this school, no greater catalyst was needed to develop a sufficient safety code. After 6 years of intensive study and discussion, two documents were developed, one applying to existing schools and the other to new buildings to be constructed.

**The School Problems Commission.** The School Problems Commission, appointed by the General Assembly in 1949, included W. O. Edwards, as chairman, and 13 other members: the superintendent of public instruction, the director of finance, three senators appointed by the president pro tempore, three representatives appointed by the speaker, and five members appointed by the Governor. The law stipulated eight areas of study and, in addition, provided that the commission determine the improvements necessary to raise the level of public education.

To become better acquainted with school problems as experienced by the people of the state, the commission chose the "grass-roots" approach. Eight days of public hearings were held during January and February of 1950 in Chicago, Dekalb, Galesburg, Normal, Mattoon, Carbondale, and East St. Louis. The estimated attendance was 1,165, and 118 presentations were made by 172 participants. Seven more meetings were held, during which various groups presented problems for consideration. Over 200 formal proposals were presented. At the same time, a research staff, assisted by Superintendent Vernon L. Nickell and his staff, analyzed these proposals and attempted to present a clearer picture of Illinois education.

In its final report, the School Problems Commission stated:

The suggestions received were so numerous and were presented in such a haphazard and disorganized fashion as to be somewhat bewildering—problems were unearthed that most members of the Commission had not known to exist. Much light was thrown on the solution to some of these (6).

The comprehensive nature of its first report alone indicates that the School Problems Commission has been of inestimable value to the cause of public education in Illinois. With modifications, the commission continues to exist and has earned the respect of schoolmen. Members of the commission, such as Representative Charles Clabaugh, have become more knowledgeable about school problems than most professional educators.

**The Task Force on Education.** The state's concern for education nurtures developments such as the Illinois Task Force on Education with its three sponsors: the Democratic Governor, the Republican superintendent of public instruction, and the School Problems Commission. In 1965, the General Assembly appropriated $105,250 to pay for 13 staff research assistants, materials, and travel expenses of...
members of the task force, who served without pay. In general, the task force had two purposes: to consider long-range goals for elementary and secondary education in Illinois and to recommend plans to attain these goals.

Professor William P. McLure, University of Illinois, served as chairman; Paul J. Misner, Western Michigan University, as vice-chairman; and State Superintendent Ray Page as honorary chairman. Among the 54 distinguished members, 13 were identified with universities of the state, 12 were state legislators, and 8 were superintendents or assistant superintendents of local school districts. Also included were five school board members, five representatives of industry or commerce, two classroom teachers, two union representatives, one attorney, and three representatives of the Office of the Superintendent of Public Instruction. The Governor's Office, the Illinois Education Association, and the Congress of Parents and Teachers each had one representative.

The group assembled in Chicago on May 1, 1965, for a 2-day session to begin the 18-month study. There were subsequent meetings of the entire membership, but most of the work was done in meetings of the subcommittees on elementary schools, junior and senior high schools, vocational and adult continuing education, nonpublic educational agencies, innovations, administrative structure, and finance. In addition to the members, 56 individuals and 32 groups assisted in the preparation of position papers and other written materials.

After the tentative findings and recommendations were established, public hearings were scheduled throughout the state. In December 1966, the study report with its 60 recommendations was published.

Summary

So far, the focus of this brief history has been on the people, organizations, and circumstances that have contributed monumentally to education in Illinois. The Free School Law of 1825, which "was from 25 to 50 years in advance of a school enactment in any of the commonwealths of the Union" (7), was passed at a time when education was considered an enemy of slavery and the pro-slavery element was strong. Pope's victory 6 years earlier in obtaining money for schools from the sale of public lands was won against similar odds. Even before statehood, Illinoisans had placed a priority on education. They reaffirmed this position in 1870 by placing the superintendent of public instruction, as a constitutional state official, in the executive branch of government and indicating that, after suffrage, education was the first work of their time.

SPECIAL PROGRAMS

Throughout its history, the Office of the Superintendent of Public Instruction has exercised positive leadership and counsel through special programs. In one sense, these programs, such as those in conservation, adult education, and educational television, tend to expand the powers and duties beyond those just outlined. These programs also are characterized by widespread public involvement.

School Lunch

By 1900, school lunch programs had been established in large cities to ensure that children from poor families were provided with needed food. It is interesting to note that, like our program today, these earlier programs were designed to provide one-third of the child's daily food requirements. Rapid growth in the program did not occur until after 1909.

The National School Lunch Program was established in 1946 when Congress enacted Public Law 396. Although Illinois had had school lunch programs since 1900, the national program gave impetus to the overall program and to better record keeping. It is reasonable to assume that the 1946 program was developed through experiences in the Depression under the auspices of the Works Progress Administration.

In Illinois, the number of school lunch programs has steadily increased, and the state now ranks among the leaders in number and volume of school lunch activities.

Education of Handicapped Children

A more complete response to the constitutional mandate for a good education for all children dictated that certain children be provided with more specialized services. In 1942, Superintendent John A. Wieland named J. Roy Byerly as director of the education of handicapped children. In 1945, the departmental designation referred to exceptional children rather than handicapped children. Ray Graham, during the Nickell administration, earned the title of "Mr. Special Education" in Illinois. Vernon Frazee, no less dedicated to the field than Graham, carried on the work, and in the third year of the Page administration, the 1965 General Assembly responded by passing one of the most important laws in educational history, ensuring handicapped children an opportunity for a good education.

The law, Article 14 of the school code, makes special education services to handicapped children in the public schools mandatory after July 1, 1969. This means that the mentally handicapped will be educated to the limits of their potential through academic and vocational training; the physically handicapped, including the blind and partially seeing, the deaf and hard of hearing, will receive added help which has been so desperately needed in the past; and the socially and emotionally maladjusted will have access to services that should enable them to reach the peak of their academic potential.
One important provision of Article 14 establishes a special education advisory committee in each of Illinois' 102 counties. In 1967, in accordance with the law, the county committees determined the needs of handicapped children in each county, wrote academically and financially sound plans for special education, and presented the plans to local school districts and to the state advisory council for approval.

Prior to 1943, some 3,000 children were receiving special education services; by 1945, almost 40,000; and by 1961, 118,646. At the end of the 1964-65 school year, special education services had reached 171,236 pupils. With services provided to only one-third of those children who need them, Illinois still has a big job to do. Article 14 is evidence that Illinois intends to meet the challenge.

**Program for Gifted Children**

Use of the term *exceptional children* in lieu of *handicapped children* focused attention on the exceptionally able child. Educators had long felt concern for improved programs for the more able children, but Sputnik I increased the acceptance of schools as instruments of national defense and led to emphasis on programs for gifted children. Public officials became more sensitive to the idea of a statewide program. The School Problems Commission recommended a special study, and the 1959 General Assembly appropriated $150,000 for this purpose. The Seventy-Second General Assembly extended the study with an additional appropriation of $150,000. In 1962, the School Problems Commission voted to approve the recommendations of the study group, and in 1963, Superintendent Page made the proposed plan a part of his legislative recommendation. The Seventy-Third General Assembly passed the bill to establish the program by unanimous vote.

Section 14A of the school code calls for a program to assist and encourage local school districts in increasing educational services for gifted children. An appropriation of $7,750,000 was approved by the Seventy-Fourth General Assembly for the 1965-67 biennium.

The Illinois plan, a comprehensive effort to improve educational services for gifted children, consists of five parts. The first part provides for reimbursement for the districts of the cost of services and materials to improve their services to gifted children up to a maximum amount determined by a formula based on the number of students enrolled in the program and the assessed valuation of the district. The second part provides for demonstration centers to enable educators to see approaches to the education of gifted children. In its third part, the plan makes funds available to conduct significant experimentation in practical programs for the gifted. The fourth part enables field consultants at the state level to develop programs in the schools. The plan's fifth part offers state support for programs to increase the number of specially trained personnel. The training program includes summer and in-service institutes and a fellowship program to help meet the great need for specially trained consultants, directors, and teachers.

The effect of the program during its relatively brief existence is most encouraging. The attention paid to teachers is producing more results than any other effort. In the 1965-66 school year, approximately 3,000 teachers participated in teacher-training programs. The following summer, 476 teachers were enrolled in eight institutes conducted by people trained in the 1964 program.

**The Illinois Curriculum Program**

The largest of the 50 advisory councils which serve the Office of the Superintendent is the Illinois Curriculum Council, made up of representatives of more than 50 statewide professional and civic organizations having special interest in educational programming. The council meets twice a year to formulate suggestions and recommendations to the superintendent regarding curriculum. One of its central responsibilities is to advise the Illinois Curriculum Program, launched in 1947.

The Secondary School Principals Association of Illinois appointed a committee to study high school curricular problems. When the 1956 General Assembly responded to a request from Superintendent Nickell with an appropriation of $35,000 to advance the study, the Illinois Secondary School Curriculum Program was set up under the sponsorship of the superintendent. Thirty-two organizations cooperated in this program. In addition to Nickell, James Blue, past president of the principals' group, and C. W. Sanford, University of Illinois, who served as the director, rendered valuable services to the program.

When the curriculum study expanded to include elementary education, it became the Illinois Curriculum Program. It is central to the Department of Curriculum Development, and, essentially, the department's responsibilities are consistent with the objectives of the Illinois Curriculum Program. These responsibilities include providing consultative services to local and state districts interested in curriculum revision, developing in-service programs, and upgrading teaching practices. The department offers leadership in the development of statewide curriculum publications to assist teachers, curriculum coordinators, and administrators. It assists school staffs in research studies, with particular emphasis on the teaching-learning process. The department uses both state and federal funds to organize and direct educational conferences and curriculum workshops for professional staff members of elementary schools, secondary schools, and institutions of higher learning. And it cooperates in developing and interpreting curriculum policies formulated in the Office of the Superintendent of Public Instruction.
Under the direction of the Illinois Curriculum Council, made up of representatives of statewide professional, civic, and educational organizations, the program operates with a director and six regional curriculum consultants. With the implementation of the Elementary and Secondary Education Act (ESEA) of 1965, the curriculum development department greatly expanded in personnel, publications, and in-service projects.

Despite 100 publications and numerous workshops, much remains to be done in the Illinois Curriculum Program. The challenge is best revealed in the findings of an evaluation of the Illinois Curriculum Council and the Illinois Curriculum Program by Thomas Barrett Goodkind. Among his observations and conclusions are these: The publications were regarded to be of high quality by those who used them; elementary school publications were used more often than secondary school publications; teachers did not use the publications as much as supervisory and administrative personnel believed; less than one-half of the districts included in the survey had their own curriculum guides; and the impact of the program on the local school district curriculum had been limited.

Goodkind recommended that the council reconsider its functions with a view toward assisting and directing the superintendent to introduce and implement state programs at the local level.

Conservation Education

In 1957, the General Assembly established the Department of Conservation Education in the Office of the Superintendent. This act served as a prime example of interagency cooperation at the state level. From 1943, when Superintendent Nickell had appointed a committee on teaching conservation, the conservation and agriculture departments had worked with the superintendent to promote the teaching of conservation. Universities and colleges had joined the endeavor as the early efforts were directed toward teacher education. Nickell had assigned Robert King to direct the first committee, and by 1955, the movement had gained sufficient momentum to justify the employment of a full-time staff member. B. K. Burton, Eastern Illinois University, had accepted the appointment as an employee of the three state agencies.

Continued cooperation among the agencies was ensured in 1957 by the provision for an advisory council to consist of the superintendent, the directors of the conservation and agriculture departments, and two members to be appointed by the Governor. One of the appointive members must represent institutions of higher education, and one must be a member of a soil conservation district.

The conservation education department cooperates with the federal government and state agencies engaged in adult education, and it promotes and aids schools and classes within the state to teach how to conserve wildlife, forests, timberlands, minerals, and scenic and recreational areas. It also is responsible for establishing courses in conservation education programs, with the advice of the advisory board.

In 1964, the staff, while continuing the programs previously initiated, assumed another responsibility—that of cooperating with the supervisory teams in the school visitation program, which includes classroom visits, conferences with administrators and teachers, and suggestion of materials and methods for informing students about the importance of natural resources to the individual and to society.

Adult Basic Education

The present adult basic education program in Illinois, perhaps the most extensive in the United States today, originated from a series of studies by Denton Brooks of the Cook County Department of Public Aid. In March 1962, Benjamin Willis, superintendent of Chicago city schools, announced jointly with Raymond Hilliard, director of the Cook County Department of Public Aid, the beginning of basic adult education classes for able-bodied adults receiving public assistance. Early evaluation of the program in Chicago indicated the program to be a sound educational approach to combating illiteracy.

At about the same time, Congress passed Public Law 87-543 making federal funds available under “The Community Work Aid Training Program.” Two state agencies worked together to formulate the plan. Superintendent Ray Page and Harold O. Swank, director of the Illinois Department of Public Aid, asked the Seventy-Third General Assembly for legislation to make it possible for Illinois to take full advantage of this law. The bill passed in both Houses and was signed by the Governor in July 1963. Thus, Illinois became the first state to require adult basic education and vocational training for those least able and in greatest need—public aid recipients.

The Illinois law provides for a dual responsibility: The public aid department selects and assigns students to classes, checks attendance, and does follow-up after the students have completed their classwork; and the Office of the Superintendent establishes standards for courses and supervises administration of the program. Local districts are reimbursed for the total costs of providing this program from funds allocated to the Office of the Superintendent from the Department of Public Aid. Of the $4 million appropriated for the 1963-64 biennium, 75 percent came from federal funds and 25 percent came from state funds. The Seventy-Fourth General Assembly in 1965 appropriated $6 million for the program and amended the school code to allow for the costs of transporting the students to and from classes. Further provision was made to allow for child care for enrolled mothers.

Because of this successful pioneering effort, the Illinois state education agency was in a position to continue...
Educational/Instructional Television

The development of educational television (ETV) in Illinois is marked by the growth of station and closed-circuit (cable) television for this purpose alone. But the state's commercial stations have donated many hours of air time to ETV. Instructional television (ITV) is also offered at commercial stations now anxious to attract students to their programs. The growth of these endeavors is shown by the development of area ETV/ITV associations made up of school representatives. The oldest and most extensive organization of this type in Illinois is Chicago Area School Television, Inc. (CAST), now in its eighth year. This group, like the others in the state, supports efforts to obtain program production or rental and the use of station time for school purposes.

The Office likely will carry its share of responsibility in preparing and recommending legislation centered around the theme of network development for statewide distribution and signal coverage for ETV.

ORGANIZATION AND PERSONNEL

This section focuses on the state education agency without direct reference to the larger environment, tracing developments chronologically from 1907 through 1965. Recognition is given to the superintendents and their appointees who have stimulated the development of a dynamic and effective state agency.

Superintendents Blair, Wieland, Nickell, Wilkins, and Page had much in common. Each had administrative training and had served in administrative and leadership positions before election to the state post. Through example and appointments, each tried to inculcate a higher level of professional administration in the Office. Blair's unbounded energy was matched by that of Page, although a description of the sincerity and intense dedication of these two men would apply equally to Wieland, Nickell, and Wilkins.

Blair issued the earliest annual school directory for the 1907-1908 school year. Since 1909, all of the directories issued by Blair have included an opening statement alluding to the difficulty of publishing such a document. Blair's final directory in 1934 appealed to schoolmen to notify the Office if the data were not correct. He also gave credit to W. A. Spence for "whatever excellence in matter and form this directory may have" (9). Despite inaccuracies in other portions of the directories, the lists of state agency personnel served as the basis for this part of the overview.

Organizational charts did not appear in the directory until 1959; apparently, none was needed during Blair's tenure. In 1907, the total office force included the superintendent, three assistants, one stenographer, and one messenger-clerk. In 1908, the departments of country schools, law, and publicity were staffed by U. J. Hoffman, J. C. Thompson, and H. T. Swift, respectively. The team of Blair, Hoffman, Thompson, and Swift remained intact until 1931; only Swift, then chief clerk, was with the superintendent when he completed his final year in office.

The professional positions remained constant from 1907 through 1911. In 1912, two new departments were added: W. S. Booth led the new country and village schools department, and A. L. Whittenburg, the statistics department. The new high schools department was created under John Calvin Hanna in 1913. The superintendent's staff of 1916 included D. F. Nichols, secretary of the Teachers Pension Board, and A. L. Whittenburg, secretary of the State Examining Board. The 1916 directory listed nine advisers: one for schools of art and drawing, three examiners for entrance into dental and medical colleges, three advisers on recognition of colleges and universities, an adviser on recognition of kindergartens, and an adviser on recognition of schools of music.

In 1919, the Office added its second supervisor of high schools and employed F. J. Muhlig to establish and maintain a section on textbooks. Vocational education appeared in the 1921 directory. The eight professional and five nonprofessional employees were listed under four educational units: home economics, agriculture, industrial education, and industrial rehabilitation.

In the same directory, Blair referred more accurately to his office as the Office of the Superintendent of Public Instruction rather than the Department of Public Instruction, as in previous directories. The 1921 directory listed Gladys Walsh, state examining board stenographer, and J.
E. Hill, assistant supervisor, agricultural education. With the exception of Hill's absence in 1922 and 1923, these two served with distinction throughout the remaining portion of the period covered in this study.

In 1923, supervision of high schools was increased with the addition of Ray L. Moore as supervisor of 2- and 3-year high schools. Hanna and H. M. Thrasher continued as supervisors of 4-year high schools, W. S. Booth was designated supervisor of city elementary schools, and U. J. Hoffman devoted his time to the country and village elementary schools.

The industrial rehabilitation staff was sharply increased with the introduction of field agents: five in 1923 and three more in 1924. In 1925, industrial rehabilitation with a supervisor, an assistant supervisor, and nine field agents equaled in number the total professional staff in the Office of the Superintendent. Throughout the remainder of the Blair administration, the number of professionals in vocational education, including industrial rehabilitation, exceeded the number of other Office staff members.

The addition of L. L. Blair in 1927 increased to four the number of supervisors serving high schools; however, the distinction between supervisors of 4-year high schools and supervisors of 2- and 3-year high schools continued until 1929.

Louis Kulinski, the first supervisor of a special subject, was named supervisor of physical education in 1929. Roselila Lancaster, hired in 1930 as stenographer, served throughout all the subsequent administrations included in this report and serves at present as a highly valued administrative secretary in the legal department.

When U. J. Hoffman was replaced by three supervisors in 1931, the title of supervisor of country and village elementary schools was changed to supervisor of rural and village elementary schools. The new supervisors were T. A. Simpson, J. E. W. Miller, and Charles H. Watts.

With two exceptions (Floyd T. Goodier replaced Booth in 1933 and S. S. DuHammel became the law assistant in 1934), the organization and professional personnel remained constant for the final 3 years of the Blair administration. At the close of Blair's tenure, the 1934-35 school directory refers to these five components of the Illinois education agency: Office of the Superintendent of Public Instruction; State Examining Board; State Teachers Pension Board; Board for Vocational Education, including industrial, agriculture, and home economics education; and Division of Rehabilitation. The relationship among these various groups is revealed in the titles bestowed upon Francis G. Blair: superintendent, Office of the Superintendent of Public Instruction; executive officer, Vocational Education; executive officer, Division of Rehabilitation; member, Board of Trustees of the Teachers Pension and Retirement Fund; and chairman, Illinois State Examining Board.

Figure 1 indicates the number of professional and nonprofessional employees of the Office of the State Superintendent of Public Instruction during the Blair administration as revealed in the school directories. It does not include the personnel, activities, or expenditures of the Board for Vocational Education. It also does not include advisers. For example, Margaret E. Lee, who served as the official adviser on the recognition of kindergartens from 1916 to 1932, was not listed. One limitation placed on a graph of
personnel employed by the Office results from the inherent difficulty of classifying people into professional and nonprofessional categories. For example, H. T. Swift was employed in 1908 as assistant superintendent in charge of publicity and was named chief clerk in 1929. Objection could be raised to the classification of Swift as one of the four professionals in 1908, or as one of the 20 nonprofessionals in 1934.

For comparison with other states, Figure 2 indicates the total personnel employed by the Office of the Superintendent of Public Instruction, Teachers Pension Board, State Examination Board, and Board for Vocational Education, including the rehabilitation division.

Wieland designated Charles C. Stadtman as first assistant superintendent in 1935 and T. A. Reynold, legal adviser, as a second assistant superintendent in 1937. The following year, Stadtman became coordinator of the supervision department, a title which he held until he was named assistant superintendent for the final year of the Wieland administration. Apparently, there was no loss of prestige in the changing titles for Stadtman; his name was listed immediately below Wieland's name throughout their 8-year association.

As coordinator, Stadtman brought about an important organizational change in the Office. The positions of high school supervisor and elementary school supervisor disappeared as a three-regional pattern emerged. The northern district, the southeastern district, and the southwestern district were staffed by a total of seven general supervisors. Of these seven, Claude Vick, Otis Keeler, Paul Belting, E. S. Simmonds, and J. Roy Byerly served with Wieland during his 8 years in office.

Wieland's second directory, in 1936, listed a new unit: the Board of Education for Blind, Deaf, and Dumb. The 1938 directory included only the employees of the Office of the Superintendent of Public Instruction.

The omission of the Board for Vocational Education and other boards in the 1938 directory breaks the continuity in the graph showing the number of professional and nonprofessional employees in the state education agency as revealed in the state school directories. The 1939 directory returned to the more established format with a noteworthy exception; the rehabilitation division was not reinstated. The same year, distributive education made its appearance under the Board for Vocational Education.

In 1941, occupational information and guidance became a unit under vocational education, and a supervisor of handicapped children was appointed on the Office staff. The following year, J. Roy Byerly was named the first director of education of handicapped children.

Vernon Nickell began his 16-year administration during World War II with a more definitive departmental structure. In 1944, a directory reference to the school lunch program appeared for the first time. The following year, the concept of education of handicapped children yielded to the more encompassing program—the education of exceptional children. In 1946, a director of audiovisual education was appointed. The director of school libraries appeared in 1950, and music education and teacher recruitment made their appearances the following year. The coordinator for Civil Defense was appointed in 1952. William Bealmer, in 1954, was the first art education coordinator. The same year, the State Agency on Surplus Property was established in the Office. Conservation education appeared in 1955.

Figure 2. — TOTAL PERSONNEL EMPLOYED IN OFFICE OF THE SUPERINTENDENT OF PUBLIC INSTRUCTION 1907-19; TOTAL PERSONNEL EMPLOYED BY OFFICE OF THE SUPERINTENDENT OF PUBLIC INSTRUCTION, TEACHERS PENSION BOARD, STATE EXAMINATION BOARD, BOARD FOR VOCATIONAL EDUCATION, AND DIVISION OF REHABILITATION, 1920-34
Two years later, nine field offices for exceptional children were listed. Field supervisors of safety and driver education appeared in 1958.

The first organization chart appeared in the 1959 directory as George Wilkins introduced the divisional approach to the organization of the Office and the allied boards.

In 1960, vocational education was listed in the instructional services division; 2 years later, vocational education regained its separate identity. About this time, a department of guidance, testing, and counseling began to take shape. Educational research appeared the following year with Ralph Marty as coordinator. The 1962 directory included two commissions: the State Scholarship Commission and the State School Building Commission.

The first directory prepared by Superintendent Page in 1963 was noteworthy in three ways: It showed six regional supervisory districts that coincided with the regional organization of the county superintendents of schools; relationships of the Office of the Superintendent, the Board of Vocational Education and Rehabilitation, the State Teachers Retirement System, and Teacher Certification were made clear; and an administrative line and staff organization was established. Page designated two administrative assistants. Roy Clark was appointed first assistant superintendent; the five assistant superintendents were Sherwood Dees, John H. O'Neill, John L. Kirby, Carl H. Wilson, and N. R. Hutson. In this same directory, the Department of Program Development for Gifted Children made its first appearance.

In 1964, Roy Clark was the first person to be named deputy superintendent, and two special assistant superintendents were named. The following year, Verne E. Crackel was appointed deputy superintendent to fill a vacancy created by Clark's death.

The uniqueness of the 1965 directory is its early and detailed presentation of Superintendent Page's response to the educational acts of the Eighty-Ninth Congress. Effective on October 1, 1965, the organization chart and personnel lists reveal the Office structure and personnel assignments for implementing the new federal programs at the local level and also plans for the use of federal funds in strengthening the state educational agency. Noah Neace was named director of Title I, ESEA, programs; his unit, with special education, was placed in the pupil personnel services division. James Boula was named supervisor of Title II, ESEA, activities as his unit was placed in the instructional materials department in the instruction division. Robert Shultz, Dale Kaiser, and Frank Santarelli were designated directors, respectively, of activities relating to Title III, Title IV, and Title V, ESEA. These three directors were placed in a newly created planning and development division established under the provisions of ESEA, Title V. Thomas W. Mann, director of adult education, assumed the responsibility for implementing the Economic Opportunity Act. William Elam was assigned to develop the new instructional areas of history, geography, and civics included under the National Defense Education Act. Gloria Calovini and Lenore Powell were named to supervise, respectively, the educational materials coordinating unit for the visually handicapped and the educational materials center for handicapped children. Sherwood Dees and John H. O'Neill occupied the newly created posts of associate superintendents; vacancies were created for the appointment of six curriculum consultants, one for each of the six supervisory regions; a data information center was established in the finance and statistics division; and a materials center was established for the use of the office personnel.

Figure 3 indicates the number of professional employees in the Office for the second half of the period covered by the overview. This graph differs from the preceding graph in three ways: (1) It does not show the number of employees under the Board for Vocational Education and other boards; (2) the 1959 directory and subsequent directories did not list personnel previously included in the nonprofessional category, thereby providing an added restriction; and (3) the scale was changed to accommodate the increase in number of professional personnel. The professional staff was increased by 10 during the 1907-33 period and by 172 from 1934 through 1965.

ISSUES

Four central questions emerged by 1900, continued throughout the period of this overview, and apparently are more challenging today than ever before: What quality programs would ensure a good education for all children? What is the best way to organize and administer these programs? How shall these programs be financed? Shall Illinois have a state board of education? Continuous responses to these naggingly persistent questions have served to shape the Office of the Superintendent of Public Instruction.

Curriculum and Supervision

At the turn of the century, Superintendent Bayliss expressed great concern about the disparities between urban and rural education. He emphasized the deplorable conditions which existed in many rural schools and pledged a crusade until every school in the state had a library. He placed emphasis also on the need for high schools, primarily to develop the well-educated citizenry necessary to deal with the social problems of the day.

Superintendent Blair equaled Bayliss in his enthusiasm for rural schools; his top assistant dealt with country schools. Blair did not support the Bayliss position that consolidation was the solution to the problem. Instead, he stated that conditions had much improved in the rural schools and inferred that the quality of education was
better when the schools remained close to the people. Interestingly, none of the nine bulletins issued in 1910 by the Illinois Educational Commission, chaired and greatly influenced by Blair, dealt directly with curriculum. Although Blair reminded the public in his 1912 report that his duties included the improvement of instruction, his criteria were sufficiently relaxed to allow one-room schools to qualify for “superior” ratings. The criteria for a “standard school” were divided into five categories: yard and outbuildings, schoolhouse, furnishings and supplies, organization, and the teacher.

Blair was fully aware in 1912 that during the preceding 25-year period the number of Illinois high schools had increased from 179 to 531, but he wondered if some high schools were being built unnecessarily and to the detriment of the elementary schools. His request for a high school supervisor had been denied twice by the General Assembly. He continued to criticize high schools for paying too much attention to college accreditation. The situation provided the impetus for a direct confrontation, the outcome of which was to affect extensively the role of the Office and its development. Prompted by a jealous normal school, the Illinois State Teachers Association passed a resolution at its 1911 convention calling for the Legislature to provide that the superintendent appoint one or more inspectors of high schools to inspect, classify, and standardize high schools under rules drawn by the superintendent.

This resolution brought about a discussion between Blair and H. A. Hollister, the University of Illinois high school visitor. Hollister proposed a dual system to allow continuation of university inspection and university standards for accrediting. Blair replied that the resolution did not
deny the right or power of the university to establish standards and inspect schools for accreditation, but that the university had no legal right to be in the schools for any other purpose except by invitation of the local authorities. Furthermore, it had no legal power to enforce the findings. Blair ruled out the double system of inspection by stating that there are as many systems of inspection as there are universities and colleges desiring and able to make such inspections.

Hollister, emphasizing his 9 years of experience as a visitor, pointed out that the university had already established a system of standardization. He made comparisons with other states and praised the university-controlled systems. In contrast, he stated that “the situation in Wisconsin is too notoriously bad to need further mention” (11). Blair, citing major contributions made by state departments, replied that the question related to “supervision” and not to “inspection.” In this respect, the school law made it the duty of the superintendent to supervise all the common and public schools, and he maintained that the high school was the last four grades of the common school. In answer to the visitor’s contention that the teachers’ proposal would lead toward political control of education, he stated: “If the political character of the Department of Public Instruction renders it unfit to supervise the high schools of this State, it is for the same reason unfit to supervise any of the schools” (12). The superintendent further pointed out that the university was controlled by a board of trustees, nominated in political conventions, who ran as candidates of a political party and had as much inclination and opportunity to administer along political lines as did the superintendent of public instruction. Even the visitor would have had to agree that the high school was the last four grades of the common school, and its supervision and direction should be the responsibilities of the same office which supervised and directed the first eight grades. Blair contended that the weakest feature of the township high school was that, as a “floating kidney,” it had very loose connections with the elementary schools and no local supervision other than its own faculty.

At this time, the Illinois Educational Commission specifically mentioned curriculum in a report to the Forty-Seventh General Assembly:

An ideal school with a fair faculty should provide a curriculum broader and more extensive than necessary for the needs of any single individual and until it does this, it has not gone far in meeting the varied needs of the many individuals that make up its constituency (13).

The report contained an example of how the school adjusts its program, following a section devoted to a general course in domestic science. To offer vocational courses for some people in cooking, sewing, dressmaking, and millinery, it suggested the school allow a doubling up so that courses such as sewing and cooking could be taken together. The school would arrange extra work specially designed for the purpose, or, better yet, put students on a part-time plan by which they should spend perhaps half their time with families, in stores, or in shops, actually practicing these arts. The report strongly advocated a plan allowing students who felt a need to earn money to do so and receive credit and thus, before leaving the school, acquire some actual business experience without severing connections with the school.

This plan was deemed better than preparing separate definitive courses which would divide pupils into two classes, one labeled in advance as the serving class. Blair stated: “Let mistress and maid be educated side by side, for both should be wives of American men and mothers of American citizens” (14).

In 1913, the Legislature authorized the appointment of a high school supervisor who immediately tackled the problem of preparing curriculums for the various high schools. By 1923, there were three high school supervisors and an abundance of ideas as to how schools could reorganize their instructional programs. The University of Illinois and the Office of the Superintendent of Public Instruction established a spirit of cooperation. They divided the state into an eastern and a western division, and in the first year of the cooperative endeavor, all western division schools requesting inspections addressed the superintendent; eastern schools, the university. The assignments were alternated annually.

During the later twenties, progress in the state’s education was marked by an expansion of vocational education and instructional pattern variations due to the John Dewey influence. The first years of the Depression were devoted to the search for money to keep the instructional programs in operation; school terms were shortened, student-teacher ratios increased, and courses discontinued. Deterioration of the schools became so critical that the superintendent requested the Governor to call a special session of the Legislature, which responded by making one-third of the fuel tax revenues available to the Common School Fund.

Charles C. Stadtman is credited with a major contribution toward curriculum improvement, but because of their close personal relationship and similar attitudes toward education, equal credit should go to Stadtman’s superior, Superintendent Wieland. Though Wieland and Stadtman opposed each other for the Democratic nomination in 1934, after the general election they joined forces in the state office. Stadtman emphasized the need for involving all units of the public school system in curriculum development. In 1936, a committee of educators met for a curriculum conference. Teacher colleges and other institutions of higher education followed the lead and included the subject of curriculum in their summer conferences. In 1938, Stadtman stated with pride that a rural curriculum guide was ready for the printer.

Apparently, Wieland believed in 1940 that radio should be used far more effectively as a teaching tool. He
established the State Radio Committee, which advocated the use of radio programs carefully planned in advance and articulated with units of class work. It encouraged individual listening to enhance pupils' appreciation and understanding of drama, music, and art. By the following year, the major stations, such as WENR, WMAQ, WLS, WCIL, WIND, WJJD, and WAIT, were transmitting educational programs. Wieland pledged his continued support of radio education.

When Vernon L. Nickell took office in 1943, he emphasized cognitive objectives of the curriculum: “Actual education is the attainment of the ability to think and act for one's self. What the student should consider and how he may best be equipped to increase his knowledge is the immediate concern of modern-day leaders of education” (15).

In the midst of the many activities related to the war effort, curriculum efforts steadily continued: Ray Graham announced the Illinois plan for speech correction; a revision of the state course of study was being considered; the importance of visual aids in education was noted; and the Office conducted demonstration clinics. When the atomic bomb ended the war, Nickell believed that education faced its greatest challenge as all people had to be rehabilitated to the postwar reconversion.

The General Assembly in 1943 placed the entire responsibility for special education on the Office instead of on the several state agencies. The Illinois Curriculum and Course of Study came off the press in 1946.

The Illinois Curriculum Program, established in 1947, and its evaluation in 1965 were treated in the Special Programs section, but the excellent leadership and extensive activities deserve elaboration. The Illinois Curriculum Council had three chairmen: Mathew Gaffney, later a senior associate of James B. Conant in the study of the American high schools, served from 1947 to 1955; Gerald W. Smith, past president of the Illinois Association of Secondary School Principals, served from 1955 to 1962; and Darrell Blodgett, superintendent of schools in Wheaton, Illinois, served through the remainder of the period covered in this report.

The superintendent of public instruction appoints the director of the Illinois Curriculum Program. Four men have served with distinction: C. W. Sanford, recently retired as dean at the University of Illinois; Eric Johnson, now vice-president of Illinois State University, Normal; Fred P. Barnes, professor at the University of Illinois; and Woodson Fishback, the present director. Activities of the program include over 100 publications, special projects in schools, and a continuing series of workshops.

In 1963, Superintendent Page gave the Division of Instruction additional responsibilities. He divided the state into six regions to carry out the work of the Division of Recognition and Supervision. Teamwork developed between the instructional and recognition personnel to improve local educational programs. Local, county, regional, and state personnel assisted local schools to assess the extent to which the program met the needs of all pupils.

School District Reorganization

At the close of World War II, professors of educational administration were pointing a disapproving finger at Illinois for having approximately 12,000 school districts. Although it required legislative action to change dramatically this condition, efforts to decrease the number of districts had been initiated much earlier.

As early as 1909, the Legislature passed an act requiring districts that did not maintain a high school to pay tuition for their eighth-grade graduates in some 4-year high school. This law provided that the district must pay the tuition only if the parent or guardian were unable to pay. The principle of compulsory public education was tested in the Illinois Supreme Court, which ruled that the board was not competent to decide who was able and who was not able to pay tuition. The Forty-Seventh General Assembly then made the necessary statutory provisions effective July 1, 1913. The effect was most noticeable during the 1915-16 school year, as the high school enrollment increased by 15 percent, while the elementary school enrollment increased by only 1 percent.

The extension of a “good, common school education” to include a high school education for all children was becoming generally accepted. However, the rapid increase in the number of high school pupils brought rapid increases in the total cost of education. Concern for economic efficiency gave impetus to the movement to reorganize schools.

A matter of greater concern to a lesser number of people was the problem of providing a high school curriculum suited to all children. In 1911, the Educational Commission appointed a special committee to study industrial education and preparation of teachers who were to teach the subjects. Concern for curriculum improvement was not limited to the high schools. As may have been expected, the grade schools were chastised for not preparing pupils for high school.

Early in the 1920's, the phenomenal growth of the American high school had its admirers and its critics. The movement for district reorganization had gained momentum with a twofold purpose: to provide more efficient schools and to provide a broader, better, and more equitable program for boys and girls.

The law providing for consolidation had been passed in 1919; however, the immediate response was limited. The purposes of consolidation remained constant, and the efforts to obtain reorganization were persistent. The General Assembly, in 1939, for the first time provided state aid for transporting pupils. Although this act did not greatly hasten
consolidation, it did help. Perhaps Illinoisans were too enamored with their one-room schools.

The Sixty-Fourth General Assembly enacted a new school survey law providing for the creation of a state advisory commission of nine members to be appointed by the superintendent. Only two of the nine members were to be professional educators. The commission was required to report to the Legislature no later than January 1950.

County survey committees of nine members each were set up to study and plan school reorganization and to make final reports by January 1948. County committees were particularly effective for several reasons: The county superintendent was named the executive secretary of each county committee (most of the superintendents favored reorganization); school boards were advocating reorganization; taxpayers federations had considered the advisability of reorganization; and a minimum salary law for teachers caused a new concern for schools with small enrollments. The Illinois Agriculture Association School Committee reported the need for equalized educational opportunities, equitable distribution of costs, and maintenance of freedom.

The success of the reorganization effort is shown by statistics. In 1945, Illinois supported 11,955 school districts; at the close of the 1964-65 school year, Illinois had 1,363 school districts—a decrease of 10,592. The dramatic change in the number of school districts is best revealed by Figure 4.

Figure 4. – ELIMINATION OF 10,592 SCHOOL DISTRICTS IN ILLINOIS, 1945-65
Financing Illinois Education

Article VIII of the Illinois Constitution states: "The General Assembly shall provide a thorough and efficient system of free schools, whereby all children of this State may receive a good, common school education" (16). In the main, the Legislature reflected the extent to which the state aided in financing education by a biennial appropriation to the Common School Fund.

The Illinois Free School Law of 1825 appropriated 2 percent of state treasury receipts to encourage free schools. In 1827, this act was amended to read "by consent of taxpayers" and in 1829 repealed entirely. The Free School Law of 1855 provided a levy of 2 mills per dollar of assessed valuation for support of common schools. This produced approximately $607,000 in 1856 and only $600,000 in 1862. The amount had risen to $900,000 per year just before the change in law in 1873, when a flat appropriation was substituted for the 2-mill tax. The taxes brought in about $1,067,000 for each year from 1873 to 1911. Such an appropriation resulted in a decline in the percent of education costs borne by the state: In 1874, state funds provided 13 percent of the total cost of the common schools; in 1911, the state's share was only 2.6 percent.

Effective July 1913, local school districts which did not maintain a high school were required to pay tuition for their eighth-grade graduates in some 4-year high school. High schools were conducted without benefit of general state aid until the 1930's.

In the 1920's, the "smart" schoolman, in order to provide the varied programs needed for an increasing number of children in the high schools, turned to funds provided for vocational courses. In the elementary school, the "smart" schoolman took advantage of the state formula which included the number of teachers employed; by having a larger number of teachers, he obtained ample money for supplies.

The forerunner to the modern plan for distributing general state aid became operational in 1927, when provisions were made for flat grants and a guaranteed foundation level: a flat grant of $9 and a foundation of $34 per elementary pupil.

In 1939, high schools received general state aid for the first time as funds were received under a special equalization formula. High schools began receiving flat grants 4 years later. In 1947, the foundation levels became the same for elementary and high schools, and flat grants for these two groups became identical in 1965.

Figure 5 shows the changes in appropriation to the Common School Fund as it rose from $2 million in 1909 to $443 million in the biennial appropriation for the 1963-65 period. This fund includes the claims from local school districts for state aid, compensation of county superintendents and assistant superintendents, state payment to the teachers retirement system, tax-equivalent grants to districts where state institutions are located, and tuition for children from orphanages and children's homes, in veterans hospital areas, in military encampment areas, and in state-owned housing units.

Biennial appropriations for the Common School Fund are difficult to analyze, especially in making comparisons with the appropriations of other states. Primarily, too often faulty analysis and misinterpretation have stemmed from the mistaken belief that the appropriation is the only financial assistance provided by the state to the local school districts for a 2-year period and from failure to recognize that the property tax is reserved to the local government. In addition to the sum for the Common School Fund, the Legislature appropriates separate sums for special education, transportation, vocational education, driver education, and adult education. In 1965, the General Assembly appropriated $559 million for the Common School Fund for 1965-67 and voted an additional total of $135 million for special programs. In case the application of prescribed formulas yields too little, the Legislature may vote deficiency appropriations before the end of the biennium.

Illinois school districts receive the major share of their income from local assessments on real and personal property, since the state, with no income tax, empowers local units of government to levy the property tax. In the 1964-65 school year, school support was divided as follows: state aid, 20 percent; federal aid, 2 percent; and local support, 78 percent. In 1965, the General Assembly ensured a

By 1965, Superintendent Page's position on state aid was clear to the members of his policy staff. He presented his legislative program to the School Problems Commission in December 1966. While recognizing that local support was high and desirable, he maintained that the property tax, the base for local revenues, could not in the future be expected to bear so large a percentage of the cost of a quality program for all children. The state share, he said, should be increased to 45-48 percent by 1973.

He further recommended increasing the guaranteed foundation level to $400; the preceding General Assembly had raised this component of the state aid formula from $252 to $330, a figure which had remained unchanged through several bienniums. The superintendent emphasized that the 1973 support level would include all programs financed by the state for the common schools, instead of only those presently encompassed by the Common School Fund.

Elected v. Appointed Superintendents

Although the 1854 General Assembly provided for an elected superintendent of public instruction, it did not provide for a state board of education. The situation remains unchanged today. The Constitution of 1848 had expressed confidence in the people by giving them broad powers to elect officials. Since the establishment of the Office of the State Superintendent, the policy in Illinois has been that the people maintain control through the election of school boards and county superintendents as well as of the state superintendent. Illinoisans generally do not believe that the chief state school officer would remain a true servant of the people if he were not elected by public ballot. The Constitution of 1870, in force today, provided added protection for maintaining an elected superintendent.

There was little evidence of disagreement with the 1854 ruling until the time of Bayliss' tenure (1898-1906), when he recommended the creation of a nonpartisan state board of education with the superintendent as the executive officer. What influenced Bayliss' recommendation? The relationship may be coincidental rather than causal, but Bayliss' assistant was J. H. Freeman, who had been the only appointed superintendent in the history of the Office since Powell's election in 1856. The two may have had considerable discussion about how convenient it was to be forced to face the people directly with the issues of the day. Then, too, the recommendation came at a time when the endorsement of the Republican party turned in 1906 in favor of Francis G. Blair.

The Educational Commission of 1907 continued the discussion and developed a plan for a state board.

At the time of the fifth constitutional convention, after World War I, Blair convincingly defended electing the superintendent, saying that it was then less necessary to have an appointed superintendent than it had been earlier. He referred to the fact that at the time of the Educational Commission's report, the superintendent had been nominated by political conventions and that the adoption of the direct primary should eliminate any objections. He countered the charge that the direct primary did not eliminate political malpractice with the statement that there was no method of selection to ensure choice of the right man. He pointed to Iowa, which had changed from the elective to the appointive plan and then back to the elective.

The state board of education is still an issue today. The need for such a board was recognized by both candidates for the superintendency in 1966. There are two central questions: Would the members be appointed or elected, and what would be the duties of the board? School administrators throughout Illinois, including Superintendent Page, agree that Illinois needs a state board of education with regulatory and supervisory powers to coordinate the functions of education on a state level. After studying the experiences of other states, Superintendent Page concluded that Illinois should adopt an elective state board system. He stated:

Many members of that Council have become aware, as I have, of the inequities which can exist when one man is given the power to make each and every selection to a board of such grave importance. For example, the present Illinois Governor recently made the appointments to the newly created Illinois Junior College Board. No members on that appointive board come from south of Bloomington. More than one-half of the area of Illinois is thus without representation on that board. Very probably metropolitan and suburban members of that board
will have little understanding of the unique problems found in Southern Illinois, just as a board entirely from Southern Illinois would have little understanding of urban problems (17).

Page further pointed out that an elected board would have the advantage of making the members responsible directly to the districts rather than to the man who appointed them. He suggested that because of the great diversity in social and cultural attitudes in the state, and to ensure that all areas and attitudes are represented in a policy-making state board, an elected board is necessary.

A bill introduced in the 1965 General Assembly to create a state board of education took the superintendent by surprise. It was his understanding that the Governor's Office, his Office, and the Illinois School Problems Commission would hold off on legislative proposals for educational reorganization until 1967. They could then use the Illinois Task Force on Education recommendations as the basis for a so-called master plan. The bill was defeated because it did not clarify the method by which the board members would be selected.

Even though he was an elected superintendent, Page urged that the proposed new board appoint the superintendent. He stated:

I see the great need for an Illinois Board of Education. And when such a board is created, it should be given the power to appoint the state school superintendent, the man who will be directly responsible to the board. We must work toward such a board, but it must be an elective board if we are to preserve representation for all sections of the State (18).

FOOTNOTES

2. Ibid., p. 415.
3. Ibid., p. 416.
4. The series of biennial reports which all elected superintendents have submitted as required by the General Assembly now serve as a highly valued primary source of information. Victor H. Sheppard, a historian of the Office (see Bibliography), with no less than 100 footnotes relating to these biennial reports, refers to these documents more frequently than any other source, including the numerous references to the laws of Illinois and the Educational Press bulletins.
5. In the 1945 revision of the school code, the distinction between powers and duties was eliminated, for it was felt that the powers should also be considered duties.
8. To emphasize the widespread network of relationships which the Office has with its organizational environment, a complete listing of the organizations represented on the Illinois Curriculum Council is attached as Appendix C.
10. In the opinion of the writer, Superintendent Page's decision during his first year in office to establish six regional supervisory districts will eventually prove to be one of the most important in the history of the Office to date. The same year, the county superintendents organized on a coterminous basis, thereby establishing relationships leading to a vastly improved program for the supervision and recognition of schools.

*The Superintendent serves as Chief Executive Officer of the Board of Vocational Education and Rehabilitation.
†The Superintendent is Chairman of the State Teacher Certification Board.
Appendix C

ORGANIZATIONS REPRESENTED ON THE ILLINOIS CURRICULUM COUNCIL

Fifty advisory councils serve the Office of the Superintendent of Public Instruction; the largest of these, the Illinois Curriculum Council, has representatives from over 50 organizations. The superintendent also invites individuals to serve as representatives-at-large. An organization or institution not represented on the council may request the superintendent to approve its organization for council membership.

Development of the Indiana Public School System to 1900

First Efforts to Establish a Public School System

As early as 1816, Indiana citizens recognized that the general diffusion of knowledge and learning was essential to the preservation of free government and the well-being of the state. The first state constitution authorized the General Assembly “to provide, by law, as soon as circumstances will permit, for a general system of education, ascending in regular gradation, from township schools to a state university, wherein tuition shall be gratis and equally open to all” (1). Although the legislators accepted the general diffusion of knowledge and learning in principle, they did little to provide the legal means necessary to implement the constitution. In fact, the phrase “as soon as circumstances will permit” may have enabled them to avoid the often sensitive issue of a general system of education (2).

Although the schools were to be tuition-free, the assembly did not appropriate funds to develop a system. In 1824, the legislators enacted a law authorizing householders of a district to levy a tax for school construction. This levy was optional on the part of the voters of each district, and there was general reliance on the scant revenue from congressional land grants to support schools.

The system that developed during this period was both public and private. Some districts constructed school buildings but had no funds available to pay teachers. In most instances, parents paid a fixed amount based on the length of time their children attended school. Consequently, education was available only to those children whose parents could afford the tuition charges.

Most functions relating to the general system were administered at the local level, but the state assumed a minor supervisory role in school finance. The constitution made it the duty of the General Assembly to provide for the sale of school lands and the maintenance of revenue derived from the sale of such lands. School lands included the sixteenth section of land in each township as prescribed by the Ordinance of 1787, land granted to schools or seminaries, and any additional land granted to the State of Indiana by the U.S. government. Through the years, the General Assembly enacted numerous laws to provide for the administration and preservation of school lands and revenues at the local level. But most local officials showed little or no interest in their duties; consequently, much of the revenue was lost.

To remedy this situation, an act passed by the General Assembly in 1843 declared the state treasurer to be ex officio superintendent of common schools. The main duties of the superintendent included preparing an instruction manual for local officials and presenting an annual report to the General Assembly.

Educational Reform in Indiana

After the work of the Legislature in 1843, interest in public education subsided. It is possible that popular education would not have received further attention for some time, had it not been for the efforts of one man—Caleb Mills.

Shortly after his graduation from Dartmouth College, Mills came to the “Wabash Country” to study the effectiveness of religious education. He was dismayed at the lack of interest shown by Indiana residents in providing schools and education. As principal of the Presbyterian School (later Wabash College), Caleb Mills dedicated himself to the cause of popular education in the state.

Concurrent with the opening session of the General Assembly in December 1846, an article addressed to the members of the assembly and signed “one of the people” appeared in the Indiana State Journal. In this article, Mills reprimanded the legislators and other state officials for their neglect of education and pointed out some rather startling facts about the public school system. The decennial census of 1840 showed that Indiana ranked sixteenth on the national scale of literacy—only one in seven persons could read or write. This was the lowest rate among the Northern states. Mills stressed the lack of school buildings, the poor training of teachers, and the need for funds as factors contributing to the low literacy rate.
The Establishment of a State-Supervised System of Public Education

Many citizens ignored Mills, but the General Assembly of 1846, by joint resolution, recommended “to the friends of education” that a state common school convention be held at Indianapolis in May 1847 “for the purpose of consulting and devising the best course to be pursued to promote Common School Education in our State.” The convention proposed to draft a school bill to be presented, along with an address to the people “on the subject of Common Schools,” to the General Assembly in December.

The address contained three general conclusions with respect to a common school system:

1. A proper education for the citizens cannot be obtained without an efficient system of common schools.
2. Such a system must be a free system, where all children of the state may obtain an elementary education.
3. It is time for the General Assembly to fulfill its duty to provide for a system of township schools.

The convention recommended that the system be administered by a general superintendent and a superintendent for each county. In order to provide the necessary funds, it recommended that a tax levy be established to keep school for at least 3 months each year. Other important recommendations pertained to teacher qualifications, teacher education, and cooperation between the common schools and the private seminaries.

In the years that followed, opposition was directed more toward the state’s paying for the system than toward a general system itself. In 1848 and again in 1849, the “free school” question was voted on by the people of Indiana at the general election. Each time, the majority vote was cast for free schools.

In 1851, a constitutional convention was held, and the basis for a general system of education was incorporated into the new constitution. The first section authorized the General Assembly to provide for the development of a “general and uniform system of common schools.”

Second, the Common School Fund was established as a permanent fund from the following sources: Congressional Township Fund, a fund derived from the sale of the sixteenth section of land; the Surplus Revenue Fund; the Saline Fund; the Bank Tax Fund, derived from a levy on state banks; the Seminary Fund, consisting of the revenue from the sale of county seminaries and properties; fines and forfeitures, a fund derived from breaches in penal law; escheated estates, or those lands and moneys which revert to the state for want of heirs; and the Swamp Lands Fund, derived from the congressional grant after deducting the expense of selecting and draining. In addition, the Office of State Superintendent of Public Instruction was established on an elective basis.

Experience had proved that if a public school system were to succeed in Indiana, supplemental legislation would have to be provided immediately. The General Assembly accomplished this task a year later. Under the new school law, the civil township became the basic administrative unit, with a board of three township trustees serving as school administrators. At the state level, the office of state superintendent became separate and distinct from any other elected office, and the State Board of Education was defined.

The Role of the State Superintendent

In addition to performing the administrative and clerical chores necessary for the operation of his office, the superintendent supervised the purchase of library books, ruled on appeals made by township trustees, maintained the Common School Fund, and licensed common school teachers. It was further required upon his induction into office that he address the State Board of Education on the most efficient ways and means to develop popular education. Also, he served as ex officio president of this body. He presented an annual report of his “labors and observations” to the General Assembly, and, perhaps most important, he spent at least 10 days in each judicial district conferring with local officials and teachers on school matters. For these tasks, the superintendent received an annual salary of $1,300 and an additional sum (not to exceed $500) for travel, postage, stationery, and other miscellaneous expenses. Should the business of the office so require, the superintendent might hire a clerk (but not for more than 6 months each year) at a salary of $2 per day.

From that time until the turn of the century, the duties of the superintendent were only slightly modified. Instead of visiting each judicial district, he was required to visit each county. Collection of data on teacher salaries, number of teachers, licenses issued, tax rates, and school facilities became the main function of the office. While this information had little value, accurate student enumeration figures were essential to make an equitable distribution of state school funds. During this time (1851-1900), the only additions to the staff were a deputy superintendent and two full-time clerks.

The State Board of Education

The first State Board of Education was created by Section 147 of the School Law of 1852. As prescribed by law, the state superintendent, the auditor, the treasurer, the secretary of state, and the Governor served as members of the board. This group may have made some notable contributions to the development of public education, but the state superintendent, as the only professional member, was largely responsible for the two functions of the board—establishment of township libraries and adoption of uniform textbooks.
In the revised School Law of 1865, the membership of the newly designated "Indiana State Board of Education" was changed to include the Governor, the state superintendent, the president of the state university, the president of the state normal college, and the superintendents of common schools from the state's three largest cities (then Evansville, Indianapolis, and Fort Wayne). Although the responsibility for the adoption of textbooks was transferred to township trustees, the revised law authorized the board to examine applicants and grant state certificates of qualification to teachers who possessed eminent training and professional ability. Very few state licenses were issued, but the board did assume the responsibility for preparation and distribution of teacher licenses to county examiners and later to county superintendents.

With the exception of the law of 1889, which returned the responsibility for adoption of textbooks to the Indiana State Board of Education, the group acted primarily in an advisory capacity. An 1875 law extended the membership to include the president of Purdue University. Under pressures exerted by rural citizens, who argued that the board represented only large city systems and the state colleges and universities, an 1899 law provided for three additional members to be appointed by the Governor, one of whom must be a county superintendent.

**Deterrents to Tuition-Free Schools**

New laws did not bring about immediate acceptance of the idea that a state system was superior to a district system. Opposition was expressed in many ways, in particular, toward local tax levies for schools. "In this respect," said State Historian Logan Esarey, "the congressional fund had been a misfortune in that it caused the citizens of the state to believe that schools should be provided with no effort on their part (4)."

Legally, the General Assembly had exclusive legislative authority—it was the duty of the assembly to provide the legal means for a general and uniform system of common schools. To this end, all local and special laws for the support of schools and the preservation of school funds were prohibited.

