Teaching strategies for the study of the economic aspects of the student's own community are emphasized in this resource unit developed from materials produced by the Project Social Studies Curriculum Center. This unit should make progress toward teaching children the following: 1) concepts: consumer, producer, capital goods, durable goods, productive resources or factors of production, natural resources and man's use of the physical environment, barter, money and banking, pricing and the cost of production, profits and economic good, demand, competition, economic model, individual proprietorship, partnership, corporation, cooperative, private enterprise system, taxes, division of labor and specialization; 2) generalizations evolving out of this conceptual approach to community study; and, 3) inquiry skills as described in SO 001 726. Attitudinal objectives are: 1) skepticism concerning single-factor causation in the social sciences; and, 2) curiosity about social data. Educational media are listed, student activity sheets and textual materials developed by the Center are also included. Other documents in this series of curriculum guides are ED 051 027 through ED 051 033, ED 052 080 through ED 052 082, and SO 001 278. (VLW)
COMMUNITIES AROUND THE WORLD

Our Community: Economic Aspects

Teacher's Resource Unit
revised by
Leda Drouin        Jean Gurecki
June Gould         Gail Hennigar

Charles L. Mitsakos
Social Studies Coordinator

This resource unit was revised following field testing in the Chelmsford Public Schools from materials developed by the Project Social Studies Curriculum Center of the University of Minnesota under a special grant from the United States Office of Education.

1969
**OBJECTIVES**

This unit should make progress toward teaching children the following Concepts (and definitional generalizations):

<p>| | |</p>
<table>
<thead>

</table>
OBJECTIVES

Make progress toward teaching children the following:

1. Initial generalizations

2. One who buys or uses services

3. Perform services or who are producers.

4. Produce some capital goods which are used to produce and services in the production process.

5. Are consumed with one others are more durable where durable goods.

6. Our natural physical environment which can be used to help satisfy man's wants.

7. Barter

Barter consists of the desired exchange of goods or services for other goods or services without the use of money.

8. Money

Money is something which is accepted as a medium of exchange.

9. Bank

A bank is a business firm which accepts savings of others, pays interest on them and/or safeguards them, loans money to others, and is paid interest on loans.

10. Price

The price is the amount which must be paid to purchase the good or service. It is its money value.

11. Cost of Production

The costs of production include the prices which must be paid by firms for all of the productive resources needed in production.
12. Profits
Profits are the income left over after costs are subtracted from prices.

13. Economic good
An economic good is one which is scarce compared to the demand for it and so is not free.

14. Demand
Demand differs from wants in that when there is demand, there is a want backed up by the willingness to pay the ability to pay for the product.

15. Competition
Competition exists where there are a number of sellers and buyers of a product or service and no single seller or buyer can dominate or control the market price.

16. Economic model
Economic models simplify the economy to make it easier to understand. They include the major components in the system and the major relationships or connections among them.
17. Individual Proprietorship

A single proprietorship is a business owned by a single person.

18. Partnership

A partnership is owned by two or more people who are legally responsible for all debts of the firm.

19. Corporation

A corporation is owned by a group of people having the legal power to act as an individual.

20. Cooperative

A cooperative is a business in which ownership and profits are shared by a group of individuals who are either the workers or those who consume the products handled by the firm.

21. Private Enterprise System

Private enterprise systems are marked by private ownership and management of most means of production as well as by private ownership of consumer goods.
22. Taxes

Taxes consist of the money collected by the government from individuals and organizations in order to pay for its operations and for services.

23. Division of Labor

In division of labor no one tries to do all of the jobs needed to satisfy wants. The jobs are divided up and done by different people. Even one job may be broken up into a number of operations each of which is performed by a different person.

24. Specialization

Specialization means that one person does only one task or job and becomes skilled in its performance.

Generalizations.

1. Every economic system faces scarcity or a lack of enough productive resources to satisfy all human wants.

   a. Economic wants of people seem never to be satisfied, since goods and services must be replenished constantly as they are used up, since population is expanding, and since new inventions create new wants.
2. The private enterprise system provides great freedom of choice for consumers; these choices are influenced by many factors.

a. Prices can influence our choice-making

b. Preference can influence our choice-making

c. Quality influences our choice-making.

d. Packaging may influence consumer choices.

e. Advertising is used to persuade consumers to make certain choices as against other choices.

3. Barter is inefficient, the development of a monetary system promotes exchange and so a division of labor and greater productivity.

a. Barter is inefficient in that goods and services are not necessarily of equal value.

b. Barter is inefficient in that goods and services cannot always be divided to equalize value.

c. Barter is inefficient in that many goods do not last well.
d. Barter is less efficient than money for a number of reasons.

e. Money serves as a medium of exchange, as a measure of value, and as a store of value. It is divisible and can be transported easily.

1) Money is wanted for what it can buy; paper money has no value in and of itself.

4. Prices are affected by supply and demand and affect supply and demand.

a. Other things being equal, the lower the price, the greater the demand usually is; the higher the price, the less the demand usually is—except in the case of certain types of goods.

1) The degree to which changes in prices affect demand depends upon the degree to which consumers consider the good or service essential to them.

b. Other things being equal, the price of a good rises when the good is in short supply as compared to the demand for the good and falls when the supply of the good is larger than the demand at the existing price.

c. Wage rates are affected by the supply and demand for labor.
4. In general people in this country wish to sell their labor, land, capital, or goods for the highest income possible in order to obtain the largest amount of desired goods and services.

