This research investigated the interrelationships of educational decision making with the organizational climate and innovativeness in public schools. The data used in the study were gathered from 1,250 professional staff members in 49 public schools in Oregon, Washington, Nevada, Idaho, and Utah. The participating schools were classified into innovative and organizational-climate levels through use of questionnaire instruments. Another instrument determined whether the decision-making structure in each school was centralized or decentralized. The findings indicate that the educational decision-making structure does not measurably influence decisions of professional staff members to adopt innovative practices. However, more innovation was indicated in schools with greater openness of organizational climate. It is concluded that factors such as personality characteristics of the administrator, his willingness to adopt innovative ideas, his leadership style, and the diffuseness of the communication network may have more influence on decisions to adopt innovative ideas than the structure of decision making. ABSTRACT

The Interrelationships Between
The Decision-making Process and
The Innovativeness of Public Schools

by

Roger L. Reynoldson, Doctor of Education

Utah State University, 1969

Major Professor: Dr. Oral L. Ballam
Department: Educational Administration

Purpose

The purpose of this study was to investigate the interrelationships of educational decision making with the organizational climate and the innovativeness of public schools.

Procedure

The subjects of the study were 50 public schools located in the states of Oregon, Washington, Nevada, Idaho and Utah. They had been identified on the basis of their innovativeness by Marcum (U.S.O.E. Grant No. (OEG 4-7-078119-2901) in a study of organizational climate and the adoption of educational innovation. The innovativeness of the schools was determined from responses to an educational innovation checklist and assistance from state department of education personnel in each of the five states. Forty-nine of the schools agreed to participate in the study.

Marcum used only the 15 most innovative and the 15 least innovative of the 50 schools in his research. The current research included the most innovative schools, the least innovative schools and the 20 schools in the middle group considered to be intermediate in innovativeness.
All professional staff members were requested to complete the Decision Point Analysis. From responses to this instrument, educational decision-making mean scores were computed for each school. Higher mean scores were considered to be characteristic of decentralized structures for decision making. Lower mean scores were considered to be characteristic of centralized structures for decision making.

Responses of professional staff members to the Organizational Climate Description Questionnaire were used to compute organizational climate mean scores. Mean climate scores for the intermediate schools were obtained in the current research. Mean climate scores for the most innovative and least innovative schools were taken from Marcum's research. Higher mean scores were considered to be representative of open organizational climates. Lower mean scores were considered to be representative of closed organizational climates.

The Pearson Product Moment $r$ was used to investigate the relationship between: (a) educational decision making and innovativeness; (b) educational decision making and organizational climate; and (c) organizational climate and innovativeness.

Analysis of variance was used to test for differences between: (a) innovativeness for schools with decentralized structures for educational decision making and for schools with centralized structures for decision making; (b) innovativeness for schools with open climates and for schools with closed climates; and (c) the difference in innovativeness for all possible combinations of educational decision making and organizational climate.

Findings and conclusions

1. There was no significant relationship between educational
decision making and innovation scores. No consistent relationship appeared to exist between educational decision-making structures and innovativeness.

2. There was a significant negative relationship between educational decision making and organizational climate scores. The structures for educational decision making appeared to be inversely related to organizational climate.

3. There was a significant positive relationship between organizational climate and innovation scores. Schools with more open climates appeared to be more innovative than schools with closed climates.

4. There was no significant difference between innovation scores for schools with decentralized structures for decision making and for schools with centralized structures for decision making. It was assumed that schools with decentralized structures for decision making and schools with centralized structures for decision making were as likely to be innovative as they were to be noninnovative.

5. There was a significant difference between innovation scores for schools with open climates and for schools with closed climates. This finding confirmed the results of the correlational analysis. Schools with the more open climates appear to be more innovative.

6. There was no significant difference in innovativeness for all possible combinations of educational decision making and organizational climate.

CHAPTER I

NATURE AND BACKGROUND OF THE STUDY

Need for the Study

Change in our society is a continual process. In the past, change has been gradual and evolutionary. Present technological and recent social trends, however, have created the need for more planned change.

Society is placing increased emphasis on education as the discipline to provide knowledge and to prepare individuals to understand and initiate change. The slowness that characterizes educational change has created concern in both public and private sectors of our society. Increased expenditures for educational research, revision of professional training programs for educational personnel, the development of new curriculums, and a more concentrated effort to individualize instruction reflect the magnitude of societal concern. The role of education as viewed by business and industry is expressed in a policy statement prepared by the Committee for Economic Development (12, p. 17).

Innovation in education, whether it involves the use of new curriculum materials or new educational technology, has become essential if the schools are to be genuinely effective in achieving their aims and goals. Continuing assessment of the product is also necessary. This means the development of principles and techniques for critically judging the worth of whatever the schools teach and the effectiveness and efficiency of their methods of instruction. To attain these goals we suggest the establishment of prototype model systems that can exhibit new learning materials and new methods and techniques of learning to both the profession and the public.

According to Howsam (25, p. 65), most of the recent research in educational change has been concentrated on organizational patterns for
instruction, educational technology, and subject matter content. Much less attention has been given to the study of behavioral relationships and their impact on the change process.

Because the decisions to make changes in school programs affect a large number of persons simultaneously, preparation for making wise decisions is an important factor. The study of decision-making structures in schools with varying levels of innovativeness should provide information which may be valuable in designing strategies to more effectively initiate change.

Background information

The discussion of educational and societal change is becoming a moot point. According to Bebell (1, p. 2), "All agree on this fact of change. Indeed perhaps it is the fact of change alone which is not subject to further alteration."

