In 1915, at the time of the Flexner-Bachman survey, the board consisted of eight members, including the Governor and the superintendent. The other six were appointed by the Governor, subject to Senate confirmation, for 6-year terms staggered so that two terms expired every 2 years; two had to be from the political party defeated at the preceding gubernatorial election. As the Governor controlled the board and as there were no professional requirements for the state superintendent, it was almost certain that the administration of the schools would be based more on politics and less on professionalism than the public interest dictated. As the Flexner-Bachman survey stated, “the arrangement... makes the State Department of Education part and parcel of the elected state government and thus exposes it—and with it, public education in general—to the vicissitudes of state politics” (6).

The Flexner-Bachman survey found that the same situation existed in the counties. The school superintendents were selected by the politically constituted county boards, and politicians in most counties regarded the superintendency as “spoils” and occupied it on that basis. The survey found that in the first year of the new Democratic administration in 1900, 16 new county superintendents were appointed in Maryland’s 23 counties. Perhaps the most flagrant example of misuse of political power uncovered by the survey involved a county superintendent who actually reclassified teachers in order to lower their salaries and reduce the amount of money needed by the county school board. When a majority of the county commissioners—the elected local governing body—belonged to the same political party, they frequently appealed to the county superintendent to reduce the school budgets on grounds of party loyalty or political expediency.

The statutes established no professional qualifications and no minimum salaries for county superintendents. The Flexner-Bachman survey discovered that 3 of the superintendents in office in 1915 had not finished high school, 4 others had no preparation beyond secondary school, and no more than 6 of the 15 who were college graduates had any special professional preparation. Only 3 of the 23 superintendents received salaries of more than $2,000 per year, and 1 was paid only $800. Under such circumstances, particularly since most county offices and staffs were totally inadequate, only a few superintendents could render skilled leadership.

As state superintendent, Dr. Stephens not only served as a member of the state board, but he also was the executive who carried out the board’s orders. At the same time, he had certain supervisory and inspection responsibilities, which included using his discretion to accept or reject normal school and college diplomas issued by other states and defining the qualifications of teachers for teaching high school domestic science, manual training, and other special courses. It was his responsibility to rate the teachers who were not normal school graduates but were offering practical experience and training that they considered equivalent. The state superintendent examined the county school boards’ reports and expenditures, and he prepared and distributed pamphlets to teachers on the prevailing methods of instruction in various subjects.

One of Dr. Stephens’ first acts was to develop a uniform course of study for both elementary and high schools. Through his efforts, commercial subjects and agriculture were introduced into the secondary schools as electives. Also, he introduced modern methods for handling the schools’ business. Stephens was able to secure legislation providing state aid to the high schools, supervision of them, certification of high school teachers, and a minimum standard of professional training for elementary school teachers.

It would have been nearly impossible for the state superintendent to “supervise,” “inspect,” or “pass upon” schools and to handle other business without a trained staff. Unfortunately, as late as 1915, he had a single assistant and one clerk, paid $2,000 and $1,200 respectively. The superintendent’s salary was only $3,000, although he was allowed $500 for expenses; an additional $1,000 for furniture, supplies, and printing; and $3,000 for travel to meetings, printing, and supplies. In other words, the entire state department cost the state only $10,700 per year. With such a meager budget and small staff, the department had to perform many of its tasks only superficially.

The 1915 survey concluded that Maryland’s system of public education, though soundly conceived and organized, was producing, on the whole, extremely unsatisfactory results. It stated:

A few counties possess good and steadily improving schools; a good school may be found here and there in other counties. But the large majority of the schools are poor; teachers are, for the most part, poorly trained; instruction is ineffective and obsolete; children attend school with disastrous irregularity; school buildings are far too often in unsatisfactory condition, school grounds frequently neglected and untidy (7).

At this time, the state had 1,935 schools for 200,783 white pupils with about 5,000 teachers, and about 550 schools for 44,475 Negro students with about 1,000 teachers. The survey reported that only 8 percent of the 500 white and 50 Negro schools visited had satisfactory physical conditions. Nearly 13 percent of the state’s white elementary teachers had only an elementary education themselves; more than 20 percent had spent only 1 or 2 years in high school; and only a third had completed a 4-year high school course. Less than 2 percent had received a standard normal school education. Of the remainder, some had briefly attended normal school, others had spent some time in college, and a few had qualified for bachelor degrees. In
summary, only about 10 percent of the white elementary teaching staff were normal school or college graduates or had some college work; not quite one-third were fairly well prepared; and at least one-third were practically untrained. Only about 8 percent of the Negro elementary school teachers had a standard normal school education. The high school teachers showed a similar range of inadequacy, with about two-fifths adequately prepared, two-fifths from 1 to 4 years short, and the remaining one-fifth woefully lacking in preparation.

On the basis of the 1910 federal census of children between 6 and 14 years of age, out of each 100 children, 17 white and 29 Negro were not enrolled in 1914. Significantly, of those who were enrolled, 31 percent in the one-room rural schools and 19 percent in the village schools were absent on the average of more than half the time. Under these circumstances, it was difficult to educate the state's pupils even if the instruction were adequate. Small wonder that the 1910 census ranked Maryland thirty-first among the states in literacy.

Financing Education

Paradoxically, Maryland was one of the states that made large contributions for local education, contributing about one-third of the total cost while the counties provided about two-thirds. Together, the state and counties furnished an annual total outlay amounting to about $5 million. But there were wide variations among the counties. In 1914, for example, the expenditures per pupil ranged from $9.17 to $28.21. The school tax rates varied from 17¢ to 45¢ per $100 of assessed valuation, while the taxable wealth back of each child varied from $710 to $3,840. For the state as a whole, the taxable wealth in 1900 was slightly more than $600 million, so that in back of each schoolchild was taxable property valued at just over $1,500. Every $100 of taxable property contributed 42¢ to education in that year. The largest source of money contributed by the state was the state school tax levied against all taxable property. It did not recognize the differences in ability to support education at the local level; in fact, some counties receiving the larger allocation from states funds were themselves making the least effort.

Other money available for the state's distribution came from the Common Free School Fund and the Academic Fund. The common fund, consisting in part of interest from a $278,000 investment derived from taxes on state bank stock, was distributed in equal shares to the counties. It also included $229,000 derived from interest from a $278,000 investment derived from taxes on state bank stock. The Academic Fund was a regular annual appropriation from the general treasury to encourage secondary education. By 1831, it had become standard policy to appropriate $1,200 a year to each county, irrespective of size and needs. Although it was a political pork barrel and there were many abuses, political deals kept it going.

Most of the state's funds were intended to support the elementary schools. Only three conditions were attached to this aid: Schools had to be kept open at least 9 months (the Negro schools varied from 4 to 10 months); white teachers had to be paid at least $300; and all allocations for textbooks and supplies had to be spent for those purposes.

The standards for high schools were raised by the state board in 1910, and this stimulated more progress during the ensuing 5 years than had been made in the previous 20. To be eligible for state funds, 4-year high schools now had to have at least 80 students, 4 academic teachers, a 4-year course with at least a 36-week year, an approved course of study, manual training, home economics, a commercial or agricultural course, a library, a laboratory, and $250 worth of science apparatus and material. The principal had to receive at least $1,000 per year, and the teachers—whose qualifications were passed on by the state board—had to receive at least $500 each (8).

EDUCATIONAL REFORM

The increased standards for the high school in 1910 were merely the starting point for a campaign to raise the state to a leading educational position. Leonard Ayers, an acknowledged national authority on tests and measurement, prepared "An Index Number for State School Systems" for use by the U.S. Census, which revealed that in comparison with other states Maryland's system was undergoing a rapid decline: from twelfth in 1890, to nineteenth in 1900, and to thirty-third in 1910 (9). Obviously, there were still many problems that prompted educators throughout the state to demand reforms.

The Reformers

During the nineteenth century, most of the initiative for improvements in the educational system had come from within the profession. Although informed and enlightened citizens played a key role in subsequent developments, the leadership came from the dedicated professionals, men who were experts in the field of education. These men included
Littleton Dennis Teackle, who was appointed state superintendent in 1826 but never served legally because the act establishing his office required that his appointment be ratified by the voters, and they refused to do so. Libertus Van Bokkelen has been mentioned as an early leader. Another was James W. Thompson of Queen Anne's County, the only school examiner (county superintendent) in the early eighties who had been a teacher; most of the others were doctors of divinity or doctors of medicine. One of the outstanding lay leaders who fought for a statewide system of universal education was Joseph M. Cushing, who served as chairman of the education committee of the Constitutional Convention of 1864 (10).

A columnist for the Baltimore Sun, writing under the nom de plume of Ezekiel Cheever, through his column-one, front-page discussions of "School Issues," probably was more responsible than any other individual for Maryland's educators' becoming activists in the second decade of the twentieth century. Cheever not only schooled himself in educational administration by extensive reading, but he attended the more important state and national educational conventions and personally contacted recognized authorities. He also was able to deal effectively with school issues in Maryland because of his membership in two relatively small power-structure groups. One consisted of superintendents of schools and certain public and nonpublic professional educators, and the other of individuals in key positions to influence public opinion. These were primarily social groups, meeting in the evening to discuss public issues over dinner.

Educators and interested laymen followed Cheever in exerting considerable pressure on the Legislature to enact the Flexner-Bachman recommendations into law. The legislation enacted by the assembly in 1916 was of marked significance not only to Maryland but to U.S. educational history as well.

The 1916 Legislation

The 1916 school laws divorced the State Board of Education from politics and invested it with reasonable and important responsibilities and authority. They prescribed high academic, professional, and experience qualifications for the state superintendent, named him the executive officer of the board, and stipulated his additional responsibilities. At the same time, the qualifications and duties of the county school superintendents were prescribed. The laws put state aid on a sound basis, provided the basis for an effective statewide attendance law, and set forth regulations for the county boards of education and county superintendents similar to those for the state board and the state superintendent.

Perhaps the most significant accomplishment of the 1916 laws was that they provided a legal basis for professional leadership. In achieving the major objective—taking the schools out of politics—they established the present-day legal structure for the state department. The Governor was authorized to appoint seven members to the board for 7 years without regard to parties and without confirmation by the Senate, the terms staggered to ensure a continuity of membership. Neither the Governor nor the state superintendent was given membership on the board. Under the new laws, the board no longer attempted to administer the schools; it legislated within its power and passed judgment on the efficiency of its paid officers. The board was given authority to appoint the state superintendent and members of his staff and to fix their salaries, within the limits of its appropriation. The laws also provided for an enlarged, adequate staff of administrative, supervisory, and clerical assistants in the state superintendent's office to carry out the board's policies.

Perhaps the most important responsibility conferred on the board by Maryland's new model school code was that of considering the educational needs of the state and, with the advice of the state superintendent, recommending to the Governor and the General Assembly the legislation it deemed desirable. These recommendations were to be in the form of prepared bills. The Senate and the House committees were then obligated to grant the board and the state superintendent a hearing on request. This clearly placed the major responsibility for Maryland's public education on the State Board of Education.

These laws produced a precedent-setting combination of state and local authority in public education. By centralizing the administration at the state level, they made possible a unity of design and uniformity of standards while allowing local authority to manage the details within the general framework. This enabled the local communities to exercise local initiative and ensured the schools of community interest, effort, pride, and sacrifice for their progress. Because of the broad, sweeping organization, these laws have been flexible enough to allow for societal changes, including those produced by two world wars.

Almost as soon as the assembly enacted the new code in 1916, Ezekiel Cheever began an unrelenting attack on the incumbent state superintendent, M. Bates Stephens. His efforts culminated in the publication of a series of charges in the January 4, 1920, edition of the Baltimore Sun. The main charges were:

1. The state superintendent was seldom to be found in his office.
2. Someone in the state department overruled the normal school principal's nomination of a teacher of music to serve on the summer school faculty.
3. The state superintendent has looked on his office as one for educational fellowship instead of educational leadership.
4. A large balance of unexpended school appropriations, earning no interest, was carried in a bank in which
Cheever came out of retirement to attack those who were developing courses of study and for supervising classroom schools when Albert S. Cook agreed to accept the position. The Board of Education appointed a state superintendent of the

4. On the following day, the newspapers announced that the Board of Education to meet him at noon on Tuesday, May than 90 days, before the expiration of the incumbent's term.

Stephens after passing a bylaw providing that the state superintendent be elected not less than 30 days, nor more than 90 days, before the expiration of the incumbent's term. On Friday, April 30, the Governor sent a call for the State Board of Education to meet him at noon on Tuesday, May 4. On the following day, the newspapers announced that the state board had repealed Stephens' election and rescinded the bylaw at the Governor's demand.

On June 4, 1920, for the first time, the new State Board of Education appointed a state superintendent of schools when Albert S. Cook agreed to accept the position. Dr. Cook had earned a national reputation both for developing courses of study and for supervising classroom instruction while serving as Baltimore County school superintendent.

Reform Under Superintendent Albert S. Cook

Dr. Cook inherited a school system that had matured considerably in the years preceding his appointment. One writer commenting on progress during the latter part of the nineteenth century stated:

For the log hut we have the substantial, or it may be the artistic, schoolhouse; for the peripatetic schoolmaster, wandering from county to county and finding no place to rest, we have a teacher firmly established from term to term and from year to year, until legally displaced. In place of teachers working under a permit or without a permit, we have regular examinations and formal certificates. In place of the individual preferences and prejudices of teachers, one being all for Grammar and another all for Arithmetic, we have a regular schedule of studies, the same in principle for all schools of the same grade, but yet elastic enough to accommodate itself to different conditions. In place of the three R's, we have a course of instruction which leads to liberal culture in many directions. We have almost abolished the rod—it may linger yet in secluded districts, like the smallpox, but it is no longer the ultima ratio regnum. Physical culture is recognized as a prime necessity and industrial training has made a promising beginning in more than one county (13).

Cook was able to operate from a position of strength that none of his predecessors had enjoyed, for the new school code allowed him a 4-year term and gave him such authority that he could have built a highly regulatory, centralized State Department of Education—as found in other states—had he desired to do so. For instance, it was the superintendent's responsibility to explain the true intent and meaning of the school laws. To enforce these provisions, he could withhold state funds if necessary. It was his responsibility to approve school sites, plans, specifications, and the contracts for constructing school buildings. Subject to the rules and regulations of the state board, he had the responsibility for certificating all public school teachers. The state superintendent also was to prepare for the state board's approval courses of study for the different grades and kinds of elementary schools, high schools, and normal schools, and the college courses for teachers.

Dr. Cook possessed the ability, temperament, and training to develop the highly professional Department of Education that could improve and advance the cause of public education in Maryland. In addition, he was an experienced and competent educator in teaching and administration. He was vitally interested in placing only well-trained and highly qualified superintendents and supervisors as well as teachers in each local school system, which meant mandating adequate state-supported salaries to facilitate recruiting them. He inspired confidence in those outside the school system as well as those in it, and he enjoyed an especially close relationship with Maryland's Governors, particularly Albert C. Ritchie, a personal friend with whom he frequently relaxed and played cards.

An Equalization Program

The outstanding achievement of Dr. Cook's administration was the enactment of an equalization law by the General Assembly. The law constituted one of the major advances of the state's public school system. Based on Cook's philosophy that there should be equal educational opportunity for all children in the state, it provided the legal and financial bases for such a program: a minimum state support behind each child in Maryland, regardless of the financial status of his particular community. Any county that could not carry the state's minimum program on a levy of 67¢ per $100 of assessed valuation, plus other forms of state aid, received support from the equalization fund.
The Maryland equalization plan required the schools to employ qualified teachers, who were to be paid guaranteed minimum salaries with increments at various intervals for successful experience. It required the public schools for white youth to remain in session at least 180 days per year, and the Negro schools at least 140 days per year. The schools were to maintain an adequate supply of free books and materials, there was to be a competent instructional supervisor in every school unit, and the county superintendents were to furnish effective professional leadership. Professor Fletcher Harper Swift of the University of California described it as "perhaps the most far-reaching and scientific method from the standpoint of equalizing revenues of any state in the Union" (14).

The principle of equalized financial aid as provided in the 1922 act enabled Maryland's counties to employ better-trained and more-experienced teachers, purchase aids for instruction, consolidate the schools more rapidly, and provide transportation for elementary pupils. The entire school system was upgraded, and when Frank P. Bachman returned to study the changes that had taken place since his 1915 survey, he commented that Maryland now had the best legally established, the most unified, the most efficient, and the most professional state school system in America.

The two principal elements in the equalization plan are mandated minimum salary scales for teachers, and the required local tax levy to support the guaranteed minimum program of education. The following chart indicates the changes that have been made in these elements since 1922:

To what extent have these equalized financial efforts resulted in an equal educational opportunity for each child in the state? The wide range of pupil abilities both within and between local school systems requires differentiated programs of instruction and well-prepared, compassionate teachers who are sensitive to the needs of children at various stages of development. The record indicates clearly that equal educational opportunity does not exist in 1968. Thousands of Maryland children with learning disabilities due to handicaps of one kind or another are not receiving an education appropriate to their needs for the simple reason that there are insufficient funds to provide it. It costs significantly more to educate a disadvantaged child than it does a so-called normal, average child. More professional personnel, teachers, specialists in learning disabilities, guidance counselors, psychologists, social workers, and teaching materials are required to individualize instruction. The state has provided certain special categorical financial assistance, in addition to the foundation program, to help solve this problem. The most recent of these aids was enacted in 1967 for the economically disadvantaged (15).

**Adult Education**

The department's leadership improved and extended the instructional, supervisory, and supporting services essential to a strong school system in several ways. During the nineteenth century, Maryland, like many other states, had recognized that illiteracy existed in certain groups and that the influx of immigrants required action on the part of its educators. The earliest public adult education program in Maryland—indeed, in the entire United States—consisted of evening schools organized in Baltimore City in 1839.

These were followed by vocational classes in Garrett, Allegany [sic], and Washington Counties. The impetus for a much more comprehensive program came much later—in 1933 when the Federal government provided funds to organize classes for the unemployed. Within a year these programs were statewide. The first state appropriation for general adult education was made in 1939 in the amount of $10,000 (16).

At present, the appropriation is $75,000, supplemented by $385,466 in federal funds for basic and vocational education.

**Vocational Education**

Since the constitution had made the state fundamentally responsible for education and the state had adopted the thesis that each individual's education should prepare him for a full and effective life, it was the state's philosophy that youth who did not go to college should receive an education that would prepare them for the world of work.
Accordingly, the Maryland Legislature accepted the provisions of the Smith-Hughes Act, passed by Congress in 1917, which made it possible to establish vocational education courses in the state's high schools. The vocational education program received additional funds and expanded considerably between 1919 and 1933. During the Depression years from 1933 to 1937, vocational education remained on a plateau; but following the George-Deen Act in 1937 and the acts of 1946, 1956, and 1958, additional federal appropriations gave the program tremendous impetus. With these increasing federal appropriations, the state was able to organize classes in trade and industry, home economics, distributive education, practical nursing, technical occupations necessary for national defense, and agriculture.

However, the greatest impact in vocational education came as a result of the Vocational Education Act of 1963. This legislation broadened the scope of the program from specialized areas to more generalized areas of need, such as health occupations, technician training, business and office occupations, trades and industry, agriculture and related occupations, home economics with particular emphasis on the wage-earning aspect, and such other programs as may be required from time to time to meet the technology of the world of work.

Education of the Handicapped

In 1929, the Legislature provided financial assistance which stimulated Baltimore City and some of the counties to begin educating handicapped children. This movement heralded the beginning of adapting education to fit the needs of individual children. Classes were organized for crippled children, and, as interest and demand increased, the state provided increased financial assistance for these special classes and for teaching the homebound. The 1940 annual report shows that 441 children were receiving this special education. In later years, special classes were established for the mentally retarded and emotionally handicapped. In 1965, there were 25,196 children enrolled in all special education programs; 80 percent were mentally retarded.

In 1929, the department also established a program in vocational rehabilitation for handicapped youth and adults 14 years of age and older, with federal funds available on a 1-1 matching basis with the state's funds. In 1933, when the Federal Emergency Relief funds were appropriated on a matching basis for this purpose, the program was expanded to include those who were unemployable because of permanent physical disability as a result of injury while employed or because of an accident, disease, congenital defect, or mental disability. Successive changes in the federal law have enabled the program to be expanded in recent years under the dynamic and aggressive leadership of the department and the support and cooperation of local community social agencies.

The Consolidation Movement

The development of the vocational and adult education movement paralleled that of the consolidation movement. Economy often was used as the argument for consolidating ineffective and expensive schools, but the State Department of Education's viewpoint was that the larger schools were able to offer a wider variety of courses that would fit the needs of the individual as well as the community. It also was discovered that the larger, consolidated schools obtained better results academically and created greater public interest. The consolidation movement received an impetus from the progressive urbanization of the state and the increasing number of automobiles and good roads. It was stimulated particularly by the 1916 law and by aid given for transportation by the equalization fund. Maryland was one of the few states that enacted consolidation and transportation laws at the same time. In 1915, nearly 1,500 schools housed almost 245,000 pupils, with 40 percent of the teachers in one-room schools that were generally deplorably inadequate. Forty years later, the number of schools was less than 1,000, only 9 of them one-room schools. At the same time, enrollment had more than tripled.

With the enactment of the Equalization Law in 1922, the state accelerated its efforts to provide pupil transportation at public expense. According to the annual reports of the Maryland State Department of Education, four counties in the state were transporting pupils in 1910. This number had increased to 10 counties in 1915, 18 in 1920, and 22 in 1925. St. Mary's, the last holdout, began providing pupil transportation in 1927. No record of the number of pupils transported is available prior to 1923, when 4,334—or 2.8 percent of the total enrollment in the counties—were reported as receiving transportation. By 1928, the number had increased to 15,907, representing 10 percent of the total enrollment; in 1933, 40,308 pupils, or 23.3 percent; in 1938, 56,268 pupils, or 32.6 percent; and in 1943, 74,711 pupils, or 41 percent of the total enrollment in the counties. In 1967, 336,201 pupils, or 56.2 percent, were transported.

State financial assistance for pupil transportation began in 1928 for elementary pupils as part of the foundation program to be supported by the Education Law. Beginning in 1933, 50 percent of the cost of transporting high school pupils was included in state aid. The full cost of high school transportation was included in 1947.

The state developed school transportation very carefully, setting standards for buses, qualifications for bus drivers, and requirements for bus inspections. Maryland's safety record has been excellent, and all pupils now receive free transportation if they do not live within a "reasonable
ATH PROFESSIONALIZATION OF TEACHERS

Certification

The groundwork for the professional preparation of teachers was embodied in the 1916 School Code, which placed the certification of teachers and supervisors in the hands of the state superintendent. It also set definite certification requirements for county school officials. Superintendents and high school principals were required to have a year of graduate work, including prescribed academic and professional courses. The elementary school principals had to have 2.5 years of normal and college work, including courses in administration and supervision. The 1916 law also stipulated that administrative and supervisory certificates could be issued only if the candidates had successful teaching experience.

High school teachers of academic subjects were to be college graduates who had taken professional courses and had a minimum of preparation in their particular subjects. High school teachers of special subjects were required to have 2 years of college work, about one-third in general academic subjects and two-thirds in their special subjects, education, and the art of teaching the subject. Four years of normal and college work (or equivalent preparation), with courses in elementary school methods and supervision, were required for an elementary school supervisor's certificate. Before the second- and third-grade certificates (valid for 2 years) could be renewed, the teacher had to take 6 semester hours of academic and professional preparation. However, any certificate could be renewed if the applicant showed evidence of successful experience and professional spirit, which was interpreted to mean a recommendation from the superintendent.

After the summer of 1924, certification by examination was abolished, and the certificates were issued only on the basis of accredited training in approved institutions. The qualifications for admission into teaching have gradually been raised until at the present time Maryland ranks among those states having the highest certification requirements.

Teacher Education

One of Maryland's most distinguished sons, Francis Scott Key, consistently and eloquently advocated that the state provide teacher education. In 1827, Key delivered the principal commencement address for his alma mater, St. John's College, and he proposed that teachers be given instruction on the university level under competent professo rs of education. The following statement from his address, delivered more than 140 years ago, is particularly significant:

That this education is a science and a very difficult one, will be admitted. Yet among the numbers engaged in it very few have received any instruction. It is true, there are some good works on the subject, but there are also bad ones. Nor is it true that those so employed seek for instruction on the subject. Every teacher adopts his own system and improves it only by his experience. This cannot be supposed right by any one who considers its importance. The most learned man in science and languages may be utterly unable to excite a desire for learning in his pupils, to form their minds, dispositions, habits, and tastes, and to impart his knowledge to them in a way best suited to their capacities. All this is certainly his business as a teacher (17).

Samuel Knox, a Presbyterian clergyman and the first principal of Frederick Academy, shared the prize offered in 1796 by the American Philosophical Society for a plan for —

The best system of liberal education and literary instruction adapted to the genius of the Government of the United States; comprehending also a plan for instituting and conducting public schools in this country on principles of the most extensive utility (18).

Knox, a distinguished Marylander who gained a measure of national prominence and advocated the education of teachers—and for a while operated a private academy in Baltimore—was offered the first professorship at the University of Virginia by Thomas Jefferson. He declined.

At the time the United States entered World War I, Maryland had only two normal schools for white teachers and one for Negro teachers. All of these institutions were for training elementary school teachers. Towson had been established in Baltimore in 1865, and Frostburg in 1897. Bowie had been founded in 1911 as the Maryland Normal and Industrial School, and for the first time the state had created an institution for educating teachers for the Negro schools.

Albert S. Cook had worked to develop teacher education long before he was appointed state superintendent. Shortly after his appointment as superintendent of schools in Baltimore County in 1900, he began conducting a 2-week teacher institute each summer. Rather than spend the time giving inspirational lectures—the common practice in those days—Dr. Cook organized professional schools of high quality, which featured programs of instruction and training that were selected with great care and administered with rare skill. The instructors were drawn from various parts of the country and were among the best known in their respective fields. The impact of these institutes was felt throughout the state as other superintendents emulated Baltimore County's experience and organized their own.
Dr. Cook not only provided professional training and stimulation to help his teachers become more efficient from year to year, but he attempted to hire and retain competent teachers in all of his schools. He profoundly influenced the selection and education of teachers in America. By 1910, a decade after he had become the superintendent, educators recognized that the Baltimore County schools were the best county educational system in the United States.

Since the 1916 laws made the state superintendent and the Board of Education members trustees of the state normal schools, Dr. Cook was eager to accept the challenge to concentrate on the professional education of teachers. For more than a decade after the Normal Department at Washington College had been abandoned in 1910, the state had not specifically provided for the education of teachers on the Eastern Shore. In 1924, Superintendent Cook was instrumental in persuading the General Assembly to authorize and to provide the necessary funds for the establishment of a state normal school at Salisbury.

America enjoyed great prosperity during the 1920's and could afford to pay more for teachers. Maryland's 1922 school law guaranteed a minimum salary schedule for teachers who were professionally trained, considerably enhancing the attractiveness of teaching in the state. An unprecedented number of students were seeking training, and teachers were remaining longer in the service of public schools than ever before. Teaching was finally approaching the status of a true profession. Outside of Baltimore, the proportion of teachers with "standard" training increased from 35 percent in 1922 to 85 percent in 1927.

The state found that, by improving its teacher pension and retirement plans, it attracted more prospective teachers into Maryland schools. Before 1916, a public school teacher with 25 years' service who became unable to teach because of physical or mental disability, who was 60 years of age, had a record without reproach, and was without means of comfortable support could apply to the State Board of Education for a pension of $200 per year if the county school commissioners agreed to substantiate the application. In 1923, the General Assembly doubled this pension to $400. Four years later, the assembly passed an actuarially sound retirement law patterned on the system Baltimore City had established for its teachers in January of 1926, providing for contributions from the teachers and the state on a 50-50 basis. Although given the option of joining or not, most of the teachers joined, and the plan proved to be a big gain for the profession.

During the Depression of the thirties, the department and the schools found there were so many teachers seeking employment that it was possible to upgrade the requirements. The normal schools had offered 2-year courses since 1916. In 1931, on the recommendation of the state superintendent and the State Board of Education, the General Assembly enacted legislation stipulating that the normal school courses should require "for graduation a total of not less than three years' work" (19). Again, 3 years later, on Dr. Cook's recommendation, the Legislature increased the graduation requirement to 4 years, and the normal schools became teachers colleges with authority to issue bachelor's degrees.

Compared with many other states, Maryland moved slowly in upgrading its normal schools. But, in line with the state superintendents' careful, long-range planning, the state waited until conditions fully justified advancing the institutions to a higher status. As has been true with other states, Maryland's major economic depressions seem to have initiated major educational advances, gains which have not been lost with the return of prosperity.

In 1939, as the Depression neared its end and competition for well-trained, professional teachers increased, Maryland improved its chances of attracting them by establishing a single salary scale for teachers of both elementary and secondary schools, which was based on preparation and experience. From 1922 to 1939, while a dual salary was in effect, high school teachers were paid more than elementary teachers of equal training and experience. The 8- or 9-year periods in which increments could be earned were too short, and teachers reaching the maximum relatively early in their careers lacked further financial incentive to improve themselves. The 1939 legislation's new minimum salary provided for biennial increments extending over 17 years. The act accomplished its purpose and considerably increased the drawing power of the Maryland schools.

In 1941, the Legislature equalized the salaries of white and Negro teachers as the outgrowth of litigation started in a U.S. District Court in 1939. Although no order requiring equalization was issued, State Superintendent Cook recommended the legislation to correct the discrimination.

**WORLD WAR II AND ITS AFTERMATH, 1942 TO 1964**

When Dr. Cook stepped into the superintendency in 1920, the department consisted of only 10 professional employees; when he retired in March 1942, there were 34. The man who inherited this expanded department, Thomas G. Pullen, Jr., had been a member of it for 8 years, 6 of them as assistant state superintendent. The Pullen administration spanned the period of World War II, the subsequent population and knowledge explosion, and the resurgence in education at all levels.

Dr. Pullen combined a classical education and training with a pragmatic, philosophical outlook. Educated in the liberal arts tradition, he became a successful Latin teacher before rising through the ranks from classroom teacher to principal, to county superintendent, to state supervisor, to assistant state superintendent, and finally to the state superintendent. In all, he devoted 38 years of his life to the schoolchildren and teachers of Maryland.
Throughout his career, and especially as state superintendent, Dr. Pullen typified the great teacher who ministers to the needs of all with a deep and abiding interest. A kindly and understanding scholar, extremely articulate, knowledgeable, and persuasive, it was the combination of these qualities that enabled him to follow through effectively on creative ideas and to implement plans for carrying them out. His duties were not always easy, and he engaged in many battles in discharging his responsibilities as he saw them, regardless of the personal consequences. Pullen's stature grew along with the state school system; respect for him as a person well beyond the confines of Maryland. Superintendent Pullen used his knowledge in a scholarly manner to enrich the educational enterprise. It was fortuitous visionary and creative educator, especially the teachers and individuals. In summary, this visionary and creative educator, who held fast to the philosophy that education should lead to a desirable course of action on the part of the learner, is credited with making a difference in the lives of countless individuals.

At the time Dr. Pullen took office, as a result of both state and national legislation, the state department was rapidly assuming new responsibilities for an ever-broadening educational enterprise. It was fortuitous for Maryland that there was a man with the creative genius and intellectual capacity to cope successfully with these demands. Under Dr. Pullen, the state department was able to develop new and more efficient methods, assuming additional duties with a minimum of additions to the staff.

Dr. Pullen shared his predecessor's belief that the department's main responsibility should be to exert professional leadership and that the local school system should administer the schools with a minimum of regulation by the state. This is contrary to the practice in most states, where new duties brought with them continuously increasing, highly centralized bureaucracy at the state level. This did not mean, however, that the department did not expand. The new needs caused by the tremendous fast-breaking developments were shaped these developments until 1945. But the shift to a 6-3-3 grade organization was gradually effected, so that by 1952, the junior high school had become an integral part of Maryland's unified program of education. The addition of the twelfth grade helped the schools take care of the burgeoning student population and at the same time enabled them to give the students a richer program of instruction.

The Legislature did not act on these recommendations until 1945. But the shift to a 6-3-3 grade organization was gradually effected, so that by 1952, the junior high school had become an integral part of Maryland's unified program of education. The addition of the twelfth grade helped the schools take care of the burgeoning student population and at the same time enabled them to give the students a richer program of instruction.

The Department's Expanding Responsibilities

The state department had to be completely flexible when fast-breaking developments were taking place in education. To a large extent the department shaped these developments and organized quickly to meet the added responsibilities. For instance, one of the most significant accomplishments in this period was the establishment of a statewide system of public libraries, authorized by the Legislature in 1945. The department created a library extension division to provide the direction and supervision of...
necessary to develop a modern and efficient system. By 1967, all of the local political subdivisions had taken steps to establish a countywide library system. Initially, state aid provided only for the books; but later, under a formula similar to that used by the public schools, the state provided general financial aid.

During this same period, school libraries also grew rapidly. In the larger school systems, they developed into instructional material centers. Since 1965, federal funds have provided an added impetus to this growth and development, and Maryland has received $2,645,425 annually from federal sources for this purpose.

During the 22 years prior to 1942, school enrollment had increased by only 41,328; but from 1942 to 1964, it soared from 282,946 to 704,379—a gain of 421,433 pupils. During the first 3 years of this period, the enrollment actually decreased, as the gains from the growth of high schools in the thirties were offset in the forties by the decrease in the birth rate during the Depression years. The upward trend occurring in the late forties was a result of considerable migration of new residents into Maryland because of wartime employment opportunities and increased federal activities. The population explosion that finally hit the schools in the fifties and continued into the sixties, a nationwide phenomenon, brought the largest increase of school population in history. Maryland is still one of the six fastest growing states in the nation.

Another factor contributing to this vast expansion of the public school system was a 1947 amendment to the compulsory school attendance law, which made mandatory the attendance of children between the ages of 7 and 16. The schools' holding power was further strengthened as programs were developed to meet the needs of all pupils, including the handicapped, and the general public became increasingly cognizant of the real need for education in today's world.

Although Dr. Pullen planted and nurtured an abundance of ideas when he was state superintendent, many of them were guided to fruition with help from outside the State Department of Education. In fact, he not only received support from educators but gained the backing of lay leaders representing a broad spectrum of the major statewide groups. For instance, during a 1942 conference held at the University of Maryland to discuss the immediate educational needs in Maryland, the participants decided to form an informal steering committee composed of three representatives each from the Maryland Congress of Parents and Teachers, the Maryland State Teachers' Association, the Maryland Superintendents' Association (composed of local superintendents), and the State Department of Education. This committee, which now includes representatives from other key lay groups as well, still functions. Though not widely known, it has played an important role in advancing public education in Maryland over the last quarter of a century. It is a powerful combination, but it has exercised its power judiciously to gain broad-based support for its proposals.

It was vital to Maryland that the public seriously study the needs of the public schools because of the dramatic changes during the postwar period. To develop quality education, the state encouraged the schools to reduce the size of their classes. It emphasized special classes for handicapped pupils, which required a lower pupil-teacher ratio. Thus, while the school population was more than doubling from 1940 to 1965, the professional staff tripled from nearly 9,000 to almost 30,000 staff members. The schools also added various subject matter specialists, librarians, and counselors.

The state department, supported by the various lay organizations, encouraged these changes and added staff personnel to assist the schools in developing quality programs with lower pupil-teacher ratios. In 1947, the assembly amended the 1922 law, which provided for supervision, to include state support for high school supervision, and at the same time expanded the pupil-personnel services.

In the midst of rapidly changing conditions during this period, leaders in industry, business, and government emphasized that quality education required good physical facilities as well as good teachers. This caused the General Assembly in 1947 to enact the first state aid law for school construction. It provided $10 per pupil enrolled, with a matching requirement of 5¢ on each $100 assessed valuation. This was increased to $20 per pupil in 1956 and to $22 in 1961. An incentive of $70 per additional pupil was provided for growing school systems.

In 1949, a state grant of $60 million was made available for construction on a 1-3 matching basis, the funds to be allocated on a basis of $60 per pupil enrolled. Also, the local political subdivisions were permitted to borrow through the state.

A significant advance was provided by the legislation of 1967, which placed the state's share for school construction on an equalization basis. The state's share includes both current construction and debt service incurred prior to July 1, 1967. This new program places Maryland in the forefront nationally and will require an annual appropriation by the state of approximately $50 million.

In order to facilitate this vast school construction program and to carry out the provisions of the law requiring the state superintendent to pass on all proposals for the purchase of school sites and all plans and specifications for remodeling old school buildings and constructing new ones, the bureau of school plant planning was added to the department in 1949.

The state department not only assisted the schools in securing qualified teachers for these newly constructed schools, but it also upgraded the certification requirements and improved the retirement system to retain them. Beginning in 1940, the state required all new teachers to
have bachelor's degrees and to have taken specified courses from accredited institutions as a minimum for regular certificates. In 1947, the department established the certification and accreditation division, whose main duties were to approve the teacher-training programs in the institutions and to coordinate them with the basic requirements.

In 1961, new requirements were established to provide three approaches to certification. They required more depth in content courses for elementary-level certificates and increased the content requirements in the various subject fields at the secondary level. The new bylaw of the state board established two certificates—professional and advanced professional—to reduce the number of kinds of certificates issued. To achieve the advanced professional certificate, the applicant had to take a fifth year at a college or university. The renewal provisions were changed to allow credit for certain in-service experiences in lieu of college courses, thus making them easier to administer. The certificates also provided for an easier transition from elementary to secondary teaching or from secondary to elementary in an effort to develop equality in the professional training for teachers at both levels.

The retirement system law was amended to provide a fixed benefit plan to guarantee a retirement allowance of one-seventieth of the average final compensation for each year of creditable service. Death benefits were revised to provide a stated pension credit to a spouse (if named as beneficiary) of any deceased member who was eligible for service retirement. The basis for averaging the final compensation was changed from the 10 highest years to 5 consecutive years of highest earnings, and Social Security was added to the members' coverage effective July 1, 1956. The new system increased disability benefits, gave supplemental benefits to teachers without Social Security, and extended the privileges of the system to retired members working part time and to substitute teachers if their combined earnings and retirement income did not exceed the average of the highest 5 years' salary as a teacher. The change made it possible for employees who entered the military service to receive full credit for both the state's and individual's contributions, and it was now possible to transfer credit service from other retirement systems within the state, such as city employees or state employees.

Dr. Pullen believed in involving people in matters affecting their own work and well-being. Thus, he attempted in every way possible to establish a good human relations policy so that both he and his staff would have rapport with the local superintendents or their representatives, and all major efforts toward improving the school program could be undertaken cooperatively. Specifically, he and the department offered conferences and workshops, surveys and studies, supervisory and consultant services, bulletins and reports that kept them in constant touch with the people in the field. As various agencies demanded that the state play a more active role, the department's good relations with the local units enabled it to move quickly and efficiently.

The General Assembly dictated the department’s expansion to a certain extent. For instance, a law passed in 1941 enabling high school dropouts to qualify for the Certificate of High School Equivalency made it necessary to establish eight official testing centers about the state (20). Again in 1945, the assembly passed a law to protect citizens against schools not qualified to give the training they claimed; many substandard schools had formed overnight to take advantage of students receiving money under the GI Bill. This law, involving the accreditation of nonpublic schools, and the act providing for the establishment and operation of public libraries required the department to add staff members. A law passed in 1961 permitting the establishment and operation of public and community colleges also required the department to add qualified people. These and other programs required administration and leadership at the state level to implement the provisions, so the department grew.

Federal legislation also accounted for increases in the department's staff. The school lunch; special milk, and surplus commodities programs affected all local school systems in the state, as did the National Defense Education Act of 1958 (NDEA), which strengthened courses in science, mathematics, and modern languages. The department participates in all these programs, along with those related to the Manpower Development and Training Act and the Civil Defense Education Program. The vocational rehabilitation division, formed in 1942 with support from federal funds, employs nearly half of the state department's total employees. It has a central office, a metropolitan Baltimore office, three district offices, and eight branch offices. Thus, the department has grown from a single unit in 1942 to nine divisions today.

Federal-State Relations

A prophetic statement by State Superintendent Albert S. Cook in a commencement address at the University of Maryland in 1925 expresses succinctly the thrust of federal-state relations:

I am not among those who have been obsessed with the idea of Federal aid to public education; I believe that the respective states, eventually, if and when they desire, can work out their educational destinies; but where we see the wonderful progress of agriculture, of agriculture education, of vocational education and of road building through the impetus of Federal aid, we are confronted with a condition, not a theory. The state that repudiates the idea of Federal aid for public education thereby assumes the responsibility for producing the results by its own efforts, by its own financial and moral support
of its schools, and such assumption of responsibility is
necessarily incompatible with a progressively diminishing
effort on the part of that state (21).

During the intervening years, Maryland has exercised
strong leadership in federal-state relations. The state super-
intendent and key staff members have been involved with
the U.S. Office of Education in the development of policies
at the federal level for the administration of various federal
grants. Also, Superintendent Thomas G. Pullen, Jr., was one
of the key members of a steering committee of chief state
school officers which was responsible for making the
Council of Chief State School Officers a dominant force in
the development of a body of nationally accepted policies
for state school administration. These policies have
influenced the type of educational legislation enacted by
the Congress. The deputy state superintendent has been a
member of the Study Commission of the council, which
has been the working group responsible for developing
policies in areas indicated by the council.

Maryland has a record of accepting federal grants
promptly and working well with federal officials in de-
veloping guidelines and regulations for effective administra-
tion. Its state plans for the acceptance of such grants have
been used as models by other states. Maryland is fortunate
and unique in that the State Board of Education, the state
superintendent, and the staff of the State Department of
Education have placed major emphasis on leadership and
have exercised the regulatory function only as required by
law. Accordingly, the state department has been structured
on the basis of broad, well-defined functions. As a result,
when federal programs become available, they are
integrated into the appropriate units of the existing
organization without creating additional units. The only
exception was the establishment in 1965 of an additional
unit known as the Division of Federal-State Programs to
coordinate the various state and federal allocations. It is the
position of the State Board of Education that all state and
federal grants should be administered through the depart-
ment in accord with policies of the state board.

Recent federal grants have provided a significant
stimulus to increasing the professional staff of the de-
partment. Since 1945, the professional staff has grown
from 34 to 309, an increase of 809 percent. Of this
number, 211 are paid wholly or partially from federal
funds. It should be pointed out, however, that the largest
increase has been in the Division of Vocational Rehabilita-
tion, which increased its staff from 15 in 1945 to 171 in
1968.

Fiscal authorities and the Legislature have approved
almost without exception requests for increased staffing
that is federally supported in toto or on a matching basis.
Requests for staffing requiring full state funding meet with
less success, depending on priorities. Yet, there is a positive
attitude across the state for increased financing for
education at all levels to improve markedly the quality of
education.

EDUCATION FOR A RAPIDLY CHANGING SOCIETY

James A. Sensenbaugh was appointed state superintendent
of schools by the State Board of Education on June 1,
1964, A native Marylander who received his elementary
and secondary education in the public schools of Frederick
and Washington Counties, all of his professional experiences—as
teacher, principal, assistant superintendent, and county
superintendent prior to becoming state superintendent—
have been in Maryland. He is steeped in the educational
tradition. His parents were teachers in Frederick County,
and six of his eight brothers and sisters also have been
teachers.

Dr. Sensenbaugh is a man of strong conviction re-
garding the challenge of the public schools to provide
educational programs to meet the needs of our rapidly
changing society. He believes that the schools should be
assertive in trying out new curriculums and teaching pro-
cedures for which research indicates a high probability of
success. He is also an advocate of radical change in school
building design to make buildings more functional, more
flexible for changing teaching methodology, and more effi-
cient. As superintendent of schools of Frederick County for
8 years, he pioneered in these areas with a high degree of
success, notwithstanding the efforts of conservative groups
to limit the rapid rise in local taxation to support new and
improved educational programs and new school construc-
tion. This is the posture he is presently espousing through-
out the state and at regional and national conferences
across the nation.

Since 1964, the State Department of Education has
been affected significantly by the following federal legisla-
tion: (1) the Civil Rights Act of 1964, (2) the Economic
Opportunity Act of 1964, and (3) the Elementary and
Secondary Education Act of 1965 (ESEA).

School desegregation, following the decrees of the
U.S. Supreme Court in 1954, proceeded with varying
degrees of deliberate speed throughout Maryland. The state
board acted promptly by accepting the decision of the
court as the supreme law of the land and urged local school
systems to take the necessary steps to comply with this
decision. None of the 24 local school systems refused to
take official action affirming its intent to desegregate.
However, only one school system promptly abandoned the
dual system for white and Negro pupils. The other 22
systems elected to follow the freedom-of-choice policy.
There are no Negro children in one county. By 1964,
15,712 Negro pupils had elected to transfer to former
all-white schools. This represented 27 percent of the
Negroes enrolled, exclusive of Baltimore City. Meanwhile,
the state board took no legal steps to accelerate desegregation. Litigation in Harford and St. Mary's Counties, pressure from the National Association for the Advancement of Colored People, together with persuasion from the state superintendent and the deputy superintendent, were responsible for the limited progress labeled as tokenism in certain counties of Southern Maryland and the Eastern Shore.

In Frederick County, where Dr. Sensenbaugh was superintendent of schools from 1956 to 1964, he had instituted a plan of redistricting geographical boundaries for individual schools as early as 1957 to eliminate the dual system. When he resigned in 1964, there remained but one Negro school to be eliminated when the required new school building construction was completed. Dr. Sensenbaugh brought this same commitment to the state superintendency. The Civil Rights Act of 1964, which required compliance with the federal regulations regarding discriminatory practices in order to receive federal financial assistance, provided the incentive and impetus to accelerate desegregation of the public schools. By September 1967, only three school systems remained on the free-choice plan. In two of them, transfers have taken place at such a rate that the depopulation of the Negro schools will automatically bring about total desegregation. In the single remaining school system, the state board has intervened on the recommendation of the state superintendent and, following a series of conferences with the local and federal authorities, has issued an order directing the local board of education to desegregate the entire school system according to a plan agreed to by all parties concerned.

The Economic Opportunity Act of 1964 contained an educational component that was destined to cause a minor revolution in the public education establishment. This legislation provided for Head Start programs for economically and educationally disadvantaged children, remedial education programs for in-school children possessing the same characteristics, and basic adult education for individuals who did not possess the basic education necessary for employment or training in skills for job upgrading.

Under the leadership of the state department, local school systems, in cooperation with local community agencies, applied for federal grants promptly and inaugurated Head Start and remedial programs to the full extent that funds were available. These programs have been continued and expanded. The basic adult education program was much slower in getting started because of the reluctance of disadvantaged adults to enroll. However, by January 1968 there were 2,900 people enrolled in the 24 local school systems.

The Head Start program, which was gradually absorbed by Title I of ESEA, provided an increased interest in early childhood education and thus assisted the passage of state legislation in 1967 that made kindergartens a part of the state foundation program of education. Also, the compensatory education for disadvantaged children provided by federal funds under Title I added a new dimension to the existing concept of an adequate educational program. The state superintendent promptly endorsed the new concept and hired three additional professional staff members to work with local school systems in instituting these new programs. There was general public acceptance of this educational advance, and the state provided a special appropriation of $5 million in 1967 for Baltimore City for this purpose.

Dr. Sensenbaugh is especially interested in Title III, which provides federal funding for supplementary educational centers and services. Here is an opportunity for innovation and creativity, an opportunity to develop new ideas to be researched, and an opportunity to push forward the frontiers of education. A highly qualified staff member was added to coordinate and provide leadership for this program, and the Maryland projects submitted for approval by federal officials rank among the best in the nation.

The greatest concern of the state superintendent is the recruitment and retention of a highly qualified professional staff in the State Department of Education. Salaries are not competitive with those paid in urban school systems in the state; thus recruitment is difficult. The State Board of Education lacks the legal authority to establish salary scales for professional personnel in the department. The control is placed in the standard salary board, which sets the scales for the state merit system. However, there is hope for a brighter future. Title V of ESEA, for strengthening state departments of education, has made possible advances that would have required a decade at the state level. Fifteen additional staff members, including an associate superintendent for instructional services, were added in areas that were understaffed and of high priority in terms of need. For the first time, sabbatical leave with full salary for half a year or half salary for a full year has been made possible for staff growth and improvement. Also, reimbursement is allowed for tuition for graduate courses that will contribute to the effectiveness of staff members. An annual 3-day workshop institute staffed by highly qualified individuals at the national level constitutes the core of the staff improvement program.

As has been stated earlier, the Vocational Education Act of 1963 expanded greatly the scope of vocational education to meet the changing technology of the world of work. In Maryland, public interest in vocational education reached such proportions that legislation was enacted to provide from state funds not less than 50 percent of the cost of area vocational school construction. The state's share in excess of 50 percent is that percentage which the local political subdivision receives from the state for current expenditures. During the past 5 years, 45 area vocational schools have been established, enrolling 43,664 pupils. The state has contributed $13,108,977 toward the construction of these facilities.
In addition, the community colleges began to offer occupationally oriented courses at the post-high school level. These courses are centered primarily on business studies, engineering technologies, health-related occupations, personal service occupations, and public (government) service. During 1967-68, 57 different occupationally oriented curriculums were offered in the 12 community colleges. And this is only the beginning in this field.

In Retrospect: Fifty Years of Progress and Change

The historians of the future will, in all probability, record the period 1916 to 1966 in public education in Maryland as the “era of enlightenment” when the citizenry evidenced unusual insight into the importance of education in democratic society. This was not a sudden flash of insight; rather it was the culmination of a series of movements and change dating back as far as 1880. New but steady changes were taking place in the purpose and direction of education along the lines of the new democratic and social forces. The schools were transformed from mere disciplinary institutions into instruments of democracy intended to prepare young people for intelligent participation in the increasingly complex life of the State and Nation.

The creative and progressive legislation which was enacted during this half century resulted from a unified effort by the forces committed to better schools, better government, and a better way of life. The State Superintendent of Schools provided the leadership for marshalling these forces in the direction of new legislation for better schools. During the period following World War II there was a vigorous “grass roots” movement for greater universal education at public expense. The returning war veterans, because of their experiences, were determined to have for themselves and succeeding generations the best education possible to perpetuate the democratic way of life (22).

Maryland has now embarked on a multifaceted program of education to meet the needs of a rapidly changing society. The department will, in all probability, expand its services to new areas still in the blueprint stage. There will be more innovations and school building construction, with greater uses planned for these buildings, including year-round schools, evening and adult programs, and general community use. The curriculums will change in order to provide more continuity, more challenges to the individual student, and a greater blending of the school and community.

The schools of the future also will include more efficient use of teaching talent. Instructional aids will be added, and more emphasis will be put on research and technology so that new and better ways of doing things will be devised. The firmly established Department of Education, based on a sound legal structure and coordinated with the state government and its internal organizations, with its tradition of statesmanlike leadership, will bring about a greater acceptance of the public schools and a greater respect for education, the teaching profession, and knowledge.

NOTE:

During the period 1868 to 1870, the principal of the State Normal School, M. Alexander Newell, was given general supervision over all the public schools of the state. The laws of 1870 made the principal of the normal school also state superintendent.

APPENDIX C—MASSACHUSETTS FIRSTS 591
THE EARLY YEARS: 1635-1837

The cause of education has been close to the heart of Massachusetts citizens since the coming of the first colonists in the early seventeenth century. One has only to examine the list of Massachusetts firsts (Appendix C) to note the establishment of the country's first public school (Boston Latin School) in 1635, the founding of Harvard College in 1636, and as well the order for the first public school supported by direct taxation in 1639.

One eminent historian wrote that “towns could be founded only by lawful owners or proprietors...”. Requirements included the following:

- Approved normal size—36 square miles. Sixty resident families within five to seven years. Besides 60 lots, three were reserved—one for the minister; one to support the ministry; one for the support of education, called the “school lot.” A meeting house must be erected near the center of town, and a lot of eight acres laid out for a “Common” (1).

“Each New England settlement thus became a unit—called a town,” writes Ellwood P. Cubberley. “At the center, facing the town common, were the meeting house, and later the town school, and the town hall” (2). Residents had to live within a half-mile of the meetinghouse, were required to attend meetings, and sent their children to the town school. One wonders how this pattern came about, as well as what the settlers of the New World brought with them as they landed on the shores of Massachusetts.

Cubberley notes that from the Greeks came the emphasis on personal freedom and initiative, with emphasis on art, literature, and philosophy; from the Romans came law and government, which provided common bases for language, dress, manners, religion, and government. Christianity became a connecting link by providing a new ethical force that called for education for all. General education, as a means to salvation, required that ministers who instruct be adequately prepared. The Puritans thus brought to New England three basic concepts: Church membership was required; the young must be educated; a learned ministry must be perpetuated.

The Tercentenary of the Massachusetts Bay Colony sums up these developments as follows:

Not only did the parents work for the education of their children, but the colonists ordered that a school be built where there were enough families and children. In 1647 a law was passed in Massachusetts which ordered that every town of fifty families should provide a school where children could be taught to read and write. Every town of one hundred families was required to have a grammar school. This would be the same as our high school. These were public schools, but they were not always free. They were supported by the parents in many cases.

The schoolmaster shall faithfully attend his school and do his best to benefit his scholars... From the beginning of the first month until the end of the seventh, he shall begin to teach every day at seven o'clock in the morning. For the other five months he shall begin every day at eight of the clock in the morning and end at four in the afternoon.

One of the men who lived in the early days wrote this story about his life in school:

When I was three years old, I was sent to school to a mistress, where I learned to read with great dispatch; in my fifth year, I was taken away and put to a writing master. In my seventh year I could flourish a tolerable...
hand, and began my grammar. By the time I was fourteen I was considerably proficient in the Latin and Greek Languages, and was admitted into Harvard College (3).

Along with this pattern of operation, as Paul H. Hanus has indicated, the following principles were emphasized:

The State may determine the kind of education and fix the minimum amount of education to be insisted upon for every member of the Commonwealth. Taxes may be assessed and collected to provide such education as the State demands, and these taxes may be general though the school attendance is not (4).

The Massachusetts Law of 1642, the so-called "Satan deluder" law, ordered the officials of the town to ascertain if the parents or masters were attending to their educational duties. Authority was given to selectmen to impose fines for nonobservance or to require regular reporting to officials. Courts were charged with enforcing the law. The licensing of teachers was in the hands of the local minister, who examined the candidate to see that he was "sound in the faith, and knew his Latin." The selectmen, usually accompanied by the minister, gave supervision by recurrent visits to all the schools, especially at the time of promotion.

Throughout this early period, the influence and authority of the Church were quite evident (5). The meetinghouse required for a town was where defense against the Indians was planned—but it was primarily where the Puritans gathered for prayer. Out of this pattern the town meeting developed, establishing a kind of religious republic. In the following 100 years, however, religious interest waned, and the monopoly of the Church ended. Schools became town schools, the town meetings were held in a town hall, and religious activities were arranged for the meetinghouse.

During this period, as towns grew and spread out, sections developed like neighborhoods or suburbs; each wanted its own school under its own control and set up parishes with parish officers and a minister in charge (6). As private schools were organized in an area, the enrollment in the town schools dropped off, even though they were free and supported by taxation. Because of this, the residents of the parish or district demanded that the town school sessions be held for a term of 12 to 16 weeks in each district. This proved costly, and the problem was finally resolved by allowing each parish to have its own parish school and to levy taxes to support it.

By the year 1768, the Commonwealth had recorded seven major educational events, beginning in 1673 with the first private, tuition schools—known as "Dame Schools"—and climaxing with the 1768 legislation authorizing districts and decentralizing the schools. In between were the initia-
Board of Education was created in 1837. One study commission comments:

Although the Massachusetts Department of Education is the state's—and the nation's—most senior state-wide agency for public education, it is a relative newcomer on the Massachusetts educational scene. It followed the constitutional injunction in being made an executive arm of state government, financed by and reporting to the legislature.

With this brief background of the early years, we will examine what took place in education in Massachusetts as a result of the appointment of the first Board of Education.

**THE BOARD OF EDUCATION**

**FROM 1837 TO 1848**

Establishment of the Board of Education by the General Court in 1837:

- Created an agency to promote and guide the lasting concern of the State for the education of its inhabitants. What Horace Mann, as Secretary, and the Board did was to arouse strongly and at length local compliance with school laws (11).

Massachusetts authorized its board to accept grants for educational purposes, to appoint a secretary who shall make abstracts, and to prescribe the forms of school registers and blanks. The board also was to prepare and submit to the Legislature each January an abstract of school returns. Principally, the board collected and diffused information.

With the mandate to “collect and diffuse information” came changes in duties and responsibilities for the Board of Education. Necessary expenses of the board and secretary were reimbursed after auditing. Periodic consolidations of statutes and regulations were needed.

Between 1830 and 1850, practically every Northern state created an ex officio state school officer, whose duties were financial, statistical, clerical, and exhortatory. In 1840, Springfield employed the first city superintendent of schools, followed in later years by Boston and Worcester. This trend revealed the need for an executive officer to manage city and town school programs, as well as state school systems, in the interest of strengthening education (12).

The 1836 Child Labor Law, as implemented in 1842, required working permits for those 14 to 16 years of age and the establishment of continuation and evening schools. In 1847, it also brought school grading, with the first separate grading at Quincy School, in Boston.

One of the outstanding developments in this period was the memorial to the Legislature in 1837 regarding the establishment of state normal schools, followed by a report on Prussian and French “normal” schools. The first normal school in America was established at Lexington in 1839, with the next one at Bridgewater in 1840.

Undoubtedly, Horace Mann made one of the greatest contributions during this period when he published and issued annual reports, following his extensive visits to cities and towns as well as throughout the country. These reports, and the *Common School Journal* edited by Mann, had great impact, in particular during the next 50 years, from 1850 to 1900.

**The Board from 1848 to 1904**

Horace Mann was succeeded as secretary by five different leaders (Barnas Sears, George S. Boutwell, Joseph White, John W. Dickinson, Frank A. Hill) during this period of 56 years, with terms ranging from 4 to 16 years (13).

In order to have adequate information and statistics, the state board was authorized to appoint special agents to make inquiries. In 1859 came the first official compilation of *General Laws Relating to Education*. By 1867, all officers were required to furnish statistics about their pupils, instruction, and schools, as well as the institutions serving the deaf, dumb, and blind (14). Another compilation of *General Laws*, issued in 1882, brought the legislators and the administrators up-to-date on educational legislation.

There was increasing activity on the part of educational associations during the last half of the nineteenth century. The Massachusetts Teachers’ Association, founded in 1845, put out the first issue of its *Massachusetts Teacher* in 1848. The National Teachers’ Association, formed in 1857, became the National Educational Association in 1870. Seven years later, the Massachusetts Schoolmasters Club came into being, meeting regularly to discuss new movements in education. The conventions, institutes, meetings, and publications of these organizations greatly influenced the development of programs in the field.

It was in this era that Agassiz, Froebel, and Pestalozzi made significant contributions which resulted in improved methods and curriculum in the public schools of the Commonwealth. Emphasis developed in science and nature, in history, geography, physiology, and hygiene. In 1860, Elizabeth Peabody founded the first English-speaking kindergarten in Boston. In 1872, the Legislature passed a law providing for industrial schools to teach industrial and mechanical drawing so that Massachusetts could maintain its position in manufacturing and the arts. The law mandated manual training in high schools of towns with 20,000 population by 1895, and in elementary schools by 1896—a step to prevocational training which has persisted to this day.

Between 1880 and 1892, in accordance with the law, the state board developed and printed many courses of study as guides for school systems. With this greater emphasis on subject matter, departmental teaching developed.
during the last decade of the century and gradually led into the movement to establish 6-year elementary schools instead of the customary 8- or 9-year schools. A series of studies, by the Committee of Ten on the secondary schools, and the Committee of Fifteen on the elementary schools, all contributed to the ferment for change in the curriculum.

An important trend developed as the result of the Compulsory Education Act of 1852, which required all children ages 8-14 to attend school at least 12 weeks of the year, of which 6 had to be consecutive. This legislation brought into the schools many children not adapted to the usual academic program, such as: "The Truant—The Incorrigible—The Foreign-born unaccustomed to books; The Mentally Retarded—The Crippled—The Tubercular—The Deaf; the Epileptic—The Blind—The Sick—The Needy—The Unfit" (15).

This action reflected somewhat the state's concern during the preceding decade, when it had established a State Reform School and the Massachusetts School for the Feeble-Minded. To implement the Compulsory Education Act, it became necessary for school systems to have personnel, such as an attendance officer, the school nurse, and the visiting teacher—all of which brought into focus the needs of individual children.

The objective became one of salvaging as many as possible, and turning students back into society prepared to do something to serve both the community and self. The Massachusetts Truancy Law in 1862 led to the erection and staffing of county reform schools, county truant schools, and county training schools to give delinquents appropriate education. The first class for the mentally retarded was set up in Springfield in 1898, followed by others in Boston and Worcester. Meanwhile, there were many adults not equipped for a changing civilization. An optional law provided evening schools for those not attending day schools. Later, this included those needing elementary schooling and then the foreign born, as well as native illiterates whose education had been neglected.

Other important developments of the period included the establishment of a new group of normal schools, the development of textile schools, the consolidation of school districts into the union structure, and medical inspection of students.

The Board from 1904 to 1946

The Douglas Commission, set up in 1905 by Governor William Douglas, responded to the mounting concern relating to inadequacies in industrial education by recommending modification of elementary programs to include agriculture and mechanic arts and of secondary schools to include drawing, mathematics, and science; new electives in industrial courses in high schools; evening schools for out-of-school youth and adults; and part-time day programs for the age group 14-16. It also recommended establishing a
Despite the lack of staff and limited department authority, there was progress in such areas as certification of teachers, equal educational opportunity, accreditation of schools and colleges, educational publications, school construction, teacher education, vocational education, and pupil services.

Certification of Teachers. Although certifying teachers was a prime concern in the colonial era, certification by modern statutory provisions came to Massachusetts only after a protracted struggle. The regulations were strengthened in 1924, when all full-time teachers were required to have a minimum of 2 years education beyond high school, but the Commonwealth trailed far behind its sister states. In fact, according to the commissioner's annual report of 1939, Massachusetts was the only state without a teacher certification law. In 1940, the commissioner and the Board of Education recommended qualifying standards for teachers and sponsored regional meetings of superintendents and school committees for voluntary adoption of these recommended standards. Five years later, the Educational Policies Committee of the Massachusetts School Superintendents Association issued a Digest of Certification Goals based on bills which had been proposed in 1920 and 1939 and the Downey brochure of 1940. The legislature again attempted to pass a bill in 1947, but it was not until 1951, following reorganization of the Board of Education, that it enacted the first comprehensive certification law.

Equality of Educational Opportunity. Massachusetts took steps to prohibit discrimination based on race or color as early as 1865 and made it a personal liability to indulge in such practices by 1895. Public service employees were guaranteed protection from discriminatory practices in 1920. The Governor's Committee on Racial and Religious Understanding was appointed in 1945. The Fair Employment Practices Act, one of the first in the nation, became law in 1946, followed in 1949, under the new board, by enactment of the Fair Employment Practices Act, which provided for admission to schools and colleges without reference to race, color, creed, or national origin. The present Board of Education and its immediate predecessor have achieved national recognition for their leadership in ensuring equality of educational opportunity.

Accreditation and Licensing. Before 1940, the General Court, through its department of corporations, passed upon the financial structure of institutions of higher education and issued charters for their operation. The Department of Education made only limited recommendations. Secondary schools were evaluated only in terms of whether they were following the statutory requirements.

With the advent of World War II came the need to provide for veterans education. Thus the Legislature established a Board of Collegiate Authority in the Department of Education in 1943 to approve schools and colleges for attendance by returning veterans. Two years earlier, it had created a recess commission on junior colleges and provided for licensing private trade schools and promulgating regulations for correspondence schools. In this same period, the commissioner appointed a planning committee to study the evaluation of secondary schools.

Although the state's role in accreditation was limited throughout these years, it should be noted that the highly respected New England Association of Colleges and Secondary Schools broadened its activities in the 1930's and thereafter and set high standards for its membership.

Educational Publications. The Department of Education continued to strive toward its objective of diffusing information, using largely the system of annual reports; nevertheless, the Legislature did not deem these of sufficient importance to print, and the board, as well as the commissioner, had difficulty getting any material other than statistical reports published. Again and again, "the absence of standardized, reliable, valid, and consistent information" (16) led to the practice of civic and educational organizations' collecting their own data and issuing mimeographed, unofficial material about school systems. Departmental publications from 1921 to the end of World War II included Manual for Junior High Schools; Manual for High Schools; Tercentenary of the Massachusetts Bay Colony; General Laws Relating to Education; The Development of Education in Massachusetts, 1630-1930; Supervision of Instruction in Junior High Schools; Massachusetts Public School Administration; Massachusetts Youth Study; and Primary Curriculum Guide.

In 1923, the Zook Report (17) had called for the establishment of a research division similar to that found in business and industry. It was not until many years later, however, that this recommendation gained recognition and then implementation by virtue of federal assistance. The department took one important step toward this goal in the 1940's with a School Survey Form, instituted to help school districts examine their educational programs and facilities with the assistance of department staff members.

School Construction. From 1920 to 1930, as prosperity increased and the suburbs expanded, 439 public schools were built. During the Depression, however, practically all construction was seriously curtailed, and only 287 schools were erected. Similarly, in the prewar and war years construction continued to be restricted as cities and towns put off major capital expenditures. It was not until the baby boom and the rapid increase in suburban living of the postwar era that the next big surge in school construction got under way. But in 1962, 40 percent of the school buildings in use in the Commonwealth had been constructed prior to 1920 (18).
Teacher Education. From the time of Horace Mann, the preparation and training of teachers had been a major concern of the Board of Education. The Legislature had assigned the board the responsibility for the normal schools, but the teacher-training programs were largely elementary school oriented. By 1921, degrees were authorized for 4-year courses, as a result of gradual extensions of the curriculum in the colleges.

With the advent of the junior high schools, a new type of teacher training was needed. The Massachusetts Junior High Principals' Association became critical of the college instructors' qualifications to give the training, and the facilities available. The association appointed a committee of five principals in 1937 to cooperate with college administrators in conducting a study of the situation. The report covered such topics as supply and demand, selection and admission, curriculum, faculty, laboratory school, graduation, and follow-up services. While college presidents generally appreciated the report, the department did not act on its recommendations. However, with the appointment in 1946 of a new commissioner who had been a member of the superintendents' policies commission, interest was revitalized and ultimately produced excellent results.

Pupil Services. As the philosophy of the purposes of education and schooling changed from teaching the fundamentals to meeting the needs of individual pupils, there came a demand for various types of pupil services. In 1920, the Commonwealth organized a "High School Equivalency Certificate," based on completion of a 16-unit high school education through a program of correspondence and/or standard courses to be completed with supervised examination. Minimum requirements in English, literature, mathematics, U.S. history, government, and science were specified. Originally intended to assist Massachusetts residents 20 years of age or older in reaching their educational goal, this program was transferred to a Veteran's Service budget in July 1947 and operated under a policies commission subordinate to the new Board of Education (19).

Health services assumed more and more importance as one of the cardinal principles. Physical examinations, physical education, and athletics received increasing attention. To encourage coordination, school health councils were set up, capped by a state interdepartmental Health Council in 1940, which met monthly during the school year and published a number of handbooks and checklists to raise the standards of school health programs.

Concurrent with the national emphasis on ability grouping and meeting of individual needs, junior high schools increased to 170 by 1928. They stressed three important objectives in particular: exploration of abilities, educational and vocational guidance, and inculcation of "how-to-study" habits.

Just prior to World War II, the field of guidance found itself in the midst of a rapid expansion, in keeping with a prime Massachusetts Youth Study recommendation. The Acts of 1941 authorized the appointment of directors of occupational guidance and placement in school systems and a supervisor in the state department. Such a program expanded into Veterans Centers throughout the state and began to bring in- and out-of-school youth and adults into a coordinated program.

More attention also was being given to atypical children. In 1919, the Commonwealth authorized formation of special classes for mentally retarded pupils. Increasingly, attention was given to deaf, the blind, and other physically handicapped pupils through appropriate legislation and services (20).

Adult Services. In 1915, when the only public institutions of higher education were 2-year normal schools and the Massachusetts Agricultural School, the General Court established the Division of University Extension in the department to offer courses at cost to thousands who wished to enrich their backgrounds. Classes and correspondence courses were set up, and enrollment soon swelled to 40,000 in numerous communities throughout the state.

The year 1919 saw the department instituting Americanization courses in English and American citizenship for the foreign-born noncitizens to attain citizenship. Enrollments ran from 20,000 to 30,000 in the 1920's and from 10,000 to 20,000 in the 1940's. The state reimbursed the communities one-half the cost of instruction.

Another important service for adults came in library extension. In the last part of the nineteenth century, the Governor appointed the first Free Public Library Commission in the United States. At that time, there were only 103 towns without libraries, but the other 248 were in need of assistance—both in terms of personnel and standards of service. The first salaried professional staff member in the Department of Education had been appointed in 1910, and this was increased to two in 1912. Interlibrary loans of books were authorized in 1911, and house-to-house delivery of books was carried on. During 1935-39, a statewide regional system of libraries was set up and was materially aided by the Works Progress Administration in 1940.

Vocational Education. In 1921, the General Court established the commissioner and the Advisory Board of Education as the State Board of Vocational Education in order to handle the activities arising from enactment of the Smith-Hughes Act. In the same year, the federal Vocational Rehabilitation Act was passed, and responsibility for extending its related services in Massachusetts was placed in the Department of Education.

Seventeen years later, the work of the department's vocational education division received added impetus with passage by Congress of the George-Deen Act. In 1941, the
Legislature voted to regulate private trade schools. The greatest boon to vocational education in this entire era was the replacement in 1946 of the George-Deen Act by the George-Barden Act whereby Congress extended the basis upon which the expenditure of federal funds could be made.

Like its counterparts in the other states, the Massachusetts Department of Education made a major contribution to the war effort from 1940 to 1946. The reports of the Board of Education in those years contain many references to actions taken. Among the more significant ones were organization of defense training classes in 10 trade schools, around-the-clock utilization of vocational education shops, establishment of high school Victory Corps, training of thousands of boys to assist in war industries, and organization of war ration book distribution.

As the war neared its end, mounting concern for the future of public education led the Massachusetts General Court to appoint a Legislative Research Commission in 1945 to study and report (21) on areas of major importance.

Chapter 652 of the Acts of 1947 resulted from this study, creating a new pattern of organization for the state board which was to last until 1965.

THE DEPARTMENT, 1947-65

The 1947 legislation placed the department under a Board of Education of nine members appointed by the Governor for terms of 9 years each. To the board went the authority to appoint the commissioner of education, who, in turn, received the power to appoint a deputy commissioner. Later legislation provided for the commissioner and deputy commissioner to serve "at the discretion of the Board."

John J. Desmond, Jr., reappointed in 1947, served as commissioner until his retirement in 1957. He was succeeded by Owen B. Kiernan, who continued to hold this position through 1968, serving as president of the Council of Chief State School Officers in 1967.

The period since 1947 has brought expansion of direct personal services by department staff and a marked increase in the number of educational conferences and institutes sponsored, or shared in, by the Board of Education and the Department of Education. The department has sponsored conferences of superintendents of schools, principals, supervisors, and special subject teachers annually with strong and repeated emphasis on new educational objectives, innovative practices, administrative techniques, research findings, policy developments, and new or contemplated legislation. Parallel efforts have been conducted by the Massachusetts Teachers Association and its affiliated county teachers associations, aided by department staff and regional and national leaders.

Each of the Governors of the Commonwealth in this period devoted considerable attention to the needs of the department and of public education in general. Of particular import were Governor Christian A. Herter's calling together the Massachusetts White House Conference on Education at Amherst in September 1955 and the address by Governor Foster Furcolo at the Governor's Conference on Higher Education at Cambridge in November 1957, focusing on the need for a more effective system of post-high school educational coordination.

The Massachusetts White House Conference on Education (22), planned by civic and government leaders (including members of the Board of Education), drew over 1,800 participants to probe the major issues of the day.

Another source of renewed strength in providing educational leadership in the Commonwealth has been the 1960 resumption of the practice of publishing the annual reports of the commissioner of education, a procedure which had been dropped for many years because of the failure of the General Court to provide the necessary funds for printing. Utilizing Title X (Public Law 85-864) funds, Commissioner Kiernan has in each subsequent year disseminated his report to the school systems and to other important makers of public opinion, thereby adding new dimensions to the process of spreading new ideas and of clarifying significant issues.

The most vital issue to achieve public recognition through the medium of Dr. Kiernan's annual reports has been the need to examine the total spectrum of education. This call, issued in 1961, ultimately led to support by the executive and legislative branches with a resultant appropriation of $250,000 to institute what has since become known as the Willis-Harrington Report—the most comprehensive study of public education in the history of the Commonwealth (23). This and other annual reports prepared between 1962 and 1966 have offered policy positions on such crucial matters as regional vocational schools, educational television, federal and state interrelationships, education of the emotionally disturbed, fiscal autonomy, and equality of educational opportunity. Few, if any, controversial subjects relating to public education in this Commonwealth have escaped scrutiny or lacked clarification within the scope of these contemporary reports.

One of the first actions of the newly organized Board of Education was to appoint an executive committee of three officers and one other member to serve with the commissioner and to accompany him to legislative hearings. They were instructed to further legislation on the budget and state aid. Expanding their efforts, board members and department staff representatives worked with, and through, regular committees or special commissions and study groups established by the General Court in the 1950's and early 1960's. Their efforts led to the enactment of a body of important statutes and related programs and facilities,
including the Commission on the Structure of State Government (1949), the Commission on State Aid (1952), the Commission on State Medical and Dental Schools (1953), the Commission To Study the Problems of Mental Retardation (1954), the State Youth Commission Relative to Facilities Available for Meeting the Problems of Juvenile Delinquency (1954), and the Special Commission To Audit State Needs (1967).

During the same years, 1947-65, the Board of Education, carrying out its statutory responsibility, also annually filed bills which not only introduced new and desirable facilities, machinery, and programs, but also, in some instances, served to correct or repeal unsatisfactory existing laws. Major changes wrought by these bills include provision for instruction and training of certain emotionally disturbed children and reimbursing cities and towns and school districts for expenses in connection therewith (1960); establishment in the department of an advisory board of higher education policy, the first major step toward centralized reviewing of present and predicted programs for higher education with budgetary recommendations therefor (1962); licensing of correspondence schools to protect Massachusetts citizens from fraudulent promotional efforts (1963); authorization of an advisory committee on disadvantaged children and of special programs for said children in elementary and secondary schools, one of the first state programs in the nation to identify and assist educationally disadvantaged children (1964); authorization of the department to prescribe special programs for academically talented children in elementary and secondary schools and to assist cities, towns, and regional school districts in establishing said programs—a pioneering effort to encourage local school systems to develop special curriculum approaches to challenge the academically talented (1964); and hiring of aides for assignments in laboratories and classrooms to enable the overburdened regular teacher to focus on prime instructional responsibilities (1965).

Legislative programs of the Board of Education have gained impetus, particularly in recent years, from the cooperation given by the Department of Education's Advisory Council on Legislation comprising representatives of the Massachusetts State Federation of Women's Clubs, Delta Kappa Gamma, Massachusetts Association of School Committees, League of Women Voters, Massachusetts State Labor Council, AFL-CIO, Massachusetts Teachers Association, Massachusetts Association of School Superintendents, Massachusetts Educational Conference Board, Massachusetts Congress of Parents and Teachers, American Association of University Women, Massachusetts Council for Public Schools, National Council of Jewish Women, Massachusetts Federation of Teachers, Massachusetts Committee on Children and Youth, Association of Massachusetts State Colleges Alumni, and Massachusetts League of Cities and Towns. Council representatives not only annually review with the commissioner all pending board bills, but also, in many instances, actively support them before committees of the General Court and in the public arena. In turn, the commissioner, acting with board approval, periodically lends public support to legislation originating with these organizations.

The commissioner, or other department staff members, also regularly appears for or against legislation filed by legislators or others affecting public education. Other significant facets for influencing the lawmaking process are the statutory requirements under which the commissioner, with occasional assistance from the department counsel and the research and development division, presents to the ways and means committee of the General Court and to the Governor his judgments as to the meaningfulness and cost of educational bills being considered by them.

Educational laws and their interpretation and implementation by the Department of Education, school committees, and others are most seriously affected by legal opinions of attorneys general and decisions of the courts. This has been particularly true in this Commonwealth since 1960 in the contentious area of civil liberties and civil rights.

Three opinions of the attorney general were of particular importance to the department in this period. All were requested during the years when the Honorable Edward W. Brooke, now a U.S. Senator, was the chief law officer of the Commonwealth.

The first of these opinions, rendered in August 1963, related to the constitutionality of certain practices, real and hypothetical, of the public schools, as affected by the decisions of the U.S. Supreme Court in the Schempp and Murray cases with respect to reading the Bible and reciting the Lord's Prayer. The questioned practices declared to be permissible were a pause for silent meditation, or gatherings of students before classes on their own initiative for devotional exercises; vocal prayer at functions such as graduation or baccalaureate exercises which are not a part of the regular curricular activities; the teaching and study of the Bible, or religion, or usages in the public schools in connection with the observance of holidays having religious overtones such as Christmas and Easter, or of exercises and songs involving religious beliefs to illustrate the religious history and universal significance of these holidays.

One of the most significant passages in the attorney general's opinion enables school officials and others to make appropriate constitutional distinctions of a state's approval of devotional exercises and its obligation to enhance moral training. This part of the opinion merits reprinting herewith:

The Court made clear that in its view of the First Amendment, devotional readings and recitations of the type under consideration exceeded the powers of the
Accordingly, it was immaterial that the exercises were brief, enjoyed widespread support, and were not mandatory. It was equally immaterial, in the Court's opinion, that the practices may have had beneficial effects on the students. A devotional reading as part of the public school curriculum is simply not within the power of the civil government, in much the same fashion that the passage of a general law, however minor in nature and however beneficial it may be, is not within the power of any church. As a constitutional ruling under the Fourteenth Amendment, these decisions set forth the supreme law of the land, and are binding on the states and all political subdivisions thereof.

But if the moral value of the exercises was not in question, it was made equally clear that within the limits of their jurisdictional competence, the schools have a right and a duty to instill into the minds of the pupils those moral principles which are so necessary to a well-ordered society. It is difficult to conceive of a more compelling function of education than is the molding of the moral strength of the student. Indeed, this function has been a part of the statutory obligations of teachers in Massachusetts since 1789 . . . (24).

In February 1964, the attorney general issued two other opinions of consequence to the public schools in their relationships to the department. One related to the highly controversial matter of a proposed school boycott, directed against the Boston School Committee in connection with charges of de facto segregation; the other pertained to the authority of the Department of Education to seek information concerning color of students, i.e., racial census.

In the instance of the proposed school boycott, the attorney general dealt with a very sensitive situation. On the one hand, many civil rights leaders and some legal experts regarded the boycott as an appropriate method with which to correct alleged injustices. On the other hand, the department felt that, regardless of the worthiness of a cause, school attendance laws could not be violated. The attorney general's opinion (25) supported the department's position.

In order to ascertain vital information with respect to the guaranteeing of equal educational opportunity to all children of the Commonwealth, the commissioner of education, with board approval, took steps to initiate a racial census. In answer to specific questions proposed by the commissioner, the attorney general, in the second of his February 1964 opinions, clearly indicated that the making of a record of color does not violate the Fair Educational Practices Law and, further, that the department or the commissioner has the power to insist that school committees provide information by which a determination could be made concerning the extent to which various racial groups utilized the public school system.

Notwithstanding this opinion, the New Bedford School Committee voted in March 1964 not to take a racial census which was requested by the commissioner to be returned before April 1. The school committee also contended, among other points, that the racial composition of the public school population of New Bedford did not lend itself to realistic distinctions between "white" and "non-white" students. Two court cases—one before the Superior Court of the Commonwealth and one, on appeal, before the Supreme Judicial Court of the Commonwealth—resulted. The ultimate decision of the Supreme Judicial Court (26), announced in the summer of 1965, upheld the right of the department to obtain such census information and the form on which it was requested.

Some issues, problem areas, and movements, while already alluded to with varying degrees of emphasis, merit additional consideration. Among these are civic education, equality of educational opportunity, pupil services, school districting, higher education, state and federal aid, vocational education, and, as a culminating feature of the period, reorganization of the Department of Education.

EXPANDING EDUCATIONAL OPPORTUNITY

The Civic Education Movement

From the earliest beginnings of public education, dating back to the 1630's, Massachusetts had placed major emphasis upon the need to prepare its children and youth for the duties of citizenship in addition to maximizing individual excellence. Horace Mann appropriately reflected this objective toward the dual mandate when he wrote about "the high purposes of training an American child to become an American citizen." By the end of World War II, this state already had many laws on the books to this effect, including requirements for the local school systems to teach U.S. history, civics, morality, and the Constitutions of the United States and of the Commonwealth. What became clearly evident by 1950, however, was the need to adopt a more sophisticated and more comprehensive concept of citizenship education, one that advanced beyond a somewhat simplistic preparation for political responsibility.

The modern civic education movement—nationally, as well as within Massachusetts—was considerably influenced by the pioneering efforts of John J. Mahoney, a former president of Lowell Normal School and the first director of the department's Americanization program. Moving to Boston University in the 1920's, Dr. Mahoney evolved an approach to citizenship over the next 20 years which strongly emphasized behavioral goals in relation to economic education, human relations, attitude toward law, practical politics, and international relations. In 1946, in concert with Henry W. Holmes, former dean of the Harvard
Graduate School of Education, Mahoney founded the Civic Education Project (later to become the Filene Center for Citizenship at Tufts University) which had the full support of Commissioner Desmond of Massachusetts and the other Northeastern states' commissioners of education. Two very specific products resulted from this Project—Department of Education relationship: enactment of Chapter 693 of the Acts of 1951—after a campaign by President Karl Compton of the Massachusetts Institute of Technology, Ralph Lowell, and other distinguished trustees of the Civic Education Foundation—setting up an Office of American Citizenship in the department; and publishing of Education for Citizenship, a blueprint for civic education by the commissioners of education of the Northeastern states, in 1952—this report was written by a committee headed by Dr. Mahoney.

The Office of American Citizenship, which became the Division of Civic Education in 1957, was the first such office established in the country. Chapter 693 charged the office with—

Responsibility for leadership in the co-operative study and fuller use, in the public schools and teachers colleges of the Commonwealth, of teaching materials and methods, student activities, and administrative and supervisory procedures directed toward more effective preparation for the duties of citizenship.

Building on the objectives incorporated into Education for Citizenship and capitalizing on the contribution to the citizenship movement by the Columbia Citizenship Education Project, the Detroit Citizenship Study, the Civic Education Project at Tufts, the Joint Council on Economic Education, and others, the Office of American Citizenship developed a state program which has achieved regional and national recognition.

This office, or division as it was later called, has stressed the service and leadership function. Among its many accomplishments, this office has provided degree-credit courses and professional improvement courses under the label "Citizen Behavior" and "Youth Problems Institute" for approximately 5,000 teachers in service; it also has conducted the state's Student Government Day program which annually involved 500 public and nonpublic schools in the study of state government, the Student Government Exchange Program which annually involves more than 100 high schools in the study of local government through intercommunity invitations, and the State Youth Citizenship Conferences, which for the past several years have annually provided more than 1,100 high school students forums for the discussion of vital civic issues.

In cooperation with the school bureau of the Greater Boston United Community Services, the division organized in 1956 a youth-in-community-services project known as Operation Kindness, which involved thousands of secondary pupils in more than 2,000,000 hours of volunteer work through 1965. (This project served as one of the models for the Peace Corps and VISTA.) In 1960, the division organized the "Freedom Lectures," a series on civil liberties that won first prize in the Freedoms Foundation Awards to governmental agencies. The following year, the division conducted a statewide survey relating to teaching about communism, which, coupled with the issuance of a basic policy statement on teaching controversial subjects and the distribution of the resource unit Ideology and World Affairs (prepared in conjunction with Tufts University and other Northeastern states' representatives), had a nationwide impact on coping with this difficult education and public policy issue. The "Education and Race Relations" special course at Boston State College also was a by-product of the division's energies organized and conducted in 1964; the course was the forerunner to the TV course approved for federal funding in the amount of $134,000 under Title IV of the Civil Rights Act of 1964 in the summer of 1965.

Separate from its focus on teacher training and other programs for elementary and secondary schools, the civic education division has, since 1954, also conducted the department's adult civic education program. This has involved the training and certifying of teachers for this activity which is carried on in approximately 70 Massachusetts cities and towns.

Equality of Educational Opportunity

Precedent to the determination to take a race census in March 1964, the Board of Education had issued a statement on racially imbalanced schools and the underprivileged child which clearly and unequivocally sustained the policy position of its predecessors in relation to the goal of equality of educational opportunity and, further, served to strike down new impediments to this objective. On August 19, 1963, the board stated:

The Massachusetts Board of Education is deeply concerned by the number of American children who are underprivileged, partly because of neighborhood racial imbalance as reflected in some public schools. The Board recognizes its responsibility to call attention to the educational needs of the underprivileged child in the Commonwealth of Massachusetts and will use to the fullest its moral and legal powers to equalize opportunities wherever the need may appear in our schools. The Board, consistent with its role of guiding and assisting school committees—all of which have prime legal responsibility locally—urges each committee to intensify its efforts to identify and to meet the educational needs of any such underprivileged children. The Board urges further that action, consistent with sound educational practices, be taken immediately to eliminate racial imbalance when and where it is ascertained to exist in any school system (27).
In the next several months, the board authorized the 15-week teacher-training course, "Education and Race Relations," at Boston State College under its civic education division and approved distribution of a so-called "Human Relations Kit" to every public school in the Commonwealth. Each kit included the course bibliography, a special bibliography on "The Negro in American Life," and a teacher's unit of study entitled "Discrimination—Danger to Democracy."

In March 1964, concurrent with the race census action, the board appointed a 21-man Advisory Committee on Racial Imbalance to reassess the research data regarding the impact of racial imbalance on minority-group and other children. Assisting the advisory committee—which included five college presidents and an outstanding array of religious and lay leaders—with this major research effort was a task force of nationally and regionally respected educators.

After a year of intensive study, the committee published its findings under the title of Because It Is Right—Educationally (28), popularly known as the Kiernan Report. The report has since achieved national recognition. It points out that 55 schools (including 45 Boston schools) contained more than 50-percent nonwhite enrollments and that racial imbalance is harmful on the grounds that it damages the self-confidence and motivation of Negro children, reinforces the prejudices of children regardless of their color, does not prepare the child for integrated life in a multiracial community and world, impairs the opportunities of many Negro children to prepare for the vocational requirements of our technological society, often results in a gap in the quality of educational facilities among schools, and represents a serious conflict in the public schools with the American creed of equal opportunity.

The recommendations and suggestions incorporated into the Kiernan Report have had a marked influence. Among the significant educational advantages have been the awarding of a $134,000 federal grant under Title IV of the Civil Rights Act of 1964 to the Department of Education to make a TV series for state, regional, and national use based on the "Education and Race Relations" course; establishment by the presidents of the Massachusetts state colleges of a Human Rights Committee composed of faculty representatives from 11 institutions to revitalize human relations education offering to all undergraduates; expansion of summer school and camp programs which provided rich interracial learning experiences, in particular for Boston nonwhite children, and served to some extent to influence the formation of the Metropolitan Council for Educational Opportunity, now regarded as one of the nation's most valuable experiments in urban-suburban human relations education; and passage by the General Court, on August 18, 1965, of the Racial Imbalance Act (Chapter 641), the first of its kind in the nation. Following the racial census taken on October 1, the Board of Education notified the school committees of Boston, Springfield, New Bedford, and Cambridge to submit plans for the elimination of racial imbalance in certain of their schools which had been found to be in violation of Chapter 641.

Concurrent with its extensive efforts to deal with the issue of racial imbalance, the Board of Education enhanced the cause of equal educational opportunity further by filing legislation which ultimately became Chapter 650 of the Acts of 1964, an act designed to provide special assistance programs to assist children and youth educationally disadvantaged as a result of home and environmental conditions. Passage of this act had a national impact in that its design served as one of the models for the development in 1965 of what has become known as Title I of the Elementary and Secondary Education Act (Public Law 89-10).

Six school systems (Arlington, Boston, Easton, Holyoke, Sharon, and Springfield) instituted programs to help the disadvantaged during the 1964-65 school year under the state's matching formula. The introduction in 1965 of Title I, Elementary and Secondary Education Act, with its more attractive funding arrangement, caused a major shift from local involvement in the state programs by the end of 1965. The year or more of state department focus on the needs of the disadvantaged contributed greatly, however, to the development of meaningful Title I proposals when this federal program was introduced in the Commonwealth.

Federal Programs

As has been the case in so many areas of government, the "federal presence" has increasingly pervaded the Department of Education during the past decade. Admittedly, while the advent of major amounts of federal money has brought problems of several kinds, the overall effect has been to provide to local school districts programs and services not available through state funds.

Prior to the orbiting of the first Sputnik in October 1957, the federal influence in the state department was felt chiefly through programs in vocational and school lunch areas. The department staff members added as a result of federal activity were engaged in administering the distribution to the local schools of money and commodities. The National Defense Education Act of 1958 and the amendments thereto have had an increasingly important effect.

For example, Title III of the National Defense Education Act for improving instruction in the critical subjects has grown from its emphasis on science, mathematics, and modern foreign languages to now include, in addition, English, civics, history, geography, reading, economics, and industrial arts. The number of specialists in these areas has grown from none to more than twenty. In addition to the distribution of federal funds to local school districts, the federal support for these supervisory positions has enabled the department to provide greatly expanded services to local educational agencies. During one recent period, the
assignments within the city school system or joining the service of the state; most chose the latter alternative.

A little-heralded event in 1954 was to develop into a major aspect of the teachers college program. In the budget for the year beginning July 1, 1954, the state teachers colleges were permitted by the Legislature to undertake a program of courses for teachers and others to be financed out of a revolving fund and "at no expense to the Commonwealth." From a small first-year gross intake of $50,000, the program increased in volume nearly 40-fold in the next dozen years. More significantly, it has provided courses of steadily increasing quality for teachers and others through the master's degree level throughout the Commonwealth.

The year 1959 brought to a close the first six decades of this century with a number of startling and progressive strides in Massachusetts public higher education. The Acts of 1959 recognized the truly collegiate character of the work being done by the Massachusetts School of Art by changing its title to the Massachusetts College of Art, thus completing its evolution from a "normal art" school. Similarly, the Legislature that same year authorized the state teachers colleges to grant "other appropriate baccalaureate degrees" beyond those in education already authorized. This action was closely followed in 1960 by a change in the title of the institutions to "state colleges" in keeping with nationwide developments. Thus the colleges were officially ready to launch into a variety of liberal arts programs and other areas of specialization having no necessary connection to teaching. This action proved to be the necessary precursor to greatly broadened programs in the 1960's.

Almost simultaneously with this basic expansion of the role of the state teachers colleges came authorization for establishment of a number of 2-year community colleges regionally distributed through the Commonwealth. These colleges were under the direction of the Massachusetts Board of Regional Community Colleges in, but not subject to, the Department of Education and were charged with providing technical and terminal forms of collegiate programs as well as 2-year college transfer programs. Rapid implementation of its responsibilities by the Board of Regional Community Colleges added a new and vital dimension to Massachusetts' higher education in the 1960's.

The year 1960 also saw the establishment of a new technologically orientated institution in the southeastern section of the state. Significantly, under the title of Southeastern Massachusetts Technological Institute, it was designed as the ultimate replacement of the two former textile schools established in the nineteenth century and later renamed New Bedford Institute of Technology and Bradford Durfee College of Technology. Its location in South Dartmouth placed it about midway between the two institutions it was destined to replace. Planned also in the program for this new campus is an undergraduate program in the liberal arts and sciences.

The Acts of 1963 provided fiscal autonomy for a new Board of Trustees of State Colleges, slightly expanded in membership from its predecessor, the Board of Education. Composition of the new board included the nine members of the Board of Education, the commissioner of education (ex officio), and one state college president elected annually by his fellow presidents. The provision of fiscal autonomy, a policy already established for the University of Massachusetts, allowed much greater responsibility and flexibility in fiscal and personnel management than had ever been possible under previous regulations by the executive branch of the state government. This act constituted a major step forward in the development of the state colleges.

In 1962, the Legislature created the Massachusetts Education Study Commission. With the appointment of this group and their immediate involvement in a comprehensive study of all levels of public education in the Commonwealth, a new impetus was added to the growth of the state colleges. Through a 2-year period a careful analysis of public higher education was undertaken, with a great deal of attention being paid to the structure and functions of all segments of higher education. The resultant legislation in 1965 created the first overall structure for coordinating all public higher education—a Board of Higher Education—coequal to a new Board of Education whose responsibilities were designated as pertaining to the elementary and secondary schools of the Commonwealth. The Willis-Harrington Act redesigned the structure of higher education, removed the state colleges from the responsibilities of the Board of Education, and established a new 11-member lay Board of Trustees of State Colleges. This action brought to a close a long era of steady progress in teacher education in these institutions and launched another in the midst of rapidly expanding horizons for public higher education in Massachusetts.

School District Reorganization

The union superintendency, an organizational pattern by which two or more towns share the services of a superintendent and some supervisory and auxiliary personnel, was first authorized in 1888. In each instance, however, the member towns retained their own school committees and school buildings. Through 1950, 66 union superintendencies had been formed involving 204 towns. There were 60 local high schools with fewer than 100 students, and 76 local high schools which enrolled between 100 and 300 pupils.

The national movement to consolidate school districts in order to allow for more meaningful educational programs and more efficient management produced a unique post-World War II result in Massachusetts: namely, a positive effect in the development of the regional high school district and at least a numerically negative ending in that the total number of school districts advanced from 352
to 390 by 1965. The explanation lies in the fact that the union structure continued at the elementary level, with only a modest number of dissolutions, while approximately forty regional districts, mostly at the secondary school level, reached the functional stage. (Fifteen more regional districts were in the formative state.) The major current thrust, induced to some degree by the Massachusetts Education Commission Study of 1965, is an all-out drive to establish K-12 regional school districts through the elimination of archaic unions and the consolidation of small independent districts.

The regional school district owed its origin to the passage in 1948 of Chapter 645, "An Act To Encourage the Establishment of Regional and Consolidated Public Schools and To Provide Financial Assistance to Cities and Towns in the Construction of School Buildings." In August 1949, the General Court enacted Chapter 638, which provided the legal machinery for establishing regional school districts. Regional vocational school districts exclusively devoted to this specialized purpose were authorized by the passage of Chapter 650 of the Acts of 1960.

Initially, Chapter 645 of the Acts of 1948 allowed state construction grants ranging from 25 to 55 percent for regional schools. Later amendments to this act extended its terminal date from June 30, 1951, to June 30, 1971, and increased the grant percentage to a range of from 40 to 65 percent for regional projects.

Since the formation of the first regional school district in 1950, approximately 200 of the Commonwealth's 312 towns have taken advantage of the regional school district legislation, and more than $100 million has been invested in the construction of new regional schools and additions thereto. The number of local high schools with less than 100 pupils has diminished to 3, while the total of high schools enrolling 100 to 300 students has been reduced to 23.

PUPIL SERVICES

Guidance

As a result of the High School Victory Corps and its emphasis on guidance from 1941 to 1945, there had been a substantial increase in the number of secondary schools offering such services to youth. This pace accelerated in the postwar period at the local level with a modicum of assistance from the department due to serious staff limitations. By 1958, 232 high schools provided guidance programs. A similar impact was felt at the junior high school level, but very little was done, in a formal sense, in the elementary schools.

A major breakthrough in terms of comprehensive guidance services came in 1958 with passage of Title V-A of the National Defense Education Act and resultant increase in department staffing and related funding. By the end of the 1958-59 school year, the department had added three supervisors, and there were 900 counselors employed in local school systems. One year later, the department's annual report revealed that 141 public school systems and 84 private school systems were formally participating in the Title V-A program. The reimbursements to public schools amounted to $325,904, while an additional $2,029 was paid for private school testing.

Strong leadership by the Department of Education's Office of Guidance and Placement had a salutary effect in the period from 1958 to 1965 with the result that many valuable publications were produced, the Massachusetts School Counselor Association was founded, workshops to train counselors were established, and regular regional conferences were instituted. There was also a marked increase in supervisory services to local school systems. Two other noteworthy achievements were the undertaking in 1963 of a Work-Study Development Program and of a statewide study of the status of guidance in the elementary schools. The statistics contained in the 1964-65 annual report reflected growth since 1958 in that there were 313 more counselors employed at the end of the period, and the number of state supervisors had doubled. At the end of 1965, $406,774 in federal funds was used under Title V-A in public schools, and the reimbursement for private school testing amounted to $9,176.

School Adjustment Counselors

The director of the Division of Youth Service, an autonomous state agency, instituted the School Adjustment Counseling Program by authorization of the Legislature upon the enactment of Chapter 696 of the Acts of 1955. This pioneering effort, whose approving authority includes the division's director and the commissioner of education, recognized the need to assist maladjusted, emotionally disturbed children (kindergarten-grade 8) if they are to avoid serious underachievement and behavioral disorders during later years. As a result, this program deals with these children, their families, and appropriate social agencies in an attempt to help them normally progress in school and to allow them to utilize effectively the resources of the school according to their own abilities.

In the 10-year history of this state-aided program, more than 100 public school systems have engaged school adjustment counselors and thereby contributed substantially to the wholesome development of hundreds of children who might have otherwise been lost to society.

School Lunch

The Office of School Lunch Programs was incorporated into the department as an educational program in 1948 following the earlier enactment in 1946 of the National School Lunch Act by the Congress. This highly efficient
operation, which appropriately recognizes the basic need to protect and maintain the individual's strength and health, has had a remarkable growth in the intervening years, going from 26,475,938 lunches in the 1954-55 school year to 78,632,058 in the 1965-66 term.

Special Education

The end of World War II coincided with the one-hundredth anniversary of Massachusetts' initial effort to establish a school for the feeble-minded. These children and those who suffer from other mental and physical handicaps have been, and continue to be, a prime concern of the Commonwealth, particularly as aided by vital legislation, financial support, and department services. The postwar period represents the most dramatic span. The following summarization does not do justice to the basic and comprehensive steps that have been undertaken.

Mental Retardation. The Acts of 1950, as amended, provided a $500 differential for teachers of the mentally retarded. Legislation passed in 1954 mandated classes for the mentally retarded where five or more such pupils were so classified by intelligence quotients, created the special education division and provided for reimbursement of 50 percent of costs for maintaining special classes and for transportation thereto. Later legislation has provided additional services for educable and trainable mentally retarded children. In addition, school psychologists and classroom teachers have been trained in increasing numbers, and summer recreational programs have been introduced.

The Deaf. Deaf children in Massachusetts also have benefited substantially in this interim. The Acts of 1958 permitted these youngsters to go to school outside, as well as within, the Commonwealth. The first supervisor of deaf children was appointed in September 1961. That same year, the board passed certification standards for teachers of the deaf. Public Law 87-276 was passed by Congress in 1961 thereby enhancing the training of more teachers of the deaf in this state.

Partially Seeing Children. The General Laws of 1951 provided for an assistant supervisor to assist in the education of blind and partially seeing children. Legislation 9 years later provided a 50-percent reimbursement to local systems for transportation and for the utilization of special audio-visual equipment. The first full-time supervisor of physically handicapped children started work in 1958. Four hours of instruction per week were to be guaranteed to each child. Fifty-percent state reimbursement was provided for home and school instruction. The year 1959 saw adoption of regulations permitting state-aided recreation programs for the physically handicapped.

Speech-Handicapped and Hard-of-Hearing Children. By 1957, when the Commonwealth appointed its first supervisor of speech-handicapped, hard-of-hearing, and deaf children to the department, cities and towns were offering speech and hearing programs to approximately 11,000 children. The Acts of 1960 included children who are speech-handicapped along with children who are hard of hearing. State reimbursement up to 50 percent was voted for communities offering programs in this area. Ninety-six cities and towns now assist 18,000 children with these handicaps.

Aphasic Children. Department staff members attended the nation's first course offered on diagnosis and therapy for aphasic children in 1957 in St. Louis. The same year, new legislation permitted special instruction for these children. With state assistance, the Boston School for the Deaf also opened a program for the aphasic in 1957.

Emotionally Disturbed Children. After 5 years of intensive activity, the Commonwealth enacted legislation in 1960 to provide instruction for the emotionally disturbed. The basic program began in 1962 and includes instruction at the local level and, where approved, in private institutions. As of January 1964, 112 children were being instructed at home, 41 were in regular school programs, and 136 were being taught in special classes for emotionally disturbed children.

Library Extension

The successful experimental project in the Greenfield area, developed by the Western Massachusetts Library Federation between October 1950 and September 1952 with the assistance of the Department of Education's Division of Library Extension, had a lasting effect in that staffing, and funds were obtained shortly thereafter to broaden the services of the division's Greenfield regional office.
The work of the Special Administrative Library Commission, which reported to Governor Herter and the General Court in March 1955, represented a significant step toward long-range planning for libraries. With the passage of the Library Services Act by Congress in 1956, the Commonwealth had a meaningful role in broadening the related studies at all levels. Not only was vocational education to both older and younger pupils and technicians in industry and hospitals, and others pursue their education at 2- and 4-year colleges.

Never in the history of vocational education in Massachusetts has the educational bureau or the state department presented such concise plans for regions and cities to meet the challenge of society and minority groups by offering diverse, comprehensive vocational education for all youth. No city is too large, no town too small for the bureau to offer assistance. When one considers that for the first 50 years only large cities and towns offered vocational education to their youth, an articulation of the need for all to have an education to profit from was unprecedented. Much of this credit should go to foresighted superintendents of schools and directors of vocational education. It was mentioned before that boards of trade initiated two surveys, but superintendents of schools, directors of vocational education, and alert school committees and citizens initiated other requests for surveys. Nearly $100 million of construction is anticipated for improving the offerings for all students in the city schools, and, were some cities to make a serious attempt, this figure would increase.

This period also saw initiation of programs in the health occupations. A State Plan for Practical Nurse Training was approved by the Board of Education in December 1956. During the next 10 years, programs to train licensed practical nurses have expanded throughout the Commonwealth as have courses for medical assistant, medical laboratory assistant, surgical technician, dental assistant, dietary assistant, physical therapy assistant, and geriatric aide. Understanding the elderly, service to the mentally ill, and nurses' aide programs are also available at present.

Research projects included institutes in guidance and the health occupations approved and funded by USOE under 4(c) of the 1963 Vocational Education Act and other institutes funded under 4(b), the state allotment of the grant for research. An Information System for Vocational Decisions was submitted to USOE by the Graduate School of Education, Harvard University, and endorsed by the Bureau of Vocational Education and funded under 4(c) of the Vocational Education Act, and Development of a Career Resource Center at Newton High School, was funded through 4(b) under the Bureau of Vocational Education. The involvement with Quincy in Project ABLE completed more research in vocational education during this decade than was believable during the previous 50 years and symbolized the

Vocational Education

The South Shore, in an area from Hull to Plymouth, was the scene in 1955 of Massachusetts' first regional vocational-technical school survey, which culminated in the opening of the South Shore Regional Vocational-Technical School in Hanover in 1962. In 1957, a survey was initiated in Northern Berkshire County, and in 1962, the Northern Berkshire Regional Vocational-Technical School was opened in North Adams.

Dedication of the first two regional vocational-technical schools in 1962 signified a revolutionary breakthrough affecting some of the most pervasive social and psychological issues of the times. Coinciding with the event were three major legislative acts passed by Congress which changed the entire complex of vocational education. Title VIII of the National Defense Education Act (P. L. 85-864), the Manpower Development and Training Act of 1962 (P. L. 87-415), and the National Vocational Education Act of 1963 (P. L. 88-210) expanded instruction in vocational education to both older and younger pupils and broadened the related studies at all levels. Not only was vocational education commissioned to introduce technical education, but also to assist the uneducated and the under-educated, as well as the culturally, socially, economically, and academically disadvantaged.

As a result of surveys conducted by the vocational education bureau and the organization of regional vocational-technical school planning boards in cooperation with the school building assistance bureau according to Chapter 71 of the General Laws for forming school districts, the decade has witnessed the opening of six comprehensive regional vocational-technical schools which, already oversubscribed, offer most diversified programs and eliminate the terminal education status. Many of the students graduate as skilled craftsmen. Many more study to be technicians in industry and hospitals, and others pursue their education at 2- and 4-year colleges.
movement of vocational education to a new parallel of latitude.

State Aid

Although the Commonwealth ranked tenth among the states in total expenditures for public education at the conclusion of World War II, the heaviest support was attributable to the local property tax. The state's own share of the responsibility represented only 9 percent in 1945.

The 1947 Recess Commission of the General Court advanced seven criteria for evaluating school aid: adequacy for a sound school program, certainty of payments, encouragement of sound local organization, equalization of educational opportunity, strengthening of local control, arousing of local initiative, and improved salaries for professionally prepared teachers.

The Acts of 1948 provided a foundation program based on $130 per child aged 7 to 16 enrolled in public schools. State aid to local school systems increased to 14 percent by 1950 when the final commission report was issued. Then, as in 1947, however, the commission urged that the state's share should be 25 to 30 percent to realize the goal of equal educational opportunity. In 1959-60, school revenue receipts by level of government were as follows: federal, 5.3 percent; state, 19.9 percent; and local, 74.8 percent.

Widespread criticism of the 1948 program mounted in the 1950's and into the 1960's based essentially on the belief that the method of determining ability was not truly equalizing. The most penetrating analysis of the existing method was presented in a report entitled State Aid to Education in Massachusetts, published in 1962 by the New England School Development Council, with the cooperation of the Department of Education (104 Massachusetts school systems were members of the council at this time). The prime outcome of this study was a strong recommendation for the adoption of a percentage equalizing program based on the measures of ability, need, and effort. It set the goal for the state support at 40 percent of the educational dollar. Based on 1960 figures, the council's percentage equalizing formula would have cost approximately $123 million rather than the then-current state aid amounting to about $48 million.

The Massachusetts Educational Conference Board, composed of delegates from the leading educational organizations of the state, the Board of Education and the commissioner, and a host of citizens, business and labor leaders, legislators, and individual educators worked intensively over the next 3 years to improve the state aid situation.

Concurrent with this concerted effort to increase state aid, the Massachusetts Education Study Commission (the so-called Willis-Harrington Commission) also gave major attention in its total study of public education in the Commonwealth to the marked need to improve financial support at the state level and to lessen, if not eradicate, the obvious educational inequities prevailing in the cities and towns. The final commission report, published in June 1965, recommended that the existing state aid formula should be applied in full rather than only half and that full adjusted equalized valuation should be used as the tax base for aid to education. The proposed costs for 1965-66 totaled $123 million and were as follows: full payment on the state aid formula to meet elementary and secondary school improvements, $91 million; categorical and incentive aids, $7 million; improvements in higher education and expansion of the scholarship programs, $25 million.

The General Court has since passed a limited sales tax of 3 percent, of which four-fifths is credited to education in the distribution of local aid funds. These funds actually go into the city and town treasuries without being earmarked for said purposes. Additionally, a new percentage equalizing distribution formula based on need and effort has been adopted. Thirty-five percent of the education dollar has been set as the state's goal. To date, however, the sales tax returns distributed to the municipalities under the revised Chapter 70 have yet to exceed two-thirds of the entitlements anticipated under the new formula. The drive to achieve full funding and to remove inequities in the distribution formula continues.

The Massachusetts Education Study

Several direct references have already been made to the Massachusetts Education Commission Study (the Willis-Harrington Report), which was launched in September 1962 and concluded in December 1964. The full report of this comprehensive study of public education, ranging from the primary grades through college, was published in June 1965. Chapter 572 of the Acts of 1965 represents the first major piece of legislation designed to implement the commission's recommendations.

In brief, Chapter 572 set up three boards: an 11-member Board of Education responsible for public elementary and secondary education (the Department of Education is the administrative arm of the board and the commissioner of education is its executive officer); an 11-member Board of Higher Education responsible for providing active and effective leadership and coordination for the public higher education institutions (the executive officer of this board is the chancellor); and a 9-member Advisory Council on Education designed to provide a medium for the continuing study of public education essentially through the research activities directed by its executive secretary and small staff.

January 1966 signified not only the beginning of another calendar year, but also the start of a new era for public education in the Commonwealth of Massachusetts. The new boards had been appointed, the legislative prerogatives
ascertained, and the sights set. A renewed quest for quality education had been instituted.

CONSTITUTION of the COMMONWEALTH
OF MASSACHUSETTS

CHAPTER V

ARTICLE I, Section II - The Encouragement of Literature, etc.
Wisdom and knowledge, as well as virtue, diffused generally among the body of the people, being necessary for the preservation of their rights and liberties; and as these depend on spreading the opportunities and advantages of education in the various parts of the country, and among the different orders of the people, it shall be the duty of legislatures and magistrates, in all future periods of this commonwealth, to cherish the interests of literature and the sciences, and all seminaries of them; especially the university at Cambridge, public schools and grammar schools in the towns; to encourage private societies and public institutions, rewards and immunities, for the promotion of agriculture, arts, sciences, commerce, trades, manufactures, and a natural history of the country; to countenance and inculcate the principles of humanity and general benevolence, public and private charity, industry and frugality, honesty and punctuality in their dealings; sincerity, good humor, and all social affections, and generous sentiments, among the people. (1780)

1635 First public school with a continuous existence—Boston Latin Public School
1636 First college—Harvard College
1639 First public school supported by direct taxation or by assessment on the establishment of the town inhabitants—establishment by a vote of Dorchester
1642 First school law—universal education in homes, enforced by selectmen
1645 First elected school committee in America—again, Dorchester
1647 First compulsory school regulation
1821 First publicly supported, publicly controlled American high school
1837 First State Board of Education, with Horace Mann elected secretary of the board
1839 First normal school in America
1851 First state law regarding public libraries
1890 First State Library Commission
1965 First act by a Legislature to provide for “Elimination of Racial Imbalance in Public Schools.”

Men wait until the tide of evil rises and desolates the land, again and again, before they will erect barriers against the deluge.... Republics, one after another,—a splendid yet mournful train,—have emerged into being; they have risen to greatness, and surrounding nations have sought protection beneath the shelter of their power; but they have perished through a want of intelligence and virtue in the masses of the people.... If we do not prepare children to become good citizens, — if we do not develop their capacities, — if we do not enrich their minds with knowledge, imbue their hearts with love of truth and duty, and a reverence for all things sacred and holy, then our republic must go down to destruction....

APPENDIX B—ORGANIZATION CHARTS 617
INTRODUCTION

Michigan historically has been a national educational leader. From the earliest days, its system of education has had the flexibility and resiliency to adapt to change without losing or destroying the basic foundations that have made it outstanding.

The Northwest Ordinance of 1787 laid the keystone: "Religion, morality and knowledge, being necessary to good government and the happiness of mankind, schools and the means of education shall be encouraged." (1). From such encouragement, the concept of free schools quickly emerged. By the time Michigan reached statehood in 1837, it had the nation's first state superintendent and a system of education that served as an example for many other states.

During the past 132 years, the people of Michigan have adopted four different constitutions—in 1835, 1850, 1908, and 1963. The citizens spelled out strongly and clearly their commitment to public education in each of these documents.

THE EARLY YEARS

In 1809, the territorial law directed the overseers of the poor in each judicial district to launch the schools they deemed necessary for their district and to serve as the trustees. It also allowed them to levy a tax for the support of these “free” schools. The law, however, was not enforced, and, consequently, very few schools were established.

Concerned that no one was taking the initiative in establishing schools, a group of Detroit citizens—the Territorial Governor, judges, and lay people—established the University of Michigania in 1817 to provide for public education for all. In the same year, the Territorial Council voted the first tax appropriation for public education: $300 for a university building and $80 for a site. This academic organization, which would serve the entire territory, was to offer courses in at least 13 fields of knowledge.

The University of Michigania prior to 1820 established primary schools in Monroe and Michilimackinac (Mackinac Island) and a primary school and a classical academy in Detroit. In 1821, the latter became the University of Michigan.

Several years later, in 1827, the Territorial Council passed a law requiring every township with 50 families to employ a schoolmaster “of good morals” to teach children “reading, writing, English, French, arithmetic, spelling, and decent behavior” (2). The law required the schools to be in session for 6 months, financed by a township tax. The law also stipulated that townships with 100 families were to provide schools for an entire year, and those with 150 families were to maintain schools for 6 months, with advanced English taught for an entire year. In addition, it directed that each township of 200 families employ a grammar schoolmaster.

In 1829, the council enacted a law making mandatory the division of townships into school districts. It abolished the township tax but left the primary responsibility for operating the schools in the hands of the people. Parents were charged tuition, and each family was required to provide a portion of the firewood used in the schoolhouse. The parents also boarded and fed the schoolmaster, who received part of his salary in this manner.

Although the tuition was waived for the indigent, the children of the poor seldom attended because, in most cases, the parents were too proud to accept the waiver.

During these early years, the pupils ranged from beginners to boys and girls 16 or 17 years of age. In some districts it was the custom to hold school for 2 or 3 months in the winter and 2 or 3 months in the summer. In such cases, the districts hired a female teacher for the summer session, when only those children too small to work attended, and hired a male teacher for the winter term for the older boys. Unless a teacher could whip the biggest boy in his class, he usually resigned.

In the meantime, a number of individuals and groups in Detroit attempted to organize schools or academies where students could prepare themselves for college work. The Territorial Council issued 12 charters for such schools,
but few were established until after Michigan became a state. In 1829, one did open in Ann Arbor under the name of Merrill's Select School. In advertising for students in a local paper, a typical ad might read as follows:

Select school for young gentlemen and ladies in Ann Arbor village. Reading, spelling, mental arithmetic, modern geography and English grammar at $2.50 per quarter (three months); including writing, practical arithmetic, ancient geography, history, philosophy, chemistry, logic, astronomy, the higher branches of mathematics, composition and declamation at $3.00; including the Latin and Greek languages, $4.50.

The instructors pledge themselves to take a lively interest in their pupils' advancement in knowledge, good habits and amiable deportment; and by a general superintendency regarding the intellectual, physical and moral welfare of those committed to their care, while at their boarding houses as well as at their class schoolroom, they hope to merit, as well as receive the patronage of parents and guardians. Boarding may be obtained at $1.00 per week.

For those who could afford it, this appears to have been a bargain even in those territorial days. However, the Merrill's Select School closed its doors after only 2 years of operation.

The early territorial laws pertaining to education in Michigan established certain important principles, and despite the little accomplished, these principles formed the bedrock for the state's public education system of today. For example, they made clear that education was a function of the state and that public education should be nonsectarian. The first officials of the Catholepistemidad (or the University of Michigania) were a Presbyterian minister and a Catholic priest. These laws established that education should be supported by public taxation and that the state would determine what should be taught in the schools. In fact, the statutes of 1817 specifically state the subjects to be taught in the primary schools and the classical academies. The law of 1827 was also definite in providing for the curriculum.

Although these laws firmly established the principle of local control rather than extreme centralization by the creation of a district system in 1829, the state was given the right to inspect and to supervise schools. The state was even given the right to determine the amount of time each school would be open. In other words, it was established that the school system of Michigan would be an organic whole—the "Michigan idea" included an elementary school, a secondary school, and the University of Michigan, all under unified control.

Two young men from Marshall, Michigan—General Isaac Crary and Reverend John D. Pierce—were leaders in the drive to formally establish public education in Michigan. They met in the early 1830's and, with vision beyond their relatively young years, planned and outlined a system of public education for the entire state. Through their efforts and dedication, the first constitution, in 1835, incorporated several educational firsts. For instance, Michigan became the first commonwealth to have an independent department of education with its own administrator— a state superintendent of public instruction. The constitution also included a section providing for the forfeiture of state financial aid in case of failure to maintain a school for 3 months. Indirectly this clause compelled communities to establish school facilities. And Michigan became the first state to provide libraries in its state institutions.

Territorial Governor Stevens T. Mason appointed Reverend Pierce as Michigan's first state superintendent of public instruction in 1836; thus, the first man in the United States to hold such a position under a state constitution. His friend and co-worker, Crary, entered politics and became a representative in the U.S. Congress, where he served for three terms: 1835-40. Together Pierce and Crary laid the groundwork for a system of public education that became an example for the states in the Middle West and even many in the East.

In 1837, Michigan was admitted to the Union. In his first report to the Legislature, Superintendent Pierce outlined a system of education and a plan for organizing primary schools, a university, and its branches. When granting public lands to this state, Congress had set aside Section 16 in each township to be used for the schools, and Pierce presented a plan for their use. Unlike other states in the Northwest Territory, the Michigan Legislature sold the land instead of turning it over to the individual townships. The money received was placed in the state treasury and designated as the Primary School Interest Fund.

Detroit, already a bustling, dynamic city, took the lead in education. In 1842, the first completely free schools were opened, and 2 years later the Board of Education appropriated $150 and fuel to support a high school. The high school was to admit only 85 students: all boys from the age of 11 up who had attended public school for 3 months and passed an examination before the committee of teachers. Unfortunately, the school did not last long.

The Constitution of 1850 incorporated several important changes. It made the state superintendent an elected official instead of an appointee of the Governor, and he was given general supervision of public instruction. The state superintendent became a voting member and secretary of the State Board of Education, which was given general supervision of the State Normal School in Ypsilanti. The constitution also stated that the Legislature should provide free schools by 1855, but that section was deferred until 1869, when all provisions of the rate bill law (passed in 1843) were repealed.

Although the high school, as such, had long been a part of the system developed in Michigan, it was not until
the celebrated Kalamazoo Case of 1874 that it became in a true sense free and public. The right of the school district of Kalamazoo to levy taxes in support of a high school was challenged by Charles E. Stuart and others, and the case was appealed all the way to the State Supreme Court.

In its opinion, the court stated:

We had supposed it had always been understood in this state that education, not merely the rudiments, but in an enlarged sense, was regarded as an important practical advantage to be supplied at their (the peoples') [sic] option to rich and poor alike, and not as something pertaining merely to culture and accomplishment to be brought, as such within the reach of those whose accumulated wealth enabled them to pay for it.

The court cited the Territorial Laws of 1817 and 1827, as well as the Constitutions of 1835 and 1850, in reaching its decision upholding the right of school authorities (boards of education) to levy taxes on the general public for the support of high schools. It upheld the right of the district to use these taxes, not only to support a high school, but also to provide free instruction to children in other languages than English; it upheld the district's right to offer instruction in the classics and living modern languages. At the same time, the decision substantiated the right of the district board to appoint a superintendent of schools. This case not only benefited Michigan but set a precedent for the support and aid to public education throughout the United States—it was a giant step forward in America's dream of free, public education.

During these early years, the work of the department was to a great extent a one-man operation, although the superintendent was often aided by a secretary and a janitor. Even obtaining adequate office space often proved difficult. Nevertheless, the department exercised influence in curricular matters. The course of study had to be authorized by the Legislature, and the majority of the state superintendents during the first 100 years either supported this policy or did not fight it.

In 1839, the Legislature directed Superintendent Pierce to recommend a list of textbooks to be used in the common schools. He was further directed to publish this list in the state journal of education and to develop a plan to ensure an adequate supply of these recommended books. There was no legal requirement, however, that the schools use them. Superintendent-Elect John M. Gregory, in 1858, suggested that it was not necessary, and perhaps not even desirable, that textbook uniformity be maintained throughout the state. He did think it would be advantageous if all schools in a township used the same texts, and he thought it was essential that a uniform series be used in the same district. The Legislature incorporated the latter suggestion into the School Laws of 1859.

Superintendent Gregory made the first attempt to establish a course of study for the primary schools in Michigan. He believed this would result in more continuity in the school curriculum, establish a definite point of progress, encourage regular attendance, and set some standards for the length of the school year. The Legislature replied in 1861 that it was the duty of each local board of education to determine which texts should be used in the local schools. It passed a law stating that once the books were selected, however, a change could not be made without a majority vote of the people.

For two decades after Gregory's term of office ended in 1865, the state superintendents all favored a state course of study. In 1877, Superintendent Horace S. Tarbell gave his support to a course of study planned by the Michigan Superintendents Association and reported that he hoped to see nine-tenths of the schools working with the uniform curriculum. He suggested that the simplest way to achieve this would be to distribute free, uniform textbooks to all schools. On the other hand, Superintendent Cornelius A. Gower (1878-81) believed that schools with only 10 grades should have a course of study that would prepare them for the common school course of study at the state normal school, and schools with 12 grades should have a course of study to prepare students for the state university. Both Superintendents Varnum B. Cochran, in 1881, and Herschel R. Gass, in 1883, advocated a state course of study to which the student should adjust rather than vice versa. Gass was concerned because less than one-third of the rural schools used the adopted list of books. It was 6 years later before the Legislature allowed school districts to vote on whether textbooks would be furnished free, but the law also specified the subject areas in which these free books would be furnished.

In 1887, the county school examiners pushed for a state manual and course of study, and State Superintendent Ferris S. Fitch incorporated this recommendation and a 30-page manual in his 1890 annual report. Seven years later, the Legislature required the state superintendent to prepare a course of study for district schools. At the same time, a bill was passed providing for a state textbook commission, which would designate the books to be used throughout the state except in those districts where books were free or where citizens voted not to come under the law. This law was repealed the following year on the strong recommendation of Superintendent Jason E. Hammond, who believed that textbook lobbying had been responsible for its enactment.

**FINANCING AN EXPANDED STATE DEPARTMENT OF EDUCATION**

By the turn of the century, the increased responsibilities and demands upon the State Department of Public Instruction were reflected in the additional personnel. In 1900, there were, in addition to the state superintendent, a
deputy, a chief clerk, three statisticians, an editor, three stenographers, a shipping clerk, and a janitor, who also served as a messenger. There were no separate bureaus or divisions. The department functioned in areas of teacher education and certification, teacher examinations, consolidation, improvement of rural education, improvements of school buildings and facilities, financing of education, and courses of study.

State Courses of Study

In 1901, Superintendent Delos Fall stated that he believed each district board should specify the studies in local schools. If, however, it failed to do so, he thought the teacher should have the right to follow the state manual and course of study. Like Hammond, he thought people should not be molded to the course of study. Despite his concern, it was 1913 before the Legislature passed two significant bills relating to textbooks. One, Act 315, required book companies to comply with certain regulations dealing with the quality and uniformity of texts before doing business in the state. Act 23 required school boards, except those in city districts, to purchase for libraries only those books on the list compiled by the state superintendent and the state librarian.

In the mid-1930s, the emphasis changed from a legislative-mandated and department-supported course of study to a cooperative venture in curriculum development involving local administrators, teachers, and the department in more positive leadership roles. In 1935, Superintendent Eugene Elliott appointed a curriculum steering committee to cooperate with the department in planning the state curriculum (7). This committee, consisting of leading educators, was chaired by Paul Rankin of Detroit. Specifically, it was charged with developing activities for achieving the goals developed by the Michigan Educational Planning Commission, officially adopted in 1934 as the state educational objectives.

By 1938, the state's pattern of curriculum development seemed to be established. The program was later expanded and more and more persons were involved. Instead of a single committee, like that which started the program in 1935, several committees were appointed by the state superintendent, and many professional organizations and groups were brought into the program. In 1941, after several revisions, the results were published in a department bulletin (8).

Both the department's administrative policy and the Michigan curriculum program explicitly included the community school concept. The program's bulletin stated that the department was "stretching the evaluation of the present curriculum and has adopted a general administrative policy designed to further the development of community school units and also a functional community-connected curriculum..." (9). The Michigan Cooperative Curriculum Program today has 28 separate committees, with a total membership of approximately 1,000 including department personnel, teachers, administrators, and representatives from business, labor, the professions, industry, church, and government.

Growing Responsibilities

Just as the State Department of Public Instruction changed its participation in curricular matters from operating a legislative-mandated program to developing one in which the department assumes a leadership and cooperative role, so did its other responsibilities grow and change. From 1900 to 1920, although there were no major organizational changes, the department continually added nonprofessional personnel, such as statisticians and stenographers. In 1917, two assistant superintendents were appointed, though their duties were not specifically stated and there were no divisions or bureaus for them to administer. Four years later, there were six assistant superintendents, four of them administrators in rural education, one in charge of the high schools department, and the other in the physical education department.

The Smith-Hughes Act, passed by Congress in 1917, caused the greatest growth in the department up to that time. Earlier, in 1907, the state, anticipating concepts incorporated by the Smith-Hughes Act, enacted Act 189, paving the way for large-scale vocational education. Since the State Board of Education did not satisfy federal requirements for operating the programs, a special board for vocational education had to be formed. This board was not actually a part of the department at this time, but there was a close working relationship. For the first time, four supervisors of vocational education were listed with the department's employees in the 1920 superintendent's annual report.

In 1922, the department created two divisions: the statistical division and the rural education division, consisting of a superintendent of rural education and four assistant superintendents. This was the first time separate units appeared in the organizational structure. Both were apparently formed for administrative purposes; there is no indication that they were developed in response to a new educational need. At the time, the department's staff consisted of 32 professional and nonprofessional employees.

In 1927, the statistical division was combined with child accounting and statistics. Other units operated as divisions, but they were one-employee units and were not listed separately. These included divisions of public school music, physical education, interscholastic athletics, private and parochial schools, and an editorial division. Two years later, in 1929, five employees were assigned to a high school inspection and supervision division. At the same time, the department launched a school public relations program to keep the people informed (10).
During the 1930's, the Depression forced the department to a status quo position. There was virtually no expansion, and because of rigid budgets services were kept to a minimum. In 1934, the department created a bureau of finance and research and a bureau of curriculum and guidance—the first units called bureaus—and divisions of personnel, public relations, and higher education. In the same year, an elementary and rural education division and a secondary and vocational education division were created, but these disappeared from the organizational chart a year later. At the same time, 1935, the bureau of curriculum and guidance became the curriculum research division, and finance became a separate division. The school board counseling division, the child accounting division, and the school plant division were added. Some of these changes resulted from a 40-percent budget curtailment during this money-scarce era.

By 1937, the department began to develop a somewhat different organizational pattern under two major units: general administration and instruction. New units now dealt with special projects which were functions of the department or were just department-sponsored. For instance, in the late thirties, the department created the secondary study unit, the in-service education project, and the teacher education study.

The impact of World War II was felt in several ways. Department personnel went into active military service; replacements were difficult to come by; and, consequently, services had to be limited. Standards for teacher certification were relaxed, and many more special certificates and war emergency certificates were issued in order that Michigan classrooms would be manned with teachers. Enrollment at the secondary level dropped as students of both sexes moved out of school into the war effort. The inflow of families from all parts of the country and the shifting of population toward centers of industrial production overtaxed school facilities in many cities and suburban communities, while at the same time a large part of rural Michigan was practically depopulated.

Peacetime standards in school health, transportation, nutrition, and instructional materials were difficult to maintain. The lack of qualified school personnel, both in teaching and administration, was keenly felt in the operation of schools.

As educational needs and demands changed—increased services, added curriculum requirements, the advent of the space age—the Department of Public Instruction continued to change its organization to meet them. From 1955 to 1965, when the department experienced its most recent rapid growth, there was a trend away from stricter administrative and regulatory functions toward broad service-type functions. This is evident through the development of such units as research, school board counseling, school plant planning, and the curriculum research group. This trend, which began in the mid-thirties, has continued up to the reorganization of 1965.

The 1963 constitution states that all executive and administrative offices, agencies and instrumentalities of the executive branch of state government and their respective functions, powers, and duties, except for the office of Governor and lieutenant governor and the governing bodies of institutions of higher education provided for in the constitution, shall be allocated by law among and within not more than twenty principal departments.

Prior to the 1963 constitution, the different state agencies, departments, and boards numbered more than 100. Article VIII of the constitution in effect established the Department of Education as one of the 20 principal departments.

Consequently, in November 1965, the most sweeping organizational change took place. Since the twenties, organizational changes had more or less followed the elections of the state superintendents, who added staff when they felt the need and when funds were available. They shifted divisions and sections when they thought the work of the department would be strengthened, and they created new units as necessary. Still, many of the previous changes were made with the idea of functional units in mind.

It was the Legislature, however, by enacting Act 380 in July 1965, that moved the reorganization. The reorganization created five separate bureaus with an assistant superintendent over each, and vocational education and vocational rehabilitation were placed under one bureau. Research became a separate bureau, whereas it had previously been a part of general education. The department's functions in relation to the universities and colleges were placed in a bureau of higher education. The State Library became a part of the department. And the name of the Department of Public Instruction was changed to the State Department of Education. By the end of the year, when the reorganization was completed, the department had approximately 1,300 employees.

Financing Education

At the turn of the century, the bulk of public school state funds came from the Primary School Interest Fund and the remainder from local taxes. In 1921, as reported in the Revision of the General School Laws, the major sources of educational support were the following: income from the Primary School Interest Fund (apportioned on the basis of the number of children over 5 and under 20 years of age); the meal tax; district, township, and county taxes; and state aid. State aid, however, constituted a very small amount.

In addition to the general fund, each district maintaining a school for 9 months received $200 annually from the state treasury when the cost of 7 months required a levy of $12 or more per $1,000 valuation. This money
could be used for purchasing textbooks for those who could not afford to buy their own. By majority vote, the department could authorize local boards to use local taxes to furnish free textbooks, to pay tuition and transportation of high school students, and to pay, from the general fund, tuition of pupils in elementary school who were nearer to another schoolhouse than to their own. Money from the general fund could be used to pay for educating the children of the indigent. It also could be used to supplement a county tax for support of county schools of agriculture. The state would apportion two-thirds of the amount actually expended, not to exceed $4,800 for any one school.

The first sizable amount of state aid voted by the Legislature came in 1927 when it passed the Turner Act, appropriating $1 million for poor school districts—the first effort by the state to equalize taxation (11). Two years later, an amendment to the Turner Act provided $2 million out of the general fund to be distributed to school districts having a tax rate of more than 10 mills on each dollar of assessed valuation, and having an average membership in excess of the average for the whole state for each $100,000 of equalized valuation. It stipulated that no district could receive a sum sufficient to bring its tax rate below 10 mills on a dollar.

As already stated, Michigan experienced considerable difficulty in supporting education during the Depression of the 1930's. Some of this was beyond the control of educators and legislators, but part of the trouble can be traced back to an act passed by the Legislature in 1905. At that time, part of the Primary School Interest Fund came from taxes of car-loading companies, express companies, insurance companies, railroad companies, telephone and telegraph companies, and from inheritance and franchise corporation taxes. All this could have been expanded, but the Legislature of 1905 did not do so. By 1930, the interest from the Primary School Interest Fund was paying approximately half the cost of education in the state.

Unfortunately, the local districts were increasingly unable to carry their share of the burden. Enrollments had increased, curriculum had expanded, and during the Depression there was a need for local tax relief. The schools cut back expenses and had to operate with a 15-mill limitation. This in turn cut the Primary School Interest Fund, since much of it was derived from specific taxes that had been reduced. The $24 million available from the Primary School Interest Fund in 1930 had dropped to $14 million in 1934.

The 1933 Legislature attempted to alleviate the schools' financial straits by passing the Thatcher-Sias Act. This legislation directed that two-thirds of the $15 million the act would provide in state aid annually be disbursed on the basis of the number of children on the school census between the ages of 5 and 19. The balance was to be used for equalization purposes. State Superintendent Paul F. Voelker pointed out that this was not enough, since the schools required $25 million above what they received from the Primary School Interest Fund. The schools were already abolishing library services and such subjects as music, home economics, manual training, and health education. They were also having to curtail spending for instructional supplies, teachers' salaries, and capital outlay, and many were forced to cut the school year (12).

When the situation did not change significantly, the 1937 Legislature guaranteed that, beginning with the 1937 school year, $38 million, including the amount from the Primary School Interest Fund, would be appropriated annually. It also ensured $65 in tuition costs for non-resident pupils attending the ninth, tenth, eleventh, and twelfth grades. This mainly benefited those rural students who lived in districts where there were no high schools. The situation was still desperate, so the state aid was increased to $41 million in 1938, and the department asked for an additional $5 million for the next year. This was not realized.

In 1942, Superintendent Eugene B. Elliott requested the state to partially underwrite school building construction. He believed that since the state paid about 50 percent of school operating costs, it should pay something for school construction, especially since the 15-mill tax ceiling made it extremely difficult for schools to finance new buildings.

Four years later, in 1946, Elliott asked the Legislature to examine the entire state program and consider a comprehensive plan that would include all forms of state aid for schools. The following year, the Governor appointed the Michigan Committee on School Appropriation to make a comprehensive study of the program. In May 1948, the Legislature passed Act 26 appropriating $70,291,776, with approximately $14 million earmarked for specific areas and the remaining $46 million to be distributed according to the formula. It stipulated that transportation allowances would be made solely from the state aid appropriations.

During the 1950's, two developments occurred that directly affected state school support. In 1954 the citizens voted for a sales tax amendment to the constitution, whereby schools would receive two-thirds of a 3-percent sales tax collected, after the costs of collecting had been deducted. This was omitted 6 years later when the sales tax was increased to 4 percent, but the amount going to the schools remained at 2 percent.

In addition, the State Supreme Court ruled in the Pittsfield School District case that the term assessed valuation, used in the Tax Limitation Act, was the local assessment as provided or changed or corrected through the statutory process of county and state equalization. In effect, this tended to equalize some of the glaring inequities that existed in the assessment of local property. There was an immediate impact on state aid to schools. In 1954-55,
the total paid to the state public schools was $203,874,530, and 2 years later it rose to $256,642,338—an increase of nearly $53 million!

By 1952, state aid to the schools amounted to $185 million, with $107,800,000 from appropriated funds according to the State Aid Act—$37 million from the Primary School Interest Fund and $41 million from the Sales Tax Diversion Amendment, the amendment that earmarked a specific amount for schools. For the 1954-55 school year, the appropriation was $200 million. Actually, an additional $20 million had been requested to meet the increased enrollment figures and the rising costs. Again, there were not enough funds to operate adequately in 1956-57, and the state superintendent recommended that the appropriation be over and above the amount set aside.

By the time Lynn M. Bartlett became superintendent in 1957, the situation was critical. In his 1956-58 report to the Legislature, he stated:

To educate their children, the citizens of Michigan invested approximately $500 million for operating purposes each year during the biennium. Of this amount, the state's share during 1956-57 was $256,642,338. During 1957-58, it amounted to $258,768,735. The state provides approximately 50 percent of the public school operating costs.

If we consider all monies invested in education during the years 1956-57 and 1957-58—operating funds, capital outlay, and debt retirement—the amount for each year of the biennium comes to approximately $700 million. The state's dollar share in this total amount remains the same as listed in the preceding paragraph. However, the percentage figure for the state's share drops to 36 percent when the total is considered (13).

Superintendent Bartlett also pointed out that operating costs all along the line would continue to increase. He charged that the financial support had not been adequate and that the support for public institutions, "particularly those having to do with education, as compared with the rapid growth of our population and economy, has lagged" (14).

The Legislature continued to revise and modify the state aid funding program, particularly to meet growing needs in specific areas, such as transportation and special education. But unfortunately, the patchwork efforts could not fully meet the problems, and there continued to be a burden on local property taxes. In an address in September 1963, Dr. Bartlett stated:

Two years ago when I spoke to you, I pointed out that if we consider the percentage of all funds (current, building, debt) obtained from local and state tax sources, we would find that during the past several years there has been a definite trend to shift more and more of the financial burden to the local level. This trend has not stopped. In 1950-51 the state was contributing 52 percent. Now we find that this has gone down to some 41 percent. During this same period, local contribution rose sharply from 43.5 percent to more than 55 percent.

During the past year $338 million in school aid, including primary money, was distributed to local school districts by the state for operating purposes. Although this represents an increase of about $34 million over 1961-62, it does not represent an equitable share of the additional revenue needed to accommodate increased enrollments and increasing costs of operation (15).

Again, in his biennial report for 1962-64, Bartlett pointed to the modification in the state school aid formula by the Legislature. Despite these gains, he stated, in most areas the tax rate applied to property had reached the confiscatory level. At the same time, he pointed out that the school-age population was rapidly outgrowing the tax base, resulting in a yearly decrease in valuation per pupil. He pointed to the evolutionary pattern of state support, beginning with the flat grant aid from the Primary School Interest Fund, then the equalizing grant incorporated in the school aid fund, and later some special-purpose grants built into the current school aid formula.

Since the 1963 constitution had discontinued the Primary School Interest Fund, further consideration of the flat grant aid was eliminated. Over the years, the amount school districts received from the Primary School Interest Fund had been incorporated into the total state aid payments. This made a separate payment from the fund unnecessary. In addition, the Primary School Interest Fund money was distributed on a school census basis and not on the actual school membership of the districts. It was argued that this was not realistic, nor did it channel this money into areas of greatest need.

To meet the schools' critical financial needs, Superintendent Bartlett recommended an appropriation of more than $91 million for the 1965-66 school year.

The Legislature, fully aware of the increasing demands throughout the state for additional school support, immediately appropriated $200,000 requested by the State Board of Education for a penetrating study of financing education in Michigan from kindergarten through the twelfth grade. State Superintendent Ira Polley, appointed in 1966, secured the services of J. Alan Thomas, assistant director of the Midwest Administration Center, University of Chicago, who had taken part in recent school studies in Missouri, Illinois, and Ohio. Polley also organized a 40-member statewide citizens advisory committee and a 5-member panel of national consultants to assist him and evaluate the study and its progress (16). The study formally began in September 1966, and a final report and recommendations were presented to the State Board of Education in December 1967.
The study concluded that Michigan students enjoy great variation in educational opportunities, but "critical problems" in financing urban education demand more support from the citizens. Also, compared with many states, vocational education is inadequately supported by state funds; present procedures for financing school construction are costly; and state aid distribution is "overly complex" and not accomplishing the purpose of equalizing educational opportunity. It pointed out that a revenue crisis faces Michigan's nonpublic schools.

The study found that the most favorable educational opportunities were available to students in districts with high per-pupil state equalized valuation, high per-pupil expenditures for education, enrollments of more than 5,000 students, and high social class reflected in incomes, homes, and occupations. Services of well-qualified teachers are not equally available to children throughout the state, the study found; larger school systems have better-qualified teachers, pay higher salaries, and provide more opportunity for teachers to upgrade their knowledge and skills.

To help meet the "severe problems" of urban education where there is a disproportionate degree of low student achievement and high dropout rates, the study recommended setting aside a "sizeable amount" of money, perhaps $30 million a year, which could be directed on a specific project basis. Projects should be aimed at such targets as cutting student-teacher ratios, using paraprofessionals, and increasing in-service education programs for teachers. The study said that all such projects should contain a "rigorous evaluatory process."

The Thomas Study also made several recommendations regarding the operation of the State Department of Education. If educational opportunities in Michigan are to be expanded at a reasonable cost, careful short- and long-term planning is needed. This requires the improvement of data gathering, storing, retrieving, and analyzing, since decision making for the present and planning for the future are based on the available information and on careful projections of future requirements.

The Thomas Study recommended that the State Department of Education expand and strengthen its bureau of research, planning, and development. It stated that the department should be provided with the staff and the computer facilities needed to gather and process information. A central information system, in which the interrelationships among programs, finance, and staffing may be examined, should be the goal of this department. Ongoing attempts should be made by school districts and the state to devise standards and means of assessing the effectiveness of educational programs.

In view of the increased usefulness of the computer as a tool in administration and instruction, the study concluded that strategically located computer facilities should eventually be provided throughout the state. The department should continue to evaluate and revise its data-collection procedures. Once collected, information should be processed electronically, thus ensuring rapid reporting and utilization.

The recommendations further suggested that as part of the planning process, attempts should be made to determine the unit costs of educational programs. Efforts should be made, through appropriate accounting and statistical techniques, to determine the factors associated with the costs of educational programs.

Federal Programs

Michigan entered the Union, as did other states formed from the Northwest Territory, with a permanent source of school support in the lands granted by Congress. The principle of federal participation in the support of public schools is a long-established one. Michigan's original sectional grants amounted to 1,148,160 acres with a valuation in 1937 estimated to be almost $6 million.

The Michigan Constitution of 1835 provided that the moneys of all lands that have been or hereafter may be granted by the United States to Michigan for the support of schools that might be sold or disposed of shall be a part of a perpetual fund, the interest from which, together with the rents of all such unsold lands, shall be inviolably appropriated to the support of schools throughout the state. Following this action on the part of Michigan, Congress in 1836 enacted a law which provided that Section 16 in every township of the public lands shall be granted to the state for the use of the schools. When such section has been sold or otherwise disposed of, other lands equivalent thereto and as contiguous as may be shall be granted to the state for the use of the schools.

It was Superintendent Pierce's idea to provide for state ownership and sale of primary school lands and to disburse the funds obtained thereby as equitably as possible for the organization and support of schools.

As early as it was possible, the Department of Education participated in federal programs. However, it was not until congressional action in 1917, passage of the Smith-Hughes Act for vocational education, that the department made significant increases in staff personnel to handle the impact of federal legislation.

Some 41 years later, reacting to Russia's dramatic achievement in space, Congress passed the National Defense Education Act of 1958. The Michigan Legislature, traditionally reluctant to accept federal financing, did not authorize the Michigan schools to accept funds under the various titles of the National Defense Education Act until late in 1959.

Superintendent Bartlett, long an advocate of federal participation in financing education, moved as quickly as money and personnel would permit to be of service to local districts and to establish a close liaison with the U.S. Office of Education.
Anticipating additional federal programs, Bartlett specifically assigned this area to the general education division. Because of limited department funds, a number of staff personnel, in addition to their other duties, also were assigned responsibility for various titles of the NDEA. From 1958 up to and including 1965, increases in staff to handle federal programs were relatively modest.

Immediately after his appointment as state superintendent of public instruction, Ira Polley established the position of assistant superintendent for federal programs. By late 1966, approximately 25 professional staff personnel were involved either full time or part time in administering federal programs. Primary thrust was increased services to local school districts in order to permit greater participation at the local level. Quite naturally, the demand for consultative help did increase.

The consensus is that the funds provided by the federal government have given impetus to new and already established educational programs. They have enabled the department to move into educational areas that needed greater exploration and emphasis. The funds have been used to strengthen the Department of Education and its operations, giving it greater depth and scope. The state is now participating in all current federal educational programs. Realistically, it can be expected that federal participation will increase in the future and assume a greater share of the support of education at all levels. The department will be prepared to take advantage of the expansion.

SCHOOL DISTRICT ORGANIZATION AND CONSOLIDATION

Consolidation

Until 1900, the organization of the schools revolved around the question of district versus township system. In 1861, the Legislature considered legislation that would have allowed townships to establish school systems. State Superintendent John M. Gregory and his successor in 1865, Oramel Hosford, pointed up the advantages; but it was Superintendent Daniel B. Briggs who discussed the matter in depth. In his 1873 report, under the title “District Versus Township,” he pointed out that the only apparent advantage of the smaller district was convenient access, whereas the disadvantages were many and great. He argued as follows:

Why is it desirable to have thirty-nine or more men in a township chosen for a service (as is true in numberless townships of the State), which six, nine, or twelve will do better? We have an army of school officers in the State exceeding twenty thousand; and it is repeatedly and very naturally urged as an objection to our district system, that the average quality of the officers is inferior, and in many districts where intelligence and character are especially needed even tolerably suited men can not be secured to hold the office; the public money is often times misapplied and wasted if not stolen; the law repeatedly violated, and the schools comparatively worthless. But by enlarging the area of the district a wider opportunity of choice is allowed, a superior average of official character is at once obtained, and more vigor, honor and intelligence is infused into the management of school affairs. But perhaps the most serious objection to the existence of small districts, arises from the difficulties necessarily existing in the way of organization, classification and gradation of schools (17).

Superintendent Briggs added that a township board would be responsible for securing equal school privileges for all of the children in the township. There would be no more schoolhouses built and operated than needed, thus enabling the township to construct better buildings. He believed that individual favoritism or nepotism would not be as likely to control the selection of teachers, enabling particular schools to find better teachers. There would be a uniformity of textbooks and a gradation of schools, leading to a better classification. The township plan would facilitate more effective supervision of the schools. Remote from petty neighborhood quarrels, the board would be more influential and could exercise steadier management. The equitable apportionment of school funds, almost impossible under the present system, would be comparatively easy, as the whole amount would come into the hands of a township board, which would expend the funds discreetly, justly, and for the general good.

It was 1887, however, before the Legislature’s committee on education reported favorably on a bill providing for the township school district. The bill lost by one vote.

The department continued to work for the township system. Actually, some townships had been allowed to form units, and Superintendent Joseph Estabrook tried to win general support for this plan in 1888. The following year, the Legislature again failed to pass an act. But 2 years later, in 1891, it adopted Act 176, which allowed the organization of township districts in the Upper Peninsula. Because of the relatively large geographical area involved, the township plan was deemed the better plan. It quickly caught on, and by 1898, 92 township units had been formed.

Interest waned somewhat until 1908, when State Superintendent Luther L. Wright suggested that this township or unit system would permit employing better teachers, increase the tax base, make more effective teaching tools possible, and allow more scientific studies of agriculture. Essentially, consolidation was a movement for centralization. Even though there was no direct relationship between the two, in actual practice it happened that wherever the township unit existed, consolidated schools also existed.
In 1901, Superintendent Delos Fall had recommended that the number of schools in each township be reduced to four and that a fifth district, in the center of the township, contain a high school. At the same time, he presented an alternate plan to abandon all district schools in a township and have one central school. The Legislature of 1901 passed legislation making it impossible for rural communities to consolidate contiguous districts.

At the turn of the century, Michigan had 7,163 school districts. In his report for 1900, Superintendent Jason E. Hammond stated: "In the first place there are too many school districts, and therefore too many school houses and too many teachers employed.... Our school districts should be reorganized and many of them abandoned" (18).

Three years later, the Legislature amended the School Code so that districts could levy taxes for the transportation of pupils to and from school, and also pay the tuition of pupils who had completed the eighth grade and had to go outside their home districts to continue their education. This legislation aided consolidation in later years, but for the first decade of the century, it did not check the rising number of districts. In fact, the number of school districts reached its peak. Despite the moves toward consolidation, by 1912 there were 7,362 school districts—a gain of 199 since 1900.

Superintendent Patrick H. Kelley attacked the problem and presented his criteria for further consolidation. He stated that "in my judgment, no school in the State of Michigan should have less than two departments and two teachers and in each of these schools there should be a course of study of at least ten grades" (19).

Consolidation could be legally conducted under the Graded School Act, the Township Unit Act for the Upper Peninsula, and the General Township Unit Act, passed in 1909. In 1917, the Legislature enacted the Rural Agriculture School Act, which brought about further consolidation. This act stated:

Three or more rural schools which have been or may hereafter be consolidated and in which the teaching of agriculture, manual training, and home economics shall or may be established as part of the regular courses of study, shall be known as rural agricultural schools and shall be entitled to state aid for the maintenance thereof, if built, equipped, and managed as provided for in this act (20).

As a result, the period from 1912 to 1920 saw the first decline in the number of school districts—7,362 to 7,273. There also was a decrease of 498 districts during the decade ending in 1930: 7,273 to 6,775.

During the Depression, in November 1934, the Federal Emergency Relief Administration sponsored a research project inquiring into the organization of school district government in Michigan. The purpose was to provide data on the ability of the 6,700 school districts to function effectively and to investigate the inequalities of educational opportunities among the children. It also was to investigate the unequal distribution of the property tax for education and to discover effective techniques for reorganizing the school districts. This FERA study prompted Superintendent Eugene B. Elliott to request the Legislature to grant more authority to the state department for reorganizing school districts. The Legislature did not respond.

Elliott's successor, Lee M. Thurston, continued the drive toward consolidation by appealing to educational leaders and lay people interested in education. In his 1946-48 report, he stated:

Educational leaders in this State feel that we need to have local reorganization studied by lay groups with the help and assistance of local professional educators and of the available State services. The principles of self-determination, equality of opportunity and responsibility, and equalization of local and State fiscal support, need clearer recognition of our school laws. The tendency in Michigan to organize around natural communities has borne good fruit and should be encouraged (21).

The following year, in 1949, the Legislature took action to aid school district reorganization. It passed Act 225 to prevent the formation of more township school districts, but provided for "area studies" to assist in reorganization. Essentially, area studies pinpointed the most feasible school district organization plan and outlined the advantages to be gained by reorganization. The Legislature in 1949 also passed Act 248 detailing the procedure for the annexation of primary districts—less than 75 students, eight or less grades, and no superintendent—to graded districts.

By the end of 1954, Superintendent Taylor reported that reorganization was proceeding slowly but steadily and that he was encouraged by factors he believed would contribute to even further changes. For instance, most people in the state now recognized the need for education through grade 12 for everyone. It was evident that larger districts could offer better and broader educational programs, and since there was a shortage of qualified teachers, the smaller districts found it difficult to attract the necessary personnel. He also believed that the people now understood that reorganization created a broader tax base for financing capital outlay, and there was a growing recognition that the equitable distribution of state aid was dependent on adequate school district reorganization.

When Superintendent Bartlett took office in 1957, he continued to work for consolidation. In his 1956-58 biennial report, he pointed out that one of the most serious deterrents to improving public education in Michigan was the existing pattern of local school district organization. The primary school district organization, conceived more
that a century earlier to meet the needs of a frontier society, had long outlived its usefulness. He stated:

I shall never challenge the contribution of America’s rural schools. Rather, I acknowledge the importance of their contribution to our American heritage. But this acknowledgment I make as one who eulogizes that which was important, but has since passed on (22).

Bartlett added that already 88.6 percent of all public school pupils in Michigan lived in 12-grade districts with a total state equalized valuation equaling 90 percent of all school districts. By the end of the decade, the number of school districts had been reduced from 4,918 in 1950 to 2,145.

Superintendent Bartlett realized that if the state was to make a major reduction in the number of school districts, it should make reorganization studies mandatory on an intermediate district basis. There was considerable opposition, particularly from such organizations as the “Friends of the Little Red Schoolhouse” and the Michigan Farm Bureau. They were unhappy with the prospect of losing local control. Despite their efforts, the 1849 Legislature did pass an act in 1964 to incorporate all non-high school districts into those operating K-12 programs. The act also intended to combine effective districts into units capable of offering a comprehensive educational program through grade 12. It provided for a state committee on reorganization to develop the guidelines for the intermediate district committees. The law, Public Act 289, was designed to eliminate non-K-12 districts, though it did not provide for the elimination of inadequate high school districts. As a result of the act, there was a dramatic reduction from 2,145 districts in 1960 to 1,241 on June 30, 1965—a reduction of 904 districts. By May 1968, this number had decreased to 718. Certainly this has led to a broader basis for educational opportunities for Michigan’s youth.

TEACHER PREPARATION AND CERTIFICATION

The Nineteenth Century

In the early days of statehood and the term of the first state superintendent, Reverend John Pierce, certifying teachers was strictly a local matter. The township school inspectors issued certificates good for 1 year and only in the township in which they were needed. There were no age limitations, no special qualifications with regard to educational background or ability to teach, and there was no uniformity in the questions used to determine competency in subject matter fields. By the 1840’s, Superintendent Ira Mayhew objected strongly to this type of certification. He proposed that different grades of certificates be granted as a way of recognizing superior teaching ability and of giving teachers an incentive to upgrade themselves educationally. He further recommended that the state superintendent be authorized to grant certificates valid throughout the state at his discretion.

Superintendent Mayhew was very much interested in improving the quality of teaching by providing opportunities for better preparation. In 1846, he held the first teachers institute in the state at Jackson. At the same time, he attempted to get the Legislature to pass acts providing special schools to prepare teachers. Out of the five attempts to pass legislation during the late 1840’s, two were to establish a separate branch or department at the University of Michigan for teacher education, two were to provide for a normal school, and the fifth was to provide for a normal school instructor (23). But in his 1849 report, Mayhew made it clear he preferred teachers institutes over normal schools. He believed that teachers would not travel to Ann Arbor to study the science of education at the University, but they might attend classes near their homes. Nevertheless, the 1849 Legislature did pass an act establishing a state normal school, which provided for instruction in the art of teaching and establishing a model school. The act also provided for a certificate to teach in the common schools after 22 weeks of classes and an examination.

Francis W. Sherman became superintendent in 1849, but in 1855 Ira Mayhew returned to the office and served until 1859. During this second period, he asked the Legislature to allow graduates to be certified by the normal schools, and in 1857 such a measure was adopted. However, his recommendation that the state superintendent be authorized to grant certificates valid throughout the state was rejected.

John M. Gregory, who replaced Mayhew as state superintendent in 1859, believed that most teachers considered their profession as a stopgap occupation and that they were not likely to spend long periods of time in normal schools. In his first report, he recommended that teaching candidates be well grounded in subject matter fields and that they avail themselves of professional classes offered at academies, colleges, and union schools. At the same time, Gregory suggested that the state superintendent be allowed to give an annual examination and certify each candidate who passed and had completed a prescribed course of study.

But the institutes had proven relatively successful. The 1855 Legislature authorized the state superintendent to draw from the treasury up to $200 for each institute, up to $1,800 for the entire year to operate these programs. In 1861, it reduced the length to 5 days and limited state support to $100 for each. Gregory then formally recommended in 1864 that the Legislature provide additional facilities for educating teachers by establishing normal classes under the strict supervision of the State Board of Education and the superintendent of public instruction. Unfortunately, nothing was done.

It was 1867 before the Legislature permitted the state superintendent to have some authority in certification
matters. This law authorized the county superintendents to examine teaching candidates in certain subjects, and on the basis of the results, the state superintendent was authorized to grant one of three grades of certificates to teach in any primary or grade school in the state. When in 1895 the Legislature repealed the law providing for the county superintendent, it also disposed of the state superintendent's certification authority.

One answer to the problem of securing better teachers was to open another normal school. In 1875, the Senate passed a bill to organize a normal school in the Upper Peninsula, but the House defeated it. One state representative claimed it failed because a normal school principal and his instructors, along with some influential professors from the university, had lobbied against it (24). They argued that another normal school would weaken the one already existing and ruin both. Two years later, the Legislature did strengthen the institutes by permitting fees to be collected from the participants for their support and by allowing the state superintendent to contribute up to $60 if local funds were insufficient. The state superintendent was authorized to hold an annual state institute, at a cost not to exceed $400, to bring together those who were to operate the county institutes in the summer and fall. In 1879, Superintendent Cornelius A. Gower issued the first manual of institute work.

Unfortunately, by this time teachers were not as interested in attending institutes. In 1879, the university detracted somewhat from the institutes by establishing a chair of science and art of teaching. The Legislature felt that this was a step in the direction of broadening the possibilities of teacher training and, therefore, institutes were not needed. By 1885, less than one-third of the teachers were attending institutes, and these were the ones who needed help the least.

The institutes faced even greater competition from the new normal schools. In 1891, a private normal school was founded in Mount Pleasant, and 4 years later it became a public normal school, mainly to educate teachers for the rural schools. In 1899, a normal school was established in the Upper Peninsula at Marquette.

In 1879, the Legislature authorized the state board to hold meetings, examine candidates, and grant 10-year certificates permitting the holders to teach anywhere in the state. It went a step further in 1887, by making the state superintendent responsible for preparing the county examinations. Superintendent Joseph Estabrook, considerably ahead of his time, in 1889 recommended reciprocity and acceptance of life certificates from other states. The Legislature did not act immediately, but in 1893 it did give the state board the authority to certify teachers who qualified for a degree and who had pursued an approved course of study in the science and art of teaching. Two years later, the Legislature finally acted on Estabrook's original suggestion and enacted legislation permitting the state board to certify teachers holding life certificates from other states that recognized Michigan certificates. At the turn of the century, teaching certificates were granted by local school authorities (county certificates), normal schools, the university, and the state board.

Teacher Preparation, 1900 to Present

The Department of Public Instruction's influence on the normal schools increased in 1902, when the state superintendent was designated chairman of a special committee to study their operations from finance to programs. The committee's scope and influence is difficult to determine, because it seems to have operated in the shadow of the Normal Executive Council, which had been organized in 1901 to advise the state board about courses of study and the needs of each institution.