5. There are different kinds of productive resources (factors of production) including natural resources (called land), labor (man) and capital goods—(tools and machines and buildings to house production).

   a. Many types of goods can be produced from the same resources.

6. Division of labor and specialization make possible increased production.

   a. Mass production assembly lines use division of labor and specialization to increase output per worker.
   
   b. Division of labor and specialization in any mass production system permits reduction of cost per unit produced.

7. Specialization makes for interdependence.

   a. Mass production factories...
b. People in most societies of the world depend on people who live in other communities or countries for certain goods and services and for markets for their goods.

9. Cities usually have greater division of labor and specialization than small towns or farm areas.

9. Output can be increased by a more efficient combination of productive resources (by the way in which production is organized).

10. Output can be increased by technological progress in the development of tools and machines and power to replace manpower.

a. New technological developments bring improved efficiency to tools and machines and increased labor productivity.

b. Machinery and power make possible greater production per person and more complicated products.

11. Savings (or forming present consumption) are needed to obtain capital goods.

a. The money saved by individuals and put into investments banks becomes a source of investment by those who borrow the money to make capital goods.

12. Business firms as individuals as partnerships or as production cooperatives

a. As companies enterprises make possible investment with an increased productivity. They also sell shares in the ownership of the firm, however, the independence

13. Firms compete in ways; this can be classified as to how things are

a. Firms may compete with each other

b. Firms may compete with other by making better quality or decreasing prices

c. Firms may compete with other by their product or service.
12. Business firms are organized as individual proprietorships, as partnerships, as corporations or as producers' or consumers' cooperatives.

a. As compared with individual enterprises, corporations make possible a larger investment in capital goods with an accompanying mass production and lower costs. They also provide some legal safeguards for owners in case of the failure of the business. However, the owners have less independence.

13. Firms compete with each in many ways; this competition affects how things are produced.

a. Firms may compete with each other by cutting price.

b. Firms may compete with each other by heavy advertising to make their products better known or to increase the demand for their product rather than for competing goods.

c. Firms may compete with each other by trying to improve the quality of their product or by product differentiation.
d. Firms may compete with each other by trying to introduce substitute products which will be more attractive to consumers or cheaper.

e. Firms may compete with each other by cutting prices which means that they must compete in cutting costs of production in order to make a profit and stay in business.

14. Some things can be produced better in one place than in another because of climate, resources, access to resources, available transportation, closeness to markets, labor supply, people's skills, etc.

a. Location of production will be influenced by natural resources needed for production.

b. Location of production will be influenced by transportation factors.

c. Location of production is influenced by physical features which affect transportation and access to resources.

d. Location of production is influenced by access to markets.

e. Different parts of a city usually have different but interrelated functions.

15. In a market it is important to be present in large quantities to be produced:

a. Demand good:

b. Competition will be a good idea:

c. The economy will be affected with the welfare of the vicinities.

16. Economic questions and how shall we get wh
ay compete with each other to introduce substitute products which will be more attractive to consumers or cheaper.

ay compete with each other by introducing substitute products which means that producers will first compete in cutting costs or production in order to make a profit and stay in business.

s can be produced better in one place than in another because of resources, access to resources, transportation, close-markets, labor supply, skills, etc.

n of production will be influenced by natural resources needed.

n of production will be influenced by transportation.

n of production is influenced by physical features which transportation and access to resources.

n of production is influenced by access to markets.

15. In a private enterprise system, it is the market which serves largely to resolve the questions of: What and how much shall be produced? How shall it be produced? and Who will get what products and services.

a. Demand affects the supply of goods and services by affecting prices. Other things being equal, the higher the price for a good the larger the quantity which will become available for sale.

b. Competition among producers affects how things will be produced in a private enterprise economy, since each producer will try to arrive at the most efficient use of productive resources in order to compete with others and make greater profits.

c. The money incomes people receive, whether in the form of wages, interest, rents or profits, is the main factor in determining how goods and services will be divided--who will get what part of the goods and services produced in a country.

16. Economic systems differ as to how questions are resolved about what and how much to produce, how it shall be produced and who shall get what goods and services.
a. There are many ways of deciding who should get scarce goods and services.

17. Private enterprise systems are really mixed economies, with government ownership of some means of production and some common socialized goods and services.

   a. Government taxation and spending policies affect what and how much shall be produced and who will get what goods and services.

18. The flow of income in a private enterprise system can be broken down into three general types of flows: Between businesses and the public (producers and consumers); between the government and both producers and consumers; and between the savers and investors.

   a. Businesses buy productive resources (labor, capital, and natural resources) from others and pay them wages, interest, rent, and money for natural resources which they in turn use to buy goods and services from businesses.

   b. People and business firms pay taxes to the government and the government provides services to the public and also buys productive resources from the public.

   c. Many people save part of their income by putting it into banks which lend the money which in turn finally re-
ays of deciding who
the goods and ser-

systems are really

which in turn pay interest and
finally repay the bank.

**SKILLS**

1. Organizes and analyzes information
and draws conclusions.
   a. Classifies data

2. Attacks problems in a rational man-
ner.
   a: Sets up hypotheses.
   b. Tests hypotheses against data.

3. Gathers information effectively.
   a. Interprets pictographs and bar
      graphs.
   b. Interprets flow charts or model
   c. Uses encyclopedias and other re-
      ferences to locate information
      on local community.

4. Uses effective geographic skills.
   a. Understands use of map symbols
to represent reality.
   b. Interprets map symbols in terms
      of key or legend.
   c. Interprets map symbols for
      cities and towns.