Supplemental legislation of 1852 consolidated the revenue would then be applied to the support of schools and the revenue from Common School Funds, including the Congressional Township Fund, into a general fund. This revenue would then be applied to the support of schools throughout the state on a per-pupil basis. This brought immediate outcries from many citizens in the state who argued that Congressional Township Fund revenues were for the support of local schools and could not be distributed on a statewide basis. In 1854, the Indiana Supreme Court upheld this view. Unlike the procedure in other states, land grants had been given not to the state but to the inhabitants of the townships exclusively for the purpose of maintaining schools. With this decision, Congressional Township Funds were returned to local units. Two weeks later, the court invalidated that section of the 1852 law which authorized township voters to impose a levy on taxable property to continue schools after state funds had been expended. This section conflicted with constitutional provisions against local and special laws for the support of schools. Although these decisions brought about the near collapse of the system, it was said that they established the state's responsibility for providing tuition and the township's responsibility for school construction.

In 1865, township trustees were given the power to levy a special tax for construction, rentals, repairs, furniture, equipment, fuel, and the payment of other necessary expenses of the school except tuition. Two years later, trustees were further authorized to levy a special tuition tax. In 1885, the supreme court upheld the use of local levies by stating that such levies were general laws for school support rather than special laws.

**The Office of the County Superintendent**

Under the provisions of the School Law of 1852, there were two administrative units—the state department and the civil township. In theory, the trustees and the state superintendent were responsible for supervising the system. In practice, local trustees did not have the training or experience to provide effective supervision. On the other hand, the state superintendent did not have enough time to provide adequate supervision to all local officials. To fill the gap between state and local administrative units, the office of county superintendent was created in 1873.

Prior to that time, some degree of supervision had been provided by county examiners and commissioners. Their duties included the examination of teachers, grading examinations, issuing licenses, accounting for license fees, and encouraging the use of teacher institutes to improve the quality of teaching.

In effect, the legislation of 1873 did not establish a new office, but merely extended the duties of an old one. The county superintendent performed the same basic duties as the examiner and commissioner; however, the new law made school visitations and teacher institutes mandatory. In addition, the superintendent examined school records and established a closer working relationship with township officials. There was one distinct difference between the offices. With extended responsibility and authority to act, the county superintendent could provide effective supervision at the local level.

**The Establishment of a General System of Education**

The general education system, as described by the Constitution of 1816, included graded schools from the elementary
through the university level. However, in the Constitution of 1851, revisions limited the General Assembly to providing a general and uniform system of common schools, tuition-free and open to all. A year later, the assembly provided the legal framework for that system. At about the same time, by a separate act, legislators recognized Indiana University as a state-endowed institution and therefore a part of the public school system. Before the rulings against local school levies, a few high schools were established, but since there was very limited revenue available, elementary schools took priority.

From the early part of 1860, private academies provided secondary education. The acceptance of the academy was due in part to the emphasis placed on a classical curriculum by the state colleges and universities. In order to be admitted to these schools, the student had to pass a rigid entrance examination, a substantial portion of which consisted of readings in classical languages, especially Greek, a subject offered only in the academies.

Many citizens opposed tax-supported secondary schools. Superintendent James H. Smart noted that many who took this position were men of more than ordinary intelligence; hence, their opinions deserved consideration. Recognizing the general diffusion of knowledge and learning throughout a community as a prerequisite to the preservation of free government, opponents argued that the state’s authority to educate extended to the level where good citizenship was ensured and that for this purpose an elementary education would suffice. Moreover, they concluded that a general tax levied on all citizens to support high schools could not be justified since a select few would benefit. By the same reasoning, a general tax levy imposed on all citizens of a county to support high schools (then limited to cities and towns) was considered discriminatory.

In the 1870’s, it had been pointed out by the state board that, in practice, Indiana had three educational systems: the common schools, the private secondary schools, and the university. In the opinion of the board, these systems should be connected; common schools should prepare pupils for the high schools, and the latter should constitute a preparatory department for the state university.

At about the same time, the state university shifted from a classical to a more liberal curriculum, discontinuing the classical language requirement. Cyrus Nutt, president of the state university and a member of the state board, recommended that students who held certificates from commissioned high schools be admitted to the university without examination. In 1873, the board completed a survey of the 78 existing high schools, evaluating the extent of courses, number of pupils enrolled, and teacher qualifications in each. On the basis of this study, the board commissioned 15 high schools.

In the 1880’s, secondary education was not a popular idea; but the number of high schools continued to increase in cities and towns. In rural areas, high school education was almost nonexistent, and elementary schools were poorly attended. In 1896, the Legislature passed the state’s first compulsory education law establishing mandatory attendance to age 14. At the turn of the century, the public school system was still legally an elementary system.

**THE DEPARTMENT OF PUBLIC INSTRUCTION**

**IN THE TWENTIETH CENTURY**

Legal Background and Developments

Article 8 of Indiana’s 1851 constitution consists of eight sections, the longest of which deals with the Common School Fund. There is no mention of a state board of education, but Section 8 has the following key provision: “The General Assembly shall provide for the election, by the voters of the State, of a State Superintendent of Public Instruction; who shall hold his office for two years, and whose duties and compensation shall be prescribed by law” (5).

Thus Indiana established a pattern of electing the superintendent, a practice followed by 33 states, most in the South, Midwest, and West. The process of amending the constitution is so complex that change was quite difficult, particularly prior to the supreme court decision in the Todd case, when it was assumed that ratification required a majority of votes in favor rather than a mere plurality (6). Even so, Hoosier voters have thus far rejected amendments to make the office of superintendent appointive. The vote in 1921 was 46,023 in favor and 117,479 against. Again, in 1957, two amendments failed, one of which would have given the power to appoint the state superintendent to the state board.

State Superintendents of Public Instruction

Eighteen men have served as superintendent during the first 7 decades of the twentieth century—10 Republicans and 8 Democrats. Two terms, or 4 years, has been the average tenure in office, but five men served three or four terms, as follows:

- **Fassett A. Cotton** 1903-1909
- **Charles A. Greathouse** 1910-17
- **Clement T. Malan** 1941-47
- **Wilbur E. Young** 1951-59
- **William E. Wilson** 1959-67

All but four were native Hoosiers. Their ages when they assumed office varied from 27 for Frank L. Jones to 62 for Wilson; the average age has been 47. The incumbent, Richard D. Wells, 39, is the second youngest. Typically, they were principals or local superintendents at the time of their election, although a few came from high school or college classrooms. Several became college presidents after leaving the superintendency.
The salary has never been attractive, a condition lamented by one of the most eminent superintendents, Fassett A. Cotton, who thought that the salary of the office should be equal to the salaries of the presidents of the state colleges and universities. An annual salary of $1,300, set in 1852, reached $6,000 in 1945. Paradoxically, William E. Wilson left the position of superintendent of Clark County in 1959 with a salary of $11,700 to receive $200 less as state superintendent. However, the General Assembly voted in 1963 to increase the salary to $18,000; this became effective in 1965 during Wilson’s final term in office. This is still the figure today, plus travel allowance.

In 1865, the General Assembly outlined the superintendent’s basic responsibilities, authorizing him to employ two clerks. Almost every session has seen the addition of other responsibilities, with the implicit understanding that his staff would be augmented. Typical legislation has included:

1913—Appointment of a high school inspector.
1921—Appointment of the high school and elementary school inspectors.
1923—Maintenance of a complete record of licenses issued to teachers.
1939—Membership on the New Harmony Memorial Commission (The superintendent could devote a major portion of his time to attendance and participation in the activities of the numerous boards and commissions of which he is an ex officio member.)
1951—Secretary of the Indiana State School Survey Commission.

One of the most interesting subjects is the relationship of the superintendent and the state board, of which the superintendent became a member with full voting rights in 1913. He served as president until the board’s reorganization in 1945, and since 1949, he has been called chairman in his annual report to the Governor.

As a part of the reorganization of state government promoted by Governor Paul V. McNutt in 1933, the Department of Education was one of eight administrative departments created. Upon the return of the Republican party to control of the General Assembly, the Department of Education was abolished in 1941 and the old title of Department of Public Instruction resumed. The superintendent’s full voting rights on the state board were confirmed.

By 1960, it became increasingly apparent that many overlapping responsibilities had developed in the department as a result of legislative enactments. Hence the General Commission of the State Board of Education and the state superintendent initiated a study which led to a reorganization as approved by the General Assembly in 1961. The superintendent was authorized to appoint an administrative assistant (designated “deputy superintendent” by the present state superintendent) and three assistant superintendents for administration, instructional services, and field services. A tentative organization chart (which has undergone several revisions) appeared in the first issue of the valuable departmental publication inaugurated in September 1961—The Hoosier Schoolmaster of the Sixties.

The State Board of Education

In 1865, the General Assembly passed legislation setting forth the composition, powers, and duties of a State Board of Education, allowing members a per diem of $5, plus 5¢ per mile for travel. One of the first major additions of authority occurred in 1889 when the board was empowered to select textbooks for use in the public schools. Other extensions of authority included:

1907—Definition of “high school” and “equivalent”
1917—Power to function as a state board of vocational education
1919—Prescription of suitable courses in physical education
1921—Power to function as a state rehabilitation board
1923—Responsibility to certify school employees.

During the first few decades of the twentieth century, the board consisted of 13 members, 8 of whom were ex officio, including the state superintendent of public instruction, the presidents of the four state institutions of higher learning, and the superintendent of the three largest city school systems (Indianapolis, South Bend, and Evansville, until the latter was supplanted by Gary). The Governor appointed a representative of a private college, a county superintendent, and three members at large. Under the 1933 reorganization, membership declined to nine, largely at the expense of the original ex officio members. Memberships of three college presidents and two city superintendents were eliminated, and the Governor and lieutenant governor became ex officio members. Lay people had more representation for a brief period than had been true previously or is true today. Later came the major reorganization in 1945, resulting in part from wide dissatisfaction with policies in the adoption of textbooks.

In 1945, the General Assembly terminated the State Board of Education, as constituted, replacing it with the Indiana State Board of Education, a bipartisan body consisting of the state superintendent and 18 members appointed by the Governor. “The term of office is for four years at the pleasure and discretion of the Governor and until a successor is duly appointed and qualified” (7).

The present board functions through three commissions, with the state superintendent serving as chairman and a voting member. Each commission consists of six members, in addition to the state superintendent, and not more than four of the six may be members of the same
political party. Presumably the three commissions may meet periodically as a state board, with the state superintendent presiding. Such action, however, is rare.

The Commission on Textbook Adoptions and the Commission on Teacher Training and Licensing have highly specialized duties. All other responsibilities of the old state board were assigned to the Commission on General Education, which meets regularly on the second Friday of each month in the office of the state superintendent.

**Perennial Subjects of Legislation**

Ideally, the needs of the pupils have resulted eventually in either formal or informal action, usually the latter in the nineteenth century. In the twentieth century, however, with the problems of mass education, centralization of government, and efforts to equalize educational opportunity both within the state and nationally, there has come to be almost complete reliance on statutory enactments and administrative regulations. As a matter of fact, rules adopted by the commissions of the state board have the effect of law if they are in conformity with Section 120 of the Acts of 1945 of the General Assembly.

Fourteen problem areas seem increasingly to be beyond local capacities for effective solution. In each case, an effort has been made to cite several of the early state or national legislative enactments. Probably the constitution makers of 1851 would have been astounded if a seer had predicted many of these developments. These perennial subjects of legislation are—

Adoption of textbooks (1889, 1891, 1893, 1905, 1907, 1913, 1921, 1935, 1939, 1943, 1945)

Compulsory attendance (1899, 1907, 1919, 1921)

Transportation of pupils (1913, 1917, 1927, 1935)

Equal educational opportunity (1905, 1907, 1921, 1933)

Minimum wage laws for teachers (1899, 1907, 1921, 1941, 1945, 1967)

School inspection (1913, 1921)

Teacher qualifications (1907, 1919, 1921, 1923, 1935, 1943)

Transfer of pupils (1903, 1911, 1919, 1921, 1933, 1935, 1945)

Consolidation (1873, 1877, 1907, 1915, 1917, 1921, 1929)

Vocational education (1913, 1919, 1963)

Schoolhouse planning (1949, 1955, 1959)

**School Reorganization**

Some 9,000 school districts, established under the Constitution of 1816, underwent merging in 1852 as a result of the first reorganization act passed under the Constitution of 1851, reducing the total of city, town, and township school districts to 1,033. School boards controlled all of these units until the creation of the unique township trustee system in 1859. Limited only by advisory boards (which met infrequently) and public opinion, the trustees had almost complete autonomy for 70 years in the control of education, welfare, and local roads. They served terms of 4 years and were eligible for reelection not to exceed two terms out of three, as contrasted with the Governor, who also had a 4-year term but might not serve successive terms.

Quite early it was perceived that many of the units lacked the financial resources to provide adequate schools, particularly for grades 9 to 12. Although permissive legislation was passed to alleviate this condition, the township trustees long were able to prevent any fundamental change in the system. The Indiana Township Trustees Association, with more than 1,000 members, had one of the most powerful lobbies at Indianapolis during the 61-day session of the General Assembly, which met biennially unless called into special session by the Governor.

State superintendents deplored the situation. Benjamin J. Burris, in 1924, urged the establishment of a county unit system. He made this comment regarding those states still employing the township or district as the chief local unit:

Nowhere do traditions developed under pioneer conditions persist more tenaciously, nowhere is there greater lack of confidence in the people, lack of faith in the integrity of public officials, and lack of appreciation of expert knowledge than in the management of the rural schools of the United States . . . (8).

It is outside the scope of this chapter to trace the legislation of the 1930's by which the General Assembly placed road building and welfare under county administration. However, the first major innovation in local school organization came in 1929. (Early legislation, which permitted transfer of pupils but did not require legal consolidation, had many drawbacks. An act passed in 1917 and amended in 1921 permitted a consolidated school district, although participating school corporations remained separate corporate bodies.) Voluntary merger of certain school townships and towns now legalized larger tax and administrative units, of which three were established before the law was repealed and a similar one enacted in 1937 (9). By 1951, 49 cities and towns had united with neighboring townships in various forms of school consolidation, and several rural townships had consolidated their schools. In Floyd and Brown Counties, county units had been established as a result of a law passed in 1949, although there
were still more than 1,000 township administrative units (10).

There is little evidence that the state department played a dynamic part in bringing about school reorganization. However, a number of private organizations, particularly the Indiana State Chamber of Commerce, through its education department, were quite aggressive. The Indiana State Teachers Association, under its able executive secretary, Robert H. Wyatt, exercised its usual potent influence on school legislation. It employed Edgar L. Morphet, then of the Florida Department of Education, to prepare a survey of the Hoosier school system, which was published in 1949 (11). Space is lacking to comment on all of the significant studies, but at least the following four should be listed:

- Report of the Indiana State Committee on Governmental Economy (1935)
- An Evaluation of the Indiana Public Schools (1949)
- A Re-evaluation of the Organization and Financing of the Indiana Public Schools (1950)
- Report of the Indiana State School Survey Commission to the Governor of Indiana (1952)

The last publication, one of the most significant in Indiana educational history, merits more than passing reference. The School Survey Commission was created by House Concurrent Resolution 18, approved in March 1951. It provided for a bipartisan commission of eight members, with State Superintendent Wilbur Young as ex officio secretary.

After extensive research, its members concluded that 11,440 additional classrooms would be needed by 1957, costing $343 million. It was estimated that $218 million could be raised in 369 corporations by means of bonds and a cumulative building fund tax. However, 396 other corporations lacked the ability to employ these methods, and 436 had no pressing needs. It was recognized that the final solution to the problem depended on school reorganization. The commission also concluded that the state department could not conduct local reorganization until it, too, was overhauled.

The School Survey Commission’s recommendations, appearing on pages 70-72 of the 1952 report, may be summarized under schoolhousing and school reorganization.

With respect to housing, it was proposed that the state should participate in financing public school buildings in local school administrative units. Seven conditions were stipulated for participation by the state. The report pointed out how imperative it was to make building funds available immediately and suggested that corporations transferring pupils should “pay a building transfer cost applicable to capital outlay in the corporation receiving such transfer pupils” (12).

Two recommendations were made regarding school reorganization. The first asked the General Assembly to create a bipartisan state commission on school reorganization empowered to establish local committees to work out suggestions for reorganization and to provide technical assistance to these committees. The second declared that the General Assembly—

Should give attention to the desirability of provisions for a greater length of term for the State Superintendent of Public Instruction, more adequate facilities for the department, additional permanent professional personnel for the performance of the various duties, and a budget adequate to meet the necessary expansions of the Department of Public Instruction (13).

An account of legislative developments which were a sequel to this report was prepared by the education department of the Indiana State Chamber of Commerce, entitled “Four Years of Indiana School Reorganization.” In 1957, a major school reorganization bill was introduced in the General Assembly, which had “powerful support, but the traditional resistance was strong also and the measure, after passing the Senate, was defeated in the House.” Nine minor measures were passed, “mostly dealing with specific localities or situations” (14). Although notable advance was made under the 1955 Metropolitan School Consolidation Law, none of the nine laws passed in 1957 hastened to any marked degree the elimination of the hundreds of small school corporations.

With bipartisan authorship and legislative support, the Legislature enacted six laws in 1959 that affected school reorganization, one of which was of great significance in launching a movement that has continued to the present. The most important (Chapter 202) was passed in the Senate by a vote of 44 to 4, and in the House of Representatives by a vote of 62 to 32. Numerous amendments were added in 1961, 1963, and 1965.

Space does not permit a detailed statement of developments as a result of the legislation outlined above. However, the 1967 report of the State Commission for the Reorganization of School Corporations pointed out that there has been an 80-percent reduction in the number of school corporations “too small to provide a minimum educational program,” and that more than 90 percent of the public school pupils “now reside in school corporations which have been reorganized” (15). There has been a reduction of about 60 percent in the number of school corporations (966 to 402). In only 10 of the 92 counties has there been no reorganization. It has been completed in 63 counties and partially completed in 19. Eventually, the state commission may exercise its statutory authority to develop a plan where little or nothing is being done locally.

Curriculum

Curriculum (16) was interpreted narrowly in the nineteenth century and was largely a matter of local policy, although
college entrance requirements were beginning to affect offerings of high schools as they came into being. By the twentieth century, however, courses of study were being published in the state superintendents' biennial reports to the General Assembly. (These volumes often exceeded 1,000 pages in length, quite a contrast to the largely statistical reports published from 1917 to 1950, as a part of the Indiana Year Book.) Moreover, a virtual textbook monopoly was established under the aegis of the State Board of Education and remained until multiple adoptions by courses became mandatory in the 1940's.

Court cases involving curriculum, as well as opinions of the attorney general, were virtually nonexistent because of the paucity of state laws. As a matter of fact, the General Assembly undoubtedly reflected the feelings of most Hoosiers by adopting laws like the following:

1907—Minimum lists of courses stipulated for high school offerings, subject to revision by the State Board of Education
1909—Provision for the singing of the "Star Spangled Banner"
1911—Teaching of hygiene and sanitary science prescribed for grade 5
1919—English language only to be employed to conduct classes in the elementary school
1925—Teaching of the constitutions of Indiana and the United States required in public, private, and parochial schools, grades 6 to 12 (This stipulation was made very specific at the high school level in 1935 and so remains to this day.)
1933—Teaching of the effects of alcoholic drinks and narcotics required for 5 years in the elementary school and 2 years in high school
1937—Instruction in morals prescribed for all grades; in safety education for grade 8.

This list, of course, does not reflect the unsuccessful efforts to tamper with the curriculum by legislative fiat, such as the effort in the 1967 session of the General Assembly to add Indiana history as an elective subject in high school. In general, however, the lawmakers appear to have been more reasonable than many college and university curriculum committees.

There is no evidence that the state superintendent exerted sustained leadership in curriculum prior to 1940. Courses of study, published periodically, appear to have been ignored by the majority of classroom teachers. A central coordinating committee, appointed by the state superintendent, was authorized in 1931 to revise the curriculum for the elementary grades. The result was a new course of study, announced in 1935.

I. Owen Foster, a member of the School of Education faculty, Indiana University, from 1926 to 1961, influenced curriculum both as a teacher and as an appointee of the state superintendent (he served as director of curriculum from 1951 until 1961). A newspaper account regarding his activities, published in 1940, declared that he "largely wrote the elementary school course of study in social studies, and the high school course . . . was prepared by him and his graduate students . . ." (17). During the 1940's, he served as consultant for further revisions, one of which, for world history, was published in 1949 as Bulletin No. 211 by the Department of Public Instruction. He appears to have had considerable responsibility for the curriculums as revised and published periodically in the Digest of Courses of Study for Secondary Schools, including the editions of 1944, 1949, 1954, and 1961.

The current Administrative Handbook lists four functions for the Division of Curriculum, the first of which warrants being cited in its entirety:

To study the curriculum needs at the state level, to organize personnel from the various school systems to work on state curriculum reconstruction, to develop curriculum conferences and workshops both in the public schools, and in the state institutions of higher education, and to produce state curriculum bulletins and courses of study (18).

As a result of federal programs in education, particularly the National Defense Education Act (NDEA), Title III, and the Elementary and Secondary Education Act (ESEA), Title V, it has been possible to employ consultants in most subject areas. Former State Superintendent W.E. Wilson considered the greatest accomplishment of his 8 years in office to be the upgrading of the professional staff of the Department of Public Instruction.

The Social Studies: An Example of Curriculum Problems

One of the most ambitious curriculum projects in Indiana educational history was initiated in 1961 with the appointment of a state committee for social studies. Wholehearted cooperation was given not only by the public schools but also by institutions of higher learning, particularly Indiana University and Indiana State University. A curriculum for kindergarten through grade 12, based on a conceptual approach to teaching, was reported to the General Commission of the State Board in 1964 and adopted, with modifications at the high school level, in 1965 (19). Eleven curriculum guides, published in the latter part of 1965, received favorable comments by Hoosier social studies teachers and national educators.

Meanwhile, the Commission on Textbooks, following a cycle established in the 1940's, adopted social studies textbooks in December 1963, for the period 1964-69. The lack of synchronization of the activities of the two commissions was most unfortunate for social studies teachers, especially in grades 5, 6, 7, and 8. It became virtually impossible to comply with decisions of the two commissions of the state board without considerable financial
loss on the part of local school corporations because large supplies of textbooks became outdated. The problem will be resolved when social studies textbooks are adopted for another 5-year period in December 1968.

Conclusion

An effort has been made to outline the principal statutory changes affecting the state superintendent of public instruction and the state board during the past 100 years. There has been a listing of some of the laws involving perennial subjects of legislation. Two of these have been described in some detail—curriculum and school reorganization. These changes indicate that the Constitution of 1851 is flexible enough except for the provision that the office of state superintendent be elective for a term of only 2 years.

There are several possibilities for future action to be considered:

1. Preserving the status quo. On several occasions, people have rejected amendments making the superintendent’s position appointive and lengthening the term of office.
2. Renewing efforts to amend the constitution as simply as possible; for example, providing for election for a term of 4 years.
3. Amending the constitution to make the office completely statutory—as is true of the State Board of Education.

Shortly after taking office, State Superintendent Richard D. Wells appointed a committee to study possible courses of action. Their findings may be reported in time for the 1969 General Assembly.

SCHOOL FINANCE SINCE 1900

Not much school financing was provided by the state until the turn of the century. It was accepted that local moneys would provide for the schools and that school costs were the responsibility of those who had children attending school. In 1865, a tax for the operation of schools was created; in 1867, the power to tax in order to pay teachers was given to local units, normally townships, cities, and towns.

In the early 1900's, most money for schools came from property taxes and fell into a special school tax for operation of schools and a tuition tax for paying teachers' salaries. These two funds have remained in existence; in 1967, they still provide about two-thirds of the moneys used to support the public schools.

The School Relief Law

The idea of using state money for local schools first developed as schools trying to keep up educational standards in their own localities became “needy.” In 1905, a School Relief Law was passed, levying 7¢ per $100 valuation, money collected to be distributed only to those schools that could show that the funds they were collecting from local revenue were inadequate.

Development of the School Relief Law

1905—School corporations with a 0.40 tax levy could draw from the state fund (created by the 7¢ tax) an amount sufficient to extend their school term to 6 months and meet the provisions of the minimum teacher salary of $300.

1907—An amendment required a 0.25 tax levy to extend schools for a 6-month term and a 0.40 tax levy to extend schools for a 7-month term.

1919—100-percent valuation of taxable property established, with the State Tax Board given the power of enforcement.

1927—Private holding companies were legalized for school construction, but mounting tax delinquencies (16 percent in Indiana) brought about repeal of the measure in 1933.

1933—Gross income tax established. Rules were adopted by the State Board of Education for reporting attendance of pupils enrolled in grades 1-12 in the public schools of Indiana for the purpose of determining the number of elementary and high school units for which a school corporation could receive support.

The public schools of Indiana suffered financial setbacks in the late 1920's and 1930's. Many local attempts were made to solve that problem. The concept of school consolidation and reorganization actually started in Indiana during the Depression years when townships joined forces as a means of survival. The Depression not only affected the schools immediately, but also had a prolonged effect on the next two decades of school operation and progress. For example, no building could be started, teachers' salaries were kept down, repairs and maintenance were neglected, and many other items were curtailed or omitted, resulting in financial problems for the post-Depression period.

The Tuition Support Law

Attempting to help schools, the Legislature passed a tuition support law in 1933. Previously the state had never provided more than 10 percent of the revenue needed for the operation of a local school. As its obligations increased, it was necessary to add the Indiana gross income tax and also establish a law limiting the property tax. In 1933, the state became an official partner, providing an average of 36 percent of total school revenue. The distribution of funds under the 1933 act was made to each school on the same basis, with no regard for difference in ability to pay or for...
high and low assessed valuation. This concept of state distribution of money continued up to 1949 and was known as relief grants.

In 1949, the Indiana Legislature developed a concept of equalization of resources which has endured to the present. Industrial growth, agricultural prosperity, and "bedroom" community status were considered along with the other factors in distributing tax funds. A criterion was developed for each school corporation receiving state funds so that tuition, current expenses, and transportation all were accounted for. From 1949 until the present, each Legislature has used the concept of distributing state support to public schools through a Minimum Foundation Program, with changes being made in qualifications for the support and total amounts of money. In addition, some categorical distributions also are made on a per-pupil basis.

During the 1967 General Assembly, the Minimum Foundation Program was funded for the fiscal year 1968 (July 1, 1967, to June 30, 1968) with $189,227,460 for instructional salaries and other current expense (equalization) and $14,190,713 for transportation. For the fiscal year 1969, $193,808,888 was funded for instructional salaries and other current expense and $14,173,750 for transportation.

The distribution formula is worded so as to provide more for greater numbers of students and better trained and more experienced teachers. It also encompasses additional administrative, supervisory, guidance, and auxiliary personnel at the rate of one for each 400 students; at the same time, it required the richer corporations (defined according to assessed valuations) to contribute a greater local share. The base pay per pupil is $185. The average factor for teachers according to state average is 1.04, which increases the per-pupil average to $194 per student in average daily attendance or 30 times the number of classroom teachers, whichever is less. Administrative, supervisory, guidance, and auxiliary personnel employment is compensated for on the basis of the value of 30 students or on the average of $5,820 for the corporation's entitlement. Each corporation that has an average daily attendance of at least 750 students is entitled to receive for its superintendent the unit value of 30 students or another $5,820. The total becomes the school corporation's share under the Minimum Foundation Program, and from this is subtracted the local charge, which is 65¢ per $100 adjusted assessed valuation for corporations receiving support for students in grades 1 through 12 only, and 70¢ per $100 adjusted assessed valuation for corporations receiving state support for students in grades kindergarten through 12. The formula allows $60 per student in grades 1 to 12 as a maximum for other current expense (equalization) but requires a corporation to make a local share charge of 75¢ per $100 adjusted assessed valuation so that no equalization is received by a corporation with an $8,000 per-pupil adjusted assessed valuation.

The base rate for transportation is $20 per student multiplied by a sparsity factor (determined by finding the relationship of pupils transported more than 1.5 miles to total miles traveled). Larger amounts are provided to corporations with few children and to those in poorer communities. The authors of the formula for distribution of state support for school corporations, as can be seen, have attempted to put the state money where the students are located but have required the corporations that have greater wealth to provide more, locally, in order to qualify.

The formula worked well throughout the 1940's and the 1950's, as the legislative sessions raised maximum tax rates as school costs increased. Levies to pay for buildings constructed, plus cumulative building funds, provided in advance of construction, brought in funds to make possible great educational strides in Indiana during these two decades.

As mentioned previously, some state money outside the formula is provided for each corporation based on a categorical per-pupil distribution. Some background information on assessed valuations is needed to understand why the Indiana General Assembly provided these funds. Indiana was the first state to establish a group charged with establishing assessed valuations, official appropriations, and the tax rates necessary to provide needed moneys—the State Tax Commission, established in 1891 and still operating.

Establishing the assessment of personal and real property on a basis that is equitable to all taxpayers is most difficult. In 1929, property was to be assessed at 100 percent of its value for taxation purposes, but in 1949 a law required that property be assessed at not more than one-third of its real value, that is, value received through sale of the property. The person charged with the assessment of property is either the township trustee or, in larger areas, an elected assessor. Because of overassessing in some areas and underassessing in others, the State Tax Commission has established a system of determining equalizing factors in order to place the ratio between actual assessed valuation and sale valuation in proper relationship to the one-third concept. If local assessing is done at too low a level, a one plus factor is used; if, on the other hand, local assessing is done at a rate of higher than one-third sale value, a factor of less than one is used. Even though factors have been applied, some areas, due to their physical makeup, have found it most difficult to maintain educational standards without overburdening the local property owner.

The late 1950's and 1960's have seen efforts made to put in the hands of local school corporations additional funds, outside the formula, to be used as property tax relief. One fund, called the Property Tax Relief Fund, is an actual appropriation of about $31 per pupil per year, distributed regardless of wealth. The second distribution, a corporate net tax distribution determined by moneys collected, amounts to about $16 per student. A third
distribution, the intangible tax distribution, is based on the
amount collected and on an assessed valuation ratio with 65
percent of the total amount collected being distributed to
schools.

Special programs for special students provide addi-
tional state funds. Mentally retarded students or tubercu-
losis patients, evening school and summer school students
taking courses for credit, students whose parents work for
the state and live on state property, vocational students,
and other groups all fall in a category with separate
formulas for distributing funds.

A crisis exists in Indiana in the 1960's due to many
factors. Young people are a precious investment, and
everyone wants to provide the best for them in educational
opportunities. Despite the benefits of consolidating many
school corporations, with new and beautiful buildings
under construction, higher teachers' salaries to maintain
professionalism, and new subject areas being offered, even
to maintain the status quo costs approximately 10 percent
more each year. Moreover, the relocation of people away
from the industrial areas has resulted in an overburdening
of the property tax to meet the gap between state funds
provided and total costs of local schools. Prelegislative
committees are working on the problem at the present
time, and Indiana has reached the point in financing schools
at which a different approach to financing with a greater
obligation on the part of the state and less reliance on local
property taxes probably will be the necessary result.

BENEFITS AND PROBLEMS OF THE DEPARTMENT'S
RELATIONS WITH OUTSIDE ORGANIZATIONS

The explicit constitutional provisions for the office of
Superintendent of Public Instruction in Article 8, Section
8, of the Indiana Constitution of 1851 have already been
discussed. The constitutional provisions include those
powers and duties stemming from statutes of the Indiana
General Assembly, and from the quasi-legislative and quasi-
judicial actions taken by the Indiana State Board of Educa-
tion, an 18-member organization divided into three
commissions of 6 members each. The three commissions
are separately concerned with teacher training and certifica-
tion, textbook adoptions, and general educational affairs.
The department is represented through the superintendent,
who is chairman of each of the commissions.

Relations with Other Governmental Entities

The Indiana Governor is responsible for appointing the 18
members of the state board at staggered intervals. Each
appointment is for 4 years or at the pleasure of the Gov-
ernor. Through his control over the state budget agency,
the Governor also can exercise considerable influence in
procuring equipment and in repair and construction
expenditures within the department itself. In addition, he
may apply inflexible economy rules to the department's
requests for new personnel, in effect influencing the rate of
growth and the areas of instructional emphasis at any time.

The treasurer of Indiana may also influence the ef-
ciciency and reputation of the department by the alacrity
or slowness with which he sends checks to school corpora-
tions for the amounts called for in the state support pro-
gram. The treasurer may experience some temptation to
extend the interest time as a service to the public and the
banks.

The attorney general of Indiana is the officer respon-
sible for furnishing legal opinions when they are sought. In
addition, he defends in suits brought against the depart-
ment's officers and checks each commission decision for
constitutionality and conformity to law before it is
promulgated.

The Department and the Indiana Vocational College

Since 1965, money for post-high school and high school
vocational training has been allocated both to the autono-
uous Indiana Vocational Technical College and to the
Department of Education. The allocating agency is the
State Board of Vocational Education, whose members are
appointed by the Governor. Thus, the orientation of the
vocational board and ultimately of the Governor tends to
enhance or impoverish the regular vocational program of
the public schools. The department's officers view this as a
major obstacle to be overcome in the interest of effective
vocational education for all pupils. The number served by
Indiana Vocational Technical College is disproportionately
smaller than the number of persons served by Indiana's
public high schools, the ratio being approximately 1 IVTC
enrollee for each 80 high school pupils. Despite the dis-
pparity, funds are now allocated on an equal basis.

Local units of government have very little contact
with the state department, other than through local school
districts.

The State Library

The library cooperates by furnishing a large supply of
books, pamphlets, and other materials to schools; and it is
hoped that the State Library also will furnish a "book-
mobile" service for art work displays in the schools of
sparsely populated areas.

The Department's Relations with Professional
Organizations

In the last 4 or 5 years, professional organizations have come
to furnish much in inspiration and assistance to specialists
within the department. Various groups are a source of
recruitment when department openings occur, and the membership of the department's study committees is partly drawn from lists of persons active in these organizations. Committees of professional people meet periodically to prepare recommendations concerning school accreditation, departmental tenure of office, school finance, administrators' salaries, and Title III, ESEA.

Since 1960, the department has had cooperation from the Indiana Language Program in sponsorship of foreign language area workshops. Also the department has gained advice from FLES, the Foreign Language Elementary Section, in revising certification requirements.

The music consultant has organized a state music education council which consists of the presidents of all the music organizations in the state. Through this organization, the department's curriculum and cultural arts staff effects improvement in communication and coordination. During 1967-68, the department has been able to establish the same rapport with the State Art Teachers Association, which selected the first art consultant in the history of the Department of Public Instruction.

There continues to be close cooperation between the department's curriculum representatives and such organizations as the International Reading Association and the Indiana Council of Teachers of Mathematics. This cooperation is improving particularly in the in-service training activities which have been instituted since March 1967.

Departmental Relations with Lay Groups

The department's use of lay groups as sources of assistance is increasing, especially in the implementing of curriculum activities. Currently, department specialists are cooperating with the American Red Cross in developing and/or trying out five pilot programs. It also is assisting the League of Women Voters in the distribution of materials about state and local government. Another cooperative endeavor with a lay group includes a 1967-68 project with migratory pupils in a church community center. In a different vein, the department is now also cooperating with the John Herron Art Institute in a series of exhibitions at Indiana colleges. Individual lay persons also are members of the several study committees created by the current state superintendent to reexamine the main issues facing the department and Indiana's educators.

A unique program of economic education has been under way privately under the joint sponsorship of labor, farm organizations, and business, joined together as the Purdue Economic Education Advisory Board. Now, after some 15 years of this group's existence, the department has entered into a joint sponsorship with the advisory board in an effort to advance a reasonable economic education program on a statewide basis.

Pressure Groups

Several nationally active interest groups are periodically represented in confrontation or cooperation with the superintendent or the commissions. The National Association for the Advancement of Colored People has shown an interest in the distribution of supplemental materials concerning the Negro heritage. The Chamber of Commerce and the Indiana Farm Bureau have taken part in discussions about school finance, and the Parent-Teacher Association has been keenly interested in reorganization.

The Indiana State Teachers Association has at times held a special relationship to the Department of Public Instruction. Under earlier leadership, the department's administrative assistants and division heads sometimes seemed to be drawn almost entirely from the ranks of those very active in the ISTA. At present, the relationship is good, but there is no dependence upon the teachers association to furnish departmental leadership.

In summary, it can be said that other government officers and agencies, particularly the Governor of Indiana, have more immediate influence on the Department of Public Instruction than on lay and professional groups. However, the department does look to these latter sources for steady assistance and support.

EFFECT OF FEDERAL FUNDS ON EDUCATION IN INDIANA

As early as the Land Ordinance of 1785, enacted by the Continental Congress, the sixteenth section of each township in the Northwest Territory was reserved for the maintenance of public schools. Moreover, the Northwest Ordinance of 1787 provided that "schools and the means of education shall forever be encouraged." In the preconstitutional era, national interest in education seemed to be predicated on the idea that a literate, informed, and educated citizenry must be the basic foundation for American democracy.

When the U.S. Constitution was adopted in 1789, education was not listed as one of the enumerated powers of the new federal government. Nor was the subject of education mentioned. Therefore, powers concerning education were reserved to the states and have been considered throughout our national history as primarily a state responsibility. However, from time to time, the federal government in exercising its power to provide for the common defense and to promote the general welfare has legislated concerning education and has appropriated funds to support certain educational enterprises which were considered to be of national concern.

Until early in the twentieth century, most legislation was related to the establishment of military schools and institutions of higher learning such as land grant colleges,
provided for in 1862. It was not until the early part of the twentieth century that the federal government began to concern itself with vocational education at the secondary level. An initial act passed in 1917 provided aid to the states on a contribution basis for vocational training in specified areas. It was the development of this program which resulted in the establishment of the Division of Vocational Education in the State Department of Public Instruction.

Vocational Education

Vocational education has always been recognized as an important part of Indiana's total educational program. Although the words vocational education have not always been used, a significant provision was made for job training in the 1851 constitution. From 1859 to 1913, the public came to appreciate the type of training that would prepare youth for the industrial employment market. Many articles were published on vocational training, and Indiana governors, superintendents of public instruction, professional teaching organizations, and lay citizens heartily endorsed it as a part of the total school curriculum.

In 1891, the Legislature authorized large school systems to levy taxes to establish manual and industrial training as part of their programs. Governor Thomas R. Marshall appointed a commission in 1911 to develop a course of action for Indiana. The report of the Commission on Industrial and Agricultural Education contained recommendations including a vocational law which was enacted and approved in February 1913. The 1913 Indiana Vocational Education Act contemplated that all Indiana public schools would provide definite helpful vocational training for the young people who would work in the shops, homes, and farms during their adult lives.

As a result of the shortage of qualified agricultural and industrial workers for employment during World War I, the U.S. Congress enacted the Smith-Hughes Act in 1917 to provide cooperation with the states in the promotion of education in agriculture, trade and industries, and home economics. The law provided for cooperation with the states in preparation of teachers of vocational subjects and appropriated money and regulated its expenditures. With the passage of this act, vocational agriculture and vocational home economics classes were started in many of the rural schools. However, by 1920-21, only 341 of Indiana's 1,256 school corporations were participating in vocational education. The enrollment of approximately 23,000 pupils represented about one-fourth of the student population of Indiana. Up to 1935, the enrollment in vocational education remained at approximately 25,000 students, with Indiana receiving a federal appropriation from the Smith-Hughes Act of $265,162. In 1940, the appropriation from the Smith-Hughes Act increased to $545,749. This resulted in an increased enrollment of 65,796 students and at this time included students taking distributive education.

Another milestone for vocational education in Indiana was the passage of the George-Barden Act of 1946, which resulted in a total enrollment of 72,063 students and an appropriation of $664,484 of federal funds for Indiana by 1950. This act, passed near the close of World War II, was designed to provide qualified technical workers and nurses.

Additional acts passed by the federal government were the Practical Nurse Act of 1956, NDEA, the Area Redevelopment Act of 1961, and the Manpower Development and Training Act of 1962—none of which increased total appropriations or enrollment for students in the public high schools. However, these acts added emphasis and increased the appropriations and enrollment for the adult classes conducted by the public schools.

Indiana received $1,298,509 in federal funds from the Smith-Hughes and George-Barden Acts in 1960, and this increased the enrollment to 75,866 students.

The greatest impetus for vocational education came with the passage of the Vocational Education Act of 1963. This opened the door to new areas such as health, business, and office occupations and stressed the importance of on-the-job occupational training for vocational agriculture, home economics, trade and industry, and distributive education. The 1963 act also encouraged the development of the area vocational schools, emphasized vocational guidance and research, and strengthened the vocational teacher training programs in all state universities.

Since the passage of the Smith-Hughes Act, and with an early appropriation of $265,162 for vocational education, the state is now receiving a combined total of $5,538,925 from the Smith-Hughes, George-Barden, and Vocational Education Acts. With this increase in federal appropriations, the 1967 General Assembly appropriated $2,400,000 from state funds for 1967 and 1968.

The public schools are now training approximately 85,000 students in vocational education, and this number will increase rapidly with the construction of the area vocational schools and increased federal and state allocations for vocational education, plus interest from legislators and school administrators.

Vocational Rehabilitation

Federal concern with vocational education for secondary school students was extended in 1919 to a concern with vocational rehabilitation of the educable handicapped person over 16 years of age. The impetus for action was the need of handicapped veterans of World War I for job training. Persons with a substantial job handicap due to physical or mental disability and with a reasonably good chance of becoming employable may get a more suitable
job through the rehabilitation service. This program is supported by the federal government on a 75-percent basis and is administered by the Vocational Rehabilitation Division, established in 1923. Special matching funds are available at higher rates of federal participation to the rehabilitation division for projects involving innovations, statewide planning to meet rehabilitation needs, and expansion of vocational rehabilitation services. Also, grants-in-aid for special projects in vocational rehabilitation are administered by this division.

As a result of the regular vocational rehabilitation program, case service reports of the division for the year ending June 30, 1967, show 1,955 clients rehabilitated. More than three-fourths of those rehabilitated became industrial, clerical, sales, and service workers, while 295 entered professional, technical, or managerial occupations. Clients in training at division expense in October 1967 numbered 2,660. The projected budget for the division for fiscal year 1968 amounts to $3,200,000—$2,400,000 from the federal government and $800,000 from the state. Federal financial assistance to education in the years before World War II was primarily for vocational education, preparing high school students and the handicapped for jobs. These programs have been supported by the federal government with increased funds since their inception.

School Lunch

The National School Lunch Act of 1946 established the school lunch program, primarily to use farm surpluses. Basically, the program rested on the reduction of the food surplus at home or abroad by feeding the surplus to schoolchildren, particularly to those children who were malnourished. Despite the fact that many school districts had instituted school lunch programs before the national program (for example, at Frankfort, Indiana, a lunch program was started in December 1917), impetus for the expansion of the program was provided by the National School Lunch Act. To administer the program the School Lunch Division was created in the State Department of Public Instruction.

Of the 2,345 public schools in Indiana, 1,785 participated in the program in the 1966-67 school year, serving 44.9 percent of the students in those schools. In that year, local food purchases amounted to $22,466,000, and federal contribution to the program amounted to $3,167,000.

The school lunch program was extended by the Children’s Nutrition Act of 1965 to provide breakfast to underprivileged children. Indiana has six pilot schools in this program, to be paid for out of the Indiana allocation for the total program.

Impacted Areas

Federal funds to relieve school districts from the additional burden of educating children brought into the districts because of national defense activities during and after World War II are provided for by two public laws. Both laws provide federal funds to qualified school districts on a formula basis. Public Law 874 provides federal funds for the operation of the schools in these districts, and Public Law 815 provides financial aid for construction of school buildings in extremely needy areas.

This program, inaugurated in Indiana in September 1950, is administered by the Division of Finance. From this program, Indiana school corporations have received millions of dollars. For example, in the period 1961-66, $7,975,749 was received under Public Law 874 and $456,720 under Public Law 815. In the fiscal year ending June 30, 1967, $3,016,892 was received from 874 and $44,364 from 815.

National Defense Education Act of 1958

While U. S. scientists were working on the conquest of space, Russia placed Sputnik in orbit around the earth. The news shocked the nation into enactment of the National Defense Education Act of 1958. The purpose of the act was to provide substantial assistance in various forms to individuals, and to states and their subdivisions, in order to insure trained manpower of sufficient quantity and quality to meet the national defense needs of the United States.” Title III of the Act provided for 50-50 matching grants of federal funds to states to help remodel and equip laboratories and classrooms and to assist in expanding and improving their supervisory services in science, mathematics, and modern foreign languages. In 1964, five additional subjects were added—history, civics, geography, English, and reading—and later, economics and industrial arts were added. So closely related to Title III of NDEA was the provision for purchase of materials and equipment in the 1965 National Foundation on the Arts and Humanities Act that the administration of Section 12 of the latter act was brought under Title III.

At the inception of the program in 1959, an NDEA division was created in the Department of Public Instruction under the supervision of the assistant superintendent for field services. At this time, both the acquisition and supervisory phases of the program were included in this division, and as additional subjects were included, they were added to the responsibility of the division.

From the beginning of the program in Indiana in 1959, to June 30, 1966, the state had used $28,239,646 of the $11,468,424 available to it. During this time, local school districts had requested in approved projects $20,393,286, one-half of which they expected to pay from local funds. During the year July 1, 1966, to June 30, 1967, expenditures of federal funds in Indiana amounted to $1,449,347, of which $1,391,729 was used for acquisition and $57,618 for supervision and administration. Of 398 eligible agencies in Indiana, 325 participated in the program.
In 1967, the acquisition phase of NDEA Title III was transferred to a newly created Federal Projects Division, and the supervision phase was transferred to the Division of Curriculum.

Civil Defense

Directly related to national defense but not a part of the education of schoolchildren, the Civil Defense Adult Education Program was established in 1958 by the federal government and lodged in the U.S. Office of Education. The responsibility for this program was transferred to the Division of Civil Defense Adult Education within the State Department of Public Instruction in February 1962 and was expanded by the federal government in 1965, 1966, and 1967. The program includes a personal and family survival course, a radiological monitoring course, and a shelter management training course, each supported solely by the federal government.

Since the beginning of the program, 1,420 teachers for the survival course have been trained, and 36,756 adult students have been graduated from the course itself; 917 have been graduated from the radiological course, and 80 have been graduated from the management course. During this period, $475,740 has been invested in all three courses.

Adult Basic Education

Adult basic education originally was provided for in the Economic Opportunity Act of 1964, and responsibility for its administration was assigned to the U.S. Office of Education. To administer the program, an adult education division was created in the state department in February 1966. The program is designed to teach elementary-level education skills to individuals 18 years of age and over who are unable because of educational deficiencies to meet adult responsibilities and profit from occupational training. It is designed to bring the uneducated and the undereducated to the eighth-grade level or as near to this level as possible, with a view to breaking the poverty cycle. Actual operation of the program is delegated to local school districts on the basis of an application submitted to the Division of Adult Education and approved by it.

In fiscal year 1967, 22 local school districts had adult basic education programs with an enrollment of over 5,000 students. Federal assistance to the program in that year was $397,489, and the amount expected from the federal government for fiscal year 1968 is $488,728.

Elementary and Secondary Education

The Elementary and Secondary Education Act of 1965 (Public Law 89-10) represents the largest single commitment by the federal government to the elementary and secondary schools of the nation. The act became law in April 1965 and was funded in September 1965. It provided for federal financial assistance in the following categories:

- Title I—Education of educationally disadvantaged children of the poor and the handicapped
- Title II—Procurement of library books and other printed or published materials
- Title III—Creation of supplementary centers and services with emphasis on innovative and exemplary practices
- Title IV—Establishment of regional research laboratories
- Title V—Strengthening of state departments of education.

In anticipation of the comparatively massive amount of money involved and the need for "crash" implementation of the act, a special administrative office, popularly known as the "P.L. 89-10 Administration," was created in the State Department of Public Instruction.

An amendment to the basic act in 1966 added Title VI, providing for special financial assistance for the education of the handicapped. This program was assigned to the special education division for administration. Also, this amendment included in Title I the education of neglected and delinquent children and the children of migrant agricultural workers.

A new division of the State Department of Public Instruction, the Federal Projects Division, was established in March 1967 to administer Titles I, II, and III of ESEA and the acquisition phase of Title III of NDEA.

In the first year of operation of ESEA (actually only 9 months), $20,911,423 was made available to Indiana school districts through Titles I, II, and III. Almost every school district in the state took advantage of one or more of the titles.

In the second year of the operation of the act, July 1966 to June 1967, 383 Indiana school corporations were allocated $14,580,135 for Title I projects; 374 Title II applications were funded for $2,510,238; 15 Title III proposals were approved for approximately $1,800,000; and under Title III, NDEA distributed $2,080,000 to 325 school districts.

Projected federal funds to be administered by the Federal Projects Division for the State of Indiana for the year July 1967 to June 1968 amount to:

- Title I $15,092,249
- Title II $2,605,381
- Title III ESEA $5,200,000
- Title III NDEA $2,330,000

Total $25,227,630

These programs, as well as the federal aspects of the vocational education program of the State Department of Public Instruction, will be discussed in more detail in connection with the history of the development of the appropriate state program.
ESEA Title V Funds Intensify Activity

The development of the Department of Public Instruction during the twentieth century has been marked by late-blooming areas of activity, many during the 1960's, and steadily growing activities, some of which have expanded as the population has expanded. Prototypes of both kinds of activities will be discussed.

Part of the very recent escalation in the intensity of departmental activity emanates from the help received through ESEA Title V funds.

Appropriately entitled "Grants To Strengthen State Departments of Education," Title V is designed as a program for making grants to stimulate and assist states in strengthening the leadership resources of their state educational agencies, and to assist those agencies in the establishment and improvement of programs to identify and meet the educational needs of states. Congress authorized this program for a 5-year period ending June 30, 1970, and it is expected that with progressively more responsibility resting on state departments, the program will be extended.

Prior to the creation of Title V, funds granted to state departments for their own use were related to the administration of specific federal programs and to that extent were categorical in nature. While Title V may also be defined as categorical in that the act stipulated the purposes for which federal funds are to be used, the criteria are sufficiently broad to allow the states great flexibility in planning and designing activities for using these funds.

The state department, in designing applications for the use of Title V funds, has emphasized activities which cover these aspects of programing: state agency planning and information, internal administration, educational information and research, school finance, teacher education and certification, curriculum, schoolhouse planning, school traffic safety.

The major thrust in strengthening leadership services of the state agency was provided through the establishment of a curriculum division as a separate operating activity of the department. With expanded activities under the fiscal 1968 application for Title V funds, this division is now staffed by 14 professional personnel and provides consultant and planning services to local schools for all major subject areas. By working in coordination with other divisions of the department, this division also evaluates applications by local schools under other federal programs so that the department shall approve only those projects that are consistent with sound educational programs and that meet the educational needs of children in the state's elementary and secondary schools.

Activities in other areas listed above were not as significant in terms of personnel, involved, but they were as significant in terms of providing and/or strengthening leadership in their respective areas. Title V projects under these areas were not established as separate entities within the department but were integrated into other operating activities. Public information and administrative personnel were added to the state superintendent's staff; research and data-processing specialists were brought into the educational information division; fiscal and field consultants were employed by the school finance division; and other professional and nonprofessional personnel were added to the teacher education, schoolhouse planning, and school traffic safety divisions.

In addition to providing personnel, Title V significantly strengthened a supportive service of the department by providing funds for the acquisition and installation of electromechanical filing and retrieval equipment in the teacher education division. Conversion to this system of filing and retrieval has reduced the time required for processing and issuing licenses from weeks or months to days.

Without question, the leadership capabilities and services of the Department of Public Instruction have been substantially improved under programs supported by Title V funds. All of the activities described here provide sound rationale for this conclusion.

It is easy to identify examples of long-term stability among the programs now being carried on by the department. Those programs and activities which began in the 1920's or earlier include vocational education, special education for handicapped children, and teacher certification.

Summary

A trickle of federal financial assistance to Indiana for education appears to be growing into an ever-enlarging stream, until the federal government has become junior partner in the educational enterprise in the state.

To recapitulate, the major federal financial assistance programs administered by the department are listed chronologically:

In practically all cases, establishment of each of the federal programs has resulted in addition of personnel to administer the program. In some cases, the new program was added to an existing division of the state department, and personnel were added to take care of the increased work load,
as in the case of the pupil personnel and guidance division, when Title V, NDEA, was made the responsibility of this division. In the case of Title V of ESEA, personnel were added in many areas of the department in order to strengthen new divisions to administer the programs. Examples of this development are the vocational education, federal projects, and vocational rehabilitation divisions.

Because of their categorical nature, federal programs have placed great pressures upon the State Department of Public Instruction in certain areas in order to meet the requirements of the various acts and have thus complicated the operation of the department. Also, these categorical programs have, in some cases, caused an uneven development of the total educational programs; other aspects of the total educational program tend to be overshadowed.

A look into the future suggests overall planning to meet the total educational needs of the state and general federal financial aid to help meet these needs. Upon the speed with which these two developments take place depends the balance which the educational program of the state will have. This is the challenge for the future so far as the effect of federal funds on education in Indiana is concerned.

SPECIAL ACTIVITIES

Education for Handicapped Children

Indiana public schools have operated programs for handicapped children on a minimal basis for nearly three-quarters of a century. The first program on record within an Indiana public school for handicapped children was a special class for disturbed and delinquent adolescent boys initiated by the Indianapolis public schools in 1897. Prior to that time, however, the State of Indiana had established state residential public schools for deaf children (1844) and for blind children (1847). Responsibility for the operation and maintenance of these residential schools was vested in the Indiana State Board of Health by the Indiana General Assembly, although the educational programs of these institutions, like other public school programs, were required to meet standards of curricular offerings and teacher certification adopted by the state board and the state department.

Legislative Developments Affecting Education of the Handicapped

The first special education legislation for nonresidential schools in Indiana was passed in 1927 (20). This law enabled public schools, on a permissive basis, to establish programs for physically handicapped children. A 1931 law was passed which permitted public schools to establish special education programs for pupils “retarded in mental development” (21). As a result of these two laws, a few of the larger Indiana cities began to serve the crippled child through special schools. In addition, children with intelligence quotients of approximately 50-75 (now termed the educable mentally retarded) began to receive services through special class placement. Growth in the statewide program was negligible, however, since neither the 1927 nor the 1931 law provided funds which could be used for state financial support of the program.