In 1903, the Legislature further strengthened the department's influence by expanding an act passed in 1897 to give the state board the authority to prescribe courses of study for normal schools, to issue licenses and certificates, and grant diplomas and degrees. The state board, in complying with the act, resolved that there should be uniform courses of study so that reciprocity would be possible without loss of credit. It also declared that it would set definite standards for certain certificates and provide for an advanced course of study.

Despite the higher standards promulgated by the state board, Superintendent Delos Fall estimated that about 3,000 inexperienced and untrained teachers were entering the field each year, especially in the rural schools. Greatly concerned, he recommended that the normal schools be taken to the people. The Legislature responded by passing a law allowing each county to house a normal school. This law permitted each county board, the county commissioner, and the state superintendent to select one school in each county as a training center, determine a course of study, set the requirements for admission, and decide the terms for granting certificates to graduates. If the local board agreed to certain conditions, such as providing space, a minimum school year, capable teachers, and an annual report, a school could be organized by a majority vote. The state would grant funds to partially support these county normal classes.

Since the officials did not want students to lose credits if they transferred, they attempted to develop uniform programs for these county normal classes. Superintendent Fall outlined the pattern of organization and the qualifications for admission and established a course of study for a 1- and/or 2-year program. By October 1903, eight counties had opened normal classes with 97 students; 86 completed the program. By the following September, 20 counties had organized classes, with a total of 300 prospective teachers attending; 267 graduated in June of 1905.

Just as the Legislature centralized authority over the normal schools and the State Board of Education, in 1905...
it placed supervision of all county normal classes in the hands of the state superintendent. He could now require the schools to follow his plan of organization, course of study, and various other rules and regulations.

The county normal classes grew at an extraordinary rate. In the fall of 1906, the number of county normal schools had jumped from 20 to 32, with 7 new ones preparing to begin operation. In June 1906, 319 teachers graduated, bringing the total number to 669 who had received 1 year of professional training to take back to the rural schools of the state. This meant that approximately one-eighth of the rural students in Michigan were being taught by teachers trained in the county normal classes and the state normal schools. That same year, Superintendent Patrick H. Kelley reported that the county commissioners were saying, “These classes have improved educational spirit, advanced wages and increased professional spirit ... (the county training class is one of the greatest educational steps taken in Michigan in recent years)” (25).

Superintendent Kelley supplemented the normal school training with active institutes, and his successor, Luther L. Wright, established the pattern which is still used today. In 1906, Kelley ordered that no institute could be planned without first consulting his office for dates and instructors, and the department set about compiling a list of specialists who could serve on the staffs. When they were in operation, a representative of the department visited each of the institutes. By 1909, 195 institutes were being held throughout the state.

The plan was changed somewhat in 1910, as there was a tendency toward the long-term summer institutes. The state normal schools held institutes in which 3,300 teachers attended, and 5,000 participated in two state institutes, one sponsored by the Upper Peninsula Education Association and the other by the Michigan State Teachers Association (26). The 143 county institutes attracted 11,543 teachers. Thus, about 70 percent of the state's teachers attended institutes in 1910.

Both the institutes and normal schools continued to expand. In June 1912, the county normal schools graduated 638 students, to make a total of 5,245 graduates since they had opened. Four years later, there were 49 separate classes turning out 759 graduates. World War I and the immediate postwar years caused many teachers to go into the service or to other fields, and the normal school classes had decreased to 37 by 1922. By the midtwenties, the number had increased to 47, and 1,063 teachers graduated in 1927, bringing a total of 13,866 graduates for the 24-year period of operation (27).

The state played an increasing role in financing the county institutes. In 1903, it had appropriated $250 for each instructor needed to operate a county normal school, with a maximum of $1,000 for any one school. By 1927, these figures were $1,500 and $3,000, respectively.

During the 1930's, the county normal schools were declining. The Legislature had changed the three state normal schools to state teachers colleges in 1927 (28). As these four teachers colleges, the University of Michigan, Michigan Agricultural College, and a number of private colleges were educating more teachers each year, the need for the county normal classes declined. But more important, during the Depression there was a surplus of teachers. The educational programs were curtailed throughout the state, and this led to strong competition for positions and lower teacher salaries. Thus, in 1931, Superintendent Webster H. Pearce discouraged counties that did not need teachers from continuing normal classes. In 2 years, the county normals decreased by 20, and the enrollment declined by 50 percent; in 1932, there were 51, and in 1937, only 24. The Legislature still appropriated $55,000 for the support of these county normal schools (as a department in the office of the state superintendent) in 1939.

The colleges and state institutes received more support during the postwar period as the county normal schools continued to decline. One educational historian stated:

The county normal schools were established for one purpose only—to train teachers for the rural schools. They have performed a valuable service, and have contributed much to the educational advancement of the rural schools during the nearly half century of their existence (29).

In 1948, only 19 county normal classes were held in Michigan. The state appropriated $75,000 for them, but this was a small part of the total state aid appropriation of $70 million.

Like the county normal school classes, the county institutes also reached their peak and began to decline during and after World War II. They have almost disappeared, with only a few counties holding them in the spring. On the other hand, the state institutes continue to be held each fall, authorized by the state board and conducted by the Michigan Federation of Teachers, the Detroit Board of Education, and the Michigan Education Association.

By 1965, however, a great many educators were seriously questioning the meaningfulness of teacher institutes. The state board appointed a 12-member committee, consisting of representatives from various educational and professional organizations, to review the purpose and need for these institutes and to make policy recommendations. Many believe that the local school districts should be given the responsibility, with individual districts determining whether time should be used for in-service training or institutes, or whether any such training should be held.

Certification

At the turn of the century, there were numerous ways for a teacher to earn certification in Michigan. For instance, the
state issued certificates, on the basis of examinations, to teachers who were successful in completing an approved program in a normal school, the university, or one of the denominational colleges. The counties issued four types of certificates, and the county normal training schools offered county normal certificates. Teachers could be certified by the larger schools in the city, and the state board could issue certificates to holders of life certificates in other states. In 1901, the Legislature permitted the state superintendent to issue kindergarten, music, and drawing certificates.

During these early years of the twentieth century, there was a definite move to broaden certification—to grant more certificates on a statewide basis and eliminate the local types. In 1910, the county certificate, which required little preparation, accounted for 27 percent of all certificates issued. Superintendent Fred L. Keeler, in particular, urged the state to adopt a program establishing various grades of certificates based on the length of the training program. He proposed a 6-week program for a third-grade certificate, 12 weeks for a second-grade certificate, and 24 weeks for a first-grade certificate. A year after this recommendation, in 1915, the Legislature did pass a law stipulating that a county could not grant a certificate unless a candidate had at least 6 weeks of professional training.

The urgent demand for manpower during World War I years made it difficult to recruit teachers. Requirements were somewhat relaxed. During the years immediately following World War I, teaching personnel became more available, and there was for a time a status quo situation.

The Legislature carried out the next major step in certification in 1929—it reduced the number of certifying bodies. Certificates could be conferred now only by the University of Michigan, the state superintendent, the State Board of Education, and the county normal boards. To earn a life certificate, a candidate had to take at least 144 quarter-hours of course work, except in special cases where the demand dictated reducing the requirements to fill vacancies. No life certificates could be conferred after January 1, 1930, however, without the candidate's earning 144 quarter-hours of credit. Those who did not have enough college work to meet degree requirements could obtain 3- and 5-year certificates.

During the Depression years, many qualified teachers could not find jobs, and salaries were declining. State Superintendent Webster H. Pearce recommended that the teachers colleges eliminate their short courses, that professional training be limited to the junior and senior years of college, that scholastic and aptitude requirements be established for admission to professional training, and that legislation provide for a probationary period before a person could be granted a life certificate. He also suggested that an accrediting agent be established for the higher education institutes.

In 1933, certificates ranging from 1 year to life were granted by five authorities: the superintendent of public instruction, the state board, county and normal boards, the university, and the vocational education board. That year, the state board created the Planning Commission on Teacher Training and Certification to study the field and give their advice. The commission recommended that all laws allowing agencies other than the state board to certify teachers be repealed, and it also suggested establishing a central system of accounting for certificates to keep a check on teacher supply.

Two years later, in 1935, the Legislature passed—

An act to authorize and require the State Board of Education to prescribe courses of study, issue licenses and certificates, and grant diplomas and degrees in connection with several educational institutions of the State, and to repeal all acts and parts of acts in any way contravening the provisions of this act (30).

Now designated as the sole agency for issuing teachers' certificates, the state board appointed an Extra Legal Advisory Commission consisting of representatives from the teaching profession and Michigan's teacher education institutions. This commission proposed a new certification code which was adopted in May 1936. At the same time, the state board appointed an advisory committee on teacher education to supervise an 8-year study of the new code's impact and the laws in general.

During the 1940's, the state advisory committee received numerous complaints about the certification requirements, particularly that not enough preparation was required. There was a general feeling that a change was needed. In 1953, the advisory committee appointed a subcommittee to draft a new certification code.

The subcommittee, in its initial report in April 1954, recommended a complete revision of the 1939 code. The committee held hearings and meetings throughout the state to get the reactions of teachers and other professional people on the proposed revisions. It finally presented the new code to the state board for its approval in December 1956, but the board rejected it on the grounds that too much dissatisfaction with the revisions had been expressed in the hearings.

The original subcommittee was dissolved, but in 1956, the state board appointed an ad hoc committee to develop a revised certification code. This committee made a tentative report to the board in May 1961, and the board gave it tentative approval. The board then combined the ad hoc committee with the state advisory committee on teacher education to form the State Advisory Commission on Teacher Education and Certification.

The commission held meetings throughout the state to explain its proposals and get the reactions of teachers, school administrators, college faculty members, and other people interested in education. After the state board held a
final hearing in January 1963, the State Advisory Commission reedited the code. The state board formally adopted it that May, and it was sent to the attorney general for approval. Local interest in the proposed code prompted a number of additional hearings, before the attorney general could give his approval. At the same time, there was some question as to the impact of a new State Constitution and a new eight-member State Board of Education, which was to be elected.

Certainly, the state had progressed, but many problems still had to be solved. In 1950-51, approximately 25 percent of the state's 38,000 teachers had master's degrees or higher, but 27 percent did not hold degrees of any kind. By 1963, only 8 percent of the 75,000 teachers employed during the 1961-62 school year did not return to their posts the following year and that the state needed some 3,000 new teachers just to meet its enrollment growth. It was estimated that some 6,000 full-time positions would be filled by teachers holding special certificates, indicating that they had not fulfilled all of the educational requirements for full certification (31).

In 1966, Superintendent Ira Polley invited former U.S. Commissioner of Education Francis Keppel and two of the nation's leading authorities on teacher education and certification, Robert J. Schaefer, dean of Columbia's Teachers College, and Donald J. McCarty, dean of education, University of Wisconsin, to assist Michigan in a comprehensive review and appraisal of the new code. The new state board, which took office in January 1965, carefully considered all of the recommendations and adopted the new certification code in June 1967.

SOME EDUCATIONAL PROGRAMS IN MICHIGAN

Special Education

Even during early statehood, Michigan's leaders declared educational opportunity for all children as one of their goals. In keeping with this philosophy, in 1848 the Legislature approved the establishment of a Michigan School for the Deaf in Flint. Funds were finally made available, and in 1854, under the direction of the State Board of Education, it opened. This school also served blind children until 1879, when the Michigan School for the Blind was established in Lansing.

In 1878, the state established an institution at Pontiac to care for feeble-minded children. Fifteen years later, in 1893, the Lapeer Home and Training School was established as the Michigan Home for Feeble Minded and Epileptic, with facilities for 210 children. The Legislature, in 1899, also provided for educating the deaf with special day classes in public schools other than the Flint school.

In 1915, Superintendent Fred L. Keeler approved the first complete survey of the state's towns and cities in regard to the number and types of youth being served by "special classes." He sent a questionnaire to the superintendents of schools in communities of 1,000 or more asking for statistics on classes and pupils who were backward, delinquent, defective in any way, late in entering school, or exceptionally bright. He hoped to learn what was being done for educating these various groups, and to what extent the teachers of backward and defective children had special training for this kind of work. He also hoped to learn from the superintendents the advisability of forming special classes, not only for backward and defective children, but for the exceptionally bright as well. The returns indicated that the state should do more, particularly in emphasizing teacher preparation in the whole area of special education.

In 1923, as a result of the 1915 survey, the Legislature enacted a law providing for the education of all physically handicapped children—the crippled, the deaf and hard of hearing, and the blind or partially sighted. In his 1929 report, Superintendent Webster H. Pearce outlined a plan for training teachers for the deaf and hard of hearing, the blind and partially sighted, the mentally deficient, and the crippled in the department of special education at Michigan State Normal College at Ypsilanti. This training also would include speech reading for adult deaf persons, and instruction for their teachers.

Until the thirties, most of the progress in special education was centered in the cities. In his 1935-37 report, Superintendent Eugene B. Elliott strongly urged that the entire program be expanded. He stated:

In the case of special education, there has existed for several years an optional program in which the State has reimbursed local districts for the excess costs of conducting classes for certain types of handicapped children, including the blind, partially seeing, deaf, hard of hearing, crippled, cardiopathic, and epileptic. The wording of the Act, however, makes it possible for only the largest cities to avail themselves of its advantages. A change in this law is needed, therefore, (1) to permit the establishment of smaller centers in the less densely populated areas of the State to serve more than one school district; (2) to permit a modified program for isolated cases (the deaf and blind excepted) in which there is an insufficient number of children for a special class; and (3) to extend the benefits as rapidly as possible including speech defectives, those low in vitality, and the mentally retarded (32).

During the next immediate years, special education programs continued to grow, and more and more people became interested. Consequently, during the 1939 session, the Legislature, by amendment, passed a special education
centers to serve surrounding districts. In line with legislative action, the Department of Public Instruction established a section of special education in 1939.

An extralegal advisory planning commission, in cooperation with the teacher-educating institutes offering training in special education, established policies and requirements for the certification of teachers in the field of special education. These were recommended to the state board for adoption in August 1940.

In 1949, Superintendent Lee M. Thurston broadened the scope of the special education work by inaugurating a visiting teacher program. In establishing this program, Thurston stated that “the term exceptional children is applied to those children, who, because of physical, mental, or emotional deviations, need additional services not required by non-exceptional children” (33).

In 1958, Superintendent Bartlett commented in regard to legislative action and support as follows:

It provided for the mentally handicapped individual who has enough potential capacity to achieve some success in a school program adapted to his needs and who, within limited expectations, can make reasonably satisfactory adjustment to his job and in the community. For the child with this type of handicap, consultant service in the regular classroom (Type C) or instruction in special classes (Type A) is available. A separate special class program (Type B) is provided for the mentally handicapped individual, who, at best, can assume only partially his responsibilities in the family and community (34).

The special education programs continued to expand. Broader tax bases and supplementary state aid benefits, in accordance with additional local costs, made possible by the County and Special Education Act, increased not only the number but also the quality of the special education programs. In 1962, Superintendent Bartlett’s pleas resulted in legislation providing for reimbursement to public school programs for emotionally disturbed children under the provisions of the State School Aid Act. By 1966, the special education programs were serving 105,739 youngsters, and the state was investing $30,289,437—about $286 per pupil.

The new eight-member State Board of Education continues to support vigorously increased educational opportunities and training for these youngsters.

**Vocational Education**

Historically, the early concerns for vocational education in Michigan are lost in obscurity. It is known, however, that a private citizen provided funds for the first manual training school to be established in Muskegon in 1897. Educators must have had considerable interest in such programs, as some 40 pages of the state superintendent’s report for 1900 deal with the broadly defined area of manual training. In 1912, Lansing started a cooperative work plan in which the students spent half time in school and half time on the job. And two private gifts made it possible to inaugurate industrial education in Saginaw.

Even before the Smith-Hughes Act of 1917, which gave the real impetus to vocational education, some Michigan schools were offering courses. Lay and professional groups were very much concerned with functional education, particularly in agriculture. Home economics, like agriculture, was a derivative of the manual training movement and resulted from community interest but did not grow as fast as the agricultural programs.

To participate in the funds available under the Smith-Hughes Act, Michigan passed the Tufts Act (Act 189). At its first meeting, held in July 1917, in State Superintendent Fred L. Keeler’s office, the State Board of Control for Vocational Education interpreted the act as applying to “any education the controlling purpose of which is to fit for profitable employment” (35). The board appointed a secretary and designated the state superintendent as the board’s executive officer, in accordance with the enabling act.

Early experimentation in vocational education made it possible for the state to move rapidly. Most of the local programs were already meeting the requirements set down in the Smith-Hughes law. The Legislature almost immediately appropriated state funds to match federal vocational education funds, and a total of $60,544 was distributed to Michigan schools for the 1917-18 school year, $37,593 of it from the federal government. This provided programs for 7,218 students.

The Legislature revised the Tufts Act in 1919 with Act 149, and this still is the controlling legislation for vocational education in Michigan. The number of school districts taking advantage of the federal and state funds for developing and improving vocational education for both youth and adults grew steadily. The federal programs were expanded considerably by the George-Deen Act in 1929 and the George-Ellezy Act of 1934. In 1937, Congress granted additional aid through the George-Deen Act, which provided funds not only for programs already in existence, but also for distributive education.

From 1917 through the war years, the Department of Public Instruction increased its staff as necessary to meet the growing demands in the vocational education area. During World War II years, primary emphasis was on meeting the needs for war production. In 1946, the George-Barden Act supplanted the George-Deen Act, and in 1958, the National Defense Education Act provided funds for training highly skilled...
Manpower Development Training Act technicians in the fields essential to national defense. In 1961 and 1962, the Area Redevelopment Act and the Manpower Development Training Act added to the department's employees and responsibilities. Today, area vocational studies are being conducted to determine the need and to plan for area vocational-technical schools.

Federal funding has played an all-important part in the upsurge in vocational education. The Vocational Education Act, enacted by the Eighty-Eighth Congress in 1963, not only increased the amount of federal funds, but again broadened the scope of the programs. Two years later, Superintendent Bartlett emphasized to the Legislature the growing need for expanded vocational and technical training. He stated:

It is high time that an end be called to the controversy that has existed between those who advocate only the academic side of high school preparation and those who teach in vocational education.

The point of view that looks down upon vocational education and training is unwarranted and detrimental to both kinds of students.

...There have been many who have called for an end to traditional and obsolescent approaches in this area of our education program. They have been asking for new programs, ideas, and attitudes. In Michigan we have recognized the fact that this must be done.

Recognizing the impact of science and technology on all aspects of educational programming, the Department of Education has acknowledged the critical need for updating, broadening, and expanding programs of vocational-technical education. Schools are urged to meet more realistically these new demands and to break with traditional and stereotyped courses.

Michigan vocational-technical education programs strive to provide occupational preparation for all Michigan citizens who need it, including students in public secondary schools; persons who completed or left high school and are available for full-time study in preparation for entering the labor market; persons who have already entered the labor market and who need training to achieve stability or advancement in employment; and persons who suffer handicaps that prevent them from succeeding in the regular vocational program.

Vocational-technical education programs for the above groups of persons are provided by local educational agencies, largely in local school districts, and community colleges. A limited number of programs of less-than-baccalaureate-degree level are offered in a few 4-year institutions of higher education.

During 1966-67, more than 6,000 students were enrolled in high school cooperative programs leading to employment in sales and related jobs, and 675 were enrolled in similar programs at the post-high school level. In the preparatory program, 8,235 high school students were enrolled, and in post-high school programs, 3,157. In the same period, 6,575 high school and 662 post-high school students were enrolled in cooperative office education programs. In addition to these, 18,677 adults and out-of-school youth were enrolled in adult preparatory programs in sales and marketing, and 5,870 were in preparatory office occupations programs. These programs were operated largely by local school districts.

Home economics education classes enrolled 62,687 high school students, including a small percentage of boys, plus another 17,300 persons in adult programs. Home economics was extended by the Vocational Education Act of 1963 to include the preparation of persons at all educational levels for employment in occupations requiring such knowledge and skills. In 1966-67, 35 communities enrolled 1,390 high school students and 25 adults in wage-earning classes in seven occupational fields.

Programs in agricultural education provide high school and post-high school preparation for production farming and for related occupations which require knowledge and skills in agriculture. In 1966-67, agriculture programs were offered in 198 high schools and 3 post-high school institutions, including Michigan State University. High schools enrolled 11,815 students, 1,113 of whom were in off-farm occupations on a part-time basis during the school year. Some students in this group were employed in off-farm occupations and also conducted farm-based enterprises outside of school hours. Local school districts operated programs for young and adult farmers in which 1,196 persons were enrolled, and two community colleges and Michigan State University offered 1- and 2-year post-secondary programs in eight specialized areas in agriculture.

In 1966-67, 265,480 students participated in various vocational education programs at a cost of $12,242,098, more than 85 percent of which came from the federal government.

**Vocational Rehabilitation**

In 1920, Congress passed Public Law 236, establishing a vocational rehabilitation program by making funds available to the states on a 50-50 matching basis. In order for Michigan to take part, the following year the Legislature enacted Act 211. Although an independent program, it was placed under the auspices of the State Board for Vocational Education.

From 1920 up through World War II, the vocational rehabilitation division remained as a part of the vocational education operation of the department which was able, with a relatively small staff, to handle the work that was required.

During World War II, in 1943, Congress passed Public Law 113, which essentially broadened the services and eligibility under the rehabilitation programs. Two years...
later, in 1945, Superintendent Eugene B. Elliott established a vocational rehabilitation section, equal in status to vocational education, and appointed a director.

The Legislature gave increased attention to vocational rehabilitation. In 1974, more funds were voted, and the program was broadened by Public Law 565. In 1965, Public Law 333 enabled the state to participate in a program which upped federal financing to 75 percent (3 federal dollars for every state dollar) and provided funds for constructing facilities, such as sheltered workshops, rehabilitation centers, and community workshops.

During its first year of operation, there were only two employees in the vocational rehabilitation program; in the second year, six. As of 1968, there were nearly 700 professional and staff people engaged in this important work, serving more than 25,000 persons. Almost $13 million is being invested in such programs.

The growing importance of vocational rehabilitation as another means of making a positive investment in our human resources is becoming more obvious each year. It offers a new opportunity and a new lease on a full, productive life for those who have physical or mental restrictions, who might be disabled, who might not have marketable skills, or who may be unemployed.

Future expansion by the Department of Education into this service area will be needed if all who might benefit are to be reached.

CONCLUSION

The State Board of Education believes that education is an investment in people, in social progress, and in scientific, industrial, and economic advancement. It believes education today is the most essential and critical factor for the continuing existence of our free and democratic way of life. It takes the position that our public schools must remain a leading, dynamic force in the development of the kind of society that respects the individual, that has a high regard for humanity, and that has a deep, sincere concern for social problems and issues. Only in such a society can human resources be fully developed, and only if our human resources are ensured maximum development can such a society flourish.

President John F. Kennedy, in his special message to the Congress on education, January 29, 1963, stated:

In all the years of our national life, the American people—in partnership with their governments—have continued to insist that "the means of education shall forever be encouraged" as the Continental Congress affirmed in the Northwest Ordinance. Fundamentally, education is and must always be a local responsibility...in our present era of economic expansion, population growth and technological advance, state, local and private efforts are insufficient. These efforts must be reinforced by national support, if American education is to yield a maximum of individual development and national well-being (37).

For Michigan education, the future holds many promises and tremendous opportunities. There is much that must be done if Michigan is to continue in the forefront of educational leadership. The State Department of Education is dedicated to this goal.

STATE SUPERVISION OF EDUCATION PRIOR TO 1900

The evolution of the role of state supervision was slow and deliberate. To the pioneer, so dependent on his own individual initiative, there was something suspicious about educational supervision from an office far removed from his neighborhood schoolhouse. The eminent Minnesota historian William Folwell stated:

A study of the subject of state supervision of schools [in the early years of statehood] leaves the impression that for a long time the people of Minnesota wanted as little of it as possible and that they later grudgingly tolerated its expansion as school funds requiring guardianship increased (1).

Territorial Days

In 1849, the Territorial Legislature enacted the first law pertaining to education: Common schools were to be open to all persons between the ages of 4 and 21 years, and townships were to be divided into school districts when the districts contained more than five families. To support the schools, the law levied a general tax of 2.5 mills and supplemented it with 15 percent of the funds collected from liquor licenses and fines for criminal offenses.

This history is the result of extensive help and cooperation from a large number of people, the names of whom are too numerous to mention individually. However, because of assistance well beyond the call of duty, special thanks go to T. C. Engum, retired staff member, who was formerly chief of the elementary and secondary school section; E. Raymond Peterson, assistant commissioner for instruction; August W. Gehrke, assistant commissioner for vocational rehabilitation and special education; members of their staffs; and Dean M. Schweickhard, former commissioner of education. Additional thanks go to staff members at the library of the Minnesota Historical Society and to countless others who kindly volunteered information and advice, both oral and written, to aid in the writing of this document.

But formal education developed slowly—in 1851, there were only three schools in Minnesota, enrolling a total of 250 children. It was not unusual in these early years for the school year to be as short as 3 months. Most schools included courses in reading, writing, geography, and some form of mathematics. The teachers' salaries averaged $13 a month for women and $21 for men (2).

Edward D. Neill, a Presbyterian minister and one of the ablest educators in the territory, was appointed the first of four territorial superintendents of public instruction in 1854. His annual salary of $100 was hardly enough to support a man and his family. When he resigned 2 years later, finding a successor was difficult; the Territorial Governor announced in his 1856 annual message that the superintendent had resigned and that he could not find anyone who would take the office at $100 a year. The following year a St. Paul lawyer agreed to take the position on a part-time basis (3).

From Statehood to 1900

Minnesota became a state in 1858, and 2 years later, the Legislature stipulated that every township would be a school district. The town supervisors were appointed school trustees ex officio, and the town clerks and treasurers were named the school officials. This township plan lasted only a year, however, for, in 1862, the Legislature adopted the so-called neighborhood plan, which firmly established the district system of public schools—a system still in existence today.

Educational progress in the early statehood years was substantial compared to the slow development during territorial days. In 1868, Governor William R. Marshall reported that Minnesota had more school buildings than any other state with comparable population and taxable property (4). In the first decade of statehood, the emphasis was on two extremes: the common school for those who desired only the basics, and the university for those who desired an extensive education. Since usually only the well-to-do could afford the luxury of a college education, there was a real need to develop a systematic and comprehensive intermediate program. Thus, in 1872, Superintendent Horace B.
Wilson appointed a special committee to plan a course of study for the high school, frequently referred to as "the people's college." Wilson also directed the committee to study a way to establish a curriculum that would provide better preparation for those who would attend a college or university.

Superintendent Wilson's dream of a realistic high school program was realized in 1878 when the Legislature enacted the first law recognizing the need for high schools: It appropriated $400 annually to each high school maintaining a minimum course of study. To enforce these regulations, the act established a high school board consisting of the superintendent of public instruction, the president of the University of Minnesota, and a third member to be appointed by the Governor.

This was the beginning of state supervision of high schools, although it is to be noted that supervision extended only to schools that desired to be placed on the "accredited list" and to receive state aid. At first there could not be more than three state-aided high schools in any one county, but later this number was increased to five (5).

Originally, the high school board assigned the duties of inspecting these high schools to university faculty members without compensation. However, this was later changed, and a full-time inspector was hired.

The Legislature made another early effort to exert some control over the public schools' curriculum by conferring power on a board to recommend a list of textbooks for the schools. The state had been overrun with book agents in the 1860's, and it was clear that some form of regulation was necessary. To prevent chaos, Superintendent Mark Dunnell urged the Legislature to set up a textbook commission to select books and ensure minimal costs. But prices did not fall substantially. There were charges that a "textbook ring" operated in the state and that textbook profits ran 100 percent or more.

In 1877, at the height of the textbook controversy, Daniel D. Merrill of St. Paul offered to supply the state with textbooks for 15 years at one-half the usual price and to put up bond to ensure his contract. State Superintendent David Burt vetoed the offer, but nonetheless the Legislature enacted it in 1877. It was later charged that the books were cheap in quality as well as price.

Establishment of the Office of State Superintendent of Public Instruction

When Minnesota became a state in 1858, one of the first legislative acts provided for a state superintendent of public instruction. The Legislature named former Territorial Superintendent Edward D. Neill to the position in April 1860; but in May 1861, he resigned to become chaplain in the First Minnesota Regiment. Neill later became the first president of Macalester College. B. F. Crary, who succeeded Neill, resigned in 1862 to become chaplain of the Third Minnesota Regiment.

When the Civil War began to drain the state financially, there was an effort to economize. The Office of the State Superintendent of Instruction was abolished. His duties were turned over to the secretary of state, who performed them under protest until 1867, when Mark Dunnell was appointed state superintendent. Dunnell served until 1870, and it was during his term that the textbook controversy reached its height.

In 1870, Horace B. Wilson, a professor of mathematics and a former county superintendent of schools, was named superintendent of public instruction. During Wilson's 5-year term, the office expanded greatly in scope and in prestige. He was succeeded by David Burt, who resigned in 1881.

In 1881, David Kiehle, the principal of the state normal school at St. Cloud and a former county superintendent, assumed the office. Kiehle served for seven consecutive terms, the longest period of service of any superintendent up to that time. A foresighted educator, he did much to improve education and to correct some of his office's obvious weaknesses. Among other things, he established a system of summer training schools for teachers. As a regent, a position held by all state superintendents of public instruction in these early years, he formulated the plan for the University of Minnesota's School of Agriculture.

In his biennial report for 1883-84, Kiehle called attention to the large number of children not attending school (6). He recommended specific legislation dealing with this serious situation, and the following year, the Minnesota Legislature enacted a measure requiring every parent or guardian of a child between the ages of 8 and 18 to send him to a public or private school for 12 weeks each year. Disobeying the law was considered a misdemeanor. Its weakness, however, was in the exceptions allowed. In cases where the parent or guardian was too poor to clothe the child, when the child was physically or mentally unable to attend school, when the child was being taught at home or had already acquired the ordinary school training, or where there was no school within 2 miles of the home, school boards could grant excuses. More often than not the children did not attend school. A parent who needed them for work on the farm was usually not reluctant to stretch the truth somewhat to keep the children home. The Act of 1885, therefore, was actually little more than an expression of sentiment.

In 1893, Kiehle resigned, and William Pendergast assumed the duties of state superintendent. Pendergast, a former assistant superintendent of public instruction in the Department of Education, was at the time of his appointment principal of the School of Agriculture of the University of Minnesota.
Under Superintendent John Lewis, who was appointed in 1899 to succeed Pendergast, two significant developments occurred. First, at Lewis’ suggestion, the Legislature passed an act designed to strengthen the compulsory attendance law. It authorized school boards in cities and large villages to appoint truant officers with power to arrest truants, take them to school, and file complaints against their parents or guardians. This attendance law also had its weaknesses: It did not affect the smaller villages and rural areas, where the majority of children lived; and the act prescribed no definite procedure for its enforcement. Many children still remained out of school at the turn of the century.

A second significant development in Minnesota education during Lewis’ term dealt with teacher qualifications. Prior to 1899, there were no meaningful requirements for the preparation of teachers. Frequently a classroom was staffed by someone with almost no education, and there was little the Office of Public Instruction could do to require much more. But in 1899, the Legislature required that prospective teachers take an examination prepared by the Office of Public Instruction and that, upon satisfactory completion of the test, the teacher be issued one of three certificates, depending on academic and professional preparation.

The primary duty of the state superintendent during the nineteenth century was the annual apportionment of interest from the school fund and the state school tax to the counties. Additionally, he classified schools according to law, regulated the examination of teachers and issued certificates, established specifications for school buildings, and approved all plans for school construction. As a direct result of the general mistrust of state supervision of schools, the state superintendent did not have the duty of supervision of the schools assigned to him. Instead, the duty evolved as a result of state aid to schools.

Financial Aid to Schools

The story of state financial aid to education prior to 1900 was one of sporadic assistance enacted only after it became clear that without such aid education in Minnesota could not progress. The State Constitution provided for a permanent school fund to be derived from the sale of lands granted by the United States for the use of schools within each township, the sale of swamp land, and other cash and investments. The interest from that fund was to be distributed according to the number of school-age children in the district. By 1877, the fund had grown to nearly $3.4 million, the fifth largest school fund in the United States.

In 1885, the Legislature made two important steps toward state financial aid to schools. First, the mode of distribution of funds from the permanent fund was changed: It would be made in proportion to the number of pupils actually in attendance at a school and not according to a census of school-age children in the district. Second, the Legislature proposed a constitutional amendment that would authorize loans from the fund for county and school buildings. The amendment was authorized by the voters in 1887.

As mentioned earlier, the first state aid to education, per se, came in 1878 with the distribution of state moneys to high schools that maintained a minimal program. After that legislation, it was not until 1895 that aid was granted to other schools. Legislation in 1895, 1897, and 1899 provided for grants of some type to practically every public school in the state. However, it must be noted that the aid was initially inadequate to meet the needs of the schools; more substantial aid was to come after the turn of the century.

ORGANIZATION OF STATE SCHOOLS

In the early days of the territory, the Legislature provided that every township with five or more families establish a school district. But because the township was considered too large and cumbersome for operation of a school, and because the early pioneers wished their schools close to their places of residence, the county commissioners in 1851 were allowed to establish smaller school districts, disregarding the formerly used township lines. In retrospect this was an unfortunate move, for the establishment of the so-called “neighborhood common school” brought on a proliferation of school districts, most of which were inefficient, inadequate to the educational task, and financially unable to support education. Today there are many educators who maintain that if the state had continued with the larger township organization, Minnesota would not have experienced as many consolidation and reorganization problems in later years. In general terms, today’s common school district in Minnesota is much the same as it was many years ago. It is usually a one-room schoolhouse with an average of about fifteen pupils.

Recognizing that areas of significant population density should have greater control over their schools, the Legislature in 1865 granted incorporated cities, towns, and villages the right to establish independent school districts, a second major form of district organization. Not only were the districts authorized to establish high schools, but they were given greater authority in electing school boards and more direct control over education in their areas.

At the request of several villages and cities, the Minnesota Legislature early in the state’s history enacted legislation establishing special school districts, a third major form of district organization. The reasons these areas desired a special classification were numerous. Primarily, however, special district classification provided for closer supervision by the local city government, permitted the districts to rule by their own charters, and gave them a degree of
independence not available to other school districts. At one time there were about fifty special charter school districts, and the result was less than effective. Educational progress in these districts was often lacking because legislation regarding them was not uniform. Legislation applying to independent school districts (which constituted the vast majority of districts) did not always apply to the special districts; thus, unless the state lawmakers took special action for them, the special districts were not affected by legislation aimed at educational improvements.

The number of special districts has gradually decreased for several reasons. Most significantly, a special district may not annex property outside the city or village limits. Growth of the school district, therefore, is tied to the often slow expansion of the city boundaries. Additionally, a constitutional amendment ratified by the voters in 1892 prohibited further special charters for school districts. In 1892, only five special districts remained, and this number will decrease further in the next few years.

If one educational issue in Minnesota could be designated as that which stirred up more controversy than most others in the past 20 years, it would be school consolidation. At the turn of the century, there were about 8,000 school districts in the state, a number with which the small staffs in the Office of Public Instruction and the high school board found it difficult to maintain any semblance of contact. Thus, after much urging by several state superintendents, legislation was passed in 1901, 1903, and 1905 enabling various forms of districts to merge. But efforts in these early years of the twentieth century failed. Only a few districts merged, and by 1913, there were still 7,900 districts. One deterrent was the farmers' concern that consolidation would mean higher taxes.

It was left to Governor A. O. Eberhart to exert sufficient influence to obtain meaningful legislation affecting school district consolidation. Eberhart, a product of a one-room schoolhouse, felt that his educational experience was less than adequate.

He feelingly recalled the old school with its little one-room building, bare walls, benches, wooden bucket and dipper, its narrow course of inferior teaching, its unattractive and unsanitary construction, and pleaded with the legislature for state aid to encourage consolidation.

Noting that there were more than 2,000 one-room schools with less than 21 pupils, and another 300 with less than 11 pupils, the Governor contended that unless legislation was soon enacted, educational improvement would continue to be dangerously slow.

In 1911, primarily due to the Governor's urging and backing from the Office of Public Instruction, the Legislature passed a new law offering a financial incentive to newly consolidated districts. They were offered one-fourth of the cost of erecting a building and were granted annual aid up to $1,500 a year if the school met 8 months of the year and supplied transportation for pupils living long distances from the school building. In the next 5 years, 170 districts consolidated, representing a remarkable achievement in light of past progress.

Nonetheless, progress in reducing the number of school districts was not adequate. From 1915 to 1947, there was no legislation of significance aimed at decreasing the number of districts. Undoubtedly such events as World Wars I and II and the Depression preoccupied educators and legislators with more immediate needs. Whatever the case, it was not until 1947 that further consolidation again became a major educational goal. In that year, when there were still 7,679 districts, the Legislature enacted a law that provided for the appointment of a state advisory commission on school reorganization by the state board. The commission was given the power to serve in an advisory capacity to the commissioner of education in conducting a program of district reorganization. In addition, local survey committees were created to formulate recommendations for reorganization to be submitted to the people in a referendum. The first election under this program, held in December 1948, merged nine districts into one administrative unit with offices in Roseville, Minnesota. The primary weakness remained, however, in that reorganization and consolidation were voluntary.

The first mandatory reorganization legislation was enacted in 1963. It provided for the automatic dissolution of all nonoperating school districts that did not join a district maintaining a high school. On the whole, the legislation was a success; most nonoperating districts voluntarily joined a so-called high school district. However, it was not expected that so many nonoperating districts would join common school districts maintaining only elementary schools. This development deferred and often complicated the later establishment of desirable school districts.

By July 1965, there were 1,742 districts, a decrease of more than 5,800 in an 18-year period. Parenthetically, late in 1965, the Department of Education was formulating plans to present a proposal to the 1967 Legislature that would require a district not offering secondary education to merge with a district maintaining secondary schools. Such a plan emanated from recommendations of the state advisory commission in reports to the Legislature in 1961, 1963, and 1965. Despite dissent by supporters of the more than 900 common school districts that would be affected by such legislation, the department became firmly convinced of the importance of this legislation in providing the education needed by Minnesota's pupils.

ORGANIZATION OF STATE DEPARTMENT OF EDUCATION
At the turn of the century, state supervision of education in Minnesota was relatively unorganized and disjointed.

EDUCATION IN THE STATES: HISTORICAL DEVELOPMENT AND OUTLOOK
Coordination of effort among the multitudinous agencies was difficult, if not impossible. Duties and powers were divided among the public instruction office, the high school board, the normal school board, the state library commission, the board of special schools, the county superintendent's offices, the local school districts, and others. It was left to Governor Van Zant, a forward-looking chief executive, to propose a remedy. In 1901, the Governor suggested that a State Board of Education be established to achieve a unity of supervision designed to promote greater efficiency and economy. Members of the board, under the proposal, would include the superintendent of public instruction, a representative of the university, a representative from the normal schools, and a person chosen by the rural schools. However, by 1912, the Legislature gave little consideration to the proposal.

It was clear that unless a more concerted effort was made to promote the idea of a state board, the proposal would not win the approval of the Legislature. Thus, in 1912, the Minnesota Education Association proposed that the Legislature appoint a committee to study the state school situation and to draft a new school code. The committee was formed the following year and in 1914 it issued its report. The central theme was clear: The state needed unification of its educational effort. As expected, it was recommended that the Legislature create a State Board of Education responsible for the duties and powers held by the public instruction office, the high school board, the normal school board, the state library commission, and the board for the special schools for the deaf and blind.

In spite of the report, however, the Legislature did not act for 5 years. In 1919, with only slight opposition, a state board was established consisting of five members. Under its jurisdiction were all educational institutions except the normal schools and the university. To administer and enforce all school laws, the board was empowered to elect a commissioner of education for a 6-year term. This executive officer was given the responsibilities of safeguarding the school funds, administering the education department, and nominating all its officials and employees.

The same Legislature directed the state board to serve as the State Board of Vocational Education. The action came on the heels of the creation of a division designed to train and instruct persons injured in industrial accidents. The new division was to cooperate with the department of labor and industry as well as federal agencies. The initial appropriation for the training and instruction program was $15,000.

Organization of the State Board of Education remained virtually unchanged until 1951, when the Legislature added two members to the board and extended terms to 7 years. Shorter terms tended to leave the board open to undue influence by a governor reelected for several consecutive terms, thus enabling him to appoint a majority of its members.

The State Board of Education has broad powers over the development of education in Minnesota: It administers, through the commissioner and the department, all laws relating to the public schools, libraries, and public educational institutions, including the educational programs throughout the state; supervises the payment of various school aids; submits to the Governor and the Legislature an annual education budget; and prescribes rules or regulations relating to all plans of education. The Legislature has directed that it meet annually on the first Tuesday in August and hold quarterly meetings and special meetings as it deems necessary; it also meets periodically as the Board of Vocational Education.

Commissioner of Education

The executive secretary of the State Board of Education is the commissioner. His role has evolved from one of general weakness to growing influence on the state's educational effort. The Legislature of the early Civil War years abolished the Office of Public Instruction, claiming that such action would not hinder the educational program of the state. When the office was restored in 1867, it remained one of gathering and reporting statistics, and its powers did not exceed the duty to make recommendations to the Legislature concerning needed improvements. The weakness of the office was not surprising when one considers the diffuse authority delegated to it. With educational responsibilities divided among many agencies, it could hardly be expected that the superintendent could exert significant influence.

It is indeed fortunate for the state department that the first commissioner, under the organization of 1919, was James M. McConnell. Throughout his administration, Mr. McConnell provided the guidance needed to nurse the infant organization to adolescence. He served diligently until his death in 1933.

When McConnell died in the second year of his third 6-year term, the Board of Education elected E. M. Phillips, a staff member who had been with the department since 1911. However, the strains of office made extraordinary demands on his health, and after only 1 year in office he resigned. In August 1934, the state's third commissioner was appointed to complete the still unexpired term of the late Mr. McConnell. By a 3-2 vote, John Gunderson Rockwell, a professor of psychology at the University of Minnesota, was appointed to serve until 1937.

In 1937, Commissioner Rockwell was reappointed to another 6-year term, which he never completed. The next 3 years were the stormiest in the history of relations between a board and a commissioner of education. Primarily because the composition of the board changed, frictions developed. The differences were kept largely in the background until 1940, when the board dismissed the director of vocational education, Eugene Debs Carstater, as not qualified to hold
the job. Rockwell protested the action. Moreover, the commissioner felt that the board added insult to injury when it appointed Harry Schmid as acting director. Rockwell maintained that Schmid did not meet his approval, but the board overruled him (10).

Further dissension occurred in November 1940, when the board abolished the position of nursing education analyst in an effort to save money. Rockwell called this false economy as much of the salary was financed through federal funds. Again he made no headway (11).

At several subsequent meetings the schism became deeper as the board and Rockwell clashed over such things as out-of-state travel expenses for department employees, which he thought to be exorbitant, and procedures in reviewing projects, in which he felt he was being bypassed.

The parting of ways came late in November 1940, when, in the presence of Rockwell, board member Mrs. Raymond M. Gould moved the adoption of a resolution suspending the commissioner for actions "inconsistent with the duties of his office" (12). H. E. Flynn was appointed acting commissioner, and a hearing for the suspended commissioner was set for December 1940.

Litigation surrounding the dismissal continued for most of the first half of 1941. In September 1941, after lawyers for both sides had submitted briefs, the board issued its final and formal order of dismissal (13). After unsuccessful appeals to the district court and to the Minnesota Supreme Court, the litigation ended.

It probably will never be fully known what prompted the action against Mr. Rockwell. Certainly some personalities were incompatible with others. But there are those who claim that the commissioner was the victim of political changes in the statehouse; others claimed that he was "used" by those surrounding him. Whatever the reason, the entire incident is still viewed as an unfortunate blot on the otherwise cordial relations that have existed between the board and its executive officer.

When Commissioner Flynn resigned in 1943, the State Board of Education elected Dean Schweickhard, who had served in the department until 1930 when he left to become assistant superintendent of schools in Minneapolis. He eventually served as commissioner for 18.5 years, the longest term of service of any chief state school officer in Minnesota's history.

Commissioner Schweickhard's years of service are marked by their quality. His wide training, interests, and involvements equipped him to make an indelible impact on education throughout Minnesota and the Midwest. Since his retirement in 1961 at the age of 69, he has received numerous calls to action on the expanding frontiers of education in Minnesota, all of which he has dutifully answered and effectively fulfilled.

E. O. Johnson succeeded Dean Schweickhard as the sixth commissioner. He served until 1964, when he accepted the superintendency of schools at Anoka, Minnesota. The present commissioner, Duane Mattheis, was named to succeed Johnson. Mattheis was superintendent of schools at Owatonna, Minnesota, at the time of his appointment.

Today the commissioner holds a vital position in state education. Through the years he has been given the powers and duties that have provided for an educational system more highly organized and better prepared than ever to meet educational problems. He is administrative head of the State Department of Education, secretary and executive officer of the State Board of Education, member and secretary of the State Board College Board, member of the Board of Trustees of the Minnesota Teachers Retirement Fund, secretary and executive officer of the State Advisory Commission on School Reorganization, a member of the Equalization Aid Review Committee, member and secretary of the School Loan Committee, member of the board of the Minnesota State High School League, member of the Minnesota Liaison and Facilities Commission for Higher Education, and an adviser to the Youth Conservation Commission.

State Department of Education

Fifteen years ago, Beach and Gibbs described three stages of development of most state departments of education: statistical, inspectorial, and leadership (14). Though the Minnesota State Department of Education still maintains all these functions, it is safe to state that the department has experienced the evolutionary process described by Beach and Gibbs.

During the early years of the department, perhaps until about 1900, the gathering, compilation, and reporting of statistics seemed to be the main preoccupation of the Office of Public Instruction. Unfortunately, lack of an adequate staff prevented the office from doing little more. At the turn of the century, there were only two members on the professional staff, the superintendent and an assistant. The several clerical members of the staff and a multitudinous number of duties related to the gathering of statistics.

Although the compilation of statistics has never ceased to be a function of the state educational agency, it slowly became a secondary function following the turn of the century. With the employment by the high school board of an "inspector," efforts were exerted to enforce rules and regulations. In the early 1900’s, the inspector's reputation was one of a dictatorial, uncompromising "snooper," and many administrators in the outlying districts exhibited a negative reaction toward him.

Without discarding the functions of statistical gathering and inspection, the Minnesota Department of Education has gradually assumed its current primary role, leadership. In this stage, the department has become increasingly concerned with not only ensuring minimal standards for
schools, but also using its influence and expertise in improv-
ing schools to greater levels of excellence. Such a turn of
events has necessitated the increased use of experts and
specialists in education and within the department.

At the time the Board of Education was organized in
1919, there were six divisions in the new department: rural
schools, high and graded schools, building and sanitation
and special classes for defectives, libraries, employment
bureau, and reeducation and placement of injured persons.
The total number of professional staff members was 20,
and 10 years later the number had increased to 30.

By 1936, it was clear that some form of reorganiza-
tion would be needed; the number of divisions had in-
creased to 13, each with a director directly responsible
to the commissioner. It was becoming impossible to maintain
meaningful contact with these numerous directors (15). By
1938, reorganization had reduced the number of divisions
to eight.

From 1943 until 1951, Commissioner Dean
Schweickhard instigated numerous changes in the structure
and organization of the department, but, by 1951, it was
again clear that a major reorganization would be needed to
keep pace with the changing structure brought about by
major curriculum changes and a rapidly increasing enroll-
ment. The new organization provided for six divisions:
ungraded elementary schools, graded elementary and
secondary education, business and legal, teacher personnel,
vocational education, and vocational rehabilitation. Three
years later, the number of divisions was reduced to five by
combining the ungraded elementary schools with the
graded elementary and secondary education division.

The last reorganization of major significance occurred
in 1957. After considerable study by the commissioner and
the board, the department was reorganized into three divi-
sions as to—

1. Give increased emphasis to basic education and
the fundamental subjects of English, science, social studies,
mathematics, reading, and writing.

2. Provide more effective use of state aid by increas-
ing the amount of high-level management in the department
and including positions long recognized in good school
administration for all school systems of the state.

3. Give new emphasis to four areas of education:
fundamental subjects for a basic education, libraries, handi-
capped children, and vocational rehabilitation. (See Ap-
pendix B.)

Thus, the board requested additional funds from the
Legislature to enable it to hire an assistant commissioner
for the division of instruction, an assistant commissioner
for vocational rehabilitation, a director of research, and a
director of program planning. This last reorganization
created three divisions: business and legal services, instruc-
tion, and vocational rehabilitation and special education.

There were numerous additions following this reor-
ganization with the advent of the National Defense Educa-
tion Act, which provided for specialists in subject areas,
Civil Defense staff, the Minnesota National Laboratory, the
Manpower Redevelopment Program, and the expansion of
the vocational rehabilitation program (16).

During the past 65 years, and particularly in the past
10 years, there has been a tremendous increase in the
number of professional staff. By 1965, there were about
400 employees in the State Department of Education.

The expanding educational program in Minnesota,
combined with increased federal influence, has drastically
increased appropriations to the state department in the last
10 years. On salaries alone the appropriation jumped
$350,000 during this period, excluding the salaries and
expenses paid by federal programs.

e Transferred to Minnesota Board of Nursing.

Despite generally cordial relations between the de-
partment and the school districts, there are times when
local school authorities and officials of the department find
themselves at odds. Such disagreement is to be fully ex-
pected when one considers the numerous contacts made
between the number of people involved in education. The
most notable differences occurred in 1931. When the
Depression struck, the state was confronted with a serious
shortage of revenue that began to affect numerous pro-
grams including education.
Partially as a result of the financial squeeze, many districts were unable to fulfill their duties. The Department of Education, overdiligently attempting to enforce regulations, raised the ire of many school districts across the state. As a result of this dissatisfaction and significant pressures from local school administrators, the House and Senate established a joint committee to investigate the department. It examined a number of witnesses, including members of the state board, the commissioner of education, his assistant, several department inspectors, and members of several of the school boards in the state. In its final report, the committee absolved the department of any malfeasance of office or violation of the law in the conduct of its affairs. However, in a subtle way the committee slapped the wrists of the department. It noted that in attempting to vigorously enforce its regulations, the department caused the people of some school districts to feel dissatisfied with its requirements. It noted that such dissatisfaction was often caused by misunderstandings.

To the accusation that the board had withheld state aid from districts for failure to comply with the laws and regulations of the state, the committee said it could find no evidence of such attempts when the districts had attempted reasonably to find a solution to their problems. The committee recommended that the department be lenient with all districts experiencing financial difficulties because of delinquencies of tax levies.

Finally, the committee noted without comment that it was difficult during the hearings to secure testimony from complaining correspondents. Most frequently they claimed they feared reprisals. It was acknowledged by the committee, however, that the department had assured the prospective witnesses there would be no reprisals, but generally such assurances were to no avail. Though the events leading to the investigation were unfortunate, the investigation itself contributed toward clearing up differences that had developed between the department and many school districts.

If the office space allotted the state educational agency was any indication of the importance it had in the state governmental structure, then until a few years ago it was none too encouraging. In 1860, the state superintendent of public instruction conducted the business of the public schools from a single small office in the State Capitol Building. When state school inspectors were appointed, the lack of space forced them to establish offices in their home.

Shortly after the turn of the century, the superintendent's office was moved to the Historical Building where it was located when the State Board of Education was created. Rooms on the first and second floors of the south end of the building and in the basement and sub-basement housed the State Department of Education.

In December 1932, the offices were moved to the third floor of the State Office Building where all but two divisions were located in 30 separate rooms. Two divisions were located elsewhere.

In 1960, the new Centennial Building was constructed, and the education department was established on the entire fourth floor. Although facilities in this building are spacious, they are becoming cramped as new programs and staff positions are added.

SUPervisory and Consultative Services of the Minnesota Department of Education

This discussion is divided into three separate parts. Each portion is patterned after the organization of the Department of Education in 1965, although obviously the organization and allocation of services were not always as described here.

Division of Business and Legal Services

In general terms, the function of this division is directing, planning, and coordinating the legal, legislative, administrative, and business activities of the department. It is one of three divisions in the departmental organization and is headed by an assistant commissioner of education.

Legal services became a function of the education department for several reasons. First, the service tended to relieve the attorney general's office of routine legal matters pertaining to education. Second, it provided educators with a legal service administered by a fellow educator who not only was well versed in law but had insight into the educational implications of laws of the Legislature, opinions of the attorney general, and regulations of the state board.

Whenever a question with legal implications arises, it is referred to the assistant commissioner for reply. When there is a legal question not answered by the statutes or a pertinent opinion, a written request is made for an opinion from the office of the attorney general. Upon receipt of the opinion, the interested parties are so informed, and the press is made aware of the new development.

The assistant commissioner also is directly responsible for administering laws and rules and regulations relating to the sale of textbooks. Minnesota statutes require that before any school textbook may be sold, used, or exchanged in the state, the publisher or dealer must file a copy of the textbooks with the state department. Moreover, a bond and price list of all textbooks sold in the state must be filed by the publisher with the department. These controls have effectively curbed the dubious textbook sales practices mentioned earlier.

State Aids and Statistics Section. As mentioned earlier, the first and primary duty of the Office of Public Instruction was gathering and interpreting statistics. In the first annual report of the superintendent in 1860, the statistics included were extremely meager; inadequate returns from town
superintendents and the lack of a systematic plan for gathering statistics by territorial superintendents resulted in a less than desirable report. The enforcement of a penalty or forfeiture of school money if district clerks failed to make reports resulted in more adequate returns by 1867 (18).

Prior to 1882, the state superintendent's annual report was, for the most part, presented in narrative form. Beginning in that year, however, the annual report contained a special section devoted to statistical tables. For educators in the state, the report was the only reliable, comprehensive account of the status of education. Today, to persons interested in the historical aspect of Minnesota education, the reports are a valuable source of information.

In those early years, there was no departmental coordination of effort in gathering statistics; each division was responsible for collecting its own data. To answer the need for some form of central control of this function, the state board established the statistical division in 1929. The one-man division was headed by a statistician, T. J. Berning, who later became the assistant commissioner of education.

Throughout the years, the functions of the statistics division increased significantly. From 1933 to 1938, when the state board examinations were the responsibility of the rural division, the statistical division assisted in the preparation of statistical summaries for the examinations, established passing marks, designed tables indicating the number of pupils who passed and failed in the various school districts, and developed a question reservoir. In 1932, the division was given the responsibility of distributing courses of study. Finally, whenever a special study of education in Minnesota was prepared, the statistical division and later the statistical section played a significant role.

State law provides that—

The State Board of Education shall supervise distribution of the school fund in accordance with the law. It may make rules and regulations consistent with the law for such distribution...including reasonable requirements for such reports and accounts as will assure accurate and lawful apportionment of state aids (19).

The state aids and statistical section was delegated the responsibility for carrying out the above legislation. It is responsible for the calculation and distribution of state and federal aids, collection and analysis of various statistics, calculation of costs per pupil in average daily attendance, preparation of reports, collection and analysis of data on assessed valuation and tax rates, and codification of forms and bulletins.

Administrative Services Section. From a department employing only several professionals and a few clerical workers at the turn of the century, the education department had expanded over the years until, by the midtwenties, employees numbered about 300. Obviously, such growth brought growing pains. Such heretofore infant "departments" as bookkeeping, personnel, and procurement were experiencing phenomenal growth. Since all these personnel reported directly to the assistant commissioner of business and legal services, the demands on his time were outstripping his ability to devote the necessary time.

In 1958, at the urging of Commissioner Dean Schweickhard—a strong advocate of departmental reorganization—the Board of Education created the administrative services section and made the supervisor directly responsible to the assistant commissioner of business and legal services. The supervisor was responsible for coordinating activities previously operated independently: departmental budgets, accounting, auditing, disbursements, fiscal reports, payrolls, office supplies, office equipment, and incoming and outgoing mail.

With constant departmental growth there continues to be a substantial increase in duties assigned to this section, particularly in relation to the expanding role of the federal government in educational assistance to the states.

School Plant Planning and Development Section. One of the earliest interests of the Office of Public Instruction was school plant planning. Although a formal division for school construction was not formed until after the turn of the century, concern for adequate facilities received considerable attention. As early as 1860, the first superintendent of public instruction, Edward D. Neill, recommended in his first report to the Legislature the provision for providing suitable school buildings and sites in the state.

That efforts to promote adequate school facilities were unsuccessful in the early years is an understatement. Secretary of State David Blakely, serving as the superintendent of public instruction, remarked in 1864 that "the schoolhouses are the worst that will at all answer to the name, many of them, indeed, being so wretchedly wanting in comfort as to render them unfit asylums in wintry weather even for the beasts of the field" (20). As an example, he reported:

The Superintendent of Houston County states that of 39 schoolhouses in the county, 20 are built of logs. A few of these are good, but the majority are very poor affairs. Some are built of poles, badly chinked, and not plastered. Some are scarcely fit for barns or stables. One school was held in a straw-covered granary with one door and no windows. In another, the doors and windows were enclosed apertures in the logs. A third was a small barn, fitted with rude seats, while a fourth was held in a dwelling house scarcely fourteen feet square, with a family of six persons living in the same room.

From Rice County the Superintendent writes: "The schoolhouses are as a general thing...in a wretched condition. Many rich districts have none, and almost every schoolhouse in the county is a mere apology for what it should be" (21).
In the ensuing years, the reports of the state superintendents continued to call attention to the need for providing good physical facilities for housing public school pupils. Periodic bulletins were issued providing guidelines for school districts planning construction or remodeling.

Realizing, however, that the influence of the state could not be effectively exerted until some legal status was conferred on a section or division responsible for school plant planning, the Legislature conferred specific powers on the State Department of Education in 1928. The legislation specifically provided that a buildings division directed by a commissioner of buildings be established in the Office of Public Instruction. The division was directed to prescribe rules for the erection, enlargement, and change of school buildings. Twenty-eight years later, the law was amended to give the department specific authority to prescribe for school sites and mechanical equipment.

As the construction of school facilities has increased, so has the influence of the school plant planning section. Following World War II, the drastic increase in enrollments began to affect school facilities in the early 1950's. As serious classroom shortages appeared, it became clear that if an orderly program of construction were to be carried out, a comprehensive study would be necessary. Thus, from 1951 to 1953, at the urging of the school plant planning section, a school facilities survey was made of all school buildings in the state. Conducted by the bureau of field studies of the University of Minnesota, under the direction of the Department of Education, the two-volume study represented a milestone in providing a comprehensive overview of school building needs in Minnesota. The study and its implementation by the school plant planning section played a major role in accelerated construction across the state; from 1955 through 1961, more than $400 million was expended by local school districts for construction.

School Lunch Section. It is difficult to pinpoint where and when the first school-sponsored lunch program began. Recently discovered records indicate that a lunch program in Minneapolis in 1903 may have been the earliest. Another early program originated shortly after in Clark's Grove, Minnesota, with children bringing a portion of their lunch from home in mason jars. These jars of lunch (warmed in a kettle of hot water just before lunchtime), combined with a hot dish prepared by the teacher, were one of several unsophisticated but significant beginnings in school-sponsored meals (22).

An early pioneer in the development of school lunches in Minnesota was Inez Hobart, a nutritionist at the University of Minnesota, who was most noted in those early years for her role in establishing a breakfast program in a Minneapolis school in the 1920's. Administrators in the school were concerned about the unusually large number of working mothers in the pupils' families who were employed as cleaning women at night in downtown office buildings and often did not return home early enough in the morning to prepare breakfast for their youngsters. To remedy this situation, the school, with the assistance of Miss Hobart, established what came to be known as the "penny breakfast." However, only after the child's family was visited and his eligibility determined could the youngster receive the meal. It was a bargain sought by most parents.

When the Depression struck, school lunch programs reached important proportions in school districts' educational programs. To the youngster whose parents were unemployed, the school lunch was the only meal of sufficient nutrition. Although some of the ingredients used in preparing meals—dry salt pork, sauerkraut juice, dried onions, and raisins—may be unappetizing by today's standards, they were better than what could be served at home.

Primarily as a result of the Depression and the consequent financial strain on smaller units of government, the federal government assumed a role in school lunch programs in 1933 with the allocation of foodstuffs. Distribution of the commodities shipped into Minnesota had to be efficient. As many commodities were fresh, speedy distribution was essential to prevent spoilage. Sometimes distribution was complicated because the food was placed in storage areas in courthouses rather than local warehouses, and those schools desiring the food were compelled to travel to the county seat to obtain it.

Further federal involvement came with the Community School Lunch Program of 1943, the National School Lunch Act of 1946, and the Special Milk Program of 1954. The combination of federal aid and significant amounts of state aid has produced an effective, far-reaching program of school lunch support.

Supervision and control of the school-lunch program in Minnesota was transferred from the State Welfare Department to the Department of Education in 1943, although it did not become a legal entity until June 1946. Since then the department's role has expanded rapidly. It reviews and approves applications and claims from schools, institutions, and welfare agencies for reimbursement aids for school lunch, special school milk, and donated foods programs. It approves school lunch programs and special school milk programs, distributes donated foods, assists in preparation of daily menus, visits schools, and conducts school lunch workshops. In 1964-65, more than 64 million lunches were served.

Pupil Transportation. The role of the education department in the transportation of youngsters to and from school has existed for many years. Minnesota today remains one of the top 10 states in expenditures earmarked for transportation. On the other hand, large geographical areas of population sparsity have resulted in ranking Minnesota well toward the bottom among all states in the actual number of pupils transported at public expense. Thus,
Minnesota retains the dubious honor of having one of the highest per-pupil transportation expenditures in the country. But despite these expenditures, the transportation program has been markedly successful. The first law on transportation came in 1901 as part of a bill designed to affect school consolidation. It gave consolidated districts authority to provide free transportation to the pupils of the district. In subsequent years, other districts were given the same authorization.

It soon became evident, however, that the heavy costs of transportation were working an undue hardship on many districts, and agitation began for state help. In 1915, the Legislature passed the first statute providing for reimbursement aid for transportation or board and room. The aid, which went to consolidated districts, was limited to $2,000 a year per district. Eventually, reimbursement was granted to other types of districts and specifically to pupils with exceptional needs, such as handicapped children.

As the transportation program expanded, legal problems arose concerning the responsibilities of various school districts to bus pupils located outside their official jurisdiction. In December 1938, the State Board of Education divided the state into high school areas to control the competition for nonresident pupils. Each high school area was to have at least one classified public secondary school and could also serve parts of school districts as could be conveniently served by the secondary school of the area.

In 1964-65, the state department distributed $14,380,000 in state transportation aid, while the local districts expended $22,000,000 of their local funds to finance transportation for 47 percent of the total number of pupils enrolled in the public schools in Minnesota.

The state board and the transportation section oversee a legion of buses, drivers, and pupils. Enforcing qualifications for bus drivers; providing consultative services to school districts; conducting meetings on transportation, school bus inspection clinics, and schools of instruction for school bus drivers; computing and administering the transportation reimbursement aids to school districts; and approving pupil transportation routes—these and other duties constitute the work load of the transportation section today.

Division of Instruction

In general terms, this second of three divisions is responsible for directing, planning, and coordinating the programs of all public schools, from kindergarten through secondary school and including adult education. The division is headed by an assistant commissioner of education.

Elementary and Secondary School Section. The largest section in the Division of Instruction in terms of personnel and the number of units is the elementary and secondary school section. Because the duties of this section are multitudinous, their historical development will be outlined according to sectional units.

1. Elementary and Secondary Units. Although these are two separate units within the elementary and secondary section, they are here considered together because their historical development is closely related.

These sections had their beginning in 1878 when the high school board was established. It was responsible for visiting and inspecting graded schools, classifying them, and approving the aid to be paid to them. Inspection of the common schools remained the responsibility of the Office of Public Instruction.

By 1916-17, the staff of inspectors from the office of the high school board had increased to nine.

When the State Department of Education was established in 1919, the graded and high school division was created. It assumed all the duties of the inspectors and many of the duties of the Office of Public Instruction. For all practical purposes, this entire division handled, at one time or another, most of the responsibilities now handled by the numerous specialized units of the present elementary and secondary section and other divisions and sections in the department.

Today, the elementary unit is headed by two directors: one in charge of graded elementary; the other heading ungraded schools, Indian education, and related duties. In general terms, the staff of the elementary unit provides consultative and advisory services on instructional and operational problems encountered in the elementary schools, provides services to superintendents and county school officers, conducts teacher institutes, visits schools, and prepares material for the use of elementary schools.

The secondary unit also provides advisory and consultative services and additionally visits and recommends classification for secondary schools; assists in the preparation of administrative bulletins and manuals, and aids in-service training workshops for teachers and administrators.

2. Curriculum Development Unit. Upon the establishment of the Department of Education, it was assumed that one of its roles would be to aid districts in curriculum development. In 1921, the state board ordered distributed the completed manuscript of a course of study for elementary schools, the first such course of study to have statewide circulation. A revision was approved by the board in 1928. Unfortunately, subsequent curriculum planning was primarily hit-and-miss. To correct the situation, the department called an educational planning conference in 1944, and the delegates in turn established the Curriculum Policy and Planning Committee. This committee set up procedures for producing a series of guides for curriculum development. Since then, curriculum development efforts have been more organized and have expanded as much as budget, personnel, and time will permit. However, today's curriculum development unit is handicapped by a lack of all three,
and there are those who claim that this factor alone has worked great hardship on efforts of the department to extend its influence regarding curriculum development in school districts throughout the state.

In addition to preparing curriculum guides, the unit directs state testing and examination programs, evaluates elective courses not previously approved, and provides consultative service in general program planning and evaluation.

The Minnesota National Laboratory (23) was created in 1958 to carry out curriculum research on the effectiveness of the "new" mathematics when compared to the more traditional programs. Funds were provided by the Hill Family Foundation of St. Paul. The laboratory carried out its research as an agency of the instruction division of the department. When legislation was passed in 1959 in support of the laboratory, the MNL began to extend its activities, still within the field of mathematics. Over the years, the laboratory has received support from the Legislature through biennial appropriations for base operations and projects and has, in addition, received grants and contracts from such agencies as the U.S. Office of Education, the National Science Foundation, the Office of Economic Opportunity, and the Upper Midwest Regional Educational Laboratory.

The Department of Education and the Legislature have demonstrated their support of MNL and interest in educational innovations. In 1963, both agencies illustrated their broad concern by giving the laboratory freedom to work with agencies outside the state and by encouraging it to extend its research activities to areas of subject matter other than mathematics. The Legislature enabled the realization of a five-state project for the evaluation of secondary mathematics and encouraged the laboratory's broader range of activities, including work with social studies, music, and new approaches in beginning reading instruction. In the future, specialists in other areas may join the staff to carry on research activities, drawing on MNL's experience with various research techniques and the now extensive data collection available.

The MNL serves five states: Iowa, Minnesota, North Dakota, South Dakota, and Wisconsin; the central staff is made up largely of psychologists and subject matter specialists.

3. Adult Education Unit. Classes for adults in general school subjects and Americanization were authorized by the Legislature as early as 1905. For many years, these classes achieved relative success in obtaining their objective—a more literate society. However, when the Depression forced the state to discontinue aid for adult education, the federal government began distributing funds to keep the programs alive. The Depression contrived to take its toll, and many districts dropped their adult education programs as economy measures. It should be noted, however, that throughout this period adult vocational education remained substantially intact.

In the early 1950's, the National Association of Public School Educators took note of a department survey indicating that local districts were not eager to reestablish general adult education. In 1956, the association granted $12,000 to the department to initiate a general adult education program at the state level; state funds were subsequently provided for the employment of a director.

In 1964, the Economic Opportunity Act provided funds for undereducated adults, particularly those in poverty stricken areas. Minnesota's allotment for fiscal year 1965 was approximately $150,000. These funds and other federal funds, from the Manpower Development and Training Act, the Vocational Education Act of 1963, the Community Action Program of the Economic Opportunity Act, and the Elementary and Secondary Education Act of 1965, have made the adult education program in Minnesota an example of money wisely spent. In 1965, more than 75 percent of the state's high school districts conducted adult education programs, with enrollments estimated at 112,000 (24).

4. Physical and Health Education Unit. As early as 1878, the Minnesota Legislature required daily instruction in health, purity, temperance, and cleanliness. Subsequent laws made it the duty of local school boards receiving state aids to instruct in physiology and hygiene, with required reference to stimulants and narcotics. Revocation of teacher certificates or withholding of state aids to districts were the penalties imposed on violators.

With the advent of World War I came the revelation that the young men of this country were not physically fit. In 1923, the landmark Physical Education Law was enacted, and a physical and health education division was created in the education department. Formulation of regulations regarding the amount of such education was left to the State Board of Education.

In 1937, the division was assigned the additional duty of working with district recreation programs authorized by legislation of that year and 3 years later was renamed the Division of Physical and Health Education and Recreation. In 1944, the division was given responsibility for safety education in the schools. The driver education program, initiated 3 years later, is undoubtedly the unit's primary contribution to safety education (25).

5. Audiovisual Unit. Although audiovisual programs existed in many schools for a number of years, it was not until 1948 that the education department established a unit for their supervision. The following year, with the assistance of the department, the Audiovisual Coordinators Association of Minnesota was organized. Eleven years later, the teacher certification section, in cooperation with the audiovisual unit, established a set of qualifications to ensure
that there were competent audiovisual leaders in the schools, to become effective in 1962-63.

Today, the audiovisual unit provides consultative and advisory services to schools; conducts several workshops and conferences; and maintains a tape-recording service for education programs, a library of tapes for distribution to schools, and a library of films, filmstrips, and slides.

6. School Reorganization Unit. The role of the Department of Education in district reorganization and the difficulties in creating districts of efficiency and quality have already been noted. Suffice it to say at this point that through departmental efforts in the last 20 years, district reorganization has made marked progress. Since 1947, nearly 6,000 school districts have been merged or dissolved through legislation promoted by this unit and the department as a whole.

7. Subject Matter Specialists Unit. By the mid-fifties, an increasing number of school district administrators were requesting information and guidance from the department on various academic subjects such as mathematics and science. As there were no specialists in these areas on the staff, the department was unable to provide adequate assistance. Recognizing the desirability and the obligation of the state education agency to provide these specialized services, the department convinced the 1957 Legislature to allot funds for the development of a program for talented and gifted pupils, for which a professional was subsequently employed.

Other specialists added to the department included science, mathematics, language arts, and modern foreign language consultants. They are responsible for reviewing each subject in the curriculums of all schools and for making recommendations to expand and improve the courses offered in elementary and secondary schools. In addition, federal funds from NDEA Title III have enabled these consultants to conduct in-service education programs for teachers in the state.

8. Indian Education Unit. Minnesota is one of several states with unique educational problems related to a relatively substantial Indian population. The first schools for Indian children were under the jurisdiction of the U.S. Army. When the Bureau of Indian Affairs was established in the Department of the Interior, the children were placed in boarding schools. However, the expense and results were unsuccessful, and the children were then placed in public schools, with the federal government providing the money.

In 1917, the Minnesota Legislature allotted the first state funds for Indians. Assistance went to public schools on Indian reservations where the taxable property was not sufficient to support public schools. The money was to be used only for teachers’ wages and for textbooks. For 20 years thereafter, the Legislature made an annual although insignificant appropriation. In 1937, the Legislature turned over the entire program to the department, authorizing it to execute contracts with the federal government and to hire a supervisor whose entire concern was Indian education.

Today, the state works under an agreement with the federal government whereby the Bureau of Indian Affairs provides funds under the Johnson-O’Malley Act to supplement basic state school aids. When Public Law 81-874, providing aid to federally impacted areas, was broadened to include Indian children in 1958, the contribution of the Bureau of Indian Affairs was substantially reduced.

Although much more needs to be done to improve the educational situation for the Minnesota Indian, substantial progress has been made, in large part due to federal assistance. The federal government, under Public Law 815, Title IV, has given aid to local school districts with large concentrations of Indian children. In addition, Indian children receive free lunches, their teachers are better qualified, and scholarships for their higher education have been granted by the Legislature.

9. North Central Association. The North Central Association of Colleges and Secondary Schools is the largest of six regional accrediting agencies in the United States. Geographically, the area covers 19 states and portions of overseas countries containing schools for children of American armed forces personnel. The Minnesota state director of NCA maintains offices in the education department and provides consultative and advisory services to the public and member secondary schools in Minnesota belonging to NCA. Minnesota had a total of 140 member secondary schools in 1965, representing about 25 percent of all secondary schools in the state.

10. Vocational Section. Years before federal legislation was enacted to encourage state supervision of vocational education, Minnesota had taken action, albeit elementary, to provide some form of vocational training. In 1905, the Legislature passed a law authorizing counties to establish county schools of agriculture.

The Putman Act of 1909 and the Benson-Lee Act of 1911 provided for state aids for vocational or prevocational departments offering training in agriculture, manual training, and domestic economy. These two laws were subsequently repealed in 1915 and replaced with more comprehensive legislation.

However, the major incentive for vocational education came in 1917 when Congress passed the Smith-Hughes Act. Without examining subsequent vocational laws in detail, it is sufficient to state that Minnesota took significant advantage of federal legislation designed to improve vocational education in a rapidly changing technological world. The years of greatest growth, from 1940 to 1960, saw the number of agricultural departments almost triple, the business education classes increase by more than 100, the home economics departments expand by almost 200,
and the industrial arts classes grow to a total of 385. Distributive education, health education, and trade and industrial education made similar significant strides.

In 1941, Governor Harold Stassen issued an executive order accepting federal funds for defense training and gave to the vocational division the responsibility of administering and supervising the program. To facilitate this effort, the Minnesota Board of Education, acting as the Vocational Board, approved the separation of war production training from the vocational education division and appointed a director for each unit. In June 1945, with the victory of the Allies, the war production program was terminated, and the equipment was ordered transferred to school districts for disposition.

In 1945, the area vocational-technical schools were first authorized. The schools, which granted no degrees, were meant to fill the need of those who needed preparation for jobs in agriculture, home economics, health, office, distributive, trade and industrial, and technical occupations. The education is generally post-high school in nature and is free to qualified persons under 21 years of age. Both graduates and nongraduates qualify, although every effort is made to persuade pupils to complete their high school education. In 1965, there were 19 such schools in operation, and several additional cities had requested approval to operate such an institution.

The section supervises private trade schools and veterans training, the Future Farmers of America, Future Homemakers of America, and the Minnesota Diversified Vocations Club. It prepares standards and plans for each major field of vocational service, assists in the planning and preparation of instructional material, and determines and calculates federal and state vocational aids to schools. The section is divided into nine major units: agricultural education, distributive education, office education, guidance and counseling, homemaking education, trade and industrial education, private trade schools, area vocational-technical schools, and Manpower and Area Redevelopment Act.

**Teacher Personnel Section.** One of the earliest concerns of the state and local educators was to provide pupils with the best possible teachers. To say that the task in Minnesota has been difficult is to underestimate the situation. The situation was critical enough in 1864 to prompt State Superintendent David Blakely to remark that "the teachers are the cheapest that can be hired, when hired at all ..." (26).

For many years, the certification of teachers was decentralized, accounting for numerous difficulties encountered in enforcing regulations. In 1893, the Legislature not only authorized the issuance of certificates by county superintendents, state normal schools, and the state superintendent of public instruction, but also defined qualified teachers. But with the exception of a few modifications, the situation did not change appreciably until 1929. In that year, the Legislature, concluding that it could not effectively continue to set standards for certification, repealed a number of laws regarding certification and vested sole authority for it in the education department. The state board was charged with adopting supplementary regulations to certification laws remaining on the books. The 1949 Legislature went one step further and gave the state board sole authority for determining the qualifications of teachers.

The problems directly or indirectly related to certification of teachers have been numerous. The primary concern is usually supply and demand, with the latter usually exceeding the former. Consequently, even today the teacher personnel section is forced to issue certificates to inadequately trained teachers to aid districts, usually small and inefficient, in placing a teacher in each classroom. In 1964-65 alone, 813 such certificates were issued.

Another difficulty has been the increased work load pressed upon this section by certification. Currently, it takes from 3 to 6 months to process a request for certification. However, plans are now under way to hire additional staff and to eventually computerize the entire certification process.

To better serve teachers, the department established in 1913 the State Teachers Employment Bureau. In 1919, the bureau was incorporated with the teachers retirement fund under a single director. The arrangement did not improve efficiency, so the state board established in 1936 the teacher personnel division. At the same time, the employment bureau merged with the certification section to form a single division.

Today the teacher personnel section is divided into three units: certification, placement, and teacher preparation. The certification unit issues, renews, and records all Minnesota teaching certificates and develops regulations relative to issuance and renewal of certificates for adoption by the state board. The teacher preparation unit evaluates teacher preparation programs of colleges and assists in developing such programs as to ensure adequate preparation of teachers. It works closely with the state advisory committee on teacher education in establishing requirements on teacher education and certification to be submitted to the board. The placement unit is responsible for registering and providing placement services to teachers and administrators in schools of the state through the teachers placement bureau. In 1965, 1,992 teachers registered with this unit. A total of 659, or 32 percent, of the registrants were placed in teaching positions.

**Library Section.** The first record of voiced sentiment for school libraries came in 1861 when Superintendent Neill specifically recommended that the Legislature appropriate $1,000 for the purchase of library books, as "the masses must have an acquaintance with the general facts of history.
and the progress of events, to prevent them from falling a prey to crafty demagogues" (27). He stated that the schools should be encouraged to use much of their own money to finance libraries. Shortly after Neill's plea, the Legislature permitted the establishment of school libraries and allowed local tax levies for their support.

In 1887, generally viewed as the year of the first major breakthrough in improving school library services in Minnesota, the Legislature passed the first state aid law for school libraries, providing $10,000 annually.

The public instruction office was not given its first control over school libraries until 1911, with the creation of the Office of Supervisor of School Libraries. Although there was no direct authority over school libraries, the first supervisor, Martha Wilson, who was originally an employee of the public library commission, provided guidelines for schools that significantly improved many school libraries.

When the Legislature created the State Board of Education in 1919, the functions of the public library commission were turned over to the state board, and the organization continued as the library division. Through the evolution of numerous reorganizations, the library division has become a section in the instruction division. Today, there are three units in the library section. The school libraries unit is charged with the responsibility of providing consultation, advice, and supervision to all public school libraries regarding materials, programs, equipment, quarters, and personnel. In addition, it is to provide for visitation of schools, develop and issue guides and lists of materials, and assist the teacher personnel section in certification of librarians.

The second unit of the library section is the public library development unit. As indicated earlier, the public libraries commission became a part of the education department in 1919. Today, the unit provides advisory and consultative services to public libraries and encourages local citizens, public officials, and library officials in the establishment, development, and improvement of public library service. Since 1956, it has administered the Minnesota public library development program, under the federal Library Services Act, and the new Library Services and Construction Act, both of which are combined with the correlated program of state aid to public libraries. This program has resulted in the establishment of the first multi-county regional public library systems in Minnesota. It has three bookmobiles for demonstration and loan to help get bookmobile service started quickly in new county and regional libraries.

The third unit, rural libraries extension, is charged with two primary duties. First, it provides references and open-shelf loans to libraries and to individuals without local library service. Second, it provides loans of books in quantity to newly established county and regional libraries to help them begin service.

Division of Vocational Rehabilitation and Special Education

In general terms, this division is to plan, direct, and coordinate the activities of vocational rehabilitation and special education. It is headed by an assistant commissioner.

Vocational Rehabilitation Section (28). In 1919, acting as the State Board of Vocational Education, the State Board of Education adopted a plan of cooperation with the State Department of Labor and Industry for the reeducation and training of persons injured in industrial accidents. The Legislature's initial allocation of $15,000 was less than adequate, but it was an important beginning. The action established Minnesota as a leader in the field of vocational rehabilitation.

The first general vocational rehabilitation act, passed by Congress the following year, was to provide vocational rehabilitation to persons disabled and unable to return to gainful employment. Minnesota was one of eight states to immediately establish rehabilitation agencies as a result of the federal legislation. When the Federal Social Security Act made the Office of Vocational Rehabilitation a permanent federal agency in 1935, the Minnesota Legislature enacted similar legislation at the state level.

In 1943, Congress made it possible for the rehabilitation agency to provide physical restoration services, prosthetic devices, more detailed and comprehensive evaluative procedures, and a limited amount of tools and equipment for use by the handicapped. Moreover, the mentally ill and mentally retarded were classified as handicapped persons who could benefit from vocational rehabilitation services.

The Vocational Rehabilitation Act of 1954 was a major milestone in federal legislation affecting the handicapped. It provided for a broad program of grants to facilities and training agencies, as well as new support to state vocational rehabilitation agencies, and established a program of matching fund grants to community organizations to establish or improve rehabilitation centers of all types; $2 million have been spent in Minnesota under the latter section. In 1954, the vocational rehabilitation division maintained a professional staff of 23 located in six offices and rehabilitating about six hundred persons a year. In 1964-65, 6,297 disabled persons received services from 72 professional staff members.

Statistics alone cannot reveal the true development of rehabilitation in Minnesota. The increased staff, case service appropriations, and rapid expansion of rehabilitation facilities in the state have enabled the section to greatly increase the scope of its service, both in terms of more severely disabled persons who can be served and more extensive services provided to clients. The section is no longer merely a training resource for handicapped persons but the coordinating factor that brings together all of the resources needed to help an individual make a successful social,
psychological, and vocational comeback from dependency created by a disability.

Special Education Section. For many years, the Legislature enacted laws granting aids to districts that provided for the education of handicapped children. However, the state department had little control or influence over the direction of special education programs.

In 1915, at the urging of concerned educators and lay citizens, the Legislature encouraged the establishment of special classes for handicapped children by granting fixed amounts of state aid to school districts for each enrolled child. Initial aid went to the deaf, blind, mentally handicapped, and children with impaired speech. Two years later, aid was granted for crippled children. Financial aid was $100 per child per year. In succeeding years, the Legislature broadened the programs by increasing the financial assistance and adding such services as transportation and room and board. However, in spite of increased appropriations for the handicapped, special education remained a "stepchild" in the statewide educational endeavor.

In 1955, a turning point for special education in Minnesota, the Legislature created an interim commission on handicapped children and charged the group with making a comprehensive and detailed investigation of the problems of handicapped children (29). The commission recommended, among other things, the enactment of a law requiring every school district to provide special instruction and services to every handicapped child in need of them and providing for adequate state aid to implement the program. It also strongly suggested the establishment of a division of special education in the education department to assist school districts in the development of special education programs, to establish standards for such programs, to supervise the system of special education for exceptional children in local school districts, and to prescribe curriculum and courses of study for state-operated residential schools. The Legislature of 1957 not only complied with these recommendations but also created an advisory board on handicapped, gifted, and exceptional children consisting of 12 members to be appointed by the Governor. The board was to aid in formulating policies and to encourage programs for exceptional children.

The new special education section in the state department was established under the jurisdiction of the rehabilitation and special education division. By 1965, every county in the state had at least one type of special education program. In that year, there were 4,189 persons teaching the handicapped in Minnesota, compared with 25 teachers in 1915 when the state first passed legislation affecting special education. However, there are still numbers of school districts that have no special education program at all and numbers of handicapped children who are not receiving appropriate instruction and services or who do not have the availability of minimum services.

Old Age and Survivors Insurance Program Section. Twenty-two years after the inception of the federal Social Security program, Congress initiated the payment of monthly disability benefits as part of the old-age survivors and disability insurance program. It was stipulated that the determinations of disability should be made by state agencies under agreements with the Secretary of HEW.

In Minnesota, the contracting agency is the education department, which acts as an agent of the federal government in evaluating disability. Costs of the program are borne entirely by the federal government, thus making the OASI section the only section financed entirely from federal funds. In providing that determinations for disability be made by a state agency, Congress intended that there would be rehabilitation contacts for every applicant and that the advantages of medical and vocational care development would be provided by an agency already working with the medical profession and the disabled.

In 1965, there were 18,196 disabled workers, and benefits for their dependents amounted to $14,378,000 annually. In that same year, the OASI section handled a work load of 8,013, the largest since the program's inception. A total of 292 cases were referred to the vocational rehabilitation section. A staff of 13 professional members, 11 clerical workers, and 6 part-time physicians administered this federal-state program.

25. The physical and health education unit became responsible for the nurse scholarship program, enacted by the Legislature in 1951, with an appropriation of $750,000. In 8 years, before it was transferred to the Minnesota Nursing Board, the department awarded scholarships to approximately 1,300 nurses.

29. Chaired by State Senator Elmer L. Anderson, later Governor, the commission found special classes for handicapped children in only 30 of the state’s 87 counties. Only a few counties offered special classes for more than one type of handicap.

THE PERIOD PRIOR TO 1860

Hernando de Soto, the famous Spanish explorer, entered the country in 1540 and spent about a year within the present borders of Mississippi. It was the French, however, who planted the first colony on the Bay of Biloxi in 1699. About 20 years later, 300 more French colonists founded Fort Rosali (now Natchez) on the Mississippi River. This settlement grew until the Natchez Indians massacred the people in 1729. When Mississippi became a part of the British province of West Florida in 1763, many of the French moved to Louisiana.

In 1770, 18 families founded the first permanent settlement in what was to be the Mississippi Territory when they moved to the present site of Natchez. “All of the settlers in the Natchez District during the seventies (1770’s) were of English, Scotch, and Irish extraction and practically all were from the colonies along the Atlantic” (1). The Spanish took British West Florida in 1779 and 1780, but they were compelled to give it up to the Americans in 1798.

On June 12, 1797, President John Adams recommended in a special message to Congress the erection of a “government in the district of Natchez, similar to that established for the territory northwest of the Ohio . . .” (2). Congress approved an act April 7, 1798, creating the Mississippi Territory. The sparseness of the population was a serious obstacle to the new territory’s growth, and particularly to education. When territorial Governor Claiborne recommended in 1802 a “system of public education and a seminary of learning, he was addressing the representatives of a number of people who would not make a respectable rural county” (3). The territory had a population of only 31,306 in 1817, about half of them slaves, and 75,448 at the end of the next decade.

The increase, due in large measure to immigration, did not much increase population density, because the immigrants did not congregate in the Natchez area but scattered about the state (4). The great bulk of immigrants came from the Carolinas, Georgia, Virginia, and Tennessee, with a sprinkling from the North and East. Imbued with the ideals and customs of the Old South, they were not acquainted with public elementary schools, nor did they conceive public education to be a duty of the state.

They did believe in education, but they conceived of that as a duty of the parent to his child. To be sure, if the parent were dead or too poor to educate the child, then they thought it was the duty of the state to stand in loco parentis (5).

The settlers brought their families and slaves to the new territory to raise cotton and cattle, requiring broad fields and grazing lands, which aggravated the difficulties of population sparseness. Too, Mississippi was on the frontier until 1840, and a distinctive Western idea of local school supremacy in government affected the people’s beliefs about public education.

This ideal is everywhere evident in legislation on school matters. It manifests itself in the vast amount of permissive legislation which left the final decision on educational questions to local communities. Township control of school was preferred to county control (6).

Marcus Jernigan, an eminent University of Chicago historian, in his introduction to William H. Weathersby’s history of educational legislation in Mississippi, stated:

The history of the educational legislation of Mississippi is of peculiar interest for several reasons. Being one of the states of the New South this legislation was influenced by the two important factors absent in the states of the Old South: first, the original settlers came principally from the back-country regions of the South Atlantic states; and, secondly, they entered an environment which approached that of the New West, the region west of the Alleghenies [sic]. Both of these factors led to the development of a democratic decentralized school system, designed to meet the special needs or demands of individual counties and even smaller units. As a result, we may observe the consequences of local self government in education at the expense of an efficient centralized state system, based on general laws operative over the entire state (7).
Two important factors, however, favored the establishment of common schools. One was the presence of a number of public leaders who strongly favored a public-supported system of schools. In February 1798, two months before the Mississippi Territory was created, John Henderson and others sent the first of many memorials to Congress calling for aid to establish and support “a regular ministry of the Gospel and schools for the education of the youth” (8). Most of the state and territorial Governors’ messages from 1802 until the Civil War recommended improvements for the schools. Time and again they requested a state tax for education, and at least one Governor made it an issue in his campaign.

The second important factor favoring common schools was the federal government’s extension of its policy of endowing education by granting public lands to “the territory south of the State of Tennessee,” reserving the sixteenth section of each township for this purpose. Until the mid-1950’s, “in at least one township of the State a free school has been maintained constantly since 1821 by sixteenth section funds” (9).

The entire state was settled by 1840, and the schools had improved distinctly. “The Choctaw Indians had ceded their lands to Mississippi by the Treaty of Dancing Rabbit Creek, September 28, 1830, and the Chickasaws by the Treaty of Pontotoc, October 22, 1832” (10). The frontier had disappeared, several areas becoming densely populated. “In 1830 the population of the state was 136,000; a decade later it had doubled; and in 1850 it stood at 606,500” (11).

As the people connected their villages with railroads, dotted the rivers with boats transporting goods, and chopped out dirt roads, they were drawn closer together. They endured the panic of 1837, rapidly recovered, and enjoyed a period of almost unbroken prosperity from 1840 to 1860. Land values increased, cotton crops were good, and prices were high. Slaves were becoming more numerous. A popular slogan of the day depicts the economic philosophy of Mississippian: “Make more cotton to get more money to buy more Negroes to make more cotton to get more money to buy more Negroes, ad infinitum” (12).

Governor Sargent and others continued to request more money from affluent planters to establish schools. With funds from the sale of the “sixteenth sections,” the Reverend David Ker, a Presbyterian minister from Ireland, started “the first public female school” at Natchez in 1801 (13). The next year, the Territorial Legislature charted Jefferson College, which continued to operate in the Natchez area until it closed in 1965. These private, chartered schools continued to grow in number, providing the basis for the public school system.

When Congress approved Mississippi’s admission into the Union on December 10, 1817, the State Constitution virtually copied the words of the Northwest Ordinance of 1787. Specifically, it stated: “Religion, morality and knowledge being necessary to good government, the preservation of liberty and the happiness of mankind, schools and the means of education shall forever be encouraged in this State” (14). The following year, the new Legislature enacted a law specifying that the justices of the county courts should—

Take charge of the lands given by the United States to the State of Mississippi, in their counties respectively, and provide for the erection of one or more schools as they deem right and useful; to lease the lands and guard against waste of soil and timber (15).

In 1824, the county court justices were replaced by a board of township trustees in those townships having rented lands.

Albert Gallatin Brown, the leading advocate of a system of public education during the period from 1832 to 1860, was elected Governor in 1843, and in his inaugural address to the Legislature “pleaded with great eloquence for a general system of common schools which would be open to all and in which the poor should be educated gratis” (16). Brown did succeed in securing the passage of the first statewide school law in 1846. Unfortunately, the new law contained the elements of its own undoing (17).

Conforming to a philosophy of local control, it required the consent in writing of the majority of the heads of township families before taxes could be levied. Efforts to strengthen the law or to enact new ones were hampered by a serious division among the legislators. “Under such conditions they drifted along to the period of the Civil War (1860), doing some good, more in some localities than in others, but in all crippled, in many paralyzed, by the want of a uniform and vigorous policy” (18).

Despite strong local control and the overall failure of Governor Brown’s legislation, some progress was made. The U.S. Census indicates considerable increases from 1850 to 1860 in the number of schools, teachers, and educational expenditures (19). Although statewide taxation for schools had not been enacted, some township taxes were levied to supplement the tuition that parents paid for their children’s instruction. Also, the “sixteenth section” lands had laid the basis for a permanent school fund.

THE PERIOD FROM 1860 TO 1900

The decade of the 1860’s could well be styled the “locust years.” It reaffirmed the old adage that man can stand adversity better than prosperity, because during these disordered times public education in Mississippi took shape. The Civil War years found Mississippian parents and their children’s instruction. Also, the “sixteenth section” lands had laid the basis for a permanent school fund.
paralyzed. When the South was defeated, Mississippi was broken and bankrupt, its interest in education submerged in the misery of the postwar period.

In August 1864, the Legislature by joint resolution authorized the Governor to appoint a committee of 20 persons to canvas the counties and receive donations and subscriptions to a fund for educating the children of soldiers killed or disabled in the war. In its report, the committee responded that—

> No subject could appeal more eloquently and touchingly to the heart of every Mississippian than the education of the children of the noble sires who have perished in this direful struggle for independence, and we only consider one thing more important, and that is to feed and clothe them (20).

Perhaps more than anything else, the need for such a committee indicates the overwhelming economic disaster brought on by the war. The total assessed value of real and personal property for 1860 was $509,472,902; for 1865, it was $134,131,128; and for 1870, it was $177,288,892. During this decade, the value of farm property declined 61.5 percent. The production of cotton, Mississippi’s chief source of income, dropped from 1,202,507 bales to 565,559 bales; the federal government had confiscated 8 million bales outright. The loaves along the Mississippi, breached during the war, were not repaired until 1870, leaving 4 million acres of fertile land open to floods. Vandals had destroyed many public buildings, and farmers suffered intense labor problems during these unsettled years.

As Mississippian busied themselves with the tasks of rebuilding, they again turned their attention to the schools. In December 1865, the Legislature passed an act calling upon the presidents of county commissions to report the exact status, nature, and availability of all school funds, along with any suggestions they deemed appropriate for establishing a system of common schools by the next legislative session. The act also included a similar request to boards of police, which were asked to collect all money owed to school funds within 12 months. The 1865 Legislature also amended the 1846 and 1848 laws by deleting sections pertaining to certain counties, to put all counties on the same statutory basis as the state school system. Unfortunately, Reconstruction and the era of carpetbag rule began soon after, and the legislators did nothing for the next 4 years.

In the meantime, educators from around the nation, meeting in Philadelphia in August 1866, asked Congress to leave the adjustment of Southern affairs to the Southern states. Mississippi teachers then attempted to follow up with a meeting in Jackson in September, but they held so many different opinions as to what to do that they postponed it twice. A group of the state’s leading educators finally did meet in January 1867.

The state teachers association reorganized and adopted resolutions calling for a state school system to meet the needs of all people. It also resolved that the Legislature should establish normal schools to train Negro teachers for the separate Negro schools. The association’s president then prepared and distributed to the legislators a pamphlet entitled “A Plea for the Common Schools,” which said, in part:

> Lower public education should be made first and foremost. In our opinion, the establishment of high schools by state aid should be abandoned for the present and all the state’s attention and resources turned to the perfecting of the common schools, ... industrial schools should be established where the eye and hand may be trained (21).

This pamphlet undoubtedly was instrumental in shaping subsequent legislation; its ideas are reflected in both the Constitution of 1869 and the statute that inaugurated a statewide school system in July 1870 (22).

The constitutional convention, often called the Black and Tan Convention, met in Jackson in January 1868 to draw up the state’s third constitution. When it was submitted to the people in June, they voted it down because it disenfranchised those who had fought and worked for the Confederacy. When the disenfranchisement was removed, the people ratified it in December 1869. This Reconstruction Constitution, the only constitution ever adopted by popular vote in Mississippi, readmitted the state to its proper place in the Union and restored its right of self-government (23).

It had been evident from the beginning that the delegates to the convention would make more definite provisions for education in the new constitution than were contained in those of 1817 and 1832. The state’s “reconstructionists” were committed to establishing an elaborate system of public schools for the benefit of both races. Many of the convention members were freedmen or Northern white men “thoroughly imbued with the idea of education for the Negro race.” The majority were ready to support measures designed to establish a system of public schools for the benefit of “all children between the ages of five and 21 years” (24). Even before the convention met, Governor Humphreys, in an address to a joint session of the Legislature in October 1865, reflected the sentiment of most Mississippian when he said:

> Several hundred thousand of the Negro race, unfitted for political equality with the white race, have been turned loose upon society; and in the guardianship she may assume over this race, she must deal justly with them in all their rights of person and property. The highest degree of elevation in the scale of civilization to which they are capable, morally and intellectually, must be secured to them by their education and religious training (25).
The new Reconstruction Legislature convened in Jackson in January 1866 with a responsibility to effectuate the provisions of the newly adopted constitution and to set up a public school system. Fifty-five of the 116 House members and 9 of the 37 Senators were Negroes, and many of the legislators belonged to what Horace Greeley called the "driftwood brigade." All members of the House Committee on Education, which introduced one of the state's most important school laws, were Northerners except for two Mississippi freedmen. The new Governor, James L. Alcorn, a native of Illinois who had been elected the previous November, appealed for a public school system in his inaugural address, arguing:

The poor white children of the State who were permitted in the past to grow up like wild flowers, without training, the administration which we are about to inaugurate today is determined to expend a large proportion of its energies in educating. And so, also, will the government which reigns over us from this hour devote a large proportion of its energies to the training of the rising generation of the colored people for the higher duties of life, under an enlightened system of public schools (26).

The law that the Governor finally signed in 1870, perhaps not as innovative as claimed when compared with the Law of 1846 (see Appendix E), did provide a legislative plan for a public school system and for a State Department of Education—an agency new to Mississippi. It authorized State Superintendent Henry R. Pease, a native of Winsted, Connecticut, to name a clerk, and together they comprised the first staff of this embryonic state department.

The constitution made a State Board of Education responsible for the general supervision of the public school system and the management of the school funds and property. The first state board, selected in November 1869, consisted of State Superintendent Pease; Secretary of State James L. Lynch, a Negro Methodist preacher from Pennsylvania; and Attorney General Joshua A. Morris, a native Mississippian. It was required to submit periodic reports, annual or biennial, to the Legislature and was responsible for naming the county superintendents.

The Law of 1870 provided for free public schools in each district, each county constituting a school district, except where incorporated cities with 5,000 or more population organized as separate districts. The law required all children from ages 5 to 21 to have equal advantages—an ambition that has not been fulfilled completely even today. It did not provide for separate schools for the races.

Teachers had to be certificated by county superintendents and were to be trained in institutes held annually in each congressional district under the immediate direction of the state superintendent of education. Teachers who regularly attended were to be granted full pay as if teaching the entire time. The law specifically declared that the Bible should not be excluded from the schools.

Henry R. Pease, 1869-74

The Law of 1870 swung from strong local control to a system of ultracentral control. It was costly—perhaps even extravagant. The direct taxation imposed by the law aroused considerable resentment among people who blamed nontaxpaying legislators and those who feared too much central control. Many of their questions could not be answered immediately, such as what to do with the freedmen, who would teach their children, and who would pay the high costs of education.

Superintendent Pease, who personally disliked several features of the new law, accepted the mandate to activate its provisions in the fall of 1870. In his report to the Legislature for the fiscal year ending December 31, 1871, he elaborated on the school situation after the fashion of his day. In showing the department's costs, he stated:

These expenditures, including the salaries of the Superintendent, Clerk, and Secretary of the Board of Education, amount to $10,719.59.... One of the largest items of expense in this total is for printing, amounting in the aggregate to $5,039.26, a large part of which was for... school registers (27).

Superintendent Pease was a man of unquestioned ability who demonstrated a devotion to his duty. He was not reelected in 1874 because "the demand of the colored race for office in 1873 caused him to be set aside for a Negro named Cardozo" (28).

Cardozo, Gathright, and Bardwell, 1874-78

Thomas W. Cardozo, a native of South Carolina, had come to Mississippi at the close of the war and had served as a circuit court clerk in Vicksburg before becoming the state superintendent of education. He resigned in March 1876, after the state Senate impeached him for crimes and misdemeanors.

Governor John M. Stone then named Thomas S. Gathright, the head of Somerville Institute, a private school he had founded in Gholson, Mississippi, to the state superintendency in April 1876. He resigned after only 6 months to accept the presidency of Texas A & M College and was replaced by the Reverend Joseph Bardwell, pastor of the First Presbyterian Church of Meridian. Bardwell worked conscientiously, particularly to increase salaries of the teachers and county superintendents. Although he got the 1876 Legislature to pass an education act, it did little to help the school system. These were lean days, and reaction against the Reconstruction acts tended to hurt the state's finances. Bardwell reported that his department spent $4,196 for 1876 and the public schools spent $417,760;
white teachers received an average monthly salary of $43, and Negro teachers received $39.55.

**General James Argyle Smith, 1878-85**

When Bardwell did not run for reelection, General James Argyle Smith, a native of Tennessee, stepped into the superintendency. An 1854 graduate of the U.S. Military Academy, General Smith served with the U.S. Army until 1861, resigned his commission to join the Confederate Army as a captain, and commanded a division at the end of the war. He farmed in Mississippi until elected state superintendent in 1878.

General Smith deplored the constant change in school laws and the lack of qualified teachers. He insisted that unless he could employ an assistant superintendent he would have to close his office whenever he visited the schools. His report for 1878 showed that the department spent almost $4,000 for the year, including his salary of $2,000.

**James R. Preston, 1885-95**

James R. Preston, a native Virginian, became the first Mississippi school teacher to be elected state superintendent. In his first report, Superintendent Preston listed several major defects in the state's educational system: "(1) a want of qualified teachers; (2) too many schools; (3) no supervision and inspection of the teaching force; (4) a waste of the school funds by dividing the term into sessions of two months each (29)." The superintendent still only received a $2,000 annual salary, and Preston was forced to pay $53 out of his own pocket for clerical services during the 1888-89 biennium—indicating that he was the state department's total staff.

During Preston's term, a constitutional convention met in Jackson and adopted in November 1890 the present constitution, which has been amended from time to time by popular vote. Its Article VIII, concerning the schools, differed very little from that of the 1869 constitution. The new constitution did provide for a 4-month school term, permitting districts to extend it by levying local taxes, and specifically provided for separate schools for white and Negro children.

**Andrew Kincannon, 1896-98**

Kincannon, a native of Noxubee County and a graduate of the University of Mississippi, became state superintendent in January 1896. He did not hesitate to comment on the difficulties that beset the people of Mississippi, but, at the same time, he felt that the public school system had steadily prospered. He rejoiced that the University of Mississippi and the Industrial Institute and College at Columbus (now Mississippi State College for Women) provided teacher-training courses, and that a board of examiners was authorized by law to place teacher certification on a statewide, professional basis. He resigned in September 1898 to accept the presidency of the Industrial Institute and College (30).

**1900 TO 1946**

**A New Century**

What a contrast in the world before and the world after 1900! Will a normal calm return one day? Probably not in our time. For, as William Alexander Percy has said,

Ishmael lived one hundred and thirty-seven years. During that time he must have laughed and joked and loved; he must have looked at the sky and sat beneath the cool palm trees; he must have been glad—but he was a wanderer and a stranger all his days. The North destroyed my South; Germany destroyed my world (31).

During the first school year of the new century, the total enrollments included 158,154 whites and 193,583 Negroes, for a total of 351,742 students. The state had 7,806 teachers (4,658 white and 3,148 Negro), who earned average monthly salaries of $30.64 for the whites and $19.39 for the Negroes (32). Henry L. Whitfield, a native of Brandon and a graduate of Mississippi College, succeeded Kincannon as state superintendent in 1898. As in 1870, his department of education still consisted of the superintendent and one clerical worker—even this assistance came by popular vote. Its Article VIII, concerning the schools, differed very little from that of the 1869 constitution. The new constitution did provide for a 4-month school term, permitting districts to extend it by levying local taxes, and specifically provided for separate schools for white and Negro children.

Andrew Kincannon, 1896-98

Kincannon, a native of Noxubee County and a graduate of the University of Mississippi, became state superintendent in January 1896. He did not hesitate to comment on the difficulties that beset the people of Mississippi, but, at the same time, he felt that the public school system had steadily prospered. He rejoiced that the University of Mississippi and the Industrial Institute and College at Columbus (now Mississippi State College for Women) provided teacher-training courses, and that a board of examiners was authorized by law to place teacher certification on a statewide, professional basis. He resigned in September 1898 to accept the presidency of the Industrial Institute and College (30).

1900 TO 1946

A New Century

What a contrast in the world before and the world after 1900! Will a normal calm return one day? Probably not in our time. For, as William Alexander Percy has said,

Ishmael lived one hundred and thirty-seven years. During that time he must have laughed and joked and loved; he must have looked at the sky and sat beneath the cool palm trees; he must have been glad—but he was a wanderer and a stranger all his days. The North destroyed my South; Germany destroyed my world (31).

During the first school year of the new century, the total enrollments included 158,154 whites and 193,583 Negroes, for a total of 351,742 students. The state had 7,806 teachers (4,658 white and 3,148 Negro), who earned average monthly salaries of $30.64 for the whites and $19.39 for the Negroes (32). Henry L. Whitfield, a native of Brandon and a graduate of Mississippi College, succeeded Kincannon as state superintendent in 1898. As in 1870, his department of education still consisted of the superintendent and one clerical worker—even this assistance came by popular vote. Its Article VIII, concerning the schools, differed very little from that of the 1869 constitution. The new constitution did provide for a 4-month school term, permitting districts to extend it by levying local taxes, and specifically provided for separate schools for white and Negro children.

Andrew Kincannon, 1896-98

Kincannon, a native of Noxubee County and a graduate of the University of Mississippi, became state superintendent in January 1896. He did not hesitate to comment on the difficulties that beset the people of Mississippi, but, at the same time, he felt that the public school system had steadily prospered. He rejoiced that the University of Mississippi and the Industrial Institute and College at Columbus (now Mississippi State College for Women) provided teacher-training courses, and that a board of examiners was authorized by law to place teacher certification on a statewide, professional basis. He resigned in September 1898 to accept the presidency of the Industrial Institute and College (30).

1900 TO 1946

A New Century

What a contrast in the world before and the world after 1900! Will a normal calm return one day? Probably not in our time. For, as William Alexander Percy has said,

Ishmael lived one hundred and thirty-seven years. During that time he must have laughed and joked and loved; he must have looked at the sky and sat beneath the cool palm trees; he must have been glad—but he was a wanderer and a stranger all his days. The North destroyed my South; Germany destroyed my world (31).

## Notes

1. Whitfield did not have to spend his time certifying teachers; he could employ an assistant superintendent he would have to close his office whenever he visited the schools. His report for 1878 showed that the department spent almost $4,000 for the year, including his salary of $2,000.

2. Superintendent Preston listed several major defects in the state's educational system: "(1) a want of qualified teachers; (2) too many schools; (3) no supervision and inspection of the teaching force; (4) a waste of the school funds by dividing the term into sessions of two months each (29)."

3. The superintendent still only received a $2,000 annual salary, and Preston was forced to pay $53 out of his own pocket for clerical services during the 1888-89 biennium—indicating that he was the state department's total staff.

4. During Preston's term, a constitutional convention met in Jackson and adopted in November 1890 the present constitution, which has been amended from time to time by popular vote. Its Article VIII, concerning the schools, differed very little from that of the 1869 constitution. The new constitution did provide for a 4-month school term, permitting districts to extend it by levying local taxes, and specifically provided for separate schools for white and Negro children.

5. Kincannon, a native of Noxubee County and a graduate of the University of Mississippi, became state superintendent in January 1896. He did not hesitate to comment on the difficulties that beset the people of Mississippi, but, at the same time, he felt that the public school system had steadily prospered. He rejoiced that the University of Mississippi and the Industrial Institute and College at Columbus (now Mississippi State College for Women) provided teacher-training courses, and that a board of examiners was authorized by law to place teacher certification on a statewide, professional basis. He resigned in September 1898 to accept the presidency of the Industrial Institute and College (30).
School Buildings. In the same report, Whitfield pointed out that "our school houses as a rule are a disgrace to the State" (34). Commenting on building new schoolhouses, he suggested: "The foundation of the building should be sufficiently high as to permit under ventilation and should be closed to keep out hogs, sheep, and goats" (35). On warm days, the odors from these animals seeped into the schoolhouses, and when commingled with that from sweaty bodies and dirty feet, must have been overpowering for the poor teachers.

Perhaps these miserable facilities explain in part why so many boys were leaving the rural areas (36). To deal with some of the patent weaknesses, particularly in the rural schools, the teachers association named a Committee of Ten which reported in May 1903 at the Vicksburg meeting and substantiated Whitfield's conclusions, declaring: "The greatest need of the rural public schools in Mississippi is better school houses" (37). Schoolmen and laymen now began focusing more attention on buildings, and architects began preparing plans based on suggestions offered by the state board.

During this first decade of the twentieth century, the Legislature appropriated more and more funds for plans, specifications, and blueprints, which were to be prepared by the engineering department of Mississippi Agricultural and Mechanical College (now Mississippi State University). The districts then began erecting buildings with fire escapes, iron ladders, slides, stairways, and outside doors opening outward. Later, beginning in 1920, school buildings also were constructed for Negroes from Julius Rosenwald Fund grants matched by state money. The Department of Education, with the assistance of a grant from the General Education Board of New York—a philanthropic agency which was exceedingly generous to Mississippi—constantly encouraged an accelerated building program and gave direction whenever asked. For the most part, the state gradually eliminated the little, crude, unsightly schoolhouses that were eyesores to their communities.

Rural Education. Since the separate city and town districts were showing more progress, most educational leaders naturally considered rural school improvement their greatest challenge. Through the generosity of the General Education Board, the state board secured funds to employ a supervisor for the rural elementary schools, and the Holmes County superintendent, W. H. Smith, accepted the assignment in July 1910. Smith emphasized repeatedly that the schools could be improved only by consolidation, better transportation, cultural supervision, and a vitiated course of study.

One result of the teacher association's committee report—and the arrival of the Mexican boll weevil—was a recommendation by the state superintendent that agricultural high schools be established. These would help rural students by providing them boarding facilities and work opportunities while teaching them diversified farming and educating them enough to emancipate them from the ranks of unskilled labor. The Legislature responded in 1908, requiring each county agricultural high school to own not less than 20 acres of land and to conduct experiments in farm crops, livestock, and poultry raising.

Fifty county boarding high schools were organized during the next 11 years. The graduates of these schools usually remained in their home communities. Each school strongly supported improved roads and consolidation, backing the teachers association and superintendents who had long argued that consolidating was necessary. In turn, consolidation required county district taxation and a good system of school transportation.

As the consolidated schools grew, the agricultural high schools began to disappear or were converted into junior colleges. In fact, during the period from 1928 to 1953, when most of the junior colleges were founded, they were set out according to the zones in the basic law. Only a few agricultural high schools remain today (38).

District Reorganization. Whitfield, in his 1899-1901 biennial report, stated:

One of the greatest defects in our school laws is that which makes it mandatory on the County Board of Education to define the boundaries of the school districts and to locate the schools(houses) every year.... Such a law has a tendency to discourage their erecting suitable school houses and beautifying school grounds (39).

Also, by modifying the districts so frequently the county board continually stirred up neighborhood dissensions which could not help but impair the efficiency of the school system. These disputes usually centered on the strong desire of many people to maintain as much local control as possible. With the School Law of 1870 permitting any incorporated city of more than 5,000 inhabitants (lowered by subsequent legislation) to constitute itself as a separate school district, these districts appear to have forged ahead, not only in basic stability, but in educational capacities as well (40).

One of the five subtopics of the Committee of Ten's report included a list of benefits to be derived from school consolidation. Convinced that it could save enough money on teacher pay to underwrite the cost of transportation, the Legislature gave school consolidation a considerable boost in its 1910 session. But this was still a weak beginning for what was later to become a vital, integral part of the public school program. In 1914, the law was amended to allow a majority of qualified electors to petition the board of supervisors and, with the approval of the county school board, to levy a property tax in the district to pay for fuel, transportation wagons, construction and repair of school
buildings, maintenance of schools, and extra teachers' salaries if the district maintained its schools for at least 7 months. The board of supervisors could also vote bonds for these consolidated districts to erect, repair, and equip buildings. Rural schools were not on a level with separate district schools. (41).

Textbooks. One more contribution to education occurred during Superintendent Whitfield's term, when the Legislature, following the recommendations of Governor James K. Vardaman, created a textbook commission. In April 1905, the Governor named eight responsible schoolmen to this commission, with the state superintendent as ex officio member. In its first meeting, the commission resolved not to discuss textbooks with any except authorized representatives, and instructed publishers to file lists of these representatives with the secretary, E. L. Bailey. Whitfield, president of the commission, stated that this “not only lessened the annoyances usually incident to book adoption, but placed the adoption on a high plane” (42).

Beginning a New Era

Governor Vardaman named Joseph Neely Powers as state superintendent in July 1907, when Whitfield resigned to accept the presidency of the Industrial Institute and College at Columbus. The new superintendent's salary was increased to $2,500 in the following session, and he was allowed a clerk at $900 per year, plus $500 for traveling expenses and $250 for office equipment.

Despite considerable progress during this first decade of the twentieth century, many of the recommendations by Superintendents Preston, Whitfield, and Powers, based on sound educational practices in other states, had been ignored.

As the year 1910 dawned, the Legislature and administrations continued to keep alive a school system based upon a plan thirty to forty years of age. They refused to believe that time had not stood still. A rather stagnant era in the history of the State Department of Education ended (43).

Governor Earl Brewer appointed W. H. Smith, the rural school supervisor, to the state superintendency when Powers resigned in September 1914. Besides the superintendent and his secretary, the department now had seven other people paid for by General Education Board grants. In March 1916, a year after Smith had been elected without opposition to continue in office, the Legislature permitted him to have an assistant state superintendent and an additional secretary. Smith resigned in September 1916 to accept the presidency of Mississippi Agricultural and Mechanical College at Starkville, and Governor Bilbo appointed W. F. Bond, a member of the Mississippi Normal College Faculty, in his place (44).

New Programs. The Legislature continued to show an increasing interest in education and passed a number of acts, for the most part initiated by Senators who had spent years as teachers. For instance, it authorized graduates of the University of Mississippi and other colleges to receive professional licenses when they had taken sufficient professional courses, improved the consolidation laws, fixed the salaries of the county superintendents and required them to have more training, and increased the common school appropriations. At the same time, the General Education Board, the Julius Rosenwald Fund, the Jeannes Fund, and the Slater Fund continued contributing to Negro education, including money for new schoolhouses and for paying teachers to supervise in the Negro elementary schools.

The Mississippi Legislature voted to accept funds for agricultural education from the Smith-Hughes Act in 1917. State Superintendent Smith had advocated this type of education several years earlier, declaring in his biennial report for 1913-15:

Education for culture is a noble ideal, but it is needlessly to talk of higher culture for the great mass of humanity until they are better housed, fed, and clothed, and until they have surplus leisure and are taught to use that leisure rationally. Our civilization rests on agriculture and we must learn to gain culture through agriculture or go without culture for the masses (45).

The federal government paid the state $30,850 for the year ending June 30, 1918, and this was matched by state funds. In accordance with the law, Mississippi established a Board of Vocational Education consisting of the state superintendent, the acting supervisor of white rural schools, the acting supervisor of Negro elementary schools, and one citizen appointed by the Governor with the consent of the Senate (46). This was a far cry from the earlier days when the emphasis was on township control—and yet what a paltry sum compared to $33.6 million for the fiscal year 1965! Mississippi education has changed dramatically, and the changes come faster every year.

Mississippi's Legislature had voted funds in 1916 to maintain an industrial and training school for children under 18 who were destitute, abandoned, or delinquent. It further extended the benefits of the public schools when local trustees were permitted to maintain evening or part-time programs if they voted the necessary local taxes to do so. And there were programs to open more schools for Indian children and illiterate adults. Congress enacted the Civilian Vocational Rehabilitation Act on June 2, 1920, and the Legislature accepted its benefits 2 years later. Commenting on this program, a former assistant state superintendent stated: "If you want to know the real joy that must have come to the Son of God as he sent the cripples forth walking and leaping and praising God—then you will want a part in the rehabilitating of these unfortunate ones" (47).
Finances. The public schools received their main financial support in 1900 from the state per-capita fund, poll taxes, interest on the Chickasaw School Fund in the north and northeastern areas, and the “sixteenth section” funds in other parts of the state. The Constitution of 1890 provided that these funds be distributed by the state board to the counties and separate districts according to the population of educable children from 5 to 21 years. The state first authorized an enumeration every 4 years, but after 1923, it was necessary to enumerate biennially because the population fluctuated so much (48).

The people voted an important constitutional amendment in November 1919, authorizing the Legislature to establish an equalizing fund which would provide a minimum school program to all local units in the state. The Legislature then effectuated it the very next year by voting $1,268,720 for the 1920-21 biennium and $2,114,535 for the per-capita fund for the same period. At the same time, the state superintendent’s salary was raised to $4,500, and the Legislature authorized $3,000 biennially for the administrative support fund; other money was provided by outside sources. The Slater Fund contributed $76,000 from 1910 to 1923, the Jeans Fund provided $70,000 from 1909 to 1922, and the Julius Rosenwald Fund contributed $73,000 annually for building schoolhouses for Negroes.

Using General Education Board funds, Superintendent Bond established a model county organization in Pearl River County with a staff composed of a county superintendent, an assistant superintendent, a county health officer, a farm demonstration agent, the agricultural high school principal, and two clerks. This experiment resulted in recommendations to empower an elective county board of education to appoint the county superintendent, give him clerical help, pay his expenses to meetings called by the state superintendent, make his salary commensurate with other county officers, and give every child a physical examination every 3 years.

To further strengthen the position of the county superintendents, J. T. Thomas, a Grenada banker, donated $2,000 for several years to pay the expenses of annual meetings for county superintendents. One county superintendent rode a mule 20 miles to attend one of these meetings. Another, after attending a banquet in a meeting in Greenwood, remarked that he had never been to a banquet before, but “didn’t see any harm in it.” After the Gulfport meeting in 1919, the state superintendent found a county superintendent in the lobby of the hotel and asked him why he did not go to bed. He replied, “Nobody had said anything about going to bed.” Realizing that the man had never been in a hotel before, Bond invited him to sleep in his room.

Much more important than acquainting county superintendents with social amenities, these conferences enlightened them about their responsibilities. Most of the educational issues of the day were discussed in depth with all county officials who dealt with the schools. Many were pleased and others appalled at the information they received. For instance, after the compulsory school law had been explained at a meeting in Lafayette County, one trustee said that he would move out of the county before he would put up with such a law. When he learned the law was statewide, he declared that he would move out of the state. It was pointed out that Mississippi was the last state to have such a law; shaking his fist with considerable emotion, he said that he would go to hell before he would put up with it (49).

Prosperous Twenties

During the affluent decade after World War I, there were many efforts to improve the schools. The department’s staff increased from 14 to 25 persons by 1930 and even included a supervisor of music. Although school accreditation had never been under the department’s jurisdiction, the superintendent took it upon himself to lay down a full set of rules and regulations schools would have to follow to become accredited. At the same time, he advocated stronger teacher certification laws, a teacher retirement fund, and much greater consolidation of schools.

The Legislature recodified the school laws in 1924 and declared the equalizing fund amendment valid and mandatory, ending the confusion that had resulted by its having been added through the initiative and referendum. At the request of Governor Whitfield, the former state superintendent who defeated Bilbo in a primary election the previous summer, the Legislature voted to allow up to $10,000 to conduct a survey of all public education. Governor Whitfield then selected M. V. O’Shea, professor of education at the University of Wisconsin, to conduct the study of Mississippi’s school system. “Many valuable recommendations for the improvement of the school system of the state were made; but like many other surveys, these recommendations were, for the most part, consigned to the archives” (50). About the only concrete result from this O’Shea Survey was the creation of the division of information.

The country as a whole enjoyed an economic boom during these years, but financing schools equitably still posed a problem. The state superintendent pointed out that in some counties over $40,000 of assessed valuations supported each child, while in other counties less than $500 per child was available as a tax base. He also reported that less than 10 percent of the state’s white children were attending the old one- and two-teacher schools, a commendation to the tremendous job of consolidation, but he recommended—and the Legislature agreed—that the educable age be changed from 5 to 21 to 6 to 18. At the same time, he recommended that the financial burden be shifted to the county and state to lighten the load on local districts.
The Depression Years

The Depression of the 1930's left the schools' economic plans in chaos. In the first sentence of his 1931-33 biennial report, the state superintendent said:

The depression came down upon the world like a wolf out of the fold and caused great havoc in every phase of the life of the people . . . . Departing, it is leaving behind a disorganized condition that challenges the heroic spirit and rugged honesty bequeathed to us by our forefathers (51).

A new Legislature, a new Governor, and the same state superintendent (reelected without opposition) began terms in January 1932, as a new President in the White House broadcast in a fireside chat to the nation that there was nothing to fear but fear itself. Catching the spirit of this changing era, a song writer wrote: "There is a new day in view, there is gold in the blue . . . ." An optimistic urge seized many Americans, suffering as they were in the throes of our greatest depression.

**Finances.** Governor Mike Conner, an able and optimistic state leader, urged the Legislature to pass a retail sales tax. Convinced that this was the only way to keep the schools open, Superintendent Bond presided over a mass meeting in Jackson of more than 5,000 educators, including every county superintendent in the state endorsing such a tax. Governor Conner and a number of legislative leaders pledged their support to the tax measure, which appeared to the great majority to be the only hope for the state as well as the public schools. The Legislature did enact the bill, and it was signed by the Governor in April 1932 (52).

As the Depression reached its nadir in 1933, the state's financial difficulties persisted. Superintendent Bond traveled to Washington to appear before a House Committee on Education to seek federal aid for his schools (53). Although the national government supplied $1,320,000 during the 1933-35 biennium, teachers and bus drivers were unpaid and due $1 million in back salary. The equalizing fund, inadequate for the demands on it and impossible to administer objectively, became the chief issue in the 1935 campaign for the superintendency.

J. Sloan Vandiver and S. L. Stringer entered the race against veteran Superintendent Bond. Charges of favoritism in distributing the equalizing fund made the race a bitter one. When the first primary returns put Bond second to Vandiver, Bond withdrew rather than prolong the struggle into the second primary. The end of his term the following January brought a close to the longest tenure of any state superintendent in Mississippi up to that time (54). Superintendent Vandiver, a native Mississippian who had served for 18 years as superintendent of the Sunflower County Agricultural High School and president of the Sunflower County Junior College at Moorhead, now wrestled with the same financial problems as his predecessor (55).

The Legislature carefully prescribed the distribution of state funds and prohibited deficits by enacting the Kyle-Cook Budget Law in 1936. This law required county and district superintendents to file with the state superintendent detailed budget estimates for each fiscal year, and to regulate their expenditures according to these estimates and within the revenues. The law further authorized boards of supervisors, boards of trustees, and governing authorities of municipalities to borrow money to pay off valid notes, teachers' and school bus drivers' certificates, and other valid obligations at the time the law was adopted. Vandiver said: "We are happy to state that the Kyle-Cook Budget Law . . . has worked wonderfully well. As a result of this, no new deficits have been created; and in most cases, teachers and other school employees have received their pay on time" (56).

More money was still needed for the schools, vocational education, rehabilitation, crippled children's services, and junior colleges. The department itself, which received itemized appropriations for salaries, travel, and other expenses, also needed more money, particularly since a majority of the staff members were supported by state funds rather than by funds from federal and philanthropic sources (57).

**School Plants.** A Civil Works Administration survey during the 1934-35 school year revealed many serious deficiencies in the state's schoolhouses, with Mississippi's investment averaging only $69 per child against $250 for the nation. The Public Works Administration, the CWA's successor, appropriated $5 million to Mississippi, about half of it for direct grants to aid school plant construction and improvement. The Works Progress Administration also allotted sizable sums to build schoolhouses and improve them. Mississippi's school plant investment increased from $41.1 million in 1934 to $61.6 million in 1941, "by far the most extensive school building program ever accomplished during a similar period in the history of the state (58).

**Textbooks.** The Mississippi Education Association recommended that free textbooks be provided, after spot checks revealed that many children dropped out of school because their families could not afford books. The state superintendent supported this recommendation, and the Legislature passed a free textbook law in 1940. It established a state textbook rating and purchasing board, prescribed its powers and duties, and detailed how the books were to be selected, adopted, purchased, distributed, cared for, and used in all schools through the first eight grades. Two years later, the law was amended to include all 12 grades.

The Governor named three members to the board, one from each supreme court district, in addition to himself as chairperson and the state superintendent as vice chairperson. To assist in textbook adoptions, the law provided for the
Governor to appoint rating committees. Later, the state superintendent did the appointing, until finally the law was changed so that the Governor named four members and the state superintendent three members.

A suit enjoined the textbook board from distributing free textbooks to children in parochial schools on grounds of violating the doctrine of separation of church and state. Following appeals, the State Supreme Court denied the injunction, holding that the books were to be distributed to the children as beneficiaries of the state’s munificence irrespective of their schools.

The department continued to expand its activities during the latter part of the decade, adding supervision in home economics and distributive education under authorization of federal acts. Its staff held two schools for bus drivers during the summer of 1940 at Mississippi Southern College and Mississippi State College; the counties followed their similar instruction for more than 2,500 bus drivers. The department organized a vocational training school for janitors in Clarksdale in the same year. Climaxing several years of effort, the 1940 Legislature set up a training school for Negro teachers at Jackson College. In arguing for better trained teachers in the Negro schools, the supervisor for Negro education said: “The state owes it to them to give them a chance to become a self-respecting, self-supporting, law-abiding people” (59).

The department’s staff continued to grow to include a supervisor of narcotics education, a supervisor of school transportation, and additional staff members for vocational education, rehabilitation, and adult education. By 1943, it had 40 members. Many of these positions were supported initially from outside sources such as the General Education Board, the Julius Rosenwald Fund, the Jeanes Fund, and the Slater Fund. But as these sources of income ceased to be available, the state financed them itself.

World War II

On September 1, 1939, World War II began, and on December 7, 1941, the United States was in it, bringing the heavy demands of war to all agencies, including the administration of the public schools. Superintendent Vandiver remarked:

We are very proud of the loyalty and patriotism shown by our teachers in the development of the wartime programs in Mississippi schools. Practically all of them have participated in some form of reorganization of their regular school programs to meet the rapidly changing needs of their communities. The schools almost as a unit have cooperated in salvage campaigns, bond and stamp sale drives. The F.F.A. and 4-H Clubs have gone forward with their Food for Victory programs. Health and nutrition have been given added emphasis. Junior Red Cross organizations have taken on new impetus. The “Walk to School” movement, initiated in many of our schools, has received national recognition. Mississippi has led the nation in the number of illiterates prepared for military service and in the total enrollment in OSYA (60).

Transportation. Transportation, always a costly part of the school program, was even more difficult to manage during the war. A committee that studied the problem finally reported “that Mississippi had in 1943-44 the least efficient and most expensive school transportation service of any southern state” (61). It further reported that 2,237 farm trucks were used to transport children, but “were also used in transporting farm produce and in many instances cattle, hogs, and fertilizer” (62). The 1944 Legislature authorized county school boards to develop a system of county-owned school buses. Following this survey, the state made so much progress in school transportation—procuring new buses, operating bus drivers training programs, and so economizing in the maintenance of its program—that Glen Featherston, a specialist for pupil transportation in the U.S. Office of Education, stated: “In view of these accomplishments, it probably can be said that Mississippi is one of the two states that have made the most progress in the last three years in developing a good program in pupil transportation” (63).

The Tubb Era, 1946 to Present

Vandiver resigned his office effective July 15, 1945, to accept the presidency of Chamberlain-Hunt Academy at Port Gibson. Governor Tom Bailey appointed J. M. Tubb to fill the unexpired term, beginning the longest tenure of any man in this office (64). A native of Hatley in Monroe County, Tubb obtained his B.S. degree from Mississippi Southern College and his M.A. from the University of Mississippi. He had represented Monroe County for one term, 1928-32, in the lower House of the Legislature and had taught many years in Prentiss and Perry Counties and at the demonstration school at Mississippi Southern College. He was serving a 6-year term as president of East Mississippi Junior College at Scooba when appointed to the state superintendency. Tubb assumed his duties well prepared by both training and experience, and his personal characteristics have endeared him to thousands of his fellow Mississipians, enabling him to serve with understanding and finesse.

Up to this time, the state department had grown by accretion, more or less Topsy-like, meeting exigencies as they arose. Many educators realized that the time had come for a more functional departmental organization. Superintendent Tubb recommended in his first biennial report that the Legislature give attention to a plan recommended by a committee assigned by the 1944 Legislature to study public education.
The committee filed its report in February 1946 after many conferences with Tubb and his staff, and the Legislature agreed with the reorganization almost in toto (see Appendix B). A department of education was set up to consist of the state superintendent, the assistant state superintendent, and directors of the six divisions. A coordinate school-health division was to be jointly administered by the State Department of Education and the State Board of Health. The duties of the superintendent and his officers were spelled out more clearly than before, and responsibility was plainly fixed.

Although the state superintendent was chairman of both the State Board of Education and the State Board for Vocational Education, frequently the lines of administrative control crossed. Sometimes this resulted in bickering on the local level between the school superintendent and the vocational agriculture teacher. To correct this, the Legislature abolished the vocational board and transferred its various duties to the education board, streamlining and centralizing the latter's administrative authority. The crippled children's services and vocational rehabilitation, formerly one unit, are now two divisions under the education board. The crippled children's services inaugurated the first program for spastic children on a statewide basis in the South in 1947. This program is now under a separate board designated by statute as the Mississippi Hospital School for Cerebral Palsy.

**District Reorganization**

Better transportation, through improved highways and modern vehicles, made it possible to step up the pace of district reorganization to reduce costs and give students richer offerings than the one- and two-teacher schools provided. Superintendent Tubb pointed this out in his 1947-49 biennial report, saying that each boy and girl in the rural areas should have the opportunity of studying vocational agriculture, trades and industrial arts, diversified occupations, music, drama, art, physical education, and other special courses if he or she needed or wanted them. He stated that a committee report from another state summed up his opinion on district reorganization:

School organizations showed the effects of failure to keep pace with such improvements as transportation and road development. However, the social lag must not be taken up too rapidly by rushing headlong into school district reorganization. If we insist on riding roughshod over attitudes and ideas that now exist in rural areas without trying to bring them into focus with social progress represented in school reorganization, we would be retarding reorganization in some areas perhaps for many years (65).

The Legislature gave impetus to the reorganization in 1953 when it revamped the School Code in large measure and created an Educational Finance Commission of six members, appointed by the Governor and confirmed by the Senate, to reorganize school districts and allocate funds appropriated for school facilities construction. To give the commission a free hand, all school districts were abolished with the proviso that they remain active until replaced, reorganized, or otherwise changed.

The reorganization resulted in 151 districts or administrative units composed of 70 county units, 24 consolidated units, 5 line consolidated units, 47 separate municipal districts, and 5 special municipal separate districts. After further reorganization, 149 districts are in operation today.

**Buildings**

Consolidation created a need for more school construction under the direction of and partly financed by the state. Recognizing this, the Legislature made a start in 1946 by appropriating $3 million to assist local school districts with their building programs. Not until January 1952 was a complete survey of all the school buildings in the state made. The study revealed that in many rural areas the buildings were not crowded, but in the cities or near the cities they were bulging.

The state's economy was changing rapidly. Cattle raising, mechanized farming, and tree farming reduced the number of laborers needed in agriculture, and new industries attracted an increasing number into the cities. The survey showed that only 224 prereorganization school districts had an assessed valuation of $500,000 or more, and 527 districts had less than $300,000 assessed valuation.

The Legislature appropriated a total of $10 million from 1946 to 1952 to help districts build schoolhouses. These funds were matched or mixed with local and federal funds so that during this same period $53.4 million was spent for school facilities—$35.6 million for white schools and $17.8 for Negro schools. The new classrooms were well lighted, well ventilated, and properly heated.

All school districts began receiving credit for aid in school facilities construction in July 1954, when a minimum program plan of financing the public schools became effective. This program, to be discussed later, gave a tremendous impetus to the building program, which continues to progress according to this plan under the administration of the Educational Finance Commission.

**Department Growth and Curriculum**

The changing world in which Mississippians found themselves after World War II challenged the department to prepare students for a new era. The state continued to take a more active part, not only by transporting students to large centrally located schools and by assisting them in constructing new plants, but by developing new programs,
improving established programs, and adding new supervisory personnel and other professional persons to its staff. With the assistance of various professional committees, the department prepared a number of valuable bulletins (66). It hired a supervisor of music education in 1948 to give the public schools leadership and to assist teachers in using the music textbooks adopted for the first six grades.

The state board entered into a contract with the Veterans Administration in May 1948 to provide elementary academic training to World War II veterans and other adults. In fact, Mississippi was the first state to offer this type of training, which was expanded in its early stages to include high school courses. The board also cooperated with the Veterans Administration to inaugurate on-the-job training and institutional on-the-farm training, two programs administered by the vocational education division. The state board and the state high school accrediting commission jointly authorized high school equivalency certificates to be issued in lieu of high school diplomas based on the results of General Educational Development Tests.

The need for driver education was apparent in most states by the end of World War II, and Mississippi added such courses to its curriculum. It also held a series of conferences in cooperation with the state highway patrol to awaken the people to the need for safety programs. The department purchased 12 simulators with money accumulated in a penalty assessment fund to more effectively teach driver education.

Finance

Improving the physical plants and transportation and enriching the curriculum required increasing amounts of money, and this was, of course, of serious concern to the legislators during the postwar years. The 1946 legislative recess study committee had barely finished its report before another study was under way. The new study, done in 1948, was limited to answering three questions: What kind of education was Mississippi getting for the money spent on its schools? How was the money being spent? Could the financial support be increased? In particular, the study was decided that before additional revenue could be appropriated, a study of the state school system by a legislative committee should be conducted to determine the kind of reorganization necessary to provide equal and adequate opportunities and facilities for all children. After a legislative committee of eight Senators and ten House members had been named, the Governor called its first meeting in his office in May 1952. He "urged the Committee to make a careful study of school attendance, school finance, teachers' salaries, transportation, and building facilities in order to equalize opportunities between the races" (71). He promised the committee that he would accept its recommendations and would work to enact them into law.
The majority of the committee argued for immediate consideration of its proposals, but a minority filed a brief listing certain exceptions to the majority report. One member dissented vigorously, primarily because of the increased cost necessary to put the proposals into effect. The segregation issue also was of great concern to the committee as cases were being heard in 1952 and 1953 by the U.S. Supreme Court on this question. The committee said:

In the event segregation is declared unconstitutional, the only possibility of maintaining a segregated system in Mississippi is by persuading the Negro to attend of his own volition, schools provided for him; such persuasion can succeed only where adequate, respectable, and equal facilities are provided. The enactment of this program will provide such facilities (72).

The Governor called the Legislature into extraordinary session in November 1953, to consider the committee's report. In December, it approved the recommendations almost exactly as presented, which in effect revamped the School Code. It was in this session that the Legislature created the aforementioned Educational Finance Commission to reorganize districts and allocate funds for constructing school facilities.

The Legislature replaced the old equalizing fund with a minimum program plan effective July 1, 1954, which practically nullified the per-capita fund as it had been known. Disbursements under the minimum program plan are based on an economic index with the burden shared by the state, the county, and the district according to a specified formula and subsequent interpretations of the law.

The Segregation Issue

Superintendent Tubb indicated his own interest in improving the Negro schools in his 1947-49 report, stating:

Quite a number of counties in Mississippi have put on a special tax levy for the purpose of improving the physical facilities of the Negro schools. State aid through the State Building Commission has enabled counties to meet, in part, their obligations for building better and more comfortable classrooms for Negro children. There is a vital need for the passage of new legislation in Mississippi that will provide a way whereby Negro schools can be conducted and maintained through more public support than is now possible under existing laws. It is imperative that the Legislature enact necessary laws that will insure a greater degree of comparable educational opportunities for all the children of all the people (73).

Later, in supporting a program for the education of spastic children, he held that—

One of the fundamental principles of the American philosophy of education is that every child, regardless of race, color, creed, social position, physical condition, or native intelligence should have the opportunity for full development of his powers through education (74).

Considerable attention has been given to upgrading the Negro schools, not only in facilities, but also in teacher preparation and pay. This was done, however, under the state's constitutional provision of separate schools for the races and the U.S. Supreme Court's "separate but equal" doctrine.

Following the Supreme Court school desegregation decisions on May 17, 1954, the Mississippi Legislature held an extraordinary session to consider a constitutional amendment to abolish the public school system as a last resort for preserving the segregated schools. It voted to repeal the old statute requiring separate districts for white and Negro children. Under the new law, children of both races were to be in the same district but in separate schools according to the state's constitution. The guidelines set up by the U.S. Office of Education based on the Civil Rights Act of 1964 in effect nullified Mississippi's constitution by their desegregation compliance plans.

The proposal to dismantle the public schools in order to maintain segregation continued to have support among a number of white people. Superintendent Tubb had earlier addressed the seventy-fifth annual convention of the Mississippi Education Association in March 1961 and had referred to this proposal in part, when he said:

In Mississippi a dual, segregated program of education has been operated for all the children. It is the belief of an overwhelming majority of our people that this type program, considering the background and traditions of our people, is best for us.

If, however, this system of operation is challenged, the solution must be found through the efforts of dedicated leaders who put the welfare of the children and the future of our State and Nation above everything else. In the day of last resort, our people must know that to abolish the public schools would be to close the door of hope for many ambitious youth in this state . . . (75).

This statement was given much publicity and provoked considerable adverse comment. So far the "day of last resort" is not gone, and many classrooms have learned that white and Negro children can work together.

Impact of Federal Programs

The state has used federal funds for its schools since as far back as the Smith-Hughes Act in 1917. Vocational and other programs have been paid for in part by federal moneys. During the Depression, Mississippi, like many other states, sought financial assistance from the federal government to maintain its schools and programs. Also, although school lunch programs had been in existence in Mississippi since 1912, they became an integral and important part of the
school day after President Truman signed the National School Lunch Act in June 1946. Following the Mississippi Legislature's action in accepting the school lunch program during a 1947 extraordinary session, the Governor assigned it to the Department of Education.

Superintendent Tubb maintained close liaison with the U.S. Office of Education. When the great White House Conference of November-December 1955 picked education as its central and singular theme for the first time in the nation's history, Governor White named Superintendent Tubb to be state chairman for the conference. Tubb called meetings on the local and state level as a preliminary to the national meeting. Men and women across the state showed an evangelistic fervor as they examined education and how it should meet the needs of their children. The experiences of the previous 5 years paved the way for active and intelligent participation in this historic conference.

More important perhaps than increased citizen interest was the money turned over to the states in both general funds and for special programs. When Superintendent Tubb took office in 1945, only 12 of the 51 staff members of the state department were paid jointly by state and federal funds, and 5 by federal funds alone. Fourteen years later, of the 191 staff members, the state paid 68, the health and education division paid 5, 31 were supported jointly by state and federal funds, and the federal government alone paid the salaries of 87. This increase over a 14-year period from 5 to 87 persons paid entirely by the federal government was due mainly to the expansion of programs in vocational education, rehabilitation, crippled children's services, and the school lunch program. But the full force of the federal government participation was not felt until the 1957-59 biennium.

Congress enacted the National Defense Education Act of 1958 as an emergency measure to undergird the defenses of our country in the face of Sputnik I. Of the act's 10 titles, Mississippi adopted plans in 4: Title III—instruction in natural science, mathematics, and modern foreign languages; Title V—guidance, counseling, and testing; Title VIII—area vocational education programs; and Title X, Section 1009—statistical services of the state department. This meant the department had to employ new personnel to supervise and handle assignments in these areas. Special supervision had to be added in science, mathematics, language, guidance, counseling, and testing to those already available in audiovisual education, alcohol and narcotics education, libraries, music, and special education.

Over the years, general supervision on the elementary and secondary levels has been provided through the instruction division. Activities under Title VIII, planned for area vocational schools, spread into the area of vocational-technical education and resulted in a tremendous program, not only at the secondary level but in the junior colleges as well. Superintendent Tubb later named a nine-member advisory committee to assist the State Board of Education in formulating plans for expanding this very practical and useful program.

Title X enabled the administration and finance division to upgrade its statistical services with IBM data-processing units. When the Eighty-Ninth Congress enacted the Elementary and Secondary Education Act in 1965, Title V of the act accelerated and broadened the services of this unit to aid the entire department. The state also had its plans approved under Titles I, II, and III of this new law. The superintendent and his divisional directors decided to set up an independent administrative unit to handle the far-reaching programs under Title I. This unit, directly responsible to the superintendent, who in turn receives the advice and approval of the directors before forwarding proposals to Washington, has proven very effective. The benefits of the program have been felt over the entire state.

The Civil Rights Act of 1964 contained two sections of significance to public education: Title VI provides for nondiscrimination in federally assisted programs, and Title IV provides for desegregation in public education. Soon after Congress approved the act and the guidelines were published, the Mississippi State Board of Education drew up its proposed plan of compliance, submitted it to the U.S. Commissioner of Education in February 1965 and obtained his approval.

The state board immediately started working with county and district boards to assist them in working out their plans of compliance with Title VI on a voluntary basis, so that federal funds would not be cut off and regular programs of public education could proceed unimpaired and uninterrupted in a given district. The superintendent, department staff members, and the state superintendent arranged for them to meet with school superintendents, their boards of education, and their attorneys to discuss the compliance plans. The local people were grateful for this assistance, and federal officials praised the plan.

Although the Governor did not encourage the school boards to draw up these compliance plans, the state superintendent thought this the soundest procedure, and school leaders continued their efforts to work out desegregation plans. Thus, most of the districts were able to qualify for financial assistance and experienced no unusual difficulties, setting examples of obedience to law and court orders which were distasteful to them. Under these adverse conditions, at variance with the customs and traditions of the past, four school districts were brought under court order for the 1964-65 session. The following year, 107 complied voluntarily and 24 were ordered to by the court; for the 1966-67 sessions, out of 149 districts in the state, 93 complied voluntarily, and 42 obeyed the court orders to do so.
The Department's Growth

The 1960 Legislature authorized a nine-member committee to make another study of public education. In a report it filed in December 1961, the committee recommended that the Governor be empowered to appoint a lay state board which would then name the state superintendent. Superintendent Tubb was not opposed to the idea of an expanded lay board but was opposed to the Governor's being given the authority to name its members. A constitutional amendment was required to make the change, and this was turned down by popular vote. These same controversial proposals had been made before, and in a study authorized in the 1966 session of the Legislature, they have again been introduced. But Mississippi continues at present to support the Governor Se empowered to appoint a lay state board which would then name the state superintendent. Superintendent Tubb was not opposed to the idea of an ex-officio board, as set up in

In the 1966 session of the Legislature, they have again been introduced. But Mississippi continues at present to support an ex officio board, as set up in 1869, and prefers selecting the state superintendent by popular vote.

The department had a staff of 191 during the 1957-59 biennium. Federal programs and the demand for new services made a tremendous impact on the department, so that by 1966-67 its staff numbered 447. Appropriations increased from $11.5 million for the 1946-47 school year to $80.5 million in 1965-66, including an increase in annual per-pupil costs of from $53.48 to $269.72 during this period. Average annual teacher salaries also have gone up—from $736.95 in 1944-45 to $4,212.58 in 1965-66 (see Appendix C, Table 2). Many present staff members have stayed with the department over the entire period of this phenomenal growth from infancy to maturity.

After 22 years as superintendent of education in Mississippi, J.M. Tubb retired in January 1968. He was succeeded by Garvin H. Johnston, president of Pearl River Junior College, a prominent Mississippi public school educator with background as a teacher and superintendent of schools.

Conclusion

This description comes up to the present on an optimistic note—note of confidence in the people of the state working together for common causes. Mississippians have long yearned and labored for federal aid to education, conditioned each time “but without objectionable federal control.” Federal aid is now available in great quantities, and tied to it are controls that most Mississippians find shocking.

To obtain the aid and adhere to the controls, men and women from the federal, state, and local levels have sat down together to tackle these very difficult problems. They can be solved. The federal aid is joined to civil rights, and civil rights calls for desegregation; desegregation has provoked guidelines which many believe go beyond the law, and certainly they conflict with local customs and traditions. The North, the South, the East, and the West eye each other a bit suspiciously on many counts, yet all of these concerns are alleged to be for children.

Perhaps by tackling these problems and disputes the great American dream will be fulfilled. The expanded—and some say overgrown—departments of education have a real challenge to meet all of the demands. Willa Cather, when looking at Nebraska, observed: “The generation that subdued the wild land and broke up the virgin prairies, inspires respect and compels admiration. We made this, our backs and hands”(76).

Now federal, state, and local governments have an obligation that compels cooperation for the benefit of humanity, and youth in particular. This will have to be done with the heart and mind. Men are too close to continue carrying chips on their weary shoulders. Those same shoulders, rejuvenated, must be put together to push the great load of national concern: education.

17. Prior to the enactment of the law, in his message to the
Legislature on January 6, 1846, in Jackson, Mississippi,
Governor Brown said:
What would we think of a man who had built a ship and
sent her upon a distant and perilous sea, laden with
priceless jewels of liberty and cast it upon the uncertain
elements of public opinion untempered as yet by the
hailed influence of education and shall we still refuse
the safety of that government by refusing to contribute
to the only means that give it safety — to the education
of its people. The rich may say, “We have no interest in
the education of the poor.” There could be no greater or
(more) fatal error. Pride, the love of offspring, the
ephemeral pleasures of witnessing the tree of youth
nurtured by our care as it expands and grows and ripens
into manhood — these teach the rich to educate their
own children, but the higher consideration of patriotism,
the holier cause of religion and morality, the pure and
unstained love of human happiness, teach them to edu-
cate the poor.
19. The U.S. Census reports in 1850 that there were 756
teachers, 782 common schools, and 18,746 pupils at
a cost of $254,159; in 1860, there were 1,215
teachers, 1,116 common schools, and 30,970 pupils
at a cost of $385,677 — an increase of approximately
33.5 percent for the decade. Elsie Timberlake, “Did
the Reconstruction Regime Give Mississippi Her Public
Schools?” Mississippi Historical Society Publications,
XII (Jackson: The Society, 1912), 75-76.

tute in Clinton, was president of the Mississippi State
Teachers Association. Lowry and McCardle, op. cit.,
p. 419.
22. Senator L. Q. C. Lamar of Mississippi considered a
public school system so important that he made an
eloquent speech in the U.S. Senate on March 28,
1884, requesting federal aid to education. He stated:
In my opinion, it is the first step, and the most im-
portant step that this government has ever taken in the
direction of the solution of what is called the race
problem; and I believe that it will more powerfully
and decisively upon the future destinies of the colored
race in America than any measure or ordinance that has
yet been adopted . . . .

36. Superintendent Whitfield came to this conclusion,
stating:
I am very much of the opinion that the criticism often
made that our schools as now conducted are educating
our boys out of sympathy with their environments and
making them dissatisfied with their surroundings is, in a
large measure, true. That our boys are manifesting more
and more a disinclination to remain in the country,
and that the State is to be great, we must make our
schools more homey and remunerative.
Superintendent of Education, Biennial Report, 1901-
1903, pp. 8-9.
37. Ibid., p. 231.
38. Knox M. Broom, living in busy retirement in Jackson,
served 25 years as state supervisor for these schools
and had more to do with laying the foundations of
the law, the philosophy, and the plans than any other
person. Although it was not fulfilled during his
tenure, it was his dream to inaugurate a program of
vocational and technical education in the junior col-
leges. Knox M. Broom, History of Mississippi Public
Junior Colleges, 1928-1933 (Raymond, Miss.: Keith

40. Superintendent Whitfield pointed out that the children in rural schools attended 90 days while those in towns averaged 163.3 days, and there were more than nine times as many attending the rural schools as attended the separate school districts. The amount of money spent for rural schools was still less than three times the amount spent at separate school districts. According to the enumeration of educable children in 1900, 89.5 percent lived outside the separate school districts. Whitfield wrote: "The great problem before the people of the State in my opinion is the betterment of the rural schools. Gosh! What a challenge is thrown to the people in 1900 toward equalization . . ." Ibid., p. 11.

41. W. H. Smith, the state rural school supervisor and later superintendent, wrote: "In Harrison County, in which I spent one week in July with county superintendent, I. J. Dawsey, we consolidated fifteen one-teacher schools and installed seven school wagons—the first school wagons ever used in Mississippi at public expense."

The honor of being the first consolidated school organized in the state is claimed by Woolmarket Consolidated School, whose cornerstone certifies that it was organized July 16, 1910, Willard F. Bond, I Had a Friend (Kansas City, Mo.: The Author, 1958), p. 97.

42. The members of this first textbook commission were D. A. Hill, H. L. Jobe, C. E. Saunders, O. A. Shaw, L. Q. C. Williams, T. K. Boggan, H. P. Hughes, E. L. Bailey, and State Superintendent H. L. Whitfield. They were invited by the Governor to meet him in his office where they received official notice of their appointment. Superintendent of Education, Biennial Report, 1903-1905, p. 17.

44. Mississippi Normal College later became Mississippi State Teachers College and is now the University of Southern Mississippi at Hattiesburg. Although past 90 years of age, Bond and his wife are very active in Jackson's church, civic, and educational affairs. He still drops by the state department to see old friends and is considered Mississippi's elder educational statesman. The book first mentioned in footnote 41 concerning his experiences is most interesting.

46. This board was reorganized in 1936 to consist of the state superintendent, state commissioner of agriculture and commerce, the executive secretary of the State Board of Health, the president of Mississippi State College, and one white citizen appointed by the Governor with the advice and consent of the Senate. This board was abolished by the Legislature in 1946, and its powers and duties transferred to the State Board of Education.

47. M. E. Moffitt, Twenty Years of Progress of Public Education, 1910-1930, Research Bulletin No. 1 (Jackson: Department of Education, 1931), p. 33. Jim Brown, the former assistant state superintendent who made this statement, was the first president of Delta State Teachers College (now Delta State College).

48. Superintendent of Education, Biennial Report, 1899-1901, pp. 5-6. The 1966 Legislature left it up to the State Board of Education to decide how often it should make the enumeration. In a special meeting in January 1967, it decided that no enumeration should be made for this year.

49. Superintendent Bond relates that at the conclusion of the program at the Gulfport meeting in 1919, the Jackson County superintendent and the Sharkey County superintendent got into an argument and pulled off a fake pistol duel over the heads of nearly 100 people. Each felt he was about to be shot by a stray bullet. One superintendent looked right at the muzzle of one of the pistols and froze in his seat, never moving a muscle. Another rolled into the aisle and tried to jerk his collar a little higher on his neck. With each shot every head would disappear behind the benches and then slowly reappear. Bond, op. cit., pp. 94-96.

52. One Mississippi historian had this to say about the Honorable Mike Conner, who became Governor in January 1932:

Beginning his administration amid the stress and strain of the greatest depression in history, Governor Conner in less than two years cut down the debt of the state, balanced the budget, restored Mississippi's credit, placed its revenues upon a solid basis by procuring the passage of the general sales tax, proved the soundness of this new source of revenue, aroused nation-wide interest in the sales tax idea, and made Mississippi a center of study for those interested in financial and economic reform.

53. This was Bond's first appearance before a congressional committee, and with its permission he began reading an imposing list of the taxes Mississippians were paying at that time. The chairman asked why Mississippi had no tax on chewing tobacco, and Bond replied that he supposed the members of the Legislature were afraid they might hurt the feelings of the
tobacco chewers in the rural areas. When asked if Mississippians chewed much tobacco, he told them that he didn't know whether they 'outchewed the people of every state or not, but that they did chew right sharply. The chairman observed that very likely the people of Mississippi were in a "state of great expectoration."

In reply to the chairman's question on how much Mississippians were paying on dogs, he told them the tax was $1 on some dogs and $2 on some others. One committee member wanted to know why it varied, why tax one dog $1 and another $2. Bond explained that Mississippi had a $1 tax on the male and a $2 tax on the female or bitch dogs, and it was his personal opinion that this illustrated one of those rare occasions when a son-of-a-bitch got a break. He said he heard someone in the committee room say, "They ought to stop asking him questions." Bond, op. cit., pp. 119-20.

54. During his administration, Bond built the State Department of Education into a potential force for intelligent, aggressive service. He had been largely responsible for establishing the equalization fund and obtaining countywide and district levies for schools. He was particularly proud of his work in consolidation, raising the minimum educable age from 5 to 6 years, organizing the vocational high schools, and extending benefits to cripple children. He had also worked to implement programs in vocational rehabilitation, helped begin services for the blind that finally became second to none in the nation, and added 2 years to the strongest agricultural high schools to start the junior college program. His surveys of both the county and city systems resulted in raising standards of both the schools and teachers. He recognized that denominational and private schools and colleges were a vital part of the educational system. He started a weekly prayer service in the Department of Education that continues until today. Ibid., pp. 132-33.

55. Vandiver attended the Iuka Normal Institute and obtained his bachelor of arts degree from Mississippi College. He had served as superintendent of schools at Nettleton, Ackerman, and New Albany, and in 1916 had been the director of the Model County School System in Pearl River County.

56. Superintendent of Education, Biennial Report, 1935-1937, p. 7. The teachers and bus drivers certificates were issued because funds were not available. The Kyle-Cook Budget Law gave the boards the authority to borrow money to pay off their indentures.

57. The 1936 appropriation began a new practice of itemizing salaries, travel, and other expenses. Since 1954, however, the department has received lump sum appropriations which are administered by the state superintendent and the State Board of Education.

62. Ibid.

63. Ibid., pp. 66-67.

64. On March 10, 1967, Tubb announced his intention not to seek reelection; when his term ended in January 1968, he had served longer than any predecessor.

66. The department's publications included the following: a manual of administration, a manual for teaching health, a manual for teaching physical education, a school library handbook, a handbook for elementary teachers, a business education syllabus, a syllabus for Negro schools, education and teachers' directories, and elementary school regulations. It also suggested lists of elementary and high school library books, lists of science equipment, and lists of maps, globes, and charts.

Appendix D

ANNUAL REPORT OF STATE SUPERINTENDENT H. R. PEASE TO THE LEGISLATURE OF THE STATE OF MISSISSIPPI FOR THE YEAR ENDING DECEMBER 31, 1871

To His Excellency, the Governor, and the Honorable Legislature of the State of Mississippi:

GENTLEMEN—In submitting the annual report required by law from the Superintendent of Public Education, permit me, first, to call your attention to a general view of the present condition of Public Education exhibited in the following summary, which has been carefully prepared from the reports of school officers, and such information as I have been able to obtain from other sources:

Number of civil school districts ....... 75
Number of public schools ........... 3,450
Number of graded schools ........... 100
Number of high schools ............ 80
Number of evening schools ........... 60
Number of normal or training schools ... 2
Number of universities ............. 2
Number of teachers employed in the public schools .......... 3,600
Number of pupils enrolled in the public schools ........... 117,000
Number of youth of legal school age in normal schools ... 100
Number of private schools .......... 460
Number of pupils enrolled in private schools .......... 7,050
Average attendance in the public schools .......... 90,000
Average length of school term .......... 5 mos. 10 days
Number of superintendents .......... 70
Number of school directors .......... 450
Whole number of school officers (including treasurers and secretaries) .......... 659
Number of schoolhouses (including buildings rented) .......... 3,450
Number of schoolhouses built since the inauguration of our school system, about .......... 600

Total value of public school property .......... $800,000

SCHOOL FUNDS

Amount of the common school fund (including the funds appropriated under the Act of 1859, Chickasaw and sixteenth section funds, regarded as available) .......... $1,950,000

Amount of revenue received and paid into the treasury from the various sources provided by the constitution and laws enacted since its adoption, accruing to the common school fund .......... 529,464

Amount of revenue by special county tax collected and paid into the county treasury—reported .......... 683,784

Amount of the common school income fund, apportioned to the several counties .......... 172,550

Average monthly salaries of teachers .......... 50

EXPENDITURES

Amount expended for superintendents’ salaries .......... $35,073
Estimated amount expended for salaries and mileage of school directors .......... 50,000
Estimated amount expended for salaries of secretaries of the Boards of Directors .......... 6,500
Total cost of the Boards of School Directors, estimated at .......... 58,000
Estimated cost, including expenditures of all kinds .......... 950,000
Appendix E

MISSISSIPPI HISTORICAL SOCIETY

LAW OF 1846

This law provided for —

1. A General School Commissioner whose duties shall be to keep all statistical matters pertaining to educational conditions of the state in his office and make a semi-annual report of this.

2. County superintendents who shall have the general supervision of the county schools and render an annual report to the General Commissioner. (Note: this was a special act passed in 1848, and applied only to Hinds, Tunica, Jefferson, Wilkinson, and Amite counties.)

3. County school commissioners, five in each county, appointed by the Board of Police. They were to serve for one year, to hold quarterly meetings, elect a president and a secretary, adopt by-laws, decide what schools, issue licenses, employ teachers, etc.

4. A Board of Police to levy a special school tax, not more than one-fourth of the state tax, provided the majority of the heads of families gave their consent in writing.

5. Funds arising from sale or lease of sixteenth sections to be placed in the hands of Commissioners for school purposes.