Resistance to change in education has been attributed to various sources. Miller (31) suggests three inhibiting factors; (a) traditionalism, (b) laziness on the part of professional staffs, and (c) fear and insecurity associated with possible failure of innovative programs. Carlson (8) cites two additional sources of resistance: the absence of a change agent and a weak knowledge base. The Committee for Economic Development (12, p. 14) views education's conservatism as a natural societal expectation:

The future of the schools depends in large part on whether they can overcome in educational practice what is frequently an extreme conservatism and a strong resistance to change. This depends on whether they can develop a genuine openness to experiment and innovation. This is difficult because the conservatism of the schools has been a natural response to society's expectation that they perform an essentially conservative function.
The lack of financial resources has also been considered a hinderance to change in public schools. Mort (32) and Ross (36) have concluded that the level of financial support contributes heavily to the implementation of educational improvement and the adoption of new ideas. Conversely, Carlson (9), in more recent research, found that the level of financial support is not always a significant factor in educational change. Studies of the amount of money spent per child and the adoption of innovative ideas in Pennsylvania and West Virginia yielded negative, insignificant correlations. Marcum (28) discovered a significant difference in per pupil expenditures between more innovative and less innovative schools. He concluded that schools which expend more funds for maintenance and operation are likely to be more innovative. Most studies indicate a high relationship between the amount of money spent per child and innovativeness. According to Rogers (35, p. 60), innovative schools are ordinarily located in wealthy communities.

Brandes, cited in Bhola (5, p. 52), considers economic necessity to be a facilitating factor in educational change. Brandes' thesis is "... that public education is heading for an economic crisis, and the current efforts to increase the efficiency of education through innovativeness is perhaps the most helpful means of avoiding the crisis." Other economic influences are related to material progress. The Committee for Economic Development (12, p. 22) states that advancements in education is one of the chief contributing factors to the economic growth of the United States. They report:

From 1929 to 1957, it is estimated that 21 per cent of the growth of real national income per person was attributable to the greater education of the labor force, while another 36 per cent was attributable to the "advance of knowledge."
It is the opinion of The Committee for Economic Development that the rapidity and effectiveness of planned educational change will continue to play an important role in economic growth.

The principles of the change process have been categorized in a number of ways. According to Rubin (37, p. 156-157), four basic phases are generally involved. They are (a) the research phase, (b) the development phase, (c) the dissemination phase, and (d) the installation phase. The research phase is characterized by the "invention of new things or ideas out of the fresh insight or new combinations of old ingredients." In the development phase, the products of research are "tested, modified, and generally made ready for dissemination." During the dissemination phase new programs "are popularized through a number of activities." In the installation phase "the innovation is introduced into the school program and nurtured until it becomes self-sustaining."

The development of strategies for change has involved scholars from various disciplines. Chin (11) has attempted to classify them into three major types; (a) the empirical-rational type (the fundamental process is based upon reason and utilitarianism), (b) the normative-reeducative type (the fundamental process is based on attitude changing), and (c) the power-oriented type (the fundamental process is based on three types of power; coercive, remunerative, and normative). A similar classification has been developed by Bennis (4).

The rationale for changing an educational program is generally to improve the quality of the present program or to introduce a new program which is presumed to be more effective. Experiments conducted at The Center for Coordinated Education, as reported by Rubin (37, p. 158), indicate that schools may change programs for one of three reasons; 

"(a)
the program is clearly better than the one it replaces, (b) the program is sufficiently popular that its absence is regarded as a sign of decadence, rigidity, or both, or (c) the program will enhance the school's image as a progressive institution."

Ineffective educational change is generally the result of poor planning. Factors either neglected or improperly considered include; (a) inadequate research and development of innovations, (b) little or no staff involvement, (c) poor evaluative procedures for the change strategy and/or the innovations, (d) too many innovations attempted at the same time, (e) lack of sufficient resources to implement the innovations, or (f) all innovations are introduced in the same manner.

In the final analysis, planned change is dependent upon decisions made by organization members acting as individuals. Individual attitudes and needs are reflected in the decisions. Innovative ideas are more likely to be accepted and effectively implemented if they meet individual criteria. Parker and McGuire (33, p. 61) state this position as follows:

Knowledge, concepts, ideas, facts, and actions become most significant to the individual when (a) he can become involved emotionally as well as intellectually, (b) when it is seen as a basis for appropriate (to him) action, and (c) when a solution is demanded by the exigencies of the situation as he sees them.

If the decision to change is not genuine, Howsam (25, p. 66) indicates that individuals will tend to "... subvert the intention of the innovator by twisting the expected new behaviors into old and more comfortable ways."

Decision making

Theories of decision making used in education are based primarily
on ideas borrowed from government and industry. Little basic research on decision making has originated in public school or college organizations (13).

The decision-making structure of an organization influences the members' attitudes and the degree of participation in organizational goals. According to Simon (41, p. 3):

Insight into the structure of an organization can best be gained by analyzing the manner in which decisions and behavior of such employees are influenced within and by the organization.

Boss and Leavitt (6, p. 584) in a study of planning and implementing tasks in business found that:

... performance was somewhat better and attitudes more positive when subjects were acting out plans they had developed for themselves. ... Productivity was lower and attitudes less positive when Ss were acting out plans developed for them by others.

A study of personality determinants of the effects of participation in decision making by Vroom (43) yielded similar results. Increased participation in decision making resulted in more positive effects on job attitudes and motivation.

Lewin and his associates, cited in Dill (14, p. 213), discovered in experiments and field studies that, "many groups (such as teachers) ... want more change to participate in making decisions that affect their activities and opportunities." By giving groups more opportunity to participate, more cooperation, and a better quality of decision resulted. Similar results are cited by Goldhammer (18) in a study of administrative issues and problems.

The influence of communication on educational decision making is reported in research by Lippett (27). In a study of innovation and diffusion, Lippett identified two types of school structure, diffuse and
heirarchial. The diffuse structure was characterized by a broad
communication network among faculty members. The opposite was true of
the heirarchial structure. It was observed that teachers in the diffuse
structure "innovated and shared more often than did teachers in the
heirarchial structure." However, teachers in the heirarchial
structure "adopted more often than did teachers in the diffuse structure."
It was assumed that the open communication structure created a climate
for promoting innovativeness. It was believed that the heirarchial
structure created a climate more conducive to follower-type activities.

Two basic types of organizational structures for decision making
may be identified (2), the traditional (centralized or pyramidal
organization structure) and the modern (decentralized or flat organiza-
tional structure). The traditional structure emphasizes the role of
management in decision making. The modern structure emphasizes human
relations. Shepard (40, p. 261) has identified five key differences
between the two structures;

... (a) wide participation in decision making rather than
centralized decision making; (b) the face to face group rather
than the individual as the basic unit of organization; (c)
mutual confidence rather than authority as the integrative
force in the organization; (d) the supervisor as the agent for
maintaining the intra-group and inter-group communication rather
than the agent of higher authority; (e) growth of members of the
organization to greater responsibility rather than external con-
trol of the members' performance of their tasks.