In 1947, a law was passed which provided state reimbursement to local schools which operated approved special education programs (22). This law also created a special education division in the department and provided salaries for a director and a secretary. The 1947 law further established the duties of the director, as follows:

1. To supervise all classes and schools for handicapped children and to coordinate the work of these schools
2. To make, with the approval of the State Board of Education, rules and regulations governing the curriculum and the instruction, including licensing of personnel in the field of education as provided by law
3. To inspect and rate all schools or classes for handicapped children in order to maintain proper standards of personnel, buildings, equipment, and supplies
4. With the consent of the state superintendent of public instruction, to appoint and fix salaries for any assistants and other personnel needed to enable him to accomplish the duties of his office.

A 1955 law provided that programs for trainable mentally retarded children could be established by public school corporations (23). This broadened the provisions of the previous program to include children with intelligence quotients below 50 and extending downward to approximately 35. Also, the 1955 law made day-school programs for deaf and blind children possible in public school corporations.

Two supervisors were added to the staff of the special education division in 1958 through funds provided by legislation in 1957, one in the area of the mentally retarded and the other in the area of speech and hearing (24).

The duties of these supervisors were as follows:

1. General supervision of state-approved programs
2. Assistance to local school authorities in the organization and improvement of programs
3. Improvement of instruction, training, and therapy through working with therapists and teachers, both individually and in workshop situations
4. Administration of the technical aspects of approval and reimbursement of programs.

The 1961 Legislature passed a bill providing for reimbursement to public school corporations for the excess cost of psychological services and of special education administration, and for the securing of more meaningful
diagnostic information concerning exceptional children (25).

The 1965 Legislature changed the formula of state support for special education of the handicapped to percentages of salaries of teachers and therapists and other approved costs (26). The purposes of the change were to provide for a greater financial incentive to public schools and to eliminate certain inequities present in the 1947 support formula.

Contribution of Rules and Regulations to Growth of Special Education

The operation of special education programs in Indiana public schools has been regulated in two ways: legislation and rules and regulations. Legislation is passed by the biennial sessions of the Indiana General Assembly, while the rules and regulations implementing the legislation have been adopted by the Commission on General Education of the Indiana State Board of Education. Rules and regulations have been established which permit the development of the following additional types of programs not specifically delineated in the previous section setting forth Indiana legislation.

1. Itinerant teachers for speech and hearing therapy programs
2. Special programs for the emotionally disturbed and socially maladjusted
3. Special experimental programs for brain-injured children
4. Homebound and school-to-home telephone programs for physically handicapped children
5. Occupational therapy programs
6. Physical therapy programs
7. Supervisory and consultative specialists

Contribution of Federal Programs to the Education of Handicapped Children

In 1979, Congress passed a law designed to improve the lot of school pupils who had visual handicaps serious enough to qualify as “legal blindness” (visual acuity of 20/200 or worse in the better eye after correction). This law, as amended and incorporated into Title VI of the 1964 Civil Rights Act, provided funds for the purchase from the American Printing House for the Blind, operated by the Department of Public Instruction, of text materials and tangible aids in braille or large print for Indiana children who are registered with the Federal Quota Plan for the Blind. The special education division instituted this program immediately after passage of the law and has conducted a survey each January among all Indiana school corporations to identify all pupils and register them with the Federal Quota Plan. Materials purchased through this program, when no longer needed by the particular child for which they were purchased, have been returned to the Textbook Library for the Blind, operated by the Department of Public Instruction with the cooperation of the Indiana School for the Blind. These materials are then loaned free of charge to all visually handicapped pupils in the state who may need them. Nearly 7,000 volumes have been accumulated, and about three-quarters of these are in use by students at any given time during the school year.

The Eighty-Fifth Congress passed a grant program for the development of professional personnel in the education of mentally retarded children. This law, which was broadened by the Eighty-Eighth Congress to include other handicapping conditions, was intended as a measure to increase the supply of trained manpower available to educate the handicapped. As a result of its involvement in this program, the state department has markedly increased its in-service training programs for practitioners in local schools who are working with, or plan to work with, handicapped children.

Title VI of ESEA Amendments of 1966

This provided authorization of funds through the state department to local schools for the initiation of new programs specifically to benefit handicapped children and youth. Funds were not appropriated until the 1968 fiscal year, however. The department used this opportunity to infuse much-needed funds into the state’s special education program. A state plan was developed for using these funds by establishing priorities based on the state’s greatest unmet needs. Local schools were subsequently invited to submit proposals for the development of projects based on these priority categories:

**Exceptionality Areas of Greatest Need**

1. Multiply handicapped
2. Minimal brain dysfunctioning
3. Emotionally disturbed
4. Deaf and hard of hearing
5. Trainable mentally retarded
6. Visually handicapped
7. Educable mentally retarded
8. Physically handicapped

**Programing Priority**

1. Joint school service program
2. Creative administration and supervision
3. Creative programing
4. Preschool programing
5. Secondary school programing
6. Creative rural area programing
7. Services for multiply handicapped.
Recent Developments: Projects and Programs

Experimentation in programming for handicapped children was given impetus by the state department in 1965 when it permitted local schools to obtain state support for innovation and flexible programming possibilities for one or more handicapped children.

Provision of additional specialist consultant assistance services has been made during recent years as follows: a supervisor of programs for emotionally disturbed children was added during the 1965-66 school year; a coordinator of special projects was added to the staff for the 1967-68 school year; a supervisor of programs for the deaf and hard of hearing was approved for the 1967-68 school year; and a Title VI, ESEA, coordinator and six regional consultants were approved for the second semester of the 1967-68 school year.

A visual aids reproduction center was established in 1967 with the cooperation of the Indiana Department of Corrections and a private association to provide otherwise unavailable teaching and instructional materials in large print and braille to visually handicapped children. This program incorporated the services of some 26 inmates of the Pendleton Reformatory and provided the means to begin to meet the special needs of all Indiana blind and partially seeing youngsters for textbooks reproduced in braille or greatly enlarged print. The program was soon expanded to include a pilot project in producing conceptual-understanding aids for deaf children.

An Instructional Materials and Media Repository and Evaluation Center was established during 1967 for the collection of commercially prepared materials for use with handicapped children. Evaluation procedures through field testing were set up by the department with the primary aim of serving Indiana schools through continual feeding of evaluational information concerning the utility of special products and equipment in actual use in the schools.

Teacher Certification

In 1921, an act of the Indiana General Assembly defined the powers of the State Board of Education to license teachers and administrators (27). Prior to this act, applicants for teaching and administrative licenses qualified by passing examinations covering the subjects or grades to be taught, or by a combination of examination and credit. Licenses were then issued by a local official, or optionally for a few years by the State Department of Public Instruction.

After 1923, examinations no longer were given, and licenses were issued on the basis of credit earned in institutions approved for teacher education. Minimum requirements for licenses in elementary school teaching were set as graduation from a commissioned high school or equivalent and 1 year of special preparation. For licenses for high school teaching, minimum requirements were set at graduation from a commissioned high school or the equivalent and 3 years of special preparation. Definite requirements for administrative licenses also were set. The pattern of preparation for each license was announced, and institutions of higher learning were instructed to adapt their curriculums in accordance with the standards for licensing if they wished their credits to become acceptable for teacher licensing.

Teachers holding valid licenses in December 1923 were required to exchange them. Some of the licenses issued on exchange carried statements of the additional credit needed to qualify for the next higher grade, but some did not. If the notation made by the state was "consult college," the license holder was expected to meet the new licensing requirements prescribed by the college. If the specific requirement for the new license was stated, the holder could, and can still, qualify by satisfying the requirement stated.

The grades of licenses issued under the 1923 law were, in ascending order, third grade, second grade, first grade, and life. Another type of license issued as the lowest grade of exchange license was the permit which was issued to the teacher holding a valid license in December 1923 who had had a specified minimum of experience and credit but could not meet the new standards for the lowest grade of the license he was holding in 1922-23.

First-grade licenses could be converted to life licenses at the close of their period of validity (5 years) by presentation of evidence of at least 3 years of successful experience earned within the period of validity of the first-grade license. If the experience necessary for conversion had not been obtained, and if the applicant still met current requirements for the issuance of the first-grade license, the first-grade license could be renewed for a second 5-year period merely on application, and this pattern of renewal could be followed until the license could be converted to life.

The permit, the second-grade license (excluding those marked valid for life), and the third-grade license each were valid for a 2-year period and renewable thereafter on evidence of 1 year of successful experience (which requirement was waived if the applicant for renewal could not meet it) and 12 weeks of work (10 semester-hours or 16 quarter-hours of credit) specified for the next grade of license; except that if fewer than 12 weeks of work were required for conversion to first grade, the license had to be converted to first grade rather than renewed.

Exchange licenses still exist, and those lower than first grade may be converted to higher grade under specified terms.

First-grade licenses issued after December 1923 and prior to September 1946, including exchange licenses, may be renewed and converted to life licenses on the terms specified for their renewal and conversion under the 1923 law, except that the experience required for...
conversion since January 1935 has been 5 years, 2 of which shall have been in Indiana (28).

In the beginning of the operation of the 1923 law, elementary licensing was highly diversified among the various levels such as kindergarten, primary, intermediate, and grammar grades, and rural. These were gradually combined into kindergarten, lower elementary, and upper elementary, and finally into kindergarten, general elementary, and junior high school and ninth-grade subjects.

An extensive revision of certification regulations became effective September 9, 1946. A candidate for a certificate who matriculated before that date on the level (undergraduate or graduate) specified for the certificate may under certain conditions elect to meet the requirements in effect on September 8, 1946 (29). Institutions of higher learning contact the teacher training and licensing division with respect to these older requirements and advise candidates for certificates regarding their eligibility. The following paragraphs describe generally the latest revisions of teacher certification which were effective September 1963.

Teacher certification in Indiana has as its major purpose the guaranteeing of qualified professional personnel for the public schools. Attainment of this aim is based on definition of minimum requirements in preparatory programs leading to certification for the various instructional, administrative, and school service personnel positions. It is always assumed that institutions of higher education engaging in the preparation of teachers may choose to submit programs to the Teacher Training and Licensing Commission that exceed the minimum requirements.

Teacher education consists of a balanced program of general education, professional education, and subject matter concentration. It is understood that, although a common core of educational experience is desirable for teachers, differentiation in preparatory programs is essential for elementary, junior high, and secondary school teachers, as well as for other areas of educational specialization.

Teacher education in Indiana consists of an integrated 5-year program of preparation. Four years of study on a teacher education program culminating in a baccalaureate degree and recommendation by the institution of higher education awarding the degree are prerequisite to granting of a provisional license to teach. A provisional certificate is valid for 5 years from date of issue. Qualification for a professional certificate is based on completion of a master's degree in teacher education and 3 years of public school teaching experience. The undergraduate program of study constitutes only the minimum preparation for a beginning teacher and in no case is terminal in nature or intent. The fifth year of study, a continuation of the undergraduate program, completes the basic preparation for a professional position in the public schools of Indiana. Although subject matter concentration and professional specialization are emphasized in graduate-level programs, continuation of study in general education is expected. Administrative and school service personnel certification requires preparation beyond the master's degree and is based on a professional teaching certificate.

Institutions wishing to be accredited by the Teacher Training and Licensing Commission must meet minimum requirements set forth in the rules for each area in which accreditation is sought.

**SUMMARY**

The superintendent of public instruction is the official upon whom Indiana's constitution places the greatest responsibility for public education. During the 117-year history of the office, there has been a change from a single incumbent, acting alone, to a department of 395 persons, several of whom hold statutory positions. The growth in responsibility that this increased size reflects has come largely in the last 10 years, although several functions were in existence in some form in the 1920's or earlier.

Indiana was a leader in creating institutions and programs for handicapped children and adults. The state was also one of the first to establish a system of certification for teachers, although the earliest efforts were by separate localities rather than through the Department of Public Instruction.

Among the activities which had gone on for a long time without emphasis, curriculum stands out, for a curriculum division was not created until the incumbent superintendent took office in March 1967. However, during the past year, a division of 14 people has been established and is assuming an increasing number of functions. Other growing divisions concern themselves with research, library and audiovisual media, traffic safety, and increasing specialization in educating the handicapped.

The Department of Public Instruction in Indiana is among those institutions at every government level that are moving steadily into positions of greater leadership and responsibility.

DEVELOPMENTS AND CONDITIONS PRIOR TO 1900

Because the Iowa country was attached to the territory of Michigan, any legislation dealing with education in the Iowa country was found in the laws of Michigan. The Territorial General Assembly actually took over the Michigan School Law of 1838 and adopted it section for section (1). It would seem that the Legislature did not give very serious consideration to the Michigan law, for the first attempt to establish a state educational agency was not made until 1841. The Territorial Law of 1841 created the Office of State Superintendent of Public Instruction, but it appears that this was done to satisfy the requirements of the earlier law rather than because of a need.

The Law of 1841 assigned the Iowa state superintendent two tasks, both financial rather than educational. He was to administer the permanent school fund and to sell the public lands. It is obvious that the title of the office had little in common with its function. The territorial leaders clearly were feeling their way, and after only 1 year, the office of state superintendent was abolished by legislative act in February 1842.

William Reynolds, the first state superintendent, urged that the superintendent give his entire time to the office so that he might give effective assistance to develop a strong school system. He cited the right of a child to a free school, the enlisting of popular support through a full publication of plans, and provision for the care of the school lands as of special importance in his first report to support his recommendation (2).

However, in the middle 1800's, Iowa was a fairly large territory, and transportation was limited. A state superintendent was handicapped in determining what was going on in the various parts of the territory, and he had an even more difficult time supervising the school system. It was, therefore, the feeling that such matters must wait until Iowa had become an independent commonwealth, and it was anticipated that the fundamental law of the state would contain such a provision.

In 1846, Iowa became a state, and the Office of Superintendent of Public Instruction was set forth in the State Constitution. The first General Assembly provided for the election of a state superintendent whose major duties were administration of the permanent school fund, general supervision of the schools, and interpretation of school law. Thus was established a pattern which exists to the present day. The office existed in this manner until 1857, when a second State Constitution was ratified by the people of Iowa.

The new state had hardly come into being when it began experiencing political unrest because of problems caused by the prohibition of banks and corporations. Many Iowa Democrats became dissatisfied with their party, and, because of the strong Quaker element and New England background of many, both Whigs and Democrats joined the new Republican party. This new party elected a Governor and immediately began the work to make changes in the government. The political upheaval also resulted in a constitutional convention called in 1857 (3).

Three propositions relative to education were presented to the constitutional convention. The first dealt with the reorganization of the public school system; the second was concerned with the withdrawal of the school fund from its distribution through small loans and its reinvestment in some permanent securities; and the third proposition was a provision that would confine the state university to one location (4).

Thus, early in the convention, work began on the creation of a board of education that would consist of 10 to 12 persons from different parts of the state. The majority of those present at the convention agreed that the Legislature had neglected the problems of education and that some radical change was indicated. Out of this belief grew a demand for a legislative body independent of the General Assembly.

Another factor of importance was the opposition to the Office of State Superintendent of Public Instruction. The problem was to provide for the continuance of the functions carried on by the office while eliminating the one-man power concept.

Thus was created a State Board of Education consisting of 11 members—one from each of the judicial districts in the state. The lieutenant governor presided over this board. The secretary of the board was appointed by this body and served as its executive officer, assuming the
duties of the state superintendent. The constitution also included the power given to the General Assembly to abolish or reorganize the board at any time after the year 1863.

The Constitution of 1857, which is the fundamental law of the State of Iowa to the present day, created a division of legislative authority. In their zeal to ensure adequate attention to educational matters, which they felt the General Assembly had not done, the framers of the constitution gave the board of education full power and authority to legislate on education. This placed educational matters in a somewhat questionable relationship. The board had the power to legislate, but the Legislature had the power of the purse.

It is the unusual law with which everyone will agree. The educational laws of the state board were no exception, and from the beginning efforts were made to get the board to change some of its laws. By 1860, there was a move to abolish the board, and a bill was passed by the General Assembly to do just that. Governor Kirkwood vetoed the bill, for the constitution gave the assembly power to abolish or reorganize the board, but not until after 1863. The State Board of Education was abolished in March 1864, with provision made for the election of a superintendent of public instruction by popular vote. The system had failed because of the division of authority between the board and the Legislature and because there was little opportunity to make it work before the clamor for change set in.

The superintendent of public instruction carried on the work of the office alone until 1865, when a clerk was provided. A deputy was added in 1868. However, the responsibilities and powers of the superintendent in those days were limited. His principal function was still the supervision and distribution of the school fund, which was almost nonexistent.

It was in 1861 that a board of examiners was created by the State Board of Education. This came about through the influence of leading teachers and the recommendation of the secretary of the education board. The new board was given authority to issue certificates good for life and in any school in the state. It also was given the power to revoke a certificate. The board consisted of the faculty of the state university, and the professor of the normal department served as secretary.

Written examinations were introduced at this time. These and the methods used were patterned after those in use in the East and particularly those used in Cincinnati. However, it was still possible to teach with a lesser certificate, and very few persons presented themselves to the examining board. In the 11 years from 1862 to 1873, only 17 did so (5). Certificates issued by a county superintendent were much easier to obtain.

The statute providing for the State Board of Examiners, of little value to teachers, was repealed to clear the right of way for the creation of a law that would be more comprehensive in nature. In 1874, the Iowa State Teachers Association recommended the appointment of a board of examiners to consist of the state superintendent and four professional teachers, but the request was not granted.

The teachers did not give up. They continued their efforts for a new board, and a petition was circulated among the teachers of the state prior to the 1882 legislative session requesting a board of examiners. The General Assembly heeded this request, and a Board of Educational Examiners was established, with the superintendent of public instruction serving as president of the board. The presidents of the state university and the state normal school also served on the board along with two persons appointed by the State Executive Council.

This body was required to hold at least two public examinations of teachers each year. As the law did not provide for the employment of staff, the work for the board, which involved a large volume of correspondence, was conducted by the state superintendent and the clerk of his office. This arrangement existed until 1907, when the General Assembly empowered the board to employ a secretary and prescribe his duties.

Thus, at the turn of the century the department of public instruction as such did not exist. The rudiments of its makeup were found in the Office of the Superintendent of Public Instruction and the Board of Educational Examiners. The total staff consisted of three: the state superintendent, his deputy, and one stenographer. From such a beginning the department was destined to grow into a single agency encompassing numerous and varied responsibilities and employing a professional staff of 199 and a nonprofessional staff of 195 on December 31, 1965.

Iowa was clearly a rural state in 1900. One-room school had been developed to meet the need for providing some education to boys and girls in an isolated rural population. Moreover, it was necessary that the schools be located so that children could walk to them, for the roads of the period defied any type of vehicular traffic other than horse-drawn wagons or carts.

The schools of the state were manned by poorly educated and poorly trained teachers. Only 4,202 teachers could be considered as experienced or well trained, as evidenced by the holding of first-grade county or state certificates. The majority of the remaining teachers—in excess of 20,000—had no education beyond the eighth grade and a few weeks at a county normal institute.

The school district structure also was inadequate at the beginning of the twentieth century. Its decentralization and lack of state direction or attention resulted in a limited ability to adjust to change. Prior to 1872, Iowa had township districts. Not heeding the advice of the state's ablest educators, the Fourteenth General Assembly passed a law permitting school districts to become independent school districts. Between 1872 and
1874, the number of independent districts grew from 400 to 2,026, and the number increased to 3,686 by 1900 (7). Schoolhouses as a rule were only 2 miles apart as late as 1910.

The conditions were poor, and the problems were much too numerous for a staff of two professional educators and one stenographer. But progress or change had taken place. Writing in 1903, State Superintendent Richard C. Barrett stated:

Fifty years ago the average annual school session for the state was 72 days, today it is 160. Then there was not a single graded school, now there are thousands; then the total enrollment was 42,442, now it is 550,202; then the total value of schoolhouses was $144,979, now it is more than $20,000,000 (8).

Gradually, Iowa began to face up to the issues and to take corrective action, although often after other states had done so. As this happened, a Department of Public Instruction slowly evolved. Road conditions were improved, reorganization of school districts took place in two different periods of history, standards for teachers were gradually raised, and instructional programs were enriched.

**GROWTH AND STRUCTURAL CHANGES OF THE DEPARTMENT**

The Iowa Department of Public Instruction came into existence as such in 1913. Prior to this time, the work of public education was carried on by the Office of the Superintendent of Public Instruction. Modifications in the structure of the department came as a result of the pressures of the time reflected in legislative acts and because the state superintendent and his staff saw a need for a new structure in order to accomplish the task assigned.

The Administration of Richard C. Barrett, 1898-1904

Two pages of the code of Iowa were devoted to the position held by Superintendent Barrett. His responsibilities were basically in the areas of record keeping, officiating at and assisting with teachers institutes, advising as to the school laws, making reports, and the general supervision of county superintendents and the common schools of the state. The state superintendent had no specific powers and duties with regard to supervision at this time.

The structure of the department has been to a great extent dictated by law. Figure 1 depicts the organizational structure for the state supervision of public schools as it existed at the beginning of the period when there were very few responsibilities.

The certification of teachers was not a responsibility of the Office of Superintendent of Public Instruction in 1900 but was under the province of the Board of Educational Examiners. This body consisted of the superintendent of public instruction, the president of the State University of Iowa at Iowa City, the principal of the normal school, and two additional persons appointed by the Governor. The superintendent of public instruction served as president of the board.

The authority of the state superintendent was increased somewhat by the General Assembly with the passage of Senate File 178 in 1900. This law gave him the power to collect, publish, and distribute information relative to public schools and education in general. It also authorized him to promote the cause of education by delivering addresses and publishing and distributing leaflets and circulars. More important, it empowered him to “make tours of inspection among the common schools and other institutions of learning in the state....” (9). He had no authority to do anything about the conditions he might have found other than to publish information on them or talk to groups about his findings.

Because the state superintendent's staff was limited to a deputy and a stenographer, he obviously had little time for inspection. However, the law was important because it established inspection of public schools as a responsibility of the state superintendent. This initiated the pattern that was to exist for many decades, and it was to become a handicap to the department in performing its leadership.

Figure 1. — ORGANIZATION OF THE IOWA DEPARTMENT OF PUBLIC INSTRUCTION, 1900

![Diagram of organizational structure](image-url)
function in the period following 1950 and specifically in the 1960's.

The Administration of John F. Riggs, 1904-11

During the administration of John F. Riggs, legislation was enacted that somewhat broadened the authority of the state superintendent. In 1906, the General Assembly passed the Teachers' Uniform State Certificate Law, which transferred the licensing of teachers from county to state authority. By this time, the teachers of Iowa had become desirous of the status that came with a certificate issued by the state, and the people wanted greater assurance of more uniform quality in the preparation of teachers.

As early as 1840, educators in the United States had known and pointed out that the one-room school, even at its best, was ineffective and should continue only where it was impracticable to provide anything better (10). Although Iowa was not a leader in the consolidation of schools, it did fit into the pattern that had evolved nationally.

The consolidation of schools received powerful help from the State Department of Public Instruction. Since Henry Sabin's administration (1888-92), most of the superintendents gave their support to consolidation (11).

In the first decade of this century the rural school buildings were in a deplorable condition, so shocking, in fact, that one writer stated that the provision for clean, supervised indoor toilets alone justified the cost of new consolidated schools (12). Conditions such as these, coupled with all the efforts to consolidate schools, resulted in the passage of a law in 1906 providing for the organization of consolidated independent districts. Although this act did not immediately extend the authority of the state superintendent, it did provide the first legal step to later extension of the responsibilities of the state office.

Iowa had few well-educated or professionally prepared teachers at the turn of the century. As indicated previously, most of the teachers of this period had received no preparation beyond the eighth grade and what they received in a few weeks at county normal institutes.

The structure of the Iowa department has reflected the grants of funds to public schools, both state and federal. In the early years, the various state funds were the cause of the gradual growth of the department staff and the extension of authority, and they determined the department structure.

Superintendent Barrett recommended in 1901 the discontinuance of the normal institutes. In 1903, he recommended the establishment of county schools, which were to have as their main purpose the teaching of agriculture, manual training, domestic science, and the training of teachers. However, it was not until 8 years later, in 1911, that this concept was partially enacted into law.

In 1911, the General Assembly enacted legislation providing for the approval of normal courses of study to prepare rural school teachers. The law also provided for the inspection and supervision of such schools and the appointment of an inspector of normal training in high school and private and denominational schools at a salary not to exceed $2,000 per year plus necessary traveling expenses. An appropriation of $25,000 for the first year of the biennium and $50,000 annually thereafter was made to carry out the provisions of this act.

The General Assembly also authorized the transportation of pupils in consolidated school districts. This act did not result in expansion of the authority and responsibility of the state office, and it was not until 34 years later that this authority was increased because of pupil transportation. However, the state superintendents throughout the first few decades of the century did give leadership in this area because of its important role in the consolidation of school districts.

The Administration of Albert M. Deyoe, 1911-19

Albert M. Deyoe must be classed as a particularly effective educational leader. During his term of office there was considerable educational progress and much school legislation.

F. L. Mahannah, president of the Iowa State Teachers Association, and Superintendent Deyoe, at the 1911 annual meeting of the association, asked that a committee be established to study the conditions of the rural, graded, and high schools of the state.

The Better Iowa Schools Commission of 1911-12 was created. Mr. Deyoe appointed 22 people to the commission, with the membership almost equally divided between educators and laymen from all parts of the state.

The commission functioned well and had great success. That its work resulted in the enactment of a considerable number of its recommendations can be attributed to two factors. The first was the technique of preparing separate bills for each recommendation, and the second was an exceptionally effective legislative committee.

Superintendent Deyoe had done his work well and exercised wisdom in his appointments. The legislative committee of the Better Iowa Schools Commission of 1911-12 was composed of a former Governor as chairman, state legislators, and a prominent newspaperman of the . . .
Another important recommendation enacted into law was the Savage Bill, which provided for reorganization of the state education agency and the creation of a State Department of Public Instruction. The bill created the department with a state superintendent of public instruction appointed for a 4-year term by the Governor, with the consent of two-thirds of the Senate.

There was not much heat generated over this proposal. Possibly this was because it had the full support of the profession and the commission. Attention also may have been diverted to other matters dealing with education. The state board, which operated the three state institutions of higher learning, had been attempting to develop coordination to provide a balanced program. There were inter-institutional rivalries involved in this, and the clash erupted in the General Assembly.

The arrangement of an appointed state superintendent did not have a long tenure, and the office was placed back in partisan politics beginning with the general election of 1918, and every 4 years thereafter. M. G. Clark, president of the Iowa State Teachers Association, gave the following reasons for this in his address in 1918:

A few years ago found Iowa making splendid progress toward educational freedom. The departments of both state and county school supervision were removed from party political control. The lost party plums, however, proved too great for our legislature to contemplate with any degree of complacency. Politics needed these for teaching purposes. Fortunately the legislature awakened before the office of county superintendent was prostituted. Our state superintendent, however, . . . must become a political diplomat rather than an educational expert. Politics must be placated before educational efficiency can be demanded (13).

Another factor that apparently contributed to the return of the state superintendent to partisan politics was the political situation of the time. Certain enemies of Governor Harding desired to deprive him of the privilege of appointing a successor to Superintendent Deyoe (14).

Even though the 1918 law returned the state superintendency to an elective office, this did not materially affect the powers of the department, for the 1913 law had not changed the legal authority of the state education agency. Because of an enlarged appropriation, Superintendent Deyoe was able to increase his professional staff by four; this made it possible to make a better determination of school conditions in the state and to bring these to the attention of the people and governmental authorities.

The State Board for Vocational Education was created in 1917 to enable Iowa to participate in the Smith-Hughes Vocational Act. The state superintendent of public instruction was designated as chairman of this board. On the board with the state superintendent was the president of the State Board of Education (now the State Board of Regents) and the commissioner of the Bureau of Labor Statistics.

The Administration of P. E. McClenahan, 1919-23

P. E. McClenahan served as state superintendent for one 4-year term. During his administration, a number of laws were enacted as a result of the accumulation of several years of work that had taken place prior to his administration.

Superintendent Deyoe had recommended special aid to mining camp schools in his 1916 and 1918 reports. Such aid was appropriated in 1919 to help upgrade the educational opportunity in these depressed areas. Superintendent McClenahan recommended that an inspector of the mining camp schools be appointed, and in August 1921 the executive council acted on the recommendation and made such an appointment.

In April 1919, the Governor approved an act providing for state aid to encourage the standardization of rural schools. Superintendent McClenahan gave the work of standardization his support, but he was handicapped by a shortage of staff. Although the Legislature had added to the responsibilities and authority of the department, it did not make provision for adequate implementation of the law.

The standardization law added considerably to the legal authority of the state superintendent. It gave him the duty to “prescribe and promulgate the requirements he shall deem necessary” for the standard schools (15). In order to get the work started, a state inspector was taken from another duty temporarily. The position of inspector of rural schools was added in 1924.

There was little opposition to the standardization of the one-room schools. This can possibly be attributed to the poor conditions that had prompted the law. It may also have been an outgrowth of the consolidation movement of this period. People resisted the loss of their one-room country school, and standardization gave them some support for retaining it if they could say that it met state standards and was considered an approved school.

In 1919, an act of the General Assembly directed the state superintendent to assist in the placement or employment of teachers in the public schools. Irving H. Hart, a contemporary of the period writing about this service, states that it was considered ineffective by some school administrators and that its operation incurred considerable hostility from private teacher placement agencies and also among laymen (16). The act was repealed 12 years later, in 1931.

World War I gave the impetus necessary for the inauguration of the federal-state program of vocational rehabilitation in the United States. The federal vocational rehabilitation legislation passed by Congress in June 1920 made funds available to the states on a 50-50 matching basis provided there was state legislative acceptance that
gave the State Board of Vocational Education authority to cooperate with the federal board.

Charles A. Prosser, formerly head of the Dunwoody Institute, was director of the Federal Board for Vocational Education. He believed rehabilitation of the handicapped was a vocational education task. It thus became a responsibility of the federal board and, as a result, was placed under the state board in 1921. Willis W. Grant, an instructor at Dunwoody, was selected as state supervisor.

The Administration of May E. Francis, 1923-27

May E. Francis had served as inspector of rural schools for 2 years immediately prior to her election to one term as state superintendent. She had campaigned vigorously and had formed her philosophy after "due consideration and after a period of travel of the State of Iowa." She was for "progress and advance of the smallest school unit—the rural school" (17). During her tenure of office the regulations for the standardizing of one-room rural schools were developed, and in 1926 an inspector of rural schools was added to the staff to implement the standards. This was 7 years after enactment of the law providing for these standards.

The Administration of Agnes Samuelson, 1927-39

During the administration of Miss Samuelson the department's responsibilities and authority continued to grow. The organizational structure experienced considerable change. Miss Samuelson became a recognized leader in education and served on various national boards and commissions. She received special recognition in the summer of 1935: She was awarded an honorary degree of doctor of letters from Augustana College, and she was elected president of the National Education Association.

The first Iowa public junior college was initiated in Mason City in 1918, and there were 12 existing in the state by 1926. The Forty-Second General Assembly repealed the law under which junior colleges could be established by resolution of the local board and made provision for their establishment with the approval of the state superintendent and the voters of the district.

The supervision of these institutions was made the responsibility of the supervisor of the normal training high schools. The Legislature over the years had established the pattern for staffing the department by specifically providing for individual positions. Positions had been added by the Legislature for specific inspectorial purposes as categorical aids were added (18). However, no provision was made for staff members to work with the junior colleges of the state, and this assignment was therefore given to a person who already had a full-time responsibility.

Prior to the passage of the 1927 law, which called for preparation by the state superintendent of standards for junior colleges, an intercollegiate standing committee had inspected the junior colleges and acted as an accrediting agency. This committee was composed of two people from each of the three state institutions of higher learning. Thus, the Legislature turned over to the department a responsibility that had been cared for by six people without making provision for adequate staffing. The committee, therefore, continued to function, and there was some duplication of effort although the department gave only partial attention to this responsibility.

Various arrangements, all makeshift, were utilized for the supervision of the junior colleges for a number of years. A regional supervisor carried the responsibility from 1954 to 1961, when funds were made available to employ a consultant for community and junior colleges.

In 1922, the Educational Finance Inquiry Commission of the American Council on Education selected Iowa as a state in which to study educational finance. The commission had previously conducted similar research in the State of New York. Iowa was chosen because of its contrast in economic conditions to an industrial state such as New York and because it had men especially qualified to do the work (19). This study pointed up a need for the comparability of data and for a state aid plan that would help financially weak school districts.

State Superintendent Samuelson followed up the finance inquiry study with a recommendation that a commission be authorized to study the needs of the public school system. The Forty-Third General Assembly heeded this recommendation and authorized the superintendent to employ a statistician and such clerical help as needed to make a survey. The sum of $8,000 was appropriated for this purpose.

The department at this time, as in other periods, was organized to attack the problems existing as interpreted by the state superintendent. Superintendent Samuelson was evidently not satisfied with the structure of the department, for in 1930 she allocated the work of the department in eight "divisions," a definite change in structure. However, while she could experiment with the structure of the department, she was limited considerably in what she could accomplish with a staff of only seven professional people to assist her.

The Legislature in 1931 took action on a recommendation of the state superintendent and authorized the continued employment of a director of research. This provided the impetus for additional legislation. The financial accounting systems in the state were so varied that it was extremely difficult to make any meaningful financial studies. The pressure to conduct such research grew out of the condition of the Iowa economy at this time. Therefore, the Forty-Third General Assembly ordered the establishment of a uniform cost accounting and financial record system in all public schools. This was to be under the supervision of the state superintendent and gave the superintendent considerable authority.
By 1935, Miss Samuelson was still not satisfied with the manner in which the department was organized. Up to this time the field work of the state education agency, not including vocational education, which for all intents and purposes was a separate department, had been handled by five persons. A substantial increase in the department appropriation made it possible for her to appoint two additional professional staff members. Thus, by 1935 the professional staff had grown to nine in the department, nine in vocational education including rehabilitation, and two under the Board of Educational Examiners—a grand total of 20.

In 1935, Miss Samuelson proceeded to reorganize the department. Because of the nature of the work, no change was made in the supervision of standard rural schools and the normal training high schools. However, it was felt that the characteristics of the consolidated and approved schools were of such nature that both could be adequately supervised by the same personnel. The state was, therefore, divided into four regions and a staff member assigned to supervise all the consolidated and approved schools in each region. Thus was established a pattern of the generalist responsible for the supervision of a certain number of schools in an area. This continues to the present day in the department through its division of supervision.

Financial recognition of the need for special education programs for handicapped children began in 1935 with an appropriation of $10,000. This did not immediately result in extending the authority of the department, and no provision was made for staff to work in this area.

The department did give considerable attention to special education during the late thirties and early forties, but it was not until the 1945-46 school year that the department had a professional staff member with a specific responsibility for the education of the handicapped. The Legislature created a division of special education in 1945.

In 1937, the Legislature designated the state superintendent of public instruction as the chief educational authority of the state where federal moneys for education were concerned. This act authorized the state superintendent to adopt such rules and regulations as were necessary and proper for the administration of the law.

The Administration of Jessie M. Parker, 1939-55

Jessie M. Parker, the seventh person to serve in the position of state superintendent in the 1900's, had the longest tenure of any of Iowa's state superintendents. Miss Parker worked well with people; as a teacher and principal she had always gotten along with the "bad boys." Miss Parker was a person of hearty and enjoyable laughter, and she found much at which to laugh. She was also a fighter and was not afraid to "take on" the Governor or groups such as the Iowa State Teachers Association.

A number of significant changes in the legal authority of the department took place during Miss Parker's administration. These alterations came about as a result of the work of two code commissions created by the Legislature acting on the recommendation of Miss Parker. The Iowa State Education Association had adopted a six-point legislative program that reinforced the recommendations made by the state superintendent.

A commission was established in 1941 to prepare a proposed revision of the school laws. The law creating this commission reiterated the purposes stated by Miss Parker and directed that a complete report be filed with the Governor not later than 60 days preceding the convening of the Fiftieth General Assembly. The state superintendent was designated as the ex officio chairman of the commission.

Unfortunately, the act creating this commission called for the preparation of a "proposed new school code which shall consist in a complete revision and codification" of the laws relating to education (20). The commission, therefore, submitted a report to the Fiftieth General Assembly, and that body found itself confronted by "The School Code Act" consisting of 437 pages. Moreover, the report was not submitted prior to the session as required and was not in the hands of the Legislature until approximately 1 month after it had begun its work. No action was taken on the recommendations of the code commission, therefore, but a second commission was authorized by the Legislature in 1943.

J. P. Street, deputy state superintendent of public instruction from 1939 to 1954, writing in 1950, listed 10 recommendations of the 1943 commission that resulted in school legislation. Two of these dealt with the department: One created state funds for the transportation of children and a division within the department to administer the law; the other established a division within the department for the special education of handicapped children. The remaining eight recommendations were concerned with county school administration, school district reorganization, teacher qualifications and contracts, school finance, and the closing of schools by boards of education (21).

Street also summarized three additional recommendations that had not been enacted into law by 1950. Two of these dealt with the Department of Public Instruction. The first called for a State Board of Public Instruction of seven members which would appoint the state superintendent, a deputy, and other personnel. The second recommended the discontinuance of the then existing State Board for Vocational Education and the transferring of its duties and powers to the new state board.

For many years the education profession in Iowa had been working to remove state education administration from politics. Back in 1910, State Superintendent John P. Riggs urged not only that such a change be made but also that the state superintendent be appointed. Iowa had an appointed state superintendent from 1913 to 1917, when
the position was returned to partisan politics. However, the
profession, under the leadership of the Iowa State Teachers
Association (later the Iowa State Education Association),
made continuous efforts to obtain the appointment of the
state superintendent by a lay board.

There was also influential support for such an
arrangement outside of the education profession. The
Brookings Institution was engaged by the Legislature to
make a comprehensive study of state government in the
early 1930's. These experts favored a lay board of educa-
tion to represent all the education policies of the public.
This board, the Institution said, should delegate the pro-
fessional aspects of education and the administration of
policies established by the board to an appointive state
superintendent or commissioner. The recommendation was
to abolish the educational examiners board, the voca-
tional education board, the vocational rehabilitation board and to
transfer their duties to the State Board of Education. As
this board already was operating the state institutions, it
was recommended that it should take over the public
schools as well (22).

State Superintendent Parker, in 1948, gave support to
such a reorganization of the three boards into one and the
appointment of the state superintendent. She stated as her
reason the danger of the lack of coordination among the
separate boards and divisions. As early as 1942, Miss Parker
had said that "the department of public instruction includes the state board for vocational education and the
board of educational examiners" (23).

The concept of an appointed superintendent also was
given support by another governmental reorganization
commission in 1950. However, this commission made no
recommendation for a state board. Reflecting the opinion
of political scientists for a strong executive, it therefore
recommended a commissioner of education appointed by
the Governor, with all phases of education the responsi-
bility of this one commissioner. The recommendation was
that the commissioner should appoint the superintendent
of public instruction (24).

The School Code Commissions of 1941 and 1943
made many recommendations for the improvement of
education in Iowa. As the effecting and implementing of
these would require a strong state education agency, the
recommendations for a State Board of Education and the
consolidation of the boards into one were enacted into law
by the Legislature in somewhat modified form in April
1953. This law gave extensive and broad powers to a State
Board of Public Instruction and to the state superintendent
of public instruction. It made the state board responsible
for vocational education as well as for the work of the
educational examiners. The state superintendent was to be
appointed by the board.

The Fifty-First General Assembly enacted several
important items of legislation that were recommended by
the commissions and that materially affected the legal
authority of the department. The act creating the special
education division has been mentioned. A transportation
division was also established by law. This accompanied the
reimbursement to school districts for transportation costs.
An appropriation of $2 million annually was made in 1945.
Such aid was designed to remove one of the obstacles to
school district reorganization, which was another recom-
mendation of the school code commissions.

Equalized educational opportunity, as recommended
by the school code commissions' supplementary aid to
schools, also was provided by the General Assembly. This
resulted in the creation of the administration and finance
division within the department and in the extension of
the authority of the state education agency, as school
officials were required to keep accurate financial and
attendance records. The department also set forth regula-
tions that required uniformity in the computation of
average daily attendance.

In 1947, the General Assembly strengthened the
reorganization law and placed additional responsibilities
with the state superintendent. Responsibilities and authority also were added in 1947 with the initiation of
general aid to school districts. The law providing for general
aid authorized the state superintendent to adopt necessary
and proper rules and regulations for the administration of
the chapter in the code that created the aid.

The newly created State Board of Public Instruction
held its initial meeting in January 1954 at the Hotel Kirk-
wood in Des Moines. Jessie M. Parker continued as state
superintendent, first executive officer.

Almost immediately the new state education agency
dashed with another branch of government when the office
of the state personnel director asserted its authority over
the department. However, at its meeting of January 1954,
the board received an opinion of Assistant Attorney General
Oscar Strauss that the Department of Public Instruction did
not come under the state personnel director. This was an
important ruling, for it enabled the department to remain
free from any possible political appointments, and it
strengthened the state board's authority as an independent
agency.

In June 1954, the state board met in executive ses-
sion and elected J. C. Wright as state superintendent.
Wright, superintendent of schools at Keokuk, Iowa, was
subsequently employed as a consultant to the board for the
period July 1, 1954, to January 1, 1955. This action pro-
vided for a smoother transition in the change of superin-
tendents.

The budget and financial control committee, a power-
ful interim committee of the Legislature, in an attempt to
obtain greater efficiency, employed Griffenhagen and
Associates to do four management improvement studies. The Office of the Superintendent of Public Instruction was one of the four state agencies included in the study which began in 1952. This work resulted in a recommendation for a greatly expanded state education agency: an increase from 11 divisions to 16, and the creation of two assistant superintendents to supervise the work of these divisions.

The Griffenhagen report pointed out the influence of the form of financial support for education on the organization of the state department. Although over three-fourths of the state aid to local school districts was for general education purposes in 1952, two of the special fields of instruction (vocational education and instruction of handicapped children) received the exclusive attention of 48 percent of the professional staff of the department (25). This made it difficult to provide a balanced system of instruction. However, it may have been equally difficult to obtain the emphasis needed to develop these special programs in the public schools without this accent at that particular time in history.

The Administration of J. C. Wright, 1955-60

J. C. Wright saw six major problem areas facing the department and the State of Iowa at the time he was appointed state superintendent of public instruction. These were —

1. The need for more adequate organization of school districts.
2. Upgrading of the preparation of teachers in Iowa and the development of a more efficient method of processing certificates.
3. The need to increase and improve consultative services to local and county school systems.
4. The need for a substantial increase in state funds for the support of local public schools.
5. The accreditation of schools and the establishment of standards for state approval of school districts.
6. The clarification of the relationship between the department and the colleges and universities in the preparation of teachers (26).

The administration of J. C. Wright was marked by the vigorous promotion of school district reorganization. Chapter 275 of the Iowa Code, which is concerned with the reorganization of school districts, had been rewritten by the General Assembly in 1953. Superintendent Wright used the techniques of personal appearance, publications, research, standards, and staff utilization to conduct this program.

The Legislature, recognizing that strong and positive measures were needed to accomplish the improvement of education in Iowa, delegated considerable authority to the state superintendent.

During the school years 1955-56 to 1960-61, the school districts of Iowa were reduced from 4,142 to 1,575. The number of non-high school districts was lowered from 3,334 to 1,013, and the reduction in high school districts was from 808 to 562. Standards for the approval of school districts were introduced in 1958, and the momentum of reorganization reached its peak in the 1959-60 school year.

The division of curriculum was created in 1958. However, it was in reality only a "paper" division for it had no new staff members. The division was created because of the recognition of a need for some special attention to curriculum. During the 1940's the state agency had published a number of curriculum guides for secondary schools. The creation of this division was an attempt to set up enough structure to enable the department to develop new handbooks.

In 1958, the department began preparation for involvement in the National Defense Education Act. Participation in this act resulted in a substantial increase in the authority of the department through implementation of the state plan that involved approval of projects. A substantial increase in staff took place in 1959. Eleven professional staff members, all of whom had responsibilities under the National Defense Education Act, were added to a professional staff of 51 the previous year, exclusive of vocational rehabilitation.

The Administration of Paul F. Johnston, 1961-

The period of Superintendent Johnston's tenure of office as the chief state school officer during the years 1961 through 1965 was also quite significant with respect to the legal authority of the department, the state superintendent, and the state board.

The newly appointed state superintendent outlined his proposed program to the state board in January 1961. In this report Johnston recommended the development of a long-range plan for the state system of public education in Iowa, which included vocational education, community colleges, adult education, and technical schools. In April 1961, House Resolution 6 was adopted by the Iowa House of Representatives. The resolution directed the Department of Public Instruction to study community colleges and vocational-technical education in Iowa and to make recommendations to the General Assembly in 1963. The sum of $12,000 was appropriated to finance the study.

Superintendent Johnston saw a need for combining the functions of the intermediate unit and the community college into a single district structure so that only one taxing unit and one governing board would be created. This actually would have resulted in no additional tax unit, but rather the replacement of the existing county board of education, which had taxing powers, with an area board. The department committee and the state advisory committee established to review and react to the work of the department committee concurred after deliberation over the pros and cons of combining the two functions under one board. The department report submitted to the
Sixtieth General Assembly subsequently recommended 16 such districts for the state.

Property tax supported the great bulk of the cost of public elementary and secondary education in Iowa in 1963. There were, therefore, those who opposed the department proposal because it contained the recommendations for part of the support of the area districts to be borne by a property tax. It was the position of the state education agency that an area community college should be responsive to the needs of the people of the area and should, therefore, be dependent on the area for at least part of the funds needed. The department also assumed that the burden on local property taxes for the support of public elementary and secondary education would be relieved and that its recommendation for such relief would not be ignored. The department recommendation was for the assumption of the building construction costs by the area district. It further recommended the sharing of the current operation expenditures by the state and the districts in proportions to be determined from time to time by the Legislature. The state agency also recommended the inclusion of the area districts in the foundation program when adopted by the General Assembly.

The department believed that the pattern of local area responsibility for capital outlay and state support for operation would be in the best interest of the state. This reasoning was explained in the following way:

The fact that the voters in an area education district are willing to assume the responsibility for capital outlay for their community college should constitute sufficient evidence of their belief in the value of this institution to warrant the state in making substantial contributions to operating costs (27).

The feeling against any additional property tax was quite strong in the rural-dominated Sixtieth General Assembly. There was also considerable opposition to the concept of combining the service functions of an intermediate unit and the education functions of a community college. This objection was given strong support by the junior college people in the state. Because of these objections and the conservative nature of the Sixtieth General Assembly, the recommendations of the department were not acted on in 1963. Had the assembly been in favor of reorganizing the county administrative units and the establishment of community colleges serving a number of counties, bills could have been drafted that would have separated the two and provided for state financing of the schools.

The proposal was reintroduced in the reapportioned Sixty-First General Assembly as two separate bills: one on area community colleges or vocational schools, and the other on merged county school systems. Both of them received a favorable vote and subsequently became law in 1965, thereby adding considerably to the responsibility and authority of the state education agency.

The department initiated automatic data processing in 1953. This service grew in importance, and in 1962 it was given division status. By this time it was making extensive use of its automatic data-processing equipment. The data from the various reports required by law and regulation were available for machine use. This capability, plus the experience and knowledge existing at the State University of Iowa and the Measurement Research Center in Iowa City, made feasible a complete educational information center that could bring the benefits of automatic data processing to bear on the problems of education.

Thus, the Iowa Educational Information Center was formally organized in December 1963 as a joint enterprise of the State Department of Public Instruction and the College of Education of the State University of Iowa. The purpose of the center was to collect and maintain a complete file of information about Iowa students, public schools, personnel, buildings, administrative units, and fiscal records. Paul F. Johnston had envisioned such a service some 4 years before. The center was to process this information, to provide a systematic feedback of it to the individual schools and agencies, and to have information available for research purposes. A coordinating committee was named, consisting of State Superintendent Johnston as chairman, Dean Howard Jones of the College of Education at the university, and Professor E. F. Lindquist, president of the Measurement Research Center.

The Iowa Educational Information Center is financed by the State University of Iowa, the State Department of Public Instruction, grants from the U.S. Office of Education and the Ford Foundation, and service fees paid by schools which voluntarily subscribe for such services as grade reporting and class scheduling.

The rapid reorganization of school districts pushed by the state department under the administration of J. C. Wright was not accomplished without some expression of dissatisfaction and resistance. In 1961, the Legislature mandated the submission of all department rules to it before they could become effective. While this law did not specifically single out any one department, it was the general belief that one of its targets was the Department of Public Instruction. An attempt also was made to again make the position of state superintendent elective, but this did not succeed. The department was taken to court, and in 1964, the Iowa Supreme Court declared Section 257.18 (13) unconstitutional (28).

Thereafter, the schools of Iowa operated without the guiding force of approval standards, and in 1965, the Legislature mandated approval standards to be written by the state board. This law gave much broader power to the board, the state superintendent, and the department than previously because it placed all private and parochial nursery, kindergarten, elementary, junior high, and senior
high schools under the jurisdiction of the state board in addition to those operated by public school districts.

The Sixty-First General Assembly added other responsibilities and authority to the state education agency in addition to those described above. Driver education was appropriated, and in addition to those operated by public school districts. High schools under the jurisdiction of the state board in

the department necessary. A departmental committee was

problems associated with

written a state plan. However, Congress fails to appropriate funds to be used by state departments of education which would enable them to hire additional personnel to prepare the state plan. This results in loading additional responsibilities on a historically already overloaded staff and the concomitant inadequate preparation of state plans. To this

must be added the effect the passage of the new legislation

comitant inadequate preparation of state plans. To this

were almost overwhelming. He indicated the office has been deluged by letters and communications from schools asking how they could make application for funds and that it was more than a full-time job of the present staff in trying to maintain some semblance of communication with the schools on current problems. This left no time for the solution of the major problem which was to write the state plan itself (29).

The implications of the Elementary and Secondary Education Act for the structure of the department were evident in the spring of 1965. Because of this legislation and enactments of the Legislature, the state board took up the proposed long-range plan for the organizational structure of the department in its April and May board meetings of that year. There had been two main staffing weaknesses in the past. One of these was that there was more work to be done than there were people available to do it. The second was that because of an overloaded staff there was no one with the time to plan, coordinate, and review the department's operation.

Effective July 1, 1965, the Department of Public Instruction experienced a major reorganization brought about by the rapid growth that had come and that was further necessitated because of the growth foreseen in the near future. The change in structure also was felt necessary because of the two weaknesses discussed above. The new structure provided for seven branches, each of which was headed by an associate superintendent who was not to be responsible for day-to-day operations. The associate superintendents were to have time to work together and coordinate the entire operation of the department. Another key aspect of the new structure was a planning and development staff which was to have the specific responsibility of working with the associate superintendents in the initiation of programs for the department. See Appendix B for the organizational structure effective as of July 1, 1965. It should be noted that important organizational features are lost in this chart. A new publications section was created within the internal services division. A noteworthy position, which does not appear on the 1965 chart, is that of administrative assistant to the state superintendent. This position was included with the planning and development staff.

On July 1, 1965, the Iowa State Department of Public Instruction consisted of 161 professional and 166 nonprofessional staff members. By December 31, 1965, there were a professional staff of 199 and a nonprofessional staff of 195.

FINANCING THE PUBLIC SCHOOLS AND THE STATE DEPARTMENT OF PUBLIC INSTRUCTION

The development of a state school support program in Iowa followed a similar pattern to that which evolved in the nation. Iowa went through the same stages, but it frequently was behind many other states. The efforts of the department to obtain financing for Iowa public schools evolved through three periods:

1900-22—Efforts to obtain and maintain state-distributed funds that would encourage selected programs

1922-36—Preparation and study for implementation of a state support program based on the foundation principle of equalization

1936-65—Repeated attempts to obtain state funds distributed on a basis that would equalize educational opportunity and the taxes necessary to provide such a program.

8
Superintendent John F. Riggs in 1905 initiated 60 years of effort by the State Department of Public Instruction to obtain state support for public schools. He recognized the possibilities for improving educational opportunity through the use of state funds and recommended their distribution on the basis of average daily attendance as an inducement to increase attendance.

The emphasis for a period of better than 25 years was on the use of state funds to improve the educational opportunities for rural boys and girls. In the period from 1911 to 1919, four different state aids were introduced to provide funds to accomplish this. Three of these were continued through 1948, when they were discontinued and replaced by general and supplemental aid. (See Table 1, Appendix C.)

Iowa could not embark on an equalization program of any magnitude during the 1920's and 1930's because the financial accounting of the schools was neither comprehensive nor uniform enough to make this possible. Iowa was not ready for such a program, and it was therefore necessary to educate the people of the state. Thus approximately 16 years were spent, from 1922 to 1938, in developing the techniques, knowledge, and accounting system necessary for the initiation of a state support plan designed to equalize educational opportunity.

Another 7 years passed, from 1938 to 1945, in which the educational campaign was paramount before supplemental aid in the amount of $1 million was provided by the Iowa Legislature. This marked the beginning of repeated and strong efforts on the part of the department, along with other groups, to obtain more adequate state support. These efforts have continued up to the present. Various plans were developed and pushed with considerable vigor by the department and other organizations, especially the Iowa State Education Association, during the 1950's and 1960's. The department provided the coordination and leadership of these efforts, none of which met with success because of the differences of opinion that existed over how the funds should be distributed.

A state educational agency is a creation of the State Legislature and is, therefore, what the lawmakers want it to be. The Legislature was dominated and controlled by rural Iowa during the first 65 years of the twentieth century. This being the case, the attention given education by the Iowa General Assembly consistently was rural-oriented. The state aids that were provided, although in very negligible amounts, were designed to improve the education of those living in rural Iowa. This was to be expected, not only because of a rural-dominated Legislature, but because the level of education in the rural areas was considered by contemporaries to be of a lesser quality than that in the cities of Iowa.