**ATTITUDES**

1. Is sceptical of single-factor causa-
tion in the social sciences.

2. Is curious about social data.
G. (D) A consumer is one who buys or uses goods and services.

1. All people are people are pro

A. The process wants is ca
the people are called

S. **Generalizes from data.**

S. **Classifies data.**

S. **Sets up hypothesis.**
One who buys or services.

1. All people are consumers but not all people are producers.

A. The process of satisfying people's wants is called consumption, and the people whose wants are satisfied are called consumers.

B. Wants can be in the form of goods which people desire

2. Wants can be in the form of service which people desire.
1. Ask children to list all of the things which their families paid money for in order to get them ready for school this fall. (Include such things as hair cuts, visits to the doctor or dentist, etc, as well as material objects.) Make a composite list on the chalkboard and transfer the items to small cards. Children should note the number of different kinds of things purchased directly for them to use. Tell them that because they use things they are called consumers.

2. Have children make lists of all items for which their families spent money during the last month. (They should do this at home with the help of their parents.) The list will include a variety of items and services such as food, clothes, haircuts, rent, movies, newspapers, magazines, visits to doctors or dentists, lessons of one kind or another, food for pets, gasoline for car, bus fare, car repairs, etc. Have each child indicate after each item the number of members of his family who will or have used the item. (In some cases it will be a whole family.) Then ask the class: Did you any of you find that there was any member of your family who will not use at least one of the things listed? What do you use? What do babies in your families use? Ask: Are all the members or your family consumers? Why?

3. Now make a composite list of the things purchased by children's families. Put each item on a small card. Add to the other cards already made. Now ask children to classify the cards in two ways. First, hold up several cards which represent goods in one hand and several which represent services in the other hand. Ask: Can you see any difference in the type of thing purchased? Why have I grouped these two items together and not included these other two items? Help children classify items as goods and services. Redefine a consumer as a person who uses goods and services. Tell the children that having a service performed for one (i.e. a barber cutting one's hair)
S. Classifies data.

G. (D) Societies produce some capital goods which do not satisfy consumer wants directly but which are used to produce more goods and services in the long run.

G. (D) Some goods are consumed with one use, while others are more durable and are called durable goods.

S. Classifies data.

G. (D) Those who perform services or who make goods are producers.

B. Worker serv

S. Classifies data.
Societies produce some capital goods which do not satisfy consumer wants directly but which are used to produce more goods and services in the long run. Some goods are consumed with use, while others are more durable and are called durable goods.

3. Some goods do not provide immediate satisfaction to consumers; they are used to produce other goods and are called producer's goods or capital goods.

4. Goods can be classified as durable or non-durable, although those generally classified as non-durable include things such as clothes which take longer to consume than other non-durable goods such as food.

B. Workers are producers of either goods or services.

1. Members of families work inside the home and/or outside the home.

2. Those who make useful things are producers of goods.
is just as much consumption as wearing clothes or eating foods. Have children set up an hypothesis about whether more people produce goods or services in this country. This hypothesis will be tested later. However, ask: How could people test this hypothesis? Tell the class about census as a source of such data.

4. Now have children sort the cards according to goods and services. Each should then rearrange his own lists in two columns, one labelled goods and one labelled services.

5. Perhaps some child will have listed the purchase of a tool or machine by his father. If so, identify such things as items which help us produce what we want but do not satisfy our wants directly — as capital goods.

6. Now take the pile of cards labelled goods and ask children to classify them in a different way. Have them sort out the goods in terms of how long they will last — in terms of whether or not they satisfy wants quickly (e.g. food) or over a long period of time (car, house) or over a period of time but much shorter than for highly durable goods (e.g. clothes.)

7. Have the children make a list of members of their families and the work which each does inside the home. They will discover than some members of the family do not work. (e.g. grandfather, baby, etc.)

8. Make a composite list of types of work done in children's homes. Put on chalkboard or on tagboard. Then point to some of the items which represent production of goods and ask them what difference there is between this group of kinds of work and the next group which you point to. (Now point to
3. Those who do useful work for others—
work which does not include making goods—
are producers of services.

(D) Those who perform services or
who make goods are producers.
types of work which represent services.) What is the difference between making a cake and washing clothes? Between making up a bed and making a new bed? Between cutting the grass and raising vegetables or flowers in the garden?

Review the difference between goods and services when asking children to note the difference between making a cake and washing clothes. Then have children classify the types of work he listed in two columns: one for Making Goods and one for Producing Services.

9. Have each child draw a picture of his family. Bind in a class booklet entitled "Work in Our Home." Use pictures for bulletin board display.

10. Have the children list the members of their families outside the home and the work each does. Ask children to classify the kinds of work by the production of goods or services. Make a composite chart for the entire class and then ask children to place two columns headed Producing "Goods" and Producing "Services." Use these columns for class discussion.

11. Now say: Suppose we say that a producer is someone who makes things to make possible things we want. What else, then, are we saying about our lists of kinds of producers? Would those doing these jobs (on services) be producers? Now have children make a general definition which defines producers as those who produce goods and services. Use Student Activity...
What is the difference between making a cake and washing the dishes? between making up a bed and making a new bookcase (or other ms such as that)? Between cutting the grass or sing vegetables or flowers in the garden? etc.

iew the difference between goods and services. Now turn the items on the combined class list which you did not when asking children to note the difference in type. children to classify each one. Then have each child sify the types of work he listed in two columns, one Making Goods and one for Producing Services.

e each child draw a picture of his family working at home. in a class booklet entitled "Work in Our Homes." Or pictures for a bulletin board display.

e the children list the members of their families who work side the home and the work each does. Again lead them to sify the kinds of work by the production of goods or production of services. Make a composite list for the ire class and then ask children to place items in columns headed Producing "Goods" and Producing "Services."

ay: Suppose we say that a producer is someone who does thing to make possible things we want. Look again at r lists of kinds of producers? Would those making goods be users? Would those doing these jobs (point to column services) be producers? Now have children work out a A eral definition which defines producers in relationship goods and services. Use Student Activities Nos. 1 & 2.