It appears to be generally agreed that the decentralized type
of organizational structure for decision making is more conducive to
the initiation and adoption of innovation as the result of greater
participation by organization members in the decision-making process
(16, 3, and 42). The major strength of the decentralized structure
appears to be the utilization of expertise in the organization. Decisions
are made by personnel close to the problem who have the knowledge and who have been given the responsibility to make the decision (4, 13 and 19).

Organizational decision making involves a number of different roles and personalities. The interaction of these variables will in large part determine the direction of decision making. The roles of personnel in organizations are perceived differently by each individual member. Environmental setting, organizational guidelines, his own unique personality characteristics, and the perception of his role as he interacts with other staff members determine an individual's behavior in a given position. A major administrative problem is to coordinate the needs of the individual with those of the organization to obtained desired goals.

Role change is a difficult process. A well-established role tends to become self-perpetuating and resistant to change. Rogers (34), Bennis and Schein (3) consider perceptual modification of individual roles as a major inhibiting factor to change. They suggest the use of basic encounter (T-groups) programs to facilitate individual change. Rogers (34) advocates the use of basic encounter groups with both vertical and horizontal levels of the organization on a continuing basis. He considers this to be an effective plan for maintaining an atmosphere of openness to change.

The role of the executive in decision making is considered by Griffiths (21, p. 89) to be one of facilitating the process. Griffiths contends that the executive should be called upon to make a decision only when the organization fails to make its own decision. He further states that:
The effectiveness of a chief executive is inversely proportional to the number of decisions which he must personally make concerning the affairs of the organization. It is his function to monitor the decision-making process to make certain that it performs at the optimum level.

Similar views are expressed by Rogers (34) and Myers (29). They feel that the administrator should serve as a catalyst for releasing the capacity of others to make decisions.

Bennis and Chase predict an increase in the movement of organizations from closed to more open systems for decision making. Chase (10, p. 4) suggests that educational administrators must continue to learn to "... play a facilitating role in education decision-making..." and "... function as participants..." rather than act as controllers of the process. Bennis (4) also contends that the trend in planned change programs will continue to be "... less bureaucratic and more participative..."

The effects of personality characteristics in decision making were considered in research by Vroom (43, p. 35). In a study of personality determinants of the effects of participation in decision making, he found:

... attitudes toward the job of low authoritarian persons with high independence needs are favorably affected by opportunities to participate in making decisions... attitudes of highly authoritarian individuals and of individuals with low independence needs are relatively unaffected...

Relationships between personality characteristics to superintendents and innovation were explored by Johnson, Carnie, and Lawrence (26). They discovered significant correlations between personality characteristics of principals and the implementation of innovation. Other research findings also indicate the importance of administrative support for decisions to initiate and adopt innovation. According to Lippett (27, p. 321):
Teachers who perceive a principal as supporting innovation do in fact innovate more often. . . There is a clear trend suggesting that the teachers who see the principal as always or almost always making constructive suggestions are more likely to innovate.

Halpin and Croft (23) have assumed that organizational climate has an effect upon leadership and organizational change. They assume that an "open" climate allows leadership acts to be more easily initiated by designated leaders or faculty members in public schools. In addition, a more harmonious relationship presumably exists among staff members and there is more likely to be mutual agreement concerning procedures to be used in achieving organizational goals. The opposite is presumed to be true of a "closed" organizational climate.

The relationships between organizational climate and innovativeness were studied by Marcum (28). He observed that the more innovative schools possess open climates and the least innovative schools possess more closed climates.

From the review of literature, it appears as if the following assumptions can be made concerning decision making, climate, and innovativeness in organizations: (a) that decentralized organizational decision-making structures may provide a more receptive environment for the initiation and adoption of innovation than do centralized decision-making structures; (b) that the degree of centralization-decentralization of the decision-making structure may vary together with the "openness" of climate in organizations; (c) that a decentralized organizational decision-making structure and an "open" organizational climate may be related to innovativeness in an organization; and (d) that a centralized organizational decision-making structure and a "closed" organizational climate may be related to non-innovativeness in an organization.
Statement of the Problem

If professional staff members in public schools are to more effectively design strategies for educational change, a better understanding of the setting in which change takes place is needed. The lack of knowledge regarding the interrelationships of educational decision making with organizational climate and innovativeness may limit attempts by professional staff members to introduce innovative practices.

The problem, then, is to identify and describe the interrelationships of educational decision making with the organizational climate and the innovativeness of public schools. From such a study, data of value in helping school districts to more effectively initiate change may be gained.
CHAPTER II

METHOD OF THE STUDY

Hypotheses

The present research will investigate the interrelationships of decision making with organizational climate and innovativeness. The following null hypotheses will be tested:

1. There is no significant relationship between educational decision-making scores and innovation scores in the public schools selected for study.

2. There is no significant relationship between educational decision-making scores and organizational climate scores in the public schools selected for study.

3. There is no significant relationship between organizational climate scores and innovation scores in the public schools selected for study.

4. There is no significant difference between the mean innovation scores for public schools with centralized and decentralized decision making.

5. There is no significant difference between the mean innovation scores for public schools with open and closed organizational climates.

6. There is no significant difference among mean innovation scores for all possible combinations of levels of organizational climate and decision making in public schools.
The Pearson Product Moment $r$ will be used to test hypothesis one, the relationship between decision making and innovativeness, hypothesis two, the relationship between decision making and climate, and hypothesis three, the relationship between organizational climate and innovativeness. Coefficients of correlation will be accepted as significant at the .05 level.

Analysis of variance will be used to determine if significant differences exist between mean innovation scores for decentralized and centralized decision making and between the mean innovation scores for open and closed organizational climates. F-ratios will be computed with .05 as the level of significance.

Interaction effect between the means of innovation scores and all possible combinations of levels of organizational climate and decision making will also be tested by analysis of variance. F-ratios of .05 will be accepted as significant.