6. All escheats, fines, forfeitures and all monies arising from licenses for the sale of spiritous liquors, or for licenses granted to peddlers, hawkers, brokers, etc., to be set apart for school purposes.

Source:
Mississippi Historical Society Publications, XII, 85.

LAW OF 1870

This law provided for —

1. A State Superintendent of Education whose duties shall be to keep reports from various counties, make an annual report to the legislature, and have general supervision of all school interests of the state.

2. County superintendents, who shall have general supervision of county schools, make an annual report embracing certain information required by the State Superintendent regarding the number of educable children, the amount of school fund, etc.

3. Boards of school directors, consisting of six members. These were appointed by the Board of Supervisors and each held office for six years. The county superintendent was ex officio president of the board and the clerk of the Circuit Court was an ex officio secretary. They were to meet quarterly; to make all needful by-laws; to divide school districts into subdivisions where necessary; to secure school grounds, establish graded schools, etc.

4. A Board of Supervisors to levy a special tax as estimated by the County School Board, provided it was not more than fifteen mills.

5. Management of sixteenth section land by County Board and the appropriation of proceeds to school purposes.

6. All fines, forfeitures, and monies for licenses, as well as gifts for school purposes to be placed in the hands of the State Board.
IN THE BEGINNING, 1812-21

The Missouri Territory became a chartered subdivision of the "Louisiana Purchase" territory in 1812, and Congress granted land to the territory for the benefit of public education. During this early period, however, the schools were all church supported. They were financed by charities or operated as "subscription" schools on a "rate bill" basis, with the tuition set according to the number of a family's children attending school. The income from the land grants was used only to pay the tuition of the indigents and orphans. Since the church and the individual family were responsible for education, the Bible and the three R's constituted the curriculum.

The "rate bill," legalized by the territory, provided for a local trustee to contract with teachers, set and collect the rate bill, and pay all expenses incurred for education in the township. This mild form of taxation, the first school tax, was on the child rather than property. The school code or law of 1853 permitted taxation by a vote of the people who would pay the tax, but it did not provide for a school board or trustee to levy a tax. Therefore, the rate bill form of taxation continued in most schools until 1865. At this time, the Legislature passed an act giving the township trustees, appointed by county courts, the right to levy a tax for educational purposes.

Under the Banner of Early Statehood, 1821-54

The act of Congress authorizing territorial authorities to frame a constitution for admission to statehood included provisions for an educational system to preserve school land from waste and establish public schools as soon as practical and possible. Anxious for statehood, the first Missouri constitutional convention, in 1820, incorporated all such ideas into the constitution. As stated by Carrington, "the state had accepted a responsibility. It knew not what" (1).

Legislation enacted in 1825 provided for one or more school districts per township, and for township trustees, appointed by county courts, to care for and preserve school lands and establish the schools.

The first semblance of a state school system emerged from several laws the Legislature enacted in the 1830's. The first, in 1835, provided for three trustees in every district, assigned specifically to employ teachers, to operate school for at least 6 months, and to approve the subjects taught. The 1837 Legislature established a $400,000 permanent school fund, and in 1842 the first state school money was apportioned from permanent funds interest. An act passed in 1839 provided for a state superintendent of schools to handle fiscal matters and license teachers.

The Governor appointed Peter Glover the first state superintendent of schools in 1839, and he served until the General Assembly abolished the office 2 years later. In 1841, the assembly assigned the superintendency's limited duties to the secretary of state, who performed them until 1854. The three men serving as secretary of state during this period did an excellent job in promoting public education. E. B. Ewing, who served the last 4 years, from 1850 to 1854, was particularly interested in improving property taxation for operating the public schools. Evidently, he was instrumental in the 1853 legislation that reestablished the office of state superintendent the following year.

If some parts of this chapter appear to be limited in comparison to others, it is a matter of value judgment, since the organization, selection of content, and personal observations were left largely to the discretion of the writer. Every attempt has been made to treat each period fairly and objectively within the limitations of time and space.

The bibliography reflects the main sources of references; however, much was gained by personal interviews with department personnel and other educators of long tenure in Missouri. I am particularly grateful for the personal knowledge and observation shared by Oscar G. Shupp, supervisor of statistics, Missouri State Department of Education, for the past 25 years. His help and counsel have been invaluable. I am indebted to Commissioner Hubert Wheeler for the opportunity to develop this paper; it has been one of the most interesting personal experiences in my career as an educator.
Vacillation to Stabilization, 1854-75

In 1854, the Governor appointed John W. Henry, a lawyer, to be state superintendent of schools for a 2-year term. He resigned after a few months because he believed the office should be held by a "school man." The Governor then appointed an educator, E. C. Davis, who served 2 years.

Davis was replaced by W. B. Starke, who served from 1856 to 1861, when the Legislature again abolished the office as a war measure. However, in 1859, Superintendent Starke was responsible for distributing the first elementary course of study. Superintendent Starke also was largely responsible for replacing the log schoolhouses with what he termed the box-car frame schoolhouse, usually 24 feet by 30 feet in dimension—generally known as the "little red school house." The Civil War forced most of the schools to close; however, Starke's influence for a graded school system and box-like structure continued to be felt in some areas during the war.

After the Civil War, such buildings became the accepted structure and continued to be used until after World War I. (The writer attended school in such a structure and began his teaching career in a building of this kind in 1927.)

The 1865 constitution provided for reestablishing the Office of State Superintendent of Schools. The Governor appointed T. A. Parker as state superintendent in 1866, and he served 5 years. Superintendent Parker, a progressive educator, prompted the 1866 and 1867 Legislatures to deviate from the status quo. Carrington wrote, "It tore up the past and substituted too many new things at once . . . . The returned soldiers want peace in their old homes and schools carried on as they left them" (2).

Among the most important changes effected by the 1866 revised school law was the requirement that free schools be maintained in every inhabited portion of the state and that there be an equalization of the taxation burden upon all persons and property for support of schools. It stated that the supervision of schools would be dictated by the course of instruction. Not only would grade schools be established, but there would be free education for the state's colored children.

Although there was resistance to the progressive, far-sighted Parker administration, it made considerable progress in new buildings, obtained additional financial support, and improved certification and instruction. Parker's demands on the Legislature and general public for better support of the public school system resulted in large measure from an increase in the school population by over 170,000 from 1865 to 1867, much of which was due to immigration.

Ira Divoll, a former superintendent of the St. Louis public schools and an attorney, succeeded Parker. Superintendent Divoll was forced to resign after 1 year in office because of his health, and the Governor appointed John Monteith, a minister and teacher from Iron County, to complete the 4-year term. Monteith's policies were the opposite of Parker's aggressiveness, and he assumed a pastoral attitude and a "soft" approach.

From all indications, at this time a renewed system of state public education emerged and was reaffirmed as a state function. Superintendent Monteith gave evidence of this in 1874, when he wrote:

I would do violence to my own feelings were I to fail to acknowledge the hearty cooperation of the teachers and school officers of the State, and the kind courtesies of two General Assemblies, in the discharge of the pleasant but arduous duties which three years have imposed (3).

The Monteith administration did work arduously. When a constitutional convention was called in 1874, public education demanded prominent and careful consideration. A "new law" regarding colored schools and a civil rights bill added to the complexities of his administration. In 1874, he wrote:

The new law, like the old, is very stringent in its requirements of school directors to establish colored schools where in any district the number of children exceeds fifteen, or where the whole enumeration in the township reaches that number. Further than this, the law provides that the combination of children may be made across township lines, or in any manner in which the directors may expend the public fund for the object for which it is set apart. For the failure to provide suitable accommodations for the colored children, school directors may be subjected to a fine of from fifty to five hundred dollars. To provide a remedy for the children in case of such failure, the law gives the State Superintendent the full power of local boards to levy tax, build school houses, and perform any other duty necessary to accomplish the desired end . . . . It may be well to soothe our excited feelings by carefully considering what the natural results of the passage of this bill would be unaided by any purpose effort.

Is it conceivable that the interests of 700,000 white school population could be sacrificed by any attempt to give forced prominence to the interests of 38,000 colored school population? If such a result could be conceived it would involve an astonishing infraction of that law of evolution or natural selection which in the progress of civilization has ever given the victory to the strongest. The first effect of the civil rights mixed school bills would be to arouse an intense hostility to the blacks in every portion of this State; and so far from entering the white schools, it is reasonable to believe that they would be driven to a closer aggregation and to more strictly separate schools under the sting of an offended public sentiment. The bill therefore would leave the white schools about as they are now, and result in a very serious crippling of the colored schools, if not in their extinction.
The best interests of the colored people lie in the direction of separate schools established by law. But if this separate system is continued, it is well for every community to reflect that it can only succeed upon the basis of equal advantages to both classes (4).

John Monteith wanted to continue in office, but in 1875, Dr. R. D. Shannon received the appointment. Dr. Shannon, an educator from St. Joseph, Missouri, with a master’s degree in education, also had a degree in medicine. The son of a Missouri university president, Dr. Shannon was serving at the time of his selection as private secretary to Governor Silas Woodson, his brother-in-law.

Shortly after he assumed office, Superintendent Shannon helped the 1875 constitutional convention change the school law. When the Legislature threatened to abolish the state teacher colleges during his administration, he staunchly defended the colleges and persuaded the public to continue them. He also proposed legislation to give adequate taxation for public education. Dr. Shannon was noted for his ability to use groups to solve current problems in education.

The following excerpts give evidence of his unyielding efforts for good education.

The apportionment of State school money has been made in exact proportion to the enumeration of school population reported to this office. There can be no compact system without union of effort. There can not be cooperation without clearly defined and simple laws. The people of the State will remain ignorant to needs until their school officials are rigidly required to perform their whole duty. On taking charge of public school interests there was committed to me a trust, by courtesy called a system. It was a system without a system (5).

Dr. Shannon was an honest, able administrator. In fact, he even took to the county grand juries the matter of inaccurate reporting and the refusal of district clerks to report to his office. The circuit judges tended to support him in rectifying the apathetic attitudes of the district clerks.

It is evident that the radical action of Parker, the pastoral approach by Monteith, followed by the fearless administrative ability of Shannon, all contributed equally to the stabilization of a vacillating state system of education previous to, during, and following the first test of national unity—the Civil War.

A Statewide System Emerges, 1875-98

The adoption of a new constitution in 1875 marked a new epoch in the history of Missouri and proved to be beneficial to a state system of education—still under the direction of Dr. Shannon. The office of state superintendent became stabilized by a legal directive of this constitution. The constitution directed that the state superintendent of schools continue to be elected for a 4-year term as were other state elective officials and that the General Assembly appropriate one-fourth of general revenue annually for school purposes, out of which the State Department of Education was to be supported. Heretofore, the Legislature decided the amount of funded moneys every 2 years.

Dr. Shannon wrote:

The New Constitution just adopted contains some objectionable features, it has made some commendable advances, and places our public school system upon a surer basis than any on which it has ever before rested. The article on education in the new is a decided improvement on the same article in the old, or the Constitution of 1865. The last named instrument left much to the discretion of the legislature; such as providing for the support of schools out of the general revenue, etc. The New Constitution directs such support. In nearly every feature in which the old was permissory and under which an inimical legislature might seriously cripple our school interests, the present Constitution is mandatory, and leaves the legislature no hurtful power (6).

In the second half of his 8 years of tenure in rather difficult times, Superintendent Shannon optimistically reported to Governor John S. Phelps in January 1879 that—

1. A more general interest in State education had been manifested by the people;
2. A more cheerful feeling and better attendance prevailed;
3. More diligence to manage schools according to law was evident;
4. A greater number of qualified teachers caused improved education; and
5. A revival of interest on the part of teachers in associations and institutes prevailed (7).

The administration of Superintendent W. E. Coleman began in 1882. Coleman continued Dr. Shannon’s struggle to clarify and coordinate the school laws. He wrote in 1888: “The entire school law should be revised... for fifteen years the laws have been patched, amended and repealed. Teachers, school ofi. Rs and taxpayers are bewildered” (8). He also spoke out frankly about poor financial accounting, hiring of the “cheapest” teacher, lack of county school supervision, terms of less than 6 months, apathy of teachers, and the teaching of German or French as the first language. His two terms represented a sincere effort to improve public education.

In 1890, L. E. Wolfe, superintendent of Moberly public schools, took office as state superintendent with the intent of improving the elementary schools. At this time, the state had approximately 10,000 elementary school districts, and fewer than 100 schools in them offered a graded school course. Evidently, strong prejudices still existed against uniformity in public education.
Wolfe began by developing a much-needed graded course of study for the elementary schools and encouraged its implementation. This 1892 course of study for the elementary schools constituted a first in Missouri. Wolfe also emphasized the value of school libraries as a means of improving instruction. He developed a Teachers' Reading Circle program, which required that teachers read a certain number of books in psychology, pedagogy, science, history, geography, and literature as a part of an in-service training program. The books were purchased and circulated by the Missouri State Teachers Association. This cooperative program not only benefited the teachers but placed L. E. Wolfe in high professional standing. He evidently was a better educator than he was a politician. The Democratic convention selected, instead of Wolfe, W. T. Carrington, superintendent of schools at Mexico, Missouri, to run for state superintendent on the Democratic ticket. But a split still occurred in the Democratic party. As a result, Carrington was defeated by a good friend and college classmate, John R. Kirk, a Republican (a lawyer turned educator, superintendent of schools at Westport, now a part of Kansas City). John Kirk was the first Republican to be elected to a state office in 22 years in Missouri (9). He struck a new note in the educational campaign of the state.

It was reported by G. A. Theilmann “that it was apparent from the time Kirk took office that his aim was to make the highest possible use of existing instrumentalities” (10). From his reporting and public addresses, it is evident that he possessed a very broad viewpoint regarding state education. His interest and activities ranged from sanitation in the schools to improved school architecture, from improving elementary education to better teacher training at the college and university levels, from better methods of instructing the normal child to encouraging special education for the estimated 3,000 atypical children known at this time, and from proposing a college preparatory course to courses such as agriculture for work-bound pupils. He even proposed centralization of schools, free pupil transportation, and free textbooks in this early day. He was defeated for re-election by Carrington in 1898—the Democrats had got together again. (Carrington later worked for Kirk's appointment to the presidency of Northeast Missouri State Teachers College at Kirksville, Missouri.)

In Kirk's last report to the General Assembly in 1898, he ended by stating, "Competent judges of educational progress agree that education in Missouri is steadily assuming a more highly organized form" (11). No doubt he was disappointed in his defeat for the second term, but a review of his record as president of the Kirksville State Teachers College (1899-1925) indicates that his contributions to the progress of education far exceeded what he could have accomplished as state superintendent. Mr. Kirk, as he was called even by his friends, was always a gentleman and scholar, and he was highly motivated by his many interests in education and the welfare of the masses.

**TURN OF THE CENTURY, 1898-1911**

At the turn of the century, leadership of the state school system remained in the hands of W. T. Carrington. It is apparent from his writings and addresses that he intended to carry on the policies and philosophy of his predecessor, John Kirk. His campaign slogan became his basic aim when elected: "A school for every child—every child in school, good teachers, higher salaries, better schools, equal taxation, and equal opportunities for all children" (12).

The State Board of Education permitted Superintendent Carrington to employ a deputy and clerk in addition to his own clerk. Carrington exercised considerable leadership in improving and expanding education, and he gained substantial aid from various lay groups. The Missouri Federation of Women's Clubs, for example, united to support a kindergarten movement. (The first public school kindergarten in the nation was established in St. Louis in 1874.) The interest and work of this organization finally resulted in the first compulsory school attendance law enacted by the General Assembly in 1905. (It is interesting to note here that a permissive kindergarten law was finally passed by the General Assembly in 1967.) The General Assembly of 1901 passed a law authorizing the state superintendent to classify public high schools and to improve the grading of the rural school. The University of Missouri supplied a part-time high school inspector. The superintendent and his chief clerk inspected the rural schools. Carrington and his staff also developed a state course of study, grades 1-12, with subject matter outlined by weeks and quarters.

In 1901, Carrington wrote:

Culture, discipline, information and utility are duly united in these courses. Isolation of both subjects and purpose has given way to unity in both theory and practice.... Everywhere students of pedagogy and supervisors of instruction have gradually seen the necessity of adjusting the work of the school to the child, rather than adjusting the child to a preconceived notion of what school should be (13).

The 1901 General Assembly, on the recommendation of Superintendent Carrington, passed legislation authorizing county boards of education, traditionally called commissioners, with certain supervisory powers: conducting teacher examinations, granting certificates, grading and classifying schools, and conducting teacher institutes. It was evident from the beginning that the county boards elected would not be qualified to perform such duties effectively. Carrington, therefore, recommended that the boards be authorized to hire a competent county supervisor or superintendent—the county unit form of school organization.
This phase of the legislation was rejected, apparently because of the people's fear of one-man rule. It is obvious, however, that Carrington's emphasis resulted in some county boards' employing a county supervisor to carry out their duties.

Superintendent Carrington wrote:

Nine Missouri counties have supervision. Within the past three years I have made a close study of the school work in these counties and have made comparisons with counties similarly situated not having supervision. I am quite certain that the rural schools in counties having supervision are more uniformly well classified and graded. There is more definiteness of purpose, the teachers work with better spirit, the pupils are more regular and prompt in attendance, and the people manifest more concern for the general educational welfare (14).

Carrington's interest continued, and 4 years later he again urged efficient supervision of rural schools. He recommended that the Legislature provide every county with a school supervisor, with at least one assistant in large and populous counties. He stated that it should fix high qualifications and safeguard the selection so as to put only trained and experienced teachers in this position. He argued that it was better not to have it than to fill it with time servers and persons lacking scholarship, leadership, and pedagogical training. He wrote:

Fix the salary high enough to commend the best talent and demand results. Make the duties more administrative and pedagogical than clerical. Give the supervisor authority to nominate teachers and transfer them for cause, such as is given to city superintendents. Consti-
tute a special county board composed of business men to employ a supervisor on merit, as one who would build a good house would employ an architect to make plans and superintend its construction. Do not shift the responsibility to the people to determine whether they want such position. It should not be treated as an office. It should be filled by the employment of an expert to perform technical duties (15).

During this period, the state department was financed by apportionments by the General Assembly from the state school fund, which constituted one-fourth of the state general revenue. In the 1900 State Blue Book, an official state publication issued biennially by the secretary of state, Superintendent Carrington wrote that Missouri enjoyed the eminent distinction of having the largest available public school fund of any state in the American Union. The fund amounted to more than $12 million. There is no valid evidence on record to support this statement, but the photostatic copy from the Fiftieth Missouri Report of Public Schools, 1899, does support the statement of the funds available in Missouri.

The state fund can be increased only by grant, gift, devise, or direct appropriation by the General Assembly.

The county public school fund is increased annually by the net proceeds of fines, penalties, forfeitures, estrays, and the sale of swamp lands.

The township school fund is annually increased by the sale of such part of the sixteenth section as yet remains in the market and is held in trust by the township.

Special district funds are such as have been secured to a district by a grant, gift, devise, or special legislation.

Superintendent Carrington left the office to assume the presidency of Southwest Missouri State Teachers College, Springfield, in 1907. He was succeeded by his chief clerk, Howard A. Gass.

Superintendent Gass entered the office with a working knowledge of public education in Missouri, since he had served as Carrington's chief clerk in two former administrations. During his administration, the General Assemblies enacted legislation placing more responsibility on the department for supervision of instruction and also appropriated funds for additional department personnel. Legislation in 1907 required that a county superintendent be elected in each county to replace the heretofore ineffective county board or county commissioners. A sum of $400 annually was appropriated from the state school fund as a part of the county superintendent's salary. It was recognized that this office was basically responsible for county supervision, but it also proved to be of aid and support to the state department in regulatory and supervisory functions and in statewide reporting.
A law was passed in 1907 on uniformity of county textbook adoption. This law directed that (a) a county commission of three persons be appointed to select books for the county schools—the state superintendent was authorized to appoint one member, and (b) the state department file a report of all textbooks sold in Missouri. A filing fee, listing of prices, performance bond, and contract were required of all companies doing business in Missouri. Additional department personnel were not provided for by the law for its implementation.

The following statement written by Superintendent Carrington indicates that he, rather than Gass, established the political climate for the enactment of a state textbook law; however, it should be noted again that Superintendent Gass was formerly Superintendent Carrington’s chief clerk and received support from the Carrington faction.

Settle the textbook question and if possible settle it permanently. The present situation is very unsatisfactory. It is as bad as it was two and four years ago, when there was strong demand for relief from the use of a few objectionable books that had been on the list many years. The last General Assembly acted wisely in repealing all laws regulating textbook adoption rather than let a law stand that fastened for an indefinite time the use of out-of-date and objectionable books. Teachers and people are practically unanimous in demanding uniformity. They differ somewhat as to whether adoptions should be by State, county, or local authority. You perhaps know public sentiment better than I; yet, I am quite positive in the belief that a large majority of both teachers and patrons prefer State uniformity for rural and village schools. I am more positive in believing it best for the schools and in the interest of economy (16).

In the implementation of the new textbook law, Superintendent Gass explained that it provided for county uniformity of textbooks to be selected by a county commission. In counties not having supervision, this commission would be composed of the county board of education (in counties having supervision, of the county superintendent), one member appointed by the county court, and one appointed by the state board. Before a book could be considered for adoption by any such commission, it had to be filed, together with sworn agreements as to the price, to the fact that books equal in quality to the one filed would be furnished Missouri schools, affidavits as to the ownership of the publishing house and as to any interests held by the publishing house or its shareholders in other publishing houses, affidavits setting forth that no agreement to control the price of books had been entered into, and a bond for the faithful execution of all contracts. Up to December 1907, there had been filed under the provisions of this law 3,585 separate volumes.

Gass pointed out that the law also stipulated that a filing fee of $10 was required for each book or series of books filed. Series having many volumes, such as several series of classics with as many as 200 or 300 separate volumes, would be filed upon payment of one fee. The Legislature’s purpose in requiring this filing fee was not to exclude any book from consideration, but to provide some revenue to pay the expenses connected with the filing and care of the books. Up to December 1907, these fees amounted to $6,150. Gass concluded:

The law does not entirely fulfill the expectations of its friends. Its opponents have much fault to find with it. But it is the law governing the selection and use of textbooks in this State, and all good citizens will unite in carrying out as nearly as may be the intent of the Legislature, and in making the law as effective as possible (17).

Since the enactment of this law, each successive superintendent apparently has applied the law as a service to public school administrators and to textbook companies doing business in Missouri. During the past 12 years, the writer has administered this law but feels that it has served its purpose and day. Fewer than 10 districts in the state (out of about 800 total districts) have made inquiry regarding the fulfillment of the law by textbook companies. It is reported, by those old enough to recall, that the enactment was actually passed to prevent some companies from selling at a lower rate to the larger city districts than to the village rural districts. It is a “nuisance” law today and serves no particular purpose.

Superintendent Gass reported in the Sixty-First Missouri Report of Public Schools in 1910 that additional office equipment had been purchased—four stacks of filing cases, one multigraph, one adding machine, one typewriter, one clock, and three office chairs; total cost was about $1,500.

The new multigraph made it possible to send thousands of circular letters to school board members, teachers, patrons, and organizations regarding the improvement of public education. Reporting during this period indicates that this represented the first concentrated effort to enlist by mailings the cooperation of agencies and organizations in solving educational problems.

Gass was defeated in 1911 by an excellent educator, William E. Evans, from St. Louis. The administration of Superintendent Evans is most noted for placing teacher training in the high schools and for apportioning public school funds on the basis of teacher training and school attendance rather than on the basis of school enumeration. The practice of state school surveys or descriptive research was begun at this time. The Carnegie Foundation was asked by the State Board of Education to make a study in 1911 for the purpose of upgrading teacher training and certification. As a result of this survey, sponsored by the state
board and teachers colleges, changes in the teacher-training programs were made to meet the needs disclosed by the study. The study revealed that the majority of the teachers had not taken training beyond the high school level. The college training program also was modified to provide training more appropriate for rural teachers.

All reporting and accounting forms were prepared by the state department—38 different forms were prepared—and 1 million copies of various materials were distributed annually. (Sixty years later the department has its own printing room, fully equipped and staffed to print and distribute all printed material with the exception of bound books and curriculum guides. In comparison to the 38 forms printed in 1911-12, the department printed and distributed 278 different forms in 1965.)

The Forty-Sixth and Forty-Seventh General Assemblies passed legislation placing additional responsibility on the state department without making provisions for additional personnel. For instance, a 1911 law required transportation at public expense of schoolchildren living more than 2 miles from school. Another 1911 law limited the amount of state aid on the basis of less than 14 pupils average daily attendance, and the assembly also passed a school consolidation law. At the same time, the assembly provided state aid of $750 annually for first-class high schools and $2,000 for agriculture, buildings, and auditoriums. The following year, in 1912, it passed a free textbook law for grades 1 through 8—and $2,000 for agriculture, buildings, and auditoriums. The following year, in 1912, it passed a free textbook law for grades 1 through 8 and raised teacher certification requirements. Another law provided for the county school boards to hold an annual conference—all expenses paid.

In 1912, the General Assembly permitted state school money to be invested in approved drainage bonds which were sold to provide funds for draining the river bottoms, thus enhancing their value. It then appropriated one-third of the general revenue of the state for public schools. Money for the operation of the department came from this source and also constituted the first time an amount above the one-fourth required by law had been appropriated. (The practice of appropriating additional moneys over one-fourth was continued until 1945. A 1945 constitutional change directed that one-third of the general revenue be appropriated annually.)

Superintendent Evans' statement in the Sixty-Second Annual Report to the General Assembly in 1911 reflected additional participation by department members in summer school sessions and county teacher fall institutes. Evans apparently continued the practice of his predecessor in soliciting the support of existing organizations interested in education—the Grange Mothers, Rural Life Commission, Parents and Teachers Cooperative Clubs, P.E.O. Clubs, and the Women's Federated Clubs were approached.

Superintendent Evans ended his administration as a supporter of the county unit, a state educational tax, equalization in apportioning school moneys, vocational education, school consolidation, additional rural schools for Negro children, state aid for school libraries, improved school architecture, and practice teaching performed in public schools.

The 4-year tenure of Superintendent Evans could be described as an interval of change in state school administration; however, political influence of the existing educational "establishment" of Carrington and Gass continued to be felt. The educational climate remained favorable in general, and worthwhile innovations previously mentioned were accepted by the people. Writings of the time, however, indicate that the Legislature (Democrat majority—Evans was a Republican) failed to reflect the enthusiasm of the people and the professionals so as to cause the department to become a more effective division of the state government. The issue of local versus state control was reflected in the legislative records.

In the final analysis, the legislative action was typical of times to follow—vote for change but resistance to funding for full implementation. Evans was apparently a political accident. He was evidently elected by the enthusiasm of large-city voters and the apathy of rural voters in an off-year election—the state had joined the Republican ranks.

The organizational plan of the State Department of Education during this time remained basically the same as the 1907-14 plan. (See Appendix B.)

WORLD WAR I, REORGANIZATION, AND A "NEW" EDUCATION 1912-23

The educational "establishment" prevailed in Missouri during the First World War. Former State Superintendent Gass ran against Evans in 1915 and was again elected. He died 9 months after taking office. Uel W. Lamkin, county superintendent of schools, Clinton, Missouri, was appointed by Governor Elliott Major to serve the remainder of the term. Superintendent Lamkin had served as W. T. Carrington's chief clerk in 1907-1909 and was noted to be a man who possessed the qualities of a "progressive" and had the courage to support his convictions. He recognized, in assuming the duties of the office, that the urgencies of the war should be given priority over innovative ideas in education; however, as the war efforts lessened in the latter part of his administration, his foresight and support of better educational opportunities for children and youth became evident.

He obtained state funding in 1918 for the implementation of the Smith-Hughes Act of 1917, which provided matching funds for vocational education. This constituted a first in education in Missouri—a particular phase of the school program supported by federal funding. There was little if any opposition to the passage of the Missouri Vocational Bill enacted by the General Assembly in 1918.
The heat of patriotism and evidence of the lack of vocational training of World War I inductees prevailed.

In a report to the General Assembly, Lamkin wrote:

From a State viewpoint, the question of revenue to meet the grants of the National government for education is a serious one and should challenge the careful attention of the Legislature. The grants should be matched by State or local funds (18).

The issue of state versus federal control appeared on the horizon. From all indications, then as now, matching federal grants were questioned by those who represented state and local autonomy concepts, but the majority of the districts complied.

In a letter to Superintendent Lamkin in June 1918, Governor Frederick D. Gardner requested that a study of rural schools be made by the department. Acting on the counsel of the state board, Lamkin planned and administered the first state rural school survey. Abner Jones, an authority in rural education, was hired to direct this first research study of rural education. Jones died during the formative stages of the study. The study was then conducted by A. G. Capps of the University of Missouri at Columbia, who later became a nationally recognized authority on rural education. The data compiled served as the basic information in the study and research for future legislative acts pertaining to all phases of state education. The major recommendations were as follows:

1. That the State Board of Education be composed of five, seven, or nine men and women of broad scholarship, appointed by the Governor. Their powers and duties were also described.
2. That the state superintendent be appointed by the board.
3. That county superintendents be appointed by a county board of education.
4. That the tax burden for educational purposes be more equally distributed.
5. That a system of supervision of school building be established at the local and state levels.
6. That rural teachers receive salaries comparable to village and city teachers.
7. That the compulsory school laws be better enforced at the rural level.
8. That state courses of study continue to be developed to ensure attainable standards in all subjects.
9. That a countywide system of standardized testing be developed.
10. That the school term be extended beyond the present term of 8 months.
11. That a plan for reorganization of school districts be developed (19).

Had the fortunes of politics—the state again joined the Republican ranks, and Lamkin was a Democrat—not prevented Lamkin from continuing his work as superintendent, it is quite possible that many of the reforms recommended in the study would have become a reality one generation sooner. Lamkin was a fearless innovator.

Superintendent Lamkin ended his administration in a prophetic manner. In his last annual report to the General Assembly in 1918, he wrote: "If, and when a new constitution for Missouri is written, a State Board of Education, appointed by the Governor, should have the power to name the State Superintendent of Schools" (20). He further advocated reorganization of the school districts, legislation to equalize the financing of public education, and extension of vocational education as an integral part of the high school curriculum.

Lamkin continued to support his beliefs during his long tenure as president of Northwest State College from 1921 to 1946 and lived to see each of his major recommendations enacted upon by successive General Assemblies. His administration constituted the beginning of contemporary state education in Missouri from the standpoint of structure, organization, and philosophy.

A "New" Education, 1919-23

Sam A. Baker, formerly superintendent of Jefferson City public schools, defeated incumbent Uel W. Lamkin. Theilmann wrote: "Superintendent Sam A. Baker was conservative enough to please the most cautious and boldly aggressive enough to put forth a wise educational policy which the spirit of the times most willingly accepts" (21).

Baker wrote under the topic of "new education" in his report to the General Assembly in 1921:

The new education is not merely stuffing the mind with facts, but it is the use of the mind in accomplishing a worthy deed. Do the thing and you will have the power. The gap of discouragement that lies between the close of a school course and the successful entrance into the work of life is fast being eliminated. The preparation of the schools is forming an easy path to the successful entrance into the practical world. . . . Filling the mind with facts is only a small part of education. Thinking by use of these facts is only a small additional gain of power. The full value of true education first blooms out when thoughts are verified by material accomplishment. The plowing of a field, the building of a house, the making of a garment, the construction of a machine, requires the true processes of education. The word "deed" spells education (22).

Superintendent Baker's idealistic approach to state education coincided with reality and the spirit of the times—Missourians were ready to move forward in education. His legislative program for improvement of education was successful in part because his predecessor, Lamkin, had
During Superintendent Baker's administration, the Legislature of 1921 passed many progressive school laws. The Missouri School of the Blind and the Missouri School of the Deaf were classed as educational institutions. Lincoln Institute was made a university. Instruction on care and hygiene of teeth was made compulsory. High school training was provided for Negro children, and a Negro inspector of schools was to be appointed by the state superintendent. State aid for teacher-training high schools was increased 50 percent; maximum wages and state aid for rural schools were increased 50 percent. Free county libraries could be established by law. A 4-year high school course was required for all teachers, and all teachers were required to secure a health certificate from a reputable physician. Ninth and tenth grades could be taught in local districts. A law provided for the rehabilitation of injured persons, and a physical education law was passed.

Although Lamkin and Baker represented different political parties, they had one thing in common—great personal appeal. They recognized and emphasized the economic and social factors involved in the progress of public education. Each believed in equal educational opportunity for all pupils. Each recognized the political power structure (political factions centered in the two larger cities) as an effective factor in school legislation.

A switch from a Republican to a Democratic administration in 1923 ended Baker’s career as state superintendent. He was defeated by Charles A. Lee, superintendent of Butler public schools. The Baker administration had achieved effective growth of the department as a state service agency. Six new sections were added to the department during Baker’s tenure: Negro education, vocational agriculture, vocational home economics, vocational trades-industries, physical education, and rehabilitation.

Superintendent Baker was the first and only superintendent to be elected Governor. His interest and influence in education were sustaining and were reflected in the progress of the public schools during his term as Governor, from 1925 to 1929. It should be noted that his opponent for superintendent in 1925, Lee, a Democrat, was reelected during Baker’s term as Governor. A cooperative spirit between the two men was reflected in obtaining school legislation.

THE COMING OF CONTEMPORARY STATE EDUCATION, 1923-47

Lee was the first state superintendent to occupy the office for three elective terms, 1923 to 1935. His tenure provided many opportunities for continuity in planning that were heretofore impossible. Many recommendations and projections of former state superintendents became a reality through his dynamic leadership.

This period marked a turning point in the method of financing education in Missouri—the first major change since 1900. After extensive research and study, the 1931 School Law was enacted by the General Assembly. Basically, this law provided for an equalization method of financing the public schools and further provided for county redistricting boards to lay out optional, enlarged districts.

The 1931 School Law had its origin in a series of conferences called by Lee, beginning in 1923 and continuing through 1928—a professional committee, an advisory lay committee, and a conference of the presidents of state educational institutions. Their statewide study was financed by the Missouri State Teachers Association. A staff was employed, and priority problems were identified by the committees. Among the five basic problems were school support and educational needs. The individual committees and staff, working under the direction of department personnel, were concerned basically about the relation of wealth and income to all kinds of expenditures, including education in different classes and size of schools, and sources of revenue—state, federal, and local. The state department provided excellent leadership and implemented follow-through procedures to enactment of the law.

Legislative enactment also strengthened the county superintendent’s office by requiring higher qualifications. Superintendent Lee and his staff were responsible for a major curriculum revision including the revision of all subjects—elementary and secondary—as a cooperative enterprise with the university. The services of the state department were extended through the addition of staff.

After the enactment of the 1931 School Law, Lee directed the writing of an extensive annual report to the General Assembly in 1932. This publication was the first and only such report that included narrative and statistical reporting of all schools in each of the 114 counties—the report contained 1,656 pages. Such reporting was beneficial at the time in bringing about a consensus of support of the 1931 law and its ramifications, as well as stimulating greater interest in the state’s educational system. Radio education also served as a means of informing the people about educational problems and progress. This medium also was used in many schools as a new method in the classroom. Superintendent Lee inaugurated, in 1928, an official Department of Education Bulletin, which was issued monthly. This bulletin included educational announcements, professional writings, regulatory dates for reporting, new laws, and statistical information.

Lee embraced national trends and applied them to the state. He was a man of conviction, commitment, and involvement. His professional behavior was reflected in...
local school administration during his tenure. Progress in education during this era in Missouri was largely due to Lee’s leadership. He was first an educator and second a politician. Although he was dependent on the political aspects as an elected official, he never confused the two on the platform.

After his tenure as superintendent, Lee continued to affect education in Missouri as professor of education at Washington University, St. Louis, for almost 30 years. His influence on education—12 years as the chief school officer—is still often recalled by present-day educators as the coming of contemporary education in Missouri.

Lee ran for a fourth term against Lloyd King, superintendent of schools, Monroe City, Missouri, in the 1934 primary and was defeated. Here, again, the political power structures of the two larger cities renewed their factional struggle and affected the election of the superintendent.

The tenure of Superintendent King, 1935 to 1943, included reconstruction programs following the Depression of the thirties and the involvements of World War II. His term encompassed education for economic stability, wartime problems, and education for the peace to follow. Such societal changes required a cooperative effort of all institutions. King unified the various educational agencies and organizations through the establishment and utilization of advisory committees of lay and educational leaders. The following advisory committees reflected this unifying effort:

- Educational Conference (presidents of all state colleges and universities)
- County superintendents (14 county superintendents)
- City superintendents (12 city superintendents)
- Educational research (5 leading research people in the state)
- Vocational education for war production (14 leading lay citizens, WPA Educational Program)
- School board members (12 leading board members)
- Education for Negroes (50 members—educators and laymen)
- Curriculum development (committees at all levels and subjects; membership of each including teachers, administrators, and college and university personnel).

The committees aided in the development of educational research studies, a most extensive development of courses of study, and educational bulletins at all levels during the forties—“Missouri at Work on the Curriculum” became a well-known theme in curriculum development and remains as a present-day guideline.

The following, a partial listing of publications, reflects the results of this cooperative effort:

- Wartime Program for Missouri Schools
- Guidance Handbook (the first in Missouri)
- Victory Garden Program for Missouri Schools
- Speech Education for Missouri—Forum Education
- Missouri Schools and National Defense
- Foreign Languages
- Elementary Course of Study (1,319 pages—respectfully referred to by teachers as the “King’s Bible,” notably because it resembled the Bible in shape and size)
- Wartime Training Program for Business Executives
- Radio Education

In addition to these, over fifty other educational publications were developed and distributed. A new monthly official department publication, Missouri Schools, was inaugurated in 1935 by King. This periodical remains today as the official department publication.

Superintendent King introduced a system of school-district financial accounting of all school funds. It was in 1942 that the 1931 School Law’s principle of equalization was fully financed at the first level.

During this period, the State Board of Education was again designated by the General Assembly to act as the board to administer federal laws on behalf of the state and was authorized to incur expenses for the administration of federal programs. The Works Progress Administration education program and other such programs were implemented in the schools under this enactment.

The state department made giant strides under the skillful leadership and cooperative spirit of Superintendent King in its progress toward becoming one of the most important divisions of the state government.

In his final report to the General Assembly in 1942, Superintendent King wrote:

If the school of the future is to play an important role in American society, it must offer a dynamic program of education and be able and willing to play an important role in social engineering. The school must train its students in the practice of democracy to insure a lasting peace (24).

Superintendent King was defeated in 1942 for a third term by his Republican opponent, Roy Scantlin, county superintendent of Newton County. The politician, a power structure of the larger cities again affected the election of a superintendent. A relatively unknown, untried candidate defeated a well-known, effective school administrator. There was a “rumble” among Missouri educators to get education in Missouri out of politics. It never reached the proportions of being a slogan like that during the good-roads program in the twenties—“Get Missouri out of the Mud”—but the feeling and fever never subsided. This feeling
affected the changes made in the 1945 constitutional convention.

The emergencies and involvements of World War II were increasingly felt in the schools during the Scantlin administration—in certification of teachers, inadequate replacement of teaching equipment and materials, replacement of transportation, and building facilities. It was a time when innovations in education could only be anticipated and previous gains held under very adverse conditions.

The General Assembly in 1944 voted to call a constitutional convention, the first since 1875. When the convention was called, it was immediately recognized that the school laws would constitute one of the major changes. The convention asked Superintendent Scantlin and his staff to assist in the revision of 243 sections of law and to aid in the writing of the new proposals regarding the office of state superintendent. Scantlin exhibited excellent leadership in this process.

Scantlin, being of a rural background in personal and professional experience, deemed it advisable to conduct a follow-up study of the first rural education study. He appointed A. G. Capps, professor of education at the University of Missouri and director of the earlier study during Lamkin's administration, to direct the 1943 study.

As a result of the 1943 follow-up study, the 1945 General Assembly enacted major changes in the 1931 school finance laws. This study also served later as a basis for the 1947 School District Reorganization Law.

As the adverse conditions to education ended with the close of World War II, a new epoch in education came into being—education was at last out of politics.

The 1945 constitution provided for a State Board of Education appointed by the Governor and confirmed by the Senate (eight members, bipartisan). The chief state school officer was to be hereafter selected by this board. Superintendent Scantlin ended his tenure of one term of 4 years with the distinction of being the last elected superintendent.

Historically, the concept of the appointment of a chief state school officer had its origin in the 1918 annual report to the General Assembly by State Superintendent Lamkin, who had said that when a new constitution is written, a State Board of Education, appointed by the Governor, should have the power to name the State Superintendent of Schools (25).

This concept was again emphasized by the 1929 Missouri School Survey Committee in its report to State Superintendent Lee and the General Assembly:

There are two elements in the situation, as affecting the administration of the public schools of the State, that need to be revised. It is not possible to secure from an ex officio board the same attention to the needs of the public school system of the State as might reasonably be expected from a board appointed for this purpose alone.

The experience of many states has led to the development of state boards of education appointed by the Governor. These boards are given full responsibility for carrying out the mandate of the constitution and the acts of the legislature with respect to the development of the public school system of the State. The survey staff believes that in the State of Missouri the cause of public education would be served by the provision of a state board of education of seven members, to be named by the Governor, each to serve seven years and, after the initial appointment of the board, no more than one member to be appointed in any one year except in case of death or resignation. As important as is the selection of a state board of education which shall have the interests of the public school system as their sole responsibility, it is even more important that the State Superintendent of Schools be chosen because of his professional fitness and without reference to his ability to secure a majority at the polls. Students of educational administration are agreed that the state board of education should be given authority to select the State Superintendent of Schools or Commissioner of Education and to fix his salary. He should serve at the pleasure of the Board (26).

STATE EDUCATION AGENCY, 1947 TO PRESENT

Following the acceptance of a revised constitution by vote of the people on February 27, 1945, the General Assembly faced a most difficult task of implementing the new provisions of the constitution. Laws relating to the superintendent and the department were repealed and new ones were enacted, setting out the powers and duties of the newly created bipartisan State Board of Education, the Division of Public Schools, and the state commissioner of education.

The 1945 constitution stated in part:

The supervision of instruction in the public schools shall be vested in a state board of education, consisting of eight lay members appointed by the Governor, by and with the advice and consent of the Senate; provided that at no time shall more than four members be of the same political party . . . . The board shall select and appoint a commissioner of education as its chief administrative officer, who shall be a citizen and resident of the state, and removable at its discretion. The board shall prescribe his duties and fix his compensation, and upon his recommendation shall fix their compensation (27).

Thus, the State Board of Education became a constitutional body and the state commissioner of education a constitutional officer.

In selecting the first commissioner, the board reviewed the qualifications of many Missouri educators. The
usual process of screening was applied, and five Missouri school administrators were invited for a personal interview with the board. After due time, a committee from the board chose Hubert Wheeler, superintendent of the Marshall, Missouri, schools. He was one of the younger men interviewed and had exhibited sound administrative leadership and progressive ideas on teaching. Wheeler also had been active in the Missouri State Teachers Association and was serving as a member of the association's executive committee at the time of his appointment. He has served as commissioner for more than twenty years. The progress of education in Missouri during his administration confirms the judgment of the first State Board of Education in their selection. His policies and procedures have proved conservative enough to please the cautious and aggressive enough to support the progressive.

Efforts have been made to return the office of the chief school officer to an elective status. However, in each attempt, during the successive sessions of the General Assembly, Commissioner Wheeler kept out of the controversy and continued to promote sound educational practices and policies. The provisions of the 1945 constitution pertaining to education were defended successfully each time by the Missouri State Teachers Association and other interested lay and professional groups. Commissioner Wheeler once remarked in a staff meeting:

We have nothing to trade but the education and welfare of the children and youth of Missouri, and I am certain that even those in favor of returning the office to an elective status also consider this commodity much too precious to use as a political pawn; therefore, we will continue our work in a nonpartisan manner and in the interest of the child.

Evidently the people of Missouri, lay and professional, have generally favored the policies and plans of the Division of Public Schools under the combined leadership of a bipartisan board and their appointed administrative officer.

The state department in Missouri has been affected over the past 20 years by state and federal legislation. Time and space will permit only a listing of the major sequential acts. This listing could also serve as a guide to anyone interested in doing a future study of any one of the acts or of the whole. Major state legislation that affected the structure, organization, and function of the Division of Public Schools from 1947 to 1965 is as follows:

1. Special education for the atypical child, 1947
2. School District Reorganization Law, 1948
3. Government surplus property utilization, 1947
4. School lunch program, 1947
5. Foundation financing program, 1955
6. Schools (operated by state board) for trainable retarded, 1958

The following acts of Congress also have affected the structure, organization, and function of the Missouri Division of Public Schools from 1947 to 1965:

1. 1944 GI Bill of Rights—veterans' education
3. Broadened Vocational Act, 1946
5. Vocational Education Act, 1963
6. Adult Basic Education Act, 1965

State and federal laws and board of education policies resulted in the following major achievements of the administration from 1948 to 1958.

1. Adoption of a system of classification and accreditation of schools (study and development made by a statewide advisory committee in 1947 and adopted by the board in 1948).
2. School District Reorganization Law of 1948 (number of districts reduced from 8,422 to 2,629).
3. Upgrading of teacher qualifications and certification (see 10-year progression illustrated by following tables).

supervisory services, and office space is now overcrowded. In the past, there was close cooperation among divisions and sections, contrasting to a present emergence of "separateness" and repetitious services. There is an uncertainty in budgeting for personnel services and equipment; thus, the department has been forced to engage in short-range planning instead of the long-range, stable planning that marked earlier operations. There is some fear that instead of strengthening the department as a state agency, it is being strengthened as an "arm" of the federal government.

Public education during the decade 1955-65 constitutes one of the largest growing businesses in Missouri. During the past 5 years, more than $50 million has been spent annually for new school buildings. The school transportation system is perhaps the largest transportation system in the state—292,000 miles are traveled daily to transport 458,813 pupils, with an overall expenditure of $17,700,000. The total expenditures for all public school services amounted to $473,260,268 in 1964-65. It is reported that school plant investment now exceeds $955 million.

During the school year 1964-65, there were 938 operating school districts—512 high school and 426 elementary; 922,027 pupils; and 37,627 teachers. Average per-pupil cost was $419.73; average annual teacher's salary, $5,631; average administrative salary, more than $9,000 annually.

It is evident that the provisions of the Constitution of 1945 removed many traditional obstacles to continuous progression and continuity in planning for improvement in public education at the state and local levels. These provisions, coupled with state and federally funded education programs, have fostered rapid strides in education—perhaps the greatest in the history of public education in Missouri. The sincere efforts, the sound administration policies and practices of the State Board of Education and Commissioner Hubert Wheeler, the cooperative spirit of all staff members cannot be discounted in the continuous progression of public education during the past 20 years. The spirit of cooperation between the department and district school administrators has also been sustaining and consistent throughout this administration. Kirk's "new note" in education, Baker's "new education," Lee's "contemporary education," King's "curricular innovations," and Scantlin's "follow-up study" of Lamkin's rural education study all served as excellent prolegomena to the present.

SUMMARY

It is not possible to analyze periodic progression on the basis of comparisons, because each era represented a particularly different set of circumstances. Readiness for improvement as well as apathy toward change were reflected in a greater or lesser degree during each period. It was evident that all administrations had one common intent—service to the schools of the state. It was also evident that the intent of all administrations was to improve the quality of procedures in keeping with quantity—additional personnel and funds.

It all began with two professionals and two secretaries in 1900; the 278 professionals and 226 secretaries in 1965 indicate the growth in quantity and the possibilities for additional services. The department's organizational structure is also an indication of quality services, but at no one period during the 65 years could it be said that the organizational plan provided the highest degree of efficiency, mainly because of a lack of adequate funds for personnel and physical facilities.

The past gave each succeeding administration lessons of courage, endurance, and achievement. The prospect of the future lured each administration on to unforeseen accomplishments. In most periods, societal changes prompted the unforeseen. It can be stated, without qualifications, that Missourians have experienced outstanding educational leadership at the state level during the first 65 years of the twentieth century.

The Missouri Department of Education seems to be in a transitional period in performing its leadership, regulatory, and supervisory services. The statement by Superintendent Kirk in 1898, "We are now working in a more highly organized form of education than thus far experienced," is, no doubt, truer now than it was at the turn of the century. The actions of the State Department of Education during the remainder of the century must be exemplary and in keeping with societal change—its knowledge and values. We must continue to exhibit courage, flexibility, and imagination to innovate as the times require.

In the fretful fever of the space-nuclear age, in the whirling passion of earnest endeavor, in the severe sixties, let us pause to ready ourselves for the most difficult era in education in Missouri—1968 to 2000—a period promising constant flux and restless discontent, the modern-day components of change, the only evident certainty during this period.

This brief history of the Missouri State Department of Education has been divided into such parts as "New Education," "Contemporary Education," and "Education Out of Politics." The coming period, 1968-2000, may be recorded by the educational historians as "Education for Survival."

Early Educational Patterns

When Montana's first Territorial Governor, Sidney Edgerton, named the first superintendent of public instruction in 1864, no funds were available for his salary or office expenses. The appointment of Thomas J. Dimsdale, then a private school teacher in Virginia City, presaged problems that were to beset education in Montana for the next 100 years. This perhaps explains why Dimsdale prepared no reports, made no recommendations, and left nothing on record to show that he had even occupied this first post. Dimsdale continued to pursue his major interests in teaching and writing. His book entitled The Vigilantes of Montana was the first to be published in the territory.

While the Montana Territory was plagued by inadequate educational funds at this early period, the citizens certainly did not lack spirit or good educational intentions. Their enthusiasm was reflected in Governor Edgerton's message to the first Legislative Assembly, which convened at Bannack in December 1864: He asked for legislation to provide a common school system and thereby take advantage of federal grants. He was referring to the federal Organic Act of 1864, which established Montana as a territory and set apart two sections of land (16 and 36) in each township for the establishment of a school fund; the principal was to remain inviolable, and the interest was to be divided proportionate to the number of pupils between the ages of 4 and 20 years enrolled in each district. In December 1864, the legislative school committee, appointed by the territorial council president, introduced Council Bill 38, "an act establishing a common school system for the Territory of Montana"; in January 1865, the bill passed the Legislature and became the first school law of Montana upon approval by the Governor.

The same year, an editorial appeared in the Montana Post, published at Virginia City, that clearly sounded the call and perhaps set the stage for Montana education in the years ahead. Certainly it showed the public's desire for further educational development from the private schools of itinerant professors and the early religious schools established by the Jesuit fathers to a more uniform and widespread system of free public education. "There is one question," the Post's editorialist argued—

That can never remain in abeyance, as long as a particle of true parental feeling remains among us, or as long as the American conception of what a man or woman ought to be shall have enough of vital reality about it to necessitate its practical illustrations through the instrument...y of the noble school system, which is at once the pride and the salvation of this great Republic. Here, among the eternal hills that upheave their vast peaks in silent testimony of the goodness of their Creator, elevating within the grasp of man treasures that would otherwise be buried far beyond his reach—we feel that the development of our material prosperity has small worth, if the mind, the stature of the man, is dwarfed and stunted by neglect or apathy on the part of those to whose care its nurture and culture rightfully belong. The people of Montana have a good School Law, and ample provision for its effective working. Shall this become useless for good, by lying dormant? Or shall the energy of the people give the dry bones life, and constitute Education the tutelary genius of our Territory? In every inhabited spot, let schools be erected. Humble and deficient in many respects they must be, at first; but in a marvelously short time, if the endeavors of the mothers and fathers of Montana are persistent and well directed, a school system shall arise in our midst, worthy of our name and station, and the riches our children will inherit will fall into hands fitted to receive them, and to apply them intelligently for their own good and the welfare of the lands of their birth. Let school meetings be called; let the County Superintendents do their duty, supported by the sympathy and labours of the people, and we shall have to bless the Legislature for one good action in giving us a school law which shall stand a monument to their everlasting honor, like a good deed in a naughty world, in bright contrast to the authorization of chartered robbery and legal stultification.

In 1872, Cornelius Hedges, superintendent of public instruction, submitted to Governor Benjamin F. Potts what
he called "the first regular report upon the public free schools of Montana," although Superintendent A. M. S. Carpenter in 1867 and Superintendent Campbell in 1868 had submitted brief reports to Governor Green Clay Smith and to Acting Governor James Tufts that undoubtedly were the first official reports of their kind in the territory. Nevertheless, Superintendent Hedges believed his report to be the first comprehensive report submitted, as indeed it was:

It would have been personally a matter of pride and pleasure to have been able to present a fairer showing but it is necessary that a beginning be made, however unfavorable it may look, and as no former report exists with which to compare our present one, and ascertain whether any relative improvement has taken place, I will state, from personal observation, that such improvement has been most decided and gratifying (4).

The First County Superintendents

During this period, county treasurers were designated as county superintendents of schools, a post not often eagerly accepted, and the early biennial reports consisted of statistical information submitted to the state superintendent. The early state superintendents lamented publicly that the county reports were not being submitted promptly, if at all. The situation evidently became critical, and the Legislature passed a law making failure to submit required reports punishable by deduction of $100 from the salary of the county superintendent (today the penalty is loss of 2 months salary). The effectiveness of this action was doubtful, as the state superintendents for the next decade continued to complain of this dereliction of duty on the county superintendents' part. Meanwhile, the county superintendents would transfer the blame to the school district officers, and there the matter would rest.

While the early county superintendents were not particularly attuned to the needs of the educational community, they were expected to provide local leadership to the district schools; visit each school at least once a year; distribute all forms, circulars, and reports for school officers that they received from the state superintendent; apportion school funds to the district; pay all bills of county school districts; examine all persons who might wish to become teachers; and keep records and report to the state superintendent.

Early Reports of State Superintendents of Public Instruction

The superintendent of public instruction published in his annual and biennial reports to the Governor the statistics furnished by the county superintendents. In addition, he wrote on the public schools, listing present conditions as well as future aims, and reporting such general information as useful statistics and other comments he felt to be of interest. For example, Superintendent Hedges, one of the most insightful men to occupy the post of superintendent, expounded on government aid for the schools, courses of study, textbooks, teachers, schoolhouses, districts, and compulsory education and made general recommendations for the benefit of the schools.

The early statistics were a summary of miscellaneous information on the number of districts, public schools, male and female students, children of African descent, the total enrolled in public schools, the average number of days of school, the number of private schools and pupils, and the number of students not attending any school. One report in 1880 said that 51 children of African descent lived in the territory, the average school term was 96 days, and the territory had 9 brick schoolhouses and 84 log schoolhouses. (See Appendix D for typical curriculum.)

Superintendent Hedges, in defense of his textbook selection for the public schools, cited the work of the teacher as being greater than that of the author of any textbook and stated that a good teacher without any textbook at all could conduct a very successful school. He also stated that "object teaching" was winning its way to prominence and recommended that all school districts speedily supply themselves with charts and other "ingenious apparatus." However, at the same time he cautioned that the good teacher would not wait or rely solely on such modern conveniences, but would make constant use of the blackboard and slate, and that a complete and quick-witted teacher would never be at a loss for means of illustration.

Superintendent Hedges reported on the poor opportunities for teachers in the territory by pointing out that of the 91 districts in the territory only 3 or 4 held school longer than 6 months. This necessitated the teachers' seeking other employment for the remaining months. He realized that the territory should have a normal school to help supply good teachers to the public schools, but he recognized that "it would be folly to expect such facilities in the near future" (5).

The Creation of New Districts

One great concern at this time was that new school districts could be created by petition of five heads of families. Superintendent Hedges had opposed the enactment of this legislation, a stand that has since been justified, as today school districts are attempting the Herculean task of reorganizing and consolidating many small, inefficient school districts into larger ones. Montana today faces a formidable task that, because of its political implications, has been avoided by the Legislature and chief educational officers throughout the state. Consolidation and reorganization is not likely to make rapid progress until the Legislature imposes mandatory regulations and obligations on the people who continue to support their small individual

EDUCATION IN THE STATES: HISTORICAL DEVELOPMENT AND OUTLOOK
had been reduced to 1,160 (with 207 listed as nonoperating), and in 1957-58 this number had been reduced to 1,160 (with 207 listed as nonoperating) (6). State Superintendent Harriet Miller, in her report of 1966, stated that there were then 775 operating districts and 76 nonoperating districts (7). Obviously, a substantial number of schools have consolidated or closed since 1948. This voluntary consolidation has been brought about in part by the fact that many very small districts have been plagued by a perennial shortage of teachers and funds to carry on a suitable educational program.

The Quest for Professional Standards

Superintendent Hedges was concerned with continually improving the school law. He pointed out that the law in many cases was incongruent with realities. For instance, the annual census was not taken before November 20 of each year, while the county superintendents' reports were to be submitted to the state office by November 1. Hence the number of students reported was necessarily that of the previous year.

Again, only one class of teacher certificate existed, issued by the county superintendent for a 2-year period. Each county superintendent fixed the standards for certification himself. The results were often bewildering, as graduates of normal schools with years of experience were required to pass a county superintendent's examination and were given the same certificate as the most poorly prepared teacher in the district. Teachers who met qualifications in one county might be unqualified in another. Hedges recommended that a simple remedy-

Would be to fix a time once or twice in each year, when teachers desiring certificates might present themselves in their several counties, and in the presence of the county superintendent, assisted by two teachers, be subjected to an examination upon questions prepared by the territorial superintendent (10).

In this way, there would be some semblance of uniformity, and teachers would be qualified in all districts at once.

Hedges also recommended that teachers institutes be held regularly to elevate the standard and equality of instruction and that teachers' attendance should be obligatory.

An Instrument of Aid—School Law

The law allowed the resident voters of each district to vote taxes for building schools but did not authorize the district to incur indebtedness for construction. For this reason, districts often had to build uncomfortable and inconvenient
log schools that were erected by subscription or joint personal labor. Hedges recommended that each district be allowed to issue bonds to provide funds for immediate school construction and to pay the interest plus one-tenth of the principal each year during the 10-year term of the bonds.

Clark Wright, territorial superintendent from 1878 to 1879, called attention to the fact that—

During the past year a school was taught containing only two scholars, and owing to a previous contract with the Trustees of the District, the teacher drew pay from the school fund, refusing to relinquish the school. The law at present allows the establishment of a school on the petition of five families, but does not designate the number of scholars requisite to entitle the teacher to a share in the school fund (11).

Superintendent Wright recommended that schools with fewer than 10 pupils not be entitled to a share of the school fund.

Evidence that an attempt was being made to keep school law abreast of the superintendent's requirements is shown by the fact that during 1878 district trustees could be fined $25 for not filing a school report with county superintendents. The law also provided for the territorial superintendent to hold annual teachers institutes of 2 to 5 days in length. School was to be adjourned during these sessions, and the cost of the institutes was to be borne by the counties.

The territorial superintendency had progressed, not always smoothly perhaps, but with high purpose and unalterable direction, to a point where districts could turn to it for leadership and direction. In 1877, the superintendent's report, for example, listed the adopted textbook titles for use in the territory; contained 10 printed forms for district use concerning leases, elections, and agreements; and asked that 6 months of school be considered the minimum. Ten years before Montana became a state, Superintendent W. Egbert Smith wrote in his report of 1879 that sparsely settled rural districts, short school terms, and small but costly schools prevented the territory from making a better educational showing. He pointed out the advantage of graded schools in reducing teacher load and inducing rivalry. "Grading," he said, "is an application to schools of the principle of 'division of labor' applied to all great business affairs" (12). In 1879, there were 99 schools in the territory, the school valuation was $99,345, and school attendance had shown a 72-percent increase from 1873. Enrollment had now reached almost 4,000. However, the superintendent pointed out that only 47.5 percent of school-age children were in school, and he advocated a compulsory attendance law. He also pointed out the obvious advantages of consolidation with the following table:

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Three small schools of 12 pupils each</td>
<td>$150.00</td>
</tr>
<tr>
<td>3 cheap teachers at $50 each per month</td>
<td></td>
</tr>
</tbody>
</table>

Better education at less cost would result under the following budget:

<table>
<thead>
<tr>
<th>Description</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 fire, 2 cords of wood at $5 per cord</td>
<td>$10.00</td>
</tr>
<tr>
<td>3 fires, 2 cords of wood each at $5 per cord</td>
<td>$30.00</td>
</tr>
</tbody>
</table>

Superintendent Smith was the first to make public the inadequacy of school supervision and reporting. He observed that "our present system amounts to no supervision." Partly to blame, he felt, was the county superintendents' lack of special qualifications for the job. This led in turn to a situation in which "there is always a class of good-for-nothing-else teachers who are ready to take advantage of such conditions and 'keep school' as a make shift . . . . Civilized nations are learning, but have not yet fully learned, that poor unqualified teachers are dear at any price" (13). Smith recommended the formation of a Territorial Board of Education to certify teachers as he agitated for professional qualifications for county superintendents of schools.

The public school system of the Territory of Montana at this time (1879) was organized as follows:

**Officers**

Territorial Superintendent of Public Instruction

County Superintendents

District Boards of Trustees, three members each

District Clerks

**Schools**

Ungraded District Schools

Graded Grammar Schools

City Graded and High Schools

**Other Agencies**

County Teachers Institutes

District and City Teachers Associations

**Statehood**

The closing years of Montana as a territory saw superintendents of public instruction preoccupied with similar problems of quality teachers, in-service institutes, school laws, and compulsory attendance. One superintendent wrote: "A 'quack' in our sick-rooms to prescribe for us medicine is sounder in philosophy and better in economy than the scapeling [sic] in our school rooms to prescribe education for our youth" (14). Seemingly, nothing was considered too small or insignificant to escape their attention. Another report mentioned the installation of two basement furnaces at a cost of $400 in the new school at Billings. The superintendent of that year wrote in praise: "But the greatest benefit of all would be the introduction of the heat at the level of the floor where it would warm
the feet instead of the head’” (15). Evidently all this was not accomplished without the usual amount of criticism, Cornelius Hedges, in seeking his second term in 1884, defended his position by stating in his report: “A word to teachers, school officers, and parents—it is made the duty of the territorial superintendent to suggest means of improving our schools . . .” (16).

With the arrival of statehood in 1889, the post of territorial superintendent of public instruction changed from an appointive position filled by the Governor to an elective one, as provided for by the State Constitution. There were 10,597 students enrolled in public schools of Montana, with an additional 1,260 enrolled in various private schools. Frame buildings had largely replaced log or adobe structures, and the superintendents’ reports at this time were more detailed, showing increased valuations, districts, enrollments, and new buildings. Large sections were devoted to school laws, and many of the recommendations made by previous superintendents were now being enacted into school law, although many of the more pertinent ones were still neglected.

In 1889, John Gannon, the first elected superintendent, petitioned the Legislature to furnish him a clerk “as the pressure of his office and his frequent removal demanded more help.” He continued: “The work is increasing and will continue to do so, while the change from a territorial form of government to that of statehood imposes duties upon the superintendent not contemplated by present statute” (17).

Gannon reported in 1891 that 20,787 students were enrolled in the state’s public and private schools and that there were 5,534 volumes in the school libraries. The 1892 school valuation was totaled at about $1 million.

The subsequently elected superintendents from 1892 to 1900 were plagued with problems common to such state agencies across America—establishing colleges and universities; providing the best means of supporting public education; shaping the educational pattern; coping with the multiplying student body; certifying teachers; expanding the school facilities; and improving the teaching materials and curriculum.

Montana had particular problems. Her state capitol followed the gold strikes and consequently moved from Bannack to Virginia City, and thence to Helena, where it resides today, as rich lodes were struck in each of these areas. This meant that the miners and their families moved frequently, and a thriving community painfully getting its roots started with homes, stores, churches, and schools could suddenly find itself deserted as the “strike” died out and news of fabulous gold discoveries came in from elsewhere in the state. Today both Virginia City and Bannack are ghost towns, whereas they were once among the largest communities in Montana. Especially hard hit were the children of farmers and ranchers who had settled fortably close to populated areas only to find themselves isolated as the miners and their families, together with stores and schools, decamped for richer areas.

The Question of Legality

Superintendent Gannon was the first to publish reports of the attorney general of Montana regarding legal school questions submitted to the superintendent. Besides his clerk and the attorney general, Gannon had no aides to help with the myriad school problems that came at the turn of the century.

It was extremely difficult to collect school taxes from unmarried men who resisted school taxation and were on the move constantly; part of the problem was undoubtedly due to the apathy or ignorance of local school trustees toward alleviating the problems by necessary action. To the everlasting credit of the territorial and state superintendents, they, almost without exception, published the deplorable conditions and continually placed before the Governor and the Legislature a mandate to improve educational opportunity in Montana. They took their responsibilities seriously, and, because they were politically attuned to the Governor and the Legislature and represented a majority of the citizens after 1889, their demands were most often heeded. Superintendent E. A. Carleton wrote in 1900: “It is refreshing to note the marked improvement in the public schools of the state . . . We have come to learn the great lesson that school is not merely ‘a preparation for life,’ but that it is life itself” (18).

At least four forces were at work in the organization of Montana’s early educational system: Federal stimulation helped to create common schools; a titular head of the common school system was recognized as necessary to devise courses of study and textbook lists, to supervise and give direction, and to collect and disseminate information to lawmakers about schools; the citizenry desired and worked to have free public schools; and the superintendent’s annual report was used as an instrument to provide needed change by prodding the Legislature.

FROM EARLY STATEHOOD TO THE MODERN ERA

Youth and Maturity

During 1916, educational progress in Montana was a matter of considerable pride, and Superintendent H. A. Davee reported that in comparison with older states Montana “could find abundant reason for felicitation . . .” (19). This judgment was passed in the face of rapid growth in Montana schools, as the 1910 federal census listed the state’s population as 376,053 with a school census of 85,126; and by 1916 the school population had risen to 147,374 (20).
Davee further reported that his department had a deputy superintendent, a rural inspector, a stenographer, and a clerk. "With the exception of the rural inspector," Davee stated, "the entire force was needed to take care of routine office duties." Consequently, Davee requested two additional assistants—one to administer the teacher retirement fund and another to work principally in the field. The "routine office duties" produced valuable assistance to Montana's education, as evidenced by the list of publications being issued by the department: school laws, elementary and high school courses of study, school bulletins, and educational directory, library lists, school registers, a pioneer pamphlet, an Arbor Day manual, a special day bulletin for teaching patriotism, 64 different blanks, pension blanks, teachers examination questions, and eighth-grade questions.

By 1918, 14 communities in Montana were classified as cities (population 2,500 or over). Such cities and many smaller towns had modern schools of brick and stone and operated 9 months. They were adequately staffed with qualified teachers and were well supervised. However, many rural schools were still plagued with attendance problems (many averaged only 4 or 5 months), poor facilities, and poorly qualified teachers. A survey revealed that in one county only 1.3 percent of the teachers in rural schools had had training beyond high school, while in town schools in the same county 93 percent of the teachers were normal school graduates, and 100 percent had had some normal school or college training. Pay for rural teachers was smaller than for town or city teachers, which led to a critical teacher shortage in the rural areas. As a temporary measure to meet this emergency, rural-teacher-training courses were established in high schools.

The rural school situation was complicated by the fact that Montana is a large state, and early, crude transportation, especially during the winter months, made it almost impossible to transport children very far to attend school. Some parents solved this problem by moving the school during the winter and living in earthen dugouts until the school term ended, and then returning to their farms in the spring. But many families could not afford this "luxury," and untold hundreds of youngsters were denied even rudimentary education. Nor was this problem soon solved, for letters to the state superintendent during the 1920's continued to plead for school facilities in remote areas. Typical letters on the subject describe the conditions:

I have been trying hard for over 3 years to get school for my children. The members of the school board is on one side of the district and they don't seem to care whether the country children get school or not. If nothing can be done I will have to keep my children at home until we are able to send them. (December 1919)

We are all agreed with the county superintendent about having two schools in our district, but how? We can hardly support one. It seems a shame not to have any school at all as there are some families in here of almost young men and women with no education whatever. (November 1920)

We are denied school when there was $2,200 in the treasury of the district. The teachers we get are always relations of the clerk. There are always teachers to be found for school for the trustees' children, also the clerk's. (February 1920)

I am a mother of 3 children. Two are of school age. We have 4.5 miles to our school. The school board promised us a school wagon when the school was being built, but they say now that they have not enuf money. It makes me feel so bad to think our 9 year old girl don't know anything. We are poor, for we don't have a crop for two years. If the school board would pay us just $20 a month I could move to town, which is 12 miles from our claim. Then I could pay rent. Then they could go every day. Oh, please help me. (October 1920)

In 1916, Davee wrote that the state had 141 accredited high schools (including 17 county high schools) and 1,801 districts. Most of these schools were 4-year high schools, but 1-, 2-, and 3-year high schools were not uncommon. The class of 1918 graduated 40.6 percent of the first year's enrollment.

Montana had made steady progress toward improved educational programs, facilities, supervision, and learning opportunities, as exemplified in part by Superintendent May Trumper's report that "in 1917-18, $1.58 was spent on the public schools of the state for each $100 of wealth. In 1910 the Russell Sage Foundation study showed that Montana spent twenty-eight cents—the twelfth lowest in the United States." (24).

World War I

The entire nation was shocked to discover in World War I that there were 700,000 male illiterates between 21 and 31 years of age and that 29 percent of the total number of men examined for military service were rejected because of physical unfitness. Superintendent Trumper accepted these facts as a further challenge to Montana education, saying, "The problem of combating ignorance and physical defects is one of education—education for all." (25).

In 1917, Congress had passed the Smith-Hughes Vocational Act designed to promote agriculture, home economics, and trades. During that same year, the Montana Legislature moved to meet the appropriation requirements of the act. The vocational work emphasized in the Smith-Hughes Act was well under way in a number of high schools by 1918. The biennial report of that year listed 13 high schools participating in the program and showed that the
federal funds involved were over $5,000 (26). Governor S. V. Stewart declared in a proclamation of 1918:

Being deeply impressed with the imperative necessity of adequately meeting the situation when it comes, I, S. V. Stewart as governor of the State of Montana, do hereby appeal to the people of our state to do all within their power to maintain our schools at their pre-war point of efficiency and, wherever possible, to improve them; to the most desirable end that no boy or girl, no young man or young woman within our state may in future chide us with the accusation that because of the war he or she was deprived of opportunity to prepare and train for the full utilization of every faculty . . . (27).

The Ayres Report

In her biennial report of 1920, Miss Trumper referred to a survey that was to impede Montana's educational progress for the next few years. "During 1919," she stated, "Dr. Leonard P. Ayres, one of the foremost statisticians in America, and director of the Russell Sage Foundation, made a study of state school systems" (28). Dr. Ayres gave every state a numerical rating based on such factors as the population of children of school age in school, length of school term, amount of money spent for the support of school, salaries of teachers, etc.

The Ayres survey revealed that Montana ranked first of all the states when five financial components were averaged. Montana citizens felt jubilant about the state's educational showing, and the Ayres report was widely quoted. The survey failed, however, to account for such factors as schoolchildren with no opportunity to attend school, retardation, educational requirements for teachers, supervision, or methods of raising or distributing school funds. Moreover, in 1924, 46 percent of Montana schoolchildren were enrolled in rural districts (districts with a population of less than 1,000), which were commonly the poorer districts. For example, one Montana county had, in terms of wealth behind each teacher, a district with a figure of $225,000 and a second district with less than $25,000 (29).

The concept of the comprehensive high school was firmly established in Montana during the 1920's. The superintendent's biennial report of 1924 lists the following major divisions of study offered by high schools in Montana: English, foreign languages, mathematics, science, history, social studies, business, manual training, agriculture, home economics, normal training, and physical education. In addition, many high schools offered such miscellaneous subjects as music, vocationals, public speaking, journalism, spelling, secretarial training, and penmanship.

The Phillips Report

The startling information that Montana had dropped to thirtieth place in national rank for the same 10 points in which Dr. Ayres in 1919 had ranked it first was revealed by Superintendent Trumper in her 1926 report, when she listed the new ranking of states by Frank M. Phillips of George Washington University (30). The Phillips report caused thoughtful concern among many Montana citizens, as evidenced by the following statement written by Miss Trumper in 1928:

For the past two years there have been evidences of a serious purpose on the part of many individuals and organizations, and of some newspapers, to face the facts and to solve the problem of providing better educational advantages in Montana's public schools (31).

And, because the Phillips report had shown that Montana had ranked poorly in part because of financial support,

The Legislative Assembly of Montana at its session in 1927 took a step which appears to be a definite effort to carry out the mandates of the State Constitution . . . . The establishment of a state equalization fund, even though it is not large, and even though it is derived from funds previously distributed to all of the schools of the state, has definitely provided for the past two years for more uniformity in school support than Montana has ever previously had (32).

School economy following World War I caused the discontinuance of kindergartens, which had been springing up rapidly in the state. In 1928-29, there were six school systems having kindergarten programs in the entire state. Progress has been slow, as today scarcely a dozen kindergartens are operating in the public schools of Montana.

The year 1929 marked the advent of a teacher certification law carrying a prerequisite of 4 years of high school preparation, or its equivalent, and 48 quarter-hours of approved academic or professional preparation. Consequently, at the end of 1931, all high schools in Montana were forced to close their normal training departments because their programs did not meet the new standards.

In 1930, Superintendent Elizabeth Ireland stated that the common school equalization fund was making it possible for "21,714 school children to be benefitted by a nine month term of school, who otherwise would have been denied this privilege. Practically 90 percent of the schools of Montana now have terms nine months long" (33).

In the early 1930's, vocational agriculture and home economics were emphasized in Montana high schools. The Depression made it impossible for the districts to match the federal funds of the Smith-Hughes Act, and at one time the federal government was furnishing $3 to every dollar of district money. Courses in trade and industry were offered in the evenings to adult students; methods of instruction involved a "laboratory" and project assignment. Curtailment of district expenditures made such programs unavailable in many districts, and enrollment in all phases of the program was approximately 1,200 students and adults in 1930. In contrast, by 1938, 6,139 were enrolled (34).
The Depression years caused a drastic setback in Montana education. Especially hard hit were many teachers who were forced to take large discounts on salary warrants when insufficient tax collections caused a shortage of funds. At times, the discounts amounted to nearly 50 percent, which reduced low salaries even further.

World War II

Superintendent Mary Condon, in her biennial report of 1950, summarized the problems which World War II thrust on Montana education:

The situation brought about by the war years was such as to throw the entire school system into turmoil in many respects. With thousands of our trained teachers going into service and war industries, Montana found itself in a place where the shortage of qualified teachers became so acute that it was necessary to accept those who had very little, if any, training beyond high school. While a teacher was paid an average of $1,200 per year, she found she could go into war work and make two, three or four times that amount. It was necessary during these years to grant emergency certificates to unqualified teachers to such an extent that at the war's end 22 percent of all certificates issued were emergencies (35).

The increased birthrates from 1941 on meant that thousands of youngsters were ready to begin school in 1948 when facilities which had not been replaced or extended during the war years were in poor condition to receive them. Coupled with the problem of increased enrollment, there was also a demand for additional courses in Montana high schools, such as vocational, adult, and veterans training programs.

Miss Condon reported that the new finance law passed by the Legislative Assembly of 1949 provided for increased state support and the distribution of county and state funds on the basis of need. Aid for the public schools was increased from $1,647,427 in 1941 to $7,265,609 in 1949-50. "The whole program was pointed toward equal educational opportunity for every boy and girl in Montana no matter where he resided"(36), according to Miss Condon.

Following the war, the rise in the cost of running Montana schools was substantial, with the records showing an average property levy for each county for school purposes going from 29.43 mills in 1941 to 43.86 mills in 1949 (37).

The Fifties

The 1950's were concerned with catching up with the burden placed on Montana education by the postwar years. Miss Condon did a remarkable job in reporting critical educational needs of the state to the public. To her able leadership can be credited substantial improvement in state aid to school districts and greater educational opportunity for Montana youngsters.

In 1950, Congress passed Public Law 815, which provided for a survey in every state to determine the condition of school buildings and to outline future needs. Montana received $11,200 for this survey, and the state department discovered that 40 percent of all schools in Montana were from 31 to 50 years old and that more than half of the buildings were combustible (38).

Miss Condon was very effective in bringing such conditions to the attention of the public in a forthright and courageous manner that promoted improvement. Her biennial reports not only pointed out conditions as they were, but also effectively urged the necessary remedies. She was especially skilled in causing people to look at all facets of public education. Her reports were knowledgeable and extensive about school boards, superintendents of schools, finance, and teaching conditions, and expounded a philosophy of education regarding the curriculum as well. Educators and laymen may not have always agreed with her views, but there was no mistaking where she stood:

The fundamentals are taught much better than they were 30 and 40 years ago. Then they were taught for knowledge of them, now they are taught for knowledge and use of them. . . . The reading rate and comprehension of servicemen between World Wars I and II rose four grade levels. Tests in spelling and language given in one of our large city systems showed pupils in every grade to be 1 to 2 grades above those taking the same test in 1919 (39).

In 1952, Miss Condon had 25 supervisors and directors in her department to help her carry out educational duties.

The period following World War II saw a need for increased financial support, more school construction, a broader tax base, salary increases, and curriculum improvement. Few would deny that Miss Condon met the challenge purposefully and well.

The present superintendent, Harriet Miller, has carried on the modern, complex role of the state superintendent in like fashion. At times direct and forceful rather than persuasive, she has worked diligently for the improvement of education in Montana. One creditable accomplishment has been the establishment of certification requirements, which resulted in well-qualified, professional teachers for Montana schools. The instructional services division was established in 1960 as part of a program to reorganize the Department of Public Instruction's functions for more effective administration and service.

Miss Miller's biennial report of 1966 lists 31 specific recommendations that she deemed necessary for legislative action. Among them were such vital issues in the improvement of Montana education as repealing the requirement
that 40 percent of the voters must vote in a school election in favor of a simple majority; expanding vocational-technical programs; using federal funds for educational television (ETV); providing education for children under 6 years of age; and simplifying laws on school district boundaries to encourage voluntary consolidation (40).

DEPARTMENT OF PUBLIC INSTRUCTION CONSTITUTIONAL AND LEGAL DEVELOPMENTS

The Federal Organic Act

The Organic Act, passed by Congress in 1864, established a temporary government for the Territory of Montana and also provided for the support of a public school system in Section 14:

And be it further enacted, That when the lands in said territory shall be surveyed under the direction of the Government of the United States, preparatory to bringing the same into market, sections numbered sixteen and thirty-six in each township in said territory shall be, and the same are hereby, reserved for the purpose of being applied to schools in said territory, and in the states and territories hereafter to be erected out of the same (41).

The first law to provide for a common school system in Montana was passed by the territory's first Legislative Council in 1864. While no provisions were made for the Office of Superintendent of Public Instruction, the Governor lost no time in creating the position by appointment.

In 1866, "A Bill to define the duties of Superintendents of Public Instruction and fix their salaries" (42) specified that a territorial superintendent was to be appointed by the Governor with the consent and advice of the council and was to receive an annual salary of $500. Although Acting Governor Thomas Francis Meagher felt the salary was inadequate, he signed the bill into law in April 1866. Consequently, after one appointee declined and another resigned, the Governor appointed A. M. S. Carpenter the first active superintendent of public instruction under the terms of the new law. However—

The law creating the office of Superintendent of Public Instruction, enacted at the Session of 1866, came under the sweeping condemnation of Congress, together with the entire proceedings of the session, which was declared null and void by the amendment to the Organic Act. The fourth session of the legislative assembly in 1867 was required to again pass upon the creation of the office. The new bill provided that the "Superintendent of Public Instruction be elected by the Legislative Assembly, in joint convention assembled, to be commissioned by the Governor, who shall hold office until the general election in the year A.D. 1869" (43).

Montana School Law of 1872

In 1872, Montana enacted a new school law which stated that the superintendent of public instruction be appointed by the Governor for a period of 2 years. Although the law of 1867 referred to a general election in 1869, no superintendent was ever elected by the people until statehood came in 1889. The new law outlined the duties of the superintendent but failed to set forth any professional or educational requirements for the appointee, thus making the post absolutely political in nature.

The law required the superintendent to execute a bond of $2,000 pending the complete and faithful discharge of his duties and empowered him to adopt a course of studies and rules and regulations for the public schools in the territory. He was to report annually to the Governor (biennially to the Legislative Assembly) and to have printed 700 to 1,000 copies of his report. It also required that he show in the report the conditions of the public schools, with full statistical tables by counties. He was to supply the county superintendents, teachers, and school officers with suitable forms for making reports, diplomas, certificates, and school registers, and maintain his office in a town in which there was a post office.

He was also to travel to the district schools, to meet with county superintendents, and to address public assemblies on subjects pertaining to the schools. For these duties he was to receive a salary of $2,000. Traveling expenses of $300 per year, with a similar amount set aside for rent, fuel, postage, and printing, were provided. In 1873, at an extraordinary session, the superintendent's salary was reduced to $1,200 (44).

Enabling Act and State Constitution

The Enabling Act made it possible for the Territory of Montana to gain admission to the Union as a state. Following passage of the act, a constitutional convention was held in Helena which adopted the constitution. After ratification by the people in October 1889 and fulfillment of other qualifications, Montana became a state in November 1889.

Article XI of the State Constitution is titled "Education." Section I states: "It shall be the duty of the legislative assembly of Montana to establish and maintain a general, uniform, and thorough system of public, free common schools" (45). Subsequent sections, as required by the Enabling Act, provided for establishment of a public school fund, sale of school lands, establishment of a state board of land commissioners, taxation procedures, age of educable children, use of public money for sectarian
purposes, nonpartisan requirements for admission to public educational institutions, elections, and establishment of a State Board of Education to preside over the state educational institutions. The membership of the state board was to include the Governor, the state superintendent, and the attorney general as an ex officio member. The eight other members were to be appointed by the Governor, subject to the confirmation of the Senate. The third Legislative Assembly passed an act providing for the appointment, terms of office, powers, duties, and compensation of the state board.

Additional sections of the State Constitution provided for the state superintendent to be elected by the people. Women were given the right to hold office as county superintendents and the right to vote in school elections.

From the time when John Gannon pleaded for a clerk to aid him in the discharge of his duties as the first elected superintendent, the state superintendency has grown to the present organization of 97 full-time staff members (including clerical personnel), 19 workers serving part time in one position while serving in one or more other positions, supervision, and programs. (See Appendix B.)

Modern Status of the State Superintendent

The rise in status of the superintendent of public instruction as a duly elected official of the people provided even more impetus than usual for frequent demands for changes in school law to better accommodate educational needs. From a humble beginning—less than a dozen legal assignments spelled out by law—the state superintendency has progressed through the years to the point where the School Laws of Montana, Annotated, prepared and published by Superintendent Miller in 1961, list 117 duties of her office as prescribed by law (46).

Some of the major duties include serving as a member of the executive department of the state government, the State Board of Land Commissioners, and the State Board of Education; supervising the public schools and the state agency for surplus property; verifying school budgets and enforcing school budget laws; preparing a course of study for all elementary and high schools and courses of instruction in identifying and educating handicapped children in cooperation with the State Board of Health; formulating regulations for the issuance of all certificates for teaching; keeping complete data about school equalization aid; advising county superintendents on school matters and prescribing rules and regulations for financial accounting by boards of trustees; apportioning the state interest and income money among the counties and participating in programs under Public Law 88-452; administering federal funds; addressing public assemblies on public school subjects; enforcing textbook licensing provisions; printing school laws; reporting to the Governor biennially; and performing other duties pertaining to the operation of the department and the fulfillment of provisions of Section 75-1302, which requires "the general supervision of the public schools of the state" (47).

MONTANA SCHOOL FINANCE

Sources of Finance

The territorial government of Montana provided for the financing of district schools from several sources: A county tax was to be levied by the board of county commissioners, collected by the county treasurer, disbursed on trustees' warrants, and apportioned to each district pro rata to children over 4 years of age. This tax was to be used for establishing and maintaining public schools.

A second source of revenue was a local or district tax to be voted by the people, at special district meetings, for buildings, teachers' wages, or other purposes.

Fines arising from the breach of penal laws of the territory were to be added to the school fund and disbursed in the same manner as other school money.

In addition, all funds deriving from the sale of town lots under territorial laws were to be used for financing district schools. Such money was to be held by the county treasurer for the district in which the town was situated and was to be used for building and furnishing schools, but could be used for special school purposes if voters of the district so decided at a special election.

Finally, all money and the interest thereon coming from the sale of school lands granted by Congress was to go into a school fund. The principal was to be irreducible, but the interest was to be divided annually pro rata according to the population of schoolchildren over 4 years of age. The territory received no funds under this provision.

To be entitled to public money, districts had to maintain at least 3 months of school during the year, and all public schools had to be taught in English, with reading, writing, spelling, arithmetic, geography, and grammar as prescribed studies, plus other subjects as trustees deemed expedient and necessary. Thus the territorial laws set certain standards which local school systems were required to meet before they could receive funds.

From 1900 to 1923, income from school lands distributed by the State of Montana to schools was fractional, averaging only 7 percent of the total school sources of income. In reality, state funds from school land could not be classified as state financial aid as these lands were set aside by the federal government when Montana became a state. In 1923, special revenues collected by the state, such as gasoline and inheritance taxes, along with a newly enacted metal mines tax, provided "an amount probably equivalent to about $1.50 per child on the census list"(48).
In 1920, Superintendent Trumper listed state funds, county funds, and special district taxes levied on the districts as the three sources of school revenue. She said: “Montana’s state school funds are derived entirely from the income from funds received from the sale of school lands and from the leasing of school lands. Montana has never provided a state tax for public schools . . . . State school funds are slowly increasing . . . .” (49).

A 6-mill county tax was distributed to the schools on the census basis, a method of apportionment that Miss Trumper declared to be grossly unfair, as it placed a heavy burden on districts with few children.

Miss Trumper pointed out that—

The district system has been replaced by the county unit system in three counties, but the district tax for schools continues to yield more than one-half of the money raised to support public elementary and high schools. Our system of taxation for educational purposes does not provide even fairly equal financial burdens for all patrons and taxpayers or equalized educational opportunities for all children of all the people.

Two districts out of ten paid less than 6 mills special levy in 1919-20, while three out of ten paid from 11 to 40 mills (50).

Miss Trumper urged that changes in the constitution be made to permit larger support from the higher units of government for the Montana school system.

The constitution now permitted district bonding to a maximum of 5 percent of the amount of taxable property, but districts were hard pressed to dispose of their bonds because bonding companies and the State Land Board were placing most of their money in farm loans. This meant that districts had to go back to the earlier practice of providing school buildings from the general school budget, requiring a special levy, or closing inadequate schools.

In 1924, Miss Trumper again pointed out the lack of state revenue support for Montana schools. Her biennial report listed revenue sources as shown below:

- Federal oil royalties 0.4%
- State appropriation for normal and vocational training 0.3%
- State inheritance tax 0.2%
- State oil license tax 0.1%
- Special county tax for high schools 13.7%
- 6-mill county tax 21.5%
- Special district levies 52.2%
- Other sources 4.4%
- State income from public lands fund 7.2%
In 1949, the method of support for Montana public schools was modernized to better meet the growing financial needs of the districts and to bring state aid in line with what was being done nationally. Each child was to be guaranteed a basic educational opportunity based on equality of financing.

The foundation law provided that after all districts and counties in the state had made the same financial effort to support their educational program, the state would supply the balance needed for minimum programs up to a point determined by law. These minimum foundation programs were based on a teacher unit for small elementary schools. For larger schools, including all high schools, the program was based on the number of pupils in the calculation known as “ANB” (average number belonging), determined by dividing the total days present and absent for all pupils by 180. Consecutive days absent over 3 were not counted toward the ANB. The ANB was used for the school budget was computed on the attendance figures from the previous school term.

The uniform effort to be made by districts and counties for their elementary schools was a 5-mill district levy and a 10-mill countywide levy. For high schools, a 10-mill countywide levy was required. Elementary schools were entitled to raise funds on the district up to 20 percent of the foundation program without a vote of the people. High schools could use the permissive levy without a vote of the people up to 15 percent of the foundation program. Additional funds required above this amount necessitated a vote of the people. The 1950-52 report shows the percentages raised to 30 percent for elementary schools and for high schools with 100 or fewer students, and 25 percent for high schools with more than 100 students.

Recent Changes

The 1963 Legislature established the county levy at 25 mills for elementary schools and 15 mills for high schools as the basic foundation effort and raised the foundation limit from 50 percent to 75 percent of the maximum budget allowable without a vote of the people.

Although the Foundation Program Law was substantially changed in 1963, the basic principles remain much the same . . . . The local district has been removed as the first level of basic Foundation Program support for elementary schools. The taxes from county-wide levies now constitute the basic support level for both elementary and high schools . . . . Broadening of the support base makes possible a greater degree of sharing of taxes from all property wealth within a county by all schools within a county (51).

The 1963 law sets forth a schedule that specifies the maximum amounts that may be budgeted per pupil without voter approval. This schedule is based on the amount actually budgeted for 1962-63 in the middle-cost schools of each size-group. “The maximum amount which a school board is permitted to budget for a school’s general fund without seeking voter approval is determined by multiplying the school’s ANB by the appropriate rate as set forth in the law” (52).

The law further provided that no elementary or high school could receive more than 75 percent of its maximum permissive budget from equalization funds.

As each school determines its Maximum Schedule, it computes 75 percent of this as its foundation program. The equalization financing, in which the state aid is used, applies only toward the Foundation Program portion of the budget. The 25 percent of the Maximum Schedule above the Foundation Program is financed by a permissive district levy. Surplus cash-on-hand, tuition, and federal funds are applied to reduce the district levy (53).

Of special note is the fact that the foundation program schedule has increased biennially since 1949, its year of origin.

The current mill rate is set at 24 mills for elementary schools and 14 mills for high schools as basic foundation effort, and the foundation limit is 80 percent of the maximum budget allowable without a vote of the people.

The law did not guarantee that the state would meet its total obligation. If the equalization funds do not equal 50 percent of the foundation program, the state deficiency must be made up by a district levy in the elementary schools and a county levy in the high schools. One source (1961) points out:

Since the Foundation Program was enacted in 1949 there have been only four years in which there were sufficient State funds available to equalize the full state obligation. In other years the State has provided only enough money to equalize from 90 percent to 95 percent of the amount necessary to meet all Foundation Programs. This state deficiency in equalization money becomes a responsibility of the local district and is raised by a property tax on the district (54).

By 1967, there were 7 years in which sufficient state funds were available to equalize the full state obligation. Presently there are two levels of equalization money—the county and the state. The state’s sources of revenue for educational purposes are legislative appropriations from the state general fund, 25 percent of individual income tax revenues, 25 percent of corporation license tax revenues, U.S. oil and gas royalties, and interest and income from school lands (elementary disbursement only). The counties rely heavily on property tax for their revenue.
In general, the foundation program has made possible great improvements in educational opportunity in Montana schools.

Prior to its enactment there were many low-valuation districts in which it was impossible to finance an adequate school program without confiscatory tax levies. In many of these districts tax levies are still below the level required in the years before the Foundation Program was enacted. In other districts levies are far below the level that would be required without the Foundation Program financing. This has been made possible because state equalization dollars have taken the place of local property-tax dollars (55).

Two features deserve special comment when Montana’s foundation program is considered:

1. The State Board of Education set a minimum program of requirements that Montana schools had to meet before qualifying for state equalization funds. Included in the minimum standards were guidance, curriculum, length of school term, courses of study, libraries, administration, and teacher preparation. In most cases, the citizens have elected to tax themselves further to provide additional improvement over the minimum requirements.

2. The public has not been miserly in providing financial support for Montana’s educational programs. In 1960, Montana’s effort placed it third nationally in percent of per-capita personal income spent for public education:

Further comparison with the Western states shows Montana ranking second in dependence on local-level taxation, with 69.4 percent of its school revenue collected from local sources (57). Montana obviously places great dependence on the property tax for school revenue.

In a tabulation for 1966-67 that includes the 50 states, Montana is ranked fifteenth in expenditure per pupil, thirty-fourth in average salary for classroom teachers, and twenty-eighth in per-capita personal income (58).

### EFFECT OF FEDERAL PROGRAMS ON MONTANA EDUCATION

The National Defense Education Act of 1958 (NDEA) and the Elementary and Secondary Education Act of 1965 (ESEA) brought swift changes to the State Department of Public Instruction in Montana. In 1956-57, for instance, the state department had about 67.6 full-time equivalency employees; in 1966-67, this number had increased to 117. According to one state official (59), about 25 percent of this increase was a direct result of ESEA.

The districts, too, were required to respond in a positive manner. First, they had to turn to the state department for interpretation and materials to take advantage of various programs and to seek qualification and support. Second, this in turn forced them to examine in detail their requirements and the specific needs of their students. In trying to accomplish this, they frequently discovered areas that hadn’t been given much attention before. ESEA made it possible for the districts to do something about the physical reasons why “Johnny can’t read”—the need for eyeglasses or other physical causes that could keep a child from learning.

Another example of meeting the needs of the child rather than of the school is the $100,000 program for migrant children in the state. Educators have long known that these children needed special help, but outside of the classroom there was little equipment or funds to be brought to bear on the problem. The recent federal program to aid these children will run during the summer in those counties that have large numbers of such pupils in an effort to help them catch up with other children.

Federal programs have enabled Montana educators to look at educational aids that were once thought too expensive: instructional materials centers, language laboratories, TV facilities, and audiovisual equipment for each teacher. As a result, teachers have had to learn how to use new materials and devices and, in doing so, in many cases have improved their instructional techniques.

Such programs have had an impact on educational languages, as educators speak of “hardware” and “software” items—hardware referring to computers, electronic learning gear, and other “hard” items of equipment and apparatus; and software referring to services, personnel, or instructional programs being developed locally.
Title III of ESEA has impelled Montana educators to think in experimental terms; the emphasis in many cases had been on unique, imaginative, and innovative educational program development.

Title V encouraged and brought together lay and professional groups to examine educational problems. A recent eight-state project exemplifies such educational cooperation and offers great promise for eventual improvement of education throughout the Western states involved.

Title IV has established regional laboratories to study educational problems of all kinds and offer solutions. The Rocky Mountain Regional Laboratory, with headquarters at Denver, is presently studying small schools and problems common to them. Barbara Longmaid, executive assistant to Superintendent Miller, is currently serving as one of the board members of the laboratory. Other board members are selected from area superintendents.

A Large School

It is not difficult to find concrete examples of the impact that federal aid has had on schools in Montana. Most of this aid has been in the form of helping the districts provide needed equipment or services on a matching-fund basis. Library books, laboratory equipment, reading materials, audiovisual equipment, and similar objects were among the first evidences of federal aid. What was in the beginning a mere trickle quickly turned into a flood as almost every school, regardless of size, submitted its plan to upgrade its scientific program or increase its learning opportunities.

Today there is evidence that more sophisticated plans for improving the learning situation are under way. A large Montana high school, for example, has a federal planning grant to create a countywide resource center designed to cross over educational boundaries and to help all schools in the county implement promising educational innovations. The resource center will provide materials and leadership to help the smaller schools share in the latest resources designed to upgrade educational programs throughout the county. The federal government is expected to provide most of the funds necessary to carry out the program. This same high school also has a federal program that provides Saturday biology classes offering actual experience in the field. Federal aid provides transportation, materials, and teachers for biological field work on several hundred acres of forest service land.

A Small School

A small school in northern Montana has used NDEA funds to purchase needed teaching equipment and to improve the guidance department. ESEA funds have enabled this district to initiate a reading improvement program with special materials and a teacher; to select 33 students for a special summer academic improvement program; and to concentrate on the concept of an instructional materials center with necessary equipment, materials, and a librarian's aide. When the superintendent of this district was asked if the above would have been accomplished without federal aid, he answered, "Probably not! Federal aid has created an atmosphere where the board of trustees is willing to go ahead. It creates a logical next step" (60).

Other Factors

One complaint frequently heard concerning federal aid is that the applications have laid a burden on the average small district superintendent who already has his hands full. Large districts in some instances have been able to designate specialists to handle the paper work involved in federal aid programs. At present, at least five full-time directors of federal programs are employed by districts in the state. This number will increase as even small districts consolidate to hire the services of such specialists.

The average Montana citizen has not escaped the impact of federal aid. Missoula citizens recently agreed to match a $500,000 federal grant to establish a vocational-technical school in Missoula to serve a seven-county area. Such facilities are badly needed, as students now have to leave the state to get most post-high school vocational training. Without the matching federal funds, it is highly doubtful that the voters would have reacted so favorably, as a district special levy was rejected by the voters at the same time the funds were voted.

Missoula is not an isolated example. For example, there is a program called "Upward Bound," in which over a hundred youngsters who were not working to their capabilities and expectations are brought to college campuses to study for the summer months in an effort to "turn them on" academically and get them interested and directed toward higher education (61). The State Department of Public Instruction has a similar program designed to stimulate high school dropouts to return to school.

However, the federal programs have not been an educational panacea for Montana schools. Some of the money spent on hardware has been wasted on educational gadgetry which the teachers in many cases did not want or did not understand how to use. A statewide check would undoubtedly uncover many such objects gathering dust in numerous school districts. The desire to purchase was often spurred by the fact that there was only so much federal money allocated to Montana, and the districts who filed applications early had the best chance of getting it. Districts that took more time to discover their educational needs in depth often discovered that the funds had all been allocated or that the percentage of matching funds had been reduced for that year. A newspaper article in March 1967, commenting on federal aid across the nation, said:

Some districts are getting only half of what they were told to plan on while others are getting more than expected, an Associated Press Survey showed... [recently].
But in every state there are districts facing a shortage of money to pay bills they contracted for in the belief the federal government stood behind them (62).

"Red tape," says Superintendent Miller, "is giving a black eye to the present system of federal aid to education." Miss Miller, in an address, referred to the fact that the federal aid program is based on "categorical" funding methods which result in short-term planning and large regional offices. She accused the U.S. Office of Education of using confusing procedures, refusing to give "definite answers" to questions from the states, requiring needless paper work, and tying up the entire program in red tape. Miss Miller philosophically supports general aid but reserves the right to Congress to support specific areas of education of its choosing. "The real problem," Miss Miller believes, "is how do you put the brakes on the U.S. Office of Education?" (63).

Similar criticism can be heard in Montana regarding the type of federal aid which should be offered. The executive secretary of the Montana Education Association feels that "control should remain with state and local school districts, with emphasis on local districts, and not in Washington, D.C." (64).

Many small districts are beginning to ask about federal aid to help alleviate current educational problems such as replacing or extending educational facilities and getting and keeping qualified teachers. Because of the present dollar-thin tax base and spiraling costs, available money for general education and construction of facilities is becoming difficult to obtain. General federal aid might provide a more realistic solution in such districts, argue many Montana educators.

Another major problem has been the size of Montana in relation to the money allocated to the state department for administration. Administrative funds for Title I programs have been based on 1 percent of the total allocation. The state department has received $75,000 to administer its Title I programs, but with its many districts covering a wide area, the money has not been adequate to successfully administer the programs. It takes just as much work, paper, and time to process an application submitted by a small district representing 60 students as to handle the same form representing several thousand students. States with about the same number of districts as Montana but with many times the population receive substantially more money for administration of federal programs. Texas, for example, had an allocation of $775,251 for administration purposes in 1966, or $510 per school district, while Montana averaged only $87 per school district for state administration of Title I programs (65). The allocation procedure put a strain on states such as Montana with their limited population and great distances to cover. Since Montana has approximately one state department employee for every seven operating school districts, one of the problems federal aid has caused in Montana is administrative: how to service the large area with the limited personnel and finances available.

Adding to this burden is the fact that many small districts have part-time clerks and administrative officers, making proper applications and material purchase and use extremely difficult. One promising approach which the state department is urging is the consolidation of several small districts into larger cooperative projects to provide more service and leadership and to save administrative costs. The state department has experienced a fair amount of success with this method. Extremely helpful for Montana will be the current federal law which sets a minimum project value of $2,500 on Title I projects.

The superintendent's 1966 biennial report shows over $7 million in federal funds distributed to Montana's counties. In contrast, the biennial report of 1950-52 reported that federal money representing Indian, vocational, lunch, veterans-on-farms, Taylor grazing, U.S. oil and gas royalties, and federal forest programs amounted to slightly over $2 million.

In 1965-66, Montana had 521 Title I projects representing $3.4 million. As of April 1967, 119 projects had been approved this fiscal year, representing almost $2.3 million. It is expected that when the fiscal year ends, total approved projects will equal the amount of money allocated to the state for Title I projects.

Federal aid to education has vastly improved the quality of education in Montana. Teachers institutes, held at university campuses during the summer, increase teaching quality; the various programs have provided equipment, materials, personnel, and facilities for improved learning-teaching opportunities; special programs for the underprivileged and the handicapped have enabled them to attain more equal footing with their normal peers; and the districts in northwestern Montana being affected by the influx of workers and their children in the 3-year construction of the multimillion dollar Libby Dam Project are receiving federal aid in terms of newly constructed classrooms to meet the immediate needs of the impacted areas.

SUMMARY

The history and development of public education in Montana have not been dissimilar to those experienced by her sister states. The need for greater educational effort sprang into being at the grass-roots level and blossomed into a state system of direction and leadership based on the needs and aspirations of the localities. The effort to increase educational opportunity in Montana has always been a cooperative one, with the local districts and the state actively participating. The laws have been amended to meet the needs as they arose, and the study of Montana school law is a study of the development of Montana education and its leadership—from a single concept in several
paragraphs to a complicated array of thousands of items to aid the schools in providing common educational experiences for man to move into the twenty-first century with honor, compassion, and understanding.

The next decade will be a critical one for the state departments of education and the local districts, as they search for answers to educational problems and seek to define new roles of educational responsibility. Montana's State Department of Public Instruction has steadily progressed during the last decades in its ability to satisfy the leadership requirements placed on it. Curriculum study guides have been prepared and distributed in major subject areas; numerous professional and lay committees have studied educational problems and made worthwhile recommendations; needed supervisors and departments have been created at the state level; and excellent handbooks, documents, and bulletins have been distributed to districts throughout the state. These efforts have strengthened the role of the state department and suggest that Montana education will be prepared to face new challenges in the future.

However, the requirements ahead call for bold and advanced thinking about such problems as—

1. **Finance.** Due to the sparseness of population, limited industrial development, and heavy reliance on property tax to support schools, the problem of how Montana will finance her educational requirements in the years ahead is a critical one. Many school districts today find that increased costs of instruction and building construction have placed them in an untenable position with the taxpayers. Their ability to legally bond themselves, for example, does not equal their educational need. Schools have been built like fortresses, and districts are extremely reluctant, and sometimes find it economically impossible, to raze the old structures and provide new spaces to house current innovations and practices. The old spaces do not lend themselves readily to modern teaching methods which place more emphasis on inquiry, independent study, large- and small-group instruction, and resource centers.

Providing new facilities, preparing for increased technological equipment and services, and maintaining a qualified professional staff will continue to be an increasingly expensive undertaking. New methods of financing educational requirements will have to be uncovered if Montana is to balance aims with means and still remain justifiably proud of its educational system.

2. **Organization.** The isolated school will continue to be a part of the Montana educational scene for many years ahead and will probably be justified and supported, but schools which operate within a 40-minute bus ride from each other cannot long afford to duplicate educational programs and buildings. Regrouping and reorganization of schools and districts is something Montana must face now if it is to cope successfully with educational problems in the future. To wait until such organization is voluntarily accomplished is too costly both in time and in financial resources.

3. **Control.** The federal government will doubtlessly have an increasingly larger role to play in future American education. Cunningham, writing on leadership and control in education, remarks:

The responsibility for education will continue to rest with the states, although it appears that there will be a contest over this obligation involving the large cities and the federal government. The contest will become severe unless states can improve in their ability to satisfy educational needs (66).

A contest involving local as well as state and federal control would not be in the best interests of Montana education. To minimize such conflict will require vitality, courage, and resourcefulness on the part of educational leaders throughout the state as they call for moral and financial support to quality education in a responsible and forthright manner.

Cunningham summarizes neatly:

There is little doubt that changes in the environment of the schools will be reflected in the leadership and control of American education. The citizen of the future will have more to say about schools, and so will teachers and students. Demands for participation will lead to alterations in the structures through which schools have been governed and administered. The traditional...[leadership and administrative roles]...will be modified but they will survive. The challenges are substantial but so is the nation's capacity to respond (67).

61. The "Upward Bound" project is at the University of Montana in Missoula. The federal government has provided the money to bring high school junior students who are underachievers to university campuses in an effort to "turn them on academically." Funds have provided teachers, materials, and a small stipend to each student. The students are expected to attend for two summer sessions during their junior and senior years.

A STUDY OUTLINE FOR STUDENTS IN MONTANA UNGRADED (RURAL) SCHOOLS, 1882*

Studies for Pupils in First Reader

1. Reading - First Reader
2. Spelling words in reading lesson
3. Writing on slates, using script speller
4. Read and write numbers to 100. Addition and subtraction by 1's, 2's, 3's, and 5's to 25.

Studies for Pupils in Second Reader

1. Reading - Second Reader
2. Spelling - oral, written, and phonic, words used in reading lesson
3. Writing - on slates, or using copybook, writing with pencil
4. Numbers - addition and subtraction tables to 12's; Reading and writing numbers to 10,000; Roman numbers to 100; multiplication tables to 6's.

Studies for Pupils in Third Reader

1. Reading - Third Reader
2. Spelling - oral, written, and phonic; use Swinton's Word Book
3. Reading and writing numbers of two periods; add, subtract, multiply, and divide; begin Robinson's First Book in Arithmetic and complete one-half
4. Geography - oral - Geography of Montana, and draw map of same
5. Writing.

Studies for Pupils in Fourth Reader

1. Reading - Fourth Reader
2. Spelling - Swinton's Word Book
3. Writing - Spencerian Copy Book
4. Geography - Monteith's Elementary
5. Grammar - Ginn & Heath's Elementary Lessons in English.

Studies for Pupils in Fifth Reader

1. Reading - Fifth Reader and History of the United States
2. Spelling - Swinton's Word Book
3. Writing - Spencerian Copy Book
4. Geography - Sill
5. Arithmetic - Robinson's Complete Declamation and composition throughout the course.

EDUCATION PRIOR TO 1900

The Territorial Period

When the Nebraska Territory was organized in 1854, the 2,723 settlers were so scattered that it was difficult for them to establish schools except in a few villages and towns. These pioneers, accustomed to the Eastern woodlands and an abundant rainfall, spent so much time wrestling a livelihood under the alien conditions of the Great Plains that cultural institutions had to play a secondary role. Building materials were scarce, and it was difficult to find teachers, textbooks, and other supplies.

Even though education had to take a back seat, the Territorial Legislature recognized its importance. During its first session in 1854, it created the Office of Territorial Librarian with the additional duty of superintendent of public instruction. More important at that time, it provided for county superintendents with the responsibility of dividing the land into convenient school districts, arranging elections, and generally supervising the schools.

The federal Enabling Act of 1854 set aside sections 16 and 36 in each township for the support of common schools. This land, amounting to 2,797,520 acres (1), was to be held in trust by the U.S. Congress until Nebraska achieved statehood. The Territorial Legislature passed an act in 1858 creating a common school fund from the land’s proceeds. However, as railroads, homesteaders, and purchasers were acquiring acreage rapidly, Librarian-Superintendent John H. Kellom recommended quickly substituting better lands for sections 16 and 36 before they were sold or disposed of. The Legislature did not immediately respond.

The law of 1858 also provided for a territorial commissioner of common schools to be elected on a partisan basis. The following year, William E. Harvey defeated Kellom in the first election. Although Harvey was not an educator, he well understood the needs of the schools and attempted to make them more efficient. He strongly advocated classifying pupils by grades, providing at public expense textbooks suited to pupils’ abilities in each grade, and requiring compulsory attendance. He continued the fight to secure better lands for the school fund. It was not until 1862, however, that the acting secretary of the interior notified the territorial land commissioner that he could select alternate lands in lieu of sections 16 and 36 if these had already been settled (2).

In the meantime, the common school fund was threatened at the local level. The Territorial Legislature in 1860 passed an act empowering the commissioner of common schools to investigate county superintendents, particularly their handling of funds. Few county treasurers actually remitted school funds to the territorial treasurer; if they sent any at all, it was only those amounts in excess of apportionment. Commissioner Harvey offered recommendations, but they were not adopted, and charges of mismanagement continued.

Despite repeated efforts to strengthen Nebraska’s educational system from 1861 to 1866, there was little progress. In 1861, the commissioner’s office was abolished and his duties assigned to the territorial auditor. The territorial auditor (librarian and school commissioner) lacked adequate funds and staff. The people did recognize education as a territorial function, however, and provided for establishing schools at the local, county, and territorial levels. This recognition influenced future Legislatures.

In 1866, the Legislature passed a joint resolution directing that a constitution for the proposed state of Nebraska be prepared and submitted to the people in an election on June 2. The adopted constitution, hastily drafted and weak in many respects, included an article on education which provided that the proceeds from all school lands should constitute a perpetual school fund and that this income, together with taxes levied by the Legislature, should be used to secure a thorough and efficient system of common schools throughout the state.

On March 1, 1867, President Andrew Johnson issued a proclamation declaring the admission of Nebraska into the Union, thus ending the territorial period.

School Lands and Funds

Governor David Butler, Nebraska’s first Governor, called a special session of Legislature in May 1867. At this time, a
statute was passed providing for the selection and management of state lands and specifying that the auditor should be made land commissioner in charge of administering them. County commissioners were to name three people to appraise the lands, which would be offered for sale to the highest bidder. No land was to be sold for less than its appraised value or for less than $7 per acre. The purchaser could pay one-tenth cash on prairie lands and one-half cash on all others, with the remainder financed by loans bearing interest at 10 percent annually. In case payments were not made, the lands reverted to the state, together with any improvements. Those lands not sold were to be offered for rent for a period of 25 years by the county commissioners in the county in which they were located.

All money received as principal from the sale of public land was paid to the state treasurer and invested by this officer, the Governor, and the land commissioner in federal or state securities bearing 6-percent interest. The interest from notes given in payment for school land constituted a temporary school fund to be distributed each year to the counties on the basis of the school census.

John Gillespie, the state's first land commissioner, favored amending the 1867 law to dispose of school lands at private as well as public sales and to place the administration of these sales directly in the hands of the land commissioner instead of the county commissioners. Although the Legislature did not agree to this at the time, 2 years later it changed the laws. These Acts of 1869 stipulated that the appraisers could not be holders of lands they were appraising, that unsold or unleased land would be offered annually for sale, and that funds from such sales could be invested in government securities or "other good and sufficient securities." This meant that many of the funds were loaned to friends and political allies at low-interest rates. Shortly after the enactment of the permanent fund, there was a default in interest on some of the loans, and the legal proceedings to recover the losses cost the public schools a substantial amount of revenue.

The air was soon heavy with charges, particularly that Governor Butler had lent some $40,000, which was supposed to be invested only in U.S. or state securities, to friends with inadequate security. It also was charged that he had speculated illegally in Lincoln lots and had accepted bribes from contractors, railroads, and private individuals. As the Governor campaigned for a third term in 1870, strong impeachment sentiment in the Legislature culminated in the creation of a joint committee to investigate all of the public activities of the capital commissioners.

Butler declared that the stories were merely gossip, and he considered the appointment of the committee solely the work of political enemies out to destroy him. Although he did not deny that he had exceeded instructions, he declared that at all times he had acted in the best interests of the state. U.S. bonds were depreciating rapidly, he argued, and the individuals to whom he lent the money provided better security. Besides, he said, it was for the state's interest to use the money to keep business flourishing.

The committee's report generally absolved the Governor and his associates of evil intent. The people apparently accepted the Governor's explanation, for he was reelected to a third term. Butler's enemies were not so easily satisfied. When the Legislature convened the following year, he was asked to account for funds collected from the federal government for school lands sold prior to the state's admission to the Union. The Governor replied that he had collected $16,881.26, which he had deposited with the state treasurer. When neither the treasurer nor the auditor's books showed the transaction, the Governor admitted that he had not deposited the money but had borrowed it for his own use. He assured the Legislature that it was adequately secured in mortgages on Pawnee County land.

Although influential voices argued that it would be expensive and cast great discredit on the new state, the House of Representatives, on March 6, approved 11 articles of impeachment against Governor Butler. The first charge, and the only one on which the Senate voted to convict him, was that the Governor appropriated school funds collected from the federal government for his own use. The trial revealed an incredible laxity in the handling of the state's financial affairs. As a result, the auditor was impeached for malfeasance but was not convicted. The state treasurer was severely criticized but not impeached. On June 1, 1871, the Senate convicted the Governor of misappropriating the state's funds, with the only penalty being removal from office. After a number of unsuccessful attempts, in 1877, Butler's friends in the Legislature finally expelled the impeachment proceedings from the record (3).

In 1875, a convention wrote a new constitution for Nebraska. The state superintendent of public instruction, whose office was reestablished in 1869 when the offices of auditor and school commissioner were divided, was specifically listed as one of the executive officers of the state. At the same time, the Constitution of 1875 forbade investing the permanent school funds in other than U.S. or state securities or registered county bonds of Nebraska. This resulted in a major portion of the funds' being invested in county bonds for the next 20 years.

Again, irregularities developed. The permanent school fund money, deposited in banks selected by the state treasurer, was highly profitable to the banks, and they willingly paid interest on it. The constitution denied the treasurer the right to receive money from the use of his office beyond his salary, but in some cases banks paid an interest on these deposits to a friend of the state treasurer. Thus, powerful interests organized to name the state treasurer. These groups provided the bond for the treasurer and
divided the profits from the interest on the deposits of state money. Not only did this violate the law, but it blocked any possibility of a wider field for safely investing the state school funds.

Land speculators often took advantage of the laws by purchasing lands, never expecting to complete the payments, and then selling them at a large profit to someone who could. In other cases, speculators obtained a lease for a few cents an acre, thus gaining legal control over large tracts, which they then exploited for their own financial gain.

These practices brought serious criticism against the Board of Public Lands and Buildings' administration of the school lands. Many charged that it had permitted these lands to be leased at an appraised value of only 25¢ per acre before being offered for sale. Others criticized the board for not appraising the school lands every 5 years. Charles H. Gere, editor of the Nebraska State Journal, and many others ardently supported a proposal written in 1882 that the sale of school lands be stopped and that they be held in perpetual ownership by the state.

In January 1883, the Legislature amended the school land law to require that all school lands under lease be reappraised at once and each 5 years thereafter upon order of the Board of Public Lands and Buildings. It reduced the minimum rate of interest on the appraised value for leasing from 8 percent to 6 percent. Lessees in default of interest payments could have their leases or sales contracts forfeited after 6 months notice (4).

Charges continued to circulate, and 2 years later, in 1885, the Legislature appointed a committee of three Republicans and three Democrats to investigate state school land practices. The majority reported no evidence of misconduct, but the minority report censured the Board of Public Lands and Buildings and the land commissioner for permitting speculators to gain control over school lands under the guise of law. The Legislature then passed a law limiting the holdings of any one person to 640 acres (5).

Immediately following the Panic of 1893, with the dearth of private deposits, the banks found it necessary to use public funds—especially the public school fund—for their speculations. When the political campaigns revealed that over $1 million of the permanent school fund had not been invested, rumors began to circulate that it had been loaned in questionable speculations and would never be recovered. In part, this resulted in the election of a Populist Governor in 1894.

In the 1895 Legislature, a resolution was introduced calling upon the attorney general to bring action against the state treasurer of the preceding decade to recover approximately $500,000 interest on the $1 million uninvested school fund. This resolution, referred to a committee, never came to a vote. But 2 years later, Addison Sheldon introduced a bill replacing the old school land law with a new one prohibiting the further sale of school lands and substituting a system of perpetual leasing. This bill became law in April 1897.

In the same legislative session, Sheldon introduced and was successful in getting passed a resolution for investigating the state treasurer's office. The investigation revealed that payments on half of the land—about $1.3 million—were delinquent an average of 6 years; 720,000 acres were declared forfeited (6). The former state treasurer, who had been defeated in the election of 1896, could not account for $537,762, mostly from the permanent endowment funds. Although he was sentenced to 20 years in prison, the funds were never recovered. The treasurer's friends, however, maintained that much of the money had been lost before his term. Powerful political and financial interests combined to have him released, and he was eventually pardoned in January 1902. The investigation resulted in improved financial practices by the Board of Public Lands and Funds and in later safeguards through improved legislation.

### Improving Education

There were many efforts to improve education before 1900. As early as 1860, the Territorial Legislature granted a charter for establishing a college-level school in the village of Peru. Reverend Hiram Burch and William Daily first solicited funds for such a school, and a female seminary was ultimately opened in September 1866. The following fall, the school was offered to the Methodist Conference; when the offer was rejected, it was offered to the 1867 session of the Nebraska Legislature. In accepting the school at Peru, the Legislature not only created Nebraska's first state normal school but also established the third teacher-training institution west of the Missouri River (7).

The University of Nebraska opened its doors in 1871, with the state superintendent of public instruction an ex officio member of the Board of Regents. Four years later, the Institute for the Blind was established, and in 1885, the School for Feeble-Minded Youth was opened. The services of the state normal school in Peru were improved, and in 1885, the University of Nebraska cooperated in developing a course of study for high schools.

In 1867, the Nebraska State Teachers Association was established "for the purpose of elevating the profession of teaching, and promoting the interests of schools in Nebraska" (8). Whether the association functioned as a strong and influential lobbying organization or whether the recommended changes would have been accomplished anyway are moot points. The fact remains that between 1867 and 1900, many of its requested organizational and philosophical changes did come into being. These covered a wide and complex spectrum, including school records, finance laws, curriculum, textbooks, administration, teacher training, certification, and fringe benefits. Through the years, the association continued to strive for improved educational opportunities for children.
The 1895 Legislature was truly a busy one. It extended to private colleges and universities the privilege of issuing teacher's certificates; amended laws governing school district boundaries and the attendance of children in schools near their homes; and passed the first free high school attendance law, which permitted nonresident students who had satisfactorily completed the eighth grade to attend a Nebraska high school at county expense. Thus, by the end of the century, Nebraska had improved its teacher preparation and its schoolhouses, enforced compulsory attendance laws, provided free textbooks, and improved the courses of study and school district organization.

Although Nebraska's last state superintendent of the nineteenth century, William R. Jackson, was unsuccessful in securing the enactment of his major recommendations into law, he did arouse interest by an official decision relating to Bible reading in the public schools. In November 1899, Jackson sent a directive, which was widely quoted across the nation, to the director of a school board near Beatrice in which he favored the use of the Bible, not as a sectarian book, but as part of the great literature of all time. In this he was sustained by the State Supreme Court.

DEVELOPING A STATE SYSTEM, 1900 TO 1930

Until 1891, when the Legislature finally authorized the state superintendent to appoint a permanent deputy, the office operated basically as a one-man department (9). But during the three decades beginning in 1870, the number of counties had increased from 32 to 90, the number of districts from 797 to 6,708, the number of schoolhouses from 298 to 6,733, and the number of children enrolled in school from 12,719 to 288,227. Thus, the responsibilities of the state superintendent became constantly heavier.

When William K. Fowler became state superintendent in January 1901, he reviewed the office's accomplishments and forecast what should be done in the twentieth century. He was supported by the Legislature, which passed an act directing the superintendent and the faculty of the state normal school to set up an examination procedure for admission to the school. The Legislature also rewrote the compulsory education law, clarified its operation, and continued the penalties for violating the law.

The 1901 Legislature passed a free high school attendance law which created an "adjunct" district of the non-high school districts in a county and provided that these districts levy a tax sufficient to pay the high school tuition of any pupils who qualified. In 1907, the Legislature passed a new free high school attendance law providing payment of tuition by the district in hope of establishing the law's constitutionality. It was tested in 1907, and Judge L. M. Pemberton of Beatrice held the law to be constitutional and reasonable.

Despite this progress, Superintendent Fowler realized there were still many problems. He saw the rural schools as largely unchanged through three generations while the city school systems were advancing because of fine supervision. It was incomprehensible to him that these two widely divergent kinds of schools could exist under the same laws. Thus, he issued 32 recommendations for urgently needed amendments to the school laws to advance consolidation of school districts, centralization of schools, and public transportation of pupils.

In 1905, State Superintendent Jasper L. McBrien, who assumed the office in January of that year, agreed with Fowler that consolidation was necessary. He had the support of the Nebraska State Teachers Association, which in 1905 made school consolidation one of its 12 programs (10). Superintendent McBrien cited 29 advantages from consolidating school districts, and he even argued that existing laws could be used if new ones were not forthcoming. In fact, several school districts did consolidate, and this encouraged other districts to follow.

The thirty-first session of the Nebraska Legislature changed the election laws so that certain judicial and educational personnel, including the state superintendent, were not to be nominated, endorsed, recommended, censured, or referred to in any manner by a political party, political convention, or primary. In other words, these candidates were to be nominated only by petition and voted upon on a nonpartisan ballot. However, the law was found to be invalid, and the state superintendents continued to be elected on a partisan basis.

Superintendent Edward C. Bishop, who assumed office in January 1909, made notable advances in consolidation. State Superintendent Augustus O. Thomas convened a statewide conference in Lincoln in September 1916 to study educational problems, at which he pointed out that 4-year high schools and 49 3-year high schools, all accredited by the university.

The state superintendents continued to advocate consolidation. State Superintendent Augustus O. Thomas convened a statewide conference in Lincoln in September 1916 to study educational problems, at which he pointed out that some 3,390 of the state's 6,571 districts enrolled no more than 12 children. Only about one-fourth of the eighth-grade graduates were entering high school. Thus, Thomas launched an intensive campaign to improve the preparation of rural teachers, establish standards for rural schools, develop a system of rural high schools, and strengthen the schools through consolidation.

It was 1919, however, before the Legislature passed an act to combine school districts within a county to create high school districts. Before new boundary changes could be effected, elections had to be held, and the superintendent was given the responsibility of refereeing any disputes arising from the act's operation. The Legislature did provide a small amount of state aid to districts consolidating under the law. Unfortunately the act proved to be defective; more than forty cases were appealed to the State Supreme Court.
The 1919 law was amended in 1921, and schools continued to consolidate. This required the state superintendent to devote a considerable amount of time to his duty as referee when disputes arose. Again, despite consolidations, the number of school buildings increased during the twenties. Moreover, Superintendent John M. Matzen reported in 1927 that 21 sod and 16 log school buildings were still in use.

Though imperfect, the law for school consolidation attempted to remedy a defect in the educational system that had existed from earliest times. Despite the small reduction from 7,264 districts in 1920 to 7,244 a decade later, the furor aroused by consolidation acquainted many people in Nebraska with the problem. Private denominational and parochial schools came under some measure of state supervision.

Upgrading the Teachers

One of the serious problems facing Nebraska schools at the turn of the century was a lack of competent teachers. During the nineteenth century, the Legislature had recognized the importance of workable laws governing teacher certification, but the several revisions still failed to entice the teachers so desperately needed. In 1901, the Legislature permitted three agencies beside the State Department of Education to issue teacher certificates: the University of Nebraska and other colleges, the county superintendents, and the boards of education in first-class cities. The state superintendent published a certification digest, but confusion continued to exist (11).

The 1901 Legislature authorized the University of Nebraska and other incorporated colleges and universities to award first-grade certificates valid for 3 years; after 3 years of successful experience, these were valid for life. The act directed the state superintendent to examine programs in the colleges and universities, other than the University of Nebraska, seeking to train teachers and to ascertain that their programs were comparable to those in the university. Confusion as to which colleges and universities might be recognized as having teacher education programs and should be eligible to grant first-grade teacher certificates prompted the Legislature of 1903 to amend the law by specifying the criteria by which the state superintendent could make his decision.

Also in its 1903 session, the Legislature provided for a new state normal school for central Nebraska at a site to be selected by the Board of Education of the State Normal School. The board, faced with many communities wanting the new school, chose Kearney on the one-hundred-eleventh ballot.

At the same time, the need for additional teachers prompted a law establishing junior normal schools in Alliance, McCook, Valentine, North Platte, and Holdrege. These junior normal schools operated in the city high schools during the summer, under the immediate supervision of the respective boards of education but under the general supervision of the state superintendent. Credits earned could be transferred to the State Normal School. New programs were later started at Alma, Broken Bow, Geneva, and O'Neill.

In its 1905 session, the Nebraska Legislature completely rewrote the teacher certification laws. It prescribed requirements for each of the three new classes of certificates and provided for three classes of county certificates, valid in the counties where issued. No changes were made in the kinds of certificates or requirements for city certificates, nor those issued by the State Normal School, the University of Nebraska, or the other colleges approved to issue teachers certificates. Since all examination questions and the subjects required for these teacher certificates were prepared and corrected in the state superintendent's office, this added materially to his work. The Legislature did provide for a State Board of Examiners, consisting of three people, to check the qualifications of those applying for life certificates. The state superintendent also could request the State Board of Examiners to assist him in comparing the educational programs in the colleges and universities with those of the University of Nebraska.

Prodded by recommendations from both the state superintendent and the Nebraska State Teachers Association, the 1907 Legislature raised standards for teaching in the rural schools from an eighth- to a twelfth-grade education and required the baccalaureate degree for all high school teachers. At the same time, it established normal training programs in Nebraska high schools and charged the state superintendent with administering them and paying subsidies to finance services of those schools deemed eligible. Those selected from the many applicants depended on the geographic distribution, staffing, program of studies, and numerous other details stipulated in the law. Within 2 years, more than 100 high schools had qualified for normal training and were enrolling more than 1,800 students, with nearly one-half qualified to teach in the rural schools upon graduation. A year later, in 1910, 107 high schools were offering normal training programs.

With two normal schools and eight junior normal schools in operation, the Legislature decided to replace the Board of Education of the State Normal School with one board, the Normal Board of Education. This new board consisted of five members appointed by the Governor, with the state treasurer and the state superintendent ex officio members. However, the act was found to be unconstitutional because of a technicality in its wording. Thus, the old board was obligated to continue operating under the 1867 law.

The state continued to expand its teacher education. In the spring of 1908, the University of Nebraska Board of Regents established a teachers college, which later became the university's largest single division. In 1909, the Nebraska Normal College, which had been established at
Wayne in 1891, became the state's third normal school. The 1909 Legislature then created a fourth normal school in the northwest part of the state. The board selected Chadron for its location and the following year accepted a gift of 85 acres for the site.

In its 1911 session, the Legislature abolished the State Normal School entrance examinations and authorized the Board of Education of the State Normal School to establish qualifications for entrance. It also amended the Normal Training Law to extend the program to some high schools not qualifying under the former law.

In 1911, the Governor appointed a School Code Commission to study the state's education. Contrary to the Nebraska State Teachers Association, which proposed that state and county superintendents be elected to long terms on nonpolitical ballots, the commission recommended abolishing the Office of Superintendent of Public Instruction and creating a State Board of Education with the authority to appoint a commissioner of education. It further suggested that the state's constitution be amended to prohibit further sale of school lands. It proposed a revised code of the school laws, including changes in the date of the annual school meeting, a requirement that county superintendents recommend a panel of qualified teachers from which school board officers might employ teachers, a requirement that all schools be graded according to the course of study, and elimination of the third-grade elementary county certificates. It also recommended that the state superintendent and the county superintendents hold valid teacher certificates. (Since 1919, state law has required the superintendent of public instruction to hold a valid teacher certificate of the highest grade issued by the office.) In addition, it was proposed that the state superintendent approve all school building plans and that the county sheriffs be designated as truant officers. The foresight of this commission must have been acute, as in a few short years the vast majority of its recommendations became reality.

One of the Nebraska State Teachers Association's 1911 recommendations received legislative sanction in 1917, when a law was passed providing for the nonpartisan nomination (by petition) and election of the state superintendent of public instruction and other educational and judicial officers. William H. Clemmons, who assumed the state superintendency in January 1917, won election in 1918 as the first candidate for the office without a political party designation.

Clemmons faced many problems resulting from the United States' participation in World War I. His reports indicate an awareness of long-range problems, but in those trying times he had little opportunity to solve them and found it difficult to keep existing programs operating. For instance, in 1919, it was necessary to revise the certification laws because of the severe shortages of properly qualified teachers. The city certificates were abolished, aliens were prohibited from teaching, and the state superintendent was authorized to issue "emergency" 1-year certificates.

In the 1918 general election, the people approved a proposal to elect members to a convention to revise the state's constitution. The constitutional convention, which met from December 2, 1919, until March 25, 1920, before recessing until October 19, proposed 41 amendments and submitted them to the electorate at a special election held on September 21. All passed, and these amendments became effective on January 1, 1921.

The new constitution, like the old one, named the superintendent of public instruction as an executive officer of the state, with a term of 4 years. It stipulated that all executive officers must maintain office in the state capitol and, except for the lieutenant governor, reside at the seat of government during their respective terms of office. The Governor could appoint officers to fill vacancies, all state officers were to report biennially to the Governor and Legislature and to post bond of not less than $50,000. There was no effort to elaborate on the superintendent's duties, beyond naming him to certain boards and commissions and requiring periodic reports from his office. But increasing his salary and doubling his term contributed significantly to the prestige and service of the office.

It was necessary for the Legislature to rewrite several statues to make them conform to the newly adopted Constitution of 1920. In 1921, it passed an act requiring all organized counties to have county superintendents with 4-year terms. The state normal schools were redesignated as state teachers colleges. At the same time, it reduced the number of county certificates to two, defined the certificates which could be issued by the state normal schools and other colleges, and required that all other certificates be issued by the state superintendent. It also expanded the examinations for issuing several of the lower-level certificates, which added to the responsibility and work of the state superintendent's office.

In 1925, the Legislature again rewrote the teacher certification laws and required that all teachers in public, private, denominational, and parochial schools hold valid certificates issued by the state. The law reduced the number of different levels of certificates and prescribed the requirements for each. This law defined the school year, required the registration of certificates in the county superintendents' offices, defined the examination procedures and costs, and provided for the revocation of teacher certificates for cause and with due process of law. Several amendments enacted in 1927 defined the certificates which the state normal schools could issue and their requirements. In 1929, the Legislature added to the list a "special music certificate" that could be issued by the state superintendent to those meeting his requirements.

Upon assuming office in 1927, Superintendent Charles W. Taylor improved the department's efficiency by establishing a central filing system staffed with trained
clerks. More important, his reforms included reorganizing the office to include a secondary education and teacher training division, staff members of which would visit high schools and inspect their qualifications for accreditation and for special aid funds. The division prepared a high school manual in cooperation with the faculty of the University of Nebraska and offered to help the high schools solve their problems. Taylor also was responsible for initiating the junior high school program.

Financing Education

When Nebraska became a state, the federal government gave it about 2.8 million acres of land. The money derived from the sale of this land was placed in a permanent school fund for investment. The fund also received annually a percent of the severance tax on oil and gas and the proceeds from the sale of escheat estates. Only the interest from the permanent fund could be used, and this was placed in a temporary school fund, to be distributed to the school districts annually. In the period immediately following 1900, it became necessary for the land department to reclaim more than a million acres of land, because the contracts had been declared forfeited since 1897. At the same time, the school lands were reappraised at an evaluation increased from $1.5 million to more than $3 million. The rents from these school lands increased from $92,573 in 1898 to $175,829 in 1908.

In 1907, two significant measures, one by the state and one by the federal government, affected Nebraska’s educational financing. In its thirtieth session, the Legislature voted a subsidy of up to $120 a year from state funds to those school districts unable to maintain 7 months of school after levying the maximum tax permitted by the statutes. This law, commonly referred to as “aid to weak districts,” started with an initial appropriation of $50,000, distributed by the state superintendent. Two years later, the appropriation was increased to $75,000. Although the law failed to ensure a minimum 7-month school in all districts, it enabled most eligible districts to provide at least 5 months of school. To improve its effectiveness, in 1913 the Legislature clarified the law, extended the benefits to some schools not previously covered, and raised the maximum aid to $385. However, during the late 1920’s, few schools were able to qualify for the aid, and although the act still remains a part of the Nebraska school laws, each year the number of eligible districts decreases.

The federal government passed in 1907 the Federal Forest Lands Act, by which it refunded to the state 25 percent of the gross receipts received from the sale of timber, seedlings, and other items raised on forest reserve lands. Five Nebraska counties qualified for revenue under this act, and the state statutes stipulate that one-fifth of the revenue shall be allocated to the county road fund, one-fifth equally to all school districts in the counties, and three-fifths to all school districts according to pupil population. Although the money received was not of great importance, it was the first federal aid to education received by Nebraska.

In the period beginning about 1910, a political movement developed to repeal the Sheldon Law of 1897 and thus to permit sale of school lands. Under the Sheldon Law, the leasing policy held that rentals should be a little lower than those of private landowners, to encourage leaseholders to improve their lands. This would give them security in its use while increasing the school fund income as population moved in and land values rose. In 1912, the outgoing state treasurer, the land commissioner, and the Governor all recommended that the educational lands again be offered for sale. But newly elected Governor John H. Morehead took the opposite view and argued that the lands should be retained by the state. Two bills introduced into the 1913 Legislature to sell the lands were killed before coming to a vote.

In 1915, the land sale proponents launched a fresh campaign, but the bill was defeated after a bitter debate. When the Legislature met again in 1917, another bill failed to pass by a single vote in the House of Representatives. A similar bill passed in the Senate, but it also was defeated in the House.

At the same time, there was considerable debate on the subject of reappraising the lands. Sentiment definitely favored reappraisal, but the controversy over the method defeated the proposals, and Sheldon’s School Land Law of 1897 continued. The Junkin Amendment in the Constitutional Convention of 1919 ended an attempt to repeal the Sheldon School Land Law by prescribing disposal of the state school lands at public auction. Would-be purchasers did not want to take a chance on losing the land altogether to a high bidder.

The 1920 constitution created a board of commissioners to sell, lease, and generally manage the school lands and funds. This was an executive board, but it did not include the superintendent of public instruction. The new constitution did cause the 1921 Legislature to change the formula for distributing the semianual appropriation of the temporary school fund to allow payment in lieu of taxes to counties which had tax-exempt school lands.

During Superintendent Charles Taylor’s administration, the department was confronted with a major lawsuit when it refused to distribute the annual apportionment to District No. 6, Cedar County, because it appeared to be operated as a parochial school. The court sustained Taylor. He remained active in his fight for more favorable investment of the permanent school fund and a greater return from the leases of school lands. He succeeded in promoting a constitutional amendment giving him membership on the important Board of Educational Lands and Funds.
Vocational Education

As early as 1909, the Nebraska Legislature passed an act permitting county high schools to include programs in manual training, domestic science, and agriculture. In 1911, the Nebraska State Teachers Association recommended that state aid be granted for specialized courses in agriculture, home economics, and industrial training.

The state continued its support, and in 1913, the Legislature passed the Shumway Act, authorizing the state superintendent to aid rural schools up to $50 and high schools up to $1,250 to offer such courses. The state superintendent also was authorized to appoint an inspector of agricultural training, subject to the concurrence of the chancellor of the University of Nebraska. However, as late as 1919, schools eligible under this act were slow to take advantage of the funds available.

More popular was the Mallery Act passed in 1917, which entitled rural high schools and consolidated high schools offering classes in agriculture, home economics, or other industrial and vocational subjects to receive from $250 to $550 annually, depending on the number of rooms used and the amount expended for equipment. This fund continued until the 1955-56 biennium, when appropriations for this aid ceased to be granted by the Legislature.

World War I gave real impetus to vocational education. The U.S. Congress passed the Federal Vocational Education Act (commonly referred to as the Smith-Hughes Act) in February 1917. Its purpose was to prepare teachers in vocational subjects and to train workers in agricultural, trade and industrial, homemaking, and service occupations other than professional fields. In the same year, in order to participate in the program, the Nebraska Legislature created the Board of Vocational Education, consisting of the Governor as chairman, the state treasurer as treasurer, and the superintendent of public instruction as secretary.

In 1919, Congress rewrote the Vocational Education Act to clarify and improve the regulations and authorizations for training these teachers. At the same time, it clarified the authority and duties of the State Board of Vocational Education. The previous year, Congress had passed the Smith-Sears Vocational Rehabilitation Act, and in 1921 the Nebraska Legislature directed the state board to cooperate with the federal government in implementing its provisions in Nebraska. It also was authorized to appoint the necessary staff.

DEPRESSION, WAR, AND POSTWAR, 1930 TO 1955

The Depression

Like most agricultural states, Nebraska suffered severely during the Depression. Many communities dismissed part of their teaching staff and dropped courses. Buildings went unrepaid, and replacements, for the most part, were out of the question.

State Superintendent Charles W. Taylor fought hard against unreasonable retrenchments and appropriation cuts, and he attempted to bring about desirable changes in the laws affecting education generally. He reopened issues that had been dormant for many years by advocating more favorable investments of the permanent school fund and a greater return from school land leases. Finally, in 1938, the Legislature proposed an amendment to the Nebraska Constitution of 1920 creating a board of commissioners for managing the school lands and investing the funds. The amendment failed in the election that year (14). But 2 years later, the voters approved another amendment designating the Governor, secretary of state, treasurer, attorney general, and superintendent of public instruction as the Board of Educational Lands and Funds.

Taylor cooperated in several national surveys during these years. For instance, in 1932, the department participated in completing the Nebraska section of the National Survey of Secondary Education. It reported on the organization of the high schools, studying the advantages and disadvantages of “general” and “special” high schools, and studying high school enrollments. It also surveyed problems involving curriculum, homogeneous grouping, provisions for atypical children, and various instructional techniques.

The State Department of Education cooperated in completing Nebraska’s portion of the American Council on Education’s survey of secondary schools. Taylor stimulated guidance services in the high schools and encouraged the use of criteria developed by a Cooperative Study of Secondary School Standards for Self-Evaluation. There was an effort to lengthen the high school recitation periods, reduce class size, and restore courses dropped because of the Depression. There was an increased emphasis on pre-professional training as well as vocational aspects of normal training. In 1939, the superintendent established the Nebraska High School Improvement Program, which resulted in more than a dozen excellent reports on various aspects of secondary education.

The state superintendent used every means at his disposal to improve rural education and give it prestige. For one thing, he encouraged county boards to allow the county superintendents to hire clerical help and secure professional supervisory assistance. He expanded the standardization of schools and offered to designate districts which could qualify for 95 points on a 100-point scale as “superior schools.” The superintendent also encouraged the formation of rural parent-teacher and county school associations. Furthermore, the department produced two excellent courses of study, one in 1929 and the other in 1936.

In 1933, to implement the law requiring schools to offer character education, the department created a character education division to bring together the various
programs. This division, in close cooperation with the rural education and secondary education division, developed materials promoting virtues set forth in the law. It produced a course of study on character education and another on scientific temperance instruction. The division promoted the organization of character-building clubs and good citizens clubs in the schools and helped organize Junior Red Cross clubs. It administered the Knighthood of Youth organization in the state, which was essentially a character education program promoted by the department. Many elementary schools, especially rural schools, conducted this program for which a syllabus was provided by the department. It cooperated in planning programs for the state's 4-H Clubs and encouraged expansion of the Boy Scout and Girl Scout programs. This division remained active throughout Taylor's administration, and although it does not exist today as a separate division of the department, its philosophies of character education are as forceful as they were during the thirties.

Superintendent Taylor also led a drive to equalize educational opportunities. He pointed out that the property values in Nebraska did not coincide with the school population centers. Thus, he suggested that a statewide tax be enacted and that revenues be distributed by a legislative formula to correct the inequities and unfairness in the taxation program.

During the Depression, when there were more teachers looking for jobs than were available, it was possible to upgrade certification. The Legislature completely rewrote the laws in 1937, providing that as of September 1938 all certificates would be issued by the superintendent of public instruction upon the recommendation of the governing and administrative officers of institutions approved to prepare teachers. Grades of the new certificates and their requirements were listed. The law abolished the Board of Examiners for life certificates, but established a new Board of Educational Examiners to advise the superintendent of public instruction as to which colleges, other than the University of Nebraska and the state teachers colleges, were eligible to recommend candidates for certification.

Again, during a national emergency — a period of chaotic economic conditions — the federal government assisted states with specific educational programs. In 1933, Nebraska's State Department of Education received aid under the Federal Emergency Relief Administration Act to provide services for rural schools, teaching of adults to read and write, vocational education, rehabilitation of disabled persons, and general adult education, and later for setting up nursery schools.

The federal government also came to the aid of the states with the Works Progress Administration and the Public Works Administration, enabling Nebraska to renovate numerous school plants. As many as 250 workers were employed on these projects at one time. These federal funds also made it possible for a number of communities to build new school buildings.

World War II

The United States's entrance into World War II continued to make it difficult for communities to build new school plants or even renovate old ones, as there were shortages of both materials and labor. But more unfortunate was the constant shortage of teachers that plagued every state in the Union. The Nebraska Legislature gave the state superintendent authority to extend the term of certification for any teacher who possessed a valid certificate when he enlisted or was inducted into the armed forces. The 1947 Legislature did make an exception to the law prohibiting the certification of alien teachers by permitting the superintendent of public instruction to issue a temporary certificate to an authorized "exchange" teacher from a foreign country.

When Superintendent Wayne O. Reed assumed office in January 1943, he faced an acute shortage of teachers and was forced to issue hundreds of temporary certificates each year. Initially, oral and written exams were arranged for the candidates, but later the examination method was discontinued. He continued the policy of extending teacher certificates when the holders were serving in the armed forces. Although teacher certification had been greatly simplified by this time, many old certificates remained in effect to complicate matters.

In one of his first acts, Superintendent Reed reorganized his office into two major divisions: administrative assistance and supervisory assistance. An assistant superintendent of public instruction headed each division. Reed had campaigned for office with the slogan, "locally controlled, locally administered, community-centered schools," and throughout his administration he directed the department with this idea in mind.

One responsibility of the administrative division was ruling on problems arising from the operation of the school laws. Properly interpreting these school laws had always been difficult. Frequently, superintendents' decisions were referred to the attorney general's office for further opinions concerning the legislative history and intent.

The state superintendent also assigned the administrative division the tasks of conducting educational research and compiling and publishing school statistics. It issued teacher certificates, handled the disposing of federal surplus properties to the schools, and administered the bureau of education and registration of nurses. It became responsible for administering the school lunch program, approving and certifying educational programs for veterans, distributing various state-federal aid funds, reorganizing school districts, and carrying out school building surveys and services.

In 1944, through the impetus of a grant from the W. K. Kellogg Foundation of Battle Creek, Michigan, the
Nebraska State Department of Public Instruction and the Nebraska State Department of Health inaugurated a cooperative experiment project for improving school health education and health services. The foundation granted additional money in 1945 and 1946 to continue this Nebraska school health project.

The Kellogg grant and the aroused interest of individuals, schools, public and private health agencies, and teacher education institutions prompted numerous moves to improve school and community health. In March 1947, the State Department of Assistance and Child Welfare joined the Departments of Health and Public Instruction to officially sponsor "A Proposal for an Extended Nebraska School-Community Health Program." This new 3-year proposal centered the program in the six larger tax-supported teacher education institutions under the administration of the Department of Public Instruction and requested partial subsidization from the W. K. Kellogg Foundation. The foundation approved the program to run from July 1947 to July 1950 and allocated funds for its development.

Postwar Problems

Veterans Programs. In 1944, the U.S. Congress passed the Servicemen's Readjustment Act, commonly known as the GI Bill. That June, the Governor designated the Office of the Superintendent of Public Instruction as the appropriate state agency to approve the educational and training institutions, agencies, and services in Nebraska. All accredited universities, colleges, junior colleges, and high schools were immediately approved and the necessary facts submitted to the Veterans Administration. When the war ended, the phase of the veterans education program related to on-the-job training in business and industrial establishments expanded tremendously.

Congress approved another act in August 1946 to establish the first definite standards for approving applications from businesses and industries offering on-the-job training. The state department appointed a committee consisting of representatives of labor, veterans organizations, and management to study all applications received after that date. In every case of a rejected application, the firm was advised of the reason for rejection and given an opportunity to revise the application.

Under the agreement with the Veterans Administration, the department was reimbursed for salaries and travel expenses of its staff, who were obligated to make annual inspections or supervisory visits to each approved business. The Veterans Administration asked the department to consider for recertification prior to January 1, 1947, all business firms and institutions previously approved to offer on-the-job training. The VA and the department maintained a close liaison with the chief of the VA's training facilities section cooperating with the department's director of veterans education and training.

The department was very active during the 1945-47 biennium assisting veterans with their educational problems. It established a program whereby high school diplomas could be granted to veterans on the basis of a satisfactory performance on the General Education Development Tests, published by the American Council on Education. These examinations were administered locally by high schools and returned to the department for scoring and recommendations. The tests were available in engineering, drawing, commercial correspondence, American history, English, Gregg shorthand, chemistry, first- and second-year algebra, and business English.

Veterans returning to high schools and colleges could claim credit for basic military training, courses completed with the Armed Forces Institute, service schools, and other special courses of instruction. At the request of the high schools, the state department evaluated these courses for credit on the basis of recommendations published by the American Council on Education.

For several months, the department conducted the Veterans Educational Information Clearance Service sponsored by the U.S. Office of Education. This made available information concerning vacancies in all institutions of higher learning, which was compiled and sent to these institutions for guidance purposes. These reports were exchanged monthly with other states and given to the county service officers and U.S. employment officers until November 1946. The following year, this service was reestablished on a semester and summer-term basis.

In 1947, the agriculture education division prepared a contract to cover institutional on-the-farm training for veterans, which was approved by the State Board of Vocational Education and the Veterans Administration. Under its provisions, local schools, with the assistance and supervision of the State Department of Vocational Education, established training programs and reimbursed approved instructors. Semiannually, the local school claimed a reimbursement from the State Department of Vocational Education. Thus, the handling of federal funds to local schools was kept in the hands of the regularly constituted state educational agencies.

When Congress passed the Veterans Readjustment Assistance Act of 1952, the Governor designated the Department of Public Instruction as the state approval agency for institutional education and training. This meant that the department had the same approval relationship with schools in matters pertaining to the education of Korean War veterans that it exercised under the law for World War II veterans. When the World War II educational program expired in 1956, the Veterans Readjustment Assistance Act of 1952 continued, but the Veterans on-farm training program terminated in April 1962.
Surplus Property. In November 1945, the Surplus Property Administration of the federal government announced that its regulation, effective 2 days earlier, was designed to channel surplus goods, on the basis of need, to nonprofit school systems, libraries, universities, research institutions, hospitals, and medical or sanitional institutions. The administration requested the Federal Security Agency to assist in distributing the surplus property to eligible educational and health institutions and other nonprofit agencies. The Federal Security Agency, in turn, delegated to its U.S. Office of Education the task of administering the program for educational institutions.

The Legislature or Governor of each state was requested to designate an agency to represent its own institutions to cooperate with the Office of Education, and Governor Dwight Griswold requested State Superintendent Wayne Reed to provide such an agency for Nebraska. Deputy Superintendent F. B. Decker, as executive officer of the state educational agency for surplus property, immediately invited all types of institutions to assist in working out ways of implementing the program. This gave all state educational institutions an opportunity to share in acquiring surplus property.

The War Assets Administration, as the principal selling agency for surplus property, allowed a discount from the listed fair value to properly certified educational institutions. These institutions could participate in bid sales conducted either by a selling agency or an owning agency, but in this case no discount was guaranteed. Through national sales and special programs, the schools were able to purchase specialized types of equipment and acquire property at discounts as high as 100 percent.

In 1950, Congress amended its surplus property regulations to authorize all federal agencies to donate property for educational purposes, thus making surplus donations a permanent service to educational institutions. In the same year another law extended the service to include tax-supported and nonprofit public health institutions, along with schools, colleges, and universities. The state law stipulated that the program should be operated under one agency.

In 1955, Congress again changed the Federal Property Administrative Services Act of 1949. Under the old act, the federal government could sell federal surplus property to private bidders. The law now contained a provision whereby all federal surplus property that had been screened by federal agencies was doantable to educational and public health institutions. As a result, the Nebraska schools, universities and colleges, and hospitals not primarily for domiciliary care received a much greater quantity and improved quality of property.

Expanding the Department's Services

Imbued with the philosophy of "locally controlled, locally administered, community-centered schools," Superintendent Reed organized numerous conferences and institutes of professional and lay groups to study the educational programs of Nebraska and published many of their findings and recommendations. He also appointed committees with wide representation to revise both elementary and high school courses of study. Of great importance, he inaugurated an accelerated teacher-training program for rural and elementary schools.

In 1946, representatives from Nebraska's colleges and universities offering state-approved teacher education programs, the public schools, and organizations interested in the improvement of teacher education and professional standards set up the Nebraska Council on Teacher Education to serve as an advisory body to agencies and institutions responsible for teacher education and certification.

The council proved to be a most effective organization. The department cooperated with it and its component organizations in conducting a campaign to encourage young people to enter teaching as a career. It also encouraged boards of education to compile policies for their own guidance, as well as for school employees and their communities.

It is well that the citizens of Nebraska had become interested early in securing quality teachers, because the national shortage continued to grow. By 1954, the U.S. Commissioner of Education warned that the nation would need at least 100,000 new elementary school teachers the coming year — nearly three times as many as completed their preparation in teacher education institutions that spring. The State Department of Education carried in its 1955 annual report a statement by the Nebraska Council on Teacher Education that thousands of Nebraska children were being taught by teachers with no college preparation, and thousands of others by teachers with only one summer of college education. More than 1,200 substandard certificates were issued in 1954-55. Although the best schools consistently retained their good teachers, many communities had little holding power, and their teachers left the state for better opportunities elsewhere. The council stated:

Nebraska needs to achieve in the near future a minimum certification standard of 2 years of college preparation for all elementary school teachers. When this standard is achieved, steps should be taken, as soon as possible, to raise the minimum of preparation to a college degree. Twenty-seven states now have this minimum standard of a college degree for all teachers. Of the remaining 21 states, 16 have a minimum standard of at least 2 years of college preparation for all teachers (16).

The School Lunch Program. The National School Lunch Act, enacted by Congress in June 1946, stipulated that the Governor of each state should appoint a state agency to administer the program in all schools. That August, the Governor of Nebraska appointed the superintendent of
public instruction's office as the state agency. A special session of the Legislature provided for funds, stating that —

The sum of $10,000 or so much thereof as may be necessary is hereby appropriated to the Superintendent of Public Instruction from the State general fund for the payment of salaries, wages, maintenance, supplies, traveling, and other expenses of administration and disbursement of funds received from the United States under the National School Lunch Act, for the biennium ending June 30, 1947 ...(17).

Congress appropriated money to a state according to the number of children between the ages of 5 and 17 enrolled in school and the state's per-capita income in relation to that for the country as a whole. Ten percent of Nebraska's share was allocated to the parochial and non-profit private schools, whose programs were administered by the state's production and marketing office, a division of the U.S. Department of Agriculture. This arrangement prevailed because state agencies in Nebraska are prohibited by law to pay tax moneys of any kind to private, parochial, or denominational schools.

Local schools interested in the school lunch program applied to the department. The department then signed a contract with the local sponsor, which could be the school, the local board of education, the PTA, or any interested local group. The law required that lunches be available without discrimination to all children in the school, regardless of ability to pay.

By 1947, so many new schools wanted to participate in the lunch programs that the State Department of Public Instruction, in cooperation with the State Department of Health and the state teachers colleges, employed two field consultants in nutrition to visit various schools and advise them in setting up new programs. In December 1954, when Congress made available an additional $50 million of Commodity Credit Corporation funds for a special school milk program, the Nebraska schools enrolled immediately.

Nebraska continued to participate in both the school lunch program and the special milk program. All funds disbursed by the department for these services are federal money, although the state pays for administering the program on the state level.

**District Reorganization.** In 1949, Superintendent Reed was successful in securing legislation giving the department complete responsibility for accrediting and approving school systems. He appointed an advisory committee to review the findings of the department's supervisory staff and to act on their recommendations. The state accreditation committee then carefully developed and adopted criteria for approving public elementary and high schools and specific standards for rural schools, private schools, and junior colleges.

The Nebraska Legislature enacted its first school district reorganization law in 1949. It established a six-member State Committee for Reorganization of School Districts, with the Governor appointing two from the teaching profession and three laymen, with the state superintendent a nonvoting member. By law, the committee functioned in an advisory capacity. County committees, elected in 92 of the 93 counties, carefully studied their district organizations, proposed reorganization plans, and worked with the state committee in submitting their plans to the electorate.

Superintendent Reed resigned in July 1950 to assume the presidency of Nebraska State Teachers College at Peru, and Governor Val Peterson appointed Otto G. Ruff to complete his term of office. When Ruff decided not to seek reelection, Freeman B. Decker assumed the office in January 1951.

Decker intensified the program of school district reorganization. To speed up consolidation, he recommended amending the law to give the State Committee for Reorganization of School Districts more authority, but the Legislature refused to act.

**The Office of State Superintendent Abolished**

The department's 1951 annual report proposed a constitutional amendment abolishing the Office of Superintendent of Public Instruction and establishing a State Board of Education. This board, consisting of six lay persons elected from the state's supreme court districts, would determine policy and appoint a commissioner of education. In turn, the commissioner would become the board's executive officer and head the State Department of Education. A bill was introduced to reorganize the department in this way and to abolish the position of superintendent of public instruction upon completion of the incumbent's term of office. The electorate then approved the amendment in 1952 to change the educational organization at the state level.

During the 1953 session, most of the Legislature's work was devoted to enacting new laws and corrective amendments to old laws to implement the constitutional amendment. In January 1955, the Office of State Superintendent of Public Instruction terminated. The Board of Education then appointed Decker as the new commissioner, and he remained in office until 1962.

The 1955 Legislature abolished the State Board of Vocational Education, established to enable Nebraska to participate in the Smith-Hughes Act of 1917, and transferred its duties to the newly created State Board of Education (18). As the new vocational education governing body, the elected State Board of Education scheduled meetings on the same date but at different times and kept a separate set of minutes for its two different functions. As the vocational board, it was responsible for administering federal and state funds and disbursing them to the local schools, providing training of teachers, and assisting local school
boards and officials in setting up vocational departments and courses, planning programs, and securing instructors.

The 1955 Legislature did relieve the vocational education board from its responsibility for the rehabilitation division, which it had administered since the program began in 1921, and transferred it to the Department of Education.

From 1947 to 1962, the vocational board contracted annually with the Veterans Administration to administer and supervise the institutional on-farm training program. This program served nearly 20,000 World War II and Korean veterans, with a peak enrollment of 9,315 in 296 public school systems.

Since 1941, the State Board of Vocational Education had administered the Nebraska State Trade School, which the Legislature had established in the former Nebraska Soldiers and Sailors Home at Milford. The school offered 10- to 20-month courses in 12 different trades, and it provided dormitory and cafeteria facilities on a cost basis. During the 1956-57 school year, it operated with a maximum capacity enrollment of approximately 400 students. By 1965, the enrollment was up to 700 students.

A DECADE OF JET-AGE PROGRESS, 1955-65

Expanding Federal Programs

During the entire post-World War II period, there was an acceleration in programs offering federal money to education, and Nebraska had not been remiss in securing this aid for its boys and girls. A number, such as the vocational education and school lunch programs, have been mentioned. In 1948, the department received $47,125 to distribute to districts financially handicapped because they contained tax-exempt Indian lands. The department contracted with the Bureau of Indian Affairs to supervise schools enrolling students with one-quarter or more Indian blood residing in these districts. The program expanded the following year to include transportation and lunch funds, and it continued to expand so that by 1965, 687 eligible Indian pupils were being helped.

In 1950, Nebraska received funds under the Flood Control Act and under the provisions of Public Law 874, by which the federal government alleviates the financial burden of local schools due to the impact of federal activities on their communities. By 1966, 48 Nebraska school districts were receiving $4,033,919 compensation for additional pupils. Public Law 815, passed by Congress in 1951-52, defined the conditions under which districts could apply for adequate school plant facilities for children in federally affected areas. The department serves as an agency of the federal government in processing applications for financial assistance under this law, and as a consultant to the applicant school districts.

During the 1955-56 school year, Nebraska sold certain submarginal lands in Sioux and Dawes Counties under the Bankhead-Jones Farm Tenant Act. This land, referred to as the Pine Ridge Utilization Project, was to be retired from cultivation. The federal law stipulated that one-fourth of the income was to be returned to the counties where the land was situated to maintain the schools or roads, or both, as decided by the county board of commissioners. In the same year, under the Migratory Bird Conservation Act, the federal government provided money for schools or roads to counties in which wildlife refuges were located. And in 1956, Congress enacted the War Orphans Educational Assistance Act to provide scholarship aids to children of servicemen who died as the result of disability or disease incurred in the line of duty during World Wars I and II and the Korean conflict.