Appendix: Student Activity number 1 and 2
S. Classifies data.

S. Interprets pictographs and bar graphs.

G. (D) A consumer is one who buys or uses goods or services.
4. More adults in the U.S. work to produce services than work to produce goods.
12. Children may draw pictures of members of their families who work outside the home. Have children group them into two piles of pictures: those that show production of goods and those that show production of services. Use them in preparing a bulletin board display which contrasts the types of production. Or bind the pictures in a class booklet entitled "Work Outside Our Homes." (Again contrast the two types of production.)

13. Ask: Which type of production is most common for parents of class members? If it is service, ask: Do you think this would be true for the workers as a group in this country? Remind children of all the goods which they and their families buy. Many workers must work to prepare these goods.

14. Perhaps show pupils a simple pictograph comparing number of workers in the country who provide goods as compared to number providing services. Be sure that you make the pictograph by using a number of stick figures of the same size rather than by increasing the size of the larger stick figure. (Changing the size of figures presents an inaccurate picture of relative sizes.) If possible, put this pictograph (made with the stick figures) on a transparency and project it with an overhead projector. Then place on top of it a transparency in which bars are used to cover the pictograph, so that the children see the same information illustrated in a bar graph. Be sure to add the necessary scale at the bottom of the graph to show the number of workers represented by each bar. By showing children the relationship between a pictograph and a bar graph, you should help children read bar graphs in the future.

15. Find pictures showing consumers and producers in the community. Be sure to include a number of pictures of people producing services (e.g. mail carrier, milk man, delivery boy, grocer,
G (D) Those who perform services or who make goods are producers.

G (D) Business buy productive resources (labor, capital, and natural resources) from others and pay them wages, interest, rent and money for natural resources which they in turn use to buy goods and services from businesses.

S. Interprets flow charts or models.
who perform services or the goods are producers.

C. Our economic system can be pictured in a simplified way by looking at a model showing consumers and producers (the components) and the flow of money and goods and service between them (the connections between components).

1. Consumers get goods and services and pay money to those who provide or produce them.
dentist, doctor, teacher). Also be sure to include pictures of consumers which show the consumption of goods (e.g. women taking goods off shelf in grocery store, people waiting in line for a ride on ferris wheel, patient and doctor, crowd watching community baseball game or football game, etc.) In small communities, you would be able to include pictures of people the children will know.

Now show the pictures as a means of reviewing what children have learned thus far. As you show each example, ask questions such as: is this person a consumer or a producer in this case? Is there a consumer as well as a producer in this picture? What is this person consuming? What is this person producing? You may wish to have each child write his answers to your questions on each slide. Then show the slides once more and discuss them orally with the class. If you cannot make slides, you could use pictures cut from magazines and newspapers, although they would not show local scenes.

16. Have each child bring in pictures of consumers and producers and make his own booklet on "Consumers and Producers."

17. Have each child draw one picture of an item purchased by his family. Prepare a bulletin board display of a simple flow chart. On the far left pin pictures of several houses and pictures of people representing families. On the far right pin pictures of various types of business establishments (e.g. factory, stores, barber shop, etc.) With white string outline a large arrow running from the pictures of businesses to the pictures of homes. This arrow should have double lines (as shown in model in appendix) and should be placed at the top of the bulletin board. At the bottom of the display, outline a similar arrow with colored yarn running from the homes
2. Most adults are both consumers and producers.

D. We can show a more accurate picture of our economic system by adding to our model the flow of productive resources from the people to the businesses and the flow of wages, rent, and interest from businesses to the people who use the money to buy goods and services from the business firms.
to the businesses. In the space provided by the top arrow, post children's pictures of things purchased by their families. In the bottom arrow, place pictures of coins, currency, checks, etc.

Ask: Why are the people living in these homes paying money to the people in these businesses? Have children label the top arrow goods and services and the bottom arrow money.

18. Take a picture of a local store owner who children may know and make duplicate copies of it. Or cut out the picture of a man from the same ad in two different magazines and give him a mythical business job and name. Now ask: Where would we place Mr. on our chart? Should we place him only on this side of our chart? Will he be only a producer? Now take a second picture of Mr. Smith and place it on the side with the homes.

19. Have children look at the flow chart on the bulletin board. Ask: How do the consumers get money to pay for the goods and services from the businesses?

Now have children select one of the smaller pictures on the board which represents goods and one which represents services. Change the flow chart by making a thinner arrow to show the flow of goods and services, using only the two pictures. Move the arrow showing the flow of money as payments for goods up under it. Now add an arrow at the bottom which moves from business to families and shows money payments for wages, rent, etc. Add another arrow going in the opposite direction which shows labor, natural resources, savings. (Use pictures of money for the first arrow which shows the flow of money payments for productive resources and pictures of a worker, of some natural resource, and of a tool for the second arrow which shows productive resources flowing to business firms.)
Every economic system faces scarcity or a lack of enough productive resources to satisfy all human wants.