Because of the rural emphasis placed on state aid, the recruitment of staff was from the ranks of school superintendents and principals in Iowa's smaller school districts. The money provided for these positions was adequate because wage demands were low in this group. Also, Iowa never really recovered from the economic recession of 1920 and 1921.

Following World War II, considerable legislation that changed the department's role was passed by the Iowa General Assembly. New state aids were enacted into law. A state board with broad powers was created to make policy for all public education through the junior college. This board appointed the state superintendent, who also was assigned considerable authority and responsibility. A reorganization law was passed, which assigned the responsibility for accomplishment to local boards, the county superintendent and county board, and the state education agency. Beginning in 1958, Congress began enacting a series of laws that had the effect of changing the state education agency.

These state and federal laws brought about a change in the staffing of the department. No longer could a professional staff be recruited from the ranks of the school administrators in the smaller Iowa school districts.

The economy of the nation was on an almost continuous upward spiral after 1950, and professional staff increasingly became more difficult to obtain at all levels of education. Thus the department found it necessary to hire younger people to fill the new specialist positions. These people were, by and large, highly mobile young men, and the department found itself in competition for professional staff with the better school districts of the nation, colleges and universities, the U.S. Office of Education, other state departments of education, intermediate units, and other agencies.

Political influence had a direct effect on the financing of the department. When the state superintendent was elected, he was treated like any other head of a state agency with regard to salary. (See Table 3, Appendix C, for a comparison of the state superintendent's salary with those of other agency heads.) This, coupled with the fact that for a period of over 30 years Iowa's state superintendents were women, served to hold down the salary of the state superintendent. This condition carried over after the position became appointive and proved to be a real detriment to the department in obtaining staff. Too often its professional staff members were considered to be like any other state government workers by the Legislature and other state department heads. The Des Moines Register of April 17, 1959, said in an editorial:

"It would appear that the legislators have made the mistake of regarding these employees of the public instruction department, not as the professional educators that they are, but as just another group of statehouse employees doing routine jobs. This is sadly underrating the work of the department."
It was, therefore, difficult to obtain the funds necessary to adequately finance the department. The department's performance of the duties assigned it by the Legislature also had detrimental effects. As the state education agency worked on school district reorganization, it encountered considerable opposition, and this was reflected in the Legislature. The appropriations for the department were used by the Legislature to discipline the state agency.

Reapportionment somewhat changed the makeup of the Legislature, and increased funds were appropriated for the department in 1965. New federal laws also provided more funds. The National Defense Education Act, the Vocational Education Act of 1963, and the Elementary and Secondary Education Act of 1965 were of special significance in providing funds for the department. In 1965, the Department of Public Instruction found itself in a healthy financial position: Funds were available for its operation, and for the first time in many years it was competitive for professional staff.

LOCAL, STATE, AND FEDERAL RELATIONS

Local School Districts

The Iowa Department of Public Instruction had very limited contact with the school districts of Iowa until the 1950's. The staff was extremely small, and it was impossible to give anything but token service to the public schools of the state. School people of Iowa had very little awareness of the department for a number of years.

The efforts of the state department to bring about an improved school district structure have colored the relationship of the state agency with local school districts to a considerable extent. The consolidation movement in the early decades of this century provided for many people their only contact with the state education agency. This situation continued until 1935, and, while limited because of the large number of schools, these contacts did serve as a narrow bridge to some of the districts of the state.

The school district reorganization efforts of the Department of Public Instruction in the 1950's and 1960's created "the" relationship of the department with local districts. It also set the tone of the support with the Legislature.

The energetic zeal of State Superintendent J.C. Wright and the steady pressure of Paul F. Johnston were greatly responsible for the considerable progress made in school district reorganization. For every action there is a reaction, and the reaction to the department's efforts to bring about a change in school district structure erupted in each session of the assembly after 1957.

There were no special state funds to encourage school district reorganization after World War II. The department did considerable work to educate the people about the need for, and the advantages of, joining school districts together.

Under the leadership of State Superintendent J. C. Wright, approval standards were developed as prescribed by law. Many school districts could not meet these standards, and the disapproval of districts was used to promote reorganization. Considerable opposition developed to this procedure, and the subsection of the Code of Iowa that provided the authority for the standards was declared unconstitutional by the Iowa Supreme Court. The General Assembly subsequently wrote very stringent and detailed standards into law in 1965.

Beginning in the late 1920's, the department embarked on a program of elementary curriculum improvement. This was followed by the development of a series of 20 bulletins devoted to subject matter fields in the high school program. In the middle 1940's, a new secondary school curriculum project was initiated that resulted in the publication of a series of curriculum handbooks. The supply of these materials was exhausted by the late 1950's.

Many new developments and much new knowledge created a need for further work of this type, but the department did not have the funds necessary to finance a new curriculum project. However, the National Defense Education Act of 1958 made it possible to develop needed materials in mathematics, science, modern foreign languages, and guidance.

Over the years, the state department has been able to serve mainly as the initiator and coordinator of committees created to produce curriculum materials. The handbooks that have been published were possible only because of the unselfish and professional efforts of teachers, administrators, and college professors who donated their time and talents to the improvement of education in Iowa.

A state plan for the improvement of education was initiated in 1963. The state was divided into 16 areas in which the school administrators could work together to solve some of the problems facing the school districts. The plan was also designed to provide a closer working relationship between the department and local and county school systems.

The certification of teachers has important public relations implications for the agency assigned this responsibility. Such an assignment was given to the Department of Public Instruction in 1953, when there was a shortage of qualified people willing to teach. This shortage of teachers continues to the present day, and the department has been subjected to pressures to lower the requirements for qualification of teachers. There has been an increasing number of certified personnel to process because of expanding enrollments and because of a requirement that children in private schools be instructed by certified teachers. Additional complications and pressures were created by new federal programs and the growth of the junior and community colleges of the state.
The position of county superintendent of schools has been an important one in Iowa education. Because of its own limited staff, the state education agency has relied on the county superintendents to accomplish what otherwise could not have been done. Constant efforts have, therefore, been made to strengthen the position and to raise the qualifications for it to a professional level. The numerous rural schools in the state retarded the upgrading of the position for a number of years. The county superintendent has been an important factor in setting the tone of the relationship between the department and local school districts.

The department embarked on a rather ambitious data-collection program in 1965. This was called CardPac and was handled for the department by the Iowa Educational Information Center. CardPac required the completion of forms by both teachers and pupils. Included as a part of CardPac was a student questionnaire. Considerable opposition to CardPac developed because the teachers did not like to work with the system and because some people objected to the student questionnaire. There had been a breakdown in communication in introducing CardPac to the public schools; however, modifications in the experimental plan were made, and CardPac was continued.

The Iowa Department of Public Instruction has had a close relationship with the state organizations representing the teachers of Iowa and local school boards. The state education agency played an important role in the early development of the organizations representing both of these groups.

Relations with the Teachers Association

A state teachers organization held its initial meeting in the courthouse in Muscatine in May 1854. The purposes of the new organization were to promote the educational interests of the state, to improve teaching, and to elevate the profession of teaching. Eleven of the 18 founding fathers of the association were school administrators. One of them, D. Franklin Wells, later became state superintendent during the association's early years by school administrators was important and set the tone of the relationship between the department and local school districts.

The department embarked on a rather ambitious data-collection program in 1965. This was called CardPac and was handled for the department by the Iowa Educational Information Center. CardPac required the completion of forms by both teachers and pupils. Included as a part of CardPac was a student questionnaire. Considerable opposition to CardPac developed because the teachers did not like to work with the system and because some people objected to the student questionnaire. There had been a breakdown in communication in introducing CardPac to the public schools; however, modifications in the experimental plan were made, and CardPac was continued.

The Iowa Department of Public Instruction has had a close relationship with the state organizations representing the teachers of Iowa and local school boards. The state education agency played an important role in the early development of the organizations representing both of these groups.

The Better Iowa Schools Commission of 1911-12 must be ranked as one of the crowning achievements of the cooperative efforts of the department and the association. The commission was suggested and chaired by Superintendent Deyoe, and it was made possible only through the cooperation and financial contribution of the ISTA. Eighteen recommendations were introduced in bill form in the Legislature, and 13 of them became law.

The association and the department have, on the whole, had common or similar legislative goals in the past 20 years. Both organizations have worked for school district reorganization, improved state financing of public schools, and the strengthening of local and county school administration. Cooperative efforts also were made to
obtain improved state school administration in the early 1950's, although the association goal differed from those of the department for many years.

Probably the most notable example of cooperative legislative effort has been in the area of state financing of the public schools. With the exception of one instance, the two organizations have worked almost hand in hand to obtain adequate state financing.

There were strained relations between the department and the ISTA during the administration of May E. Francis. It was stated in *Midland Schools* that opposition in Iowa on the part of the state superintendents to organized teachers had been neither general nor chronic. Rather, it said, the Iowa situation in 1925 was unique among the states and unusual in its own history. It said that instead of offering opposition, most state superintendents in the nation worked harmoniously with teacher groups because the cause of education was of such vital concern to the state and nation that active cooperation between the forces interested in schools was necessary to accomplish their task (30).

Miss Francis had campaigned in 1922 on a platform of economy and improvement of the rural school, but she called for retrenchment in consolidation. She said that if she were elected, "Fads and fadism shall not run rampant like a hungry lion." She was for "progress and advance for the smallest school unit—the rural school" (31). The opponents of Miss Francis spoke of progressive education measures. It follows that Miss Francis did not endeavor herself to the majority of the members of the ISTA.

Superintendent Francis was investigated during the last week of the special session of the Fortieth General Assembly in April 1924. For many months, charges were circulated around the state concerning alleged illegal and unfair acts by the department. Miss Francis was charged with raising the grades of teachers to unfair acts by the department. The matter was not settled, and Miss Francis left public office after her term as state superintendent was completed.

The Department of Public Instruction and the Iowa State Teachers Association were not in accord on the method by which the state superintendent should be selected. This situation existed until approximately 1949. The ISTA reiterated its policy in favor of the appointment of the state superintendent by the state board quite consistently over the years. State Superintendent Samuelson avoided conflict by openly refraining from stating a position on the issue until 1938, when she publicly recommended the appointment of the state superintendent of public instruction.

Jessie M. Parker succeeded to the state superintendency in 1939. Whereas Miss Samuelson's administration had been marked by a very smooth and cordial relationship with the ISTA, Miss Parker's was somewhat strained from time to time. During her 16 years in office, education became a highly controversial field. Problems of financing public schools, school district structure, and teacher certification grew during these years. Following World War II, schools came under attack generally as an aftermath of the war and as a result of the uncertainty of the world situation.

Personalities were brought into the fight for an appointive state superintendent in 1945. They were introduced by name in behind-the-scenes maneuvering and by implication. The personalities involved were Agnes Samuelson, executive secretary of the Iowa State Education Association, and Jessie M. Parker, state superintendent of public instruction. The implication was that a "feud" was on between the two and that Miss Samuelson wanted the superintendency back.

In 1945, the *Cedar Rapids Gazette* reported that the two ladies did part company on the appointive bill. Their organizations were, however, in accord on the other school bills. Miss Parker was said to have been working through subordinates to keep the office elective. Miss Samuelson, along with her subordinates, worked to make the office appointive. Miss Samuelson maintained that the stories were not true and that they were circulated to kill the bill. Miss Parker was of the opinion that making the office appointive would open it more widely to politics than under the elective system.

The association dropped its push for an appointive state superintendent until 1949. Miss Parker had begun working for an appointive state superintendent late in 1948. However, the association was still at odds with Miss Parker. Harvey Hill of Des Moines, president of the ISEA, said that a letter opposing the reorganization of the department had been sent to some association members. Officials of the association "did not deem Miss Parker's attitude satisfactory in regard to either reorganization of the department of public instruction, or cooperation with the ISEA and educational officials in Iowa" (32).

In 1952, the department and the ISEA joined forces in sponsoring a bill for the reorganization of the state education agency with an appointive state superintendent. The superintendent was to be appointed by a board elected by school board members from each congressional district, with one member appointed by the Governor. This was the first time the two organizations had reached agreement on this issue.

The arrangement was a compromise. Miss Parker favored an elected state board that would appoint the state superintendent. Charles F. Martin, then ISEA executive secretary, advocated a board appointed by the Governor, which in turn would appoint the state superintendent. This
compromise on the method of selecting the board, as well as the cooperative efforts of the two organizations, resulted in enactment of the measure into law.

The Iowa State Education Association and the State Department of Public Instruction worked very closely together over the years to obtain adequate state sharing in the costs of the public schools. On one occasion this cooperation broke down, and friction temporarily resulted.

The Iowa State Education Association included the minimum foundation program recommended by the committee on educational finance in its legislative program in 1950. In fact, it was given first place in the discussion of legislative goals in *Midland Schools*. However, 2 months later, the ISEA withdrew its support of the program. Charles F. Martin, executive secretary, stated that there was not sufficient time to disseminate information essential to the successful promotion of the program (33).

This created considerable friction within the educational profession of the state. It is significant to note that the only increase in the amounts appropriated for state support of schools in the 1951 legislative session was $200,000 for vocational education. No other highly important educational legislation was passed at this time.

**Relations with the School Boards Association**

The beginning of an organization representing the school boards of Iowa is somewhat hazy. There is evidence that school boards met together in annual sessions as early as 1894, with the proceedings published by the superintendent of public instruction. Such publication ended after 1905.

An association of consolidated school boards was formed in 1920 as a result of a meeting of the National Conference on the Consolidation of Schools held on the campus of Iowa State Teachers College at Cedar Falls.

In 1933, the department began the sponsorship of an annual conference for boards of education. The department was requested to assist in the organization of a state school board association at the fourth annual conference sponsored by the department. Such organizational work did get under way in 1936.

The early conferences for school board members were held in February, but later they were conducted during the last week of March immediately following the reorganization of boards of education. Prior to the 1950's, school board elections were held in March.

By 1938, the Iowa Association of School Boards was holding an annual meeting in Des Moines during the convention of the Iowa State Teachers Association. The state superintendent of public instruction gave recognition to the association for the considerable amount of work that had been done to improve the service of boards of education.

The department was feeling its way in attempts to provide leadership to the school boards of the state in the 1930's. Obviously, a meeting attended by only 350 of over 21,000 school board members was not a very effective way in which to make a great impact. Therefore, the department took the meetings out into the state where the school board members were.

Conferences for school board members and superintendents were organized and promoted in half the counties of the state during the biennium ending in 1940, and they were planned for the other half in the next biennium. The importance of school budgeting was stressed in these conferences, and principles of state support and equalization of tax burdens were discussed.

The Iowa Association of School Boards became an established and permanent organization under the leadership of Don Foster, its first full-time executive director. Generally, it has enjoyed a cordial and cooperative relationship with the Department of Public Instruction because of the efforts of the executive directors and the state superintendents. Regional meetings were cosponsored, and the department furnished considerable talent for the annual meetings.

No major points of disagreement have developed between the two organizations. The one area in which some difference in policy can be found has been in that of the method by which the state should participate in the financing of the public schools. In its representative assembly meeting of November 1962, the IASB voted to work for a minimum of 25 percent of total school costs to be paid directly to school districts from state funds. It also recommended that an equalization feature be incorporated into any plan for the distribution of state moneys.

However, the January 1963 issue of *The Iowa School Board Bulletin* stated that the IASB had not endorsed any one plan for increased state aid to schools, and it was thus left free to evaluate the different proposals made. The minimum foundation plan recommended by a legislative study committee and by the State Department of Public Instruction was described.

Also discussed in this issue was the Nelson Plan for state aid, which provided for payment of state funds on a per-pupil basis with no equalization factor. This plan also included a “bonus,” which provided for the payment of more state aid for any reduction in per-pupil expenditures. In addition, those districts that had a smaller increase of expenditures were to receive “bonus” aid. Thus the wealthy district, which had been spending at a high rate, could reduce expenditures or hold the increase to a minimum and receive more state aid. This was the opposite of an equalization factor.

The views of the Iowa Association of School Boards and the Department of Public Instruction differed somewhat 2 years later when a proportionate sharing plan was recommended by the state education agency.
In 1963, when the state board and the state superintendent were under fire in the Legislature because of school district reorganization, the IASB came out against making the position of state superintendent elective, considering such a move as a backward step.

**Relations with Agencies of State Government**

Although the Department of Public Instruction has maintained amicable relationships with many agencies of state government, the best of these, as would be expected, have been with those departments or boards interested in some phase of the educational program.

There has been a notable relationship with the State Department of Health dating back to at least 1936, when a course outline for health and physical education in the elementary school was prepared. All the agencies of the state having to do with health and physical education cooperated in the production and distribution of the outline under the leadership of the Iowa Physical Education Association. The bulletin produced was printed by the State Department of Health because the Department of Public Instruction did not have the necessary funds. Over the years the two agencies have developed and distributed similar materials.

There has been a close working relationship with the Department of Public Safety. In 1938, the motor vehicle division published and distributed safety education bulletins at the request and with the cooperator of the state department. Safe school bus transportation has been a shared goal. The state highway safety patrol has cooperated since 1937 in a program of school bus inspection and has been helpful in instructing school bus drivers.

Relations with some agencies of state government have not always been smooth. The physical needs of the department must be approved and allocated by the State Department of Health because of school district reorganization, the IASB came out against making the position of state superintendent elective, considering such a move as a backward step.

**Relations with the Federal Government**

Iowa has been hesitant about accepting federal participation in school affairs. A wary Legislature delayed participation in the National School Lunch Program. Once enabling legislation was enacted, it was done in a way that indicated considerable skepticism about continuance of the program by the federal government.

For a number of years, the State Board of Public Instruction took a neutral attitude about federal aid. While it authorized participation in such programs as the National Defense Education Act, it did not come out for or against the program. As to further participation, the department staff was informed that the state board's position was one of neutrality.

The board discussed the pros and cons of federal aid at some length during its February 1960 meeting. It was the consensus of the members that while they did not think federal participation in education was necessarily needed in Iowa, it would probably be authorized by Congress eventually. The board was of the opinion that if this did occur, such funds should take the form of grants to the several states to be administered by the state departments of education.

Iowa has steadfastly maintained the position that there should be a minimum of federal control. It also has taken the position that the state rather than the federal government should supervise the operation of the federal programs. It has insisted that the federal government deal with the state education agency, which in turn would deal with local school districts.

While the department has maintained this position, it also has attempted to meet faithfully the intent of federal legislation. Thus, while some states have allocated federal funds on a per-pupil basis, Iowa has required local school districts to plan and show how the project submitted met the intent of the law and would specifically improve instruction in the particular area concerned.

Under the National Defense Education Act, local school districts have been required to submit projects indicating considerable planning. This has resulted in a
certain amount of complaint from local school administrators who have found at national and regional meetings that some other states required little or no such planning. Thus the department's position has been one of state operation and control within the guidelines and intent of the federal legislation.

EDUCATION IN KANSAS PRIOR TO 1900

Education was wholly unorganized during territorial days under the Kansas-Nebraska Act of 1854. This stormy, unsettled period saw proslavery and antislavery forces fight to control the newly formed territory. First one side and then the other formed a government, the voters adopting three constitutions before approving the “Wyandotte” Constitution under which Kansas became a state.

The curriculum and the quality of instruction for those schools that existed, and whether to establish a school at all, depended entirely on the people in each community. Neither the 1855 nor the 1857 Legislature, each proslavery, provided for territorial supervision, but when the first free-state Legislature met the next year, it created an office officially designated as the “territorial superintendent of common schools.” The first superintendent, James H. Noteware, served only 9 months and left no record of his official acts except a recommendation for textbooks. His successor, Samuel Wiley Greer, the first elected territorial superintendent, traveled extensively and recommended improvements in the schools, demonstrating the important task of the new office (1).

Academic achievement played a minor role with the immigrant farmers of the state, but they came determined to build a better future for their children. The pioneers brought with them a desire for education and the hope of religion. Schoolhouses of rude pattern, built of logs or sod, sprang up everywhere. They were used for the dual purpose of education during the week, and devotional exercises on Sunday. The building of any schoolhouse in any neighborhood was an event of more than passing interest. They were frequently built before a regular organized district was set apart and any taxes were levied for schools or school buildings (2).

Peter MacVicar, state superintendent from 1867-71, stated in his report on the sanitary conditions found in these schools: “It is evident that very great neglect extensively prevails. Very many of the edifices have no outhouses at all. Only a few have one each, and rarely are schoolhouses provided each with two such conveniences” (3).

MacVicar’s successor, Superintendent Hugh D. McCarty, vigorously attacked the primitive conditions of the schools, visiting each county biennially, interpreting school laws, and holding annual teachers institutes in each judicial district. But he found the job too much for one man. In his 1872 annual report, he requested that he be allowed to hire two clerks to assist him in the time-consuming duties of carrying on correspondence with other states, providing blanks and forms for school reports, publishing school laws, and preparing the annual report—particularly since he was also busy interpreting school laws, serving as secretary to the Commission for the Permanent School Fund, and attending State Board of Regents’ meetings.

In his report, McCarty further recommended that the Legislature establish a State Board of Education, provide for uniformity in textbooks, and compel every healthy boy and girl to attend school for at least 4 months each year. He deplored the meager financial support provided his office, pointing out that his $1,200 salary compared unfavorably with 14 other states (4).

The 1873 Legislature, acting on the superintendent’s recommendations, created a State Board of Education and prescribed its duties. For the most part, the new law limited the board to issuing certificates and diplomas that were to be valid in any school district during the life of the holder. Applicants not qualified for the diploma could take an examination for certificates valid for either 3 years or 5 years. The frugal character of the Legislature was reflected in a concluding limitation: “The provisions of this act shall be carried out without expense to the state” (5). It was to be 20 years before a $300 annual appropriation was voted to cover members’ expenses to attend state board meetings. Formerly, the superintendent was by himself the entire state agency for education, making policies and administering them. Under the newly formed State Board of Education, he spent even more time on clerical duties. His success in developing programs depended mainly on his initiative, because the law provided him little authority to exercise leadership.

Both the Board and the State Superintendent participated in administering such programs as the preparation of courses of study for county institutes and the public schools, and in the accreditation of colleges. In many cases both the Superintendent and the Board seemed
responsible for developing policy. The actual practice for dividing duties and allocating responsibility remains obscured in the informal practices. Coordination of effort was achieved, apparently with success, by the dual role of the Superintendent as the leading member of the State Board of Education and as an independent officer responsible for the Department of Education (6).

Following McCarty's recommendations, the Legislature enacted a Compulsory Attendance Law in 1874 requiring children aged 8 to 14 to attend school. Many schools operated only 3 or 4 months of the year, however, and the law gave school boards the authority to grant children exemptions from attendance. The law was further weakened by a provision allowing home instruction to be substituted for school attendance in preparing the child for his examinations (7).

The first session of the Legislature created a Board of Commissioners, authorized in the constitution, to manage the permanent school fund. Today, as then, the board consists of the state superintendent of public instruction, secretary; the secretary of state, chairman; and the attorney general. The fund itself receives money collected from the estates of persons dying without heirs or wills and from the sale of school lands—mainly sections 16 and 36 in every township—which Congress set aside for the schools. The board had the responsibility of investing the permanent funds wisely since only the interest can be used for the schools. Today all of these lands have been sold, but earlier superintendents worried about speculators' gaining control and diverting the funds from the schools. Superintendent MacVicar uncovered several instances of questionable practices. He also found one serious loophole in the regulations: the authority of county treasurers to hold private sales. Too often, none of the bids equaled the appraised value (8).

The 1897 Legislature exercised a profoundly beneficial effect on education in Kansas for the next 60 years by following the recommendations of several early superintendents and creating a School Textbook Commission to administer a uniform, statewide adoption program. The state superintendent served as ex officio chairman until 1945, when the commission's functions were assigned to a lay state board, leaving the superintendent with no jurisdiction over a most important educational activity. The commission's functions had simply been superannuated by new instructional techniques, better-prepared teachers, and the new availability of a wide variety of materials. The transfer marked virtually the end of statewide textbook adoption.

THE LEGAL FRAMEWORK FOR KANSAS EDUCATION

By 1900, most of the legal structure for Kansas education's next 45 years of development had been established in rudimentary form. The "Wyandotte" Constitution, under which Kansas was admitted to the Union in 1861, had created the Office of State Superintendent of Public Instruction, provided the authority for the Board of School Fund Commissioners, formed a State Board of Education to certify teachers, and established a system of common schools and higher education. Until the mid-1940's, most statutory revisions were evolutionary, though superintendents continuously called for extensive improvements.

The constitution provided for a county superintendent of public instruction in each county, and the Legislature, following a pattern set by the 1858 Territorial Legislature, assigned each superintendent the task of dividing his county into school districts (9). With "convenience" the only stated criterion to guide them, county superintendents tried to found schools within walking distance of most pupils. In general, they tried to establish schools at 2-mile intervals in populated areas, each within a district governed by a three-man board. By 1896, 35 years after Kansas became a state, 9,284 school districts had been created, which until 1945 required a veritable army of more than 24,000 school board members, who outnumbered the state's teachers by several thousand.

Many thousands of New England immigrants familiar with the town-meeting form of government brought to Kansas that statutory framework for their school districts. The districts' electors conducted business in annual meetings on such issues as the election of board members, the spending of school funds, the length of the school year, and the schedule for each term. In turn, the elected boards employed the teachers, kept the building in repair, and purchased supplies.

This form of school government, operating in all districts except those of first- and second-class cities, remained in effect until the school district unification programs of 1963 and 1965 placed unified districts under the jurisdiction of boards of education (10). Usually, only a handful of electors attended most annual meetings, but if controversial issues aroused the citizens, the meetings could, and sometimes did, degenerate into little more than mob scenes at which an unpopular teacher or board member suffered verbal crucifixion. Before this type of government was abandoned, some districts and urban areas with populations running into the thousands found the annual meeting an anachronism that painfully exemplified the difficulty of revising governmental procedures.

In 1876, the Legislature changed the law to allow other types of school districts to organize. Several first- and second-class cities took advantage of the law to form districts differing from those established by county superintendents. These city districts, according to the 1876 legislation, were governed by autonomous boards of education operating outside the jurisdiction of county superintendents. But the district structure still had weaknesses. The superintendent's report in 1895 noted that 390 districts were not operating any schools. Despite a growing demand
for high schools, thousands of small common school districts did not have sufficient pupils or financial resources to maintain them. Only 11,508 students were enrolled in public high schools in 1900, but the number more than doubled during the following decade.

As high school enrollment increased, the Legislature did not realign existing districts so that they would have sufficient population and financial resources to support 12 grades, but rather formed several types of high school districts. Operating under governing boards separate from those responsible for the first eight grades, these new districts usually included all or parts of several common school districts. The movement finally developed into a double-decked system of districts with diverse boundaries, mainly because citizens had a fierce loyalty to the “home district,” reluctant to relinquish control of their elementary schools, and, in some instances, opposed higher taxes. One state department staff member observed that many taxpayers fought to maintain the school district status quo as though their small inefficient districts had been let down from heaven in a basket.

The first units providing only secondary education were authorized in 1886. Any county with 6,000 or more inhabitants could establish a high school district. Within a few years, an increasing number of common school districts were extending their programs to include high school courses. When this occurred in county high school districts, the residents of the common school districts were faced with double taxation; not only did they have to pay for the county high school, but they also had to support the local high schools—all without outside financial assistance. Quite understandably, county high school patrons resisted any change which threatened to wipe out these tax resources. The issue was not fully resolved until 1923, when the county high schools were designated as community high schools, to be supported by all in the county who were not included in another high school district.

The 1911 Legislature enacted a law authorizing the establishment of township high schools. It was repealed 4 years later in the face of a new act creating rural high school districts. If 40 percent of the area’s electors petitioned, the people could call an election to vote whether they should establish a rural high school district. According to the original legislation, high schools formed under districts of this type were governed by annual meetings and school boards similar to the common school districts. Operating under governing boards separate from those responsible for the first eight grades, these new districts usually included all or parts of several common school districts.

The 1915 Legislature authorized the state board to employ a secretary, who, in the words of the law, “shall be an expert in education,” to serve as inspector of colleges and universities accredited by the state department of education. After 42 years of confusion, the state department’s time had come.

The state’s rapidly expanding population demanded an increasing number of high schools, which in turn created a need for more 4-year higher education institutions to prepare more teachers. As in other states, schoolmen and the public realized that better procedures for accrediting high schools and teacher education programs were necessary, as was improved instruction at all levels. The 1915 Legislature authorized the state board to employ a secretary, who, in the words of the law, “shall be an expert in education,” to serve as inspector of colleges and universities accredited by the state board and to have charge of all matters relating to teachers’ certificates. It also directed the board to prescribe courses for the normal institutes and to act as the sole authority in defining official standards of excellence in all matters relating to the administration, course of study, and instruction in the public schools. It could then accredit schools adhering to these standards. To help the superintendent facilitate these improvements, the legislation enabled him to add two elementary and two high school supervisors to his staff.

Other forward-looking recommendations by Superintendent Ross were not enacted for many years. Only in 1941 were his suggestions for expanding the health and physical education programs and establishing a teacher retirement program heeded. And it was not until 1966 that the Kansas electorate approved a constitutional amendment making the position of state superintendent of public instruction appointive.
When the Legislature created the education department, it failed to take seriously the constitutional provision that "the State Superintendent of Public Instruction shall have the general supervision of the common school funds and educational interest of the state . . ." (13). Instead, it placed such supervision and policy-making powers in the hands of the state board. The constitutionality of giving the state superintendent a minor role in relation to the state board was later challenged. In 1947, and again in 1965, although the Kansas Supreme Court ruled against delegating powers to other boards, it did uphold the Legislature's delegating these powers to the state superintendent of public instruction.

The State Department of Education carried on its activities for the first 30 years with no significant change in its legal structure. Finally, in 1945, the Legislature restructured it as the State Department of Public Instruction, defining it as the state superintendent of public instruction and the State Board of Education. The professional educators, who composed the board since its creation in 1873, were replaced by laymen, and the relationship of the board to the superintendent was radically revised. The Legislature stripped the state board of its direct jurisdiction over teacher certification, elementary and secondary school accreditation, junior college supervision, teacher education programs, curriculum development, and other activities, placing them in the hands of the state superintendent, who would develop policies to be approved by the board. Thus, as an arm of the state department, the state board's dominion was limited to approving or disapproving the superintendent's proposals and serving as an advisory body.

This action was a step in recognizing the constitutional status of the state department, but it was not the paramount reason for changing the legal patterns established in 1915. Superintendent W. T. Markham, who provided outstanding leadership from 1932 to 1939, was esteemed by school leaders throughout the state. A Democrat, he had been swept out of office in the 1938 election on a tide of political change. Friction developed between political leaders and educators strongly represented on the professional state board, which in turn led to differences between the board and the superintendent who succeeded Markham. It was finally apparent to the legislators that this unrest was seriously affecting the department's ability to lead (14).

Other serious problems arose. No clear-cut lines of demarcation separated the functions of the professional board from those of the state superintendent. The department suffered from a poor image and inadequate financial support. It was short of staff members, and the annual budget of less than $40,000, together with the minimal sum collected from teacher certificate fees, could not finance its operations.

In moving from a professional to a lay board, the Legislature prescribed the Governor's limitations in appointing board members (15) and listed the required qualifications for candidates to the superintendency (16). Prior to this, any candidate receiving a plurality in a statewide election became eligible if he met the resident requirements applicable to all elected state officials.

Although the 1945 legislation provided a legal framework for cooperative action between the state board and the state superintendent, the transition from a predominantly professional board to a lay board and the removal of the state superintendent from membership and ex officio chairmanship of the board created unforeseen problems. The lay board had no legally designated professional leadership in the adoption and printing of textbooks. These duties, transferred from the School Book Commission to the professional State Board of Education in 1937, remained in the hands of the lay board and outside the jurisdiction of the superintendent. Thus, the official responsible for developing courses of a study and supervising instructional programs in the public schools had no voice in selecting a major tool with which these activities were carried on.

Another problem arose because the state superintendent was given no official connection with the lay board's administration of vocational programs in secondary schools, junior colleges, or area-vocational schools. The state board is legally the vocational education board, administering these programs under its own budget and appointing its own administrative officer. In effect, this means that Kansas has two state departments.

The Department of Public Instruction's continued growth necessitated an internal reorganization in 1955. Three divisions were established: administrative services, instructional services, and teacher certification and accreditation - - each under a director and divided into sections also headed by directors. With the exception of the sections added since 1955, the department was reorganized according to the chart in Appendix B (17).

Since 1945, there have been increasing demands for more services from the department. School administrators, lay organizations interested in education, and special-interest groups concerned with adult education, driver education, and the state scholarship program applied considerable pressure, and federally financed activities led to even more calls for assistance. Perhaps another factor contributing to the department's expansion during this period was its growing prestige and competence in the eyes of legislators and the state and local agencies.

This increased interest in the department gave new impetus to a reorganization calling for an elected lay board, which the Kansas Teachers Association and other organizations had recommended for years. In 1955, the superintendent and his staff published a statement calling for an elected lay board with power to appoint a commissioner of education as its chief administrative officer (18). A report published in 1960 covering the entire Kansas system of public education from kindergarten through the university
and conducted by out-of-state personnel aroused further interest (19). Its recommendations pertaining to the state department were similar to those proposed by the superintendent in 1955.

The report didn't have to point up a number of the problems because they were all too obvious. The division of responsibility among several state agencies had become increasingly unsatisfactory as educational programs had expanded and federally sponsored activities multiplied. The Highway Department administered school transportation; the Budget Division handled surplus commodities for the schools; the Kansas State High School Activities Association controlled interscholastic competition in athletics, music, and forensics; and the State Board of Education supervised vocational education and rehabilitation services as a separate agency outside the State Department of Public Instruction. Also, the election of a state superintendent every 2 years on a partisan political ticket often hampered continuity in administrative policies. The Kansas Supreme Court raised questions about the constitutionality of the State Board of Education's administering the vocational programs.

The problems and pressures continued to build, until the 1965 Legislature stripped the board of functions it had performed for 20 years and increased the authority of the state superintendent. The junior colleges were put under his direction, and he could now, without board approval, enter into agreements and develop plans with federal agencies for federally financed programs. The governing body of a newly created state technical institute included the state superintendent and two other persons appointed by the Governor, with no voice given to the state board or any of its members. The following year, the Legislature amended the State Constitution to create a State Board of Education composed of 10 lay persons to be named by the electors of 10 board-member areas as determined by the Legislature (20). The board would then appoint the state commissioner of education. When the amendment was submitted to the electorate in the general election, they not only approved it by a substantial majority, but they elected a state superintendent for a 2-year term, allowing the Legislature that much time to work out the details for electing a board of education. The amendment was to be in full operation not later than January 1969.

In reviewing the legal framework of the State Department of Public Instruction, it is necessary to take a close look at the State Department of Administration, an office that exercises control over all state agencies. This department, created by the Legislature in 1953, includes a finance council, an executive director, a budget division, an accounts and reports division, a purchasing division, a personnel division, the state architect, and other employees. Not only must the state superintendent's clerical and secretarial appointments be made from lists of qualified persons provided by the personnel division, but the division also establishes the standards for professional staff members. The state superintendent's annual budget is submitted and reviewed by the budget division before it is presented to the Legislature. The purchasing division must approve all orders for equipment for the superintendent's office in excess of $50; supplies and materials are generally purchased under open-end contract arrangements made by the purchasing division. New positions can be established by the education department only with the approval of the finance council, a six-member body composed of the Governor, the lieutenant governor, and four legislative leaders. The state department obviously is not an autonomous agency.

Aside from the time required to work through the administration department, however, the system has proven to be quite satisfactory. In fact, personnel in the budget division have testified before the Legislature and its committees about the department's financial needs. For example, it simplifies the process of selecting competent clerical, secretarial, and professional employees. The state department should increasingly benefit from working with the administration department as the latter unit's leaders become familiar with educational problems.

EDUCATIONAL PROGRAMS IN KANSAS
AND THE ROLE OF THE STATE
DEPARTMENT OF PUBLIC INSTRUCTION

The State Superintendent of Public Instruction

The state superintendent, an arm of the state department, is the chief state school officer with powers granted by the Legislature under authority of the State Constitution. Traditionally, the office in Kansas has been regarded as a minor one and is still so considered, despite the heavy responsibilities assigned to it in recent years. Not only must the superintendent lead the department, but, as pointed out earlier, he has sole responsibility in many areas. He is the state authority for junior colleges, he enters into agreements with federal agencies for administering several government-financed programs, he presents the department's budget for the Legislature's approval, and he makes the final decisions on many issues respecting school district organization and boundary changes. In addition, he appoints staff personnel, addresses numerous educational conferences, keeps in close touch with institutions of higher education, and holds many interviews and informal discussions. The Legislature looks to the superintendent for recommendations for improving the state's educational program. He is subject to a thousand pressures as he backs up staff members who handle school district problems and who administer teacher certification, accreditation activities, distribution of state funds to schools, and other departmental programs.

By law the state superintendent is an ex officio member of several other state agencies. He serves as chairman of the state teacher retirement board; chairman of the
budget review committee, which administers expenditure
limitations required by the school foundation finance act;
and chairman of the governing board of Schilling Institute,
a state technical school. He is also secretary of the school
fund commission, which administers the permanent school
fund, and a member of the executive council, composed of
elected state officials. He cooperates with a member of
unofficial agencies that work to improve education, such as
the Kansas State Teachers Association, the Kansas Associa-
tion of School Administrators, the Congress of Parents and
Teachers, and the State Association of Boards of Educa-
tion, and is on the executive committee of the Mid-
Continent Regional Education Laboratory, which has its
headquarters in Kansas City.

W. C. Kampschroeder, who served as assistant state
superintendent most of the time after joining the staff in
1951, has been instrumental in developing a spirit of coop-
eration between the department and other state agencies.
He has established good working relations with the State
Department of Administration and its subdivisions, since
the State Department of Public Instruction's activities are
channeled through the assistant superintendent's office.
Kampschroeder was appointed state superintendent in
September 1966, following the resignation of Adel F.
Throckmorton, who had filled the post since January 1949.
Kampschroeder was then elected to serve a full 2-year term.

Since federal programs are administered in most
segments of the department, a coordinator of federal pro-
grams, reporting directly to the state superintendent and his
assistant, acts as a central clearing agent and keeps informed
about educational developments at the federal level. Other
personnel working outside the department's three divisions
include a personnel director; a director of what is known as
the Iowa Project, a cooperative endeavor involving Mid-
western states in the development of a new and unique
educational information system for facilities, finance,
pupils, instructional programs, and personnel; and a di-
rector of information, who edits Kansas Schools (the offi-
cial publication of the department), edits teacher guides,
writes news releases to keep the public informed about
educational developments, and assists in orienting staff
members.

Department Status Improved

The state superintendent, more than any other person,
shapes the department's image and constantly appraises the
effectiveness of its public relations. In the early days of
statehood, the department was either ignored or considered
to be a necessary evil, but abundant evidence suggests that
legislators and the public in general have learned to
appreciate it more, especially in the last 10 years. Perhaps
the first Sputnik and the fear that our schools were not as
good as Russia's contributed to its new status. Most as-
sumedly did a series of supreme court decisions firmly
establishing the state superintendent as the constitutional offi-
cer to whom the Legislature can delegate almost unlimited
powers in the field of education. One example of this in-
creased confidence is the power granted the state superin-
tendent to administer the 1963 and 1965 school district
reorganization laws. He had been bypassed by the 1945 and
1961 acts, both of which were declared unconstitutional by
the Kansas Supreme Court.

The Division of Instructional Services

George Clelland, former president of the National Associa-
tion of Secondary School Principals and director of the
Division of Instructional Services (21) since its formation in
1955, heads the staff of 28 professional assistants, divided
into five sections, working to upgrade the instructional
programs in the Kansas schools.

The development of educational programs and activi-
ties from 1900 to 1965 and their relationship to the state
department are outlined under the department's appro-
priate divisions as indicated in this section. In the past,
some have been administered by the superintendent, some
by the state board, a few under organizational patterns that
no longer exist in the department, and others by outside
state agencies.

From the time the first Kansas schools opened, the
state superintendents have played an important role in
certifying teachers, supervising institutes designed to raise
teacher qualifications, and publishing course guides. With a
few rare exceptions, they have been aware that enriching
education is the real purpose of the schools. But, lacking
funds and staff, too much of their energy has been required
just to keep the schools operating. Comparatively little
appears in the record about improving instruction, except
as this most important concern is indirectly affected by the
preparation of teachers.

It was not until 1915 that the superintendent was
able to add elementary and secondary school supervisors to
his staff, specialists in curriculum development who could
devote full time and effort to helping teachers do a better
job. In fact, only four of these assistants were available to
cover the state until two more were added in 1945. Despite
their small numbers and the inspectorial nature of their
assignment, they contributed greatly in uplifting classroom
procedures through the dual role of working with teachers
and evaluating their schools for accreditation.

Prior to World War II, most instruction was the tradi-
tional textbook-oriented method of teaching, with few
instructional materials available. State Superintendent W. T.
Markham (22) published the first elementary courses not
based on textbooks in 1934 — the Unit Program in Social
Studies. Prepared by May Hare, a department elementary
supervisor, it introduced Kansas teachers to the social
studies concept that was replacing courses in history, civics,
geography, and some phases of science in other school
systems (23). Unfortunately, few elementary teachers had the training or experience needed for this approach. Materials required to carry out the new program were not available in thousands of small elementary schools. Most of Kansas was still rural, and teachers and parents who had been taught by the old textbook method resisted this and any other innovation. For a decade, social studies was all but a subsersive term.

With the publication of the Unit Program in Social Studies, a 5-year curriculum study and research project was introduced, in which all state institutions of higher education participated with the State Department of Public Instruction (24). Results of the curriculum studies were published in a series of bulletins (25), but before the project was completed Markham was defeated in his bid for reelection in 1938. The loss of his leadership, widespread opposition to the social studies guides, and pressures for a return to textbook instruction by subject all but shelved the studies. With aggressive leadership, they could have served as a model for curriculum improvement 30 years ago.

In the decade after World War II, teachers began coming out of college with the preparation and understanding needed for the new social studies approach. Today, Superintendent Markham and Miss Hare receive due credit for courageously breaking with tradition and introducing new concepts that have since been almost universally adopted.

Curriculum. The curriculum section is one of the most important in the Division of Instructional Services. It operates under the philosophy that the curriculum includes all experiences which pupils have in school, and it attempts to project this philosophy through conferences, curriculum guides, and visits by consultants. The department held 46 curriculum conferences for over 7,000 elementary teachers as early as 1951, an indication of the long-standing demand for some kind of consultative service (26). By 1965, the staff included 10 specialists representing as many subject areas. Three additional consultants were added in 1966.

The section holds a series of annual conferences for administrators and their curriculum directors at conveniently located centers throughout the state. It publishes teachers guides, compiles lists of instructional materials, and gives individual help to teachers who come to the state office. The subject matter specialists spend about half of their time in the field with administrators and teachers conferring about local problems. These specialists also serve as consultants for many federally financed programs designed to improve instruction, and they have the major responsibility for administering Title III of the National Defense Education Act, under which school districts are reimbursed for equipment purchased to upgrade programs in specific subject matter areas.

Special Education. The Kansas Society for Exceptional Children, composed of both lay and professional persons, was organized in the mid-1940's to press for legislation that would authorize special services for educating the handicapped and other nontypical children. It gained the support of the Kansas Council for Children and Youth, the Kansas State Teachers' Association, the State Federated Women's Clubs, the Congress of Parents and Teachers, the State Department of Public Instruction, and other groups concerned with the educational welfare of all children. Their activities culminated in legislation in 1949 authorizing the department to create a special section and form special classes in the districts. With a modest appropriation for a director and other staff, the superintendent began searching for personnel. All appointments were subject to the state board's approval.

Progress was dishearteningly slow. The services were available to districts only on a voluntary basis—children were not legally required to enroll in the special education classes. It was 2 years before the Legislature provided funds with which to reimburse districts for organizing special classes. Besides inadequate financing at the district level, the program suffered from a serious lack of space, a shortage of qualified teachers, sparse population areas, too many school districts, public apathy, and even overt opposition in several locales.

The Legislature retained its interest in special education despite this foot-dragging by the local districts and in 1951 expanded the program by agreeing to reimburse school districts that established classes for the mentally retarded or provided instruction for homebound children. Two years later, it again voted funds for the exceptional children—this time defining the term more explicitly and including the intellectually gifted—and by law extended authorization to give these children special full-time or part-time instruction.

In the meantime, numerous organizations had begun working in the field of mental retardation, mainly due to the effective leadership of James Marshall, who has headed the special education activities in the department for 12 years. Marshall and his staff cooperate with universities and colleges in developing teacher education programs and work closely with personnel in the U.S. Office of Education (27).

Textbook Adoptions. The history of instructional programs in Kansas would not be complete without a review of textbook adoption policies and their impact on education over a 60-year period. Textbook adoption has been a controversial issue from the earliest days of statehood. State Superintendent Isaac T. Goodnow joined his school superintendents in urging the Legislature to enact a law providing for uniformity. But his successor, Peter MacVicar, took the opposite view, evincing the same philosophy and same arguments used by those seeking to repeal such a law 88 years later, when he said:
I presented somewhat at length the impracticability of requiring by law a state uniformity of textbooks, and of giving either to a state superintendent, or to a board, the power of deciding what that uniformity should be for a series of years. . . . A vast system of state monopoly would be created. It is doubtless much better that books, like other products of brain and industry, be left free to a healthy competition (28).

Certainly such powerful opposition delayed the enactment of a textbook law until 1897, 26 years after MacVicar left office.

The 1897 act created a School Textbook Commission, making the state superintendent ex officio chairman and giving him the right to vote on all propositions. It was the commission's responsibility to contract with publishers, adopt uniform series of textbooks, and make bids. One unique provision foreshadowed later unsavory developments: No one except members was to be present or cognizant of the commission's proceedings during its sessions, and no member was permitted to give information to anyone about what was going on during any of the meetings. After all business had been transacted, the proceedings were published. This would never have satisfied people today, who demand "the right to know."

Shifting the responsibility for adopting textbooks from one commission or government agency to another indicates the sensitivity of the issue (29). The most serious problems did not develop, however, until after the 1913 Legislature mandated that all elementary textbooks and some high school books be manufactured in the state printing plant. A punitive provision in the law, remaining in effect for 44 years, stated that any school official convicted of adopting, using, or procuring for use in the public schools any textbook as a substitute for an adopted one could be subjected to a fine of not less than $25 nor more than $100, or be imprisoned in the county jail, or both (30).

The state superintendent remained the ex officio chairman of the commission until the laymen took over the state board in 1945. This reorganization provided for an advisory committee, but the manner in which the board selected the committee's members proved to be one of the major weaknesses of the adoption procedure. Contrary to the state superintendent's recommendation, the board followed a policy whereby each member appointed his proportional share; thus 8 of the 14 advisory committee members in 1954 came from the hometowns of board members (31). The board thereupon tended to disregard the committee's recommendations. Operating outside the education department and without professional leadership, it often made ill-advised adoptions. The Legislature finally realized its mistake and abolished the whole system in 1957.

Under the present law the superintendent, with the approval of the state board, appoints a State Textbook Review Committee which publishes a list of all textbooks suitable for Kansas schools, unless in the committee's judgment they contain subversive material or cannot be classified under one of the subject matter areas. This committee has operated successfully, assisted by a member of the department's staff. The published lists provide a welcome service to school officials who now make their own adoptions at the district level and determine when textbook changes are needed. Following expiration of the 1957 adoptions in 1962, the plan went into full operation, and the demands for statewide uniform adoption and state textbook printing had a peaceful death.

Guidance and Counseling Services. The use of guidance and pupil personnel services in Kansas schools is a recent development. In the 1946-47 school year, only 21 secondary schools had at least one person assigned as much as 1 hour per day for this work (32); 11 years later, only 222 nonadministrative personnel were doing guidance and counseling. The department did not become actively interested until 1956, when it hired one guidance counselor. The following year, the superintendent established the first standards for certifying counselors. Not only were guidance services seldom requested, but schools even opposed the certification standards, so that in the closing hours of the 1959 session, one legislator was persuaded to introduce a resolution revoking them. It was 2 years before this action was repealed.

The National Defense Education Act, which became effective in 1959, gave counseling and guidance real impetus. At the time, only 85 full-time counselors in Kansas were qualified under both the state's standards and the agreement with the U.S. Office of Education. With federal funds under this act, the state department staff was enlarged to include three counselors in addition to the director; the number of full-time counselors increased to 161, the part-time counselors showing a comparable growth.

The department gives consultant services to local schools, holds conferences for their counselors and administrators, studies various problems faced by dropouts and high school students who enter college or go to work, cooperates with institutions of higher education in developing training programs, and publishes and distributes numerous bulletins. Its staff also exercises general supervision over a state testing program administered by Kansas State Teachers College in Emporia. It has given aptitude tests to ninth- and tenth-grade students annually since 1959-60, and the results have been turned over to their schools to be used for research purposes under special arrangements with the department's guidance section.

Elementary and Secondary Education Act, Titles I and II. Appropriations for programs under Titles I and II were not made until late 1965, which made it difficult for the small staff in the instructional services division to plan how
best to use them in the schools during the 1965-66 term. The state approved projects to spend about $9.8 million out of the $10.8 million allotted to Kansas, primarily to improve the educational opportunities for culturally deprived children from families living at the poverty level. Securing trained personnel to handle the original projects was not only difficult but impossible in some instances, so the projects had to be replanned with an unfortunate emphasis on equipment and materials. The evaluation of the results under Titles I and II were not completed until late 1966.

The Division of Administrative Services (33)

School Finance Section (34). This section serves as a clearinghouse for the department and for local school officials who need information from the financial and statistical records. Until 1965, it administered the general support funds, but the number of new programs became so heavy that this function was transferred to the statistical services section. It still prepares the department budget and supervises accounting procedures, and because the accounts required by federal agencies differ from state practices, its record keeping has almost doubled.

School Facilities Services. These services were initiated by the department in 1951 to deal with two new aspects of administration: (1) federal activity in school enrollment and its effect on buildings, equipment, and transportation; and (2) a nationwide study of how to alleviate school building shortages created by shifting populations, increasing birthrates, and obsolete buildings that had developed since World War II—each state to make its inventory. Since the Kansas Legislature delayed 3 years before sanctioning the use of federal funds for the survey, the department collected the necessary data with the assistance of the state's 105 county superintendents. While processing the local school districts' applications for building funds, the department began providing consultative services in this field.

School Lunch Programs. The superintendent appointed a school lunch director in 1946, the first year of the National School Lunch Program, to train supervisors and cooks in the schools, conduct field visits, and compute the federal reimbursement rate to the districts on a per-meal basis. In general, the public disliked the program at first, branding it a socialist venture contrary to the American way of life. Today, it is considered, along with the special milk program established by Congress in 1954, as indispensable in most districts. The school lunch section cooperates with the Department of Social Welfare, which handles the distribution of surplus commodities.

Statistical Services and School Finance. The superintendent's office has always had the task of collecting statistical data and incorporating them into the annual and biennial reports. As the school system expanded, adding new activities and spreading all over the state, the need for statistical services intensified. Until recently, electronic data-processing equipment was used only for teacher certification procedures and related activities. But it has now come into use in finding a new formula for distributing state funds to schools—the basis for a school foundation finance law. The statistical services section's principal duty is now to administer the law.

Before 1937, more than 95 percent of the financial support for Kansas public schools came from district ad valorem taxes. But in that year the Legislature appropriated the first state aid (other than an insignificant amount from the permanent school fund). However, changing conditions and a too-rigid formula for distributing the money resulted in a 46-percent decline from the $2,113,000 allotted in 1937 to the amount of a decade later. Financing the schools gradually changed from a local district responsibility to a joint endeavor by the federal government, the state, and the county (35). Until 1965, when the first school foundation finance law was enacted, these attempts to provide adequate financing included a hodgepodge of at least a dozen funds from county and state sources to supplement revenues from the school districts. The school lunch and milk funds, and money from Public Laws 814 and 874, the National Defense Education Act, and Public Law 89-10 put much-needed funds into the kitty.

Little imagination is needed to envision the complexities involved in administering allotments from so many different sources. Because of inequities in the property tax, inadequate state support, and insufficient revenues from all sources, plus encouragement from legislative leaders, the department decided to conduct studies of its sources of income. It sought a formula to gain substantially more state aid from non-ad valorem sources, consolidate many funds already available, correct educational and tax inequities, and set up incentives for improving instruction in the schools. Carl B. Althaus, the departmental specialist in school finance who had developed the basic formulas in most of the legislation since 1947, commenced work in 1963 and published his reports the following year (36).

The Legislature made a few minor revisions in the formula Althaus submitted, then enacted its significant features as the school foundation finance law in the 1965 session. As a basis for distributing state funds, the formula takes into consideration (a) preparation and experience of teachers, (b) population density, (c) countywide tax levies from ad valorem sources, (d) amounts of state money received, and (e) pupil-teacher ratios. It also includes an economic index to determine the financial ability of each county to support its schools. Another feature is the new limitation on district expenditures: Instead of the old mill levy limits, it restricts spending to 104 percent of the per-pupil expenditures the preceding year.
Civil Defense Adult Education. The federally financed Civil Defense adult education program prepares public school teachers to instruct adults and upper-class high school students in disaster preparedness and cooperates with Civil Defense authorities in a radiological monitoring program. Staff members and public school officials together promote these classes; the teachers brought into the program are paid a nominal fee.

School District Unification. State Superintendent Peter MacVicar undoubtedly made the understatement of his illustrious career when he said: "More difficulties probably arise from organization and changes of school district boundaries than from all other sources" (37). He should have added that no social change is made against more agonized resistance than school district reorganization, only to be accepted with so much satisfaction a year or two afterward.

The 9,284 school districts in Kansas in 1896 met the needs of a pioneer society in which academic achievement was secondary to wrestling a living from the soil. The schools served as community centers sponsoring ciphering matches, box suppers, spelling bees, community sings, and other social activities. Under these conditions, people developed sentimental attachments to the one-room schools that persisted long after the educational and economic welfare of the state demanded a new framework for education. As recently as 1950, many people thought of rural education in terms of one-room schools, although no semblance of the uniform system of school districts prescribed by the constitution remained. In fact, only a decade later, no fewer than 18 different kinds of districts were operating. An ever-increasing number of special laws was needed to enable such a variety to carry on.