Civil Defense Adult Education. Early in 1958 the director of the Office of Civil and Defense Mobilization (OCDM) delegated to the U.S. Office of Education the responsibility of cooperating with state and local school authorities in teaching adults the principles of personal and family survival. The following March, the U.S. Commissioner appointed a director of Civil Defense education as a member of his staff. Nebraska, because of its strategic location, was one of the seven initial states selected to carry out a Civil Defense adult education program. The state superintendent, who was responsible for the program, in July 1960 appointed a coordinator and two consultants for Nebraska's program.

The state department certifies teachers who complete their training as Civil Defense adult educators. These persons are then qualified to teach Civil Defense courses in their communities under the auspices of local administrators. Teachers and the state staff are paid from federal funds, and the federal government supplies instructional materials. In July 1965, radiological monitoring training, funded by the federal government, also came under the CDAE program.

The National Defense Education Act of 1958. The National Defense Education Act of 1958, passed by Congress to strengthen instruction and provide increased educational opportunities to students in critical subject areas, brought new resources and encouragement to Nebraska public schools at a time when financial help was needed more than ever before. The U.S. Office of Education officially approved the Nebraska plan for participation in NDEA Title III in February 1959. These funds were to be used on a matching basis by the local school districts to strengthen public elementary and secondary school offerings in science, mathematics, and modern foreign language. The money could be used by local schools for equipment, materials, and minor remodeling. Funds also were available for the department to improve its supervisory program, and in the 1962-63 school year, it added a science supervisor and an audiovisual supervisor to its staff under this portion.
of the program. Since October 1964, Title IIII has been amended to include five additional subject matter areas: history, civics, geography, English, and reading.

Under NDEA’s Title V, school districts could receive compensation for expenses in testing, materials, and counseling, though not specifically for administering the tests. The guidance and counseling areas had to conform to the state department standards to qualify for financial support. The state plan for testing, counseling, and guidance became effective in January 1959, and federal funds were received. Because of certain legal technicalities, the expenditure had to be limited only to testing during fiscal year 1958-59. As additional federal funds became available in subsequent years, the Nebraska program was expanded to include all three areas of testing, counseling, and guidance.

The State Board of Education approved a plan for area vocational-technical schools in December 1958 to receive funds immediately available under Title VIII of the NDEA. The state board approved Omaha Technical High School and the Nebraska Vocational-Technical School at Milford as area vocational schools to train highly skilled technicians for national defense. Under the law, the instruction had to be of less than college level.

The Nebraska program was developed through 1- and 2-year post-high school courses and/or as short unit extension courses for presently employed journeymen or technicians. The Nebraska Vocational-Technical School was at that time operating seven approved courses on a less than 12-month basis. The school began operating on a yearly basis during the 1965-66 school year and was offering 11 approved courses.

Under Title X of the federal assistance program, Nebraska could secure up to $50,000 per year in federal funds to match an equal amount of state funds for improving statistical services in the department. The Nebraska plan was approved in June 1959, revised in October, and again the following July.

The Manpower Development and Training Act. In November 1962, shortly after Congress passed the Manpower Development and Training Act, the state department initiated an occupational training program subsidized by these funds. Gradually, the program became centralized in the public schools of Omaha, Lincoln, and Sidney (Sioux Ordinance Base Facility), and at the Nebraska Vocational-Technical School at Milford. It was found that large centers could better provide the necessary equipment, facilities, and training personnel, so students were gradually moved to these primary centers from throughout Nebraska and neighboring states.

During 1965 and 1966, the Department of Education’s vocational education division conducted MDTA training in agriculturally related occupations, business education, distributive education, trades and industry, and health occupations. Guidance and counseling services and basic education were available, as were programs especially designed for the severely disadvantaged.

Congress changed the Manpower Act by an amendment in 1965, limiting federal support of these projects to 90 percent. The 1965 Nebraska Legislature appropriated $50,000 to continue the program.

Rehabilitation and Economic Opportunity Acts. The Nebraska State Department of Education’s Division of Rehabilitation Services obtained funds in 1962 from the Woods Charitable Foundation and the Vocational Rehabilitation Administration of the Department of HEW for a research and demonstration project to rehabilitate severely disabled people who were receiving benefits from the Bureau of Old Age and Survivors Insurance. Nebraska was one of 11 states taking part in this 3-year program (Project 965). The purpose of the project was to increase, intensify, and improve methods of rehabilitating severely disabled individuals and to determine how, when, and which cases would respond to effort and why.

Workers in this field had been frustrated for a long time because they could not give needed services to a great many people with severe and complex physical or mental disabilities. It was hoped that this program would devise new methods and patterns of administration, comprehensive rehabilitation centers, work adjustment centers, and other medical units that could be coordinated to meet the problem. It also included a study of the effect of sub-cultural and economic factors on the rehabilitation process in urban, semirural, and rural areas.

Out of 2,351 cases reviewed, the project selected 413 and referred them to counselors. Personal interviews and thorough investigations eliminated 69 percent, and effort was concentrated on the remaining 31 percent. When the project ended in 1965, 15 persons undergoing treatment continued to receive needed rehabilitation services through the division’s regular program.

It was learned from Project 965 that the average cost of rehabilitating the severely disabled did not differ significantly from regular programs. Thus, the researchers recommended that part of the funds these people would be eligible to receive from the Trust Fund of the Old Age and Survivors Insurance Program be used for rehabilitation. It also was learned that physical restoration, preferably through a vocational rehabilitation center, was the most utilized service. The project concluded that job placement specialists should be added to the rehabilitation team. But perhaps the most valuable fact learned was that a state-operated, comprehensive rehabilitation center could increase the number of clients helped. Such a center could provide for mentally retarded and psychiatrically disabled individuals.

In June 1963, the department initiated a program, financed in part by the Vocational Rehabilitation Administration of the Department of HEW, to provide intensive,
comprehensive vocational rehabilitation services to selected groups of handicapped individuals, who would apply for benefits from the two largest county public welfare offices. These groups included people receiving three categories of public assistance: families with dependent children, the permanently and totally disabled, and people receiving general assistance. The department hoped to create an effective interagency relationship to ensure that every possible effort was made to help these individuals return to gainful employment.

The coordinator-counselor of the project was located in the Lancaster County Department of Public Welfare, while Douglas County was served by a counselor in its department of public welfare. From June 1963 to the end of February 1965, 239 persons were referred to the project. When it terminated, there were 132 disabled persons in either a referred or an active case status. Of these, 85 were receiving vocational rehabilitation services, and decisions regarding acceptance were pending in 47 cases. The project did find that many “hard-core” welfare people could be rehabilitated and returned to employment.

Due to the Economic Opportunity Act, Nebraska, in 1965, began administration of a statewide program of adult basic education. Authorized by Title II-B of the act, the program is the responsibility of the adult basic education section of the state department. During its first year in operation, approximately 327 adults with less than an eighth-grade education received instruction under this program in three school districts of the state.

The Elementary and Secondary Education Act of 1965. President Johnson signed the Elementary and Secondary Education Act on April 11, 1965. To many this was an educational dream come true. It authorized more than $1.3 billion in federal funds to improve the education of young Americans.

Title I of ESEA provides federal grants to local public school districts for programs designed to meet the needs of educationally deprived children. Local school administrators, teachers, and selected lay people identify these children in low-income areas, establish the priority of their needs, and design a project. These projects may include supplementary and remedial instruction, guidance and counseling services, or health and welfare services. The state education agency is responsible for administering the program.

Again, the department's staff visits schools having Title II projects to provide assistance in improving libraries and instructional materials.

Title III, Projects to Advance Creativity in Education (PACE), attempts to stimulate local districts to reap the benefits of research and channel them from the educational laboratory into the classroom. A local committee, widely representative of the community, determines the priority of educational needs and plans a project to meet them. These projects are submitted to both the U.S. Office of Education and the State Department of Education. The state department may recommend approval or change, but funding is directly from the U.S. Office of Education.

Title V provides federal funds to state departments to improve educational planning through evaluation of programs, data collection and interpretation, curriculum materials, research, and teacher preparation. It provides funds to local school districts to provide consultative and technical assistance. The funds under Title V have enabled the Nebraska state department to make unprecedented progress. The addition of highly skilled specialists has had an impact on Nebraska's schools.

Financing Education

Until 1967, state aid to education in Nebraska could easily be classified as “piecemeal.” Not only was there no foundation or equalization program for state aid, but there was no sales or income tax. Approximately 92 percent of the revenue of Nebraska public school districts came from local sources. The remaining 8 percent was derived from educational lands and funds, and state and federal aid. State appropriations were made for vocational and special education for handicapped children.

The state temporary school fund included rentals for use of school lands, interest earned on the investment of the permanent school fund, and a small amount of liquor and itinerant merchant license fees. The annual division of the temporary fund among the school districts was known as school apportionment. A fractional part of a tax levied on insurance premiums in lieu of a tax on intangible property of insurance companies was distributed statewide each year. None of these was of any sizable amount.

The permanent school fund consisted of money derived from the sale of school lands, a 2-percent severance tax on gas and oil, and proceeds from the sale of escheat estates. Only the interest earnings of this fund could be used, creating the above mentioned temporary school fund, which was distributed annually.

An amendment of the constitution in 1954 provided that the general management of all lands and funds and the investment of school funds be administered by a board of five members appointed by the Governor. The law was changed the following year, so that the Governor appointed one member from each of the four congressional districts
and one from the state at large. Original terms were staggered, and reappointments for 5-year terms were prescribed (19).

The 1964 distributable sum of the school fund was larger than the usual annual amount because about 2,300 new leases on school land were written in 1963, representing about one-half of the total number of leases written on all school land in the state and also representing about one-half of the total acreage of school land. Rents on school land were customarily payable in semiannual installments, but on new leases the first annual payment was required. This brought an extra half-year's rent on 0.8 million acres to the income of the fund in 1963 for distribution in 1964. In addition, a bonus payment on a new lease was payable in its total amount when the lease was consummated. These two conditions increased collections in 1964, which were in excess of $6 million instead of the usual $3 million.

The following year, in 1965, over the objections of the Governor, the Legislature enacted a law requiring that all school lands be offered for sale as the leases expired. Thus, during 1966 the sale of 1,356 acres brought a total of $142,218 to the school fund (20). The fight still continues in each legislative session as to whether these lands shall be sold or held in trust for future generations.

Local school districts in Nebraska finance their public schools mainly by property taxation. In 1964-65, the school district taxes contributed $102,516,658 to the total revenue receipts of $134,645,338. The property taxes also provided $7,144,314 to pay high school districts for the tuition of pupils who resided in Class I districts. Additional revenue came from a tax on gross revenue derived by public power districts from retail sales, less the in-lieu-of tax paid by the agencies on the physical plant. The schools also received funds from such sources as police court fines and local license fees.

Revenue provided by the counties comes mainly from fines imposed in county courts and fees for operating licensed businesses outside incorporated cities and villages. This amounted to about $1,328,635 in 1964-65.

District Reorganization

The tax structure, and the financial inequities resulting from it, presented one of the major barriers in reorganizing school districts. In 1956, Nebraska, for the first time in 70 years, had fewer than 5,000 school districts. School district reorganization continued to be a constant and perplexing problem.

The State Committee for Reorganization of School Districts proposed that the Legislature require all land in the state to be in districts offering kindergarten through twelfth grade (K-12) by June 30, 1960. This proposal would dissolve any K-8 district that failed to become a K-12 district and would attach it to an existing K-12 district. Although educators and interested laymen heartily endorsed this proposal, it failed to become law.

Commissioner Freeman B. Decker pointed out in his annual report for 1960 that well-planned school district reorganization, making possible stronger financial support, had resulted in a broader and better curriculum in many schools, with special attention to highly important areas such as English, science, mathematics, history, and government. Schools could offer more electives and increase greatly their holding power.

In January 1962, Commissioner Decker resigned. From that time until the state board appointed his successor, Stanley L. Hawley served as acting commissioner. Hawley, a long-time member of the department staff, had served as deputy commissioner under Decker. In April 1962, the state board appointed Floyd A. Miller as the state's third commissioner of education. The new commissioner, a veteran staff member of the department, had been assistant commissioner for instructional services before being appointed.

During his first year, Commissioner Miller held a series of 11 meetings throughout the state to discuss Nebraska's educational program and prepare school district reorganization legislation. His suggestions resulted in a coordinated effort by educational organizations to introduce a reorganization bill. Numerous local citizen groups and community boards of education cooperated in forming educational study committees.

In 1962 and 1963, the State Board of Education took a firm and courageous stand on three of the most unpopular problems facing the state's educational progress: school district reorganization, a broader tax base, and state aid to education. Concerning reorganization, it stated:

We believe that our commitment to quality education requires us to work vigorously toward adequate school district organization. Just to rearrange districts is not enough. A school district should have sufficient pupils and financial resources to make possible a quality program of general, special and vocational education for all children from kindergarten through high school. As a Board we accept the challenge of bringing about reorganization through both educational and lay leadership. We also believe that this demands the type of budget support which permits an adequate Department staff to provide the necessary leadership (21).

Even though the 1964-65 Legislature passed acts of far-reaching importance to Nebraska education, school district reorganization remained unsolved. It was extremely difficult to get county committees to prepare comprehensive reorganization plans for their people to vote on. The department attempted to provide local communities with as much help as possible in organizing citizens committees and developing sound plans. The department used
every available opportunity to help the public understand that adequate, unified school districts could provide better education for the same amount of money.

Expanding Educational Opportunities

Nebraska's citizens continued to show considerable interest in educating exceptional pupils, including both the handicapped and the gifted. Parents, teachers, school board members, and administrators were interested in seeing that each child was given a program that met his individual needs, regardless of his ability or physical condition. Of three bills introduced in the 1957 session of the Legislature, two established educational services for the severely mentally retarded or "trainable" child, and the third provided special education for the gifted.

In 1961, the county chapters of the Nebraska State Society for Crippled Children financed a program of testing the hearing of both public and parochial school children throughout the state. The department administered the program, and a state consultant from its office of special education assisted the counties in the testing.

The department's responsibilities were further expanded when it assumed responsibility in 1960 for administering the Nebraska School for the Deaf and the School for the Visually Handicapped. In 1961, it began administering the Experimental School for Trainable Mentally Retarded Children at Cozad, which had 30 children attending regularly at the time.

Under the auspices of the Cozad State School and the State Department of Education, Nebraska held its first camp for trainable mentally retarded children in Lexington, Nebraska, in 1963. Forty-seven children and sponsors were involved in a variety of camping activities designed specifically to meet the needs of the children.

Upgrading Instruction and Curriculum. Perhaps one of the most significant factors in improving education in Nebraska was the department's development and refinement of "committee evaluation" of the school systems. Actually, the Nebraska state department was one of the pioneers in developing the use of self-evaluation. In 1957, the department planned for committees to visit, review, and develop recommendations. This resulted in a realistic and efficient long-range program for classified schools, based on the strengths and weaknesses found in the total school program. Thus, a requirement for self-evaluation has become part of the accreditation procedure in Nebraska, and it has now been adopted by the North Central Association of Secondary Schools.

The department also has developed the practice of inviting local boards of education to meet with members of the state department when the school is being visited for evaluation. These contacts help local citizens develop a clearer understanding of the aims and objectives of school systems and how to meet these goals.

The 1959 Legislature permitted the State Board of Education to accredit privately owned business and trade schools domiciled in Nebraska that could meet standards set by the Committee for the Accreditation of Private Schools. In the same year, the Legislature required all privately owned correspondence, business, and trade schools to be licensed and bonded.

The state board continued to emphasize school classification as well as school district reorganization to ensure a minimum educational program. Superintendent Miller and his staff assisted people in various communities to organize grass-roots studies of available educational opportunities.

In 1965, the Legislature divided the state into 19 multicounty areas to provide supplementary educational services to local school districts. A county could ask to be excluded from these services if at least 5 percent of the voters in each of three-fifths of the county's school districts signed a petition requesting that exclusion be voted on at the next general election. These petitions were filed in 79 of the 93 counties. For this reason, the continued existence of many units would not be determined until November 1966.

Eighteen educational service unit boards, with the help of the state department, held meetings during the first year (1966) to develop a budget and explore what services to provide.

Teacher Certification. In 1957, the Legislature reduced the types of initial and renewal certificates for teachers from 68 to 12 (22). For renewals, the law required the applicant to take 8 semester hours, including 3 in education. If the certificate was based on a degree the renewal hours had to apply toward a master's degree or be approved by a recognized college as most suitable for the teacher.

At this time, 1957, a State Board of Education Examiners, appointed by the superintendent of public instruction, evaluated the teacher education programs of the colleges and universities by comparing them with the programs offered by the University of Nebraska. The Council on Teacher Education recommended that the approval of teacher education programs be transferred to the State Board of Education, with the stipulation that the board would perform this function through an advisory committee. The seventy-third session of the Legislature did shift to the State Board of Education the responsibility for establishing requirements, with the assistance of an advisory committee of 22 persons appointed by the board. The state board immediately adopted a policy of strengthening teacher education on the premise that all Nebraska teachers should have a liberal education, based on not less than a baccalaureate degree.

The Nebraska State Board of Education approved rules for issuing certificates and permits to teach, counsel,
supervise, and administer, effective January 1, 1964. The rules required that the institution, as well as its teacher education program, be approved by the state board. Perhaps the outstanding feature of these new rules was a provision for recognizing successful teaching experience as one of the criteria for an advanced certificate. New rules and regulations effective in 1965 further provided for eliminating all new nondegree certificates, except the Provisional Rural Elementary, based on 60 college hours, and valid in Class I and II schools only. All certificates based on an approved teacher education program with a baccalaureate degree were valid from kindergarten through grade 12.

The state board appointed an official College Approval Committee consisting of the director of teacher education, the assistant commissioner of instructional services, the assistant commissioner of vocational education services, and representatives of the public school teachers, school administrators, college teachers, college administrators, and guidance and library specialists. This committee represents the State Board of Education and the commissioner of education in evaluating the colleges' and universities' education training programs. It then makes its recommendations to the State Board of Education.

Since this evaluation process was designed to supplement and not duplicate the efforts of existing accrediting agencies, the degree-granting institutions were required to hold regional accreditation to be eligible to offer a teacher education program. Thus, in Nebraska, the North Central Association of Colleges and Secondary Schools assumes major responsibility for evaluating staff, finance, facilities, library, administration, and academic competence. This enables the Advisory Committee on Teacher Education to concentrate its efforts on the programs themselves.

THE DEPARTMENT TODAY, 1965-67

State Aid to Education

In 1967, the State Board of Education again took a hard look at its philosophy and beliefs. On May 12, the board adopted the following statement: "We are committed to the principle that there be substantial state funds allocated to the school districts of the State to be distributed on the basis of total enrollment of all the children in all of the public and nonpublic school systems" (23).

At this time, Nebraska had not had a general state aid program since 1907, and it was estimated that it ranked near the bottom of all states in the amount of tax dollars appropriated to public elementary and secondary schools. But a number of unrelenting educational leaders and lawmakers were working continuously to change this. After numerous attempts to enact a bill for increased state tax dollars, in July 1967, the legislators voted 39 to 7 to approve one, despite adamant opposition. The bill was not perfect, and it needed legal clarification, but it was a step in the right direction.

Specifically, the new act included foundation aid based on average daily membership, incentive payments based on college preparation and the summer school program, and an equalization fund calculated on the assumed need of each local school district. Equalization aid is distributed so as to give districts with low valuation per pupil proportionally more assistance in order to equalize tax levies and educational opportunities. Foundation aid is allocated to a district in an amount equal to $12.50 per kindergarten pupil, $25 per pupil in grades 1 through 6, $30 per pupil in grades 7 and 8, and $35 per pupil in grades 9 through 12, based on average daily membership.

To qualify for equalization aid, Class I districts must provide local property tax support amounting to at least 10 mills. The minimum qualifying levy for Class II, III, IV, and V districts is 16 mills and must total at least 7 mills in Class VI districts. The law ensures each school district financial support amounting to one of the following two criteria, whichever is smaller: (1) $250 per kindergarten pupil, $450 per pupil in grades 1 through 6, $500 per pupil in grades 7 and 8, and $550 per pupil in grades 9 through 12; or (2) 108 percent of the district's per-pupil cost for the preceding year multiplied by average daily membership.

Bonus assistance is provided for school districts in counties with sparse population density amounting to less than four persons per square mile, and to all districts with special programs for gifted or culturally and educationally deprived children. School districts are eligible to collect bonus assistance for transportation costs for K-8 pupils residing in the district who live over 4 miles from school and high school students who live more than 8 miles. Additional incentive payments include $350 for each classroom teacher holding a doctorate degree, $250 for each teacher who has completed a 6-year college program or earned a master's degree, $150 for each teacher holding a bachelor's degree, and 20¢ per student hour for each student participating in summer school programs.

Under the new law, a district is not eligible for state aid when, together with other financial support, it increases per-pupil expenditures more than 8 percent over the previous year or by an annual average of more than 8 percent over the previous 5-year period, whichever is larger. Districts which may suffer "undue financial hardship" from these limits may petition the State Board of Education for relief.

The law states that in the event the program is not fully funded, state aid will be distributed proportionally among the school districts. During the 1967-69 fiscal biennium, per-pupil financial aid was to be fully funded first, with the second priority going to incentive payment, and the third priority to equalization assistance (24). When
the program is fully funded, the state will pay nearly one-half all local school costs. This will require about $67 million per year.

The Legislature made the state board, and consequently the state department’s financial and statistical section, responsible for administering the law. To facilitate this administration, the department, in December 1967, added to its staff a director of state aid to public schools.

**School District Reorganization**

In October 1966, there were 2,346 school districts in Nebraska compared to 6,734 in 1949, when the Legislature passed the state’s first school district reorganization law. Even though the 1966 total was a reduction of 182 from the previous year, this still left Nebraska with a greater number of school districts than any other state in the nation and a greater number than the combined total of 23 states. In other words, for the most part the 182 districts dissolved during the year represented little more than a rearrangement of boundary lines (25).

At least, the importance of school district reorganization was becoming more apparent. Citizens, local boards of education, and county reorganization committees were planning for better school district structures. The Department of Education’s reorganization staff gathered data for these groups and assisted them in organizing their committees.

With only one full-time and one part-time staff member assigned to school district reorganization, it was not possible for the department to fulfill all the requests for assistance from the 93 county school district reorganization committees, local school officials, and citizens. Because of the increased need for field consultants to work with the locally organized study committees, the staff was greatly enlarged in 1967. Members of the State Committee for Reorganization of School Districts visited and advised community groups on their problems and met in 12 regular monthly sessions to review election plans and petition proposals.

The State Departments of Education in Iowa, Missouri, Nebraska, and South Dakota undertook in March 1966 an interstate project of school district organization, the Great Plains School District Organization Project, funded by the U.S. Office of Education until June 30, 1968. The Nebraska state department serves as the administrative agency for the project, which gives these states an opportunity to take a long, hard look at a problem that has plagued the region for many years. It is hoped that the research, discussion, and planning activities will help the participating states see their problems more clearly and provide a basis for developing acceptable units for administering education.

**Accreditation**

To upgrade the schools, the State Board of Education has continued to adopt new rules and regulations for approving nonpublic as well as public schools. During the years 1965-67, new regulations were adopted with penalties for violations. The citizens of many school districts fought them, particularly a rural-oriented organization dedicated to the status quo, ironically called the Nebraska School Improvement Association. The public hearings held by the state board often erupted into stormy sessions. Finally, in March 1967, the board adopted new rules and regulations for accrediting both public and nonpublic school systems.

To be sure that these rules and regulations were professionally sound, the board had submitted them to 14 different boards of education work conferences and to school personnel throughout the state. Individuals unable to attend the various meetings wrote in suggestions. It was emphasized again and again, before the state board approved them, that these rules and regulations did not apply to Class I school districts or to any other school districts or systems that did not voluntarily seek to be accredited. A school district or system did not have to be accredited to qualify for state funds. However, if the school district operated both a high school and an elementary school, it had to meet all the rules and regulations for those particular types of schools. Only entire school districts and/or systems were accredited; separate attendance areas or schools part of a school district or system were not individually accredited.

**Teacher Certification and In-Service Training**

In 1967, Nebraska again took a giant step forward when the state department added a special services certificate, providing a means for recognizing people who perform school services but are not actually involved in teaching. For instance, this certificate can be issued to nurses, speech therapists, librarians, and media specialists. Student teaching certificates also were added to the list, to be issued on a 1-year trial basis to student teachers recommended and assigned to the Lincoln City Schools by the University of Nebraska, Nebraska Wesleyan University, Union College, and Doane College.

To improve the quality of teaching, it is important to offer in-service training as well as preservice training; each is inadequate without the other. While preservice education is almost completely the responsibility of the colleges and universities, in-service education is primarily the task of the local school districts. However, the funds available from NDEA and ESEA have expanded considerably the State Department of Education’s role in the in-service education of teachers. The department’s acquisition of consultants with specialties has added a new dimension to this program since 1965.
During the 1966-67 school year, the department organized and promoted five workshops on "totalitarianism versus democracy" that attracted 220 teachers. The University of Nebraska and the department sponsored a summer workshop which brought together 25 outstanding K-12 social studies teachers to begin work on the state's first major social studies curriculum overhaul in a decade. The department also organized 25 English workshops for 2,000 K-12 English and language art teachers; and it sponsored a successful reading workshop for 541 teachers. It conducted 23 workshops to orient elementary teachers to the new art curriculum guide, copies of which were distributed to nearly 4,000 teachers. It also selected eight schools to organize in-service programs for elementary science.

One of the new services offered by the department is the library-media mobile unit, operated under ESEA Title II funds. It provides equipment, produces instructional materials such as transparencies, and offers book selection aids and catalogs of sources of nonprint materials such as filmstrips, films, and recordings. It enables specialists to give demonstrations in the production, utilization, and operation of instructional equipment to entire faculties. This mobile in-service training unit was displayed at many Nebraska schools during the 1966-67 school year and is available on request to any school or organization wishing to use it.

Model demonstration center libraries for elementary schools have been established at Omaha and Grand Island with ESEA Title II funds. Model demonstration libraries for secondary schools were opened at Waverly and Bellevue during the second semester of the 1967-68 school year. The department has urged administrators, teachers, school board members, and citizens interested in improving their school library programs to visit these centers. The Nebraska State Department of Education also has received money under NDEA and ESEA to produce curriculum materials and teacher handbooks which should greatly enrich the in-service program. The lack of funds has limited distribution of these materials in the past; but from 1965 to 1967, curriculum guides were planned for subject areas in which the teachers felt there was greatest need. Committees comprised of selected teachers and supervisors were assigned the task of producing the guides in art, health education, reading and language arts, English, and other fields.

Special Programs

Gifted Children. After the 1957 bill for educating Nebraska's gifted children failed to pass the Legislature, it was a decade before further legislation was introduced, despite the strong interest of many citizens. In 1967, the Legislature passed two bills that were important to this field. One was a section of the historic State Aid to Education bill, which provided special programs for both gifted children and culturally and educationally deprived children. The second bill enabled the state department to employ a consultant in special education.

Western Nebraska Vocational-Technical School. The federal government deeded to Nebraska a tract of land at Sidney known as the Sioux Army Depot, which contained approximately 1,000 acres with 111 buildings including 85 double apartments and equipment. In 1965, the Legislature established the Western Nebraska Vocational-Technical School on this tract, the acquisition value of which was nearly $750,000. The purpose was to offer post-high-school-level training in drafting, automotive technology, electricity and electronics technology, building construction technology, diesel and tractor mechanics, and airframe and power plant mechanics for the aircraft industry.

As of fiscal 1967-68, the enrollment was approximately 130, but it was anticipated that some 250 students would attend in 1968-69. It is estimated that this school can accommodate up to 2,000 students.

Vocational Rehabilitation. In March 1966, the Legislature established a vocational rehabilitation unit at Hastings State Hospital to rehabilitate individuals who might otherwise spend the rest of their lives in an institution. The unit began with 40 staff members, including some hospital personnel who were assigned to do vocational rehabilitation work under the administration and technical supervision of the state department's rehabilitation services division. Thus, the program was a cooperative effort between the division, the hospital, and the federal vocational rehabilitation administration, which provided matching funds for its operation.

The staff, multidisciplinary, consisted of both physicians and special personnel, such as a psychiatrist, psychologist, psychiatric social workers, a psychiatric nurse, a psychiatric technician, and an industrial therapist. Other positions included a coordinator of work preparation and a vocational instructor for the mentally ill. Housed in a modern four-story building within the hospital complex, the VRU accommodates 60 clients.

Also during 1966, another vocational rehabilitation unit was planned for the Norfolk State Hospital. Instead of being housed in one building, however, the 50 staff members were deployed throughout the institution, and clients remained in the various treatment units while undergoing rehabilitation. This decentralized type of VRU will provide a comparison with the centralized unit at Hastings. Perhaps it can be discovered what techniques and methods are best adapted to treating various types of mental disabilities.

Impact of Federal Funds

National Defense Education Act. Nebraska revised its plans for NDEA Title III funds in 1967 to add three new subject matter areas: the humanities, arts, and economics, and soon
after, industrial arts. In December 1967, it amended reimbursement procedures so that state-operated public schools, which had been prohibited from participating in Title III programs because of state agency administrative procedures, could now secure funds.

In May 1965, the Nebraska State Board of Education approved a new state plan for guidance, counseling, and testing under Title V of NDEA. The U.S. Office of Education approved it in July. This change made it possible for elementary schools as well as secondary schools to receive funds for approved guidance-counseling programs. During the 1965-66 school year, a state advisory committee adopted progress criteria to evaluate counselor preparation and the counselor-student ratio in determining the amount of reimbursement to which a school is entitled under the NDEA programs.

In July 1967, Congress made the greatest change in the National Defense Education Act since its inception. Title X funds, which had been available to state departments of education to assist in statistical reporting and data processing, were shifted to Title V of the Elementary and Secondary Education Act. Title III NDEA supervisory funds were also shifted to Title V of the ESEA. Remaining NDEA title programs were left intact, including the section of Title III allocating funds to local public school districts for strengthening specified subject matter areas and assisting local schools in acquiring equipment, materials, and minor remodeling necessary for educational programs.

Elementary and Secondary Education Act. Congress reaffirmed the nation's commitment to quality education for all of America's youth by revising and extending the program to June 30, 1970. In 1966, Title VI was added, authorizing a 4-year program for handicapped children, including those with multiple handicaps. It was also established in the U.S. Office of Education a National Advisory Committee on Handicapped Children and a Bureau for the Education and Training of the Handicapped. A Nebraska state plan was approved, effective October 1967, allowing the department to administer the Title VI program. Nebraska's 1968 allocation was set at $100,364.

Congress, in Title IV of the ESEA, named the Mid-Continent Regional Educational Laboratory (McREL) as one of 20 regional laboratories directed to take bold and imaginative steps to expedite application of educational research findings to solution of the nation's school problems. McREL, a nonprofit corporation, with more than 300 members representing public and private schools, colleges, and special institutions, primarily served major parts of Kansas, Missouri, Nebraska, and Oklahoma. However, due to a lack of appropriations, Nebraska's offices at Kearney, Omaha, Wayne, and Lincoln were closed in 1967. The state research projects in Omaha and the University of Nebraska continued to be administered by McREL's Kansas City regional headquarters.

Of special importance to Nebraska was an amendment to ESEA in 1967 that doubled the minimum allocation to state educational agencies for administering Title I programs. The state's allocation of $75,000 was now raised to $150,000.

One Title III revision by the Ninetieth Congress provided for state educational agencies to administer 75 percent of appropriated funds in fiscal 1969, with the U.S. Office of Education administering the remaining 25 percent. Previously, these funds had been administered solely by the USOE. In fiscal 1970, the states will assume administrative responsibility for all Title III funds except those necessary to complete projects begun in prior years.

Vocational Education. Great strides have been made in vocational education since the Vocational Education Act of 1963. By 1967, agricultural enrollment had increased 5.2 percent, distributive education 38 percent, health occupations 135.2 percent, home economics 4.5 percent, and technical education 61.7 percent. Secondary education expanded its vocational enrollment by 54 percent, post-secondary by 200 percent, and adult education by 12.1 percent. Comparing 1967 with 1966, new programs, such as diversified occupations, had increased 182.7 percent, office occupations by 50.1 percent, and special needs by 80 percent.

For the first time, it was possible for Nebraska to help local boards establish special needs programs for youngsters handicapped in various ways who could not benefit from regular programs of vocational education. This new program had developed training facilities in Nebraska schools for over 7,000 boys and girls. A home economics-related occupations program enables the schools to conduct vocational training for those preparing for gainful occupations involving knowledge and ability in the general area of home economics instead of just for work in the home.

Unfortunately, Nebraska's three newly developed area vocational-technical schools are not adequately financed from available federal money. It is now estimated that the need for additional federal funds for the 1968-69 school year will total between $1 and $2 million.

Special Education. Through continuing expansion, the State Department of Education has strengthened its special education program to serve the speech handicapped, acoustically handicapped, homebound physically handicapped, orthopedically handicapped, visually handicapped, educable mentally handicapped, and trainable mentally retarded.

During the 1965-67 school year, 8,914 handicapped children were served in 147 approved special education programs in 94 public school districts. Of these, 638 received speech and hearing diagnoses and psychological testing services under the direction of 338 teachers and therapists.
Conclusion

It has often been said that "the job makes the man." In Nebraska, the job has made the State Department of Education. From a small beginning, when the state superintendent's duties were performed by the territorial librarian (1855-59), the department has grown in service, size, and responsibility. There has been a spurt in recent years as a result of increased public interest in education and liberalized federal financial assistance.

Few, if any, of Nebraska's chief state school officers were content merely to perform the duties imposed on the office by law. The earlier ones were concerned with establishing schools and operating them, which in most cases involved applying and enforcing laws already on the statute. But their concern about the qualifications of the persons who served as teachers led to plans for teacher education and certification. They sought to lengthen school terms and to publish better courses of study for elementary schools. Their early interest in constructing schoolhouses, sites, equipment, apparatus, supplies, and textbooks later was extended to include adequate provisions for heating, ventilating, lighting, and sanitation.

Nearly all the state superintendents offered plans for improving school finance. They saw the inefficiency of thousands of small school districts and recommended consolidation into larger districts.

The state superintendents led in efforts to adjust school programs to meet changing needs, advocating improvement of instruction in the "basic" subjects, addition of vocational courses and fine arts subjects, and experiences relating to improving citizenship. They advocated free high school privileges, a teacher retirement system, strengthening of the State Department of Public Instruction (later the State Department of Education), increases in services to local school districts and officers, and improvement of state educational programs. Their public pronouncements and recommendations for new laws and amendments were reported in newspapers and magazines and appeared in their annual and biennial reports. Thus, the amount of progress in the state educational system was dependent in large measure on the leadership and public relations programs of the chief state school officers.

The development of state school administration in Nebraska has been affected by economic fluctuations and by the Legislature's attitude toward school programs. Fortunately, as the public became more interested, it has increased its demands upon the state department for expanded and improved educational services. Thus, the department today had taken on a stature it has never had before. But if it is to meet its new responsibilities effectively, the state must be willing to see that it is properly financed, adequately staffed, and not constrained by constitutional, statutory, and political limitations.

Throughout the period covered by this study, state appropriations for the support of the State Department of Education were minimal and in no case entirely adequate. The same is true of special aid funds distributed by the department to eligible schools.

Nebraska took one of its most important steps when it established a policy-making State Board of Education, which in turn appoints the state commissioner of education. This brings greater unity to the statewide program of education.

Today, the department's stature is indicated not simply by its many responsibilities, but by the appreciation so frequently expressed by teachers, administrators, and supervisors for its quality of work and tireless efforts to provide assistance. The department is giving leadership through long-range planning and professional guidance. This leadership has strengthened local programs of education. At the same time, the department has recognized that local educational freedom is of surpassing importance in our American system. Although federal funds have enabled the State Department of Education to do a much better job for Nebraska's children, the department believes that these funds should lose their identity at the time of appropriation and become subject to management expenditure by the state and local boards of education.

FOOTNOTES

2. Ibid., pp. 217-18.
9. A deputy was authorized in 1873, but his office was abolished 3 years later.
10. In 1905, the NSTA advocated (a) high standards for entrance into the teaching profession; (b) tenure for teachers; (c) creation of juvenile courts; (d) workable free high school attendance law; (e) child labor laws; (f) state aid for weak districts; (g) strengthening of the compulsory education laws; (h) increase in junior normal schools; (i) a library in every school district; (j) an emphasis on character education; (k) con-
solidation of schools; and (l) a general survey of the state's resources.

After 75 years as the Nebraska State Teachers Association, a World War II offensive to replace "Teachers" with "Education" was launched. In December 1942, the organization thereby changed its name to the Nebraska State Education Association, the name it is still known by today.

11. Six years later, when the Legislature rewrote the certification laws, it set up three classes of certificates but did not reduce the number of agencies permitted to issue them. Not until 1938 was teacher certification placed entirely in the hands of the State Department of Education.

18. The superintendent of public instruction had always served on this board. In 1941, the composition of the board was changed to include a member of the Board of Control, to be appointed by the Governor; two other persons appointed by the Governor; the dean of the University's College of Agriculture, and the superintendent of public instruction. Two years later, the Legislature named the Governor to the board as chairman, the state superintendent of public instruction as the executive secretary, and the presiding judge of the workmen's compensation court. In 1951, it was again changed to include the Governor, the superintendent of public instruction, the state treasurer (ex officio), and three additional persons to be appointed by the Governor—one in agriculture, another in industry, and a third representing skilled labor.

22. The list of teaching certificates now included third-grade elementary, general elementary, junior elementary, Nebraska elementary, rural elementary temporary, elementary temporary, elementary substitute, Nebraska secondary, secondary temporary, secondary substitute, Nebraska administrative and supervisory, and miscellaneous (including special music permits).

25. Of the 182 school districts abolished, 14 were Class II or Class III (K-12) districts, while 168 were Class I (K-8) districts.

**NOTE:**
A constitutional amendment, approved at the election of 1952, established a State Board of Education and a State Department of Education, with an appointive commissioner of education. The position of superintendent of public instruction was abolished upon the completion of the incumbent's term of office. From that time until the present, the commissioner of education has been appointed by the State Board of Education.

The State of Nevada

Nevada, with an area of 110,540 square miles, ranks seventh among the states in size. All of the New England states can be contained within its borders, Massachusetts and New Hampshire within Nye County in central Nevada, and Connecticut within Washoe County, whose county seat is Reno. This great expanse, now populated by approximately four persons per square mile, had but one person per square mile as late as 1930. About two-thirds of the entire population live in Washoe and Clark Counties, represented by 14 of Nevada's 20 state Senators. Vast areas of the state remain uninhabited.

One writer aptly sums up the setting for education in the state:

About 85 percent of the land is in the public domain; that is, it is still controlled by the federal government and not owned by private individuals. It serves the miner, the livestock owner, the sportsman, or the tourist at times, but most of it is of little use for the general public.

Although much of Nevada is a “desert waste,” the history of the state is a living example that the unwanted land of one era may be most valuable to a later age. Much of our story will be related to the fact that men have been able to extract valuable minerals from the Nevada mountains, making important contributions to the commerce and technology of modern society. The desert has many important advantages and possibilities as a playground and recreation center in a country where open space is becoming more difficult to find. Besides, our Nevada desert is becoming an important world laboratory in man’s quest to reach the stars: It provided the nuclear rocket-testing grounds in the southern part of the state.

Much of Nevada history, then, shows Nevada’s desert is not really a “waste land” but a challenge and opportunity for civilized man (1).

The early history of Nevada is for the most part an account of its mining towns, such as Virginia City, Gold Hill, Austin, Aurora, Hamilton, Pioche, and later Tonopah and Goldfield. Fortunes were made quickly in these towns, which too often evaporated into “ghost” communities of empty, deteriorating buildings. The state’s recent history includes the development of agriculture, its ranges, industry, education, and tourism, as well as its mining.

But Nevada is still truly the land of “the sage and the pine.” While much of the state is occupied by sagebrush, better grades of pine are found along the western slopes. There are numerous rivers with fertile valleys, beautiful lakes, superhighways, fine churches, and excellent schools.

Statehood, 1864

Mormons, interested in the agricultural potentialities, were the first to establish a settlement in what became the Nevada Territory. In 1854, Brigham Young sent his people into the Carson, Walker, Washoe, and Truckee Valleys, where they built farming communities modeled on those that had proved successful in the Salt Lake region. Three years later, a Mormon colony was started in Las Vegas, but trouble with the U.S. government caused Young to pull his settlers back into Utah.

Prospectors and other farmers began to trickle into the Nevada country, but it was the discovery of the Comstock Lode in 1859 that brought a horde of miners into what was then a county of Utah. These were followed by saloon keepers, dance hall operators, gamblers, gunfighters, lawyers, capitalists, and men who were more interested in making money by selling to the new settlers than in mining. By 1860, while still a part of the Utah Territory, Nevada had a population of 6,857.

Nevada had little law and no effective government for its first few years, and claims were jumped and counterjumped. During most of the mining period, the people were dependent on California for foodstuffs and other supplies, and Nevada was little more than a colony of California.

Despite the isolation and small population, the Nevadans frequently petitioned Congress for territorial status separate from Utah or suggested that California
extend its dominion over them. A few farsighted citizens attempted to establish local governments, but they found little popular support. It was the approaching Civil War that forced Congress to accede to Nevada’s request for independent territorial status. On March 2, 1861, two days before retiring from the presidency, James Buchanan signed the Organic Act creating Nevada as an independent territory.

As the Lincoln Administration took the reins of office, several congressional leaders were already suggesting statehood for the Nevada Territory. Gold and silver were needed to raise and equip federal troops, and pro-Union votes were badly needed in both the Senate and House of Representatives. Congress approved the first Enabling Act for statehood, but the territorial voters rejected the proposed constitution. In February 1864, another Enabling Act passed, and this time the new State Constitution was approved. The Territorial Legislature sent a certification of Nevada’s loyalty, the first message sent over the Western Union Telegraph Company’s new transcontinental wire, and President Lincoln proclaimed Nevada’s statehood on October 31, 1864.

Nevada’s swift progress to statehood in large measure resulted from pressure to get additional congressmen who could be counted on to vote for the Thirteenth Amendment, which excluded slavery from the United States and any place in its jurisdiction. The proposal had been defeated in the House the previous June. On February 1, 1865, the day Nevada’s two Senators and one Representative were sworn in, the Thirty-Third Congress officially proposed this amendment to the Legislatures of the states.

By 1870, 6 years after statehood, Nevada’s population had risen to 42,491. As in most other mining states, population fluctuated, depending on the discoveries both in the state and in other mining areas. In 1900, the census showed 42,335 people in the state—slightly fewer than 30 years earlier.

Establishing a State School System

The constitution adopted by Nevada in 1864 did not actually provide for a State Department of Education, but it did state that the people would elect a superintendent of public instruction for a 2-year term beginning the first Monday in January 1865. The members of the constitutional convention recognized the importance of education and included a provision for—

A uniform system of common schools, by which a school shall be established and maintained in each school district for at least six months in every year ... [and] in addition to other means provided for the support and maintenance of the university and common schools, the Legislature shall provide for their support and maintenance by direct legislative appropriation from the general fund ... (2).

Three other sections of the State Constitution specifically stated that no sectarian instruction should be tolerated in any school or university established under the constitution.

In 1865, during its first session, the Legislature enacted a law establishing a State Board of Education composed of the Governor, the state superintendent of public instruction, and the surveyor general as ex officio members (3). These officials were responsible for investing the state school fund, later known as the state permanent school fund, and adopting all textbooks for school use (4). The board exercised its power to adopt textbooks until the Legislature created a State Textbook Commission in 1907. As members of the State Board of Education comprised a majority of the new commission, the board still had final control over the adoption of all textbooks and supplementary books used in the state (5).

Until 1885, county boards of examiners handled practically all teacher certification in Nevada. As in most states, these examinations covered the elementary school subjects for first-, second-, and third-grade certificates. The county boards certified teachers in each of the counties, which meant that a teacher could be certified for one county but not for another. The 1885 Legislature stated that it was the duty of the State Board of Education—

To adopt a uniform system of rules for the State and County examinations; to grant, first, life diplomas, second, State Educational Diplomas, valid for six years, and all other types of elementary and high school certificates; also, certificates to graduates of Nevada State Normal School; to revoke any State Diploma or State or County Certificate (6).

In 1893, the state board was empowered to prepare teacher examinations for all the counties in Nevada, and in 1907, it became the sole teacher-certificating agency in the state. It adopted the courses of study, approved the books for public school libraries, and invested the state school fund. The board also appointed and removed the state deputy superintendents under the reorganization that occurred in 1907. But the minutes of the state board show that teacher certification continued to be the major theme of its meetings and one of its main functions up to 1966. The board at first considered each individual application for certification separately, but by 1965, it had become a matter of approving the recommendations of the state superintendent of public instruction.

Of the first four state superintendents, three—A. F. White, A. N. Fischer, and S. F. Kelley—were clergymen; but D. R. Sessions, who had resigned from the presidency of the University of Nevada (located at that time in Elko), was a professional educator (7). The terms of service for all of these men were marked by attempts to strengthen the authority of the office, to correct organization problems within the state, and to change through legislative action
the method of distributing state funds to the several school districts. Superintendent Fischer, in his biennial report for 1868-70, first recommended a change in the method of the distribution of state school funds, stating that a pro-rata plan of apportionment was unfair to the small school districts.

Despite three such biennial recommendations from Fischer, the apportionment of state school funds on the basis of school population continued until 1877. The administrative problems centered largely on the inability of county school superintendents, often ill-equipped for their responsibilities, to fulfill the statutory requirements of making meaningful reports to the state superintendents. They were required also, according to the Statutes of Nevada, 1864-65, to make quarterly apportionments with public school moneys from the county treasury among the various school districts in proportion to the number of white children between the ages of 6 and 18 years; to visit each school in the county at least once each year; to distribute all blanks, forms, and copies of the school laws furnished by the state superintendent to school district trustees; to conduct teachers institutes annually at a cost not to exceed the sum of $100; to file reports from boards of school trustees, teachers, and census marshals; to fill vacancies of school trustees in school districts within the county; to draw warrants on the county treasurer for the purchase of textbooks for indigent children; to subscribe for school journals for each teacher and each member of the various boards and school trustees; and to give such aid as might be desirable to boards of school trustees, teachers, and school census marshals.

The state superintendent was faced with not only an inequitable distribution of available funds, but also an inadequate tax base. The state school tax was 5¢ on each $100 of taxable valuation, and remedial legislation was years late. The inequities among the counties are well illustrated in the biennial report of 1884 by C. S. Young in which he raises some interesting questions.

Why is it that some of Nevada's offspring, with a scanty three months in school, must struggle to obtain from a cheaply paid teacher the elements of a primary education, while others can, for ten months annually, under the tuition of normal school and college graduates, enjoy the privileges of the grammar school and the high school? . . . Is there any rational explanation of the fact that while Storey County has an average of ten months of school, White Pine County has an average of four and one half months? . . . Have we a state system at all or is it not rather a county or district system? (8)

Yet, by the time Young had ended his tenure in 1886, he discerned a more favorable attitude toward the Office of State Superintendent of Public Instruction. He wrote:

The duties of the executive state officer are more arduous than is generally supposed. His service is appreciated by but few. However, within the past two or three years this office evidently has been growing in favor with the people. Whereas a few years ago there was a general newspaper attack upon the office, it being charged that the office was useless and should be abolished, more recently it has received no words of censure from any source, but rather words of encouragement and commendation (9).

W. C. Dovey, elected in 1886, traveled 20,000 miles and made 250 visits to schools (at a cost to the state of $763) during the first year of his administration. His successor, Orvis Ring, elected in 1890, produced Nevada's first state course of study 3 years later. Despite its brevity, Superintendent H. C. Cutting, who served from 1895 to 1898, reported that this outline for each grade filled a great need in the schools.

The 1864-65 Legislature provided for county superintendents to be elected for 2 years. The county commissioners fixed the salaries of these officials with the proviso that such salary would be "at least sufficient to pay all necessary traveling expenses incurred by him in the performance of his duties" (10). The Legislature evidently did not consider visiting schools, apportioning public school moneys, and reporting to the state superintendent as professional, because the annual salaries of these county superintendents ranged from only $393 in 1868 to $449 in 1872. In 1879, the Legislature fixed the salaries to be paid at a minimum of $75 per year in Lincoln County and a maximum of $900 in rich Storey County, the home of Virginia City.

All of the early state superintendents, and especially Sessions and Young, felt keenly that the legal specifications of duties of the office prevented the exercise of genuine professional leadership. Office routine, clerical work, and other minutiae prevented the full exercise of the office in the best sense of the word. Both of these men made strenuous efforts to increase the strength of the office. In his 1882 report to the Legislature, Sessions insisted that—

As long as the State Office of Superintendent of Public Instruction is continued in existence, it should be vitalized. The incumbent should be vested with some authority at the present; officially, he is a man of straw. The most conspicuous thing that he has to do is to visit schools (11).

State Superintendent C. S. Young likewise felt that the office should have greater executive power. Despite Young's failure to persuade the Legislature to remove the limitations of the office, he felt toward the end of his term, as we have seen, that the stature and favor of the office had advanced in the eyes of the public and the press.

A precedent was established in 1883 when the county clerk of Washoe County was named the ex officio county
superintendent of schools. In an economy move 4 years later, the legislators designated Nevada's district attorneys ex officio county superintendents beginning January 1, 1889. Ben Curler and Patrick McCarran, one to become a Reno district judge and the other a U.S. Senator, were serving as district attorneys, and they pointed out that since no additional salary was provided, they generally did not relish the extra work. Their wives helped collect statistics, but little else was accomplished (12). As a result, during the years from 1887 to 1907, when the district attorneys were responsible for the county school administration, very little was done for the schools.

Up to the year 1907, then, the state was laboring to develop a satisfactory system of public education under almost insuperable handicaps. A series of able state superintendents of public instruction operated with little real authority. The county superintendents, elected officials, and the multitude of county and district school board members constituted a capricious and politically oriented power structure that, in effect, placed the development of education in Nevada in the hands of those characterized by C. S. Young, in an address to the Nevada State Teachers Institute in Virginia City, December 29, 1884, as—

Merchants, and miners, and butchers and ranchers... though too illiterate to read or write his own name... yet such a man may attain the office of greater power in our educational system... In our temple of learning there may sit enthroned accepted ignorance, before whom intelligence must bow in abject humiliation (13).

Despite pointed comments and astute political maneuvering by many of the able men who occupied the position of state superintendent of public instruction, and despite the almost general recognition of the futility of the district system by able educators, it remained entrenched in the state. Any suggestion to abolish it aroused cries of outrage from those who benefited from it the most. It was not until 1906 that the winds of change blew hard enough to shake the structure.

**THE PERIOD FROM 1907 TO 1931**

The Reorganization Act of 1907

Legislation enacted in 1907 ushered in a new era of public education in Nevada. This legislation effected a general reorganization of the school system resulting in a real plan of supervision. The Reorganization Act of 1907 was the culmination of over 20 years of discussion and agitation on the part of school officials who realized the need for more efficient school administration. Among these officers, Superintendents W. C. Dovey (14), Orvis Ring (15), and H. C. Cutting (16), many of whose early recommendations were written into law, should be credited with outstanding work. Romanzo Adams, professor of education and sociology at the University of Nevada, formulated the final plan of reorganization. Together with State Superintendent Orvis Ring, he ably led the movement which resulted in the adoption of the reorganization plan by the Nevada Education Association in 1906. After the widest possible publicity, a bill incorporating the provisions of the plan was presented to the Legislature and passed in March 1907.

The plan that evolved located state deputies at Elko, to supervise Elko County; at Eureka, to supervise Lander, Eureka, and White Pine Counties; at Winnemucca, to supervise Humboldt and Churchill Counties; in Reno, to supervise Douglas, Esmeralda, Lyon, Ormsby, Storey, and Washoe Counties; and at Tonopah to supervise Nye and Lincoln Counties. Three additional counties were established after 1907 (17). With the approval of the state board, the superintendent conferred upon the deputies the power and authority to act in his name, and in reality they were representatives of the state superintendent, serving as intermediary officers between the local schools and the state department at Carson City. Since the district attorneys, who had acted as county superintendents from 1889 to 1907, considered any work connected with the public schools secondary to their main duties, the 1907 act specifically stipulated that the deputies would devote full time to their positions.

The deputies had many and varied duties: to visit each school in their educational districts at least twice each year; to advise teachers about organization, management, and teaching methods; to inspect school buildings and equipment; to examine the records and observe the work of each school; to confer with school trustees; to hold teachers meetings; to act as deputy examiners at teachers examinations; and to report in writing regularly to the state superintendent. These reports comprise an interesting portion of the history of Nevada education. The law definitely specified that to hold this office the deputy must hold a Nevada teacher certificate of high school grade and have not fewer than 45 months of successful teaching experience, including 9 in Nevada.

**Other Changes Under 1907 Reorganization Act**

The Reorganization Act of 1907 created for the first time a commission authorized to adopt both elementary and secondary textbooks. Prior to this, the State Board of Education had this responsibility, but in actual operation local school principals, teachers, and superintendents always selected the high school textbooks. The Textbook Commission consisted of the State Board of Education, plus five additional members, one from each of the five educational supervision districts. All of these appointed members were required to be elementary school employees.

The Reorganization Act also added to the state superintendent's duties. Since 1864, he had been responsible for reporting annually to the Governor, visiting each county at least once per year, convening a state teachers
institute annually, prescribing and preparing for school registers, and apportioning school moneys to the counties (18). He was now responsible for apportioning state aid, calling county teachers institutes when necessary, convening state teachers institutes biennially in the even-numbered years and district teachers institutes in odd-numbered years, and appointing school trustees where districts failed to elect. He also was required to nominate deputies for appointment by the state board and perform such other duties as might be prescribed by law (19).

Superintendent Ring died in 1910, and John Edwards Bray, appointed to fill his term, stayed in office until 1919. Bray urged the Legislature to compel school districts to levy a tax for the schools, but this was not to come until 1955. It was during his administration that Congress passed the Smith-Hughes Act early in 1917. This act called for the Governor to appoint a State Board of Vocational Education until legislative provisions could be made for it. The appointees were Superintendent Bray, the state director and supervisor of agriculture education, the supervisor of home economics education, and the supervisor of trades and industries.

Vocational Education

As early as 1910, vocational education received attention from the State Department of Education. For example, the Nevada high school course of study for the year 1910 outlined a complete agricultural curriculum. The state superintendent’s 1909-10 report contained many references to course work in industrial training and domestic science in the high schools. Thus, it is not surprising that, when the Smith-Hughes Act passed, Nevada became one of the first states to accept its benefits by its Legislature’s passing an act accepting its benefits within a few weeks. The Nevada law stated--

That the State of Nevada does hereby accept the benefits of an act passed by the Senate and House of Representatives of the United States of America in Congress assembled entitled “An Act to provide for the promotion of vocational education; to provide for cooperation with the states in the promotion of such education in agriculture and the trades and industries; to provide for cooperation with the states in the preparation of teachers of vocational subjects; and to appropriate money and regulate its expenditure,” approved February 17, 1917, and will observe and comply with all the requirements of said act (20).

In the same act, the Legislature designated the State Board of Education as the board for administering the act. It also appropriated $30,000 for the 1917-19 biennium as its share of the matching funds.

In 1923, the Legislature passed an act requiring the State Board of Vocational Education to be comprised of the three members of the State Board of Education, plus two appointed members. Four years later, another law made the state superintendent of public instruction the state director of vocational education.

THE THIRTIES TO THE PRESENT

In 1931, the Legislature altered the membership of the State Board of Education to include the Governor, the state superintendent of public instruction, and one elected representative from each of the five educational supervision districts. The president of the University of Nevada no longer was a member. At the same time, the Legislature authorized the position of secretary of the bureau of certification and added the public school teachers retirement-salary fund board to the state department. It expanded the State Board of Vocational Education to consist of the seven-member State Board of Education, plus one representative each from labor and agriculture, to make a total of nine. A director of vocational rehabilitation and a “local supervisor” to supervise industrial education in the White Pine County area were added to the vocational education staff.

State Superintendent Mildred Bray placed the schools of Nevada on a wartime footing soon after World War II began in December 1941 (21). During the war period, the schools became involved in the “Defense Stamp and Bond” campaign, the organization of students as officers in fire-alarm or air-raid drills, and the sacrifice of social activities to allow pupils and teachers to invest in government securities. There were wartime concerns in connection with most school functions and new problems for all schools.

The impact of the war on Nevada centered around the revival of mining, the establishment of air bases and radar facilities, and the expansion of training and testing facilities already in existence. The influx of service personnel and their families led to the anticipation of a serious teacher shortage. This problem was solved in part through the issuance of war emergency certificates, which permitted teachers who were otherwise qualified but who lacked recent professional training to reenter the teaching profession. Subsequent wartime bulletins from the state superintendent reflected the drain in national manpower on the schools and lesser problems such as tire and gasoline procurement for school transportation and the impact of the gasoline shortage on athletics.

Once the trying and harrowing period of World War II was over, the schools faced the almost equally difficult days of transition.

The state superintendents’ reports from 1932 to 1950 show no major changes occurring in the state department, but a period of great progress began when Glenn A. Duncan, one of Nevada’s great chief school executives, took...
office in January 1951. By the end of 1952, the department could list the following additions: a certification bureau, a retirement clerk and statistician, a supervisor of Indian education, a state supervisor of the school lunch program, a supervisor of occupational information and guidance services, and a state director and counselor of vocational rehabilitation. During the next biennium, the department added a supervisor of distributive and business education, a medical consultant to the vocational rehabilitation staff, and a supervisor for OASE disability determination.

More important than the department's expansion, the state superintendent was able to provide for a survey of Nevada public schools. In answer to suggestions from school administrators from many sections of the state, and upon State Superintendent Glenn Duncan's request, Governor Charles Russell, in the summer of 1953, appointed 28 prominent Nevada citizens representing all geographical areas of the state to a State School Committee. The group met at Carson City on November 5, 1953, and was given two specific responsibilities by the Governor: first, to investigate the financial conditions of schools throughout the state and, upon the basis of such investigation, recommend as to whether a special session of the Legislature was necessary; second, to carry on a survey of school conditions during 1954 and report the results of their survey at the 1955 session of the Legislature.

The committee represented many fields of industry and professional life of Nevada. At the first meeting, M. E. Lundberg of Elko, a prominent citizen of Nevada, was made chairman. Subcommittees were appointed to direct immediate investigations, and a second meeting of the entire committee was called for December 18. At this meeting, a resolution was presented calling for a special session of the Legislature to consider urgent school needs.

The Legislature met in special session in the spring of 1954 and authorized the Governor to appoint a fact-finding committee and provided for the appropriation of $30,000 from the state general fund for that purpose. Upon the recommendation of Superintendent Duncan, the Governor's School Committee assigned that responsibility to the George Peabody College for Teachers of Nashville, Tennessee. At the same time, the Legislature of 1954 indicated that a written report of the results of the investigation should be made to the Governor not later than January 15, 1955. During the period from March to December of 1954, a survey team moved into the state with 11 members headed by W. D. McClurkin, director of the Division of Survey and Field Services, George Peabody College. Among those who came to Nevada on this survey team were D. Harold Benjamin, then chairman of the Division of Social Foundations of Education, and Henry Harap, associate director of the Division of Surveys, both of George Peabody, and Charles Bursch, assistant division chief, School Planning, of the California State Department of Education.

The survey staff started its work in March 1954, visiting an extensive number of schools before the end of the school year. On the basis of observations in the schools, numerous conferences with parents, teachers, and other citizens, and analysis of school records and questionnaires, the survey team was able to make recommendations late in the fall of 1954. These recommendations went to the State School Committee. The Peabody survey report under the title, Public Education in Nevada, was adopted by the Governor's committee with minor alterations. Since there were on the committee representatives of industrial concerns, such as the Kennecott Copper Company, it was not surprising that its report paid close attention to financial aspects. A feature of the report which the Governor's committee especially favored was that whereas in the past there had been several superintendents of schools in a county, there would henceforth be but one.

It was immediately evident that the Peabody report, calling for basic foundation funds, would demand additional expenditures. Something like an additional $4 million in funds per year would be necessary. The state sought new sources of income and settled on the introduction of a sales tax.

The Sales Tax

For several years prior to 1955, school administrators requested legislation that would provide additional funds from the state treasury. Repeatedly, the legislators assured them that they would be happy to provide additional funds for schools if there were any available. In response to such answers, the school administrators presented to legislative committees figures to show what a 1¢ gross sales tax would realize and what a 2¢ tax would realize. It was estimated before the bill was passed that assessment of a 2¢ sales tax would provide approximately $6 million in revenue. When a 2¢ sales tax was passed, many Nevada voters favored the bill thinking that it was earmarked for public schools. Such was not the case. (Later, in 1963, when there was an effort to pass a 3¢ sales tax in Nevada, by referendum vote, many of those who previously voted for the 2¢ tax voted against and defeated the passage of the 3¢ measure, feeling that they had been misled previously.) The sales tax, however, became effective July 1, 1955, and provided about $7 million in the first year of its operation.

Many voters in the state disliked the idea of the sales tax. This sentiment was particularly noticeable in the southern part of the state, where a petition was presented to put the 2¢ sales tax up for a referendum vote in the fall of 1956. State Superintendent Duncan urged defeat of the referendum to repeal the 2¢ sales tax, as unless the schools got additional funds, the operation of the formula recommended by the Peabody survey team would be impossible. The referendum calling for its repeal did fail, and the 2¢ sales tax remained on the books.
Basically, the Peabody formula for financing education, as passed in 1955, was as follows: State minimum requirements would be calculated by multiplying the average daily attendance of pupils in grades 1 through 12 by $80, kindergarten pupils in average daily attendance by $40, the number of certified teachers employed by $4,000, and adding the results. From this figure a 70¢ tax on the county's assessed valuation would be subtracted. The remainder would constitute the state's contribution. Changes in the per-pupil and per-teacher allotments from 1955 to 1966 greatly increased the state appropriation.

In the school year 1966-67, the last year of state distribution of school funds under the Peabody formula, the law provided that the state minimum requirements should consist of the sum of the following: the number of elementary and secondary school pupils in average daily attendance multiplied by $100, the number of kindergarten pupils in average daily attendance multiplied by $50, the number of handicapped pupils in average daily attendance multiplied by $500, the number of teacher entitlements multiplied by $5,100, and one-half the cost of transportation.

Other Results of the Peabody Survey

The Peabody survey provided not only for a new method of distributing state funds, but also for far-reaching changes in state school administration. After 5 years of "local" school districts, when as many as six kinds of districts were recognized by law and allowed to organize with five resident children and to exist with but three, Nevada was now to have 17 countywide school districts, each with its own administrative unit. This eliminated from 175 to 200 "local" school districts. The law stipulating that county superintendents be appointed by county boards of school trustees greatly simplified Nevada school administration by making countywide school districts directly responsible to the state department and eliminating intermediate school officials in Nevada.

The 1955 reorganization also streamlined the State Board of Education and the State Board of Vocational Education along lines recommended by the Peabody team: that each consist of identical membership, six lay members elected from the six educational supervision districts and one representative each from agriculture and labor, both selected by the six selected members. This is the composition of today's State Board of Education. In 1967, the state board again assumed final authority in selecting textbooks for the schools. Thus, with the power to determine who should teach and what should be taught, the state board is the most important educational agency in Nevada.

Under previous laws, there could be a superintendent of the county or district high school when there were 10 teachers employed, and an elementary school superintendent with a like number of teachers. Two entirely different philosophies of education might exist in the same geographical area, one pertaining to the secondary school and one to the elementary. Similarly, secondary and elementary education were financed by entirely different methods. Henceforth, there would be but one Board of Education, one superintendent of schools in an entire Nevada county, and one method of financing education.

Vocational Education

The state continued to increase its expenditures for vocational education (see Appendix C, Table 1, column 3). Expenditures increased from $33,150.99 in 1920 to $654,397.33 in 1965. The directory for the Department of Education in 1966 shows the State Vocational-Technical Advisory Committee consisting of nine members, and the State Vocational-Technical and Adult Education Division consisting of 16 members. At present, state and local sources are providing about $3 for every $1 received from the federal government for this program. In 1967, the Legislature transferred the Vocational Rehabilitation Division from the State Department of Education to the Department of Health and Welfare, now designated as the new Department of Health, Welfare, and Rehabilitation.

Other Important Changes

Prior to the administration of Glenn Duncan, there had been periodic efforts made to amend the Nevada constitution to allow the position of state superintendent of public instruction to be appointive rather than elective. Duncan, although an elected superintendent himself, continued to urge this change. It was, ironically, in the November 1956 election, 6 months after Duncan's untimely death, that the proposed amendment passed. Governor Charles H. Russell appointed Byron F. Stetler, Elko County superintendent, to serve until the next general election. In this election, which was the same one in which the constitutional amendment was passed making the office appointive, Stetler stood for election and was successful. He served as an elected superintendent until the State Board of Education, designated by the Legislature as the agency to appoint the state superintendent under the new constitutional amendment, selected him to continue in office on December 19, 1958. He thus became the first appointed state superintendent in Nevada's history.

One of the most interesting and curious changes brought about by the School Code of 1956 was the legal recognition of the Nevada State Department of Education. The document begins: "A State Department of Education is hereby created" (22). Over a period of years, as the state superintendent had developed and as various supervisors and deputies had been added to the department, the agency had grown out of necessity but with no legal basis.
There had been frequent references to the "State Department" in the statutes, in issues of the Nevada Education Bulletin, and in other state documents, but the department had indeed existed without legal status. In the narrowest sense, the history of the State Department of Education as a legal entity begins in 1956.

1959 Legislation

The county school authorities, school trustees, school administrators, and the deputy school superintendents themselves all felt that the deputy superintendents should be eliminated as supervisors of public instruction in the schools throughout the state (23). Consequently, the 1959 Legislature amended the law so that deputies might be located where the state superintendent and State Board of Education desired and that their functions henceforth would be primarily of a statewide nature, such as certification, administration, federal subsidies, transportation, and driver training. The new law provided that there would be only as many deputies as the state superintendent and the state board thought necessary and that these would be located where the state superintendent recommended. At present, all except one, an "area administrator" for the southern part of the state, stationed at Las Vegas, are located at the state capitol in Carson City. Since both county and state school administrators sanctioned the change, the new legislation encountered little resistance in the Legislature.

THE PRESENT STATUS

The Nevada Plan of Distributing State Funds

Despite the fact that there was not much opposition to the Peabody formula by the Nevada school administrators, a bill was presented to the 1967 Legislature which would alter considerably the method of distributing state school funds. Known as the Nevada Plan, it would require an additional 1½ sales tax collected by the state to be returned to the counties in the same amount as collected from each county. Needless to say, whereas large sums of money were previously supplied from the state general fund to support the schools, now the county would be responsible for contributing much more than under the Peabody formula. Because many voters felt that the 3½ sales tax was unconstitutional, the Nevada Supreme Court acted on its constitutionality soon after its passage in 1967; it declared it constitutional. Without the additional 1½ sales tax, the new Nevada Plan would have been completely inoperative.

The Nevada Plan as passed provides basically as follows: To find state minimum requirements for a county school system, the weighted average daily attendance of pupils in grades K-12 is multiplied by "the average cost per child in the county. To determine "local funds available" these figures are added: proceeds of a 70¢ countywide tax on assessed valuations, 25 percent of funds from Public Law 874 (the federal act providing funds for impacted areas), and proceeds of a 1½ local (sales) school tax. From the figure attained by finding state minimum requirements the amount of "local funds available" is subtracted. The result represents the state's appropriation to a county's school fund.

The success of the Nevada Plan is yet to be determined. However, Lyon, White Pine, and Lincoln Counties, hit by strikes of miners that caused a decrease in school enrollment, have voiced opposition to a plan which distributes state aid solely on a per-pupil basis.

Recent Reorganization

In 1966, the State Board of Education contracted Thomas T. Tucker, Jr., chairman of the Department of School Administration, and J. Clark Davis, professor of education and administration, both of the University of Nevada, to make a study of the state department which might ultimately result in a new organization. In December 1966, the new organizational pattern of the Nevada State Department of Education was presented to the State Board of Education (24). As expressed in the proposals, the philosophy of the reorganization plan was that form should follow function. The plan dealt in the main with questions pertaining to (a) legislative enactments necessary to implement the recommendations; (b) recommendations concerning the type and number of consultants that the department should provide to service the various public school districts; (c) recommendations concerning the phasing-in of the proposed organization chart for administering the State Department of Education; and (d) the development of educational facilities for a new State Department of Education.

In respect to item (a), the consultants recommended that new legislation be drafted to the effect that the State Department of Education would be declared by law an educational institution with legislative autonomy of operation under the State Board of Education similar to that enjoyed by the University Board of Regents. In respect to item (b), after developing instruments to gain information from superintendents of the county school districts concerning many phases of state school administration, such as federal programs, special education, and adult education, the consultants recommended that the state board cause the state department to differentiate between the type and quality of services to be provided to the heavily populated counties, Clark and Washoe, as contrasted with the type and quality of services to be provided to the remainder of the 14 less populated counties. The consultants further recommended that the State Department of Education change from the practice of staffing with subject matter specialists to a plan whereby personnel would possess "area qualifications," i.e., elementary curriculum, secondary curriculum, etc. It also recommended that the state department employ, as soon as practical, specialists for the
following areas: elementary education, secondary education, vocational-technical adult education, central services, and school administration.

In respect to item (e), in which recommendations were made for the phasing-in of the new organizational chart, the committee urged the establishment of the following positions: deputy superintendent and coordinator of divisions; associate superintendent of the operations division; associate superintendents of educational services; associate superintendent of administrative services; and administrative assistant to the state superintendent of public instruction (office to be established in Clark County).

In respect to item (d), pertaining to facility planning for the state department, the consultants recommended that the new facility be designed primarily for utility, but that the design evolve aesthetically from the architect's solution to the needs of the state department. The Department of School Administration of the University proposed these and many other recommendations of a similar nature. The state board has approved the proposals and is now taking measures to implement the organizational plan. It will probably take several years, perhaps 5, for proper adjustment to the organizational proposals.

The chart in Appendix B shows the approximate divisions with the functions and responsibilities to fall under each division. This is essentially the Tucker-Davis Plan.

State Distributive School Fund

In conclusion, some further comment is in order on the state department's participation in public school finance. Throughout its history, the state government of Nevada, in comparison with many states, has contributed generously to public school support. Never in its history has the state government through the State Department of Education failed to provide a sizable fraction of total public school budgets. In addition to federal funds, for instance, apportionments for vocational education have been made from the state distribution school fund, the main source of which is the state general fund.

Table 2 in Appendix C reveals the growth in this fund. Prior to 1947, when a law was passed providing for state support of high schools, only small amounts had been allotted for this purpose. The figures for 1961 and 1966 include not only the increases necessary to meet Nevada's great growth in population, but also the increases necessary to meet the legal requirements of teacher and pupil apportionments under the Peabody formula.

SUMMARY

Nevada has made progress since 1864 in public school education. Throughout its history the state has always supplied funds for elementary schools and since 1947 for high schools. Under the Peabody formula, in effect from July 1, 1956, to July 1, 1967, the state has contributed annually more than 30 percent of the total public school budgets. The county government, before and since 1956, when all "local" district schools were consolidated into 17 county school districts, has been a main source of school support. Prior to 1956, local school districts contributed but a small fraction of the total of public school budgets, and prior to 1906 no school district had derived as much as 10 percent of its support from this source. As late as 1912, Superintendent John Edwards Bray complained that "approximately three-fourths of the districts in the State have never raised any money locally for the support of their schools..." (25).

In the school year 1927-28, fewer than 40 percent of the school districts levied a local tax. In 1955-56, the year before the adoption of the Peabody report, calling for countywide school districts, no local school district might levy more than a 25¢ tax (on $100 of assessed valuation) for school purposes, and district taxes accounted for less than 20 percent of total operating funds for elementary and high school education.

The adoption of countywide school districts has at least lessened greatly the disparities in educational opportunities among the schools within a county, and a state school system financed mainly by state and county support has tended in Nevada to equalize opportunities throughout the state. Under the Nevada Plan of 1967, where a 1¢ sales tax is part of the county's contribution to school support, the county will now contribute vastly more than the state to school operations.

FOOTNOTES

3. See Appendix E for the membership of the State Board of Education for different periods.
4. The board's participation in the investment of the state school fund is described in the minutes of the State Board of Education, found in the Office of the State Superintendent of Education, Carson City. For instance, the entry for January 11, 1879, reads: "The state board met in extra session to instruct the State Treasurer to reinvest the amount of the Nevada State School Fund." The State Board of Education continued to perform this duty until 1919, when the Legislature turned it over to the State Board of Finance.

Appendix D

DUTIES AND POWERS OF STATE SUPERINTENDENT OF PUBLIC INSTRUCTION

The Statutes of 1864—65 list five:

1. To make annual report to Governor
2. To visit each county once a year
3. To convene a state teachers institute annually
4. To prescribe, prepare, and distribute forms and school registers
5. To apportion school moneys to counties.

The Statutes of 1907 list ten:

1. To visit each county
2. To apportion state aid
3. To apportion county aid
4. To report to the Governor biennially
5. To prescribe rules and regulations for making reports and keeping the school register
6. To convene state teachers institutes biennially in even-numbered years and district teachers institutes in odd-numbered years
7. To call county teachers institutes when necessary
8. To appoint school trustees
9. To nominate deputies
10. To perform other duties relative to the public schools.

The School Code of 1935 lists eight:

1. To visit each county in the state at least once a year
2. To apportion the state distributive school fund
3. To apportion the county school funds
4. To report to the Governor biennially
5. To prescribe rules and regulations for making reports
6. To convene state teachers institutes biennially in even-numbered years
7. To call county teachers institutes
8. To perform other duties relative to public schools.

The School Code of 1947 lists the following:

1. To visit each county at least once a year
2. To apportion the state distributive school fund
3. To apportion the county school fund
4. To report to the Governor biennially
5. To prescribe rules and regulations
6. To convene a state teachers conference and five district teachers conferences
7. To perform other duties relative to the public schools
8. To prepare and supply printed materials to school trustees and teachers
9. To act on appeals
10. To be a member and secretary of the State Textbook Commission
11. To fill vacancies in school boards in accordance with law.

The 1965 Code, in its opening sentences, reads as follows:

As executive head of the State Department of Education, the superintendent of public instruction shall perform duties prescribed by law and also—

(a) Execute, direct, and supervise all administrative and technical activities of the department in accord with the policies prescribed by the State Board of Education;

(b) Employ such personnel as are approved by the State Board of Education and as are necessary for efficient operation of the department;

(c) Be responsible for maintaining liaison and coordinating activities with other state agencies exercising educational functions.

In addition to these more general statements, the Code also lists the following:

1) Execute, direct, and supervise all administrative and technical activities of the department
2) Employ such personnel as are approved by the State Board of Education
3) Be responsible for organizing the department
4) Be responsible for maintaining liaison and coordinating activities with other state agencies
5) The superintendent of public instruction shall perform such other duties relative to public schools as may be prescribed by law.
Appendix E

POWERS AND DUTIES OF STATE BOARD OF EDUCATION

1865
1. Invest the state school fund
2. Adopt elementary school textbooks.

1885
(Added to powers of 1865)
1. Participate in certification of teachers, a joint responsibility with county boards of examiners.
2. Life diplomas are authorized.

1893
(Added to previous powers)
1. State board empowered to prepare teachers' examinations to be given in the 14 counties of Nevada.

1907
1. Sole teacher-certificating agency in Nevada
2. Adopt courses of study
3. Appoint and remove state deputy superintendents of public instruction
4. Approve books for public school libraries
5. Invest permanent school fund.

1919
1. Power to invest the permanent school fund removed from State Board of Education and placed with State Board of Finance.

1955
1. Life diplomas discontinued 1/1/56.

1956
1. Public school year should consist of 180 days taught.

1957
The superintendent of public instruction shall be appointed by the State Board of Education, but any person elected to the office of superintendent of public instruction prior to the effective date of this section shall continue to hold such office until the expiration of the term for which he may have been elected.

1958
Appointed first state superintendent of public instruction to take office the first Monday in January 1959.

1967
State Board of Education to assume final authority in selection of textbooks for Nevada's public schools.
MEMBERSHIPS OF STATE BOARD OF EDUCATION BY PERIODS

1865–95
Ex officio membership: the Governor, the state superintendent of public instruction, and the surveyor general.

1895–1931
Ex officio membership: the Governor, the state superintendent of public instruction, and the president of the University of Nevada.

1931–55
Governor, state superintendent of public instruction, and five elected lay members, one from each of the five educational supervision districts.

1955
Eight lay members—six to be elected, one from each of the six educational supervision districts, and two to be appointed by the elected members of the board. Of these two, one would represent the interests of agriculture, the other the interests of labor.

1966
Board the same as in 1955.

EARLY ATTEMPTS AT ORGANIZATION, 1820-1900

“Live free or die,” the state motto, typifies the spirit of the early settlers who founded this tiny state. It expresses a revolt against centralized authority—a determination to satisfy their own needs, meet their own problems, and survive or perish with no assistance, guidance, or domination from any outsider. Perhaps this explains in large measure their strong insistence on local control in most matters, including education. Early New Hampshire laws reveal a concern in the state for a common school program, but the individual towns were left to initiate the programs, build the schools, and hire teachers from their own resources. Since the state exercised no effective authority in education, the common schools developed unevenly, their progress depending on the interest and will of local parents and officials. By 1827, the Legislature, noting failures in the town system, voted to create the district system, whereby progressive residents in a section of the town could establish and administer their own school and support it by whatever taxation they agreed to impose on themselves.

The three decades following the Revolution saw a marked increase in New Hampshire’s population. In 1790, the state had 141,885 residents, but in 10 years the number increased to 183,858, a gain of almost 30 percent. Most of the newcomers settled in rural areas until about 1820, when industry and business began to spur the development of urban centers and become a vital factor in their economies. When the State Legislature sought in 1828 to increase financial support to the district schools being formed in these growing cities, rather than taxing its citizens directly for this aid, it turned over to them money from the Literary Fund (1) established in 1812 through an annual levy of one-half of 1 percent on the capital stock of banking corporations. In fact, from 1812 to the present, the state has resorted to various stratagems to aid education from a corporation levy to the sweepstakes without attempting to impose a direct tax on the people. A tax earmarked for education would have been violently opposed by the local forces. Even today, this opposition is clearly expressed by rejection of any broad-base tax proposals. Certainly, until 1900, the fate of the common schools depended almost entirely on local initiative and control. Although education was assumed to be a state responsibility, no state program or system of education existed until the outstanding legislation of 1919 was enacted.

The state did not attempt to exercise direction of the schools until 1846, when a law was passed creating the Office of Commissioner of Common Schools. The commissioner was to be appointed annually by the Governor and his Council. However, he never had control over the local superintending school committees, and the office was abolished in 1850. Seven years later, the Legislature established a Board of County School Commissioners, one member for each county. This first attempt at a state board of education certainly took little unified action and provided little centralized direction during its 17 years of existence. In 1867, the Legislature tried again, this time providing for a superintendent of public instruction, who would report to a Board of Education composed of the Governor and his Council (2). The loss of revenue during the panic of 1873 forced the Legislature to temporarily dissolve the superintendency, which, in turn, nullified the Governor’s and Council’s control. The Office of Superintendent of Public Instruction was reactivated the next year, but, until 1919, when the Office of Commissioner of Education and a State Board of Education were established, state direction of education rested on one man, responsible not to the Governor and Council, but only to the Legislature.

In the meantime, certain significant developments had taken place. In 1840, the Legislature granted districts permission to organize graded schools to eliminate the common, but unfortunate, practice of one person teaching all the children. Responding to a growing demand for secondary schools, the Legislature in 1845 acted to permit two or more contiguous districts to form a union to establish and maintain a high school. Three years later, with the enactment of the Somersworth Act, special school districts were allowed to open and maintain high schools independent of the towns. Yet, despite examples of genuine effort, dissatisfaction with progress under the district system (3) was growing and culminated in the Legislature’s passing an
act in 1875 making each town responsible for the education of its children and abolishing all districts with the exception of those maintaining high schools.

Another indication of the people's growing concern for the quality of their public schools was the passage of legislation in 1868 directing that each county hold an annual teachers institute at the expense of the state. Two years later, the Legislature established a normal school for the preparation of teachers, to be financed by the state and controlled by a board of trustees responsible to the Legislature. Not until years later, however, did the Legislature provide for a system of teacher certification and permit two or more towns together to hire a superintendent. Unfortunately, towns ignored the certification requirements and showed little interest in engaging competent school supervisors, though the normal school was preparing a modest number of trained teachers. To help correct these problems and encourage professional direction of the schools, the Legislature in 1899 agreed to pay half of superintendents' salaries and appropriated a modest sum to help poorer towns engage trained men.

Briefly, this is the situation as it existed in 1900. The picture was not a pleasing one. With the exception of the larger towns, where education was taken seriously, most of the teachers were not only untrained but had a limited education; schoolhouses left much to be desired in sanitation, neatness, and comfort; school boards were more concerned with the local tax rate than they were with the welfare of the children; supplies and texts were severely limited; and professional supervision was seldom seen. Transportation, where furnished, was poor; there was no requirement for the number of days schools were to be in session; and compulsory attendance was unknown.

It is true that the high schools were frequently well treated, since they were a source of local pride. Teachers were better paid and better prepared, and buildings were of more recent construction, but the curriculum and the teaching aids (libraries and laboratories) were very limited. Many towns refused to provide tuition, and so parents were forced to provide both the funds and transportation to the school. Many able youngsters were deprived of a high school education because their families couldn't afford to send them. A decline of population in the state from 1880 to 1900, about 22 percent, was undoubtedly due in part to the movement of people away from the countryside in the hope of securing better employment opportunities in the growing industrial centers of the East, where their children could attend better schools. It was a period of rapid decline in agriculture; many farm families, weary of the struggle with New Hampshire's stony soil, left to try their luck in the more fertile fields to the west. Only in the last quarter of the century did the state show any sense of financial responsibility for its schools; until this time, the normal school had been given inadequate funds, and the Legislature (as evidenced by its voting record) was in no mood to help the towns with their fiscal burdens.

1899-1900 Report

In Superintendent Channing Folsom's biennial report for 1899-1900, it is evident that the office was primarily a one-man operation with quarters in the State House for Folsom, possibly a secretary, and a clerk to handle his correspondence and help collect statistics. The report is interesting because it makes no reference to salaries paid or expenditures made by the superintendent. It does indicate that he was to be assisted by the local directors of the school system, the eight superintendents in the larger towns and cities, and a supervisor in each of the three supervisory unions. It also contains a report from the trustees of the normal school urging the Legislature that "greater liberality be shown in your appropriation to the State Normal School" (4). It gives a detailed account of the superintendents' activities, as well as abundant statistics: attendance by teachers at the institutes and the number of pupils, schools, and local expenses for education. A questionnaire sent to all school boards on the subject of transportation revealed that a considerable number of towns opposed closing the one-room schools and transporting children to a central school, but the majority that had adopted the program reported that transportation cost less than maintaining the small schools and that the children received a better education.

Superintendent Folsom himself was a dedicated and able educator of considerable experience, who labored tirelessly to improve his state's schools. In addition to his other duties, a law was passed in 1897 which made the superintendent the regent of the State Board of Medical Examiners, responsible for admitting candidates, conducting the examinations, and issuing licenses to practice to those who in the judgment of the board were qualified. Nevertheless, he traveled the length and breadth of New Hampshire urging greatly increased state aid to education, a longer school year, higher standards and salaries for teachers, elimination of inefficient one-room schools, and more and better high schools. He sought help from organized groups such as the Grange and committees of the state teachers association.

His aggressiveness led to his dismissal in 1904. Superintendent Folsom worked hard to secure passage of the Grange Bill, an act giving $25,000 in special state aid to rural school districts. His efforts antagonized representatives from the cities and some members of the Governor's Council. When the Governor nominated him for reelection to another 2-year term, politicians in the Legislature defeated the recommendation, ending the career of this faithful public servant.

The new superintendent, Henry C. Morrison, was a trained, progressive schoolman who was not deterred by the clamor that led to the downfall of his predecessor. For 14 years, he unhesitatingly grappled with one problem after
another. He was a skillful analyst and a clear thinker, who advanced a definite program of attack on each problem. His carefully prepared reports, while including the usual statistics, were devoted largely to presenting the issues. Armed with facts and a knowledge of what other states were doing, he fearlessly pointed out the steps New Hampshire had to take to gain a decent standing with its neighbors. He spent little time in the office; day after day he visited the schools and the normal school, talking with teachers and school boards, addressing institutes and innumerable public meetings, conferring with legislators, council members, and the Governor. He persuaded the Legislature to relieve him of his duties as regent of the medical examiners’ board so that he could devote all of his energies to the schools.

Superintendent Morrison emphasized two basic needs: adequate state support for education and the improvement of schools through expert supervision and well-trained teachers. His inspections had uncovered weaknesses in the teaching programs and the lack of professional preparation and control. He pointed out time and again that one normal school was completely inadequate for the state—at least two were needed to supply a sufficient number of well-trained teachers in the rural schools. His campaign succeeded. In 1909, the Legislature voted to establish and maintain a second normal school at Keene to serve the southern part of the state. He also insisted on a better certification program with higher standards. To improve school attendance, he obtained authorization to investigate child labor, and, as a result, in the following session a more stringent Child Labor Act was passed which furnished him with two factory inspectors as well as an “attendance agent. At the same time, he convinced the Legislature that not only was more state aid needed but the system of aid was the most inadequate where the funds were most needed, thus securing passage of the Equalization Act, which provided a much better distribution of additional state aid.

The 1913 legislative session revealed a greatly increased interest in education on the part of its members. Three deputy superintendents, responsible to the superintendent and charged with specific functions, were added to the staff. This permitted the superintendent to amass an array of evidence concerning conditions in the schools, because the deputies were expected to devote the major part of their time and energy in the field. They gathered facts about the health standards of the schools and the health of the children. As a result of their comprehensive study, the Medical Inspection Act was passed, and, though it did not yield the immediate improvement hoped for, it opened the way for better health for schoolchildren. Armed with the facts about the need for better supervision, the superintendent persuaded the education committee of the Legislature to recommend a bill calling for a system of professional supervision for the entire state. The bill was introduced and defeated by a very slim margin, but the issue had been placed squarely before the public and the legislators.

Two years later, the Legislature, impressed by the facts gathered by the attendance agent and the factory inspectors, passed a Mother’s Relief Act and designated the Department of Public Instruction as the agency to give financial aid to widows and destitute mothers whose children were forced to leave school to help maintain the family. A Teachers Pension Fund was passed but failed to operate effectively because of an insufficient appropriation. The act established a Teachers Employment Bureau to check the loss of able teachers to other states and to attract out-of-state teachers to positions in New Hampshire. Two other acts were passed: one requiring better sanitary conditions in schoolhouses, the other a more workable and effective medical inspection service. At the same time, Superintendent Morrison persuaded the General Education Board to grant the department $5,500 to establish a bureau of research, primarily for making studies and publishing bulletins dealing with the curriculums of the elementary and secondary schools.

The State Board of Education in Connecticut had watched with interest the progress that had been made in New Hampshire as a result of Superintendent Morrison’s militant efforts. In 1917, the board invited him to come to Connecticut as deputy commissioner of education at a substantial increase in salary. He accepted. Morrison had accomplished much and laid a sound foundation for the progress which was to be made a few years later. Fortunately the new superintendent, former deputy Ernest W. Butterfield, was an equally dedicated educator.

World War I

At this point we might do well to note certain factors that were to exert a great influence upon developments within the next few years. Possibly the greatest of these was America’s entry into World War I. This global conflict, which called for new techniques in the conduct of modern warfare, placed a high value on education as an important factor in waging war. Modernized equipment, new weapons, and production problems in industry all demanded greater skills from the workers and a high degree of intelligent planning from those chosen to lead us to victory (5). The effort of providing better medical and social services for our fighting men accentuated the need for well-trained doctors, nurses, and social workers. The obsolete tactics of the Civil War and the brief war with Spain no longer were effective. Warfare had changed from individual to mass conflict, demanding a higher degree of intelligence on the part of both civilians and combatants. The draft required all citizens to be physically able and mentally alert.
It was the draft statistics that condemned common school standards as obsolete regarding our military preparation for modern warfare. The state and nation were shocked at the high percentage of young men being declared unfit for service for both physical and mental reasons. People asked, "Is this the best our schools can produce?" Many young Americans, most of them newcomers to our shores, were unable to read or write English and had little understanding of the true meaning of being an American. A nationwide demand for change under the name of Americanization swept the country, and state committees were organized to study the situation. The New Hampshire group soon found much to be done and challenged the schools to improve their programs. Many teachers left the classroom to enter the service, work in munition plants at better wages, or, as educated individuals, offer their services to their government in this emergency, thus creating a serious shortage of teachers.

Several organizations, notably the Grange and the teachers association, felt they must arouse the people to action to guarantee better schools. They were supported by the press, and the new superintendent, Butterfield, seized the opportunity to preach the gospel of better teachers, more state aid, and a stronger statewide program. He urged that an advisory committee of citizens be appointed to study the needs of the public schools, and in Governor-Elect Bartlett he found a sympathetic listener.

Advisory Committee Appointed

In November 1918, the Governor-Elect named eight outstanding citizens to such a committee (6). Since the Legislature convened in January, the committee had to move swiftly. Within 6 weeks, it had completed its task and reported to the Governor, who not only approved the substance of the report but promised to give it priority in the forthcoming legislative session. On March 13, the House of Representatives' Committee on Education recommended passage of the proposed act. The public's sense of pride in their state had been hurt; the people had been surprised to learn that their schools were not adequate and demanded immediate attention. Sensing this sentiment and hearing demands for drastic change from various groups, the Legislature passed the bill, effective the opening of the school year that September.

The salient points made by the Advisory Committee on Education were as follows:

1. The present state system is antiquated and out of touch with present-day needs. Most of the statutes are ineffective and actually impede progress; moreover, there is no strong central authority to enforce them. Excessive local control has worked harm, especially in rural areas, where conditions are deplorable.
2. Education is insufficiently financed. The state has failed to meet its responsibilities and what limited state aid has been given has been poorly distributed.
3. The normal schools and the program of teacher preparation and certification should be under the supervision and administration of a strong central authority.
4. The entire state program should be organized under an effective supervisory union law, thus ensuring professionally trained administrators to direct the public schools.
5. Schools should have a standard curriculum and should be in session for at least 34 weeks. Adult evening schools must be established to further the Americanization program, and the state must assume responsibility for an effective educational program in the "unorganized places" (7).

All this required that the government, as well as education, be reorganized to ensure the maintenance of an intelligent citizenry. Children must be housed in a satisfactory schoolhouse, given a proper curriculum, and taught by competent teachers working under professional direction. Where necessary, mothers must be adequately subsidized in order that all children might benefit. Federal funds should be sought to develop a good vocational program, and sufficient revenue must be levied to ensure an effective system of state aid.

Three general principles prompted the above recommendations:

1. When parents cannot or will not protect their children, the state must. Children then become legally, socially, and economically wards of the state.
2. Education must be divorced from politics and conducted on a sound business basis. To achieve this requires a strong, central governing board with powers and duties similar to those of the directors of a corporation.
3. An executive officer is needed, responsible to the board and authorized to hire a competent staff. Local district employees should be removed from positions of authority when the best interests of the state require such action.

The Great School Law of 1919

The Law of 1919, frequently referred to as the Great School Law, gave the state the momentum it needed for forward progress. Now a central agency existed with authority to make rules and regulations and to enforce school law while rendering true professional service to all pupils, teachers, and school boards. For the first time it could be said that New Hampshire had a state system of education;
no longer did all progress in education depend on the uncertain action of independent school districts. Under the act (8), the Governor and Council appointed a nonpartisan state board of five members, none to be professional educators, for 5-year terms. The Governor was an ex officio member of the board. Any appointed member could be removed for just cause and a successor appointed. They were to have the same powers and duties as the trustees of a corporation, with full authority to make rules and regulations for all facets of the educational program. They were to take over the responsibilities of the Americanization Committee, assume all powers vested in the superintendent of public instruction, the trustees of state normal schools, and the State Board for Vocational Education (created in 1917), and they were to administer federal funds.

One of the board’s chief duties was to appoint an executive, the commissioner of education, who would serve for an indefinite period and could be removed from office when circumstances warranted it. It was to fix his salary, prescribe his duties, and appoint four deputy commissioners nominated by him. It also was authorized to prescribe the qualifications and duties of superintendents, assistant superintendents, teachers, and the employees of the state department.

The state board members were assigned the task of organizing the state into supervisory unions and establishing schools in the unorganized places or furnish tuition and transportation or board at a suitable and approved school for these resident pupils. They also were responsible for submitting budgets for the operation of schools, checking expenditures, preparing a biennial report on the schools’ progress, and recommending further changes in the school laws. In consultation with local boards, they were to employ superintendents and, where necessary, assistant superintendents, whose salaries would be paid by the state and the supervisory unions. They were authorized to employ the necessary staff, confer with superintendents and teachers, and prepare courses for the schools. Also, they were given discretionary authority to employ competent persons “to examine and care for the health of pupils” (9), unless such activity was opposed by a parent or guardian.

To meet the costs of statewide supervision, districts were to pay annually to the state $2 for each pupil enrolled. Superintendents were given the sole authority to nominate teachers for employment by the local board members and to remove teachers, subject to their right of appeal to the commissioner. They also were required to report any violations of the law.

An investigation conducted by the Committee on Americanization revealed that a large number of children attending private schools conducted by a church group were being instructed in a foreign language. The new law required that all instruction in all schools, both public and private, be in English. A foreign language could be used by a private school purely for devotional purposes and could be taught in an elementary school provided that all subjects required by law were given proper time allotments.

Persons between the ages of 16 and 20 who could neither speak nor write English were to attend evening or special classes until they completed the minimum course of studies. Every district having twenty or more persons above the age of 21 or fifteen or more persons between the ages of 16 and 21 unable to speak or write English was required to teach them the language. The law forbade industry from employing such persons unless they could produce certificates from the superintendent of schools showing that they were attending schools or had been excused from the requirements. Employers failing to comply with this requirement could be fined up to $50 for each offense. These rigid regulations concerning non-English-speaking persons reflect the deep concern over persons who were not willing or anxious to learn how to think and speak like Americans, perhaps a natural part of the civic efforts undertaken under the stress of war (10).

The statistics gathered over the years by the superintendent clearly indicated that where children were able to go to school the attendance record was unusually high: The problem of poor attendance was confined almost entirely to rural areas. The lack of a state-enforced statute requiring a minimum number of days or weeks of schooling and the inability of children in isolated places to get to school were largely responsible for the poor record of the country schools.

The members of the commission unhesitatingly applied a remedy. The act not only called for a minimum school year of 36 weeks, but it also stipulated that transportation be furnished to all children below the ninth grade who lived more than 2 miles away from their schools. If transportation was not available, the pupils could be boarded in a suitable home at the expense of the district with the parents’ consent. However, if a district could present evidence proving that a 36-week school year was unreasonable or impractical and that the school tax levied under the act would be insufficient, the state board could reduce the time requirement and adjust the tax rate to meet the situation.

Just how was this ambitious program to be paid for both on the state and local level? In addition to the $2 per pupil to be paid to the state by the towns for the support of supervision, section 29 stipulated that the income from the Literary Fund should be used to implement the act. Locally, the selectmen were obligated to assess “an annual tax of $3.50 on each thousand dollars of the value of the ratable estate taxable therein” (11).

If a district’s obligations were not satisfied by a tax of $5 per $1,000 assessed valuation, the state would supply the difference. In such a situation, the state, acting through local school boards, would administer all the funds and make an accounting annually of all expenditures. In the
unorganized places, the state treasurer would annually assess a tax of $3.50 per $1,000 of ratable property values for the support of public education.

The concept of furnishing equal educational opportunity to all children implied that common standards should apply to all schools, thus challenging the act's authors to define a "standard school." Section 24 leaves no doubt as to the requirements a school would have to meet before it could satisfy the conditions for state assistance. It states (12):

A standard school as that term is used in this Act is one (1) maintained for at least 36 weeks in each year, (2) in a suitable and sanitary building, (3) equipped with approved furniture, books, maps and other necessary appliances, (4) taught by an approved teacher, (5) directed and supervised by an approved superintendent, (6) with suitable provision for the care of the health and physical welfare of all pupils.

Elementary schools under the act were schools teaching the first eight grades. The upper grades could be organized as a junior high school. Attendance at approved private schools was permitted.

The act also stated the amount of money available for the next 2 years, the sources of these funds, and the specific uses to which they would be put. For the first biennium the state was required to appropriate $558,200, with the act's provisions becoming effective September 1, 1919; but any unexpended appropriation from the first fiscal year would be available for use the following year (13).

The Law of 1919 gave New Hampshire a state system of education and abolished variant, uncoordinated, purely localized practices which had prevailed for nearly 300 years. It would be a mistake to conclude that all this came about spontaneously. It did not; rather, it was the effort of many concerned citizens who had worked for better schools over a period of years, an effort which was accentuated by the impact of World War I.

Nor can the influence of the Vermont School Law of 1915 be ignored. With a generous grant from the Carnegie Foundation for the Advancement of Learning, leading citizens and educators of that state joined forces to study the condition of the schools. The result was the Law of 1915, which produced sweeping changes in the organization of the state's school system. Since this law was widely publicized in New Hampshire, it served as a guide for the study commission and the members of the education committee, who cooperated in a study of methods of improving local schools. With a neighboring state forging ahead in a determination to improve its schools, state pride urged New Hampshire to take action—what Vermont could do, New Hampshire could do, too, and in fact, might do better.

Objections to the Law

Naturally there were doubting Thomases and critics. It was foolish, they said, to believe that the rural districts of the north country would ever be able to enjoy the opportunities available to the children of Manchester, even with state aid. And why, indeed, should the citizens of Manchester contribute to a state tax to help the schools of the north country? And who would believe for a moment that the private schools, particularly the numerous parochial schools organized by the Roman Catholic Church, would submit for one moment to the standards set by a State Board of Education? Surely the sprawling parochial system with schools in 19 large communities enrolling some 19,000 pupils in the elementary grades would not permit any interference with its established program and organization.

And how could children in the mountains be transported in all kinds of weather? Would not superintendents employed by the state serve as inspectors, continually harassing local boards to make improvements and spend more money? What was going to happen to the cherished heritage of local control under which each district cared for its own? And what legislator, sent to Concord to protect the interests of his own district, would vote to spend such a huge sum to establish a bureaucracy to run the schools?

In addition to the specifications of the law itself, the state board was to be given broad powers to make its own rules and regulations controlling the conduct of superintendents, teachers, and even school board members. This, the dissidents maintained, was the final death blow to local independence and freedom of action.

All this was sheer speculation. The facts gathered by the proponents of the new order, widely disseminated by a progressive press and presented at public meetings of citizens and at hearings before the education committees of the House and Senate, could not be denied. The problems confronting the schools of the state and the best methods of solving them were clearly presented to the people. The time for temporary expedient measures had passed. A bold advance had to be made—the people demanded prompt action, and got it.

THE PERIOD FROM 1919 TO 1947

Organization of the First State Department of Education

The responsibilities of the various officials of the first State Department of Education are worth noting (14). The commissioner's chief functions were the interpretation and enforcement of school laws, the program of the normal schools, and the improvement of teachers, child welfare,
and the other needs of the schools. He was expected to hold frequent conferences with his staff, direct their activities, and advise the members of the state board on the needs and progress of the schools under the new law. The deputy in charge of elementary schools was responsible for the program of supervision, distribution of state aid, condition of schoolhouses, the health program, and child labor. The deputy in charge of secondary schools was assigned the tasks of inspecting and approving high schools, representing the state in the development of the Smith-Hughes program, and conducting high school examinations. The Americanization program was the responsibility of the deputy in charge of school extension, who also inspected and approved private and parochial schools. Statistics, certification of teachers, registration of nurses, compilation of an educational directory, and the supervision of office correspondence and routine activities were the duties of the deputy in charge of office organization. The commissioner and the four deputies jointly prepared policy statements for the state board's approval.

It is quite obvious that much needed to be done, and the successful inauguration of such an ambitious reorganization of functions and powers called for men who would proceed, not as though armed with authority and power, but cautiously and diplomatically. This plan got off to an auspicious start, due largely to the caliber of the five men appointed to the board and to the common sense solutions to problems applied by the commissioner and his deputies. The fact that the law was passed by popular demand did not guarantee that those who had previously controlled the schools were going to surrender their authority willingly and embark on a policy of immediate cooperation. Delaying tactics and evasion of obligations were employed in several instances in recalcitrant areas, to be overcome in time by the calm, yet determined, approach of the state officials. The transition from the former organization to the new was accomplished by their patience, tact, and diplomacy, not by force or arbitrary action, so that great credit is due to those tolerant men who put the law into operation and the spirit of cooperation found so frequently in town and district officials.

The law's critics anxiously awaited the state board's rules and regulations. The board did not keep them in suspense for long, issuing a call for a "joint business conference on October 16 to be attended by the members of the board, the state department, and the superintendents and members of local school boards" (15). In his opening remarks, the chairman made it clear that the board's only purpose was to help local officials with their problems and that it wanted information which would help determine sound policies and methods of procedure. Rule making was to be a cooperative effort. The board clearly indicated that it intended to proceed by a rule of common sense and not be strictly tied to the letter of the law. The rules and regulations finally adopted were quite flexible and subject to change. The first concerned the board itself, clearly indicating its responsibilities. This was followed by two important statements, one dealing with the powers and duties of school boards and the other outlining the powers and duties of superintendents. The board wanted to clearly define the areas of authority between lay and professional control.

Rules and Regulations of the State Board of Education

It is not possible to discuss in detail all 22 sections of the rules and regulations which covered every facet of school activity. Certification of teachers and qualifications of superintendents and teachers were considered at length. The board urged that teachers councils be formed to arrange conferences on school problems among staff members, school boards, and superintendents in the hopes of developing a cooperative spirit and improving the effectiveness of the school program. Based on the Program of Studies for Elementary Schools accepted in 1916 and the Program of Studies for Secondary Schools approved in 1919, minimum curriculum standards were established for public, private, and parochial schools. Since so much concern had been expressed over our young men's fitness for service following the findings of the draft boards, considerable effort was devoted to setting up health and physical welfare standards for pupils and sanitary and health standards for school buildings. The rules and regulations further held that textbooks and supplies were to be selected by the superintendents within budgets established by local school boards. They also provided for a director, nominated by the commissioner, to manage the normal schools and outline the standards for admission and graduation, tuition payments, and the conduct of summer sessions and model schools.

A careful analysis of the rules and regulations, along with the law itself, clearly indicates the extent to which control shifted from local authorities to the State Board of Education through the state department and the superintendents who served communities as agents of the board. However, though the rules and regulations greatly emphasized the program and direction of the elementary and normal schools, they paid little attention to secondary schools other than making provisions for inspection and approval by the deputy commissioner in charge of secondary education, and decreeing that the curriculum was to follow the program of studies recently endorsed. Little had been said about secondary schools and the preparation of their teachers because most of the teachers were either college graduates or had completed their education far beyond that of the elementary teachers. The limited attention given to secondary schools was the outstanding weakness of the 1919 reorganization. It was hardly a surprise to many when, after a decade of secondary school inspections, some of the poorest teaching was found in these schools.
Postwar Activity

Even after the war was over, patriotic fervor was still at a high pitch, and some of the problems uncovered by the war still had to be faced. For instance, universal use of English was of paramount importance. Thus, the 1919 statute transferred the program of the Committee on Americanization (established in 1918) to the state department, and Deputy Commissioner Brooks was instructed to proceed at once to speed up the work begun by community groups and form special day and evening classes for adults. The extension of the school program to include Americanization classes met with almost no public resistance.

The schools had been drawn into many wartime programs. At the end of the war, some of these projects, such as the first aid courses, the thrift programs, and home economics programs, were continued. Local community groups cooperated closely with the schools: Banks conducted the thrift programs, industrial leaders organized classes for their employees and took much more active interest in what the schools were doing, labor unions passed resolutions supporting education for workers and began to take more interest in the development of the practical arts programs. The schoolhouse was no longer an isolated unit. All of these activities continued to be a concern for the state department. Some even took on greater significance due to the demand for better programs in vocational-technical education, industrial arts, and business practice. In August 1921, the Smith-Hughes program was adopted for secondary education in New Hampshire, a joint federal-state project which was desperately needed (16).

The Americanization program also reached the private and parochial schools. A great many pupils in these schools, especially the French-Canadians, were children of recent immigrants who wished to preserve their tradition and language and conducted these schools in their native tongue. A majority of the citizens denounced this practice as divisive, claiming that American ideals and knowledge of the political and social structure could only be transmitted to the children in English. It wasn't a matter of trying to downgrade or destroy a culture or tradition; most of the citizens simply felt that education for these children should break the barriers which were dividing the social order. Once this was understood by the private schools, there were few problems. The 1919 act required that English be used in all the schools. Implementation of the law proceeded smoothly, thanks largely to the talents of four outstanding leaders.

Much of the credit for leading the way to accepting the new order must be given to the Rt. Rev. Bishop Guertin, a progressive man with a broad understanding of social problems, who was the one recognized official head of the Catholic school system. In November 1918, he assured the people that he was willing to cooperate and appointed a liberal clergyman, Rev. P. J. Scott, diocesan superintendent of parochial schools. Bishop Guertin issued the instructions, and Father Scott saw to it that the Catholic schools complied. Great credit goes to Wilfred J. Lessard, a member of the state board and a Catholic of French-Canadian descent, who, as executive officer of the diocesan board, served as a liaison officer and worked closely with Bishop Guertin and Father Scott. Deputy Commissioner Brooks must be applauded for his patience, tact, and wisdom in representing the state department.

These four men succeeded largely because of the support given by the Association Canado-Américaine, the large Franco-American fraternal order which endorsed the entire program of the Americanization Committee and urged all Catholics to support their bishop in his liberal stand. In fact, with approximately 20,000 of the state's 90,000 enrolled in parochial schools, it would have been extremely difficult to implement the statute if the leaders of the church and the French-Canadian group had not worked for prompt compliance with the law. The parochial system now cooperates with the public schools in all matters of curriculum building and teacher preparation.

Financial Problems

The most serious problem that developed in New Hampshire is the one that usually plagues education—insufficient funds. The Legislature, committed then as now to a strict pay-as-you-go fiscal policy, was unwilling to appropriate enough money to meet the budget presented by the State Board of Education, because it had no prospects for securing the necessary revenue.

The 1920 commissioner's report included the following summary of expenditures of the state board:

<table>
<thead>
<tr>
<th>Payments to districts</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>For equalization of opportunity</td>
<td>75.28</td>
</tr>
<tr>
<td>For maintenance of teacher training</td>
<td>11.89</td>
</tr>
<tr>
<td>For administration of the department</td>
<td>7.97</td>
</tr>
<tr>
<td>For Mothers Aid</td>
<td>4.86</td>
</tr>
</tbody>
</table>

Funds were needed for new buildings, cadet training centers, and extension courses, but the requests were repeatedly denied. Keene and Plymouth were woefully inadequate to meet the needs for professionally trained teachers, and the teacher shortage was becoming serious. Teachers received such low salaries that they soon left for other states where they could make more money and enjoy better teaching conditions. Four members of the state board and a deputy commissioner resigned in 1921, frustrated at the Legislature's failure to make necessary appropriations. In the meantime, other states were abandoning the 2-year normal school programs and instituting 3-year and 4-year courses for the preparation of junior and senior high school teachers, and it was obvious that New Hampshire would have to follow the trend as soon as the legis-
The first bachelor of education degrees were conferred. It was 1927 before the new 2-year, 3-year, and 4-year curriculums were approved by the state board and 3 years later before the first bachelor of education degrees were conferred. When Ernest W. Butterfield became commissioner, he knew full well the difficulties facing him in securing funds to implement the new state program. He labored to convince board members, the professionals, and the public that it deserved their full support. Employing diplomacy and yet being firm with those who opposed a centralized system of education, he consistently and doggedly hammered toward his objectives. Without his determined devotion and the support of his staff, the state board, and the teaching profession, the new organization would have been ineffective.

The state department gave major consideration to improving what went on in the classroom — curriculum, supervision, and the teacher. Not only was there a serious shortage of trained teachers, particularly in the rural areas and small towns, but standards of certification were much too low, facilities for teacher preparation were inadequate, and the curriculum at the normal schools needed to be improved. Courses usually centered on the textbook, and even here, fortunate indeed was the classroom that had a supply of good books. To meet this situation, the department decided to make the most of the existing training schools at Keene and Plymouth, expand them as rapidly as possible, initiate good summer schools and extension courses, and organize efficient practice schools as part of the training programs. In spite of the prevailing low salaries, the period of preparation was to be increased to 3 and 4 years, with more stringent certification requirements. At the same time, the department attempted to develop closer cooperation with the University of New Hampshire, hoping to gain more teacher preparation courses and additional extension courses for in-service training. Frank Spaulding, a New Hampshire native who was professor of education at Yale, accepted the commissioner's invitation to help develop a suitable curriculum for the schools.

Though supervision became a state responsibility, not all the supervisors were professionally competent. They, too, had to be given training. Though they were tied up with many administrative details, the superintendents were directed by the commissioner to make teacher improvement and better classroom performance their major concern. Institutes and conferences for teachers and supervisors were convened regularly.

The local school board, once the all-powerful unit in district affairs, still retained much authority and, unless guided in making the transition from the old to the new order, could retard progress considerably. Consequently, the department organized statewide conferences for school board members and superintendents. To help those boards whose progress was being undermined by apathy or outright opposition at the annual district meetings, it called numerous public meetings to stimulate local interest. In particular, it tried to interest the people in providing better health services, lighting, heating, and sanitation in the local school buildings. Progress did come, but slowly. Many of the one-room schools were closed; the students were transported to larger centralized schools with superior buildings, programs of study, and teachers. The public finally became convinced that this paid off for their children; and with better highways being built, transportation was no longer the serious obstacle it had been earlier.

Educators throughout the country had watched with great interest the daring step forward taken by New Hampshire in 1919 that had given the state so much authority and control over education. In particular, some of the faculty at Teachers College, Columbia University, had read the law carefully. Though they agreed it was a fine piece of legislation, they were skeptical as to how it would actually function. Thus, in 1927, 8 years after the law had been in operation, they sent a Ph.D. candidate, E. A. Bishop, to New Hampshire to make a careful check of the state's accomplishments during this period. His dissertation, published by Teachers College in 1930, said: "It has secured highly desirable results. It has secured them with a reasonable degree of economy. Surely this is the proper outcome of a meritorious system of educational organization, administration and support" (17).

Bishop found that all schools met or exceeded the 36-week year, and attendance was up from 91.3 percent to 94.6 percent. Health and sanitation conditions were greatly improved, now that the authority to condemn school buildings had been transferred from the State Board of Health to the State Board of Education. Previously, only 30 percent of the children had been given medical examinations, while nearly all in the state were now receiving them. The turnover of teachers had been greatly reduced, statewide standards had been raised, and more teachers were being trained than ever before. Perhaps part of this was due to the greater control the state had over professional administrators.

The report, widely distributed and discussed in college classrooms, supported the contention that progress can be made when there is a capable, centralized administration, legally empowered to give direction to local education. In fact, a system of local independent units developing at their own pace was vigorously condemned. However, progress calls for fiscal support. No matter how capable and dedicated the administration might be, regardless of the amount of authority given to a board or department by law, insufficient funds weaken the administrative process and slow down progress. New Hampshire had a good organization in motion, but the money to support this commendable legislation was not forthcoming. That has been New Hampshire's basic problem from 1919 to present.
Because the Legislature refused to appropriate the funds necessary for equalization aid to local districts, this vital part of the 1919 program failed, resulting in a serious setback to education. More money than previously was spent on education by the state and local districts, but it was still insufficient to meet the needs. Local boards presented annual budgets only to have them voted down at the district meetings. Firmly ingrained in the fiscal philosophy of “pay-as-you-go,” the people’s representatives at the state level followed suit. Now and then, the seriousness of the educational situation impressed the legislators, and they were willing to put out money for buildings to accommodate the normal school students and vote capital outlays for school buildings that were bursting at the seams. Teachers’ salaries, however, increased very slowly. The legislators evidently felt that the appalling situation that had existed up to 1919 had now been corrected. They even strongly opposed accepting federal funds on a matching basis.

When Commissioner Butterfield resigned in July 1930 to become commissioner of education for the State of Connecticut, he was replaced by his deputy commissioner, James N. Pringle. Having served in the department since its reorganization, Dr. Pringle endorsed the policies and practices of his predecessor and made little change in the program. He expanded the efforts to get better teachers, more effective training programs at Keene and Plymouth, and better professional supervision, and to eliminate the ineffectual one-room schools. He worked as closely as possible with the school boards and the local communities. He also sought the help of newly formed lay organizations interested in public education, along with the Congress of Parents and Teachers, the Education Committee of the Grange, and groups of parents interested in handicapped children.

**Depression and World War II**

Federal participation in state programs greatly increased during the 1930’s and 1940’s, not because the people had a change of heart, but because of two great events affecting the entire nation — the Depression and the entrance of the United States into World War II. During the Depression, New Hampshire, like other states, turned to the national government for help. Programs were needed to assist youth, to help the unemployed in both the professions and labor, and to stimulate the local economy. The people of New Hampshire began to realize that the federal government must play an important role in meeting grave social and economic emergencies. This gradual acceptance of federal aid was first apparent in highway improvement, social services, and various forms of economic development; it was a necessary forerunner to a general acceptance of the principle that federal aid could and should be employed to improve local education. A few critics still raised the cry about wasted funds and clamored against bureaucratic control, but most people were too pleased with the overall results to listen.

The Japanese attack on Pearl Harbor aroused the nation to declare war, but America had already been working furiously for 2 or 3 years to provide the allied nations with weapons and war supplies. During this period, New Hampshire’s industry was busy, and a number of educational programs were set up for training mechanics to tool the new weapons. In 1945, the Legislature voted to establish two state trade schools and several area vocational programs for high school students. Federal crash programs to improve standard courses in elementary and secondary education were not developed, however — certainly a difference from World War I. The Depression and World War II projects were largely economic in nature rather than educational.

The war also had an adverse effect on the schools of the state. A general manpower shortage soon developed, and many teachers went into lucrative fields in industry. Many attracted by good salaries never returned to the classroom. A shortage of all kinds of materials and supplies hurt the schools, and supply-economy measures were commonplace. Fighting for survival, the nation felt it could give few priorities to education. On the positive side, World War II, like World War I, reemphasized the importance of health and physical fitness, clearly demonstrated the need for more and better education for all levels of society, and ushered in a new age of technological and vocational education growing out of the experiences and the lessons learned in all fields during this national emergency.

Though the war effort did slow educational progress in the state, the demand for economy closed many ineffective one-room schools, fostered a decided improvement in transportation, and reduced the number of supervisory unions from 64 to 48. Greater interest was taken in deaf and other handicapped children due largely to the cooperation of private organizations with the state department. Local districts had to assume much of the increased cost of education, because the Legislature continually failed to appropriate the necessary funds for effective state aid. Though the state department made persistent efforts to improve the equalization formula and submitted carefully prepared budgets biennially for legislative action, state aid failed to keep pace with the steady growth of the school system. The fiscal situation became critical.

Finally realizing that something had to be done, the Legislature in 1945 appropriated $10,000 for an Interim Study Commission “to study the state educational system and to make a report of its findings and recommendations for the use of the 1947 legislature” (18). By the following May, the study group had been named and it in turn appointed A. D. Simpson of the Harvard Graduate School of Education to direct the study. Instead of surveying all facets of education, Dr. Simpson wisely limited
his investigation to three critical areas: finances, the organization of the state department, and relationships with higher education. Guided largely by his findings, which were supplemented by other studies, the interim commission submitted its report to the 1947 session of the Legislature in February.

Commissioner Fuller

In the meantime, Dr. Pringle ended his 48 years of educational service, retiring in December 1945. He was replaced in February by Edgar Fuller, professor of education at the Harvard Graduate School, who had earned a doctorate of law at the University of Chicago and a doctorate of education at Harvard. The new commissioner had served as a high school teacher, principal, superintendent, junior college president, college instructor, and as acting chief of the aviation education division of the Civil Aeronautics Administration. Since it would be his responsibility to act on the recommendations of the commission, Dr. Fuller applied himself diligently to the great mass of material and information that had to be digested in less than a year if the commission's report to the Legislature was to be of value. He and his staff assisted the commission in every way possible, laboring to supply it with information of all kinds.

Commissioner Fuller was convinced that no matter how well the commission's report was prepared, effective action would not follow unless the people of the state were made aware of the seriousness of their school situation. As in 1918, much had to be done in a comparatively short time. To enlist the support of prominent laymen and professional leaders, he organized the Lay-Professional Educational Council in May 1946. Its sole function was to study the educational problems of the state" (19). The organizational pattern was unique. The state would be divided into 12 regions, each region furnishing 36 members to the council; of this membership, one-third would be lay citizens, one-third professional educators, and one-third school board members. The regional councils would then meet regularly, and, in the majority of school districts, local meetings would be organized to include as many interested citizens as possible. Thus, all phases of elementary and secondary education were carefully discussed and debated in a sincere effort to find solutions.

This carefully planned campaign to secure the cooperation of the people was highly successful, confirming the commissioner's conviction — along with that of his department and the state board — that "given full opportunity to consider the facts about public education, the people of New Hampshire will make the right decisions about it" (20). To keep the issue alive at the local level, he took steps to organize the New Hampshire School Boards Association to utilize the special interests and talents of the local school officials.

Dr. Fuller felt that there was too much centralization of authority and that local school boards should assume more initiative and direction of their schools. Two decades after the state had made necessary changes by assuming the major role and enforcing statutes and exercising regulatory and investigating functions, it was time for the state department to change character, namely, to be more of a service agency. Dr. Fuller hoped that with the 1919 law operating quite effectively, with better supervision, and with a program of studies conducted by better trained teachers, the department could relax its controls and devote its efforts to helping school boards, superintendents, and teachers build stronger local school systems. This service function has been consistently developed and refined during the past 20 years.

In July 1947, the state department published the recommendations of the council in a bulletin entitled Lay-Professional Council Report to the People of New Hampshire for the Youth of New Hampshire (21). The report urged the establishment of kindergartens, stressed the importance of mastery of the basic skills and recognition of individual differences in grades 1 through 6, endorsed a comprehensive curriculum for all secondary schools including vocational training (thereby improving the "holding power" of the senior high school), and recommended changes in the teachers colleges to ensure better teacher preparation. It pointed out the need for a statewide guidance program directed by a specialist on the staff of the state department. Local school districts, the teachers colleges, and the university were urged to conduct adult education programs. The report stated that the council would make two special studies during the next biennium — one on the supervisory union as an administrative unit, the other on the financing of public education by local districts and the state. Unhappily, the council's zeal for these studies waned, and it published no reports. The well-known jingle "For want of a nail, etc." probably offers the best explanation of why the lay-professional movement suddenly collapsed. Commissioner Fuller had been the sparkplug that kept the project going. When, unfortunately, he resigned in July 1948, "the leader was lost," and with his departure "the cause was lost."

Report of the Interim Commission, 1947

After 9 months of intensive work, the Interim Study Commission completed its report for the Legislature. Its findings and recommendations were presented in seven sections: a general summary of the survey, financing education, personnel policy, educational structure of the state school system, the state board and education department, institutional relations with higher education, and nurse education. Of particular importance to history is Section V, which dealt with the state board and the education department:
The State Board of Education represents in this state one of the oldest and most effective organizations in our country. If every state had such a board and board organization, educational progress on a nationwide basis might be assured. New Hampshire should take pride in the long history of good state educational organization and effective work on the part of the State Board of Education.

The commission added: "The key purposes of a State Department of Education — that is, the purposes looked at more broadly than as the execution of law and rules — are three in number: (1) guidance and leadership, (2) service, and (3) research and planning." (23)

Specific recommendations for improving the work of the state department were based not only on its findings, but on a modern philosophy of the function of any state government agency. The commission gave attention to the relationship between state and local authority and responsibility, pointing out that the state department was responsible for organizing a sound statewide educational program, but that encouraging local initiative and responsibility for good schools should also be a major concern of the state. It should cooperate more in supplying specialists to advise and guide local officials in their efforts. One of the great needs the commission found was for a research and planning division that would produce facts and statistics on which programs could be launched and evaluated. Instead of having divisions for elementary, secondary, and vocational education, the report recommended that five divisions be established: instructional service, administrative service, research and planning, personnel administration, and personnel improvement. In each case the emphasis was on service to local communities by staff specialists. The commission felt that a specialist should be engaged temporarily to improve citizenship education and that the supervision of nursing service could be improved by placing it under professional direction. In addition to urging adequate salaries for specialists and a doubling of the physical facilities available to the department, the commission praised Dr. Fuller's efforts in establishing the lay-professional council and his desire to bring the schools closer to the people by encouraging a greater local participation by school boards and citizens.

The interim commission's grave concern about the lack of state aid, the teacher shortage, and poor pupil transportation, and its conviction of the need for further study prompted it to recommend six legislative proposals: a new state aid formula, a state council on teacher education, a $1,500 minimum salary for teachers, a certification council to advise the state board on the certification of all personnel, a $200,000 annual appropriation for pupil transportation, and a special grant of $2,000 to establish an interim commission to study the government structure of the state educational system and report its findings to the 1949 Legislature. After hearings on the above proposals the Legislature rejected all six.

Legislation of 1947

However, the 1947 Legislature did take enough positive action for Commissioner Fuller to state: "The General Court [state legislature] of 1947 passed the most fundamentally important educational legislation since 1919" (24). Publication of the interim commission's report, the activities of the lay-professional council, and the cooperation of the press and various organized groups in alerting the people to the critical state of public education produced sufficient pressure for the legislators to pass several important bills.

One of the most significant new laws, passed with little opposition, appropriated $2 million annually from 1949 to 1949 according to a formula developed by the state department. No doubt the legislators were influenced substantially by the widely publicized report prepared by the lay-professional council, which censured the state for giving less than 5 percent in state aid to the school districts, but certainly the bill received favorable consideration because of a sizable surplus in the state treasury.

At the same time, other fiscal action was taken to help the districts. In order to have a reserve fund for capital outlays, districts were permitted to lay aside annually .005 percent of their assessed valuations, and the local debt limit was increased from 2 percent of assessed valuation to 5 percent, and it could go up to 8 percent if the board of investigation, the Governor's Council, and the Governor all approved. But despite the interim commission's strong recommendation that local boards and districts be financially independent of town and city governments, the Legislature refused to act. Impressed, however, by the commission's strong case for larger administrative units that could guarantee better educational opportunity for all children, the lawmakers permitted districts to unite as "co-operative" school districts under a single administration. The act did not provide for incentive aid from the state.

To hold good teachers and to attract candidates from other states, the Legislature, following the example of other progressive states, passed a compulsory Teacher's Retirement Law that liberalized the provisions of the old permissive retirement system. Recognizing that many children needed psychiatric study and treatment, the General Court established a Children's Study Home and Clinic in Concord, a big step forward in the movement to give special care to problem children. Prompted by the recommendations of the U.S. Public Health Service, which were included in the interim commission's report, it created the Office of Director of Nursing Education in the State Department of Education and provided state financing for better supervision and services for the nursing schools.

Though the action taken by the 1947 Legislature was of great significance, the state could not sustain the pace of progressive legislation and soon returned to the old practice of compromising on appropriations far below the amounts...
requested and needed. But a start in many directions had been made: new services in physical education, the fine arts, and the professional supervision of guidance and mental health. Local districts were freer to invest in educational programs. The GI Bill of Rights and other programs for World War II veterans brought new federally supported projects to the state and greatly increased the amount of federal aid it accepted.

The chart in Appendix B shows how the department was organized as of 1948. The development and progress that took place during the 29 years can best be appreciated by comparing this with the 1919 organization chart in Appendix B. The department now has four divisions, including the two teachers colleges, both completely under the supervision of the state board. Instead of 4 deputy commissioners, it has 1; there are 2 chiefs, 9 directors (including 1 for nursing education), 14 supervisors, 13 inspectors, and a consultant. In 1919, the department had one lone agent of industrial education; note the number directing vocational activities 28 years later, supported either all or in part by federal funds. The central office now has 23 secretary-clerks instead of 5. The accounting staff has increased from one accountant to a principal accountant, a director of educational finance, and three junior accountants. This chart of the expanded department does not include the staffs of the teachers colleges and trade schools.

THE RECENT PERIOD, 1948-68

Four commissioners of education have ably served the state since 1948. Commissioner Hilton C. Buley (1948-54) strove to improve education by recommending the reorganization of school districts into larger administrative units, thus providing a broader basis for increased financial support, and by emphasizing construction of modern schools with better equipment and facilities.

It was during the administration of Austin J. McCaffrey (1954-57) that attention was focused on the necessity for full implementation by the state of the Foundation Aid Act and provision by the Legislature of state aid for the education of physically handicapped, mentally retarded, and emotionally disturbed children.

Commissioner Charles F. Ritch, Jr., (1958-63) stressed the importance of the state’s participation in federal aid programs under the NDEA Act and emphasized the need for expanded vocational education on the secondary and postsecondary school levels. He also secured passage of the act establishing minimum standards for secondary education.

The efforts of these leaders bore fruition during the administration of Commissioner Paul E. Farmum (1963-68), who skillfully engineered the expansion of larger administrative units, legislation for all handicapped children, greater vocational education opportunities, wider participation in NDEA and other federal aid programs, and implementation of rapid growth in school district and supervisory union reorganization. On July 1, 1968, Commissioner Farmum retired and was succeeded by his deputy commissioner, Newell J. Paire, an experienced former superintendent of schools.

Transfer of Division of Teacher Education

The department does not have the same responsibilities in all areas it did in 1948. For instance, it no longer contains a division of teacher education. The 1963 Legislature created the University of New Hampshire, a single corporate body under its own board of trustees. This board includes the commissioner of education and the presidents of the state colleges, now liberal arts institutions called Keene State College and Plymouth State College. This was in keeping with the nationwide trend, based on the idea that teachers needed broader preparation with less emphasis on methodology and more attention to subject matter. Enough time has not elapsed to evaluate the effectiveness of this administrative change.

Transfer of Youth Employment

Another of the department’s functions that was transferred to a different agency was the handling of youth employment. The 1951 and 1953 Legislatures passed bills directing the commissioner of labor instead of the commissioner of education to be responsible for enforcing child labor laws.

The service activities of the department have increased greatly during the last decade and a half and have shifted in emphasis in the areas and types of services. Two stand out: vocational-technical education and special education. What the organization chart (25) does not show is the dramatically increased involvement of the federal government and the amount of federal money now available to the state. The State Board of Education intends to make greater use of federal funds under existing statutes in an effort to expand its services. Another development which should be pointed out is the increased concern for public school administration at the local level. In 1948, there were 48 superintendents and 7 assistant superintendents; in 1965, there were 46 superintendents, 19 assistant superintendents, 12 teacher consultants, and 3 business administrators.

Technical-Vocational Education

The marked increase in facilities for technical-vocational education is due to several factors. First, there was a substantial population increase during the last decade and a half: In 1950, 70,448 pupils attended public schools in the state; in 1965, the public schools enrolled 127,558, an increase of 44.9 percent.
New Hampshire is the second most industrialized state in New England and can boast the lowest unemployment ratio in the nation. With no sales or income tax to pay, manufacturers of electronics products, plastics, and small precision instruments moved into the state. Many were compelled to find employees in neighboring states because of a local skilled worker shortage. The state trade schools were unable to supply the demand. The manufacturers voiced their concern about the situation. Earle Little, chief of the division of vocational-technical education, capitalized on the situation. With the active support of the industrial leaders of the state, he engaged in a vigorous campaign to put an ambitious program for vocational-technical institutes before the 1963 Legislature. The overflow hearing before the education committees of the House and Senate was dominated by lay industrialists who pleaded the cause of a modern technical-vocational program. When the legislation passed, it inaugurated a new era in technical-vocational education. Within 2 years, a new technical institute was in operation, the two trade schools had been expanded, a third school was under way, and plans for two more postsecondary technical-vocational schools are on the drawing boards.

In an effort to make full use of the state's manpower, the department has begun an extensive program of vocational rehabilitation. In 1948, the vocational education division directed its attention to the war veteran, giving special emphasis to job training, guidance, and placement. The division staff included a director of vocational rehabilitation, two supervisors, and a medical-social consultant. By 1965, the department also had a codirector of Civil Defense adult education and an assistant coordinator, and it operated a vocational rehabilitation division, headed by a chief, with a professional staff of 12 assistants. This program, organized as a special division of the education department, was largely the result of the initiative and financial support of the federal government. New Hampshire has accepted federal assistance for its public school programs since Congress passed the Vocational Education Act in 1917.

Service to Handicapped Children

For years, advocates of special but separate education for the physically handicapped, mentally retarded, and emotionally disturbed had introduced bills in the Legislature but had always had inadequate support. James O'Neil, chairman of the House education committee, introduced a bill that focused legislative attention and support on a single total program with professional guidance responsible for its success. This was a decided step forward.

The Special Education Act of 1965 declares it "to be the policy of the state to provide the best and most effective education possible to all handicapped children in New Hampshire" (26). It placed responsibility for the program squarely on the state board and education department, empowering them to appoint personnel, submit an approved plan to school districts, set standards, and see that the tuition adjustments and transportation facilities were provided. The act stipulated that the program was to be established within the funds appropriated or available. Unfortunately, the department has never had enough money for a total attack on the problem.

The 1965 Legislature went a step further in its effort to establish a program of special education: It authorized the department to make a study of the education of gifted children. This was to be an intensive study over a 2-year period, and a full report was to be submitted to the Legislature.

The Junior College Movement

New Hampshire has no publicly supported junior college. Since the middle 1950's, civic, educational, social, and business organizations have stressed the need for such a program, mainly because such a large number of in-state pupils have been rejected by the colleges due to higher academic standards. In 1963, the interim commission recommended that such a program be added. Two years later, the Governor's Conference on Education again strongly recommended a junior college program. This time, the Legislature responded by creating a Junior College Commission to study the problem and submit recommendations to the Governor. A major question now is whether the state board or the trustees of the university should organize and operate the junior colleges. The commission report favors "adding a comprehensive curriculum to the programs of the Institutes" (27). If this is voted by the Legislature, the state board will assume the responsibility.

Recent Federal Programs

The successful launching of Sputnik by the Russians unleashed a storm of criticism of public education. Goaded into action, Congress passed the National Defense Education Act of 1958 (NDEA) to meet the charge that our schools were too weak in mathematics, science, and foreign languages.

The purpose was to stimulate state action by making grants (some on a matching basis) to state governments and holding the departments of education responsible for supervising the local programs within the framework of federal guidelines. New Hampshire lagged behind in demanding federal money and more federal participation in public education. Its leaders pursued a rather cautious policy, partly because of the state's poor showing in its support of education and partly because of strong opposition to federal aid per se. Historically, the burden of supporting schools had fallen on the local government.

As Congress voted additional millions — the Elementary and Secondary Education Act of 1965 (ESEA) — and
as the government’s program for education became more and more involved in social and economic problems such as the War on Poverty, employment, youth services, and rehabilitation, it affected all sectors of the population. If these needed programs are to continue, local and state revenues will be insufficient to maintain them, and federal aid is essential. Many conservatives have now accepted the fact that federal aid is here to stay and have decided they must go along with the trend.

Many organizations deserve credit for the part they have played in furthering the cause of education in New Hampshire. Parents organizations pushed for schools for handicapped children; several groups promoted educational television; and industrialists, concerned with better facilities for vocational and technical education, worked actively to secure state support for their projects. The state department staff welcomed the support of these citizens, cooperating by supplying necessary facts, serving on committees, and speaking at public meetings. In many instances, the state department has been the continuing influence behind their efforts.

In 1958, three representatives from each of the following New Hampshire organizations—the Congress of Parents and Teachers, the Council for Better Schools, the School Boards Association, the State Teachers Association, the Association of School Superintendents, and the State Department of Education—formed a joint committee to study the needs of New Hampshire education to inform citizens and legislators about the state’s educational program. The state department supplied the basic facts, and the group held public meetings to outline the need for action at hearings conducted by the Legislature. The committee was responsible for putting in motion two Governor’s Conferences on Education.

In all of these activities to stimulate citizen interest and action, the state department played a vital role. By working through and with these citizens groups, the state board has been able to secure helpful legislation. This strategy has been most successful, especially in dealing with the Legislature and public officials. It seems that the best way to block educational legislation in New Hampshire is for someone to introduce a bill sponsored by the state board. On the other hand, if a group of citizens introduces the bill and actively supports it, the chances for success are greatly enhanced.

Growth of Larger Administrative Units

A small state composed of many independent districts is bound to have many small high schools, especially in sparsely settled rural areas. Small high schools (attendance of less than 100) with their limited curriculum and excessive teacher turnover have hampered efforts to achieve quality education. Among elementary schools, a number of one-room schools disappeared with the rapid increase in good highways and a satisfactory transportation program.

Two towns successfully petitioned the Legislature as early as 1927 for special legislation to incorporate in a single school district. Thus began the cooperative school plan, creating a single administration with a larger tax base for its support. For more than 50 years, the state department has been working for the establishment of larger administrative units, convinced that more opportunities are possible if larger financial backing is made available. In the beginning, the state gave no financial aid to the project, and progress was slow. And many small districts were so imbued with local pride that they have fought any change in the operation of their own small high school.

In the midfifties, a committee of citizens and educators was appointed to study the state’s high schools and recommend to the state board reasonable “minimum standards” it should employ for certifying “approved secondary schools.” The board accepted and published the Minimum Standards for Secondary Schools. Then, in 1959, the Legislature passed an act defining in specific terms the standards a high school would have to maintain to qualify for state aid. Many school officials, realizing that they would not be able to meet the minimum standards, gave serious consideration to joining another district or districts. Certainly this boosted the cooperative movement. In 1963, two important acts were passed: the Cooperative School Act and the Authorized Regional Enrollment Act (AREA schools) which gave even greater impetus to the cause of larger administrative units through state incentive financial aid.

By 1965, 15 cooperative school districts were in operation, with two more commencing in 1966. Also, four AREA schools are open, with a fifth likely to be added. These larger schools naturally added considerably to the superintendent’s duties, so the state department has added more assistant superintendents (28). To handle the financial operations of these larger units, five business administrators were hired by the districts. And since the superintendent could no longer spend the time to serve as a supervisor, a 1961 statute permitted district officers to employ a teacher consultant with specific duties; within 2 years, 12 teacher consultants were hired. The services and guidance of the state department staff are readily available to all these administrators.

Despite great strides in the work of the State Department of Education during the past 65 years, many problems remain. The chief of these is revenue; the department is always short of money. The local districts still bear the brunt of taxation and carry too much of the tax burden. New Hampshire is near the bottom of the list of states in the percentage of state aid given to education. This is likely to be true as long as the state seeks revenue chiefly from levies on alcohol, tobacco, the race track, and the sweepstakes. The solution is to draw from a broad-base tax, either sales or income. More and more people are aware of this, and in a matter of a few years it must certainly be
voted for education. As compared with the 1900's, the people have become education conscious; good schools are given priority in the mind of the average citizen. The state has a fine education department responsible to a state board, fortunately separated from politics. Though money is not the only answer, it is the vital and critical factor if the state is to have a strong educational system striving for excellence.

Federal, State, and Local Relations

Financial considerations will be the determining factor in the future development of public education in New Hampshire. Education, like national defense, will become a vital issue, for in the present unstable world, education will be considered a powerful weapon of national defense. The federal government, in the national interest, will become more and more involved in education, particularly at the state level. More millions for education will be voted by Congress, not with the thought of nationalizing the schools, but because of its conviction that maintaining the highest standards of education for all our people is vital to the success of a democratic society. Federal aid, therefore, will exert a greater influence.

The federal government, respecting the principle established by the Constitution that education is a state responsibility, will function largely through state boards and departments of education. It will seek a partnership with the states to raise the standards of education. Millions of dollars will be funneled, not directly to local communities, but through state departments operating as agents of the national government. The state will distribute these funds to local school districts according to guidelines mutually acceptable to the state and federal governments. This will result in stronger state departments of education. The passage of Title V of ESEA clearly indicates the desire of the federal government to develop strong state departments. States that refuse federal funds will find themselves increasingly becoming targets for criticism by local school officials and citizens who want good schools.

Not all citizens will be happy over this mutual effort of the states and federal government. Some fear federal cutbacks in spending that will force the state and the local communities to carry the financial burden. Among this group are those who oppose any federal aid on a matching basis, claiming that once a program has been initiated the federal money will stop coming, thus creating a serious financial crisis for state and local governments. Recently, a group of New Hampshire citizens organized themselves as the Public Schools Association in opposition to the acceptance of federal and state participation in schools. Demanding more local control of education, they plan to alert the public to the dangers of centralized authority.

The cost of conducting good schools will continue to increase. With more federal funds dispersed through the state education agency, there will be greater reliance on the state and on the federal government for leadership and guidance in both programming and administration. The development of larger administrative units will call for closer cooperation between local and state governments. To meet the increasing complexity of problems, local boards must draw up effective written policies, develop new techniques in working with teachers and administrators, and keep their fellow citizens better informed about modern education. Should they fail in these vital areas, local control will become a mere formality.

FOOTNOTES

1. The Literary Fund was created to provide funds for a state college. The project was abandoned because of limited interest in public support of higher education.
2. During this period, two superintendents, Amos Hadley (1867-68) and James W. Patterson (1881-93), stood out as effective leaders in education.
3. Under the district system, in a given township a district was created. In the isolated, sparsely settled mountainous areas of New Hampshire, the state sometimes did not establish school districts. The district with limited assessed valuation. This inequality of educational opportunity was the cause of grave public concern and dissatisfaction. Professor Hiram Orcutt and other members of the Dartmouth faculty were instrumental in having town control replace the district system.
5. It was at this time that federal aid to public secondary education was introduced. Fifty years earlier, the state college had been founded under the Land Grant College Act. Now Congress passed the Smith-Hughes College Act. Now Congress passed the Smith-Hughes Act of 1917 to further the technical and vocational training of our youth.
7. In the isolated, sparsely settled mountainous areas of the state, township boundaries were established, and the various sections were given a town name. However, no formal governmental organization was established by the widely scattered settlers; in fact, in many cases no school districts were created. These areas were referred to as “unorganized places.”
9. Ibid., ch. 106, sec. xxvii.
This type of law was being passed all over the country by a society swept up in a war hysteria.

Ibid., sec. 24.

The Legislature also voted that there should be a codification of the statutes and that any laws inconsistent with the act be rescinded. This codification was achieved in 1921.

APPENDIX A—NEW JERSEY CHIEF STATE SCHOOL OFFICERS 833  
APPENDIX B—ORGANIZATION CHARTS 834
INTRODUCTION

The New Jersey State Department of Education has had a somewhat checkered history. The struggle to create an effective state system of education and to build and maintain public support for the system and the schools has moved ahead in spurts. New Jersey has been among the leading states of the nation in recognizing its educational needs, but not always among the first to take action to implement the necessary programs. It is to the everlasting credit of the many farsighted and dedicated leaders who, with the determined support of educational organizations, overcame numerous obstacles to advance the development of the state system and make possible the establishment of today's strong and viable department.

New Jersey was somewhat slow — slower, at least, than some of its fellow states — to enact the necessary legislation to establish a functioning state system of free public schools. But once the foundation was laid — a century ago, in 1867 — it was done carefully and thoroughly so that a dynamic and responsive Department of Education has emerged and flourished.

In the last century, the operation of the state school system has been marked by a steady and rewarding attempt to put together the best of a sound tradition with the imaginative adaptations necessary to the education and advancement of the individual and of society. The nature and scope of the department's activities have changed greatly over the years. As the state's population soared and became more urbanized — New Jersey is the nation's most urban state today — the philosophy of education and the concept of the state's role were continually revised accordingly.

It has not been easy to add the new and scrap the old as the times and needs required. But, as the result of a carefully laid foundation, New Jersey has managed to meet its educational responsibilities. Its school programs both for college-bound and vocationally oriented youngsters compare favorably with the best in other states, and its special programs for the physically and mentally handicapped, for preschool children, and for adults have been cited as among the best in the country.

Education in New Jersey is a state responsibility. The Legislature is mandated by the State Constitution to provide for the maintenance and support of a thorough and efficient system of free public schools for the instruction of all the children in the state between the ages of 5 and 18 years.

That constitutional clause has been the cornerstone of the development of an efficient and effective public education system in New Jersey since 1876. It was written as an amendment to the State Constitution of 1844, which had recognized the need for free public schools but had not set forth the state's responsibility. New Jersey retained the clause when its constitution was rewritten in 1948.

LAYING THE FOUNDATION

The early settlers in New Jersey brought with them a deep conviction of the importance of schooling and saw to it that schools were formed in the settlements.

The state's first residents were of various origins, and they brought with them different ideas about education. Some of the settlers were Dutch from New Amsterdam, some New Englanders from Long Island and Connecticut, some Swedes from the lower Delaware; others, English, Scotch, and Scotch-Irish from England, Scotland, and Ireland; and still others, Quakers from England and the neighboring colonies. Schools were established largely in communities settled by members of one of four Protestant denominations — Dutch Reformed, Congregationalists, Presbyterians, and Quakers. Many of the settlers had already acquired a liberal education and were determined to provide educational facilities for their children, under the direction of their own church leaders.

This heterogeneity of population naturally deterred the establishment of any uniform state school plan, in sharp contrast to Massachusetts where almost every colonist was an English Puritan from England, with the result that church and state, with the same plans and purposes, could direct educational procedure uniformly.

New Jersey's first schoolmaster was Engelbert Steenhuysec. He set up shop in 1662 in the village of Bergen, now Jersey City, which had been settled by the
Dutch in extending their territory across the Hudson from New Amsterdam. Steenhuysen contracted to keep the school and to serve as church clerk. A log building erected about 1664 was used as both a schoolhouse and a church.

In these Dutch schools, the Dutch Reformed Church examined the teachers, enforced subscription to the creed, and largely determined the appointments (especially in the elementary schools), although legal support and control were apparently vested in civil authorities. In addition to the elementary subjects (reading, writing, spelling, and arithmetic), these schools taught the principles of Christianity and the catechism and prayers of the Reformed Church. Immigrants from New Sweden settled on the east side of the lower Delaware River and, like the Dutch, brought with them their elementary schools dominated by the Lutheran Church. These settlements were soon taken over by the Dutch and later included in the English territory (1).

Immigration from New England to New Jersey stepped up with the English conquest of New Netherlands in 1664. Numerous settlements came into being, including Elizabethtown, Rahway, Piscataway, Woodbridge, and Newark. The Congregational Church dominated most of the educational activities. All children were taught reading, writing, and arithmetic.

In 1668, New Jersey Governor Philip Carteret granted the Bergen Dutch immigrants a charter which stipulated that all persons should contribute according to their estates and proportions of land for the keeping of a free school to educate the youth.

This edict was received with less than unanimous acceptance. Balky citizens of surrounding villages objected to making payments to support the schoolmaster. As a result, the magistrates took what has become known as the earliest legal action in the state for the support of public education and declared in an order issued in December 1672 that all should pay their share for the schoolmaster’s support.

At this time in history, immigrants were beginning to reach New Jersey’s shores in large numbers from England, Ireland, and Scotland. Among them were Scotch Presbyterians seeking escape from persecution during the period of the Stuart Restoration (1660-89). Their religious customs and educational ideas are described by David Murray in the History of Education in New Jersey:

Education was scarcely less essential to these hardy immigrants than religion. They followed the example of their native land and their native church in providing for the education of their children. Each family saw to it that the little ones were taught the rudiments of learning. Even without schools, and when the children were too young to be sent to school, they were taught by their mothers and older sisters to read and write. So that in such a community, where the adults were intelligent and educated, it was impossible that the children should grow up ignorant. In all the church organizations it was the custom and the authorized method of administering the affairs of the congregation to have a school for the better training of the young; of course, the main end aimed at in all these church schools was to learn to read the Holy Scriptures and to be able to commit to memory the catechism of the church. The clergymen were often, in these early times, themselves the teachers in the schools connected with their churches, and for this purpose the Presbyterian clergymen of the central regions of New Jersey, being mostly from the best parts of Scotland and Ireland, were especially well adapted (2).

The English Quakers, who settled in West Jersey, first in Salem in 1675 and then in Burlington in 1677, made sure that a school was attached to every meetinghouse. In 1682, the Assembly of West Jersey gave to Burlington the island of Matinicus in the Delaware River for the maintenance of a school and the education of youth. This was the earliest grant of land in New Jersey for public education (3).

The second Assembly of the Pennsylvania Quakers outlined the plan of education for Quaker children at Philadelphia in 1683. The program provided for fundamental education in reading and writing for all until age 12, for trade education, and for the levying of a fine of £5 against parents who neglected their children’s education.

In East Jersey, the General Assembly passed laws in 1693 and 1695 authorizing the inhabitants in any town to elect three men to handle such school matters as selecting a schoolmaster and designating a convenient place for a school. If any one refused to pay his assessment of school tax, these laws provided that his property should be sold in sufficient amounts to pay the tax.

When East and West Jersey were united as a royal province in 1702, their population totaled about 14,000. East Jersey contributed 10,000 inhabitants, largely New Englanders, Quakers, Scotch Presbyterians, and some Dutch; West Jersey had about 4,000, for the most part Quakers, an increasing number of Scotch, and a few Swedes and Germans (4).

Among the settlers coming from Scotland, Ulster, England, and Germany in large numbers from the 1680s until the time of the Revolution were many redemptioners or indentured servants. These persons, in order to pay their passage to America, had sold their services for a term of years (frequently 7) and thus became a sort of slave for that time. Upon completion of their term of service, New Jersey redemptioners received 50 acres of land to cultivate in their own right and became free citizens. During this period, the presence of so many redemptioners made social and educational problems in the state more difficult.

The churches maintained schools in areas where they could be afforded, and some made special provisions for the poor. Changes took place in educational procedures, but there was no organized plan in operation for the education
of all children and youth of the colony. The period of royal government saw little legislation in regard to education.

Several grammar schools were in operation, but there was a need for a college to train men for the ministry. The Presbyterians won approval in 1746 to establish the College of New Jersey (now Princeton), and it opened in 1747 in Elizabeth. In 1776, the Dutch Reformed Church established Queen’s (now Rutgers) College.

Little attention was available for schooling in the Revolution years. Schools closed or operated intermittently. The two colleges were hard hit. Uncertainty and depression for the schools continued for many years after establishment of the national government in 1789. Politics and political change were the absorbing interest. For some three decades following adoption of the federal Constitution, New Jersey gave few indications of any serious interest in public education. There was continued action toward making sure the very poor were given some education, and there were the private schools for those who could afford them. But there was not much attention for the large proportion of children between the two extremes.

Most citizens were opposed to taxation for schools. They felt that schools and schooling were a responsibility of the churches, or of individuals, or of families—not the responsibility of the state.

But there were some leaders, notably James Parker of Perth Amboy, a member of the State Assembly, who recognized the need for some state support for education. Thomas Jefferson had introduced a school bill in the Virginia Legislature in 1779 providing for tax-supported free schools within a state education system, and, even though his plan was not approved at that time, it had some impact on Parker and others in New Jersey. In 1809 and again in 1813, Parker tried unsuccessfully to introduce legislation to establish a state fund for public schools. He finally succeeded in February 1817, when the Legislature created a state school fund for the support of free schools.

The fund consisted of U.S. bonds and stock held by the state in the Newark Turnpike Road, the Trenton Banking Company, and the Cumberland Bank, which at the time totaled $113,238. The interest was to be used for the benefit of schools. In 1818, the Legislature created a board of trustees for the fund consisting of the Governor and other officers of the state. The trustees sought to expand the base of revenue for the fund before attempting to put it to use. In 1824, the Legislature provided that one-tenth of all state taxes should be added annually to the fund.

During this time, with the amount in the fund considered inadequate to meet its designated purpose, the Legislature took steps to encourage municipalities not to rely solely on state funds. In 1828, New Jersey authorized its townships to raise money for public schools. In 1828, they were empowered to raise money locally for the purpose of building and repairing schoolhouses. An act passed that same year added to the school fund all the taxes received from banking, insurance, and other incorporated companies in the state.

In 1829, a dozen years after the fund was created, the Legislature finally put it to use. Annual appropriations were begun as part of the state’s first comprehensive school law.

**Common School Crusade**

New Jersey’s first attempt to legislate some kind of a state public school system stemmed from a general movement in the state that began in 1828 and became known as the Common School Crusade. The leaders of this movement, notably Professor John Maclean of the College of New Jersey, who later was to become president of the college (now Princeton), felt that establishment of a system of public schools was required if New Jersey was to overcome its apparent educational shortcomings. At this time, more than a third of New Jersey children were without schooling of any kind.

In January 1828, Maclean delivered an address before the Literary and Philosophical Society of New Jersey at Nassau Hall, Princeton, on “A School System for New Jersey.” Presenting a series of recommendations for legislative action, he said that townships should be authorized to raise money to build and operate schools, with the support of state funds apportioned to the necessities of the townships. He urged that provision be made for the education of teachers.

Professor Maclean recommended establishment of a State Board of Education which would be authorized to appoint a state superintendent of schools. He also advocated examining committees for the several counties to examine all persons seeking to become teachers. He issued a plea to the Legislature to enact measures as speedily as possible to afford all youth the means of obtaining a good education.

Many of Maclean’s proposals were subsequently adopted by the Legislature. Among other things, a teacher-training institution was established, of which Maclean became a trustee. A State Board of Education was created, and he became a member. Maclean’s proposed state school tax also finally came to be, although not until 1871.

Professor Maclean was a key member of a committee named by the New Jersey Missionary Society in 1828 to work to establish a system of schools in destitute parts of the state. The committee appointed Rev. Robert Baird as its agent to bring educational opportunity to areas lacking it. Rev. Baird visited every county and held public meetings to set forth the advantages of a good system of common schools. He also wrote and published numerous essays on the subject.

Rev. Baird’s efforts did much to produce a popular sentiment in favor of a system of public schools. Various organizations and agencies were working toward that ob-
jective. The numerous petitions and communications which came to the Legislature from all parts of the state were referred to a committee.

After a study, the committee issued a report stressing the importance of a well-regulated system of common school education that would permit equal opportunity for all citizens to enjoy the benefits of education. The committee found that nearly 15,000 persons over 15 years of age in New Jersey were unable to read or write and that nearly 12,000 children under 15 were deprived of the means of obtaining even the rudiments of an education. The deplorable state of education, the committee said, called for the aid of the Legislature in establishing common schools. The committee declared it was time to put the school fund to use.

Acting on the report, the 1829 Legislature passed the first comprehensive school law in New Jersey. The law appropriated $20,000 annually from the school fund, which at the time amounted to $245,204 and was producing an interest of about $23,000. The money was to be apportioned to the counties in the ratio of the state taxes paid by them. The county board of freeholders was then to apportion the money to the townships. The legislation required each township to vote an additional sum for school purposes, or otherwise state aid would be withheld. Each township was authorized to elect a school committee to designate convenient school districts, to examine and license teachers, and to arrange for creation of a board of trustees for each district. The trustees were to provide a schoolhouse and a teacher and to compile a list of all children in the district between 4 and 16.

As soon as the law was enacted, however, the foes of the common schools, led by powerful private school interests, organized a crusade in opposition. They succeeded in 1830 in prevailing upon the Legislature to repeal the section providing for election of township school committees. This meant that the various committee duties in operating schools could no longer be performed.

The following year, the acts of both 1829 and 1830 were repealed, and another was passed. Although the same amount of money was appropriated from the school fund as before, its use was changed markedly. Whereas the public school money apportioned to the townships, together with that raised by township tax, had been used exclusively for schools established by the township committee or district trustees, these funds could now be used for the benefit of all schools, whether public, private, or parochial. This change was made in obedience to the demands of the religious denominations in the state. The money was distributed among all schools in proportion to the number of children taught, thus serving to dissipate the annual apportionment. The act allowed for a local vote to determine whether the money should be apportioned in accordance with the number of indigent poor in each school, rather than the total enrollment. The act contained no provision for forming school districts or for examining and licensing teachers.

Although dismayed by the turn of events, the friends of the common schools were not discouraged and continued to fight. But several years were to pass before prejudices were overcome and the general plan of a state system of schools was finally accepted.

With increasing agitation for legislation to change the 1831 school law, Governor William Pennington declared in his message of January 1838 that public sentiment and public interest alike demanded a thorough revision of the school system. He said the system was defective in that the common schools were not giving the mass of the population a sound education. The system, he said, should be revised without delay.

A convention of friends of the common schools assembled in Trenton later that month and declared the school laws defective. It recommended appointment of a state superintendent of common schools. The convention named a committee to issue an address to the people. The address said, in part:

Every free State must provide for the education of all her children. Tax yourselves for the support of common schools, and you will never be in danger of taxation from a foreign power. You will need less taxation for the support of pauperism and the punishment of crime. Look to your school houses. See that they are convenient of access; that they are comfortable; that they are neat and tasteful. Look to the teachers. See that they are taught themselves and apt to teach — men that fear God and love their country. See that they are well accommodated, well treated, and well remunerated. Respect them and they will respect themselves, and your children will respect them. Look well to the scholars. Remember, you are to grow old among them. Remember, you are to die and leave your country in their hands.

In response to this expressed will of the people, the Legislature in 1838 repealed the acts of 1831 and enacted a law that restored many of the features of the act of 1829. The new legislation provided that township school committees again were to be elected, townships were to be divided into school districts, and district trustees were to be elected. Also, the bill increased the annual appropriation from the school fund to $30,000, fixed the maximum of school money that could be raised by the townships at twice the amount received from the state, authorized the board of freeholders to elect boards of county examiners for teacher licenses, and raised the minimum age of children to be included in the school census from 4 to 5. A feature of the 1831 law that was retained in the new law was that authorizing certain religious organizations to draw a portion of the public funds for the support of schools under their care.
Sentiment for public education continued to increase, and the movement drew strength from the establishment of a professional organization at New Brunswick in 1843 called the Society of Teachers and Friends of Education in New Jersey. About the same time, Newark gave birth to a group known as the Newark Educational Society, and in 1845 a Society for the Improvement of Common Schools was established (11).

Feeling was widespread for complete reorganization of education and establishment of a state system comparable to those being established in other states, including a state superintendent and provision for training and certification of teachers.

In keeping with a democratic reawakening among the people and largely through the efforts of James Parker, the new Constitution of 1844 (replacing the Constitution of 1776 which was then the oldest among the states) included the assumption of responsibility by the State of New Jersey for free public schools. It declared:

The funds for the support of free schools and all money, stock and other property which may hereafter be appropriated for that purpose or received into the treasury under the provision of any law hereafter passed to augment the said fund shall be securely invested and remain a perpetual fund, and the income thereof, except so much as it may be judged expedient to apply to an increase of the capital, shall be annually appropriated to the support of public schools, for the equal benefit of all the people of the state; and it shall not be competent for the legislature to borrow, appropriate or use the said fund or any part thereof, for any other purpose under any pretense whatever (12).

This provision, however, could hardly be realized until attendance at public schools was made free by prohibiting tuition charges and by making arrangements for state and local financial support, as the Legislature of New Jersey did in 1871. Schools may have been free in theory under the 1844 constitutional provision, but they seldom were in practice; it was the custom to charge tuition for public schools as well as for private schools. Townships might refuse to raise money for schools, or they could raise a minimum of twice the amount received from the state school fund. State money was returned to the counties and townships on the basis of taxes paid — in other words, on the basis of wealth, not on the basis of the number of children to be educated. Consequently, the poorer sections of New Jersey received little state money, and at the same time there was little or no money raised by taxation for schools in these townships. Further, parents in these sections could hardly afford to pay tuition for the schooling of their children. The result was that schools in some districts remained closed or were open but for a short time — 2 or 3 months during the year (13).