Economic wants of people seem never to be satisfied, since goods and services must be replenished constantly as they are used up, since population is expanding, and since new inventions create new wants.

II. There are not enough productive resources to satisfy the wants of people.

A. Most families can satisfy wants for food, clothing, and shelter, and can satisfy some of their desires for other goods and services.

B. Taken as a whole, the great majority of people do not seem to have all the goods and services they desire. As a matter of fact, there are not enough productive resources to satisfy wants for many goods and services. Further, there are not enough productive resources to generate a sufficient amount of future income to prevent the limitation from occurring.

1. Goods and services are not equitably distributed. Some people receive more goods and services than others. The people who do not receive the goods and services they desire are those with the lowest incomes.

2. New inventions create new wants.

3. The productive resources are not efficiently used. On the average, the United States produces less than half of the goods and services produced in the United States.

4. Natural resources are not efficiently used. The United States has a shortage of natural resources.

5. The distribution of productive resources is not efficient. The United States has a shortage of productive resources.
II. There are not enough goods and services to satisfy the desires of all of the people for them.

A. Most families have more wants than they can satisfy with the money they have to spend; therefore, they must make choices as to what they will buy.

B. Taken as a whole people's wants are greater than can be produced in any society. Economic wants of people never seem to be satisfied.

1. Goods and services must be replenished because they are used up by the process of consumption.

2. New inventions create new wants.

3. The population is expanding, and more people need more goods and services.
20. Read aloud the fairy tale *The Fisherman and His Wife*. Allow time for children to discuss the behavior of the wife. Then say: Suppose you had a magic fish? What would you ask for? Let's imagine that all goods and services are free. Make a list of all the goods and services you would want and need.

After a few minutes, tell the children to stop writing. Then ask: How many of you were able to list all the goods and services you would want if they were free? Why did most of you fail to finish? What does this tell us about our wants?

21. Ask a series of questions aimed at bringing out unlimited wants as compared to limited supply. e.g.

a. Does your family have enough money to buy all the goods and services that it wants?

b. Why don't our wants for food get satisfied in the same way that our wants for (name of toy) get satisfied? (We eat a meal and then get hungry again, toys last longer.)

c. Why does your mother have to buy you new clothes? (They wear out, Styles change. Children outgrow them.)

d. How many of you have black and white televisions sets? Keep your hands up if you would like a colored television set. Why would you like it when you already have television? Can you think of other things which you would like because they are new or better than things your family already has? (New car, any newly invented item,

H. Tell children how many new people are added to our population in this country each year. (Or do the same for the community.) Ask: What does this mean about the total wants of people in our community or country?
fairy tale "The Fisherman and His Wife." Let's discuss the behavior of the fish.

Suppose you had a magic fish? What would you use it for? Let's imagine that all goods and services are free. Make a list of all the goods and services you would want and need.

After a few minutes, tell the children to stop writing. Many of you were able to list all the goods you would want if they were free. If you fail to finish, what does this say about your unlisted wants?

Appendix: "The Fisherman and His Wife."

Questions aimed at bringing out unlisted wants compared to limited supply. E.g.

- Family have enough money to buy all the services it wants?
- If your wants for food get satisfied in the same week, do your wants for (name of toy) get satisfied?
- Meal and then get hunger again, toys last longer than a week?
- Your mother have to buy you new clothes? (They styles change. Children outgrow them.)
- If you have black and white televisions sets? Hands up if you would like a colored television. Why would you like it when you already have one? Can you think of other things which you would like because they are new or better than things you already have? (New car, any newly invented item, etc.)

Then how many new people are added to our population each year? (Or do the same for the community.) Does this mean about the total wants of people in your city or country?
G. (D) An economic good is one which is scarce as compared to the demand for it and so is not free

C. Economic which are the want acquired for thro
A good is one scarce as compared and for it and so is C. Economic wants are wants for things which are scarce in relationship to the wants for them; they cannot be acquired without somehow being paid for through labor, money, taxes, etc.
f. Ask: When you made your lists of things you wanted, how many of you listed clothes as one of the goods you would want? If clothes were free would you want fair quality goods or would you want the best? Do you think everyone in our community would want the best quality of clothes possible? About [quote figure] people live in our community. How many of these people would want find clothes? There are about [quote current estimate] people in the United States. Would we have enough resources to satisfy the wants of everyone in the U.S. for fine clothes? In the world?

g. Can you think of other things or services which must be replaced or repeated? (e.g. pencils wear out; hair grows again after hair cut; etc.)

h. Can you think of any other examples of wants which are likely to continue or increase rather than being satisfied?

22. You may wish to find and read aloud sections of news articles illustrating other examples of scarcity (e.g. articles on food shortage or famine in some part of the world; article on water shortage in some part of the country; article on labor shortage in some occupation; article on work stoppage because of materials shortage; article on cut in government spending because of increased spending on war effort, etc.) Have children look in newspapers and magazines for other examples of shortages of one kind or another.

23. Have each child draw or find pictures he can use to illustrate a booklet entitled "People's Wants Exceed Supply."

24. Say: How much do your parents pay for the air you breathe? Why don't they pay anything? How much do they pay for the water you drink? (If pupils live in an area with private wells, they may not pay for water, but what they have paid for is the well. If
1. If goods are air or water small population people will

2. Some of other families them. In them usually private

G. Private enterprise systems are market by private ownership and management of most means of production as well as by private ownership of consumer goods.

G. Private enterprise systems are really mixed economies, with government ownership of some common socialized goods and services.