The Legislature made its first major effort to correct some of the obvious inadequacies of this system in 1945 when it required all elementary districts to reorganize. Public officials -- including legislators, county committees, and the state superintendent -- attempting these reforms were accorded rough treatment.

While a 1947 amendment strengthening the reorganization act was under consideration, a thousand rural citizens including wives and many children appeared before the Senate Education Committee. They protested vociferously, calling for the abolition of the county committees and a return to democracy, charging that they were being forced into town school systems so that farm children would have to travel long distances and be unable to help with the chores. One elderly man testified: "Why in the name of God, common sense, and democracy would anyone want to tear up our system which has brought bleeding Kansas schools from the next to lowest to the next to highest of any state in the Union?" (38). He failed to mention the scale he used to arrive at this evaluation. The bitterness reached a climax when two senators received letters threatening them with death unless they supported a repeal of the law (39), and State Superintendent L. W. Brooks reported he received similar threats.

In spite of the uproar, much was accomplished—the Legislature validated all redistricting completed before the Kansas Supreme Court declared the reorganization acts to be unconstitutional 2 years later. The court ruled that the legislators had no authority to delegate lawmaking powers to the county committees in charge of the program. By March 1947, more than 45 percent of the 8,112 elementary districts in existence 2 years earlier had been affected in some way, with 3,700 either eliminated or their boundaries changed. Approximately 4,300 districts remained the same (40).

If the school district system was bad in 1945, rural-to-urban population shifts made it terrible by 1961. School-finance laws became more discriminatory against urban schools, and special legislation further complicated the situation. The state's welfare and local responsibility was little heeded. In most years, one or more schools operated with only one teacher and one pupil. For a time, four boards of one-room school districts were paying salaries to teachers who had no pupils, and in one instance a board employed two teachers to instruct three pupils, all from the same family. The boards of several closed schools paid exorbitant sums to transport pupils to other districts, and the law permitted hundreds of schools to operate only 8 months a year. In 1960, 255 of the state's 552 public high schools operated with less than 75 students each; 18 had less than 25 students each.

In an attempt to bring some order out of this chaos, the 1961 Legislature enacted another reorganization law to create unified districts. But opponents, dead-set against any kind of realignment, exerted so much pressure that the bill was rendered ineffective before it was passed. In a test case, the State Supreme Court declared even this law to be unconstitutional on the same ground as the 1945 legislation.

By 1963, the situation begged for action. The legislators, determined to enact a sound law, consulted continuously with the attorney general and other lawyers concerning the new bill's constitutionality until it finally passed that year. The role assigned the state superintendent under the new act completely reversed the authority granted him under the 1945 and 1961 laws. To ensure its constitutionality, every significant procedure in the reorganization process required either the superintendent's approval or certification, including action taken by the county planning boards and, in some instances, the results of elections. It provided for all territory in the state to be incorporated into school districts offering instruction from grades 1 through 12 and included authority to operate kindergartens and junior colleges under certain conditions. This act resulted in considerable unification, but unforeseen
problems and inequities in it had to be adjusted by amendatory legislation 2 years later.

The staff of the new section created to administer the unification law traveled extensively over the state, consulting with county planning boards, holding hearings, and participating in hundreds of discussions and conferences. They prepared official forms, published instructional bulletins and brochures, and in many other ways contributed to the program's success. The department also assumed many duties formerly handled by the state's 105 county superintendents, such as certifying to county clerks the boundaries of school districts, advising them of all boundary changes, preparing up-to-date maps of all districts, conducting hearings on disputes over boundary changes, and advising local school officials on legal matters. This section even includes a transportation consultant who helps boards of education work out problems resulting from their enlarged districts.

The state superintendent had suffered a storm of unparalleled vilification and abuse when he had tried to administer the new law. So much authority had been delegated to him that opponents of the reorganization leveled a campaign against him as though he had enacted the legislation by dictatorial edict. They filed numerous law suits against him, hoping that the State Supreme Court would invalidate the statutes. Since this had been the fate of the 1945 and 1961 acts, opponents widely believed that the 1963 and 1965 legislation also would be thrown out. But the law stood; unification was upheld in every case (41).

Division of Certification and Accreditation

Teacher Certification. In the spring of 1864, Rosella Honey, a young prospective teacher from the Elm Creek settlement where Clyde is now located, traveled the 30 miles to the seat of Washington County to take the examination for a certificate. She had to make the 60-mile round trip twice because the county superintendent was not at home the first time. The examination itself proved not too difficult. She qualified for her certificate by writing her name, reading a paragraph from a newspaper, and answering oral questions in grammar, geography, and arithmetic. With this evidence of her ability, she began teaching the Elm Creek school the following fall.

From prestatehood days, Kansas required public school teachers to be certified and made certification the principal responsibility of the State Board of Education. The Legislature conferred this authority on the county superintendents during the territorial period, and they continued to exercise it until 1937.

In 1877, the demand for better qualified elementary teachers prompted the formation of county normal institutes to replace the senatorial district institutes conducted by the state superintendent. Closely supervised by the state board—which even certified each instructor—these institutes, usually meeting for about 4 weeks during the summer months, constituted the only professional preparation available for many teachers. After 1915, county superintendents were allowed to run institutes for only 5 to 20 days and then administer one of the four examinations conducted by their office annually. Since 1937, these county institutes have become little more than briefing sessions of from 2 to 5 days' length.

The Legislature took another step to ensure better-prepared elementary teachers in 1909, when it authorized accredited high schools to establish normal training programs. High school graduates who satisfactorily completed work prescribed by the state board became eligible for certification upon passing an examination conducted under the board's supervision. These graduates helped fill the demand for thousands of beginning teachers. But new teachers in rural schools seldom stayed long. Girls hoped to marry after a few years of teaching, and a number of rural boards adopted a policy of not retaining teachers more than 2 or 3 years regardless of their proficiency. Encouraged by a $500 subsidy to each participating high school, the normal training program reached its height in 1924 with 349 schools offering courses (42).

F. Floyd Herr, appointed secretary to the state board in 1943, administered the teacher certification program and the board's policies for accrediting educational institutions until 1945, when he became the director of teacher education and certification in the newly organized State Department of Public Instruction. He has provided state and national leadership in these fields for more than 23 years.

Under the direction of Dr. Herr and State Superintendent L. W. Brooks, the Kansas Advisory Council on Education was formed in 1947 (43), when the department became the only certifying agency in the state. This voluntary, independent agency's members are named by the organizations represented on it, including 4-year colleges and universities, several groups of professional educators, the State Department of Public Instruction, and the Kansas Association of Boards of Education. The Kansas Advisory Council has played an important role in raising standards for teachers and improving teacher education in the colleges and universities (44).

The council's first task was to rewrite certificate regulations and develop a set of standards for evaluating colleges and universities that trained teachers. The result was a dramatic reduction in the kinds of certificates—teachers held no less than 89 different types from 1944 to 1964. Today, the state issues only one type each for elementary, secondary, and junior college teachers, three levels of certificates for administrators, and an original 1-year certificate at each level under certain conditions (45). The council also coordinates teacher education programs in the colleges and universities, conducts studies of current educational issues, and provides a forum for discussing college and
public school relations. In its advisory capacity, it facilitates the department's policy-making responsibilities.

Elementary and Secondary School Accreditation. From the 1870's, the University of Kansas served as the first accrediting agency for high schools. When the State Department of Education was formally created in 1915, all of these responsibilities were transferred to it. The move was the climax of long-time criticism of the university by public school officials who charged that it had overemphasized college preparation for accreditation (46). Under the rules and regulations the state board adopted, the department had the power to accredit high schools and standard elementary schools.

Under a kind of ex post facto policy, the department did not accredit high schools until the close of the term. Neither the students nor school officials knew whether they were working in an accredited school until the year ended. Not until 1959 were the schools accredited on June 30 for the coming year.

Classifying accredited high schools as A, B, or C was discontinued that year. This classification system had worked well for a long time, but eventually pressures on the department made it difficult to lower A ratings of the schools that held them for several years, whether they maintained standards or not. Also, since the A rating placed little emphasis on the breadth and variety of curricular offerings, it was not a satisfactory criterion for judging the quality or quantity of instruction. A majority of high schools offered only a few courses outside college preparatory programs, although until 1960 less than one-half of their graduates enrolled in college. Laymen naturally assumed that a class A high school enrolling 75 students offered the same quality of education as a large school teaching a comprehensive diversified program.

A neighboring state approached the same problem in a clever and sensible manner by changing the A, B, and C classifications to A, AA, and AAA, thus offending no one when A became the lowest classification. But rather than attempt to rejuvenate the classification system that had been used for more than 40 years, the department decided to revise the whole accreditation procedure. During 1957, hundreds of administrators, teachers, and college personnel collaborated in revising the standards. After 2 years of work and study, the state board formally approved new standards. It scheduled a 2-year transition from the old to the new plans, the revised standards to be the basis for accrediting all high schools starting with the 1961-62 school year.

The new standards established three categories of high schools: comprehensive, standard, and approved. Distinctions between them are both quantitative and qualitative. The comprehensive high school must offer and teach a minimum of 50 units of balanced courses in addition to meeting the highest requirements for teacher preparation.

Standard high schools must meet the same requirements but must teach only 30 units, the minimum permitted by statute. Schools accredited as comprehensive or standard can receive special recognition for meeting the highest standards of excellence if an appraisal by a committee named by the department and the school's own self-evaluation warrants it. Since legislation passed in 1965 requires all high schools to offer and to teach a minimum of 30 units of instruction as defined by the state superintendent, the "approved" category will not be used after 1966-67.

In the early 1920's, the state board adopted standards for accrediting junior high schools, but since the schools have no system of classification and the standards are loosely drawn, practices have been somewhat sketchy until recently. More attention has been given to upgrading these schools since C. W. Rice joined the accreditation section in 1963 as a junior high school consultant. He directed a 2-year study and prepared an evaluation guide which promises to strengthen these schools tremendously (47).

Standards for elementary schools adopted by the state board under the 1915 act were not used for accreditation, but rather to stimulate improvement by issuing certificates and door plates that would recognize schools meeting superior, standard, or approved requirements. In the late 1930's, these designations were changed to A, B, and C, but aside from the difference in terminology the program remained the same until 1945, when a self-rating plan was adopted. At present, elementary schools are accredited under procedures similar to those used in evaluating secondary schools. The standards are published, the administrators must make annual organization reports, and departmental consultants visit schools and cooperate with administrators in evaluating them.

Kansas Junior Colleges. The enabling law of 1917, under which the junior colleges were established, closely followed the national pattern for such laws. Although the Kansas junior colleges were originally organized as high school extension courses and continued as such until 1965, they have almost certainly met the needs of many young people. The demand for higher education increased along with opportunities for educated persons in business and industry, but many prospective students were unable to travel the distances from their homes to colleges. The junior colleges served these students and, by being so easily available, motivated some to continue their schooling. The schools improved significantly under state department supervision and accreditation. In 1960, the standards were revised, and all 2-year institutions conducted evaluation studies which they filed with the state superintendent.

Many Kansas educators hoped that the junior colleges could teach a comprehensive curriculum, including courses that would be acceptable for the first 2 years of a college degree, vocational-technical courses, and terminal courses.
Economics again proved to be the obstacle, preventing many schools from implementing these plans and even forcing some of them into financial crises by 1965. A contributing factor was the policy of the vocation education board, which adopted a recommendation by its executive officer to bypass junior colleges in distributing new federal funds available under the 1963 vocational-technical act. Since the state department supervised the junior colleges but had no jurisdiction over vocational-technical education, its only recourse was to protest to the Legislature. One school threatened suit to test the constitutionality of delegating legislative powers to the vocational board. As a result, the Legislature created a separate board in 1965 to govern the state technical institute and curtailed the state board’s jurisdiction over junior colleges. The board then reversed its policy for vocational education so that junior colleges could receive the federal funds.

Anxious to establish junior colleges on a sound basis, the Kansas Legislative Council authorized its education committee to study the colleges’ role, function, organization, financing, and supervision. The report, published the following year, served as the blueprint for a law providing for a state system of community junior colleges. This legislation, also passed in 1965, names the state superintendent as the authority over junior colleges and allows him to employ a director, an assistant director, and a secretary for a junior college section in the Division of Teacher Certification and Accreditation. Not only does the law separate the authority over junior colleges but it also allows the junior college districts to expand with additional state support. It calls for the development of a plan under which new community junior colleges can be established and for a state advisory council of 11 members to give them all possible assistance. The community junior colleges have taken on new life since 1964: Three new ones have been organized, and 12 of the present 17 have begun building programs to accommodate expected enrollment increases.

The state superintendent has turned over to the junior college section the administration of 200 annual scholarships created by the Legislature in 1963 for college freshmen with ability and need. They are limited to tuition and fees not to exceed $500 at the college of the applicant’s choice and are renewable for 1 year if the student successfully completes his freshman work.

Adult Education. The growing need for more skilled personnel in business and industry not only created the demand for junior colleges, but also resulted in a call for more adult education. Business organizations, university extension divisions, and other groups pointed to the technological advances that created a need for trained workers. Many people with a minimum of schooling became increasingly aware of the need for better training. The department created an adult education section—headed by a director employed under a foundation grant for 1960-61—which received almost unanimous support from the various adult education groups. The Legislature failed to make an appropriation to continue this service but authorized its reestablishment in 1965, when federal funds became available under the adult basic education act.

Under a 90-10 finance agreement with the U.S. Office of Education, the director and his assistant divide their time between the adult basic education program and the services launched in 1960 under the foundation grant. The adult education section conducted 14 programs in basic education during 1965-66, enrolling 1,100 adults under the direction of 75 specially trained teachers. The total expenditures for the first year were $132,000. The 1966-67 expenditure was expected to be $285,000, for a projected enrollment of 2,000.

This section also administers other important programs that meet the needs of adults who have not graduated from high school. It issues annually some 1,200 certificates of academic equivalency to adults who make the required score on the general educational development tests. Most employees accept the certificate in lieu of a high school diploma, and some colleges use it for entrance requirements.

Private, commercial, and trade schools must qualify for permits before they can solicit students, and the adult education section has granted more than 150 such permits since the law was revised in 1961 to include all categories operated for profit.

FEDERAL-STATE RELATIONS

Most Kansans have dramatically changed their attitudes toward federal support of education since 1960. In spite of the nationwide concern following Russia’s first Sputnik, Kansas legislative leaders were extremely reluctant to provide funds in 1959 to match federal money appropriated under the National Defense Education Act of 1958. Although Congress enacted the NDEA to improve educational opportunity throughout the nation, the Kansas Legislature appropriated only $20,000 the first year to match the $59,000 in federal funds allocated to Kansas on a 50-50 basis for administering and supervising Title III (purchase of instructional equipment).

Until the Kansas Legislature established the area vocational schools in 1963, financed partly with federal funds from the Vocational Education Act, local chambers of commerce consistently opposed federal support for education. Now, in a reversal of their historic position, they have engaged in a spirited competition to acquire one of the 20 area vocational schools for their communities. This scramble for federal money was amusing to educators who long had sought support from Washington for educational programs; many of the business groups were almost
“climbing the walls” to obtain the benefits they realized would accrue from these federally subsidized schools.

When Congress enacted Public Law 89-10, the Elementary and Secondary Education Act of 1965, the traditional Kansas opposition to federal support had mostly disappeared, although a small group of lawmakers tried unsuccessfully to push through legislation that would have deprived the schools of such aid early in 1966. With $1,847,000 in federal money available on a 50-50 matching basis during the first 2.5 years under the NDEA, Kansas districts applied for only $1,568,170, indicating again the reluctance of the citizens to use federal money. But in 1965-66, the applications for NDEA funds exceeded the state’s allotment by 25 percent—convincing evidence of the change in attitude.

All of the department’s guidance and counseling activities except the director’s salary are wholly supported by federal funds under Title V of NDEA. Much has been done with NDEA Title X funds to upgrade the department’s statistical services, including the development of an accounting system for schools and partial financing of the studies that led to the 1965 school foundation finance act. A Civil Defense adult education program is wholly supported by federal money, as are activities under Titles I and II of ESEA. School lunch programs have been supported entirely by federal funds. The requirements with respect to the federal agencies seem to defy justification. One example is the administration of federal funds used for professional development laboratories established under Title IV of ESEA, official state systems, which are too often incompatible.

State department officials are somewhat critical of activities authorized under Title III of Public Law 89-10, because these programs, involving local school districts, are administered directly by the Office of Education, thus violating the philosophy that education is a state function. Department officials also have reservations about the regional educational laboratories established under Title IV of ESEA, believing that the stated objectives of the title could be more effectively achieved by state departments if comparable funds were available to them and at the same time would be consistent with the principle of state control of education.

Another basic issue in federal-state relations is the requirement that the state, in addition to maintaining an accounting system of its own as prescribed by state law, account for the federal funds under another system. This means that state agencies must maintain two accounting systems, which are too often incompatible.

The Kansas department is in full accord with the principle of federal support for education but believes that the categorical aid approach has not been properly balanced in several instances. As the federal government increases its support of education, all of its agencies should recognize the role the states play in this field and trust state education agencies to be as effective and competent to handle funds from federal sources as in administering state funds. State department officials are somewhat critical of activities authorized under Title III of Public Law 89-10, because these programs, involving local school districts, are administered directly by the Office of Education, thus violating the philosophy that education is a state function. Department officials also have reservations about the regional educational laboratories established under Title IV of ESEA, believing that the stated objectives of the title could be more effectively achieved by state departments if comparable funds were available to them and at the same time would be consistent with the principle of state control of education.

**FOOTNOTES**

7. These exemptions were also allowed in a 1903 revision of the law. See Table 1 in Appendix C for listing of compulsory attendance laws.
8. For further instances of fraud, see Superintendent of Public Instruction, *Ninth Annual Report* (1869), p. 35.
10. In Kansas, there are three classes of cities: first, second, and third. Communities of 150 or more persons may incorporate as third-class cities. Their only relationship to common school districts is that every third-class city is located in a common school district. When cities reach a population of 2,000, they may, by making application, qualify as second-class cities. The school districts in which second-class cities are located are designated as second-class city districts. When a city reaches a population of 15,000, it may apply to become a city of the first class, and the school district in which it is located becomes a first-class city school district.

Each classification of cities and each classification of school districts is governed by codes of laws that differ widely. Except for a small scattering of school districts not yet reorganized under the 1963 and 1965 Unification Acts, all categories of school districts were wiped out in 1965. All reorganized districts are now unified districts, the Legislature provided that unified districts would be governed by laws applicable to school districts of cities of the first class in matters not covered in the skeleton code.

11. Superintendent of Public Instruction, Twelfth Biennial Report (1900), pp. 154-59. Dr. Throckmorton questions the accuracy of this enrollment of 11,508, but this is the figure reported. The enrollment in 1910 was 29,933. Seventeenth Biennial Report (1910), p. 164.

12. The School District Unification Acts of 1963 and 1965 and the realignment of school districts under their provisions are discussed in section 3. “Educational Programs in Kansas and the Role of the State Department of Public Instruction.” See Table 2 in Appendix C for kinds of school districts in 1963.

Chart III.--KANSAS DEPARTMENT OF PUBLIC INSTRUCTION, 1968

Projected under provisions of revised State Constitution effective in 1969.
Appendix B

Supplement 1. — Qualifications for Membership on State Board of Education

In appointing members to serve on the State Board of Education the Governor—

Is prohibited from appointing anyone who is engaged in school work as teacher, principal, or superintendent.

Must appoint members of the two major political parties with not more than four at the same time from the same party.

May not appoint more than three members who are residents of territory governed by boards of education of school districts in cities of the first or second class.

Must appoint at least one member from each Congressional District.

May not appoint any of the seven members to serve more than two consecutive terms of three years each.

—Laws of Kansas (1945), Chapter 282, Section 19

Supplement 2. — Qualifications for State Superintendent of Public Instruction

At the time of filing candidates for the office of State Superintendent of Public Instruction must—

Hold the highest type of teachers certificate prescribed by law.

Be a resident of Kansas for at least 5 years immediately preceding.

Be a graduate of an accredited college or university with at least 30 hours of postgraduate credit.

Have at least 10 years teaching or administrative experience, of which at least 5 years shall have been in the public school systems of Kansas and active in such work within 2 years prior to the date of filing for such office.

—Laws of Kansas (1945), Chapter 282, Section 5
Appendix B

Supplement 3.—House Concurrent Resolution No. 505

A Proposition to amend the education article of the constitution of the state of Kansas, being all of article 6 of the constitution.

Be it resolved by the Legislature of the State of Kansas, two-thirds of the members elected to the House of Representatives and two-thirds of the members elected to the Senate concurring therein:

Section 1. The following proposition to amend the constitution of the state of Kansas shall be submitted to the qualified electors of the state for their approval or rejection: Article 6 of the constitution of the state of Kansas is amended to read as follows:

"Article 6.—Education

"Section 1. Schools and related institutions and activities. The legislature shall provide for intellectual, educational, vocational and scientific improvement by establishing and maintaining public schools, educational institutions and related activities which may be organized and changed in such manner as may be provided by law.

"Sec. 2. State board of education and state board of regents. (a) The legislature shall provide for a state board of education which shall have general supervision of public schools, educational institutions and all the educational interests of the state, except educational functions delegated by law to the state board of regents. The state board of education shall perform such other duties as may be provided by law.

"(b) The legislature shall provide for a state board of regents and for its control and supervision of public institutions of higher education. Public institutions of higher education shall include universities and colleges granting baccalaureate or postbaccalaureate degrees and such other institutions and educational interests as may be provided by law. The state board of regents shall perform such other duties as may be prescribed by law.

"(c) Any municipal university shall be operated, supervised and controlled as provided by law.

"Sec. 3. Members of state board of education and state board of regents. (a) There shall be ten members of the state board of education with overlapping terms as the legislature may prescribe. The legislature shall make provision for ten member districts, each comprised of four contiguous senatorial districts. The electors of each member district shall elect one person residing in the district as a member of the board. The legislature shall prescribe the manner in which vacancies occurring on the board shall be filled.

"(b) The state board of regents shall have nine members with overlapping terms as the legislature may prescribe. Members shall be appointed by the governor, subject to confirmation by the senate. One member shall be appointed from each congressional district with the remaining members appointed at large, however, no two members shall reside in the same county at the time of their appointment. Vacancies occurring on the board shall be filled by appointment by the governor as provided by law.

"(c) Subsequent redistricting shall not disqualify any member of either board from service for the remainder of his term. Any member of either board may be removed from office for cause as may be provided by law.

"Sec. 4. Commissioner of education. The state board of education shall appoint a commissioner of education who shall serve at the pleasure of the board as its executive officer.

"Sec. 5. Local public schools. Local public schools under the general supervision of the state board of education shall be maintained, developed and operated by locally elected boards. When authorized by law, such boards may make and carry out agreements for cooperative operation and administration of educational programs under the general supervision of the state board of education, but such agreements shall be subject to limitation.

"Sec. 6. Finance. (a) The legislature may levy a permanent tax for the use and benefit of state institutions of higher education and apportion among and appropriate the same to the several institutions, which levy, apportionment and appropriation shall continue until changed by statute. Further appropriation and other provision for finance of institutions of higher education may be made by the legislature.

"(b) The legislature shall make suitable provision for finance of the educational interests of the state. No tuition shall be charged for attendance at any public school to pupils required by law to attend such school, except such fees or supplemental charges as may be authorized by law. The legislature may authorize the state board of regents to establish tuition, fees and charges at institutions under its supervision.

"(c) No religious sect or sects shall control any part of the public educational funds.

"Sec. 7. Saving clause. (a) All laws in force at the time of the adoption of this amendment and consistent therewith shall remain in full force and effect until amended or repealed by the legislature. All laws inconsistent with this amendment, unless sooner repealed or amended to conform with this amendment, shall remain in full force and effect until July 1, 1969.

"(b) Notwithstanding any other provision of the constitution to the contrary, no state superintendent of public instruction or county superintendent of public instruction shall be elected after January 1, 1967.

"(c) The state perpetual school fund or any part thereof may be managed and invested as provided by law or all or any part thereof may be appropriated, both as to principal and income, to the support of the public schools supervised by the state board of education.

"Sec. 2. This resolution, if concurred in by two-thirds of the members elected to the house of representatives and two-thirds of the members elected to the senate, shall be entered on the journals, together with the yeas and nays. The secretary of state shall cause the proposed amendment to be published and submitted to the electors of the state at the general election in the year 1966 as provided by law. This resolution shall be published by the secretary of state in the Special Session Laws of 1966, and shall be given a chapter number therein.

APPENDIX B--ORGANIZATION CHARTS 485
EDUCATIONAL PATTERNS BEFORE 1900

The development of Kentucky's system of public education and that of the Kentucky State Department of Education are intertwined. Both developed slowly and haltingly through delayed beginnings. Both have their origins in statutes enacted by the General Assemblies of 1837 and 1838; and both were recognized constitutionally by Kentucky's third constitution, the Constitution of 1850. The evolution of the state department, as its patterns emerged in the nineteenth century, is presented in this first section. Its development in the twentieth century is a story of efforts to build on these early foundations.

The Commonwealth of Kentucky, the Bluegrass State, created out of the westernmost county of Virginia, was admitted as the fifteenth state of the Union on June 1, 1792 (1). The early inhabitants of Virginia held the opinion that education was a private matter and that it was not the business of the state to furnish it free. Following the examples of the constitutions of Virginia and of the United States, which were silent on education, the first and second constitutions of Kentucky, in 1792 and 1799, failed to provide for education. This failure to authorize education as a state function did not mean that early Kentuckians were not interested in the education of their children. The pioneers who came prior to and during the Revolutionary War had an interest in education. As early as 1776, a school was established at Harrodsburg, Kentucky, as an outpost of civilization in the wilderness (2). It was taught by Mrs. Jane Coomes, who crossed the Alleghenies from Pennsylvania. This frontier state, the first west of the Alleghenies, inherited two institutions of higher learning created by the General Assembly of Virginia, including Transylvania Seminary, established in 1783 (3).

Kentucky made several unsuccessful attempts to provide education below the college level throughout the state, beginning shortly after its admission into the Union. The first general plan, in 1794, provided for the establishment of an academy in each county, to be supported by a grant of 6,000 acres of land for each. This plan was soon recognized as a failure because these were secondary schools which charged tuition and were controlled by independent boards of trustees. In 1821, the Legislature adopted a second plan, the Literary Fund, to be supported by profits of the newly created Bank of the Commonwealth. The fund ceased to grow, and the records fail to show that even one penny from it was ever spent for public schools. The third plan, that of private academies, made it legal for five individuals in a community to organize a school. Under this plan, 230 private academies were established, owned, and controlled by religious denominations, stock companies, and private individuals. In the main, only pupils whose parents could pay tuition attended private academies, which tended to produce a cleavage between the wealthy and the poor. In January 1830, the General Assembly enacted an ambitious piece of legislation in its fourth attempt to establish a system of public education. This act allowed counties to establish school districts and levy a local tax for school support. However, since establishment of school districts was entirely voluntary, very few counties took advantage of the act.

In the first quarter century of its statehood, Kentucky had only two Governors who regarded education as a function and responsibility of the state. Governor Christopher Greenup, a well-educated lawyer, included a few lines relative to education in his message to the General Assembly. Governor Gabriel Slaughter spoke out boldly for public education during this period. In pleading for a system of schools administered at the state level, he said, "Every child born in the state should be considered a child of the Republic and educated at public expense..." (4). In his second message to the General Assembly, Governor Slaughter made a plea for a wide distribution of schools in order to fulfill the state's obligation, saying that "nothing short of carrying education to the neighborhood of every man in the state would suffice" (5). Because of his political conflicts with members of the Legislature, his recommendations for education were not heeded.

The concept of a unified system of education for the masses, paid for out of the public treasury and administered by a state agency, had not been accepted by early Kentuckians and their political leaders. The slow development of public education during the first half century of Kentucky's statehood was dramatized by McVey in The Gates Open
Slowly. A chapter entitled "They Walked in the Dark" emphasizes that "between the two dates 1792 and 1908, there is a period of more than a hundred years filled with the struggle for a living and a place in the wilderness, with political conflict, and religious controversy" (6).

The Common School System by Statute

Governor James Clark’s message to the 1836 General Assembly proposed that Kentucky’s anticipated share of money from the federal government be set aside for education. Congress passed a law in June 1836 distributing to the states the surplus funds in the U.S. Treasury. In 1837, the General Assembly passed an act declaring that $1,000,000 of the $1,433,757 which Kentucky received should be set apart for the establishment of a general system of public instruction and providing for the custody of the fund until such contemplated system had been devised (7). In February 1838, the Legislature approved an act establishing a system of common schools and creating the position of superintendent of public instruction. Although this was the beginning of a system of common school education, it was not yet a system of "free" education. The act also provided for reduction of the state school fund to $850,000; appointment of the superintendent of public instruction by the Governor, to be confirmed by the Senate, for a period of 2 years; creation of an ex officio State Board of Education including the superintendent, the attorney general, and the secretary of state; apportionment and distribution of the school money by the superintendent of public instruction, with advice of the state board, on the basis of the number of white children on the census; appointment of five commissioners of common schools in each county by the state board; establishment of local school districts as fast as they met the requirements of the law, including the levy of a local tax and establishing a school building; and election of boards of trustees with full control of schools in their districts.

The first superintendent of public instruction, the Reverend J. J. Bullock, was appointed in 1838 (8), the year after the appointment of Horace Mann as secretary to the Massachusetts State Board of Education. Superintendent Bullock’s 1839 report to the General Assembly, made in keeping with a provision of the 1838 act requiring such a report, includes a philosophy of universal education consistent with the ideas of Horace Mann, one of the earliest proponents of universal education. Superintendent Bullock’s philosophy, expressed as follows, is as challenging today as it was a century and a quarter ago:

The great object of the Common School law is to give to every child in the Commonwealth the good common school education; to develop the whole intellect of the State. The great principle of the System is that of equality; the rich and the poor are placed on the same footing;... The State has an interest in every child within her limits... (9).

The effect of the new school law was gradual. In 1840, only 24 of the 90 counties had been divided into school districts; and 1 year later, only 33 counties had established common schools. Kentucky’s depressed economy, weak local government, and lack of interest among the scattered population were barriers to the early success of the common school system.

Constitutional Provisions

An unfortunate situation developed in regard to the use of the school fund. The Sinking Fund Commissioners, entrusted under the 1837 act with the custody of the school fund, had lent much of it to other units of state government for internal improvements in return for bonds on which the principal and interest were to be paid to the State Board of Education. In 1840, Governor Letcher reported that the commissioners were falling behind on their interest payments to the state board. The General Assembly passed an act in 1845 making it mandatory that the state board deliver to the Governor the bonds it held, which were to be burned. The Sinking Fund Commissioners had found it politically expedient to expend the funds for general internal governmental improvement rather than for redemption of bonds of the new and generally misunderstood public school system. Robert J. Breckinridge, the sixth superintendent of public instruction, courageously led the struggle of the State Board of Education with the Sinking Fund Commissioners over the failure to honor their obligations. This was climaxed in a struggle between Superintendent Breckinridge and Governor Helm during the period 1848 to 1850. Under the able leadership of Superintendent Breckinridge, landmark decisions and fundamental changes were made in the common school system and in the Office of the Superintendent of Public Instruction. State support through taxation for the common schools was initiated by vote of the people in 1848 for a state tax of 24 on every $100 worth of taxable property for the support of schools. This tax was enacted into law and approved by the Governor in February 1849.

During the conflict between Superintendent Breckinridge and Governor Helm, a constitutional convention was called in 1849; and the support of schools became one of the major issues in the selection of delegates to the convention. The vote of the people for a state plan of taxation to support common schools strengthened Superintendent Breckinridge in his effort to safeguard the public school fund and to establish the system on a permanent basis. The delegates, reflecting the sentiment of the people, supported Superintendent Breckinridge as indicated in the provisions for education in the Constitution of 1850. These provisions included making the Office of the Superintendent of Public
Instruction elective for 4-year periods, with no limit on reelection; making the capital of a perpetual school fund inviolate; and providing that "the interest and dividend together with any sum which may be produced for that purpose by taxation and otherwise may be appropriated in aid to common schools and for no other purpose" (10). Superintendent Breckinridge, who had served one appointed term, was elected by the people in 1850. The Governor took the position that the school fund was not a debt that the state owed itself and that money set apart for schools had never been recognized as a part of the public debt. Superintendent Breckinridge denied this contention with arguments which were accepted by the Legislature. The Legislature, by an act approved in March 1851 (11), required the Sinking Fund Commissioners to pay interest with the intention of the common schools. With the passage of this act over Governor Helm's veto, the struggle for the establishment of a permanent school fund was ended.

Under Superintendent Breckinridge's leadership, the 1851-52 Legislature provided for a fundamental change in the state system of education by defining a common school as a school "accessible to the poor as to the rich" and a school which "every free white child in the district between the ages of six and eighteen years" might attend (12). Further, the common schools were defined as elementary schools since the course of study was limited to "the elements of plain education in English, including grammar, arithmetic, and geography" (13). This action represents the acceptance of the principle of education for all children at public expense. The idea of universal, rather than private, education, at least at the elementary level, had been accepted. "The change that took place in Breckinridge's time was fundamental; it was so far reaching that it may be said to have influenced greatly every movement toward improving our school system from that day to this" (14).

After the Constitutional Convention of 1849 and the subsequent battle to strengthen public education in the early 1850's, the development of the public schools once again faced a setback with the outbreak of the Civil War. The deterrent effect of the Civil War on the school system is illustrated in a statement by Superintendent Richardson in 1861 in which he pointed out that the number of children in the public schools was reduced from 165,000 to 90,000 in a 1-year period. As a result of the war, the operation of the common schools was brought to a virtual halt. Funds which had been dedicated and set apart for education were "seized upon and wickedly misappropriated by those who invaded or connived at the invasion of Kentucky" (15).

The Constitution of 1891, Kentucky's fourth and present constitution, retained Section XI, which guarantees a permanent school fund and provides for the election of the superintendent of public instruction by the people for a term of 4 years. Under provisions of the new constitution, the superintendent was included among the state officers who could not succeed themselves and whose salary within a maximum limit of $5,000 should be fixed by the General Assembly. Further, the 1891 constitution contained the following new principles:

1. Section 183: The General Assembly shall, by appropriate legislation, provide for an efficient system of common schools throughout the state;
2. Section 186: Each county in the Commonwealth shall be entitled to its proportion of the school fund on its census of pupil children for each school year; and
3. Section 187: In distributing the school fund, no distinction shall be made on account of race or color; and separate schools for white and colored children shall be maintained.

Implications for Centralized Administration

During the last quarter of the nineteenth century, trends were developing which had implications for centralized administration.

A dual system of schools for white and Negro children had been established in 1874, with the superintendent of public instruction responsible for the administration of the system and the distribution of school funds on a separate basis for white and Negro children. Beginning in 1882, the superintendent had authority to distribute the funds without regard to color (16). State administration relative to range of school age, length of school term, course of study, and qualifications of teachers was provided on a uniform basis.

Selection of textbooks on a uniform and statewide basis was gaining popular support. This controversial question became an issue in the 1899 gubernatorial campaign.

The trend toward uniform standards for the issuance of certificates at the state level appeared with the creation by the Legislature in 1884 of the State Board of Examiners, composed of the superintendent of public instruction and two professional persons he might select.

It had been recommended by superintendents from J. J. Bullock in 1838 to H. V. McChesney in 1899 that the state establish normal schools for preparation of teachers. One unsuccessful attempt was made to establish a normal department at Transylvania University, and then, in 1880, a normal department was established in the Agricultural and Mechanical College (17).

There was a growing demand for high schools as part of the common school system. In 1867, Superintendent Z. F. Smith recommended that free high schools be provided. Public high schools had their origins in the city graded school system, authorized by the Legislature in 1888. High schools were organized in the independent and graded schools prior to 1900; however, authority for establishing high schools as a part of the common school system had to wait until the twentieth century.
Recognition of the failure of the voluntary plan of local taxation for the support of schools and the sentiment against local control of schools by district trustees reflected the need for a more strongly organized state system of common schools. The fact that too few districts were taking advantage of the local tax levies to improve schools led Superintendent Ed Porter Thompson to express the need for a more strongly organized state system of education.

The delegates to the constitutional convention also pointed out that the law did not require a single common school to be taught in the whole state (19). Popular sentiment was more favorable, however, toward state taxes for school purposes, first established in 1848 and then raised from $100 worth of taxable property. State taxation for school purposes was consistent with national thinking, as reported by the National Education Association in 1897, to the effect that "units of taxation should be created ... as will fully develop the sound American principle, that the whole wealth of the state shall be made available for educating all the youth of the state" (20). From 1860 to 1900, state payments to local schools had increased from $342,440 to $1,867,597.

The trustee system was failing because of lack of county and state control. All real control was in the hands of 25,000 district trustees who had jurisdiction over 8,000 school districts. By 1900, the state superintendents were speaking out boldly in criticism of the trustee system.

These attitudes no doubt influenced the 1893 statute wherein the Legislature provided that "there shall be maintained throughout the State of Kentucky a uniform system of common schools ..." (21). This provision continued to stimulate further legislation increasing the administrative and supervisory responsibility of the State Department of Education.

Emergence of the State Department of Education

After the position of state superintendency was given constitutional basis, this office began to be referred to, generally, as the State Department of Education. In 1875, Governor James B. McCreary, in his gubernatorial message, referred to the Department of Education as one of the coordinate departments of state government. In an 1893 act, the legislators referred to the State Department of Education in connection with the uses of the annual resources of the school fund. It was not until 1924 that the Department of Education was recognized by statute as an organization of state government and defined according to the divisions of services and personnel. In 1942, the Legislature precisely defined by statute the coordinate parts of the State Department of Education as the State Board of Education, the superintendent of public instruction, and his staff.

The attitude of the Legislature toward the office of superintendent was reflected in the salary increases and decreases, beginning with $1,500 in 1838, reaching $3,000, and being reduced to $2,500 by the close of the nineteenth century (22). In 1850, Superintendent Robert J. Breckinridge spoke of the importance of the superintendency as follows:

During almost the entire period which preceded the adoption of the new Constitution, attacks were made upon the existence of the office itself, or upon its dignity and efficiency; and almost every recent session of the Legislature witnessed attempts to degrade the office, or to abolish it on the part of those who selected this as at once the safest and most effectual method of waging war upon the common school system itself. By the second section of the Xirth Article of the Constitution of 1850, this office is made constitutional and permanent, and is to be filled by election by the qualified voters of the Commonwealth every fourth year. Henceforward, he who shall fill it will do so as the representative of the entire people of Kentucky—called by the voice of a great Commonwealth to discharge a great constitutional trust, touching the very greatest interests of the people .... The Superintendent of Public Instruction is not the clerk of the board of education, but is the head of one of the most difficult and important enterprises ever undertaken by the State (23).

Until the close of the nineteenth century, the state department was a one-man enterprise except for the brief period at the close of the century when the superintendent was allowed by the Legislature to employ three clerks. His authority included numerous responsibilities: to collect and tabulate statistics on census, attendance, teachers, and finances; to advise as to the law; to visit the counties throughout the Commonwealth; to advise the local school authorities; to encourage the public to establish schools by providing for local taxation; to advise the Legislature on the conditions and needs of the schools; and to apportion and distribute the state school fund to the local school districts.

By tradition and practice, professional preparation and educational experience have been established as qualifications of the men who are elected to the position of superintendent of public instruction. Although academic qualifications have not been fixed by statute, beginning with the election of Ed Porter Thompson in 1891, every man elected to this office has emerged from the leadership of the profession. This is in harmony with an 1897 recommendation of the National Education Association which states: "The Superintendent of Public Instruction should be a person in close touch with the educational spirit of the times and one whom the profession regards as authority in all that constitutes excellence in school matters" (24). Early in the twentieth century, Barksdale Hamlett observed...
that "a careful study of our school system reveals the fact that it has been built largely by our state superintendents. In the past these men, as a rule, have been able men devoted to the cause of education..." (25). The state superintendents of the nineteenth century, however, had demonstrated by the force of their personalities, abilities, and dedication that the Office of the Superintendent of Public Instruction should be one of leadership and authority.

KENTUCKY EDUCATION FROM 1900 TO 1930

Although significant achievements were few and the quality of education was certainly questionable, there had been steady progress toward a desirable public educational system during the 50 years prior to 1900. By the turn of the century, the public education concept had been indelibly imprinted on the mind of the public. In addition, public school enrollment had steadily increased, and the state was making a definite commitment for financing education.

The educational system of Kentucky took an important forward step in 1908 when, under the able leadership of State Superintendent John G. Crabbe, the General Assembly enacted legislation abolishing the local district and setting up the county as the unit of school administration. This was one of the most significant pieces of school legislation in the history of the state. This "county administration" act takes on additional importance when one realizes that most of the Midwestern and Northeastern states are still working toward such legislation. This act specifically provided for division boards within counties, the chairmen of which were to constitute the county board. In addition, each county was required to establish one or more county high schools within 2 years after the passage of the act; and each county was required to levy a tax for school purposes not to exceed 20¢ on each $100 of taxable property (26).

The taxation required at the local level, climaxing 70 years of little or no local fiscal effort for education, was extremely important. This provision alone substantially increased the educational commitment and obligated the local community to supplement state efforts for support of education.

The 1908 Legislature also created a commission to study the educational needs of the state. In the commission's report to the General Assembly in 1910, the major recommendation was that the General Assembly establish a seven-member State Board of Education, consisting of six experienced educators and the state superintendent. This board would supplant the old three-member, ex officio state board. The powers and duties of the state board were to be extended, also. Unfortunately, the 1910 General Assembly did not enact the recommended measures. However, the commission report was important because it helped establish an awareness of public education in the state; and many of its recommendations served as a guide for subsequent Legislatures (27).

Following the 1908 legislation, there was widespread opposition to the "county administration" law and to the required tax at the local level. In order to promote public acceptance of the legislation, State Superintendent Crabbe went to the people in what he called "whirlwind campaigns." Through these campaigns, he and three other speakers made addresses which reached 60,000 citizens. In addition to informing the people concerning the 1908 legislation, a side benefit of Crabbe's effort was a strengthened State Department of Education. During his presentations before the people, Superintendent Crabbe expressed the viewpoint that the state department is "a center of educational thought and activity, a clearing house for educational ideas, a forum for open discussion of legislation affecting the schools. It is the place where educational sentiment is crystallized" (28).

In both 1908 and 1911, the Kentucky Education Association recommended changes to strengthen the state board. This question was presented periodically to the Legislature from 1908 to 1920, but the board remained unchanged.

In 1920, the General Assembly amended the "county administration" law to provide for a county board of education elected from the county at large. The term of office was to be 4 years. This law was again amended in 1922 with the provision that county board members would be selected from five geographical divisions, with one board member from each division.

Again in 1920-21, the question of state board selection came to the forefront. A report by the Kentucky Educational Commission in 1922 maintained that an ex officio state board could not be effective. This commission pointed out that two of the three members of the ex officio board—the attorney general and the secretary of state—could not be effective board members because, as officials elected to serve in capacities other than education, they might not have the interest and seldom the time to serve adequately. The commission observed that the political nature of the board prevented it from assuming its proper position in educational matters and, to some degree, explained the reluctance of the Legislature to bestow more power and authority in the board. This commission recommended a State Board of Education of nine members, made up of the superintendent of public instruction, an ex officio member, and eight broad-minded laymen appointed by the Governor (29).

Pursuant to this recommendation, a bill was introduced in the General Assembly in 1922, passed the Senate, but failed to receive the approval by the House of Representatives. A similar bill was defeated in 1924, and again in 1928. It was not until 1934 that there was sufficient
strength mustered in the General Assembly to change the ex officio board.

The portion of the "county administration" law of 1908 which provided for a mandatory local tax not to exceed 20¢ on each $100 of taxable property and allowed for an additional tax, not to exceed 25¢ voted by the people of a subdistrict was followed 10 years later by a law which provided that a county board of education could levy a tax not to exceed 30¢ on $100 of taxable property and a poll tax of $1. "In 1926 the maximum tax rate was raised to 75 cents and the capitation tax was still not to exceed one dollar" (30). This increase in the local tax rate from 20¢ in 1920 to 75¢ in 1926 was a very significant improvement over the previous years of little local support for schools.

During this period, the state school fund was distributed to the counties on a per-capita basis of school population, and the districts within the county having the largest number of children received the most state money. In 1912, the district's school population was dropped as a means of allocating state funds, and "thereafter, each district shared in the funds available, both state and county, according to its needs . . . " (31).

Even though the 1912 legislation was an improvement, there were still many inequities in fund distribution. The primary one was that the fiscal ability of the local district was not taken into account in distributing the funds.

The Legislature of 1920 passed several laws designed to give the state a better public school system. One was an act creating a county board of education with the power to select a county superintendent on the basis of professional training and experience. Another Legislature was to create a commission to survey the public school system of Kentucky. Other legislations provided for certifying teachers on the basis of training, employing attendance officers, and authorizing county boards of education to issue bonds to raise funds for the purchase of grounds and the construction of buildings.

The Kentucky Educational Commission conducted a survey of the public school system and concluded that an ex officio State Board of Education could not be effective. It also reported that the election of the superintendent of public instruction on a partisan ticket reduced the chances of finding a competent man and made continuity of policy impossible. At the same time, it found the office of the superintendent of public instruction freedom and authority to establish divisions as he deemed necessary.

A method of distributing state school funds that thus ignores differences in financial resources, ignores differences in the grade and in the quality of the schools, although there is equal willingness on the part of the people to make sacrifices for them, and ignores the state's responsibility to provide equal educational opportunities of a satisfactory standard for all the children of the commonwealth, ought not to be longer tolerated. Sound policy requires that these differences be taken into account in distributing state school funds (33).

In 1922, the General Assembly created the Efficiency Commission to study all functions of the state government and to make recommendations. In this commission's report it was stated that—

With respect to the distribution of State funds, educators are generally agreed upon the principle that districts (counties, cities, and graded school districts, in the case of Kentucky) should receive aid in inverse proportion to their "ability" to support schools as shown by their deficiencies in true valuations per teacher or per child of school age, and in direct proportion to the amount of effort they make to support schools as shown by their true tax rates (34).

State Department of Education

Beginning in 1908, with the creation of the county unit system of local schools, the Legislature has created an increasingly complex enterprise involving broader powers for the local boards as the school program and the total school system have expanded. Correspondingly, there has been an increased demand for legal advice on school issues, problems, and laws.

Three developmental stages of growth of the State Department of Education are evident in the programs and services provided to the local school systems. Its clerical and statistical services, extending throughout the nineteenth century, continued through the first decade of the twentieth century. Its regulatory and inspectorial services, emerging in the first decade of the twentieth century, extended into the early 1920's. Its administrative leadership has become the firmly established pattern in the 1930's.

The 1912 act provided that the state superintendent, with the help of two assistants, should inspect and examine the fiscal and general management of schools to see if the laws and regulations of the State Board of Education were being enforced and operated in the interest of efficiency (35). In 1924, when the Legislature defined by statute the State Department of Education, an inspection and accounting division was one of the nine divisions of service specified. This division was retained by statute until all divisions were abolished in 1956, leaving the superintendent of public instruction freedom and authority to establish divisions as he deemed necessary.
By 1923, the court of appeals had ruled that members of the local boards of education were not county officials and that the county attorney had no duty to advise them (36). The General Assembly, which constitutionally has power to determine authority of state officials, had provided that the attorney general was the chief law officer of the Commonwealth of Kentucky and of all its departments but had no power to intervene in local matters. Consequently, the Legislature of 1924 expanded the legal responsibility of the superintendent of public instruction by providing that, as executive officer of the State Board of Education, he “shall explain the true intent and meaning of the school laws and of the published regulations of the State Board of Education ... and in all such matters he shall consult fully with the Attorney General” (37).

The 1924 laws provided that the superintendent of public instruction should prepare regulations for adoption by the State Board of Education in areas including, in addition to the state school budget and census, courses of study, certification, buildings, and classifying and accrediting schools.

1930 TO THE PRESENT

The years 1930 through 1934 marked a very important period in the development of education in the state. Of special significance were the Equalization Act of 1930 and the School Code of 1934.

The General Assembly of 1930 showed its perception of educational needs by providing a financial program which would facilitate equal educational opportunity. The Constitution of 1891 had prevented equalization through its mandate that state fund distributions must be on a per capita basis.

In an effort to change this pattern, the State Department of Education prepared and submitted to the Legislature of 1930 a bill which provided for appropriation of state school aid on an equalization basis. This bill was enacted into law and became operative in the 1930-31 school year. It provided for an annual appropriation of $1,250,000, which was to be expended under the direction of the state department. The purpose of this fund was described by the statute:

Equalization of educational opportunities, as used in this Act, means the raising of the level of expenditures per pupil for educational purposes in school districts where the level of educational opportunities is below the level or standard fixed and prescribed by law and the State Board of Education ... (38).

This act enabled the state board to help local boards in poorer counties to pay their teachers a minimum of $75 per month. Under the provisions of this law, the state distributed $630,005.50 during 1930-31 (39). But in 1932, the constitutionality of the act was questioned because of the constitutional limitations of Section 186. The court of appeals ruled that the act did, in fact, violate the constitution (40). This constitutional limitation greatly handicapped the state department in distributing state funds, and the inequalities caused by wealth differentials were perpetuated for many years.

The General Assembly of 1932 enacted a law providing for a Kentucky Educational Commission consisting of the superintendent of public instruction and eight appointed members. The General Assembly directed this commission to make a study of public education in Kentucky and report the findings to the Governor and the assembly at the opening of the next regular session, “with recommendations of such measures and such revision of the school laws as may be found necessary to increase efficiency and equalize the benefits of public education throughout the Commonwealth” (41). The work of this commission resulted in the adoption of a completely new school code for Kentucky. Several other fundamental educational achievements resulted from its recommendations.

At the time of this report, the State Board of Education was an ex officio board composed of the superintendent of public instruction, the secretary of state, and the attorney general, all politically elected officers. The commission also pointed out that the superintendent of public instruction, a politically elected officer, was unable to succeed himself and that this manner of selecting the chief educational officer was fixed by the constitution and could not be changed except by constitutional amendment. It was recommended, however, that the superintendent of public instruction serve as ex officio member of the State Board of Education as long as he held this position. The commission also recommended that the state board be
made up of seven representative laymen appointed by the Governor from the state at large.

These recommendations were enacted into law by the 1934 session of the General Assembly; and from 1934 to 1962, the State Board of Education was composed of seven lay members appointed by the Governor from various locations in the state, and the superintendent of public instruction was ex officio chairman.

The new school code gave the superintendent wide authority and responsibility as the educational leader in Kentucky. Other meaningful provisions enacted in 1934 resulting from the study of the commission gave broad authority, instead of specific duties, to the superintendent and to the state board in the areas of courses of study, curriculum, and instruction. The state department, under this general authority, has made continuing efforts to develop to the fullest the potential of this leadership responsibility. Since 1934, the role of state superintendent has included approval of minimum courses of study and the adoption of rules and regulations describing the scope of the instructional program.

After 1934, the courses of study as set forth by the state board consisted of the subject areas, the name of subjects in each area, and the listing of subjects by grades. The state department's other legal functions had direct influence upon the courses of study. These included adoption of textbooks by the Textbook Commission (a division of the state department), setting of certification standards, adoption of qualifications for teachers assigned to high school subjects, and adoption of accreditation standards covering a broad spectrum of elements having direct bearing on the curriculum and the quality of instruction. It is evident from the reports of the superintendents of public instruction that the goal has been to have in every school curriculum offerings broad and deep enough to meet the varying abilities, achievements, career interests, and aspiration levels of all students.

The 1934 school code provided for only two kinds of districts, county and independent. It abolished subdistricts and provided that independent graded common school districts should have a school census enumeration of at least 250 or more white children. Both types of districts were to be governed by boards of education consisting of five members elected by the people. Further, the 1934 act made provision for the merger of school districts.

In 1934, the State Department of Education was given the legal responsibility for accrediting schools, as well as approving both elementary and high schools. The 1934 law follows:

The Superintendent of Public Instruction shall prepare, or cause to be prepared, and submit for approval and adoption by the State Board of Education rules and regulations for grading, classifying, and accrediting of all common schools, and for determining the scope of instruction that may be offered in the different classes of schools, and the minimum requirements for graduation from the courses offered. The Superintendent of Public Instruction shall prepare, or cause to be prepared, and submit for adoption and approval by the State Board of Education, rules and regulations for approving private and parochial schools of elementary or high school grade and commercial schools (43).

Since the responsibility for accrediting high schools was given by the Legislature to the State Board of Education, the accrediting committee of the Kentucky Association of Colleges has served as an advisory body to the supervisory staff of the State Department of Education. With minor changes, the 1934 legal provisions continue to provide the legal basis for accreditation for both elementary and secondary public schools, for private schools, and for commercial schools.

By 1939, the state department was organized in eight divisions along the lines of services offered: school buildings and grounds, school census and attendance, school finance, textbooks, school supervision, teacher education and certification, special education, and vocational education.

The Department of Education at this time reported that the state had 494,339 pupils in average daily attendance. This figure represented only 78.5 percent of the public school enrollment. The average annual salary for teachers was only $890.32, and the typical teacher had had but 3.5 years of college. The percentage of certificated teachers who were college graduates had increased from approximately 25 percent in 1935-36 to only about 40 percent in 1938-39 (44).

The problems indicated by these statistics were increased by the outbreak of World War II. John W. Brooker, who was state superintendent from 1940 to 1944, stated:

National defense is not measured alone by ships, planes, guns and bombs. These can be taken care of by government. We must deal with the problem of making men able to use our physical instruments of defense; but more important is the task of emphasizing the spiritual values which we must defend. Democracy is a way of life. We must work together and reason together (45).

A problem of considerable magnitude during the war years was teacher turnover. In 1943, the state department reported that one-fourth of the men and women had left the teaching profession. The positions vacated were filled chiefly by emergency teachers.