Governor Daniel Haines in his legislative message of 1845 urged revision of the school law, declaring that it was a great shame that New Jersey, without any state debt, should suffer such neglect in the means and blessings of common school education. Later that year, the Legislature authorized the trustees of the school fund to appoint a superintendent of public schools. His authority was limited to the Counties of Essex and Passaic, but other counties wanting to come under his supervision could do so through their boards of freeholders. In April 1846, this authorization was superseded by a comprehensive law extending the jurisdiction of the superintendent over the whole state and designating the office as state superintendent of public schools, to be named by the school fund trustees.

The act of 1846 made obligatory the licensing of teachers, either by the county examiners or by the township superintendent. No teacher was entitled to a salary unless he possessed a certificate. Under the act, the townships were required to raise school money in an amount at least equal to that received from the state, and not greater than twice such amount. The townships were authorized to elect town school superintendents to perform the duties formerly assigned to the township school committees. These officers were allowed $1 a day for their services. The town superintendents were required to visit schools at least once every quarter, to examine and license teachers, to hold school moneys, to apportion and pay out the same, and to make an annual report to the state superintendent.

Filling the Office

The year 1846 saw the appointment of New Jersey's first state superintendent, Dr. Theodore F. King, a physician intensely interested in public education. In his first report as state superintendent, he said that the general feeling in regard to the common schools was dull and dormant and needed awakening. Dr. King traveled widely throughout the state and visited many schoolhouses. Although he found many shortcomings, which he duly reported, the superintendent put the greatest emphasis on the good facilities he found, citing these as examples to foster the spirit of improvement he was determined to lead. The doctor served 6 years in the job and in that time did much to focus attention on the need to upgrade the teaching profession. He urged formation of teacher associations and establishment of a training school for teachers. The first teachers institute was held in Somerville in June 1849.

Prompted by Superintendent King, Governor George Fort in his inaugural address in 1851 emphasized the need for a more complete system of free public schools. The Legislature of that year responded by increasing the state appropriation from the school fund to $40,000 and appropriating an additional sum of $40,000 out of the state treasury, making the annual school appropriation...
$80,000. This act changed the basis of apportionment of the state appropriation. It was made to the counties in the ratio of population and to the townships in the ratio of the school census. No longer could the wealthy sections of the state receive the greater portion of state aid. The age range of school children was changed to 5 through 18. The maximum amount of school money that could be raised by the townships was set at $3 per child. The public money was to be used, as long as it lasted, in maintaining free schools. The remaining portion of the year, the schools were to be supported by tuition fees.

In 1852, the school fund trustees elected Dr. John H. Phillips state superintendent of public schools. Like his predecessor, he was a physician concerned with public education. In October 1853, Dr. Phillips issued a call for an educational convention in Trenton. The convention urged liberal state appropriations for education in the state, recommended formation of associations of friends of education, and advocated establishment of an educational journal in New Jersey to spread information among the people and to promote in various ways the cause of common school education (14).

The teachers at the convention called for a meeting to organize a state teachers association. December 28, 1853, was the date decided upon for this meeting, and on that day in New Brunswick's Bayard Street School, the organization now known as the New Jersey Education Association was formed. The association named its first state agent, Dr. Christopher Columbus Hoagland, the following year; like Dr. King and Dr. Phillips, this man was a physician who had abandoned the medical practice to become an educator. The association was to have a major role in advancing public education in the succeeding century by securing significant legislation affecting operation of the schools and by bolstering the teaching profession and the welfare of its members.

In 1854, teachers institutes were first established by law. The state appropriated $100 for each institute of not less than 40 teachers of common schools, in any county or in two or more adjoining counties of the state, who desired to assemble for that purpose for not less than 5 working days. The organization of any such institute, i.e. place of meeting, and its general management were to be under the control and direction of the state superintendent.

Although educators in New Jersey were among the first in the country to advocate establishment of schools for the professional training of teachers in the 1820's, it was not until 1855 that one was actually established. By that time, four other states had founded normal schools. The legislation for the establishment and support of a normal school in New Jersey appropriated $10,000 for its support and provided for a board of trustees to locate and operate a state normal school. State Superintendent Phillips, by virtue of his position, became a member and secretary of the board. Choosing among several site offers, the board selected Trenton. The school opened with 15 students in a temporary building in October 1855.

The close working relationship between the state superintendent's office and the State Teachers Association in the early years was shown in 1860 when the school fund trustees elected the association president, Frederick William Ricord, as state superintendent. Ricord had conducted a private school in Newark from 1845 to 1847, was a member of the Newark Board of Education from 1852 to 1869, and was president of the teachers association in 1860 when he became superintendent. He proved to be a superintendent who liked to observe classroom work firsthand, as shown in this report he made in 1863:

While riding on official business through a well-settled and beautiful country district, I stopped my horse in front of a neat and newly built school house, prompted by a desire to see if matters within corresponded with appearances without. The teacher politely offered me a seat but proceeded with an arithmetic lesson. A small urchin seated at the end of one of the forms commenced the old fashioned recreation of snapping flies with a bit of whalebone. The amusement did not, to be sure, occasion much disturbance, but it was a breach of decorum, to say nothing about the feeling of the flies. The teacher, who was at the moment standing in the middle aisle making some explanations to the class, moved slowly toward the young Negro, and without changing her voice, or ceasing to speak, raised him gently from his seat by the aid of one of his ears, and still continuing her explanations to the class, opened a closet, thrust him in, buttoned the door, and returned as if nothing had happened (15).

In 1864, the school fund trustees named Caleb M. Harrison state superintendent. A movement was under way among education leaders in the state and members of the Legislature to create a State Board of Education. Commenting on the proposal in 1865, Harrison said: “When New Jersey enacts that the interests of public instruction shall be placed in the hands of a State Board of Education, we may confidently look forward to the early dawn of a brighter era in our educational history” (16).

A Functioning System

The years 1866 and 1867 were active ones for education legislation in New Jersey, effecting significant changes in the administration of public education. Enabling legislation was enacted early in 1866 to create the first State Board of Education. The board consisted of the trustees of the school fund and the trustees of the normal school.

At its first meeting, in March 1866, the board elected 29-year-old Ellis A. Apgar as state superintendent at an annual salary of $3,000. A former professor of mathematics at Trenton State Normal School, he was widely known for
his ability as an educator and for his intense interest in improving public education.

Near the end of the 1866 session of the Legislature, the section of the school law providing for distribution of a portion of the public money to schools under the management and control of religious denominations was repealed, and all the school moneys have since been reserved for the exclusive support of public schools (17).

In his first year as superintendent, Apgar realized that there was a need for more comprehensive legislation. As it was, his duties were limited, there were no powers spelled out for the board, and no public system was defined. He felt that the state school system should be better organized, with county school superintendencies established to afford liaison between the municipalities and his department. He long had felt that the weak feature of the state school system was its supervision by town superintendents. There were 230 town superintendents in 1866. They could not be brought together for consultation or instruction, nor could any uniformity in the performance of their duties or in the educational work of the state be secured by correspondence. Apgar also considered a number of these men incompetent.

In 1866, he recommended a change in this cumbersome system, stating his argument as follows:

Let the State secure the constant services of 21 active, intelligent and right-principled men to look after and superintend the education of her children, and no one acquainted with the importance of proper school supervision can doubt the happy results. The provisions of the law and the instructions of the State Board of Education can be carried out; harmony of action on the part of all school officers can be secured; the standard of qualification of the teacher's profession will be elevated; county institutes will be better organized and better attended; statistics will be more readily and accurately reported; the provisions of the school law can be made known and explained to school officers and patrons; trustees and teachers will be made familiar with their duties and required to make accurate school reports; public attention will be aroused to the importance of encouraging and sustaining the educational enterprises of the day; the school finances of the State will be carefully looked after and faithfully reported; valuable suggestions occurring to any one in the performance of his duties will be made known to the rest; and unity of design and harmony of action will be secured by the facility with which they can meet and consult each other's views (18).

A bill embodying this change was submitted and made part of “An Act To Establish a System of Public Instruction” enacted by the 1867 Legislature in March 1867, to be effective immediately. The act included several revisions in the 1866 law, mainly toward enlarging the powers and duties of the State Board of Education. The board was given the authority to appoint county superintendents whose yearly salaries were to be 10¢ per child in the county between 5 and 18, provided the salary be not less than $300.

The 1867 legislation abolished the office of township superintendent, but the townships were required to raise by tax every year, in addition to the amount apportioned to their use, an amount of money not less than $2 nor more than $4 for every child in the township between the ages of 5 and 18. City districts were retained. The school districts of the townships under the supervision of the new school official for the county received much more definite and specific control through their school trustees. The state board was required to make rules and regulations for carrying out the provisions of the school laws and for examining and licensing teachers. It also was given authority to hear and decide appeals from decisions of the state superintendent.

The law of 1867 provided for state, county, and city boards of examiners. Without proper certification, teachers could not receive salaries. The legislation authorized the county superintendent to supervise the public schools of his county, with the exception of cities having a city superintendent of schools. The county superintendent heard all controversies arising under the school laws, with the provision that appeals from his decision could be made to the state superintendent.

The law of 1867 also created the State Association of School Superintendents for county and city superintendents, the president to be the state superintendent; increased state appropriations from $80,000 to $100,000 annually ($60,000 from the revenue of the state and $40,000 from the income of the school fund); specified that no school district could receive any part of state aid if that district did not maintain a public school for at least 5 months; and forbade corporal punishment in all public schools.

State Superintendent Apgar in his report for 1869 praised the soundness of the 1867 law but noted two defects: It did not make the public schools truly free, and it did not ensure adequate financial support. He rallied public opinion to his plea for necessary revisions, and in 1871 the Legislature enacted “An Act To Make Free the Public Schools of the State.” The act contained the features suggested by the superintendent and made all the public schools of the state entirely free. The uncertain township tax was replaced by a uniform state school tax of 2 mills per $1 assessed valuation. The public schools were to be in session 9 months each year. If the money for schools from state and other sources was not sufficient to maintain the schools for 9 months in any township, then that township was to levy a tax to meet the deficiency. School trustees were prohibited from charging tuition fees.

In 1874, New Jersey passed its first compulsory school attendance act, requiring children between 8 and 13 to attend some school for at least 12 weeks in the year,
including 6 consecutive weeks. Securing compulsory attendance had been one of Apgar's initial proposals when he took office. Reports from county superintendents showed that, despite increasing enrollment, a substantial percentage of children of school age was not enrolled. The 1874 law provided for an annual census in July to determine the number of absentee children (19).

In 1876, the state ratified amendments to its constitution barring appropriation of state money for the use of any society, association, or corporation whatever and mandating the Legislature to provide for the maintenance and support of a thorough and efficient system of free public schools for the instruction of all children between 5 and 18.

Thus, by 1876, Ellis A. Appar saw virtually all his basic concepts of the needs of education embodied into law. These concepts have stood the test of time, and he has been called "the man who may rightfully be considered as the father of the state system of education in New Jersey" (20). In his 20 years as New Jersey's state superintendent, Appar was the leader in planning and carrying out the revamping of education in New Jersey and the establishment of the foundation of a system that has remained fundamentally unchanged.

Appar was succeeded by Edwin O. Chapman, who had compiled a varied yet impressive record as teacher, high school principal, colonel in the Union army, superintendent of Jersey City schools, member of the Jersey City Board of Education, member of the State Assembly, and an editor with the American News Company.

Chapman was appointed state superintendent by the State Board of Education in March 1885. He had no way of knowing that before the end of his service as chief state school officer, in 1892, he would become involved in one of the most unusual and intriguing chapters in New Jersey's education history. It was midway in Chapman's service that, as the result of a political hassle, the power of appointing the state superintendent was shifted from the Board of Education to the Governor, where it has remained ever since.

When Chapman's 3-year term expired in March 1888, the board appointed Charles W. Fuller to replace him. This action was somewhat unusual because, at the time, Fuller was a Republican leader in the assembly and the majority of board members were Democratic. Furthermore, Fuller, a lawyer, had had no experience as a working schoolman, although he had served on the Bayonne school board and the state board itself. His appointment was made possible because a Democratic member of the board agreed to support Fuller in the hope the Republican-dominated Legislature would then confirm his reappointment as a judge.

As it turned out, the judge was not reappointed, but Fuller had gained the superintendent's chair. He was unseated, however, after serving less than a year, as soon as the Democrats gained control of the Legislature in 1889. They decided the quickest way to oust Fuller would be to enact legislation giving the Governor power to appoint the superintendent, effective immediately. The bill passed in the State Senate on February 11 and in the assembly on February 13. Democratic Governor Robert S. Green signed it on February 14. The Governor rounded out the legislation annulling Fuller's appointment by nominating Chapman to a 3-year term on February 20. The Senate confirmed Chapman on February 28, and he returned to work for a second term. The Democratic newspapers of the day considered it a triumph of justice, but the Republican newspapers thought the removal of Fuller in this fashion was a dastardly deed (21).

In 1892, the Governor named Addison B. Poland, who had been superintendent of schools in Jersey City and president of the State Teachers Association, as state superintendent. In that year, the State Normal School and the School for the Deaf were placed under the jurisdiction of the State Board of Education.

The Township Act of 1894 consolidated all the small districts into one district with a board of education for the township; township boundaries were also to be the district boundaries. The act was followed by the appointment of supervising principals in many townships. Many small districts previously had not had such principal positions. City and borough districts were not changed by the act.

As a direct result of the 1894 act, the number of school districts in the state fell sharply from 1,408 in the 1893-94 school year to 374 in the fall of 1894. Children who lived in remote areas could be transported to and from school at public expense, with the necessary funds to be raised by a special tax the school districts were authorized to impose.

The State Board of Education was reorganized in 1894 to include two members from each congressional district. Members were to be appointed by the Governor for 5-year terms.

The Free Textbook Act, passed in 1894, provided free textbooks to all pupils enrolled in public schools. High schools came late in New Jersey partly because of the opposition of private academies and partly because of the long period consumed in the establishment of the common schools. There was a well-established belief, held chiefly by an ultraconservative group, that more advanced education was a privilege of the "better class" and should not be extended to the children of the masses. This element was critical of the idea-advanced by the progressives that public high schools should be expanded throughout the state. A principal obstacle to high schools appeared when the taxpayer realized that he was required to pay taxes for the support of the common schools and also was compelled to provide funds for the maintenance of a high school, to which he strenuously objected. It was not until 1895 that legislation was enacted establishing high schools in the larger counties. This meant that New Jersey, despite its
geographic location, its resources, and its wealth, was late in adopting a complete system of education (22).

As the nineteenth century drew to a close, New Jersey had accepted its responsibility for a free public school system, had become really conscious of its educational problems, and was making a praiseworthy effort to solve them.

**TWENTIETH-CENTURY SPURT**

The dawning of the twentieth century seemed to awaken a new spirit in New Jersey to move more rapidly and more decisively to strengthen and upgrade the state system of public education. The Legislature enacted measures in 1900 to ensure adequate supervision, more modern facilities, and a sounder structure.

Having accepted its constitutional mandate to provide free public schools for all children between 5 and 18, New Jersey decided in 1900 to go even further. Schools were made free for children between 7 and 12, instead of between 8 and 13, and no child under 15 could be employed unless he had attended some public or private school within the preceding 12 months.

The state passed legislation making the kindergarten an integral part of the public school system in March 1900, and many districts wasted little time in forming such classes.

In his report for the year 1900-1901, Charles J. Baxter, who had become state superintendent in 1896, stated that the number of children going into kindergarten classes during the year was a substantial 15,006. This was the first official record of the kindergarten enrollment in New Jersey schools. Baxter said in his report:

Other things being equal, pupils who have had the advantages of kindergarten invariably outstrip their classmates in the higher grades who have not had such training. When the kindergarten and the high school shall become conveniently available to every child in the State and the kindergarten spirit shall pervade all school work, our school system will then make a much closer approach to present ideals. Still higher ideals then will arise and the struggle toward the genuinely ideal will ever continue (23).

A most significant statistic concerning education in New Jersey at the turn of the century was that in 1901 there was a decrease of 63 in the total number of private schools compared with 1900. This reflected the growth of the public system. In that same year, 30 new public schools were built and 69 public schools enlarged. As Baxter commented in his report,

This is the very natural result of the increased efficiency of our public schools... The public school should be so well-equipped, its instruction so excellent, its moral tone so pronounced, and its environment so attractive that no child, save for exceptional reasons, will be sent elsewhere (24).

There were 336,432 pupils enrolled in New Jersey public schools in the 1900-1901 year, and the size of the average class was 44 pupils, with some classes up to 50 and 60. In commenting on the size, Baxter was most pleased that it had gone down from the figure of 46 in the previous year. He said:

This is a most encouraging advance on right lines. No teacher should be given more than 40 pupils and he could accomplish far more for the community and the State if not required to teach more than 30. The greater the number of pupils placed under the instruction of one person, the greater the amount of force expended in maintaining order and the less his teaching power; also the greater the tendency to make use of formal and cumbersome school machinery which consumes valuable time in its operation and the more rare the opportunity to assist and encourage the individual pupil. Boards of Education that permit an enrollment of 50 or 60 pupils in one classroom really do economize in the expenditure of school funds, but, in so doing, are reprehensively wasteful of far greater values — the teacher's health and vitality and the pupil's most precious years (25).

The average annual salary of teachers in 1900-1901 was $543.62. The state school tax for that year was $2,317,825, based on $5 for each of the 457,479 school-age (between 5 and 18) children reported in the census. Average daily attendance was 207,947, less than half the number of eligible children counted in the census. Added to the state school tax for apportionment among the counties, also on the basis of the census, was the sum of $200,000 from the state school fund. All of the 389 school districts operating at the beginning of the 1900-1901 school year voted a school tax to supplement the state aid.

Under legislation enacted in 1900, local boards of education were authorized to appoint supervising principals, and, to encourage their use, any district employing a superintendent or a supervising principal full time was to receive a state appropriation of $600.

Other legislation in 1900 required that the state supervise schoolhouse planning, construction, and repair. County superintendents were delegated the responsibility of noting the condition of school buildings and sites and advising boards of education regarding school construction, heating, ventilating, and lighting.

In summing up the condition of public education at the time, Baxter declared in his report for the year 1900-1901:

The first year of the new century finds New Jersey ably maintaining her educational rank among the
sisterhood of states. Our most liberal, intelligent and progressive citizens were never so interested in the public schools, never so deeply impressed with their importance to the Commonwealth, and never so helpful in the effort to establish a correct educational sentiment throughout the State. A higher standard of qualification and better salaries for our teachers, more thorough and effective instruction, more advanced and rational courses of study, and more adequate and sanitary school accommodations are the demands of the times, and to these the people are ably and generously responding. Progress is the watchword (26).

During the early years of the twentieth century, Charles J. Baxter continued to press for the legislation he felt was needed to widen the benefits of an education program to reach a greater proportion of the population and to ensure better teacher salaries.

Legislation enacted in 1903 authorized school boards to establish kindergartens for children between 4 and 7, authorized evening schools for persons over 12, set up the first statewide minimum salary schedule for teachers and administrators (the teacher minimum was $408 and the maximum ranged from $1,200 for females and $2,400 for males), required teachers to keep school registers, authorized business managers for city school districts and established the Teachers Retirement Fund.

The State Board of Education in 1904 created the state inspector of high schools office and appointed Louis Bevier to the post. During the 5 years he was inspector, the number of approved high schools increased from 67 to 133, and the enrollment in public schools increased more than 50 percent and the number of teachers more than 60 percent. After the state, in 1907, began to reimburse districts without high schools 75 percent of the transportation costs for pupils attending high schools outside these districts, the number of such pupils increased from 1,817 that year to 3,151 in 1909. From 1904 to 1909, the amount of money expended for high schools in New Jersey was more than doubled. Dr. Bevier worked for agricultural high schools in rural communities and manual training high schools in cities and towns.

New Jersey passed its first teachers tenure of service act in 1909. This gave tenure to teachers, principals, and supervising principals completing three years of "good behavior and efficiency" in a district. The legislation resulted from continuing efforts by the State Department of Education and the teachers association to strengthen the professions and thereby benefit education generally. Salaries were improving. Teachers were staying on the job longer; the average teaching experience increased from 4 years in 1896 to 9 years in 1908. Teachers were better trained; in 1910, two-thirds of the teachers in the public schools were graduates of either normal schools, city training schools, or colleges (27).

**Reorganization of 1911**

A movement to reorganize the State Department of Education took shape between 1907 and 1909. Much legislation involving the operation of the public schools had been enacted since establishment of the state system in 1867. Enrollment had increased fourfold in that period, compared with a population increase of hardly threefold. Various education groups and social organizations began to express concern that the state department as it was then constituted lacked sufficient size and power to direct the continued expansion of educational services in the state. The department was little more than a business office for gathering data and compiling reports. There was no adequate machinery by which the state superintendent could exercise a leadership role in giving direction to efficient teaching and efficient school organization. The groups seeking a reorganization of the department prevailed upon state legislative leaders to set the legal wheels in motion (28).

With the support of Woodrow Wilson, then Governor of New Jersey, a resolution was adopted by the State Senate in April 1909, authorizing its president to name a committee of three Senators, together with the members of the State Board of Education, to study the education system and make recommendations.

The Senate directed the committee to investigate the methods and practices, expenses and disbursements of the free public schools of the state and to determine what, if any, amendments should be made to the present school laws for the purpose of securing greater economy in school expenses without decreasing the efficiency of the public school system.

In March 1911, nearly 2 years after the committee had been named, the Senate received the report on the educational survey. The report recommended a reorganization of the Department of Education, including establishment of a new Board of Education and new machinery for the operation of schools, with stronger state supervision and control. The major proposals were enacted by the Legislature in April 1911, to become effective in July of that year.

The reorganization abolished the State Board of Education with its 20 members and replaced it by a board with 8 members. The board was authorized to appoint an inspector of buildings who was to visit the schools and make reports, and an inspector of accounts to examine the accounts of the local school districts. The board also was to prescribe a compulsory, uniform, and simple bookkeeping system for districts.

The state superintendent of public instruction's office was abolished and replaced by that of commissioner of education to be appointed by the Governor for a term of 5 years. The reorganization plan authorized the commissioner to appoint four assistant commissioners, with the advice...
and consent of the board. The assistants were designated specifically to supervise secondary education, elementary education, and industrial education, respectively, and to hear controversies and disputes.

Authority vested in the commissioner also included the prescribing of minimum examinations throughout the state for graduation from grammar schools and for admission to high schools, and of a minimum course of study for the elementary schools and for the high schools.

The reorganization also provided for county superintendents to be appointed by the commissioner for terms of 3 years and required them to hold the highest teacher certificate issued in New Jersey. It further established special classes for the blind and the deaf and also for pupils 3 years or more below the normal, who were to be placed in classes of between 10 and 15 pupils.

The teacher-licensing system was changed to a single state system, thereby doing away with some 22 standards for the certification of teachers and replacing them with a single state standard. The state established four forms of certificates: provisional, limited, permanent, and special.

New legislation specified that plans and specifications for school building construction were to be submitted to the state board for approval, instead of only for suggestions and criticisms as in previous legislation.

In 1911, Governor Woodrow Wilson appointed Calvin N. Kendall as the new commissioner of education.

Former Indianapolis school superintendent, Mr. Kendall organized the department in three divisions—educational, law, and business—and assigned his assistants to definite positions within the three divisions, at the same time freeing himself of detailed work in order that he might have time as "the general advisory and supervisory officer of the state educational system." The commissioner and his assistants, working with the county superintendents, did much field work inspecting the public schools in various sections of the state (rural and urban) and talking with teachers and others employed in the schools, with members of boards of education, and with other residents of the school districts. Thus were Kendall and his assistants not only to obtain firsthand information about school conditions and school support, but also to assist directly in furthering remedial or constructive measures for the schools and in strengthening public support (29).

The year 1913 witnessed significant revisions of New Jersey's educational statutes. A compulsory school attendance act passed that year required all children ages 7 through 15 to attend school (30). County superintendents were made direct field representatives of the state department and required to devote full time to their duties. While some of their powers were transferred to assistant commissioners of education, the duties of the county superintendents in general administration and in supervision were greatly increased. The requirement that their appointment be approved by county boards of freeholders was eliminated.

The Legislature authorized establishment of vocational schools at the local and county levels. The law provided that, subject to the approval of the commissioner and state board, the board of any district, or two or more districts, might establish and maintain industrial, agricultural, and household arts schools. Each such school was to receive a $10,000 annual state appropriation. Response to the new legislation was slow at first. The act encouraged some big-city high schools to add vocational programs, but no statewide rush developed to give vocational education to the state's children. One result of the act was the growth of agriculture and home economics courses at high schools in rural areas.

Vocational education programs grew markedly with the passage by Congress in 1917 of the Smith-Hughes Act to promote vocational, agricultural, and industrial education. The act made federal aid available for the salaries of teachers, supervisors, and directors and for the training of teachers of vocational subjects. New Jersey was one of the first states to accept the federal funds. The allotment for New Jersey in 1918 was $42,550, but this amount increased annually until it reached $200,000 in 1926 and succeeding years. The act provided for distribution of the federal funds through the state department.

Throughout Kendall's occupation of the chief state school position (1911-21), he devoted much of his time and energy to bolstering the quality of instruction in the schools of New Jersey—particularly in the rural areas—and in boosting the image of the county and local school administrators.

In 1915, he observed:

The public does not sufficiently realize how much the efficiency of a system of schools depends upon the character of the leadership. A high-minded, courageous, industrious, intelligent, trained superintendent of schools is a great educational asset. Nor does the public realize the differences that exist in different systems of schools in the same state and in different schools of the same city. Why these differences? They are due to the quality of the work of the superintendent and the supervising principals in charge of the respective systems and schools (31).

In that year, the state established a certificate for supervising principal requiring 1 year of experience as principal or supervisor and a passing mark on examinations in school organization and school law.

The role of the state department in providing help and advice to upgrade the effectiveness of teaching and the quality of education generally in the rural areas gained considerable strength in 1916 when county superintendents were authorized by legislation to appoint helping teachers. The act was passed on recommendation of the state depart-
ment after a year's successful experiment involving the use of a teacher to assist in supervision of the rural schools in Hunterdon County.

The helping teachers quickly proved the value of the legislation by the assistance they gave in the numerous one- and two-room schools that existed throughout the state. At the time, New Jersey was encouraging consolidation of the small schools into larger units to enable more effective instruction and to provide additional services. An important influence was the assumption by the state of 75 percent of the expenditures for the transportation of pupils to approved public schools outside the home district and, in addition, a portion of the tuition charges.

The country's involvement in World War I had a distinct impact on New Jersey schools. The Legislature in 1917 directed that a course in physical training be taken by all pupils, excepting kindergartners, in the public schools. The poor physical condition of many young men who were called for military service at the time of this war was largely responsible for this law (32). In 1918, an act directed that each high school offer a course in community civics and a course in problems of American democracy. In 1919, the Legislature mandated a course for elementary grades in geography, history, and civics of New Jersey. Under these acts, the required courses were to be prepared by the Department of Education, which had the effect of strengthening the department's interest and voice in curriculum developments in the schools.

As a result of the increased attention from the state department, improvements were going ahead rapidly both in school facilities and in instructional programs. Courses in music, painting, shop and craft work, sewing, and cooking were being added to the curriculums in most high schools. And auditoriums, libraries, science laboratories, and gymnasiums were found in many high schools. The state was preparing and distributing guides for elementary school programs.

The upsurge in education in the state gained national recognition. In 1919, the Russell Sage Foundation ranked the schools of New Jersey fourth in efficiency of all the states of the Union, first among the states east of the Mississippi (33).

During this period, changes also were taking place in arrangement of grades. The New Jersey commissioner and his assistants had spoken out for the 6-year high school, or some modification of it, as early as 1912. Some districts by then already were combining the seventh, eighth, and ninth grades into separate schools. By 1925, junior high schools had been established in many cities. The junior high movement was accompanied by a greater attention in the schools to individual differences, to music, art, literature, leisure time activities, manual arts, and a better understanding of occupational life in industry, agriculture, commerce, and the home.

With the expansion of the public school system, the need for additional teachers was becoming all-important. Two state normal schools were in operation—Trenton and Montclair (the latter established in 1908)—when Commissioner Kendall in 1912 recommended that training be provided for teachers in service and that at least two additional state normal schools be established.

The majority of New Jersey's teachers at that time was being supplied from normal schools outside the state. In 1913, the Newark Normal School, built by the City of Newark, was taken over by the state. The Legislature of 1913 appropriated $14,000 for summer schools for the training of teachers. Courses for in-service teachers sprang up at Rutgers, where the education courses were directed by Charles H. Elliott from 1915 until he became state commissioner of education in 1927.

In 1923, Glassboro State Normal School was established, and Paterson City Normal School became a state normal school. Jersey City Normal School joined the ranks in 1929. These six normal schools—Trenton, Montclair, Newark, Glassboro, Paterson, and Jersey City—subsequently became state teachers colleges. In 1958, the word teachers was dropped as the schools began to develop into multipurpose institutions. They remain today as New Jersey's six state colleges. The six normal schools had been under the direct control of the State Board of Education until 1926 when the Legislature vested control and management in the commissioner.

Commissioner Kendall was succeeded in 1921 by John Enright, who had enjoyed a highly varied career as a teacher, county superintendent, president of the State Teachers Association, and assistant commissioner in charge of controversies and disputes. Enright served 4 years as commissioner and was followed by two Rutgers professors, John H. Logan (1925-27) and Charles H. Elliott (1927-43).

Until 1929, the general control and management of public education in New Jersey—elementary, secondary, and higher education—were vested in the State Board of Education. Then the Legislature created the State Board of Regents consisting of 9 members appointed by the Governor. Its duties were to determine the state's needs regarding higher education and also to exercise custody over existing state property and facilities for higher education. Higher education then was lagging in facilities and financial support. (It should be recalled that from the time of the early settlers, a considerable proportion of New Jersey's college students attended institutions outside the state. The greater proportion of the state's population for many years lived in what might be called for all practical purposes the suburbs of New York City and Philadelphia and became accustomed to the advantages of higher education available there.)

In response to a growing demand, the Legislature in 1929 permitted the operation of school cafeterias. In 1931, school boards were authorized to establish kindergartens
for children between 4 and 5 and required to establish kindergartens for children between 5 and 6.

The Depression brought severe problems in financing the schools. Teachers were released, class sizes increased, appropriations curtailed, the yearly supply of textbooks reduced almost to the vanishing point, the annual increment unpaid, special services eliminated, and teachers asked to accept a 10-percent reduction in salary. Everywhere was heard the cry of more economy until, in numerous instances, education was reduced to a mere skeleton (34).

Economic conditions were such that many worthy youth were denied the opportunity of higher education. To solve this problem, eight emergency junior colleges were organized during 1933 and 1934, with approval of the State Board of Education. These institutions had the dual purpose of preparing for advanced standing in college, if and when the family economic conditions improved, and of providing a terminal course. Federal relief aid was secured to reduce the costs of operation of these colleges, which operated in high school buildings from 4 to 10 p.m. The teaching staff consisted of college professors who, because of retrenchments in many colleges due to decreased enrollment, were willing to accept a position which barely provided necessary living expenses. The Legislature created a supervisory board for the junior colleges, and a staff member of the state department was appointed to work with the board. Most of these junior colleges were discontinued at the close of the Depression (35).

Enrollment in secondary and vocational schools increased greatly during the Depression. Federal funds were made available for new structures and additions, as well as for adult day and evening classes under the direction of the public school authorities. With municipal financial resources hard hit, a state public school fund was created in 1935 for the support of New Jersey's public schools and the equalization of educational opportunity. The state established a foundation program allotting a minimum aid to each district of $13 per elementary pupil and $22 per high school pupil and equalization aid of the excess cost over a 4.75-mill local tax. The total state aid was to be not less than $57 per elementary pupil or $98 per high school pupil. The money for this fund was to come from the railroad property tax, income from the state school fund, interest on the federal surplus revenue fund established in 1837, and other funds to be appropriated for the public schools by the Legislature.

Between 1911 and 1944, public education in New Jersey changed considerably in scope, content, and procedure. Some of the subjects and activities prescribed by law for the public schools of the state were physiology and hygiene (including special attention to the nature and effects of alcoholic drinks and narcotics), geography, history, and civics for advanced grades or intermediate schools; problems in American democracy for senior high school grades; and certain instruction in fire and accident prevention, and physical training (36).

There were periods of uncertainty and drifting when it seemed that the people of New Jersey were very doubtful about assuming responsibility for public education. The state was very late in assuming its full responsibility for free public schools. But it managed to make provisions for state and local boards and officers to supervise and direct a changing and frequently expanding education program (37).

The New Jersey population was changing from mostly rural to mostly urban. This had great influence on the nature of the curriculum in the schools, especially toward expansion of vocational offerings.

CONSOLIDATION OF 1945

New Jersey created a new State Department of Education in 1945 through the enactment of legislation consolidating and reorganizing numerous boards and agencies whose functions concerned the educational and cultural services of the state. The movement leading to the reorganization had started early in 1944 with conferences among the State Board of Education, the State Board of Regents, and Commissioner John H. Bosshart (38). The regents for a number of years had urged that their board be abolished and its duties in higher education transferred to the State Board of Education to achieve coordination of all public education in New Jersey under a single agency.

In February 1944, the commissioner and the two state boards sent a joint statement urging consolidation to the Commission on State Administrative Reorganization, headed by Charles R. Erdman, Jr. The commission concurred in the move, and bills designed to consolidate all the numerous educational and cultural services of the state were introduced in the 1944 session of the Legislature. The consolidation was planned to bring together— in addition to the Board of Education, the Board of Regents, and the commissioner of education—the Department of Public Instruction, the State Library, the Public Library Commission, and the State Museum into a single State Department of Education and to designate Rutgers University as the State University of New Jersey. The bills were widely studied by the people of the state, and 82 interested groups approved them in principle.

The 1945 Legislature saw the reintroduction and passage of the consolidation bills. The acts abolished the State Board of Education, which had 10 members (39), replacing it with a 12-member board to be appointed by the Governor for terms of 6 years instead of 8 years as previously. The Board of Regents was abolished and its functions transferred to the State Board of Education with expanded responsibilities in the field of higher education. The
commissioner was directed to appoint a sixth assistant commissioner as supervisor of higher education. The State Board of Education fell heir to the State Library and the State Museum, which were made separate divisions in the department.

The 1945 bills also created a division against discrimination in the department to enforce compliance with laws intended to eliminate discrimination because of race, color, creed, or national origin (40). Rutgers University was designated as the State University of New Jersey, recognizing the historic relationship between Rutgers and the state. The legislation empowered the state to approve appropriations and thereby, in effect, to contract with the university for educational services.

The 1945 reorganization directed the commissioner to appoint directors, inspectors, and assistants for inspection of buildings and accounts, research, supervision of health education, issuance of academic qualifying certificates, supervision of adult education, supervision of teacher training, and supervision of special classes for subnormal, blind, deaf, and physically handicapped children; and such other services as the State Board of Education may deem necessary.

The reorganization strengthened the Department of Education's ability to face demands being made on the schools as a result of World War II. There were problems in providing facilities and establishing programs for returning servicemen and in meeting public pressure for curriculum changes to keep pace with scientific developments and social and economic conditions. The department coordinated the formation of special school programs for veterans. In the 1946-47 school year, New Jersey secondary schools cared for more than 14,000 veterans. This number was in addition to the more than 7,000 veterans in apprentice and on-the-job training programs who were given related instruction in vocational programs. The number of community adult schools in New Jersey tripled in 3 years, rising from 24 in 1945-46 to 75 in 1947-48.

Commissioner Bosshart noted in his report for the 1948-49 year that the concept of the educational responsibility of the state was expanding. Opportunities for adult education, requested and financed largely by the adults themselves, were being fostered by the department. Plans for the licensing of correspondence schools, to be required by law after July 1, 1950, aimed at the improvement of service available from those schools. More than 300 private nursery, child care, and prekindergarten schools had been licensed under the supervision of the department, ensuring safe, sanitary housing and education adjusted to the children's needs.

Early in the summer of 1949, the State Department of Education and Conservation jointly established a School of Conservation for Teachers, whose purpose was to help teachers and other community leaders understand that conservation of human and material resources was a most urgent social and economic problem. The conservation school stressed that soil erosion, forest fires, lessening of the water supply, waste of minerals, and destruction of wild life were endangering society's future. The school was established in Stokes State Forest in northwestern New Jersey, where it has operated ever since.

John H. Bosshart continually spoke out on the importance of providing "appropriate" education for all the people, in the best interest of both the individual and the state. In his annual report for 1949-50, he said:

Education has two basic functions. The first is to serve the needs and interests of the society which establishes and supports it. The second, without which the first cannot satisfactorily be achieved, is to provide, for the individual, growth opportunities appropriate to his particular abilities, needs, interests and aspirations. When an individual obtains an education appropriate to him, to an immeasurable extent, the welfare of the State is enhanced. The state that contains a people who individually have had their worthwhile potentialities developed to the highest possible extent can rightfully classify its people as a limitless resource. Its citizens will be varied in the contributions they can render. They will be deeply imbued with a consciousness of their own individual worth and dignity, which is the foundation of self-respect. They will be freer from the frustrations which warp personalities and impair the pursuit of happiness. The state which amply succeeds in providing appropriate education for its individual citizens will inevitably be strong in achievement, rich in character, powerful in influence, enterprising in nature, blessed with prosperity, infused with wisdom, and vigorous with the loyalty of capable people (41).

**HIGHER EDUCATION CONTROVERSY**

The historic shortage of higher education facilities in New Jersey became a matter of growing concern for the State Department of Education following World War II. There was the problem of accommodating returning servicemen in college. There was the increasing demand for post-high school courses to meet the needs of industry and the professions. And there was the prospect of a rising birth rate and consequent population explosion. Commissioner Bosshart foresaw the need for action as early as 1948 when he called for establishment of both 2- and 4-year public institutions of higher learning within commuting distances of students' homes. He urged the development and expansion of graduate courses, the establishment of professional schools, great increase in the state colleges, and a doubling of the facilities of the State University. In 1950, Bosshart said that a system of junior colleges should be created to offer 2-year terminal courses in technical areas and 2-year academic courses leading to transfer to a senior college.
When Frederick M. Raubinger (42) became commissioner of education in 1952, he took up the call for a vast expansion of public higher education facilities. Aware of the impact the postwar "baby boom" would eventually have on the state colleges, Raubinger and the state board in 1955 undertook a study of future space requirements. This was to become the first in a series of studies aimed at convincing the public and the legislators of the necessity for sharply increased capital appropriations for college facilities. Funds subsequently made available, largely through bond issues, fell far short of meeting the demonstrated needs.

Although expansion of the public college campuses was moving ahead, the lack of funds in the amounts sought by Raubinger and the state board meant that the expansion was not keeping pace with the rising demand for space. Controversy began to develop over reasons for New Jersey's continuing shortage of facilities. The department became the center of the controversy and was accused of failing to develop adequate plans for higher education. The department insisted that the necessary plans had been prepared but that insufficient funds had been appropriated to implement their recommendations. The Governor appointed a Committee on Higher Education in 1963 as a fact-finding committee, with Carroll V. Newsom, former president of New York University, as chairman. The Newsom committee reported in December 1964 and recommended a revamping of the higher education system in the state, including the removal of control of higher education from the state board.

The Newsom proposals were not acted upon, but they formed a part of the background for even more drastic proposals made in May 1966 by the Citizens Committee for Higher Education in New Jersey. Robert F. Goheen, president of Princeton University, chaired this committee. Its declared purpose had been to describe the college expansion required and then to win public support for an all-out campaign. After making a preliminary recommendation to strengthen the higher education division within the existing department, the Goheen committee, in a revised proposal, advocated transfer of control of higher education to a new state department of higher education.

Commissioner Raubinger and the Board of Education opposed the separation proposal, declaring that the single, unified system of public education, as established in the 1945 consolidation, should be maintained. The board presented its own proposal for restructuring the higher education system, keeping it under the board's control.

A bill embodying the plan for a separate state department of higher education as proposed by the Goheen committee and supported by the administration of Governor Richard J. Hughes was introduced in the Legislature May 31, 1966. A series of lengthy and sometimes bitter hearings on the bill took place in the Senate that July. The Senate heard some 80 witnesses, including Commissioner Raubinger and State Board President George F. Smith, who repeated their opposition. The majority of the witnesses, including 25 members of the Goheen committee, favored the separation plan. In December 1966, the Legislature enacted the "Higher Education Act of 1966." The new law removed control of higher education from the board and established a new State Board of Higher Education to oversee a new State Department of Higher Education headed by the cabinet office of chancellor, to become effective July 1, 1967 (43). The act also created individual boards of trustees for the state colleges.

It was during the controversy over higher education in 1966 that Commissioner Raubinger handed in his resignation. He said only that he had accepted an offer to become a professor of education at the University of Illinois. He left New Jersey in August 1966.

Although New Jersey's facilities for higher learning remained well short of what both Raubinger and his critics desired, the rate of expansion of the public institutions of higher education, including 2-year colleges, was rapid.

The record shows that public higher education in New Jersey experienced unprecedented growth under the 22-year stewardship of the state department, from July 1945, when the State Board of Education assumed control from the Board of Regents, to July 1967, when responsibility passed to the newly created Board of Higher Education. The six state colleges, Rutgers University, and Newark College of Engineering expanded their physical facilities and upgraded their educational programs. Between 1945 and 1967, funds contributed annually by the state for operating expenses at the eight public institutions of higher learning increased from $3 million to $59 million. Student enrollment, full-time equated, rose from 9,000 to 52,000.

Capital appropriations during the 22-year period totaled $163 million, some $121 million of which came from bond issues. The top salary paid to full professors rose from $6,000 to $14,863, with supermaximums to $18,867. The six state colleges grew from small normal schools to multipurpose institutions with liberal arts offerings and strong graduate programs.

Five major studies carried out by the Board of Education between 1955 and 1965 spelled out the need for expansion of New Jersey's system of higher education to meet rising college enrollments. One of the studies, made in 1960, blueprinted the legislation (enacted effective in 1963) to help county governments establish 2-year public colleges. In the first 4 years after the law took effect, 17 of the 21 counties took positive action toward establishing such a college. Four opened in 1966 and two in 1967, with five more scheduled to open in 1968. A sixth study on New Jersey's higher education needs was initiated by the state board in 1967 when a consulting firm was engaged with federal funds to draw a master plan.

In late 1964, the Legislature approved purchase of the physical assets of the Seton Hall College of Medicine.
and Dentistry, and on July 1 of the following year, the institution was reconstituted as the New Jersey College of Medicine and Dentistry.

Working with representatives of New Jersey's private colleges, the Board of Education made recommendations leading to establishment and improvement of the State Scholarship Commission and the State Student Loan Program. The State Scholarship Program in 1966-67 was assisting 14,000 students, approximately 1 of every 11 New Jersey youth studying in or out of the state, in private or public colleges.

As of June 30, 1967, outstanding loans numbered 31,877 and were valued at $28 million.

The state created the New Jersey State Commission for the Higher Education Facilities Act of 1963 in that year to gain maximum benefits from federal financial aid programs. Between 1963 and 1966, New Jersey colleges, both public and private, shared $29 million in federal funds distributed through the state under the federal act.

The New Jersey Educational Facilities Authority, popularly known as the "Dormitory Authority," was established in 1966 to provide funds through the issuance of revenue bonds to build college dormitories and service-related facilities, thereby reducing the demand on the state for capital funds.

PRESSURES ON THE SCHOOLS

During the 1950's and 1960's, while the concerns over higher education were receiving the greatest discussion, the State Department of Education found itself involved also in a continuing struggle to meet the problems brought about by changing the nature of the public school system. Pupil population was soaring, and the districts were hard pressed to provide the required increases in instructional personnel and classrooms. There was pressure also to revise the educational programs in keeping with far-reaching scientific and technological developments.

Faced with the prospect of a rapidly increasing high school population, the department moved in the 1950's to spur the creation of regional high schools and thereby avoid the establishment of small, inefficient high schools. Legislation enacted in 1954 provided greater financial incentive for regionalization. In the period since 1931, when the first permissive regionalization legislation was passed, only five regional high schools had been established. After 1954, however, the number of regional high school districts grew rapidly, and by 1967 there were 56 in operation. The department's regionalization drive has given New Jersey a strong public high school system, with most of the high schools large enough to offer broad educational programs.

The dispute over the structure of the higher education system was not the only area in which Commissioner Raubinger was involved in controversy. He fought with vigor what he termed "the growing pressures toward impersonality, uniformity and rigidity in our schools." He declared his vehement opposition to proposals being made in the early 1960's for a higher degree of centralized control of education by the federal government, and he lashed out hard at the idea of a national curriculum commission. He became known nationally for his battle against outside control of the schools.

The greatest strength of American education on the elementary and secondary as well as on the college and university levels, Raubinger said, has been its diversity, its flexibility, its adaptability. He declared that this country has long maintained its conviction that its educational system controlled by its states and localities was one of its great democratic strengths. His premise was that program improvement should rest principally with the professional staff of the schools in cooperation with the local board of education, parents, and other able and interested citizens, under the general leadership and guidance of the state.

The U.S. Supreme Court's 1954 decision banning segregation in schools considerably widened the State Department of Education's leadership role. Even before the decision, the department had been active in seeing that enforced segregation—confined largely to some 50 elementary schools in southern New Jersey—was ended in compliance with a provision in the new State Constitution of 1947. When the 1954 ruling declared that "de facto" school segregation resulting from racially segregated neighborhoods was unconstitutional, Commissioner Raubinger moved quickly to urge districts to make plans to comply. His decisions in cases involving Orange, Plainfield, and Englewood established as New Jersey law the proposition that a school board must take appropriate action to eliminate "de facto" segregation where it could reasonably be accomplished.

Raubinger declared that the mere existence of racial imbalance in a school, whether intentional or not, constituted an educational handicap to the pupils. He said that New Jersey law required school boards to provide "suitable" facilities and that segregated facilities were not "suitable." The commissioner's position, upheld by the State Board of Education and the courts, now provides clear-cut guidelines for the local school boards of the state.

One of the most nagging, most persistent problems that have faced the State Department of Education in the post-World War II period has been that of financing the expansion of the public schools. Historically, the state depended largely on local property taxes to operate the schools, with state aid meeting only a small portion of the costs. The New Jersey State School Aid Act of 1954 provided a fundation program on a permanent basis to assist all districts "in the maintenance and support of a thorough and efficient system of free public schools." The distribution formula was based on school operating costs, school enrollments, and community wealth, using a foundation program of $200 per pupil, with minimum aid of $50 per
pupil and equalization aid added. In 1956, the school building aid act provided state funds for acquiring, constructing, and maintaining school facilities.

Commissioner Raubinger in the early 1960's declared flatly that the $200-per-pupil foundation program was meaningless. He urged greater state funds to relieve local real estate taxes and to maintain equal educational opportunity for all children. In 1964, he reported that during the previous 10 years enrollment had increased 70 percent, per-pupil costs had climbed from an average of $250 to an average of $420, a total of $850 million had been spent on facilities, and the outstanding school debt had risen from $162 million to more than $800 million. In that decade, support from local property tax sources had increased from $153 million to $430 million, while state support had gone from $25 million to $96 million.

The pleas of the Department of Education and numerous education organizations for greater state financial assistance were finally heeded by the Governor and the Legislature. New Jersey enacted its first broad-based tax, a 3-percent sales tax, in 1966. As a result, $95 million, representing more than half of the total sales tax revenue, was appropriated as school aid, thereby increasing the state's share of the total school costs to some 28 percent. The Legislature revised the equalization formula to provide a $400-per-pupil foundation program, with minimum aid of $75. About half of the 590 school districts received the minimum aid of $75; the average for all districts was figured at $130. The state's six largest cities were granted an additional $27 per pupil.

Although the state's share of school costs had increased substantially to 28 percent, the department did not relax its efforts to boost it even further. Joseph E. Clayton, the deputy commissioner who became acting commissioner upon Raubinger's departure in August 1966, appeared before the State Aid to School Districts Study Committee in November 1966 and recommended that the state aid be increased gradually over several years until the state furnished about 40 percent of the local districts' education expenditures. He pointed out that the nationwide average of state support was 39 percent.

While New Jersey ranks low among the states in percentage of school costs paid by state aid, it ranks high in per-pupil expenditures as a result of the great amount of local support. In 1967, the per-pupil expenditure in New Jersey exceeded $600.

Nearly 12 months elapsed between the date of Dr. Raubinger's departure and the appointment of a new education commissioner. Clayton was called upon to lead the department through the 1966-67 school year. Although working in an "acting" capacity, Clayton nevertheless moved to improve the state school system. Long recognizing the problems and inefficiency resulting from the state's great number of school districts, Clayton appointed a committee of educators in November 1966 to study the next steps in regionalization of districts and to make recommendations. He felt that the educational program would be enhanced if districts operating separate high school districts or separate elementary districts could be regionalized into full K-12 programs. He suggested that the state provide incentive aid to accomplish this.

If New Jersey has been behind other states in the total state financial aid for the schools, it has been ahead of most states in several other significant areas of aid. There has been considerable legislation in New Jersey in recent years to support the schooling of the handicapped. A 1954 law "mandated public schools to provide special education services and facilities for children classified as mentally retarded or physically handicapped." In 1959, child study teams were authorized in the counties and in individual districts to coordinate special education services. In 1966, legislation required school districts to identify and classify all handicapped pupils and to provide services for them. Under this legislation—considered the most comprehensive law in special education in the nation—the state pays one-half the cost of the education of children in special education categories. The education department's staff was expanded to provide the additional supervision and guidance required.

By 1967, New Jersey was paying three-fourths of the transportation costs for both public and private school pupils living far from their schools. Also, the state was assuming the burden of paying the employer's share of Social Security and other fringe benefits for the teachers at a cost, in 1967, of $90 million. In summary, by 1967, the state was paying some $300 million toward the school districts' total annual expenditures of more than $1 billion.

Accompanying the increase in state aid in the 1960's was a sharp hike in federal aid programs which have had a great impact on New Jersey schools. A new dimension was added to the work of the department in approving and overseeing the vast array of federal programs. During fiscal year 1967, New Jersey effectively utilized more than $76 million in federal funds made available for education programs operated through the State Department of Education. The money was used to carry out educational innovations, to develop remedial and compensatory programs, and to provide additional personnel and services—all directed toward effecting equality of educational opportunity for all children. Some $32 million of the total was allocated to the state under the Elementary and Secondary Education Act. There were 66 innovative projects under way in the state under Title III of the act. Approximately $15 million in federal funds was being spent on vocational education in the state, and other federal funds were being used for adult education, school lunch programs, and implementation of the National Defense Education Act.

New Jersey broadened considerably the services of its state department in the 1960's to guide the local districts in coping with society's changing needs and demands. In 1967, the department staff prepared booklets to provide...
the schools with data on establishing sex education programs, handling the problem of drug abuse, conducting experiments with live animals, and using bibliographies to aid in the teaching of the Negro's role in American history.

The department expanded educational programs for the children of migrant workers. A Center for the Humanities was formed to provide the leadership and services required to implement the department's expanding programs in the humanities and the arts and to provide a more intensive focus for cultural concerns. In vocational education the development of a master plan was under way, and committees were formed to work toward greater cooperation.

In an address to the professional staff of the Department of Education in December 1967, Commissioner Marburger said that he planned to establish innovative centers throughout the state "as a direct outreach to the local superintendents." The aim, he said, would be to help the local districts plan the most effective programs for all types of pupils, to help them assess the "hardware and software" the schools are being asked to use, and to make available through research projects and demonstration schools the latest data on how children learn and how they can best be taught. The education department, he said, must continually assess its operations to make sure it is giving the most effective service possible to the public schools of the state, their 1.3 million pupils, and their instructional force of 60,000 teachers and 10,000 supervisors and administrators.

Organization and Administration of the New Jersey State Department of Education

The New Jersey State Department of Education is a principal department of the executive branch of the state government. It is composed of the State Board of Education and the commissioner of education, with such divisions, bureaus, branches, officers, and employees as are necessary.

The Board of Education has 12 members, who serve without pay for overlapping terms of 6 years. Restrictions on appointments are that not more than one member can be appointed from any one county and that at least three members must be women. Regular meetings are held in Trenton on the first Wednesday in each month. The commissioner of education is secretary to the board.

The state board is a policy-making and regulatory body whose rules have the force of law when so designated by legislation. Examples of such regulation are rules for certification of teachers, school accounting procedures, school building guide requirements, approval of secondary schools, and establishment of standards in special education of handicapped children.

The commissioner of education is the chief state school officer. He is appointed by the Governor, by and with the advice and consent of the Senate, for a term of 5 years, commencing July 1, and until his successor is appointed.

As chief executive and administrative officer of the Department of Education, the commissioner is the budget and fiscal officer. He makes all appointments of personnel, subject to the approval of the state board and to Civil Service laws, and assigns their duties. He supervises all schools of the state receiving any part of the state appropriations.

The functions of the department can be described in four separate areas, the primary one being that of service to school districts throughout the state. New Jersey's 21 county superintendents, who are appointed by the commissioner, are field agents for the department to advise all those within the field of public education and to provide
the services necessary to meet the needs of the schools in their counties.

The second area of responsibility is that of regulation. The department is charged with certification of teachers, approval of secondary and nursery schools, distribution of federal funds, and—through the county superintendents—all pupil transportation.

Another function of the department is adjudication. The commissioner is the first court of appeal and must render a decision before a case is carried to the State Board of Education or the courts.

The department also has an executive function in such matters as the dispensing of state aid and the administration of the State Library, the State Museum, and the State School for the Deaf.

Key staff members of the department are the deputy commissioner, who is in charge of the Division of Administration, and four assistant commissioners, who are in charge of the Divisions of Business and Finance, Controversies and Disputes, Curriculum and Instruction, and Vocational Education. The Library and Museum divisions are headed by directors.

The State Department of Education offices are located in the new State Education Building at 225 West State Street in Trenton. The department moved into the new building May 27, 1963, after 16 years in cramped quarters in an ancient brownstone. The building is part of a new New Jersey State Cultural Center which also includes the State Museum and State Library divisions of the education department. The Cultural Center complex, which adjoins the State Capitol buildings along the banks of the Delaware River, was completed in 1964 as part of New Jersey's tercentenary celebration.

38. John H. Bosshart, who had been supervising principal in the South Orange-Maplewood school district, was named state commissioner in 1943. The title of supervising principal was changed to superintendent in 1952, and the number of superintendents in the state increased from 45 to 251.
39. The number of members of the State Board of Education had been increased in 1921 from 8 to 10.
40. The Division Against Discrimination was redesignated as the Division on Civil Rights in 1960. This division was
transferred to the State Department of Law and Public Safety in 1963.

42. Frederick M. Raubinger had been superintendent of Ridgewood schools before becoming commissioner.

43. The transfer of higher education functions from the Board of Education to the new board did not include two offices which had been part of the old higher education division. The offices of teacher education and certification and adult education and academic credentials were retained in the State Department of Education.

44. Commissioner Marburger's views on the direction and goals of New Jersey's schools were spelled out in an address to the New Jersey Association of School Administrators on September 28, 1967, in Atlantic City.

INTRODUCTION

New Mexico was first explored by the Conquistadors more than a half a century before the Pilgrims landed on the East Coast. Today, little Spanish villages, interspersed along the Rio Grande and hidden in deep mountain canyons, have lived under the flag of the United States only little over a third as long as they did under the Spanish and Mexican flags. Indian villages basking under the sun have not changed greatly over the past 500 years. Navajos and Apaches roam their vast reservations and, until quite recently, have isolated themselves from any consequential contacts with the outside world.

Intermingled with these cultures in the late nineteenth and early twentieth centuries were a relatively few migrants from Eastern states, who lived in the towns and on the farms and ranches. It was a land of almost endless space and silence, broken now and then by the dust of a cattle drive or the lonely whistle of a locomotive.

Parts of New Mexico were dramatically changed from the moment the first mushroom of an atomic explosion "blossomed" over White Sands in southern New Mexico. The erection of scientific and military installations during the 1940's initiated a population explosion that caused tremendous economic and social changes, particularly in such cities as Albuquerque, Alamogordo, Clovis, Los Alamos, Las Cruces, and Roswell.

Today, New Mexico is a blend of the past, the present, and the future found in few other states. It is a long way from the lonely hogans of Shiprock to the scientific laboratories of Los Alamos.

SPANISH COLONIALISM, 1536 - 1820

When Cabeza de Vaca, the first Spaniard to see New Mexico, entered the Rio Grande Valley in 1536, he discovered the cliff houses or large communal dwellings constructed by the Pueblo Indians and became convinced that they held treasures. Francisco Vasquez de Coronado, one of the world's greatest explorers, who followed in 1540, found a flourishing culture but not the gold that had lured him into these deserts and mountains. Although disappointed at not uncovering sudden wealth, the Spaniards did appreciate the resources that had attracted the Pueblo Indians into settling this region and, under the leadership of Don Juan de Oñate, established the first town of San Gabriel in 1598.

Since the Spanish government considered it just as important to Christianize and educate the Indians to be good Spanish subjects as to raise crops and practice animal husbandry, 10 friars, including Alonso Martiniz, accompanied Oñate. During the next 11 years, they established missions and schools as they moved northward up the Rio Grande Valley. These friars and their successors made a valiant though not very successful attempt to teach agriculture, reading, writing, simple mathematics, singing, tailoring, shoemaking, carpentry, blacksmithing, metal working, weaving, music, and painting.

The Pueblo uprising in 1680 halted the development of missions for approximately 11 years, but when Don Diego de Vargas reconquered the Indians, he began rebuilding, though there was not as much zeal in maintaining the schools as earlier (1). The Spanish king gave specific orders in 1717 to reopen them, but apparently no aggressive attempt was made to obey this command by either church or state officials (2). Education continued to decline. Decrees issued in 1777 and 1813 to found a college at Santa Fe again showed good intentions, but because there were no resources to carry out the decree, it never opened.

The revolt of 1820 ended almost three centuries of Spanish rule. Within the first year, the Mexican government ordered the town councils to establish schools as soon as possible. Supported by the tithes collected in New Mexico, schools were maintained at Santa Fe, Albuquerque, San Miguel, Belen, Taos, and Santa Cruz (3). A deputation, serving as a school board for the entire territory, further strengthened the schools by designating the teacher at Santa Fe as the chief teacher and passing a compulsory school attendance law.

A struggle went on during these years between those who wanted free public schools and those who preferred private schools. In 1833, the private school proponents succeeded in getting the upper hand and persuaded the Mexican government to order that tithes collected by the church be placed at the disposal of the bishop. The struggle
continued, and 3 years later the government decreed that all public and private schools be abolished and reestablished under government supervision, supported by heads of families, with all children between 5 and 12 attending. Despite this effort to generate a public school system, it failed to materialize, and formal education was virtually nonexistent during the last years of Mexican control.

THE TERRITORIAL PERIOD, 1846 - 1912

Mexican rule over New Mexico ended with Kearny's occupation of the territory during the Mexican War and with the treaty of Guadalupe Hidalgo. Despite repeated pleas for aid and money, the Spanish-Americans and many Anglo-Americans, particularly the business groups and wealthier families who controlled the Territorial Legislature, fought taxation for a public school program and remained opposed to providing funds for education by playing on the fear that the new tax would be an invasion of personal property and an infringement of religious freedom. This was particularly evident in Santa Fe, where the University of New Mexico and the College of Santa Fe were merged to form the University of New Mexico, and in Albuquerque, where the landowners of the Santa Fe Ranch did not wish to pay taxes for public schools in their community. Despite these efforts, the Territorial Legislature passed a law in 1855 requiring the construction of schools in all communities, financial support coming from taxation. As a consequence, in December 1856, the laws for the establishment of schools were repealed for the rest of the territory, only 10 months after they had become effective.

In 1855-56, the Territorial Legislature attempted to establish regulations and financial support for a public school system. Every male whose property value did not exceed $250 was to pay a tax of $1, and males whose property exceeded $250 were to pay $1 on each additional $1,000 of its value. However, the counties of Rio Arriba, Santa Ana, Taos, Valencia, and Socorro were influential enough to secure exemptions for their residents whose property value did not exceed $50, and they forced through a provision allowing them to decide by popular vote whether they would be subjected to these laws. The vote was 37 for and 4,053 against public schools supported by taxation. As a consequence, in December 1856, the laws were repealed for the rest of the territory, only 10 months after they had become effective.

Despite efforts by the 1860 and 1863 Legislatures to require schools in all communities, financial support continued to be the insurmountable problem. During the 1870's, several laws forced culprits to pay for their misdeeds and at the same time support the schools with their fines for such crimes as burying the dead on Sunday, marrying "close relatives," and engaging in certain Sunday sports like cockfighting. Property owners obviously were determined not to be taxed. The great landowners Spanish patrons and the newly arrived businessmen from the East combated taxes for education by playing on the fear that public schools were an American scheme to wean the Spanish-American people away from the traditions and beliefs of their parents (4).

While most of the settlers from the East wanted public schools, many Spanish-Americans preferred parochial schools, which were well established by the midnineteenth century. As more and more Anglos settled down in the region, their demand for public schools grew stronger and louder. Governor L. B. Prince gave the latter his backing, and when a group of educators organized in the New Mexico Education Association in 1886 to lobby for better schools, he encouraged them. Soon, the association had gained considerable influence with the Legislature and in 1891 finally mustered sufficient strength to pass an act giving substance to an 1863 statute creating a Board of Education and the Office of Territorial Superintendent. At this time, the old board composed of the Governor, the secretary of state, the judges of the supreme court, and the bishop of New Mexico was replaced by one consisting of the Governor, the superintendent of public instruction, and the presidents of the University of New Mexico, the Agricultural College, and Saint Michael's College. The new board operated until statehood in 1912 (5).

To allay the apprehensions of the Spanish-Americans, Governor Prince appointed Amado Chavez, a Spanish-American, as territorial superintendent. An intelligent man, Chavez was sincere in his convictions about the need for public education. The 1891 statute proved to be an important turning point in New Mexico education. Not only did the superintendent exercise strong leadership, encouraging communities to found new schools and construct suitable buildings, but the law itself provided for bond issues for this construction, for levying local taxes, and licensing teachers. The latter was badly needed. It was 1889 before the Legislature had dared proclaim that anyone unable to read or write sufficiently to keep his records in Spanish or English should not be hired to teach, and the archives show signatures of both teachers and school directors written as X's. The new laws also provided for courses of study to be developed through elementary school and required attendance for the entire school year. As a result, the attendance figures increased from 18,315 in 1891 to 61,022 in 1911, and school expenditures jumped from $50,259 to $594,407 (6).

Unfortunately, no subsequent territorial superintendents exerted strong leadership until 1905, when Governor Miguel Otero appointed Hiram Hadley. Hadley had been president of the New Mexico Agricultural College (now New Mexico State University) in Las Cruces from 1890 to 1894 and vice-president of the University of New Mexico until 1897. Convinced that the power and influence residing in his office was "the most important factor" in developing a satisfactory school system (7), and despite being 72 when he was appointed, he traveled nearly 18,000 miles during the 2 years he served, vigorously attacking problems he found in nearly every community. State Superintendent John V. Conway paid the following tribute during a memorial service in his memory, December 10, 1922:
Hiram Hadley was regarded as the Father of Education in New Mexico, and it was during his term as Territorial Superintendent of Public Instruction that the first steps were taken toward the establishment of progressive educational laws, that have brought about the advancement we now have (8).

Despite considerable progress, New Mexico schools continued to have major weaknesses. In particular, the development of the county school administration followed a strange pattern because the statutes of 1886 called for the county probate judges to act as county school superintendents, and the justices of the peace in each precinct to appoint the teachers. Attempts to improve the system often merely added to the chaos. In 1884, the Office of County Superintendent was made elective, with three directors to be elected for each school district, the candidates running on a partisan ticket. The district judge appointed the county boards.

Since there were no minimum professional requirements for the county superintendent whose maximum term was set at 4 years, counties had a transient, political administration which was often in conflict with the municipal superintendent. Also, there were a large number of small, weak districts with few students and unqualified teachers. The district boards of directors, who were elected and served as advisers to the county superintendents in matters relating to the district schools, were often the chief opponents to district consolidation because from their point of view this meant centralizing power in the hands of a virtually alien board.

The appointment of able territorial superintendents did not lessen the opposition to taxes. Big corporations, such as the railroads whose trains crossed New Mexico, owned about 30 percent of the assessed property in the territory. Understandably, their outlook was the same as that of the large landholders. Local railroad tax agents also had little sympathy for the state's needs as a whole because the roads were completely transcontinental connections between the East, the Pacific, and Mexico; local districts were interested in taxing the rights-of-way to gain railroad property wealth, which in many instances meant better school buildings and indoor restrooms for their children in contrast to outhouses and coal stoves in other rural schools (9).
his election by popular vote to no more than two consecutive 2-year terms, the same as the other state office holders, and left to the Legislature determination of his power, duties, and compensation. The state superintendency as well as the other offices were probably made elective because the people were determined to swing as far as possible from the appointive officials of the long territorial period. Indeed, the citizenry continued to be most jealous of its prerogative of controlling officials through election and was no doubt responsible for the defeat of several amendments proposed at later dates to make the superintendent's office appointive.

The Board of Education under the new constitution was to be composed of the Governor and the state superintendent as ex officio, and five additional members appointed by the Governor, including a county superintendent, the head of a state educational institution, and at least one other person connected with schoolwork. In practice, except for rare exceptions, the Governor appointed all five persons connected with "educational work." While the constitution stated that the state board should "have the control, management, and direction of all schools" (11), it limited its power by such regulations as might be provided by law. When the statutory regulations were adapted in 1923, this new school code conferred two major powers on the state board.

One was the responsibility to "determine qualifications of persons teaching or desiring to teach in any of the public elementary and high schools of the state and to that end promulgate, from time to time, a system of classification of teachers" (12). These standards could be established by either examinations or credentials, such as institutional credits. Moreover, the board determined the ability of institutions to train teachers for certification. For example, in 1922, the board took official action to accredit the University of New Mexico for summer teacher education with the same standing as the state normal schools.

The second major responsibility given to the board was to establish minimum standards of instruction (13) and approve the textbooks. The 1923 code required certain basic curriculums:

In such grades as the state board of education shall prescribe, the following subjects shall be taught in the public schools of the state: Reading, writing, arithmetic, spelling, geography, language and grammar, Spanish, New Mexico history, United States history, including the Declaration of Independence and the constitution [sic] of the United States and New Mexico, and other branches of learning as may seem expedient may be prescribed by the State Board of Education (14).

Specifically, the Legislature required courses on the effects of narcotics and alcoholic drinks and made teacher certification dependent on a knowledge of U.S. and New Mexico history; these subjects to be taught throughout the public schools. It further required that courses of study include manual training, domestic science, the elements of agriculture, and commercial science.

Textbook adoption has continued to be under the board's jurisdiction. For the past 20 years, a system of multiple adoption has been in effect, the board merely giving various publishers permission to persuade local boards that their texts should be purchased. It protects the board from pressure by the publishing companies. The state department accounts for textbook funds, seeing to it that no local administrative unit obligates itself for textbooks beyond its allocation or for books not included on the adopted list.

**FINANCIAL CONTROLS**

Three years after the constitution had been approved, the Legislature authorized school directors to estimate the funds they would need within their districts each year. The directors gave these estimates to the county superintendents, who transmitted them to the county commissioners. It granted the same authority to municipal boards of directors, but their estimated costs were given directly to the county commissioners. The rural district directors' authority was further weakened by the requirement that the county superintendent had to approve their warrants before payments could be made.

The current school fund provided by the constitution is primarily derived from land leases and interest from the permanent school fund, supplemented by court fines and proceeds from a statewide property tax. This money is then distributed to the districts on the basis of the school census. Provision also was made for an equalization factor to be applied in districts unable to maintain a 5-month school term when a tax was "levied to the limit allowed by law" (15).

When the Legislature wrote the School Code in 1923, it stipulated that county commissioners should levy and collect annual taxes of one-half mill on all taxable property for the current school fund, a part of which was to be designated as a reserve. If the county superintendent could verify to the state superintendent that his finances from a 15-mill local levy, plus the census proration, were insufficient and that not more than $300 had been spent for each schoolroom in the district during the full 5 months, he could requisition an allotment from the reserve to be paid by the state treasurer. The school district special property tax could not exceed 15 mills except in incorporated cities, towns, and villages where the maximum was 20 mills (16).

The New Mexico Education Association has played a significant role in pressing for improved education since its formation in 1886. In 1915, the Parent-Teachers Association became a part of the power structure, and these two
were joined the next year by another organization, the New Mexico Taxpayers Association, which acted as a counter balance to the older two. The taxpayers association took the position that proposed expenditures were based on an overoptimistic forecast of income. So as New Mexico sought a solution of its educational problems, a power struggle over the distribution of money played an important part in shaping the legislation.

The influence of the economy-minded taxpayers association was evident in the 1923 School Code. Even the newspapers, echoing its demands for more returns from educational dollars, commented on the association's dominance in the Santa Fe power structure. But newer towns were aggressively demanding certain improvements, and to finance them they were talking about taxing property. The railroad and mining representatives, the ranchers, and the industrialists, alarmed at such "subversion," sought to smother their zeallessness and, in particular, to keep the idea of taxing property from spreading to rural areas.

Thus, it was no coincidence that recommendations appearing in the New Mexico Tax Bulletin, published by the taxpayers association, were identical to the code adopted by the Legislature. For instance, it advocated that --

1. A strong tax commission should be provided.
2. Local and state budgets should be controlled and prepared by the state comptroller, the educational budget auditor to serve under his supervision.
3. Substantial reductions should be made in the educational budget, since schools cost more than any other agency; specifically,
   a. Teachers should be paid only "what they were worth";
   b. A schoolroom should not be provided for less than 10 pupils;
   c. School terms should be reduced to 7 or 8 months (except through local support);
   d. The county-unit property tax should be distributed to the units within the county on the basis of average daily attendance;
   e. School districts should be consolidated wherever feasible; and
   f. Transportation should be limited to bare necessity.
4. A limitation on tax levies should be established.

The association even admitted its potency, stating:

At the regular and special sessions of the Legislature during the past six years, the Director of the Taxpayers' Association has been afforded every opportunity to assist the Governor and the Legislature in ascertaining needs of state departments and institutions in the preparation of the appropriation bills (17).

The association used the 1921-22 recession as a justification for some of its recommendations. For example, the January 1923 Bulletin reported that property assessment fell from $405 million in 1920 to $330 million in 1922 and that tax delinquency had reached $5 million (18). So, the code contained a limitation of 40.5 mills on the property tax.

Since the method by which budgets are made in New Mexico lies at the heart of many of the state's educational problems, to appreciate them it is necessary to understand how these budgets are determined. In each county the commissioners appoint two resident taxpayers to serve as the local budget commissioners. The educational budget auditor, appointed by the Governor, visits each county in the spring and with the two local budget commissioners forms the commission which sets the allowances for the schools, passing on each budget item by item.

The thing that is surprising to one from outside the state is the power the Budget Commission, the State Budget Auditor, and later the State Tax Commission has to deny any item to a school district. Another interesting feature of this system is the obligation the county budget commission is under to divide funds between rival districts and between districts whose interests are well and poorly represented (19).

Many local school board members were treated as if they were intruders at budget hearings for their districts. At best, they were little more than observers at their own budgetary-approval proceedings, too often dominated by agents of large taxpaying groups.

The position of "educational budget auditor" has not changed, although the title has become "chief of the school finance division" (20). In other words, since 1923, the State Board of Education has operated efficiently and effectively in the areas of teacher standards and instruction but has little official power in the area of financial control, even though education is heavily supported at the state level. Under such a system, criticized severely by educational leaders throughout the state, it is no wonder that local school boards were forced to look toward Santa Fe, because here was the source of a large part of their revenue and all of their permission to spend it. As former State Superintendent Tom Wiley has pointed out,

The budget auditor with the mark of a pencil could vacate classrooms, overload classrooms, and relocate, extend or reduce school bus routes. He might tailor the educational cloth in any pattern he desired, as long as he did not displease the Governor (21).

Quite likely, the far-reaching implications of these provisions were not realized by the state department officials. Because the proper role of the department in New Mexico was not blueprinted as it was in a number of other states, there was no tradition to follow. Also, it was generally agreed in the early part of the century that academic matters should be handled by educators but that the
educational purse should be under the stewardship of laymen, who were considered more practical in matters of business. No available evidence indicates that educators opposed this division of powers; in fact, there is at least meager corroboration for the contention that a few powerful local superintendents who operated their systems like federal barons were fully aware of the situation and condoned the division because it weakened school power at the state level.

In specific areas, the State Board of Education has been given financial prerogatives. The transportation director, who holds a position created within the department in 1936, has jurisdiction over bus routes, minimum standards for buses, consumption of contracts for routes, and general administration of the distribution formula, most of the money coming from legislative appropriations (22). The state board also exercises financial control over the school lunch program—the entire federal allotment of funds, the minimum standards for lunches, and the post-audit of funds for these purposes all being part of its responsibilities. The same is true for vocational education. By statute, the state board is the vocational board and the state superintendent is its executive officer. Thus, the department controls the funds for trades and industry, vocational agriculture, home economics, distributive education, and vocational rehabilitation. A staff employed particularly for this purpose administers the National Defense Education Act allotments. The department must also approve local projects and request appropriations from the U. S. Office of Education before funds can be granted under Public Laws 815 and 874 of 1950 and Public Law 89-10 of 1965.

THE DEPRESSION

Like most other states, New Mexico was severely hurt by the economic chaos that befell the nation in 1929. The schools, as well as other government agencies, lacked the money to continue. The struggle to reduce the tax burden, centering around a proposed constitutional amendment limiting property taxation to 20 mills, involved most of the state's newspapers, educational leaders, ranchers, and businessmen. The taxpayers association, supported by the Albuquerque Journal, complained that too much had been spent on educational frills and charged that real property was bearing an undue share of the financial support. On the other side, the education association and The New Mexico American Legion, while admitting that real property was probably taxed too heavily, argued that the already crippled schools would become ineffective if the amendment passed without new revenue proposals.

State Superintendent Georgia Lusk predicted that 3,000 teachers would be out of jobs, that schools would be idle, and that 141,000 children would be denied an education. University of New Mexico Professor George I. Sanchez denounced the taxpayers association for misrepresenting the new amendment by claiming that laws could authorize additional taxes if the people so voted. He pointed out how difficult it would be to put such a law in operation, since the Legislature met only once every 2 years.

The issue was hotly debated throughout the summer of 1933. The New Mexico American Legion finally passed a resolution supporting the state education association's position, arguing that the children would be unable to secure an adequate education unless some means was found to finance the schools. The Central Labor Union took the same position, but it probably hurt the association's position more than it helped, since it was engaged in a series of unpopular coal strikes in the Gallup area at the time and some of the newspapers apparently tied the two issues together. Moreover, the Albuquerque Journal reported that all seven former Governors of New Mexico still living had endorsed the 20-mill limit and editorialized that the Chicago schools were to be commended for stripping down their educational program to operate within their income.

Banner headlines in the Albuquerque Journal announced on September 20 that the 20-mill limitation amendment had passed the previous day, carrying a majority of the counties. The Governor immediately called a special legislative session for April 9, 1934, to provide substitute taxation to make up for the revenue reduction. The Joint Tax Committee of the New Mexico Federation of Taxpayers Associations, a prestigious group of important men answerable directly to the Governor, recommended that money from new sources be placed in the public school funds, since the schools would bear most of the loss. It advocated a gross-receipts tax to be distributed on an average daily attendance basis; it also recommended that the laws be revised to give equality of property assessments between individuals in the counties and among the counties.

The emergency session finally passed a 2-percent "privilege tax" on gross receipts, exempting all societies and agencies not operated for gain. Rural power evinced itself in exemptions on "proceeds from the sale of poultry and products of the farm, ranch, grove or garden, when made by the grower or producer thereof, and of livestock or any growth or product derived therefrom..." (23). The executive secretary of the New Mexico Education Association complimented the Governor and the Legislature and expressed his pleasure that this "business" tax, by spreading the burden over a wider area, would be more equitable and satisfactory than heavy dependence on the property tax. New Mexico, like most other states, was forced to look for new sources of revenue during the Depression years.

Almost immediately, an argument began that has continued to rage for more than 30 years concerning the proper division of state funds. Since the Legislature had never trusted the people with the power to exert local
initiative on behalf of their schools beyond the 7.25 mills established by tradition after the 20-mill limitation amendment, there was no willingness on the part of the Legislature now to supplement the difference with local effort, and the effect was stifling to education. Most tax authorities agree that state limitations on local taxation are of dubious merit, contending that taxpayers are not effectively protected and that such limitations obstruct sufficient financial support. Still, the proceeds of the new tax were earmarked for school purposes, the beginning of designating specific sources of revenue for the schools, at least fulfilling a genuine need for a statewide stabilized source of revenue. For the 29 years that this type of financing remained in operation, the state resources amounted to about three-fourths of the total revenues for education.

In 1934, a plan for distributing the new state funds was hurriedly drawn that called for the distribution of funds on the ratio of each county’s school budget to the sum of all budgets within the state and used figures for previous years as a basis for the computation. The plan obviously favored the wealthier counties and immediately drew the fire of Dr. Sanchez. He argued that the 1933-34 budgets could not be accepted as a measure of educational need because drastic, inconsistent, and erratic reductions of already unsound budgets had made them the poorest and most inequitable measurement that could be conceived. The New Mexico Education Association’s executive, legislative, and finance committees recommended a classroom-unit plan developed by Paul R. Mort of Teachers College, Columbia University, which finally was accepted. Along with it, however, a basic allowance was guaranteed for each county equal to the amount budgeted in 1934; this figure was then converted into classroom units, the high schools being weighted at four-thirds the cost of elementary schools. The plan remained in effect until 1941. As long as tax sources were earmarked, the taxpaying groups tended to go along with the school people in their arguments and recommendations.

With the Depression bearing heavily on the state, the New Mexico Education Association predicted at least $700,000 additional funds would be necessary by 1940. Yet, schoolmen complained about the misappropriation of the money available, charging that 13 counties suffered shortages while 18 enjoyed a comparatively favorable financial condition. It was not so much the complications in the formula, but the basic guarantee—a concession forced by the more powerful and wealthy counties—which “robbed” growing counties by overappropriating funds to those that were losing population. Under the formula,

The state guaranteed counties an appropriation equal to the “basic allowance,” regardless of whether they actually contained the number of classroom units indicated in the “basic allowance.” In other words, a county could officially have more, but never fewer, classroom units than indicated by the basic formula (24).

The 18 “wealthy” counties followed the lead of Raymond Huff, superintendent of the Clayton public schools and president of the State Board of Education from 1931 to 1954, who quietly but effectively allied himself with the state’s Governors throughout his long career. Since the Governor made appointments to the state board, to a large degree the members were answerable to him, and Huff used this relationship on many occasions to influence the Governor and the Legislature on educational matters. Quite naturally, he showed considerably more interest in the rural districts.

The 13 “poor” counties were defended by John Milne, the Albuquerque superintendent of schools for 45 years, and president of the state board from April 1928 until Huff succeeded him in 1931. Milne could be classed as an influential “feudal baron” in the field of education who worked capably behind the scenes with the dominant local political group. As superintendent of the largest school system in New Mexico, he had influence approximately equal to that enjoyed by Huff as state board president. At times, the two men clashed over issues involving the distribution formulas for school revenues, such contests ending in a deadlock or compromise. On many issues they agreed, however, and, when this was the case, they seldom lost a legislative battle.

In the conflict raging over the 1935 distribution plan, George I. Sanchez entered the list as champion of the poor “northern” counties, and quite by accident under the same umbrella as Albuquerque. He had been one of the stalwart supporters of the 1935 plan and stoutly defended the merits of the formula properly applied, but he challenged the state board’s administration of it. He actually threw down the gauntlet in behalf of the northern counties and exhibited proof that the funds were not distributed according to the formula, thus disconcerting Huff and the board, who contended that the funds had been distributed in a “practical” manner to keep the schools open. Milne was not seriously disturbed because, according to Sanchez’s study, he had lost an insignificant amount by the “practical” distribution. The northern counties were the real losers. Sanchez claimed that giving them the amounts due them under the formula would have taxed the earmarked funds to the extent that Albuquerque would not have benefited financially and that the “eastside” counties would have lost instead of actually benefiting as they did from the allocation. In short, neither Milne nor Huff agreed with Sanchez, and in the power struggle which ensued, the “eastside” and the “big population” centers were careful not to play into the hands of the “northern” counties.

A Citizen-Taxpayers Committee, appointed by Governor John E. Miles in 1940 to study the situation, recommended a new formula for distributing funds based
upon "average daily attendance," weighting 1.75 for high school students in comparison to the elementary pupils. The victory went to the heavily populated areas with a considerable financial gain for those having a large ratio of high school students, to the disadvantage of the sparsely settled areas. The "eastside" sparsely settled areas did exercise sufficient power to secure a preferential position for financing transportation from earmarked sources of school revenue. During a meeting on the recommendations in the spring of 1941, Milne predicted transportation would get an appropriation even if the schools had to close because of insufficient funds to pay teachers. At his insistence, a provision was passed setting a maximum of 20 percent for transportation costs from state funds (25).

The age of "educational feudal barons," when Milne and Huff wielded great power with most superintendents following in their train, essentially disappeared following their retirement in the middle fifties. However, there were still a few powerful individualists in the state reigning in their own bailiwicks. One of the best examples of this kind of baron was T. C. Jaramillo, superintendent of the La Joya school system 50 miles south of Albuquerque, who ruled his community with an iron hand and defied attempts to usurp his power. When the state board tried to consolidate La Joya with the Socorro school district in 1953, Jaramillo was a member of the State Senate. He thundered in the Senate chamber that "the hierarchy that coerces the schools" should be trimmed of its power (26). Since the state board had a great deal of discretion in ordering district reorganization at the time, Senator Jaramillo followed his denunciations with a bill, which he forced through the 1954 session, reducing its authority substantially.

Jaramillo successfully defied the state board in a number of its efforts to consolidate his small district with adjoining districts. For instance, in 1962, pursuant to a law requiring the state department to survey all small, independent districts and recommend a suitable reorganization, it advocated that La Joya merge with the Belen school district. Though Jaramillo was no longer a member of the State Senate, he organized the boards of all affected small districts, and under his leadership they became so aggressive that the Legislature rescinded its mandate in 1963, passing a statute forbidding the State Board of Education to survey small districts for reorganization unless their boards requested it to do so. Jaramillo retired from his superintendent in 1964, and a few months later La Joya was consolidated with the Belen system. But while he had ruled his tiny "kingdom," it had remained unchanged.

By 1966, all of the "barons" had departed. Leaders such as Earl Nunn, superintendent in Las Cruces, and Joe Otero, the Taos superintendent, are very influential, but they work mainly as members of a team along with the state superintendent.

COURT DECISIONS AND STATUTORY PROVISIONS

The Church and State Issue

Many Catholic nuns accepted teaching positions in the public schools of New Mexico, particularly in the economically poor districts of Mora, Taos, and Rio Arriba Counties. Some of the public schools could not have existed had these nuns or others not taught with missionary zeal rather than for the monetary rewards the districts could afford. After the passage of the Equalization Act in 1935 making state funds available for all school districts, however, it was possible to employ teachers for fair salaries even in the poorer counties, which in turn made available a reasonable supply of lay teachers.

In 1948, a number of citizens complained about nuns' teaching in the public schools of Dixon, a small Rio Arriba community which was one of the strong Presbyterian missionary centers in the state. Out of this opposition emerged the Dixon Case (27), which the court decided with the following significant stipulations:

1. One hundred thirty-nine nuns were specifically barred from teaching in the public schools.
2. The State Board of Education and all local boards were prohibited from holding tax-supported school classes in buildings having religious emblems.
3. The state board was restrained from adopting special textbooks for use by religious orders.
4. The state board was restrained from allowing children state-furnished transportation to parochial schools.

Although the decision favored the plaintiffs, they appealed to the supreme court for more general prohibitions against religious involvement in the public schools.

When the state board passed a resolution prohibiting public school teachers from wearing religious garb and declared that church property should not be used for public school purposes early in 1951, Archbishop Byrne of the Santa Fe Archdiocese directed that all nuns leave the public schools at the end of that term. The outcome was an effective and definite separation of church-school relations. No longer did schools sponsor baccalaureate exercises except when attendance was on a voluntary basis or when various churches inaugurated services for their graduates. Undoubtedly, the quality of teaching deteriorated in some schools because it was difficult to replace the nuns, who were often qualified and effective teachers, but in a few years the schools were operating satisfactorily with a lay teaching corps.

The eastern section of the United States had separated the public schools from the church some years earlier; New Mexico had only recently become a state and as a territory had not felt the impact from the other states until late in the nineteenth century.
The Integration Issue

In 1954, the U.S. Supreme Court ruled segregation to be illegal and notified the Governors that integration must commence at the beginning of the following term unless they requested and were granted a special reprieve. Governor Edwin L. Mechem, after consulting with the state superintendent and the state board, notified the court that such an extension would not be necessary in New Mexico. The very next year, Clovis, Hobbs, Lovington, Las Cruces, and Gadsden integrated their schools with only a few minor incidents. A teacher in Las Cruces, discharged because she would be teaching white as well as Negro children, did appeal, and the State Board of Education ruled that her tenure had been unlawfully violated and ordered the school to reinstate her (28). In another case, Negro children transported from the Gadsden school district to a segregated high school in Las Cruces demanded entrance to the Gadsden high school. The local board appealed to the state superintendent who, with the advice of the attorney general, ruled that they should be admitted to the high school within their own district.

ORGANIZATION AND FUNCTIONS OF THE STATE DEPARTMENT OF EDUCATION

Since its creation, the state department has been organized primarily as an agency for (a) regulation and control, (b) service and leadership, and (c) research. The time given to each of these factors has varied considerably over the past 50 years, shifting with the times as well as the administrations. In the beginning, supervisors were considered to be little more than inspectors who searched out weaknesses in the local schools but did very little to help correct them—too often the tragic history of understaffed departments in poor states. It was not until after the Council of Chief State School Officers initiated its study of departmental functions in 1950 that New Mexico began to operate under the theory that “for every control there should be a corresponding service” (29).

In 1959, the department set forth its new approach as a “partnership concept” along nine fronts: curriculum and instruction, finance, school business administration, personnel, transportation, school plant facilities, school district organization, special services, and state-federal relationships. Instead of spending so much time on enforcement, the department gradually placed major emphasis on encouraging and sponsoring in-service training. Sometimes this was accomplished by the department’s supervisors; at other times it was done in cooperation with universities and colleges. The first extensive effort along this line developed in the early fifties when the department sponsored a cooperative program for education administration with funds partially furnished by the Kellogg Foundation (30). Other programs followed, such as the bus drivers institute held each summer on the New Mexico Western College campus. Supervisors organized workshops in arts and crafts, mathematics, language arts, and social studies in cooperation with and often sponsored by other state universities and colleges. Many guides were published and distributed on teaching Spanish, music, the social studies, and other subjects.

As was the case in many other states, New Mexico’s department was weakest on research. Dr. Sanchez, who served as director of research statistics for the department, inaugurated its first significant study in the early thirties of the underprivileged children of Spanish descent in northern New Mexico. With a grant from the Rockefeller Foundation, the department initiated intensive research in teaching English as a second language, assisted by the University of New Mexico and the Bernalillo County public schools. Directed by L. S. Tireman and Marie Hughes, this study did not terminate until 1937 and in large measure converted the school into a force in the community.

Although the actual findings were not organized and disseminated effectively, the outstanding product was the development of teachers who succeeded to supervisory positions and who for many years exercised a wholesome influence on education. Perhaps more could have been done if the funds had not been terminated and if the results had been published and distributed statewide.

Two other major projects conducted by the department should be mentioned, one relating to Navajo schoolchildren and the other to small schools. Virginia Keehan, director of guidance, accomplished the former in the early fifties with a grant from the Field Foundation. Sponsored cooperatively with Colorado, Arizona, Utah, and Nevada, the study in the Small School Area commenced in 1960 and is still in progress. Certainly more research is needed, and the U.S. Office of Education is to be commended for its recent efforts to strengthen the departments in this area.

RELATIONS WITH OTHER ORGANIZATIONS

The position of the state department within the structure of the Santa Fe scene is difficult to assess. Generally speaking, the chief of the school finance division stands for economy while the New Mexico Education Association urges more expenditures, specifically for teachers’ salaries. The department’s position is somewhat between these two, at times throwing its influence closer to one and then the other. It is rare when all three of these powerful agencies are in complete agreement, so a triangular situation seems almost inevitable, since the issue of school finance is one of “high tension.”

The agency least vulnerable to direct pressure by the state’s officialdom is the education association, because its
budget is not subject to government review and control. Its chief foe is the taxpayers association and its subsidiaries, which claim in essence that the education association has no regard for economic factors. On the other hand, the education association continues the perennial contest, accusing the taxpayers association of caring less for human values than for a well-balanced fiscal climate. The state department has often attempted to be the mediator, at times with dismal results and at others with fair success.

For many years, public school men had done little more than guard earmarked sources against intrusions by other agencies, persuading the Legislature to "leave alone" the sales tax and three-fourths of the income tax, which had been the major revenues assigned to education since 1934. While this income had been adequate in the forties and had even enabled a large surplus to develop, by the end of the next decade it dwindled so much that by 1960 the schools were in financial trouble. In short, the earmarked sources could no longer supply the funds to carry the educational load. Since there was a 7.25-mill tax limit on property (usually assessed at a very low average rate), there were no leeway for local initiative and no alternative but austere budgets. For the first time in many years, school leaders appeared before the Legislature to request additional sources of revenue. Accustomed to viewing the fiscal structure as permanently suitable, the legislators were alarmed; before the situation was solved, they as well as many schoolmen suffered traumatic experiences.

The Mort Report

The Legislature reacted by requesting a study of the situation. The department responded by bringing in Paul Mort to conduct an all-inclusive survey of the financial condition of the state's public education. Following a painstaking examination, Dr. Mort recommended that the Legislature guarantee a base appropriation for each pupil and stop earmarking sources. He advised the state to make a supplementary appropriation over and above this support, based on the ability and effort of each district, the matching ratio to be determined by the true taxing power of the district. In other words, a district would be free to raise as little or as much as it desired, but the state's proportion would be determined by the ability rating of the district.

Mort also pointed out that the local tax base should be developed, (a) permitting the school board of the administrative units to vote a tax beyond the 20-mill limit, (b) raising assessment levels on an equalized basis, and (c) transferring the state property-tax levy to local school units, or authorizing a local school surtax on income at the local level, collected along with the state income tax and returned to the unit. He further recommended that hindrances to efficient local management should be removed by paying the state appropriation directly to the school administrative units, making the 5-mill county maintenance tax a school district tax, and eliminating the earmarking of maintenance and direct-charge taxes.

He felt that the State Department of Education should continuously study this new system and report any weaknesses to the Legislature. His report recommended using the average daily membership rather than average daily attendance in computing the financial ability of the unit, and weighting the schedule for small schools at both the elementary and high school level. To assist the poor municipal government, already spending heavily for other services, he recommended a reduction which would "apply to any school district in which the local burden of non-educational government exceeds" (31) the average for all communities under 20,000 population.

Mort suggested a graduated system whereby administrative units which demonstrated maturity in supporting and operating their schools would be freed from state control in their budget making. Other units, less alert, would be supervised in preparing their budgets by state agencies, preferably the education department. Thus the report embodied recommendations that (a) the state maintain a substantial base support, (b) the state reward local units on the basis of local funds raised, and in inverse proportion to their true ability and tax-raising power, and (c) the district be given more judgment in school taxation and budget making.

Legislative Reaction

The Legislature called a special session in February 1962 for the exclusive purpose of enacting emergency school legislation. Mort's recommendations were introduced in Senate Bill 27 and gained immediate support. In the meantime, Governor Mechem requested John Gott, chief of the school finance division, to withdraw from the study committee and come up with a plan. Gott, who had worked closely with Mort and the committee, was in an embarrassing position. He finally recommended all features of the Mort plan except the partnership aspect for supplemental state assistance, one of its vital elements. However, Gott testified that his proposal was an "interim recommendation" and expressed hope that the full Mort formula would become law at a later date. In his appearance before the Legislature in February 1962, Mort testified that Gott's proposal was "exactly the same thing that I thought in 1924 and I have learned a lot since 1925" (32).

The New Mexico Education Association officials, compounded the confusion by proposing that no changes should be made in the distribution of state funds. Legislative leaders and Governor Mechem rejected this and endorsed the Gott-recommended portion of the Mort plan, introduced as House Bill 15. The school administrators and the State Board of Education finally conceded that the
Senate bill carrying the full Mort plan did not have sufficient support, but many of its provisions were accepted and the law enacted. The unit for distributing state funds was changed to "average daily membership" from "average daily attendance," the weighting system now took into account administrative-unit size, and state funds as well as countywide taxes were to be allocated on a new formula basis instead of being distributed to the counties as in the past. Although the federal mineral lease fund and the current school fund were assigned to education, the law abolished earmarking the sales tax and income tax, stating that the "distribution shall be made within a limit set by the Legislature...using the support figure. All funds remaining in the equalization fund at the end of each fiscal year shall revert to the general fund" (33).

A year later, the state board presented a program for state-level support calling for a slight change in the weighting formula, the support figure to be increased from $270 to $280 per weighted pupil and a minimum guarantee per pupil. This guarantee would amount to $45, the state to supply any deficiency after taking credit for 75 percent of non-state-derived funds, allowing 25 percent of local or federal funds for leeway at the administrative-unit level. In other words, the full minimum guarantee under the board's plan would be $325 per pupil, the first $280 being the base support, any difference within the remaining $45 after credit had been taken for 75 percent of nonstate resources to be filled from state revenue.

Politically powerful Senator Albert Greer introduced a second plan which included a formula based on detailed slide-rule calculations using as a source the "line of best fit." Drawn on graph paper, it indicated the pupil-cost for each school attendance unit in the state which involved a cost figure for elementary, junior, and high school levels. It was computed for school size, carrying 28 weighting intervals, beginning with schools having less than 20 pupils up to schools with 1,500.

Education leaders reacted sharply to the Greer formula, and on February 5, in a fiery hearing before the Joint Finance Committee, State Superintendent Tom Wiley and representatives of the State Board of Education faced members of the committee who challenged the role of the board in the area of school finance. One old-time Senator asked the question, echoed by several satellites, "Why in the hell are you recommending a finance plan? That should come from the Chief of the School Finance Division!" (34). This expressed the general attitude that the state board had very little prestige in the area of finance. Greer used every means possible to carry his plan into effect, and a few days later, the bill carrying the board's proposal was scuttled. However, House Bill 364, which was almost identical to it, was introduced with Governor Jack Campbell's approval. It met with heavy opposition, and John Gott, who was appointed by the Governor to defend it, was hard pressed at the hearings.

In the meantime, Democratic Floor Leader Austin Roberts appealed to New Mexico Education Association officials to work with Senator Greer for some kind of an agreement on his proposal. After several meetings the Senator finally agreed to modify some of his plan's objectionable features, one in particular relating to an exceptionally light "weighting" of pupils in the large high school bracket. This was a necessary modification, because despite the fact that he used the "line of best fit" up to a certain point in plotting his weighting scheme (35), by his own admission he had deliberately tipped it toward the lower-cost side of the graph at the level of the larger high schools, claiming that "if the Roswell high school can operate at a low pupil cost level, so can all of the others" (36). With this compromise, the plan was reluctantly accepted by educational leaders, and the Legislature passed it.

For the first time, the Legislature provided a minimum-support clause. It had no real significance, however, because it concluded: "In the event the appropriation for this section is insufficient to permit all districts to meet the minimum level established by the legislature, the Chief shall make an appropriate reduction in the minimum support level" (37). Along with this, the Legislature resurrected the system of budget commissioners which it had abolished in 1962. This meant that local school board members who for the past year had been serving as local budget commissioners no longer could do so; budgetary review once more became the province of two local budget commissioners appointed by the county commissioners.

During this period, strong power plays were in motion. One major reason the state board contracted Paul Mort as a consultant during the 1961 financial dilemma was the feeling that if the state department exercised leadership, it could wrest control of school finances from the chief of school finance and give it to the superintendent of public instruction. Despite a strong effort, the tradition of 40 years prevailed, and there was no fundamental change. Again, 6 years later (1967), the state board formally resolved that this control over finances should be under the agency responsible for education standards, the state department. Whether it succeeds or not, it will serve as a defensive measure against those who would transfer to the chief of the state finance division the department's present power to distribute federal funds.

CHANGE IN STRUCTURE

As early as 1929, there had been a futile effort to change the state superintendency to an appointive position. The Legislature again attempted to change it in 1935 by submitting a constitutional amendment to the people, only to see it voted down. For the third time, New Mexicans
rejected an appointed superintendency in a special election 11 years later. The Congress of Parents and Teachers, its sizable membership always posing great potential political strength but seldom exerting it, finally became militant. It was determined to pass a state-reorganization amendment introduced in the 1957 legislative session which would establish an elected State Board of Education, one member from each judicial district, with the power to appoint the state superintendent. Despite severe attacks against the reorganization, the amendment did pass in the 1958 general election.

On January 2, 1959, Governor John Burroughs appointed the first interim state board under the new provision. Two days later, the board organized and named as superintendent the individual elected at the time the amendment passed, although it was not mandatory that it do so. Four of the originally appointed members were elected to the board in 1960, and in their first meeting all 10 members drew lots to decide the length of terms: three drew 2-year terms; three, 4-year terms; and four, 6-year terms. Two years later, after the 1962 election, only three of the originally appointed board members remained.

There were definite improvements following the reorganization: The board no longer served at the pleasure of the Governor, and the superintendent no longer was restricted to two consecutive terms totaling 4 years. As an appointed officer, he served at the pleasure of the new board—a board essentially composed of laymen elected from judicial districts. The new system has aroused criticisms, particularly because board members are elected in a partisan manner, running on party tickets at primary and general elections.

This does not imply political manipulations on the part of the board, the real objection being that educational issues and candidates are virtually lost in the lengthy ballots and general campaign confusion. The result has been a heavy turnover of board members, in part because incumbents have fallen victim to the popularity of upper-echelon candidates of the opposing party carrying the entire slate to victory. Also, the judicial districts from which the candidates run are not geared to the county or state power structure, nor do they make allowance for adequate representation from heavily populated areas. For example, one district with a population of over 300,000 and another with less than 30,000 each elect one, and only one, state board member. Fortunately, several strong personalities have capably represented the state's educational interests (38).

Perhaps one of the most significant decisions the state board faced in its first year concerned teacher certification. Due to considerable agitation from a few legislators who felt that "professional education" courses were unnecessary prerequisites for certificates, the Senate passed a memorial requesting the state board to eliminate them. During the board meeting in 1959, Dean Chester Travelstead of the University of New Mexico's College of Education, Dean Donal Roush of New Mexico State University's College of Education, and John Aragon, assistant executive secretary of the New Mexico School Boards Association, defended the prevailing requirements. After a lengthy discussion, one member abstained, five voted against and four in favor of a motion to abolish the requirement.

IMPACT OF FEDERAL PROGRAMS

The Smith-Hughes Act marked the first traces of federal influence on the department's budgets and services. The State Board of Education was designated as the board for vocational education which had to be in operation before the state could receive the funds from the government. With the state superintendent as the executive officer, the department employed supervisors of vocational agriculture, trade and industry, home economics, and vocational rehabilitation. The appropriations finally reached the point in 1964 where it was necessary to name a director of vocational education.

Despite the long period of federal aid to education, the U.S. Office of Education's influence on New Mexico's programs was negligible until the state acquired funds under Titles III, V, VIII, and X of the National Defense Education Act passed in 1958. Within 6 years, approximately one-fourth of its employees were connected in some way with the services extended through federal appropriations. When the Elementary and Secondary Education Act (Public Law 89-10) funds became available in 1966, nearly one-half of the employees were federally connected through appropriations and categorical services.

The department struggles to maintain a service attitude toward the local districts and at the same time retain as much autonomy as possible, but there is no doubt that its activities are "Washington oriented." It bustles with activity, processing and administering federal contracts; large department divisions and substantial staffs work under the various titles (39) and the 1963 Vocational Education Act. In 1962-63, federal funds comprised only 30 percent of the department's operating budget, but 5 years later (1967-68) the national government furnished 50 percent of the budget. It appears that the state departments of New Mexico and other states are to a much larger extent than might be supposed becoming "clearinghouses" for the U.S. Office of Education.

OBSERVATIONS

In theory, the State Board of Education should properly interpret the financial needs of the schools for the Governor and the Legislature, but it is vulnerable for several reasons. First, as long as school budgets are controlled by the chief of the school finance division or by any other noneducational agency, it is reasonable to assume that the state board will be considered an intruder or at least a
second-level authority if it takes a militant stand on school finance. This is the record thus far. The board was effectively relieved of fiscal responsibility in 1923 when the Legislature created the office of educational budget auditor. Changing the state superintendency to an appointed position only cured half the difficulty. Few people seem to have discerned that as long as budgetary control is held by another agency, the department cannot be strong or effective regardless of how the superintendent is selected. John Gott sums up the situation well:

Most people recognize that theoretically the proper residence of educational leadership is the State Department of Education. All too often these same persons criticize that agency for lack of leadership, little noting that the legal division of authority on certain phases and aspects of education leaves the Department of Education completely incapable of assuming the role that is theoretically its prerogative (40).

If the Legislature begins to feel pressure from the state board, it can immediately attack the internal-operating budget, an old but effective trick. It has been said—with too much truth—that "special treatment of legislators and legislative committees is automatic and axiomatic within the bureaucracy. Requests of legislators are handled swiftly and with special care" if the agency is not willing to face a budgetary attack (41). And the state superintendent is in a very peculiar position. To gain the schoolmen's respect he must be an educational statesman, not a politician, but if he is to enter the legislative area as a public official, he must be able to speak in terms understood and appreciated by politicians. The Governor who runs and serves as an out-and-out political official is in a much stronger position, even after discounting his veto power.

Another reason for the state board's vulnerability is its built-in rivalry with the New Mexico Education Association, a rivalry which developed in part because the association desires to create its own council and has tended to resent leadership from the state agency. Neither wants to be accused of following the other's lead. But the state department operates in a unique atmosphere. It cannot claim a direct effect on the education of boys and girls because its operations are once removed from the pupils, and it has no alumni to rally to its legislative aid as do local schools, colleges, and universities.

Legally, education is a state responsibility, but the average parent or man on the street is not aware of this, if indeed he gives it much thought at all. When pressed, a parent will say, "The education of my child is my responsibility. A part of this job I delegate to the local school." Note that he will say "the local school"; most parents do not admit that their children's education is controlled by an individual or board in some far-away place, such as the state capital, because, historically, education has been a local responsibility. The point is simple: The school must be administered in such a place and manner that its management is accessible to its patrons. Observation of nonlegal groups such as the parent-teachers association indicates a determination on their part to have an active and continuing voice in school matters. If parents are dissatisfied or distrustful, they will storm the local school board's citadel to break through oppressive administrative controls with informal or nonofficial approaches if necessary, and not wait until the next board election for a solution.

How does this affect the state board and the state superintendent? History indicates that departments of education have evolved or are in the process of evolving through several stages. The early state superintendent's chief duties were to tabulate and edit the few reports demanded of local divisions, to advise about the law, and to apportion the meager state aid as the Legislature provided. Gradually, these duties included vocational education and approval of minimum standards. Minimum standard signifies a level of education below which no district should operate, but to the laymen it too often connotes a different standard of education. The state superintendent usually thinks in terms of larger school plants, better equipment, and a more efficient per-capita investment, which means a consolidation of schools, while the patron of the small school thinks in terms of individual attention bestowed on his child, school spirit, proximity of the school to his home, and its identification with the community.

Often the people in the rural districts are inherently suspicious of city people and feel that consolidation significantly diminishes their voice in school matters. When they appeal to the state board or superintendent, they are rightly told that they should discuss their troubles with the local board, a board which does not seem local to them since they do not live in the same neighborhoods as the board members. Often they contend that they have appeared before the local board without receiving a satisfactory reply. This is not too far wrong because every minority group tends to desire state control until it becomes a majority and controls the local situation, at which point it regards state control as meddlesome and obnoxious.

This leaves the state agency in a peculiar position. People fundamentally desire and believe in local control, yet they realize (more clearly in times of crisis) that there should be a governing body at the state level. Argue as they will that education can be governed in the same manner as all other government agencies, when education is subjected to the authority of any other agency than the State Board of Education, its unique features become evident, and the need for a strong state board appears. The question arises, "How can the state board function effectively where there is a firm belief in local control on one hand and the implicit need for state direction on the other?"

One solution is that the state should do for the local community only what the community cannot do as well or
better for itself, thus encouraging local maturity. There should be a feeling of gain rather than loss when a local board and superintendent go beyond the point of needing supervisory assistance from the state department. Although the department should know of important deviations from standard procedures, it should respect and encourage local units to inaugurate educational research and projects and to develop innovations. One school authority stated that "essential needs must be recognized by those who are aware of these objectives and at the same time in close association with boys and girls" (42).

Encouraging superior schools, both large and small, to serve as "lighthouses" to others is an important function of state departments, which should also assume the responsibility for making the results of these local research projects and innovations available to all schools. Mort, in discussing the considerable lag between beneficial educational discoveries and the general consciousness of them, made a serious charge: "The lag in permissive legislation may be due partly to fear on the part of local administrators that to bring the adaptation to the attention of the state department of education would be to awaken opposition" (43). Where such a climate exists, it borders on the "cat-and-mouse" concept of state-local relationships rather than that of a partnership.

A partnership carries with it more controversy and peril than is noticeable at first glance. Many legislative leaders who believe that the state department should operate as an inquisitorial agency—one that constantly challenges local districts in their expenditures—may not realize that this destroys a working relationship between the department and local units which obligates mutual judgments on important problems. Too many critics have construed "partnership" as "connivance," unable to perceive that the department should be a facilitator of local progress. Needless to add, the safe position would be for the state department to "nest" in the security of legislative approval by taking a dim and suspicious view of local procedures. Fortunately, mainly through the professional leadership of the Council of Chief State School Officers, there has been a trend away from the inquisitorial approach during the past 15 years.

Perhaps the state department could realize its most significant potential by taking the lead in an evaluation of educational philosophy. To be successful, this would require wide participation of leaders of local groups and organizations, as well as of skilled specialists from institutions of higher learning.

The quality and form of an educational system is dependent upon the value judgements made by those in a position to affect the system; therefore, it behooves us, as educational leaders, to be as certain as possible that this direction is as valid as we can possibly make it (44).

This is no insignificant task, because it involves taking account of objectives and aims of individual pupils, teachers, and citizens from the community level, the state level, through the national and international levels. There is a sense of urgency as we rocket into the latter decades of the twentieth century to develop a philosophy we can use, but it can and must be accomplished. Neither methods nor curriculum are sacred if changes are necessary for progress. Perhaps this situation is dramatically illustrated by the federal government's two-booted jump into the educational arena. The emphasis—a part of the pattern—has been legally established at the national level ever since the Russians first ventured into space. It is reflected in the high school vocational education programs and the post-1958 emphasis on science, mathematics, and language. Recent appropriations are guiding the course of education, but it is difficult to define the long-range effects, particularly on the Department of Education.

Will the state departments become subdivisions of the U.S. Office of Education, to a great extent, merely following the "big cookbook" that details the recipes for using funds appropriated by Congress? Can the departments maintain an independent voice in dealing with the local school administrations, or will they eventually be forced to play supporting roles with the federal government controlling them? The answers are just now unfolding, but in New Mexico as in many other states the department is attempting to maintain its independence to the fullest extent possible. And although the task of settling these baffling problems must be shared by many groups and agencies, a greater responsibility must rest with the educational system. It cannot be done by Retreat into the past, but by using the past as a launching pad for advancing beyond the present in establishing clear goals for the schools. The state department is in the most favorable situation to exercise leadership and bring about a meeting of minds which could launch such ventures. And although its activities are often viewed with a jaundiced eye, they are essential, and most thoughtful people recognize this. Education, as set forth in the constitution, is a state responsibility, and vigorous leadership by state departments to give directions in the coming years is absolutely necessary.

FOOTNOTES

2. Bishop Lamy in the midnineteenth century made the first significant move toward establishment of schools.

4. Since the public school idea was entirely new and brought in by the “gringos,” a great many of the people were suspicious, afraid that these newcomers were determined to change the ideas and ideals of their children. Tom Wiley, *Public School Education in New Mexico* (Albuquerque: Division of Government Research, University of New Mexico, 1965), p. 25.

12. New Mexico, *Session Laws* (1923), ch. 148, sec. 105. A most successful cooperative effort between the State Board of Education and the New Mexico Education Association is in the field of teacher certification standards. The Teacher Education and Professional Standards Commission, an affiliate of the association, brought its first recommendations before the state board in 1954. Since that time, a number of far-reaching proposals have been presented for its action by the standards commission. In practically every instance, the board has adopted these proposals.

13. Jennie Gonzales, who had been a teacher in the San Jose Training School, pioneered as a qualified state supervisor of elementary education in the early thirties. Mary Watson, an expert in elementary education, served as elementary school supervisor in the State Department of Education during three periods: 1937-38, 1943-46, and 1951-54. Through her perseverance and skill, she exerted a lasting influence on the instructional program of the state's elementary schools.

15. New Mexico, *Constitution* (1912), art. 12, sec. 4.

22. J. T. Reese served as director of transportation from 1936 to 1966. Through his efforts, minimum standards of safety were established; he was instrumental in organizing the school bus drivers institute which was held annually in cooperation with one of the state's higher institutions of learning.

25. The author was present at the meeting of the school officials when this item was discussed with the Governor's committee.

26. The author personally attended those sessions.

27. Officially, Zellers v. Huff, 55 N.M. 501; 236 P. 2d 949 (1951). Lydia Zellers was a resident of the community, and Raymond Huff was the president of the State Board of Education.

28. The tenure law passed in 1937 allows classroom teachers a hearing at the local level with the right of appeal to the state board. Many cases have been appealed, and the local boards have been upheld in about one-half of them.

30. Frank Angel, an outstanding teacher in the Nambe Community School Project of which Mary Watson was principal (1939-42), later served as supervisor of rural schools in Bernalillo County. He joined the staff of the state department in 1951 and served through 1954. His outstanding contribution has been his leadership as director of the New Mexico Cooperative Program in Educational Administration. He has been a member of the University of New Mexico faculty since 1958 and served as a consultant on many important state department committees relative to state-local relations and finance while Tom Wiley was superintendent of public instruction.

34. Question addressed to Tom Wiley by Senator P. M. Carr.

35. After plotting the actual per-capita cost by school size, Senator Greer attempted to run a line of average relationship between per-capita cost and size of attendance units.

36. Tom Wiley heard Senator Greer make this statement in February 1963.
37. New Mexico, Session Laws (1963), ch. 310, sec. 4.
38. A few persons who can serve as examples of efficient state board members include Virgil Henry of Hobbs, president of the board since 1961; K. I. Langley of Tucumcari; Edward Jory, Mary Wilson, and Fred Comstock, who have served successively from Albuquerque; Billie Holder of Alamogordo, who served a 2-year term; and Beverly Agnew from the northwest area of the state.
39. Mildred Fitzpatrick, with a supervisory and principal-ship background in Curry County, New Mexico, joined the staff of the state department in July 1959 and served most capably as supervisor of elementary education until 1965, when she was appointed the department's director of Title I under Public Law 89-10. Dr. Fitzpatrick is presently serving in that capacity and has been instrumental in creating a harmonious, cooperative climate between the U.S. Office of Education and the local school districts.

**APPENDIX C—IMPORTANT DATES IN THE HISTORY OF EDUCATION IN NEW YORK STATE, 1904-68** 895
THE EARLY YEARS

The New York State system of education is inherited partly from the Dutch, and partly from the English, who wrested the colony from Holland in 1664. The Dutch and English concepts of education were essentially different. Primarily trades people, the Dutch were concerned with providing widespread general education and established tax-supported elementary schools under the control of church and state in all of their colonies. Under the English, who were more concerned with the education of the elite at the secondary level and beyond, the common school system of the Dutch all but disappeared, a system of private and church-supported academies developed. The year 1754 witnessed the opening of the private Kings College in New York City to cater to the special needs of the well-to-do.

After the Revolutionary War, one of the first problems to which the new state government gave its attention was education. In 1784, before adoption of the first State Constitution and within 6 months of the time that British troops evacuated New York City, the State Legislature created the corporate body of the Regents of the State of New York to act as a governing body of Kings College, later renamed Columbia College. Three years later, the state authorized the Board of Regents to charter new colleges and gave the board broad powers of supervision over them. At the same time, it was charged with the general supervision of all academies and authorized to charter new ones. The state empowered the regents to grant financial aid—direct monetary grants and land grants to colleges and, in small amounts, money grants to academies. Later the Board of Regents was relieved of direct operating responsibility for Columbia College and became solely a state control agent. Thus, secondary and higher education continued in the colonial pattern of church and private local control, but under general state governance and with state support.

The Board of Regents had no responsibility for elementary education, but it recognized the state's need for a strong elementary program as early as 1787, when it reported to the Legislature that the building of public schools for teaching reading, writing, and arithmetic was of great importance which should not be left to the discretion of private individuals but should be promoted by public authority.

Although the Board of Regents and other groups continued to urge the establishment of common schools, New York took no action until 1795, when, partly in response to Governor George Clinton's message to the Legislature urging that common schools be established throughout the state, the Legislature enacted a bill appropriating $100,000 a year for each of the next 5 years to encourage the establishment and maintenance of common schools. The same legislation required that to qualify for state funds, the local school must raise a sum equal to half again as much as the allotment for which it qualified. Thus were initiated two of the principles that have appeared in all legislation relating to public school support—state support and a mandated local contribution.

After the 5-year period of the 1795 legislation, its terms were not renewed, and for a decade the state made no further effort to encourage public education. Evidence indicated that the lack of action was due not to lack of interest, but to disagreement over what should be done and whether the common school program should be placed under the control of the Board of Regents.

Finally, under persistent and growing pressure, the Legislature passed the Common School Act of 1812, laying the groundwork for the pattern of public school control that exists in the state today. This act divided the towns of the state into school districts which became the bases for today's centralizations and consolidations. It provided for the local control of schools by boards of trustees, who serve as state agents. It established a system of support similar to that in the early Dutch colonies: The board of trustees was empowered to levy a tax to build and maintain schools; the state contributed to the payment of teachers' salaries; additional costs were to be covered by an assessment against the parents of pupils. To govern the public elementary school system, the Legislature created the Department of Public Instruction, headed by the state superintendent of schools, thus marking the first organization of the elementary schools in any state into a common system under the jurisdiction of an appointed officer.
In 1853, the Union Free School Act extended public support of education to the secondary level. The immediate intent of this law was to permit cities and other populous places to consolidate their many common school districts into a single district and to organize public high schools under the control of boards of education.

Thus, all through the nineteenth century, there were two state educational authorities: The regents had general control of colleges and universities and of the private academies; the state superintendent of schools was in general control of elementary education. Both authorities claimed control of the public high school. An inevitable conflict for jurisdiction over the high schools arose between the two and lasted until after the turn of the century.

The nineteenth century was a period of evolutionary but solid growth toward a state educational system, the legal status of which was founded on legislative acts. In the constitutional convention of 1894, however, an education article gave education a constitutional foundation—culminating the effort of 250 years of campaigning for a system of free public education. It also directed that the corporation created in 1784 as the Regents of the University of New York State be continued under the name of the University of the State of New York and that not less than nine regents should govern the body and discharge its functions which may be changed by the Legislature.

This short article provided a firm base for state support and general control of education in the state. Because it left all details as to the allocation of responsibilities, establishment of state-local relationships, standards, and finance to legislative decision, it has given the state system great flexibility and enables it to adjust quickly to changing needs and conditions.

The nineteenth century saw also the birth of the State Library (1818); the State Museum (1836); and the Board of Regents control of the professions of medicine (1890), dentistry (1895), veterinary medicine (1895), and certified public accounting (1896).

THE TWENTIETH CENTURY: ORGANIZING FOR QUALITY EDUCATION

The twentieth-century history of the New York State Education Department properly begins with the important legislation of 1904. During the nineteenth century, there had evolved two separate educational authorities—the regents and the state superintendent of schools—and there had been a considerable area of overlapping authority and consequent dispute and conflict. The Unification Act of 1904 settled the relevant issues by joining the two authorities into one organization with the Board of Regents as its governing board and the state superintendent of schools, retitled state commissioner of education, as the chief executive officer of the Board of Regents and chief administrative officer of the State Education Department. Thus all educational institutions—public and private, elementary and secondary, colleges and universities, libraries and museums—were placed under the general supervision and governance of a single control board, the Regents of the University of the State of New York.

The Board of Regents has broad powers of governance and control over all educational institutions in New York State, public and private, from the elementary to the university level. It has sweeping power over public schools and lesser but still highly influential power over private schools through its right to charter and register (which implies the right to establish requirements for a charter) and its right to visit and to require periodic reports from the institutions. The board continues, through the powers vested in it earlier, to license and regulate specified professions, to maintain and operate the State Library, and to charter and have general governance of public and private libraries in the state. The 1904 legislation also transferred to the Board of Regents the responsibility for maintenance and operation of the State Museum and Division of Science.

Members of the Board of Regents are elected by vote of the joint Houses of the Legislature. The constitution provides that there shall not be fewer than nine members. There are now 15, 1 from each of the state’s judicial districts and 4 at large, serving 15-year overlapping terms. Each year, one member is elected, in addition to any unplanned vacancies which might occur. The members meet monthly for a 2-day session. They are nonsalaried but are reimbursed for expenses in connection with their office.

The Board of Regents appoints the commissioner of education, who is chief administrative officer of the Education Department. As chief executive, he enforces the school law and the regulations approved by the regents. With the approval of the Board of Regents, he makes and enforces regulations concerning the schools, including the establishment of standards and the certification of teachers and other professional personnel in schools; prescribes examination procedure; and makes regulations governing other selected professions. These regulations have the effect of law. Responsible for long-range educational planning and development of appropriate educational programs, the commissioner allocates state funds to state-supported educational institutions and administers a broad program of supervisory and consultative services to the schools and colleges. Aside from his responsibilities as chief executive officer of the regents, he has the judicial authority, originally held by the state superintendent of schools, to settle disputes in the schools.

The Education Department of New York State is unique in its relationship to state government. The Governor does not appoint the head of the department, the Board of Regents, or its chief administrative officer, the commissioner of education. This gives the department a greater degree of autonomy than is enjoyed by other state
departments of education. Nevertheless, it should be noted that the Legislature has the power to increase, modify, or decrease the authority of the regents. It approves the department budget. And it can and does legislate with respect to such educational matters as minimum salaries for teachers and district organization.

The administrative offices of the University of the State of New York, including the State Education Department, are located at present in the State Education Building in Albany. Authorized by a law passed in 1906, the building is the first in the world to be erected and devoted exclusively to the administrative educational work of a commonwealth.

At the time of unification in 1904, in addition to the State Library and State Museum and Division of Science, the department was organized into seven bureaus: examinations, accounts, attendance, inspections, law, records, and statistics. The three general divisions, each headed by an assistant commissioner, were elementary, secondary, and higher education. In 1912, when the department moved into the newly erected Education Building, its staff numbered 250. (See Appendix B.)

Developments in education—and in the Education Department—during the twentieth century have not proceeded in an orderly way toward the attainment of established goals but rather have reflected the forces of change in society in general. The 1904 Unification Act provided the legislative base for the department, and Andrew S. Draper, New York's first commissioner, guided its organization. Until the mid-1930's, although the department expanded, the basic administrative structure remained unchanged. In 1937, partially as a reflection of recommendations made by the "Regents Inquiry into the Character and Cost of Education in New York State," a major reorganization of the department took place. The state made broad programs the responsibility of the several associate commissioners and assigned more specifically defined areas to the directors and bureau chiefs. (See Appendix B.)

Elementary and Secondary Education

Examinations administered under the authority of the Board of Regents have played an important role in developing and maintaining the high standards of instruction in New York's secondary schools. At their inception in 1865, the examinations were a series of specific end-of-course tests which were used as entrance examinations for the academies and colleges and to ensure the maintenance of standards. As changes in society led to changes in the function of high school education, the regents modified the examinations so they would serve as broad evaluation instruments. Today the regents examinations are a comprehensive system of end-of-course high school achievement tests prepared and rated by teachers. They are offered in January, June, and August and include 25 different high school subjects. The public high schools of the state are required to make general use of regents examinations; their use is optional in the private high schools.

From 1913 to 1944, regents examination grades determined the winners of state scholarships. In the early 1940's, the State Examination Board explored alternate methods of granting awards, culminating in 1944 with the development of the regents scholarship examination which has, since that time, determined scholarship winners and also served a general college guidance function. Since 1962, the regents scholarship examination has also been used as a qualifying examination for distribution of scholar incentive awards.

The most recent testing service is the pupil evaluation program, established in the fall of 1965 to provide teachers, schools, and the State Education Department with an annual inventory of pupil achievement in arithmetic and reading in grades 1, 3, 6, and 9. The tests used in the program are standardized tests of achievement, based on New York State courses of study and are administered at the beginning of each school year to pupils in every school in the state. The test advisory service provides consultative help to the schools in selection and use of all published standardized tests and aids in improvement of teacher-prepared classroom tests.

Education in 1904 consisted of many small schools, meagerly trained teachers, secondary programs designed for the academically able pupil only, and supervision in the form of inspections by Education Department personnel. There were 690 union free school districts and 9,961 common school districts staffed by 37,954 elementary and secondary teachers, the majority of whom had no more than a year's training beyond high school. The school commissioners, most of whom had no professional training, were supposed to supervise these scantily trained and widely dispersed teachers. The commissioners devoted most of their time to administrative supervision and detailed reporting of school conditions and activities.

The department had, in addition to assistant commissioners for elementary and secondary education, a division or bureau (the term seems to have been used interchangeably) of inspections. The assistant commissioners were expected to be generalists, to settle controversies wherever practicable, and to promote the interests of schools in every feasible way. Apart from a stenographer and a messenger, an assistant commissioner had no staff. When he wanted an inspection he called on the Division of Inspections, which carried one out and reported the results to him. The 15 employees of this division investigated universities, colleges, technical and professional schools, normal schools, training classes, academic institutions, and common schools. Apparently not specializing, they were expected to be so conversant with schoolwork as to be fairly able to judge its quality at any level and in any area.
Growth and development in the educational system have occasioned very different supervisory needs. After 1914, and especially after the Central School Act of 1925, there was a steady diminution of one- and two-room schools as larger schools were formed. Concurrent with the changes in district organization was a slow but constant rise in the level of teacher training. The trend away from the strictly academic started with the introduction of agriculture and home economics in the rural high schools established under the Central School Act—expanded to include business and distributive education, agriculture, home economics, vocational-technical subjects, art, and music, each taught by a teacher specialist. During and after the 1930’s, there was a steady growth in the point of view that supervision, if it was to produce better teaching, should not be of the inspectorial, rating, and reporting type, but rather should be an advisory and supporting activity. Such a trend may be observed superficially in changes in titles: For example, local supervisors were retitled consultants and helping teachers. Less frequently, it has resulted in a complete separation of the rating and reporting function (for tenure, promotion, and, in some cases, salary decisions) and the instructional improvement function.

Changes in the nature and organization of supervision in the state department have paralleled changes in the schools. As teachers became more specialized, supervision necessarily became specialized, too. The appropriate assistant commissioners organized supervisory units staffed by specialists. With the expanding work, first in the vocational fields and later in the academic fields, bureaus or units with bureau status replaced the individual specialist. Early instructional supervision, in the form of classroom visits, continued for some years. As state supervisors used group meetings, conferences, and workshops to aid in supervision, improved local leadership lessened the necessity for supervision at the classroom level.

Initiation in 1961 of a new supervisory device, the cooperative review service, marked the beginning of a new relationship between the department and the local school. To date, some 100 school districts have been reviewed under this system. A review focuses on the overall school program and the development of a plan of action to solve the most serious problems of an individual school district. Although the initial request for a cooperative review must come from the local school board, both local and department personnel are involved in its completion. After local authorities complete a preliminary review of practices and policies and administer a series of prescribed tests, a team of department specialists visits the school to examine its practices. Finally, the results of the two reports are correlated, and recommendations are made.

The years since 1904 also have seen important and far-reaching changes in curriculum. In 1910, the Education Department issued a 256-page syllabus for elementary schools that made definite provision for an elementary course of 6 years and an intermediate course to cover the work of grades 7 and 8. At the secondary level, the specialists in the inspections division, which had come under the direction of the assistant commissioner for secondary education and whose members were becoming academic specialists, prepared course outlines. The Smith-Hughes Act of 1917 and the Vocational Law of 1918 spurred curriculum writing in the vocational subjects, and the department wrote outlines which would conform to federal requirements.

In 1933, the department issued a Prospectus for Rural Teachers. It suggested the division of subject matter into five broad areas: language arts, social studies, arts, science, and mathematics. A radical departure from the former rather limited and specific skills organization, this Prospectus initiated a new trend in curriculum organization which eventually led to today’s emphasis on development of concepts. Following World War II, social and economic factors and new knowledge placed great pressure on curriculum writers for new and different materials. A trend toward moving materials downward in grade level left room at the top for more advanced courses for which materials had to be prepared. Science, which had not been widely taught in the elementary schools, was voluntarily taught in many districts after World War II and was made mandatory in 1958. Advances in technology opened up new occupations for which training programs had to be written. Child development principles were more deeply examined as a guide to curriculum organization, and the viewpoint was being strongly presented that school programs should place less stress on remembering and greater stress on reasoning and the development and application of principle.

As a result, there was a great upsurge of curriculum work in the Education Department. New programs were written that expressed the new points of view in learning, suggested new materials and methods, and incorporated new technical devices for teaching. The department also conceived advanced courses and programs for groups with special needs. As materials for secondary level use were prepared, the plan writers followed up on what had been done in elementary education in 1938 by breaking down discrete subject walls. For example, they molded algebra, geometry, and trigonometry into a comprehensive mathematics course. And, for the first time, they wrote the program in basic subjects—language, social studies, mathematics, and science—and art and music as full 12-year sequences without the traditional break between elementary and secondary level.

The present procedure for revising curriculum involves experts in the various curriculum areas and key teachers and instructional supervisors from public, parochial, and independent schools of the state. New curriculum publications are prepared, and usually 100 to 150 cooperating schools representative of the various regions of the state try them out experimentally.
The period from 1965 to 1968 brought several significant changes to the New York State Education Department. The department developed a new performing arts program involving about 1.5 million students. Activities include in-school performances, attendance at summer matinee performances at the Saratoga Performing Arts Center, visits to the Lincoln Center and museums in New York City, as well as a series of workshops for professional personnel. A Division of Humanities and the Arts, formed in 1967, includes the new bureaus of music and art education and is responsible for the supervision of humanities programs in elementary and secondary schools.

Prekindergarten programs have become a major concern for the public schools in New York State. These programs receive support from the Office of Economic Opportunity under Project Head Start (which began in 1965), Title I of the Elementary and Secondary Education Act, and a special state-aid fund established by the 1966 Legislature for experimental prekindergarten programs for disadvantaged 3- and 4-year-olds. The 1968 Legislature approved $5 million for continuing these programs.

In February 1967, the department organized an office of science and technology to coordinate the activities of elementary and secondary schools, colleges, and other agencies—both public and private—trying to solve a wide variety of problems facing society. Surveys are providing information on facilities and personnel in higher education for teaching and research in order to establish long-range objectives. The office has special interest in the role of state government in the development of science and in the unique and specific roles of a state education department in the field of science education.

**Qualifying Examinations**

In 1904, a Division of Examination, administratively responsible directly to the commissioner of education, was responsible for administration of the regents examinations, teacher examinations as a basis of certification, and preliminary examinations for entry into normal and professional schools. As certification of teachers by examination ground to a halt in 1924, this part of the division's responsibilities ceased. Expanding its testing program to include elementary and secondary tests of a standardized type, the department renamed the division the Division of Examinations and Testing. Continually increasing responsibilities, due to the development of scholarship tests and fellowship tests for professional study, led in 1961 to a further reorganization of the division as the Regents Examination and Scholarship Center under an assistant commissioner. Within the center are three bureaus: elementary and secondary educational testing, higher and professional educational testing, and pupil testing and advisory services.

In 1904, there were assistant commissioners of education for elementary and secondary education, both without a staff. Soon thereafter, the inspections division came under the direction of the assistant commissioner for secondary education and, in 1938, was renamed the Division of Secondary School Supervision. That same year, the state established a Division of Elementary Education.

A medical inspections bureau came into being in 1923 to administer the mandated health examinations. Its responsibilities expanded, and in 1930, the state established a Division of Health and Physical Education which had the added duty of encouraging and supervising health instruction and physical education programs.

From the time of their inception, these divisions grew continuously, with the specialists becoming a group of specialists of bureau status. In 1963, a major reorganization of the State Education Department recognized this growth and made a distinction between instructional supervision and supervision of administrative and organizational arrangements.

The state appointed an associate commissioner for educational supervision in 1937. In 1963, he was retitled associate commissioner for elementary, secondary, and continuing education. Responsible to him are assistant commissioners for instructional services (general education), educational administration and supervision, occupational education, and pupil personnel services and continuing education.

**Districting**

Sparsely populated agricultural and forest areas contrast sharply with the large metropolitan centers in New York, to produce a very unevenly distributed population. In 1904, the state had 10,651 school districts, as set up by the 1812 Common School Law, and the majority of its population lay in rural areas. In order to bring professional leadership to rural districts and strengthen the program of the rural schools, the Legislature in 1912 created the Office of District Superintendent of Schools and divided the counties of the state into 207 supervisory districts. Local school commissioners elected the district superintendent from among candidates who qualified under state regulation. The district superintendent thereafter was a state intermediate officer, through whom information flowed between the schools and the Education Department. In 1923, the state formed a rural education bureau to supervise the rural schools and provide district superintendents with a direct contact in the department.

By 1933, education leaders saw that the process of centralization was having a dual effect on the district superintendency. Centralization was bringing a higher level of professional leadership to the local districts at the same time that it was reducing the number of local units under
the district superintendent’s supervision. Therefore, the state authorized the commissioner of education in each case where a superintendency was vacated to review the situation and, where advisable, discontinue the superintendency, annexing its territory to one or more adjoining superintendencies. As a result, the number of district superintendencies had, by 1965, been reduced to 70.

Further attempts to improve rural education were made through the creation of stronger local units. A 1914 Central School Law permitted rural districts to consolidate to form more efficient units. Because it carried no reward features, the legislation was largely ineffective. Three years later, the Legislature enacted a bill to join into one administrative unit all of the common school districts in each town. This bill aroused such vigorous opposition that it was repealed.

In 1925, studies of rural education needs carried out by the Committee of 21, composed for the most part of representatives of farm organizations, resulted in passage of a revised Central School Law. The law provided that a central district would receive all the state moneys to which it would be entitled as a union free district and, in addition, those moneys the former constituent districts would have received, and a building and transportation quota. Under the highly favorable terms of this act, centralization advanced rapidly. As it did so, however, two sources of potential danger surfaced. The state had left formulation of districts and district boundaries to local initiative. Some districts were too small to be effective units, and between the centralized districts intervening spaces had been left that never could become effective units.

The year 1942 found a total of 5,857 school districts in New York State including 295 central districts formerly comprising 3,991 districts. That year, the state formed a joint legislative committee on the state education system which, in 1946, presented a master plan for the reorganization of school districts. This master plan would guide the commissioner of education in laying out new central districts when voters of uncentralized areas expressed a desire for reorganization.

The master plan recognized that small districts, inadequate in size and financial base, are wasteful of personnel, facilities, and money. By 1965, the total number of school districts in New York State was 997. When the master plan for school district organization has been fully implemented, the total number of districts should be approximately 500.

Development of the master plan also focused attention on the fact that there were many districts contiguous to cities where social and economic ties were essentially cityward. In 1952, the Legislature passed a law enabling such districts to consolidate with the city district, thereby forming enlarged city school districts. Under this legislation, the state extended the school district boundaries of 33 cities to include a total of 365 neighboring districts.

In the late 1930’s and early 1940’s, it became obvious to educational leaders that local districts in thinly populated areas would not be able individually to meet the variety of needs of rural youth in a highly mechanistic and mobile society. The Council on Rural Education and the State Education Department undertook joint studies, and in 1948, the Legislature passed the Intermediate District Law. Under this act, a sufficient group of central and union free districts could combine to provide to all of the schools of the area those kinds of educational services that the individual districts could not provide.

A provision of the Intermediate District Law of 1948 made it possible for each supervisory district, later two or more contiguous supervisory districts, to form a Board of Cooperative Educational Services (BOCES) to provide services to the local districts. BOCES received state aid and generally had the powers granted intermediate districts except that they could not levy taxes or own real property. BOCES proved an acceptable form of organization, and in 1965 there were 69 boards covering almost the entire rural areas of New York State.

In recent years, with the pressure for increased education brought on by scientific and technological advances, there have been renewed efforts to strengthen education through area schools. In 1964, legislation was introduced to permit the establishment of Area Centers for Cooperative Educational Services (ACCES). ACCES schools would serve relatively large areas of the state and build and operate schools to provide vocational-technical education and other services that local schools could not provide. An ACCES bill passed both Houses of the Legislature in 1964 but was vetoed by the Governor. Introduced again in 1965, the bill failed passage. It is anticipated that interest in such legislation will be sustained in the future and that these enlarged districts will be allowed to build and operate facilities.

Urban School Problems

The greatest area of concern in recent years has been city schools, where slightly over 50 percent of the state’s children attend school. The city districts have long been hampered by financial stringency and, in recent years, by the growing resentment of minority groups isolated in a particular school or area.

Accompanying the financial problems of the city schools are the problems of equalizing educational opportunities for all children. In 1961, Commissioner James E. Allen, Jr., in a speech, showed concern about the growing evidence that segregated schools are detrimental, psychologically and educationally, to students and pointed out the relevancy of the problem to the stability and vitality of our democratic society.

In order to identify the extent of the problem of segregation and determine how best to solve it in New York State, the State Education Department conducted a census...
of the racial characteristics of its schools in the fall of 1961 and in their meeting of March 19-20, 1964, the State Board of Regents issued a statement against de facto segregation in which they stressed the various conditions among communities and the need for localities to devise solutions according to their individual needs. The regents pointed out that legislation restricting community choices would hamper local initiative and determination.

New York State formulated plans to increase assistance to its urban school system. In May 1965, Commissioner Allen stressed that the problems of urban education are inseparable from those of the urban community and that the decline of the school has paralleled the decline of the central city. The department established an Office of Urban Education to strengthen services to larger city school districts.

Twenty-six school districts will share $52 million during the 1968-69 school year for community education centers and equality incentive projects. Three factors used to select participating school districts were low student scores on statewide achievement tests, the number of participants in the aid to dependent children program, and school enrollment. The grants will range from $44.5 million for New York City to $14,000 for Fulton.

New Programs

At the beginning of the twentieth century, the state's program of public education was rigidly structured and primarily academic. The state examination system, which then covered every subject in grades 4 through 12, set single, inflexible standards. Pupils conformed to the program and met the standard, or they were eliminated. An indication of the difficulties encountered is the 1904 records which show that 1 in 16 pupils completed a 4-year high school program.

Although some of the forces which led to changes in school programs in this century came from within the educational establishment, many were the result of outside influences. For example, farm and rural organizations urged programs that would prepare students for effective rural living. Similarly, labor organizations insisted on preparatory programs for business and industrial occupations. Developments in the field of educational measurement led to the wider recognition and better understanding of individual differences in the needs, purposes, and abilities of school children.

At the same time, there was growing acceptance of the principle that education is not the privilege of the more able. In a democracy, it is a social and economic requirement and the birthright of all.

These developments led, first, to the extension and broadening of programs. They also led to the acceptance of new responsibilities by the schools: the responsibility for seeing, as far as possible, that children come to school in good enough physical and psychological condition to benefit from instruction and that they are not denied an equal opportunity for education because of personal limitations.

In 1904, schools provided instruction in physiology and hygiene with special reference to the effects of alcoholic drinks, stimulants, and narcotics on the human system. In 1910, this program was expanded to include the health value of proper dental care, and, in 1918, a full-time dentist was appointed to coordinate the program of dental care required by the 1910 legislation. Today, a school district may appoint a dentist and/or dental hygienist; it is not required to do so.

The New York State Education Department has been a pioneer among the states in developing school medical and physical education services. In 1913, legislation transferred school medical inspection, then largely a check of sight and hearing, from the State Department of Health to the State Education Department and made annual medical examinations mandatory in all schools except those in New York City, Buffalo, and Rochester. Although the program aimed at the control of communicable diseases, such as diphtheria and scarlet fever, it was based on the philosophy that no child should suffer unnecessary retardation or maladjustment in school through physical handicaps or defects which could be corrected. The first state school medical inspector took office in 1915. Gradually the staff increased, and the state created a bureau under the chief of medical inspection in 1923. And also, new services were added to the supervision of medical inspection throughout the state, and the bureau eventually included among its services the conservation of sight and hearing, the elimination of tuberculosis among schoolchildren, the development of a better understanding of the services that can be rendered by psychiatry, the improvement of oral hygiene, and school nursing services.

The year 1916 witnessed the birth of the physical education bureau as part of the state military commission. Three years later, it became a bureau in the State Education Department.

When the United States entered World War I, the physical examination conducted under the National Selective Service Act showed that a very large percentage of prospective draftees had physical defects sufficient to bar them from service. Legislation immediately following made physical education compulsory for all children over 8 years of age. In 1920, the regents authorized the assistant commissioner for elementary education to coordinate the work of the physical education and the medical inspection bureaus and in 1928 created the health and physical education division.

At the time of World War II, there still was a high prevalence of physical defects among draftees, and the physical education requirement was expanded by regulation to 5 hours of physical education per week. At the present
time, the commissioner's regulations indicate that school districts should provide daily instruction in physical education of up to 120 minutes per week in grades 1 through 6, and up to 300 minutes per week in grades 7 through 12, of which 90 minutes per week must be class instruction. Over the years, the department has developed a series of tests to evaluate programs and measure physical fitness.

In 1951, the assistant commissioner for instructional services continued the instructional phases of health and physical education in the Division of Health, Physical Education, and Recreation. The health service aspects of the program—the supervision of medical, dental, and school nurse services—were assigned to the Bureau of Health Service in the newly created Division of Pupil Personnel Services, under the charge of an assistant commissioner for pupil personnel services and continuing education.

The 1967 Legislature authorized an allocation of $250,000 a year for 5 years to the Education Department to revise the entire elementary and secondary health syllabus. A five-strand syllabus is being prepared to include physical health, sociological health, mental health, environmental and community health programs, and education for survival. The emphasis is on a broad coverage of material designed to enable students to make intelligent decisions about such matters as smoking, drinking, and use of drugs.

Compulsory Attendance

At the time of unification, the state had a compulsory education law requiring attendance in school of all children from 8 through 14 years of age. In the Education Department, the attendance division had the responsibility for child accounting and enforcement of the law. Local attendance officers were law enforcement officers, and their attitudes toward absentees were legalistic and authoritarian. They regarded truants as incorrigibles. Over the years, attitudes and practices changed from punishment to remediation. The title “attendance officer” was changed to “attendance supervisor” in 1939, and schools were urged to employ persons with appropriate training. In 1955, legislation became effective which required professional preparation for full-time attendance personnel.

Although the state enacted legislation in 1908 that required an annual census of all children between the ages of 5 and 18 (large cities were exempt from this requirement) to provide a firmer basis for the enforcement of attendance, other factors were increasingly recognized as having an effect on attendance.

In 1941, the state reassigned the responsibilities of the attendance and child accounting division—the child accounting functions went to the bureau of statistical services, and attendance supervisory services went to the bureau of guidance. After 1943, no reference to arrests for truancy is found in departmental reports.

EXTENDING EDUCATIONAL OPPORTUNITIES

Handicapped Children

Attention to the needs of the physically handicapped at the time of unification was offered in special schools. Ten such schools were operating in 1910. With the exception of the New York State School for the Blind, Batavia, these institutions were private corporations, all subject to visitation and supervision by the State Education Department.

Legislation enacted in 1917 required cities and union free school districts to take a census of physically handicapped children and to establish special classes for such children. In 1923, the state established a Special Schools Bureau, under the direction of the assistant commissioner for secondary education, to supervise the schools for the handicapped, Indian schools, and reform schools. Six years later, the state transferred the bureau to the direction of the assistant commissioner for vocational education. Supervision of the blind and deaf was a responsibility of the bureau from the time of its creation until 1936.

Additional legislation in 1917 required that the schools identify all pupils who were 3 or more years retarded in school, thus focusing attention on the mentally handicapped. This was followed by legislation requiring districts with ten or more mentally handicapped children to maintain special classes for them. In 1918, two specialists, a psychiatrist and a supervisor, joined the staff of the mental hygiene bureau in the medical inspections division to administer this law. Two years later a psychologist was added, and in 1923, these duties were assumed by the newly created Bureau of Educational Measurements when the mental hygiene bureau was discontinued.

In 1925, the Legislature made provision for state aid for the physical and educational needs of physically handicapped children. In 1926, the Board of Regents established the Bureau of Physically Handicapped Children to administer state aid under the supervision of the assistant commissioner for vocational education. The bureau gradually assumed the responsibilities relating to the handicapped which had been performed by other units. In 1936, the department transferred supervisory duties relating to residential schools for the blind and deaf to the physically handicapped children bureau. Services pertaining to the mentally retarded children were assumed in 1941. In 1946, the bureau became responsible for supervising the education of delinquent children.

Two years later, the department placed the physically handicapped children bureau under the supervision of the assistant commissioner for instructional supervision, changing its name to the Bureau of Handicapped Children. In response to a need for closer coordination, the bureau in 1950 became part of the newly created Division of Pupil Personnel Services. Its purpose is to supervise educational

Emotionally disturbed children were also being brought to the attention of educators, and in 1959, the state enacted legislation to permit school districts to establish services for these children. This type of program has become mandatory under the direction of the Division for Handicapped Children.

Educational activities on behalf of handicapped children during the past 10 years have focused on extending educational opportunities to disability categories such as brain-injured children, emotionally disturbed children, and children with multiple handicaps who before this time had not been provided with adequate educational opportunities in our public schools. Approximately 95,100 handicapped children were being served in public schools during the 1964-65 school year.

Educational and Vocational Guidance

The early years of the twentieth century witnessed a period of intense concern for the educational needs of children not adequately served by the traditional academic program. At the time the first Central School Act was passed in 1913, labor organizations were urging the expansion of vocational education.

The period 1904 to 1920 marked the beginning of the scientific movement in education. In 1903, the Society of Educational Research was organized in New York City to carry out educational measurement. During the next few years, scales for measuring handwriting, spelling, and fundamental operations in arithmetic were developed. At the same time, methods of measuring intelligence and achievement were being developed, and psychological testing methods were being applied to the study of problems of delinquency and retardation. In 1920, the department employed a specialist in educational measurements and 3 years later organized the Bureau of Educational Measurements. The function of this office was to encourage and provide instruction in the use of standardized test materials in the schools.

Legislation in 1933 required the large cities of the state to organize and maintain local bureaus of educational and vocational guidance. In the same year, the Education Department employed a supervisor of guidance to encourage and direct the growth of guidance in the schools. In 1937, the state formed a Bureau of Guidance under the direction of the assistant commissioner for vocational and extension education. Its functions included the general supervision of the guidance programs maintained by local school authorities; the assisting of local school authorities in development of guidance bureaus and special guidance and counseling programs; and the preparation of courses of study.

During the first half of the century, all of the special services to children—the health services (including the services of the school nurses and the dental hygienists), guidance and psychological services, and special services for the handicapped—grew rapidly throughout the state system. Within the department, they were directed by units quite separate from each other organizationally. The state saw the need for their close coordination and, in 1950, appointed an assistant commissioner for pupil personnel services. The state attached the health services, guidance, and handicapped children bureaus to the division.

The services continued to grow. In 1955, legislation made permissible special classes for the severely mentally handicapped (trainable but not educable), and 1961 legislation made these classes mandatory. That year also witnessed the formation of the Bureau of Psychological Services. Also in 1961, Project STEP (School to Employment Program), aimed at the prospective school dropout, was developed under the direction of the guidance bureau. Toward the end of this period, plans were under way to bring together in one bureau the attendance and school social work functions of the pupil personnel services division. A program for special classes for the emotionally disturbed became mandatory in 1966 under the direction of the physically handicapped children bureau.

Adult Education

In the early twentieth century, New York State's adult education program was directed toward meeting the special needs of immigrants. The state provided instruction in the common branches, in high school subjects needed for employment or for entrance to technical or professional schools. In 1915, a supervisor was appointed in the Education Department to give general supervision to evening schools and classes.

World War I saw the program much broadened with new vocational training programs organized to meet the needs of war industry; and in 1917, the state created an educational extension bureau to promote adult vocational classes. In 1931, it was renamed the Bureau of Adult Education and placed under the direction of a newly created assistant commissioner for vocational and extension education.

The Depression of the 1930's brought about another surge in adult education with stress on consumer education and vocational retraining, resulting in 1937 in the creation of the adult education bureau in the Division of Adult Education and Library Extension.

In 1945, the Legislature amended the Education Law to provide special financial aid to schools maintaining adult classes. With this encouragement, the program continued to...
grow with the main objectives of training adults for more effective citizenship, greater earning power, improved home and family life, and enrichment of their lives as individuals. A departmental reorganization in 1949 transferred adult education from the jurisdiction of the assistant commissioner for vocational education to that of the new assistant commissioner for pupil personnel services and adult education.

The state reduced the amount of its special state aid for adult education in 1958 and discontinued it in 1962 when a revision of the state formula greatly increased general aid. Although adult education programs managed to meet new needs as they arose, problems of the developing retirement plans, retraining for supplemental income, and planning interesting leisure time activities became areas of great concern. The rapid technological changes of the time, too, were changing employment needs, and adult education in many places was undertaking the task of retraining workers. The federal Manpower Development and Training Act of 1962 brought new financial resources for the retraining of unemployed and underemployed workers. In addition, a massive drive to reduce adult illiteracy continued with greater advances being effected by the Vocational Education Act of 1963 and provisions of the Economic Opportunity Act of 1964. With the continuing growth and broadening of programs for adults and out-of-school youth, New York has reconstituted the adult education bureau as the Division of Continuing Education with three bureaus.

The department inaugurated a new program of college proficiency examinations in 1963. Under the program a series of examinations is given to enable persons to earn some college credit and meet certain teacher certification requirements without attendance at regular college courses. The tests are open to all persons who believe they have competence in a subject, and scores are sent to colleges which can decide whether or not to award college credit.

Civil Defense

After World War II and the development of the nuclear bomb by other world powers, much concern evolved as to the possibility of nuclear warfare and the extreme vulnerability of schools and communities in case of nuclear attack. Schools were urged to plan what they could do to provide shelter against all but a direct hit during attack and to avoid the effects of fallout. In 1951, a coordinator of Civil Defense was appointed in the Education Department. His function was to work with schools and colleges on the development of bomb and fallout shelters and to train children to respond to a warning signal. He also worked with leaders in adult education and in cooperation with the State Civil Defense Commission to help communities train local leaders and develop community defense plans.

Vocational Rehabilitation

Between 1916 and 1920, as a result of strong pressures to meet the needs of injured workers and disabled veterans of World War I, the federal government engaged in broad-scale studies of the problems of the handicapped. Passage of legislation providing rehabilitation services for veterans gave impetus to the drive for similar services for the civilian population, and, in June 1920, the first federal Vocational Rehabilitation Act, providing grants-in-aid to states for programs for vocational rehabilitation of handicapped persons, became law. During this same period, several states similarly were studying and considering the development of services for handicapped persons, especially for injured workers. New York was one of 12 states which passed legislation regarding vocational rehabilitation prior to the passage of the federal law.

The New York State law designated the Board of Regents as the State Board of Vocational Education and placed the rehabilitation program under the jurisdiction of the board; it created an advisory commission consisting of the commissioner of education (as chairman), the commissioner of health, and the industrial commissioner; and it directed the commissioner of education to designate, within the Education Department, a director for the new program who would serve also as the executive secretary of the advisory commission.

The program got under way in July 1921 with the establishment of a Bureau of Rehabilitation under the general direction of the assistant commissioner for vocational and extension education. Offering a broader program than that provided by the federal act, the New York State law authorized services to render a physically handicapped person fit to engage in a remunerative occupation. In its early years, the state program followed the pattern of the federal legislation, devoting its attention primarily to persons injured in industrial accidents and concentrating on provision of prosthetic appliances and counseling, training, placement, and follow-up services.

Since its inception, the vocational rehabilitation program has continually increased the number of handicapped persons served annually and the scope of its programs and services. A major revision of the federal Vocational Rehabilitation Act in 1943 was followed by revision of the state law in 1944 which made medical, surgical, and psychiatric treatment available to the disabled in the program. In 1945, the state broadened the law to include the mentally handicapped and those disabled by epilepsy.

Further growth followed passage of the revised federal Vocational Rehabilitation Act of 1954 which increased financial support and broadened coverage of the program. This revision empowered state rehabilitation agencies to make project grants to voluntary community agencies for development of rehabilitation facilities and services.
In 1955, the New York State agency approved the first of many such project grants which have enabled it to maintain leadership in the availability of rehabilitation facilities and services. The 1954 federal act also provided the first authority and funds for the training of professional rehabilitation counselors, and the New York State agency was the first state agency to benefit from these provisions by establishing an organized rehabilitation counselor intern training program with the help of a federal training grant.

**Vocational Preparation**

Prior to 1904, half a dozen cities of the state had seen the introduction of home economics instruction. The regents, in 1895, had authorized a syllabus for a course entitled Home Science which they designated an academic program. Its principal curricular subdivisions were food, home nursing, household science, and public hygiene.

Legislation enacted in 1910 permitted school districts to establish schools or classes to teach vocational homemaking and courses in “household arts” specifically classified as general education courses leading to the development of two parallel paths in the study of home arts. In 1912, the state appointed a supervisor of home economics. The central school movement, which required the teaching of home economics in all centralizations, gave impetus to the development of a distributive education program.

Private business schools in New York State were the first to recognize the need for courses which would prepare youth for office employment. The regents recognized business education as an approved part of the secondary school program in 1897.

In 1905, pupils could qualify for a state business or stenography diploma or a state business or stenography certificate, the certificates being granted for less than the full 4-year course. After 1910, the state discontinued the state certificates and granted only an academic diploma in commercial subjects. The major objective of the early commercial education program was vocational—to prepare youth for employment in various kinds of office work, especially after World War I increased the demand for office workers.

In 1925, a syllabus organized business content into courses and suggested teaching methods and supervisory procedures. In 1934-35, the state developed 2- and 3-unit sequences in business subjects to meet the major and minor requirements for its general (nontenational) diploma. That same year, the state introduced outlines for an approved office practice course and, the following year, saw a syllabus written for a secretarial practice course.

The Education Department created the Bureau of Business Education in 1937. The following year saw development of a distributive education program to meet the requirements for federal aid from the George-Deen Act.

During the World War II years, a variety of changes rendered programs more effective as vocational preparation. The state made subjects such as secretarial practice, office practice, and advanced courses in bookkeeping and shorthand double-period subjects. Since that time, the program has advanced rapidly, and the department has introduced new course materials to meet modern conditions. The new course materials have included machine transcription, office practice, business data processing, preparatory distributive education, and twelfth-year vocational business practice.

In 1904, there was strong pressure, particularly from labor organizations, for secondary programs that would (a) hold pupils in school longer and support the drive against child labor and (b) have direct occupational objectives and content. Only one year after unification, in 1905, the Technical High School of Buffalo opened its doors.

The Vocational Education Act of 1917 gave incentive to the establishment of vocational programs in the public schools. Under this legislation, school districts could receive partial reimbursement for the cost of a program. In the same year, to administer federally aided programs and to give leadership to the development of vocational education, the state created the Division of Agricultural and Industrial Education in the department.

This became, in 1920, the Division of Vocational and Extension Education, and its functions included the organization and supervision of all forms of education under public supervision and control of less-than-college-grade education planned primarily to prepare persons for definite vocations. Included were the areas of technical and industrial education. In response to the need for persons with both teaching and work experience, the state established a scholarship fund at Oswego specifically for training trade and industrial teachers. The Bureau of Vocational Curriculum Development and Industrial Teacher Training, established in the industrial education division in 1948, derived from this early work. The greatest emphasis on industrial teacher training came in the early 1940's as a result of World War II.

Continued growth in this area culminated in 1927 in appointment of an assistant commissioner for vocational education and placement of the renamed Bureau of Vocational Education under his jurisdiction. The bureau has held still other names in the interim, being known from 1944 to 1949 as the Bureau of Industrial and Technical Education and, from 1949 to the present, as the Bureau of Trade and Technical Education.

Vocational education expanded rapidly during World War II when over a million persons were trained for war industry in New York State. The national emergency preceding the entrance of the United States into World War II found exceedingly little trained manpower for industrial plants. Acts of Congress at this time authorized emergency defense production training. The schools of New York State rapidly expanded their training programs to meet...
defense and war production training needs. Training was initiated through joint action of the department and local boards of education, with the advice of industrial leaders and labor representatives. The federal government bore the total cost of instruction, while the local schools contributed the equipment.

In rural areas, cooperative organizations provided vocational training more efficiently. The state passed a law permitting the formation of boards of cooperative educational services in 1948, allowing the districts to establish and provide many types of programs as a cooperative venture.

Paralleling this expansion of facilities was creation of a Division of Industrial Education which included the bureaus of trade and technical education, industrial arts education, occupational extension and industrial services, private trade schools, and vocational curriculum development and industrial teacher training.

Industrial arts education grew out of the manual training and manual arts programs of the nineteenth century. Original courses in woodworking, metalworking, and painting aimed at developing understanding of tools and materials rather than perfecting salable skills.

In 1908, the department added a supervisor of drawing and industrial training. Although the general education values of industrial arts found ready acceptance, programs in the early part of the century were limited largely to the city and other large systems. Centralization and the junior high school movement gave a strong impetus to industrial arts in the following years.

As a result of a survey conducted in 1931, the state placed emphasis on the use in industrial arts shops of the materials most widely utilized in its industries—woodworking, textiles, printing, electricity, ceramics, and metal. However, industrial arts continued its general education characteristics and objectives. In 1935, the Legislature amended the Education Law to provide a legal basis for establishment of industrial arts subjects. This legislation specifically defines the program as general education.

The increase in the industrial arts programs throughout New York State resulted in 1950 in creation of the industrial arts education bureau under the assistant commissioner for vocational education (now occupational education).

No established courses of instruction in agriculture existed in New York State schools at the time of unification in 1904. However, leaders in agricultural organizations—the State Grange, the Dairymen's League, the American Farm Bureau Federation—were advocating such courses, and in response to their demands the state added a Division of Trade and Agricultural Education in 1908. Local high schools began instruction in agriculture 2 years later. At this time, a supervisor of agricultural education was employed in the Education Department.

The year 1914 saw incorporation of a full program for training agricultural teachers in the Department of Rural Education at Cornell. Legislation established agriculture as a secondary subject throughout the state in 1917. By 1937, programs were so numerous that the state formed a separate agricultural education bureau. Following World War II, attention began to focus on the agriculturally related occupations and their training needs. Trends since World War II have been toward development of programs in which at least 2 years are specialized and in the provision of cooperative instruction, as through BOCES, to provide the larger student groups necessary for specialization.

To meet economic, sociological, and educational challenges in New York State, trade and technical educators have initiated, expanded, and enriched training programs to serve both in- and out-of-school youth and adults. The shortage of public trade and vocational educational facilities in the early part of the century encouraged the establishment of private trade schools and correspondence schools in many vocational areas. The Education Department appointed a supervisor in the Division of Vocational Education with the special responsibility of inspecting these schools.