**Subjects of the Study**

Fifty-two schools in Oregon, Idaho, Washington, Utah, and Nevada were selected for study. The schools had been identified on the basis of their innovativeness by Marcum (28).

Innovativeness was determined by the use of an educational innovation checklist and by assistance from state department of education personnel in each of the five states. State department of education personnel were asked to submit names of schools which they determined to be most innovative and least innovative. The names of the eighty-six schools were submitted to Marcum. Seventy of the schools indicated willingness to complete the checklist. Principals from these schools responded to the innovation checklist. These responses were used to
rank the schools according to their innovativeness. Due to duplication of checklist scores, fifty-two schools ranging along a continuum from those considered to be highly innovative to those considered to be non-innovative were identified. Marcum selected the fifteen most innovative and the fifteen least innovative schools for his study of organizational climate and innovativeness. The twenty-two schools comprising the middle range were considered to be intermediate in innovativeness.

The present study includes the most innovative schools, the least innovative schools and twenty of the schools in the intermediate range. The extra two schools in the intermediate range were included in the event that two of the schools in the intermediate range failed to respond.

Principals of schools agreeing to participate in the study were contacted by phone, correspondence, and personal visitation concerning administration of the questionnaires. Principals or their representatives were requested to administer the questionnaires to full-time professional staff members. They were to instruct participants to follow directions exactly as printed on both the questionnaires and the accompanying special instruction sheet.

The innovative checklist and the questionnaires were mailed to the school principal. The innovative checklist was to be completed by the principal and returned with the questionnaires. All professional staff members in each of the schools were requested to complete the Decision Point Analysis. Professional staff members in the intermediate schools were also requested to complete the Organizational Climate Description Questionnaire. The results of the administration of the Organizational Climate Description Questionnaire to professional staff
members in the most innovative and the least innovative schools were taken from Marcum's (28) research.

The innovative checklist was readministered to determine if significant changes had occurred in the innovativeness of the schools since the first administration of the checklist in 1967 by Marcum.

**Instrumentation**

The Educational Innovation Checklist

The Checklist of Educational Innovation was developed by Hinman (24) as part of her doctoral dissertation at Utah State University (Appendix A). The checklist is based on procedures used by Brickell (7) to survey innovative practices in the State of New York and upon innovations implemented in the Clark County School District (Las Vegas, Nevada) from 1962-65. Six structural elements are included in the checklist: scheduling (time), staff utilization (teachers), procedures (methods), organization (students), curriculum (subjects), and facilities (places). In developing the checklist, Hinman limited the structural elements to those over which the principal had decision-making power.

One additional response category was added to the checklist for the present research. The category was "4--innovation has been discontinued." None of the schools reported the discontinuance of any innovation.

The scoring procedure for the checklist is designed to reflect the degree of innovativeness. The higher the mean score the more innovative the school. The converse is true of lower mean scores.

The Organizational Climate Description Questionnaire

The Organizational Climate Description Questionnaire was developed
by Halpin and Croft (23) at the University of Chicago. The purpose of the instrument is to describe the organizational climate of schools as perceived by the professional staff members.

Halpin (22) defines organizational climate as the "personality" of the school. He suggests that climate is to the school what personality is to the individual. The major reason given for assessing this group personality is to attempt to gain information which may help in planning activities to better achieve organizational goals.

In constructing the Organizational Climate Description Questionnaire, items were prepared which might describe schools in terms of their "personality." A bank of 1000 items was used. Three forms were used to screen and test the items. The major analysis was done with Form III. Form III contained 80 items. After administering Form III to 1151 respondents in 71 elementary schools, the analysis resulted in the reduction of the items to 64. The final version, Form IV, includes the 64 items plus five buffer items which were added solely to fill out space on IBM cards. A Likert-type scale is used for responding to the items. A complete list of the items used in the questionnaire is reported in Appendix B.

Items in the Organizational Climate Description Questionnaire are grouped into eight subtests. The first four subtests (disengagement, hindrance, esprit, and intimacy) refer to teacher behavior. The other subtests (aloofness, production emphasis, thrust, and consideration) apply to the principal's behavior. A complete description of the subtests is included in Appendix C. From these eight subtests, open and closed organizational climates may be derived.

Marcum (28) in a telephone conversation with Don Croft found the
A mean score for a school is computed by adding the scores on subtest #3 (esprit) to #7 (thrust) and subtracting the mean scores of subtest #1 (disengagement). The highest resulting scores represent the open climate schools and the lowest scores the schools with the closed climates.

The Decision Point Analysis

The development of the Decision Point Analysis began at the University of Wisconsin in 1957 (15). Researchers were attempting to identify administrative or supervisory tasks that were essential to the development and support of school instructional programs. Approximately 400 task items were selected. Selections were based on the rational judgments of researchers.

A pilot instrument containing 30 items was developed. The items were carefully reviewed and tested before inclusion in a working draft of the instrument. The pilot instrument also contained 17 positions considered to be possible loci of decision points in public schools. The instrument was then administered in a pilot system. The pilot system was about average for the 100 to 700 teacher systems included in a study of planned and implemented curricular change (15). Data from the pilot system were used for further refinement of the instrument.

The final draft of the instrument includes 25 decision items which are equally among five functional administrative areas; pupil personnel, staff personnel, curriculum, business management, and school-community relations (Appendix D). Ten decision point positions are included in the instrument. The positions are: business manager, principal, vice-principal, department head, special subject supervisor, superintendent, guidance coordinator, board of education, and teacher.
The determination of consistency of measurement for the Decision Point Analysis could not be obtained by conventional measures since the instrument does not provide a value score. Consistency of measurement was determined through a comparison of test-retest response patterns of schools in a study by Eye (15). Indices of Consistency obtained from the comparison were considered to be significantly higher than would be achieved by chance assignment.

The basic format of the Decision Point Analysis includes an introductory page stating the general purpose of the study, a background data page, and a backing sheet (Appendix E). The general directions and the ten decision positions are printed on the backing sheet. The decision items are attached to the backing sheet. Each decision item is printed on a separate two and one-half by eight and three-eights inch tab. The 25 items and a sample question are stapled to the backing sheet. As the respondent completes an item, he folds it over the top of the backing sheet, then answers the next item. Each decision item tab contains two response areas. In response area I, questions A and B are answered. In response area II, question C is answered.