3. Some of ourselves individual themselves the government through the
1. If goods are not in short supply (such as air or water in some areas with only a small population and many lakes and rivers) people will not pay for them.

2. Some of our wants can be satisfied by families or individuals who can pay for them. In this country these wants are usually provided by private enterprise.

3. Some of our wants would cost too much for individuals or families to provide for themselves; these wants may be provided by the government and paid for collectively through taxes.
pupils live in cities, they pay small amounts for water.) Now ask: Suppose you lived in an area of many lakes or rivers and only a few scattered families. Would you have to pay for your water then? Why or why not? During a big snow storm would anyone pay for snow? Why not? Does anyone ever pay to have snow made? (e.g. ski resorts) Why? What then can we say about why we pay for some things we consume or that we have and not others? Now define economic goods for children.

25. Ask: Who pays for most of the things you and your families consume? Where do they get the money to pay for them? (Children will probably say by working or selling their goods and services. Do not try to get them to come up with other ideas at this time. Wait until after they have studied the different kinds of productive resources.)

26. Have each child made a chart (perhaps using cut-out pictures or his own drawings) to illustrate sources of income for a family. Save and let children add to charts later.

27. Ask: Who usually produces the things that supply our wants for food, clothing, and shelter. (Help children understand that most businesses are private in this country.)

28. Ask: Can you think of any goods or services which your families get which are not provided for by private industry? What services are all of you getting right now? (education). Who pays for this service? Can you think of any other services or goods which your parents do not pay for individually even though you and they share in their use? (Review what pupils learned in third grade course about services provided by government and reasons for such services.)
a. It would encourage local fire protection and pay for its own costs.

b. It would encourage individuals and organizations in order to pay for its operations and services.

c. Taxes consist of the money collected by the government from individuals and organizations in order to pay for its operations and services.
a. It would be too expensive and uneconomical for each family to hire teachers and provide facilities for educating its own children, to provide its own fire or police protection, to build its own roads on which to drive its car, etc.

b. Governments provide such services by collecting taxes from people and business firms. Therefore the people are paying for these goods and services indirectly and collectively.

C. The government must buy resources, goods and services from people in the society in order to provide these public services and goods. Therefore, it must be added to any model showing the flow of goods and services and money.
Could every family provide its own fire truck or hire firemen? Could every family hire teachers and pay for education? Could every family build highways for their car? Would it be sensible to do so if they could? etc. What plan does our community have so that all families can have education, protection against fire, highways, etc? Who pays for these services? (parents through taxes).

29. Develop a chart in class:

<table>
<thead>
<tr>
<th>WHAT FAMILIES BUY FOR THEMSELVES</th>
<th>WHAT FAMILIES BUY TOGETHER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Food</td>
<td>Schools</td>
</tr>
<tr>
<td>Clothing</td>
<td>Roads and Highways</td>
</tr>
<tr>
<td>Automobiles</td>
<td>Fire Protection</td>
</tr>
<tr>
<td>Houses</td>
<td>Police Protection</td>
</tr>
<tr>
<td>Etc.</td>
<td>Post Offices</td>
</tr>
<tr>
<td></td>
<td>Etc.</td>
</tr>
</tbody>
</table>

30. Return once more to the flow chart on the bulletin board. Ask what else needs to be added to our diagram?

Make a new chart or add to the bulletin board display in order to show government providing services to business and getting
G. People and business firms pay taxes to the government and the government provides services to the public and also buys productive resources from the public.

S. Interprets flow charts and models.

III. People can

G. (D) Barter consists of the direct exchange of goods or services for other goods or services without the use of money.

A. People has man

G. Barter is inefficient in that goods and services are not necessarily of equal value.

G. (D) Barter is inefficient in that goods and services are not necessarily of equal value.

G. Barter is inefficient in that goods and services cannot always be divided to equalize value.

G. Barter is inefficient in that not many goods do last well.

S. Generalizes from data.
A. People may use barter to exchange goods and services; however, barter has many disadvantages.

III. People can buy goods and services or be paid for what they do in various ways.

consists of the direct exchange of goods or services for goods or services, the use of money.

flow charts and models.
taxes from them and providing services to consumers and getting taxes from them. Have pupils identify what is provided. They might draw pictures to illustrate them.

31. Say: Listen carefully to the two accounts which I will read to you. Listen to find out how they are alike. Read a brief account of the purchase of Long Island from the Indians with beads, etc.

Now read aloud an account of how Sue traded marbles with Ellen. Afterward ask: Do you think this was an even trade? How are the two accounts I have read to you alike? What do we call this method of obtaining goods? (Barter) Did you ever trade or barter with your friends? How? What problems were there in such exchanges?

32. Ask: What do we usually use to obtain goods and services today instead of the beads that the early settlers used, for the exchange of goods? Today we will see how we would have to get along if we could not use money to obtain the goods which we desire.

Conduct a live trading session in class. Have each child bring in one object that he would be willing to trade with other children (emphasize the fact that this object will not be returned.) During class give children five minutes in which to trade. Tell the children that they must trade at least once but may trade more often if they wish. Following the trading session ask children to respond to the following:

a. What object or service I started with
b. The trades I made
c. Was I satisfied with my trade(s) and why

d. Would this be a useful method of obtaining goods and
providing services to consumers and them. Have pupils identify what is pro-

be a useful method of obtaining goods and services?
Money is something which is accepted as a medium of exchange.

Most societies make exchange easier.