After World War II, when educational and training grants were available to returning veterans, there was a tremendous upsurge in the number of private occupational schools. A bureau of private trade and correspondence schools was established in 1952 in the vocational education division to meet the demand for more supervisors in that area. Following passage of the federal Manpower Development and Training Act in 1962, the state established the bureau of manpower development and training to coordinate all of the department's efforts in the area of manpower development and training. Creation of this bureau in 1963 reflected the regents' and the department's concern with the technologically unemployed, the underemployed, the dropout, and the graduate with no salable skills. In 1964, the state formed a Division of Special Occupational Services to include the bureaus of occupational school supervision and of manpower development and training and to administer the vocational work-study program for high school youth.

**EXPANDING RESPONSIBILITIES**

**Finance and Management Services**

In 1904, the State Education Department had none of its units assigned solely and specifically to finance and management services, but it soon recognized the need for specialization in these services. However, several grants or quotas—such as teacher quotas, district quotas, and grants through the literature fund—provided state aid equivalent to about 11 percent of school costs. In fact, the first quarter of the
twentieth century might be called the quota period in New York's school finance. In the department, the Division of Statistics carried out the work connected with apportionment of state aid.

After 1904, there was a steady increase in the amounts of state aid given schools, mostly from granting new quotas established for special areas. As a result of an increase in the work in connection with apportionment, the department created a Division of Finance, under the assistant commissioner for elementary and secondary education in 1921 and transferred to it all apportionment responsibilities from the statistics division.

The number of quotas continued to increase so that, by 1925, there were no less than 25 quotas or grants through which state aid was provided to the districts. No sound underlying principle governed the rapid growth in the number of different kinds of quotas the state was distributing, and it was generally recognized that a more scientific plan was necessary. During the 1920's a number of studies reviewed, among other things, the need for revised financial methods.

In 1920, the U.S. Commissioner of Education called a Citizens Conference on Education, and, as a result, the American Council on Education undertook an extensive inquiry concentrated on certain states, among which was New York. The findings of the council, reported in three volumes dealing with general problems of financing the state schools and of dealing with the costs of elementary and secondary schools, had a powerful influence in shaping the policies of New York with respect to state aid for public education. These reports clarified the principle of equalization of educational opportunity and support.

The Committee of 21 on Rural Schools (1921-22), the Educational Finance Inquiry Committee (1923), the Legislative Committee on Taxation and Retrenchment (1924), and the Friedsam Commission on Educational Finance (1926) pointed up the need for three significant adjustments: (1) a higher level of state support; (2) recognition of the equalization principle in apportioning aid; and (3) a method, more scientific than the multiple-quotas method, of allocating state aid. The study of the Committee of 21 called particular attention to the differences in the ability of local communities to support schools. These studies resulted in state aid formulas that, with only minor revisions, served the state adequately until after World War II.

The New York State Joint Legislative Commission accepted the principle of equalization of support as classified and defined by the above studies. In 1925, proposed legislation included this principle in the Cole-Rice Law, which recognized that, in order to give equal educational opportunity to all the children of the commonwealth, the wealth of the entire state must be made to contribute to the support of educational need wherever and in whatever proportion such need exists. Although it provided more generous apportionment to small districts which combined into a larger central district, the Cole-Rice Law did little to alleviate the financial problems of the city districts.

The Friedsam Commission in 1926 presented a plan for greatly increasing the amount of state aid as a means of providing local tax relief.

Following World War II, increasing costs and decreasing value of the dollar necessitated further revisions, particularly as related to a measure of the cost of a minimum or foundation program.

All through the 1950's, soaring enrollments and mounting costs were among the more serious problems faced in education in New York State. Study of state aid continued. In 1960, the Joint Legislative Committee on School Financing came into being and led to the first state aid overhaul since 1925. The new law, effective July 1, 1962, substituted for the principle of foundation aid the new principle of shared costs and incorporated numerous special aids heretofore in existence. The new formula provided aid in four areas: operating expenses, school facilities, pupil transportation, and size correction.

The increasing complexities of financing education in the state are reflected in the changing structure within the department. In 1929, the state appointed an assistant commissioner for finance and transferred the finance division to his jurisdiction. Among its responsibilities is that of allocating federal funds to local educational agencies.

The year 1946 saw creation of the school lunch section and an educational agency for surplus property. In 1964, the finance division was divided into two sections: one to administer state aid funds, the other federal aid funds, including the school lunch program. In the same year, the state appointed an associate commissioner for finance and management services and transferred the function of research in educational finance to its finance division.

During the later 1920's, the finance division began to extend its activities to include the apportioning of funds. The division added an associate in educational finance to advise local authorities on subjects affecting administration and to make occasional audits on request.

The state established a Bureau of Field Services (finance) in 1937 to supervise budgeting, financing, and business methods in schools; assist in the improvement of business management; make special studies of financing and business practices; and provide advisory services to local school officials. The bureau was placed under the jurisdiction of the assistant commissioner for finance.

In 1941, the state gave the bureau responsibility for administering the school transportation program; the next year, it made the bureau responsible for recommending whether small school districts should be discouraged from continued operation by a curtailment of state aid. When, in 1951, New York State granted fiscal independence to its 56 cities with population under 100,000, it also extended the
bureau's service responsibilities to more and larger school districts. The Bureau of Field Services became the Division of School Business Management in 1957.

In 1904, the personnel of the inspections division carried out all school visitations and inspections, including the inspection of physical facilities.

Legislation enacted in 1910 required the approval by the commissioner of sites and school construction plans in all districts except in cities over 50,000 in population, causing the inspections division to concentrate primarily on physical facilities. Six years later the regents renamed the division the Bureau of School Buildings and Grounds.

Postsecondary Education

New York State historically placed its reliance for higher education on a system of private universities, colleges, and professional schools. The 1904 annual report of the State Education Department gives a count of 78 such institutions in operation, all under the general governance and control of the Board of Regents. In addition, there were 1 public professional schools. The 1904 annual report identifies the Division of Higher and Professional Education.

Responsibilities imposed on the department as a result of new federal programs led to a reorganization within the higher education division, including the formation of three new bureaus. The Bureau of College Evaluation concerns itself with the accreditation of colleges and changes. The Bureau of 2-Year College Programs administers the higher education aspects of the Vocational Education Act of 1963 and Title V of the National Defense Education Act. The Bureau of Special College Programs administers graduate fellowships awarded by New York State and provides consultative services to colleges and universities on financial aid available to students. It also serves as liaison with the College Committee on the Disadvantaged.

Teacher Training and Certification

At the turn of the century, there were many ways in which teachers could be certified to teach. Elementary teachers could be certified on completion of a course in one of the state normal schools, on completion of a training class course in an academy or public high schools, or on passing a superintendent's examination or a state examination. The State Normal College at Albany trained secondary teachers. The private college system prepared teachers of all grades. Control of this diversified system by the Education Department was divided. The first assistant commissioner (higher and professional education) supervised teacher programs in the private institutions, the second assistant commissioner (secondary education) supervised the teacher-training program of the State Normal College, and the third assistant commissioner (elementary education) supervised the several ways of preparing elementary teachers. Finally, in 1925, the state created a teacher training and certification bureau to effect better supervision over teacher education programs and be directly responsible to the commissioner of education. In 1932, the state established the Office of Assistant Commissioner for Teacher Training and Certification.

Concurrent with changes in the administration of teacher training and certification in the department, changes were occurring in the schools which prepared teachers. In 1923, the normal schools, which had been providing 2-year training programs, lengthened their programs to 3 years. The state discontinued all forms of teacher certification based on 1 year of training by 1924; 2 years of training by 1925; and 3 years of training by 1936. Except in New York City and Buffalo, certification by examination was continued in 1926, and in all but some vocational subjects, 4 years of training are now required for temporary certification, 5 years for permanent.

In 1942, the state placed the Division of Teacher Training and Certification under the assistant commissioner for higher education. Following World War II, a strong effort was made to improve the quality of teaching. The division worked with college and local authorities to develop in-service training programs, especially in mathematics and science, and to adopt revised objectives in other courses, such as modern foreign languages. Over the years certification has become much more specific. In the place of the early all-purpose life certificate, there are now specific certificates for various grade levels and subjects, and for administrators, student personnel workers, and teachers of special subjects.

The Teachers Reserve, started in April 1967 to alleviate teacher shortages, recruits and trains prospects interested
in entering or reentering the profession. Refresher courses at Syracuse University, Long Island University, and the State University Colleges at Cortland and Plattsburgh have been given to more than 600 former teachers, primarily mid-career women who interrupted teaching careers because of family responsibilities, to prepare them to reenter the classroom. A system of partnership teaching has been devised whereby two persons teach one class, each on a half-time basis. This has proven particularly effective in bringing teachers back to the classroom at the elementary school level.

In its efforts to recruit teachers, the Teachers Reserve has also looked for people outside the profession. Long Island University and Syracuse University conduct training programs designed to qualify liberal arts graduates for teaching. More than 150 former members of the Peace Corps have been placed in teaching positions in New York State schools, and approximately 100 others were assisted by the Teachers Reserve office in securing placement.

Future plans for the Teachers Reserve include a comprehensive canvas to locate former teachers who might be persuaded to return to the classroom and the establishment of more university-based programs to involve all qualified teachers who are not presently teaching.

**Licensing the Professions**

At the time of unification, the Board of Regents determined the requirements for licensing the professions of medicine, dentistry, veterinary medicine, pharmacy, nurse training, and public accounting. In 1926, the state formed the higher and professional education division, including a professional examinations bureau. In 1931, the professional licensing bureau was born.

The year 1941 saw the establishment of the position of assistant commissioner for professional education. The state created a Division of Professional Education and assigned to it all of the responsibilities connected with ensuring a high level of professional service in the state: qualifications for entry into training, professional examinations, licensing, and control of professional practice. The state also transferred, from the higher education division, the functions of evaluating and registering the curriculums of professional schools and evaluating foreign credentials. In 1942, the Division of Law Enforcement was formed.

The Division of Professional Education has responsibility for the development and application of curriculum registration standards for all educational programs relating to the licensed professions, the evaluation of charter applications, relations with advisory councils, and the improvement of licensing examination content. Close liaison is maintained with the office of the assistant commissioner for planning in higher education in the evaluation of needs in professional education.

The Division of Professional Licensing Services is responsible for the evaluation and processing of applications for admission to the licensing examinations, for endorsement of out-of-state licenses, for final confirmation of qualifications, for analysis and processing of petitions to the regents relating to licenses, and for the biennial registration of all licenses.

The Division of Professional Conduct functions in relation to matters involving alleged unprofessional conduct on the part of all professions except pharmacy (which is the responsibility of the Board of Pharmacy) or unlawful practice in any profession. It carries out necessary investigations, cooperates in the presentation of facts before disciplinary bodies, and handles related enforcement duties.

**State Master Plan**

In 1959, Governor Rockefeller and the Board of Regents appointed a committee to study higher education needs in New York State. The committee reported in 1960 and recommended (a) wide availability and diversity of educational opportunity to students with various intellectual capabilities and of all income classes in the state; (b) a strong system of public as well as private education, including strong public universities; and (c) the attainment of excellence in academic instruction and research in all the institutions of higher learning in the state.

New legislation required the Board of Regents to prepare a state master plan for the development of higher education, to be presented in 1964 and every 4 years thereafter. The master plan was to coordinate the institutional plans of the State University of New York, City University of New York, and private institutions.

In 1962, the state formed an Office of Planning in Higher Education to gather, analyze, and interpret the necessary data from public and private institutions and prepare for the regents materials in relation to a statewide plan for the development and expansion of higher education. An Office of Assistant Commissioner for Higher Education Planning was created in 1965. The assistant commissioner is responsible directly to the associate commissioner for higher and professional education.

**Administration and Foreign Affairs**

In 1961, the state created in the Education Department an Office of Administrative Services in Higher Education. It helps institutions secure the maximum value from funds expended in administrative, business, and academic areas. It gives consultative services on such topics as space planning and utilization, student registration procedures, admission procedures, long-range planning techniques, machine accounting, and long-range budgetary planning. It also helps in the development of interinstitutional cooperation projects.
The nation’s involvement with emerging nations in Asia, Africa, and the established but turbulent nations of South America sparked a growing recognition of a need on the part of Americans for greater knowledge of the history, culture, and problems of many national groups. Up to this time, these groups had been largely ignored or treated superficially in our educational programs. The State Education Department’s recognition of this need resulted in 1961 in creation of the Office of Foreign Area Studies, charged with the responsibility of advising and assisting schools and colleges in developing programs of study and intercultural exchanges.

Birth of the State University

The State University of New York came into being in 1948 during the administration of Governor Thomas E. Dewey. Although New York was the forty-eighth state to establish a state university, the idea of a decentralized institution consisting of colleges of various types in every part of the state had nowhere been tried on so large a scale. The institutions brought together under the aegis of the State University of New York included teachers colleges, agricultural and technical institutes, and specialized programs at private universities.

Just as the establishment of the normal schools in the nineteenth century was accompanied by controversy and opposition, there were many citizens in the 1940’s who saw no need for a state university. However, others believed that the state’s provisions for higher education were not sufficient. In 1946, Governor Dewey appointed a commission to study the need for a state university. After 2 years, the commission proposed formation of a university which would preserve the geographically decentralized pattern already established. A subsequent legislative act made all state-controlled colleges and institutions parts of a state university governed by a board of trustees appointed by the Governor. In the fall of 1964, the State University of New York included 30 public 4-year institutions, 6 state supported 2-year schools, and 28 community colleges.

Financial Assistance

New York State has a long history of generous public support for higher education. The total state program of financial assistance is broad and comprehensive, comprising an extensive network of low-tuition public colleges, scholarships for outstanding high school graduates, scholar incentive assistance in the form of tuition grants to all students with college potential, and state-guaranteed loans to college students.

At the present time, New York State’s financial assistance program to postsecondary students is the largest of all the states, with a $70-million program serving 200,000 students. New York State instituted its first scholarship awards in 1865 when the Cornell University scholarships were established. They were designed as full-tuition scholarships for 4 years at Cornell. The first awards of $100 per year were made in 1868.

The period between 1865 and 1965 witnessed a dramatic growth of direct financial grants to college students in New York State, in both amounts awarded and numbers of students served. The Legislature established the Regents College Scholarship Program, the first such program in any state. The program provided an annual stipend of $100 a year to 750 students each year. Despite the growth in secondary and college enrollments and increased college tuition, the number and stipends of the regents college scholarships remained unchanged from 1913 to 1946. In 1946, the first step was taken to increase both the number of awards and the stipends.

Accompanying the growth in the number of scholarships and in the stipends was the introduction of a requirement that family financial ability be considered in determining the size of the award granted an individual. Financial need has been a consideration since 1958. Current range of the stipends of the regents college scholarship awards is $250 to $1,000 per year.

Financial aid for students at the graduate and professional level was initiated in New York State in 1949 with establishment of a program of medical and dental scholarships. A fellowship program for college teaching began in 1958, to be followed by regents graduate fellowships in arts, sciences, and engineering, and the Lehman fellowships in social sciences and public affairs. Scholarships for undergraduate study are restricted to use in approved public and private colleges in New York State.

Cultural Education

The cultural education services, under the control of the regents and the department, include the informal educational opportunities and services made available to the general public, such as libraries, museums, and historic places in the state. As of 1965, the organization under the associate commissioner for cultural education included the assistant commissioner, State Museum and Science Service; state librarian and assistant commissioner for libraries; director, Division of Educational Communications; state historian, Archives and History; administrator, Division of Intercultural Relations in Education; and director, Division of Motion Pictures.

State Library. In the early 1900’s, the State Library comprised a law library, a medical library, an education library, a general reference library, and an extension library. It had especially rich collections in American and state history and in genealogy. Heading the library was a director of libraries and home education, directly responsible to the commissioner of education. Shortly after 1904, the state
created a school libraries division to provide advisory and supervisory services to libraries in public schools. These functions remained under the jurisdiction of the State Library until 1921, when they were transferred to the secondary education division.

In 1912, the state formed a library extension division to provide reference services and to supplement, on a loan basis, the collections of local libraries. It was primarily concerned with supplementing school library collections.

The State Library was transferred in 1937 to the jurisdiction of the assistant commissioner for higher education. Further changes occurred in 1947, when the state moved the home education responsibilities of the director of the State Library to the adult education division under the assistant commissioner for vocational and extension education. In 1948, to make internal operation more efficient, New York State established a new technical processes section to order, bind, catalog, and shelf library collections, and to plan a library rehabilitation program.

The New York law requires all the free libraries serving the public, whether supported from tax funds or not, to be chartered subject to the will of the regents. The existence of regional systems and their contracts with member libraries must be approved. In addition, the library certification law requires that systems libraries and registered public libraries employ only certified librarians with public funds. Thus the coming into existence of new libraries and the consolidation of existing ones are under the control of the State Library.

With the availability of federal funds and new developments in modern equipment adaptable to the needs of libraries throughout the state, the need to strengthen the division of library development became more apparent. The department established two new units, the Bureau of Academic and Research Libraries and the Bureau of Public Library Services, to provide the necessary leadership in this area.

State Museum and Science Service. Another of the state's long-established educational services is the State Museum and Science Service. In 1904, under the reorganization brought about by the Unification Act, the department grouped all the scientific interests in a separate division termed the Division of Science, with trained scientists in archaeology, botany, entomology, genealogy, palontology, mineralogy, and zoology. The State Museum functioned in this connection as the depository of the materials acquired by the scientific corps. The Division of Science functioned at this time under a director of science and state museums.

In the 1937 reorganization of the department the state made the State Museum and Science Service responsible to the assistant commissioner for higher education. Legislation passed in 1945 redefined the functions of the State Museum and Science Service when the entire staff of the two services was placed under the director. The state empowered and directed the newly created Science Services to make its services available to all departments of the state government and to the citizens of the state. It was authorized to engage in continued scientific research and to cooperate with scientific units of other states, federal government educational institutions, and industry in the discovery, analysis, and dissemination of scientific information.

In line with other departmental changes in 1954, the position of assistant commissioner for the State Museum and Science Service was established. Later, in 1958, an associate commissioner for cultural education was appointed, and the State Museum and Science Service was then transferred to his jurisdiction from that of the associate commissioner for higher education.

The State Museum attracts approximately 225,000 visitors each year, including many delegations of teachers and schoolchildren from all parts of the state. It is also responsible for publishing reports, bulletins, special studies, and other materials.

State History. In 1911, the state transferred the office of the state historian from the Executive Department to the Education Department, thus bringing all governmental units concerned with state history under one control board. The transfer accomplished, the Legislature authorized the regents to create a Division of History and a Division of Public Records, responsible directly to the commissioner of education. Four years later, the regents united the two divisions into the Division of Archives and History with the state historian as director. Archives is actually a misnomer, as the state historian has never collected public documents for archival purposes. His responsibility in this field has been confined to records management and advisory services.

Legislation in 1913 made the state historian responsible for ensuring the safety of official records of all kinds relating to history in the state and all of its subdivisions. Subsequent legislation, in 1919, provided for the appointment of a local historian in every city, village, and town in the state and gave the state historian the responsibility for advising and assisting the local historians in their duties. The administration of historic sites was added to the duties of the state historian in 1944.

Records in local offices of government are the responsibility of the Education Department, and the commissioner's statutory authority is exercised through the state historian. Nearly 4,000 offices of local government are serviced in this program.

In 1937, the state transferred the archives and history division to the jurisdiction of the assistant commissioner for higher education. In 1958, it was moved from the jurisdiction of the then associate commissioner for higher and professional education to that of the associate commissioner for cultural education and special services.
Further reorganization resulted in the rank of assistant commissioner for the state historian.

A New York History Museum is in the process of development. Collections have been arranged, recorded, and made available for research, exhibits, and loans. Extensive planning has been undertaken for a proposed historical museum in the cultural center of the South Mall, a complex of governmental and cultural buildings being developed in Albany.

Visual Aids. In 1904, the state established a bureau of visual instruction in the Education Department. It had the responsibility to advise and assist schools in the selection and use of maps, globes, and all other types of visual aids. As more technical devices for visual instruction came into being, there was a tendency to concentrate more on these, gathering and maintaining collections of slides for loan to schools, and later evaluating and recommending motion picture films. In 1937, the state renamed it the Bureau of Audio and Visual Aids and incorporated it into the school administrative services division. Two years later, the bureau discontinued the loan of slides and other materials and redefined its functions in terms of research, experimentation, and consultation. In 1950, the state placed the bureau directly under the supervision of the assistant commissioner for instructional services.

Reflecting departmental interest in television as an educating medium, the state employed in 1956 a consultant on educational television, directly responsible to the deputy commissioner of education, to make investigations and advise on the most effective ways of using television in instruction.

In 1958, New York formed an educational communications division and placed it under the jurisdiction of the associate commissioner for cultural education with the audio and visual aids bureau, retitled in 1960 the Bureau of Classroom Communications. It established a mass communications bureau in 1964 within the Division of Educational Communications, with responsibilities for educational television and radio.

Since 1927, the Board of Regents had been charged with reviewing and licensing motion pictures for showing in New York State theaters. To accomplish this, the regents had created a motion picture division, directly responsible to the commissioner of education. The division operated under the statutory right granted the regents to reject films which they found to be indecent, inhuman, immoral, sacrilegious, or tending to incite crime or corrupt morals.

The division operated for many years to the apparent satisfaction of both the public and the motion picture industry. Its imprimatur came to be accepted by many states. Over the years, however, court decisions narrowed the area of regulation to the point where restrictive powers were almost nonexistent. In 1965, the state abolished the Division of Motion Pictures.

Racial Inequalities

Passage in 1948 of the Educational Practices Act forbidding discrimination by educational institutions on the basis of race, creed, or color led, in the early 1950's, to a growing concern as to whether the members of minority groups were being accorded full and equal opportunity for education. By 1955, widened interest led to the appointment of an administrator of the Educational Practices Act to the Education Department staff. His office, under the jurisdiction of the associate commissioner for higher education, was at the beginning primarily concerned with discriminatory practices in admission to higher institutions.

In 1957, the state charged the Division of Intercultural Relations in Education to deal with problems related to racial, religious, and ethnic factors at all levels of education. The division administers antidiscrimination legislation, assists in the development of programs designed to achieve integration, and provides consultative services to local school boards. It has worked closely with the commissioner's advisory committee and was the agency which carried out the ethnic census in the public schools.

During the 1960's, the division has become heavily involved in problems of integration in the local schools and in providing materials designed for integrating information about the Negro into daily teaching. Other resources are being prepared, and attempts are being made for the use of various media in teacher education, classroom instruction, and community enlightenment.

OPERATING A GROWING DEPARTMENT

Departmental Advisory and Administrative Services

The Board of Regents is legally charged with long-range planning and policy making with respect to education in New York State; the commissioner of education, with advising the regents in policy formulation and decision making. As chief executive officer of the Board of Regents, the commissioner has responsibility for administering the State Education Department. Those units and offices in the department whose prime responsibility is concerned with the policy-making function and with departmental management can readily be conceived as staff, as opposed to line, units.

Legal Services

Immediately after unification, in 1964, the regents created a Law Division, headed by a chief or director, immediately responsible to the commissioner of education. A few years later, he carried the title of chief of the Law Division and counsel to the university. Up to the present, the counsel has continued to be directly responsible to the commissioner of education.
In 1919, the state empowered the commissioner of education to designate an assistant commissioner or the counsel to the university as deputy commissioner to perform specified duties and to exercise the functions of the commissioner in case of absence or disability of the commissioner of education. The counsel to the university was so designated, and, with a short interlude in 1926-28, he served the double function and carried the dual title of deputy commissioner and counsel until 1940, when the two offices were separated.

Responsibilities of the counsel are to act as legal adviser to the regents, the commissioner of education, and the department; prepare legislative bills for introduction to the Legislature when requested; perform such legal services as are required in the administration of the education system; and represent the regents and the commissioner of education in all matters and proceedings to which they are a party.

In addition to the responsibilities listed, the state gave the counsel added duties ex officio. In 1921, legislation made him legal adviser to the State Teachers Retirement System. He took on further responsibilities in 1944 when he was made counsel for the State Dormitory Authority, a corporation created to facilitate increased higher education construction. In 1958, the state made him counsel to the Higher Education Assistance Corporation, a legal corporation which, with the cooperation of banks, lends money to students enrolled in higher education institutions to cover their educational costs.

The growing responsibilities of the Law Division led to an increase in staff. In the latter 1950's, an internal reorganization took place. The state created three sections: the higher and professional education section, the elementary and secondary education section, and the department operations section. It added the federal matters section in the 1960's.

Financial, Administrative, and Related Services

One of the divisions established by the regents after unification in 1904 was the Division of Accounts which had charge of all departmental financial records, certified all expenditures, and looked after departmental payrolls. The regents also authorized appointment of a secretary to the commissioner of education who was really the business officer of the department. He kept all departmental personnel records and supervised those not attached to the established divisions. He was in charge of publications, building maintenance, mail service, and similar departmental operations.

Because of growth of the administrative functions, the state created an administration division in 1907. This supplanted and absorbed both the accounts division and the Office of the Secretary to the Commissioner of Education. There were no recorded subdivisions within the division, but note is made of a cashier’s office and an editor, the latter newly appointed to the department.

During the following years, the groups engaged in each of the several activities charged to the division became identified, at least semiformally, as the following sections: personnel, planning and procedures, business management, office services, accounts, building and ground maintenance, and publications.

Departmental publications had so increased by 1923 that the Bureau of Publications became a subunit in the administration division. In 1932, as a result of continued growth, the state made the director of the division the assistant commissioner for administration. In 1935, it re-titled him assistant commissioner for personnel and public relations. Although the new title appears more limiting to the administrative activities and adds public relations, there seem to have been no substantive changes in his responsibilities. When the special public relations office was created in 1950 in the department, the assistant commissioner became assistant commissioner for business management and personnel. As of 1965, the title was assistant commissioner for administrative services. (See Appendix B.)

Continued growth of the department and new responsibilities resulted in 1961 in the raising of several of the sections of the business management and personnel office to bureau status, as follows: finance, personnel, and planning and procedures bureaus. The state added a Division of Electronic Data Processing in 1962.

Statistical Services

In 1904, the State Education Department had, as one of its operating units, a statistics division responsible for gathering, tabulating, and aiding in the interpretation of educational data. In the years immediately following, a widespread interest developed in scientific measurement as a means of improving teaching and learning. The use of intelligence and psychological examinations in World War I increased interest in standardized testing, and, in 1920, the department added a specialist in educational measurements, his responsibility being to advise school authorities on the selection and use of standardized tests. During the same year, the state established an educational measurements bureau.

Following its formation, the educational measurements bureau began to make studies of the characteristics of pupils and of the factors affecting their educational welfare. In 1928, it became the Division of Research, directly responsible to the commissioner of education and charged with the responsibility of conducting surveys and research as a basis for educational planning.

The Regents Inquiry into the Character and Costs of Education (1938) recommended that research be the focal point of the reorganization of the State Education Department as a basis for establishing new policies and for
leadership. An assistant commissioner was given jurisdiction over the research division and the Bureau of Statistics.

In a statement of 1939, the regents pointed out the future direction of research. They planned to conduct inquiries and studies to evaluate current programs and to formulate new policies to be used as the basis for educational planning. Correspondingly, the state expanded the program to cover, as the need arose, all facets of the program from elementary school through the college level.

With the great growth in college enrollments after World War II, the state appointed a temporary Commission on the Need for a State University to make studies relative to the need for and organization of public higher education facilities. Staff members of the research division were assigned to work with the commission. After the creation of the State University of New York, this same staff continued to work, on loan, for the university. In 1957, they were recalled, and a Division of Research in Higher Education, under the assistant commissioner for research, was created in the department.

The postwar years were characterized, also, by a tremendous increase in the cost of education. In 1957, the state created a finance studies section in the research division to make studies of the financial needs of education and to devise equitable methods of distributing costs. This unit expanded and 3 years later became the Bureau of Educational Finance Research.

The state reorganized the research offices in 1964 to provide greater specialization of activity. It also transferred the Bureau of Educational Finance Research to the jurisdiction of the associate commissioner for educational finance and management services. The state created four new bureaus in the former research offices under the retitled associate commissioner for research and evaluation.

That same year, a Center on Innovation was established in the office of the commissioner. The center was the outgrowth of departmental concern about how the educational system might best be organized to discover new ideas and accelerate their adoption in the schools. In response to this concern, Commissioner Allen appointed a consultant, Henry M. Brickell, to make a study of education experimentation in the state and to recommend a plan for action. The analysis of the dynamics of instructional change accompanied by recommendations for the adoption of changes appeared in *Organizing New York State for Educational Change*, a 1961 publication of the department. The center has concerned itself with innovations that promote quality education and the abolition of educational inequity associated with race or economic class.

**Information Center on Education**

In 1966-67, the department created an Information Center on Education to be responsible for identifying, implementing, and operating data systems in all areas of education and coordinating all data-collection procedures within the department. The information center's first major endeavor was to develop a Basic Educational Data System (BEDS) to streamline the procedures by which data from the public schools were reported and processed. In the fall of 1967, New York State teachers spent approximately half a day completing machine-readable forms to satisfy many of the department's information needs for the entire school year.

The relative decentralization of data collection within the department had resulted in schools' receiving multiple requests for the same information. Under BEDS, there has already been a sharp reduction in the number of requests for the same information. In addition, liaison with other educational agencies means that surveys can be completed more readily and effectively. The system enables the department to summarize data within weeks after receipt and provide a current and updated view of education across the state.

**Public Relations**

Beginning in 1935, public relations activities had been carried out in the offices of the assistant commissioner for personnel and public relations. No specialized unit had been developed for this service, but, in 1950, Commissioner Francis Spaulding recognized that the issues of public education were assuming new and increased importance for the citizens of the state and that not only parents but all public-minded citizens desired and had a right to know what the state educational program was, what it needed, and how it worked. Acting upon the commissioner's recommendation in 1950, the regents created the Office of Public Relations with a special assistant for public relations. This special assistant is directly responsible to the commissioner of education. It is his responsibility to analyze public relations needs, to advise the commissioner and the regents on public relations matters, and to develop and coordinate an ongoing public relations program.

**THE EDUCATION PICTURE**

The legal and administrative structure for education in New York State continues to be the state's greatest asset in accomplishing educational objectives. Within this framework, New York has succeeded in developing a closely knit progressive and efficient system of education extending from the prekindergarten to the adult level. A network of higher education facilities, including public and private, 2-year, 4-year, technical, and professional institutions, has been chartered. The aegis of the Board of Regents has been extended over a wide variety of educational and quasi-educational activities, such as the supervision of libraries, museums, sites famous in history or science, historical records, survey and research projects, and licensing of the
professions. The schools have adjusted their goals and programs to meet every type of ability and vocational need, and to assist mentally, physically, and emotionally handicapped pupils. An education through and beyond high school is accessible to every young New Yorker with ability whether he lives on an isolated farm or in a crowded tenement.

IMPORTANT DATES IN THE HISTORY OF EDUCATION IN NEW YORK STATE, 1904-68

1904 The Unification Act, uniting all education in the state under one responsible control board, the Board of Regents of New York State.
1904 Pharmacy established as a profession under the regents.
1907 Osteopathy established as a profession under the regents.
1908 Optometry established as a profession under the regents.
1908 State legislation provided for the organization of a system of general trade and industrial schools.
1909 Creation of education law.
1911 Certified shorthand reporting established as a profession under the regents.
1911 Office of School Commissioner abolished and that of District Superintendent created.
1912 State Education Building completed and dedicated.
1912 Podiatry established as a profession under the regents.
1913 Passage of law establishing 3,000 university scholarships throughout the state.
1913 Adoption of law providing for medical inspection of schoolchildren.
1913 Creation of Office of President of the University.
1915 Central Rural School Act passed.
1915 Architecture established as a profession under the regents.
1915 Dental hygiene established as a profession under the regents.
1916 Physical training law enacted.
1917 Establishment of city school districts.
1917 Establishment of tenure system for teachers in city school districts.
1917 Legislation required that all physically handicapped be identified in the school census.
1917 Legislation required that schools identify all pupils who were 3 or more years retarded in school, focusing on the mentally handicapped.
1917 Legislation established agriculture as a secondary school subject.
1918 Continuation school law passed.
1919 First teachers’ mandatory salary increase passed.
1919 First junior college chartered.
1920 Professional engineering established as a profession under the regents.
1920 Land surveying established as a profession under the regents.
1921 Committee of 21 on Rural Schools.
1923 Normal school course increased.
1923 Educational Finance Inquiry Committee.
1925 Centralization law revised to encourage centralization through special fiscal aid.
1925 First equalization quota for apportionment of school funds established by statutory enactment.
1926 Friedsam Commission on Educational Finance.
1926 Physiotherapy established as a profession under the regents.
1927 Framing of the cardinal principles of education.
1935 Education law amended to give legal basis for the establishment of industrial arts subjects.
1938 Extension of tenure system for teachers employed in “village superintendencies.”
1938 Normal schools changed to teachers colleges and the course changed from 3 to 4 years.
1938 Licensed practical nursing established as a profession under the regents.
1944 Regents propose new institutes of arts and sciences.
1945 Extension of tenure system to all school districts employing eight or more teachers.
1945 State aid voted to local public schools for adult education.
1946 Ophthalmic dispensing established as a profession under the regents.
1946 State scholarship stipend raised from $100 to $350 a year.
1947 Master Plan for School District Reorganization (Joint Legislative Committee on the State Education System).
1948 Creation of State University of New York.
1948 Community colleges authorized by law.
1948 Act to prohibit unfair educational practices with respect to admission to educational institutions.
1948 Intermediate District Law passed.
1949  Number of state scholarships doubled.
1949  Scholarships established for medical and dental students.
1950  First community college established at Jamestown.
1951  Grant of fiscal independence and responsibility to the 56 smaller city school districts.
1951  Regents' Statement on Moral and Spiritual Training in the Schools.
1952  Law passed for instruction in the schools about the nature and effect of narcotics and habit-forming drugs.
1952  Regents apply for educational TV channels.
1954  Abolition of separate schools for Indian pupils.
1956  First state-supported closed-circuit TV programs.
1956  Legislative action materially increasing teachers' salaries and state aid to schools.
1956  "Need factor" in awarding state scholarships established by the regents.
1956  Psychology established as a profession under the regents.
1957  Higher Education Assistance Corporation created to guarantee loans to students attending higher institutions.
1958  Legislature mandated science one of common subjects for elementary education.
1961  Special classes for the severely mentally handicapped mandated by law.
1961  Cooperative Review Service, a new supervisory device.
1961  Office of Foreign Area Studies established.
1962  New York State scholar incentive program began.
1962  Regents college teaching fellowships for advanced graduate study established.
1963  Board of Regents for the first time issued a position paper on methods of instruction in one of the Three R's, The Teaching of Reading, a Position Paper, 1963.
1963  College proficiency examination program began.
1963  Law provided for the licensing of chiropractors by the State Education Department.
1964  Legislation introduced to encourage special classes for the emotionally disturbed.
1965  Prekindergarten programs were coordinated with Head Start projects.
1965  A new performing arts program was begun by the department.
1965  The Office of Urban Education was formed to aid large cities.
1966  A new Information Center on Education was established.
1966  The department began extensive experimental programs for children ages 3 and 4.
1967  The New York Legislature made a 5-year appropriation to revise the elementary and secondary health syllabus to include physical, sociological, mental, and environment health, and education for survival.
1967  The Teachers Reserve was organized to bring additional persons into teaching.
1967  The Office of Science and Technology was organized.
1968  The Legislature voted state funds to expand pre-kindergarten programs.

BEFORE 1900: TOWARD A STATE ADMINISTRATION OF SCHOOLS

Creating the State Superintendency

The evolution in North Carolina of the position of a chief state school office, a state board of education, and a state department of education was the natural result of the need in state government for receiving and editing local school reports and, on the basis of these, for distributing funds to local schools. Although the first common school law of North Carolina, the legal authority for the beginning of a system of public schools, was enacted in 1839, it was in 1852 that the first specific statute was passed that virtually guaranteed the creation of a state department of public instruction. It was in 1868, however, that the first semblance of a department staff was in evidence.

The first official reference to the state administration of public education occurred in 1817, when State Senator Archibald D. Murphey of Orange County, later known as the father of North Carolina’s common schools, presented an elaborate report to the General Assembly designed to stem emigration and to increase North Carolina’s wealth. The report outlined a comprehensive plan for public education, including primary schools, academies, a state university, a course of study, provisions for the education of the poor, an asylum for the deaf and dumb, a state school fund, and a state board of education. Although a bill incorporating Murphey’s plan did not pass, the assembly did enact legislation in 1825 similar to that of six other states, providing a literary fund to establish public elementary schools and a board to manage the fund. This fund for establishing the common schools consisted of the following:

The dividends arising from the stocks then held or afterwards acquired by the State in the banks of New Berne and Cape Fear, the dividends arising from the stocks owned by the State in the Cape Fear Navigation Company, the Roanoke Navigation Company, and the “lub-foot and Harlowe’s Creek Canal Company, the tax imposed by law on license to retailers of spiritual liquors and auctioneers, the unexpended balance of the agricultural fund, all moneys paid to the State for entries of vacant lands, and all the vacant and unappropriated swamp lands of the State, together with such sums of money as the Legislature may hereafter find it convenient to appropriate from time to time (1).

As North Carolina parted with its public domain in 1790, when Congress requested it as a means of paying the public debt incurred by the 13 original states in their struggle for independence, it had surrendered what would have yielded a magnificent school fund under this legislation of 1825. This was in marked contrast with Connecticut, which had not contributed her public lands to paying the common debt but had held her “western reserve” for her own uses and thus laid the foundation of her school fund.

At the General Assembly’s request, the president and directors of the literary fund—in reality a state board of education—drew up another report in 1838 emphasizing the urgent need for a central administrative authority for the common schools. It outlined the function and duties of a proposed “superintendent of common schools,” functions and duties later to be carried out by the Department of Public Instruction. The following year, the assembly enacted many of the main features of the report, but it made no provision for an executive head or administrative officer.

This 1839 law, although weak in several respects, did set forth certain basic principles that have been fundamental in operating the North Carolina public schools. The first section, for example, permitted the people to vote for or against taxes to support the schools. For every dollar such a tax would yield, the state literary fund furnished $2, thus establishing the precedent of school support based on a combination of state and local funds, a principle found in varying degrees in all subsequent school legislation. The law also contained the germ of the current concept of county boards of education. But it was silent about teachers’ qualifications and employment, the length of school terms, subjects to be taught, and a chief state school officer.

In 1840, there were 632 public primary schools with 14,937 students, and about 140 academies with 4,398 students (2). As the school system was growing rapidly, Governor John M. Morehead in 1842, Governor William A. Graham in 1846, and Governor Charles Manley in 1850 urged the General Assembly, on behalf of the literary
board, to provide for a superintendent; the assembly failed, however, to make such a provision. J. B. Cherry, with Calvin H. Wiley's support, introduced a similar bill that became law in December 1852. This act provided for a general superintendent of common schools, defined his duties and functions, and indicated that he was to be elected by the General Assembly for a 2-year term and that he was to be paid $1,500 per year from the literary fund.

Although a Whig, Wiley was elected by the Democratic Legislature as first superintendent of schools the same month the bill became law; he assumed office in January 1853. This date also marks the beginning of a state department of public education; for, in actuality, the first superintendent performed many of the duties and services that were assigned to the Department of Public Instruction in 1868.

Wiley, a reformer at heart, labored with determination and patience during his 13 years in office to develop an enthusiastic interest in education, to unite the people in a common effort, and to reorganize the state's entire educational program. He devoted himself unselfishly and constructively to the improvement of teacher training, teacher certification, classroom instruction, the preparation and distribution of printed materials—especially textbooks, the publication of school statistics, and procedures for textbook adoptions.

Early in 1857, Wiley pointed out that when he took office 4 years earlier, a work on general education in the United States had classified North Carolina at the bottom of the list and spoke of its educational statistics as "startling." But, "now the last publication of this kind, the Educational Year Book, published in Boston, a few weeks ago alluded to our progress as 'unparalleled' " (3). He admitted that while North Carolina was not altogether undeserving of the harsh sayings, it was entitled to the complimentary ones, and he asked the people to do their duty and work toward the goal of universal education of the people. He pointed out that the common schools, once considered charity schools only for the poor, now were regarded as one of the greatest and most honorable interests of the state.

By the time the Civil War erupted in 1861, Wiley's resourcefulness, versatility, and indefatigability had produced one of the best school systems in the South. The number of public primary schools had increased to approximately 4,000 with 160,000 students, and the number of academies had risen to 350 with approximately 15,000 students.

Although some schools remained open during the Civil War, the public school system as a whole suffered a tremendous setback. When the state was forced to repudiate its Civil War debt, the literary fund was wrecked, and the common schools were left without adequate state aid. The Thirteenth Amendment presented an equally serious problem relative to the social status of the freemen. In addition, the office of state superintendent was vacated and the position abolished.

When North Carolina adopted its Constitution of 1868, it created the Office of Superintendent of Public Instruction in lieu of the superintendent of common schools. The Republicans controlling the state government immediately appointed the Reverend Samuel Stanford Ashley, a carpetbagger from Massachusetts, as the new superintendent. The records indicate that Ashley was an earnest man of some ability; but he possessed pronounced prejudices, traits which made him impudent and reckless. He favored mixing the races, a concept intolerable to most of the state's citizens. The State Board of Education, authorized by the new constitution, appointed a Negro from Connecticut, J. W. Hood, as its agent and assistant superintendent of public instruction. Ashley, Hood, and three clerks constituted the actual beginning of the Department of Public Instruction in North Carolina.

The Constitution of 1868 guaranteed that public instruction in North Carolina would be at public expense for all the children without regard to race, condition, or color. In its declaration of "rights," it affirmed the right of every citizen to be educated and the duty of the state to furnish the advantages of education. But when State Superintendent Ashley spoke in August 1869 at the tenth session of the National Teachers Association at Trenton, New Jersey, he stated:

We have in North Carolina, 300,000 children between six and twenty years of age, and they are scattered over a territory of 50,000 square miles; we have few adequate school houses. These two difficulties seriously obstruct our work. Most of the old school houses are log shanties; often without doors, with entrance for light made by removing a log or two from the side, and destitute of furniture. In fact, in that great State, while there are many very good private school buildings, there are whole counties, and populous counties, too, which have no public school houses such as you would regard as worthy of the name of a school house.

We have, therefore, to build our school houses in cities, towns and villages. At least $2,500,000 are needed to put us in possession of comfortable houses (4).

He also pointed out that there were few teachers and no normal schools; academies were giving some normal instruction, but there were no teachers in regular training.

To open the schools, North Carolina raised money partly by a "capitation tax" on every man between the ages of 21 and 50 years. Seventy-five percent of this tax was earmarked for public instruction. The Legislature appropriated $100,000 from the general treasury, and with the $250,000 expected from the tax, it hoped to open 1,000 schools within the first 12 months. Although the $350,000 appeared meager, Ashley pointed out that this was a great
thing for the Legislature to do when there was a debt of $30 million resting upon the state.

Building a State School System

The General Assembly of 1869 virtually reenacted the Law of 1839, with the addition of a general school tax, a definitely prescribed school term, provisions for educating the Negroes, and new responsibilities for the state superintendent. The task of rebuilding the state school system was staggering in the face of widespread poverty, inexperience, ignorance, prejudice, and the fear of mixed schools. The task was further complicated when the conservative assembly, reacting against the Republican administration, abolished the state superintendent's staff in 1870, reducing the office to a little more than a poorly paid clerkship. In spite of the fact that the General Assembly of 1873 further enlarged the state superintendent's responsibilities, particularly in the areas of schoolhouse planning and publications, it was almost impossible for the department to function. Although most of its efforts to improve education were largely ineffectual, the department did devote attention to supervising Negro schools and training Negro teachers.

Many individuals supported the department's efforts to assist the Negroes. In three of the largest towns in North Carolina, the graded schools for both races were managed by the same white superintendent. One of the state's prominent physicians instructed a class of Negro medical students at Shaw University in Raleigh, and the son of a prominent clergyman of the Southern Presbyterian Church was instructing Negroes at Biddle University in Charlotte. The principal of one of the most successful private schools took charge of the Negro normal school at New Berne (5).

In 1885, in accordance with the constitution of the state, the General Assembly established a "normal department" in the University of North Carolina. It was open to young men preparing to teach, tuition free, on condition that they sign a pledge to teach at least 1 year after leaving the institution. A total of 13 normal schools were active in the state during this period: 8 for whites and 5 for Negroes. The annual appropriation for the Negro normal schools was double that for the whites. White normal schools were in the nature of teacher institutes and were held at convenient points for 1 month during the summer. Negro normal schools were established at fixed points and were regularly in session 8 or 9 months of the year. These efforts were clearly effective in supplying more and better teachers (6).

Despite such progress, however, the public schools still suffered from the effects of the Civil War. Superintendent Sidney M. Finger, who took office in 1885, summed up the dilemma clearly and bluntly:

The State has done well in the revival of her public schools, and she will continue to struggle on, carrying her burden, earnestly looking forward to the time when the Congress of the United States will open the doors of the Treasury and extend aid. North Carolina and other Southern States gave to the United States vast domains which were used to pay a common debt, a debt of the original thirteen States, and in the course of events it turns out that the United States frees the slaves of the South, and makes them citizens and voters while in a condition of extreme ignorance. . . . Surely the Government that could find warrant in the Constitution to free the Negroes and make them citizens can also find authority to distribute from its overflowing Treasury funds to educate them for the proper discharge of the duties of freemen and citizens (7).

According to legislation enacted in 1890, students were limited in what they could study since the laws stated that no branches should be taught in the public schools except spelling, defining, reading, writing, arithmetic, English grammar, geography, elementary physiology and hygiene, and the history of the state and the United States. The General Assembly of 1891 added a new subject to the curriculum, "the nature of alcoholic drinks and narcotics and special instruction as to their effect upon the human system" (8).

In 1897, the Fusionist-dominated Legislature created the State Board of Examiners as an agency of the State Board of Education, with the superintendent of public instruction as its chairman. The Legislature gave this board the authority to define and grant first-grade life certificates, to furnish annual examinations to supervisors, and to prepare and recommend a course of reading and professional study for teachers (9).

Superintendent Charles H. Mebane

In 1898, Charles H. Mebane (10), who served as state superintendent from 1897 to 1901, prepared the most comprehensive biennial report (895 pages) ever assembled by a superintendent. Replete with photographs, it traced historical developments; gave sketches of academies, colleges, and private schools in North Carolina; included the official records of Calvin H. Wiley; explained the major school laws; and detailed the course of study for teachers drawn up by the State Board of Examiners. Mebane, a Fusionist, tried desperately to keep the schools out of politics (11). He recommended to the 1899 assembly that textbooks be adopted by the board of examiners rather than by the county boards of education; that a tax be placed on the earnings of railroads, telegraph, telephone, express, and insurance companies; and that the assembly enact some form of compulsory attendance.

He also advocated that "civil government" be added to the subjects taught in the schools. The General Assembly of 1899, controlled by the Democrats, not only repealed much of the legislation of 1897, which was passed by the Fusionists, but it refused to act on a majority of Mebane's recommendations. This assembly, however, did pass an act,
recommended by Mebane, appropriating $100,000 to the public schools to be distributed to the counties on the basis of their population (12). With the Democrats in full power, Mebane was not reelected in 1901 (13).

During the latter part of the nineteenth century, the department was little more than a statistical bureau and the superintendency little more than a clerkship (14). Since the department had limited authority and personnel, improvement of instruction was a matter for local authorities. The department assumed practically no responsibility for the preparation of teachers, for the improvement of Negro schools, or for teacher examination and certification. On a much smaller scale, however, the department prepared and distributed printed matter essentially as it does today.

THE DEPARTMENT OF PUBLIC INSTRUCTION, 1900 TO 1931
The Educational Ground Swell

The development of the department from a minor bureau in 1900, consisting of only the state superintendent and his clerk, into a strong state agency in 1921, made up of nine divisions, began in the political campaign of 1900. The Democrats, preoccupied with consolidating their gains after Reconstruction and the period when Negroes had dominated the state's politics, had passed only a few laws for the public schools and the Department of Public Instruction. Charles B. Aycock, the Democratic nominee for Governor, realizing that his party's campaign for white supremacy might boomerang, changed it into a crusade for universal, popular education.

The major obstacles to an organized, strong Department of Public Instruction had been the apathy of the people, the lack of support in the General Assembly, and the indifference of state officials. But when James Y. Joyner became state superintendent in 1902, a great educational revival was sweeping the state. Joyner, who had taught in the public schools, was charming, likable, and passionately interested in the schools. A former professor of English in the State Normal and Industrial College at Greensboro, he proved to be an expert politician capable of uniting practically everyone in an effective campaign for universal public education. Joyner predicted that within the next 25 years, every country and city child would have access to a complete system of education, which he described with eloquence and precision:

This system will include elementary and high schools adequately equipped with comfortable houses, ample grounds, and trained teachers. The schools will be efficiently supervised by competent superintendents, maintained for eight or ten months in the year by state, county, and district taxation. Every child will be required to secure at home in the elementary school a mastery, at least, of the rudiments of learning that constitute the foundation of all education and of all preparation for intelligent citizenship and efficient service. Every child who has the desire and capacity will be afforded opportunity to secure near home, in county and township high schools, fuller preparation for college or for life, through courses of study shaped to meet the needs and natural adaptations of all for literary, professional, commercial, and industrial life.

These elementary and high schools, planted in the rural districts within reach of the rural population, will become the centers of a new social, intellectual, civic, industrial, and agricultural life. They will elevate to a higher plane of intelligence, labor, and service the great masses of the country people and prevent the degeneration of this biggest and best part of our population into an Old-World peasantry (15).

Grass-roots enthusiasm for better schools in this period received much of its impetus from the political parties, the Governor's office, the state superintendent, the colleges and universities, and outstanding educators and businessmen across the state. But its most powerful motivating force grew out of direct discussions with people at the local level, which were made possible by funds from the Southern Education Board. The Central Campaign Committee for the Promotion of Public Education in North Carolina planned systematic campaigns for local taxation, for consolidating school districts, for building and equipping better schoolhouses, and for providing longer school terms and larger salaries for teachers. Various committees collected, wrote, and distributed weekly articles about better schools to every newspaper in the state. They even wrote to all ministers requesting that they preach sermons on public education at least once a year.

This enthusiasm was specifically reflected in the activities and growth of the state department during the first two decades of the century. Superintendent Joyner made intensive efforts to prepare and certificate teachers, to improve Negro education, to bring new quality to supervision, to extend education in the local communities, to prepare and distribute more useful material for public school personnel, to improve schoolhouse planning, and to supervise more effectively school finance and records.

Superintendent Joyner also stressed publications as a major means of improving all facets of education throughout the state. Between 1902 and 1908, the department published 31 bulletins. A division of publications was established in 1909, when the General Assembly gave the superintendent specific authority to print at state expense "such educational bulletins as he shall deem necessary for the professional improvement of teachers and for the cultivation of public sentiment for public education..." (16). Under this authority, the department issued 70 bulletins between 1909 and 1912. In 1915, the General Assembly
appropriated $18,000 biennially to be used for the department’s printing.

Preparation and Certification of Teachers

In 1903, at the request of Superintendent Joyner and the State Board of Examiners, the seven normal schools for Negroes were reduced to four by the State Board of Education. The following year, Charles L. Coon, superintendent of the Salisbury schools, became the “superintendent of the Colored Normal Schools.” When the General Assembly expanded his duties in 1909 to include supervision of the training of all teachers, the first definite step was made toward the formation of a division of teacher training. The department attempted to improve instruction by requiring teachers to attend 2-week county institutes, 30 of which were held in 1909 and 66 in 1910, enrolling a total of 6,551 teachers. The department also organized institutes for Negro teachers in the majority of counties, most of which were taught by Negro schoolmen.

The state department encouraged colleges and universities to develop summer school sessions as another step to improve teacher preparation. Beginning in 1910, it required that teachers attend either a biennial county institute or an accredited summer school or else be debarred from teaching in the public schools until they had met this requirement (17).

Another method of teacher training, designed to furnish a carefully selected course of reading, was the North Carolina Teachers’ Reading Circle, organized in 1909. Although membership in this group was optional, the department requested county superintendents to give preferences in positions and salaries to teachers who participated in it.

Until 1915, the state department’s examination was the only basis for initial certification, but in this year it was agreed that academic and professional credits from approved institutions of higher learning might be accepted in lieu of an examination. In 1917, the General Assembly abolished the State Board of Examiners, which it had created 20 years earlier. A new system of certification and training was instituted under a reorganized State Board of Examiners and institute conductors, with the superintendent as chairman. During the period of certifying teachers by examination only, stimulation for professional improvement came from the examinations themselves, from the reading circles, or from the normal school programs.

In 1920, the State Education Commission reported that the state’s certification system was grossly inadequate (18). The following year, a teacher training division was established. A. T. Allen, the first director of this division, was succeeded by James E. Hillman in 1923, when Allen became state superintendent. His interest and understanding of conditions prompted Superintendent Allen to recommend in 1926 that 20 normal schools be established throughout the state over a period of 10 years to provide prospective teachers with at least 2 years of training beyond the high school. In 1927, the information and statistics division conducted a comprehensive study of teacher training, findings of which indicated the need for higher standards and more teachers. It was 1929 before the teacher training division instituted these changes and promulgated new certification requirements and possible standards for practice teaching in the colleges (19).

Negro Education

In each of his biennial reports from 1902 to 1912, Superintendent J. Y. Joyner strongly recommended improvements in Negro education. He especially emphasized the need for training Negro industrial and agricultural teachers. With money from the Jeanes Fund, the department employed its first state supervisor for Negro schools, N.C. Newbold, in 1913. Newbold coordinated the work of the county supervisors employed through the Jeanes and the Slater Funds, and he encouraged the counties to hold institutes for Negro teachers. He instigated the preparation of a course of study and training for rural Negro teachers and urged the assembly to appropriate $10,000 annually for county industrial-teacher training schools, industrial supervisors for Negro rural schools, and institutes or summer schools for Negro teachers. The assembly, however, took no action on this recommendation.

Mrs. Annie W. Holland, employed as the state Jeanes Teacher in 1916, assisted Newbold in his work with the county supervisors (20). She organized Negro women and children into clubs for instruction in gardening, cooking, canning, sewing, home sanitation, and other practical household activities.

Throughout the twenties, the Division of Negro Education continued to promote better interracial relations, to assist Negro schools with educational problems, and to supervise the three state Negro normal schools and the Indian normal school. It also administered funds donated by private foundations: By 1929, the Negro education division was responsible for spending about $450,000 donated by the General Education Board, the Jeanes Fund, and the Rosenwald Fund. The General Education Board, through the Jeanes Fund and without department assistance, paid the salary and expenses of the director of Negro education, beginning in 1913.

Supervision of Instruction

Prior to the twentieth century, only State Superintendent Ashley (1868-71) had a staff member for supervising instruction, an assistant who could give only limited supervision to the Negro schools. In his biennial report of 1902, Superintendent Joyner requested five deputy superintendents or state supervisors of education who might focus attention on improving instruction; bringing reasonable uniformity to
the state’s educational system; collecting more accurate information on school conditions; aiding the county superintendent; preparing courses of study and reading for superintendents and teachers; assisting schools in instituting graded courses of study; stimulating county boards by their personal visits; and aiding in the collection of fines and forfeitures belonging to the school fund. It was 1907, however, before North Carolina’s first public school law required the addition of a competent person to the state department’s staff to inspect the general condition pertaining to the high schools “to see that suitable arrangements have been made for giving high school instruction” (21). In the same year, Superintendent Joyner appointed N. W. Walker, professor of secondary education and agent for high schools at the University of North Carolina, as the first inspector of public high schools in North Carolina (22).

The state superintendent appointed L. C. Brodgen, superintendent of the Kinston graded schools, as supervisor of rural elementary schools in 1909. Not only did he work with county superintendents on problems of tardiness, increasing enrollments and attendance, grading and classifying pupils, and preschool work, he also conducted a study concerning the feasibility of consolidating one-teacher elementary schools and transporting pupils at public expense.

As early as 1910, Superintendent Joyner advocated vocational education. In his president’s address to the NEA convention in 1910, he said:

But 95 per cent of the people of the United States make their living by industrial pursuits. Scarcely 5 per cent of our population ever reach the college or the university. It was, therefore, but another natural evolution of democracy, but another inevitable demand of the common man, that the courses of instruction in the secondary schools should be adapted to the needs of the 95 as well as of the 5 per cent, should lead into life as well as into college, and into industrial pursuits instead of away from them (23).

In 1903, the General Assembly required schools to offer “Elements of Agriculture.” The 1911 assembly appropriated funds for county farm-life schools (24) and continued to expand this program in subsequent years. When the Smith-Hughes Act passed in 1917, the assembly immediately created a State Board of Vocational Agriculture to administer the program and supervise the work the schools were already doing in this field. The board named T.E. Browne as director of vocational education and in 1919 added supervisors for agricultural education, trade and industrial education, and home economics. Since the status of these supervisors was not clearly defined in the Vocational Education Act of 1919, the State Education Commission of 1920 recommended abolishing the State Board of Vocational Education and consigning its power and authority to the State Board of Education. The result was that a new vocational education division was created under the department with T. E. Browne as its director. By 1923, the division had a staff of 16 persons.

Throughout the twenties, the vocational education division continued to supervise agricultural education and trade and industrial education (25). Since this division provided supervision only in specific areas, Superintendent Eugene C. Brooks created the supervision division in 1921 to bring together the state inspector of high schools, the state supervisor of rural elementary schools, and the director of schools for adult illiterates. The director of schools for adult illiterates was the only one provided by state funds (26). In 1927, the supervision division was renamed the Division of Elementary Instruction.

Community Education

Superintendent Joyner became genuinely concerned when the 1910 census ranked North Carolina third in the nation in its percentage of native-born white illiterates. In 1914, the department inaugurated a statewide plan for promoting community improvement by designating Community Service Week as a cooperative effort of the State Department of Education and the extension service of Agricultural and Mechanical College at Raleigh. The success of this venture prompted Superintendent Joyner to suggest that it become permanent. The following year it was expanded, and November was designated as “Moonlight School Month,” a period in which more than 5,000 public school teachers volunteered to teach adult illiterates in the community schools.

In 1917, the General Assembly appropriated $25,000 to be used on a matching basis to organize “moonlight schools” throughout the state, under the general supervision of the state superintendent. Two years later, the assembly made these schools a part of the school system by providing for their support from the state’s public school funds and for the county superintendents to administer them. The state department prepared a reader and other textbooks for these schools.

The success of the adult illiterate program caused many people to declare that community service should be expanded and made permanent. In 1916, this general enthusiasm culminated in the formation of a state bureau of community service, cooperatively supported and directed by six state organizations, including the state department. During the following year, the General Assembly passed an act for further improving the social and educational conditions of rural communities through a series of motion pictures to be provided by the superintendent of public instruction. This popular and successful motion picture service and the bureau of community service were combined at Superintendent Joyner’s request, and in 1920 this combination became a bureau in the state department.
Schoolhouse Planning

The School Law of 1869 stated that the superintendent of public instruction should make "such suggestions on school architecture as he may deem useful with such woodcuts and plans of schoolhouses as he may be able to obtain" (27). From that time, state superintendents displayed considerable interest in improving school buildings, to contract with an architect to prepare plans, specifications, and cuts for building new schoolhouses. Superintendent Joyner explained that these plans were prepared "to prevent waste of money on barnlike and improperly constructed houses, and to suggest more convenient, sanitary, and beautiful schoolhouses at reasonable costs..." (28).

In 1903, the new state literary fund set up a loan fund that enabled the state board to help school districts erect or improve their buildings. The board required that all schoolhouses built or improved by these funds be constructed in accordance with plans approved by the state superintendent; by 1908, the department had published a bulletin on "Plans for Public Schoolhouses." Although granted this authority by both the assembly and the state board, the superintendent was unable to enforce this requirement until 1920, when the state board appointed a director of schoolhouse planning. In a special session, August 1920, when the General Assembly appropriated $10,000 for schoolhouse planning, State Superintendent Eugene C. Brooks appointed a "Supervisor of School Loan Funds and the Building of All New Buildings," thus creating a Division of Schoolhouse Planning.

The assembly strengthened the new division in 1925 and 1927 by acts providing for a special loan fund of $5 million for school buildings with two stipulations: no loans could be made for repairing or erecting a building with fewer than seven rooms; and no loans could be made until the building plans were approved by the state superintendent. This division helped the county boards of education with their plans for organizing schools on a countywide basis and gave assistance to other department divisions in working out county school surveys and plans.

Governmental and Departmental Reorganizations

Throughout the 1920's, both Superintendents Eugene C. Brooks (1919-23) and A. T. Allen (1923-34) led a movement to make the county the unit of administration under the control, supervision, and direction of the state. Since they regarded the state's responsibility as one of furnishing leadership and expert assistance to the counties, there was a greater need than ever before for a strong state department. In 1919, the General Assembly attempted to implement this countywide idea by requiring that the state public school fund's apportionment be administered to encourage district consolidation and the elimination of small schools. The assembly went still further in 1924 by passing an act forbidding the county boards of education to create, abolish, or consolidate school districts except in accordance with the county plan outlined in the act.

The financial support for this plan would come from both the county and the state. Those counties unable to provide the 6-month school term required by the constitution would be aided from a $3.25 million equalizing fund, established by the General Assembly in 1927 to provide equal educational opportunities throughout the state. Following the recommendations of the commission for the county boards of education, the assembly also established an equalization state board and a uniform system of accounting and fiscal procedure. By the 1929-30 school year, the assembly had increased the equalizing fund to over $5 million.

As the department attempted to streamline school administration through the county unit plan, its staff and duties increased. From 1920 to 1924, the department was organized into 10 divisions (29). In 1920, it consisted of the superintendent, 13 professional specialists, and 5 stenographers; 3 years later it included 53 professional plus clerical staff members. Changes continued to take place as new divisions were created and as old divisions were combined, separated, renamed, or abolished.

As efforts continued to organize the department most efficiently to accommodate rapid growth and progress, overlapping and some illogical grouping of responsibilities resulted. For instance, the school inspection division, responsible for some of the same general activities at the high school level as the supervision division, was established in 1925 with funds appropriated by the General Assembly. Comparable efforts had been supported by the General Education Board since the first statewide high school law of 1907.

During these years, the department was fortunate in receiving money from several foundations with which to supplement its state money. The General Education Board of the Rockefeller Foundation, for example, provided the funds for the countywide school planning. It also subsidized many specific positions, such as the director of Negro education; in addition, divisions were granted special funds in the areas of schoolhouse planning, supervision, rural elementary supervision, and high school inspection. In 1926, the General Education Board gave the department $7,500 on an indefinite annual basis to establish an information and statistics division, whose function was to conduct research studies and compile research information and statistics for publication by the department.

The first activity of this division was a study of teacher training for the State Education Commission. Published in 1929 as "Teacher Training in North Carolina," this study was the first bulletin of the new division, which was...
headed by M. C. S. Noble, Jr. During the 1927-28 school year, the division was involved in 136 programs, projects, and research studies; in 1928-29, there were 380; and in 1929-30, the director collected data on almost 600 studies. In 1929, the General Education Board of the Rockefeller Foundation offered to give the state department $6,500 annually for 4 years to help the schools improve their libraries. The following year, this money was used to employ a director and a stenographer.

In 1929, the General Assembly authorized another educational commission to study the school system primarily to promote efficiency and prevent overlapping. Responsibility for the study was turned over to the Brookings Institution. After a 4-month intensive study of the state institution, the commission issued a report in 1930, which read in part:

The Department as now organized consists of twelve divisions. Under these conditions it is difficult to maintain consistent approach to the field or to obtain unity of purpose and activity in the Department's contacts with local school officials. It often happens that the separate divisions, acting in their advisory capacities, give conflicting and diverse opinions on educational matters. This, of course, leads to criticism.

There is also a tendency for each division to build around itself impregnable walls and to divest itself of all interest other than its own field of endeavor. This situation renders it impossible for the Department to function effectively because of the lack of wholesome cooperation which is so vitally important.

The report recommended that the department be organized into five bureaus: administration, supervision, information and statistics, Negro education, and vocational education.

The assembly also authorized another study by an educational commission in 1929, primarily to devise a more economical plan of administration. The report of this commission in 1930 paved the way for legislation enacted the following year that changed the entire philosophy of state and county responsibilities for education. The report did not, however, alter the department itself.

DEPRESSION AND WAR, 1931-46

Divided Authority

The Depression had a profound impact on North Carolina education. Actually, the creation of the State Board of Equalization in 1927 marked the turning point in transferring control from the county unit to that of the state. But in 1931, the General Assembly gave the board the power to decide the number of teachers to be allotted to each county as well as the authority to make all necessary rules and regulations regarding the transportation of children at public expense. In view of the state's financial situation, this assembly also disallowed separate increments in the state's salary schedule for 2 succeeding years and reduced all salaries up to 10 percent. Powers given to the board were so broad and significant that by 1933 it was virtually the dictator of the state's educational system. The assembly assumed complete responsibility for supporting public school education for a term of 8 months. This meant that most local taxes for supporting schools were abolished and that the state would support most of the costs of public education by levying a statewide sales tax.

State control followed state support. The state equalization board not only forced the schools to abide by its decisions, but it also began to bring other state boards and educational agencies within its sphere of influence. Following the recommendation of the Brookings report, the General Assembly abolished the board in 1933; but instead of transferring its duties to other departments as recommended, it created in its place an even more powerful agency, the State School Commission. Its authority and responsibility altered in many ways the work of the Department of Public Instruction. State Superintendent Clyde A. Erwin, a former school superintendent in Rutherford County who succeeded Allen in 1934, praised the assembly's work. He stated that a desperate financial situation had been saved and that the assembly's action had laid the foundation for one of the soundest educational systems among the states.

When the State Board of Education was established in 1868, it was the only state agency concerned with the administration of the public schools. Over the years, the General Assembly created others, so that by 1940 there were five state agencies directly involved: the State Board of Education, the State Board for Vocational Education, the State Textbook Commission, the State School Commission, and the State Board of Health. In 1942, Superintendent Erwin pointed out that although his office was authorized by law to "direct the operations of the public schools and enforce the laws and regulations thereto . . ." (33), subsequent legislation had transferred specific duties to these other state agencies. He called attention to the confusion existing among the local school superintendents as a result.

In an effort to bring some order to school administration at the state level, the General Assembly passed an act in March 1941 permitting the people to vote on an amendment to the constitution that would place the supervision and administration of the public school system and its funds entirely in the hands of the state education board. The amendment passed in November, and the changes became effective in April 1943. The 1943 General Assembly then abolished the State School Commission, the State Textbook Commission, the State Board for Vocational Education, and the State Board for Commercial Education,
Improving the Schools' Instructional Programs

In an effort to organize the state's public schools into a unified system from the first grade through high school, the department in 1932 merged its school inspection and elementary education divisions to form the Division of Instructional Services. Two years later, the Division of School Libraries was placed in this division, and the state assumed all responsibility for this service, including the director's salary formerly paid by the General Education Board. The federal Civil Works Administration assisted libraries throughout the state from 1933 to 1935, thereby enabling the number of librarians to increase from 88 to 282.

To improve the schools' instructional programs in all subjects, the instructional services division sponsored regional 1-day conferences and institutes in music, child development, character education, language arts, reading, commercial education, social disease control, mathematics, art, safety, physical education, science, and social studies. Recognized authorities in these subject areas and representatives from textbook publishers often assisted in these conferences and institutes. At the same time, the division continued to inspect the schools, supervise elementary and secondary schools, supervise the accreditation of schools, and prepare courses of study and special bulletins.

Curriculum Revision

The department created a Division of Curriculum Instruction in 1934 to prepare a new state course of study; the division, financed in part by the General Education Board, was abolished when the task was completed. Superintendent Clyde A. Erwin, director of certification, directed this comprehensive curriculum study. Members of the department, teachers, lay citizens, summer school participants, and special consultants cooperated in publishing an outstanding bulletin entitled "Courses of Study for the Elementary and Secondary Schools in North Carolina, 1935." Following this study and the publication of this bulletin, Hillman assumed the directorship of the new Division of Professional Services, formerly the Division of Certification.

In 1941, the assembly adopted the recommendation of the education commission of 1939 for 12 years of instruction in the public schools. In the fall of the same year, Superintendent Erwin announced that the 12-year program would be planned primarily by two study groups: the Central Curriculum Committee and the Lay and Professional Study Group. These committees studied the nine general subject areas offered by the schools and recommended that the additional grade be placed in the elementary school. They also recommended changes in almost all elementary school subjects, but few in the high school course of study.

Improving Teaching

During the Depression, there were more teachers looking for jobs than there were jobs available. Since improving instruction also involved upgrading the teaching staffs and the preparation of teachers, the department took this opportunity to increase its requirements. By 1941, all beginning teachers were required to be graduates of standard 4-year colleges, and the state board ruled that those who were not would have to obtain a degree by September 1943 or be dropped to the certificate of the next lower class.

From 1936 to 1940, Superintendent Clyde A. Erwin worked diligently to upgrade standards for teachers. Although not a college graduate himself, Erwin was an astute politician and excellent speaker, who could communicate with all groups. His close association with the North Carolina Education Association made him a favorite among the state's educators. Erwin recommended time and again that the school law be amended to require all newly elected superintendents of schools to hold a certificate authorized by the state board. He also requested an annual appropriation of $250,000 to be used for "master's certificates" for teachers who had earned graduate credits and who were familiar with many of these teaching abilities. Erwin also requested $750,500 for the 1941-43 biennium to bring the state salary schedule for Negro teachers in line with that for white teachers.

After the United States entered World War II, it was necessary to lower the certification requirements in order to replace those teachers who went into the armed forces or war industry. The first graduate certificates became effective in July 1941, and the first principals' certificates in July 1942. Beginning in 1942, it was necessary to issue "war permits" to those having at least 60 semester hours of college credit. As the war extended into the 1944-45 school year, certification requirements had to be relaxed still further.
Negro Education

During the Depression, the Division of Negro Education operated primarily as a coordinating agency between the Negro schools and the other divisions of the department, with particular emphasis on improving organization and instruction in the elementary schools. The division lost three of its staff members between 1929 and 1933, leaving only one person to supervise the organization and instruction of all the state's Negro elementary schools. The division worked closely with the Jeanes supervisors for Negro schools in 26 counties; it attempted to organize and supervise the teacher training program in the 12 Negro colleges; and finally it prepared and revised courses of study to be used in the colleges for training both elementary and high school teachers. Throughout this period, the Negro education division also supervised the accreditation of colleges and normal schools, as well as public and private schools. It encouraged and assisted schools in consolidating their programs, secured new buses for Negro schools, sent representatives to the countywide teachers and PTA meetings, met with local boards of education in behalf of the Negro schools, and promoted conferences on race relations. It also helped Negro schools secure the libraries and equipment required for accreditation.

In December 1943, the state board authorized the division to make a comprehensive study of Negro education in the state. N. C. Newbold and his staff produced a report in which a long-range program for improving public school facilities was recommended. The state board adopted this report in January 1945. Recommendations also were made for reorganizing and consolidating Negro schools under plans approved by the state department and for making further surveys to determine the future needs of Negro schools. The report also pointed out that vocational education should be expanded in the Negro schools, that there should be more supervisors for the Negro elementary schools, and that these schools should receive a larger appropriation for equipment and supplies (34). The 1945 General Assembly, however, took no action on these recommendations.

Vocational and Adult Education

Adult Education. Although the department had operated vocational educational programs for school-age students since the passage of the Smith-Hughes Act in 1917, it was the Depression and funds from the Civil Works Administration that prompted the organization of a Division of Adult Education in the early thirties. At its inception this program was primarily a relief effort and secondarily an educational program. During the 1933-34 school year, approximately 900 unemployed teachers were paid $50 per month with these federal funds to work in adult schools. The adult program received funds from the U.S. Office of Education in 1936; and in 1937 and 1939, the General Assembly voted funds to guarantee continuance of the program.

The schools for teaching adults established in 1937 varied from unit to unit; but, for the most part, they emphasized adult elementary education to combat illiteracy, Americanization programs for the foreign born, home management, health and hygiene, homemaking, public speaking, and the practical principles of economics. In the 1937-38 school year, more than 43,000 adults were enrolled in these community schools.

In 1940, Superintendent Erwin requested an annual appropriation of $145,000 to establish adult educational programs entirely financed by state funds in 20 counties, and on a matching basis in 80 counties. The adult education division continued to cooperate with the WPA until 1943, when the division was discontinued to avoid duplication of effort in other divisions.

Vocational Education in the 1930's. Federal aid enabled the department to expand its vocational education division during the thirties. For example, the number of staff members increased from 17 in the 1929-30 school year to 25 in the 1939-40 year. During this same period, the 154 schools enrolling 5,300 students in vocational agriculture increased to 412 with 18,965 students in 1940-41. The Citizen Conservation Corps began providing instructors for evening classes in agriculture in the 1937-38 school year. At the same time, the CCC cooperated with the schoolhouse planning division to promote the construction of home economics cottages in connection with the high schools. At the end of the twenties, only six schools enrolled 227 girls in home economics; but at the end of the next decade, 286 departments were enrolling 21,247 girls. There were 384 classes with 12,122 students.

The War Years. The Division of Vocational Education worked closely during the war years with the state National Youth Administration director, John A. Lang. In January 1941, the department employed a supervisor of NYA education. Shortly thereafter, he employed an assistant, six other staff members to work in the state's three NYA districts, and one supervisor for the program for Negroes. By the end of the 1940-41 school year, there were 10,509 out-of-school youth enrolled in the NYA education program, and 447 resident and nonresident centers under the supervision of the vocational education division. When the NYA funds were cut drastically, enrollments dwindled during the next year to approximately 4,000 in 144 centers. The program was discontinued in June 1942. A new program, Vocational Training for Defense, assumed the functions of the NYA program.

The U.S. Office of Education allotted funds for training people in national defense, and the department began such a program in July 1940. The vocational education division set up seven training centers throughout the
state to instruct students in shipbuilding, aircraft production, and other related industries. When the United States entered the war in 1941, this program was expanded and strengthened. In July 1942, the NYA program was replaced by a dual program: vocational training for war production workers and rural war production training. By June 1945, more than 48,000 persons had been trained for work in 92 war industries. When the war ended, the program was changed from war production to training for the textile industry.

The department also modified its vocational agriculture program so that specific efforts might be directed toward the needs resulting from the war. It attempted to strengthen courses in mechanical operations for out-of-school rural youth, to acquire positions both in the defense industries and for mechanical jobs on the farm, and to develop programs on rural war production. During the 1943-44 school year, 4,011 classes enrolled 57,862 students in these defense training programs, and at the same time more than 29,000 North Carolina farm people were being trained in 250 school community canneries.

The occupational information and guidance section, which had been added to the vocational education division in 1939, proved to be invaluable during the war as more and more people were drained into the service. Although the guidance service itself suffered from the loss of key counselors, this section continued to contribute positively to the realization of department goals throughout the forties (35).

Under the terms of the Emergency Relief Administration Act of 1935, the U.S. Office of Education sponsored a significant study of local school organization and administration in 10 states, including North Carolina. This “Study of Local School Units in North Carolina, 1937” recommended that the vocational education division be enlarged to include a supervisor of distributive occupations as well as a director of vocational guidance. The George-Deen Act of 1937 enabled the department to employ a state supervisor of distributive education in 1939. Particularly useful during the war years, this program emphasized special courses for preparing new workers to replace those who went either into the service or into war industries. It attempted to familiarize experienced salespeople with wartime regulations and new merchandise, as well as to provide information on government regulations and laws for managers and owners of retail businesses. In addition, it provided instruction for executives in supervising employees.

Even before the war, the department’s vocational rehabilitation work had expanded. For instance, in the 1929-30 school year the program had rehabilitated 72 persons, whereas in 1940-41 it had served 402. During the war, there were many applications for rehabilitation services from men rejected by Selective Service, and many more were served who were referrals from the State Employment Commission and the American Red Cross. The emphasis was on short training courses in order to prepare these people for essential war industries (36). Long-range rehabilitation and training had to be delayed until the end of the war.

In 1939, the State Board of Health and the State Department of Public Instruction received financial assistance from the Rockefeller Foundation to prepare teachers for assuming responsibility for a large share of the health instruction. As a joint operation they organized the division of school health coordinating service in July 1939, not only to instruct but to simplify and facilitate health services for all youth. The state department supplied three health and physical education advisors who worked as staff members in the school health coordinating service beginning in 1944. Two years later, Superintendent Erwin recommended that the General Assembly appropriate $50,000 annually to the state board to initiate a program for preparing personnel to render health services to youth and to correlate health work in the schools with other agencies engaged in remedial health aid.

Physical Facilities

Schoolhouse Planning. North Carolina was the first and virtually the only state to profit from the approximately $300,000 in federal relief funds available in 1932. During the next 2 years, the Division of Schoolhouse Planning gave all possible assistance to school administrators in survey work, preparation of plans, and applications for CWA and PWA projects. It assisted in selecting building sites and in supervising construction; finally, it inspected the completed buildings.

During the 1935-36 school year, the department, in cooperation with the Julius Rosenwald Fund, sponsored a statewide contest in school plant rehabilitation and beautification. With additional aid from the Rosenwald Fund, it also established a 3-year demonstration in school plant maintenance in Nash County. State Superintendent Erwin recommended that the assembly increase the literary fund to $3 million so that the amount available for school building loans could be increased from $300,000 to $500,000.

In 1939, the director of schoolhouse planning and the director of vocational education were authorized to select rural communities in which vocational buildings could be built and equipped from funds appropriated by the General Assembly to the North Carolina Rural Rehabilitation Corporation, established in 1935. The schoolhouse planning division prepared building plans and then distributed them to units unable to employ an architect. In 1940, the director reported that the division had cooperated with the WPA in planning and erecting school buildings costing $13 million.
Until the United States entered the war, school plant construction proceeded in a normal manner. Beginning in 1942, when labor and materials required for building purposes were deemed essential to the war effort, the chief objective of the schoolhouse planning division was to maintain the status quo (37). The division was engaged, however, in a study of school plant needs in preparation for construction in the postwar period; in addition, it prepared a bulletin on planning modern school plant facilities, also for use by local school units at the conclusion of the war. During this period the federal government, under provisions of the Lanham Act, provided assistance in the erection of school plant facilities in war-impacted areas of the state, such as the city of Wilmington and the counties of New Hanover, Onslow, and Craven. Curtailment of building activities during the war years was followed by a tremendous construction program that caused the staff and functions of this division to be greatly increased.

Textbooks

Prior to 1935, the state took no active part in distributing textbooks to the public schools, even though the state board was authorized to adopt the texts. In 1935, the General Assembly passed an act providing for a state textbook purchase and rental commission to operate as a part of the state department. Two years later, the assembly amended the 1935 law, authorizing the textbook commission to supply free textbooks to all elementary school pupils and to continue the rental system for supplementary readers in the elementary grades and for basal textbooks in the high schools. By 1939, the commission abolished this system of establishing a rental fee for each textbook by creating a flat fee system whereby all students paid one fee to cover the cost of renting all high school textbooks (38).

School Lunch Program

The school lunch program evolved as a result of the emergencies created by the Depression and World War II. From 1935, North Carolina schools operated some school lunch programs by using WPA and NYA labor along with food products donated by the Surplus Commodities Corporation. When the WPA and NYA programs were discontinued in March 1943, the lunchroom programs declined. But, as a part of the nation’s food program during World War II, a child-feeding program was developed; this program became a part of the vocational education division in August 1943. Governor Melville Broughton issued an executive order transferring $13,114, previously allocated for lunchroom workers, issued bulletins, and cooperated with the schoolhouse planning division in drawing up plans for school lunchrooms. When Congress passed the National School Lunch Act in 1946, the program was put on a continuing basis.

Publications

The Division of Publications continued to be concerned with compiling, editing, publishing, and distributing printed materials during the thirties. “State School Facts,” issued since 1924 as a semimonthly five-column paper to keep the people informed about public education, became a monthly in 1930.

In October 1936, the department also began publishing a 24-page mimeographed pamphlet, the “North Carolina Public School Bulletin” which by the following year was increased to 12 pages. After May 1941, “State School Facts” became a regular feature of the “Bulletin.”

A PERIOD OF NOTABLE GROWTH, 1946-65

Changes Within the Department

In 1947, the General Assembly appropriated $50,000 to supplement $100,000 donated by the Knapp Foundation for the State Education Commission to make a study of North Carolina’s educational system. In its 1948 report (39), the commission was highly critical of the administrative system that the General Assembly had established in 1945. The law creating the office of controller had resulted in a division of authority and an overlapping of duties with the state superintendent. Although the commission strongly recommended that the assembly clarify the lines of authority and make the state superintendent the sole executive officer of the State Board of Education, the assembly failed to act.

The commission recommended that the staff of the Department of Public Instruction be increased and that its name be changed to “State Department of Education.” It indicated that the department should be brought together into not more than five major divisions, with each division being headed by a person with education equivalent to a doctor’s degree. It did not recommend that the organization be fixed by law, but it did suggest that the state superintendent be given the authority to organize the department with the approval of the state board.

When Superintendent Erwin died in 1952, Governor Kerr Scott appointed Charles F. Carroll as state superintendent of public instruction. Prior to his appointment, Dr.
Carroll had been superintendent of the High Point City Schools and was widely known as a genteel, level-headed individual, who possessed a remarkable understanding of education in North Carolina. Under his leadership, the department continued to expand, and by 1956, four new divisions—research and statistics, vocational rehabilitation, school health and physical education, and special education—had been added to the six that had existed a decade earlier (40). The department also added a general assistant state superintendent, an administrative assistant, an assistant state superintendent of instruction, and a coordinator of teacher education. In 1945-46, the department's annual budget was $133,366, but by the 1955-56 school year, the budget had grown to $361,341. Along with these administrative changes and new legislative appropriations, division services had been expanded to embrace many new areas.

This tremendous expansion continued to accelerate from 1956 to 1965 as the entire state manifested a widespread desire to improve education. Although part of this enthusiasm for quality education was spawned by a national trend, there were notable experiences in North Carolina that led to significant educational progress. Governors of the period indicated strong interest in education and exercised outstanding initiative to bring about improvements. Governor Terry Sanford, who had campaigned on a platform of improving education, was active on behalf of North Carolina's youth (41). There was also a new era in the state superintendent's dealings with superintendents, principals, supervisors, teachers, and the lay public (42).

This healthy climate for better education resulted in a number of critical evaluations of both the state department and the public schools as a means of improving education. There were efforts to develop state accreditation standards within the department, to supervise self-studies of local schools, and to formulate effective teaching guides. Emphasis on helping all youth in North Carolina achieve to the best of their abilities was reflected in refined and expanded programs at all levels. These efforts to improve education were strongly supported by organized groups within the state, particularly the United Forces for Education, which endorsed many legislative proposals for more effective services. This organization was composed of the North Carolina Congress of Colored Parents and Teachers, Congress of Parents and Teachers, American Association of University Women, North Carolina Education Association, Federation of Music Clubs, Federation of Women's Clubs, State Grange, North Carolina Teachers Association, and State School Boards Association.

In this atmosphere for improving education at all levels, the state department engaged in experiments and innovations. Emphasis on planning and educational leadership became increasingly apparent. Working relationships with other organizations and agencies were broadened, and the department assumed constructive leadership in effecting provisions of the Civil Rights Act of 1964. Federally sponsored or cosponsored programs, along with foundation projects, became one of the major aspects of the department's overall responsibility.

Although the department in recent years had operated through 10 divisions, the number was reduced to 5 during the 1958-60 biennium, as the state education commission had recommended several years earlier. This reorganization, designed to coordinate services and facilitate efficiency, still left several former divisions as staff services: publications and central services, educational research, statistical services, NDEA administration, school athletics and activities, teacher merit study, and the North Carolina fund project. The controller's office continued to be organized in seven divisions: auditing and accounting, insurance, personnel, plant operation, teacher allotment and general control, transportation, and textbooks.

Expanding Instruction

The department continued to add staff members as it expanded its general supervision of elementary schools and high schools. During the summers of 1947 and 1948, it organized special courses in the teaching of safety and driver education for teachers at the University of North Carolina. Through private funds (43), the department was able to employ a director of safety education in 1948; and in 1949, the General Assembly appropriated funds to continue this program. Teacher-training courses in driver education increased to 4 in 1952, 8 in 1953, and 12 in 1955. The General Assembly passed legislation providing for teaching safety and driver education in the public schools in 1953, and during the following year the department added two additional staff members for this program. It also prepared a curriculum guide in driver education and a manual in safety education in the spring of 1954.

Following a request by Superintendent Erwin, the General Assembly enabled the department to employ a supervisor of music education in 1950. Within 3 years, interest in music education had become so extensive that the assembly, with widespread organized encouragement throughout the state, primarily from the home demonstration clubs of North Carolina, voted the funds to employ six music supervisors. These consultants not only held area workshops with classroom teachers but also cooperated in an advisory capacity with teacher-training institutions. In 1955, the assembly withdrew funds for three of the six supervisors.

Resource-use education, with emphasis on the conservation of natural, social, and human resources in schools and communities, also received emphasis in this period. Governor Gregg Cherry appointed a commission of 50 persons, representing all interests in the state, to explore the need for comprehensive resource-use...
programs. The General Education Board provided funds to employ a staff for 2 years to initiate this experimental program. Richard L. Weaver, the program director, first had offices at the University of North Carolina but was eventually transferred to the Department of Public Instruction. In 1949, the state decided to support resource-use education as a permanent part of the instructional services division.

Special Education

In keeping with its objective of giving quality education to all students, the General Assembly of 1949 amended the law of 1947 to authorize the state board to use public funds to establish a special education program in accordance with rules and regulations which the board might prescribe. This permitted the schools to include special classes for children with physical and mental handicaps. In 1949, the department established the Division of Special Education.

One of the first problems faced by this division was that of working with the children who were recovering from poliomyelitis contracted during the epidemic of 1948. School centers were established in four hospitals to which the state assigned 11 teachers. Functioning as continuation schools, these centers served 182 students until they were able to return to school or home, where they came under the "homebound" phase of the special education program.

By 1954, special education had expanded to the point that the state superintendent requested an additional supervisor in the area of mental retardation. The General Assembly of 1955 took no action on this request. In 1963, the assembly authorized the department to staff and equip a curriculum library in the area of mental retardation for use by teachers, administrators, and other professional and interested lay persons.

Negro Education

N. C. Newbold, a member of the department since June 1913 and the director of the Division of Negro Education since its organization in 1921, retired in 1948. He was replaced by G. H. Ferguson. Between 1950 and 1960, much emphasis was placed on expansion of plants, consolidations, and transportation facilities. Beginning in 1957, many Negroes were granted student loans through the Prospective Teachers Scholarship Loans, a program which was initiated at that time.

The Negro education division was merged into the instructional services division in 1960. By 1965, this division included seven professional staff members who were Negroes, each of whom worked in the areas of elementary and secondary education and that of library services. Increasingly these staff members rendered services on a nonracial basis. Primary emphasis throughout these years, as many accomplishments were realized, was on the achievement of status through educational attainment (44).

Teacher Certification

Biennially for 16 years, the North Carolina General Assembly passed legislation to extend the life of certificates held by teachers who could not meet the state board's certification requirements. Early in this period, James E. Hillman, director of the Division of Professional Services, advised teachers that renewal credit would be required by September 1948.

In 1948 the State Education Commission recommended that the professional services division be provided with at least one additional highly trained consultant in teacher education and that the staff of the division be expanded to render additional services in guidance and leadership in the selection and recruitment of teachers, in administration and supervision of an enlarged and expanded program of supervised student teaching, and in administration and supervision of scholarship aid and placement services for teachers. The 1953 General Assembly made provisions for the department to employ a coordinator of teacher education.

Four years later, the assembly created a scholarship loan fund for prospective teachers. Administered by the state superintendent, the fund included provisions for 300 regular scholarship loans of not more than $350 each for the first year of the 1957-59 biennium and $600 for the second year. The program was extended in 1959 and again in 1961. By 1962, students utilizing this fund were enrolled in 51 North Carolina colleges and universities, and 3 years later they were studying in 56 institutions. More than 300 teachers had repaid their obligations by teaching in the state by 1965, and approximately 1,000 at that time were teaching and simultaneously repaying their financial obligations.

In August 1959, the state board passed rules and regulations governing the use of a 3-day extended term of employment for academic teachers. In July 1961, the department extended the terms of academic teachers to 5 days in order to offer 180 full days of instruction and to provide the instructional staff with an opportunity to perform the duties essential to the opening and closing of school. The 1961 and 1963 sessions of the General Assembly further attempted to upgrade and update the subject matter knowledge of classroom teachers by appropriating $150,000 annually for in-service education.

The 1959 General Assembly authorized the state board to make a study of "teacher evaluation, rating, and certification." The board named an advisory committee to implement the study, and by December it had appointed a director. The state department cooperated with the director throughout the 2-year study in collecting and interpreting all data relative to the subject.

In the final report adopted by the state board emphasis was placed on the continuing use of the National Teacher Examination by the teacher preparation institutions
of the state as a means of improving the preparation of teachers and not as a basis for rating.

It seems important now for the Board of Education to assist the various teacher education institutions in improving the quality of the program in the various units by stimulation, guidance, and understanding. Testing will measure one important phase of preparation and should be continued under State Board supervision (45).

The State Board of Education accepted in principle an approved program approach to teacher education and certification in January 1961. In September 1962, the board adopted standards and guidelines, developed by committees and subcommittees involving more than 1,000 educators, which placed a greater share of responsibility on the teacher preparation institutions in determining the necessary certification qualifications. This meant that the institutions were responsible for recruiting, selecting, and retaining only those persons displaying genuine promise. It placed emphasis on the appropriateness of the institution for teacher education in such areas as faculty, personnel, policies, resources, and facilities.

During this period of rapid growth, the 1961 assembly authorized the state board to conduct an experimental program in merit pay for teachers, the third such study within a period of 20 years; the 1963 assembly voted to continue the program for an additional 2 years. This $400,000 study involved approximately 1,200 teachers in three administrative units. In spite of the excellent in-service experiences the experiment afforded teachers, the final report to the 1965 assembly recommended that a uniform, statewide merit pay program not be introduced. It declared, however, that merit programs should be encouraged at the local level as specific conditions conducive to their success were found to exist. The study also prompted other recommendations for the continuing improvement of instruction. The assembly took no action on this report or any of its recommendations.

School Health and Physical Education

In 1949, the General Assembly began appropriating $440,000 annually to the state board for school health work, including the diagnosis and correction of chronic remedial defects of indigent children. It was the responsibility of the school health coordinating service to plan the program and administer these funds. Two years later, the service moved from the Board of Health Building to the Education Building, and the following year the department organized it as a separate division of school health and physical education and school health coordinating service. This new division was to work not only with health instruction and physical education, but also with safety, healthful environment, mental hygiene, and health services to the public schools.

In 1952, the state board adopted uniform standards of health, safety, and eligibility for schools operating athletic programs. The department appointed a consultant in health and physical education to integrate athletics with the total program of physical education.

Vocational Education

In 1945, the assembly designated the department as the approval agency for the funds Congress appropriated for training World War II veterans. By the end of 1946, there were 51,765 North Carolina veterans in institutional, on-the-job, and veteran farmer training; 3 years later, there were 70,539. The vocational education division's trade and industrial section supervised the on-the-job training, which included 17,508 veterans in December 1946, 18,605 in 1947, and 3,219 in January 1956. The vocational agriculture section employed five district supervisors and one supervisor for Negro schools to conduct a program of 200 hours of group instruction plus 100 hours of individual on-the-farm instruction per year. There were 6,530 veterans in this program in December 1946 and 24,098 by the end of 1949; but by January 1956, there were only 2,606.

Both the guidance services and the industrial rehabilitation programs continued to grow during the postwar period. Of the state's 933 high schools in 1956, scheduled time for student guidance was available in 323. In the same year, the industrial rehabilitation operation had expanded to such an extent that it was set up as a separate division and spent more than $1.25 million during the 1955-56 school year in treating 7,097 cases.

Improving Physical Facilities

Schoolhouse Planning. At the end of World War II, Superintendent Erwin reported that a survey directed by the state board revealed the need for $100 million of new school buildings in North Carolina. This 1946 report, approved by the board, proposed that the state distribute $25 million to local administrative units over a 5-year period. The 1947 General Assembly, occupied with many other postwar problems, took no action on this recommendation. The next year, again with the support of the state board and this time with the backing of the State Education Commission, Superintendent Erwin reported to the Governor and the assembly that at least $100 million was urgently needed to provide up-to-date school facilities. Moreover, the commission recommended that the department employ nine people at the schoolhouse planning division—which had only a director at the time—and that it expand its advisory services to all administrative units.

In April 1949, the General Assembly passed an act appropriating $25 million for the state board to allocate to the counties for school buildings and authorized a bond
election for an additional $25 million. The act also authorized the board to deduct up to one-fourth of 1 percent of the amount allocated to each county to be used for surveys and construction plans, improvements, or repairs of school buildings. The department then created a survey section in the schoolhouse planning division, and by 1951, it had added two additional staff members.

North Carolina received $93,520 from the federal government, which it matched with state funds in 1951, to initiate a statewide survey of school facilities. The first step—collecting information concerning the condition of buildings, facilities needed, and the financial resources available—was incorporated into a report submitted to the U.S. Office of Education. The second phase of the survey involved a long-range study to determine the need, location, building sites, type, and size of individual school plant projects in each administrative unit. On the basis of this information the department developed a statewide master plan for school construction.

With the urgent recommendation of Superintendent Charles F. Carroll, the 1953 General Assembly voted to hold a statewide election for issuing $50 million in school construction bonds. In October, the citizens voted in favor of the bond issue, and the building program was continued. By the end of June 1956, the state board had approved 1,040 school projects amounting to more than $77 million.

School Lunch Program

During the postwar decade, the school lunch program continued to expand. When it began in 1943, there were only 4 people on the staff with 549 schools participating; by the end of 1948, the staff had increased to 18, and 1,422 schools were serving lunches. Two supervisors for the Negro school lunch program were added to the state office in 1949. During the 1955-56 school year, 1,628 schools participated in the school lunch program. In 1963-64, a total of 2,040 of the 2,154 public schools in the state provided meal service, with over 90 percent of these schools participating in the National School Lunch Program.

NEW AND EXPANDED SERVICES, 1956-65

As the department initiated new services, it became responsible for certain "new" areas in curriculum, assumed responsibility for operating federally inspired programs, and launched a number of experiments throughout the state. Its personnel increased from approximately 230 in 1956 to almost 500 in 1965. The office of the controller employed an additional 140.

Enriching Instruction

During this period there was widespread emphasis on standardized testing in the schools of the state. The percentage of students tested annually, grades 7 through 12, increased from 60 percent in the 1961-62 school year to 68 percent in 1963-64. Slightly more than two-thirds of this testing was made possible through Title V of the National Defense Education Act.

In an effort to insist that all students stay in school as long as possible, for the first time in the history of North Carolina state funds were allocated during the 1962-64 biennium to aid county and city administrative units in enforcing compulsory attendance laws. Attendance counselors, operating in 46 of the 159 administrative units, worked in every possible way with potential dropouts and chronic absentees in an effort to encourage these people to remain in school. Reports indicated that these counselors had a considerable impact in improving school attendance and in preventing dropouts.

For those who dropped out of school, the department established a high school equivalency program that covered five broad areas of knowledge. As the program evolved, it was extended to qualified prison inmates and to members of the armed forces who met residence requirements. Applications for these tests increased each year until approximately 12,000 certificates had been issued by the end of 1965.

One of the most significant programs of this period was that for educating the disadvantaged, made possible through federal funds allotted under the Elementary and Secondary Education Act of 1965. The department disseminated information about the program to all school administrative units and interpreted the guidelines and regulations concerning the program that were issued from the U.S. Office of Education. This was accomplished in part through numerous personal conferences with local school personnel. The department organized a series of regional conferences early in 1966 to evaluate the projects that had been approved. It appointed coordinators for each of the several titles of the ESEA and assigned virtually all staff members certain responsibilities for implementing the provisions of this act.

From 1958 to 1963, the North Carolina public schools spent more than $14 million in federal and local funds for improving instruction under Title III of the National Defense Education Act of 1958. All administrative units in the state participated under Title III at least 1 year during this period. As a result, science laboratory facilities increased in quantity and quality throughout the state. Through the use of additional teaching aids, schools were able to increase interest and improve instruction in mathematics. The audiolingual approach to teaching modern foreign languages also improved instruction in this area. North Carolina’s progress under the NDEA program attracted national attention during this period.

Another program designed to improve instruction, sponsored by the U.S. Office of Education through the Goldsboro city schools and the state department, was
inaugurated in the 1964-65 school year. Under the Cooperative Research Study, a project in first-grade reading was developed for the 751 children in all of the Goldsboro schools' 28 first-grade classes. The major purpose of the project was to compare three approaches to teaching first-grade reading: a traditional basal reader approach, an approach using basal readers plus intensive phonics, and an approach using the above methods plus sensory experiences. Findings indicated that no approach to the teaching of reading will necessarily reach all children, but that the sensory experiences approach is more beneficial than either of the other two.

Since the statutes of North Carolina declare that the state superintendent is responsible for the education of all children within the state, the department during this decade provided a consultant for its 170 nonpublic schools and issued three publications on the subject. The first full-time coordinator for nonpublic schools was appointed in 1961-62, and he and his successors worked with the more than 700 kindergartens throughout the state. State Superintendent Charles Carroll urged the 1963 and 1965 Legislatures to establish statewide kindergartens, beginning with certain experimental and pilot programs. By the end of 1965, however, no funds had been appropriated for public kindergartens, although the 1965 Legislature had given Orange County permission to experiment in this area for a period of 3 years with money offered by the Ford Foundation.

With grants from the Richardson Foundation of Greensboro, the state board in November 1957 authorized a special curriculum study, which was initiated in April 1958. In 1961, the General Assembly made the curriculum study and research department a permanent agency under the state board's supervision. The general objective of the agency was to provide the board with information and recommendations needed in its policy-making decisions on curriculum and other matters of educational concern. Specifically, it was—

To sponsor new experiments designed to produce high-quality education in the public schools; to disseminate information about new developments in education and to adapt these developments to public school needs in North Carolina; and to promote the adoption of successful new educational developments . . . (46).

The agency was terminated in June 1965.

One other program sponsored under Title III of the Elementary and Secondary Education Act, known as Projects To Advance Creativity in Education, was designed to assist schools in establishing a variety of supplementary educational centers and services. The state superintendent appointed a planning and review committee for Title III, with the chairman serving as the acting coordinator. Fifty-four school systems submitted 58 proposals during the first three application periods, 16 of which were approved with budgets totaling approximately $660,000. Eight of these projects were for comprehensive, supplementary educational centers and services; two were for fine arts programs; two, for purposes of planning new curriculum approaches; and one each for a marine science center, a center for Latin American studies, a model school unit, and a guidance program for delinquent youth.

In July 1962, the state board made provisions for a new staff service in the state department known as "School Athletics and Activities." This official action was paralleled by the issuance of a policy statement by the state board concerning the protection of school time necessary for a quality curriculum, with emphasis on a proper balance between subjects and activities. In February 1965, a student activities handbook, unique among the states, was published. In this significant bulletin, "Student Activities, North Carolina Public Schools," emphasis is placed on objectives, policies, and legal responsibilities. The publication was intended not only for teachers and administrators but for school board members as well.

Provisions for further in-service education of teachers were made by the 1961 and the 1963 assemblies when $150,000 was appropriated annually to provide for upgrading and updating the subject matter knowledge of classroom teachers. In 1964-65, through the transfer of funds secured by the state board, opportunity was made available for approximately 8,000 elementary teachers to participate in a televised course in mathematics.

Materials

In March 1960, the state board established a vocational materials laboratory to collect, evaluate, develop, and distribute new materials and suggest new techniques for vocational education teachers. Attention was focused on materials in trades and industrial education, as expansion in this area had been so rapid that printed materials often were outdated soon after publication.

The curriculum library in mental retardation—organized, staffed, and equipped in 1963—quickly became an up-to-date center for comprehensive materials on mental retardation. Materials and services available through this center were available not only to department staff members but to teachers, administrators, and other professional and lay personnel interested in mental retardation.

The department also established a general professional library in 1965 for its staff members. With both state and federal funds, these materials and services were expanded in such a comprehensive manner that almost any materials needed in relation to the staff's professional responsibilities were available, including those through interlibrary loans.

In cooperation with the University of North Carolina and the Ford Foundation, the state department initiated an in-school TV experiment in 1957. The General Assembly
appropriated funds for the 1959-61 biennium to supplement the Ford support. The success of this experiment prompted the state board to agree that TV education should be incorporated into the North Carolina public school program. The first supervisor, appointed in 1961, was assisted by a consultant and four studio teachers. Funds were appropriated by the General Assembly in 1961, 1963, and again in 1965 to finance a statewide program of TV instruction under supervision of the department. At the end of the 1961-62 school year, approximately 30,000 students were receiving TV instruction in one or more courses.

Beginning with the 1962-63 school year, the department, with state and Old Dominion Foundation funds, coordinated 60 statewide presentations of professional dramatic productions. Theatre-in-Education, Inc., a New York equity company, presented excerpts from Shakespearean dramas to approximately 50,000 students in the first year. The success of this venture prompted similar productions in subsequent years and in as many different schools as possible. The state board assumed full responsibility for financing these presentations after the first year, except in 1965-66 when a group of North Carolina banks undertook the project.

Through the Vagabond Players of the Flat Rock Playhouse, North Carolina's oldest professional theater, another effort in live theater for students was initiated in 1964-65 with 60 performances of *The World of Carl Sandburg*. These productions, financed through arrangements with the Northwestern Bank and the State Board of Education, also were presented to audiences of approximately 50,000 each year. Follow-up evaluations by teachers and students indicated that the productions were eminently worthwhile, both educationally and as entertainment.

**Exceptional Children**

In its effort to give every child in North Carolina an opportunity to develop to his fullest extent, the state board initiated a short-term, residential school for gifted and talented students during the summer of 1963. This experimental school, known as the Governor's School of North Carolina because Governor Terry Sanford was influential in starting it, was financed by the Carnegie Corporation and by businesses and foundations of Winston-Salem.

The school served 400 gifted and talented high school students in each of its 8-week sessions with a minimum duplication of students from summer to summer. The curriculum was designed to enrich the knowledge of each student and to encourage creativity in his particular area of interest, such as English, mathematics, natural science, social science, foreign languages, art, choral music, orchestra, dance, drama, and piano. In addition, all students participated in special discussion groups, forums, and lectures under the supervision of instructors from the various academic disciplines. The school attempted to examine the content and instructional methods appropriate for gifted and talented students. Results of the experiment, including the findings of several broad research projects, were made available to the schools of the state so that they might profit from what was learned.

The department was indirectly involved in an experimental residential school for underachieving eighth-grade boys from all sections of the state during this period, with Superintendent Carroll serving on its board of directors. Financed by grants totaling $3.5 million from the Carnegie Corporation, the State Board of Education, and the U.S. Office of Education, the North Carolina Advancement School was founded in November 1964 as a research project of the Learning Institute of North Carolina. Its purpose was to develop and test ways effectively to educate underachievers. It had the unique advantage of operating annually four separate sessions of 3 months each, with nearly 1,000 boys participating. This arrangement permitted a large number of experiments and a great number of comparisons in a short time.

The Advancement School, utilizing experimental as well as established methods and materials, attempted to devise and evaluate new ways of teaching and learning that might be adopted in all classrooms throughout the state. The testing of methodology was conducted in selected experimental classes throughout the state as well as in the Advancement School itself. The school also was designed to give selective groups of classroom teachers a working knowledge of new approaches to the understanding of student problems and motivation. The especially designed counseling program encouraged continuing achievement on the part of the students after they returned to their home schools.

The Comprehensive School Improvement Program, financed by the State Board of Education and the Ford Foundation through the North Carolina Fund, was initiated in October 1963 as a field-oriented project and was coordinated by the State Department of Public Instruction. In its efforts to improve methods of teaching reading, writing, and arithmetic, emphasis was placed on team-teaching, multigrade organizational patterns, use of college consultants, use of teacher aides, extensive use of instructional materials and audiovisual aids, and visits to other schools.

Consideration in this program also was given to reorganization of the school day, redesign of the curriculum, redeployment of the teaching staff, more effective use of television and other technological resources, in-service education of teachers, and improved communication between teachers and pupils and between teachers and parents. At the end of 1965, the program involved 228 schools, 398 teaching teams, and approximately 25,000 students, 900 teachers, and 100 college consultants from 28 colleges.
Leadership Training

In North Carolina the state board has been responsible for making personnel allotments for superintendents, assistant superintendents, supervisors, teachers, principals, and attendance counselors. The department first received funds from the General Assembly in 1961 to provide assistant superintendents, and in that year, it allotted 44; during the 1965-66 term, it provided 95.

State-allotted supervisory positions in North Carolina, according to board policy, must first be used to ensure competent instructional leadership for general studies common to all students. After this supervision has been provided at both the elementary and secondary levels, special services may be given in specific areas, such as library and instructional materials, guidance and counseling, and the fine arts. In the 1965-66 school year, there were 304 state-allotted supervisors, although, others were employed locally.

North Carolina allot teaching positions to meet minimum standards only; the department, however, encourages local communities to provide financing beyond state allotments for ensuring maximum efficiency. From 1956 to 1965, these allotment procedures were liberalized at the state level, thereby permitting more and more state-allotted personnel to local administrative units. In 1965, the assembly appropriated funds for reducing the teacher-pupil ratio in grades 1 through 3.

Members of the state department, especially the superintendent, the assistant superintendent, the directors of divisions, and special consultants, are called on frequently for advice, counseling, and assistance in planning. This was particularly true after the schools became involved in federal programs, many of which were new and untried. Throughout this period of rapid growth and expansion, the state department acted on the premise that it had a primary leadership responsibility for planning, executing, and evaluating area conferences and workshops that might be of value to educators throughout the state. For example, in 1958, after Congress passed the National Defense Education Act, the department arranged a series of conferences concerning the acceptable way to prepare projects, request materials and equipment, and evaluate projects. The department also held area conferences concerning the implementation of the Vocational Education Act of 1963 and the Elementary and Secondary Education Act of 1965.

Throughout this period, the department gave leadership to classroom TV teachers each year in helping them evaluate their work and make plans for the coming year. The state department in this decade planned four state conferences for beginning principals and similar conferences for all principals. It arranged leadership conferences to introduce new publications, to discuss their contents, and to share suggestions on how best to use these publications.

Similarly, the department gave increasing assistance to schools during this period in planning self-studies; it also formulated study guides in various areas and arranged for state and Southern Association accreditation. The state department's leadership had an impact on all curriculum programs—including those which were federally financed—and on all programs pertaining to school activities in athletics, publications, research, school libraries, testing, audiovisual education, and the school lunch program.

Even before Congress enacted the Civil Rights Act of 1964, North Carolina had already desegregated 274 of its 2,135 public schools. During the 1964-65 school year, 84 of the 169 school units were integrated, compared to 45 the preceding year; 3,054 Negroes were attending white schools in 1964-65 as compared to 1,519 in 1963-64. There were 47 teachers and 180 white students in predominantly Negro schools in 1964-65, compared to 5 teachers the previous year.

State Superintendent Carroll and Assistant Superintendent J. E. Miller worked individually and in groups with local superintendents, school board members, board attorneys, and others in interpreting the Civil Rights Act. In this area, as was commonly true, North Carolina's educational leadership assumed intelligent initiative and mustered effective cooperation throughout the state in understanding and implementing the provisions of the act. The changes that occurred in this critical period were effected with the dignity typical of a state accustomed to obedience to law and respect for all races.

FOOTNOTES

7. Ibid., pp. 175-76.
9. The Department of Public Instruction did not assume the functions and duties of the State Board of Examiners until 1921, when the Division of Certification was created by the General Assembly.
10. Mebane was a native of Guilford County, a graduate of Catawba College, and a schoolteacher of some years' experience. He was earnest and enthusiastic, and under him the office of state superintendent became a new educational agency. Mebane showed a clear grasp of the state's educational problems and he won the respect of the school forces. A live wire, he has been called one of the great campaigners for universal education in North Carolina, News and Observer (Raleigh), December 16, 1926; R. D. W. Connor, North Carolina: Rebuilding an Ancient Commonwealth, 1584-1925, II (New York: The American Historical Society, 1929), p. 449.
11. Having taken no part in politics, unlike his predecessors, he expressed the hope that the time would soon come when public opinion would forbid any superintendent from taking an active part in political campaigns.
12. North Carolina, Public Laws and Resolutions of the General Assembly (1899), ch. 637. This was the first direct appropriation by the state for public schools. The General Assembly of 1869 had appropriated $100,000 for schools out of any surplus in the state treasury; but as there was never any surplus, this was only a paper appropriation.
13. Although elected on the Fusion ticket in 1896, Mebane had administered his office without a trace of partisanship. He was so acceptable to many Democrats that they urged their party to take this opportunity to divorce the schools from politics. The majority of the convention, however, was determined to make a clean sweep of the Fusion group. Thomas F. Toon, with an honorable Confederate Army record to his credit, was nominated and succeeded Mebane in office in January 1901.
14. Actually, the state superintendent and a clerk, Major John Devereaux, who was assigned to the office in 1881, comprised the entire staff of the department until a stenographer was added in 1901.
17. Ibid., sec. 6.
18. The State Education Commission reported that the teachers in North Carolina were "as a body, ill prepared, inexperienced, and unstable" primarily because of "low salaries, a poor certification system, and inadequate teacher training institutions." Public Education in North Carolina: A Report by the State Education Commission, prepared under the direction of the commission by the General Education Board (Raleigh: State of North Carolina, 1920), p. 57. Concerning the problem of certification, the commission stated that the prevailing way of certificating teachers had contributed to the present unpreparedness of the teaching body. "With salaries low, with little distinction in pay or otherwise between the trained and the untrained, with teachers scarce, our certificating authorities have been able to do little to foster teacher training, while the conditions under which certificates were issued minimized even the little they could do." Ibid., p. 49.
19. James E. Hillman, who replaced Allen as director of the Division of Teacher Training in 1923, was responsible for initiating these changes; and he prepared a booklet setting forth these new standards and certification requirements.
20. Mrs. Holland, whose salary was paid by the General Education Board and by the Jeanes Fund, was responsible to N. C. Newbold, who directed her itineraries and her efforts throughout the counties.
21. North Carolina, Public Laws and Resolutions of the General Assembly (1907), ch. 280, secs. 1, 3, 4. Although the General Assembly of 1864-65 had passed a graded school law to provide instruction in public schools beyond the common schools, no schools went into operation because of the collapse of education during the closing months of the Civil War. High schools were operating in 1907 in the towns and cities of the state by special acts of the General Assembly, but these were maintained by local taxation with no help from the state and were not a part of the state public school system.
22. Walker served from 1907 to 1920. His position at the University was made possible by the funds from the General Education Board, and until 1917 the General Education Board paid for his services to the state department. After 1917, the General Assembly allowed the State Board of Education to reserve $500 out of the appropriation for high schools to be used in defraying part of the necessary expense in connection with the inspection and supervision of rural high schools. North Carolina, Public Laws and Resolutions of the General Assembly (1917), ch. 285, sec. 4.

24. The 1911 General Assembly appropriated $25,000 annually to establish a maximum of 10 farm-life schools each year in connection with the best county high schools. It was agreed that only one farm-life school might be established in a county and that the county had to provide $25,000 for buildings and equipment and $2,500 annually to maintain the school.

25. In 1921, North Carolina matched funds available under the Smith-Bankhead Act of 1920 to provide vocational rehabilitation of disabled citizens.

26. Salary for the state inspector of high schools was furnished by the General Education Board; salary for the state supervisor of rural elementary schools, by the Peabody Fund.

27. North Carolina, *Public Laws and Resolutions of the General Assembly* (1868-1869), ch. 184, secs. 22, 69. Two sections of the law of 1869 may be interpreted as steps toward the functions of the Division of Schoolhouse Planning in plans and estimates for building a schoolhouse were to be approved by the superintendent and State Board of Education. Another section of the law required the superintendent of public instruction to distribute plans of schoolhouses and suggestions on school architecture. These were the first legal requirements for schoolhouse planning at the state level, and the initial move toward the functions of a Division of Schoolhouse Planning.

28. Superintendent of Public Instruction, *Biennial Report, 1900-1902*, p. 15. This was the first step toward a Division of Schoolhouse Planning since 1869, when Superintendent Ashley had issued a collection of plans for school buildings.

29. Each of the assigned functions had previously been delegated to individual staff members, or they were new functions assigned by the General Assembly.

31. Heretofore, the counties had provided the money for the constitutional 6-month school term, with some aid from the state treasury in an increasing equalization fund. Hereafter, the state was to take over all provisions for the 6-month school term with aid from the counties.

32. In 1923, for the first time in North Carolina's history, state funds ($30,000) were provided for pupil transportation. From 1923 until 1927, the state board distributed these funds for the various administrative units. But in 1927, the State Board of Equalization was given the authority to determine the amount of money any single administrative unit might receive for pupil transportation.

34. White and Negro teachers were paid on the same salary schedule for the first time in the 1944-45 school year. North Carolina was the first state with two different salary schedules to make them equal.

35. North Carolina was the second state in the nation to have a full-time coordinator of counseling and guidance services.

36. The program was administered from Raleigh through five district offices, with three district supervisors working out of each office.

37. Priorities and permits were granted for the construction of essential buildings destroyed by fire or other causes; but no other new construction was allowed except for new lunchrooms, cafeterias, vocational buildings, and canneries which were approved by the federal government as essential even in wartime.

38. All books submitted by publishers for particular subjects were evaluated by the textbook commission, which was composed of teachers, principals, supervisors, and superintendents. The textbooks were then purchased and distributed to the county and city units by the textbook division.

39. The report, *Education in North Carolina Today and Tomorrow: The Report of the State Education Commission* (1948), was published in its entirety by the United Forces for Education after obstacles had been met at the state level for printing more than a summary of its recommendations.

40. See Appendix B for organization of the department in 1955-68.

41. In his campaign speeches throughout North Carolina, Sanford, the youngest Governor since Aycock at the turn of the century, pleaded for "massive education, not massive resistance." In his inaugural address he forcibly declared that "quality education is the foundation of economic development, of democracy, of the needs and hopes of the nation."

Sixty days later, he outlined his program of quality education to the General Assembly and asked for the elimination of practically all exemptions from the state's 3-percent sales tax. This meant tax on food, and the critics cried loudly about unfairness and "High Tax Terry." In one of his public answers to the critics, he stated, "If we tax bread, we also will tax caviar. If we tax caviar, we also will tax filet mignon. No one is going to go hungry because of this tax. But the children of North Carolina will go thirsty for quality education if we do not enact this program for better schools."

While Sanford was in office, a network of community colleges was established; three new senior colleges...
were created; teachers' salaries were increased approximately 22 percent, an experimental school for talented youth was established; the North Carolina School of the Arts came into being; a residential school for underachievers was founded; the Learning Institute of North Carolina, a research organization, was organized; a retraining program for dropouts was initiated by the North Carolina Bankers Association. Nearly 3,000 additional teachers were employed under Sanford's program, as well as 44 assistant superintendents and additional supervisors. Clerical assistants were added to the schools; library allotments were doubled; funds were provided for in-service education; 300 additional prospective teacher scholarship loan funds were provided; college salaries were increased; TV services were expanded; and a Department of Curriculum and Research was established.

42. In addition, other forces of statewide importance were at work during this period. The Legislatures, through their appropriations, their extension of staff services in the State Department of Public Instruction, their educational study commissions, evidenced a strong interest in improving public schools. The State Board of Education continued to establish forward-looking policies; pronouncements of the state superintendent were increasingly forthright, realistic, and dynamic; priorities established in the state department, with special emphasis on local self-studies, were conducive to improved education; organized efforts of informed laymen were felt throughout the state; and federal assistance, through appropriations and guidelines for effecting educational improvements, alerted state and local officials to ways of making education more productive at all levels.

43. The North Carolina Association of Insurance Agents, Inc., offered funds and encouragement for the department's first director of safety education.

44. Between 1921 and 1960, Negro high school enrollments increased from 16,817 to 68,255; because of consolidation the number of schoolhouses decreased from 2,442 to 996; the number of accredited high schools increased from 7 to 208; the number of high school graduates increased from 59 to 10,837; and the number of teachers, principals, and supervisors increased from 4,556 in 1924 to 10,137 in 1960. In 1921-22, the average training of the Negro teacher was 3.51 years of high school; by 1959-60, the training was approximately 4.33 years of college. G. H. Ferguson, "Some Facts About the Education of Negroes in North Carolina, 1921-1960," unpublished manuscript, prepared as a historical document for the State Department of Public Instruction, 1962.

APPENDIX A—NORTH DAKOTA CHIEF STATE SCHOOL OFFICERS 942
APPENDIX B—ORGANIZATION CHARTS 943
INTRODUCTION

Sir Richard Livingston has stated that the most searching question that can be asked concerning any individual or nation is: "Whom has he taken for master and how faithful is his service?" (1). He suggests that excellence might be accepted as the master. North Dakota has been blessed with more than its share of leaders who have served the cause of excellence with vigor and fidelity.

A bountiful sufficiency of educational statistics on North Dakota can be found in the references listed in the bibliography of this chapter. Information regarding the men and women who made these statistics is not so plentiful. It is the intention of the writer to emphasize the careers of some of the leaders who developed public education in North Dakota from a log cabin to a well-organized and highly regarded department of education in less than a century, thereby introducing the chronological events for which they usually were responsible.

So many people have been helpful in furnishing material that it is impossible to recognize them here. However, a special acknowledgment must be made to Bertha Palmer, whose Brief History of the Department of Public Instruction, 1860-1932 (2) is a gold mine of information. It was obviously prepared prior to the fire which destroyed the North Dakota capitol and most of the educational records of the state.

TERRITORIAL DAYS

As was the case in most Midwestern states, early settlement of Dakota Territory and North Dakota followed the rivers. Steamboats appeared early on the Missouri. In 1832, when the steamer "Yellowstone" reached Fort Union, located near the present boundary between North Dakota and Montana, the event was noted even in European newspapers. In the late 1850's, small settlements sprang up at Sioux Falls, Vermillion, and Yankton, all located in what is now southeastern South Dakota. About the same time, French-Canadian fur traders appeared at Pembina and at St. Joseph, a mission established by Father Belcourt on the site of present-day Walhalla, North Dakota. The largest house, 28 by 50 feet, served as chapel, school, and residence for the religious. Ministry was primarily to the métis (3). In 1853, the U.S. Commissioner of Indian Affairs gave $500 in support of the school. It was Sir George Simpson, governor of the Hudson Bay Company, who made the settlement a hinterland of St. Paul, Minnesota. Simpson encouraged business and mail connections with St. Paul, and his enthusiasm prompted the construction of the first steamboat on the Red River of the North (4) in 1859.

President Buchanan signed a bill creating Dakota Territory on March 2, 1861. At that time, there was only one school in all the area comprising the present States of North Dakota and South Dakota plus portions of Montana and Wyoming. Organized in the summer of 1860 at Bon Homme, South Dakota, this school met in a log cabin. Emma Bradford was the teacher for its nine pupils.

The first territorial officers were appointed by President Lincoln. Provision for public schools was made by an "Act for the Legislation and Support of Common Schools," which was passed by the first Legislative Assembly and approved in May 1862. That summer, when the people were alarmed by the Santee Sioux uprising, practically all inhabitants abandoned the territory, except those in the Yankton and Pembina settlements. Most of the settlers who abandoned their homes never returned.

The first Territorial Legislature also declared that schools should "at all times be equally free and accessible to all white children over five and under twenty-one years." It is doubtful that discrimination was intended. In any case, the word white was deleted by 1868 and has never reappeared (5).

The next school legislation was an act approved in January 1863. The law created a territorial Board of Education comprised of the territorial Governor, secretary, and treasurer, and required an annual meeting at the capitol. The board was to appoint a superintendent of public instruction, whose duties were specified by the law and who would serve as clerk of the board (6). Superintendent W. H. H. Beadle, who was one of the best territorial superintendents, later stated, "This provision was retained many years and ought never to have been abandoned" (7). The members of the first Board of Education were Newton Edmunds, Governor; John Hutchinson, secretary; J. O. Taylor, treas-
Dakota was built in 1875. Although it was in use for only 6 years, it is still standing in Pembina, complete with the original blackboards.

An act approved in February 1879 was drafted by A. W. Barber, superintendent of Yankton County, who introduced several practical improvements based on his experience. While there had been little or no agitation for women suffrage, this act authorized women to vote at school district meetings. In 1881, several amendments were made, one of which authorized women to hold the office of county superintendent.

Superintendent Beadle secured passage of the act approved in March 1883, which was an almost entirely new law. It required the organization of school districts by township lines in all but 18 of the older counties; in these, each board of county commissioners was authorized to put the law in force. The boards in two counties did so, and it went into operation in all new counties. The old districts remained in 15 counties, of which Cass, Grand Forks, Walsh, Pembina, and Barnes are now in North Dakota.

Congress enacted the Homestead Law in 1862. One of its by-products was the organization of a colony called the Free Homestead Association at Syracuse, New York, with James S. Foster as secretary. Before he came to Dakota, Foster had been engaged in educational work in central New York. It was natural that he should become the first superintendent of public instruction in Dakota Territory. He proved to be an excellent man and almost single-handedly organized the first Department of Education. Mr. Foster ascertained by interview and letters that there were about 600 children of legal school age in the territory. After his retirement as superintendent of public instruction in 1868, he became the first commissioner of immigration for the territory.

From 1869 to 1879, five different superintendents struggled to get schools going in the territory. The short periods of time each was in the office did not allow great accomplishment. Most of them left the office when greener pastures beckoned.

When Ulysses S. Grant was President of the United States, he chose W. H. H. Beadle as surveyor-general of Dakota Territory. Beadle was a citizen of Grant County, Wisconsin, and it is said that he was appointed due to the influence of a Congressman who feared that Mr. Beadle would be a successful candidate against him at the next election. Whatever the reason for Mr. Beadle’s appointment, it was a most fortunate one for Dakota. For over 20 years, he dominated affairs in Dakota Territory. A picture of Beadle indicates that he was a distinguished-looking gentleman. It is said that he was not ostentatious in his public duties and did not appear to realize that he was doing any more or carrying any more than his share of a citizen’s duties. However, the record shows that he took part in almost every necessary and commendable work. He frequently wrote for publication in journals and newspapers and often gave public lectures regarding the vast and useful resources of the territory. He was a member of various boards and councils to the Legislature, churches, schools, and colleges, all of which substantially benefited from his capable assistance. The first real promoter of Dakota, he is best remembered for his labors to the benefit of educational matters, including the conservation of school lands. In 1879, he was nominated superintendent of public instruction by the Governor and confirmed by the legislative council for an indefinite period. He held office until 1885.

In 1881, Beadle published a review of statehood questions, including division of the territory into two states. Touching school lands, his article says:

We have an intelligent people. Let the state be formed by them intelligently, deliberately, and wisely. . . . The chief material interest the convention will handle will be the school, university, and other state lands. The welfare of the people, the honor of the state and its future character are involved in the handling of the school and university lands. . . . They are reserved for the permanent common welfare. Their full value should be secured to this end (8).

Beadle is credited with the responsibility for those sections in the Enabling Act dealing with lands for the support of public schools and educational institutions, which read in part:

Upon the admission of each of said states into the Union, sections numbered 16 and 36 in every township of said proposed states . . . are hereby granted to said states for the support of common schools . . . . All lands herein granted for educational purposes shall be disposed of only at public sale, and at a price not less than $10.00 per acre, the proceeds to constitute a permanent school fund, the interest of which only shall be expended in the support of said schools. But said lands may . . . . be leased for periods of not more than five years . . . . Shall not be subject to preemption, homestead entry . . . but shall be reserved for school purposes only . . . (9).

This provision, which apparently was opposed by some citizens of Dakota Territory, has proved to be one of the wisest of the Enabling Act and of the constitution of North Dakota. Beadle was appointed by the Secretary of the Interior to make the selection of the lands donated by Congress. The people of North and South Dakota owe him a debt of gratitude for the preservation of the school lands which still form a handsome endowment (10).

A remarkable statement appeared in the annual report of the U. S. Commissioner of Education for 1884–85,
giving statistical information of value to the reputation of the Territory of Dakota. The commissioner found that Dakota led 22 of the states in the amount it expended for educational purposes. He also found that Dakota had a schoolhouse for every 151 people within its borders. In the value of permanent school property, Dakota outranked 15 states; and in the number of teachers employed, 14 states (11).

From 1885 to statehood in 1889, three men occupied the office of state superintendent. None served long enough to have much influence on the permanent development of the schools of the territory. It should be noted that the Legislature in 1887 provided for a Board of Education to be appointed by the Governor, with the superintendent of public instruction as president. Eugene A. Dye was the first president as ex officio superintendent of public instruction. The other members of the first board were Frank A. Willson and George A. McFarland, who was secretary of the board. McFarland was the young superintendent of schools at Scotland, South Dakota, who had come West 3 years before. A graduate of Hiram College of Ohio, he was destined to have an important influence on education in North Dakota for many years. In 1889, he became instructor in history and psychology at the state normal school at Madison, South Dakota. In 1892, he became principal of the state normal school at Valley City, North Dakota, where he served as principal and president until 1918. He became president of the State Teachers College at Minot in 1922 and remained there until his death in 1938.

No organization can be better than the persons comprising it, and certainly this applies to the education profession. As today, territorial administrators cried for more and better prepared teachers. This much we may be sure of: Few persons entered the profession unless they were unselfish and dedicated to the task of educating the children placed under their care. Most had the knack of getting along with children, and a goodly number were natural teachers with the ability to inspire their young charges.

Two examples of early Nelson County teachers are worth recounting. When a blizzard threatened one afternoon in 1888, the teacher of a one-room country school, not much older than some of her pupils, kept the children at school and kept them marching all night. The next day all were found safe. These remarkable women brought their own brand of courage to the territory.

Rachel Tyndall taught at Mapes in the late eighties and early nineties. She was a well-educated woman, who with her mother was proving up on a homestead. One of Miss Tyndall’s pupils, who is still living in North Dakota, remembers her as a cultured lady who inspired her charges and taught them well.

The constitution of the new State of North Dakota provided for the election of the superintendent of public instruction. The first election was held in October 1889, at the same time that the State Constitution was ratified by the people. The officers, including William Mitchell, who had been elected superintendent of public instruction, qualified for office immediately after November 2, 1889, the date President Benjamin Harrison signed the bill that admitted North Dakota to the Union.

Mitchell, who was always known as Captain Mitchell, had served in the Civil War as an officer in an Ohio regiment and had been superintendent of schools in Columbus, Ohio. He came to Fargo in 1883 and was elected superintendent of Cass County schools in 1887. He was a first-class executive and administrator and a fine lecturer. Captain Mitchell presented to the Legislative Assembly a comprehensive plan for a system of free public schools for enactment into law under the mandate of the State Constitution, which read:

The legislative assembly shall provide at its first session after the adoption of this constitution for a uniform system for free public schools throughout the state, beginning with the primary and extending through all grades up to and including the normal and collegiate course (12).

There was considerable controversy regarding the existence of a dual system of public schools created under widely differing general school laws. There was the “district” system and the “township” system, plus a heterogeneous mass of special school districts that had grown up in territorial days. It might be said that the territorial school system was entirely devoid of system; it had to be unified. The department decided to promote township organization without doing violence to existing districts, and it wisely formulated a plan whereby all future changes of school district boundaries should be made to conform with civil township boundaries.

Superintendent Mitchell died in March 1890. His educational bill providing for a uniform system of free public schools was enacted into law and approved by the Governor soon after his death.

To fill Mitchell’s unexpired term, the Governor appointed William J. Clapp, who was then followed in 1891 by John Ogden. Prior to the Civil War, Ogden had been principal of the state normal school at Winona, Minnesota. Something of his character may be found in his letter of resignation, which was presented to the school’s governing committee on December 14, 1861.

Gentlemen: I hereby tender you my resignation of the principalship of the institution intrusted to my care, thanking you most sincerely for the generous support
and council [sic] you have given me. In taking this step it is proper that you and the public should understand the reason that impels me to it.

My distracted and dishonored country calls louder for my poor service just now than the school does. [sic.] I have, ever since our national flag was dishonored, cherished the desire and indulged the determination that — whenever I could do so without violation of a sense of duty — I would lay aside the habitiments of the schoolroom and assume those of the camp, and now I am resolved to heed that call and rush to the breach, and with my life, if necessary, stay, if possible, the impious hands that are now clutching at the very existence of our free institutions.

What are our schools worth? What is our country worth without these? Our sons and daughters must be slaves. Our beloved land must be a hissing and a by word among the nations of the earth! Shall this fair and goodly land, the glorious Northwest become a stench in the nostrils of the Almighty, who made it so fair and so free? No, not while there is one living soul to thrust a sword at treason. I confess my blood boils when I think of the deep disgrace of my poor service just now than the school does. [sic.]

I am with very great respect,

Your most obedient servant,

John Ogden (13)

Ogden had a most unusual career as an officer during the war and after. He was the first principal of Fisk University.

In 1892, submitted to Governor Andrew H. Burke (the drummer boy of Chickamaua), was a volume of 805 pages!

Two state normal schools at Mayville and Valley City were organized and began to function. A joint Board of Directors was created by law, which was afterwards established as the Board of Regents, with control of all state educational institutions. The superintendent of public instruction was chairman, and the deputy superintendent was secretary of the joint Board of Directors of Normal Schools.

The North Dakota Education Association was organized in 1890. One of its first projects was promotion of the Teachers' Reading Circle, which was subsequently recognized by enactment of a law making provision for certifying the completion of reading courses by teachers and for reporting the results to the department. A state educational library, including a circulating library, was established.

Unfortunately, a new state superintendent was chosen at every election until 1904. This did not allow any long-term policies to be formulated and put into effect. All the state superintendents were excellent men and women, and all did their duty. During this time, the Board of University and School Lands, with the superintendent of public instruction as ex officio secretary, was organized, and it handled the school lands well.

The constitution provided that women be granted suffrage on school matters, thus making them eligible for election as state and county superintendents of schools. In 1893, Laura J. Eisenhuth was elected superintendent; 2 years later, Emma F. Bates was chosen for 2 years. Both these women were of high character and dominating personality. Both were of unusual mental attainments, deeply religious, positive, and fearless. With reluctance it must be recorded that part of the reason education did not advance faster was petty political jealousy between otherwise capable and efficient persons. For example, Mrs. Eisenhuth and Miss Bates were not on speaking terms. When Miss Bates was ready to assume the office of state superintendent, she sent a messenger to her predecessor to get out, as she was coming! Amusing, but not conducive to an efficient turnover of the office.

The ladies were followed by two interesting gentlemen, John G. Halland and Joseph M. Devine. Halland particularly interested himself in preparing a uniform course of study, and he did much to standardize the common schools. Under his leadership, the state high school board adopted regulations for required and elective subjects. Summer schools were organized with the aid of state funds for training teachers in service. Halland's recommendations for improving the common schools through supervision of teaching and careful selection of teachers were far in advance of the practice in 1900. Unfortunately, Halland had neither the time nor the personality to carry out his fine plans.

In 1900, Joseph M. Devine was elected superintendent of public instruction. Devine had already been Governor of North Dakota, as he had completed the unexpired term of Governor Frank Briggs, who died in office.
Devine, who attempted to grade the rural schools, stated in his report:

The greatest difficulty encountered was the inability of the teachers to interpret the course of study for the reason that they had no previous training in graded schools and, therefore, were wholly unfamiliar with the plan and scope of the course of study (15).

He predicted the exchange of the little red schoolhouse for the consolidated school. His successors retired from elective office, to carry out some of the policies he first advocated. After retiring from elective office, Devine served as superintendent of the state training school.

During this period of relative instability in the Office of Superintendent of Public Instruction, a group of young men began coming into the state. They were to have a marked effect on education in North Dakota for many years to come. We have already mentioned George A. McFarland, who arrived in Dakota Territory in April 1887 and became principal of the state normal school in Valley City in 1892. He was destined to serve North Dakota well for the rest of his life.

THE GOLDEN AGE

Walter Lincoln Stockwell was graduated from the University of Minnesota in 1889. He came to North Dakota as principal of the school at St. Thomas, and in 1892 he became superintendent of the city schools of Grafton, where he served until he was elected superintendent of public instruction in 1902. He chose for his deputy Edwin James Taylor, who had been superintendent of Grand Forks County. Taylor succeeded Stockwell in 1911 and continued in office until 1917. Bertha R. Palmer spoke of this period as the “Golden Age of Education” (16) in North Dakota.

The long period of continuity was sufficient to establish the school system of the state, and many of the policies initiated at that time continue to the present day.

Stockwell was noted for the zeal, youthful vigor, energy, and enthusiasm that always characterized his work. Over and beyond his educational duties, he was intensely interested in the development of the state and gave freely of his time, energy, and money for the building of the communities in which he lived. Largely through his efforts, the first Carnegie Library in North Dakota was established in Grafton. He was an outstanding leader in education, an eloquent and inspiring public speaker, and a progressive and forceful thinker. He was author of the law providing aid to schools secured from a statewide tax. The measure was a most progressive one at the time it was enacted, and it resulted in material improvements in those schools that met the requirements. Much was done during his administration to make the high school system more effective, including the appointment of the first high school inspector. He made a most valuable contribution to education by creating widespread favorable sentiment toward the public schools. After his retirement in 1911, Stockwell became grand secretary of the Masonic bodies of the state. In this office he continued to contribute his influence to the development of the public schools.

In January 1911, Stockwell was succeeded by Edwin James Taylor, who had served as deputy during the entire preceding administration. Taylor was well prepared to build on the gains already accomplished.

In 1890, two weeks after his graduation from St. Lawrence University, Taylor arrived at Grand Forks, North Dakota. It was his intention to seek admission to the North Dakota bar, and he accomplished this aim. It was frequently the custom of young would-be lawyers to teach school while preparing for the bar examinations. He followed that course and taught school at Emerado, North Dakota. The measure of the 20-year-old schoolmaster became apparent in the one-room country school. According to Chief Justice William L. Nuesle of the supreme court of North Dakota, Taylor was a strict disciplinarian and a stern taskmaster. When he left Emerado for Grand Forks, he took with him five boys from that one-room rural school whom he encouraged to enter the new state university. One became chief justice of the supreme court; another, John Hancock, had a successful career in Wall Street and became a benefactor of the university. The other three became president of Kentucky State Agricultural College, president of a bank, and a respected grain elevator superintendent.

When he was just past his twenty-second birthday, Taylor was elected county superintendent of the Grand Forks County schools. He himself became a benefactor of the struggling new university when he contributed a month’s pay to help keep the university alive as the Legislature had failed to appropriate sufficient funds. He inspected his schools on horseback, and once he had a narrow escape when caught in a blizzard.

Taylor and another Lawrentian, John Haig, for many years superintendent of schools of Ramsey County, were due to have great influence on education in North Dakota. As a youth, Haig had been injured by a horse and as a result had lost a leg. This did not affect his mobility or his fine sense of humor and marvelous personality. He once made the statement that he recognized the loss of his leg as a blessing of God, as he realized that he would never have had the opportunity to go to college had he been able-bodied and fit for work on the farm. When he visited Bismarck, he was invariably the overnight guest at the home of the state superintendent. Among their mutual interests from the time they were young men was the organization and building of an education association in North Dakota. Taylor became president of the new organization at the age of 25 (17).

What kinds of teachers were available in North Dakota prior to World War I? The reports of every state superintendent mentioned this problem and suggested remedies. Higher certification standards were advocated and
adopted. Salaries were raised, even though they remained pitifully small by present-day standards. Every superintendent cried for more and better teachers. This does not mean to imply that there were few good teachers in North Dakota. On the contrary, there were many excellent and devoted ones. In the one-room country school, the high-quality teacher was likely to be a farmer’s wife and the mother of one or more children. She usually had a reasonably good education, and her principal motivation was to see that her own children received the best possible education. Some superior teachers could be found, usually in the towns, who would compare favorably with the best found anywhere.

Shortly before World War I, county superintendents exchanged their horses and buggies for Model T Fords — the kind that had to be cranked. Mrs. Senner Nertrost Whipple, superintendent of Wells County from 1915 to 1922, recalled the Model T as a great time-saver and an improvement over the horse and buggy, although it did succumb to mud holes and sand dunes. Newspapers, old gunny sacks, and Sears-Roebuck catalogs usually exerted enough traction to jar it loose! She regularly visited 90 rural, 3 county consolidated, and a dozen small town schools in this manner.

Another big problem was enforcing rural school attendance, especially during the seeding and harvest seasons. Mrs. Whipple found one 9-year-old lad ploughing with a team of four horses. When his mother was asked about this, she replied: “Oh, that’s nothing, all he has to do is hold the lines, and he will have plenty of time to go to school!” School lunch programs were unknown. Once Mrs. Whipple surprised a gopher invading a lunch pail in the school entry!

In 1917, a commission was created to revise the school laws of North Dakota. The commission consisted of five members, one appointed by the governor and four by the legislature. The commission made its report and recommended repeal of almost all existing school laws. It drafted a comprehensive bill, which was passed by both Houses of the Legislature and approved by the Governor. The law became Chapter 266 of the Session Laws of 1911. The most pronounced change in the law was that governing the issuance of teachers’ certificates. A board of examiners was created which had full charge of the certification of teachers. The superintendent of public instruction was ex officio secretary (19).

Another important accomplishment of the legislative session of 1913 was the creation of a State Board of Education to consist of the president of the university, the president of the agricultural college, the superintendent of public instruction, a normal school principal, an industrial school principal, the high school inspector, the rural school inspector, a county superintendent of schools, and a male citizen of the state not engaged in educational work. This board took over the work of the high school board, the boards of management of the county agricultural and training schools, the board of examiners for teachers’ certificates, and the classification of rural, graded, consolidated, and high schools. During this period, the start was made toward consolidation of rural schools.

The advent of the Model T Ford gave a glimmer of the possibility of transporting pupils for considerable distances. As the roads of that day were poor, or sometimes almost nonexistent, little was accomplished. Nevertheless, the foundation was laid for rapid consolidation once school buses and good roads were available.

Cultural problems were enormous in North Dakota during the first part of the twentieth century. In 1910, with settlement practically completed, North Dakota had eight persons per square mile. The United States had 31 persons; the middle Atlantic states, 193; and Ohio, 117. In North Dakota, only 11 percent of the population lived in centers of 2,500 or more. The sparseness of population, living mostly on farms and in smaller villages, made difficult the support of churches, schools, libraries, and other social institutions. North Dakota needed these institutions, but the scarcity of people increased the per-capita cost. In North Dakota, as in all the semi-arid West, space itself became a social cost (21). Nevertheless, there were leaders who not only recognized the cost and were willing to pay it but were willing to sell their fellow citizens on the matter. The problem was aggravated by the large portion of first-generation immigrants from Europe. In 1910, more than 27 percent of North Dakota’s adult residents were foreign born. With their children (one or both parents foreign born), they made up 71 percent of the population. The remainder, except for about 6,000 Indians, were largely persons of older American stock. About 21 percent of North Dakota’s residents were Norwegian, 20 percent German (about half of them from Russia), 12 percent English and Celtic (Irish,
region decided to emigrate (23). Starting about 1874, the inhabitants of many of the German-Russian colonies emigrated to various parts of the world, the first of them moving to Kansas and later Nebraska. Later, considerable groups migrated to what is now North Dakota. The German-Russian groups had their own schools in Russia, and, in general, the people were determined to have schools and see that their children were not illiterate. This situation continued when the colonies migrated to the United States and to North Dakota in particular. Unfortunately, their schools too frequently were conducted in a German-Russian dialect into which a certain amount of English was absorbed—an almost impossible dialect developed.

The situation was delicate but had to be met head on. E. J. Taylor was not the man to shrink from the task. He found a good ally in Rt. Rev. Vincent Wehrle, a pioneer missionary priest, who became the first abbot of Assumption Abbey at Richardton, North Dakota, and later first bishop of Bismarck. Superintendent Taylor's insistence that only teachers qualified to teach standard English be employed met with some resistance but with ultimate success. The popular TV star and band leader Lawrence Welk is a product of one of the schools in which English superseded the German-Russian dialect.

The report of the state superintendent for the biennium ending in June 1912 has a joyous note. Optimism is evident. The new codification of school laws had become effective July 1, 1911. The board of examiners for certification of teachers had been hard at work, and the results of its labors seemed to be “beneficial in the extreme.” Consolidation of rural schools seemed around the corner. In the year ending June 30, 1911, there were 114 consolidated schools with an enrollment of about 19,668 pupils, with about 117,000 pupils enrolled in 4,732 one-room schools. During that year, 113 one-room schools had been done away with. Parts VIII and IX of the report consisted of some ninety pages of a special report on rural, graded, and consolidated schools. It was obviously prepared to sell members of the Legislature and responsible citizens on the benefits of consolidation. Little did Superintendent Taylor know that it would require half a century to accomplish his goal.

During the period from 1911 to 1916, inclusive, all school laws were revised, the attendance laws strengthened, qualifications of teachers increased, state aid to rural schools provided, a teachers retirement fund created, county agricultural and training schools organized, the election of county and state superintendents provided for on a non-party ballot, salaries of county superintendents and deputies increased, and the health of pupils safeguarded.

An important survey of the state educational institutions was made by the U.S. Commissioner of Education, who appointed three educators to do the work and published the report in a national bulletin which appeared in 1916.
At the close of 1916, the records of the office were up-to-date, and the files in excellent order. Unfortunately, most of them were destroyed when the capitol burned in December 1930.

\section*{WAR AND DEPRESSION}

In the fall of 1916, a political revolution occurred in North Dakota, when the nonpartisan league gained control of the state. Neil C. Macdonald, who had been the rural school inspector, was elected superintendent of public instruction. He offered as his major policy "equality of opportunity for all the children of the state to attend good schools."

Superintendent Macdonald was followed by two ladies, both of whom served long enough to define and put into effect substantial policies. Moreover, both ladies were in close accord regarding their policies, so the schools enjoyed another period of sustained leadership. Minnie Jean Nielson was elected superintendent of public instruction in 1918 and continued in office until January 1927. Miss Nielson had a strong, aggressive personality, an energetic and untiring physique, and a broad, far-reaching vision. She was a natural publicist, and during the years of her leadership "school was news."

The legislative session of 1919 created the State Board of Administration with five members: three on salary, to be appointed by the Governor, plus the commissioner of agriculture and the superintendent of public instruction as members ex officio. The new board superseded and took over the duties of three boards: the Board of Educational Examiners, in charge of certification; the Board of Regents, in charge of normal schools, colleges, and the university; and the Board of Control, in charge of penal and charitable institutions. The State Board of Administration also was designated as the State Board for Vocational Education by the Legislature, which enacted in 1919 an acceptance of the Smith-Hughes Vocational Education Act of 1917.

A measure was initiated at the primary election of June 1920 which returned to the superintendent of public instruction the preparation of the course of study and the certification of teachers. Moreover, it gave the superintendent charge of all high school examinations, which before 1919 had been directed by the president of the university.

Miss Nielson was followed by Bertha R. Palmer, who was elected in the fall of 1926 and took office in January 1927. Miss Palmer had become assistant superintendent of public instruction in 1919, so she was familiar with the policies and problems when she took office. She was well aware that the weak spot was the one-teacher school, where more than one-half of all the teachers in the state were employed and where more than one-half of all the children of legal school age attended. Much progress was made during her administration, which continued through 1932. Unfortunately, most of the records of her administration, as well as preceding ones, were lost in the fire of December 1930.

In 1916, Arthur E. Thompson, recently graduated from St. Olaf's College, Northfield, Minnesota, arrived in North Dakota to become superintendent of the city schools in Washburn. He was destined to have great influence on the schools of North Dakota. In 1917, he entered the Army and served about 18 months in France with the Rainbow Division. After the war, he returned to Washburn and resumed the position of city superintendent of schools from 1919 to 1922. In that year, he was elected McLean County superintendent, which office he held until he became state superintendent in January 1933.

Thompson's administration, from 1933 to 1946, covered a most difficult period (24). The drought in North Dakota and the Depression played havoc with the schools. Taxes were not being paid, and the Legislature was compelled to make severe budget cuts. Superintendent Thompson, at the request of the Governor, reduced his request drastically and later had difficulty in getting the Legislature to increase the budgets to their former size.

Among the special duties that fell to the new superintendent was participation in a new state capitol commission, where he rendered excellent service. The functional design of an architecturally beautiful capitol, which was constructed at minimum cost, is a lasting memorial to the members of this capitol commission.

For 14 months, Thompson also was a member of the Federal Economic Recovery Administration Committee, which met evenings and helped set up projects that would give relief where it was most needed. It was well that the superintendent was a member of this committee, for many school districts would not have been able to operate had federal funds not been made available to them. The situation was particularly acute in September 1934, when many telephone calls came to the desk of the superintendent requesting information concerning what school districts should do when there were no funds to pay teachers or otherwise operate the schools. Characteristically, Mr. Thompson always answered, "Open anyway." He did not know how funds would be obtained, but he succeeded in getting sufficient federal funds to keep the schools going. The permanent state school fund, even in the depth of the Depression, yielded over a million dollars per year for distribution on the basis of the school census.

Perhaps the outstanding accomplishment of Superintendent Thompson, legislative or otherwise, was the establishment of the state school equalization fund, which he designed to help distressed school districts. The concept of a state fund to give state aid and equalize aid to districts gradually developed. Support for this idea was given by members of the education association, the parent-teacher association, and the Department of Public Instruction. When it was proposed to Governor Moses, who was ill at the time, he promised his support and did help. The basic
principle was to finance the school fund with a sales tax. The law was passed by the 1933 session of the Legislature. While the amount first allocated was inadequate, it was the basis for support of the needier schools. The Sales Tax Law of 1933 was referred to the voters and defeated. Nevertheless, the idea remained. In 1935, efforts again were made to set up the fund. The sales tax was again referred, and this time upheld by the people. The principal argument by its proponents was that the sales tax would replace local taxes.

The 1935 Equalization Act proved a success. Certain emergency features in the original law were changed when prosperity returned to North Dakota. Ever since that time, equalization has been a major feature of the educational structure of the state. It has kept many schools in operation and maintained others above minimum program status.

Around 1942, a teacher shortage developed, which was met by calling back to the classroom many retired teachers and by an intensive recruitment program to induce high school graduates to go into the teaching profession.

Throughout his entire time in office, Thompson had acute political problems, all of which he handled skillfully and to the advantage of the schools of North Dakota. But for his wise leadership, the situation might have become chaotic. His ability to get along with people was well illustrated by the fact that, despite heavily divided political opinions in the state, he was regularly reelected. He was unopposed for reelection in 1946 but chose to resign from office in order to campaign for the office of U.S. Senator.

As previously mentioned, the legislative session of 1919 had enacted a law creating the State Board of Administration. At the state primary election held in June 1938, a constitutional amendment, known as Article 54, was approved, establishing a State Board of Higher Education, with seven members appointed by the Governor and confirmed by the Senate. The Governor must appoint from a list of names submitted by a committee consisting of the president of the education association, the chief justice of the State Supreme Court, and the superintendent of public instruction. Should the Governor not approve any of the names submitted, he has the right to request the committee to submit additional names. Other than this, the superintendent of public instruction has no control over the state institutions of higher learning. The board appoints its own commissioner and operates separately from the Office of the Superintendent of Public Instruction.

**POST-WORLD WAR II**

In September 1946, Governor Aandahl appointed Garfield B. Nordrum superintendent of public instruction to succeed Thompson. Nordrum had been director of the equalization fund in the Department of Public Instruction from 1942, and in 1946 he had been promoted to deputy superintendent. Thus, it was felt, there would be a continuity of policy provided Nordrum was elected at the impending statewide election. Because of the late resignation, no names were printed on the no-party ballot. This was the first and only state "sticker" election held in North Dakota.

Nordrum was chosen by the people from several candidates and reelected in 1948 and in 1950. In spite of the many immediate postwar problems with which he had to cope — a teacher shortage, new building construction, and school finance — his administration was a progressive one. He secured passage of the countywide 10-mill levy law, which provided assistance in financing public elementary education. In 1949, high school tuition payments were extended to include all students in high school. To assist in the recruitment of qualified teachers, a state scholarship law was enacted. Other important laws included a school building code, provision for permanent school building funds, and one which provided for reorganization of school districts so as to increase the tax base. Superintendent Nordrum recognized the need and the state's responsibility for the education of handicapped children. He was tireless in promoting legislation that provided for special education for exceptional children, which was enacted into law by the 1951 Legislature.

In order to force reorganization of school districts, the 1947 Legislature set up a special Committee on School District Reorganization, which was intended to hurry the abolition of the one-room country school (25). However, the committee moved too fast, and opposition developed. In 1951, the Legislature abolished the committee and placed the responsibility for reorganization in the hands of the state superintendent, setting certain requirements that made the task more difficult. However, reorganization went forward, and today the one-room rural school is a thing of the past in North Dakota except in a few isolated places.

In January 1951, Nordrum resigned to accept a position as chief of party, responsible jointly to the Institute of Inter-American Affairs and to the Diplomatic Mission of the Department of State. Governor Norman Brunsdale appointed M. F. Peterson, who had been deputy state superintendent from July 1947. He continues in office to the present time — 1968. Thus, another long period of continuity of general policy came about.

The first problem confronting the new state superintendent was that of legislation, as he came into office at the beginning of the 1951 session of the Legislature. Several important laws for improvement of public education in North Dakota were passed by that Legislature. Two are referred to above. The county tuition fund law was amended to provide payments to small schools employing two, three, or four elementary teachers.

For many years, school districts located on the borders of the state that offered no school facilities or high schools had been a pressing problem. The Legislature authorized reciprocity between North Dakota and its three
The bill allowed the state superintendent to enter into reciprocal tuition agreements, a plan that has worked quite satisfactorily. The Legislature levied a countywide tax of 1 mill to establish a county equalization fund for high schools, and this tax was increased by the 1953 Legislature. This law has been of great value in equalizing the support of high school education. The same Legislature also amended the county tuition law so that school districts which closed their schools and made agreements with neighboring districts for the attendance of their pupils and also provided transportation for these pupils to the neighboring schools would receive the same amount of money from the tuition fund that they would receive if their schools were in operation. This has been an important factor in closing inefficient and uneconomical schools. Another step forward that year was the elimination of the second-grade elementary certificate.

The 1955 legislative session took action to correct some of the problems created by the growing complexities of scope and function posed by the State Board of Administration. It created a State Board of Public School Education, consisting of the Governor as chairman, the attorney general, the state superintendent of public instruction, a member to be selected by the North Dakota Education Association, and a member to be selected by the North Dakota School Officers Association. The state superintendent of public instruction was designated by the law as the executive director and secretary of the board. The State Board of Public School Education was designated as the State Board for Vocational Education and given responsibility for all federal-state programs of vocational education and vocational rehabilitation. It also took over the functions of the state board of equalization, the emergency fund board, the board for school district reorganization, the state board of teaching scholarships, the advisory council on special education, the state school construction fund, and other elementary and secondary education funds. It assumed responsibility for the high school correspondence division, which had been operating under the higher education board.

SPECIAL PROGRAMS

Vocational Education

The report of the superintendent of public instruction dated November 1, 1912, stated that agricultural education was receiving a good deal of attention and was being emphasized throughout the state. The superintendent expected that in the election to be held a few days later several counties would take action regarding establishment of county agricultural training schools under provisions of Chapter 265, Session Laws of 1911. He further stated that the state high school board, acting under the provisions of Chapter 40, Session Laws of 1911, had designated five high schools as agricultural high schools. It was noted that all first-class high schools were offering manual training and domestic science and most of them agriculture. He felt that the state would greatly benefit from this teaching if properly done and the pupils taught the dignity of work. However, county agricultural schools did not develop as had been anticipated, and the 1966 report of the superintendent of public instruction indicates that only the Walsh County school still exists.

The 1955 legislative session created the State Board of Public School Education and further designated it as the State Board for Vocational Education to administer all reimbursable vocational education in North Dakota. This program has been developed in conformity with the provisions of the Smith-Hughes Act, the George-Barden Act, and the Vocational Education Act of 1963. It is designed to promote and develop vocational education programs for persons of all ages and in all parts of the state. By 1966, the vocational agriculture program in North Dakota had grown to 4,456 pupils enrolled in 65 schools. The same year, 13,291 were enrolled in various home economics programs and 2,077 in other programs.

Indian Education

Since 1868, all schools legally have been equally free and accessible to all children. The integration of Negro children has never been a problem in North Dakota, and Indian children always have been accepted. Although the education of Indian children was long considered a "federal problem," this should not be construed to mean that Indian children were ever excluded from the public schools of North Dakota. Statistics regarding Indian schools first appeared in the report of the superintendent of public instruction in 1940. They indicated that 2,150 pupils, both day and boarding, were enrolled in federal schools in North Dakota and that 228 tuition-paid Indian children were in the public schools during the 1939-40 fiscal year. Reports after 1940 contain increasing amounts of valuable data, including tribes represented and degrees of Indian blood. From names given, it is apparent that some Indian teachers were being used.

The Johnson-O'Malley Act of 1936 marked the beginning of a new policy in Indian education. The superintendent of public instruction's report of 1954 mentioned that receipts from Johnson-O'Malley funds equaled only 40 percent of the average cost per pupil. It also mentioned that despite overcrowding, communities in the neighborhood of Indian reservations deserved commendation for their acceptance of these pupils into their schools and communities. The report for the biennium ending June 30, 1962, indicates that 20 to 30 percent fewer Indian pupils graduated from high school than non-Indian pupils. It was
believed that special guidance would partially alleviate this problem. Only a year later, the director of Indian education reported that integration of Indians in the public schools was proving beneficial to all concerned. He cited the attendance of Lucky Mound pupils at Parshall as an example and stated that use of Johnson-O'Malley funds for the guidance program at the Maddock High School had proven beneficial. However, he mentioned that failure of Indian students to receive proper training for job placement was the greatest problem on our Indian reservations.

RECENT YEARS

This seems a good point to summarize the evolution of the administration of the educational system of North Dakota since statehood.

The first state educational institutions to be organized were the university, the agricultural college (now North Dakota State University), and two normal schools, one at Valley City and the other at Mayville. Both of the latter are now 4-year state colleges. Each institution had its own board of trustees. The boards of the two normal schools met jointly once a year, under the chairmanship of the state superintendent of public instruction, for formal ratification of faculty appointments.

In 1891, Webster Merrifield, who had just become president of the University of North Dakota, called a conference of high school men (26) to consider organizing a state high school system. This conference resulted in a system of high school examinations to be conducted by the university and a determination to secure legislation regarding the high school system. In 1895, the Legislature created a state high school board with power to classify schools. The first appropriation for state aid to high schools was made in 1899 and increased by succeeding Legislatures until the establishment of the equalization fund in 1935.

The 1911 legislative session created two state boards: the State Board for Normal Schools and the State Board of Examiners, with the state superintendent as president. The latter was charged with the duty of examination and certification of teachers. The same Legislature changed the personnel of the already existing high school board, replacing the Governor with the president of the agricultural college. Changes followed rapidly. The State Board of Education, which embodied both the board of examiners and the high school board, was set up in 1913, with the superintendent of public instruction as president. The State Board of Administration, established in 1919, took over the administrative duties of the three existing boards. Reference has already been made to this powerful board. When the Smith-Hughes vocational education act became effective, the State Board of Administration also became the State Board for Vocational Education.

At the primary election held in June 1938, a constitutional amendment was approved establishing a State Board of Higher Education. The 1939 legislative session enacted a bill into law placing the administration of the extension division under the higher education board, designating it as the State Board for Vocational Education.

In 1955, the Legislature established virtually what existed prior to the enactment of the State Board of Administration Law. It set up a State Board of Public School Education which, with the Board of Higher Education and the Board of Administration, seemed a logical division of responsibilities. This organization, with certain modifications to be discussed below, remains to the present day.

As mentioned above, M. F. Peterson became state superintendent in 1951 and continues in office today, having served longer than any of his predecessors. Superintendent Peterson is well prepared for the position. His undergraduate training was received at Concordia College, with graduate work at the University of North Dakota. Prior to becoming deputy state superintendent in 1947, he was teacher, principal, and city superintendent.