Respondents are to answer three questions in completing the questionnaire.

A. Who makes the decision?
B. What others participate in making the decision?
C. What is the nature of your participation in making the decision?

The ten decision point positions are used for answering questions A and B. Four possible responses may be selected for answering question C:

1. Make the decision.
2. Recommend the preferred decision.
3. Provide information only.
4. None

The responses to question C, "What is the nature of your participation in making this decision?" were used to determine the degree of centralization or decentralization of the decision-making structure. It is assumed that the more involved the respondents perceive their role to be in making decisions, the more decentralized will be the actual decision-making structure of the school. Conversely, the less involved the respondents perceive their role to be in making decisions, the more centralized the decision-making structure. A similar scoring procedure was used by Sasse (38) in studying teacher and administrator participation in decision making and curriculum development.

Scoring procedures for the Decision Point Analysis were based on the following point system:

1. Make the decision . . . . . . . . . . 4 points
2. Recommend the preferred decision . . . . 3 points
3. Provide information only . . . . . . 2 points
4. None . . . . . . . . . . . . 1 point

Schools with the highest composite mean scores are considered to have the most decentralized decision-making structures. Schools with the lowest composite mean scores are considered to possess the more centralized decision-making structures.
CHAPTER III

ANALYSIS OF THE DATA

Descriptive Data

The subjects of the study were 49 public schools located in the states of Oregon, Washington, Nevada, Idaho and Utah. Fifty schools were originally selected for study. Forty-nine of the schools agreed to participate.

The 49 schools included 19 secondary schools, 9 junior high schools, 17 elementary schools, 3 junior-senior high schools, and 1 school containing kindergarten through grade twelve. A total of 1501 professional staff members were employed in the schools. Faculty size ranged from five professional staff members to 104. The number of students ranged from approximately 80 to approximately 2600. Schools were located in both rural and urban areas.

Principals of the schools utilized in this study responded to the checklist of Educational Innovation (Appendix A). From these responses Marcum (28) determined the innovativeness of each school. The 15 schools with the highest scores were designated as the most innovative; the 15 schools with the lowest scores were considered to be least innovative, and the 20 schools in the middle group were determined to be intermediate in innovativeness. Participation of schools by state and innovative category is presented in Table 1.

The school failing to respond in the current study was in the least innovative category. Two reasons were cited for nonparticipation (a) the school staff was too busy, and (b) the administration felt the study
of decision making and innovativeness was of questionable value.

The Checklist of Educational Innovation was readministered to determine if schools had maintained their relative positions in innovativeness. A comparison of the two sets of scores is reported in Figure 1. A product moment correlation of .96 was computed between the two sets of scores. According to Garrett (17, p. 338), a retest coefficient may be considered to be a close estimate of the stability of scores.

When the innovation scores are analyzed by categories, mean increases are noted for the least innovative schools and for the schools considered to be intermediate in innovativeness. A mean decrease was found for the most innovative schools. A comparison of the mean score is shown in Table 2.

All professional staff members in each of the 49 schools were requested to complete the Decision Point Analysis. Faculties in the schools
Figure 1. A comparison of innovation scores obtained by Marcum and in the current research.
considered to be intermediate in innovativeness were also asked to complete the Organizational Climate Description Questionnaire. Climate scores for the most innovative and the least innovative schools were taken from Marcum's (28) study. Twelve hundred and fifty of the 1501 professional staff members completed and returned the Decision Point Analysis. Four hundred thirteen of 491 professional staff members in the intermediate category completed the Organizational Climate Description Questionnaire. In Table 3 the percentage return by state and innovative category is reported.

(M) Marcum's research (R) current research

The scoring procedures recommended to Marcum (28) by Croft and reported in Chapter II were used to obtain climate scores. Climate scores for the intermediate schools were pooled with the scores reported by Marcum (28) for the most and least innovative schools.

</tbody>
</table>
The higher mean scores were considered to be representative of more open organizational climates and the lower mean scores were considered to be representative of more closed climates.

It is interesting to note that the range of climate scores for the most innovative schools is from 36 to 77 and the range for the intermediate schools is from 53 to 71. A comparison of climate scores by innovative category is shown in Table 4.

Responses obtained from the Decision Point Analysis were used to obtain education decision-making mean scores for each of the schools. The higher mean scores were considered to be characteristics of more decentralized decision-making structures. The lower mean scores were considered to be characteristic of more centralized decision-making structures.

Testing of Hypotheses and Analysis of Data

Hypothesis no. 1--decision making and innovativeness

"There is no significant difference between educational decision-making scores and innovation scores in the public schools selected for study."

To test this hypothesis, mean decision-making scores were correlated with mean innovation scores. With 47 degrees of freedom, a correlation of .28 is required for significance at the .05 level.

The Pearson product moment r was used to test the relationship between decision making and innovation mean scores. The analysis revealed an insignificant correlation of -.07. The null hypothesis is accepted and it may be concluded that no significant relationship exists between educational decision-making scores and innovation scores in the schools selected for study. A comparison of decision making and innovation mean scores are reported in Table 5.

Hypothesis no. 2--Decision making and organizational climate

"There is no significant relationship between educational decision-making scores and organizational climate scores in the public schools selected for study."

Mean decision-making scores were correlated with mean climate scores obtained from the Organizational Climate Description Questionnaire to test this hypothesis.

A correlation of -.32 was obtained between the names of decision making and organizational climate. With 47 degrees of freedom, a correlation of .28 was needed for significance at the .05 level. The null hypothesis is therefore rejected. The result of the analysis indicates that a significant negative correlation exists between educational decision making and organizational climate mean scores. From this analysis, it is therefore assumed that an inverse relationship may exist between educational decision making and organizational climate. Mean scores for educational decision making and organization climate are shown in Table 6.

Hypothesis no. 3--Organization climate and innovativeness

"There is no significant relationship between organizational climate scores and innovation scores in the public schools selected for study."