Worker migration from rural areas to industrial centers was greatly accelerated by the war. From 1940 through 1943, county districts lost 46,864 census pupils, and independent districts lost 13,673. Of course, this was not a net loss to the state, since many pupils moved about within the state and were not recounted properly; but the migration did greatly complicate and increase problems in pupil
attendance services, school building construction needs, staffing, and instructional services.

The impact of the war on education, felt in all phases of the program, was particularly important to vocational education. Defense training became a standard part of the vocational program; and educators were called upon to organize courses for out-of-school youths in auto mechanics, electricity, metalwork, and woodworking. In many cases the courses were coordinated with the National Youth Administration. In courses involving NYA, there were 6,221 persons enrolled and 162 teachers employed. During the 1940-44 period, nearly all of the trade schools offered part-time and evening extension courses for apprentices. The Kentucky Department of Education cooperated with the federal government in providing trainees with courses which were essentially preemployment training or were of a supplementary nature. In addition, the area trade schools carried on a foremanship training program which was of great value to the war effort.

In 1944, Governor Simeon Willis stated that the commitment to the crisis which faced the nation should not lessen the duty to educate our children and youth. As the obligation to youth is continuous and cannot be postponed, Governor Willis felt that the financial program for the betterment of the common schools must be met.

The 1944 General Assembly responded to the needs of education by enacting legislation which allowed local school districts greater latitude in financing their own educational programs. Under this legislation, city school districts could levy from $1 to $1.50 per $100 of taxable property, depending on the classification of the city. Subdistrict taxes in counties were abolished by this act, and county school districts were given authority to levy a maximum of $1.50 per $100 of taxable property. These levies were for other than sinking fund purposes.

This same General Assembly appropriated $3 million to supplement salaries of teachers. The enactment of this pay increase was important because, as the act stated, "due to the present emergency, there is a great shortage of teachers because of low salaries and the attraction of more lucrative paying positions in war and in private industries" (46).

This same Legislature attempted to ease the school construction problem by authorizing boards of education in county and independent school districts containing second-class cities to establish a building fund. The tax for this fund could be levied for 1½ to 5¢ on each $100 of property valuation annually in addition to existing taxes. A 1946 amendment to this act allowed the board of education of any district to levy from 4¢ to 20¢ on each $100 of property valuation. The revenues from this tax could be used for the erection, alteration, enlargement, and equipping of school buildings (47).

During 1945 and immediately after the war, there were signs of substantial progress in the public school system of Kentucky. The state common school fund had increased 94 percent between 1942-43 and 1947-48. The median annual teacher's salary in the state had nearly doubled, from $782 in 1942-43 to $1,325 in 1946-47. The 1946 enactment by the General Assembly allowing school districts to levy a tax of up to $1.50 gave local superintendents and boards of education more discretion in preparing an adequate school budget (48). School districts had begun to reduce some of the school building backlog which had accumulated during the war. In 1947, the state department approved 201 projects for new buildings and remodelings, with an estimated cost of $16,232,000.

While Kentucky's educational system as a whole was improving, the state department continued to grow and offer educational services so badly needed by local school districts. It was reorganized during this period into four bureaus: administration, finance, instruction, and vocational education. New divisions included surplus property, Negro education, and library science.

The Foundation Program Law and Implications for Development of the State Department of Education

The Foundation Program Law was enacted by the General Assembly in 1954, initially financed at 70 percent of its estimated cost level, and fully financed by the General Assembly in 1956. The first report of the Commission on Public Education, released December 1961, includes the following observations:

The enactment of the Minimum Foundation Program for support of public schools in Kentucky has been one of the most phenomenal and historic acts of any state legislature in modern history of American education finance . . . The Foundation Program is quite effective in sending its funds where there is most need in order to put a nine months school program in every district with a qualified teacher in each classroom. . . . The Foundation Program and more adequate expenditures came none too soon for almost any measure of educational attainment showed Kentucky at the bottom of the list of states at that time. . . . Between 1953-54 and 1960-61 the increase in current expense per pupil in average daily attendance in Kentucky was 1.54 times as great as in the highest neighboring state and 1.7 times as great as the national average (49).

In 1956, Governor Chandler said:

I have said . . . that the Executive and Legislative branches of the government will furnish the tools to the Department of Education with which it can do a dramatic job and the Department must get its house in order to perform the task which lies ahead of it. The people of Kentucky are entitled to value received for the enormous amount of its tax money which will be spent.
for education during the next four years. The reorganization of the Department is essential to the performance of its important and increased responsibilities (50).

This was in reference to the budget representing a $20 million increase over the previous year and to the 1956 Reorganization Act, through which all divisions were abolished and the superintendent of public instruction was given authority to reorganize the Department of Education.

The enactment of the Foundation Program Law was a culmination of more than a century of effort to provide equal educational opportunities for the children of Kentucky. As early as 1848, Superintendent Breckinridge said:

"...broad interest in getting children into school (51).

Thus, the state was 106 years getting this principle embodied in the Foundation Program Law.

Progress Toward Foundation Program

As early as 1921, Superintendent George Colvin in his biennial report expressed succinctly a concept of a foundation program based on equality of opportunity for children:

"...the school system than any other, it is that school money be distributed among counties and districts in proportion to the number of children in districts instead of the number of children attending schools in the district. Children who never attend school should no more be considered in distribution of school revenue than the same number of people who are not children. If this method were changed and counties knew they would be paid the State's money on the basis of the number of pupils in school, then everybody, not the teacher only, would have an immediate and a vital interest in getting children into school (51).

The method of distribution has been too complicated. If there be one idea said to be more fatal to the school system than any other, it is that school money be distributed among counties and districts in proportion to the number of children in districts instead of the number of children attending schools in the district. Children who never attend school should no more be considered in distribution of school revenue than the same number of people who are not children. If this method were changed and counties knew they would be paid the State's money on the basis of the number of pupils in school, then everybody, not the teacher only, would have an immediate and a vital interest in getting children into school (51).

Thus, the state was 106 years getting this principle embodied in the Foundation Program Law.

In his biennial report of June 1939, State Superintendent Peters pointed out that there is "an ever-increasing demand from the people that the schools serve better the needs of children, and we are now facing problems which are preventing the schools from serving the children as they should." As a solution, Superintendent Peters recommended increased state aid and an equalization fund (53).

In 1941, the voters approved an amendment to Section 186 of the Constitution of Kentucky, a section of which had long hampered state aid to local districts because it put distribution of state school funds on a pupil-census basis. The amendment of 1941 authorized the state to distribute 10 percent of the state funds on other than a pupil-census basis. In 1942, the General Assembly authorized an equalization fund, which represented the first step toward the present foundation program. This act stipulated that if the available funds of any district failed to provide an income of $30 per pupil per year, then the equalization fund would bring the total up to $30 per pupil for the district. In case the fund was not sufficient for this, the available amount of the fund was to be distributed on a percentage basis determined by the ratio of the fund to $30 per pupil per year.

As a result of the 1941 amendment, in 1944 the Legislature appropriated $1.5 million for equalization purposes for districts whose total net revenue did not yield as much as $40 per pupil in average daily membership. In 1943-44, 60 counties and 19 independent school districts participated in this equalization program. In 1945-46, 57 county school districts and 12 independent districts shared in the fund. In 1946-47, $1.8 million was distributed to 51 county districts and 39 independent districts.

In 1949, another amendment to Section 186 of the constitution was approved by the voters, changing the percentage that could be used for equalization from 10 to 25 percent.

In 1950, a series of steps were taken which culminated in the enactment of the Foundation Program Law by the General Assembly in 1954. First, the Kentucky Education Association held a leadership conference in August for the purpose of discussing a minimum foundation program for Kentucky. However, the report of the association's Committee on Education recommended that legislation be enacted to provide an efficient system of schools throughout the Commonwealth.

Another step toward a foundation program was taken when the report of the Committee on Functions and Resources of State Government was presented to the people of Kentucky (54). Superintendent-Elect Wendell P. Butler pledged to devote his administration to the removal of the "road-block" by amending Section 186 of the constitution and to enactment into law of a foundation program of education. In 1952, the Legislature appointed a statewide Advisory Committee on Educational Policy. Through studies involving 5,000 members of local advisory committees and

In 1952, the Legislature appointed a statewide Advisory Committee on Educational Policy. Through studies involving 5,000 members of local advisory committees and
20,000 interested citizens, some significant conclusions were reached: The distribution of the school fund should be based on ability and need if educational opportunities were to be provided all children on an economical and fair basis; and the pupil-census basis of distribution of school funds perpetuated inequities, rewarded nonattendance, and ignored the need for ensuring a low pupil-teacher ratio (55).

As a result of this painstaking work, Section 186 of the constitution was again amended in November 1953; in 1954, the Legislature enacted the Foundation Program Law. Two years later, the Legislature appropriated funds to implement the foundation program, declaring its intent in enacting Kentucky Statute 157.310 as follows:

It is the intention of the General Assembly to assure substantially equal public school educational opportunities, through a Foundation program for those in attendance in the public schools of the Commonwealth, but not to limit nor to prevent any school district from providing educational services and facilities beyond those assured by the foundation program; and to provide, as additional state funds are made available for the public schools, for the use of such funds for the further equalization of educational opportunities (56).

The foundation program provided for at least a minimum school program for every child in the state, regardless of where he lives, and an opportunity for the people in any school district to go beyond the minimum program whenever they decide to do so. It also demanded that educational responsibility be shared between the state and the local school districts and that the school district's contribution be based on local ability to support an educational program.

The foundation law, as amended in 1956, contains slightly less than 12 printed pages. The Legislature, elected by the people, set the limits and safeguards as to what may be done under the law, but assigned the task of administering the foundation law to the superintendent of public instruction under regulations adopted by the State Board of Education under the laws of the Commonwealth.

The foundation program provided for the distribution of funds, not only for salaries for which all state aid in the past was expended, but for transportation, capital outlay, and materials and supplies. Thus, the State Department of Education has each year, within limits of the available budget, been expanded in order to provide more adequate leadership services in all these facets of the school program.

The Office of the Superintendent of Public Instruction and the State Board of Education

The Office of the State Superintendent of Public Instruction and the State Board of Education are interlocked legally, organizationally, and functionally.

As pointed out earlier, in 1934, climaxing an effort of many decades on the part of the state superintendents and other educational leaders, the General Assembly enacted a law reconstituting the State Board of Education. The statutory provision for a new state board of seven laymen appointed by the Governor, with the state superintendent of public instruction as chairman, was consistent with the recommendation of the 1933 report of the Kentucky Educational Commission, of which Superintendent James H. Richmond was chairman (57).

In 1951, the final report of the Committee on Functions and Resources included the following recommendation:

The Constitution should be amended to provide that the State Board of Education shall appoint the State Superintendent of Public Instruction on the basis of proven experience and qualifications and that he be eligible to serve for more than a period of four years (58).

The 1961 report of the Kentucky Commission on Public Education made by Booz, Allen and Hamilton, Management Consultants, stated:

The Administration and leadership of schools throughout the state depends more upon the ability and integrity of the State Superintendent of Public Instruction than on any other single individual. The position of State Superintendent of Public Instruction should become an appointive position . . . (59).

In 1921, 1953, and 1957, attempts were made, under the leadership of the state superintendent of public instruction and the Kentucky Education Association in conjunction with the various Legislatures, to amend the 1891 constitution in this regard. All three efforts were rejected by the people at the polls. Then, again in 1954, the Legislature took action to give the people an opportunity to vote on a revised constitution. One of the significant revisions related to the election of the superintendent. Harry M. Sparks, a leader in this movement, stated in January 1964, on beginning his limited 4-year term:

In the last ten years eleven states have adopted the plan to keep public education out of politics as much as possible. Our neighbor state of Ohio is changing now. The new concept puts educational leadership in the hands of truly professional administrators, plus a direct relationship with the representatives responsible to the people (60).

The cochairman of the statewide committee of Kentuckians for a Better Constitution, John Fred Williams, was a former superintendent of public instruction. Although the proposed revised constitution was supported by the State Department of Education, the Kentucky Education Association, the Governor, and many lay organizations, it was overwhelmingly defeated in November 1966.
An amendment to the constitution making it possible for the superintendent of public instruction to succeed himself in office remains an imperative.

The relationship between the superintendent and the State Board of Education has varied. From 1838 to 1908, the superintendent was designated by the law as the president of the board. In 1908, he was designated as chairman and executive officer. In the 1934 acts, when after nearly a century the ex officio board was replaced by a lay board, the superintendent of public instruction was designated as chairman. In describing this relationship in 1961, the survey by Booz, Allen and Hamilton stated that—

Under the present system, the regulating authority, at the state level, over the state school systems is divided between the elected state superintendent and the appointed state board members. Either can block the action of the other, but the state superintendent has the dominant role (61).

A fundamental change was made in this relationship by the acts of 1962, which removed the superintendent of public instruction from membership and chairmanship of the state board, effective January 1964, and which provided that the state board elect its chairman from its membership. The relationship was further altered by the 1962 acts in that provision was made under Section 156.132 that action on the removal or suspension of any district board member or superintendent of school could be taken by a majority vote of the state board without recommendation from the superintendent of public instruction. Further, under the 1962 acts it was provided that the attorney general, upon the written recommendation of the Governor, the auditor of public accounts, the superintendent of public instruction or the state board, shall institute the necessary actions to recover from any source school funds which he believes have been erroneously or improperly allowed or paid to any person. These two fundamental changes broke the 124-year-old legal procedures and relationship between the state superintendent of public instruction and the State Board of Education. These changes emerged during a period of high tension created by statewide publicity of a local school situation where there were alleged irregularities in the expenditure of public school funds. Out of this situation, uncordial relationships developed between the 1960 General Assembly and the superintendent of public instruction’s office. An extremely critical report made by a special legislative committee in response to House Resolution 55, enacted in February 1960, led to the creation of the Commission on Public Education, for which the firm of Cresap, McCormick and Paget, Management Consultants, was engaged to make a study of the State Department of Education. Out of this study, recommendations were made which were enacted into the laws bringing about the changes described.

At present the law provides that the superintendent of public instruction shall be head of the Department of Education, which shall consist of the State Board of Education and the superintendent of public instruction. Further, in the same section of law, the Department of Education, of which the superintendent is the head, shall exercise all the stated administrative functions in relation to the management and control of the public common schools. But then again in another section, the statutes specify that the superintendent shall perform such duties as are assigned by the board. The fact that he is elected by the people raises a question relative to this basic relationship as stated by law.

The State Department of Education Today

In 1924, the State Department of Education was recognized by the General Assembly as a unit of state government, and budget appropriation was made directly to the department for its operation under the administrative direction of the superintendent of public instruction. The Legislature, in the acts of 1924, gave the types of positions needed and the appropriate salaries.

The responsibilities of the department have been increased substantially during four periods since 1924. The adoption of the new school code in 1934, in keeping with the Kentucky Educational Commission recommendations, reflected additional appropriations and responsibilities for the department; in 1944, a substantial increase was made in the state budget appropriation for the department; in 1954 and in 1956, the department was greatly strengthened in order to provide the services demanded for proper administration of the newly enacted Foundation Program Law; and during 1965, the department again significantly increased its staff in order to administer the state’s portion of the Elementary and Secondary Education Act of 1965.

The Department of Education today has a total of approximately 500 professional and nonprofessional employees. This number does not include the personnel in vocational schools, School for the Blind, School for the Deaf, Kentucky Industries for the Blind, and clerical and stenographic staff in those special schools and district offices, all of which are under the direct administrative control of the Department of Education. If these personnel are included, the total employee force of the department numbers in excess of 1,500. This figure may be contrasted with a total staff of only 11 in 1915-16, 43 in 1935-36, and 86 in 1945-46 (62).

The Department of Education today is organized into six bureaus made up of 32 divisions: administration and finance, instruction, pupil personnel services, rehabilitation services, state-federal relations, and vocational education. In addition to these bureaus, there are special divisions directly responsible to the state superintendent or the deputy superintendent which provide services in the areas of information, civil rights, school law, and research.
SELECTED PROGRAMS AND THEIR DEVELOPMENT

In order to provide a better view of the historical development and the present operation of the Department of Education, several selected service areas are presented separately. The key dates in the historical progress of these program areas of course correspond with the overall development of the Department of Education; however, a micro-investigation of the internal development of the department may be of added historical interest and significance.

Certification and Teacher Preparation

The act of the Kentucky General Assembly approved in February 1838 providing for a system of common schools prescribed a method of certificating teachers. The only duty assigned by this act to the superintendent of public instruction relative to certification was that of prescribing the form on which the certificate was to be written. The gradual change in authority over certification from local administrative units to the state level was not complete until 1934.

By the acts of the General Assembly in 1914, the state board was empowered for the first time to fix standards for qualifications of teachers in the public high schools, specifying that, to be eligible to teach in the public high schools of Kentucky, persons must give satisfactory evidence of scholarship equivalent to graduation from a 4-year standard high school and, in addition thereto, the equivalent of 2 years of work in a college or normal school (63).

Under the acts of 1920, the General Assembly transferred the certification of teachers from counties to the State Board of Examiners by requiring that this board prepare the questions and grade all the examination papers, which were to be returned to the State Department of Education by the county board of examiners. The State Board of Examiners had been the certifying agency since 1870.

The General Assembly of 1924 passed a different certification law abolishing the different kinds of certificates previously issued by the State Board of Examiners and setting up a new basis, terminology, and validity of certificates. This act inaugurated the issuance of provisional and standard elementary certificates, provisional and standard high school certificates, emergency permits, and the local elementary certificate, which was the only grade of certificate left to be issued upon the basis of examination. By statute, also, the 1924 Legislature created a certification and examination division, to be headed by a director with such assistants and stenographers as were necessary and consistent with the funds available (64). Responsibilities of the state department in the whole area of teacher certification and teacher preparation had been recognized as of such importance that by 1933 the superintendent of public instruction, with funds from the General Education Board, created the teacher-training division. The 1933 report of the Kentucky Educational Commission, of which the superintendent of public instruction was chairman, included teacher education and certification recommendations. Under the impact of this report, a significant change was made in the whole structure of teacher preparation and certification. The 1934 acts, in their reorganization of the state department, combined the teacher education and examinations division with the teacher-training division to form a teacher-training and certification division. Further, the 1934 acts placed all certification authority in the hands of the reorganized State Board of Education and provided that—

The State Board of Education, upon the recommendation of the Superintendent of Public Instruction, should from time to time publish... rules and regulations governing the issuance of each kind and grade of certificate, ... the renewal of certificates, the transfer of certificates to and from other states, the acceptance of credentials from institutions of other states, and such other information relating to the training and certification of teachers as it deems advisable (65).

The 1950 Legislature repealed all certification acts which referred to certificates or standards in terms of college preparation or semester hours. Beginning with the acts of 1950, only two statutes (KRS 161.020 and KRS 161.030) have served as the legal basis for determining types of certificates and the programs and standards under which they are issued. As recommended by Superintendent Boswell B. Hodgkin, all certificates are issued and renewed by the State Board of Education upon curriculums as prescribed by the Council on Public Higher Education and approved by the state board; and all teacher education curriculums offered in any standard college or university of the state for the training of teachers are submitted to the state board for approval.

In 1949-50, the median preparation of elementary teachers was 88.8 semester hours, while in the fall of 1965 the median had reached the bachelor's degree plus 17.3 semester hours. The percentage of elementary teachers with a bachelor's degree increased from 33 percent in 1949-50 to 91.1 percent in the fall of 1965. The percentage of teachers holding a master's degree increased from 23.6 in 1949-50 to 33.3 in the fall of 1965. The percentage of all elementary and secondary teachers holding a bachelor's degree rose from 50.9 percent in 1949-50 to 94.3 percent in the fall of 1965 (66). In addition to raising the quality of teacher education and certification, there has been opportunity under the freedom of the 1950 act to develop standards and programs for additional types of personnel, including guidance counselors, special education teachers in all areas of exceptionality, finance officers, and curriculum consultants.
Office of Education on an annual basis. Statistics on school areas of responsibility from the beginning.

Pupil personnel records and accounting have been vital in planning with local school systems and with the Kentucky Legislatures.

As early as 1873, school attendance was so poor that the county school commissioners advocated compulsory attendance laws — laws regarded by the people as tyrannical. The superintendent of public instruction suggested that comfortable houses and efficient teachers would be magnets of influence to attract parental attention to the advantages of regular attendance in school. The attendance continued to remain so poor that in 1896, 23 years after the 1873 proposals, the General Assembly passed a compulsory attendance act which became a law without the approval of Governor William O. Bradley. However, the law proved so inefficient that in 1904, 1908, 1912, 1920, 1922, and 1928, revised compulsory attendance laws were enacted. These laws attempted to place responsibility for attendance first on the teachers, then on the county commissioners, and, finally, on the parents, providing penalties for parents who failed to keep their children in attendance. In 1934, the present compulsory attendance law was enacted, and the state department was required to employ a staff member who would give services to the local systems in the area of attendance and census (67). Recently, the title of attendance officer was changed to director of pupil personnel.

Records, Reports, Statistics, and Computer Services

In 1956, with the full financing of the foundation program and the reorganization of the state department, the records and reports division, including statistical services, was organized. During the period 1956-60, the work of this division increased tremendously. In calculating the foundation program allotments to each school district, computations were based on an array of data including the attendance of each child in each separate district by schools, as well as the qualifications of teachers and the number of teachers in each classification provided for by law.

In 1959, the Kentucky Department of Education inaugurated a state plan for improvement of statistical services as the first step in implementing Title X of Public Law 85-864, known as the National Defense Education Act. Services in the area of records, reports, and statistics could then be facilitated by the use of automatic processing machines. Information and data are furnished to all divisions of the Department of Education, to local systems, to the U.S. Office of Education, to the Legislature, the Office of Public Information, state universities and colleges, the Departments of Health, Economic Security, and Finance, and to the Governor.

By 1965, a computer services division had been created, staffed by seven professional personnel and eight clerks. This was in addition to the statistical services division.

Supervision and Consultative Services

The present Bureau of Instruction, with approximately 50 professional staff members, is an outgrowth of a program of supervisory services begun in 1910 when two educational supervisors, one for the rural elementary schools and one for the high schools, were appointed by Superintendent Ellsworth Regenstein and supported by funds from philanthropic agencies.

In 1924, the Legislature, recognizing supervision as one of the major functions of the state educational agency, created the rural, high school, and Negro school divisions and appropriated sufficient funds to cover part of the salaries, the remaining part being paid by philanthropic agencies. The new school code in 1934 stated that the establishment of the divisions was for "the successful administration and supervision of the common schools and other educational agencies placed under the management and control of the board" (68). This is the legal authority under which the State Department of Education continues to provide supervision and consultative services.

For a short time beginning in 1923, the services of a supervisor of music were made available with state funds. In the 1930's, a supervisor of library services and an elementary supervisor were added to the staff for a short time. Then, in the latter part of the 1940's, with funds from private agencies, a supervisor of health and, again, a supervisor of library sciences were added; and with state funds, a supervisor of elementary education was employed. It was not until 1956 that the State Department of Education began to provide on a continuing basis supervisors and consultative services in art, music, physical education, and special education. Since the passage of the National Defense Education Act in 1958, supervisors and consultants have been provided in areas of mathematics, science, reading, and guidance. Under the Foundation Program Law, no distinction is made between elementary and secondary schools, and these services are available on a 12-grade basis.

With additional personnel made possible by the Foundation Program Law and the National Defense Education Act, a more comprehensive plan of providing consultative services to the local school systems has been inaugurated. The plan, known as the team approach to system-wide evaluation, was initiated on a voluntary basis. The total staffs of the instruction and vocational education bureaus participated in creating the plan and implementing it in the local districts.
Special Education

Kentucky school leaders in 1934 influenced the Legislature to establish vocational rehabilitation and special education divisions in the department. The program was administered by the State Board of Education in cooperation with local county and independent boards of education. By 1938-39, under state department stimulation, 51 school units were providing some special education to more than 1,800 handicapped children.

In 1948, the Legislature created a Division of Special Education for Handicapped Children and appropriated funds for the State Department of Education for administrative and supervisory services. The 1948 acts created within the State Department of Education a Division of Special Education and gave to the department responsibility for maintaining a census of handicapped children and authority to approve plans of local school systems for providing special education programs. Further, the acts required that teachers of exceptional children meet standards of preparation and certification adopted by the State Board of Education.

In 1952-53, just prior to the enactment of the Foundation Program Law, 23 school districts under the reimbursement policy act were providing to a limited extent educational opportunities to a number of handicapped children.

The 1954 legislation contained special provisions for the education of exceptional children. In implementing the foundation program, the state board adopted criteria for approving each classroom unit, including teacher qualifications, facilities, and programs. The law itself specifies sizes of classes. Since the financing of the foundation program in 1956, the number of classroom units provided for exceptional children has increased from 99.3 to 424 in 1964-65. These 424 classroom units include programs for a variety of exceptionalities: the crippled, the visually handicapped, the speech handicapped, the hearing handicapped, the mentally retarded, and the neurologically impaired. The Department of Education has increased its consultative staff in special education from one supervisor in 1947 to a director and four supervisors.

Legal Services

The very first service performed by the first superintendent of public instruction in 1838 was to order and distribute 1,000 copies of the 1838 act on education, containing 42 sections.

The acts of 1894 placed upon the state superintendent the statutory responsibility for rendering decisions on school law and for co-operating, indexing, publishing, and distributing throughout the state biennially the general school laws and abstracts of decisions of the appellate court and the attorney general on points of school law and "construction thereof," as well as decisions and regulations of the State Board of Education.

The 1924 law, when the main provisions of the present statutes concerning legal services were enacted, stated:

The Superintendent of Public Instruction shall explain the true intent and meaning of the school laws and of the published regulations of the State Board of Education. He shall explain, if requested, to the parties concerned, all controversies and disputes involving the proper administration of the public school system, but in all such matters he shall freely consult the Attorney General.

He shall publish biennially school laws of the State, omitting all that have been repealed and inserting in its proper place that which is amendatory or new. There shall also be included and inserted in connection with the proper sections abstracts of the decisions of the appellate court, and the decisions and interpretations of the Attorney General and of the Superintendent of Public Instruction.

Increasingly, as local school controversies arose, the superintendent of public instruction and the attorney general were called upon to explain the laws and to render decisions and opinions. The attorney general, in practice, has interpreted the laws for local school officials, usually rendering opinions after consultation with the state superintendent or his representative. The Legislature in 1924 authorized the superintendent to appoint an assistant superintendent. The superintendent designated his assistant to be legal adviser to local school officials. It is significant in the historical development of the State Department of Education that each superintendent has provided these legal services through the assistant superintendent. Cooperation between the state department and the attorney general's office has led to a continuity of legal interpretation which has earned the respect and confidence of local school personnel.

Vocational Education

As early as 1908, curriculum offerings now classified as vocational education were recognized as essential to the high school program. The 1908 act of the General Assembly which made mandatory provisions for establishment of at least one county high school in each county also provided that the high school course of study prepared by the State Board of Education "may provide for instruction in manual training, domestic science, and elementary agriculture." In 1917, a half century ago, the Congress of the United States passed an act signed by President Woodrow
Wilson for the promotion of vocational education. This act provided for annual federal appropriations for salaries of teachers, supervisors, or directors of vocational subjects, including agriculture, home economics, and industrial arts, and for funds to assist in preparing teachers, supervisors, and directors of these subjects. The Governor of Kentucky immediately appointed a State Board of Vocational Education with the state superintendent as chairman. In 1918, the Legislature passed an act accepting the provisions of the acts of Congress and providing for a vocational education board as already established and with the same personnel. It was not until 1934 that the Legislature transferred the responsibility for the administration of vocational education to the State Board of Education.

Under the leadership of the state department, the Legislature, from time to time, has been encouraged to make appropriations on a matching fund basis to enable Kentucky to take full advantage of the additional funds and programs offered under the George-Reed Act of 1929, the Ellzey-Reed Act of 1934, the George-Deen Act of 1936, the George-Barden Act of 1946, the Health Amendments Act of 1956, the NDEA Act of 1958, the Area Redevelopment Act of 1961, the Manpower Development Act of 1962, and the Vocational Education Act of 1963. With these supporting funds, vocational education has been expanded to include distributive education, practical nursing, technological education, industrial arts, business education, education for veterans, the Manpower Development Program, and the Work Study Program. With increased federal funds under the George-Barden Act of 1946, post-secondary preparatory programs in vocational education were established. The Health Amendments Act of 1956 provided for practical nursing. The Vocational Education Act of 1963 provided for more flexibility in the program of vocational education than was possible under previous acts. Programs for unemployed of all age groups are provided. The NDEA Act of 1958, providing for the training of technicians, and the federal Vocational Education Act of 1963 have added new dimensions to vocational training, including programs in health occupations, technician training, office occupations, home economics for gainful employment, and for the academically and socioeconomically disadvantaged. Also, encouragement through funding has been given to occupational guidance, to more effective teacher training, and to local and state supervision.

No doubt, continuity of leadership by the Department of Education in the overall area of vocational education has contributed to the growth of all facets of vocational education as provided for under the various federal acts.

**Vocational Rehabilitation Services**

The federal government, through the Federal Civilian Rehabilitation Act of 1920, provided matching funds to the states for the purpose of reeducating persons of employable age who had been incapacitated in industry. Governor Morrow worked out an agreement between the State Board of Vocational Education and the Workmen's Compensation authorities, but funds were not available until the Legislature met in 1922 (72). In 1954, Public Law 565, amending the Rehabilitation Act, set up the financial structure under which the State Department of Education provides services to the disabled. The 1956 act authorized the superintendent of public instruction to establish within the department a state rehabilitation agency which should have such powers and duties as were contained in the act and such other functions as might be established by regulations of the state board.

In 1958, the Bureau of Vocational Education was organized around its three distinct programs of services—rehabilitation services, services to the blind, and disability determinations. By an agreement with the U.S. Department of Health, Education, and Welfare, the federal government provides the funds for this program.

The Bureau of Rehabilitation Services is responsible for the administration, supervision, direction, and overall promotion of the state-federal program for the vocational rehabilitation of the disabled in Kentucky. The head of this bureau maintains liaison with the U.S. Department of Health, Education, and Welfare.

The latest report on the study of the State Department of Education points out the following:

The Bureau operates on a separate budget from the regular budget of the Department of Education. For the 1965-66 fiscal year, the Bureau provided rehabilitation services to 9,554 persons through its eleven district offices and 22 special facilities throughout the state. The Bureau of Rehabilitation Services is one of the fastest growing and most vigorous units of the department. The advancement in number of cases served, the increased use of available federal funds, and the imaginative plans for the future are highly commendable (73).

**Adult Education**

Adult education has been recognized as an area of need for at least a half century. Superintendent John G. Crabbe, in his report to the 1908 Legislature, pointed out that the federal census showed that of the 52 states and territories, only 3 had a higher percentage of illiterates than Kentucky (74).

The need for a state program in adult and continuing education has become increasingly clear each decade since 1908. According to national census reports in each decade from 1920 to 1960, Kentucky has ranked low in the educational level of adults. From February 1961 until June 1962, a general adult education program, with funds provided by
a special appropriation of the Legislature to the state department, was sponsored through the Bureau of Vocational Education. The funds were discontinued in June 1962, but during that brief period 5,051 adults had attended classes in 23 school districts, and the value of such services to both the communities and the schools had become clear (75). When funds were withdrawn, only 9 of the 23 districts could continue the program.

Adult education has now become one of the fastest growing concerns of Kentucky's public school system. A significant forward step was the creation in 1962 of a program for high school equivalency certificates. This program of services is administered and supervised through the Department of Education under regulations authorized by the State Board of Education. This program is not subsidized by federal funds. A dramatic expansion of the program of adult education was sparked by the Economic Opportunity Act of 1964, through which funds are distributed to the states on a 90-10 percent ratio. By the end of 1965, the value of adult education had been recognized by every district.

The success of the adult education program is evidenced by the fact that a substantial number of adults who complete the adult basic program continue their education until they receive the equivalency high school certificates; substantial numbers are promoted to better jobs, secure jobs as a result of their additional schooling, or enroll in vocational and manpower training programs; and a significant number enroll in college. During the 1965-66 and 1966-67 school years, the basic adult program cost $2,400,836, the administration and supervision being provided through the State Department of Education (76).

School Buildings and Grounds

"Next to the Scriptures, I want you to read this bulletin constantly" was the key message by Superintendent of Public Instruction John G. Crabbe in 1909 in an educational bulletin he prepared entitled School Buildings and Grounds. He was alarmed over the condition of the buildings in which young Kentuckians were receiving their educations. He was especially concerned over the number and condition of log huts being used as schoolhouses, even though the number had decreased from 2,845 in 1891 to 740 in 1909. As reported in the school report for 1907-1909 by Superintendent Crabbe, there was a great demand among school officers for plans for better country schoolhouses. He said:

With great care I have prepared this bulletin containing modern plans for one-room school houses, a two-room school house, and a four-room building; instructions for heating, ventilation, lighting, and equipping school buildings and for improving and beautifying the buildings and grounds . . . (77).

Prior to 1908, each district was responsible for its schoolhouses. Under the 1908 county school law, the county became responsible for the rural schools.

In order to achieve the present improved status of school buildings in Kentucky, the Legislature has taken significant action from time to time since 1900; and the state department, in fulfilling the legal and leadership responsibilities delegated to it by the Legislature, has provided significant programs and services. Each development paved the way for the next. Some of these developments follow.

First, an act of 1920 required the state superintendent to approve plans for school buildings in local districts; but these provisions had been ineffective, said the Educational Commission of 1921 (78). In 1921, Superintendent George Colvin reported that although the law required county boards to submit their plans and specifications for school buildings to him for approval, few had.

Second, acting on the basis of the 1921 and 1923 reports of the Efficiency Commission (79), the Legislature in 1924 enacted a law which placed more specifically on the superintendent the responsibility of preparing and submitting for approval by the State Board of Education plans for public school buildings and of providing advice to public school officials on planning and constructing school buildings. Further, the law provided that all plans, specifications, and contracts from the county board of education and boards of trustees of graded schools for new buildings and repair of old buildings should be examined and approved or disapproved by the superintendent of public instruction.

Third, in 1936, Superintendent H. W. Peters secured from the U.S. Office of Education a grant to be used in making a study of school conditions in Kentucky. One of the major goals of the study was to plan a long-time program of improvement, including schoolhouse construction and facilities. Through this study, buildings were identified as permanent or temporary, and school building sites were determined. On the basis of the full study, a plan of school improvement was developed for each school system in the state. This became a guide for two decades or more.

In 1946, the Legislature enacted legislation making it possible for local boards of education to levy up to 20 percent on each $100 valuation of property subject to local taxation, to provide special funds for the purchase of school sites, for erecting and equipping new buildings, and for enlarging existing buildings. By 1947, projects for new buildings and remodeling costing $16,232,000 had been approved by the state department. In 1946, a consulting schoolhouse construction engineer was employed in the buildings and grounds division.

Fourth, the General Assembly in 1950 enacted a "Special Voted School Building Fund Tax," in keeping with a recommendation by Superintendent Boswell B. Hodgkin, who called for this tax as a basis for securing
revenue for financing the capital outlay program. Under this new law, school districts could request the authority to submit to the voters of the district the levying of a special school building tax rate of not less than 5c but not more than 50c. The State Board of Education, by judicial interpretation, had been given authority to approve or advise on school bond issues. This represented a major expansion in the functions of the State Department of Education. The state board placed this responsibility upon the superintendent of public instruction; therefore, the state department became responsible for approving all types of school bond issues and determining the fiscal ability of a district to retire this type of indebtedness.

Fifth, the impact of the foundation program enacted into law in 1954 has proved to be the most significant development in stimulating the school building program. The foundation program legislation provided for the first time in the history of Kentucky state funds for capital outlay, up to $400 per classroom unit. This amount was increased to $600 per classroom unit in 1960 on the recommendation of the state department.

State financing of school construction and state assistance in planning school buildings have steadily increased, especially during the past 25 years. The services for planning school facilities are provided by five professional staff members in addition to the assistant superintendent, who has overall responsibility for this and other related divisions. These services focus on five programs: general school plant services; school building planning and engineering; school building maintenance and operation; school property accounting; and school property insurance. The finance division assists local districts in devising schoolhouse financing programs.

Transportation

At the turn of the century, several local superintendents had expressed the desire for legal authority to transport pupils. The state superintendent of public instruction submitted such a program to the Governor in 1907. But the County School District Law enacted in 1908 did not provide for transportation.

As the need for transportation authority increased, one county (Mason County) provided transportation out of funds provided by taxation in the district. When the right of the board to use these funds for transportation was contested in the courts, it became clear that further legislation would be needed. The General Assembly in 1912 passed an act giving county boards authority to transport pupils and to finance their transportation. The amount of money expended for transportation in 1915 was approximately $15,000.

The 1938 General Assembly passed a law requiring the State Board of Education to adopt and enforce regulations governing design and operation of school buses. Upon recommendation of Superintendent H. W. Peters, who gave encouragement and leadership to the transportation movement, the state board adopted in December 1939 rules and regulations relative to safety, comfort, bus equipment, school bus drivers, and the operation of school buses (80). In 1949, the state board revised school bus standards to conform to national standards.

The foundation program legislation provided the first state funds for transportation of school pupils in the amount of $1,600 in 1954. The amount was determined by the number of pupils who lived a mile or more from school and the area in square miles served. This legislation placed increased responsibility on the state department for regulatory, administrative, and consultative services (81).

The transportation division of the state department coordinates school bus purchases by local school districts. The state cooperative purchase plan has resulted in an average price reduction of $1,000 per bus, making Kentucky school bus prices among the lowest in the nation. These reduced prices have enabled the districts to upgrade their school buses faster than otherwise would have been possible (82).

School transportation has grown as districts consolidated schools or merged into larger school centers and as the school population increased. In 1964-65, the number of schools totaled 2,272, while the number of buses totaled 4,814. This represents a decrease during the decade of 42.2 percent in the number of schools and an increase of 31 percent in the number of buses. The number of pupils transported increased from 263,572 in 1954-55 to 379,859 in 1964-65. Expenditures for transportation increased from $6,101,399 in 1954-55 to $11,893,618 in 1964-65. In 1964-65, all of the 120 county districts and 45 of the independent districts had pupil transportation programs. The pupil transportation system continues to grow as the population moves to suburbia, as school systems continue to merge, and as enrollment and attendance increase.

M. E. Wright
EARLY BEGINNINGS

Sporadic efforts attempted to establish public education in Louisiana before 1860, and some of these starts had lasting influence on education in the state. Significant among these were provision for a state superintendent of education in 1845; the first statewide public school law of 1847; provision for parish superintendents in 1847; provision to distribute state school funds on a per educable basis in 1847; abolition of the office of parish superintendent in 1852, which continued to 1877; and division of parishes into small school districts.

Early State Educational Efforts

Prior to statehood, the Legislative Council for the territory in 1804 set up a board of regents which was to establish in each parish (county) one or more academies for instruction in the French and English languages, reading, writing, arithmetic, grammar, and geography. The territory also set up academies for females. The council appropriated $50,000 to be raised by lotteries, but indications are that this money never became available in amounts sufficient to implement the program. In 1811, the territory appropriated $39,000; no county was to receive more than $2,000. It also allowed $500 for poorer families. But the parishes did not draw upon the money available, and the parish system was abandoned in 1819.

The Louisiana Constitution of 1812 did not include any provision for education, although each revision since that time has done so. Free schools were of no concern to the members of the convention, who primarily were men of means, able to employ private tutoring or patronize the private schools so firmly entrenched at this time. The Legislature of 1812 enacted a law which created crude public school machinery and provided limited funds for financing public schools.

The General School Act, passed by the Legislature in 1821, provided that police juries in each parish -- local governing bodies active in administration of schools (especially in calling school tax elections) -- should appoint five landowners as school board members. In 1833, the Legislature designated the secretary of state as ex officio state superintendent of public instruction and required parish school boards to report to him. Provisions also were made by the Legislature to allot $2.50--$4.00 per child to schools, based on the number enrolled.

In 1847, the Legislature passed the first statewide public school law providing for a public school system at state and parish levels. At this time only a few poorly attended schools had been established, and there is little evidence as to their organization or the type of program they conducted. The people were still largely indifferent toward public schools, due to the entrenchment of private education and the feeling that public schools were for paupers. The Legislature subsidized many private academies if they offered free board and tuition to a certain number of indigents. However, under the 1847 law each parish was to elect a superintendent and pay a salary not to exceed $300 annually. More important, the act provided for a full-time state superintendent of public education appointed by the Governor for 2-year terms. State school funds were to be distributed on a per educable basis, a practice that continues today. The Governor appointed Alexander Dimitry to serve as the first state superintendent of education. Dimitry served two terms, from 1847 through 1851. In 1852, the Legislature felt that the salary paid to parish superintendents was extravagant and abolished the office. For the next 25 years, the schools of Louisiana lacked local administrative leadership. The state superintendent became the administrative leader for the parishes. The additional handicap of the division of parishes into small school districts lingered well into the twentieth century.

The Dark Decades, 1860–1900

The War Between the States, beginning in 1861, ushered in four of the darkest decades in public education. Even though the Confederate Legislature in 1862 appropriated $500,000 for this purpose, public education came to a near standstill. The war lessened the little sentiment that had existed for public education in Louisiana and in the South and practically wiped out the financial resources of the section.
Shortly after the war, the people of Louisiana gained temporary control of the state government. The mild Reconstruction plan of Presidents Lincoln and Johnson had allowed a large number of ex-Confederates to win election to the Legislature and to parish and municipal offices in 1865. Robert M. Lusher, appointed state superintendent of education, attempted to reorganize the defunct school system, but his efforts were halted by the return of Reconstruction personnel and their Freedman's Bureau. Thus, from 1868 to 1877, Louisiana government was in the firm grip of officials alien to the Southern cause. These officials imported Thomas W. Conway from New England to serve as state superintendent of education from 1868 to 1872. Conway apparently did little, and newspapers at the time labeled him an "ignorant, drunken, incompetent politician." A Negro, William G. Brown, became the state superintendent in 1872, holding the position until the end of the period. Little is known of Brown or of his activities since he apparently had little to do with the schools and employed as his secretary a Northern Baptist minister who did the work and wrote his reports. Many New Orleans teachers later testified that they knew nothing about Brown, and only one could recall ever having seen him (6).

The Reconstruction Convention of 1868 adopted a constitution similar to the preceding one insofar as education was concerned. The new constitution forbade separate schools for the races, thus destroying the schools for that time. One notable provision was the establishment of a State Board of Education. The Governor had appointive power over the state superintendent of education and was responsible for appointing all local parish and district school boards, giving his office complete power throughout the educational structure (7). In 1869, when the Reconstruction Legislature convened, apparently the only concern for education was to provide the largest number of education jobs for those in power. Records reveal that large appropriations were made for schools during this period. Education appropriation bills seldom failed to pass, but most of the moneys appropriated never reached the public schools. The Legislature apportioned school funds on the basis of the number of educables, and the tax assessors—who made the enumerations—seldom agreed with the census takers. For example, in 1870, Plaquemines Parish listed 4,000 educables and had only 100 pupils in school. New Orleans listed 90,000 educables and enrolled only 19,000; and while the 350 teachers were paid an average of only $70 per month, the cost of the city's educational system was $374,000. In 1874, Natchitoches Parish had a school fund of nearly $20,000 yet operated only one three-teacher Negro school; Raford Blunt, an illiterate Negro State Senator, was one of the teachers and was also a member of the parish school board. In 1871, the state superintendent of education reported that most of the $1,193,500 received from the sale of school lands had been stolen by the political machine and diverted to its purposes. An investigation of the Department of Education 6 years later revealed that $2,137,369 had been lost to the public schools by mismanagement and corruption (8).

The educational climate continued to be poor during the period between 1877 and 1900. Ravaged by the war and misconduct of Reconstruction, most of the people of Louisiana were poverty stricken and thus handicapped in their efforts toward rebuilding an educational structure. Other obstacles that blocked their progress were the lack of educational leadership at the state and local levels, the absence of suitable legislation, and fear of the return of forced integration of the races in the schools (9).

When the military forces withdrew in 1877, Francis T. Nicholls was elected Governor and, because of popular demand stemming from Reconstruction experiences, the position of state superintendent became an elective one. Robert M. Lusher, who had served previously as the appointed state superintendent of education, was elected by popular vote in 1877. That same year, in an effort to create more local initiative as well as statewide financial support, the Legislature adopted a general school act which provided for a State Board of Education, parish and district school boards, parish superintendents, and a statewide property tax of 2 mills for school support. In 1879, the state drafted a new constitution leaving the responsibility of separate schools for the races up to local school boards. The constitution required the Legislature to provide for establishment, maintenance, and support of the public schools. It also provided for a state superintendent of education, parish school boards, and parish superintendents (10).

In 1898, the voters of Louisiana adopted a new constitution. It included provisions for a state superintendent of education to be elected every 4 years by popular vote. An annual salary of $2,000 was prescribed along with an additional $2,000 for expenses necessary to performing duties as prescribed for his office by law.

The Turn of the Century

At the turn of the century, the State Department of Education consisted of State Superintendent Joseph V. Calhoun (1896-1904) and his secretary. The $2,000 provided for the expenses of the office was used to pay the secretary's salary, travel, stationery, postage, and other necessary items (11).

When J. B. Aswell became state superintendent in 1904, he initiated the semblance of a staff for the department by moving the state institute conductor from the state normal college in Natchitoches to Baton Rouge. The state institute conductor was responsible for institutes held throughout the state for instructing teachers in methods of
procedures and for educating the public in favor of tax-supported schools. This office continued until 1914. In February 1908, the first high school inspector was added, and in November 1909, Superintendent T. H. Harris added a supervisor of rural schools. The salaries and expenses of these new positions came from various funds. The General Education Board, a John D. Rockefeller educational foundation agency which took the lead in promoting and financing educational development in the Southern states, and the Peabody Education Fund for teacher training and scholarships were the mainstays until the state provided additional funds (12).

In conjunction with Louisiana State University, the department also utilized the director of club services in the agricultural extension division as supervisor of agriculture in the state department. In 1910, the department consisted of the state superintendent and his secretarial staff, the state institute conductor, the supervisor of agriculture, the high school inspector, and the supervisor of rural schools. This was an imposing staff compared to that of a few years earlier, but indeed small considering what the future held in store (13).

The Constitution of 1921

The Constitution of 1921, which affects the State Department of Education and public education today, provided for a State Board of Education consisting of 11 members, with 3 members appointed by the Governor for 4-year terms, 1 each from the districts corresponding to the public service commission districts, and 8 members selected by the people, 1 each from the districts corresponding to the congressional districts, with overlapping terms. Since 1948, the three members heretofore appointed by the Governor have been elected by the people for 6-year terms. The State Board of Education was to elect the state superintendent of education for a term of 4 years. Before this provision became effective, however, the election of the state superintendent was placed in the hands of the voters through a constitutional amendment based on Act No. 105 of the 1922 Legislature. (In 1946, a constitutional amendment calling for the appointment of the state superintendent by the State Board of Education was defeated.)

The new constitution gave the State Board of Education general supervision and control of the state's public elementary and secondary schools and direct control of all other state educational institutions, except Louisiana State University and Agricultural and Mechanical College. It authorized the state board to employ such assistance in the state department as was needed. (It was almost 30 years (1950) before the state laws specifically authorized the state superintendent to establish and staff the State Department of Education.) Parish school boards were authorized to elect parish superintendents for terms of 4 years (this has continued since July 1925), fix their salaries, and employ such assistants as might be needed.

The minimum state property tax for schools was set at 2.5 mills, and the parish tax at 3 mills. In addition, at the parish level, special maintenance taxes up to 8 mills, building taxes which would not be funded into bonds up to 5 mills, and building bond issues up to 10 percent of the assessment were permitted. A severance tax of 2 percent on the gross output of national resources, except agriculture, was dedicated to the support of Louisiana State University until January 1925; thereafter, the university was to be supported by the state property tax of 0.5 mill and such additional appropriations as the Legislature would make. The Legislature was required to set aside annually a minimum of $700,000 for the support of state institutions under the control of the State Board of Education. Provision was made for the pensioning of old and incapacitated teachers, but a funded teacher retirement system was not set up in Louisiana until 1936 (14).

EDUCATIONAL PROGRAMS

Elementary Education

Prior to 1908, the department had no functional elementary division; elementary schools were supervised by the superintendent directly, and later by the supervisor of high schools. The state superintendent's responsibilities in elementary education were of a general nature, concerned mainly with distributing state funds to local schools and making recommendations to the state board for improvements.

In 1909, the superintendent appointed a rural school supervisor and charged him with the responsibility of improving the rural elementary schools. This position was created when the Peabody Fund offered to pay salary and expenses. Rural consolidation of one- and two-room schools, a major problem, received the immediate attention of the elementary (rural) supervisor (15). More emphasis on higher education and high schools had created bad conditions in the rural elementary schools. The constitutional provisions of 1898, permitting school tax elections for building and maintenance, were a powerful factor in promoting consolidation. Other factors were the improvement of road building throughout the state, the employment in 1909 of a rural school supervisor, and appropriations from the Legislature with the assistance of the state board to many parishes for consolidation purposes.

Due to the limited support by the people for public education in general and the diversity of Louisiana's rural population, there was no close relationship between the schools and the communities. This made it easier for the department to promote consolidation.
Between 1908 and 1920, the rural (elementary) supervisor made efforts to bring about improvements in buildings, grounds, equipment, teaching procedures, and the program of studies. A report during this period indicated that popular support was increasing for consolidation of schools and pupil transportation as well as for more competent teachers and a better course of study.

In 1920, two additional elementary supervisors were added to the staff, making a total of three, and they assisted in making curriculum improvements as well as in instructional procedures. Several changes were made in the elementary course of study during the 1920's. With outside help, the elementary division issued curriculum bulletins (courses of study) emphasizing the scientific approach to problems in reading, language, spelling, and testing, and containing specific help for teachers (16).

By 1926-27, a definite program for elementary schools was emphasized. Each parish conducted supervising programs which were designed to accentuate the importance of "careful planning for the year's work" and to suggest how the planning might be done. The program also stressed the evaluation and analysis of lessons and listed points to assist teachers in doing their work.

The Depression affected elementary education programs less than others as far as financial matters were concerned. Perhaps most of Louisiana's schools fared better than those of many other states because Louisiana's economic base was a larger, parish-wide system rather than the small, independent district township system common to other states. The department staff actually shows an increase in personnel from 21 in 1929 to 40 in 1940. There was no reduction during any of these years.

A 1936 department bulletin listed major elementary school functions as development of desirable understandings and attitudes that typify the good citizen and preparation of the pupil for satisfactory high school work (17).

Even during the Depression, department officials were interested in upgrading elementary education. The State Department of Education and Louisiana State University cooperated in an all-out effort to improve the educational program in the public schools. For instance, they cooperated in inaugurating curriculum studies in the summer of 1936, which continued for several summers thereafter. As a result of the efforts of the state supervisor of elementary schools, the department published bulletins citing the results of these studies conducted by educators each summer. The State Department of Education published courses of study for the basic programs in reading, math, etc., in an effort to correlate these courses with the latest advances in pedagogy.

During the 1936-37 school session, department supervisors, local supervisors, principals, teachers, and college faculty members promoted the curriculum study. The following year the cooperative meetings showed that the studies had gained tremendous momentum and were clearly indicating a movement toward formulating basic principles and a philosophy for elementary schools.

In summary, the elementary division, in the early beginning, provided very little service to the schools of the state. A course of study for the elementary schools was a very brief statement of subjects to be taught in the different grades. With appointment of an inspector of elementary and rural schools, the services to the schools were increased through better conditions, consolidation, new equipment, and increased length of term. The state department, in an effort to improve elementary schools, published a standards bulletin in 1936. Provision was made that high schools would accept only those students who had completed the grade work in an approved elementary school, and students from unapproved schools only by examination. Students going from one elementary school to another were subject to similar requirements.

Parish school boards were asked to establish such public schools as were deemed necessary, and, at their request, personnel of the state department would visit the schools for approval. The standards for approval were raised and strengthened about 14 years after the first standards bulletin was published.

The curriculum development project during the thirties which involved the department received the interest and attention of elementary supervisors for several years. Elementary schools were definitely influenced in the areas of philosophy, curriculum, supervision, teaching methods, and materials of instruction. In the years that followed, members of the department continued to work on courses of study and methods of teaching. Questionnaires sent to parish superintendents for evaluating the proposals indicated an increase in the teachers' understanding of educational problems, an improvement in the professional attitude and initiative of teachers, extensive use of local materials, encouragement of adventuring and experimenting in teaching, reduced stress on memorizing facts, and promotion of interest in education on the part of parents.

The 1940's saw a general continuation of the basic programs of the thirties. The department's supervisor of elementary schools became director of elementary schools with assistant supervisors of elementary and primary areas. Standards for approval of elementary schools, adopted by the State Board of Education, are used as the basis for the granting of school approvals by the Elementary Section, which functions under the direction of Superintendent William J. Dodd and the assistant superintendent of curriculum and instruction.

The present major role of the Elementary Section is one of service, along with certain regulatory functions and curriculum work.
Secondary Education

Prior to the Louisiana Purchase in 1803 and before Louisiana became a state in 1812, the territory had only a few private and four public schools. The Spanish established in 1771 the first public school, which was a failure because its purpose was to assimilate the French. In 1811, three public schools, established in Pointe Coupee Parish with the help of Julien Poydras, represented the sum total of public school effort in Louisiana. Because very little had been done prior to 1908, a High School Section in the State Department of Education had received only token recognition. Superintendent Calhoun, during his term of office from 1896 to 1904, recognized the need for state accreditation of high schools. In 1902, Calhoun recommended to the state board that an approved diploma be designed and adopted and that all students receiving the diploma be entitled to admittance into any of the advanced state institutions of learning without examination. He felt that this recognition would add prestige to the high school diploma and encourage students to continue in school until graduation.

It was highly possible that Calhoun made his recommendation at that time because Louisiana State and Tulane Universities had taken steps to admit without examination students from recognized schools. Although there were then no accredited high schools in Louisiana, the state superintendent listed 35 public schools as high schools, and annual statistical reports showed the attendance in the schools. This, at least, was a measure of affiliation and the beginning of accreditation by the state. In the biennial report for 1904-1905, a list of "Authorized High Schools" appeared, listing names of 43 public schools, most of which were located in the larger towns and parish seats.