Due to Mr. Peterson's work, the 1959 Legislature increased requirements for and stabilized accreditation of high schools. The same Legislature also enacted a far-reaching bill setting up a state foundation program for financing public elementary and secondary schools, repealing the former equalization levy. More important legislation followed. In 1963, the Legislature changed the personnel of the Board of Public School Education, which also continued to serve as the vocational education and vocational rehabilitation boards. The Legislature prescribed that the board should consist of seven members, six of whom were to be appointed by the Governor for 6-year terms, one from each of the judicial districts of the state. The seventh member is the superintendent of public instruction, who is ex officio director and secretary of the board. He is a voting member of the board (27).

The people of North Dakota expressed their confidence in the state school administration by adopting in 1964 a constitutional amendment increasing the terms of the state and county superintendents to 4 years. In 1965, another milestone was achieved when the Legislature decreed that after July 1, 1969, no teacher certificates will be issued to anyone with less than 4 years of college education. All certificates will be first-grade but will be divided as to elementary or high school, and the high school certificates will specify the field.

There is little question that this law will present problems, but they promise to be the problems of growth and progress. Help will come from the North Dakota School Boards Association (28) and the North Dakota Council on Education, two fine organizations which have been in existence for many years. The association, which has been active for over 42 years, was given official recognition in 1967.
The council, with over 22 years of service to North Dakota, is composed of interested professionals and laymen and offers a splendid channel for communication between schoolmen and the public.

This account closes on an optimistic note. In 1966, the Council of Chief State School Officers chose Superintendent M. F. Peterson as its 1967-68 president, the first North Dakotan to hold that office. Growth continues on all fronts. Funds to support a statewide study, evaluation, and plan for educational development for North Dakota from 1967 to 1975 were provided by the Legislature, by the federal government under provisions of Title V, Elementary and Secondary Education Act of 1965, and by the University of North Dakota. The study was made by a staff under the leadership of Kent G. Alm, and a preliminary report or “Overview” was recently published. The “Overview” sounds a bugle call for dramatic improvements in education in North Dakota over the next 8 years. The cost seems within reasonable expectations. North Dakota is still marching forward.

FOOTNOTES

3. Métis refers to a person of mixed blood, especially French and North-American Indian.
4. The Red River of the North flows northward toward Winnipeg, Manitoba.
6. There were revisions and changes to the above mentioned law by the Territorial Legislature in 1866, 1867, 1869, 1877, 1879, and 1881.
10. After leaving the Department of Public Instruction, Beadle served as president of the state normal school at Madison, South Dakota. He died in 1915. A statue of him stands in the capitol at Pierre, South Dakota.
14. Ibid., p. 25. The words one language had real meaning for North Dakotans in those days.
17. John Ogden was the organizing chairman. Homer B. Sprague was the first president. Other early leaders included William Mitchell, M. A. Shirley, A. L. Woods, J. M. Devine, George McFarland, and Joseph Kennedy.
19. The ex officio members were Andrew Miller, attorney general, and E. J. Taylor, then deputy superintendent of public instruction. Governor John Burke appointed Dean Joseph Kennedy of the School of Education of the University of North Dakota, Dean Arland D. Weeks of the School of Education of the State Agricultural College, and Professor R. M. Black, a member of the faculty of the State School of Science.
20. Appointed members of the first Board of Examiners included Dean Kennedy, Professor Black, Superintendent W. E. Hoover of Fargo, and Superintendent P. S. Berg of Dickinson.
22. Ibid., p. 287.
24. The school population (ages 6 to 21) of North Dakota reached an all-time high of 224,169 in 1932. It fell until 1948, when it approximately equaled that of 1911. Since 1948, it has climbed steadily.

25. The members of the special committee included S. E. Halpern, chairman; Carl C. Swain, president, Minot State College; Mrs. Oliver Nelson; Harley R. Swanson; A. C. Van Wyk; Arthur H. White; and Superintendent G. B. Nordrum, ex officio member and secretary. The committee employed T. S. Grimrud, superintendent of the Lisbon city schools, as director.
26. Among those present were Superintendent W. L. Stockwell of Grafton, Superintendent Darius Stewart of Fargo, County Superintendent Joseph Kennedy of Trail, and Mrs. Mattie Davis, principal at Casselton.
27. In 1967, the State Board of Public School Education was split into two boards: the State Board of Public School Education, and the State Board for Vocational Education. The superintendent of public instruction is ex officio secretary of both boards. The board members are appointed by the Governor from three
recommendations submitted by a committee consisting of the president of the North Dakota Education Association, the president of the North Dakota School Boards Association, and the president of the North Dakota Bar Association. The Governor may request the committee to submit additional names if none submitted are satisfactory to him. At the present time (1968), the same persons are members of both boards. Both these boards must meet at least once a year with the State Board of Higher Education.

28. D. B. Allen, for many years secretary of the North Dakota School Boards Association, is spoken of as being the "father" of the organization. He was recognized as the 1967 "Layman of the Year" by the North Dakota Council on Education.

Superintendent of Public Instruction

   Deputy Superintendent

   Director of School Lunch

   Director of Surplus Property

   Director of Certification

   Director of Secondary Education

   Director of Equalization Fund

   Director of Examinations

   Director of Special Education
INTRODUCTION

Ohio was admitted to statehood on February 19, 1803 (1), and was, thus, the first state to be admitted to the Union from the Northwest Territory and the first state to which the grant of section 16 for school purposes was made. In its early statehood, Ohio was a frontier community, settled by a class of people who were compelled to be self-reliant and to solve their own problems, educational as well as others. It was a heavily timbered area, where means of communication were lacking or extremely difficult at best. Because of these natural conditions, it would have been a difficult task to establish any general system of control or supervision over education in the early period even if there had been a wholehearted desire to do so.

By the time means of communication had become simplified through a system of public roads and canals, the people had become accustomed to attending to their own educational needs and were somewhat resentful toward any outside influences or suggestions. Furthermore, the settlers in Ohio had no common educational background. They came from New England, from Virginia, Maryland, and Kentucky, and, in fact, from nearly all of the older states (2).

From the very first, the traditions of Ohio were against centralization or consolidation of power or authority. The first State Constitution was formed soon after the bitter political struggle between Jefferson and Adams and at a time when the arbitrary domination of the Territorial Governor, Arthur St. Clair, had prejudiced the people against centralized executive power. Nowhere was this prejudice against centralized administration better illustrated than in the field of educational legislation.

The tendency, during this early period of Ohio history, was to depend largely on local initiative and control. The encouragement of public education by legislative provisions as specified in the constitution was interpreted by the Legislature to mean the passing of a large number of acts to meet the special needs or desires of particular districts, or, even in the case of school lands, the desires of certain individuals. The general laws passed at that time may be said to have pointed out methods of organization and control instead of devising any efficient system of supervision or of inflicting any penalties in order to bring about specific educational results. They were largely permissive in nature, often leaving the initiative to the discretion of the local communities. In its customs and ideals, each area reflected the current thought and practice of that part of the country from which its settlers came. In no field was this more evident than that of education.

After Ohio was admitted as a state, its population increased with astonishing rapidity. In the years from 1810 to 1840, the transformation from a thickly wooded frontier to a settled farming community had largely taken place. The following census figures from 1800 to 1850 give some idea of this transformation (3):

The state was divided into a number of separate tracts such as the Western Reserve, the Ohio Company's Purchase, the Symmes Purchase, the Virginia Military Lands, and the U.S. Military Lands. The early settlements in these sections usually were made up of people who came into the wilderness together from one or another of the older states of the Union.

The Ohio Company's Purchase and the Western Reserve were, at first, largely settled by colonists from New England. Marietta, dating from 1787, and Cleveland, from 1796, were respective centers of influence in these two separate areas.

Three colonies were established in the Symmes Purchase in 1788: the one at Losantiville, later rechristened "Cincinnati" by Governor St. Clair, was destined to be, in many ways, a leader for the entire state as well as for the Miami Valley. Many of the early settlers here, as at Marietta, had seen service in the Revolutionary War. Although
the early settlers came from many localities, men from New Jersey figured quite prominently, aided by settlers from several other middle states. Later, there were many settlers from Virginia, Maryland, Pennsylvania, New York, and New England.

The Virginia Military Lands section, located between the Little Miami and the Scioto Rivers, received its first settlers from Virginia and the South. General Nathaniel Massie and Duncan McArthur founded Chillicothe, on the Scioto River, in 1796, the first colony on this tract.

On the eastern ridge of the state, south of the Western Reserve, the first settlers were largely from Pennsylvania. Many were of German stock, with a considerable number of Scotch, Irish, and Scotch-Irish.

The U.S. Military Lands seem to have had no homogeneous group, but drew settlers from practically all of the older states. There was also a considerable settlement of French at Gallipolis and a sprinkling of French all along the Ohio River. From 1830, there was considerable German influence from the influx of German immigrants that had begun at about that time (4).

As these data suggest, attempts to establish a state system of public education encountered many problems in the early days of Ohio history. There was no agreement as to the means of financing any general system of education, nor, indeed, any real agreement as to the need for such a system at all. The educational traditions were quite different in different portions of the state.

The first state superintendent, Samuel Lewis, stated in his second annual report in 1838: "The people have not heretofore followed any particular system. The directors of each district have done that which was right in their own eyes, and generally adopted, as far as they could, the particular system of the state from which they came" (5).

Those from the South brought with them the traditions of the private school and parental responsibility for education. The New England settlers brought the idea of a public school system with taxation and public control, but unfortunately for Ohio's subsequent educational history, the New England migration came at a period when the public school sentiment in Massachusetts and other New England states was at a comparatively low ebb, and when the decentralization tendency that gave Massachusetts the district school legislation of 1789 was at its time of greatest influence.

The New England settlers in Ohio favored the public school idea, but the district system with which they were familiar was a highly decentralized one. The common school (locally supported and controlled), as a district school, and the academy, as the secondary school, were two fundamental concepts in the minds of practically all of those who were active in securing Ohio's early school legislation.

Prior to 1825, support of public education in the rural areas of Ohio depended largely on the proceeds from land grants, such as section 16 and section 29 in each township.

A broad indifference to education prevailed in many sections of the state. Apparently, it was often considered educationally sufficient for a boy to be able to write, to read the Bible or an almanac, and to calculate the value of a load of hay or other farm produce involved in common financial transactions. Indeed, many people believed that an education tended to destroy a boy's capacity for manual labor and that a girl did not need to learn to write.

Before canal transportation opened a market for farm produce, it was difficult for families to earn a living, and the development of brawn appeared to be more important than the acquiring of knowledge.

In 1879, the first school was established at Belpre. It was operated in a log cabin, which an ancestor of one of the founders of the Battelle Memorial Institute donated for the purpose. In most places, a church or an abandoned log hut was considered adequate for a school building. Ink was made at home from oak bark or poke berries, pens were made of quills, and textbooks were sewed from linen thread. At best, the school term was short and the schools primitive.

The first schoolhouse in Ohio was built at Columbia, now Cincinnati, and supported by subscriptions, as were most other schools of this period. Because subscriptions for educational purposes were generally quite meager, the Ohio Company added $160 to implement the funds to provide instruction for children at Marietta, Belpre, and Waterford.

EDUCATION PRIOR TO 1906

The recognition in Ohio that public education is a state function and responsibility developed through the influence of the Ordinance of 1785, the Ordinance of 1787, the Constitution of the United States, and the Ohio Constitution.

Ordinance of 1785

The Ordinance of 1785 was known as the ordinance "for ascertaining the mode of disposing of lands in the Western territory" (6). It reserved section 16 in each township "for the maintenance of public schools within the said township." This provision was the inception of the rule for the reservation of certain sections of land for school purposes. This grant set aside for the use of the schools an amount of land equal to one square mile or 640 acres for each surveyed township of 36 square miles.

The first action in accord with this provision occurred when Manasseh Cutler, an agent for the Ohio Company, completed the bargain for the lands acquired by the company at the mouth of the Muskingum River (7). Not only did Cutler obtain a reaffirmation of the provision for the grant of section 16 for school purposes, but, in addition, he
obtained a grant of section 29 in each township for the support of religion and also an added grant of two sections for the support of a university. It was this bargain of the Ohio Company that put into actual operation the provisions of the Ordinance of 1785 concerning school lands. This was followed immediately by the Symmes Purchase between the Miami Rivers, and both sections 16 and 29 were similarly reserved.

These statewide grants directed the attention of settlers in all parts of the state and from all parts of the United States to the purpose for which the grants were made, namely, the operation of schools.

It was evidently the original opinion of many of the settlers in Ohio, and, perhaps, even the design of Congress, that these land grants, if properly managed, would support public schools without a tax on the citizens. It soon became evident, however, that this one source of income would be inadequate.

**Ordinance of 1787**

The Ordinance of 1787 for the Northwest Territory stated that religion, morality, and knowledge, necessary for good government and the happiness of mankind, and schools and the means of education should forever be encouraged. However, the financial encouragement offered at that time consisted of reserving one section—namely, section 16—out of each township in the Northwest Territory, the proceeds from the lease or sale of these lands to be used for the maintenance of public schools.

Although the early Governors congratulated the state on this provision which had been made for the "encouragement" of schools, it soon became evident that funds in amounts sufficient to operate the schools could not be derived from the proceeds of school lands alone and that the granting of lands for purposes of education was therefore not sufficient encouragement to guarantee "good government and the happiness of mankind."

Having thus encouraged education in the Northwest Territory, Congress left to the territories and to the states the tremendous task of actually providing schools. However, the early pioneers were too busy clearing the land and building homes to give much serious attention to establishing schools. Meanwhile, the estate of the schools as provided by the Ordinance of 1785 was gradually becoming dissipated. Much of the land was being sold at a figure considerably below its true value, and, consequently, much less was being derived from the sale of lands than what had originally been expected.

**The Constitution of the United States**

Public education as such is not mentioned in the Constitution of the United States. However, Ohio, like other states, received its authority and responsibility for supporting public education through the enactment of the Tenth Amendment to the U.S. Constitution. This amendment states that the powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively or to the people.

Therefore, public education in Ohio may be considered as one of these powers reserved to the states. Consequently, public education in the governmental structure is essentially a matter of state responsibility. Provision for public education is now contained in the constitution of all of the states.

**The Ohio Constitution**

The constitution adopted in 1802, when Ohio became a state, remained in force until 1851. It made no specific provisions for education, but, following the pattern established by the Ordinance of 1787, stated that—

"Religion, morality, and knowledge, however, being essential to good government, it shall be the duty of the General Assembly to pass suitable laws to protect every religious denomination in the peaceful enjoyment of its own mode of public worship, and to encourage schools and the means of education (§).

Also, the Constitution of 1802 contained the following provision:

No law shall be passed to prevent the boards in the several counties and townships within this state from an equal participation in the schools, academies, colleges, and universities within this state which are endowed in whole or in part from the revenue arising from the donations made by the United States for the support of schools and colleges; all doors of said schools, academies and universities shall be opened for the reception of scholars, students and teachers of every accord, without any distinction or preference whatever contrary to the intent for which said donations remain (§).

Further constitutional provisions for education required that the principal of all funds granted or entrusted to the state for educational and religious purposes should forever be preserved inviolate and undiminished; and the income arising therefrom should be applied to the specific objects of the original grants or appropriations. It also stated that no religious or other sect or sects should ever have any exclusive right to, or control of, any part of the state's school funds.

Sections 3 and 4 of Article VI of the Ohio constitution, adopted September 3, 1912, stated:

Provision shall be made by law for the organization, administration and control of the public school system of the state supported by public funds; provided that each school district embraced wholly or in part within any city shall have the power of referendum vote to
determine for itself the number of members and the organization of the district board of education, and provision shall be made by law for the exercise of this power by such school districts.

A superintendent of public instruction to replace the state commissioner of common schools shall be included as one of the officers of the executive department to be appointed by the Governor, for a term of 4 years, with the power and duties now exercised by the state commissioner of common schools until otherwise provided by law, and with such other powers as may be provided by law (10).

Inasmuch as the Constitution of Ohio makes it a state duty and responsibility to establish and maintain a system of common schools, education is a matter of state concern, and the system of public education in Ohio is the creature of both the State Constitution and statutory laws (11).

The policy of the Ohio Legislature and of the state from the beginning of its existence under the first constitution has been to encourage schools and to foster education in every reasonable way. Also, insofar as the laws do not conflict with the constitution, the courts have no responsibility or authority to question legislative wisdom or policy relating to the management and control of the school system. The courts are limited to interpreting the provisions and enforcement of such laws that may conflict with the constitution (12).

Early Legislation in Ohio

The first legislation concerning schools involved efforts to work out a method of handling the school lands, and during Ohio's early statehood these efforts remained one of the most persistent incentives to educational legislation and a constant reminder of the need for a state school system.

The first general school act for Ohio, which was passed in January 1821 (13), did little more than legalize means by which the settlers in the townships could lay off districts and establish schools. It made no provision for taxation and organized no definite system. It was, however, important as the first recognition by the state of a system of common schools. Since the Law of 1821 was obviously inadequate and ineffective, a campaign was immediately launched for a more effective law.

The Legislature appointed a committee of five to investigate the schools and school lands, but problems of hegemony with the trustees of the school lands prevented the committee from being very effective. However, the committee's recommendation to the Governor that seven commissioners be appointed, charged with the duty to "devise a system of law for the support and regulation of common schools" (14), resulted in the first active steps toward state regulation of education. These seven commissioners, through the media of addresses, pamphlets, and the press, awakened public interest in the financial support of schools. The Legislature of 1825 enacted a compulsory county tax levy of 0.5 mill, the first state legislation designed to improve the common schools. This tax was raised to 0.75 mill in 1829, 1 mill in 1834, and to 2 mills in 1838. It was reduced to 0.4 mill in 1847.

In 1827, the principle of using fines for the support of schools first appears. These fines were assessed for various offenses, such as allowing Canada thistles to mature, keeping a breasty or unruly animal, engaging in medical malpractice of various kinds, or disregarding court orders in quo warranto procedure.

Following the Act of 1824, the law underwent numerous modifications and amendments, but the system of administration remained essentially unchanged until 1838. The Law of 1824 had made no provision for centralized control and had created no adequate machinery for uniting into a true state system the various schools and school districts already established. There were no state, county, or township supervision; little actual knowledge; and no control of what various communities were doing educationally. While the law had established the fundamental principle of taxation for schools, the actual system remained disjointed, decentralized, and ineffective.

The first suggestion for reform came from the friends of education in Cincinnati. A group of teachers and other earnest advocates of popular education had organized a voluntary organization known as the College of Teachers or Western Academic Institute. Partly as a result of a demand from this group for a better organization, a bill was introduced in 1837 to create the Office of State Superintendent of Common Schools. It met with determined opposition but finally passed the House by a vote of 35 to 34 and became a law in March of that same year when the Senate cast a decisive vote in its favor.

The movement for a state department of education and a state superintendent had grown rapidly after 1824 and culminated in 1837 when, by a joint resolution of both Houses of the General Assembly, Samuel Lewis of Cincinnati was elected as the first superintendent of common schools in Ohio and was commissioned by the Governor. Ohio thus became the seventh state in the Union to make provision for a chief state school official.

The duties of the first state superintendent in Ohio were mostly clerical in nature and subordinated to the Office of the Secretary of State. Statistics concerning the schools were to be gathered and submitted to the Legislature with suggestions for the betterment of the schools within the framework of existing funds (15).

The same Law of 1837 provided for a township superintendent of common schools, who was to be the township clerk, and a county superintendent of common schools, who was to be the county auditor. The duties of each were clerical only, rather than administrative and regulatory. At least, the schools of the state were now more
closely linked through the offices of township, county, and state superintendents than ever before.

The Law of 1838 was a direct result of the work of Samuel Lewis during his first year as state superintendent and his report of the needs and conditions of the schools as he saw them while touring the state, visiting the schools, and addressing meetings, in an attempt to arouse people to an active interest in the need for better school conditions. In this work, he visited more than 300 schools, traveling on horseback over 1,200 miles over the rough country roads, visiting schools by day, addressing public meetings by night, and everywhere preaching the gospel of a better school system and a free education for every Ohio boy and girl.

His report for the year 1837, based on his own observations and such statistics as he could gather from the county auditors, gave the first assembled information about the common schools of the state. The report found the Legislature in a receptive mood, and the Law of 1838 was passed with but little opposition.

The essential feature of this new law was that it was the first one to give a degree of organization and some headship to the system. The new code not only retained the state superintendent of common schools office but made it a “permanent” office. The Act of 1837 had created the office but had done nothing to change the other school laws or to establish any machinery of administration. The new law made the county auditor in each county also the county superintendent of schools and, as such, responsible to the state superintendent of common schools in all educational affairs. Similarly, the township clerk was made the township superintendent of schools in each township, subordinate to the county superintendent.

An organization had thus been effected, by means of which an authorized state officer could reach out into the most remote district of the state, either to give help or information or to see that the law was obeyed. If equipped with sufficient assistance through a department of education, Ohio, through this law, had the mechanism for effective educational administration.

The real strength of the system rested in the person of the state superintendent. Mr. Lewis filled the office for 3 years and, in those 3 years, did the same kind of work for Ohio that Horace Mann had been doing in Massachusetts. Unfortunately for Ohio, and its subsequent educational history, Mr. Lewis, because of failing health, gave up the office after 3 years of tireless service. Because some opposition had developed, the Legislature transferred the work to the Office of the Secretary of State. This office was given $400 additional for clerical assistance, and the work became almost entirely the collection of statistics and making reports, instead of the administration of a statewide school system.

Permanency in the area of political life and political enactments is often impossible. The Office of State Superintendent of Common Schools created “permanently” by the Act of 1838 was abolished by another act and by another General Assembly in 1840. Apparently, the action was taken to effect a savings of $800 in the superintendent’s salary. The secretary of state was made ex officio superintendent. In an amendment to this latter act, the title of “township clerk” was substituted for that of township superintendent, and “county auditor” was substituted for county superintendent. Duties, clerical in nature, were changed only slightly, and some semblance of the connections among the township, the county, and the ex officio superintendent continued to be maintained (16).

The general educational legislation passed between 1840 and 1850 was concerned only with the district school. No general legislation was enacted to establish secondary or higher education institutions as a part of the state system, and it was not until 1847 that any legislation was passed to make provision for town and city schools and a graded school system other than that found in a few special town and city charters. The Akron Act was passed in 1847, and in 1849 the provisions of this act were extended to all municipalities having 200 or more inhabitants.

In 1850, the Legislature passed another act which again created the office of state superintendent, but in an entirely different form than the former law. This law never actually became operative because the General Assembly, which was the appointing body, allowed it to lapse through its failure to appoint the officers provided for in the law.

Briefly, this law provided for a State Board of Public Instruction consisting of five members, appointed by the General Assembly. The first members were to be appointed for terms from 1 to 5 years. After that, one member was to be appointed each year for a 5-year term. Each member, during the last year of his term, was to receive the title of state superintendent of common schools and was to perform the duties of that office. The duties were limited mainly to the collection of statistics and making reports. The board was to divide the state into four districts, and each member would serve as a district superintendent in one of these districts. The salary of each district superintendent was to be $1,000, and the salary of the state superintendent was to be $1,200.

However, this law never came into effect because the General Assembly passed an act providing for “the reorganization, supervision, and maintenance of common schools” (17).

This law reestablished the office of state superintendent but changed the title to state commissioner of common schools. The provisions of this law served as the basis for the regulation of the public schools of Ohio for nearly 50 years.

While public education in Ohio has always been considered the responsibility of the state, the abdication of this responsibility by the state to the local schools and school districts in the early 1800's resulted in a slow growth in state responsibility and administration of its schools. It was
not until about 1861 that the growing power, authority, and responsibility of the state began to be apparent. The acts and laws—however ineffective—passed by the Legislature from 1861 to 1900 portray the evolution of state responsibility for administration of the education of youth and the regulation of the schools.

An act which was indicative of the developing authority of the state commissioner was one passed in 1861 that required the officers of the teachers institutes to furnish the state commissioner of common schools an account of the money received, from what sources it came, and how it was expended.

An Act of 1865 requested the commissioner to gather information concerning "the organization and results of the best normal school in this country, and the probable cost of establishing one or more efficient normal schools in this state." (18)

The Law of 1873 required a codification of the school laws relating to the commissioner of common schools. A summation of the powers and duties of the state commissioner of common schools indicates that even though many clerical duties still remained, these aspects were slowly changing to that of power, influence, and prestige. (19)

The commissioner was required by law to furnish forms for the reports of boards of education, and these boards were required to report to him on demand. Probate judges and clerks of city and county boards were required to make reports to him, as were officers of seminaries, academies, and private schools. The commissioner was required to publish and distribute copies of the school laws to school officials and to make an annual report to the Governor and to the General Assembly. He was mandated to be a member of the State Geological Board, now known as the Ohio Archaeological and Historical Society. Many other memberships, later mandated by law for the state commissioner, required such a tremendous amount of time and energy on his part that, eventually, he had very little time to devote to his real job, namely, leadership in the field of education. Some of these memberships mandated by law were the State Library Board, the State Teachers' Retirement Board, the Ohio Records Commission, the boards of trustees of the state universities, and the War Orphans' Scholarship Board.

He was required by law to appoint a State Board of Examiners; to hold or order teachers institutes to be held; to countersign life certificates issued by the board of examiners; and to have supervision of the state school fund.

Cost of Textbooks Standardized

A law passed in 1890 standardized the cost of textbooks, and a law in 1891 required boards of education to make their selection of textbooks from the list as prepared by the state commissioner of common schools. Cost of books was not to exceed 75 percent of the publisher's list price. Commissioner Charles C. Miller reported in 1891 that, in his opinion, this provision would reduce the cost of textbooks to parents in the sum of $1 million. (20)

Commissioner Miller further stated that there was a growing belief among educators that the state should supply all needed textbooks free of charge.

Important acts of the Legislature between 1891 and 1906 give further evidence of more duties and responsibilities being assigned to the commissioner of common schools. Important acts passed by the General Assembly during the tenure of Commissioners Charles C. Miller, Oscar T. Corson, and L. D. Bonebrake provided for uniform teachers examinations under the direction and control of the commissioner, and authorization of day schools for the instruction of the deaf under the supervision of the State Department of Education. In fact, the Law of 1898 establishing the day schools for the instruction of the deaf is the first reference made by law in Ohio to a department of education. Although the State Department of Education was not officially defined until the enactment of Section 3301.13 R.C. in 1956, it has always been considered to be the administrative unit and organization chosen by the superintendent to assist him in his duties and responsibilities in connection with public education in the state. The department consists of a staff of such professional, clerical, and other employees as may be necessary to perform the duties and to exercise the required functions of the department.

While there appears to be no definite record concerning the exact number of employees in the state commissioner of common schools office in the period prior to 1906, evidence indicates that the number was quite small. The first reference in this respect is found in an act passed in 1900 which made an appropriation for a chief clerk, a statistical clerk, and a stenographer. Again in 1902, the Legislature made an appropriation for a corresponding clerk. The state commissioner was required to prepare Arbor Day exercises for use in the schools, and during this same year the law required him to prepare questions for certain examinations in the schools.

From 1837 to 1906, 18 commissioners of common schools served a total of 55 years, averaging a tenure of approximately 3 years. During this span of 69 years, the secretary of state performed the duties of the commissioner from 1840 to 1854. The first superintendent, Samuel Lewis, was appointed to the office by a joint resolution of both Houses of the General Assembly. All of the others, known as state commissioners of common schools, were elected to office by the qualified voters of the state.

In 1906, the General Assembly of Ohio provided by law that the state commissioner of common schools should be elected biennially at a salary of $4,000 per year. This was an increase of $2,000.
EDUCATION IN OHIO FROM 1906 THROUGH 1940

This period in the educational history of Ohio extends through World War I, the Depression, and to the eve of World War II. It includes a period when the public schools of Ohio experienced the greatest financial difficulties ever encountered. Teachers received lower salaries, at times they were paid in script, and for long periods they received no payment of any kind. Reductions were made in supplies and equipment, schoolrooms were overcrowded, and school terms were shortened. It is to the everlasting credit of the school administrators, teachers, and other school employees that, during this crisis, they accepted larger classes, additional duties, and less money, thus riding out the storm with fortitude.

During this period, several things occurred which tended to give the state commissioner of common schools more authority and responsibility in the administration of the public schools. This trend probably resulted, at least in part, from the existing crisis rather than from any real desire of the citizens to give up local autonomy. In order to clarify what took place during this period, the following sections will discuss some of the responsibilities shifted to the state commissioner.

Financial Aid for Financially Weak School Districts

From 1906 to 1940, there were five legislative enactments dealing with state financial support for schools. Three of these acts were favorable, because they assisted in the financial support to schools, and two were unfavorable, because they, at least indirectly, had the opposite effect.

The 1906 law, commonly known as the State Aid System for Weak School Districts, remained in effect until its repeal in 1935, when the State Equalization or Foundation Program Law replaced it. Under the provisions of the State Aid Law, the state commissioner of common schools was charged with the responsibility of administering the fund according to law and on approval of the state auditor. In the early years, school districts were reluctant to apply for state aid, partly because of the stigma attached to being a "financially weak" school district and partly because of the fear of state control. In the first year, only $82,000 was distributed, and even 10 years later, the amount was only $173,000. However, in later years (1918 to 1935), between one-third and one-half of the school districts in the state were receiving aid, the total average amount for the last 3 years being $6 million.

It appears that in the later years of the existence of this State Aid Law, certain legislators brought political pressure on the state commissioner and state auditor to promote aid for certain districts in their legislative districts. This pressure led to some questionable aid (21).

In spite of this shortcoming, one former state commissioner who had experience with the administration of this law contended that this act was really the only true state aid system for financially weak school districts. This former state commissioner contends (and many people agree) that the State Foundation Program Law enacted in 1935 and amended several times thereafter provides financial assistance to the rich school districts as well as the poor districts even though it is not needed in the rich districts (22).

The contention of the former state commissioner is substantiated in part, at least, by an article in the Ohio Schools, entitled "State Aid up to Now" (23).

An article, written by an Ohio assistant attorney general, bemoans the fact that, under the foundation program, some of the wealthiest districts in the state have received state aid. It appears to him (a) that the policy of the state should have continued as it was expressed in the 1906 law which provided for the equalization of educational advantages throughout the state, (b) that districts having ample taxable property valuation locally and the means of defraying the costs of educating their children should be required to provide the support locally, and (c) that the state ought not to be called upon to assist except in certain districts which are known as permanent state aid districts and in which taxable property is not sufficient to raise adequate revenues for school purposes.

Three incidents occurred after 1928 which seriously affected the 1933 school districts financially.

In 1929, legislation was enacted which exempted much tangible personal property from the tax duplicate and also lowered the rate of assessment on the remaining tangible personal property.

In the early 1930's, the worst economic collapse in Ohio's history brought additional reductions in the tax duplicate. Between 1929 and 1935, the total tax duplicate in Ohio dropped from $13.7 billion to $8.7 billion. In addition to this, delinquent taxes were mounting each year.

The third reduction occurred in November 1933 when the electorate voted into the constitution a tax-limitation amendment which reduced from 15 mills to 10 mills the maximum which could be levied without a vote of the people for the support of all forms of local government in any local taxing subdivision.

B. A. Stevens, director of research, Ohio Education Association, reported in an article in the Ohio Schools that as early as the school year 1930-31, many school districts were feeling the effect of diminishing tax collections. In a significant number of cases, retrenchments in operating costs were being made. School operating costs had declined steadily from a peak of expenditures of nearly $113 million in 1931-32 to budgeted expenditures of approximately $74 million for 1932-33.

During the school year 1931-32, one-third of the city school districts of the state were forced to shorten the school term. In a number of cases, the full term was completed only because the teachers taught from 1 to 4
found an accumulation of a deficit for the school districts of the state of approximately $22.5 million.

Dr. Stevens, research director of the OEA, collected statistics from the superintendents of schools in the state concerning the number of months schools could operate with resources available for the 1933-34 school year. He received reports from all of the city districts and from 85 percent of the exempted village and county school districts in the state.

He found that three cities, two exempted villages, and seven local districts in the county systems did not have enough money in sight to keep their schools open for even 1 month during the school year. Only 3 cities, 1 exempted village, and 47 local school districts had sufficient money available to keep the schools open for the full 9 months. Medians for the three classes of school districts were strikingly uniform. The typical district of the state had only enough money in sight for the year to keep the schools open for 4 or 5 months at most during the year.

During the years 1932 to 1935, part of the financial burden of school support in Ohio was shifted from the local school district to the state. In the Ninetieth General Assembly, an effort was made to secure tax support for a state foundation program and an equalization method of distributing state funds. However, both programs failed by a few votes in the closing moments of the regular session. However, 1\% of the liquid fuel tax was appropriated for schools, the money to be distributed on a straight per-pupil basis without reference to need.

In a special session late in 1934, the Legislature passed a sales tax of 3 percent, which, together with the liquid fuel tax and what remained of the intangible tax, furnished sufficient state funds to supplement the revenue available from local sources to support a meager educational program in 1934 and 1935.

It finally became evident to the General Assembly that the tax base would have to be broadened in order to avert a financial collapse of the schools and local subdivisions of government. By this time, the state's share of the total operating costs of the public schools had dropped to as low as 4 percent.

Governor George White authorized B. O. Skinner, director of education, to appoint a commission to make a survey of the financial situation of the public schools of Ohio. The Ohio Education Association pledged its financial support to the commission for the survey.

Paul R. Mort of Columbia University was employed as director of the commission, and L. L. Rummel, field editor of the Ohio Farmer, was chosen as secretary.

The secretary of the commission gave a summary of its report in the Ohio Schools for December 1932. The commission discovered that in the poor districts, salaries of teachers had been reduced in many cases 20 percent to 40 percent and that building programs were well nigh impossible. The commission observed that Ohio schools had suffered more in this time of economic distress than those in nearby states.

The commission discovered that the appraisal of real estate caused a decline of taxes from 10 percent to 20 percent and that the return from personal property under the new law was less than that anticipated by the lawmakers. Tax delinquency assumed unprecedented proportions. Moreover, Ohio schools faced a bonded indebtedness above $238 million, and these bonds, plus the interest on them, had to be paid at face value prior to anything else. Many school districts expended from 20 to 30 percent of their revenue for interest and debt retirement.

The commission report noted that in formulating its program for public education, Ohio had placed responsibility on the local district and forced property to bear nearly all the tax burden, which amounted to almost 97 percent of the cost of education. Only about 4 percent was paid from the state treasury.

It stated further that schools are a state institution, just as roads are; that 12,000 miles of roads in the state highway system are built and maintained largely by the motorists through a gasoline tax and license fees earmarked for roads. It said that the state should assume a greater responsibility in financing education and guarantee to every child equal educational opportunities to a certain prescribed minimum standard.

The commission explained what type of minimum educational program the state should demand and support. The school districts in Ohio had an average operating expenditure per child amounting to $60 for elementary pupils and $102 for high school students. Half of the districts spent more, and half of the school districts had a lower level. The lower level of 800 state-aid districts averaged only $40 annually for elementary pupils and $68 for high school pupils. If a $60 minimum were established in Ohio, it would immediately require $8 million in additional revenue.

The director of research, Dr. Mort, decided that it would be wiser to take the level of state-aid districts as the starting point for equalization—$40 per pupil. This minimum program would include all current operating expenses but not capital outlay, interest on indebtedness, or bond retirement. Administration, supervision, salaries, textbooks, library books, wages of janitors and engineers, fuel, water, light, power, supplies, promotion of health, transportation, school lunches, playgrounds, insurance, and other incidentals all were included in the recommended program of $40 per pupil, or of $1,200 per year for a classroom of 30 in average daily attendance.

State Foundation Program. The report of the new commission was named the Mort Plan for the Equalization of Education Through the Medium of Financial Support for
Financially Weak School Districts. The state superintendent of public instruction and the teaching profession took the leadership in trying to gain support for the Mort plan. Some of the various organizations throughout the state that endorsed the plan were farm bureaus, Kiwanis Clubs, local American Legions, Federations of Women’s Clubs, county boards of education, farmers institutes, local Granges, parent-teacher organizations, the Ohio Pastors’ Association, some local county taxpayer leagues, and also some local chambers of commerce. Rural organizations were strongly in favor of the plan.

Opposed to the plan were the cities and some of the financially poor school districts. The latter believed that they would receive more support under the old equalization plan than they would under the new.

The former were certain that they would have less money to run their schools and that, indirectly, it would be an additional cost to them.

Superintendent Skinner and other educational leaders spent a prodigious amount of effort in getting the plan enacted into law. Renamed the State Foundation Program of School Support, it was introduced in the General Assembly in the year 1933, embodying the recommendation that $29 million of state money be appropriated. When the program failed to be enacted, another attempt was made to pass it at a special session. This time, the program failed to pass by four votes.

When a new Legislature convened in January 1935, the foundation program was submitted again. Although the Foundation Program Bill passed the House with a splendid vote on April 2, 7 long weeks of struggle followed before the House put on the finishing touches by concurring in the Senate amendments. During this time, there were behind-the-scenes efforts to introduce aid for private and parochial schools, but on June 5, 1935, the Traxler-Kiefer-Matthews Bill was signed by C. W. Dorsey Davey, and a great milestone had been passed.

The Foundation Program Law enacted in 1935 established a per-pupil foundation of $22.50 for kindergarten, of $45.50 for elementary school, and of $67.50 for high school.

Schools with fewer than 180 pupils were granted a weighted scale of enrollment, since, if their existence was recognized as necessary, an adjustment was made to be in their favor. For example, a high school of 45 pupils needed as many teachers as one enrolling 90 pupils.

The foundation program of transportation was included, subject to the approval of the director of education. An approved budget of tuition cost was included to pay for the attendance of the district’s children who were assigned to the schools of another district.

The funds necessary to meet a foundation program were derived from a levy of 3 mills on the tax duplicate of the school districts and a uniform payment by the state to every district amounting, on a 9-month basis, to $15.30 per kindergarten pupil on average daily attendance, $30.60 per elementary pupil, $49.50 per high school pupil, and $36 per part-time continuation and evening school pupil. This flat distribution from the state public school fund represented the state’s full obligation to all districts where the total of the 3-mill levy and the uniform payment equaled the total foundation program as described above. In cases where the 3-mill levy and the state’s uniform per-pupil payment did not provide enough money to meet the approved foundation program, the state was obligated to provide additional aid so that the district would not have less than the foundation program.

The guiding principles of the law remain in effect in much the same way today, but the details of the program have been amended by law continuously since 1935.

Consolidation and Centralization of School Districts

Consolidation of school districts in Ohio can be divided arbitrarily into about three distinct eras that stand out in the history of public education in Ohio. The first began in 1912 following the adoption of an amendment to Article VI of the constitution. The second began in 1937, and the third in the 1960’s.

Centralization and consolidation of schools was practically nil prior to 1906. As early as 1872, the state commissioner of common schools, Thomas W. Harvey, stated in his report to the General Assembly and to the Governor that—

Something must be done soon by way of redistricting the townships, or for providing for centralization of the schools in Ohio. Our townships have from six to nine sub-districts in many instances, and very many of these schools are run during the summer months with from 3 to 8 scholars. The winter schools also are proportionately small (24).

Harvey said that, with this state of affairs, no person could create any real enthusiasm in his schoolwork, and the school authorities did not feel that, in these cases, they could pay the wages which qualified teachers would demand. Harvey added that he was satisfied that some method of collecting children of the rural districts could be devised by which they could have all the advantages of the graded schools.

Twenty-eight years later, Commissioner Lewis D. Bonebrake, in his report, bemoaned the fact that there had been practically no consolidation or centralization of schools. He reported that, in 1892, just 20 years after the recommendation of Commissioner Harvey, one school district was consolidated in Kingsville, Ashtabula County. He said that the Kingsville Township Board of Education, confronted with the necessity of providing a new school building, boldly undertook to solve the complex problem. Realizing that Kingsville schools were small and the per-capita expense was unduly large, the board finally decided
to transport the children of the township to a village school. In order to make the centralization legal and to provide for the cost of transportation, a special bill applying only to Kingsville Township was introduced into the General Assembly, and it became law in 1894.

In 1898, Commissioner Bonebrake was instrumental in obtaining permissive legislation which would permit any township to change the boundaries of subdistricts, to suspend the school in such districts, and to provide for the conveyance of said pupils to another district or districts as might be most convenient for them and providing that the cost of such conveyance would be paid out of the contingent fund of the district.

Thus, the groundwork was established for consolidation of school districts, but no great progress in that direction was made until about 1916 when the recommendations of the 1913 School Survey Commission and the resulting New Rural School Code began to be effective.

The State School Survey Commission of 1913 and the New Rural School Code

The Fourth Constitutional Convention of Ohio, which convened in Columbus in January 1912, submitted to the people a proposal to amend Article VI of the constitution as follows: “Provision shall be made by law for the organization, administration and control of the public school system of the state supported by public funds” (25).

This proposal was adopted at the special election held in September 1912. James M. Cox, who was elected Governor the following November, was keenly conscious of the great importance of the movement to organize rural life, a subject which, broadly speaking, was at that time gaining more public attention than any other. He realized that a school system commensurate in efficiency with the importance of rural life and its industries was necessary and fundamental to the progress and consummation of such a movement; that the country boys and girls were not getting a square deal because the so-called system then in use was inadequate to their needs, purposes, and interests and failed to reveal to them the possibilities of rural life and rural activities (26).

In his first message to the General Assembly, Governor Cox made a number of recommendations. He called attention to the fact that Ohio had no uniform school system and that it did not rank with the best states in the Union. He suggested that investigation should precede legislation. He called further attention to the fact that other states had found it necessary to withhold distribution of the state common school funds to districts until these had fully complied with minimum standards.

In response to the suggestions and recommendations of Governor Cox, the General Assembly passed an act, which became law in March 1913, to create a commission to conduct a survey of the public schools and the normal schools of the state. The survey, which extended into every county of the state, gave particular attention to the “common schools” in the county districts. This policy grew out of “the apparent need of a thorough awakening of the rural communities.”

The letter of transmittal from the commission to Governor Cox stated that laws for improvement must come from the people of the state and that an “awakening” was necessary.

The report moved Governor Cox to action, and he sought to create an “awakening” immediately. He issued a proclamation to the people suggesting that every school district in Ohio observe Friday afternoon and evening, November 14, by assembling at the “shrine of the local schoolhouse” in observance of School Survey Day, and urging action and support for legislative action. “Let it be a day of ‘genuine awakening,’ ” he said. He promised speakers and literature so that all might know the true conditions and prescribed remedies. He suggested further that an Educational Congress be held in Columbus on December 5 and 6, inviting every community to send delegates (27).

A 1913 survey disclosed the following discouraging facts:

1. Less than half the teachers in the rural schools were graduates of high school, and 18 percent had no education beyond elementary school. Sixty percent of the teachers in high schools in such districts had no college training, and one-fifth of them were not even high school graduates.
Governor Cox called the General Assembly together, explaining to the members that rural communities were entitled to the same educational advantages as the cities. He made clear that the Ohio Survey Commission laid stress on consolidation, supervision, and the training of teachers. He pointed out that a state as rich as Ohio could take hold of the conditions, pass laws permitting and encouraging consolidation of districts, and institute proper supervision of teachers with the state paying half the cost, which was its constitutional responsibility.

The General Assembly, in response to Governor Cox, enacted what was commonly known as the "New Rural School Code." The new code created a county school district, a county board of education, and a county superintendent, with proper educational qualifications. Certification requirements were increased, and the county board was given power to consolidate school districts and to divide the county district into supervision districts for the purpose of improving instruction.

Vernon M. Riegel, assistant director of education under F. B. Pearson, gathered and published in 1920 all the data he could obtain from county superintendents who had consolidated school districts on what consolidation did to improve education. As a result of his efforts and those of county superintendents, many second- and third-grade high schools either merged with schools of higher grades or built new ones. This was the first concerted movement in Ohio toward consolidation in a period when dirt roads exceeded paved roads.

The second movement toward further consolidation had its origins in 1935 when the Works Progress Administration provided funds to the U.S. Office of Education for studies of school organization in 10 states. E. L. Bowsher, director of education, explained that Ohio was one of the 10 selected because of the state's need for school reorganization and the probability that the results of the study would be used in connection with the reorganization provisions of the school foundation program of the state. (The State Foundation Program enacted in 1935 stated that any school district with fewer than 180 pupils could have the state's share of funds prorated on a schedule somewhat less than that for larger schools.)

The first school district to be created in Ohio at the conclusion of the survey was Jefferson-Union in Jefferson County, largely, if not completely, with the efforts of County Superintendent Delbert Woodford. A modern high school was built. Sixty percent of the cost of construction was funded by the WPA.

Beginning of Increased Emphasis on Secondary Education

The latter part of the nineteenth century and the early part of the twentieth century occupy a unique place in the history of secondary education in Ohio. Independent academies and seminaries reached the peak of their rapid development in 1851. Shortly thereafter, the influence of the seminaries and academies began a steady decline, which was still in progress 75 years later. The publicly supported secondary school was almost unknown prior to the middle of the nineteenth century. After the year 1850, the interest in secondary education began to center about the public high school.

The earlier secondary schools were independent academies and seminaries, which were dependent on the initiative and interest of the individual parent or community for their existence and sustenance.

It was to these schools that the children had to look for educational opportunities beyond the elementary grades. The constitution had made provision for private groups to organize schools of secondary rank. Beyond this constitutional provision, nothing had been done by the state to encourage the growth of secondary education.

The story of the development of the tax-supported, free public high school in Ohio belongs particularly to the period from 1851 to 1925. Its numerical growth has been most rapid since 1900. At the beginning of the year 1851, Ohio had no general law concerning tax-supported, free secondary schools. A few of the more forward-looking communities had passed legislation establishing high schools similar to the academy in organization and support. The earliest high school of this nature in Ohio was chartered in Elyria in 1830, to be followed the next year by the Woodward High School of Cincinnati. By the year 1851, 14 such high schools had been chartered in Ohio, and the sentiment in favor of free high schools steadily gathered momentum from that time forward.

Ohio's first general law providing for the establishment of high schools passed in 1853 was permissive in character. By the terms of this law, boards of education were authorized to establish schools of higher grades than primary, to be called central or high schools. More than one of these could be established where the school boards deemed them necessary. When the board of education had
decided on the need of one or more high schools, the voters of the township were authorized to vote on the question of the cost and location of the schools.

Ohio's legislation concerning high schools for this period is not commensurate with the growth or importance of these schools. Following the passage of the first general law in 1853, high school legislation was confined to the details of district organization and support. The early legislation was, at all times, permissive in character.

In an era of dirt roads and horse-drawn vehicles, it is understandable that a township could have two or three high schools and make consolidation or centralization a problem for the future. This is exactly what happened. From a very few high schools in Ohio in 1850, the number reached 836 in 1900, 1,475 in 1920, and 1,275 in 1925.

Teacher Education and Certification

In the period between 1906 and 1940, the state commissioner of common schools and his staff, now known as the Department of Education, began to assume real authority and responsibility for the preparation and certification of teachers.

In order to more fully understand the progress made during this period, some explanation must be made concerning the situation with respect to these matters prior to 1906.

In 1821, the district school committee was authorized to employ "competent" teachers, with no mention being made of certification. Four years later, the principle of county certification appeared and remained until 1850. The Law of 1825 provided for the appointment of three examiners of common schools in each county by the court of common pleas, who should examine and visit and examine schools.

In 1827, the court of common pleas was allowed to appoint such number of examiners as they might deem expedient, not to exceed one for each organized township in the county. The evident intent of the law was to allow single examiners to examine within the township. Four years later, in 1831, the examiners were directed to give a certificate in the branches in which the teacher was found qualified to teach, and no certificate was to be granted unless the candidate could teach reading, writing, and arithmetic (29).

In 1838, the county became the unit for certification, and the mode of appointment of three examiners was by the court of common pleas (30). No teacher in any common school was permitted to teach a subject not named in the certificate. In 1849, English and geography were added to the requirements for certification.

The power and control of the commissioner of common schools over teacher education and certification was slow in developing. The first act indicative of his growing power was in 1861 when a legislative act required the officers of teachers institutes to report to the commissioner "thirty days after every meeting giving an account of the moneys received, from what sources, and how expended by them, and such other matters relative to the institute as the Commissioner might require" (31).

In 1864, the commissioner, for the first time, was given some control over inspection of teacher education. The county examiners were required to report to the commissioner all details of their certification activities and the moneys received. One year later, the state commissioner was given authority to appoint a board of three examiners to have jurisdiction over the issuance of life certificates which had to be " countersigned by the Commissioner" (32).

State control of teacher preparation had its beginning in 1865 when the Legislature, by an act, passed a resolution requesting the commissioner to gather information concerning "the organization of the best normal school in this country and the probable cost of establishing one or more efficient normal schools in this state" (33). It was not until 1893 that legislation was enacted aimed at setting up more uniform standards for teachers. This law provided for a uniform system of examination for teachers in the state specifying that "the secretary of the State Board of Examiners and Commissioner of Common Schools should prepare a series of questions, and print and distribute the same to the examiners in the several counties of the state" (34). The grading of the examinations, however, remained with the county examiners. All of this had happened prior to 1906.

An act passed in 1910 provided for some standardization of teacher education. This act granted the commissioner the power to approve normal schools, teachers colleges, or universities as teacher education institutes.

From about 1920 to 1935, the directors of education sought to upgrade the education of teachers by obviating the need for examining teachers. Under Vernon M. Riegel, director of education, and E. B. Hawes, Division of Examination and Licensing, a pamphlet of laws and regulations relating to teacher certificates was published for the first time in the school year 1921-22. The superintendent of public instruction could grant a 4-year provisional elementary certificate without examination to an applicant who had graduated from a first-grade high school and had completed a full 2 years academic and professional course at any approved normal school or college. He could grant a 4-year provisional secondary certificate without examination to an applicant who possessed a diploma from a first-class high school and had completed a full 4-year academic and professional course in an approved institution (35). For the first time, the State Department of Education entered into the granting of provisional certificates issued by the superintendent of public instruction to qualified applicants.
A subsequent publication was issued in 1930 for the purpose of further interpretation of rules and regulations for certification. The State Department of Education was now regulating the renewal of certificates issued by local examiners by requiring a graduated scale of additional training for each renewal (36).

In September 1935, a new law went into effect which abolished the local boards of examiners and centralized the issuance of all certificates in the hands of the state director of education and five-member State Board of Examiners. The Law of 1935 also mandated the state director to issue all certificates in the hands of the state director. The Bureau of Education and Certification was established and charged with preparing standards for both certification of teachers and teacher education institutions.

The Division of Teacher Education and Certification was established in 1937, remaining in this position until 1958 when he was appointed assistant superintendent of public instruction. Dr. Bowers, who became the division director in 1937, remaining in this position until 1958 when he was appointed assistant superintendent of public instruction, in which post he served through 1966, when he was appointed deputy superintendent of public instruction.

The present organizational structure of the state department includes most of the agencies or divisions which were created between 1920 and 1940, although some consolidations have been made and division titles have been changed in some cases. Attempts have been made to coordinate the work of the various divisions by placing them under the supervision of assistant superintendents of education. One deputy superintendent and four assistant superintendents now assist the state superintendent of public instruction in his work. Since 1955, several new divisions, such as research and development, computer

The educational program at the state level experienced a rapid growth during the 1920's. In 1921, administrative action established the position of assistant director of education. Between 1920 and 1930, the following agencies and divisions of the Department of Education were created: vocational rehabilitation, special education, high school supervision, visual education, teacher training, music, child accounting, adult education, examining and licensing, scholarship tests, health and physical education, guidance, and radio education.

In 1927, the state schools for the blind and deaf were transferred from the Department of Public Welfare to the Department of Education. The rapid growth of the state department was temporarily checked in the 1930's by the Depression. With the enactment of the first State School Foundation Law in 1935, the department assumed major responsibilities in the calculation and allocation of state school aid.

**EDUCATION IN OHIO SINCE 1940**

The State Department of Education in Ohio has been marked by several contrasting periods of development. Between approximately 1840 and 1920, the growth of the department was extremely slow in terms of organization and personnel. From 1920 to 1930, the growth was fairly rapid, and then, as has already been mentioned, it was considerably retarded between 1930 and 1940 by the Depression. Since 1940, each succeeding decade has witnessed a more rapid growth for the department.

The present organizational structure of the state department includes most of the agencies or divisions which were created between 1920 and 1940, although some consolidations have been made and division titles have been changed in some cases. Attempts have been made to coordinate the work of the various divisions by placing them under the supervision of assistant superintendents of education. One deputy superintendent and four assistant superintendents now assist the state superintendent of public instruction in his work. Since 1955, several new divisions, such as research and development, computer
services and statistical reports, publications, and guidance and testing, have been established in the department.

The need for increased financial assistance, minimum standards, and advisory services from the state level has been increasing each year in the local school districts. The increase in the appropriation for school assistance from $200,000 in 1837 to the biennial appropriation for 1967-69 of $922,838,686 gives one measure of the state's participation in the operation of the schools.

The history of the State Department of Education from 1940 to 1968 was marked by increased cost of school operation, a steadily increasing shortage of the number of qualified teachers, accelerated birthrate, and teacher salary problems.

The Ohio School Survey of 1954 and the creation of the State Board of Education in 1956, which occurred during this period, probably had tremendous effects on the future progress of public education in Ohio.

The Ohio School Survey

Not since 1913 had state authorities made a thorough attempt to appraise the public schools of the state. The One-Hundredth General Assembly of Ohio enacted Sections 103.41 to 103.43 of the Ohio Revised Code providing for an 11-member Ohio School Survey Committee, charged with the responsibility of making a comprehensive study of the public school system of the state.

Organized in the fall of 1953, the committee approached its task in the firm belief that public education should not be studied from the viewpoint of the professional educator alone, or any other special group.

The committee organized six study committees in the fields of instruction, personnel and teacher education, state educational organization, local district organization, housing and transportation, and finance. Each committee was composed of lay and professional people of all races and creeds from all sections of the state. Each committee had a highly qualified out-of-state consultant, as well as a staff assistant provided by the six state universities.

Before formulating their recommendations, the study committees collected and analyzed a mass of information from official records, personal interviews, and questionnaires. During School Visitation Week the members of these committees, the survey committee, and the consultants visited a cross section of schools in 66 of the 88 counties of the state.

The following are some of the findings made by the survey committee:

Only two-thirds of Ohio's school districts operate high schools. In other districts, the older pupils have to go outside the district to attend high school on a tuition basis. Only about 55 percent of the high school pupils attending schools have a satisfactory program, as determined by the research staff.

It is difficult to secure enough qualified teachers to keep pace with increasing enrollments. Teaching loads are generally heavy throughout the state. The quality of instruction varies greatly from school to school. In general, guidance and counseling receive too little attention, and many schools do not provide adequately for exceptional children.

Ohio ranks high in financial ability and low in financial effort to support public schools. Because of high costs and existing debt limitations, many boards of education are unable to provide enough classrooms and other necessary school building facilities.

It is impossible to determine satisfactorily how Ohio schools compare with those in other states. However, the following listing gives some idea of Ohio's standing:

Increased school populations will inevitably result in increased costs for public education in Ohio. Approximately twice as many children were born in Ohio in 1953 as in 1939. During the same 14-year period, the public school enrollment increased approximately 250,000.

The enrollment increase from 1953 to 1956 will probably be as great as during the preceding 14-year period, and from 1956 to 1960, it is expected to be even greater. Estimated increase in school population required by 1960 at least 17,000 additional teachers and approximately that same number of new classrooms.

Ohio schools range in quality from excellent to very poor. Evidence indicates that some excellent teaching is found in nearly every community, but a large proportion of the teaching in many communities is not satisfactory. Some of the unsatisfactory teaching is due to faulty organization...
ment. It may be the result of overcrowded classes, obsolete buildings, or lack of community interest or cooperation.

In a number of communities, the financial resources are too limited to permit the employment of well-trained teachers or the development of good school programs. In most communities, schools give too little attention to the development of exceptional children or to meeting the individual needs of other children. Ohio schools should continue efforts to secure better teachers and better teaching.

Practically all Ohio high school teachers are college graduates, and one-third have master's degrees, but about half of Ohio's elementary teachers are not college graduates.

Practically all Ohio teachers have some professional training in addition to general college work, but, except in a few special fields, the amount of time devoted to professional courses is not excessive.

School authorities and citizens are well satisfied with the quality of teaching done by most teachers. There is, however, substantial dissatisfaction with the performance of some teachers, and teachers themselves recognize the need for improvement.

A good school district is one which has enough pupils and a large enough tax base so that it can (a) offer at least 12 years of schooling; (b) attract and hold a competent staff; (c) employ supervisors, teachers of special classes, guidance counselors, and other specialized professional personnel; and (d) provide a broad educational program and the necessary staff, teaching supplies, and building facilities to make it effective. It is difficult to provide a satisfactory program with fewer than 240 pupils in the high school, and a total enrollment of at least 1,200 pupils in the school district. (Recommended minimum standards later were established as 500 pupils in high school, grades 9-12, and a total enrollment of 2,500 to 3,000 pupils in grades 1-12.)

Ohio has too many small school districts and too many small high schools. In October 1953, Ohio had 1,337 school districts. By counties they ranged from 4 to 40. Eight counties had more than 25 school districts, and 12 had fewer than 10 districts.

Three-fourths of the high schools of the state had fewer than 500 pupils, and 58 percent had fewer than 300 pupils. One-third of the school districts had no high school at all.

About 45 percent of Ohio high school pupils were in schools which did not have a satisfactory program. Only one district in six had as many as 1,200 pupils in total enrollment. One-tenth had fewer than 100 pupils, and one-fourth had fewer than 200.

State financial aid is now distributed to school districts in a way which discourages the combining of small, inefficient schools. Ohio school districts vary in tax valuation from $1,500 to $255,000 per pupil. The richest district has 170 times as much ability to support schools as the poorest.

Ohio has a shortage of school buildings. Furthermore, although there are many excellent school buildings in Ohio, there are also many which are old, unsafe, and unsuitable for today's educational programs. It would cost $61 million to replace them and approximately $84 million to make needed repairs on existing school buildings which are otherwise suitable for continued use.

Schools throughout the state are overcrowded. Ohio should spend $89 million at once for added capacity for pupils already in school. It needs to build eight new classrooms a day at a cost of an additional $340 million to house anticipated enrollment increases by 1960.

If all Ohio school districts needing buildings were to borrow up to the 8-percent legal debt limit, about 20 percent would fall short of their immediate needs. The total shortage would be at least $37 million. This shortage would increase as enrollments grow and would reach a cumulative total of $153 million by 1960. Boards of education now have no legal means available to raise necessary funds.

The present plan of financing public education is unsatisfactory and should be completely overhauled. The proposed foundation program (to be financed from state and local funds) would permit the following educational services for all children:

A competent teacher for every 30 pupils, in both elementary and high schools. Necessary small schools, classes in vocational education, and classes for exceptional children would require smaller classes. Additional principals, supervisors, librarians, and other special instructional personnel would be needed in proportion to the number of teachers.

All services needed for administration, operation, and maintenance of the schools would be based on the number of classroom units; transportation would be based chiefly on the number of pupils transported and the area served.

In an attempt to guarantee that each school district would have sufficient funds to provide a reasonably satisfactory program of education, the survey committee recommended a new foundation program plan for financing public schools.

In 1955, the Ohio General Assembly enacted a new foundation program law based on the recommendations of the Ohio Survey Commission. The steps in computing the program were as follows:

Step 1. Find the cost of the foundation program for each school district as follows:

(a) Determine the salary allowance by multiplying the number of classroom units by an allotment ranging from $3,000 to $4,100, depending on the training level of the teachers, and add 10 percent for retirement and sick leave. (b) Multiply the number of classroom units by $1,300 to get the amount to be included for all other
current expenses except transportation. (c) Determine the transportation cost by a formula yet to be established.

   Add the above three items to determine the total cost of the foundation program to be financed from state and local funds.

   Step 2. Find for each district the amount which would be available from a 10-mill levy on the assessed valuation. This is the required local contribution.

   Step 3. For each district, subtract the yield from the 10-mill levy (Step 2) from the cost of the foundation program (Step 1). The difference is the amount to be provided from state funds, except that no district is to receive less than $1,750 per classroom unit (approximately the amount now received) from state funds.

   The program has been amended by the General Assembly in practically every session since 1955, but the basic principles remain much the same as those originally recommended by the commission.

Another recommendation of the Ohio School Survey Commission was to have an elected State Board of Education composed of lay citizens serving staggered terms of 6 years.

The Creation of the State Board of Education in 1956

The concept of a State Board of Education was not new to Ohio or to the nation. In 1838, the first state superintendent of common schools had recommended to the Legislature that a state board be established. In 1850, the General Assembly passed an act providing for the creation of a State Board of Education. The bill stipulated that state board members were to be elected by the Legislature. This bill never became law because the General Assembly failed to carry out the election before adjournment.

In nearly 90 years, Ohio had never come as close to obtaining a State Board of Education as it had in 1850. Between 1850 and 1939, periodic attempts were made in the Legislature to establish a state board. Although several Governors and numerous state superintendents of public instruction had advocated the creation of a state board, only six bills pertaining to this subject were introduced in the Legislature during this period of time. None of these bills succeeded in passing both Houses of the Legislature.

Pursuant to a recommendation of the Governor, the Legislature, in 1939, adopted a resolution proposing an amendment to the Ohio constitution. The proposed amendment would have included a State Board of Education and a director of education, appointed by, and whose term of office and compensation would be fixed by, the state board. The amendment was voted on by the electorate in November 1939 and was defeated by a 3 to 2 margin.

Despite the 1939 defeat of the proposal for a state board, the proponents of such a measure were encouraged by the new interest which was aroused for a state board.

During the next 14 years, there was more activity in support of a state board than there had been in the entire preceding 100 years. Professional educators and educational organizations were in the forefront in stressing the need for a State Board of Education. Consequently, again in 1953, the General Assembly adopted a resolution to amend the Ohio constitution. The proposed amendment was similar to the one which had been defeated in 1939 and contained the following language:

There shall be a state board of education which shall be selected in such manner and for such terms as shall be provided by law. There shall be a superintendent of public instruction, who shall be appointed by the state board of education. The respective powers and duties of the board and of the superintendent shall be prescribed by law.

The “yes” vote was 298,460; the “no” vote, 213,337 (38).

Consequently, the Legislature, which met in January 1955, was faced with the task of enacting legislation to provide for a state board and a state superintendent of public instruction appointed by the state board. The amendment did not specify the number of board members and the method of election. The sponsors of the amendment recommended a board of nine members, one member to be elected from each of the nine judicial districts in the state. The bill passed the House with those provisions but was amended in the Senate to consist of 23 members, one to be elected from each of the 23 congressional districts as they existed on January 1, 1955. The General Assembly meeting in 1967 amended the law to provide for a board of 24 members, one to be elected from each of the 24 congressional districts as they existed in 1967. Consequently, Ohio has the largest membership of any State Board of Education in the country.

As mandated by the constitutional amendment (Section 4 of Article VI), the 1955 Legislature prescribed the powers, duties, and responsibilities of the State Board of Education and of the state superintendent. The Ohio Revised Code contains a major portion of these statutory powers and duties. In general, the powers and duties of the state board are in the realms of policy making, and the powers and duties of the superintendent are executive in nature.

More than 100 sections in the Revised Code pertain to functions of the State Board of Education. The board has the general power and duty to—

1. Exercise general supervision over the system of education.
2. Formulate policy, plan, and evaluate functions pertaining to public schools and adult education.
3. Exercise leadership in the improvement of public education.
4. Administer the educational policies of the state relative to public education.
5. Provide consultative and advisory services to school districts.

Its many specific powers and duties fall into five major categories: finance, operation of the Department of Education, curriculum and instruction, school district organization and administration, and miscellaneous.

The Ohio constitution also requires that the powers and duties of the superintendent of public instruction be prescribed by law. The General Assembly, meeting in 1955, enacted Sections 3301.11 and 3301.12 of the Ohio Revised Code, which gave a general description of his duties and responsibilities. In general, the superintendent is authorized to—

1. Serve as executive and administrative head of the State Board of Education in its administration of all educational matters and functions placed under its management and control.

2. Execute, under the direction of the State Board of Education, the educational policies, orders, directives, and administrative functions of the board, and direct, under rules and regulations adopted by the board, the work of all persons employed in the State Department of Education.

3. Provide technical and professional assistance and advice to all school districts in reference to all aspects of education including finance, buildings and equipment, administration, organization of school districts, curriculum and instruction, transportation of pupils, personnel problems, and the interpretation of school laws and school regulations.

4. Prescribe forms and require the preparation and filing of such financial and other reports from school districts, officers, and employees as are necessary or proper.

5. Prescribe and require the installation by school districts of such standardized reporting forms and accounting procedures as are essential to the businesslike operations of the public schools of the state.

6. Conduct such studies and research projects as are necessary or desirable for the improvement of public school education in Ohio, and such as may be assigned to him by the State Board of Education.

7. Prepare and submit annually to the state board a report of the activities of the state department and the status, problems, and needs of education in Ohio.

8. Supervise all agencies over which the board exercises administrative control, including schools for education of handicapped persons.

In November 1955, the 23 members of the state board were elected to office (one from each congressional district as they existed at that time), and at the first meeting of the board in January 1956, the board members chose by lot their length of terms according to law (39).

However, in 1967, the General Assembly amended the Ohio Revised Code to provide for 24 members of the state board to coincide with the newly redistricted 24 congressional districts. Consequently, in November 1967, the entire membership of 24 was elected to office. Again, in January 1968, these 24 members drew length of terms by lot—8 for 2 years, 8 for 4 years, and 8 for 6 years. Presumably, in 1969, and in each succeeding 2 years, 18 members will be elected or reelected for 6-year terms.

Voting statistics on the election of state board members indicate that if the board reflects voter desires, it does so in a very limited sense. Election results indicate that voter interest concerning state board elections has apparently declined in the 13-year period in which these elections have been held. The issue of an elective versus an appointive board is still a matter of concern throughout the state.

Appointment by the Governor is the most frequently mentioned alternative method of selecting state board members. Several arguments are commonly voiced in support of gubernatorial appointment. The Governor is able to select members of the highest caliber who could give considerable prestige to the education program at the state level. Many years of experience with gubernatorial appointment of trustees for Ohio's state universities indicate that these appointees are quite often persons who have received national recognition in academic, business, and governmental fields.

Nevertheless, despite all the shortcomings of the elective method, Ohio was fortunate in securing high-caliber membership on its first state board, although the majority had never previously served on any board of education. Of the 23 members, 21 were men and 2 were women. Eleven were practicing attorneys. The turnover of membership on the board has not been large, although of the 23 original members elected in 1953, only 6 remain on the board at this time (1968).

Upon its establishment in 1956, the State Board of Education in Ohio immediately encountered many problems. The law permitted the board to continue to employ any person holding any position or office in the state department which was in existence immediately prior to January 3, 1956, until such time as appointments of personnel were made under the provisions of the Ohio Revised Code (40).

In order to prevent a complete disruption of the educational program, the state board, at its first meeting on January 3, 1956, took action to continue the employment of all of the members of the department who were on the staff at that time. In fact, the superintendent of public instruction, R. M. Eyman, and his assistant, W. D. Darling, who were in office at that time, continued to serve in those same positions until April 1957, when E. E. Holt became the first state superintendent of public instruction selected by the State Board of Education. Both Eyman and Darling were then made Holt's assistants.

In November 1956, the board announced the appointment of a superintendent to take office in July...
1957. However, in February 1957, the board rescinded the appointment made 3 months earlier, because the constitutionality of the appointment was questioned on the ground that the person selected for the superintendency was not a resident of Ohio. According to the constitution, "no person shall be elected or appointed to any office of this state unless possessed of the qualifications of an elector..." (41).

When Eyman retired in July 1958, his position was filled by Harold J. Bowers, who had served as director of the Division of Teacher Education and Certification since 1936. Holt retired from office in July 1966, and Darling retired in September 1966. M. Byron Morton was appointed as an assistant superintendent in 1958 and served in that capacity until he retired in 1967. Martin Essex was elected state superintendent of public instruction to succeed Holt and took office July 1, 1966.

Dr. Bowers was appointed to a newly created position, that of deputy superintendent. Wayne Carle and Paul Spayde were appointed assistant superintendents in 1966, and Thomas Quick was appointed as an assistant in 1967. Robert Greer was appointed assistant superintendent in 1968.

After the first State Board of Education had completed its organization, its first task was to adopt policies. Previously, the director of education, as state superintendent of public instruction, was the policy-making official as well as the executive officer who executed the policies.

The law enacted by the General Assembly in 1955 attempted to transfer all policy-making functions from the superintendent of public instruction to the state board. Consequently, the board spent considerable time during the first several months of its tenure in reviewing policies which were already in operation in the department in relation to the schools, and either adopting these same policies, amending and then adopting the amended policy, or formulating and adopting completely new policies to replace some of the old ones.

As soon as some of these routine matters could be properly handled, the board gave its attention to some problems which had been pointed out by the 1955 Ohio Survey Committee. These specific problems involved improvement of instruction, teacher education and certification, and school district organization, each of which will be discussed in the following sections.

**Improvement of Instruction.** In February 1957, the board adopted the elementary school standards which it had been studying for a year. These standards became effective in April 1957. The board then considered high school standards, and these became effective in January 1958.

The staff of the Division of Elementary and Secondary Education was increased so that schools could be visited by a representative of the department more frequently. Previously, because of the limited number of general supervisors in the division, many schools had not been visited for 7 or 8 years, although the department was responsible, according to law, for chartering high schools and for revoking charters when schools did not measure up to state standards.

Programs of instruction are now being broadened continuously, and more attention is being given to specialized courses. Vocational education, special education, guidance and testing are being emphasized to a greater extent.

One of the problems facing the state board was the number of high schools (most of them with small enrollments) which were not meeting the Ohio high school standards. Between the years 1934 and 1948, the state superintendents had revoked only 15 high school charters. In 1949-50, the General Assembly established a high school board consisting of five staff members in the state department. In accordance with the legislation, the superintendent was required to revoke charters upon recommendation of the high school board. In slightly less than 4 years (1949 to 1953), 121 charters were revoked. The high school board was officially dissolved by the Legislature in 1955. The State Supreme Court had made the high school board somewhat inoperative in 1953, when it ruled that the Administrative Procedure Act must be followed in the future and that an unlawful delegation of legislative power had been made to an administrative agency.

By adopting new high school standards and following the Administrative Procedure Act, the state board was again able to revoke the charters of high schools which did not meet these standards. Table 2 on page 967 gives a picture of high school charters revoked during the 25-year period 1934-35 to 1959-60.

**Teacher Education and Certification.** In 1957, the State Board of Education adopted another revision of laws and regulations which became effective in 1959. Elaborate committees representing a cross section of all segments of the teaching profession, both public and private, conducted research and made recommendations to the Board. Both subject matter people and personnel from the colleges sought significant increases in semester hour requirements for their respective disciplines. At the somewhat stormy public hearing in September 1957, conducted by the board, which hearing was required by the Administrative Procedure Act, the professional educators attended en masse. Some members of the state board were opposed to what they called excessive hours of professional preparation for teachers and wished a reduction, but although the board finally approved the substantial increase in semester hour requirements for certification in most of the subject matter fields, it left the professional semester hour requirements substantially unchanged.

The board adopted one more significant change in certification in December 1961, which affected the certification of superintendents. Acting on a request which stemmed largely from leadership of the American Association of School Administrators, the board adopted a prescribed curriculum for the certification of superintendents which required a minimum of 60 semester hours of graduate credit, at least 10 semester hours of which were to be completed while in full-time residence.

School District Organization. The issues raised by school district reorganization have been numerous and difficult. Local pride in maintaining small school districts (many of which were inadequate with respect to revenue resources and educational standards) has been a difficult and understandable roadblock to school district reorganization. During the period 1954-55 to 1959-60, the number of school districts in Ohio was reduced to a greater extent than in any other 5-year period, as shown in Table 3.

The State Board of Education, through the State Department of Education, has exerted considerable influence in the reorganization of school districts in Ohio by formulating and adopting certain policies. Board policy has prohibited some school districts from submitting bond issues in excess of 6 percent of the assessed tax valuation of the district. The constitution forbids a district to submit a bond issue which would make the net indebtedness exceed 6 percent of the assessed valuation of the district without approval of the state board. Other regulatory actions of the state board have encouraged consolidation of school districts. Prior to 1968, the state board had little or no authority to mandate consolidation. It had authority to conduct studies and propose consolidations where there was evidence of need for consolidation. Four such studies

Source: Ohio Department of Education.
were conducted in 1965-66, and several have been conducted since that time. However, the electors in the territory affected have the right by referendum to accept or reject the proposal (42).

The General Assembly of 1965 mandated the state board to prepare and submit to the assembly, not later than January 1967, a master plan for the organization of school districts in Ohio. This study was conducted under the direction of Ralph D. Purdy of Miami University. The Master Plan, which was submitted to the next General Assembly, established, as a primary objective, the creation of school districts as administrative units, each of which could economically provide and financially support an educational program sufficiently broad to meet the various post-high school needs of its students, including those entering college, those entering the labor market, and those entering other post-high school careers.

Even though endorsed by the State Board of Education, the Master Plan failed to be enacted into law.

Due in large measure to the dynamic, aggressive leadership of State Superintendent Martin Essex and of members of his staff, this General Assembly did, however, enact numerous laws which form the basis for "An Educational Renaissance in Ohio." This legislative program includes the following highlights:

The major increase in state funding for schools in the 1965-67 biennium, the largest thrust for elementary and secondary education in Ohio history, represented an unprecedented 39.2-percent increase over the previous biennium—$260,010,156 in additional dollars and a total of $922,838,686 in state support that is nearly three times the state's $363,346,189 investment a decade ago (1957-59). It brings needed relief to the mounting pressure on local property taxes, producing an amount for schools, statewide, equivalent to a 3.8-mill levy.

These funds are helping Ohio schools compete for needed teachers. They have raised teacher salaries to the range of the upper one-fourth of the states. The new statewide pay scale, which will encourage the employment of qualified and experienced persons in poorer districts, is the highest schedule of its kind in the nation.

The educational purchasing power for instruction, books, utilities, and other operating costs has jumped 38 percent, from $290 to $400 per pupil in the poorest districts.

This appropriation is also making possible the following:

Largest expansion of vocational education in history for 85,000 students in vocational classes

Largest growth ever of classes and other services for 200,000 mentally and physically handicapped children

The Midwest's first state-supported programs to improve the educational status of disadvantaged children in urban centers and rural pockets of poverty. Major extension of instructional TV programs for schools.

A special state subsidy to make driver-training classes available to every Ohio youth.

The first state funds to match federal funds for a million-dollar basic education program for the retraining of unemployables.

Funds to make auxiliary services, such as audiovisual aids and television, available to nonpublic school pupils on the same basis as in public schools.

Tuition assistance to local boards of education for payments for mentally retarded children.

The chartering of school districts to ensure emphasis on good elementary, as well as secondary, schools.

Major reforms in the voting of school funds, the more equitable funding of pupil transportation, improvement of all state pension benefits, and provision for employee insurance plans have been among more than forty other significant enactments.

Truly, Ohio schools have been brought to the threshold of a new era, with a mighty thrust to improve the supply of suitable teachers, to extend and expand vocational education, to bring special services to the handicapped and disadvantaged, and to finance better education for all pupils.

CREATING A SCHOOL SYSTEM

The Indians

Until the early nineteenth century, Indians roamed across the tall, lush grasses of the prairies, hunting the abundant buffalo and other game, or tilled the soil in the rich river bottoms. When the Louisiana Purchase in 1803 made this land a part of the United States, American explorers began mapping the Oklahoma Territory. After the War of 1812 and the acquisition of Florida, Southerners harassed by frequent Indian uprisings eyed these newly acquired western lands as a place to which they could banish the Indians.

Indian removal treaties sent the five civilized tribes—the Cherokee, Chocktaw, Chickasaw, Creek, and Seminole—over the “Trail of Tears” to eastern Oklahoma, where the soil and climate were much more favorable than in the plains of western Oklahoma, where dry land farming had to be developed.

Oklahoma became a haven of refuge for Indian tribes from all areas. The newly located Indians were allotted areas for settlement and given land. They eventually established governments of their own and became nations with capitals and elected officials. Aided by missionaries and to a lesser degree by the United States, they built schools and churches.

Since the Indians who became involved in the Civil War were usually on the side of the Confederacy, this often was used as an excuse for abrogating treaties and taking their land. To protect the Indian lands, the U.S. government established military posts in eastern Oklahoma, which was this country’s western frontier at the time. These forts became centers for negotiating with the Plains Indians, who still lived in central, northern, and western Oklahoma and roamed from Texas to the Dakotas. Plains Indians began settling on the reservations after 1867. The invention of the repeating rifle, which resulted in the slaughter of the buffalo by white hunters, destroyed nature’s balance and thus the economic basis of the Plains Indians’ way of life. Their anger at the white man, who had reduced them to dependency, was vented in occasional uprisings until about 1875.

In the meantime, Texans began driving their cattle north to the railway terminals in Kansas, and this resulted in many grazing leases on Indian land in the central and northern part of the state. Railroad building caused an influx of many other white men; and the discovery of coal in eastern Oklahoma in the 1870’s lured still more white people into the lands of the Indians.

The Creek and Seminole tribes ceded a large area in the western part of their nations to the United States. Many white people were attracted to these government-owned “unassigned lands” by the agricultural opportunities and put pressure on the government to open this fertile area for settlement. In 1889, Congress passed legislation authorizing the opening of these unassigned lands.

Land Openings

On April 22, 1889, some 50,000 homeseekers and adventurers lined the borders of the unassigned land, each with his dreams, either confident of a better life on his own land carved from the new territory or with hopes of staking a choice spot which could be turned for a quick profit. At noon, a gun sounded the signal, and horses, carriages, wagons, and men on foot moved in a wave to begin the first race into this virgin country, devoid of fences, with few highways and few bridges (1). By nightfall, hundreds of settlers mingled in new towns that were miraculously springing to life, and thousands of tired families camped on new homesteads of 160 acres each. Because even the climate was inhospitable to the family-enterprise economy to which these settlers were accustomed, they endured many hardships before their dreams could be realized.

At the end of the opening day rush into Oklahoma’s “promised lands,” six counties were born: Oklahoma, Logan, Cleveland, Canadian, Kingfisher, and Payne. Beaver County was added in 1890. On September 22, 1891, the second run took place, this time into the Shawnee Reservation.

In 1893, the government established the Dawes Commission to negotiate with the Indian tribes for their
surplus land. It offered them allotments and then reached an agreement for purchasing large tracts around them. Three other runs followed, from 1892 to 1895, into the Cheyenne-Arapahoe Reservation, the Cherokee Outlet, and the Kickapoo Reservation, opening an additional 9,868,976 acres to settlement. On August 16, 1901, the Kiowa Comanches' lands were opened by lottery. In 1906, sealed bids opened an area known as the Big Pasture.

**Territorial Schools**

It took little time to establish law and order and the departments and agencies necessary to carry on the functions of government in these newly opened lands. Congress designated Oklahoma a territory under an Organic Act passed in May 1890. This act set up executive and judicial branches of government and provided for a delegate to Congress, a Territorial Legislature, and schools. It also provided for an appointed territorial superintendent of public instruction and county superintendents.

When the new Territorial Legislature held its first session in 1890, what is now the State of Oklahoma was still divided into Indian Territory and Oklahoma Territory. Although it adopted the school laws of Kansas (with a few modifications) as the school laws for the Oklahoma Territory, the responsibility for educating the children fell mainly on each locale. The settlers made every effort to organize one-room, one-teacher, eight-grade schools within walking distances of every rural family—which for the most part were inadequate for the society at that time. Since most homesteaders were young parents with growing families, these schools often overflowed with 50 or more pupils.

There was no serious effort to provide more than an eighth-grade education, as not many farm boys or girls were serious about pursuing studies beyond this point; for most, it was terminal. In 1908, one county with nearly 5,000 children in 74 schools graduated only 42 from the eighth-grade education, as not many farm boys or girls were pupils.

Two months of school was the average term and school opened in November and closed in December. The district got its own district owned school house in 1898 and it was built by patrons of the district who donated their labor.

Teachers' salaries, too often little more than those paid unskilled labor, were so low that many communities found it difficult to attract good teachers. In its first session, in 1890, the Legislature wisely established a territorial normal school to prepare teachers for these rural schools, which did alleviate the situation to a considerable degree. Until statehood, each county superintendent was responsible for certifying his own teachers on the basis of examinations prepared by the Territorial Department of Education.

Fortunately, hundreds of enthusiastic and self-sacrificing individuals scattered throughout the state dedicated a major portion of their lives to developing Oklahoma's greatest asset: its wealth of boys and girls. And despite short terms, crowded and inadequate buildings, little or no equipment, and poor lighting and heating facilities, all real handicaps to educating students, the success of many outstanding citizens who attended these schools attests to the ability of some people to overcome handicaps and even thrive on adversity.

The white population in Indian Territory continued to increase, and many of these children were deprived of even the most rudimentary education. Under the Curtis Act of 1898, the federal government assumed control of the schools in this area and appointed a superintendent for Indian Territory. The tribes were hesitant to surrender control of their institutions, but since the Secretary of the Interior controlled their funds, they had to acquiesce. Former leaders were left in administrative positions, however.

The federally appointed superintendent set up summer normal schools and certified teachers. Joe C. Jackson, who surveyed education in eastern Oklahoma, stated:

Under Federal control, funds were made available to expand and increase the number of day schools in the Territory and opened them to whites. Consequently by 1907 there were 996 day schools in the region, most of which were available to white children.

Along with this program of increasing educational opportunities for rural children, the Government broadened the curriculum of the academies to the end that vocational work replaced or supplemented much of the liberal arts; intensified and broadened the program of the summer normals; raised teacher standards; made it possible for towns to incorporate; vote bonds; levy taxes and thus provide schools through legal channels; minimize graft and corruption; and generally laid the groundwork for the state educational system that was to come.

**Statehood**

The Indian nations struggled to remain independent of Oklahoma Territory. In 1905, they held a convention and adopted a constitution for an Indian state of Sequoyah, but
their effort to gain separate statehood failed. The following year, President Theodore Roosevelt signed an Enabling Act combining the Indian Territory and Oklahoma Territory into a single state. A convention adopted a constitution in July 1907, and the people ratified it 2 months later. Oklahoma was declared a state on November 16, 1907.

The new constitution Alabama had adopted greatly influenced the convention that drew up the Oklahoma document. It also decided that the laws enforced during the territorial period "at the time of the admission of the state into the Union, which are not repugnant to this constitution and which are not locally inapplicable, shall be extended to and remain in force in the state of Oklahoma until they expire by their own limitations or are altered or repealed by law" (5).

The constitution framers stipulated that "until otherwise provided by law, the Governor, Secretary of State, and Attorney General shall be ex officio members, and with the Superintendent, compose said Board of Education" (6). Obviously, by adding "until otherwise provided by law," they recognize that the original state board, composed of ex officio members, could not for long spend sufficient time to meet the needs of the public school system.

The new constitution stated specifically that "the legislature shall establish and maintain a system of free public schools wherein all of the children of the state may be educated" (7). Statutes now specifically list the powers and duties of the State Board of Education, designating it as the governing board of the State Department of Education. It lists the qualifications and duties of the state superintendent, an elected official, who serves as the state board's executive officer.

No person shall be eligible to nomination, appointment, or election to the office of State Superintendent of Public Instruction unless he (1) holds at least a Master's Degree in school administration from a college recognized by the state board of education; (2) is a qualified elector of the state of Oklahoma; and (3) meets the requirements to qualify for an administrator's certificate. Provided further, that no person shall be allowed to file as a candidate for nomination or election to the office of State Superintendent of Public Instruction nor shall the name of any person appear on any election ballot as a candidate for such office unless he then has the qualifications herein prescribed (8).

The 1907 constitution provided for the state to be divided into counties, and eastern Oklahoma was divided into 40. Each county was to elect a superintendent with the authority to establish and largely control the local schools. The first county superintendents divided the counties into school districts; in the first year of statehood 2,142 school districts were formed in what had been Indian Territory.

At first, local rather than state officers were responsible for renovating old buildings, constructing new facilities, and certifying and finding competent teachers. The financial burden proved to be more than the local units could bear, however, and Congress responded with a $300,000 special appropriation to provide rural schools for Indian Territory.

At the start, both the county superintendents and federal supervisors were involved in teacher training and certification. Conflict soon developed because there was strong sentiment for complete local control. Congress appropriated $300,000 each year until 1913, when it stopped federal aid to county schools (9).

In November 1907, E. D. Cameron, who had served as territorial superintendent from May 1893 to May 1897, became the first elected state superintendent of public instruction. He presided over the 1909 convention of the Oklahoma Teachers Association in Oklahoma City, which urged the establishment of rural high schools throughout the state. As president of the convention, Superintendent Cameron asked for civil service for teachers and seven-month minimum school terms, arguing that "the occupation of the teacher should be made more secure and less uncertain" (10).

LEGAL CHANGES

R. H. Wilson, a native of Scotsville, Kentucky, who came to Oklahoma in 1903, taught school 7 years, served as the Grady County superintendent of schools from 1907 to 1911 and became state superintendent in January 1911. In his first year in office, the Legislature changed the school laws and created the State Board of Education as it is known today. The Legislature decreed that the Governor should appoint six members to the board. The superintendent of public instruction was its constitutional president.

Although the State Department of Education is the administrative agency for the State Board of Education, it is not subject to its governing board's initiative alone. The department itself must be sensitive to the needs of a dynamic society—completely flexible. On many occasions it must take the responsibility to initiate necessary changes, subject, of course, to the board's or Legislature's approval.

The seven-member board was organized in March 1911, with Leslie T. Hoffman of Oklahoma City as its secretary and R. H. Wilson as president. The new law continued to make the office of state superintendent elective for a 4-year term, and it stipulated that the salary would be $2,500 per annum. No person was eligible to the office except a male person of more than 30 years of age, who had been a qualified elector of this state for 3 years before his election (11).

State Superintendent R. H. Wilson pointed out that the state board strongly favored the consolidation of rural
school districts, as provided for by the state's laws. He agreed wholeheartedly that farm boys and girls should have the same or equivalent advantages of education as the boys and girls in the towns. He believed this could be brought about only by grading the country schools more effectively, providing more efficient teachers, securing better supervision, and providing additional instruction above the eighth grade as needed.

Superintendent Wilson believed that forming larger districts from smaller ones would accomplish this, since this had already happened in a number of the progressive states, as well as in more than a score of schools in Oklahoma. Wilson stated: "So far as this Board is advised, not one of these schools, either in other states or in our own state, has reported that it would be willing to go back to the old system" (12).

The State Aid Law of 1911 permitted the superintendent and the state board to use the union graded consolidated district fund to assist in constructing school buildings for consolidated districts. The law read as follows:

Whenever a school district of not less than twenty-five (25) square miles in area shall have been established and conducted for a period of not less than six months under the terms of existing laws with reference to the consolidation of schools, and a building containing not fewer than three rooms, suitably constructed, equipped and furnished shall have been built, and a graded school employing not less than three teachers shall have been conducted for a term of not less than six months, upon making proof of compliance with the foregoing provisions approved by the State Superintendent of Public Instruction shall have drawn a warrant in favor of the district treasurer as provided in Section 5 of this act (13).

Superintendent Wilson continued to serve as chief state school officer and president of the State Board of Education until 1922, when he decided to become a gubernatorial candidate. During this time, the department grew in both size and prestige. The number of teachers in Oklahoma increased from 10,282 to 17,274, and the general fund expenditures for public education increased from $8,957,568 to $26,973,599 (14).

Progress Under State Superintendent M. A. Nash

M. A. Nash, secretary of the Oklahoma Education Association, won election to the state superintendency in 1922 and assumed office in January 1923. Extremely able, he was the first Phi Beta Kappa to hold the state superintendency. He worked hard to standardize the rural schools throughout the state, using a "model school score card." About 500 districts qualified as "model schools" in 1924; 1,500 the following year; and 2,000 in 1925.

Nash also emphasized both the teaching of reading and health education. He added two additional rural school supervisors to his staff at the close of 1926 and, with the cooperation of every health agency in the state, improved this phase of the schools' work considerably. In this same year, he made a number of important recommendations that became the basis for many later statutes that today constitute the program for public education in Oklahoma.

Dr. Nash specifically recommended increasing the minimum school term from 3 to 9 months and the enactment of a full-time school attendance law. He recommended a plan for state financial aid to guarantee more equality of educational opportunity, with specific procedures for bringing this about. Superintendent Nash asked the Legislature to give the State Board of Education sole responsibility for issuing teacher certificates. He also requested an appropriation to help provide county supervisors of instruction, and he cooperated with The American Legion in promoting an adult education program to eradicate illiteracy (15).

Oklahoma lost a farsighted state superintendent when Dr. Nash resigned in April 1927 to become president of Oklahoma College for Women at Chickasha.

The Better Schools Amendments

Approval of the Better Schools Amendments in the general election of 1946 constitutes a landmark in the state's educational history. These amendments increased state aid to school districts and allowed teachers a wider preference in choosing textbooks, a measure supported by teachers and administrators for many years. In fact, the Oklahoma Education Association presented the amendments and financed most of the campaign for their adoption. The OEA was joined by the State School Boards Association and the Oklahoma Congress of Parents and Teachers, whose leaders and members contributed much time and energy. The presidents of these associations spoke on the radio several times to ask people to support the amendments. Local parent-teacher groups telephoned and passed out literature urging voter approval, and they even stood in the rain to hand out materials on election day.

Taxpayer groups, especially the Oklahoma Chamber of Commerce, strongly opposed the Better Schools Amendments. The proponents also had to overcome a natural tendency by many to leave the situation alone. This was the first time in the state's history when significant amendments to the constitution were approved in a general election with the silent vote counted as a negative vote.

Dread predictions—an integral part of most opposition campaigns—failed to scare the voters, who were willing to vote a feasible program for improving the schools. And with the successful campaign to pass the amendments began the close cooperation among the OEA, State Schoolboards
their effort to gain separate statehood failed. The following year, President Theodore Roosevelt signed an Enabling Act combining the Indian Territory and Oklahoma Territory into a single state. A convention adopted a constitution in July 1907, and the people ratified it 2 months later. Oklahoma was declared a state on November 16, 1907.

The new constitution Alabama had adopted greatly influenced the convention that drew up the state's basic law, and some of its provisions appear in the Oklahoma document. It also decided that the laws enforced during the territorial period "at the time of the admission of the state into the Union, which are not repugnant to this constitution and which are not locally inapplicable, shall be extended to and remain in force in the state of Oklahoma until they expire by their own limitations or are altered or repealed by law" (5).

The constitution framers stipulated that "until otherwise provided by law, the Governor, Secretary of State, and Attorney General shall be ex officio members, and with the Superintendent, compose said Board of Education" (6). Obviously, by adding "until otherwise provided by law," they recognize that the original state board, composed of ex officio members, could not for long spend sufficient time to meet the needs of the public school system.

The new constitution stated specifically that "the legislature shall establish and maintain a system of free public schools wherein all of the children of the state may be educated" (7). Statutes now specifically list the powers and duties of the State Board of Education, designating it as the governing board of the State Department of Education. It lists the qualifications and duties of the state superintendent, an elected official, who serves as the state board's executive officer.

No person shall be eligible to nomination, appointment, or election to the office of State Superintendent of Public Instruction unless he (1) holds at least a Master's Degree in school administration from a college recognized by the state board of education; (2) is a qualified elector of the state of Oklahoma; and (3) meets the requirements to qualify for an administrator's certificate. Provided further, that no person shall be allowed to file as a candidate for nomination or election to the office of State Superintendent of Public Instruction nor shall the name of any person appear on any election ballot as a candidate for such office unless he then has the qualifications herein prescribed (8).

The 1907 constitution provided for the state to be divided into counties, and eastern Oklahoma was divided into 40. Each county was to elect a superintendent with the authority to establish and largely control the local schools. The first county superintendents divided the counties into school districts; in the first year of statehood 2,142 school districts were formed in what had been Indian Territory.

At first, local rather than state officers were responsible for renovating old buildings, constructing new facilities, and certifying and finding competent teachers. The financial burden proved to be more than the local units could bear, however, and Congress responded with a $300,000 special appropriation to provide rural schools for Indian Territory.

At the start, both the county superintendents and federal supervisors were involved in teacher training and certification. Conflict soon developed because there was strong sentiment for complete local control. Congress appropriated $300,000 each year until 1913, when it stopped federal aid to county schools (9).

In November 1907, E. D. Cameron, who had served as territorial superintendent from May 1893 to May 1897, became the first elected state superintendent of public instruction. He presided over the 1909 convention of the Oklahoma Teachers Association in Oklahoma City, which urged the establishment of rural high schools throughout the state. As president of the convention, Superintendent Cameron asked for civil service for teachers and seven-month minimum school terms, arguing that "the occupation of the teacher should be made more secure and less uncertain" (10).

LEGAL CHANGES

R. H. Wilson, a native of Scotsville, Kentucky, who came to Oklahoma in 1903, taught school 7 years, served as the Grady County superintendent of schools from 1907 to 1911 and became state superintendent in January 1911. In his first year in office, the Legislature changed the school laws and created the State Board of Education as it is known today. The Legislature decreed that the Governor should appoint six members to the board. The superintendent of public instruction was its constitutional president.

Although the State Department of Education is the administrative agency for the State Board of Education, it is not subject to its governing board's initiative alone. The department itself must be sensitive to the needs of a dynamic society—completely flexible. On many occasions it must take the responsibility to initiate necessary changes, subject, of course, to the board's or Legislature's approval.

The seven-member board was organized in March 1911, with Leslie T. Hoffman of Oklahoma City as its secretary and R. H. Wilson as president. The new law continued to make the office of state superintendent elective for a 4-year term, and it stipulated that the salary would be $2,500 per annum. No person was eligible to the office except a male person of more than 30 years of age, who had been a qualified elector of this state for 3 years before his election (11).

State Superintendent R. H. Wilson pointed out that the state board strongly favored the consolidation of rural
Textbook Law

When Oklahoma wrote its 1907 constitution, it provided for what was then considered the most progressive method of choosing a textbook: the one-book, exclusive adoption method at the state level, by a commission composed of laymen and schoolmen. It stated that “the legislature shall provide for a uniform system of textbooks for the common schools of the state” (16). The Oklahoma Education Association, the Oklahoma Congress of Parents and Teachers, the State School Boards Association, and other groups supported the 1946 amendment, which made educators assume the entire responsibility for selecting and adopting textbooks. This constitutional change stipulated that the state would provide funds for purchasing the books, and it gave the teachers an opportunity to select from multiple lists. The constitution, as amended in the general election of 1946, now reads:

The Legislature shall provide for a system of textbooks for the common schools of the State, and the State through appropriate legislation shall furnish such textbooks free of cost for use by all pupils therein. The Legislature shall authorize the Governor to appoint a committee composed of active educators of the State, whose duty it shall be to prepare official multiple textbook lists from which textbooks for use in such schools shall be selected by committees composed of active educators in the local school districts in a manner to be designated by the Legislature (17).

The School Code of 1947

The School Code of 1947 was one of its most important measures for education since statehood when it approved the Oklahoma School Code in 1947. Educators and legislators had long recognized the necessity for repealing or clarifying these numerous laws; many were obsolete, contradictory, and unsuited to the needs of modern schools, and actually hindered the educational process. The code not only repealed some outdated and unworkable statutes, but it grouped all pertaining to particular subjects in a convenient manner and improved the administration of the system considerably. Perhaps the best proof that this code was wisely written and satisfied a real need in the state is that subsequent sessions of the Legislature have not changed it except for minor revisions, and the state’s administration of public schools has encountered fewer difficulties than before.

SCHOOL FINANCE

The Territorial Period

As stated earlier, during the territorial period (and early statehood) school terms were generally short, ranging from 3 to 8 months, and the funds for maintaining them and paying the teachers were hard to collect. In one county, carved from the Cherokee strip in 1893, a contract for the 1895-96 school year shows that a teacher was employed for a 3-month term with a salary of $20 per month in cash. It also was very difficult in those days to turn school district warrants into cash. But, at the same time, a man with a shovel or pitchfork could demand the magnificent wage of $1 per day.

During this territorial period, all districts were authorized by law to levy a maximum of 10 mills if a majority of the school district electors voted to do so. In addition to the amount this levy raised for the schools, each district was entitled to prorate part of a county 2-mill levy and to receive a share in the funds from the public school land leases, which in turn was based on its enumeration. In the few independent districts, the city council could levy a maximum of 15 mills for school purposes.

When Congress opened the unassigned lands to settlement, it reserved sections 16 and 36 for the public schools. By 1900, the revenue from these lands amounted to only $1 per enumerated pupil; thus, if a district had 60 students, it received a total of $60. One reason these sections did not produce more revenue was the fact that until a settler proved his claim and received a deed, no tax could be levied on the land itself. The Indian lands were not subject to ad valorem duties, leaving only personal property upon which school levies could be applied. It is no small wonder that the schools had only the bare necessities: short school terms, inadequate buildings, few supplies, and poorly paid teachers.

In an effort to keep the schoolhouse within walking distance of every child, the regional school districts were based on the township, and each township was divided into four parts, allowing 9 square miles to a school district. Since these homesteads were widely scattered, it was necessary to create many districts, so that in the first school year (1907-1908) the new state had a total of 5,656—slightly over 3,400 in Oklahoma Territory, and a few over 2,000 in Indian Territory. We cannot be too critical of these early day schools because they were the best this young territory’s settlers could afford.

The Permanent School Fund

When Oklahoma was admitted to statehood in 1907, its constitution permitted each district to allocate its income from a 5-mill local tax for current expenses, and if a majority of the people approved, the district could make an
excess levy of 10 mills. At the same time, the public school lands that Congress had set aside in the territory were turned over to the new state, and in lieu of the school lands not reserved in the Indian Territory, Congress gave Oklahoma $5 million. It was the revenue from this trust fund and the public school lands which became the state's permanent school fund. The constitution provided for the care and distribution of earnings from this fund, and though it has been carefully preserved through the years, it still does not produce a large amount of revenue in comparison to the overall financing. For instance, in the school year 1964-65, it amounted to only $3,000,461—less than 1.5 percent of the school's total revenue.

One serious problem that afflicted the state's financial structure was the wide variance in the wealth evaluation of the counties and school districts. In the fiscal year 1961-62, a rural two-teacher school of Delaware County, a northeastern Oklahoma school district containing restricted Indian lands, had a total net evaluation of $15,276. In the same year, a school district maintaining a one-teacher rural school in a county in central Oklahoma had a net evaluation of $993,262. While a southeastern county had an assessed evaluation of only $1,000 for each enrolled pupil, a northwestern county's evaluation exceeded $10,000 per student (18).

Providing for Equalization

The unequal distribution of wealth made state aid imperative for Oklahoma's schools. From 1907 to 1933, school districts participated in the distribution of a 0.25 mill statewide levy, but the Legislature discontinued it during the Depression to give relief to the ad valorem taxpayers. The state also has utilized other sources of revenue, such as county mortgage taxes, gross production taxes, and auto and farm truck licenses. But these additional sources did little to equalize the school districts ability to provide adequate educational programs for all students. The Legislature appropriated $100,000 to help pay current expenses of financially weak schools in 1919, and succeeding Legislatures increased it fivefold within 6 years.

When M. A. Nash resigned, the Governor appointed John Vaughan, a Tennessean who had served as superintendent of schools at Kingston and Wapanucka and as a member of the Oklahoma State Senate from 1917 to 1921. At the time of his appointment, he was dean, registrar, and acting president of Southeastern State College at Durant. In part as the result of Superintendent Vaughan's leadership, the 1927 Legislature earmarked one-fourth of the revenue from a gross production tax to create a state equalization fund, stipulating that not more than $1.5 million could be so apportioned during a school year. Two years later, the Legislature supplemented this fund by $250,000, by another $175,000 in 1931, and by $600,000 in 1933. Although these were the Depression years, state aid to schools had increased from $1,489,762 in 1927-28 to $8,180,000 in 1935-36, when Vaughan resigned to become president of Northeastern State College at Tahlequah.

The chief weakness of these early efforts was that no objective method had been designed for distributing the funds. The state department put forth every effort to make an equitable distribution but too often allowed the loud wails of the needy districts to be the measure of bare necessity. Undoubtedly, some districts received more than their share while others, equally deserving, got little or, in some cases, no state aid.

Just before Vaughan's resignation became effective, the 1937 Legislature passed its first state aid bill by appropriating $8,180,000 from the general revenue fund for each year of the biennium—really a milestone in the history of Oklahoma education. Governor E. W. Marland appointed A. L. Crable, the director of correspondence study at Oklahoma A & M, to complete the term of office which had begun in January 1935. It was in part Crable's leadership, in cooperation with other educators and associations in the state, that prompted the Legislature to increase its appropriation to $12,800,000 for each year of the biennium. This law also extended the high school year to 9 months and greatly increased the number of approved junior and senior high schools. Crable received specific funds from the Legislature to establish the position of director of curriculum in the state department.

The Program of State Aid Today

With modifications, the program of state aid established in 1935—supplemented by additional funds from larger appropriations or from additional sources of revenue in successive legislative sessions—is the program of state aid that Oklahoma followed for the next 30 years. These legislative appropriations have never been easy to procure, but the state superintendent and the department have consistently cooperated with the Oklahoma Education Association, the Oklahoma Congress of Parents and Teachers, and the State School Boards Association in presenting the schools' needs as clearly and fairly as possible.

The competition for revenue funds remains a permanent condition. Generally, earmarked funds have not benefited all segments of public education, because in many instances funds raised for the public schools have been placed in the state's general revenue fund and appropriated for other purposes. In the 1964-65 school year, the grand total available for the public schools was $217,595,744. Of this amount, $87,336,525 (about 40 percent) came from state sources, and $48,522,031 represented the Legislature's appropriation paid to school districts as state aid (19). The following year, state aid increased to $65,540,880.

When the separate or segregated schools provided for in the original constitution were discontinued, the 4-mill
Title V-A of NDEA provides federal funds for testing and counseling guidance where properly certified personnel are available to administer the program. In 1958-59, only 67 programs were approved and 15,634 ninth-graders tested. In 1966, the eighth year of its operation, tests were given to 37,563 ninth-graders. The state plan has been amended now to provide for elementary school guidance.

Title X of NDEA, now supplemented by Title V of the Elementary and Secondary Education Act (ESEA) of 1965, provides funds for improving state department programs for gathering, compiling, analyzing, and disseminating educational data. The state department has planned to install terminal data-processing equipment to serve a network of many centers established by school districts and other subagencies throughout the state.

Title V of ESEA provided $231,000 to strengthen the state department, enabling it to purchase equipment and employ additional personnel. It already has been of assistance to the department's curriculum division; finance division; instruction division; certification and teacher education; special education; and health, safety, physical and driver education. It has provided assistance for the guidance, informational services, and school lunch divisions, and it has enabled the department to expand its special professional library. It would be difficult to overestimate the value of this program.

Title I of ESEA provides funds for improving and increasing the education of the educationally deprived and disadvantaged youth. In 1965-66, Oklahoma was allotted $17,393,688 for these purposes. By March 1966, some 697 projects from 748 school districts had been approved to spend $50,843,705. These programs have enabled the school districts to employ additional teachers, administrative assistants, clerks, health workers, psychologists, and teacher aides. Also, districts have purchased equipment and materials and have organized in-service training programs so as to more effectively implement this program.

Title II of ESEA supplements present expenditures for books, library, and educational materials for pupils and teachers. The state department receives 5 percent of the funds allocated for administering the program. The law provides for loaning these materials to private schools, but the Oklahoma attorney general ruled in September 1965 that neither state nor school districts can legally make these loans (21). Thus, the U.S. Commissioner of Education contracts directly with other agencies, and $1,266,000 is held from the Oklahoma allotment to provide this service.

There has been considerable prejudice against the state's receiving money from the federal government, and many people and a large part of the press for years have regarded it a capital sin to recommend any kind of a new tax. Despite this, the State Department of Education and the Oklahoma Education Association have worked together to secure more finances for education. The issue between the two has been what financing is necessary to provide...
competitive teachers' salaries, proper teacher-student ratios,
and adequate facilities to give the children of the state the
quality of educational services considered minimal for
today's world.

A considerable part of this outcry against federal
money and taxes has come from far-right extremists, who
are well financed and organized in the state. They have
neatly packaged their economic doctrines against federal
financing with the emblem of the cross and the flag.

Despite the prejudices of many Oklahomans and the
fulminations of the far right, the state increasingly needs to
use federal funds on the local level to support
financing with the emblem of the cross and the flag.

Explosions in knowledge and population have given us a
heritage undreamed of at the beginning of this century. It is
conservatively estimated that more than 50 percent of the
value of our resources today lies in the field of intangible
knowledge (such as technical know-how). Local political
boundary lines have less significance in the geography of
everyday life. Thus, the political fiber and fabric of our
country must respond to changes in the economic body,
regardless of political partisanship, and the state must rely
on these new federal programs to meet the challenge of this
changing world.

It is not unusual in this century for an individual to
have had more than $50,000 in public and private funds
invested in his education. He starts out in life "affected
with public interest," and it is our schools which will pass a
greater part of our heritage from generation to generation.
A properly educated individual may easily have an earning
potential of $250,000 or even millions of dollars. In our
affluent society, instantaneous prosperity may well come to
a man brought up in poverty, if the man is properly
educated and placed where his knowledge and skills have
the greatest value.

The idea that high purpose and productive initiative
must be limited to individual and local dimensions went out
with the development of modern transportation, commu-
nication, and industrial techniques. Regardless of politi-
cal partisanship, the economic laws of private enterprise
will determine the use of federal instruments in many areas
which were previously considered local.

SCHOOL DISTRICTS AND CONSOLIDATION

Early Efforts To Consolidate

The Territorial Legislature enacted a law in 1891 to or-
ganize school districts in the western lands opened by
homesteaders, squared 3 miles on each side (one-fourth the
size of a township) or 9 square miles per district. On
admission to statehood 16 years later, Oklahoma Territory
contained 3,441 school districts with only 185 high
schools, all in cities or towns. Forty new counties had been
created in Indian Territory or the eastern part of the state,
and these were divided into 2,200 school districts in
1908 (22). For the most part, these eastern school districts
were much larger than those in Oklahoma Territory.

The law permitted the county superintendent to or-
ganize districts, and the Department of Education worked
closely with these officials during this early period. But in
his first biennial report, the state superintendent wrote that
he found a number of school districts too small and with
too few children to justify schools with even a minimum
grade school curriculum, to say nothing about opportu-
nities for high school education.

The Legislature passed an act in 1895 enabling two or
more districts to unite to offer instruction in the higher
grades at a central school while maintaining the district
schools. Four common school districts with territory in
Payne and Pawnee Counties formed the first consolidated
district at Quay in 1903. But for the most part, this plan
was not successful, and though the law was modified, only
a few districts were organized as union graded districts
during the next 15 years. The poor roads and bridgeless
creeks that handicapped transportation presented one of
the major barriers.

It was obvious by 1908 that students in many small
districts should travel greater distances to larger schools.
Stating his position plainly in his first annual report, State
Superintendent E. D. Cameron said: "In some of these
districts, we will put into operation the plan of conveying
the children to and from school every day. We favor this
plan of large districts, graded schools and conveying chil-
dren to and from school every day" (23). The report con-
tinued: "If an average of four districts would unite in this
way to run one school, our state would soon be filled with
rural district schools doing good work in the higher grades,
and our district schools would be as good as any in the
world" (24).

In the meantime, the problem was becoming more
acute due to a shift in population; Oklahoma was no longer
strictly rural. New methods of farming, the tractor, and
other mechanized operations were causing thousands to
leave farm communities for industrial areas. In effect, the
process of urbanization gradually pulled people away from
localities so that schools could no longer be supported and
were no longer needed, though the buildings stood for years
as monuments to the earlier days.

As mentioned earlier, State Superintendent R. H.
Wilson secured support from the new State Board for
Reorganization, and the State Aid Law of 1911 enabled
this board and Wilson to consolidate school districts. Nev-
evertheless, by 1914, the number of school districts had in-
creased to 5,880. The 1919 Legislature attempted to reduce
the number of schools by giving county superintendents
arbitrary power to annex school districts, and it allowed
them to disorganize districts with fewer than eight children
by annexing to adjoining districts. But county superin-
tendents were elected officials, reluctant to close schools
Period of Active Consolidation, 1915-30

By the time Oklahoma was admitted as a state, it had gradually solved its transportation problems with a fair system of dirt roads stretching across the territory and bridges spanning most of the larger streams. The state had constructed some permanent highways in 1915, and it was at this time that public school consolidation really gained its impetus. In 1918, 86 consolidated districts were providing transportation, and 2 years later, this number had increased to 184. Motorized vehicles gradually replaced the horse-drawn wagons, so that the Legislature legalized them for transporting pupils in 1919. Local districts generally paid for this transportation until the General Equalization Aid Law of 1935 made transportation a part of the minimum program for Oklahoma public schools.

State Superintendent R. H. Wilson wrote in 1916 that "the records in some counties have been carelessly kept and county superintendents are unable to give complete information concerning the consolidated and union graded districts in their counties" (25). Several districts, after voting for consolidation, had not voted bonds for central buildings and had been forced to disorganize. Both the state board and the Legislature made several attempts to bring about reforms. For instance, the board published a bulletin in September 1911 entitled Rural School Consolidation, outlining the requirements and procedures for consolidation, as well as a survey of progress up to that time.

Two years later, in 1913, the Legislature tried to help newly organized districts and at the same time give an impetus to consolidation by appropriating $100,000 for buildings. The Legislature required the following: that (a) new school buildings be located centrally, (b) the consolidated districts have an area of 25 square miles each, and have a minimum evaluation of $500,000, and (c) transportation be provided for students living 2 or more miles from schools. It failed to appropriate funds for this purpose in 1915 but in later sessions continued to aid buildings, and this undoubtedly promoted consolidation.

By 1920, the cost of transportation still appeared to be the major problem in creating large central schools; 98 consolidated districts reported that they spent 20 percent of their entire operating costs for this purpose. This delayed consolidation, particularly in those areas where evaluations were extremely low and it was impossible for them to meet this additional expense.

The most active period of consolidation occurred from 1915 to 1930, during the superintendencies of R. H. Wilson, M. A. Nash, and John Vaught. Fortunately, they served with boards composed of men with vision and initiative, whose chief aim was to make high school education accessible to every boy and girl in the state. It was during this period that terminal education moved first to the high school and then beyond to college and the university. This could not have been accomplished without the dedicated efforts of numerous able county superintendents. It is impossible to name every superintendent in the 77 counties who contributed so greatly to improve the state's education through consolidation, but particularly outstanding were H. H. Porter of Jackson County and Milton C. Butler of Greer County.

Transportation Solved

Consolidation brought all school-age children to central buildings. The union graded school provided for the lower grades to remain in the district's original buildings, while the upper-grade students were transported to the central location where suitable facilities and curriculums could be provided. This enabled the districts to pay higher teachers' salaries, follow a higher standard of maintenance, and provide transportation. Each morning, in every community, buses with similar equipment and personnel line up in front of the local schools to begin the day's run. This takes place routinely throughout the school year. The state department has carried heavy responsibilities in developing and administering this important program, and it represents one of the significant factors in the increased cost of education.

From 1935 to 1945, hundreds of school buses rolled over all-weather roads built from material obtained locally, such as sand, gravel, crushed rock, and in more fortunate communities, asphalt. And since World War II, Oklahoma has constructed thousands of miles of first-class roads. By 1945, many rural schools no longer operating but were transferring their elementary as well as high school pupils and providing transportation routes through the districts. And by this time, the state was helping districts transport all of their transferred pupils.

The 1947 Law

The Legislature finally enacted a stronger law in 1947 to bring about school district reorganization. This law stated that any district not maintaining its school for 1 year would be annexed, and if the average daily attendance fell below 13 in any elementary school district, it would be annexed unless it could be declared an "isolated" district (26). It also provided for a reduction in the number of small and uneconomical high schools.

By September 1, 1950, the total number of school districts had been reduced to 2,177, from 4,450 in 1946, and more than 1,100 of these were not maintaining home schools. Many other districts were hard-pressed financially and suffered from inadequate standards in both their elementary and secondary schools. By the 1964-65 school year, the districts were reduced to 1,118, and by September 1, 1966, the finance division reported only 998 school
districts in the state. The Oklahoma State Department of Education has attempted to administer the annexation laws fairly and, at the same time, provide proper and adequate educational opportunity for all.

SPECIAL PROGRAMS

Vocational Rehabilitation

As a direct result of World War I, Congress enacted “an Act for the promotion of the vocational rehabilitation of persons disabled in industry, or otherwise, and their return to civil employment.” Passed on June 2, 1920, it was known as the “civilian rehabilitation program” to distinguish it from a veterans program organized the previous year. One of the most far-reaching pieces of social legislation of the day, it established one of the first national grant-in-aid programs designed to give financial support to a state-administered operation (27).

Oklahoma initiated its own program when the Tenth Oklahoma Legislature enacted Senate Joint Resolution No. 39 in March 1925, accepting the terms of the federal act and pledging the good faith of the state in carrying it out. Unfortunately, it did not provide an appropriation for its support, but the state board accepted the responsibility and operated it for almost 2 years with funds contributed by civic clubs and interested individuals, matched dollar for dollar by the federal government. The Eleventh Oklahoma Legislature then voted an emergency appropriation of $5,000, effective in March 1927, for the remainder of the first biennium, and an appropriation of $19,267 for each year of the following biennium. Two years later, in September 1929, the Legislature made the program a division of the State Department of Education.

The rehabilitation program experienced a slow but constant growth during the next few years, expanding to include persons with hidden disabilities, such as lung and cardiac conditions, as well as those suffering from emotional and mental illnesses, mental retardation, and character disorders. This development can best be seen through a comparison of figures from 1929 to 1965 (28).

The figures given above adequately dramatize this dynamic national movement as it affected Oklahoma, but they do not tell the entire story. The state’s financial investment has been recovered many times over, the most important result being the reclamation of thousands of disabled men and women who subsequently enriched their communities and the State of Oklahoma.

Special Education

The Legislature passed the first special education law in 1945 to provide for individual children whose handicaps made it impossible or impractical for them to benefit from regular school programs. Subsequently, it has amended the law a number of times and now authorizes the districts to organize classes for children who are mentally retarded, mentally handicapped, physically handicapped, and emotionally disturbed. Since it is not practical for every district to organize such classes, the law provides for reimbursing districts for transportation or boarding costs up to but not exceeding $450 per year if children are transferred for placement in special classes.

The Legislature placed the Children’s Memorial Hospital in Oklahoma City under the state board’s control in 1957, and in 1965 it was placed under the supervision of the Division of Special Education. The department also provides counseling and job placement services for students through its Division of Vocational Rehabilitation. The cooperation and coordination of these two agencies has proved to be a major factor in providing a successful and realistic educational program for handicapped children.

The U.S. Office of Education’s spot surveys have found that more than 10 percent of our nation’s school children are handicapped, but Oklahoma discovered these figures to be very conservative when it conducted surveys in its own communities. Despite the problem of providing educational programs to meet the needs of handicapped youngsters, the department continues to strive to live up to its philosophy that all children are entitled to an education, and this is becoming more of a reality in Oklahoma year by year.

School Lunch Program

Congress placed the school lunch program on a permanent basis on July 4, 1946, by voting funds to assist in providing nonprofit lunches to both public and private schools of high school grade or under. The U.S. Department of Agriculture is responsible for carrying out the provisions through the state departments of education. In Oklahoma, as in several other states, the State Department of Public Welfare has handled the commodity distribution, but the State Department of Education’s school lunch division handles the functions of the program. This division has two primary objectives: to increase the consumption of food in order to develop a better domestic market for agricultural commodities, and to assist local communities in developing,
maintaining, operating, and expanding a program to provide from one-third to one-half of the nutritive requirements of schoolchildren.

The state matches each dollar paid by the federal government with $3 from its own resources as long as its per-capita income equals or exceeds the average per-capita income of the United States. Oklahoma, participating on a limited basis with a small number of schools in 1943, now serves 225,000 pupils daily. From 1947-48 to the 1963-64 school year, the total number of meals served children grew from 16,706,247 to 37,299,730. The local communities contributed more than $11,700,000 to the lunch program in 1963-64 to pay for lunches, labor, and equipment.

The state appropriated $150,000 for the fiscal year beginning June 30, 1965, to administer the National School Lunch Program, but the state had provided no funds up to this time to reimburse schools as had several other states. The state furnishes supplies each month to the schools and mails a monthly newsletter with a list of foods in plentiful supply, menus, and recipes. The newsletter also emphasizes the contractual responsibilities so that schools are posted on items affecting the program's operation. Workshops for food service personnel are held on college campuses during summer months, and approximately 1,000 register for this one-week training program each year. The school lunch division maintains liaison with the State Department of Public Health, the State Department of Public Welfare, the Oklahoma and National School Food Service Association, as well as the Department of Education's other divisions and architects who design school buildings (29).

Indian Education

From 1830 to 1840, a number of mission teachers accompanied the tribes when they were removed to Indian Territory and established schools, usually separating the boys' schools from the girls'. Each of the five civilized tribes provided facilities for educating its own young people. The bicameral Legislature of the Western Cherokees passed the first school aid law in 1832 to provide for five schools and to employ Sequoyah at an annual salary of $400 to supervise the teaching of his syllabary.

In recent years, the Oklahoma State Department of Education, through its Indian education division, has been able to assist in the education of Indian children under a contract with the U.S. Department of the Interior's Bureau of Indian Affairs, based on the Johnson-O'Malley Act of 1936. Prior to 1947, the Indian bureau administered the entire program, but since then the State Department of Education has supervised it.

In general, the Indian children have a good attendance record in the public schools, staying on through graduation from the eighth grade and even from high school. During the 1964-65 school term, there was an increase of 71 pupils in the eighth grade and 159 graduates over the previous year. These students are taking an increasing interest in post-high school training, and large numbers of them are seeking placement in both vocational schools and colleges.

Obtaining free school lunches is an ever-increasing problem for the Indian child, especially if his family resides inside the city limits of an incorporated town or city of 500 or more, because, according to the Oklahoma plan, he is not eligible for the aid. Also, each individual school district and its board has the sole responsibility for determining who is indigent. Many who need aid are not receiving it at present, but there were 425 districts with 426 schools in 60 counties (of the state's 77 counties) participating in the program during the 1963-64 school year, with 12,634 Indians included in a total of 165,270 pupils (30).

At present, there are two area offices administering Indian educational affairs, one in eastern Oklahoma at Muskogee and the other at Anadarko in the western part of the state. There were 338 schools enrolling 9,912 Indian pupils in Muskogee and 75 schools enrolling 2,955 in Anadarko in the 1964-65 school year.

RELATIONS WITH OTHER ORGANIZATIONS

The Curriculum Improvement Commission

The Oklahoma Secondary School Curriculum Improvement Commission was organized in 1952 by the Oklahoma Secondary Principals Association. In 1955, the name was changed to the Oklahoma Curriculum Improvement Commission, and the sponsors now are the Oklahoma Association of School Administrators, the Oklahoma Secondary School Principals Association, the Oklahoma Department of Elementary School Administrators, the Oklahoma Department of Classroom Teachers, and the Oklahoma Association for Supervision and Curriculum Development. The membership of the commission is selected from these sponsoring organizations and from the 12 geographical districts of the Oklahoma Education Association.

A unique organization, the Oklahoma Curriculum Improvement Commission is incorporated under the laws of the state and is financed by dues paid by constituent members. All school systems receive curriculum guides, which the commission produces free of charge. This self-perpetuating commission has about 35 members, chosen from all sections of the state and from all levels of instruction. A plan of rotating membership ensures a steady but orderly revision of the roster. It has written, published, and distributed 30 curriculum guides, including revisions. Generally, the vertical approach (kindergarten through twelfth grade) has been followed in preparing each guide.

The director of the curriculum division of the State Department of Education is the executive secretary of the commission, and the department furnishes secretarial
assistance, office space, and equipment. The commission is an extension of the curriculum division and supplements its program in a definite and satisfactory manner. It helps to organize and promote meetings, conferences, and workshops designed to improve in-service training in most of the subject matter fields. Each year, the commission completes a volume of Successful Ventures in Contemporary Education and sends free copies to schools within the state.

The Oklahoma Commission on Educational Administration

The Oklahoma Association of School Administrators (OASA) created the Oklahoma Commission on Educational Administration (OCEA) for the specific purpose of promoting better educational administration. The commission incorporated a state committee as its policy-making body in November 1955, as a nonprofit corporation under the provisions of the state's laws. This committee holds a minimum of six regular meetings each year and collects dues from school systems, individuals, and groups to finance its activities and the work of the commission.

The committee's scope and importance have grown to the point that it has broadened its membership to include representatives from other organizations of professional school personnel and those with allied interests. At present, in addition to the OASA, the state committee consists of representatives from the State School Boards Association, the Oklahoma Congress of Parents and Teachers, the Oklahoma Association of Secondary School Principals, the Oklahoma Association of Elementary School Administrators, the State Department of Education, colleges of education, and coordinators appointed by the state chairman to represent the Oklahoma Education Association districts.

The purpose of the commission is to help improve all phases of public school education in Oklahoma. It cooperates with other agencies in a wide variety of specific projects and activities, jointly sponsored by both educators and laymen. OCEA has financed the publication of an impressive list of documents and research studies designed specifically for use in Oklahoma and has distributed them without charge (31). The State Department of Education furnished secretarial assistance, office space, and necessary equipment at the state capitol.

Most of the publications by the OCEA's affiliated groups are shared. Copies of newsletters are exchanged, and each has permission to use this material. Many of these newsletters and bulletins are received by the same people, but each has its own mailing list. Publications also are distributed at the state committee's regular meetings.

At each meeting, representatives of the groups affiliated with the state committee report on projects and activities in progress and those planned for the future. Members are thus able to render assistance whenever it is needed.

STATE SUPERINTENDENT OLIVER HODGE

Oliver Hodge filed for the Office of State Superintendent of Public Instruction in 1946, while he was county superintendent of schools in Tulsa County. He won nomination over the incumbent and led the ticket in the November election. A former classroom teacher, principal, athletic coach, and graduate instructor at the University of Oklahoma, he led the department during the period of its greatest change. The year he took office, the new school code was enacted. The U.S. Supreme Court decision on school integration made him responsible for implementing it. Hodge outlined a dignified and successful program to accomplish this, and it has been activated.

The shortage of teachers during this period vied with the problem of upgrading professional qualifications; but with the philosophy that quality comes first, 99 percent of the public school teachers employed in recent years have had at least a bachelor's degree. This has placed Oklahoma at the head of the nation in this category for a number of years (32). It was also under Hodge's leadership that the unworkable, exclusive one-book adoption was changed in 1947 to a system of multiple selections.

The State Department of Education carries many responsibilities of which some of its citizens are unaware. For instance, the Legislature passed a law in 1963 authorizing annual workshops for newly elected school board members (33). The statutes assign many similar responsibilities to the State Board of Education (34). The total state expenditure from the general fund in the school year 1946-47 was $46,181,682; by the school year 1964-65, it had increased to $182,744,540 (35). The state department is a big business operation and must have the best leadership that Oklahoma can offer.

Dr. Hodge died in January 1968, during his sixth 4-year term. An editorial in the Daily Oklahoman paid one of the many tributes to Hodge. It said in part:

In the death of Dr. Oliver Hodge, the state has lost not only the head of its public school system but a genuine leader in education ....

Holding a political job, Dr. Hodge was less politician on the surface than almost any other elected official during his career. He was an idealist in education and although there were legal restrictions that somewhat limited his activities, many improvements can be laid to his influence and quiet balancing of the possible with the impossible ... (36).

To fill the unexpired term, Governor Dewey F. Bartlett appointed D. D. Creech, superintendent of schools in Pryor, Oklahoma, who took office as state superintendent in April 1968. A native Oklahoman, Dr. Creech had held superintendencies at Fargo, Arnott, and Velma, before going to Pryor in 1960.
With the addition of federal money and state matching funds, the schools of Oklahoma will continue to attempt to meet the challenge of educating young people for a complex, technological world community. There are few educators in the state as qualified to face this challenge as Dr. Creech. How well he succeeds will depend not on his own ability and that of his staff, but on the people of Oklahoma—legislators, teachers, school board members, interested laymen, administrators, and parents.

IN CONCLUSION

Twentieth-century Oklahoma has a nineteenth-century heritage that is unique in many ways. Its roots go back to the pioneer period, but its history is relatively short. However brief chronologically, this history is conterminous with the greatest revolution or explosion of knowledge our world has known. This has meant an extremely rapid adjustment to changing conditions. Some of the pioneers still living have seen the state’s educational opportunities grow from 6-month terms in one-room county schools to terms of 180 days in centralized, modern, consolidated schools and great universities.

During the first 15 years of this century, Oklahoma was largely a rural agricultural society, consisting of a family enterprise system in which each family farmed a homestead of 160 acres. The family produced the greatest part of its food supply on its own land. When drought, hail, flood, or grasshoppers ravaged the land, there was much privation. Under these conditions, eighth-grade grammar school education was more adequate than a bachelor’s degree today.

The development of revolutionary means of transportation and communication produced new conditions. For example, when better highways were built, it was no longer necessary to have a school within walking distance of every child. The ability to transport students quickly and safely gave the annexation and consolidation movement impetus; the one-room school became obsolete and was replaced by larger and newer schools with modern facilities.

The 5,580 school districts in 1914 were reduced to approximately 900 by January 1965 and to 856 by May 1968, as the state became rapidly urbanized. A concentration of large numbers of students in one school is not only sociably desirable but makes it possible to offer a better curriculum and adopt the new educational media. It also makes it economically feasible to institute a school lunch program.

State Board of Education—Nov. 15, 1907, to Mar. 6, 1911

When Oklahoma Territory and Indian Territory merged to form the present State of Oklahoma, no specific legislation was passed creating the State Board of Education, and the Territorial Board of Education became the temporary State Board of Education. The State Board of Education during this interim consisted of the Governor, secretary of state, attorney general, and the state superintendent of public instruction.

THE DEPARTMENT AS A CLERICAL ARM OF THE SUPERINTENDENT, 1849-1925

The early development of Oregon's public schools was the responsibility of the superintendent of public instruction, the State Department of Education existing only as his clerical help. As late as 1925, the department consisted of the superintendent, two professional assistants, and a handful of secretaries. The early superintendents carried out most of their business personally, answering letters and collecting reports entirely on their own. Sometimes they dug into their own pockets for expenses.

Initial Legislation, 1849-72

Oregon's administrative authority for education began in 1849, when the Territorial Legislature authorized the Governor to appoint a superintendent of common schools every 3 years (1) and established an educational fund to be distributed according to population. Since no organized common school system actually existed, the Legislature abolished the office in 1851, and it was not until 8 years later, when Oregon became a state, that the public school concept again assumed importance.

A statewide public school system was still not fully established when Oregon's constitution was adopted in 1859, so it contained a provision that the Governor serve as the superintendent of public instruction for the first 5 years of statehood (2). This arrangement was prolonged for the first 13 years, however, with four Governors—Whiteaker, Gibbs, Woods, and Grover—holding the office. With so many other demands on their time and a rapid turnover in the Legislature, these men did little to develop legislation for a public school system. Gibbs did pay out of his own pocket to finance the first state reports on the public schools. And his successor, Governor Woods, claimed that he found the schools still "disorganized and unsatisfactory" and pressed for legislation that would allow him to appoint a state school official who could devote his entire time to education (3).

The constitution stated: "It shall be competent for the legislative assembly to provide by law for the election of a Superintendent of Public Instruction, to provide for his compensation, and to prescribe his powers and duties" (4). The Legislature elected a superintendent in 1870 but 2 years later made the office part of the general election and set the salary at $1,500 (5). The constitution did not specify whether "election" in Article 8 referred to a popular or a legislative election. The Legislature decided early that it could assign the election to the public, but it remains a controversial issue today.

The 1872 legislation also outlined the responsibilities of state, county, and local educational administration. The State Board of Education, comprised of the Governor, secretary of state, and superintendent of public instruction, was to meet semiannually to authorize textbooks, provide for school government, and grant teaching certificates. This state board and the Office of Superintendent of Public Instruction thus constituted the beginning of state administration of education. The State Department of Education, not defined by law until 1951, evolved from the superintendent's need for assistance rather than from a specific legislative program. The early history of the department is actually no more than a record of the activities of the state superintendents and their professional and clerical help.

Early State Superintendents, 1873-1900

Simpson and School Statistics, 1873-74. The law provided for the superintendent to be elected by the joint ballot of the House and the Senate, but so much legislation had to be crowded through in the last session that the Legislature failed to choose anyone. Consequently, the Governor exercised his constitutional power to fill state offices and appointed Sylvester C. Simpson. In the 20 months he served, Professor Simpson accomplished two important tasks: He initiated a system for supplying school statistics, beginning with the first biennial report; and he organized a plan for acquiring a uniform series of textbooks for the entire state. When he took office, "he found not only different textbooks being used in several schools throughout the state for the teaching of the same subject, but teachers actually conducting classes where pupils were following different texts in the same room" (6). His plan—
Was not accomplished without considerable dissatisfaction on the part of parents who were forced to buy new texts, some teachers who did not like the new texts, and some who complained against the "school book monopoly." However, once established, the opposition to the series has appeared to have died out rapidly (7).

Superintendent Powell reported that the authorized texts were being used exclusively by 1880.

Rowland and Powell--A Stable Public System, 1874-82. When Professor Simpson chose not to serve another term, his co-worker and professor at the Willamette University Medical School, L. L. Rowland, was elected in 1874. From study at Virginia's Bethany College to the presidency of Christian College in Monmouth, he had gained the rich educational background necessary to carry on the development of a common school system. At the end of his 4-year term, the number of districts had increased 34 percent, public school enrollment 29 percent, the number of teachers 72 percent, and the total value of school property 50 percent (8).

Perhaps the most important task entrusted to the state superintendent during the terms of Dr. Rowland and his successor, L. J. Powell, was establishing annual teacher institutes in each judicial district according to the 1872 law. Otherwise, their main duties consisted of gathering educational data and certifying teachers with the State Board of Examiners. The clerical assistants, the only semblance of a department, were often paid by the superintendents themselves to gather statistics and negotiate teacher certificates. Both Rowland and Powell spent much of their time establishing a system of authorized textbooks chosen by the state board from a list provided by the local districts.

McElroy and Teacher Improvement, 1882-95. E. B. McElroy, educated at the State Normal School in Pennsylvania, taught several years on the East Coast and was a county school superintendent in Oregon for 4 years before becoming state superintendent. He devoted most of his 13-year term to improving the teaching staff. After securing the State Board of Examiners' approval, he persuaded the 1882 Legislature to "recognize" the state normal schools at Monmouth and Ashland. Recognition implied that the schools would receive financial support, but appropriation laws failed to pass in several sessions. Three other normal schools met the state standards during the following 7 years, greatly improving their ability to upgrade standards for teachers.

In 1887, the Legislature enacted a law providing free education to all residents under age 21. It passed a Compulsory School Attendance Act 2 years later requiring all Oregon residents from 8 to 14 years of age to attend public schools a minimum of 12 weeks each school year, at least 8 of them consecutively (9). This law was revolutionary for the time, and the citizens reacted strongly against the state's assuming so much authority. The superintendent received a large share of the public's criticism. Three years later, McElroy wrote: "The law has proven to be very defective...the very name 'compulsory' seems to be offensive to many people of the state" (10).

Irwin and High School Development, 1895-99. When George M. Irwin became superintendent, the country was still in the grip of the depression that followed the panic of 1893. The excitement over Cuba and free silver also diverted public attention from local issues. Not only were times unfavorable for educational expansion, but the new superintendent himself was conservative. Educated at Ohio Wesleyan University, he had served as a Methodist Episcopal pastor and as superintendent of the Chemawa Indian Training School. High schools increased in both number and importance during this period, and Irwin did attempt to continue the policies established by his predecessors for improving the quality of both teachers and normal schools.

New Responsibilities for the State Superintendent, 1900-25

Before 1900, the state superintendents spent most of their time on correspondence. They continually had to train new county superintendents for these low-paying, frequently vacated jobs. They had to present the biennial report to the Legislature, and gathering data with little clerical help used up much of their time. The Legislature finally recognized their problems and in 1899 provided the superintendent with an assistant and $1,500 for clerical help to answer questions about teacher certification. This meager appropriation marked the birth of the State Department of Education. For some time after 1900, when the state superintendent's authority was extended to include the controlling boards of higher education and ex officio membership in the Oregon Library Commission, this clerical allowance remained the same.

Before the higher education department was placed under a single separate board, the members of the State Board of Education served ex officio as regents of various state colleges and universities. For a time, each school had its own board of trustees, appointed by the Governor with the consent of the Senate, and including the state board members, but this was abolished by a law which went into effect in July 1931. By the end of 1932, a newly created Board of Higher Education integrated the schools into a single cohesive unit (11).

John H. Ackerman, 1899-1911. John Ackerman taught in three states and was a principal in the Portland schools and school superintendent of Multnomah County before becoming state superintendent. His administration became one of the most important in the state's history. During his first 3 years as superintendent, the school law was largely
rewritten. The Daly Bill of 1899 established the first uniform statewide curriculum for grammar schools and an eighth-grade examination to help standardize instruction. Two years later, a newly established State Textbook Commission consisting of five members appointed by the Governor was given the responsibility for selecting textbooks. Although the textbook law was amended in 1907, 1921, 1923, and 1951, the basic principle of selection has not changed.

The Legislature inaugurated the state system of high schools by passing a "Grades Above the Eighth" bill in 1901, allowing counties to establish high schools when the district voted to do so. Six years later, it passed an additional law allowing two or more contiguous districts to form a union high school. The public normal schools were closed during Ackerman's administration, and the school at Monmouth was reestablished with a different method of support.

During his 12 years as state superintendent, Ackerman did much to raise the standards for preparing teachers, to improve the educational record systems, to improve school buildings, and to make the teachers more sensitive to their professional opportunities and obligations. The county institutes, in their prime at this time, were the principal means for providing in-service training. Since each wanted the state superintendent to be one of its speakers, Ackerman performed near miracles in getting to three widely scattered meetings in three consecutive days, driving all night, over bad roads after each engagement. Fortunately, he had tremendous physical energy and always gave a forward-looking, optimistic talk.

In spite of his enthusiasm, his definite ideas, and his perseverance, Ackerman was big enough to allow persons to do... with him. He was an administrator enough to know how to delegate tasks and then refrain from interfering, giving full blame or credit when it was completed. By utilizing his staff's special abilities and preparations, he enabled them to perform their jobs more efficiently and, at the same time, was free to work at tasks which he could do more efficiently than others.

E. S. Evenden, professor of education, Teachers College, Columbia University, had this to say of John H. Ackerman:

He did things that got results by the best means at his command though he paid the usual price of arousing opposition from persons who differed with him in the ends he sought or the means he used to obtain those ends. He had hosts of friends who knew his idealism, students who were loyal to him... and citizens who appreciated his championship of their schools...(12).

Alderman and Vocational Education, 1911-13. Lewis R. Alderman assumed the superintendency in 1911 during a time of growing interest in vocational education. In 1913, the Legislature appropriated $6,000 per year to begin developing a vocational education division in the state department and authorized the superintendent to hire two assistants to travel around the state promoting studies in agriculture, manual training, home economics, and industrial programs. Before resigning to become chief administrator of the Portland public schools, Alderman asserted that the vocational program and, surprisingly, the temporary reopening of the state normal schools were among the most significant developments of his 2 years. In a review he stated:

A deep and widespread interest in the study of agriculture, domestic science and manual training, a steady increase in the number of high schools, a vigorous attempt on the part of the state to bring the school and home into closer relationships by the home credit plan, and the securing of a firm and permanent position in our education system for a State Normal School are some of the most interesting signs of progress in our public schools (13).

Churchill and the First School Standards, 1913-26, Julius A. Churchill, superintendent of schools in Baker City since 1891, was appointed to fill the vacancy created by Alderman's resignation. He continued to work in vocational education, attracting national attention by establishing a program of extracurricular industrial training which enrolled 12,000 children in clubs that gave them practice in sewing, poultry raising, cooking and baking, crop growing, and similar skills.

Perhaps Churchill's outstanding contribution was the improvement of school building standards. The county superintendents and the State Board of Education adopted the first set of regulations for rural and village school buildings in 1913. These, plus more stringent standards established in 1920, sought to regulate lighting, heating, ventilation, condition of the grounds, water sanitation, and even teacher qualifications. Although the state could not offer monetary rewards for schools that complied, the office did send visiting committees to the various schools to try to enforce the standards. Less than a third of the rural schools were able to meet the standards between 1923 and 1934. Not until 1947, when the superintendent threatened to withhold funds from the Basic School Support Law unless the minimum standards were fulfilled, were all of the building regulations enforced. On the other hand, the state board adopted standards for high schools in 1915, and 5 years later visiting committees reported that most schools could meet them.

World War I widely affected Oregon schools. For example, Superintendent Churchill spent considerable time directing the sale of saving bonds stamps. Also, vocational agriculture was reemphasized, and a State Board for Vocational Education was established by Governor Withycombe under emergency circumstances in 1917 to administer
funds from the new National Vocational Education Act (Smith-Hughes Bill). The following year, the Legislature made the board permanent. It consisted of the State Board of Education and four persons appointed by the Governor. The superintendent of public instruction served as executive officer. This board, administering a separate budget of about $80,000 a year including federal funds, remained a separate agency under the state board and state superintendent until it was officially incorporated into the State Department of Education in 1951 (14).

The war also revealed the poor physical condition of many young men. Superintendent Churchill appointed a committee in 1919 to investigate how the schools could promote physical exercise and training. The committee produced a series of pamphlets detailing the exercises and activities suitable for pupils at each grade level through high school.

One problem faced by the superintendent after the war stemmed from a popular initiative measure enacted in 1922 that required all children to attend public schools only. Hill Military Academy and other private institutions challenged the law, and 3 years later the U.S. Supreme Court ruled it unconstitutional.

Another problem arose in 1923 when a group of concerned citizens pressed the Legislature to require the schools to teach the federal Constitution. Perhaps they were sensitive because other states regarded their initiative and referendum as evidence of radical tendencies, and they felt they should reassert their regard for the ancient hallmarks of federal government. People were seeking a pre-World War I “normalcy” and rejecting anything that threatened to disturb the status quo. Actually, civics, with an emphasis on the federal Constitution, had been taught in both the elementary and high schools since the beginning of state supervision. Nevertheless, the act passed in 1923. Except for a few changes in wording, it is still in effect, stating:

In all public and private schools located in the State of Oregon commencing with the school year next ensuing after the passage of this act, there shall be given regular courses of instruction in the Constitution of the United States. Such instruction in the Constitution of the United States shall begin not later than the opening of the eighth grade, and shall continue in the high school course, and in courses in state colleges, universities, and the educational department of state and municipal institutions to an extent to be determined by the Superintendent of Public Instruction (15).

Also, in 1925, the state board appointed five people to serve as a Commission of Americanization, which was added to the adult education program.

Summary: The First Half-Century of State Administration

During the early years of the state’s involvement in education, the superintendent of public instruction, at first a mere researcher for statewide reports, became responsible for supervising teacher certification, establishing a uniform curriculum, and standardizing school facilities. He also administered the distribution of federal funds from the National Vocational Education Act and programmed physical education courses.

But the state superintendent was able to do little about the most serious educational problem during this period: providing sufficient funds for school support. The Oregon constitution directed the state treasurer to distribute money from the irreducible school fund received from the sale of federal lands, but this was insufficient and was not state support in the usual sense (16). A voters pamphlet for the May 1920 election pointed out that Oregon was one of seven states not using state revenues to support its schools, which in turn usually meant low teachers’ salaries. As a result of the publicity, the Legislature, by a three-to-one vote, established the elementary school fund. Money was to be derived from a statewide tax of nearly $2 million, levied by each county, and was to be distributed to each elementary district according to the number of elementary teachers in the district. While this bill promoted the principle of state support, it was far from sufficient because it excluded the secondary schools and provided only 12.5 percent of all school revenue. The public and the Legislature frequently discussed additional state support, but no new legislation was passed until 1942, first because of the Depression and later because of our entry into World War II.

Progress in education during these first 50 years resulted primarily from the superintendent’s personal initiative and interest. After 1925, it came from external forces. The first sizable federal grant had already created a vocational education board which was subsidiary to the department, but had more personnel and a larger budget. The Depression and World War II brought more federal projects requiring state administration. Thus, during the next 25 years, the department’s growth resulted more from external demands such as national emergencies, economic necessities, and population growth than from the personal efforts of the chief state school officer.

The budget for state and county administration was $10,000 in 1872; by 1924, it had increased to $41,850 for the state alone, with an additional $40,000 allotted to the vocational education board. Yet, by 1920, the education department consisted of only two professional members, including the superintendent, and a handful of clerical workers. Over the next 40 years, it increased to 340 employees with a budget of more than $250 million (17).

THE STATE DEPARTMENT AS PROFESSIONAL STAFF, 1925-50

The period from 1925 to 1945 is not particularly important for legislative or organizational changes. Problems and
Responsibilities created by the Depression and World War II, such as school enrollment fluctuations and federal education projects, challenged the department to attempt additional projects of its own. The state superintendent from 1927 to 1937, C. A. Howard, recognized the department's organizational difficulties and made corrective recommendations in his biennial reports. Despite his early diagnosis, most of the problems were not corrected until after World War II.

Legislative Changes, 1929-31

Two changes of some significance took place in 1929 and 1931 affecting the organization and responsibilities of the department. First, the Legislature established the State Board of Higher Education as a separate organization (18), making Oregon colleges and universities "in no way subject to the authority of the superintendent of public instruction" (19). Since that time, higher education has operated under an authority separate from the elementary and secondary schools. Second, a free textbook act was passed, requiring districts to budget funds annually to purchase books used by the elementary (but not the secondary) schools. By further acknowledging the state's duty to supervise school finance, this law established a principle that became increasingly important after World War II.

State Responsibility During the Depression, 1930-40

Federal Programs. The department's largest single task between 1933 and 1940 was operating the emergency education programs established with federal funds. For instance, during the 1933-34 biennium, the Federal Emergency Relief Administration authorized funds for emergency vocational, adult, and rural education programs. These required no additional staff members except for a few secretaries who received federal relief funds. The programs operated under the direction of the department until 1936 (20). They were then transferred to the Works Progress Administration officer for Oregon, E. J. Griffith, who appointed his own staff and incorporated the programs into the scope and organization of his other projects, depicted in Figure 1 (21).

By the 1939-40 biennium, the state department employed five supervisors, who directed projects and were spending about $340,000 in 17 different areas for the WPA education and recreation programs. In the 1935-36 biennial report, Griffith had commended the state department:

The WPA education and recreation program of the State Department of Education is effectively rendering two important services: first, giving employment to needy, qualified persons throughout the state, and second, extending to the people of Oregon certain educational and recreational opportunities which heretofore they have not been able to obtain. The state department of education, as sponsor for this program, has given time and energy unsparingly and has constantly maintained cooperation and sympathetic understanding to the end that the objectives of the program might be effectively achieved (22).

High School Development, 1930-38. With no jobs available for children who would normally have dropped out of school, the Depression years saw an overwhelming increase in high school enrollments. As early as 1930, the new standards adopted by the state board had emphasized practical subjects, such as general mathematics and business, and had placed less stress on purely academic or cultural studies. This "commercial" trend continued during these years, and even the smaller schools were offering bookkeeping and typing, according to a 1938 survey (23). But the many small high schools created a special problem: They were least capable of handling the extra students and had the poorest equipment to meet the demand for vocational courses. They also suffered from rapid teacher turnover and limited funds. The biennial reports continually restated the need for a separate administrator for secondary schools, but they also showed that other demands on the department were too heavy to allow it to create such a specialized position.

The high schools did receive federal assistance between 1935 and 1940. Stimulated by aid from the Civil Works Administration and the Public Works Administration, a wave of high school building construction spread throughout the state, resulting in 52 new high
schools, 27 new gymnasiums, and 33 new building additions (24). At the end of this active period, the WPA inspected all rural and some first-class districts, selected model buildings as guides for future construction, and prepared a statewide map of district boundaries and school locations (25).

Recognition of the Department’s Problems, 1926-37

Superintendent C. A. Howard recognized the weaknesses in the state administration and strongly recommended changes that eventually became law, but not until after his retirement. Numerous small schools and 2,200 separate districts, many unable to meet education costs, created a major obstacle to statewide standardization. Howard reported:

There is a growing tendency in other states toward more centralized responsibility and control with resultant higher efficiency in value received for correspondingly fewer tax dollars. It is becoming obvious that the acceptance by the state of a larger participation in school support will also yield fruits of efficiency and economy (26).

In relation to this, he recommended in his 1935 report that the state establish a larger school-support fund. Oregon was providing only 2.3 percent of the state’s annual education costs, the second lowest rate in all 48 states. Howard maintained that although state responsibility for education had been firmly established by all states, Oregon was delegating too much of the financial burden to county and local governments.

Superintendent Howard found that Oregon had the second smallest department of education in the nation and repeatedly asked for a larger budget and staff, particularly for a secondary education administrator and a special budget for publications. But the Depression and strong competition from other state agencies nullified the effect of these requests. The department only increased from two in 1926 to six in 1942, plus an additional staff of five professionals under the WPA project. The staff of the vocational education department, thanks to the Smith-Hughes and George-Reed Acts, equaled that of the education department and the WPA combined.

Repeated requests for a more centralized school system, a larger percentage of state support, and an enlarged education department to supervise the system went unheeded while public attention was given to the war effort in the first half of the forties. During the term of Rex Putnam, who took office in 1937, the public did vote in the most important piece of school legislation since the turn of the century: a Basic School Support Fund Law with an appropriation from the state general fund to be allotted to all public elementary and secondary education in Oregon.

World War II, 1940-45

From 1940 to 1942, Oregon teachers, responding to a need for more workers trained for war industry, worked through the summer to create programs for more than 75,000 persons. The department organized nursery schools and extended-care plans for schoolchildren of working mothers. Both the department and individual schools organized programs to register people for rationing, collect scrap materials, sell defense bonds and stamps, and recruit volunteers for Civil Defense. As the biennial report for 1941-42 stated, “Because schools are natural centers for all communities, . . . are staffed with able and willing persons, and because they generally have public confidence, the government turned to them for help in various war efforts” (27).

In 1943, the vocational rehabilitation department enlarged its program to include the mentally disabled as well as the physically handicapped. It was removed from the vocational education board to become a separate agency and finally was incorporated back into the Department of Education in 1951. It is the only division in the state education complex that administers direct instead of advisory services. Although the vocational rehabilitation division has the largest operating budget and number of employees of all the divisions, it is actually the least involved with matters immediately pertaining to public schools.

The war brought to the state department many new problems and responsibilities. It had to issue emergency certificates when qualified teachers went into the service or accepted defense jobs. The state’s urban schools were overcrowded because of congestion in defense plant areas, while many rural schools were almost empty because of high school dropouts and population shifts. The school year had to be shortened to allow children to harvest crops. And school buses could not be replaced as they deteriorated.

During the upheaval of the war years, the state department was officially defined for the first time. The 1941-42 biennial report acknowledged the department’s responsibility to coordinate public education:

The State Department of Education has general administrative and supervisory responsibility for the operation of public schools of the state. In performing this function it works with the county school superintendents in the counties and the local administrators and teachers in the school districts. This cooperative relationship is the necessary and desirable procedure to make a statewide program move forward and to give initiative and responsibility to local districts (28).

This report also pointed out that the state department was serving as a mediator between federal project administrators and their executors on the lower level. In the first year of the war, the superintendent requested the U.S. Office of Education to channel federal funds through the
Finance Revisions, 1942-47. The state school support fund, created in 1942, was the first major move to increase state aid to local districts. Prior to this, a kind of state aid trickled down from the irreducible school fund and the elementary school fund, but the new law ordered the surplus from state tax funds distributed to schools districts to complement special school tax levies, thus putting into practice the principle of state support. It supplied $5 million per year to public education until 1945 when the amount was increased to $8 million.

In 1947, the Legislature passed a revolutionary new law, the basic school support fund, which not only guaranteed each district a minimum level of state support but provided extra funds for transportation and special programs, equalized the state’s share of school district taxes, and provided for periodic studies of the school system. One provision, that local districts would not be able to obtain state funds unless they met the state standards, greatly increased the state department’s influence on local districts. Revised and adopted by the state board, these standards established minimum requirements for school buildings, staff, organization, curriculum—in fact, all important phases of the school system. According to the biennial report, the department gained its greatest influence through the legislation of 1947, initiated by citizens dedicated to the principle of state responsibility for finance and standards in public education. The basic school support fund is based upon the concept of the foundation program which may be considered as a state responsibility and a minimum program of education below which no school district should be permitted to fall (29).

The many programs added during the forties demonstrate the department’s growth as the centralized agency for public schools in Oregon. Not only did various federal projects call for new professional positions, but, even more important, the Legislature began making regular appropriations for special educational services. From 1925 to 1950,
the department's professional staff increased from 2 to 26, presaging the much greater expansion that would occur in the fifties and sixties.

**THE DEPARTMENT AS A LEGALIZED CENTRAL AGENCY**

Commissioned by the 1949 Legislature to survey public education in Oregon, T. C. Holy presented a report that resulted in a vast reorganization of state administrative policies as well as the formal recognition of the State Department of Education. The office now assumed full responsibility as a centralized agency. Its professional staff distributed state and federal funds to local school districts, supervised teacher certification, and enforced the minimum state standards for education, in addition to administering many specialized programs in research, curriculum development, and other areas. The standardization program alone required many additional employees after 1947.

Appropriations from state and national agencies have enabled the department to expand the staff to carry on exciting experimental programs in classrooms and administrative procedures. New professional positions are being created to efficiently use increasing federal grants, such as those under the Elementary and Secondary Education Act. At present, the possibilities for the department's growth seem unlimited.

**Recommendations for Reorganization, 1950-66**

**The Holy Report.** While the 1949 Legislature recognized that no legal basis had ever been created for an agency called the State Department of Education, such a department had already assumed several important functions. So that progress would not be hindered by obsolete laws, the Legislature appropriated $55,000 for a study of the major revisions needed for a unified, strong system of state education. It was to cover the following:

The public elementary and secondary schools of the state and any questions relating to the improvement of the public school system of Oregon, including particularly a study with a view toward making recommendations on the state organization and supervision of schools, the equalization of education opportunities, the reorganization of local administrative units, the financing of schools from the state and local level and its effect on taxation, the effect of the basic school fund, transportation, simplification of school laws, financing school buildings, and building requirements (31).

The advisory committee selected T. C. Holy, director of educational research at Ohio State University and a nationally known authority on education, to execute the study and submit recommendations to the 1951 Legislature.

Dr. Holy completed his report in 1950, and the Legislature used it to make major reorganizations in certain aspects of school administration as outlined below. Figure 2. – OREGON DEPARTMENT OF EDUCATION, 1951

![Diagram of Oregon Department of Education](image)

As created by Chapter 169, Oregon Laws, 1951.

The department was placed under the direction and control of the State Board of Education, comprised of seven members appointed by the Governor for 7-year terms, one from each congressional district and the remainder from the state at large. These state board members could not be engaged in school teaching, administration, or operation. The law also said:

As executive head of the Department of Education, the Superintendent of Public Instruction performs duties prescribed by law and executes, directs, and supervises all administrative and technical activities of the department in accordance with the policies prescribed by the State Board of Education (32).

During its first 16 years of formal existence, the department issued many statements of its operating philosophy. The first, from the "Holy Report" of 1950, emphasized the development of strong leadership at the state level but with sufficient flexibility to encourage local initiative. It deplored any attempt to operate or control local school programs but promised to see that the districts were properly organized to develop programs that best met their needs. It added that—

The chief responsibility of the central education agency... should be to provide competent leadership. In the final analysis, the provision of such leadership will be the best assurance that needed improvement will be made in the state school program (33).

As a result of large increases in federal grants between 1950 and 1965, mainly through the National Defense
Education Act and the Elementary and Secondary Education Act, the department was again forced to think seriously about its purposes and its relations with the U.S. Office of Education. A 1965 proposal by the Oregon department to the USOE declared that it was imperative that the departments of education be strengthened if they were actually to improve education through the increases in financial support. The proposal stated that the federal government was calling on state administrators "to organize creatively in such a way as to bring additional human and financial resources to bear upon the identification of problems in education and the development of useful concepts that lead to solutions to these problems." Although this proposal was not developed, it shows that creative leadership and maintaining a proper balance among state, federal, and local school administrations have been the department's constant concerns.

Administrative Changes in the State Board and Superintendency. The "Holy Report" labeled the State Board of Education obsolete because it consisted of four gubernatorial appointees with three ex officio members: the Governor, the secretary of state, and the state superintendent. Holy felt that this was contrary to the general practice in more effectively organized states, where state boards were elected by and responsible to the people, and he recommended popular election for Oregon's board. The 1951 reorganization made these positions elective. Holy also criticized the election of the state superintendent by popular vote, because he believed that qualified educators might pass up an office requiring a political campaign, but the Legislature refused to change the procedure.

Rex Putnam, who had served as superintendent for 24 years, resigned in the middle of a term in 1961. His administration had been distinguished by many progressive changes in school financing, evaluation, and organization. Among the significant changes were state support for special education and curriculum improvement, establishment of dual teacher-training institutions, extension of the period for preparing both elementary and secondary teachers, certification of school administrators, school district reorganization, federal funds for general education, and the beginning of the Oregon Program with foundation grant funds. Under his guidance, the department gained appropriate recognition and influence as the centralized agency for the school system.

The assistant superintendent, Joy Hill Gubser, describes him as a humble man without boast and pretention, a gentle and kindly man who knew none so bad but he could find good in him. He delighted audiences with his stories and shared his homely and practical philosophy with his staff, reminding them often that the state department did not have answers to all of the problems of education. He felt strongly that there was much to be gained by sharing in educational effort with the schools and colleges of the state.

Governor Mark O. Hatfield appointed Leon P. Minear to replace Dr. Putnam. Leon Minear's 5 years in office saw many statewide programs initiated to improve education, the Oregon Program among the most important. During Minear's first year, the Legislature made the state superintendency subject to election by the state board. This action was challenged 2 years later, and the Oregon Supreme Court ruled it unconstitutional in April 1965. The people have twice since defeated an amendment to the constitution providing for an appointed state superintendent.

Dr. Holy's "Report Card," 1966. Dr. Holy returned to Oregon in 1966 to evaluate the progress achieved during the 16 years since his study and made up-to-date recommendations that are still bringing changes. For instance, in 1950 he had vigorously attacked the state for permitting the existence of 1,230 school districts, many of them overlapping or inactive, which resulted in inefficient administration. The 1957 School District Reorganization Law reduced the number of districts to 478, including 91 new administrative districts. Today, there are 390, and the state department can better communicate.

Holy's "Report Cards" for 1950 and 1966 show that he considers school finances to be in even worse shape today. In 1950, Oregon ranked twenty-eighth in percent of school revenue provided by the state; in 1960, it ranked forty-fifth. Holy pointed out that the intent of the basic school support fund had not been fully realized because the Legislature failed to increase the fund proportionally with the educational system's growth. His finding has prompted the department to make a comprehensive study of the state's school support.

Dr. Holy's first report claimed that the Oregon Textbook Commission gave teachers very little voice in selecting
materials. The law was amended in 1951 to require a multiple selection of textbooks in all subjects, as initially suggested by committees of teachers. It allowed for local adoptions if the books met the standards laid down by the commission.

These evaluations of Oregon education undoubtedly have had a strong progressive influence on the state department. Holy was not an easy grader. But the state department could cite with pride improvements in all of the 16 areas except school finance and health and physical education. Perhaps the greatest advances have been made in local school organizations, instructional materials, and pupil transportation. Based on his 1966 study, Holy's legislative recommendations, supplemented by specific plans from the department, include provisions for state-aided kindergartens, state school support reorganization, a state subsidy for gifted children, and further school reorganization. Undoubtedly they will influence the 1967 Legislature to make additional changes.