To test this hypothesis, mean climate scores were correlated with mean innovation scores. Using 47 degrees of freedom, a product moment r of .28 was required for significance at the .05 level.

The analysis of the data yielded a correlation of .42. The correlation is significant at the .01 level. At the .01 level, an r of .36 was required for significance. The null hypothesis is rejected. It may be assumed that a significant positive relationship exists between organizational climate and innovativeness.

</table>
A comparison of organizational climate and innovation mean scores is reported in Table 7.

Hypothesis no. 4--Decision making and innovativeness

"There is no significant difference between the mean innovation scores for public schools with decentralized and centralized decision making."

A dichotomy was established between the schools to test this hypothesis. The 16 schools with the highest mean decision-making scores were considered to possess the most decentralized educational decision-making structures. The 16 schools with the lowest mean scores were considered to have the most centralized decision-making structures.

The mean innovation score for schools with decentralized decision making was 27. A mean innovation score of 29 was computed for schools with centralized decision making. The analysis of the data revealed an F-ratio of .18. To be significant at the .05 level, an F-ratio of 4.17 was required. The null hypothesis is accepted. It is concluded that no significant difference exists in innovativeness for schools with decentralized decision-making structures and for schools with centralized decision-making structures. A summary of the analysis is reported in Table 8.

Hypothesis no. 5--Organizational climate and innovation

"There is no significant difference between the mean innovation scores for public schools with open and closed organizational climates."

Organizational climate scores were dichotomized to establish open and closed climates. The 16 schools with the highest mean climate scores were considered to have the most open climates. The 16 schools with the lowest mean climate scores were considered to have the most

closed climates.

The mean innovation score for the open climate schools was 30. For the closed climate schools, the mean was 16. The application of the analysis of variance technique produced an F-ratio of 12.44 which was significant at the .01 level. The null hypothesis is therefore rejected and it may be concluded that a significant difference exists in innovativeness for schools with open climates and for schools with closed climates. A comparison of mean innovation scores for open and closed climate schools is shown in Table 9.

Hypothesis no. 6--Innovation, decision making, and organizational climate

"There is no significant difference among mean innovation scores for all possible combinations of levels of educational decision making and organization climate."

To test this hypothesis, four combinations of educational decision making and organizational climate were published. They are illustrated in the following diagram:

<table>
<thead>
<tr>
<th>Decentralized decision making and Open climate</th>
<th>Centralized decision making and Open climate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decentralized decision making and Closed climate</td>
<td>Centralized decision making and Closed climate</td>
</tr>
</tbody>
</table>

No significant interaction was discovered among the combinations. An F-ratio of 4.17 was needed for significance at the .05 level. The analysis yielded an F-ratio of .23. The null hypothesis, that a significant difference does not exist among innovation scores for all possible combinations of educational decision making and organizational

CHAPTER IV

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

Summary

The problem

The problem of this research was to study selected variables which may influence the initiation and adoption of innovative practices in the public schools. Specifically, the interrelationships of educational decision making with the organizational climate and the innovativeness of public schools were investigated.

Procedures

The data used in the study were gathered from 1250 professional staff members in 49 public schools located in Oregon, Washington, Nevada, Idaho and Utah.

The schools who participated in the study were selected on the basis of their innovativeness. The criteria for determining innovativeness was based on scores obtained from responses to a checklist of educational innovation (Appendix A) and assistance from state department of educational personnel in each of the five states. The level of organizational climate in each school was established by using the Organizational Climate Description Questionnaire (Appendix B). The decentralization and centralization of educational decision making was determined by using the Decision Point Analysis (Appendixes D and E).

Linear relationships were explored by using the Pearson product moment r. Analysis of variance was used to investigate differences.
Findings

Six hypotheses were formulated for the purpose of investigating the problem. From the analysis of the data, it was determined that three of the hypotheses could be accepted and three could be rejected.

The first null hypothesis that there was no significant relationship between educational decision making and the innovativeness of public school was accepted. The correlation between mean scores for educational decision making and innovativeness was low and negative. It was determined that no consistent relationship exists between educational decision-making structures and innovativeness.

The second null hypothesis that there was no significant relationship between educational decision making and the organizational climate of public schools was rejected. Educational decision making and organizational climate were found to be negatively related. The correlation between the means of the two variables was significant at the .05 level. Assuming a functional relationship, schools with more decentralized structures for decision making appear to have more closed climates. Schools with centralized structures for decision making appear to have more open climates.

The third null hypothesis that there is no significant relationship between organizational climate and the innovativeness of public schools was rejected. Organizational climate covaried with innovativeness. Schools with open climates were more likely to be innovative than were schools with closed climates.

The fourth null hypothesis that there was no significant difference between mean innovation scores for public schools with decentralized and centralized educational decision making was accepted. Schools with
the most decentralized structures for decision making as well as schools with the most centralized structures for decision making were as likely to be innovative as they were to be non-innovative.

The fifth null hypothesis that there is no significant difference between mean innovation scores for public schools with open and closed organizational climates was rejected. The difference was significant at the .01 level. It was determined that schools with the most open climates were more innovative than were schools with the most closed climates.

The sixth hypothesis that there was no significant difference among innovation scores for all possible combinations of educational decision making and organizational climate was accepted. Significant differences in the degree of innovativeness were not obtained for schools when categorized according to the type of decision-making structure and the openness of climate. Schools with decentralized structures for decision making and open climates as well as schools with centralized structures for decision making and open climates were as likely to be innovative as they were to be non-innovative. The same was true for schools with decentralized structures for decision making and closed climates and for schools with centralized structures and closed climates. However, when considering only the main effect of organizational climate, a difference significant at the .05 level was obtained. Schools with more open climates were more innovative. The converse was true of schools with closed climates. This finding substantiates the results reported for hypothesis number three and for hypothesis number five.
Conclusions

From the analysis of the findings, it is concluded that the type of educational decision-making structure in public schools does not measureably influence decisions of professional staff members to adopt innovative practices. Both decentralized and centralized structures were found in the more innovative and the less innovative schools. No consistent pattern of relationships could be established.