During 1906, the State Board of Education set up the following requirements for high schools: (a) title to the property on which the school was located had to be vested in the parish board of education; (b) the parish board of education had to pass a resolution establishing such a school as a high school; (c) all schools in the parish where the high school was had to run at least 7 months; and (d) a copy of the property title, parish board resolution establishing the school, a certificate certifying that the schools were operated for 7 months, and a proposed course of study were to be forwarded to the state board. Thus, for the first time the state was assuming responsibility for approving the various high schools throughout the state.

Other than a general listing of subjects prescribed by the state board in 1896, nothing had been done to approve courses of study. There was no follow-up of this general listing until 1904, when Superintendent Aswell recognized, in a report to the board, the need for a more uniform pattern of schools and course offerings.

Beginning of the High School Section. The real beginning of a high school section in the state department was made when the state board, in October 1907, created the office of state high school inspector. In February 1908, an inspector was hired to be paid from funds provided by the General Education Board of New York. His duties were to visit some of the approved high schools and aid the state superintendent in his many duties. One of the first recommendations made by the new inspector was that the principal be allowed at least one teacher to help with the high school program.

In 1909, upon recommendations by Superintendent Harris and the high school inspector, the state board passed a series of resolutions governing the approval of high schools. These resolutions included (a) following the state course of study; (b) maintaining a 9-month school session; (c) maintaining a minimum 40-minute recitation period; (d) employing at least two high school teachers; (e) providing at least two periods of the principal's time for supervision; (f) acquiring science laboratories at a minimum of $300; (g) purchasing laboratory equipment only after the approval of the state department; (h) requiring students in the inductive sciences to perform and report a minimum of 30 experiments; (i) subsidizing each newly approved school with $500; and (j) subsidizing each previously approved school that continued to meet standards with $500.

To assist in the approval and visitation of rural schools, the state established the position of inspector of rural schools in November 1909. The number of approved high schools increased until nearly one hundred schools had state approval by 1910. The high school inspectors made recommendations early in the century as to requirements for high school teachers. In fact, the early concern for certification of teachers appears to have evolved from the visitation and approval recommendations of the high school inspector.

During the years 1910 to 1920, high school improvements throughout the state continued. Through the inspector's recommendations, teacher certification improved, school facilities progressed, libraries and science laboratories expanded, professional attitudes of principals were developed, and the number of approved high schools increased to 298.

Over the years, the title of high school inspector was changed to supervisor of high schools. An assistant supervisor of high schools was added in 1916-17.

Coordination of High School Work. Until 1939, there was little coordination of the different phases of high school supervision. The state high school supervisor involved himself primarily in standards for approval, buildings, equipment, libraries, requirements for graduation, and numerous other problems of general interest. Supervisors in special fields such as agriculture, home economics, health, and physical education charted their courses with little
direction for the high school supervisors. In 1939, Superintendent Harris decided to bring together the different departments of the secondary schools and include the program of elementary instruction as an integral part of supervision under a single head. The supervisor who worked in this capacity also was to perform most of the duties of the assistant state superintendent of education (23).

The first 50 years of the twentieth century saw a tremendous expansion in the responsibilities for the High School Section. During the school year 1905-1906, there were 55 approved high schools with 1,408 high school students and no graduates. Statistics reveal that the session 1949-50 produced 460 approved high schools, 82,199 high school students, and 12,860 graduates.

Early high school inspectors and supervisors contributed considerably to the growth and development of high schools throughout Louisiana. They pointed up the dire need for improvement of teachers, facilities, and instructional materials. They also recommended improvements to the proper policy-making bodies, thus providing needed change and development. The responsibility of the High School Section grew from a regulatory function into a more sophisticated, combined regulatory and instructional service function.

The High School Section Today. In 1964, Superintendent William J. Dodd reorganized the State Department of Education into three administrative divisions, placing the High School Section in the Division of Curriculum and Instruction under the direction of an assistant superintendent. Today, the High School Section — consisting of a director, four supervisors, and six secretaries — administers regulatory responsibilities and instructional services to 812 schools that are composed partially or totally of high school grades. Regulatory responsibilities include school approvals, evaluation of transcripts, issuance of diplomas, and related activities. Instructional services involve workshop participation, consultative services for Southern Association Accreditation, and related high school activities. The number of high school graduates per year now is approaching 50,000 — a considerable increase from the turn of the century. The High School Section also issues diplomas and equivalency certificates to those who can qualify through veteran stipulations and adult education programs. Special area supervisors today cooperate with the High School Section to help develop better instructional services to Louisiana schools.

Negro Education

In 1881, Superintendent of Education Edwin Fay, with the cooperation of the general agent of the Peabody Fund, hired two experienced conductors of teachers institutes to open summer institutes for a short period in several Louisiana towns to instruct teachers in their duties and upgrade their certification and training. These highly successful institutes instructed both white and Negro teachers, stimulating much enthusiasm for education (24).

Nonetheless, prior to 1900, the educational picture for Negroes in Louisiana was bleak. There were very few Negro schools, salaries for Negro teachers were low, teacher training and certification were at a low level, and generally there were minimum opportunities for Negro education. In 1898, Superintendent Calhoun reported that 982 schools for Negro children employed 1,039 teachers at an average annual salary of $140. These schools enrolled 72,021 children and reported an annual daily attendance of 52,217, or 72.5 percent of the enrollment. In all probability, most of the schools operated on a split-session basis of 3 or 4 months in winter and 2 or 3 months in summer after the "crops were laid by" (25).

Factors causing these conditions, particularly in Negro schools, were poverty and lack of leadership and legislation. As is the case in other Southern states, the provision of educational opportunities for Negro children has developed very slowly in Louisiana. The state superintendents of education in their annual and/or biennial reports would point out the need for something to be done for Negro education (26). Local school board members, parish superintendents, and high school principals passed resolutions at their annual conferences to the effect that training for Negro teachers should be provided to help them in teaching agricultural and industrial subjects (27).

The Jeanes Fund — a sizable amount left by Anna T. Jeanes of Philadelphia to be devoted to assisting the Negro rural schools — was incorporated in 1907 and gave assistance by providing Negro teachers and supervisors to work in the various local school systems. There were other grant-type programs that gave assistance to the Negro education work (28).

In the biennial report for 1911-13, the state superintendent stated that the Negro school situation was deplorable. He said that either the schools should be organized to do good work or all efforts to educate the Negro child should be abandoned.

Early Supervision. In August 1916, Superintendent Harris announced that the General Education Board of New York had approved a plan to finance the employment of a state agent of rural schools for Negroes. This supervisor was charged by the superintendent to assist in every way possible in the organization of movements to build up a system of Negro education adapted to the needs of the race. Some of the movements deemed necessary to promote at the time were improvement of reading, writing, and arithmetic skills; teaching of practical skills concerned with homemaking and farming; organization of agricultural clubs to encourage thrift, greater farm production, and interest in farm life; stressing of sanitation and personal hygiene; establishment of industrial and agricultural schools in each parish for
older youth; fostering of training of rural teachers; and stress on the erection of substantial school buildings.

In 1917, when the Julius Rosenwald Foundation saw a dire need for improving Negro schools in the South, Louisiana was receptive to any aid for this purpose. Negro schools at this time were housed mainly in cabins, churches, lodge halls, and abandoned structures. In order to promote the construction of better buildings, the Rosenwald Fund paid one-half the salary and expenses for the employment of an assistant to the state agent of Negro schools. The Jeanes supervisor endeavored to arouse interest among Negroes and communities to raise money to qualify for the building of Rosenwald schools and county training schools, for the employment of additional Jeanes supervisors, and for the lengthening of school terms. This Rosenwald Fund money paid part of the expense of each Negro school building erected under certain conditions and also paid the salary and traveling expenses of a Negro agent to interest communities in providing better school facilities.

With the appointment of agents to supervise Negro education from 1916 through 1964, there was noticeable improvement in the Negro schools. The Depression years took their toll on white and Negro schools in Louisiana. Teachers' salaries went down, school terms shortened, and expenditures were cut to the bare minimum. The burden that the schools had to carry was increased while support decreased. At the outbreak of World War II, Negro school plants were generally inferior to white school plants. As the war progressed, there was very little money available for maintaining schools. Since the Negro facilities were generally in worse shape, this lack of maintenance money left many Negro schools in deplorable condition. Also, many white and Negro teachers were drawn away from education during this period by higher-paying industrial positions (29).

Since then, agents supervising Negro education have helped the situation considerably. Eight men have held the position of supervisor of Negro education in the state department. These supervisors helped to create harmony between the races and an atmosphere conducive to good working relationships. They stimulated public sentiment in favor of a sound elementary education for all Negro children and a good program for those wishing to prepare for work in the state's industries. The elementary as well as high schools were given more attention by the local school boards because of the work of the state department supervisors. Attendance in the Negro schools increased, and the teachers began to prepare themselves better for their profession (30).

Upon retirement of the director of Negro education in 1964, Negro education was placed under the supervision of the directors of elementary and secondary education. These supervisors have worked with white citizens, Negro leaders, parish school boards, and superintendents throughout the state. They have rendered a service that would be difficult to duplicate.

**The Picture Today.** Although the number of schools for Negroes reported for 1965 (527) is considerably smaller than the 1898 figures, it can safely be assumed that this smaller number represents, in quality, a substantial improvement in facilities and personnel. The following statistics for the 1964-65 academic year help to confirm this fact:

**Adult Education**

When federal funds were made available for the public schools by the Smith-Hughes Act of 1917, classes for adults became an important part of the work of teachers of agriculture and home economics. Two years later, Superintendent Harris asked that parish school boards attack the problem of illiteracy among adults by employing special teachers. A 1920 census showed that Louisiana had the largest percentage of adult illiterates of any state in the nation.

In 1929, the Legislature passed the "malt tax" law and dedicated the receipts for use in eliminating adult illiteracy. A course of lessons, textbooks, and a plan of
procedure were recommended by Superintendent Harris and adopted by the state board.

The National Advisory Committee, created by President Hoover, later adopted and revised the Louisiana manual for adult illiteracy for use in other states.

The Depression limited financial support for adult education. The program continued as long as the Federal Education Relief Administration and the Works Progress Administration activities operated in the state. The results of the program cannot be estimated, but it is safe to say that Louisiana kept in step with the progress that was going on in the rest of the United States.

In 1950, the Louisiana Legislature passed Act 252, which appropriated $25,000 to initiate a program for adults at the elementary and secondary school levels. The adult education programs are conducted by the local school systems in addition to regular school year and summer programs.

The adult education program met with immediate success and proved highly popular with persons inside and outside education. Appropriations increased steadily. From 1960 to 1965, the Legislature appropriated almost $250,000 for reimbursement of teachers' salaries for conducting adult academic education classes in the state's 67 school systems.

Adult students attending the classes have the opportunity of advancing themselves from grade 1 through grade 11. If certain qualifications are met, adults may be issued a certificate indicative of the grade level which they have completed. Qualified adults may be given the General Educational Development Test, and if they have completed minimum class requirements and score 13.0 on the test, they are issued a certificate of equivalency.

The Economic Opportunity Act of 1964 provides for adult basic education and makes substantially increased funds available for adult education in Louisiana.

In 1964, State Superintendent William J. Dodd launched the Adult Literacy Testing Program. Over 30,000 adults successfully passed sixth-grade equivalency tests, indicating that Louisiana should occupy a more favorable position with respect to its literacy status.

EDUCATIONAL SERVICES

Teacher Certification

Prior to 1877, certification of teachers was the responsibility of parish police juries, and (during Reconstruction) the parish superintendent. From that date until 1912, the parish school boards assumed the responsibility.

During the period 1877-1907, there were three institutions offering programs in teacher education: Louisiana State Normal College, the New Orleans Normal, and the Department of Education and Philosophy at Louisiana State University. Graduates from these were exempt from the parish board examinations. The parish superintendent gave the examination, graded the papers, and awarded first-, second-, or third-grade certificates. If a teacher was needed in the schools of the parish and had a modest education and the recommendation of local trustees in the community, he usually received a certificate (31).

The state certificates issued in keeping with Act 55 of 1906 were based on a written test given by the State Board of Examiners. In 1910, a committee of five teachers appointed by the state superintendent of education administered and graded teacher examination papers prepared by the state superintendent.

The requirements for third-grade certification stipulated that the applicant must average 75 percent or more and not fall below 40 percent in any area of the test; some of the subjects were spelling, reading, penmanship, arithmetic, and English grammar. Requirements for a second-grade certificate were that the applicant must average 80 percent and not fall below 50 percent on any subject; some of the subject areas were grammatical analysis, physical and political geography, elementary algebra, and agriculture. Requirements for a first-grade certificate required that the applicant average 85 percent and not fall below 50 percent on any subject. Some of the subject areas were advanced algebra, physics, geometry, penmanship and drawing, theory and art of teaching, and English grammar and composition.

Complete state control of teacher certification came with Act 214 of 1912 when the State Board of Education assumed control of certification through an examining committee appointed by the board (32).

A certification division was organized in the department in 1913. Examinations were abolished, and certificates were issued upon the basis of college courses completed. Life certificates were issued to teachers who had earned a college degree, and three lesser grade certificates to those who completed 1, 2, and 3 years of college work. The procedure was altered by 1940, and a degree was required for all classes of certificates.

In 1924, the state board passed regulations which based all future certification of high school teachers on the completion of the baccalaureate degree. After 1925, the preparation of teachers became more specialized due to (a) the expanding program of studies in the high schools; (b) the state approval of elementary schools, which began in 1928; (c) the statewide program of curriculum revision between 1936 and 1940; and (d) state certification regulations, particularly those for high school teachers and administrative and supervisory personnel (33).

Certification of Teachers Today. To be eligible for professional service in the public schools of Louisiana, a teacher must hold a valid teacher's certificate issued by the Louisiana State Department of Education in keeping with
Minimum General, Professional, and Specialized Education

The Constitution of 1868 set up a State Board of Education through which all state school funds were distributed. For the most part the General Assembly, as directed by the Constitution of 1898, provided that state school funds be apportioned to the parishes on a per educable basis, and specified certain sources of revenue for the state school fund. The sources were designed as a statewide levy of not less than 1.25 mills on the assessed value of property, poll tax, and a provision for local school districts to tax themselves beyond the former limitation of 10 mills on the dollar. An educable was defined as within the age of 6 to 18. Each school system received a variable amount per each educable, depending on the amount of state funds available for schools. The state superintendent of education, in 1935, provided a school census of the number of educables, and from this date forward the department figures of educables have been used in the distribution of state school funds.

Financial and statistical reports from the parish school systems sent to the state superintendent of education were based on a calendar year until 1910, when the Legislature required that parish superintendents prepare reports ending June 30. Gathering information on a calendar year required that the statistics from two fiscal sessions be mixed to make up this report. Reporting on a fiscal year avoided this confusion, and it was felt that the information was much more accurate (34). In 1912, Act 214 placed all public school statistic on a session basis and required that parish school boards adopt, at the beginning of the session, a carefully prepared budget of receipts and expenditures. This act also required that state funds be distributed to the parish as a unit rather than to each school district as in the past. This same act designated the parish superintendent of the public schools as the treasurer of all school funds appropriated by the state to such parish, or raised, collected, or donated therein for the support of free public schools. The parish superintendent, as treasurer, was to draw warrants, and the warrants were to show the school districts they were drawn against (35).

Finance Division, State Department of Education. During 1925, a service and information division was added to the state department. The ensuing years witnessed studies on the inequities in educational opportunities in Louisiana because of the inability of some parishes to support reasonably good schools. The State Teachers Association, through its research committee and in keeping with its record of service, conducted during 1925-26 an equalization study of the distribution of state school funds among the parishes. It recommended more money and a better plan for distributing funds. John M. Foote, of the department, conducted a study in 1929, and the department published a bulletin setting forth a plan for administering an equalization fund which became the basis of the equalization program that was later established.

School Finances

The Constitution of 1868 set up a State Board of Education through which all state school funds were distributed. For the most part the General Assembly, as directed by the Constitution of 1898, provided that state school funds be apportioned to the parishes on a per educable basis, and specified certain sources of revenue for the state school fund. The sources were designed as a statewide levy of not less than 1.25 mills on the assessed value of property, poll tax, and a provision for local school districts to tax themselves beyond the former limitation of 10 mills on the dollar. An educable was defined as within the age of 6 to 18. Each school system received a variable amount per each educable, depending on the amount of state funds available for schools. The state superintendent of education, in 1935, provided a school census of the number of educables, and from this date forward the department figures of educables have been used in the distribution of state school funds.

Financial and statistical reports from the parish school systems sent to the state superintendent of education were based on a calendar year until 1910, when the Legislature required that parish superintendents prepare reports ending June 30. Gathering information on a calendar year required that the statistics from two fiscal sessions be mixed to make up this report. Reporting on a fiscal year avoided this confusion, and it was felt that the information was much more accurate (34). In 1912, Act 214 placed all public school statistic on a session basis and required that parish school boards adopt, at the beginning of the session, a carefully prepared budget of receipts and expenditures. This act also required that state funds be distributed to the parish as a unit rather than to each school district as in the past. This same act designated the parish superintendent of the public schools as the treasurer of all school funds appropriated by the state to such parish, or raised, collected, or donated therein for the support of free public schools. The parish superintendent, as treasurer, was to draw warrants, and the warrants were to show the school districts they were drawn against (35).

Finance Division, State Department of Education. During 1925, a service and information division was added to the state department. The ensuing years witnessed studies on the inequities in educational opportunities in Louisiana because of the inability of some parishes to support reasonably good schools. The State Teachers Association, through its research committee and in keeping with its record of service, conducted during 1925-26 an equalization study of the distribution of state school funds among the parishes. It recommended more money and a better plan for distributing funds. John M. Foote, of the department, conducted a study in 1929, and the department published a bulletin setting forth a plan for administering an equalization fund which became the basis of the equalization program that was later established.
In 1928, when the Legislature enacted the malt tax law, it approved the principle of equalization of school facilities. The law stipulated that revenues were to be used by the state board to help weaker parishes provide adequate educational opportunities. However, this tax did not yield sufficient funds to implement equalization, and the first actual distribution of equalization funds was not made until the 1930-31 fiscal year, when the sum of $360,712 was sent to 35 parishes.

By 1920 most parishes had voted taxes for new buildings, longer school terms, and better teachers’ salaries. The existence of small taxing districts, however, resulted in unequal school facilities. It was gradually realized that larger taxing units should be used in raising school funds, first on a parish-wide basis, and then at the state level in order to aid the weaker school districts. In 1928, State Superintendent Harris, recognizing that the system then in effect failed to equalize educational opportunity, pointed out that education was a responsibility of the state and that the state should ensure some satisfactory standard or minimum of education for all local units. He also advocated taxing existing economic resources and expending the revenues to meet the needs.

Prior to 1930, the entire public school fund was distributed to parishes on the basis of the number of educable children from 6 to 18 years of age, inclusive. This is still considered the basic source from which parish and city school boards receive state school funds. In 1930, however, an amendment was written into the constitution which provided that one-sixth of the public school fund be apportioned and distributed to the parish and city school boards on the basis of equalization, and five-sixths on the basis of the number of educables. Sources of state funds for equalization in 1930-31 were from the malt tax and any of its derivatives and combinations. Despite the availability of additional state funds during the early thirties, overall support for schools declined due to depressed economic conditions. The major support for public schools came from the property tax; however, property assessments were declining, and land was being adjudicated to the state for nonpayment of taxes. All this had a serious effect on the finances of public education, causing many school systems to operate for shortened terms of 4 to 8 months. In many parishes, special maintenance taxes had expired, and the voters refused to renew the taxes because they were unable to pay them. In an effort to find solutions to the problems of school finances and tax revenues, the Legislature appointed a tax reform commission in 1932. With the assistance of the state department, this commission made extensive studies, and its recommendations to the 1934 Legislature resulted in important changes in state school financing (36). The constitution was amended in 1934 to provide that three-fourths of the funds be distributed to the parish and city school boards on the basis of the number of educable children and that one-fourth be apportioned and distributed to the parish school boards on the basis of equalization. Thus, it attempted to enable the state board to ensure a minimum educational program in the common public schools for all parishes. It further provided that the state board would administer and regulate this apportionment and distribute this fund to the parish school boards, as well as provide the plans, rules, and regulations for this distribution.

As more and more state and federal funds were added to the support of public education, the state department hired additional personnel to administer these funds for the state board. In 1925, an educational services and information division was added to the department; its one professional staff member had responsibilities in the areas of surveys, reports, budgets, etc. One additional staff member was added in 1929-30. Reorganization of the department in 1940 established an administration and finance division with two professional staff members and three other employees with titles of clerk and auditor specifically assigned to finance.

Reorganization of State Department of Education. The administration and finance division, which was set up by the reorganization of the state department in 1940, was later changed to include administration only, and then went back to its original form. The sole responsibility of one section in this division having to do with finances is to administer school finances for the state superintendent and the state board.

Immediately following the close of World War II, in 1944-45, the public schools of Louisiana added the twelfth grade. The great knowledge explosion and the interest shown in science and mathematics prompted many states to add an extra year to their programs. This entailed an increase in school funds, but the people of the state were inclined to go along with the increased taxes and the transfer of funds to the public school fund.

Division of Administration and Finance Today. Disbursement of school funds from state and federal sources was handled for the state board by the state department’s administration and finance division. The division’s finance section has capable, experienced personnel with long years of service on the local and state levels. This section receives certain statistical and most financial reports from the parish and city systems for processing, recording, and future publication, and all requests for payments on special programs are received here. State funds are distributed to the local school systems today on the basis of per educable and equalization. The Louisiana Constitution provides that an amount totaling not less than $10 million per annum be maintained in the public school fund for these two distributions. The cost part of the equalization formula includes five factors: (1)
teachers allotted and employed with salaries, (2) supervisors of instruction allotted and employed with salaries, (3) visiting teachers allotted and employed with salaries, (4) transportation, and (5) other costs. The support part visiting teachers allotted and employed with salaries, (3) equalization formula includes five factors: (1) per educable unit, (2) 5-mill constitutional tax, (3) severance tax, (4) 50 percent of rent or lease of school lands, and (5) court fines and forfeitures.

State revenues are derived primarily from the 2.5-mill ad valorem tax, which is the property tax, the severance tax, and the state sales tax. Local revenues are derived from the 5-mill parish-wide maintenance tax, 5-mill construction tax, 7-mill maintenance tax for current operation, and 7-mill special-way tax for maintenance (37).

The division administering finances today performs many services for the parish and city systems. Under the leadership of Superintendent William J. Dodd, this service goes far beyond that performed in previous years, and yet it is the desire of the state department to further expand these services. With the advent of data processing this should advance by great strides.

Curriculum Development

Teacher institute work was turned over to the State Department of Education shortly after the turn of the century. In 1904, State Superintendent J. B. Arwell appointed J. E. Keeny as state institute conductor, the first professional staff member of the state department. In this capacity, Keeny promoted higher qualifications for the classroom teachers and organized institutes at various places throughout the state. Teachers attending these institutes heard lectures, witnessed demonstrations, participated in discussions, and became acquainted with new books and materials.

Many state department divisions and sections were established over the years: high school, elementary, agriculture, home economics, teacher certification, Negro schools, vocational trades and industries, reference and service, library, music, health and physical education, distributive occupations, safety, business education, and higher education.

Since 1940, other sections have been established to meet new needs: Civil Defense, finance, administration and research, school lunch, data processing, school transportation, school attendance, audiovisual aids, veterans education, adult education, federally financed programs, materials of instruction, guidance, industrial arts, manpower development and training, and trade and industrial education (38).

The supervisory staff, appointed in various subject area fields, includes personnel in Baton Rouge, New Orleans, Monroe, and Shreveport. In addition to state supervisors, local school boards employ supervisors to help the local superintendents in improving classroom instruction.

The Legislature established the State Board of Education and gave it control and supervision of all public education. The board has under its direct control and supervision 10 institutions of higher learning, 31 trade and vocational-technical schools, and 5 special schools. The state department performs services to a limited extent for the state board in these areas, such as providing supervisory personnel to work with these institutions in carrying out board policies and regulations.

Educational Surveys and Studies

Six studies of the Louisiana educational system were made after 1940: the Reorganization Study of 1940, commonly known as the Griffenhagen Study; the Louisiana Educational Survey, popularly called the Washburne Survey; the Legislative Committee on Education Survey; the Peabody Survey; the Special Committee on Education Survey; and the Committee of One Hundred.

Surveys generally are performed to help determine the needs and necessities for improvements in one or more areas or institutions of education. Louisiana undertook these studies because its citizens realize that education is an ongoing, dynamic, and changing endeavor, and that to remain static would mean disaster. Louisiana educators have generally provided the leadership for attempting to solve the state’s education problems, but persons from outside the state have participated in most of the studies and surveys. The persons participating have shown vision, intelligence, and determination to have a broader, more realistic educational program. Most of the recommendations from the surveys have been implemented.

The Reorganization Study of 1940. An act of the Legislature authorized a survey in 1940, commonly known as the Griffenhagen Study, because the new Governor Sam Jones and the Legislature felt there was a need for general reorganization on a statewide basis. It directed the Governor, with the aid of an advisory committee, to undertake a comprehensive and constructive program of review, reorganization, and improvement in every department, agency, and political subdivision of the state. The study was conducted by a team of professional consultants from Chicago in cooperation with state and local education leaders.

The Louisiana Education Survey. The Louisiana Education Survey was popularly called the Washburne Survey, Authorized by Act 36 of the Louisiana Legislature in 1940, this survey of elementary and secondary education was made by a commission headed by John M. Fletcher of Tulane University as chairman and general director. Carleton Washburne, superintendent of schools in Winnetka, Illinois, was
director of the committees that studied the elementary and secondary schools.

Dr. Washburne stated that his function as director was to organize the people of Louisiana to do their own thinking and make their own recommendations. To effect this, he gathered a large staff of highly competent persons—mostly from Louisiana and the rest of the South, but also from the nation at large—who carried out a remarkable group of studies. The recommendations, except for a very few of a technical nature, are those of the committees of Louisiana people.

Washburne organized numerous study groups throughout the state, and his extensive report, submitted in a series of volumes, had a stimulating effect on the schools, improving their organization and teaching methods. The report cited many areas of concern for the schools of Louisiana. It specified that the state should progressively adjust toward a uniform salary schedule and that parishes should assume some responsibility for developing special services for exceptional children. The report also recommended counseling service for high school students, training programs for adolescents in child care, parish ownership and operation of school buses, community use of school plant, an end to public competitions (e.g., to select the brightest academic students, best speakers) known as "rallies," parent education, more practical shop and mechanical work, vocational guidance and vocational training, a state program for exceptional children, a 12-year school program, federal aid to educators, revision of method for distribution of state funds to parishes, and consideration of the desirability of permitting graduate work for the master's degree in teacher education at state colleges.

The Legislative Committee on Education Survey. Six years after the Washburne Study, the Louisiana Legislature set up the Legislative Committee on Education Survey. This survey was authorized in 1946, and its report was submitted by Committee Chairman C. H. Downs, Rapides Parish, in May 1948. The Committee was—

To make a survey of needs and necessary improvements of the following institutions:

The kindergarten, primary and secondary public schools under the supervision of the parish school boards, the colleges and schools under the supervision of the Louisiana State Board of Education; and the Louisiana State University and Agricultural and Mechanical College and colleges under the supervision of its Board of Supervisors, and to report their findings and recommendations to the Governor and members of the Legislature.

In accordance with the spirit of the act creating it, the Legislative Committee on Education Survey made a study of Louisiana education, but it was not the committee's plan to conduct a "professional" study. It attempted to obtain essential information which would make it possible to make practical recommendations to the Legislature for improving the schools.

Every effort was made to enlist the educational talent of the state to assist with the study. School people at all levels cooperated wholeheartedly, and many individuals gave generously of their time and energy when called upon by the Committee.

The Committee included Representative C. H. Downs, chairman; Senator H. H. Richardson, vice-chairman; Representative Bonnie V. Baker; Representative W. J. Dodd; Senator A. A. Fredericks; Representative W. I. Hair; Senator Gilbert F. Hennigan; Representative Ragan Madden; J. W. Brouillette, coordinator; and Ruth Holland, secretary.

The recommendations of the committee were in two categories—those requiring legislative action and those not requiring legislative action—and suggested steps to be taken by the Legislature, educators, and citizens generally to strengthen education. The committee urged that an independent agency be set up to make a continuous organized study of all levels and types of education in Louisiana.

The report played an important role in setting the stage for school legislation which was passed in 1948 and in subsequent sessions of the Legislature.

The Peabody Survey. The 1952 Louisiana Legislature established a Legislative Council as its fact-finding agency. On the recommendation of its Education Committee, the council engaged the Division of Surveys and Field Services, George Peabody College for Teachers, to conduct a comprehensive study of public education in the elementary, secondary, and special schools of Louisiana. The study was designed to determine the conditions existing in the public schools, to consider the problems identified, and to develop suggestions and recommendations for their solution.

W. D. McClurkin, head of the college's Division of Surveys and Field Services, was chosen as director of the Peabody Survey. E. L. Lindman, professor of school administration at George Peabody College for Teachers, served as the general consultant. An Education Advisory Committee, appointed by the Legislative Council, gave McClurkin and his staff assistance in planning the outline of the study, pointing out unique problems, and suggesting procedures to be followed. The committee represented the major organizations most actively related to the public school enterprise—education committees of the Louisiana House and Senate, State Department of Education, Louisiana Education Association, Louisiana Parent-Teacher Association, Louisiana School Boards Association, and Louisiana State University Extension Division.

The final report constituted a thorough, overall analysis of the problems of public education in Louisiana, with a practical, workable guide to the planning of a long-range program.
The Special Committee on Education Survey. Because of the rise in cost of public education and the many new and expanded programs, it became apparent in 1959 that a source of additional revenue would be needed to meet needs. Educational leaders felt that a statewide committee should seek ways to ensure programs of excellence in all schools of Louisiana. These educators were aware that all schools were not on a par with each other and that many young persons were not completing their education.

The Governor appointed a survey committee in February 1959, consisting of representatives from the Legislature, business, labor, lay groups, and professional educators. The committee was charged with recommending ways and means to provide more adequately for the financial needs of the state's elementary and secondary schools.

The Committee of One Hundred. On the basis of a legislative concurrent resolution, State Superintendent William J. Dodd appointed a Committee of One Hundred in 1965 to conduct a comprehensive study of the educational programs of Louisiana at the elementary and secondary levels. In addition to educators, members of the committee included persons from labor, business, law, medicine, government, agriculture, and other fields. William F. Beyer, Jr., the state department's assistant superintendent of curriculum and instruction, served as general chairman.

After evaluation of existing programs, the committee made 19 recommendations based on identified objectives of Louisiana education. For instance, it recommended that the school curriculum place special emphasis on the academic disciplines to give each person the best possible liberal education consistent with his ability, aptitudes, and interests. It recommended that the state department use the reports from the committee in the several academic disciplines as a basis for improving these areas.

The committee further recommended extending the length of the school day and the length of the school session, and that the schools include kindergartens. It suggested that consideration be given to the advisability of adding grades 13 and 14, particularly in highly populated areas.

At the same time the committee recognized the need to improve certification standards for teachers by strengthening subject matter preparation, the understanding of children, and teaching skills. It recommended expansion and improvement of programs in guidance and testing for children at all levels of instruction; library services for every school, meeting the standards of the Southern Association of Colleges and Schools; and more extensive use of the new instructional media, including development of a statewide educational TV system under the direction of the state department. The committee felt that high schools should be encouraged to move in the direction of multitrack curricular offerings, including adequate programs in the academic disciplines, comprehensive offerings in the various vocational areas, and adequate guidance services.

The committee commended those responsible for inauguration of the recent "crash" program in adult education and literacy testing and recommended it be continued and further developed. It recognized that there are many children and youth in the state needing special education services and recommended that adequate funds be provided to meet the needs of all exceptional children. It stated that interscholastic competitive sports should be eliminated at the elementary level, be discouraged at the junior high school level, and that more emphasis should be placed on health and physical education at the high school level than upon varsity competition. And the committee recommended that the state accept and use to the best advantage all federal funds available for public education.

Because the state felt that adopting these recommendations was important if Louisiana was to gain the maximum from its educational resources and remain abreast of contemporary demands, Superintendent Dodd appointed a Curriculum Advisory Council composed of 25 educators to review the steps necessary to implement the 19 recommendations of the Committee of One Hundred. Several meetings have been held and progress reports made on many of the committee's recommendations.

SCHOOL SERVICES

The State Department of Education has been service motivated since the turn of the century when it became a vital force in Louisiana's educational picture. Of the many services offered by the department to the school systems and citizens, three will be elaborated upon: materials of instruction, school lunch program, and transportation.

Materials of Instruction

In 1928, the Legislature, at the insistence of Governor Huey P. Long, approved a bill providing free textbooks to schoolchildren. Act No. 100 provided that the severance tax fund, a tax on produce or resources severed or separated from soil or water, be distributed for the purchase of school books and that the remaining balance be placed in the state public school fund. During the 1928-29 school year, a total of 2,329,027 books were distributed at a cost of $1,115,297, or an average cost of $2.34 per pupil.

The textbook law was written into the constitution in 1936. As a result, the textbook program was extended and a state printing board established. The same year, a group of citizens from Caddo Parish in northwest Louisiana instituted a suit contesting the free textbook program and maintaining that the textbook law was unconstitutional. The State Supreme Court, in 1936, ruled the law constitutional and further ruled that school books could be furnished free...
to the schoolchildren of the state attending public, private, and parochial schools, based on what has become known as the "child-benefit" theory. This theory advocates that the purchase of textbooks is made for the benefit of the schoolchildren and the subsequent benefit of the state; the schoolchildren and the state are the sole beneficiaries. The local school board bringing the suit soon recognized the benefits of the program and joined in the distribution of the materials (39).

Act No. 153, of 1936, provided that a part of the revenues from the severance tax be used for the purchase of library books. Funds were used, beginning with the second semester of 1935-36, to buy school supplies such as paper, pencils, and ink. Since their beginning, these funds have continued to be available for materials of instruction. The sum of $6,862,580 was appropriated for textbooks for the 1964-65 school year, and $1,135,000 was appropriated for library books. School libraries have been under the supervision of a professional librarian since 1929, when the General Education Board granted funds to Louisiana to establish this supervisory position, one of four in the United States at that time. During 1964-65, 1,411 libraries were operating in the public and private schools of Louisiana.

School Food Services

During the Depression years of the 1930's, many families were not financially able to provide their children with sufficient school lunches. The PTA often helped in this matter by furnishing sandwiches and milk; the Emergency Relief Administration also provided food, and the Works Progress Administration canning projects aided in supplementing lunches. These various projects developed a sentiment favoring hot lunches for all children. The U.S. Bureau of Indian Affairs, the State Department of Education, and the St. Mary Parish School Board opened the first publicly supported lunch program in Louisiana as the Charenton Indian School in St. Mary Parish in 1932-33 on a cooperative basis.

The first state appropriation for the school lunch program was $250,000 during the 1939-40 school year. After federal legislation for school lunch programs was inaugurated in 1946, there were 165,598 children in Louisiana eating lunch at school daily. This legislation helped to expand lunch programs by enabling local school systems to provide lunchrooms and lunchroom workers in most of the schools, and by making possible a well-coordinated program of food preservation centers for receiving and storing surplus commodities from the federal government. By 1958, 75 percent of the state's schoolchildren were participating in the school lunch program. The program has been expanded through the provision by local school systems of lunchrooms and lunchroom workers in most schools and through food preservation centers for receiving and storing surplus commodities from the federal government. During 1964-65, the Legislature appropriated $11,089,321 for Louisiana's school lunch program.

Transportation

Transportation for Louisiana's schoolchildren had its origin in a 1902 cyclone that destroyed a school in Lafayette Parish. Because of the necessary delay in erecting a new building, members of the parish school board furnished, at their own expense, a wagonette to transfer children to a school 6 miles away. The project was so successful that the board decided not to rebuild the demolished school, but to continue operating the wagonette at public expense. Comparable disasters such as hurricanes, tornadoes, floods, and fires in other sections of the state brought about consolidation of schools and transportation of children. In 1932, the state began to subsidize the transportation of elementary and secondary pupils.

The system of transporting children in sparsely settled districts to consolidated schools rather than multiplying the number of one-teacher schools was generally appreciated by the people. Consolidated schools were found to be far superior to the small, isolated schools, but the transportation of schoolchildren over bad roads to these schools was unsatisfactory. Superintendents of local school systems found that vehicles operating on good roads for distances greater than 4.5 miles did not work well, and they reported that the transportation system would break down unless a responsible man was placed in charge (40). The state superintendent, in his biennial report for 1911-12, stated that many of the parishes had adopted a system of transportation which eliminated the school wagon: Parents would provide transportation for their children, and the school board would reimburse them monthly, based on the average attendance of the child in school (41).

The building of farmers' roads in the period from 1920-50 made it easy to consolidate the country schools and to transport the children to the centers of consolidation (42). The advent of paved highways, improved bus bodies, and steel chassis all have helped to increase the progress of school transportation. In 1920, some 20,000 children were transported; in 1930, 95,000; and in 1940, 159,500. By 1966, there were 479,149 pupils being transported in 5,530 vehicles.

FEDERAL PROGRAMS

The beginning of federal participation and aid to education cannot all be found in one document, nor can it be cited as one dramatic event. The expanding federal influence has developed in different ways, and more frequently by indirect control rather than by the direct assumption of school administration and control.
During 1917, the same year Congress passed the Smith-Hughes Act supporting vocational education, the Louisiana State Department of Education entered into an agreement with the College of Agriculture, Louisiana State University, to conduct the training program for teachers of vocational agriculture and home economics. Part of the salaries was to be paid by the state department with federal vocational funds. In 1918, a vocational trades and industries division was established in the state department to administer some of the vocational programs. The department already had a division established in 1909 to handle agriculture programs. Local schools were able to establish classes in agriculture and home economics and to receive financial support through these programs.

After the close of World War I, Congress passed legislation for rehabilitation of war veterans. In 1920, the Smith-Bankhead Act gave additional grants to states for vocational rehabilitation programs. The Vocational Rehabilitation Act of 1943 provided assistance to disabled veterans. In January 1921, the State Board of Education accepted the Louisiana plan for administering the Vocational Rehabilitation Act of 1920. In the annual report for 1922-23, the state superintendent reported that federal funds were used to pay a part of the cost of artificial limbs and to give instruction to physically handicapped persons who desired to prepare themselves for earning a livelihood. The annual report for 1923-24 reported that 64 persons had been helped with the purchase of artificial limbs and that 52 had received instruction. In 1925, a person was employed with the dual responsibilities of industrial education and rehabilitation. Prior to this, the responsibility was in the hands of the trades and industries section. During this year, 145 cases were handled, with an expenditure of $12,691. Two years later, a section was added to the trades and industrial education division to administer this program. These federal programs were first administered from previously established divisions until 1943, when the programs were consolidated into a separate section in the instruction and supervision division.

During 1964-65, the state staff was composed of 14 professional people. The state was divided into four districts, each district having a supervisor and a number of counselors, instructors, and medical consultants. Most of the medical consultants are on a part-time basis, and the other employees are full-time. The whole section has several hundred employees. The total expenditure for this year was $3,422,802, including regular vocational rehabilitation with state and federal support. The section completed services for well over 2,000 individuals.

During 1919, Congress passed a law authorizing the use of federal surplus property by educational institutions. Again, in 1944, the Surplus Property Act authorized the transfer of surplus property to educational institutions. The Federal Property and Administrative Services Act of 1949 provided for the donation of surplus property to educational institutions and for other public uses. A specific section to handle this program was established after 1944. In 1948, a supervisor in the schoolhousing section was added to handle surplus property. Later, a separate section was established in the department's administration division.

During 1964-65, the expenditure for several thousand projects...
amounted to $1.5 million for NDEA Titles III, V, VIII, and X.

Among other federal programs instrumental in expanding the State Department of Education, the Manpower Development and Training Act of 1962 added a director and seven other professional personnel, and projects accounted for $591,000 in 1964-65. The Vocational Education Act of 1963 increased the present vocational offerings for residential vocational schools and work study programs, and the Adult Basic Education Title under the Economic Opportunity Act of 1964 expanded the services of the adult education program on the local school level. Two additional supervisors were added to the Adult Education Section in 1964-65, and a total expenditure of just under $2 million was made.

One of the most important federal programs covered by this chapter was passed by Congress in 1965—the Elementary and Secondary Education Act. This resulted in establishment of a federally assisted programs section in the curriculum and instruction division, with a director and four supervisors and consultants. Thirty-eight of the 67 school systems were eligible to participate, but at the close of 1965 only one or two projects had been approved, and expenditures for administration only from the state level had been made.

Use of federal funds for education by the Louisiana State Board of Education and the State Department of Education has been a practice for many years. The Louisiana Legislature has accepted these funds but has not always been willing to match them with state funds. Because of this, the local school systems have had to match with local funds, thus leaving some of the federal allocations unused each year. A concern of the department has been that several of the local school systems have not participated recently in the various federal programs. Unless these school systems have the local funds, their schools could be hampered by the resulting lack of equipment and material to carry on a school program equal to the rest of the state. Another major concern and problem of the department is the matter of budgets. The state is not notified in advance of the exact amount of funds it can expect, and Congress has the tendency to appropriate these funds late in the fiscal year. This makes it almost impossible to have advanced planning at both the state and local level. It places a hardship on the State Department of Education and local school systems in employing new personnel and purchasing much needed equipment and material.

The Department of Education today, under the leadership of Superintendent William J. Dodd, assists in the administration, from the state level, of approximately 17 federal programs. Personnel in the three divisions of the department—administration and finance, curriculum and instruction, and vocational education—work directly or in related areas of one or more of these programs. Support for the various phases of education has been timely and, in all cases, needed. Superintendent Dodd and the State Board of Education are strong advocates of obtaining financial support from all sources as long as the control of education remains in the hands of local and state authorities.

APPENDIX B—ORGANIZATION CHARTS 534
EDUCATION IN MAINE PRIOR TO 1900

During the early years of exploration and settlement in the “Province of Main” there was little interest in the establishment of schools. Survival itself was paramount, for the area was settled slowly, and the threat of Indian attacks was ever present. Because children could not go out of sight of their homes with any degree of safety, regularly maintained schools did not appear until about 1700.

Although education was slow in developing, we find in the eighteenth and nineteenth centuries the elements of the system that was to come to fruition in later years. Nearly every aspect of current-day education emerged out of the strivings for an improved program prior to 1900.

The Massachusetts Bay Colony in 1652 claimed the Province of Maine under its charter, which stated that the colony had title to all lands “within the space of three English miles to the northward of the River Merrimack and to the northward of any and every part thereof” (1).

The purchase of the Province of Maine by Massachusetts in 1677 removed all doubt about the claim and brought it under the Massachusetts Bay Colony laws of 1642 and 1647, which contained the first legal requirements regarding schools. In 1642, the General Court of the Colony and Province of Massachusetts Bay had ordered—

That the selectmen in every town, shall have a vigilant eye over their brethren and neighbors, to see, first, that none of them shall suffer so much barbarism in any of their families, as not to endeavor to teach, by themselves or others, their children and apprentices, so much learning as may enable them, perfectly, to read the English tongue and knowledge of the capital laws, upon penalty of twenty shillings for each neglect therein (2).

Thus, in this ancient law we see the first step taken toward compulsory attendance and recognition that neglect of duty was a punishable offense. The legislators of those days seemed to recognize the danger of youth’s growing up in ignorance and took positive action to avoid it.

Another enactment followed in 1647 by which public schools as such were first established. This law ordered every township of 50 householders to appoint a person—

To teach all such children as shall resort to him to write and read, whose wages shall be paid either by the parents or masters of such children or by the inhabitants in general: provided that those who send their children be not oppressed by paying much more than they can have them taught for in other towns (3).

It also directed that when any town increased to 100 families, a grammar school should be set up to instruct youth for the university.

This law is remarkable because it provided the basis for the establishment of schools of a higher grade than the so-called common school. The early grammar schools, however, were not the same as those of today, but were more like high schools and academies. The law actually compelled the establishment of what would now be called a high school in every town of 100 families.

In spite of these basically sound laws, little attention was given to their observance until sometime after the controversies over the Maine territory were settled by the 1677 purchase.

Education was not allowed to be a dead letter, however, for as early as 1671 the penalty for “failure to keep a school” was increased from £5 to £10. Apparently some towns neglected the law, for in 1673 the towns of Kittery and York were presented for not providing a school and schoolmaster as required. In reality, public education as a going concern was not definitely established in Maine until after the turn of the eighteenth century.

Although 161 towns had been incorporated within the territorial limits of Maine by 1800, only 7 had grammar schools. From this it may be assumed that no more than seven towns contained one hundred or more families and that the population was relatively sparse. In theory, at least, the provisions for higher education at public expense were much more extensive than any now existing.

Early Schools

The towns in York County, adjacent to Massachusetts, were the first settled in the state. As most of the early records were destroyed during the Indian wars, there is no reliable history of schools prior to 1700.
In 1701, following a vote of the town, the selectmen of York—

Indented and bargined with Mr. Nath'l Freeman to ceep
a free scool, for which the town to pay said Freeman for
one year eight pounds in or as money and three pence
per week for taching to reade, and four pence per week
for writing and sifering and no moor (4).

The town of Wells had the next oldest record, for in
March 1715, it was voted "to procure a schoolmaster at the
town's charge." Apparently the selectmen met with no
success, because in 1716 the town was indicted for not
having a school. This action apparently had the effect of
awakening the people to a sense of their duty.

In the beginning, there was not a schoolhouse in a
single town, and whatever provision was made for the in-
struction of children must have been at some of the dwell-
ing houses. The first recorded action was in the town of
York in March 1725, when it was voted that "a school-
house shall be built at ye lower end of ye town on ye
ministerial land this year at ye town cost" (5). In Wells, the
first schoolhouse was built in 1731, and in 1734 two were
built.

The description given of the first schoolhouse in the
town of Kennebunk is a far cry from today's school facili-
ties. It was built of large round logs notched at the ends so
as to let into each other, as logging camps are built today.
The walls were about 6 feet high, with a roof over the top,
though the gable ends were entirely open. There were no
windows, the light coming in freely from the ends. The
only way of entering, both for masters and scholars, was by
climbing up on a stile at the end and jumping down into the
house. There is no description of the means of egress.

Teachers

Maine was settled for the most part by Puritan stock from
Massachusetts, which accounts for the close connection
that existed between the school and the church. Early laws
regarding teachers were more concerned with moral char-
acter than with educational qualifications. This concern is
evidenced in an act of 1671 that directed that the youth be
educated not only in good literature, but in sound doctrine,
and ordered the selectmen not to allow anyone to teach in
the schools or colleges who had manifested themselves
unsound in the faith or scandalous in their lives and had not
given satisfaction according to the rules of Christ.

For a long period, the church took care of educa-
tional affairs, receiving money from the town and disbur-
sing it for parochial purposes in parish meetings. Teachers
were given examinations and certified by the settled mini-
ster.

The remuneration paid to teachers seems small com-
pared with today's salaries. Yet, considering the hardships
and actual poverty of the early settlers, a teacher's salary of
£20 per year, plus his "diate," compares quite favorably
and probably was more liberal than the salaries of teachers
in more recent times.

School Districts

In 1789, Maine, as a part of Massachusetts, adopted
the school district plan for operation of schools (6). Each town
or plantation was authorized to determine the number and
limits of school districts. In some cases, to accommodate
the pupils, a school was kept part of the time in one section
of a town and part of the time in another.

In the District Act of 1789 are found a number of the
principles on which education in the state was to develop in
succeeding years. These principles include the requirement
that towns support schools; establishment of districts as a
part or subsection of a town; teaching of morals; issuance
of certificates to teachers; establishment of primary
schools; recognition of women as teachers; and rights of
towns to manage schools by a committee (7).

The school district plan undoubtedly served an
important purpose in the pioneer period, guaranteeing a
school wherever there were people. But there were indica-
tions that it was beginning to hamper the development of
schools rather early in the nineteenth century. As early as
1822, when the city of Portland found the district system,
as well as the multiplicity of school officers, committees,
and agents, an obstacle to good schools, it asked for and
obtained a special act abolishing school districts and grant-
ing to the school committee all the powers of district
agents (8). Bath and Bangor soon followed Portland's lead,
and a general law was enacted in 1834 authorizing towns to
discontinue school districts in favor of town organization.

Dissatisfaction with the district system continued to
grow and came to the surface in 1843 in the report of a
group known as the Friends of Education. This group
agreed that many of the defects were due to having over
4,000 independent districts in 450 towns with nearly 7,000
teachers operating without direction, the inevitable result
of such a system being chaos and inefficiency. An organiza-
tion was proposed that would join together the individual
parts and serve as a channel of communication from school
to school and teacher to teacher.

Legislation was presented to implement the report
providing for a board of school commissioners. It passed
the House by a close vote but was indefinitely postponed in
the Senate without debate. Its significance lies in its initial
efforts to improve education on a statewide basis and in
that it was followed by other efforts that did bear fruit in
later years.

In 1868, State Superintendent Warren Johnson listed
the district system as one of the causes of partial failure of
the common schools, and it was along this line that a real
battle was to be fought. In 1870, a law was passed authoriz-
ing any town to abolish districts, since the district system
had come to be regarded as an obstacle to progress. Its subsequent demise in 1893 was assisted by the passage of another act in 1870 whereby the town committee, rather than the district agents, was empowered to employ teachers. From 1880 to 1893, when the district system was abolished, the number of towns employing a supervisor of schools increased, and the need for more professional supervision emerged.

State Board of Education

The initial step in an attempt to secure information of a statistical nature came in 1825 when towns were required to make reports to the secretary of state once every 3 years. As these returns were incomplete, they were of doubtful value and obviously a far cry from today's system for data collection. Until the middle of the nineteenth century, few statistics were collected, and no information was available on how the laws were being observed by the towns or how school money was being expended. Teachers had no associations or conventions for mutual improvement.

In January 1846, a convention of teachers and friends of education appointed a committee to "carefully consider the defects in our school system, and to suggest measures for improvement" (9). These defects were identified as the multiplication of school districts, the inefficiency of school committees, the lack of qualification of teachers, the absence of a systematic course of study, and the want of general interest in schools.

This convention is notable in that it recommended for the first time the establishment of a State Board of Education, which was introduced in the Legislature and became a law (10). Maine thereby became a pioneer in establishing a state board. Even though the board lasted only from 1846 to 1852 and a solid basis for a state board was not realized until 1949, this was a significant step and a solid basis for a state board.

The Legislature replaced the board with county commissioners who were directed to spend at least 50 days in visiting schools and to report to the Legislature on the character of the teachers and the order and condition of the schools and schoolhouses. The county commissioners were named, but there is no record of any work accomplished, and apparently no reports were ever made. The failure of these county officials to act removed any tendency to establish a county system of education. From that day the county in Maine had no educational functions.

State Supervision

The abolition of the state board and discontinuance of the position of secretary left the state without a chief state school officer, but this gap was filled in 1854 by passage of an act establishing the Office of State Superintendent of Schools. The superintendent was to be appointed by the Governor, with the approval of the council, and was "to devote his time to the improvement of common schools and the general interests of education" (13). An annual salary of $1,200 was set by statute. The position continued uninterruptedly from that time on, although the title was
changed in 1897 to state superintendent of public schools and later, in the twentieth century, to commissioner of education (14).

The first state superintendent was Charles H. Lord of Portland, who served in 1854 and seems to have spent his time visiting various parts of the state and observing the schools. He reported on the lack of punctuality in attendance, absence of parental interest, poor discipline, and incompetence of teachers. As a solution, he proposed the enlightenment of the public and a normal school for the training of teachers.

In 1868, the duties of the state superintendent were set forth more distinctly; the salary was raised to $1,800, exclusive of travel and other necessary expenses. The office was given a "local habitation," which it had not had before, at the capitol in Augusta. The duties of the superintendent were to supervise all the public schools, to advise and direct town committees, to disseminate information, to hold a state teachers convention each year, to prescribe the studies to be taught in the common schools, and to supervise the normal schools.

In the early years, the tenure of the state superintendent was short. In the 46 years between 1854 and 1900, no fewer than 12 persons held the position, although Nelson A. Luce served for 15 years, from 1880 to 1895.

State Financial Assistance

When Maine became a state in 1820, 236 towns had elementary schools supported by public taxation. The constitution emphasized the advantages of education but directed the Legislature to require the towns to support and maintain schools at their own expense (15). This might be interpreted as an intent to delegate responsibility for public schools to local units; but, in actual practice, the state has participated in school financing and has demonstrated by appropriate action that the support of public schools is a joint responsibility of state and local agencies.

The first school law passed in 1821 established the minimum amount of money that a town must raise annually for the support of schools at 40¢ per capita. Interestingly enough, a minimum per-capita requirement continues to the present day; despite inflation and extension of educational opportunities, it has risen in nearly 150 years to only 80¢.

The development of state assistance to local schools was slow and probably reflects a strong prejudice of Maine citizens against anything in governmental affairs that looked like centralization of control. Even in the early years, however, the need for state participation in the support of schools became evident.

The first evidence of state financial support came in 1828 when 20 townships of public lands were sold and the proceeds of approximately $200,000 used to establish a common school fund, the income from which was to be distributed according to the number of scholars. This fund established the principle of state support and was the forerunner and basis for funds of later years for equalization of educational opportunity.

In 1833, the banking corporations were required to pay to the state one-half of 1 percent semiannually on their capital stock. This has significance as it was the first state appropriation from tax money for school aid. The amount was not large compared with present-day sums, for from 1833 to 1849 the revenue averaged only $31,511 per year. The bank tax did not prove for long to be a stable source of revenue because of a tax on state banks imposed by the federal government. It seemed likely that this school resource would disappear entirely. So in 1863, in order to supply the deficiency, the sums to be raised by taxation were increased to 75¢ per inhabitant, and in 1868, to $1.

The Legislature of 1872 provided a broader basis for support by the enactment of a tax for common schools of 1 mill per dollar on all property in the state. The same session reduced the per-capita tax from $1 to 80¢ where it has remained ever since.