New State-Funded Programs, 1950-66

When the department incorporated the vocational education and rehabilitation division, its staff size immediately doubled. But greater state and federal appropriations for special programs were a more important influence in increasing the number of employees—from 26 in 1950 to about 340 in 1966. The development of community colleges, one of Oregon's most ambitious programs, resulted in the addition of a new assistant superintendent and several professionals.

Community Colleges, 1951-66. The Holy survey found that the state needed community colleges and, along with a special study in 1950, recommended the development of three post-high school institutions offering mainly vocational-technical training. The permissive legislation of 1951 and the funding laws of 1957, 1959, and 1961 established standards for community colleges and created a plan for developing a statewide system of 2-year, post-high school institutions, perhaps the most important single development in public education in Oregon since the basic school support fund of 1947. The Legislature outlined the requirements but did not provide enough funds for rapid growth of community colleges until 1961. At present, there are 11 (37), with an enrollment of nearly 30,000 students during 1966-67. They offer more than 200 lower-division collegiate, vocational-technical, and adult education courses, with approximately 65 percent of the students taking occupational and related courses (38). Dr. Holy called this 15-year growth "northing short of phenomenal."

Gifted and Mentally Retarded Children, 1951-63. Following Dr. Holy's recommendations, the 1951 Legislature initiated studies and pilot programs for both gifted and mentally retarded children. Four years later, it ended the pilot operation and established a permanent program for mentally retarded children offering three types of services: (1) special classes, (2) referral to the Outpatient Diagnostic Clinic at Oregon Fairview Home (via the state department), and (3) consultant services to school districts. The retarded child program was expanded in 1959 and now receives about $1.2 million a year.

The Legislature did not vote extensive funds to help gifted children until 1957, after Sputnik. It reviewed this appropriation in 1963 and reduced its support to the point where the state department could no longer afford to staff the program. Apparently, the Legislature's intent had been to provide stimulative rather than supportive funds. The appropriation provided districts with 3 years of funds on a diminishing, phase-out basis, intending for local funds to take up the program in each district that wanted to continue it. In his 1966 evaluation, Dr. Holy strongly criticized the state for not having special programs for gifted children.

Adult Indian Education and Training Programs, 1955-61. The department contracted with the Bureau of Indian Affairs in 1955 to take over the adult Indian education program, which included formal education and college training, on-reservation vocational training, and general information about the withdrawal of federal supervision of Indian property. The department employed six staff members in this program at its peak but reduced the staff to two when several projects were completed in 1961.

Curriculum Improvement and Driver Education, 1957. The department initiated a bill in 1957 to provide state funds to local school districts to upgrade their curriculums. Local superintendents were so involved with the problems of finance, staff, and facilities growing out of the post-World War II population explosion that they needed extra help in stimulating schools to enrich their offerings. The resulting Curriculum Improvement Fund Law marked the beginning of an emphasis—a show of real concern—in this area. Efforts in curriculum improvement have since been accelerated through additional support from the National Defense Education Act and the Ford Foundation and through the creation in 1963 of the Oregon Council for Curriculum Instruction.

Along with the Curriculum Improvement Fund Law, the Legislature authorized a statewide reimbursement program for high school driver education. The secondary education section was given the responsibility for counseling local districts on driver education and making it part of the regular standardization and visitation program.

New Cooperative Operations, 1963-66. The department began two experiments in 1963 that emphasized cooperation between different levels of organization. The new
Oregon Council for Curriculum Instruction units organized a cooperative effort between state officials and special committees from regional areas, and the Governor's Education Improvement Advisory Commission encouraged a series of direct contacts between the state administration and the citizens. Finally, the launching of "Project Springboard" in 1966 marked the beginning of a cooperative venture among the department, local districts, and major industries, involving varying levels of education and crossing county lines. This placed the department in a unique position, compared with many other states that usually concentrate on working through single administrative units.

The Council for Curriculum Instruction is composed of 10 regional units especially designed to identify local curriculum problems and make necessary changes, and more specifically to improve curriculum instruction, provide extra in-service teacher training, and increase instructional materials services. The department provides a state coordinating committee and a general field consultant for each of the 10 regions to encourage the systematic study and solution of regional curriculum problems.

The Governor's Education Improvement Advisory Commission. The Governor appointed this commission in 1962 to inform citizens about current education programs. Within three years, it had prepared 10 pamphlets on problem areas, each with an attached opinionnaire on possible solutions (39). In the 1965-66 school year, it presented a series of "Public Conversations on Education" dinners, presided over by Governor Mark Hatfield, which disseminated its reports to community leaders, such as members of school boards, PTA's, and service clubs. These people in turn were asked to complete the questionnaires and pass on the information to their own service and business organizations. The reactions culled from the questionnaires were then compiled by the state department as the basis for possible legislative recommendations. There is little doubt that the commission has greatly improved relations between educators and the general public and that, by basing action on prevailing attitudes and promoting interest and discussions, it will have a major impact on educational issues in the future.

"Project Springboard." By developing 10 schools as state-coordinated audiovisual demonstration centers, this project is the nation's first professional partnership among a state department, local schools, and a dozen major audiovisual companies. Each school has collected a comprehensive array of audiovisual materials which the department and commercial firms are training teachers to use. Purchases of the latest technical equipment are made possible by matching funds from these commercial firms and the local districts. The demonstrations, which will begin in 1968, are expected to attract visitors from throughout the nation.

New Nationally Funded Programs, 1950-65

The almost hysterical concern for education that followed Russia's success with Sputnik in 1957 prompted Congress to pass the National Defense Education Act of 1958. Seven years later, it enacted another major government program for education, the Elementary and Secondary Education Act. Both of these programs have created many new functions for state departments of education, such as planning proposals for obtaining the funds and acting as liaison between the U.S. Office of Education and local districts. Oregon's department employs more than 25 professionals whose salaries are paid out of these two grants. In 1962, the state department used its own initiative to obtain $3.5 million from a private, nonprofit corporation, enabling it to add an entirely new division. Other federal legislation such as the Vocational Education Act of 1963 and the Economic Opportunity Act of 1964 also expanded the department's specific services.

National Defense Education Act, 1959-66. The department created the Instructional Services Section in April 1959 to coordinate the state's participation in the National Defense Education Act. With Title I funds, the department developed the instructional materials centers, regional pools of audiovisual equipment serving nearby school districts. The Jackson County service provides the most outstanding example of progress in this area, growing from a "package set" of 50 motion pictures to a $600,000 collection including every audiovisual medium. The department has used Title V funds to stimulate guidance services in elementary schools. As a result, 44 schools have added full-time counselors, and 20 others, part-time counselors. These funds also have been used to furnish approved guidance services in high schools since 1959, many under the direction of the department's consultants. Title X supplied funds to improve the state's statistical services, allowing for a complete overhaul of reporting forms and accounting procedures. The department's data-processing service, an extensive IBM complex, was also initiated under this title and was expanded with Elementary and Secondary Education Act funds a few years later.

The National Defense Education Act, originally providing consultants in science, mathematics, and modern languages, was extended in 1964 to include English, geography, history, and civics. The department thus was able to employ special consultants in many of these areas, providing leadership and improving instruction. The National Defense Education Act funds fostered the biggest growth in the department's staff since 1947.

The Oregon Program, 1961-66. The Legislature appropriated $35,000 in 1961 to plan a proposal for a 4-year educational improvement program to be financed by the Ford Foundation. The following year, the foundation
granted Oregon $3.5 million, mainly to improve instruction through additional teacher training and experiments in modern teaching methods. Specifically, the program was designated to accelerate change through such experiments as team teaching and flexible scheduling, a teacher-intern program, and exploration of the latest instructional materials and techniques.

Under this program, the education department employed two full-time staff members in teacher education to mediate among colleges, universities, and the school districts receiving interns. It also established an education development division in 1962, composed of specialists who analyze problems and develop corrective proposals. Along with these projects, the department planned annual summer workshops for teachers and administrators, inviting educational authorities from throughout the nation to present the latest information on school organization, team teaching, learning theory, education for the disadvantaged child, and reading and writing instruction.

Vocational Education Act of 1963. This act provided matching funds to improve vocational agriculture training for people of all ages. The Legislature approved a study of vocational information procedures to establish data-gathering instruments for continually assessing human resources and work opportunities. The department received funds to create a model for guidance in vocational agriculture at high school and post-high school levels, mainly in counseling students in realistic terms and helping them get jobs. The number of new vocational classes supported by these federal funds has increased greatly.

Economic Opportunity Act of 1964. This act has had a limited effect on the department because it established its own administration. But the War on Poverty immediately affected Oregon schools through preschool training programs, supplementary remedial aid for schoolchildren, special education for children of migrant farm laborers, and work-study programs for disadvantaged children. The department employs a liaison officer to work with the Office of Economic Opportunity and help local schools with their proposals. The preschool training programs held in Oregon during the summer of 1967 have strongly influenced the legislators in considering the department's proposals for state-supported kindergartens in the 1967 legislative session.

Growth Under the Elementary and Secondary Education Act, 1965. Since most of the provisions of this legislation were created on a 5-year basis, the programs are still in the developmental phase and have not yet exerted their full influence on the department. But several staff members have been added to the department to help process proposals for Elementary and Secondary Education Act funds from the local districts. A large group is engaged in examining programs for the special education of culturally deprived children under Title I, and others are inspecting proposals under Title III for special services instruction before passing them on to the U.S. Office of Education for approval. But Title V has had the greatest impact by allotting money for strengthening state leadership. Various divisions have added several employees, but the greatest number has gone to the new Communications Material Center, which provides the department with a research library and librarian, a graphic artist, a photographer, and a program coordinator. These should greatly increase the quality and variety of state department publications.

Summary: The State's Education Under State Department Leadership, 1966

The major developments under the Oregon Program, the National Defense Education Act, and the Elementary and Secondary Education Act occurred under the able leadership of Superintendent Leon P. Minear. At the close of the 1965-66 school year, he cited the following evidence of Oregon's superior school system:

General Statistics. Ninth-graders remaining in school until graduation have increased from 63.8 percent in 1952 to 82.6 percent in 1965, with half of this increase occurring since 1960.

Selective Service statistics for 1965 show that Oregon had the lowest number of draftees failing the mental ability test of any state; the failure rate was 1.9 percent compared to a high in one state of 46.8 percent.

The education department, local school districts, and the colleges and universities have cooperated in a 4-year, $3.5-million Ford Foundation-supported effort to update and upgrade public school programs; to reduce the gap between actual classroom instruction and new knowledge in subject fields, teaching, and learning; and to improve teacher training.

Subject Matter Achievement. Oregon children's basic skills in reading, writing, and arithmetic were 1.5 years above the national standards when Science Research Associates conducted the last statewide sample testing in 1962.

Oregon's colleges and universities report a high median score for entering students on the 1965 Scholastic Aptitude Tests in English and math, and superior achievement scores on the College Board Entrance Exams.

The state has been a leader in developing elementary and secondary courses in economic understanding. Three school districts, the education department, and the Oregon Council on Economic Education are participating in a $2.5-million nationwide developmental economic education program. The schools are demonstrating how to teach economics at varying degrees of complexity at all elementary and secondary grade levels.
The President's Council on Physical Fitness cited Oregon as one of the top three states in the nation in its support of physical fitness programs. Six schools served as national demonstration centers for outstanding physical education programs this past year. Extensive research and development is currently under way to improve the quality of vocational education programs and to make such programs available to all students.

Special Education. These programs have been expanded to enable 20,000 mentally and physically handicapped children to attend public schools. These facts, combined with Dr. Holy's "Report Card" of 1966, indicated that Oregon is providing mature leadership and that great gains and improvements can be made in the quality of education. The local districts, for their part, seem to be confident that the State Department of Education will cooperate with them while attaining greater quality and strength as the centralized agency for state school administration.

The incentive for much of the progress made in Oregon's schools since 1961 came from Superintendent Leon P. Minear. Born in Texas, educated and employed in California, Colorado, and Oregon, Dr. Minear brought a spirit of pioneering and "ground-breaking" to state school administration that is highly essential in this age of unprecedented social and technological change.

His wide variety of interests and intense concern for the welfare of children in terms of the learning experiences that can be provided for them gave Dr. Minear his strength as an educator. His amazing ability to grasp "the big picture" and relate its parts provided him with the administrative skill to head the education department staff and a 23,000-teacher school system.

On April 1, 1968, Superintendent Minear accepted a position in vocational and technical education in the Office of Education in Washington. Deputy Jesse V. Fasold served as the interim chief state school officer until June 30, when Dale Parnell was appointed to serve until the election in November 1968, which will determine the person to serve the remainder of the 4-year term ending in January 1971 to which Minear was elected in November 1966.

In Oregon, the change followed a 1965 decision of the Oregon Supreme Court, which found a technical mistake of wording in the Oregon State Constitution: The words elect and election were held to refer to selection by the people rather than by the State Board of Education (40). This decision removed the power to appoint the chief state school officer that had been exercised by the State Board of Education during the period 1961-65 and forced the state superintendent who had been appointed by the board to run for reelection. After his reelection, the decision continued to raise many question about the authority of major elements of the Oregon state system of education.

The charts in Appendix B show these changes, including that resulting from the decision of the Oregon Supreme Court in July 1968 which restored the general authority of the State Board of Education, leaving the state superintendent a constitutionally elected officer and the executive officer of the board without substantial authority of his own.

Supplement 1.— OPERATIONAL PHILOSOPHY OF THE STATE BOARD OF EDUCATION

The Oregon Constitution directs the Legislative Assembly to provide by law for the establishment of a uniform and general system of common schools. Laws relating to the Oregon public school system provide that the administrative functions of the state relating to supervision, management, and control of schools which are not conferred by law on some other agency shall be exercised by the Department of Education under direction and control of the State Board of Education. The Superintendent of Public Instruction, an elected official, exercises, under the direction of the Board, a general superintendence of school officers and the public schools. He has certain other educational duties and powers conferred upon him by statute, and it is provided that he shall be the administrative officer of the Board and executive head of the Department. Thus, the State Board of Education, the Office of Superintendent of Public Instruction, and the Department of Education act in concert in carrying out the constitutional mandate and the legislative program relating to public schools in Oregon.

The State Board of Education has five basic functions—regulatory, executive, evaluative, and those related to policy-making and leadership. The two major areas of Board responsibility are in regulation and leadership.

In exercising the regulatory functions provided by law, the State Board of Education establishes standards, rules, and regulations applicable to the Department of Education; the public elementary and secondary schools of the state; and in certain instances, private schools. Board regulations and standards exist to ensure that the instructional and educational program of the Oregon public school system adheres to a minimum basic program in scope, quality and efficiency. Standards established by the Board are minimum and not maximum requirements.

It is the policy of the Board that standards and regulations be developed cooperatively between the professional staff in the Department of Education; local school officials; and whenever possible, lay citizens. It is the intent of the Board to encourage local administrative units to develop sound educational programs which at least meet the Board's minimum requirements and exceed them whenever possible. Unless otherwise provided by statute, however, administration and control of the local educational program is vested in the local administrative unit.

In addition to the general field of public education, the State Board of Education is responsible for regulation and administration of programs of vocational rehabilitation in Oregon, under both federal and state laws. This it does through the Division of Vocational Rehabilitation, a part of the Department of Education.

The Board exercises leadership to improve education and vocational rehabilitation at both the local and state level. Leadership services from the Department of Education should be available to local school districts, colleges and universities in the state, the legislature, the governor, other state agencies with programs bearing on education and vocational rehabilitation, and to the public generally. The leadership responsibility of the Board entails planning and research, consultant services, coordination, public relations, and in-service.

Planning involves identification of problems and purposes and determination of ways to resolve and attain them. Continual planning is required for each of the operating divisions of the Department of Education and for the total state program of education and vocational rehabilitation. In planning, the Board uses the services of the entire professional staff of the Department of Education. It also enlists the participation of representative groups and individuals outside the Department. The purpose of the Board in all educational planning is to stimulate and encourage initiative and responsibility at the local district level.

Research provides the basis for policy formulation and long-range planning. The Department should maintain research activities of its own and should collaborate with the research activities of other organizations and groups interested in education and vocational rehabilitation. The Department of Education should also serve as a channel for the exchange of ideas and for the dissemination of data accumulated through research.

The Department assumes leadership responsibilities with schools at the local and community level in the administration and improvement of the state educational program. The Department should be staffed with specialists able to translate ideas for education development into action; it should become the major communication and service center of education, linking schools to each other and to the state, and the state to the nation. The regulatory authority of the Department is exercised only when it is required by statute or when local responsibility has not been assumed and discharged. The Department shall be
judicious in its use of authority and shall recognize the control over education that is vested in the district school boards.

The State Board of Education recognizes that an increasing portion of the burden of financing education is being assumed by the federal government, and this will continue if all individuals are to have equal opportunities through education and training. The Board will continue to accept federal funds and to cooperate with federal programs, but neither the funds nor the programs will be permitted to serve partisan interests or allowed to lessen state or local control and responsibility for education. Federal programs must operate within the framework established by Oregon statutes and rules and regulations of the State Board of Education.

*Actual employment in September 1966 showed approximately 340 full-time positions in the department.*

The approved budget for 1967-69 is $269,856,240. This budget is still subject to the approval of the 1967 Legislature.
The first mention of a working schoolmaster appears in the official records for 1679 of what is now the Commonwealth of Pennsylvania. In March of that year, teacher E. Draughton sued Dirck Williams for payment promised him for teaching Williams' children to read the Bible. It was a forecast of things to come, for Pennsylvania, in spite of its historic role as one of the 13 original colonies, lagged far behind Massachusetts and New York in the development of public education. To understand the staggering problems which faced those who sought to build a centralized system of public education in the Keystone State, it is necessary to go back almost 300 years to explore the diversity of elements that went into the Commonwealth at its birth.

The great Quaker, William Penn, following the tenets of his faith, founded his Commonwealth as a "Holy Experiment" in civil liberty and religious freedom. But this act, noble as it was, sowed the seeds of friction which continued to haunt the supporters of public education 150 years later.

Penn dreamed of a free and universal public school system for his colony. In fact, the first Frame of Government he drew up in England stated that "the Governor and Provincial Council shall erect and order all public schools, and encourage and reward the authors of useful sciences and laudable inventions in the said Province" (1). Another article directed that "all children within this Province of the age of twelve years, shall be taught some useful trade or skill, to the end that none may be idle, but the poor may work to live, and the rich, if they become poor, may not want" (2). Penn's ideas in education, as in other fields, were far in advance of his time.

After Penn returned to England to remain for 14 years, his Provincial Council did not press the development of a school system. Continuing quarrels between the Governors who succeeded Penn and the Provincial Assembly, the diversity of the new settlers, and the Commonwealth's geography all contributed to a loss of interest in the founder's dream. Gradually, control of education slipped into the hands of private and religious groups.

Other colonies attracted more or less homogeneous groups—Catholics flocked to Maryland and Puritans to New England. But Penn's doctrine of tolerance and religious freedom and the Quaker tradition of noninterference in others' affairs attracted an impressive mixture of nationalities and creeds: English Quakers, German Pietists, Scotch-Irish Presbyterians, Dutch and Swedish Lutherans, and Catholics from England, France, Holland, and Germany. For instance, the German Pietists, like the Quakers, fled from persecution in their homeland. Suspicious of central authority, asking only to be left in peace to practice their faith and follow their traditions, the various sects settled into communities speaking their own language and provided the education they alone deemed necessary for their children. This was also true of other national and religious groups of immigrants.

The Quakers, who exercised the strongest influence in the infant colony, provided good common-school or elementary education for their own children and, in many cases, for the children of the poor. They were not equally

This history of Pennsylvania's Department of Public Instruction has been a responsibility of J. R. Rackley, superintendent of public instruction, who appointed a committee of department staff members to coordinate the research. A. G. Breidenstine, deputy superintendent of public instruction, was named chairman of the committee. Other members were Herbert E. Bryan, Neal V. Musmanno, George W. Hoffman, and Warren E. Ringler. As secretary of the committee, Warren Ringler supervised the project for the department and was appointed to the Study Commission of the Council of Chief State School Officers which cooperated in its early development.

Severino Stefanon, secretary to the State Board of Education, worked with the department committee during its planning phase and suggested Patricia Rosenbaum to do the research and prepare the manuscript for the department. She was assisted in her work by contributions from many present and former staff members in the department and others working for education in the Commonwealth of Pennsylvania.
interested in higher education, mainly because they did not believe it was necessary for spiritual leadership. More important, they would not impose their own concern for education on others, since to do so would violate their belief in individual freedom. Nor did they encourage the development of a strong central government; their problems were settled in Meeting, and they considered any outside authority unnecessary. The Quakers' hands-off attitude toward the affairs of others, their lack of interest in a strong central government, and their general lack of interest in education beyond religious training, together with the isolationism of the German Pietists, made Penn's vision of a system of public education an impossibility (3).

The state's geography also discouraged cooperation. Although the eastern part is fairly level, northern and western Pennsylvania are cut by mountain ridges into narrow valleys and small fertile plains. With transportation depending on rivers or rough trails, communication was difficult. The national and religious groups gathered into communities to protect old heritages and folkways and became largely self-sufficient entities.

In the late eighteenth century, the Whiskey Rebellion in western Pennsylvania amply demonstrated this self-sufficiency and resistance to central authority. The predominantly Scotch-Irish farmers, still living under frontier conditions, resisted with muskets the government's attempts to collect a tax on whiskey. A few years later, in 1799, another attempt to levy taxes precipitated the Fries' Rebellion of the Pennsylvania Germans in the eastern part of the state.

The Commonwealth's tolerant atmosphere diminished the threat to the early settlers' religious beliefs, and the hard frontier life had brought no new need for schooling. On the contrary, the average man had little time for niceties. Thus, there was little demand for common schools and even less for secondary and higher education. At the outbreak of the Revolutionary War, education generally was in a decline except in Philadelphia, then the intellectual center of the colonies.

Although a few leaders realized the need for public schools, it was difficult for them to persuade others. For instance, although the State Constitution of 1776 carried a requirement that the Legislature open a school in each county, it was more than 50 years before a single elementary school was founded. Ten years later, in 1786, the Legislature set aside 60,000 acres of state lands to endow public schools, but in the following years most of the state's financial efforts were directed toward private education at the secondary or college level in an attempt to develop a supply of teachers.

When the constitution was rewritten in 1790, the first article of the section on education read: "The Legislature shall, as soon as conveniently may be, provide by law for the establishment of schools throughout the state, in such a manner that the poor may be taught gratis" (4). This brief statement, plus one on promoting the arts and sciences in one or more institutions, were copied into the 1838 constitution and remained the sole constitutional provisions for education until the constitution was again rewritten in 1873.

Throughout the early nineteenth century, most of the Governors and a majority of the legislators supported better public schools, while the conservative rural voters generally opposed them. In particular, the Germans still considered public education a threat to their language and customs, an alien creation of a distrusted central authority which would demand increased taxes of them. When the Legislature, at the request of Governor Thomas McKean, passed a law providing free elementary education for paupers' children in 1802, it was never applied. Two years later, the Legislature passed a similar law, to similar effect, and passed a third version in 1809.

However, sentiment in favor of the public schools was rising. The Pennsylvania Society for the Promotion of Public Schools was organized in Philadelphia in 1827. Two years later, the workingmen's organizations in Philadelphia asked each candidate for office for his views on public schools.

The Free School Act of 1834

The winner of the gubernatorial campaign of 1829 was regular Democratic candidate George Wolf of Northampton County. A lawyer and early follower of Thomas Jefferson, Wolf had served three terms in the lower House of the Legislature and three terms in Congress before retiring to run for Governor. During his two terms, Governor Wolf's major accomplishment was establishment of a free public education system in the Commonwealth. Although other Governors had given their support to the idea of free public education, he was the first to make it an avowed purpose of his administration. In fact, his ardent advocacy of free public schools contributed to his defeat when he ran for a third term in 1835—perhaps the first time, but not the last, that a political career has risen or fallen on an education issue.

The actual author of the legislation creating a system of free public schools for the Commonwealth was State Senator Samuel Breck of Philadelphia. A native of Massachusetts, a man of wealth and education, Breck had already served in the State Senate and the U.S. Congress when he agreed to run again for the Senate in 1833, primarily to promote public education. He was named chairman of the Senate Education Committee for the 1834 session, and through his efforts a joint committee on education was appointed. Under his guidance as chairman, the bill to establish free public schools passed both Houses of the Legislature with very little opposition and only four dissenting votes (5).
Although somewhat cumbersome, the Act of 1834 was a milestone in the state's educational progress. It directed every county to organize a school division, with every political subdivision down to the ward level forming a school district. It authorized the county commissioners to levy county taxes for school support. If no taxes were levied, the county could receive no financial assistance from the state, thus setting a pattern for future relations between the districts and the state and for the expansion of educational services. It provided for boards of school directors with specific duties and powers and charged them with inspecting the schools. The secretary of the Commonwealth was named the superintendent of common schools. The Legislature appropriated $75,000 to pay the state's share of the educational costs.

The ease with which the bill passed the General Assembly was deceptive. When, according to the act, the notices of election of school directors were posted, opposition began to mount. At least 4,000 schoolhouses had been built in the state by volunteer contributions; the teachers' salaries and maintenance costs were paid through tuition charges. "Why build free schools?" people asked. In the more densely settled communities, church schools were established with the local minister in charge, frequently teaching as well as preaching; many religious denominations believed that secular education should be closely tied to religious instruction. German-speaking citizens feared the destruction of their traditions and language, and opponents of central government and taxation also rallied to resist the public schools. Others argued that "free schools would furnish the hot-beds wherein idle drones too lazy for honest labor would be reared and maintained" (6).

The fight over elections to the General Assembly was bitter, and feelings ran high. One historian wrote:

"Party and even church ties were for a time broken up, the rich arrayed themselves against the poor and the business and social relations of whole neighborhoods were greatly disturbed.... Enmities were created between individuals and families that outlasted the lifetime of those concerned." (7)

It appeared at first that the enemies of the free school bill had won the day, and, as the new assembly convened, most people had little doubt that the act would be repealed. More than 500 petitions came in, most in opposition—including 66 who signed their names by marks—from the mass of Pennsylvania Germans who lived in the southeastern counties.

The Senate quickly passed a repeal bill, but since the foes of public education could not command a clear majority in the House, a vigorous struggle ensued. The cause of public education seemed lost until Thaddeus Stevens, representing Adams County, delivered a brilliant speech supporting the Free School Act (8). His fervor and the unassailable facts moved the House to pass a measure strengthening the act, and the Senate approved it just before adjourning. Although it was years before free public schools were a reality for all, the principle of state control of the system was finally established.

Much to the surprise of many people who had supported Joseph Ritner in his campaign to succeed Wolf as Governor, once in office Ritner became a strong supporter of public education. He appointed Thomas Burrowes, a political figure, secretary of the Commonwealth; thus, under the terms of the Free School Act, Burrowes also served as superintendent of common schools. During his administration, the School Act of 1836 corrected some of the weaknesses of the 1834 legislation. At the same time, the Legislature passed a special law permitting central high schools to be established. Almost immediately, the Central High School opened in Philadelphia, and the rest of the state gradually began to develop an interest in secondary education. Other laws were passed during the 1840's, but perhaps the most important was the 1849 Act which eliminated the "permissive" features of the 1834 and 1836 Free School Acts and made the state directives mandatory. The progress and interest in education sparked during this period continued throughout Burrowes' life.

Generally, this was the pattern of Pennsylvania's development of education. Educators, concerned citizens, and legislators would urge an innovation; the assembly would enact a measure permitting but not requiring it, with varying amounts of financial support; then progressive districts would inaugurate the new program. Its success would bring increasing public pressure to make it comprehensive, and sooner or later this would culminate in mandatory legislation with a state subsidy. The Department of Public Instruction (established in 1873) would be involved in persuading districts to cooperate, suggesting standards and procedures, supervising distribution of the subsidy, and finally administering the standards and financial support when the program became mandatory. The speed with which the program would be accepted depended on the organized power of the local resistance to change, the traditional distrust of centralized authority and taxation, the strong rural conservatives in the Legislature and the apportionment of legislative seats tending to give this element a disproportionate influence, and the character and interest of the incumbent Governor and superintendent of public instruction.

An Act Creating County Superintendents

Pennsylvania took another big step forward when William Bigler became Governor in 1852. After working closely with a number of the state's leading educators, his administration got from the Legislature the Act of 1854, which created the position of county superintendent of schools, strengthened the powers of school boards, and eliminated as districts the subdistricts and wards of cities. The law also
involved the state more closely in local administration of schools, providing a channel for distributing state funds to the districts. The county superintendent was empowered to examine and certify teachers, a move in the direction of uniform statewide standards, not fully to be achieved until the next century. This county supervision of schools was to be replaced by a network of larger "intermediate units" in July 1968.

Various groups reacted violently against the law creating county superintendents. The anti-free-school element—the mass of conservative, tax-fearing, change-resisting citizens still smarting from their defeat in 1834—was joined by school directors, who resented what they viewed as an attempt to limit their authority, and by teachers, who feared they would not qualify under the new law. Once again, a controversial education issue influenced political fortunes: Governor Bigler was defeated for re-election in the fall of 1854. However, his successor, Governor James Pollock, not only defended the Act of 1854 but boldly advocated increasing appropriations for education and opening normal schools for training teachers. He also strengthened the cause of public education by appointing Andrew G. Curtin secretary of the Commonwealth and superintendent of public schools and Henry C. Hickock as his deputy superintendent (9).

Strengthening Public Schools

For more than 15 years, educational leaders had been contending that by separating the offices of the secretary of the Commonwealth and superintendent of public schools, the public education program would gain efficiency and prestige. In 1857, the Legislature did separate the two offices. Deputy Hickock became the first superintendent of common schools to head a separate department of education. Later the same year, the Pollock administration answered another appeal that educators had been making for years by securing a law establishing normal schools. As early as 1825, the principal of the Germantown Academy had urged that such schools be established. The new county superintendents' reports starkly revealed the deficiencies in the preparation and qualifications of teachers. But the schools created by the 1857 legislation were to be privately owned, again amply demonstrating the fear of state control and the prevailing emphasis on local authority and initiative. The state would only give them aid.

The Civil War diverted the public's concern from education; when peace returned, changing social conditions brought new challenges to the public schools. Industrial production boomed; the cities were growing, and workingmen were organizing at an increasing rate. This industrial urban growth did not affect Pennsylvania as much as it did other states at this time, for many of the state's young farmers returned from the war to their farms and stayed there. In spite of the lure of the cities, farm crops and acreage under cultivation increased in the state, and the conservative rural population remained to influence the course of education during the next few years.

Legislation in 1867 strengthened the authority of the county superintendents, raised the requirements for teacher certification, and gave school boards the right of eminent domain, but not until 1874 was the superintendent of common schools, James P. Wickersham (10), able to report that free public schools were operating in every district. That this was 40 years after passage of the law requiring them illustrated a common weakness in the state's educational legislation: the lack of penalties to enforce compliance. For instance, the Free School Act required schools to be established but provided no enforcement beyond withholding state subsidies. If a district had no schools, it did not need the subsidy, so 23 districts with six or seven thousand school-age children had still not provided public schools by 1866. It was financial incentives in the form of retroactive payments that brought all of the lost sheep into the fold by 1874.

Pennsylvania adopted a new constitution in 1873, the one it operates under today, which enlarged the educational provisions of the 1838 constitution and changed the name of the educational agency to the Department of Public Instruction—its present title (11). At the time, the department consisted of six persons: the superintendent, his deputy, three clerks, and a messenger. The constitution placed the superintendent of public instruction at the head of the department and prescribed his term of office to preclude his being arbitrarily dismissed by the Governor (12). The constitution made definite provisions for the education of "all children of the Commonwealth above the age of six years" and firmly shut the door to further appropriations of state funds to sectarian schools. Women were given equality under the school laws, making them eligible for any office or position.

Secondary education, which was mainly in private hands until the end of the nineteenth century, developed slowly in Pennsylvania in part because the state gave financial support to the private colleges and academies. Directors were given the authority to form "joint high schools" in 1854, but few did. It was 1887 before the Legislature permitted city and borough districts to establish high schools; 8 years later, it allowed every district to do so.

The movement gained ground, stimulating the growth of the Department of Public Instruction and receiving encouragement from it. The state education association, organized in 1852, set up a high school section in 1905. Three years later, the position of high school inspector was created, the first professional staff position beside the superintendent and his deputies.
PUBLIC EDUCATION IN THE EARLY 1900'S

State Superintendent Nathan C. Schaeffer

At the beginning of the twentieth century, Nathan C. Schaeffer was serving as superintendent of public instruction. A native Pennsylvanian, Dr. Schaeffer was ordained as a minister in the German Reformed Church, served on the faculty of Franklin and Marshall College in Lancaster for 8 years, and then became principal of Kutztown Normal School, a post he held for 16 years. Governor Robert E. Pattison had asked him to be superintendent of public instruction in 1893. Even though he was a Democrat appointed by a Democrat, he was re-appointed by Republican Governors until his death in 1919, achieving the longest tenure of any superintendent.

Under Schaeffer's supervision, the department continued to encourage high school growth, worked to raise the level of teacher preparation, and had the responsibility for inaugurating the first compulsory free textbook law in 1893. It was also during his administration that the Legislature passed the first compulsory attendance law in 1895. A man generally of conservative tendencies, he viewed the department's role as one of mediation between the old and the new. In an editorial he wrote for the Pennsylvania School Journal, he stated his desire "to abolish the defects of the present without sacrificing the heritage of the past . . ." (13).

As the new century began, Superintendent Schaeffer was seriously disturbed over the low state of the teaching profession. The basic requirement for teachers was a high school education offered by the normal schools or the public high schools; both offered 2-, 3-, or 4-year programs, and a high school diploma was not necessary for admission to the normal schools. Teachers completing the program were then certified through examinations given by the county superintendents according to the Act of 1854. This, plus the fact that private corporations controlled the normal schools and, thus, teacher education, made it difficult for Dr. Schaeffer to do little more than urge better salaries and higher qualifications.

The State Teachers' Association became the Pennsylvania State Education Association in 1900, with its constitution and bylaws modeled after those of the National Education Association. Schaeffer now had an ally in his efforts to raise the standards for teachers, and cooperation between the department and the association on standards, salaries, and working conditions proved to be the rule. Many professional people served in both organizations; the present executive secretary of PSEA, Ralph Swan, was once the acting state superintendent.

Schaeffer, the PSEA, and others believed that improving the quality of teachers would improve the public high schools. Unfortunately, local control was so strong that the department could not play a leading role in the high schools' steady growth during the first decade of the century. The Legislature first offered state support for township high schools in 1901. Two years later, school directors of districts without high schools were permitted to pay tuition for their students to attend high schools in other districts; this became mandatory in 1905. The department was able to exercise more influence after the Legislature approved salaries for two high school inspectors in 1908—the first professional expansion of the department since it had become an independent agency—particularly since the department had to approve a high school before it could be paid state subsidies.

The state had attempted to consolidate districts and eliminate wards and subdistricts as early as 1854, but this confronted localism head-on (the conflict has not ended to this day). When the first centralization law passed in 1901, authorizing the establishment of central high schools in townships, with pupils transported at public expense, no districts took advantage of the law.

Another of Superintendent Schaeffer's most vexing problems was the dilemma over the 1895 compulsory attendance law and the regulation on vaccination. No law existed requiring vaccination, and parents could not legally be forced to have their children protected against smallpox, but school attendance was mandatory, and vaccination was required for admittance.

The 1911 Code. The increasing body of education legislation and the resulting contradictions and confusions prompted the Legislature to request Governor Edwin S. Stuart to create an educational commission to draw up a school code. Appointed in 1907 (14), the commission did more than simply compile the existing legislation into a single document. The code it presented to the Legislature in 1909 was a comprehensive bill embodying all the principles of previous legislation in a harmonious whole. After a stormy session in which many amendments were tacked on to it, Governor Stuart, a strong supporter of educational progress, decided to veto the bill because the amendments made it "more than doubtful whether an approval of the bill would be of any benefit to the cause of education in the State" (15).

Discouraged but not defeated, the commission members continued to meet at their own expense to work out a new version of the code. It finally appeared in the July 1910 Pennsylvania School Journal, the same issue which carried the Governor's veto of the original code. The General Assembly passed the revised code in 1911, and it was signed into law by Governor John K. Tener. It not only codified existing legislation but included new provisions which (a) classified high schools and districts as first, second, third, and fourth class by population; (b) established a six-member board of education to oversee the system and equalize educational advantages throughout the Commonwealth; and (c) specified the qualifications for
various types of teaching certificates and the minimum salaries for each. It also listed procedures whereby the Board of Education could purchase the state normal schools outright.

The 1911 code increased the size of the departmental staff in order to aid the development of secondary education. Within 2 years, four high school inspectors were employed, along with expert assistants in agriculture, industrial education, and drawing—a new high school curriculum interest. Two supervisory bureaus also were added (16). The department also had begun to publish advice to local schools on curriculum, and the state board was issuing suggested school building plans and specifications.

**Vocational Education.** William Penn had expressed concern “that all children within this Province...shall be taught some useful trade or skill,” but the real impetus for formal vocational education did not develop until after the Civil War. In 1887, the Legislature authorized Governor James A. Beaver to appoint a five-member industrial education commission to study the desirability of developing technical and industrial education. It was this commission’s report that encouraged the growth of manual training schools in the cities and larger towns. Perhaps the popular exhibit by the Russian railway apprentices at the 1876 Philadelphia Centennial Exhibition, as well as the work being done in the schools of France and Germany, suggested the need for such training. Pennsylvania’s postwar industrialization made such a program doubly attractive.

Pennsylvania, with its prosperous agriculture, suffered a shortage of adult industrial workers; thousands of children were thus employed in industry in the early decades of the twentieth century. Many groups, including educators, social reformers, and labor unions, opposed child labor and were strong enough to bring about the Coxe Child Labor Law in 1915, which required minors between 14 and 16 to attend school for a certain number of hours per week. This provided an additional opportunity for developing vocational programs as well as basic instruction.

General education was already a part of the regular curriculum, but the Showalter Act of 1913 set up a statewide vocational program in agriculture, trade, and industrial education, and home economics. This effort was formalized 2 years later in an official vocational education bureau, which contained agricultural and industrial divisions. In 1917, the Legislature voted to allow the state to apply for federal Smith-Hughes funds for programs in the skilled trades, handicrafts, and agriculture. By the following year, the Bureau of Vocational Education had a professional staff of 18, illustrating dramatically the impact of federal money on state services. This federal support proved a mixed blessing, however, as vocational education’s independent finances encouraged it to be independent in action, and the superintendent had problems controlling it from time to time (17). A vocational, technical, and continuing education bureau still administers some of the programs begun in the early twentieth century, along with a host of new ones.

Teaching standards and working conditions improved significantly during and after World War I. For instance, the state enacted minimum salary laws and in 1917 established the Public School Employees’ Retirement Fund. All 13 of the normal schools had been purchased by 1920, and the Cheyney Training School was added in 1921 to prepare Negro teachers. World War I undoubtedly acted as a catalyst on the expansion of these teacher-training institutions and, since there was a real shortage of teachers, brought about further improvements in status and conditions. The department did everything possible to lure young people into the field, while the emphasis on industrial growth was bringing about new opportunities in vocational education.

**Superintendent Thomas E. Finegan**

When Dr. Schaeffer died in office, Governor William C. Sproul (18) appointed Dr. Thomas E. Finegan, then deputy commissioner of education for New York, to succeed him. A native of New York, Dr. Finegan had been a teacher and administrator in the public schools before joining the New York department as supervisor of examinations in 1892. By 1915, he had advanced to deputy commissioner, and his departure from the state was lamented by his fellow educators (19). Governor Sproul was assailed for going outside Pennsylvania to choose his superintendent, but the Governor did not waver in supporting Finegan and his programs throughout his term. This partnership formed by an interested Governor and a vigorous superintendent resulted in marked educational progress.

Dr. Finegan first reorganized the department into a businesslike, service-oriented organization staffed with qualified professionals. Indeed, the reorganization was so thorough that it might better be called a reconstruction. From Dr. Schaeffer’s 3 bureaus—vocational education, professional education, and medical education and licensure—Dr. Finegan made 10: administration, attendance, health education, preprofessional and professional credentials, rural education, school buildings, school employees’ retirement, special education, certification and training of teachers, and vocational education. The conservative elements in the department who disapproved were soon outweighed by the new staff brought in to administer the new structure.

Dr. Finegan then established the Education Congress, a 2-day meeting which brought local school people from all parts of the state to Harrisburg to review old problems and discuss new developments. The congress has been held regularly since Dr. Finegan’s time and remains an important feature of the current program.
Consolidation. The General Assembly did not act on Finegan's legislative program until 1921, but it did pass the Sweitzer Act during its 1919 session, requiring all schools with ten or fewer students to close unless special permission to continue operation was obtained from the Board of Education. Two years later, to sweeten the proposition, it voted a $200 subsidy for each closed school. Rural people were slowly realizing that their children were suffering educationally from the one-teacher schools. Most had inadequate buildings, outdated textbooks, unspeakable sanitary facilities—schools which were little more than training grounds for new teachers. The conservative nature of the Pennsylvania Germans, however, made it painful for them to relinquish these local institutions. As late as the 1926-27 school year, 486 were still operating, and by the spring of 1934, 237 still were open.

More than 30 years passed before all one-teacher schools in Pennsylvania finally closed their doors. As they declined, the rural consolidated schools increased. In the 1916-19 school year, there were 115, most founded as a result of smaller schools' closing; by the end of the 1932-33 school year, 780 approved consolidated schools enrolled some 180,000 pupils (20).

To meet a teacher shortage, the Legislature passed the Woodruff Salary Act and increased state aid for salaries. Teacher certification became an important element in determining state reimbursement, the law providing a minimum of $60, $70, and $80 per month for various categories of certification. On the basis of standard teacher certificates, the act offered the districts $5 per month for provisional, $12.50 for professional or normal school, $20 for others, with an additional $5 per month for rural teachers. The remainder was still paid on a 50-50 basis on teachers and pupils.

The Edmonds Act. Finegan's program was presented to the General Assembly in more than one hundred bills. The House and Senate Education Committees condensed them to one omnibus bill covering 72 specific laws, which the General Assembly passed as the Edmonds Act, named after the chairman of the House Committee. This act provided the legal and financial basis for sweeping changes in the department and in public education itself for the next 24 years. It replaced the State Board of Education with a State Council of Education, the superintendent remaining the chief executive officer. The College and University Council, created by the Legislature in 1895 to grant charters to institutions of higher education, was eliminated and its functions turned over to the state council, which now had the power to coordinate all educational policy at the state level.

One of the principal weaknesses in Pennsylvania's educational system was the low standard for beginning teachers. The Edmonds Act made the class of school district, the division or organization, and the grades of teaching certificate the bases for state subsidies to encourage higher salaries and higher certification levels. Although the act established a statewide minimum standard, it took the power to issue teacher certificates from the county superintendents and vested it in the State Council of Education and the superintendent of public instruction. The state now had control of all teacher training and certification.

Another part of the act defined elementary and secondary education systems and made the junior high school an official part of the system. It gave the state council the right to prescribe high school studies, the beginning of a responsibility for curriculum requirements that has increased through the years. Libraries were required in all new secondary school buildings, mainly because the Middle States Association of Secondary Schools and Colleges required them for accreditation. Elementary school libraries have received the same attention only recently.

With the strong support of Governor Sproul, the Edmonds Act passed the Legislature against relatively little opposition. The increased centralization of authority resulting from the act again mobilized all the forces defending local control. Previous laws had not disturbed local authority to a great extent, but the Edmonds Act brought the power of the state into every district. Specific attacks centered on the certification requirements—now in the hands of the state—the increase in salaries, and the state's interference in such administrative matters as attendance, sanitation, and construction. The Pennsylvania Grange led the sortie against both the legislation and Dr. Finegan personally, calling him a "czar" and a "carpetbagger." Despite these efforts, the Legislature was not disposed to repeal its work, and the Edmonds Act remained in force until the next great educational upheaval in 1945.

Both gubernatorial candidates supported Dr. Finegan's program in the 1922 Republican primary campaign (21) when Gifford Pinchot, one of Pennsylvania's outstanding Governors, was elected to his first term (22). Despite Pinchot's endorsement of Finegan's program, friction soon developed between the two men. Whatever its nature, political or personal—the records are not clear—the Governor refused to reappoint Dr. Finegan on the expiration of his term unless Finegan agreed to submit in advance an undated resignation which the Governor could accept at his pleasure. Dr. Finegan refused.

Although he was not reappointed, Finegan deserves the credit for creating the department's modern structure, which stresses services to local districts. Under his administration, Pennsylvania moved toward the gradual achievement of William Penn's dream of providing education for every child. When the Second Education Congress in 1920 focused on the Ayres Report of the Russell Sage Foundation, it revealed, to the consternation of Pennsylvania educators, that the state had dropped from
tenth place in 1890 to twenty-first in 1918. But by 1922, the director of statistics for the Russell Sage Foundation reviewed the state's progress and announced that it had advanced to a rank comparable to the second-ranked state in the 1918 report.

J. George Becht

Governor Pinchot appointed J. George Becht, first deputy superintendent and former secretary of the board of education, to replace Dr. Finegan. Born in Lycoming County, Dr. Becht began teaching at the age of 15; in 1893, he was appointed superintendent of Lycoming County schools. He became a teacher at West Chester State Normal School in 1903 and 2 years later was principal of Clarion State Normal School. When the Board of Education was organized in 1912, he became its secretary and remained in that position until the board was replaced by the state council, at which time he became the first deputy under Finegan (23).

One of the Pinchot administration's first acts was to develop an administrative code for the entire state government. Clyde King, lured from the University of Pennsylvania to the Governor's office, wrote most of this code, which significantly strengthened the department's role as the chief executive agency for the state's educational policies. The code brought all agencies concerned with education under the department's umbrella: 14 professional examining boards; the state library and museum; the school employees' retirement board; the historical commission; the board of censors; four state institutions—the state oral school, the Home for Training in Speech, the Soldiers' Orphans School, and the Thaddeus Stevens Industrial School. In June 1924, the department's reorganization showed five divisions with more than 20 bureaus. The state council's role was also enlarged to include supervision and development of standards for all institutions supported wholly or in part by state funds and not supervised by public school authorities.

The Legislature passed an act in its 1919 session allowing local districts to carry out programs for physically and mentally handicapped children, replacing the system whereby each district paid for institutional programs arranged by families. In its 1925 session, the Legislature not only made the extension schools an integral part of the public education program but also authorized state subsidies for districts operating classes for physically and mentally handicapped children. This was an important step in the state's efforts to offer a chance for education to all children.

An act in 1923 considerably advanced consolidation by authorizing transportation subsidies to be paid districts on the basis of their wealth. At the same time, the 1923 Edmonds Act took into consideration the wealth of a district as a factor in reimbursement, thus enlarging its equalization philosophy. It was beginning to offer proportionately larger shares of support to poorer districts to enable them to offer an education program comparable to that in the wealthier districts (24).

State Superintendents Haas and Keith

Not in the best of health when he assumed office, Dr. Becht died in 1925, the strain of the position undoubtedly having hastened his death. Governor Pinchot selected his second deputy, Francis B. Haas, to complete his term. Born in Philadelphia, Dr. Haas had been a teacher and school administrator in his home city until he came to the department in 1920 as assistant director of the teacher bureau. He received his doctorate of education (then called pedagogy) from Temple University in 1927. His term was short because when the Senate refused to confirm his appointment, he resigned in January 1927 to permit incoming Governor John S. Fisher to name his own superintendent.

Haas did organize a kindergarten and elementary education division and changed the state normal schools into state teachers colleges during his short term. He was again appointed superintendent 12 years later and served with distinction for 16 years.

Governor Fisher, himself a former teacher and supporter of the first minimum salary bill, appointed the former principal of the Indiana (Pennsylvania) State Normal School, John A. H. Keith, superintendent of public instruction. Dr. Keith was born in Illinois and had taught in public and normal schools in his own state until he became president of the state normal school in Oshkosh, Wisconsin, in 1907. Ten years later, he moved to Indiana, Pennsylvania.

The department's services and programs changed little during his administration. The General Assembly did authorize construction of an education building in the capitol complex in Harrisburg in 1929. Pennsylvania was only the second state to provide a headquarters for its state education agency, and the cornerstone was laid in November 1929, with great enthusiasm and high hopes.

DEPRESSION AND WAR

Tight Budgets

The onset of the Depression halted progress immediately. Almost a million men were unemployed in Pennsylvania by 1931, and Governor Pinchot, serving his second term, was locked in battle with the Legislature to provide relief measures. Pennsylvania was harder hit than most parts of the nation; with 8 percent of the population it had 10 percent of the unemployed.

Since most people's attention was turned to other concerns than the public school system, educators simply
fought to survive. The 1931 Legislature appropriated about $93 million for education support but reduced it in a 1932 special session to about $89,300,000, decreasing the department’s funds by more than 10 percent. The state had to assist financially distressed districts, however, and the department’s school business bureau administered these funds. The Legislature voted additional emergency legislation in 1933 allowing districts to cut teachers’ salaries to 90 percent of mandated minimums, with an additional 10-percent reduction if the superintendent approved. Thus, Pennsylvania’s schools tightened their belts and weathered the storm. It was the superintendent’s boast that not one Commonwealth school disbanded from 1931 to 1935, although throughout the rest of the country, 20,000 schools closed their doors during this same period.

By concurrent resolutions in 1929 and 1931, the Legislature created the Sterling Committee, which launched a study of the state government’s organization in 1935 (25). Mainly concerned with economy and cost reductions, its report recommended an extensive reorganization of the department, reducing the number of bureaus and the staff’s salaries. For instance, it suggested that the visual education division be scrapped and called for a 25-percent reduction in the professional licensing division’s staff. It recommended that the school districts reorganize into larger, more economical units; that two state teachers colleges close immediately, with the possibility that two more would be closed; and that the boards of trustees of the state teachers colleges be discarded. It also suggested that the department charge nominal fees for teaching certificates. The department heeded part of the report and reorganized into a three-bureau structure in the following years.

Despite serious financial problems brought on by the Depression, a law passed in 1931 allowed districts to establish kindergartens as integral parts of their school systems. The new education building, begun so optimistically in the twenties, was dedicated in 1931 and is the home of the department today.

Superintendent Keith’s term expired in 1931, and his poor health removed him from consideration for another term. Governor Pinchot appointed James N. Rule as acting superintendent and later as full superintendent. As a member of the department since 1921 and the deputy superintendent since 1923, Dr. Rule had directed much of the department’s activity during Dr. Keith’s illness. A native of Manchester, Iowa, he was educated at Washington and Jefferson College in Pennsylvania and taught in the Washington, Pennsylvania, schools before becoming assistant principal of the Washington and Jefferson Academy. He became the academy’s principal in 1907, went to Pittsburgh 5 years later as principal of Central High School, and then to Schenley High School. He came to the department in 1921 as the first director of science, became second deputy for secondary education in 1923, and first deputy under Dr. Becht. In 1925, he became the first executive secretary of the State Council of Education.

During the early years of the Depression, Dr. Rule was limited by the Legislature’s overriding concern with economy and cost reduction. In 1934, he called a meeting of educators and interested citizens to consider ways in which these problems could be met—an appropriate celebration for the centennial of the free public school system. More than 2,000 attended this “Citizen’s Conference on School Recovery in Pennsylvania” to hear the superintendent outline the “Three R’s of School Recovery”:

Restoration of the instruction program, Reorganization of school districts, and Revision of the system of school support.

The final “R” was a cause of mounting concern. The Legislature, besieged by hard-pressed citizens, found the schools an increasing problem, with educational organizations calling for more funds and different ways of distributing them. Almost every year, a committee was appointed to study the problem (26). However, some sound legislation resulted, and it was a little more than a decade before another change was made in the system by which the state supported public education.

The emergency legislation on teachers’ salaries expired in 1935 and was not reenacted; the state reverted to the provisions of the Edmonds Act. Federal-state emergency relief programs in adult education were supervised by the department and included courses in academic education, art, English, citizenship, guidance, handicrafts, music, nursery schools, parental education, recreation, social science, vocational education, and workers education. Federal aid was becoming available for school buildings, and the tone of official reports indicated that public education might be returning to a more normal condition.

State Superintendent Lester K. Ade

Dr. Rule’s term expired in 1935, and he was succeeded by Lester K. Ade, president of the Connecticut State Teachers College at New Haven, and the first superintendent to hold a Ph.D. degree. Dr. Ade, a native Pennsylvanian, began teaching in the Williamsport (Pennsylvania) public schools, became supervising principal of the Muncy (Pennsylvania) schools, and finally principal of the Muncy Normal School. He left Muncy to become dean of West Chester (Pennsylvania) Teachers College and in 1928 took the position in New Haven.

Dr. Ade, vitally interested in improving the quality of teacher education, appointed an Advisory Committee on Minimum Standards in 1936 to review certification requirements. The following year, the Legislature enacted the Mundy Tenure Act and gave the superintendent power to withhold state subsidies from districts failing to award the mandated minimum teacher salary increments.
Convinced that the department needed a strong public relations program, Dr. Ade established monthly staff conferences, prepared many publications, and encouraged frequent meetings between his professionals and the public. He also inaugurated training programs for firemen and building custodians; this service expanded to the present independent Public Service Institute, which offers a variety of training programs to government and municipal employees.

The legislators again turned to consolidation in 1937, passing an act which provided for the merger of smaller districts. To their disappointment, it proved to be no more attractive than the provisions for union districts. Although there were now three ways by which districts could be organized into larger units, it was the late 1940's, when the mandatory reorganization law passed with its financial incentives, before notable consolidations occurred (27). The 1937 legislation offered state aid for transportation and created boards of school directors with powers to merge and reorganize districts, but it, too, was mainly "permissive" and was thus ignored (28).

During Dr. Ade's superintendency, the 1937 Legislature expanded the special education program by permitting mental hygiene clinics to be established for children and requiring local authorities to appoint county supervisors of special education within 2 years. Two years later, it gave the superintendent the power to make these appointments where districts failed to do so.

Governor Arthur H. James appointed Deputy Superintendent Clarence E. Ackley as acting superintendent when Dr. Ade's term expired in 1939. Several months later, Dr. Francis B. Haas resigned as president of Bloomsburg State Teachers College to accept his second term as Pennsylvania state superintendent. Elected president of the Pennsylvania State Education Association, Dr. Haas had gained an enviable reputation in education circles since his first term.

The War Years

Vocational Education. The threat of war forced the government to place considerable stress on vocational education and training for vital wartime industries. The Governor's Job Mobilization Committee had already stirred interest in industrial training programs when the National Defense Vocational Education programs began in the summer of 1940. By the following year, the department's staff included a state director of vocational training for defense workers, who supervised three types of programs: specific training in and for industry, the National Youth Administration vocational programs, and essential instruction for young people out of school. Dr. Haas was especially proud of the aviation education program; beginning with the Pennsylvania State School of Aeronautics in 1942, it is still part of the state's curriculum.

Educational guidance, especially for developing and preparing skilled workers for vital industries, became important as wartime production demands increased drastically. The Division of Occupational Information and Guidance, established in 1943, handled most of these activities. Academic and psychological guidance is a relatively recent development; state guidance activities were first designed to meet wartime industrial needs.

School Building. The federal Lanham Act of 1940—the predecessor of the present-day aid to impacted areas—provided financial assistance for school building construction in areas heavily affected by defense industries and the war effort. Two years later, the federal Community Facilities Act enlarged the program and authorized the superintendent to approve school sites and buildings. Unfortunately, these acts did little to alleviate the sad conditions found in most communities where so many school buildings dated from the previous century. The Depression era restrictions and the wartime halt to civilian building turned the schools into one of the state’s worst war casualties (29).

Financing Postwar Needs. As early as 1943, the Legislature looked forward to Pennsylvania's postwar needs by appointing study committees to check into the distribution of school costs between local and state sources. A wartime industrial boom had put Pennsylvania's finances in good shape, and a surplus had accumulated sufficient to permit Governor Edward Martin to retire the General State Authority bonds, amounting to nearly $48 million. This time the committee's report resulted in the approval of a new subsidy play in 1945.

The Hare-Lee-Sollenberger Act offered state aid to school districts on the basis of local ability to pay for basic education programs (30). In general, the state set a figure which it estimated as the basic amount necessary to educate a roomful of schoolchildren identified as 30 elementary or 22 secondary students. In 1945, it set this figure at $1,800, but by 1959 it was up to $5,800. The state guaranteed that each district would have at least that amount for each teaching unit that met the state's regulations and standards.

Most of the districts were willing to comply. The amount they actually received from the state depended on the wealth of the district measured per pupil in taxable property. It was calculated by a complicated process, using a "reimbursement fraction" for each district, applied to the total amount, to determine the state's share. It was possible for the state to pay as much as 95 percent of the $5,800 amount guaranteed to a poor district in 1959, and as little as the $1,000 minimum to a wealthy one. Of course, there was no limit to the amount which the district could spend if its resources permitted. The state's schools had suffered from a severe teacher shortage, and the state had been
forced to issue emergency certificates by 1943. Cost-of-living salary increases attracted a few teachers, but by the end of the war the schools were still understaffed. The new legislation helped the situation to some extent by including a new single salary schedule for teachers, with an additional increment for the master's degree.

During the war, the department was given the power to regulate private trade schools. In the postwar years, this regulatory function expanded to include private academic, business, and correspondence schools founded to meet returning veterans' demands for educational opportunities, thus giving the public some protection against fraudulent operations.

POSTWAR EXPANSION

The war had encouraged many educational programs outside the standard high schools, and these created problems for students who had participated in them. The 1945 Legislature authorized the department to set up procedures to grant high school diplomas for this "equivalent experience." The department then turned over the task of rating credits earned in these special study programs to a newly formed Division of Secondary Education Evaluation, which issued equivalent diplomas when merited. At the same time, however, the department lost some of its administrative responsibilities when the historical commission and the state museum and archives division merged into an independent State Historical and Museum Commission.

The department began a general reevaluation and revision of the school curriculum on its own initiative in 1946. The war years had brought a tremendous increase in scientific and technical knowledge, which had to be incorporated into what was being taught. More important, very little work had been done in curriculum revision during the Depression and war years. The 1947 Legislature backed the department's efforts and requested that it make a thorough study of the curriculum regulations as a basis for updating them. The superintendent also appointed an Advisory Committee on Secondary Education.

The new subsidy program and the curriculum regulations marked the beginning of an outpouring of education legislation by the 1947 General Assembly. Everything seemed outdated—the shadow of the postwar population explosion loomed just as the knowledge explosion from the wartime discoveries in science and technology was becoming apparent.

As mentioned above, the school buildings were in a pathetic state. To help districts meet their construction costs, the assembly created the State Public School Building Authority. It then amended the Municipal Authority Act to include school construction. Because of the constitutional limit on the debts that municipalities could incur, Pennsylvania pioneered the authority method of construction for all manner of public buildings (31).

In other legislation, the General Assembly increased teachers' salaries along with the basic school subsidy. It established a State Tax Equalization Board to help determine local wealth for school tax purposes. The benefits of special education were enlarged to include cerebral palsied children, and the extension programs were expanded to include recreational and social services for school-age children.

Perhaps the most important accomplishment of the 1947 Legislature was in the field of school district reorganization. Act 361 (32) for the first time mandated a general reorganization rather than simply permitting it. It directed county boards of school directors to prepare plans for mergers and the reorganization of county districts according to the state council's standards. It was by no means a complete success, because it did not penalize the directors for failing to comply and did not impose rigid standards. Until the Legislature offered subsidies for jointures, mergers, and unions in 1951, comparatively few districts consolidated (33). But even these reorganizations did not fully meet most educators' standards for consolidation, and reorganization has remained a hotly contested item in the state's education program.

The Legislature and the State Department of Education pushed ahead during the next few years in the fields broken by the 1945 and 1947 legislative landslides. The 1951 Municipal Authority Act was rather enlarged to permit school districts to set up their own authorities. The state's share of rental payments was made more liberal, and the state participated in a federally sponsored national survey of school facilities which resulted in the publication of a report entitled Pennsylvania Surveys Its Public School Facilities (34).

The department continued its curriculum revision and published a number of guides for elementary and secondary school programs. Audiovisual services, enriched by techniques developed during the war, expanded; by the end of 1952, 17 audiovisual service centers had been established, partly with funds appropriated by the George-Barden Act. In 1952, the Board of State Teachers College Presidents asked the State Council of Education's permission to offer graduate programs leading to the master of education degree; although these colleges had expanded their facilities and curriculums, this request was not granted until 1957.

Higher Education

Beyond its administration of the state teachers colleges, the department had little authority in the field of higher education. The state council could only grant charters to colleges
and universities and approve their teacher education programs. It reported every year on the funds given to certain colleges and universities, but the funds themselves were provided by direct legislative grants, and the department had no control over them (35).

Public interest in higher education increased in the postwar years, resulting in a rising number of inquiries to the state council. These were usually passed on to the teacher education bureau. By 1951, this procedure had become so unsatisfactory that the Legislature authorized the department to create a Bureau of Higher Education headed by a deputy superintendent. This program has since grown tremendously, and the need for an expanding staff in this bureau has been one of the outstanding characteristics of the department’s postwar expansion (36).

Special Education

The 1951 Legislature further extended the state’s special education program. One act allowed districts to establish speech and hearing centers, and another allowed them to establish day-care training centers for mentally retarded children who could not be served by the regular schools. But this legislation was still permissive, stating that only districts wishing to provide these services were to receive state funds—none could be compelled to provide them.

When Dr. Haas retired in 1955, the newly elected Democratic Governor, George M. Leader (37), appointed Deputy Superintendent Ralph C. Swan as acting superintendent. At one time, Governor Leader had hoped to become a teacher himself, and he was especially interested in education for handicapped children. Establishing a mandatory program for these children became one of the early priorities of his administration; the program passed in the 1955 session, with an accompanying act providing funds for transporting the children to school—almost 30 years after the state passed the first permissive legislation in special education.

Two years later, in 1957, the department organized a Bureau of Special Services for pupils to supervise the special education programs. The next year, the assembly again expanded special education by mandating that programs be established for all “exceptional children.” The bureau now supervises instructional programs for the gifted, the physically and mentally handicapped, and the emotionally and socially disturbed—one of the most comprehensive special education programs in the country.

Departmental Reorganization and Expansion

Another in the long line of governmental surveys to bring economy to state government was made by the Chesterman Committee in 1953 (38). Its report on education recommended that a lay Board of Education be created to formulate policy and recommend candidates for the state superintendency. It further recommended that the department’s professional staff be covered by Civil Service and that the department be reorganized to eliminate some of its administrative responsibilities that were not truly educational. In particular, it called for a reorganization of the school districts to abolish the financially distressed districts still receiving subsidies begun during the Depression. The report advised closing half the state teachers colleges. The superintendent implemented whatever recommendations he could by administrative action, but the major ones required legislative action, and they were not approved.

When the National Defense Education Act of 1958 provided funds for guidance and testing, the department created a Division of Guidance and Testing to handle all of these functions except occupational counseling. Another expansion occurred in 1961, when the department set up a Division of Testing to administer the state scholarships, the secondary school equivalency diplomas, the preprofessional and high school testing programs, and the examinations for special teaching certificates.

EDUCATION FOR THE SPACE AGE

Charles H. Boehm

Departmental Expansion. In 1956, Governor Leader chose Charles H. Boehm to replace Swan, the acting superintendent for the previous 17 months. Dr. Boehm, who had started as a teacher in the Woodbridge, New Jersey, schools, became a supervising principal and then a high school principal in Pennsylvania. He was first the assistant superintendent and then superintendent of the Bucks County schools, where he grew up. He was a great admirer of Thomas Finegan and tried to pattern his own administration after his.

Perhaps the new superintendent’s strongest interests were in the fields of research and curriculum development (39), at a time when a combination of factors aided in making these fields matters of serious public concern. The 1955 Legislature collided with the Governor over a tax program (40) but finally approved a statewide sales tax devoted solely to education. Russia orbited Sputnik late in 1957, and the ensuing shockwaves jarred the public’s complacency about the superiority of American schools.

Taking advantage of the public’s demand to “do something” about education, Governor Leader called a Conference for the Improvement of Instruction, which met in Harrisburg in January 1958. Civic leaders and educators from all parts of the state spent 2 days discussing ways of improving the quality of the Commonwealth’s education. The same year, the Pennsylvania State Education Association’s Committee of Fifteen recommended a broad expansion in program and financial support. The publicity from both the conference and the PSEA’s recommendations stimulated more public interest.
In mathematics, science, languages, guidance and testing, increased research. This federal aid, which allowed the department to expand its services and staff, meshed with the superintendent's keen interest in developing a curriculum for the space age. Dr. Boehm won national recognition for instituting programs in earth and space science. He also set about establishing such innovations as regional instructional and audiovisual centers throughout the Commonwealth and a network of educational TV channels. To handle these responsibilities, he created a Bureau of Instructional Materials and Services.

Higher Education. The rising interest in education could not help having an impact on higher education; in particular, there was pressure to improve teacher education. Over the years, the state teachers colleges had grown individually, with no overall comprehensive planning. One of Dr. Boehm's concerns was to develop a master campus plan. He set about acquiring sites and started one of the nation's largest college construction programs, at the same time laying plans to develop the individual specialties in each college.

After they strengthened their curriculums to include liberal arts, the state teachers colleges became state colleges. In 1961, they received permission from the state council to offer more than teacher education programs, and 4 years later they were authorized to become universities after meeting the necessary qualifications. At the same time, in 1965, Indiana State College became Indiana University of Pennsylvania.

Investigations and Recommendations. The year 1959 saw the department the target of a legislative investigation. The state director of vocational education had been purguing an independent course—he received funds from federal and state appropriations, not from the general departmental appropriations. Dr. Boehm was determined to exercise control over this program and, with the consent of the State Board for Vocational Education, eventually maneuvered the director out of his job by abolishing it. Its functions were turned over to the director of the vocational education bureau. Controversy naturally resulted, and from it came charges of misuse of funds by the superintendent.

The Republican-controlled State Senate appointed a special committee to investigate charges that excessive sums had been spent for redecorating the superintendent's office suite, particularly the ultramodern, electronically equipped conference room. When the committee could find no proof of the charge, it abandoned the inquisitional character of its investigation to examine the department's total program. The department took full advantage of this opportunity to tell its story to what had become basically a sympathetic audience. The committee exonerated the superintendent of any charge of wrongdoing, but in the end its report had little impact on the progress of education in Pennsylvania. Its brief exploration of departmental programs, however, encouraged the legislators to request further studies.

Late in 1959, the House asked the Governor to appoint a blue-ribbon study commission to thoroughly assess public education and make recommendations for the future. In response, Governor David L. Lawrence appointed a Governor's Committee on Education under the chairmanship of Lieutenant Governor John Morgan Davis. This committee made one of the most exhaustive and detailed studies of education on record, publishing nine research monographs during the evaluation (41). Its report and recommendations, presented to the Governor in 1961, lit a fire under Pennsylvania public education which is still burning.

The committee noted: "Equality of educational opportunity may be the law, but it is not the fact" (42). It recommended changes, improvements, and expansion in every area, and Dr. Boehm ordered his staff to put into effect all that could be implemented without legislative or executive order.

A campaign was undertaken to secure the remaining recommendations by legislative action. The first two bills passed reorganized the school districts and established a system of community colleges. The community college proposal was not new; Governor Leader had made a similar recommendation in 1957, but it had been defeated. This 1961 proposal, based on the recommendation of the Governor's Committee, never even came to a vote in the Legislature. But the need was still there, and in the next session the Legislature passed a bill which not only permitted the establishment of community colleges but committed the state to generous financial support for them. Perhaps this was due in large measure to support from the newly appointed Governor's Committee of 100 for Better Education. This committee, composed of most of the Governor's Committee on Education and many Commonwealth leaders, waged an active campaign for reorganization and for community colleges.

A sweeping reorganization bill (Act 561) to achieve the ends the department had sought for years passed in the 1961 session, despite storms of protest. The proponents of local control again marshaled their forces. Led by the Pennsylvania Grange, the Pennsylvania Association of Township Supervisors, the school board directors, and the citizens and schoolmen who believed the legislation posed a threat to their jobs and influence over school affairs vigorously campaigned against the legislators who had voted for it. As a result, a number of legislators lost their seats.

Although Act 561 was repealed in the 1963 session, the forces supporting reorganization were too strong to be defeated completely (43). They were able to put through a new act that seemed less sweeping, though its effect was much the same as the previous one. It contained an additional requirement that the state board (44) study ways...
of measuring educational quality as a factor in district re-
organization.

In the meantime, the department, urged by the super-
intendent’s interest and stimulated by the Governor’s
committee report, continued to move ahead in its cur-
iculum experiments. It created the Office of Curriculum
Research and Development to foster experiments as well as
courage the adoption of proven innovations. Area
curriculum centers were set up at the state colleges. The
schools added a course in world culture to the curriculum,
and NDEA grants continued to encourage better teaching in
science, mathematics, and languages.

In his 1962 report, the superintendent noted that
nine regular broadcasting councils had been added to the
state’s educational TV network. With the assistance of an
NDEA grant, the superintendent had appointed a special
committee to study the use of teaching machines and pro-
gramed learning—the first such study in the country. The
department reorganized the higher education bureau and
began preparing a 5-year plan based on the recom-
mendations of the Governor’s committee for state colleges.
The department also focused attention on development of a
master plan for higher education throughout the Common-
wealth.

The General Assembly’s 1963 session was very pro-
ductive for education. It passed a district reorganization
bill, created the Pennsylvania Higher Education Assistance
Agency to offer state-guaranteed loans to young people
wanting to attend college, and allocated $2.5 million for
planning and design of state colleges. Although two area
technical schools were opened in the previous school year,
it passed a State Vocational Education Act to encourage
the development of other such schools with federal money.

Criticism of the State Council of Education had been
growing louder year by year. President Eric Walker of
Pennsylvania State University and the official representa-
tive of the Pennsylvania Association of Colleges and Univer-
sities, among others, complained that the council was
slighting higher education and urged the creation of a
separate policy-making body. The Governor’s committee
report also had included a strong recommendation that
the council be reorganized to give a bigger voice to higher
education and to remove it from the superintendent’s direct
control.

In response, the Legislature, with Governor William
W. Scranton’s endorsement, followed the Governor’s
Committee of 100 for Better Education report and created
a State Board of Education as the top policy-making body
in state education. The state superintendent became its
nonvoting chief executive officer. The board was divided
into two seven-member councils—one for basic education,
one for higher education—plus three members serving at
large. Each council was held responsible for action in its
own area, though the board was to make all final decisions.
The State Board of Education, like the State Council of
Education before it, also serves as the State Board for
Vocational Education (45).

In subsequent legislation, the assembly directed the
state board to make studies and specific recommendations
in five areas of education: measurements of quality of
education, a master plan for higher education, a study of
state vocational-technical education, a plan for community
colleges, and a subsidy system for support of public
schools. Authorized to develop standards for school district
reorganization, it completed its task in less than a month.
The vigor and ability of the board members were amply
demonstrated; not only did they complete this task
quickly, but during the same period they adopted standards
for community colleges. The board sponsored a study in
the administration and organization of state colleges and
completed an overall review and revision of all curriculum
regulations.

The department continued its work in curriculum
development throughout 1963, adding economics and
world cultures to high school graduation requirements. It
also added 4 years of language study and earth and space
science to the elementary school curriculum. Under a grant
from the Ford Foundation, the office of curriculum,
research, and development began an experimental program
on the dropout problem. Several prekindergarten classes
were operating before Congress inaugurated the national
Head Start program. Pennsylvania became the first state in
the nation to adopt a program for intergroup and human
relations education, and the department received national
endorsement, and the Freedoms Foundation George Washington
Medal Award for a teacher’s guide on this subject.

Dr. Boehm resigned as superintendent early in 1964
to accept a position as an educational consultant for the
federal government. A controversial figure, he had greatly
expanded the department’s functions in curriculum
development and higher education. The department’s staff
had grown to 1,000 persons, and the number who held
doctorates increased from two to over forty-five. Education
now accounted for over half of the state’s annual budget.

J. R. Rackley

Deputy Superintendent George W. Hoffman served as
acting superintendent for 18 months, until Governor
Scranton appointed J. R. Rackley in October 1965. Dr.
Rackley, vice-president for resident instruction at
Pennsylvania State University, was born in Oklahoma
and taught history and social studies in the Oklahoma City
schools before teaching in colleges in Tennessee,
Connecticut, and Oklahoma. He joined the U.S. Office of
Education as deputy commissioner in 1955, served for a
short term as acting commissioner in 1956, and became
dean of the College of Education and professor of educa-
tion at Pennsylvania State University that September. He
became vice-president of the university in 1962 (46).
At the time Rackley took office, education costs were steadily mounting, and there were increasing demands for new programs to meet the space age. The 1959 Governor's committee had noted that since the beginning of state aid for public education, the state's share of the cost had increased to nearly 50 percent, and it recommended that this percentage be maintained as a matter of principle. A joint study committee, appointed by the Governor to consist of legislators and the newly appointed state board members, pointed out these concerns to the 1965 General Assembly, which responded by passing a new subsidy plan that preserved the philosophy of equalization of educational opportunity, as well as the 50-50 division of cost. At the same time, it attempted to give help to heavily populated areas experiencing the problems peculiar to urban societies.

A LOOK AT THE FUTURE

Pennsylvania's public education programs have shifted gradually from an intense local control to a state and local partnership during the century. The state's desire throughout these years has remained constant: to offer equal educational opportunity to all children. Alternatively it has tried to gain cooperation by offering money and advice and to compel it by law. The department's and the state superintendents' continuing concerns have been to consolidate districts and improve teaching standards, two vital elements in a successful educational program. Their success has always depended on a variety of factors: their own enthusiasm and drive, the interest of the legislative and executive branches, the support of public opinion, and the climate of the times.

A look at the future indicates an ever-increasing state responsibility—both financial and administrative—especially in the areas of post-high school and higher education. A growing partnership with the federal government seems inevitable, as it, too, becomes more deeply involved in educational support and planning. The 1965 Pennsylvania school subsidy program promises a deepening emphasis on the problems of the urban schools and the children who attend them.

5. Walsh, op. cit., p. 117.
6. Department of Public Instruction, 100 Years of Free Public Schools in Pennsylvania (Harrisburg: The Department, 1934), p. 17.
8. Thaddeus Stevens, born in Vermont in 1792, was active for many years in Pennsylvania politics before achieving national prominence as an abolitionist and member of Congress immediately before and during the Civil War. He was the acknowledged leader of the House until his death in 1868, a fanatic opponent of slavery. Although his national reputation rests on his work in this cause, much of his prewar career in state politics concerned the strengthening of the free school movement.
9. According to one historian, Andrew Curtin was the moving spirit behind the educational advances of the Pollock administration. A dynamic and gifted man, Curtin later served as "War Governor" of the state and continued in public life until his death in 1894. Wayland F. Dunaway, History of Pennsylvania (2d ed.; New York: Prentice-Hall, 1948), pp. 345-50.
10. James P. Wickersham, a native Pennsylvanian, was a leading figure in the early days of the free public schools. He was the first county superintendent of Lancaster County and one of the founders of the oldest state normal school, now Millersville State College. He served as head of the State Department of Education from 1866 to 1881, a period which included the change from the Department of Common Schools to the Department of Public Instruction. He helped organize the Lancaster County, Pennsylvania State, and National Education Associations and served as president of each. His History of Education in Pennsylvania (Lancaster, Pa.: Inquirer Publishing Co., 1886) is a treasury of source material.
11. The available source material indicates no public controversy over this change. It seems to have developed because of a rising interest in secondary education; the constitution now referred to "public schools" instead of "common schools." The general trend was to expand education beyond the elementary level. Superintendent Wickersham indicated that the constitutionality of state support for secondary education might have been raised in the following sentence in his annual report for 1874: "No constitutional objection will hereafter stand in the way of the establishment of schools of the highest grade. . . ." p. xvi.
12. In 1886, Governor Robert E. Pattison attempted to remove Superintendent E. E. Higbee by requesting his resignation on a charge of mismanagement of the Soldiers' Orphans School, but Dr. Higbee refused to resign. When Governor Pattison was elected for a second, nonconsecutive term, he tried to remove David J. Waller, the incumbent superintendent,
appointed by his predecessor, in favor of Z. X. Snyder. The matter was carried to the State Supreme Court, which decided in Dr. Waller’s favor.

14. The commission, chaired by Dr. Schaeffer, was composed of Martin G. Brumbaugh, David B. Oliver, William Landel, John S. Kiling, James M. Coughlin, and G. M. Phillips as secretary. Brumbaugh was perhaps the most influential member of the commission. A native Pennsylvanian, he was superintendent of schools in Huntington County, president of Juniata College, and finally superintendent of schools in Philadelphia when named to the educational commission. He later served as Governor of the Commonwealth from 1915 to 1919, and his administration supported many educational developments, including the child labor laws and the creation of the Bureau of Vocational Education. He appointed Dr. Schaeffer to the superintendency for Schaeffer’s last term.

15. Governor Stuart’s veto message as quoted in Walsh, op. cit., p. 402.

16. These were the Bureau of Medical Education and Licensure and the Bureau of Professional Education. The former, mainly responsible for approving medical education programs, was the first of a number of professional licensing boards which came under the department’s jurisdiction. The latter approved programs in preprofessional education for medicine, dentistry, and pharmacy; it was the first of many efforts to set standards for various types of professional training.

17. A legislative investigation in 1959 had its origins in the efforts of the superintendent to exercise more control over the Bureau of Vocational Education.

18. Governor William C. Sproul, a native of Lancaster County, was a newspaperman and businessman before being elected to the State Senate in 1896. He served in the Senate for 22 years prior to being elected Governor. His administration played an important role in education through his firm support of Dr. Finegan and his program. Dunaway, op. cit., p. 485.

19. A tribute to Finegan by William McAndrew, assistant superintendent of the New York City schools, refers to “his fine quality of brains” and “his considerate heart” and notes the “personal bereavement” of a “great company of public school workers” because he was leaving the state. Walsh, op. cit., p. 404.

20. Department of Public Instruction, 100 Years of Free Public Schools in Pennsylvania (Harrisburg: The Department, 1934), pp. 41-42.

21. From 1861 to the present, Pennsylvania has had only four Democratic Governors: Robert E. Pattison, 1883-87 and 1891-95; George H. Earle, 1935-39; George M. Leader, 1955-59; and David L. Lawrence, 1959-63. After the Civil War, Pennsylvania politics were controlled by the Republican machine headed first by Simon Cameron; then by his son Donald; later by Matthew Quay; and finally by Senator Boise Penrose. After Penrose’s death in 1921, no single man or machine held complete control, but the Republican party still dominated the state. Consequently, in most cases it was the party primary and not the general election which determined who would be Governor. The Governors usually were men of good quality, but they remained proteges of the machine which named the candidates; the law forbidding the same man from serving consecutive terms made it impossible for them to develop any real power while in office.

22. Gifford Pinchot, one of the most colorful figures in Pennsylvania politics, was a progressive Republican who won the nomination for Governor as a reform candidate in the confusion following Boise Penrose’s death in 1921. The first American to make forestry his profession, he had served as chief of the U.S. Forest Service under President Theodore Roosevelt. Pinchot was defeated in 1926 for the Republican nomination by Philadelphia boss William S. Vare (whom the Senate refused to seat) and was reelected Governor in 1930. Pinchot’s principal interests as Governor were conservation, reorganization of state government, highway development, and opposition to the public utilities. Pennsylvanians still refer to him as the man who “got the farmer out of the mud.” He was also an ardent “dry,” and this was an issue in his campaigns.

23. According to veteran educators and department staff members, Dr. Becht was the choice of the education community to succeed Dr. Schaeffer. Governor Sproul refused to appoint him, however, because he was strongly disliked by one of the Governor’s political allies. While secretary of the state board, Dr. Becht had vigorously pursued the task of purchasing the state normal schools from the private corporations, and since the Governor’s friend held an interest in one of these corporations, he opposed the state’s taking over.

24. This concept of the state’s responsibility in education grew until, in 1945, a new subsidy program was enacted clearly expressing this idea.

25. These investigative committees can be divided into three basic types. First is the study committee appointed by the Legislature—the Sterling Committee is an example—with membership drawn from either or both Houses or the outside; it investigates and recommends legislation in a particular area. The second type is the study committee appointed by the Governor at the Legislature’s request or on his own initiative. The third type is appointed by the superintendent to advise and help in developing standards and procedures in such areas as teacher certification and curriculum.

26. In 1927, the Legislature appointed an educational commission on subsidies which made recommendations, but the Legislature did not act. Another
study committee on subsidies was appointed in 1930. The superintendent appointed the Committee for the Study of Educational Problems in Pennsylvania in 1931 to revise the School Code; its efforts were unsuccessful. The Sterling Committee made its study the following year. In 1933, a legislative committee was appointed to investigate the cause of the increasing costs of education and ways to reduce them. The next year, Superintendent Rule held his Citizen's Conference on School Recovery. The Legislature created another Educational Costs Survey Committee in 1935, and 3 years later the Pennsylvania State Education Association appointed a study committee on school costs. The Legislature appointed a committee to study state and local participation in school costs in 1943, and its recommendations resulted in the 1945 Hare-Lee-Sollenberger Act.

27. The three methods of reorganization available to school districts were union, as provided in the 1911 Union District Act (revised in 1921); merger, as provided in the 1937 legislation; and jointure, or joint board organization, which had been permitted since 1854. In merger and union, the districts involved actually ceased to exist individually and formed a new district; these methods required approval from the voters. Jointure was a contractual agreement among a group of districts to conduct joint schools. The districts retained their individuality and their own boards; in fact, several districts were part of two jointures at different educational levels.

None of these methods was widely used until the 1947 mandatory reorganization act. Jointure, because of its simplicity—it could be arranged by school boards without a popular vote—became the most common. Few districts created in this way were large enough, however, to meet educators' standards for efficiency and financial resources. For a study of reorganization, see Governor's Committee on Education, E Pluribus Unum, Educational Research Monograph Series (Harrisburg: Department of Public Instruction, 1960).

28. Throughout the 1920's and 1930's, the Department continued to coax districts into larger, more efficient units. Lee Driver, first director of consolidation projects and later head of the Bureau of Rural Service, toured the state tirelessly, speaking to Granges, rural groups, and various citizens associations. His lectures, illustrated by lantern slides which were a curiosity then, drew large crowds and won him a reputation as the "Magic Lantern" man.

30. According to an interview in May 1967 with Harvey E. Gayman, retired executive secretary of the Pennsylvania State Education Association and member of the department staff from the early 1920's to 1928, the National Education Association recognized Act 403, the Hare-Lee-Sollenberger Act, as the best law of its kind in the country at the time.

31. Under the Pennsylvania constitution, all municipalities (including school districts) are limited in the amount of debt they may incur to a percentage of their assessed valuation. This has resulted in the development of authority financing, except where districts have sold general obligation bonds to cover the construction costs and are still within the debt limit. The Legislature authorized municipal authorities in 1925, but not until 1947 was the law amended to allow these authorities to finance school buildings. The State Public School Authority was created to assist districts, but the real impetus to school building came in 1951, when school districts were empowered to establish their own authorities, with state support. Governor's Committee on Education, Johnny Gets a Schoolhouse, Educational Research Monograph Series (Harrisburg: Department of Public Instruction, 1960).

32. The 1938 extra session of the Legislature passed three acts embodying the Thompson School Building Program. These acts would have provided a broad school building program generously financed by the state, with the department approving the plans and proposing more efficient district reorganization. Details for making the money available were never worked out, however, and the program was never put into effect.

33. In the 1949-50 school year, there were 11 union districts, no merged districts, and 190 joint boards in a total of 557 districts. By the 1959-60 school year, there were 71 union districts, 60 merged districts, and 436 joint boards, covering 1,875 districts. Governor's Committee on Education, "The Report and Recommendations to the Governor's Conference on the Improvement of Instruction, December, 1960, by Task Force 2," Harrisburg, Department of Public Instruction files. (Mimeographed.)

34. Department of Public Instruction, Pennsylvania Surveys Its Public School Facilities (Harrisburg: The Department, 1954).

35. Beside the state colleges, 15 institutions of higher education received financial support from the state in the 1958-59 school year. These included the Pennsylvania State University, University of Pennsylvania, Temple University, University of Pittsburgh, Lincoln University, three medical schools, Dickinson Law School, Drexel School of Technology, Philadelphia College of Osteopathy, and four other technical institutions. Governor's Committee on Education, Crisis in Academe, Educational Research Monograph Series (Harrisburg: Department of Public Instruction, 1961).

36. The reorganization of the department approved on October 17, 1966, provided for a deputy superintendent to be the chief administrative officer for
the superintendent. A commissioner for basic education is supported by an assistant commissioner and director of staff services for the Council of Basic Education, an assistant commissioner for programs and services, and an assistant commissioner for school administration. A commissioner for higher education is supported by an assistant commissioner and director of staff services for the Council of Higher Education.

37. George M. Leader, the third Democrat to serve as Governor since the Civil War, had turned to chicken farming when he was selected to follow his father, Guy Leader of York County, in the Senate. He served one term before he was chosen by party leaders to run for Governor in 1954. After its lean years, the Democratic party was discouraged and weakened; experts gave Leader little chance for victory. Young, vigorous, intelligent, and attractive, he waged an energetic campaign that contrasted favorably with that of the inarticulate and relatively colorless Republican candidate. His victory by nearly 280,000 votes carried with it Secretary of Internal Affairs Genevieve Blatt and a majority in the House. A liberal and champion of good government, Leader is sometimes called "the Democrats' Pinchot." He was defeated in his try for the U.S. Senate in 1958 and has not held public office since. Sylvester K. Stevens, Pennsylvania, Birthplace and has not held public office since. Pennsylvania, Birthplace and has not held public office since.

38. No real governmental reorganization had taken place since the Pinchot administration, but increasing pressures forced Governor John S. Fine to appoint this committee, headed by Francis J. Chesterman, retired Bell Telephone executive, and composed mainly of men from the business and financial world.

39. In Dr. Boehm's official biographical sketch, prepared while he was superintendent, his specific activities were divided into the categories of curriculum development, research and development, and higher education, indicating the order of importance he placed on each.

40. Governor Leader had promised in his campaign that he would repeal the 1-percent sales tax levied by his predecessor, Republican Governor John S. Fine. He kept his promise but then had his own proposal for a classified income tax flatly opposed by the Republican-controlled State Senate. No compromise was possible, and after a record 17-month session, the Governor was forced to accept a 3-percent sales tax earmarked entirely for education.

41. These were: Keystone High—Fifty-Nine, One End of the Log, The Chance To Learn, Johnny Gets a Schoolhouse, E Pluribus Unum, The Noble Investment, all in 1960; A Respect for Talent, Crisis in Academe, Our Standing Among the States, all in 1961. The committee also published Facts and Figures on Education in Pennsylvania and The Fourth "R."

42. Governor's Committee on Education, Final Report (Harrisburg: Department of Public Instruction 1961), p. 5.

43. The Governor's Committee of 100 for Better Education and the PSEA were active in this fight, both strongly supporting the principle of reorganization. The committee authored Recommendations for Legislation Leading to an Improved Program of Education in Pennsylvania and Community Colleges for Pennsylvania (Harrisburg: Department of Public Instruction, 1963) as well as Facts and Figures on Education in Pennsylvania (rev. ed.; Harrisburg: Department of Public Instruction, 1962).

44. The state board replaced the State Council of Education in 1963.

45. The reorganization of the department, completed in 1966, matches the organization of the State Board of Education.

46. Dr. Rackley announced his resignation as of June 1967 to return to Pennsylvania State University as the Provost, and David H. Kurtzman was named to succeed him on September 1, 1967. A. G. Breidenstine served as acting superintendent during the interim.

Supplement 1.—DEVELOPMENT OF PENNSYLVANIA DEPARTMENT OF PUBLIC INSTRUCTION

1900

Superintendent
Two deputy superintendents
   Financial clerk
   Recording clerk
   Statistical clerk
   Messenger
   Stenographer-typist

1905

Addition of:
   Stenographer-typist

1908

Addition of:
   Two high school inspectors

1911

(Reorganization following passage of School Code)

Superintendent
Two deputy superintendents
   Financial clerk
   Recording clerk
   Statistical clerk
   Messenger
   Two stenographer-typists
   Four high school inspectors
   Expert assistants in agriculture, industrial education, drawing

Bureau of Medical Education and Licensure
Bureau of Preprofessional education

1913

Addition of:
   Two stenographer-typists

1915

Creation of:
   Bureau of Vocation
      Agricultural Division
         Staff of six, including expert assistant in agriculture
      Industrial Division
         Staff of seven; including expert assistants in industrial education and drawing

1916

Addition of:
   Supervisor of home economics in Agricultural Division
   Supervisor of music and drawing in Industrial Division

1918

Addition of:
   Supervisor of homemaking
   Supervisor of school gardens in Agricultural Division
   Supervisor of household arts education
   Supervisor of continuation schools in Industrial Division

1920

(Reorganization by Thomas E. Finegan)

Ten service-oriented bureaus:
   Administration
   Attendance
   Health education
   Preprofessional and professional credentials
   Rural education
   School buildings
   School employees' retirement
   Special education
   Certification and training of teachers
   Vocational education

Departmental staff included supervisors of:
   Art education
   Child study
   Continuation schools
   English
   Gardens
   High school inspection
   Home economics
   School libraries and juvenile literature
   Social studies

1924

(Reorganization following passage of the Administrative Code)

Superintendent
Executive assistant
Chief accountant and budget officer
Director of research and statistics

Five divisions, each headed by a deputy superintendent:
   I. Secondary education
      Extension education
Appendix B

Supplement 1.—DEVELOPMENT OF PENNSYLVANIA DEPARTMENT OF PUBLIC INSTRUCTION (Continued)

I. Normal schools
   Secondary schools
   Special and extension education
   Certification of teachers
   Teacher instruction
   Library

II. Legal relations and services to school districts
   School business
   Child help and accounting
   School buildings

1926

III. Vocational education
   Vocational agriculture
   Vocational home economics
   Industrial and continuation school education

IV. School visitation, conference, and advice
   Rural service
   School visitation
   Art
   Kindergarten and elementary education
   Health and physical education
   Visual education
   Music

V. Service to professional examining boards and higher education
   Credentials
   Examinations
   Real estate licensing

VI. State Library and Museum
   General library
   Library extension
   Law library
   Archives and Historical Commission
   Museum

Director of statistics and research
Comptroller
Department services

1933

(Reorganization according to recommendations of the Sterling Committee)

Superintendent
Two deputy superintendents
Executive assistant
Editor
Bureau of Curriculum
   Extension education
   Kindergarten and elementary education
   Secondary education
   Special education
   Agricultural education
   Art
   Music
   Health and physical education
   Home economics
   Industrial and continuation education

Bureau of School Administration and Finance
   School business
   Fiscal control
Appendix B

Supplement 1.—DEVELOPMENT OF PENNSYLVANIA DEPARTMENT OF PUBLIC INSTRUCTION (Continued)

Child accounting and statistics
Rural schools
School buildings
   Institutional
   District
Bureau of Professional Licensing
   Teacher certification
      Elementary
      Secondary and placement
   Preprofessional credentials and examination
   Law enforcement
   Issuing
   Professional Examining Boards Advisory Committee
   (Listed as separate agencies)
      State Library
      State Museum
      Public School Employees' Retirement Board
      State Council of Education
      Board of Motion Picture Censors
      Historical Commission
      State teachers colleges and trade schools
      State-owned schools

1936
Superintendent
   Deputy superintendent
      Executive assistant
      Editor
   State Council of Education
   Bureau of Administration and Finance
      School law
      Child accounting and research
      School plant
      Consolidation and transportation
   Bureau of Teacher Education and Certification
   Bureau of Instruction
      Elementary
      Secondary
      Special
      Extension
      Agriculture
      Home economics
      Guidance
      Tests and measures
      Industrial
      Business
      Vocational rehabilitation
      Health and physical education
      Art
      Music
      Conservation
      Curriculum construction
      State Library and Museum
   Bureau of Professional Licensing
      Personal examination
      Law enforcement
      Preprofessional credentials
      Registration and renewal
      Boards of state teachers colleges
      Board of presidents of state teachers colleges
      Public School Employees' Retirement Board
      Pennsylvania Historical Commission
      State Board of Motion Picture Censors
      Professional Examining Boards

1938
Changes:
   Two deputy superintendents
      Public Service Institute under the Bureau of Instruction

1940
Changes:
   Division of Business Education in Bureau of Instruction
      Public Service Institute becomes independent agency

1944
Addition of:
   Regulation of private trade schools, highway safety,
      preinduction training, and school lunch under
      Bureau of Instruction

1945
Creation of:
   Division of Secondary Education Evaluation, Historical
      Commission, Museum and Archives combined in
      Museum and Historical Commission; made an
      independent agency

1947
Addition of:
   State Board of Private Business Schools; Division of
      Private (Academic) School Registration
      Farm and home safety under Bureau of Instruction

1950
Superintendent
   State Council of Education
   State-aided institutions
   School law
   Comptroller
   Publications and Public Information
   Public School Employees' Retirement Board
   Credentials Evaluation Division

Bureau of School Administration
Appendix B

Supplement 1.—DEVELOPMENT OF PENNSYLVANIA DEPARTMENT OF PUBLIC INSTRUCTION (Continued)

Child accounting and research
Consolidation and transportation
School business
School plant
Bureau of Teacher Education and Certification
State Teachers Colleges
Bureau of Professional Licensing
State Library
Bureau of Instruction
   Elementary
   Secondary
   Curriculum revision in secondary schools
   Art
   Audiovisual
   Health and physical education
   Music
   School lunch and nutrition
   School nurse
   Special education
   Agriculture

APPENDIX A—PUERTO RICO CHIEF SCHOOL OFFICERS AND OTHER EXECUTIVES 1085
APPENDIX B—ORGANIZATION CHARTS 1086
INTRODUCTION

Upon the signing of the Treaty of Paris on December 10, 1898, which ended the Spanish-American War, the Island of Puerto Rico ceased to be a Spanish colony and became a possession of the United States. The final paragraph of Article IX says: “The civil rights and political status of the native inhabitants of the territories hereby ceded to the United States shall be determined by Congress” (1). The United States ratified the treaty February 6, 1899, and 2 months later, on April 11, President William McKinley proclaimed its ratification by both nations. General G.W. Davis then issued Military Order No. 132, allowing Spanish citizens born in Spain 1 year to declare their intention of retaining their Spanish citizenship “in default of which declaration they shall be held to have renounced it and have adopted the nationality of the territory in which they may reside” (2). This same Article IX left the declaration of citizenship of the Puerto Ricans “to be determined by Congress.”

The acquisition of overseas colonies was something inconceivable to most Americans. The debates in the press and in Congress indicate the resulting confusion. In an article for the New York Daily Tribune, Attorney General James H. Hoy enthusiastically placed McKinley on the same level as George Washington, declaring: “Washington, Father of the Republic; Lincoln, the Saviour of the Republic; and McKinley, the Pathfinder of the Republic” (3). But both Houses of Congress showed a disorientation very foreign to a pathfinder. The citizenship of the Puerto Ricans and the status of the island were converted into moot questions that remain so today. The Foraker Act made them citizens of Puerto Rico; the Jones Act made them citizens of the United States; but still, in 1927, 1934, and 1938, amendments were introduced on citizenship, and today Puerto Ricans are discussing whether the Congress, which voted for American citizenship in 1917, has the power to take it away. The U.S. Supreme Court has never made a clear and definitive decision on this point.

Three days after landing in Guánica, General Nelson A. Miles issued from Ponce a proclamation “to the inhabitants of Puerto Rico” as to the purpose of the invasion, in which he said:

They (the Americans) come bearing the banner of freedom... They bring you the fostering arm of a nation of free people, whose greatest power is in justice and humanity to all those living within its fold. The chief object of the American military forces will be... to give to the people of your beautiful island the largest measure of liberty. We have come to bestow upon you the immunities and blessings of the liberal institutions of our government (4).

Justice and fair play have always been essential characteristics of the United States, but their manifestations sometimes seem obscure.

Miles’s promise is what the Diffies called, in 1931, A Broken Pledge (5). On February 3, 1928, when Colonel Lindbergh flew to Puerto Rico as an ambassador of peace, José Tous Soto, Speaker of the House, read a legislative resolution welcoming the Colonel as a symbol of the United States. He added a reminder of Miles’s promise:

The good wishes of Porto Rico will go with you to the land of the brave and the free, and to your country and to your people you will convey a message of Porto Rico not far different from the cry of Patrick Henry—Liberty or death!... Grant us the freedom that you enjoy... which you have promised us (6).

The people were not crying for independence, but for freedom—the kind of creative freedom symbolized by the American flag.

This kind of freedom has been pursued and is being achieved, basically, in the schoolrooms. It is the story of 67 years of hard, sacrificial, and intelligent effort. It is the effort that a commission from Columbia University called “the wonder of a century” (7). The purpose of this chapter is to trace a brief outline of this “wonder.” The full story would take several hundred pages more.

Puerto Rico is the highest peak of a submerged mountain range forming the Archipelago of the Caribbean and extending from the southern part of Florida to Trinidad, north to Venezuela. All the islands of the Archipelago are called Antilles. Puerto Rico, about the size of Long Island, is the smallest of the larger islands, and Cuba is the largest. Including the small neighboring islands of Vieques, Culebra, Santa Cruz, Monito, and Desecheo that form part of Puerto Rico, the area is 3,435 square miles with a
population of 2,349,544, according to the census of 1960. There are more than 687 persons per square mile.

Up to 1950, Puerto Rico had practically no industries; it was a rural county, “a government of poor people for poor people,” said Governor Jesús T. Piñero. The principal problems for education were excess population and lack of resources. Although federal aid has ameliorated the situation to some extent since 1950, then and today the island faces additional problems caused by rapid urban growth.

In 1898, with less income and the same territorial expanse, the island had a population of 857,660 inhabitants and a school population of 397,912 children between 6 and 16 years of age. The 1960 census revealed a school population of 859,982 children between the ages of 6 and 18. In 1898, the illiteracy rate was 85 percent, and in 1965, it was only 15 percent. In his report to General Davis for the creation of the Department of Education, Governor Jew’s T. Piriero. The principal problems for education were excess population and lack of resources. Although federal aid has ameliorated the situation to some extent since 1950, then and today the island faces additional problems caused by rapid urban growth.

In 1898, with less income and the same territorial expanse, the island had a population of 857,660 inhabitants and a school population of 397,912 children between 6 and 16 years of age. The 1960 census revealed a school population of 859,982 children between the ages of 6 and 18. In 1898, the illiteracy rate was 85 percent, and in 1965, it was only 15 percent. In his report to General Davis for the creation of the Department of Education, Governor Jew’s T. Piriero. The principal problems for education were excess population and lack of resources. Although federal aid has ameliorated the situation to some extent since 1950, then and today the island faces additional problems caused by rapid urban growth.

From this moment to the present, the history of Puerto Rico has been the story of The Quiet Revolution—in a much deeper sense than Homer Page (9) realized—and reform has been the perpetual feature of its education. Faith in public education continues to be as great as it was before the turn of the century. During the period prior to 1898, the schools were not graded; each teacher classified his pupils according to his own ideas. Generally, the teacher himself taught the pupils in the first and second classes (the most advanced); and advanced pupils, as assistants to the teachers, had charge of the third and fourth (or beginners) classes. The pupils learned by heart the lessons in textbooks written in the old way with questions and answers. The pupil who recited the lessons without omitting any of the words received the highest mark. Object lessons were entirely unknown.

The alcalde and the párroco (priest) were the only members of the school board who visited the schools and exercised any supervision over them. The teachers obtained their schools through competitive examinations before an examining board appointed by the Governor. Thus, “the teacher obtained his school for life. He was the proprietor of his school . . . . In fact, it can be said that there was no real organization in the public schools of Puerto Rico, every teacher being the ruler of his own school” (10).

After General Nelson A. Miles took official possession of the island in October 1898 from the Spanish Governor, General Ricardo Ortega, he left for the States and turned over his command to General John R. Brooke, the first American military Governor. Brooke left Puerto Rico in December, and General Guy V. Henry became the second military Governor. General G.W. Davis, the third and last military Governor, took charge in May 1899.

At the time General Miles took possession, the island was governed by an autonomic charter granted in November 1897 by the Queen Regent of Spain, María Cristina, mother of the child King Alfonso XIII. General Macías inaugurated the new system in February 1898. The autonomic cabinet, composed of six members, included Manuel F. Rossy as the secretary of instruction.

Governor Henry issued a military order abolishing the cabinet and creating four departments: state, justice, treasury, and interior. Education was established as a bureau under the head of the interior department. But when General Davis found that local political strife made it impossible to work through civil officials, he dismissed all the heads and replaced them with military officers.

On May 1, 1900, in pursuance of orders from the Secretary of War, the military Governor transferred control of civil affairs to Charles H. Allen, the first civil Governor of Puerto Rico (11).

**THE FOUNDERS, 1899 TO 1907**

The first four commissioners of education, two under military government and two under the first civil charter (the Foraker Law), founded the Puerto Rican Department of Education. The President sent to Puerto Rico the best he could find in the States, and all four proved to be excellent choices. (See Appendix A.)

General John Eaton, who had been U.S. Commissioner of Education, was recommended for the job by his successor in Washington, D.C., W.T. Harris. When the President created the Military Geographical Department of Puerto Rico October 1, 1898, the Adjutant-General's office directed General John R. Brooke to assume command. Eighteen days later, by Order No. 1, General Brooke assumed command of the Headquarters Department of Puerto Rico and began his duties as military Governor. That same day, he raised the American flag on the island. But on December 9, General Brooke was recalled to the States, and when Dr. Eaton arrived early in January, General Guy V. Henry was in command as Governor (12). About the middle of January 1899, Victor S. Clark joined Eaton as his assistant.

Early in February, as mentioned earlier, Governor Henry reorganized the administrative departments of the insular government and formally organized the bureau of education under the interior department. As head of the
bureau, Commissioner Eaton made two tours of inspection, visiting all the large towns, while his assistant visited about one-fourth of the smaller municipalities.

Eaton had to develop an educational system from scratch. Whatever buildings were left from the Spanish system were badly damaged by San Ciriacó, a tropical cyclone that swept over the island in 1899, causing 3,000 deaths and $20 million in damage. The coffee plantations were ruined for many years to come.

Dr. Eaton, however, was encouraged by the people’s tremendous enthusiasm for education. Two years after the American flag had been raised at La Fortaleza (Governor’s Palace), a number of distinguished citizens met in the San Juan Theater. Their first petition was for teachers and schools, and they expressed their desire in written resolutions. They wrote that “the best means of advancing the people would be kindergartens and normal schools as established in the United States. Our elementary and superior schools should be transformed and graded according to modern pedagogical methods” (13).

Federico Degetau, head of the interior department and Eaton’s superior, wanted to introduce in Puerto Rico the practices of the famous Spanish scholar and educator Francisco Giner de los Rios, who had been Degetau’s professor of law in the Central University in Madrid. For instance, he wanted to found a pedagogical museum and a Spanish-American university. Eaton knew that under the circumstances this was a dream. Giner himself had worked in the face of tremendous opposition and difficulties, including imprisonment. “The rule of this people by Spain,” wrote Eaton, “was one of both suppression and oppression” (14). Beside this, the cyclone had worsened the financial condition of several municipalities. He pointed out:

There are towns where there literally has not been a cent in the treasury since the cyclone. The actual amount expended upon the schools is nothing. . . . The American teachers are in some cases teaching in bar rooms without so much as a table or chairs or benches, simply with a reading chart and books, with the little children seated on boxes or little chairs which they bring from home. . . . (15).

Yet, the people still had hope in the Americans. The American nation had been to the Puerto Rican the synonym of all that was just and grand and righteous. They hoped their island could be made into a twentieth-century Garden of Eden, “in which the native, trained in the new methods of freedom, may for the first time in three centuries enjoy the sweets of liberty” (16).

As a result of his surveys, Eaton began preparing a code of school laws. Governor Henry promulgated in May 1899 the first 10 General Orders, making them effective immediately. They provided and defined the duties for an insular board and local or municipal boards, and for the election of municipal school trustees. Thirteen additional orders were to go into effect July 1. These abolished the fee system, made education absolutely free to all residents between 6 and 18 years, limited the school year to 9 months, and established a graded system of schools. They also determined the legal qualification of teachers and provided for their certification.

Despite the many changes and trials so soon after the war, Eaton felt that General Henry showed great singleness of purpose and devotion to the public interest, and his vigorous enforcement of the law had been combined with great personal kindness. True, there had been many personal disappointments, but when it was known that he was leaving the command, the officers of the Society for the Benefit of the Children conferred with the teachers and invited both General Henry and General Davis, who would assume office as the third military Governor in May 1899, to meet with them. The teachers then had a beautiful farewell ceremony for General Henry and a welcome for General Davis, described in part as follows.

The singing of Columbia by the young ladies of the Normal College was nicely rendered. . . . The band of the Beneficencia (Charities) assisted by playing the “Star-Spangled Banner” and “America.” The speeches in English were made by two pupils of Mr. Timothee, 22 Sol, and the same in Spanish by two pupils of Mr. Saavedra, Santurce (17).

When General Henry embarked, the multitudes gathered on the wharf for a further manifestation of regret and word of parting. As his vessel touched at Ponce, there was a similar demonstration by all classes of citizens, but especially by those who had cooperated in plans of improving the place and in efforts for promoting the American School at Ponce (18).

In May 1899, the same month Governor Henry relinquished his command, Commissioner Eaton was forced by ill health to give up his work in Puerto Rico and return to the United States. He was succeeded by his assistant, Victor Clark.

In July 1899, Governor Davis introduced a new feature in the educational system by appointing an insular Board of Education composed of five members, of which Victor S. Clark was president. A month later, he issued a General Order providing for municipal elections and the election of five school trustees for each municipal board. General Davis’ school code defined the term, power, and organization of these boards and divided the island into six school districts.

The internal political turmoil and the failure of the local boards forced greater centralization. In October 1899, Davis ordered that not more than three of the local trustees could belong to the same political party, and the power to appoint teachers was transferred to the president of the insular board.
Victor S. Clark, president of the board, received an order from the Headquarters Department to summarize Henry's General Orders concerning education. Dated February 26, 1900, Clark's report, entitled *Laws Governing Public Instruction* and published first in the official Gazette, contains a report of the 16 district supervisors then at work in the island.

The new board also produced a bilingual *Teacher's Manual for the Public Schools of Puerto Rico* (19-595 pages, with hundreds of photographs and illustrations. This gave teachers and school officials a brief account of the educational thought, literature, and system of school organization prevailing in the United States. The Manual proved to be very influential in Puerto Rico.

Following two surveys by Eaton and Clark, occasional surveys by commissions and American experts developed as a general trend of education in Puerto Rico. The Institute (high school established before 1898) and the normal school for girls were investigated by Professor J. G. Meyers, former instructor at the Massachusetts Institute of Technology. Both were found wanting.

The following March, Dr. Clark resigned his position as president of the board and was succeeded by George G. Groff, one of the original board members, who had been vice-president of Bucknell University. Groff held the position until the civil regime took over on May 1, 1900, when he was appointed acting commissioner of education, pending the permanent organization of the new civil government.

As acting director of public instruction and president of the insular board, Groff visited the schools. He described the results:

We visited a school during school hours and found the teacher in bed taking a siesta; other teachers were away attending store. In another case we found a teacher who was running a rum shop. Teachers went around the schoolroom in untidy and insufficient attire and the demand of the neighborhood calls upon the time of the teachers left him less than the required time for instructing the pupils (20).

An insular (survey) commission, composed of Kennedy, Watkins, and Curtis, came to this same conclusion after visiting the schools early in spring 1899. They reported:

The schools we visited are simply pretensions to education and in the United States would not be regarded as being worthy of the name. The books most generally found in those schools are a primer, a catechism, and a mental philosophy, and the system of education consists almost entirely of memorizing alone (21).

The misery of the people was so great and the teachers' salaries so ridiculously small that it is no wonder these deplorable conditions existed. However, there were private schools, such as Timothee's in San Juan, Saavedra's in Santurce, and Huyke's in Arroyo, that were exceptions to the rule and where English was very well taught.

Martin Grove Brumbaugh

President McKinley appointed Martin Grove Brumbaugh, head of the department of pedagogy at the University of Pennsylvania, as the first civil commissioner of education in June 1900. A graduate of Harvard with an M.A. and Ph.D. from the University of Pennsylvania, Brumbaugh had taught in both the public schools and college, had written several books, and at the time of his appointment was editor of the Lippincot Educational Series (22).

When Brumbaugh assumed office on August 6, there was great confusion and practically no system of education. Unqualified persons had received teachers licenses, and there was practically no supervision of their work. The municipalities, most of them in debt, could make no appropriations to the local boards. Under these conditions it seemed necessary to further centralize education.

The bicameral Legislature, as established by the Foraker Act, consisted of an Executive Council of 11 members appointed by the President and a 35-member House of Delegates elected from seven districts created by the council. The President was required to appoint to the council five native Puerto Ricans, plus, ex officio, the secretary, attorney general, treasurer, auditor, commissioner of the interior, and commissioner of education.

Since the commissioner of education also was a legislator, he had the opportunity to design the first educational law in Puerto Rico and give his office the authority necessary to bring some order to this situation. In January 1901, the Legislature passed the school law that is still the legal foundation for the Puerto Rican educational system. Because of his wide experience in educational matters, Commissioner Brumbaugh was able to correct the errors made by General Henry, Dr. Eaton, and Dr. Clark. One of the island's educational historians wrote:

In contrast with the military orders where administration of schools was in the hands of local Boards, there is now a high degree of centralization... The tendency has generally been to extend more and more (the Commissioner's) powers and duties, to centralize the system more and more (23).

The commissioner received absolute authority in some cases. For instance, the local school boards could select and recommend teachers to the commissioner, but only he had the power to appoint them. The law also stipulated that the commissioner would select the teachers of English. To handle these duties, it was necessary to staff a central office of 10 persons, thus creating a Department of Education. Besides the commissioner, there were an assistant commissioner, a disbursing officer, a secretary, two stenographers, a bookkeeper, a shipping clerk, a messenger, and a janitor.
At first, the department was burdened with a tremendous mass of details. For instance, it distributed the following quantities of books and materials: 524 reading charts, 18,000 first readers, 19,400 second readers, 7,680 third readers, 800 fourth readers, 700 fifth readers, 6,000 song books, and 2,440 elementary and 100 advanced geography books. It also distributed 10,720 elementary arithmetic books, 1,690 advanced arithmetic books, 4,960 language lessons, 3,460 U.S. history books, 7,800 elementary language books in both languages, 800 Spanish-English dictionaries, and tons of other teaching materials. Although the commissioner realized that the department should not be obliged to handle all of this, he "thought best to assume all these obligations of detail in order that a compact and consistent organization of the system of education should be wrought out from the beginning" (24).

At the time Brumbaugh took office, there were 508 schoolhouses used by the public schools, only two belonging to the government and the rest rented from private parties by the municipalities. Brumbaugh was able to persuade the President to allot to public school construction $200,000 from the trust fund for public works created from custom duties collected on Puerto Rican products, according to Public Law 69, approved by the U.S. Congress April 12, 1900. By the end of his first year in office, he had constructed two new schoolhouses and was in the process of building 27 others.

In June 1901, there were 33,854 pupils attending the public schools, with 771 teachers in the regular schools, 16 in the high schools and normal school, and 16 supervisors. Puerto Rican statesman Luis Sánchez Morales introduced a bill granting scholarships for 20 Puerto Rican students to study in the United States. The Legislature enacted it, and the program ran for 12 years, supported by Puerto Rican funds.

It was necessary for the state government to pay most of the expenses of education, because not less than 10 percent nor more than 20 percent of all moneys received by the municipalities was set aside for the schools. The department’s records were destroyed by fire in July 1900, but in his first annual report Commissioner Brumbaugh stated that since that date the government of Puerto Rico had spent $331,791 on public education.

Samuel McCune Lindsay

In December 1901, President Theodore Roosevelt appointed Samuel McCune Lindsay to replace Brumbaugh, who had resigned because of ill health. A native of Pittsburgh, this distinguished sociologist had attended the Universities of Pennsylvania, Vienna, Rome, and Paris, and earned his Ph.D. from the University of Halle in Germany. He assumed the office of commissioner of education in February 1902 and became the first chancellor of the University of Puerto Rico. It was unfortunate that the tropical Eden, rife with diseases, political unrest, and unsanitary conditions, was not favorable to scholars like Brumbaugh and Lindsay, who were unable to carry out their 4-year terms.

During Lindsay’s first year in office there were 1,115 schools, both public and private, with 70,216 pupils in 717 separate buildings, but the highest daily attendance averaged only about 40,000 pupils. All classes were conducted in English in approximately 30 schools, although English as a subject was taught in every school on the island. In fact, there were 150 American teachers of English in Puerto Rico.

To accommodate all of the pupils who should have been attending, the island desperately needed new schools and buildings. This condition was only partially relieved when 19 agricultural-rural schools and two industrial schools (the first at San Juan and the second at Mayagüez) opened before the end of 1902. Two more industrial schools were projected, one in Arecibo and the other at Ponce, where a Spanish-Renaissance style building was under construction at a cost of $25,000. In all, the government had set aside $250,000 from the trust fund for erecting school buildings.

All the schools offered 8-year courses, except the island’s only high school, established in San Juan in 1899. In its fourth year, the high school enrolled 235 students (both graded and secondary), with an expected graduating class of 5 students. Commissioner Lindsay was confident its work was "going forward and producing results that those who observe it at close range have scarcely dared to expect" (25).

Lindsay argued that Puerto Rico needed immediately a number of well-trained native teachers. The salary paid to an American teacher of English, the best salary in the island, was $50 a month for 9 months, plus an allowance by the local school board amounting to from $54 to $135 per year, or a total annual income of about $504. The rural teachers of the first class received $35 monthly, those of the second class $50, and the third class $75. Graded teachers of the first class received $55 per month, the second class received $50, and the third class, $45. Principals earned from $70 to $80, depending on the class of the school.

During the summer vacation of 1899, 48 native teachers were sent to the United States at government expense to study English in American schools. Selected youth from the public schools also were sent to preparatory schools in the states, and by the summer of 1901, 219 pupils had taken advantage of this program under the supervision of the commissioner. Many of these students became excellent educators. But there was an urgent need to establish other programs to educate people who would teach. Lindsay wrote in his report for 1902 that the "demand for the establishment of an institution of college grade, which in time will lead to the development of a great Antillean
University as part of the public schools system of Porto Rico, is likely to increase as the years go on" (26). The University of Puerto Rico was formally organized in June 1903. The university’s first building was a normal school, erected at a cost of $21,000 from the extra trust fund of $150,000 approved by the President (27).

Besides founding the university, Lindsay also continued the practice of teacher excursions to the United States for professional improvement. In 1904, he made arrangements with the presidents of Harvard and Cornell Universities for 500 teachers to study, on their campuses during a 6-week summer session. The War Department offered transportation at $1 per day, and the teachers left June 26. One transport went to Boston and the other to New York, and at the close of the summer school, they left for Philadelphia and on to Washington, D.C., where they were received by Roland F. Falkner, who already had been appointed to succeed Dr. Lindsay. President Theodore Roosevelt received them at the White House with the following words:

> I wish to greet you with all my heart at the national capital. It is my earnest wish, as it was the wish of my lamented predecessor, and it is the wish of the people of the United States, that only an unmixed good shall come to the people of Puerto Rico because of their connection with this country. I greet you with peculiar pleasure and interest, because this body and those like you, that are engaged in the work of education in Puerto Rico, are doing that work which more than any other is vital to the future of the Island (28).

Summary

By the time Commissioner Lindsay left office in October 1904, the first commissioners of education had performed a Herculean task (29).

During these first 5 years of American occupancy, 914 schools had been opened—a gain of 134 over the previous year (1901)—and by 1903, there were 1,914 schools. By April 1903, 1,097 teachers were coping with about 377,200 boys and girls from 5 to 18 years of age, compared to 322,393 in 1899. But total enrollment during the 1903 school year was only 64,039 pupils, with 6,177 in the special schools, or an estimated 19 percent of the school population and 7 percent of the 1,000,907 total population. The special schools included 10 kindergartens, 44 night classes, 6 industrial classes, 23 high school classes, 2 practice school classes, and 4 normal classes.

The total yearly expenditures for education from insular appropriations amounted to $545,106. The municipal governments contributed an additional $149,917, and insular funds provided $1,038 for two training classes for professional nurses and $14,865 for educating Puerto Rican students in the United States. There were 45 Puerto Rican students in the states, 20 receiving $250 each per year and the remainder receiving $400. One of these students, José Padín, later became commissioner of education. Altogether, the total expenditures for education amounted to $817,815, as compared to $777,585 the previous year. The average cost of the common school per pupil amounted to $7.97.

The highly centralized school system worked so satisfactorily that the Legislature favored even more centralization. It enacted a new school law, approved by the Governor in March 1903, which included the first provisions for compulsory attendance in elementary school.

The President of the United States set aside for Puerto Rico $2 million in trust funds, mainly collected by the federal government in custom duties on Puerto Rican products entering the United States. Most of it, $1,400,000, went to the public roads, and $447,500 went into school buildings. In Mayagüez, a newly erected 16-room brick building was named Roosevelt Industrial School after Miss Alice Roosevelt, and a cornerstone was laid during her visit to Puerto Rico during the 1903 winter season. Lindsay recommended at least $100,000 annually to construct schools and encouraged the municipalities to build their own.

During these 5 years, a number of distinguished American educators came to the island to contribute to the Propaganda Conferences—short seminars for the in-service training of teachers. These included Charles J. Skinner, U.S. Congress’; State Superintendent Mason S. Stone, of Vermont; and Professor W. F. Phelps, of Minnesota. Charles de Carmo, head of the School of Education at Cornell University, and James Earl Russell, dean of Teachers College at Columbia University, both outstanding educators, served as professors at the conferences, meeting in different parts of the island, usually for 8 days, with as many as seven meetings each day. Brumbaugh pointed out that about 300 teachers and at least 3,000 of the leading citizens interested in education attended these conferences.

De Carmo, in a letter to Dr. Lindsay, stated that he was somewhat skeptical before he visited the island regarding the efforts to teach all of the people a new tongue—still one of the most important single issues in education in Puerto Rico today. De Carmo did conclude that there should be better publicity and better public relations for Puerto Rico in the States. Governor Hunt, on the other hand, responded that “the insular Legislature and insular authorities respond to every demand the Department of Education makes for legislation or aid and any other kind in building up or strengthening the school system” (30).

Sarah W. Dagget, State Regent of the Daughters of the American Revolution in Massachusetts, established a school at her own expense as a memorial to her father. Major R. H. Pratt, the superintendent of the Indian School at Carlisle, Pennsylvania, offered scholarships, and Juan José Osuna started his American studies at Carlisle as a Puerto Rican Indian boy. W. T. Harris, U.S. Commissioner
of Education, "was watchful to furnish every aid in the power of his office" (31).

THE STRUGGLE: FROM SAN CIRIACO TO SAN CIPRIÁN, 1905 TO 1932

The successors to Commissioner Lindsay and Governor Hunt did everything possible to build an excellent educational system, but they struggled in the face of many odds. San Ciriaco and the new regime's commercial laws crippled the coffee industry for many years, making it necessary to develop the tobacco and sugar industries (32).

Then came World War I and its aftermath, with the influenza epidemic, the earthquakes, and the tobacco crash caused by the economic depression in the nation. Then on September 13, 1928, another cyclone caused 300 deaths and $50 million in losses. Under the New Deal, there was a painful recovery (33), but when Rexford G. Tugwell arrived to govern the island in September 1941, he perceived it still to be "a stricken land" (34).

The Language Problem

The years from 1904 to 1915 were marked with progress, the main aims being to reduce illiteracy by increasing the enrollment, provide additional classrooms, and train more teachers. The major educational problem, however, remained that of language. Educators, in appraising the cultural status of the islanders, committed the usual mistake of judging the cultural level only by the wretched conditions of public education. For instance, Commissioner Victor S. Clark states:

There does not seem to be among the masses the same devotion to their native tongue or to any national ideal that animates the Frenchman, for instance, in Canada .... Another important fact that must not be overlooked is that the majority of the people of this Island do not speak pure Spanish. Their language is a patois almost unintelligible to the natives of Barcelona or Madrid. It possesses no literature and little value as an intellectual medium. There is a bare possibility that it will be nearly as easy to educate this people out of their patois into English as it will be to educate them in the elegant tongue of Castille (35).

Apart from the fact that Catalonian and not Spanish is spoken in Barcelona, that the elegant language of Castille is not pure Spanish, Clark shows himself completely ignorant of the Puerto Rican cultural reality. But, in 1930, he corrected himself by writing that—

The teaching of two languages not only increases the cost of instruction, but it encroaches upon the time available for other subjects .... However, the members of the present Survey incline to the opinion that the teaching of English in the elementary grades should be continued (36).

This opinion, in itself, was carefully conditioned.

Commissioner Brumbaugh, who was more cautious on the language question, stated that the children should use both languages, and he formulated the policy that has governed language teaching to the present. N. C. Shaeffer, state superintendent of public instruction in Pennsylvania, wisely remarked that a man is as many times a man as he has languages in which to think. Thus, American teachers received instruction in Spanish, and the Puerto Rican teachers learned English. But, as one observer wrote, these Puerto Rican teachers "have large schools, crowded daily, ... and although they have never been given a good professional training, they are so hard-working" that he wished "all the teachers might take example from them" (37).

Perhaps one of the most dramatic illustrations of a talented boy's efforts in the new school language program appears in Commissioner Lindsay's annual report of 1902:

It is true I am in a position with the San Juan Light and Transit Company, but I can do little that scarcely it is not sufficient for me to address myself. I have prepare myself to can a teacher. The next time for being not able to pay one who could give lessons to me. This letter will not be correct but it is a sign of my progress in the English language. I wait for a satisfactory answer, for I go every time forward and forward .... At the end of September I will be 16 years old (38).

Commissioner Falkner made English the official language of the schoolroom and the medium of instruction in all subjects except Spanish itself. He had boundless enthusiasm. In 1907, he reported that "so great an impetus has been given to this work that the time seems not far distant when the graded schools will be taught exclusively in the English language" (39). The whole curriculum of the school system was thus leveled so that it could be adapted to the deficiency in language of both pupils and teachers.

In order to accommodate more children of school age, in 1907, Falkner introduced the double enrollment and increased the number of rural schools to 614. The urban schools were already well organized with a school population of 354,721, but still a great deal had to be done. The industrial schools were closed this year, and in the following year, 1908, the agricultural program was eliminated, because the Legislature failed to appropriate the necessary funds, and there were not enough trained teachers.

The only school at the secondary level, the Model and Training School, burned down on July 1, 1900. The following November, the English and Graded School of San Juan was established and offered high school work. In its fourth year, 1904, and the first year of Falkner's term as commissioner of education, it graduated its first class. At the same time, another one had begun in Ponce, one more had been started in Mayaguez, and a fourth had been planned for Fajardo.
When Edwin G. Dexter succeeded Falkner as commissioner in August 1907, he stepped up instruction in English. Pauline Rojas, director of the English program under Villaronga, writes: "With the exception of Dexter, no Commissioner of Education ever attempted to teach everything "in English" (40). Even though half the first grades were receiving instruction in English, Dexter seemed to ignore this and instituted his new course for graded schools, which went into effect at the beginning of the 1909-10 school year. Dexter wrote that, in this way—

English has been made the medium of instruction in practically the entire graded school system... enrolling 35,000 pupils—89.7 percent the preceding year; 9.9 percent were taught partly in English; and 0.6 percent had English taught as a special subject (41).

Commissioners Dexter and Bainter, 1907 to 1915

Commissioner Dexter found that of the 68,828 enrollment, only 44,218 were attending school; the census of 1910 reported 390,640 children of school age. Since his aim was "to provide instruction for all children of school age" (42), he found himself compelled to introduce the double enrollment practice, prevalent in some parts of the United States. When he resigned in 1912, the enrollment had reached 160,657 pupils, but he also left the problem of double enrollment that even today is a challenging one.

Brumbaugh's law in 1901 provided for night schools, and Dexter decided these must be extended. During his first 2 years, the adults attending these night schools were in the majority, but by 1906, of the 2,846 night pupils in the urban areas only 23 percent were adults. Dexter also established night schools in the country, so that, by 1912, there were 139 urban and 209 rural night schools, with a rural enrollment of 8,594. The following year, the urban schools increased to 150 with 7,430 pupils, and the 149 rural schools enrolled 5,157.

In the 1909-10 school year, 18 municipalities opened first- and second-year continuation schools beyond the eighth grade. These extended rapidly, and several developed into full-fledged high schools: Arecibo in 1912; Humacao in 1913; and Bayamón, Yauco, Guayama, Aguadilla, Fajardo, and Caguas in 1916.

Dexter also encouraged higher education and professional schooling by providing student aid. In 1907, the Legislature empowered local boards to use not more than 5 percent of their income to aid students from rural schools who wanted to obtain their common school diplomas. The commissioner was given the power to grant these students scholarships amounting to $108 to continue their high school education. Scholarships ranging from $40 to $100 also were granted to candidates for teaching agriculture.

The program was extended so that students could be granted scholarships of $280 for attending the normal school at Rio Piedras, and the commissioner could grant $250 and $500 annual scholarships for students to study in the United States.

The teachers themselves were vitally interested in helping the island progress educationally. In June 1911, 516 teachers met at Ponce to organize the Teachers Association of Puerto Rico (AMPR). Its main purpose was to cooperate with the government to improve the schools, offer creative criticism, and oppose practices that seemed unjust, inadequate, or improper. Although the association has received criticism, it has performed its work admirably well, particularly after it was reorganized in 1949. All persons holding a teacher license are eligible to join, and it is governed by a constitution and bylaws registered with the Puerto Rico Department of State.

Edward M. Bainter, who succeeded Dexter in July 1912, was fortunate in having more money with which to work for improving schools. In his January 1913 message to the Legislature, Governor George R. Colton stated that in Puerto Rico there were over 390,000 children between 5 and 18 years of age, while the school enrollment was only 160,657 and the average daily attendance 125,000 pupils. He blamed the situation on a shortage of funds. And although the islanders were Puerto Rican citizens, they received no federal grants except from Morrill Land Grant funds and special appropriations.

Colton laid the groundwork, but it was Governor Arthur Yager, who entered office in November 1913, who was able to get the Legislature to pass the Big Budget that gave the schools an economic bonanza in 1913. A former schoolteacher, Yager was sympathetic toward education and in his January 1915 message expressed his concern that only 50 percent of the school population was actually enrolled (43).

As early as 1902, Commissioner Lindsay had stated that there was no more important forward step in the educational work in the island than to get the proposed industrial and trade schools established on a solid foundation. Three were opened at San Juan, Mayagüez, and Ponce, but the solid foundation was lacking; there was only $20,000 appropriated and $25,000 from trust funds. These industrial schools and the agricultural-rural schools did the pioneer work in vocational education; however, the industrial schools eventually failed, due to lack of funds and well-trained teachers.

Commissioner Bainter, a specialist in vocational and prevocational education, emphasized manual training, home economics, and agriculture as subjects essential to the curriculum. Beginning in 1913, manual training was required in grades 6 through 10. Since an average of 3,181 boys were enrolled in these manual training classes, Bainter appointed a general supervisor for this field. Although home economics was equally emphasized, it was not until 1919 that Commissioner P. G. Miller appointed Elsie Mae Willsey as special supervisor for this subject.
The problems continued to mount, however. By 1914, Puerto Rican school enrollment reached 207,101, the largest up to that time, despite the fact that only 50 percent of the school-age population was enrolled. By 1915, it jumped to 419,282, and there were 1,473 schools and 2,535 teachers. This meant an average enrollment per teacher of 81, and in one rural school an 18-year-old girl taught 250 pupils!

One development that benefited the children of a few schools was the initiation of a school lunch program by a rural school teacher in Manati in 1914-15. The following year, the teachers of Ponce made arrangements with a local restaurant to furnish lunches for 8 children, and each teacher took one child home so that 24 children were given lunches. San Germán and Juncos followed, and soon the practice became general.

Commissioner Bainter was very interested in developing a physical education program. In 1913, he appointed a general supervisor with instructions to develop playgrounds and athletics. Two years later, there were 68 towns with playgrounds, operating at a cost of $59,000, compared with the 27 towns with playgrounds in 1909, at an expense of $3,000 per year (44). All of the subsequent commissioners have given attention to health and physical education.

In his 1914 report, Bainter stated that he was giving special attention to the Spanish language because the people desired to conserve their mother tongue in all its purity. Since English was being used as a medium of instruction in practically all branches of the curriculum for the graded schools, many thought that Spanish was not receiving due attention. As a result, the Legislature created the position of general supervisor of Spanish, and Bainter appointed Manuel G. Nin. The 1914 report stated that—

The instruction in the graded school system is given in the English language in all subjects, with the exception of Spanish, nature study, and the first year's work in hygiene and sanitation. . . . The Spanish language is taught as a special subject, beginning with the first grade and continuing to the end of the course (45).

The Miller Decade, 1915 to 1925

Paul G. Miller had entered Puerto Rico with the invading army, and by 1902 he was chief of the Division of Supervision and Statistics and in charge of English examination of Puerto Rican teachers under Commissioner Lindsay. His office attempted to encourage a more rapid acquisition of the English language, especially by Puerto Rican teachers, by holding an annual examination in elementary English, open to all teachers on the island, to check their progress and attendance. Local school boards were advised to select those who scored best in the examination. In fact, the examination was required of all new candidates for teacher certificates of whatever grade.

The results of the examination seemed to be worthwhile. In Commissioner Lindsay's 1903 report, Miller wrote:

Although this Circular was criticized in the Island press . . . under the pretense of defending the rights of the teachers . . . and by a limited number of teachers who had underestimated the importance of English . . . I am glad to say that the vast majority of teachers immediately began to prepare for this examination (46).

Manuel G. Nin of Yauco received a prize for a 96.6 mark. Gerardo Sellés Schá from the Humacao District got a 95, but no prize. Both men later made great contributions to education in Puerto Rico.

Together with Albert Martinez, secretary of the department and former supervisor of the San Juan District, Miller accompanied Commissioner Lindsay, Dr. de Garmo, and E. T. Divine on an inspection tour of the island. He acted as interpreter for public addresses and frequently spoke to the audiences in Spanish. Thus, Miller understood the educational problems when he became the commissioner of education in August 1915.

Miller's term as commissioner was very creative and eventful. He began during the economic crisis that followed the Big Budget, and it was not until 1919 that the economy began to recover. Puerto Rico sent 17,000 men to World War I, but there was no economic boom as after World War II. Instead, the difficulties of 1918 were followed by an influenza epidemic which closed the schools for several months. By the end of the decade, the island had suffered a tobacco crash and the San Felipe cyclone.

It was only a year after Miller had assumed office as commissioner of education that the first disaster hit: the great statesman Luis Muñoz Rivera died in November 1916. He had been able to keep the island's politics under control since 1904, and his death signaled the beginning of new agitation which did not stop until his son, Luis Muñoz Marín, won in 1944.

But the following year, 1917, there was great rejoicing on the island when the Jones Act, the new Organic Charter granting American citizenship to the islanders, became effective on March 2. According to the new statute, the Executive Council consisted of seven members to be appointed by the President of the United States, including the commissioner of education. However, the council had no legislative power.

The new act defined the powers of the commissioner as follows:

The Commissioner of Education shall superintend public instruction throughout Puerto Rico; all proposed disbursements on account thereof must be approved by him, and all courses of study shall be prepared by him, subject to disapproval by the Governor if he desires to act. He shall prepare rules governing the selection of teachers, and appointments of teachers by local school
boards shall be subject to his approval, and he shall perform such other duties, not inconsistent with this Act, as may be prescribed by law (47).

This law was the end result of a 19-year trend toward absolute centralization of power in the head of the department of education.

At the time Miller became commissioner, the population of Puerto Rico was estimated to be 1,200,000, out of which 419,282 were of school age (between 5 and 18 years) and 211,588 of compulsory school age. But the enrollment was only 151,582, including private schools, or 35.8 percent of the total school age population. The problem persisted. In the 1920 official census, the total population was 1,299,802, with a school-age population of 438,743, but the total enrollment of 193,269 had increased to only 43.1 percent of the total. By the time Miller left the office in 1925, the total enrollment was 230,120.

Miller established professional reading courses for his teachers, which included such works as Bagley's Classroom Management, Earheart's Types of Teaching, Thorndike's Principles of Teaching, and Strayer's A Brief Course in The Teaching Process. The supervisors conducted weekly discussions and exercises and required a written work in English at the end of the year. In all, 924 urban and 138 rural teachers participated in these courses.

In 1919, Commissioner Miller made a genuine effort to determine how well the English language was being taught in the schools by requesting José Padín, then subcommissioner of education, to make a study. Padín concluded that the program was failing because of poor teaching and the imposition of methods and materials suitable in the States but not in Puerto Rico.

The commissioner immediately adopted a new plan of using Spanish as the medium of instruction in the first four grades, making a transition to English in the fifth and sixth, and from the seventh to the eighth using English as the medium of instruction. He assigned General Superintendent Pedro P. Aran the task of writing the Spanish course and Joseph Morin that of developing a method for introducing the new plan in the elementary schools. José González Ginorio, who became general superintendent of Spanish in 1919, worked out a method similar to that developed by Morin. For many years, both Ginorio's and Morin's methods were in use.

In 1919, the Legislature revised the school law to replace the local school boards with a director of education, elected as a member of the municipal assembly. Miller also suggested a general survey of education, but this was not accomplished until a few months after he left office in 1925. He suggested that the 6–3–3 system be used, and this was later carried out by a man who succeeded him more than a decade later.

In the same year, 1919, Commissioner Miller attended one of the most productive meetings held in 25 years. The commissioner called a meeting of the supervisors of schools and the municipal directors to be held at the same time and then arranged for both joint and sectional meetings. This promoted goodwill, mutual understanding, and a new point of view on educational problems.

Huyke and Consolidation, 1925 to 1930

When Juan B. Huyke succeeded Miller as commissioner of education in October 1925, he became the first Puerto Rican to hold the position. His father, Enrique Huyke, was the founder of Colegio San Bernardo and was a member of the first two insular boards of education. Huyke, who was born in Arroyo, progressed from classroom teacher to general superintendent under Dexter. In 1911, he graduated in law and was president of the lower House from 1912 to 1920. From 1918 to 1920, he was Acting Governor of Puerto Rico and was practicing law when he was appointed commissioner of education in June 1925.

Huyke's term coincided with the survey of the public educational system of Puerto Rico, directed by the International Institute of Teachers College, Columbia University, under an appropriation of $25,000, voted by the Legislature in March 1925. Although Huyke did not mention it in his annual report for 1925-26, he was a member of the survey committee (48). The report, published the following year, covered the historical, economic, and social aspects of education, along with the measurement of results, teachers, administration, supervision, financing, and the work in both elementary education and the university. It concluded that educational progress during the previous 27 years was "a great achievement, without parallel in the United States" (49).

According to the Columbia University survey, the general aims of education in Puerto Rico had served to reduce illiteracy, to increase enrollment, and to improve democratic citizenship. It pointed out that the two most difficult problems to be faced were double enrollment and bilingual instruction. The report went on to analyze various other shortcomings and to make suggestions that the rural schools be consolidated and that there be a diversification of schools and curriculums and a broadening of the aims of education beyond the linguistic. It put special emphasis on vocational education.

In regard to centralization, the survey stated: "In few other school systems is the administration so completely in the hands of a single person as in Puerto Rico. Responsible only to the President of the United States, the Commissioner of Education is absolute in his authority" (50). It recommended that the central office be reorganized into two divisions, technical and administrative, and that English be taught as a separate subject up to the fourth grade and from then on used as a general medium of instruction. It also proposed that education be compulsory at 6 instead of 8 years and that rural school teachers be
trained in the Mayagüez College of Agriculture. It proposed that the post of municipal school director be abolished, that the school boards be reinstated, and that a long-term program of education be planned.

Despite the fact that the Department of Education disregarded most of the 15 items in the survey recommendations, Governor H. M. Towner made a lengthy commentary in his fifth message to the Legislature in February 1927. He wrote:

The Department of Education must organize a Division of Technical Research dedicated to the study of the educational program and to carry on experiments relating to it. A Division of Health and Physical Education must be established. . . . The local Boards of Education must be reinstated instead of the School Director. The Legislature should establish a permanent fund for educational extension. Forty per cent of the total budget for education should be distributed equally among all municipalities, according to their needs (51).

He then analyzed the convenience of the 6-3-3 plan and reemphasized the reduction of the 40-percent illiteracy then prevailing. No other Governor's message had ever given so much space to education.

Commissioner Huyke, however, had already decided to put his emphasis on consolidation. He considered it necessary to bring together several one-room schools into a larger unit if these rural schools were to be turned into something more than agencies to combat illiteracy. After consolidating more than 200 rural schools, he created a series of second units to bring several rural one-room schools together. Grades 6 to 8 were placed on a vocational curriculum with emphasis on agriculture, manual arts, home economics, and trades. The purpose of this second unit was to raise the standard of living of the rural community, to improve the productive capacity of the island, to carry out a program of social and health instruction based on the needs of the people in the rural centers, and to improve the life and home conditions of the people.

Convinced of the possibilities of these second units, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them. Six were established in 1928: Carolina, Arecibo, Lares, Aguadilla, Utuado, and Corozal. During the 1929-30 school year, the Legislature voted $25,000 to establish them.

By 1939, there were 83 second units enrolling 9,522 pupils, and in 1945-46, there were 130 units operating as junior high schools with an enrollment of 14,368 pupils. They have proven to be very successful. Not even San Felipe was strong enough to stop their growth. In fact, this is perhaps one of the most important single features of education in Puerto Rico.

Huyke also campaigned to improve teacher training, with the slogan: "A high school diploma for every rural teacher." He recommended that a rural traveling library be created, although this was not done until years after his term, and that a 6-3-3 organization of schools be adopted. In 1926, the Central High School in Santurce was dedicated, the largest and most beautiful high school building in the island.

Huyke's language policy followed the traditional slogan of "acquisition of English and conservation of Spanish." Grades 1 through 4 were taught in Spanish; with English as a subject, the first and second grades following the oral approach. The fifth grade was transition, half and half: from there on English was the medium of instruction. He declared the aim of this arrangement to be in harmony with the racial traits of the Puerto Ricans.

San Felipe caused considerable damage, and the First Church of Christ in Boston sent $1,035 to replace damaged books. A total of $136,371 was being used for school lunches for 11.5 percent of the total attendance. By this time, according to Huyke's last annual report in 1928-29, there were 220,940 pupils studying under 4,478 teachers, and the island's budget totaled $4,197,657, plus $1,625,785 from municipal funds.

THE REFORMERS, 1930 TO 1945

The years from the cyclone in 1928 (San Felipe) to the one in 1935 (San Ciprián) constitute a transitional period in the history of Puerto Rico. In fact, from 1928 to 1944, still suffering birth pangs, the island experienced economic, political, and cultural turmoil. This cyclonic period has been succeeded, from 1944 to the present, by a creative revolution.

Depression and Cyclone

President Hoover appointed José Padín commissioner of education for Puerto Rico early in 1930, and he took office in January. In turn, he appointed Pedro A. Cebollero as his subcommissioner, and these very capable men accomplished a lot under severe conditions to advance education on the island. Padín himself had received his early education during the period of the founders and as an outstanding student was sent to various states on a scholarship. He received his B.A. from Haverford, which also granted him an L.L.D., in 1931; he earned his Ph.D. from Dartmouth in 1934. He served as teacher of English and assistant supervisor in Guayama from 1908 to 1909, and supervisor in Arecibo until 1912. From 1912 to 1913 he was general supervisor of English, undercommissioner in Muler's administration from 1916 to 1917, and at the time Hoover appointed him commissioner he was working as an editor for D. C. Heath Company. Following his resignation as commissioner in December 1936, he returned to work with the D. C. Heath Company.

Because Padín had the mind and outlook of an educator, as well as the titles, his work was creative and
influential beyond the bounds of his term of office. Puerto Rico had not recovered from the damage caused in 1928 by San Felipe when San Ciprián swept over the northeast, killing 257 people, injuring 4,820, destroying 42,431 buildings, and damaging 32,446 dwellings. The losses amounted to $40 million, and 76,295 families were ruined. The effect on the schools was devastating: 893 schoolrooms were destroyed, and it was estimated that 46 municipalities were seriously affected.

Governor J. R. Beverly appointed an executive committee of aid and rehabilitation to be presided over by Padín. The insular government still had $164,258 left over in the emergency fund created for San Felipe, and this, together with an appropriation of $74,988 by the Legislature for immediate relief of the victims, was used to initiate reconstruction. The government then floated a loan of $5.5 million for a long-term reconstruction program.

Puerto Rico was to suffer another calamity. The tobacco crash, caused by the limitations of the American market, seriously hurt Puerto Rico as the Depression in the States struck the island. Coffee plantations were destroyed once more by the cyclones. But President Roosevelt's New Deal also began to operate in Puerto Rico, and it brought about some relief. In 1934, Carlos E. Chardón, chancellor of the University of Puerto Rico, Rafael Méndez Ramos, commissioner of agriculture, and Rafael Fernández García, professor of agriculture at the university, were called to the states to help plan the economic reconstruction of the island. After several months of hard work they presented a reconstruction program known as Plan Charidón. Under the management of Ernest Gruening, head of the Division of Territories and Insular Possessions, Puerto Rico's Economic Reconstruction Administration began to put the plan into operation, with Dr. Chardón serving as Gruening's local assistant (52).

Commissioner Padín had a sharp and profound mind and a very broad understanding of history and contemporary culture. He took advantage of the surveys and writings of his predecessors to get a complete picture of the educational situation at the time he took office.

Surveys of Conditions. In particular, the commissioner relied on a report prepared by Victor S. Clark, the former commissioner of education under the military government, who served as director of a committee to investigate the island for the Brookings Institution. This report pointed out that two dissimilar cultures were in the process of assimilation on the island. Clark wrote that its people constituted a relatively small and isolated community, vividly conscious of its individuality and correspondingly jealous of its special character and privileges. This essential feature of the Puerto Rican, called insularismo by Antonio S. Pedreira, one of the island's most distinguished university professors, imparts a sort of ambivalence to the collective personality which is very difficult for outsiders to understand. Padín himself showed his inability to appreciate it when he asked the question, "Where are we going?" and answered, "We do not know but it seems that we know the way" (53).

The situation in the rural communities was nothing short of deplorable. According to the 1925 survey, approximately 97 percent of the urban children between 5 and 14 years of age were on the school registers, but only 40 percent of those in the country districts were registered. And about two-thirds of the rural schools operated on the double enrollment system, whereby the children attended only half a day. Furthermore, between the first and fourth grade there was about an 80-percent dropout rate; for every 100 first- graders, only 20 went beyond the fourth grade. However, the school lunch program inaugurated a little after the survey did improve this situation, although it was not extended to the whole island until 1940.

In March 1931, President Hoover visited Puerto Rico, and Luis Sánchez Morales, president of the Senate, delivered a welcome address at a joint meeting of the Legislature. He pointed out that the islanders had been asking for some of the federal laws to be applied to Puerto Rico to improve and extend public instruction. He added: "That aid is needed more than ever in the midst of the great crisis that weighs on us, due mainly to the hurricane of 1928, made worse by the disastrous economic conditions now prevailing... We are unable to educate half of our children..." (54). In December 1933, President Franklin D. Roosevelt sent Ernest Hopkins, president of Dartmouth, to survey the educational situation in the island and report to him personally. Hopkins wired Roosevelt the following message: "I arrived here this morning and found myself immersed in the question at issue almost immediately. There is more politics to the square rod down here than to the square mile at home..." He added that he thought Governor R. H. Gore "is probably the worst blunderer that ever came along" (55). Despite Gore's opposition, Padín was reappointed commissioner of education for a second term in February 1934. The following month, President Roosevelt himself visited the island.

Padín faced intelligently and squarely the problems of double enrollment, school mortality, industrial education, the need of federal aid by legislation, and the equalization of educational opportunities for the rural as well as the urban areas. He also pushed for the 6-3-3 plan and strengthening of the second unit. He urged that the island establish a governmental development agency (Fomento) for industrialization, but this was not accomplished until 20 years after his term of office.

In agreement with the Columbia survey and the Brookings report, Padín got approval in April 1931 for an act improving vocational education. At least this was a start. In an "Address on Vocational Education," delivered to the graduating class of the Mayagüez College of Agriculture, he pointed out that there were many ups and downs
in establishing industrial and vocational education in Puerto Rico despite the efforts of his administration and those of his predecessors.

The Language Issue. Padín had clearly expressed his philosophy for Puerto Rican education in 1930 in an address in which he said:

For thirty years we have been hesitant and anguished without knowing with certainty what are we educating our country for. I assert that we must educate Puerto Rico for living its own life in its fullness. Its own life, because Puerto Rico is conscious of itself, because its personality is already clearly defined. We must replenish the Puerto Rican personality with vigorous and healthy nourishment (56).

In 1945, in a graduation address at the University of Puerto Rico, he again stated that “the Fatherland is not made by royal decree, nor by the mercy of a sovereign. It is created from the spiritual substance of its offspring” (57). These are the ends to which he dedicated his years of service.

In August 1934, Commissioner Padín issued Circular Letter No. 10, stating that all subjects in the elementary schools would be taught in Spanish except the classes in English. He pointed out that the time given English had increased 100 percent in the upper grades so that intensive instruction could be given. In his report for the 1934-35 school year, he wrote: “Since the beginning of my term of office, I have been trying to attack the problem of teaching English to the people of Puerto Rico along pedagogical lines...” (58).

In the face of criticism from Governor Blanton Winship, before taking a strong stand on the language issue Commissioner Padín invited William S. Gray, an eminent educator from the University of Chicago, to visit the island and evaluate his program. Dr. Gray arrived in the spring of 1936 and after a careful survey reported to Padín that he approved the change from English to Spanish as the sole medium of instruction in the elementary grades. The value of English as a subject in the curriculum was still receiving full recognition.

Again, in 1936, the commissioner brought Michael West, an English educator and expert on bilingualism, to inspect the matter. In his report to the commissioner, West stated the following:

There is essentially no bilingual problem in Puerto Rico. Devote English periods of Grade I and II to reading in the mother tongue, and begin English reading when the children have got a sound foundation of reading ability in their own tongue....Learning in the school subjects is considerably impeded by the use of textbooks in English (59).

In June 1937, José M. Gallardo replaced Padín as commissioner of education. Born in San Germán, he received his Ph.D. from the University of North Carolina in the spring of 1937. At the time President Roosevelt appointed him, he was professor of modern languages at the College of Charleston, South Carolina (60).

Looking at Padín’s administration, Gallardo found enough educational issues in Puerto Rico to challenge any young man. Padín had perhaps boiled it to a head when asked the crucial question, “Where are we going?” The facetious answer, “We don’t know, but we know the way,” is only a symptom of perplexity, and this was the real challenge to Gallardo, although he perhaps did not realize it. It was the task of the reformers to pull Puerto Rico out of this perplexity.

Almost immediately the President wrote to the new commissioner:

I desire at this time to make clear the attitude of my administration on the extremely important matter of teaching English in Puerto Rico... It is regrettable that today hundreds of thousands of Puerto Ricans have little and often virtually no knowledge of the English language... It is an indispensable part of the American policy that the coming [sic] generation of American citizens in Puerto Rico grow up with a complete facility in the English tongue...(61).

Commissioner Gallardo’s Accomplishments

Gallardo’s attempt to solve the language problem was not acceptable to most of Puerto Rico’s leaders, nor was it acceptable to the federal policy makers. Nevertheless, he was responsible for two important accomplishments: introducing the junior high school to Puerto Rico and framing a philosophy of education for the island. The 6-3-3 plan had been considered by his predecessors and had been recommended by the Columbia survey, but it was not accepted until Gallardo introduced it in July 1942. Today, it is the structure of the system of public instruction.

Before Gallardo’s term as commissioner ended in August 1945, he had created 1,000 additional teaching jobs and new classrooms, largely from $3 million contributed by the United States. He also had established professional norms for selecting teachers and had eliminated the system of classifying them. Teachers were paid for 12 months instead of 10 months for the school year, and Commissioner Gallardo established a scale of salaries according to professional qualifications. In other words, the salaries of rural and urban teachers were equalized. Secondary schooling was introduced into the rural zones, and there was a special emphasis on vocational and prevocational education in both rural and urban areas. Musical and art education were emphasized, visual education was established, and there was an expansion of extension and adult education. It is also to his credit that he improved the School of the Air and created a Division of Research and Evaluation.
In January 1938, Gallardo inaugurated a Bureau of Adult Education; by September, it operated 132 schools with 8,502 students. Its growth has been steady, and by 1944 it was ready to cooperate with the Veterans Administration.

At the very beginning of World War II, the vocational schools contributed 400 trained workers to the Army and Navy shops. War veterans were later enrolled in the vocational schools and rehabilitation centers. Under Gallardo's leadership, the public schools sold $883,768 in war bonds and stamps during the year 1943-44 and $1,871,387 during the year 1944-45.

After Gallardo's resignation in August 1945, Herbert A. Martin served as acting commissioner until the appointment of Mariano Villaronga. Martin organized the educational services to enlisted men and veterans that expanded greatly during Villaronga's period. In the year 1945, 78 diplomas were granted to veterans, and 131 certificates and 2,500 units of high school credit were approved.

Gallardo's language policy was very complicated. At the very outset of his term, he called a meeting of his supervisory staff at Arecibo to intensify the teaching of English, according to his commitments with President Roosevelt. First and second grades were to be taught in Spanish; third and fourth, two-thirds in Spanish; fifth and sixth, one-half in Spanish. For the seventh and eighth grades there were three alternatives: (1) one-third of the time devoted to instruction in Spanish; (2) all instruction in English, with 90 to 100 minutes daily devoted to Spanish; (3) Mondays, Wednesdays, and Fridays, instruction all in English; Tuesdays and Thursdays, all in Spanish.

This plan was discontinued very soon, as it was not practical. The following year the plan was modified, and again in the year 1940-41, after 4 years of experience. In Circular Letter No. 1, July 1942, another modification was introduced. English was to be taught as a subject from the first to the sixth grades and Spanish was the medium of instruction. Harold L. Ickes, Secretary of Interior with Roosevelt, was quite displeased with the outcome of Gallardo's plans. In February 1943, Gallardo had a hearing before the Subcommittee on Territories and Insular Affairs meeting in San Juan, and in March 1943, he received a cable from Secretary Ickes expressing regret that he had paid little attention to specific instructions from the President to teach English in the Puerto Rican schools and stating that he would not have been appointed if he had not assured Ickes that this would be the keystone of his school policy.

Now it was Gallardo's turn to be displeased. He answered Ickes in respectful, informative, and strong terms in May 1943. Gallardo's policy, however, did not have more approval in Puerto Rico than in Washington. It was followed by Villaronga's policy, which has been continued with improvements until the present.

THE QUIET REVOLUTION, 1946 TO THE PRESENT

Mariano Villaronga

In December 1944, in an interview for El Mundo, the elected resident commissioner for Puerto Rico in Washington, D.C., Jesús T. Piñero, stated: “In ten years many things and many experiences in the life of our country have changed: governments, men, and parties. The attitudes of our people toward life and destiny have changed almost radically” (62).

This change really began in 1940, the year Theodore Brameld has called “a year of destiny.” Brameld points out that during the thirties the Roosevelt administration encouraged a mood of social change in Puerto Rico, and Rexford Tugwell, a leading New Dealer, served during World War II as a vigorous Governor. The Popular party achieved its first success at the polls in 1940; 4 years later, Luis Muñoz Marín was elected president of the Senate by a large majority. In 1946, President Truman appointed Jesús T. Piñero as the first Puerto Rican Governor; 2 years later, Luis Muñoz Marín was the first Puerto Rican Governor elected at the polls. It was not until 1952 that the Commonwealth of Puerto Rico framed its own constitution.

Parallel to the political developments, Chancellor Jaime Benítez led a reform at the University of Puerto Rico. From an enrollment of about 4,000 students, the university has now grown to about 25,000. The School of Medicine, created in 1952, measures up to the highest standards of the American Medical Association. Thus, as the economic structure of the island changed, the social and cultural milieu completely changed with it, to bring about the “quiet revolution.”

Mariano Villaronga, after receiving his M.A. from Harvard, had been involved in the turmoil of these creative years as principal of the Ponce High School. He shared in the university reform as professor and personal consultant to the chancellor. Then in November 1946, President Truman appointed him commissioner of education, and as commissioner he was president of the university's board of trustees. In the meantime, subcommissioner Francisco Collazo, a graduate of Columbia and professor of education at the University of Puerto Rico, acted as commissioner from July 1947 to the end of 1948. But when Governor Muñoz Marín was elected, he appointed Villaronga his secretary of education. Villaronga assumed office on January 1, 1949 (63).

As a member of the Governor's cabinet and as president of the university board, Villaronga was very influential during this revolutionary period. In part, this was because he had the foresight to develop close collaboration with the Puerto Rican Teachers Association and the university.
Since Padín's time, the Puerto Rican Teachers Association had been agitating for educational reform and had actively called for a new philosophy of education. When Villaronga assumed office, one of his main purposes was to "bring the school more in touch with the social reality of Puerto Rico" (64). The cultural and social realities had changed at such a vertiginous rhythm that it was all the department of education could do to keep pace. The change from an agricultural to an industrial economy and the subsequent concentration of population in the urban zones brought new administrative problems, not to mention the rapid changes in the political structure. In the wake of World War II, Villaronga had the tremendous task of making it possible for the public schools to accommodate the veterans who wanted to study under the GI Bill of Rights.

Villaronga also was interested in promoting reform. Top educators, both local and from abroad, had been lecturing in every annual convention held by the Puerto Rican Teachers Association, and Gallardo had included Villaronga on a committee with a number of these distinguished educators to work out future plans. When he assumed the post of secretary of education, Villaronga got the Legislature to approve an appropriation of $75,000 for the first Columbia survey, which was conducted during the 1948-49 school year and published in 1950 (65). Villaronga's wide and intensive program was guided by the approach, research, and findings of this survey. Since it also served as a guide for the succeeding secretary, and since a great number of leading Puerto Rican educators are graduates of Columbia, it has been very influential on the island.

One of the most important contributions of Villaronga's administration as secretary of education was the definite proclamation by law that Spanish was to be the official language of instruction for all levels and subjects, except English. The subject of English was accorded a preferential position when the department created a special section just to guide, intensify, and improve by all possible means English teaching. Professor Charles C. Fries, from the University of Michigan, served as a consultant and produced the world-famous Fries English Series. A program for training field supervisors is still under way.

Villaronga also instituted an accelerated program to increase the teaching personnel and the school enrollment. This greatly reduced illiteracy but forced the government to accept many teachers who could not meet the earlier standards. The vocational high school was created, and its high school diploma was accepted as an entrance requirement by the university.

By Act No. 76, ratified in March 1946, the Legislature approved a united budget, transferring to the state department the expenses that had been paid by the municipalities up to this time, and all the school property belonging to the municipalities was transferred to the insular government. Equalization of finances in the school districts has been a moot question since the department's beginning. The school planning office, created by Villaronga, still works under the Insular Planning Board. The law concerning the certification of teachers was revised and approved by the government. And the department created an education press for producing textbooks and other teaching materials. The magazine for the schools, Escuela, commenced publishing three different editions, one for each school level, to be used as teaching materials and as a supplement for the too few textbooks. Although the constitution states that textbooks are to be provided as one of the marks of free education, during Villaronga's time there still were not enough textbooks.

The centralization so important to the early commissioners was now partially discarded. For instance, the appointment of teachers was decentralized and vested in local school authorities. At the same time the secretary's office assumed the additional responsibility of operating the government's broadcasting station (WIPR) and expanding the School of the Air. This period brought an increased budget for scholarships and student aid, and an expansion of cooperative education. The department obtained more federal grants and established a Division of Research and Statistics. The Legislature also approved the organization of a Division of Community Education and drafted the Morovis Plan for self-instruction in adult education.