Both the organizational climate and the innovativeness of public schools were found to be negatively related to educational decision making. Schools with more decentralized structures for decision making may tend to possess more closed climates and be less innovative. Schools with more centralized structures for decision making may tend to have more open climates and be more innovative. However, correlations obtained between educational decision making and innovativeness and between educational decision making and organizational climate were low. Their use for inferring functional relationships is quite limited.

The organizational climate and the innovativeness of public schools were positively related. The more innovative school possessed a higher degree of open climates and the less innovative schools possess a higher degree of closed climates. The openness of organizational climate appears to be an important variable to consider in attempting to establish an environment conducive to the adoption of educational innovations.

No combinations of types of educational decision making and organizational climate were found to be significantly higher in public schools of varying degrees of innovativeness. Schools with decentralized decision-making structures and open climates were no different in innovativeness from schools with centralized decision-making structures.
with open climates. The same was found to be true of schools when
decision-making structures were combined with closed climates.

In summary, it is concluded that factors which operate within the
overall educational decision-making structure may have more relevance
to the adoption of innovative practices than does the decision-making
structure when considered in its entirety. Such factors as the
personality characteristics of the administrator and his willingness
to adopt innovative ideas (26), the leadership style of the administrator,
and the diffuseness of the communication network (27) may have more
influence on individual and group decisions to adopt innovative ideas
than does the structure for decision making.

Speculations

The basis for speculation has been derived from the review of
pertinent literature and from the analysis of the data in the current
study.

In Chapter I it was assumed that more innovative schools may possess
more open climates and more decentralized structures for educational
decision making. The converse was assumed to be true of less innovative
schools. The assumptions were only partially corroborated by the
findings.

On the basis of the statistical analysis, the decision-making
structures of more innovative and less innovative schools do not appear
to be different. It is suggested that circumstances such as the following
may have influenced the outcome of the analysis. Although wider parti-
cipation in educational decision making may be encouraged by administra-
tors, teachers may not perceive this expanded responsibility as a
legitimate function of their role. In the past, many teachers have not
been provided with the opportunity for wide participation in decision making. They have primarily relied upon administrators to make the decisions affecting educational goals. Therefore, teachers may be unwilling to accept leadership roles that they may still believe the administrator should perform (30).

It is also possible that educational decision making might more realistically be viewed as operating on a continuum from decentralization to centralization rather than as being either decentralized or centralized. The effect of the administrator's leadership style, the interaction of the personalities of professional staff members, the types of decisions associated with the various educational problems and programs and other variables may produce such a fluid structure for decision making that a directional trend cannot be characteristically defined. It may be more feasible to investigate decisions as they relate to a particular innovation or program rather than to consider the overall decision-making structure of a school as being a definitive type.

None of the speculation was statistically verified in the current research. It is offered as a plausible explanation of factors which may have influenced the results of the study.

Recommendations

On the basis of the results of the statistical analysis and the conclusions drawn from that analysis, the following recommendations are made:

1. It is recommended that further study of the interrelationships between educational decision making and innovativeness in schools be conducted in a smaller number of schools, but in more depth. By limiting
the number of schools, a longitudinal study of the factors which influence decisions to initiate and adopt innovative ideas could be carefully observed and recorded. From the analysis of the decision-making structure in action on a continuing basis, more precise data concerning the effect of educational decision-making structures on the innovativeness of schools could be obtained.

2. Other criteria for determining the innovativeness of schools should be used in combination with the Organizational Climate Description Questionnaire to further substantiate or refute the relationships which appear to exist between the organizational climate and the innovativeness of schools. If the findings of the current research and those reported by Marcum (29) are upheld, the Organizational Climate Description Questionnaire may prove to be a valuable tool for aiding the administrator in evaluating the climate in his school prior to the attempt to introduce innovative practices.

3. The study of the interrelationships among educational decision making, innovativeness, and other variables seems warranted. Variables from within the school and from within the community that supports the school should be considered. For example, studies such as the following may provide data of value to administrators and boards of education in designing programs for educational change: (a) the exploration of possible differences between the personality characteristics of professional staff members and the types of personal and group decisions they deem necessary to establish an environment conducive to the adoption of innovative practices; (b) the study of the attitudes, the support, and the opposition of informal leaders within schools concerning the adoption of innovative practices; (c) the differences between the attitudes of community power structures and the professional staff members in schools concerning
decisions to adopt innovations, and (d) the differences in community involvement in the development of educational programs between more innovative and less innovative schools.

4. In future research, it is recommended that the innovativeness of schools be determined by involving all professional staff members rather than just the principal. From such an approach, a more complete description of the innovativeness of the school might be gained.

Educational Innovation Checklist

A. Introduction to the Checklist of Educational Innovation. In making an inventory of innovations for the state of New York, Brickell identified six structural elements of schools: teachers, students, methods, subjects, times, and places. He indicated that innovation at the school level often requires major shifts in one of these structural elements. The checklist of Educational Innovation follows Brickell's pattern.

B. Directions for Use of the Checklist of Educational Innovation. Different checklists are provided for elementary and secondary levels. Complete the checklist applicable to your level of administration. Principals of schools are asked to indicate those innovations which have been implemented or discontinued during the period of September 1, 1967 to May 31, 1968. Only those innovations which can be verified by the principal should be checked. The degree of involvement* should be indicated by scoring as indicated below.

Organizational Climate Description Questionnaire

The items in this questionnaire describe typical behaviors or conditions that occur within a school organization. Please indicate to what extent each of these descriptions characterizes your school. Please do not evaluate the items in terms of "good" or "bad" behavior, but read each item carefully and respond in terms of how well the statement describes your school.

The descriptive scale on which to rate the items is printed at the top of each page. Please read the Instruction which describes how you should mark your answers.

The purpose of this questionnaire is to secure a description of the different ways in which teachers behave and of the various conditions under which they must work. After you have answered the questionnaire we will examine the behaviors or conditions that have been described as typical by the majority of the teachers in your school, and we will construct from this description, a portrait of the Organizational Climate of your school.

The Questionnaire

The Organizational Climate Description Questionnaire was developed by Andrew W. Halpin and Don B. Croft at the University of Chicago. The Questionnaire is used and reprinted for this study with permission of the MacMillan Company from "Theory and Research in Administration" by A. W. Halpin. Copyright, Andrew W. Halpin, 1966.