Money serves as a medium of exchange, as a measure of value, and as a storer of value; it is divisible and can be transported easily.
thing which is
medium of
a medium of
measure of value, it is
can be transported

B. Most societies use some form of money to
make exchange of goods and services easier.

1. Money serves as a medium of exchange,
as a measure of value, and as a storer
of value. It facilitates both the ex-
change of goods and the savings needed
for investment.
33. Write a list of the problems involved in barter on the chalkboard. Ask: How do we solve these problems created by barter? Do we solve each of these problems with our money system? Discuss each problem and how it is solved in our system of exchange.
G. Money is wanted for what it can buy; paper money has no value in and of itself.

2. Money is valuable buy.

G (D) A bank is a business firm which accepts the savings of others, pays interest on them and/or safeguards them, lends money to others, and is paid interest on these loans.

C. Banks make it easier for save or borrow money to purchase machines or...

G. The money saved by individuals and put into investment banks becomes a source for investment by those who borrow the money to make capital goods.
1. Money has no value for itself.

2. Money is valuable because of what it can buy.

C. Banks make it easier for people to save or borrow money; they make it easier for business organizations to borrow money needed to get more machines or to build factories.
34. Hold up a coin such as a half dollar and also a dollar bill. Ask: "What makes each of these valuable? Is it the ink or paper on this dollar bill? Is it the metal in this coin? Would you like the money? Suppose no one would accept it for something else you want to buy? Would you still want it?

35. View transparencies #1-4 of Everyday Economics and use related worksheets.

36. Show the film The Story of Our Money System. A simple timeline showing the development of our money system could be made to check understanding.

37. Find advertisements that inform us of services provided by banks within the community. Emphasize the savings service of the bank, the checking service, loans, insurance, savings bonds, etc.

the checking service, loans, in-

, etc.
Many people save part of their income by putting it in banks which lend the money to business firms which in turn pay interest and finally repay the loans.

Interprets flow charts or models.

Classifies data.

There are different kinds of productive resources (factors of production) including natural resources (called land), labor (man) and capital goods (tools and machines and buildings to house production).

Factors of sources (land, labor, capital).

A. Land or soil resource

B. Labor excluding and admission of people

Because loans are used in the model to determine economic growth.
ave part of their thin in in banks e money to business in turn pay interest epay the loans. ow charts or models.

-34-

D. Because banks get money from people and loan it to others, they must be added to the model of monetary flow in the American economy.

IV. Factors of production include natural resources (land) labor (man) and capital goods (tools and machines.)

A. Land or natural resources include fertile soil, minerals, water and timber resources, climate appropriate for growing crops, etc.

B. Labor consists of the human effort including the technical, managerial and administrative skills of the people in a society.
38. Show filmstrips: *What the Bank Does with Andy's Money*, and *What is Profit?*

39. Visit a bank in the community for the purpose of finding out what services are offered and how these services are provided. Make arrangements ahead of time and be sure to tell the person who will serve as guide what the class has already studied about banks, or show the film *Money in the Bank and Out.*

40. Return to the flow chart on the bulletin board. Ask: Do we need to add anything else to this chart to show how money moves in our society? (If necessary, ask: Do we need to add banks to this chart? Why?) Use a cut-out picture of a bank and add it to the chart, perhaps moving some of the other parts of the model around to make room for it. Again add strings (of a different color) to make arrows showing the flow of money, this time from banks to consumers and back again and from banks to business firms and back again.

41. Ask: What will we need if we are going to make doll clothes? What do we need to cut the grass? To prepare a meal? (List all of the suggestions on the chalkboard.) Have children examine the lists to find items that have in common. It should now be possible for them to category items and place them in three as yet un-named columns: materials, labor, and tools. Have the children supply appropriate headings for the columns.

r, and tools. Have the children supply appropriate 

the columns.
A productive resource is anything which can be used to produce goods or services.

Societies produce some capital goods which do not satisfy consumer wants directly, but which are useful to produce more goods and services in the long run.

Machinery and power make possible greater production per person and more complicated products.
A resource is which can be used goods or services.

C. Capital goods include those means of production like tools, machines, and factories, which do not satisfy our wants directly but help us produce what we want.

1. Capital goods enable us to make things, or do jobs faster, to produce more, and to make more complicated goods and provide more complicated services.

and power make possible production per person complicated products.
Say: Taken all together, these things are called resources or factors of production. How would you resource? How are the three kinds of resources all they different? What other kinds of things might be each of these columns? (Get pupils to add by having of the things needed to produce wheat or corn or fl appropriate climate—or other objects not mentioned.)

42. If the term capital goods has not come up in previous introduce it now. Discuss machines and tools used in cooking, preserving food, cleaning, etc. What ma or tools do their parents use in their jobs? (Have ask at home.) To reinforce this concept use trans 5 & 6 of Everyday Economics and their related work.

43. Ask: How do machines and tools help us? Perhaps how they make jobs easier by having children compare as follows:

(a) Boiling something on a stove as against making the yard and boiling it over that fire.

(b) Sewing something by hand as compared with sew sewing machine.

Ask: How easy would it be to make an automobile with machines? Could it be done without any tools?

Show pupils picture of a computer and tell them how the time for making mathematical computations. Or speed of adding machine by timing it and children's numbers.