Teacher Education

The early standards for teachers seem somewhat out of line with the actual status of teaching, for, according to a law of 1789,

No person shall be employed as a schoolmaster unless he shall have received an education at some college or university and if he was to teach in a grammar school he must be skilled in the Greek and Latin languages (16).

The teacher institutes established in 1847 by the State Board of Education were the beginning of teacher preparation and filled a need for a time; but these were abolished by the Legislature in 1860 in favor of a so-called normal training program in connection with 18 designated academies. This plan was soon found to be impractical, and the law was repealed in 1862. It was evident that some better means than institutes and academy programs must be found to prepare teachers. The secretary of the state board and later the state superintendents and every teachers convention passed resolutions calling the attention of the Legislature and the people to the need for normal schools. The constant urging at length produced results.

The first normal school was established in Farmington in 1863, when the trustees of Farmington Academy offered its property to the state for a normal school. A second normal school, Eastern State at Castine, was opened in September 1867; and a third at Gorham, known as Western Normal, was opened in 1878 on the site of the Gorham Female Seminary.

The Madawaska Training School, which later became Fort Kent State College, was opened in 1878 to prepare teachers for the French population of the St. John's Valley...
area of northern Maine. Other normal schools were established at Presque Isle and Machias soon after the turn of the twentieth century, in 1903 and 1905, respectively. In the early years, these normal schools were under the control of the Governor and council, but they were transferred to a board of trustees in 1873. The board of trustees continued to be responsible for the state’s normal schools and teacher colleges until 1949, when it was superseded by the State Board of Education.

The condition of the public schools at the end of the nineteenth century resulted more from natural growth and a desire for the advantages of an education than from adherence to a well-developed plan. However, the state succeeded in establishing the foundation for a basically sound school system which has grown and improved with passing years. The organization and structure of public education was well prepared to enter the twentieth century and to move ahead toward the attainment of recognized goals.

THE CHIEF STATE SCHOOL OFFICERS

From the time of the appointment of the first state superintendent of common schools in 1854 to about 1913, the State Department of Education was predominantly a oneman operation. He kept what records were available, visited schools, held an annual conference for local superintendents of schools, and served as secretary of the normal school board of trustees.

In 1899, the superintendent was assigned the responsibility for the education of children residing in the Unorganized Territory, an area comprising nearly one-half the state, with numerous townships sparsely settled and with no local government. This remained his personal responsibility until 1911, when a director for these schools was employed. In making provision for complete state support and control of schooling in the Unorganized Territory, Maine took a step that still stands as a model for other states. Not only has it guaranteed educational opportunities to children in sparsely settled areas, but it has been able to provide an education equivalent to that offered in organized towns and plantations at a cost that is exceedingly low compared with similar services under what similar conditions in other states.

A review of the statutes reveals a gradual growth in the responsibilities assigned to the state superintendent or commissioner from 1900 to 1949 when the State Board of Education was reinstated. At that time the selection of a commissioner was removed from the political realm of appointment by the Governor to election by the Board of Education, and most of the policy-making duties of the commissioner were transferred to the board although he became its executive officer and professional leader.

The scope of legislation extending the chief state school officer’s duties and responsibilities ranged from the professional to the ridiculous, with items of the highest educational implications mingled with items of perhaps lesser but practical importance. The authorization of the commissioner to devise and furnish plans for privies is one such item.

The strengthening image of the education department and its services may be attributed, in large measure, to the caliber of men holding the position and the relatively long tenure enjoyed.

The advances made in extension of services and programs were almost universally based on recommendations of the chief state school officer. In some cases, however, it took many years before an idea obtained acceptance. The educational history of the period is closely related to the endeavors of these men and would not be complete without some comment on their achievements. As contrasted with the high turnover in previous years, only eight men regularly occupied the office. From 1900 to 1965, the average term of service was over 8 years.

William W. Stetson, 1895-1907

William W. Stetson spanned the turn of the century, serving as state superintendent from 1895 to 1907. His formal introduction to the profession came when he was appointed as the teacher of a district school at the age of 15. For some years he taught the winter term and worked on his father’s farm when not engaged in teaching. Using some accumulated savings, he followed the example of many other Maine boys and went west in search of greater opportunity. With a minimum of education, but evidence of great ability, he became superintendent of schools in Rockford, Illinois. Returning to Maine, he served with conspicuous success for 10 years as superintendent of schools in Auburn and in 1895 was appointed as state superintendent of public schools. Among his accomplishments during his term of office were the establishment of the town system of school administration and the abolition of the district system, the institution of free conveyance for elementary pupils, the adoption of the free textbook system, the extension of free tuition privileges to all pupils, the improvement of courses of instruction in the teacher-training institutions, and the adoption of an optional plan of professional supervision. His annual reports, from 1895 to 1907, are noted for his knowledge and grasp of educational operation in the state and are filled with constructive suggestions (17).

In 1905, he was selected as president of the Department of Superintendence of the National Education Association. He might well be called the Horatio Alger of his day in education, for he proved that a poor farm boy, through his own initiative and effort, could progress from a one-room district school to positions of state and national leadership.
An indication of how close Superintendent Stetson was to the pupils and teachers of the state is found in a report of a visit he made to the schools in northern Aroostook County, where he noted some things with which he was not pleased and some which gave him satisfaction. He wrote:

I noticed in certain schools that the pupils were idle and listless. You must realize that one of the great advantages which children derive from attending school comes from learning to work, to dig things out for themselves . . . . Do not place upon the walls of your school-room advertisements of tobacco or other pictures representing objects with which children should not become familiar. Be sure of your facts and that which you state is true (18).

The printing of these comments in his annual report undoubtedly had a wholesome effect on all of the schools of the state.

As a good teacher should, he did conduct a follow-up inspection, accompanied by the Governor. He noted good results from his suggestions in that—

Pupils read fluently in French and English; pupils are clean, bright, wholesome looking; dressed neatly and becomingly; manners courteous and easy; prompt and accurate recitations; methods employed by the teacher are such as would be used by our best teachers in cities. There is a marked improvement in calling and dismissing classes. In many schools when the signal is given, the children rise in their places, face in the direction they are to march, keep step as they pass to their places, face the teacher and visitor and bow simultaneously (19).

State administration has changed considerably since 1900, but without a doubt, many of his successors also would like to have time to visit schools.

Payson Smith, 1907-17

During the incumbency of Payson Smith, much constructive legislation was enacted. Dr. Smith was particularly interested in lengthening the school year and was able to increase the minimum from 20 to 30 weeks. He was an ardent champion of adequate salaries for teachers and showed his understanding of human nature by admitting that a solution was not to be reached by legislation, but through public opinion. He believed that certain requirements could be enforced by law, but that the real spirit of educational progress was not to be obtained by statute but to be found only in the people.

Promotion of industrial or vocational education was one of his many endeavors. He saw that too great an emphasis was placed on college preparation while 90 percent of the product of Maine's public schools went into agriculture or the trades. He was a pioneer in the advocacy of vocational schools, which did not come to pass until years later. He was, however, successful in introducing manual training and home economics into the normal schools.

Summer schools were encouraged, and a beginning was made in 1909 when five were held. A report from St. Agatha in northern Maine indicates the value of the summer programs because "many have never heard English spoken outside of the schools, for French still remains the language of the home in much of Northeastern Maine" (20).

Dr. Smith was a champion of good education for the rural sections, believing that the country boys and girls deserved the best teaching and that the course of study for rural schools should not be an imitation of that used in city schools. He recommended state certification of teachers, rather than optional state examination, on the grounds that the state will fail to guarantee a reasonable equality of educational opportunity unless it safeguards entrance to the teaching profession.

During this period, a great effort was made to provide professional supervision of schools. A permissive law allowing towns to join together in unions for the purpose of jointly employing a superintendent of schools had been passed by 1897, and a number of voluntary unions had been formed. During Dr. Smith's term of service, emphasis on union formation was increased, and in 1917 he was authorized to group all towns with less than 50 teachers in school unions (21). This was unprecedented and reflects the confidence of the legislators in Payson Smith.

Dr. Smith moved on to become commissioner of education in the Commonwealth of Massachusetts, and later he returned to become dean of the College of Education at the University of Maine. In his college teaching he had a great influence on teachers and administrators, liberally sharing his philosophy and experience with those who were fortunate enough to attend his classes.

An illustration of his keenness is remembered when one day in a class he was asked to comment on a newspaper article which stated that Maine public schools were godless. He said, in reply, that it was his understanding that God was not subject to the ruling of a school committee or the Legislature, and he thought it would be difficult to keep Him out of the public schools.

Dr. Smith's accomplishments were great, and Maine schools progressed in many directions under his leadership. But he was also a dynamic force toward changes that came about many years later. William H. Soule, in his biography of Smith, says:

Payson Smith meant more to the education of his time than a person who provided the leadership for translating into accomplishment an impressive number of educational goals . . . he played two important roles in the educational circles in which he moved: he was a conscience for education; and he was a balance wheel for education . . . (22).
To summarize, Payson Smith believed in well-trained and well-paid teachers, adequately equipped schoolhouses, professional supervision, a simple and definite course of study, reasonable consolidation for educational advantages, and community interest and support.

Augustus O. Thomas, 1917-29

Soon after Dr. Thomas assumed office, the United States became involved in World War I. Considering that it was the purpose of the department to safeguard the welfare of schools in the essentials of education, keep up the standards of instruction, and, at the same time, participate in the war effort, he called upon the schools to prepare to meet the conditions that would come with peace. He urged the schools and the people to get ready to accept new ideals and newer concepts of education.

His chief concern was for qualified teachers. In 1918, he warned:

This is a “making” time and it would be a mistake to lower standards from which the state could not recover for a decade. It is better to close some schools than to supply them with poorly trained teachers. If schools were places for herding of children standards might be lowered, but viewed from the standpoint of professional service, standards should be raised. A teacher shortage will bring this country to a realization of the necessity of an adequate remuneration for trainees of coming men (23).

In September of the same year, he wrote that it would be unwise to lower the minimum qualifications for certification. Two years of post-high school study was considered to be the minimum allowable. He did express a hope that matters would gradually adjust themselves, because “salaries are uniformly higher and will tend to hold teachers from the allurements of lucrative war work and will gradually bring back some who have gone for that purpose” (24).

His optimism was short-lived, for the end of the war did not solve the teacher shortage. An appeal was made by Dr. Thomas for young people to attend normal school or college. The mobility of teachers and their short duration of service were pointed out in 1919, when 4,281 teachers out of a total of 6,554 were new to the positions held. At that time, 2,014, or 31 percent, were normal graduates, with an average experience of only 3.6 years. Commenting on the need for more stability, he said:

It would seem reasonable to expect a teacher who receives a normal or college education to teach five years. This would make it a profession and a life work and give her a chance to settle down in life at the age of 25 (25).

The shortage continued throughout the 1920's despite the commissioner's constant urging of local units to increase salaries and make teaching an attractive profession. Some advancements were made, and many places were planning improved salaries when the Depression hit, and school officials were forced to retrench.

Dr. Thomas was prophetic of the growth in the leadership roles of the chief state school officer and the state department when he stated in an annual report:

There is a strong tendency today to make state departments of education more vital to the progress of education. The office is more and more becoming a promotion enterprise susceptible of as high art and technical skill as the engineering profession. It is necessary that the departments of education be brought together into a purposeful whole (26).

Noting the need for what he termed educational engineering, he initiated a statewide survey of school conditions so that he could know if the system was progressing or slipping back from year to year. Although Dr. Thomas had strong support from the educators in the state, a change in state administration in 1929 brought his term of office to an end.

Bertram E. Packard, 1929-41

During the difficult Depression years, Bertram E. Packard, formerly deputy commissioner, served as commissioner of education. He was a thickset, practical man not given to hyperbole, but well aware of Maine's educational needs. In his writing and speeches he continually called attention to the need for courses in the fine arts, which many citizens considered “fads and frills.”

The effects of the Depression were somewhat slower in affecting Maine than more urban sections of the country, but by 1931, general unemployment had turned many former teachers to seeking positions in schools. This situation is described in the Maine School Bulletin of April 1931:

There is no longer an appreciable shortage of teachers, no superintendents should find it difficult to fill all or nearly all vacancies from the graduating classes of the normal schools. There is an oversupply of teachers of English, Latin, modern language and social studies. There is a demand slightly in excess of supply in mathematics, science, commercial and vocational subjects (27).

The effects of the Depression worsened, and in 1933, many school systems were eliminating special subject offerings that had previously been introduced after much work and effort. The number of regular elementary and secondary positions was also decreased, and over 4,000 teachers received reductions in salary ranging from 5 to 20 percent. Other retrenchments involved transportation of pupils, purchase of textbooks and supplies, and deferment of needed repairs. These cutbacks represented a saving well beyond the half-million mark (28).
Commissioner Packard minced no words in saying to the people in 1933:

When we consider the fact that the amount expended two years ago was at a very low level, no one can for a moment believe but that a decrease in these expenditures in the two-year period of over $2,000,000 must have resulted in serious impairment of facilities for the children in our schools. It means the schools in our state are being maintained on a starvation diet and if further reductions were to be made it would be preferable to entirely close the public schools. The time is ripe for organized public sentiment to demand that further attempts at chiseling and paring of school appropriations be abandoned and that substantially increased appropriations be made (29).

Again, in 1936, he warned that the day of the $10- or $12-per-week teacher was over and that if municipalities expected to employ teachers at those salaries, they must accept a more or less inefficient and unsatisfactory type of service.

The years of Commissioner Packard's service were difficult ones and might be characterized as a holding operation.

Harry V. Gilson, 1941-47

Maine had barely recovered from the effects of the Depression and regained the ground lost when World War II erupted, and schools became involved with Victory Corps, Victory Gardens, and many other patriotic endeavors. A surplus of teachers soon became a critical shortage.

Harry V. Gilson, who succeeded Bertram E. Packard in 1941, was young, dynamic, and aroused the school systems to greater efforts. He implored teachers to stay on the job as a patriotic duty. Like his successors, he was a defender and an advocate of high standards and adequate salaries. In 1942, however, he was forced to recognize that the war with its various demands on teaching personnel, both on the home front and for defense, had created a serious situation in which, if schools were to open, he must lower the standards for certification. The situation grew steadily worse: Some schools were forced to drop courses because of lack of personnel, and an already heavy pupil load was increased. In 1944, he reported at midyear that some schools had not yet opened. During these years, permits and emergency licenses were granted to persons who lacked the established minimum requirements for certification, and the department was compelled to "sanction" the employment of persons having little or no education beyond the high school level.

Harland A. Ladd, 1947-52

Harland A. Ladd, a former superintendent of schools and department director of curriculum and instruction, was appointed commissioner in 1947. While the emphasis during his term of office was on instructional programs, much constructive legislation was passed. The most important was the reestablishment of the State Board of Education with authority to select the commissioner. Mr. Ladd became the first commissioner appointed by the board.

Other forward steps included authority for the creation of community school districts, the Maine School Building Authority, and the start of Maine's first postsecondary vocational-technical institute. State subsidies were increased, and a more equitable method of distribution was adopted, based on state valuation of local units. Tenure for teachers, which had been a controversial subject for some years, was adopted, and equal pay for women was mandated. Commissioner Ladd literally gave his life in the cause of Maine education, dying from a heart attack brought on by overwork.

Herbert G. Espy, 1952-55

Commissioner Espy's term was relatively short in comparison with that of some of his predecessors. He was an intelligent, scholarly person, noted for his academic achievements as a teacher and author of professional books. He was the first commissioner to hold an earned doctoral degree. During his incumbency, attention was given to safeguarding the integrity of granting degrees, and largely due to his efforts a statute was enacted. An increase in the minimum salary for teachers was adopted, and the school year was extended from 32 to 36 weeks.

Warren G. Hill, 1956-63

From 1956 to 1963, under the leadership of Warren G. Hill, Maine moved ahead rapidly on many educational fronts. Dr. Hill, born in Nova Scotia, came to Buxton, Maine, at an early age and was educated at Gorham State Teachers College and Boston and Columbia Universities. He began his teaching on the tiny island of Islesford on the Maine coast and had progressed to the acting presidency of New Haven State College when he was elected commissioner. He had a kinship with Maine people and Maine ideas that enabled him to capitalize on their strengths and create a desire to overcome their weaknesses.

During this period, the commissioner, state board, and department were active in promoting the acceptance of the Sinclair Bill, a district reorganization act. This piece of legislation has been called the most significant educational law enacted since 1893, when the town school districts were abolished in favor of a townwide school system. It led to the establishment of 65 school administrative districts embracing 238 towns. A revised state foundation program to equalize opportunity and guarantee a minimum program of education was adopted; it provided supplemental operational aid to districts and, for the first time, construction
aid to districts and properly organized units. Dr. Hill was recognized outside the state as a leader and impressive speaker, and through his efforts Maine became more and more involved with regional and national educational affairs. He resigned in 1963 to become president of Trenton State College in New Jersey. Dr. Hill was succeeded in 1964 by William T. Logan, Jr., superintendent of schools at Burlington, Vermont.

The men who served in the position of commissioner of education in the twentieth century without exception were men of vision who spared no efforts to discharge their responsibilities and extend education to the children of Maine. Their reports and public utterances indicate the seriousness with which they undertook their duties and their dedication to education. Personalities undoubtedly shaped the course of events.

Leadership was not limited to the chief state school officer, for there were many able members of the state department who served in perhaps a less conspicuous manner but nevertheless made many worthwhile contributions. To single out individuals for mention would be most difficult, but a history of the Maine Department of Education would not be complete without mention of Richard J. Libby and Florence Hale. Mr. Libby served as agent for rural education and in other capacities. He was a respected adviser to commissioners and was revered by all with whom he came in contact. He became known as "Mr. Department of Education" for his broad knowledge and the service he rendered. Although he retired in 1950, he did not lose his interest or perspective as is evidenced by his observation to the writer in 1964 that "it is good to know that this generation is better than we were." Miss Hale served as a rural agent from 1916 to 1932. She was a dynamic leader in the improvement of rural schools and attained national prominence by being elected president of the National Education Association. She resigned as rural agent to become editor of The Grade Teacher.

The positions for these rural agents came about in a somewhat curious way as they were financed by the General Education Board, a forerunner of present-day foundations, which was interested in improving schools in rural areas and donated funds for this purpose to be handled by the commissioner. Maine was the only New England state to receive such a grant. The commissioner employed Mr. Libby and Miss Hale and paid them by his personal check from funds advanced by the board. This procedure continued until 1932, when the grants were discontinued, and Commissioner Packard was able to secure state funds to continue the positions.

THE DEPARTMENT AND THE TEACHER

A review of school bulletins, biennial reports, and public addresses of the commissioners and staff indicate continuing concern for an adequate supply of teachers and for their well-being.

Two world wars and a major depression made it difficult to staff Maine schools with well-qualified teachers and to expand the normal schools and colleges to a point of annually preparing enough teachers to fill vacancies. Maine has been handicapped by its location at the northeast corner of the United States and its proximity to states paying the highest salaries in the nation. Maine teachers have been welcomed in other states for their dedication and efficiency; consequently, the drain has been heavy and serious.

Although positive efforts were made to attract young people to teaching and enrollments in the state colleges doubled between 1953 and 1966, shortages persisted in primary grades, English, mathematics, science, and vocational subjects.

Certification

The development of standards for teachers has progressed from the day when certification was voluntary, and the only requirements for being a teacher were to be a good disciplinarian, excellent in penmanship, quick at figures, and a good grammarian, to full certification based on 4 to 5 years of professional study. Teacher examinations leading to state certification were offered in 1895 and became compulsory in 1913.

Standards were revised and strengthened in 1924 under Commissioner Augustus O. Thomas, who stated in a foreword to a manual of information:

A trained teaching staff is essential to good schools. We do not hope to come at once into the ideal of a trained teacher for every school in the state but it is not too much to expect that by 1930 our teaching staff will be raised to a reasonably satisfactory level (30).

He expressed the hope that the regulations would be conducive to a full professional training in normal school or college.

No particular changes were made in certification laws or regulations until 1931, when the Legislature authorized the commissioner to set up, from time to time, such standards as would seem advisable for the best educational interests of the state. Acting under this statute, the examination plan was abandoned except for the certificate of superintendence grade. In place of teacher examinations, some actual training in an approved institution was required; elementary teachers could not be certified without evidence of completion of at least 1 year of postsecondary work, and secondary teachers with 4 years of college study. It was an opportune time to raise standards, as there was an oversupply of teachers.

In 1949, a summary of regulations was published which updated the changes that had been made since the
earlier bulletins had been issued. The philosophy expressed was that Maine must set justifiably high standards while adjusting minimum requirements to a point where a reason-
ablely adequate supply of teachers would be available. Sub-
ject matter certification was never prescribed because of the
large number of small high schools in isolated areas.

The national trend toward greater participation by
the teaching profession in the establishment of standards
was recognized in 1958 by Commissioner Warren G. Hill,
and through his influence the State Board of Education
appointed the Maine Advisory Committee on Teacher Cer-
tification. By this action, teachers and lay people for the first
time had a formal voice in setting the standards for the
profession. The committee recommended that procedures
be streamlined and that standards be raised to the bachelor
degree level. The recommendations were adopted by the
state board. In 1963, after continuing study by the advisory
committee, several changes were made with a reduction in
emphasis on "how to teach" courses for elementary certifi-
cation.

In retrospect, the history of certification in Maine has
followed the national pattern to a large extent. Some of the
modern trends adopted include increased participation by
the profession itself, involvement of lay and advisory
groups, simplification of procedures with a reduction in the
number of certificates issued, a gradual increase in the level
of preparation required, the use of proficiency examina-
tions, and the extension of reciprocity among the North-
estern states. An analysis of Maine practices and policies
indicates a high degree of conformity with James B. Con-
ant's specific recommendations with the exception of strict
subject matter certification (31). In the twentieth century,
the teacher became a professional while retaining the qual-
ifications of character, strong discipline, and "know-how."

The role of administering certification and upgrading
standards has not been an easy one or without assaults from
both within and without the profession. Measures were
presented to the Legislature in 1963 that would have
dominated any required professional preparation, but the
matter was referred to an interim research committee. A
report of the committee was presented to the next session
with no action taken, and the matter was left to the com-
misssioner and state board.

Teacher Retirement

The first pension or retirement law for teachers enacted in
1913 was not based on concern for teachers but, in the
words of the act, "to increase the efficiency of the public
schools by retiring teachers of long service" (32). It pro-
vided, at age 60, a pension of $250 per year for 35 years of
service, $200 for 30 years, and $150 for 25 years of teach-
ring service. Improvements have been made from time to
time, but small as the first pensions now appear, the non-
contributory type of pension was never equaled.

The Maine Teachers Retirement Association was
organized in 1924 and administered by the commissioner
and state department. Membership was voluntary in the
first years of its operation, but as so few teachers joined
and would be without any benefits in later years, it was
made compulsory in 1930. In 1947, the Teachers Retire-
ment Association was merged with the Maine State
Employees Retirement System.

An act, passed in 1965, provided substantial adjust-
ments for teachers and other retired state employees
according to the length of time retired. More significantly,
it provided that on all future adjustments in state salaries
made to active employees, the same percent of increase or
decrease would be applied to all retired state employees.
This measure provided a safeguard against the inroads of
inflation and made retirement for teachers more secure.

In all of the changes the commissioner and depart-
ment staff have been active promoters and supporters of an
equitable retirement system.

Minimum Salaries for Teachers

The first annual minimum salary law for teachers was $575.
This was increased in 1943 to $720, and in 1945 a state
minimum of $1,000 was required.

In the early years, when teachers were neither well
organized nor particularly vocal, the commissioner was
their spokesman in bringing the need for better salaries to
the attention of citizens. He and his staff consistently
advocated increased state appropriations for subsidies and
equalization measures so that local units could improve
teachers' salaries. The words of Commissioner Harry V.
Gilson in 1943 are illustrative of these endeavors. He wrote
at the time:

Teachers are being forced out of teaching not because
they want a change of vocation but because prices are
going up and the dollar is losing its purchasing power.
More generous financial support of schools and teachers'
salaries is the logical answer (33).

The Legislature in 1947 made additional state funds
available to committees to compensate for a substantially
increased minimum salary, and Commissioner Harland Ladd
hauled the action as the dawn of a new day for school-
teachers. At the same time he cautioned that in spite of the
salary increases the teacher was little, if any, better off
financially than he was in the prewar period (34). The
amounts for various levels of training and experience have
been revised upward at nearly every session of the Legisla-
ture in recent years until the minimum for those with a
bachelor's degree starts at $5,000 and goes to $7,500 with
10 years of experience. The range for teachers with a
master's degree is $5,300 to $8,000.
Teachers Associations

The first state convention of teachers was held in Waterville in November 1859. At this meeting an organization was formed under the name of the Maine Educational Association, and provision was made for an annual meeting. In 1882, the association transferred its records and property to the Maine Pedagogical Society, which had organized in 1880.

Another teacher group called the Maine Teachers' Association was formed in 1876, and in 1879 it also merged with the Maine Pedagogical Society. The object of the society was to promote the consideration and discussion of all questions relating to the organization of schools, methods of instruction, and professional standards. In 1901, the name was changed to the Maine Teachers' Association, and a new constitution was adopted.

The relationship between the department and the officers and members of the Maine Teachers' Association has been characterized by a spirit of cooperation in working for common goals. The commissioners and department staff encouraged the teachers association by planning and participating in programs and provided office space and a part-time secretary. From 1920 to 1940, Adelbert W. Gordon, state agent for the Unorganized Territory, also served as secretary for the teachers association. In 1940, the organization established its own headquarters and selected Richard B. Kennan as the first full-time secretary. This action did not affect the cooperative spirit, and a harmonious relationship has continued to exist.

Other Benefits to Teachers

Many other benefits have been achieved by teachers since 1900. The state commissioner and department have operated a teacher placement service that has been mutually advantageous to teachers, superintendents, and school officials. The success of this service, which began in 1917, may be attributed in large part to Margaret (Lewis) Arber, who has served as placement director continuously since 1923. Mrs. Arber has become acquainted with nearly every teacher in the state and is known for her remarkable memory for names and faces. The extent of the service is indicated by more than 2,700 placements made in 1966.

In 1919, in a move to improve supervision and teaching practices in the rural schools, the state initiated a special summer school for 100 teachers and paid their expenses for attendance. These teachers were the forerunners of a group of experienced teachers who had special training at the normal schools to enable them to assist other teachers in the same school system. The plan followed was for them to teach their own class or school on Saturday and to visit another school on one of the regular school days. This was the beginning of state assistance in improving instruction by visitation.

Sabbatical leave was authorized in 1929 at the rate of one-half the annual salary. But worthy as the idea was, there is no indication that it was widely utilized.

In 1959, sick leave of 10 days a year cumulative to 30 days was provided, which was subsequently made cumulative to 90 days. Fringe benefits such as insurance on life, health, accident, liability, major medical expenses, and tax-sheltered annuities were authorized in 1965.

The education department has supported all of these measures and cooperated closely with the teacher associations in bringing them about.

PROGRAMS AND SERVICES FOR EFFICIENT EDUCATION

Curriculum and Instructional Developments

In 1915, the state department was first granted a formal voice in what was to be taught in the public schools, for in that year the Legislature prescribed that courses of study for all schools be approved by the state superintendent of schools. The following year a state course of study was developed and initiated in all elementary schools. The state superintendent's authority to approve courses of study was extended to private schools in 1919, and since that time approval has been required of all private schools receiving public funds for payment of tuition.

An interesting extension of educational opportunity occurred in 1915 when a modicum of school privileges was extended by the state to the children living at the numerous light stations scattered along the coast. The need for providing some education for these children had been considered for some time, and a program was put into active operation early in the summer of 1915. A traveling teacher, who was known as the "lighthouse teacher," was employed to make visits to each light station and remain for several days to a week at a time. She gave the pupils regular instruction and upon her departure left an outline of work, which the pupils were to pursue until she came again. During her absence the pupils were supposed to be taught by their parents or some other person living at the station, and on her return visit the work was reviewed.

Many of the light stations on Maine's extensive and rockbound coast were out of the usual routes of travel, and to reach these places the teacher often had to go some distance in a small boat. The commissioner's report of 1915 indicates that, despite usual hardships of this mode of travel, especially during the stormy season of the year, the teacher was able to follow a reasonably regular schedule of visits. The plan was described as "practicable and bids fair to be a permanent solution to the problem" (35). It was not a permanent solution, however, for the number of light stations and children living at them diminished until the program was discontinued after a few years. Still, the
“lighthouse teacher” did serve a real need for a period of time, and her arrival must have been an important event for the children isolated from the mainland.

In 1919, in response to the state superintendent’s urging, legislation was enacted requiring the teaching of personal hygiene, sanitation, and physical education.

With the passing years, many laws were enacted affecting the curriculum, some of which stemmed from the commissioner’s recommendations and others which were reflections of the times but required implementation by the department. There has been continuing emphasis on the teaching of American history and civil government, the Constitution of the United States, the Declaration of Independence, and the American Freedoms. Special day observances have grown in number, such as Temperance Day, Poetry Day, and John F. Kennedy Day. In each instance, the department has been charged with supplying suitable materials for observance.

The annual reports of the commissioners and department bulletins are replete with suggestions for curricular improvement. As early as 1917, no doubt due to the passage of the federal Smith-Hughes Vocational Education Act, industrial and vocational education were being advocated. Vocational guidance was first proposed in 1918 and received some attention, but it was not until 1940 that a state guidance director was added to the staff. The first director was Dana M. Cotton, who later became placement director at Harvard University and has held other positions of national importance. In 1919, distributive education was recommended, but it did not become a reality until 20 years later when the city of Bangor initiated a program.

Improved libraries were stressed in 1920, when it was reported that “Maine is rated as having the smallest high school libraries,” but the report hastened to add that “this position is about to undergo a change” (36). The importance and value of libraries has been emphasized since that time, and today many schools have quite respectable collections. The secondary school accreditation standards of 1955 gave added impetus to library improvement when libraries were made a consideration for accreditation.

A survey entitled The Financing of the Public Schools of Maine, made in 1934 by a special commission with Paul R. Mort, director, was very critical of the curricular offerings (37). It classified the schools surveyed into three expenditure levels: high, medium, and low. The author reported that the only attempts to make the curriculum a living thing were on the high-expenditure level. Bangor was cited as an example of a community where the school committee was engaged in revising the curriculum. In the low-level elementary schools, the scope of the curriculum was limited to the mastery of the tool subjects, and the teacher was portrayed as more of a taskmaster than a teacher. The secondary schools on the medium and high levels showed evidence of developing programs to fit the needs of pupils rather than to force all to take a program made for conditions common 50 years earlier. A student had some choice of courses in high-level schools, whereas one program only was offered in the low-level schools. The Mort survey undoubtedly had some beneficial effect in identifying the need for changes, but the times were adverse and progress was slow. In 1940, it was reported in the Maine School Bulletin that very little work on the whole was being done to broaden and enrich the curriculum for pupils completing their education in high school. The need for improvement, however, was not forgotten but was delayed until district reorganization was improved. The reorganization of schools after 1957 did much to broaden educational opportunity.

Educational use of the radio was attempted, but, as in other states, it did not develop into an ongoing program. Its most effective use was a series of radio talks on current educational issues by Harrison C. Lyseth, state director for secondary schools.

Educational television has proved to be an effective means of instruction, and by 1966 it was being widely utilized. The establishment of a state station at the University of Maine and authority for the department to contract with WCBB (Colby-Bates-Bowdoin) extended coverage to over 90 percent of the pupils in the state. The department added a specialist in TV instruction to the staff and has produced programs in health, Maine history, and other subject areas in which programs have not been readily available.

Educational Finance

As a basis for comparison with later state appropriations, the total allocated to the state department for all purposes for the 1901-1902 biennium was $2,174,678. Sixty-six years later, the biennial appropriation totaled $74,709,536, an increase of 3,335 percent.

State financial assistance to local education had originated with the sale of public lands in 1828. It was increased in 1872 when the Legislature earmarked 1 mill of tax money for the support of common schools. In 1909, another 1.5 mills of tax money was allocated for the support of education, with 1.5 mills being distributed according to the school census and the other mill on the basis of the town’s valuation. This action resulted in increasing the funds available from $869,188 in 1909 to $2,377,684 in 1910, the first year the law was in effect. This was probably the greatest percentage increase in state support ever experienced before or since that time. The state tax was raised to 3.3 mills in 1921 with the establishment of the state school fund. The fund provided first for all department expenses; the balance was distributed to cities and towns on the basis of $100 per teaching position, $3 for each person on the school census between the ages of 5 and 21, and the remainder, if any, on aggregate attendance (38).
The most significant event during the thirties relating to financing of education was the survey by the Maine School Finance Commission. The study concentrated on potential economies in the operation of schools, more equitable sources of revenue for the state school fund, and the distribution of funds on an equalized basis. The commission endeavored to present an accurate portrayal of existing conditions and to improve the financial structure so as to guarantee to all boys and girls a minimum program of educational opportunity.

Among other things, the survey found that the cost of education was a small item in the total expenditures of the citizens of the state and that state government funds going to education had dropped from 39 percent to 16 percent in the period between 1915 and 1931 even though the percentage for highways more than doubled in the same period. It was apparent that Maine must increase its expenditures considerably to reach a satisfactory minimal condition. It was pointed out that the state department had not been sufficiently well supported to permit it to give any extensive guiding standards. The report emphasized the responsibility of the state for setting up an acceptable foundation program and for distributing the burden over the state so that it would fall on the people in accordance with their ability to pay. The commission recognized that it would take time to accomplish its suggestions and stated that under “recovery conditions” the goals could be attained within the next 10 to 20 years.

The study did not lead to many immediate reforms. However, it created more interest in education and did much to establish the principal of state responsibility for providing equal educational opportunity for children in all sections of the state. It undoubtedly contributed to the adoption of a foundation program in 1949 and the Uniform Effort Tax Principle in 1965.

In 1945, the Legislature adopted the policy of making all appropriations from the state’s general fund, and the day of “earmarked funds” for education was at an end.

The need for equalization of tax burdens and educational opportunities was a critical issue during the twentieth century. The first effort was made in 1919, when a special fund of $40,000 was appropriated to strengthen small high schools (39). Further acceptance of the state’s responsibility for the education of all its children was revealed in two ways in 1920. An equalization fund deducted from the common school fund, plus interest on reserved lands of unorganized townships totaling $55,621, was distributed to towns having tax rates for school and municipal purposes in excess of the state average. In the same year, a somewhat unprecedented action was taken when the Governor and executive council allocated $100,000 to help towns maintain schools and pay teachers’ salaries under emergency conditions resulting from the high cost of living following World War I. Funds for equalization purposes were increased from time to time, until in 1949 a new formula for the allocation of subsidies was adopted. This divided the 492 separate school units into nine classifications according to wealth.

Another study, known as the Jacobs Study (40), was authorized in 1955 to examine all expenditures of funds within the jurisdiction of the state department, particularly the distribution of funds to municipalities on an equitable basis. This study led to the enactment of legislation that provided a minimum foundation program and, perhaps more important, the means for reorganizing small units into larger, more efficient school administrative districts embracing all pupils from the kindergarten through high school. Through this act some of the long-sought goals were achieved, such as establishing a basic educational program for every child in the state toward which the state would contribute a greater share of the cost of education.

The per-pupil allowances in the foundation program have been updated at each session of the Legislature in an attempt to keep pace with increased local costs. They, however, have never been realistic in terms of local costs and actually have been approximately 2 years in arrears.

The adoption of the Uniform Effort Principle in 1965 was another forward step in sound financing of education (41). Under this law, each unit was required to make a 20-mill effort on an equalized valuation toward the support of the foundation program, with the state providing the difference between the local assessment and the foundation program.

In the 25-year period from 1940 to 1965, state appropriations for subsidies to local units increased from slightly less than $2 million to nearly $26 million. The percentage of state support, however, did not increase proportionately but remained fairly constant at approximately 27 percent in 1965.

In addition to the foundation program aid, which includes construction aid varying from 18 percent to 66 percent according to the wealth of the unit, there are various special subsidies for driver education, vocational education, special education, adult evening schools, education of island children and children of temporary residents, education of orphans, and professional credits for teachers.

At the conclusion of this period, the state’s responsibility in underwriting local school operations has become accepted. While state support in Maine is still much below the national average of state support, it is on the rise.

Extension of Services to Pupils

With the possible exception of financial measures, more laws have been enacted since 1900 for the benefit and extension of services to pupils than on any other educational subject. Educational opportunities were extended from the kindergarten to evening classes for out-of-school youth and adults. Included were programs for physically
The Community School District Act, however, is significant in that it was the forerunner of the Sinclair Act of 1957, which provided additional state assistance when towns joined together. This act included all grades, kindergarten through 12, and Maine was spared the ills of overlapping intermediate districts. The formation of 65 administrative districts embracing 238 towns has reduced the number of small high schools, and the consensus of opinion is that better education has resulted.

The formation of the school administrative districts was not accepted unanimously and wholeheartedly in all sections of the state. In the early history of administrative district formation, many questions were raised, and a few cases were carried through the courts. School Administrative District No. 3 in Waldo County, comprising 11 towns, had more than its share of legal troubles and was the battleground on which the legal problems for all districts were fought to a conclusion. The decisions were generally favorable to the district, and the court was sometimes irked by having the same questions presented repeatedly. In one case, the superior court stated that the issue had been laid to rest and the parties couldn't litigate it again. The court appeared to be in tune with the space age terminology of the times, for in a 1962 decision Judge Armand DuFresne wrote:

The pad from which they say their legal rocket ship is now being prepared for launching is Landover vs. Dennner. Unless the plaintiffs in their count down realize that their vehicle must be completely overhauled, they shall witness the major fizzle of the century (43).

The complaint was dismissed with prejudice and with costs.

State Standards and Accreditation of Schools

Standards for high schools developed slowly. In 1909, an act designed for the improvement of free high schools established three classes of approval dependent on the number of courses offered, the amount expended for instruction, and the length of the school year. Recognition of the relationship between the curricular offering and level of expenditure is evident for the first time in legal terms. In 1915, the commissioner's authority was strengthened by an act requiring that the course of study prescribed by him be followed. It was some years before truly broad-based standards for curriculum approval were established, for emphasis continued to be placed on the academic studies. As late as 1930, the statutes stated that "the ancient or modern languages and music shall not be taught except by direction of the Superintendent School Committee." These barriers were gradually overcome and more flexibility allowed.

In 1955, a system of optional state accreditation of secondary schools was authorized in addition to the basic minimum approval that had been required of all schools (44). Standards for the new level of classification...
were designed to reflect a high-quality program. The commissioner was assisted in developing criteria by an advisory committee composed of representatives of both public and private schools. These criteria have been reviewed periodically in recent years, and increased emphasis has been placed on quality of instruction rather than facilities.

The accreditation program has been credited with stimulating many worthwhile improvements in local schools, such as a program of studies to better meet the needs of pupils with differing abilities, the expansion of libraries, a reduction in teaching loads to levels that will permit effective teaching, and greater emphasis on the preparation of teachers. Within a decade, 59 schools were accredited out of a total of approximately 125, and the department reported that probably more had been achieved by this program than any other single development in the previous 50 years. Considering the high quality of standards established and the number of necessary small schools due to a sparsity of population, the record is commendable. In 1965, plans were initiated to extend accreditation to elementary schools.

The State and Higher Education

In 1900, the five state normal schools and Madawaska Training School were under the jurisdiction of a Normal School Board of Trustees. The state superintendent was the executive officer for the board and was nominally in charge until 1930, when the deputy commissioner was assigned this responsibility. The annual appropriation in 1900 was only $31,000, as compared with approximately $3,800,000 65 years later, not including nearly $5,000,000 for capital outlay.

In 1949, the normal school board was terminated, and its duties and functions were assumed by the newly created State Board of Education (45). The 2- and 3-year normal schools gradually emerged as state teachers colleges with degree-granting status. In 1965, they became state colleges with authority, subject to state board approval, to offer 5-year programs and to grant appropriate baccalaureate degrees.

The primary function of the state colleges has been to prepare elementary teachers. Other areas of concentration include art, business, health and physical education, home economics, industrial arts, music, and special education for the handicapped and mentally retarded. The board and state colleges have operated on a planned program to meet the need for teachers in the state. All of the department personnel are in the classified service, with the exception of the commissioner, who is selected by the state board and whose salary is set by statute.

The organization of the department is determined by the board, which, on the recommendation of the commissioner, may organize and, from time to time, reorganize the department into divisions, branches, or sections as may be found necessary or desirable.

In 1956, the department had grown to the point at which a reorganization was necessary. On the recommendation of Commissioner Warren G. Hill, the staff was grouped into six major divisions and subdivisions known as bureaus. The major divisions established were administrative services, with responsibility for district reorganization and research; finance, which in the 1965–67 biennium dispensed nearly $75 million; field services, embracing planning of school facilities, transportation, surplus foods, property, and school lunch programs; professional services, with responsibility for higher education, certification, and placement of teachers; instruction, including elementary and secondary school programs and special services; and vocational rehabilitation, whose function is to assist handicapped persons to become self-supporting. The organizational pattern conforms quite closely to national trends, with adaptations to Maine’s needs.

The State Department and Federal Aids to Education

The first real impact of federal aid on Maine education came with the passage of the Smith-Hughes Vocational Act of 1917. A state plan for extending vocational education was developed, and thereafter a director of vocational education and supervisors of agriculture, industrial arts, and home economics were employed. The state superintendent served as chairman of the State Board of Vocational Education, which was required under the act. This board was later superseded by the State Board of Education when it was created in 1949. Further funds were provided and programs extended under the George-Barden Act of 1946 and the Vocational Education Act of 1963. The grants of federal funds stimulated local efforts and led to the acceptance and
establishment of courses in vocational education in many high schools.

For several years, Public Law 874, providing aid to federally impacted areas, was by far the largest federal program. It provided assistance to 79 separate units amounting to approximately $3 million annually. The largest recipients of this aid were Limestone, Bangor, Presque Isle, Brunswick, and Kittery. The department and local school officials have found the federal administration of this program to be excellent, and oftentimes it has been pointed to as an illustration of federal aid without interference and restrictive controls.

The National Defense Education Act of 1958 brought much-needed funds to strengthen the department's supervisory staff and to provide for the purchase of equipment by local schools. The department had recognized the need for subject matter supervisors for years but, except for vocational education, which was federally assisted, had not been able to convince the Legislature of this necessity. This act made it possible to employ state supervisors in science, mathematics, foreign languages, social studies, and re-reading and to add a second person in guidance. One unfortunate aspect was encountered in that even though large sums of federal money were available for equipment, the local units were not able to provide sufficient matching money to utilize all the funds available.

The statistical services of the department were expanded under Title X. Procedures for the collection of information and methods of reporting were revised in keeping with federal handbooks, and Maine data were made more reliable and consistent with practices followed elsewhere.

In another program the department served as the agency for coordination and operation of all the Neighborhood Youth Corps Projects of the state, involving nearly 3,000 students. A financial crisis appeared in the making at one time in the early days of Youth Corps Projects when a ruling from the state personnel department required that all students employed on local projects be registered with that department and certified before payrolls could be approved. A call to the Governor soon eliminated the red tape, and the checks were sent on their way to expectant students.

The Elementary and Secondary Education Act of 1965 had the greatest impact on education in Maine. Title I projects amounting to approximately $4 million provided funds for the employment of teacher aides to work with classroom teachers, remedial programs in the basic skill subjects, extension of the school day, evening programs of supervised study and individual help, classes for the mentally retarded, and speech therapy. The programs were designed to assist the underprivileged, and all funds available were utilized. Some clashes occurred between local school officials and Office of Economic Opportunity officials over jurisdiction of programs, but in most sections the issues were resolved amicably. The department and local officials have felt strongly that educational programs should be operated by school officials and that the Congress should transfer such programs as Head Start and adult education to school authorities.

Under Title II of the same act, the state distributed funds to local units for the purchase of library books and materials. The state also served as the agency for the distribution of books to religious and independent schools. This plan was approved by the attorney general on the basis that the funds were federal funds and that federal law allows participation by nonpublic schools.

The state utilized other federal funds available. The state board, serving as the higher education facilities commission, has allotted several millions of federal funds for college classrooms. The Vocational Act of 1963 stimulated vocational courses in secondary schools and expansion of postsecondary vocational-technical institutes. The Manpower Development and Training Act, operated jointly with the Employment Security Commission, made training and retraining possible for members of the labor force. Other programs under which substantial grants have been administered include Head Start, rehabilitation, surplus foods and commodities, school lunch, and Civil Defense.

Although a harmonious relationship has existed between the department and the federal government, there has been a distinct feeling that a more general form of aid would be preferable to such a proliferation of special aids administered through so many federal departments and bureaus.

**Advisory Committees**

The Maine department has moved from a one-man role to one that has made increasing use of advisory committees composed of lay and professional people. The philosophy that has governed these activities was expressed in 1938 by Commissioner Packard:

I have a conviction that a better type of educational opportunity for our youth depends on informed public opinion. Any far-sighted school official should lay his plans with the cooperation of teachers, school committees, influential citizens and friends of education (46).

The use of advisory committees appears to have begun with vocational education in 1917 and has been used with excellent results in other fields. A Governor's Advisory Committee on Education, composed of approximately one hundred members, has supported sound and progressive measures. An Educational Conference Board organized during Dr. Espy's commissionership, with representation from organizations having an interest in youth, has devoted much time and study to educational matters and has spoken effectively for the combined membership at legislative hearings. Other advisory committees have been formed as needs have arisen, and their assistance has been beneficial.
Conclusion

The role of the Maine Department of Education has been one of constant effort to provide leadership and services. Progress and change have not been spectacular, but the slow and steady pace has been due largely to the lack of resources. Two world wars, with accompanying shortages of teachers and other personnel, and a major depression had retarding effects. But education as measured by the opportunities to students has emerged in a stronger position than at any other time in the period covered. The leaders and legislative powers have not been ones to rush to embrace every new idea proposed, and perhaps for this reason there are few instances where a program once begun has failed or been discontinued. The department has given top priority at all times to assisting local school officials and citizens and has endeavored to provide the leadership and coordination needed to develop and implement statewide plans for the attainment of desirable goals. The growth of staff and the extension of services in recent years have added much to the department's influence.

This résumé is concluded by reference to a review of the department conducted by the U.S. Office of Education in 1967 at the request of Commissioner William T. Logan, Jr. It was made by nationally prominent educators supplemented by local legislators and citizens. In the report the department is described as one which has grown from a small, service-oriented agency to one providing educational leadership. The report found that the department had attained a higher level of service and leadership while remaining sensitive to the principle of local control. It commended the strategy and philosophy used in dealing with local educational agencies and found that a proper degree of flexibility had been exercised in beginning new programs with federal funds. It considered that the salary schedule for staff members was unsatisfactory and that crowded office conditions threatened its efficiency. However, it concluded that despite these deficiencies the department was "functioning efficiently in mounting the constantly increasing dimensions of an educational program for the state" (47).

APPENDIX A—MARYLAND CHIEF STATE SCHOOL OFFICERS 557

APPENDIX B—ORGANIZATION CHARTS 558
INTRODUCTION

Public education was well organized in Maryland by 1900, but the system's achievements were highly unsatisfactory. The Maryland Department of Education was undermanned and poorly equipped, professionalism was practically nonexistent, and politics permeated and controlled the entire system at both the state and local levels. Today, Maryland's public education system is achieving eminently satisfactory results. In large measure, this is due to an increase in staff from 3 to 550 people in nine divisions, the development of professional leadership in all of the department's activities, and the elimination of politics from its operation over the last half century.

In 1916, the State Legislature moved to eliminate the factors that had hampered the Department of Education in the early 1900's by adopting the recommendations made for the Maryland Educational Survey Commission by Abraham Flexner and Frank P. Bachman of the General Education Board of New York. The Maryland General Assembly had created the commission in 1914 to make a comprehensive study of the public school system and had appropriated $5,000 to carry it out. As this amount was insufficient, the commission requested the General Education Board, then conducting educational surveys throughout the country, to undertake the Maryland survey. In consenting to do so, the board agreed to supplement the legislative appropriation with $7,500, or such part as might be needed. To direct the survey, the board employed Flexner, who had been one of its secretaries, and Dr. Bachman, a former assistant superintendent of schools in Cleveland.

BEFORE 1900: DEVELOPING A CENTRALIZED SYSTEM

Between 1671 and 1867, several attempts were made to establish some type of free schooling in Maryland, but they were ineffective. The most notable effort came in 1825, when the General Assembly passed an "act to provide for the public instruction of youth in primary schools throughout the State," subject to a general referendum (1). Based on a report prepared by Littleton Dennis Teackle of Somerset County, the act provided for a state superintendent, appointed by the Governor and council; nine commissioners of primary schools for each county, appointed by the justices of the levy courts; and no more than eighteen inspectors of primary schools, also appointed by the justices. However, the voters rejected the act in 1826, and Maryland continued without a state system of education.

Although the 1825 act marked the General Assembly's acceptance of the principles of modern public education, it had two cardinal defects —

The first of which was due to the fact that its provisions were largely borrowed from states in which the people were trained in local political action in the township system, while the people of Maryland had no such training. The second was the want of adequate provisions for raising money sufficient to carry it out even on the fallacious basis of the Lancaster system, in which one teacher was deemed sufficient for the instruction of any number of children up to 400 or 500 that could be brought together in one schoolroom (2).

As a result, this legislation accomplished very little.

The Act of 1825 stipulated that the establishment and regulation of Baltimore's public and private schools be vested in the mayor and city council. If the mayor and city council did not establish a system of public education within 5 years, however, the city might lose this privilege and also be under the full effect of the act. Three years later, Baltimore passed an ordinance appointing commissioners and directing that they establish six male and six female schools, but then failed to provide adequate funds. In 1829, when the commissioners presented their first report, they stated that one female and two male schools had been established on the monitorial (Lancastrian) system, under which a single teacher was responsible for 200 to 300 or more pupils. The teacher selected "clever" pupils to teach as many as 10 other pupils lessons that the teacher previously had taught. These schools, which caught on only slowly at first, never became common throughout the city.
Prior to the Civil War, public education in Maryland was primarily a local responsibility. But the constitution adopted in 1864 provided for the establishment and maintenance of free public schools and created the office of state superintendent. Governor Bradford appointed an Episcopal minister, the Reverend Libertus Van Bokkelen, rector of St. Timothy's Church at Catonsville, as the first state superintendent. Dr. Van Bokkelen investigated both public and private schools in and out of the state, and he corresponded with college presidents and superintendents where state systems existed. In accordance with the constitutional mandate "that the State Superintendent should within thirty days after the first session of the General Assembly report a uniform system of free public schools" (3), he submitted a comprehensive analysis. The General Assembly then enacted his recommendations into law.

The plan accepted by the assembly provided for a uniform statewide system of common schools that would qualify the pupils for admission into any of its high schools and academies; uniform secondary courses, qualifying high school pupils for admission into any of the colleges; and scientific, classical, and mathematical instruction in the colleges, qualifying every graduate for admission into the state university's law, medical, or mechanical departments. The 1865 assembly established the first state normal school in Baltimore City (now known as Towson State College), which enrolled its first students the following year. The plan concentrated considerable power in the hands of state officials (4).

Dr. Van Bokkelen received national recognition as an educator. In 1866, he was elected a director of the National Teachers' Association, its secretary in 1868, and its president in 1869 (5). Within the state he was recognized as an outstanding leader in promoting the cause of free public education.

During the reactionary period following the Civil War, the majority of the people had no desire to allow a centralized government so much authority over their schools. A public school system headed by a State Board of Education comprised of the Governor, the lieutenant governor, the speaker of the House, and a state superintendent appointed by the Governor was entirely unsatisfactory to the counties, and especially to Baltimore City. There were immediate outcries. A convention met in 1867 to repeal the Constitution of 1864 and to enact a new one. Thus, a good beginning was doomed to early failure. It should be noted that the Constitution of 1864 was adopted only with great difficulty; without the vote of Maryland soldiers serving in the Union Army, who overwhelmingly supported it, it would never have been approved.

The new constitution provided for free public schools and their maintenance, but it did not retain the office of state superintendent. The essentially conservative document was adopted by a vote of 47,152 to 23,036. The forces for local control were able to muster enough votes in the assembly to pass a new school law in 1868 which, although it retained some of the features of the 1865 act that implemented the 1864 constitution, restored the right of local self-government in school affairs and left the private academies that received state aid in the same position they had occupied previously. The 1868 law gave a board of three trustees the authority to control the normal school, whose principal was granted general supervision over all of the state's public schools.

Two years later, the forces for stronger state control were able to push through the General Assembly re-establishing the Maryland State Board of Education and designating the principal of the normal school as the state superintendent of public instruction. Fortunately, the principal, M. Alexander Newell, was a noted scholar and a man of broad attainment who had organized the Maryland State Normal School 5 years earlier. During the next 20 years, he infused new life into the schools.

E. Barrett Prettyman succeeded Dr. Newell in 1890 and conducted a conservative administration for the next decade. Dr. Prettyman, a forceful public speaker with exceptional general knowledge, gave considerable thought to the processes of public school administration. But rather than introduce change, he concentrated on emphasizing and refining the elements he considered good in the system he had inherited.

In the development of Maryland's governmental structure, the county played a vital role from the beginning. While school districts were established later as "conveniences," the county had always been the administrative unit, with the county school superintendent serving as the head of the local school system. Thus, by the end of the nineteenth century, Maryland had a sound state-county organizational pattern that enabled it from the beginning to provide educational opportunities on a much broader base.

FROM 1900 TO WORLD WAR I

Political Superintendents

In 1900, the General Assembly separated the state superintendent of public instruction's office from the principal-ship of the normal school, and Governor John Walter Smith appointed M. Bates Stephens as the new superintendent. Governor Smith appointed Dr. Stephens for 4 years by and with the consent of the Senate; he could be removed at the Governor's pleasure when sanctioned by a two-thirds vote of the board. Dr. Stephens, one of Governor Smith's close political associates, had been a school examiner (county superintendent) since 1886. Actually, no professional qualifications were required for appointment as superintendent; the only legal limitation imposed on the Governor's free choice was that the appointee be "competent." As state
superintendent, he did not have the strong executive powers that had been proposed in 1864.