Marking Instructions

Printed below is an example of a typical item found in the Organizational Climate Description Questionnaire.

1. Rarely occurs
2. Sometimes occurs
3. Often occurs
4. Very frequently occurs

Teachers call each other by their first names. 1 2 3 4

In this example the respondent marked alternative 3 to show that the interpersonal relationship described by this item "often occurs" at his school. Of course, any of the other alternatives could be selected, depending upon how often the behavior described by the item does, indeed, occur in your school.

Please mark your response clearly, as in the example. PLEASE BE SURE THAT YOU MARK EVERY ITEM.
1. Rarely occurs  
2. Sometimes occurs  
3. Often occurs  
4. Very frequently occurs

1. Teachers' closest friends are other faculty members at this school.  
   1 2 3 4

2. The mannerisms of teachers at this school are annoying.  
   1 2 3 4

3. Teachers spend time after school with students who have individual problems.  
   1 2 3 4

4. Instructions for the operation of teaching aids are available.  
   1 2 3 4

5. Teachers invite other faculty to visit them at home.  
   1 2 3 4

6. There is a minority group of teachers who always oppose the majority.  
   1 2 3 4

7. Extra books are available for classroom use.  
   1 2 3 4

8. Sufficient time is given to prepare administrative reports.  
   1 2 3 4

9. Teachers know the family background of other faculty members.  
   1 2 3 4

10. Teachers exert group pressures on non-conforming faculty members.  
    1 2 3 4

11. In faculty meetings, there is a feeling of "let's get things done."  
    1 2 3 4

12. Administrative paper work is burdensome at this school.  
    1 2 3 4

13. Teachers talk about their personal life to other faculty members.  
    1 2 3 4

14. Teachers seek special favors from the principal.  
    1 2 3 4

15. School supplies are readily available for use in classwork.  
    1 2 3 4

16. Student progress reports require too much work.  
    1 2 3 4

17. Teachers have fund socializing together during school time.  
    1 2 3 4

18. Teachers interrupt other faculty members who are talking in staff meetings.  
    1 2 3 4

Appendix C

The Eight Dimensions of Organizational Climate

Teachers' Behavior

1. Disengagement refers to the teachers' tendency to be "not with it." This dimension describes a group which is "going through the motions," a group that is "not in gear" with respect to the task at hand. It corresponds to the more general concept of anomie as first described by Durkheim. In short, this subtest focuses upon the teachers' behavior in a task-oriented situation.

2. Hindrance refers to the teachers' feeling that the principal burdens them with routine duties, committee demands, and other requirements which the teachers construe as unnecessary "busy-work." The teachers perceive that the principal is hindering rather than facilitating their work.

3. Esprit refers to morale. The teachers feel that their social needs are being satisfied, and that they are, at the same time, enjoying a sense of accomplishment in their job.

4. Intimacy refers to the teachers' enjoyment of friendly social relations with each other. This dimension describes a social-needs satisfaction which is not necessarily associated with task-accomplishment.

Principal's Behavior

5. Aloofness refers to behavior by the principal which is characterized as formal and impersonal. He "goes by the book" and prefers to be guided by rules and policies rather than to deal with the teachers in an informal, face-to-face situation. His behavior, in brief, is universalistic rather than particularistic; nomothetic rather than idiosyncratic. To maintain this style, he keeps himself--at least, "emotionally"--at a distance from his staff.

6. Production Emphasis refers to behavior by the principal which is characterized by close supervision of the staff. He is highly directive and plays the role of a "straw boss." His communication tends to go in only one direction, and he is not sensitive to feedback from the staff.

7. Thrust refers to behavior by the principal which is characterized by his evident effort in trying to "move the organization." Thrust behavior is marked not by close supervision, but by the principal's attempt to motivate the teachers through the example
which he personally sets. Apparently, because he does not ask the teachers to give of themselves any more than he willingly give of himself, his behavior, though starkly task-oriented, is nonetheless viewed favorably by the teachers.

8. Consideration refers to behavior by the principal which is characterized by an inclination to treat the teachers "humanly," to try to do a little something extra for them in human terms.
Appendix D

Decision Point Analysis
(Decision Items Grouped by Subtest)

Non-Categorized Item (Sample): The decision on the practice of using workbooks in the instructional program.

Business Management:

3. The decision on the priority for the use of unscheduled rooms and multipurpose areas.

6. The decision for the educational specifications for a new or remodeled building.

7. The decision on the instructional aids to be included in the budget.

18. The decision on the procedure for obtaining instructional supplies.

23. The decision on who will participate in the formulation of the school budget.

Curriculum:

1. The decision on the selection of curriculum problems for study.

10. The decision on the selection of teachers for participation in experimental instructional programs.

14. The decision on the regulations concerning lesson plans.

17. The decision on the selection of textbooks.

19. The decision on how to evaluate the curriculum.

Pupil Personnel:

2. The decision on the ways to group pupils by classes.

9. The decision on the content of pupils' cumulative records.

12. The decision on the retention of pupils.

16. The decision on the rules governing pupil conduct.

21. The decision on the practices for assigning homework.
School-Community Relations:

8. The decision on the means for increasing community understanding of curriculum developments.

11. The decision on how to report pupil progress to parents.

15. The decision on which community drives and activities merit school participation.

24. The decision on the content of local news items to be released.

25. The decision on the use of citizens' committees.

Staff Personnel:

4. The decision on the orientation activities for new staff members.

5. The decision on the appointment of teachers to curriculum committees.

20. The decision on the activities for inservice development of staff.

22. The decision on the assignment of teaching and non-teaching loads.
Appendix E

Decision Point Analysis

DIRECTIONS: This instrument contains 25 decision items. The column to the left is a list of positions of persons in your school system who may participate in making these decisions. In the column to the right there are three questions regarding each of the decision items. For each decision item, answer the three questions in the manner indicated.

<table>
<thead>
<tr>
<th>POSITIONS:</th>
<th>DECISION ITEMS:</th>
<th>QUESTIONS:</th>