44. Have children think of other comparisons such as the pictures comparing work by machine and work by han
ken all together, these things are called productive re- or factors of production. How would you describe a ? How are the three kinds of resources alike? How are different? What other kinds of things might be placed in these columns? (Get pupils to add by having them think things needed to produce wheat or corn or flowers—e.g. climate—or other objects not mentioned so far.)

form capital goods has not come up in previous lesson, so it now. Discuss machines and tools used in the home ing, preserving food, cleaning, etc. What machines do their parents use in their jobs? (have children home.) To reenforce this concept use transparencies of Everyday Economics and their related worksheets.

ow do machines and tools help us? Perhaps demonstrate make jobs easier by having children compare such things is:

iling something on a stove as against making a fire in a yard and boiling it over that fire.

ing something by hand as compared with sewing it on a ning machine.

how easy would it be to make an automobile without any tools? Could it be done without any tools?

ils picture of a computer and tell them how it reduces e for making mathematical computations. Or demonstrate ng machine by timing it and children's addition of children think of other comparisons such as this and make os comparing work by machine and work by hand.
G. Savings (or forgoing present consumption) are needed to obtain capital goods.

G (D) Natural resources are those things in our natural physical environment which can be used to help satisfy man's wants.
2. Capital goods are acquired by saving oneself or borrowing the savings of others.
45. Now ask: What is done so that capital goods may be bought? (e.g. What do your parents do in order to get the money to buy a new refrigerator or stove, etc.) Some of the children are likely to say that they save it. Some will say that they get it at the bank. Is it their own or do they borrow it? If it is their own, how does it get to the bank in the first place? (saved) if they borrow it, what do they eventually have to do?

46. Perhaps give pupils a certificate indicating a certain amount of money. On the bulletin board, mount a series of pictures of things which you think they might like to buy with this money. After each, indicate the price of each good. Now ask each child to make a list of the things he would buy with his certificate. Then say: Suppose you wanted to purchase a machine or tool which costs twice as much as the amount on your certificate. What would you do? Help children see that they would have to forgo the purchase of some things now in order to save money to purchase the capital goods. Or if they borrowed the money now, they would have to forgo the purchase of other goods in the future in order to repay the loan. See Appendix for Student Activity number 3.

47. Say: In other words, when your parents wish to buy capital goods, such as refrigerators, stoves, power mowers, etc., they save and so must give up buying some other things they might want and would use immediately. How do you think factory owners get the money to buy machines and put up factories?

48. Show film Conserving Our Natural Resources, to develop more fully the concept of natural resources.
Is done so that capital goods may be bought? Our parents do in order to get the money to generator or stove, etc. Some of the children may that they save it. Some will say that they get Is it their own or do they borrow it? If they borrow it, what do they eventually have to
tils a certificate indicating a certain amount the bulletin board, mount a series of pictures you think they might like to buy with this ch, indicate the price of each good. Now ask ke a list of the things he would buy with them. What would you do? (Help children see have to forgo the purchase of some things save money to purchase the capital goods. Or if e money now, they would have to forgo the pur-ods in the future in order to repay the loan.
Studet Activity number 3.
s, when your parents wish to buy capital goods, ators, stoves, power mowers, etc, they save up buying some other things they might want mediately. How do you think factory owners buy machines and put up factories?

Film: Conser ving Our Natu-ral Resources
Bailey/Film Associates.
S. **Classifies data.**

G. **There are different kinds of productive resources (factors of production) including natural resources (land), labor (man) and capital goods (tools and machines and buildings to house production.)**

G. **Many types of goods can be produced from the same natural resource.**

S. **Uses encyclopedias and other references to locate information.**
49 Find pictures of different kinds of productive resources. On the chalkboard make three columns entitled: natural resources, human resources or labor, and capital goods. Have the children identify which factor of production is shown and list the item in the appropriate column.

50. Divide the class into groups to investigate the products which can be made from a single natural resource. Each group might prepare a large poster showing the resource and the products. (Or children might prepare a display of the resource and some of the products produced from it.) Bring to class some of the reference books which they might use and teach them how to use them.

51. Now say: You remember that we discussed how our families got the money to buy goods and services. What was the way we mentioned? (Write on chalkboard.) Can you think of any other ways we should add now? (Ask enough questions to bring out possibilities of rent and interest.) Perhaps ask children to go home and ask their parents this question. (You may not wish to do so if you have some children whose mothers or parents receive aid from the government.) Ask: What are people doing when they rent buildings or land? (Relate to capital goods and natural resources.)

Now have the children add to their charts on sources of income.
G. Division of labor and specialization make possible increased production.

Specialization makes for interdependence.

In division of labor no one tries to do all of the jobs needed to satisfy wants. The jobs are divided up and done by different people. Even one job may be broken up into a number of operations, each of which is performed by a different person.

Output can be increased by technological progress in the development of tools and machines and power to replace manpower.
Division of labor and specialization can increase production, but it also increases interdependence.

A. Most goods and services are produced by workers who specialize.

1. Division of labor and specialization help to produce goods and services better and faster.

2. Division of labor results in specialization and interdependence.

Increased by tech-
52. Say: Let's review the jobs you have at home. Why is it necessary? Why is it a good idea to divide up the jobs? What would happen if everybody in the family tried to do jobs? (e.g. cook, make beds, put up shelves, etc.) What would happen if you didn't do your job? (Bring out interdependence among family members.)

53. Project the list of parents' jobs outside of the home. Notice the number of different types of occupations. Ask why parents chose their jobs. Discuss freedom of occupational choice in this country.

54. Ask: Why doesn't each family produce everything its members need? Did families ever do this? (Review what children learned in grades one and two, particularly about the colonial family of Boston.

55. Review with children what they learned about how colonial women made clothing. Now show the film, How Is Cloth Made, and have children compare two ways of making clothing. Which system makes it possible to produce more clothes? Which requires more workers? Don't your mothers make all of the clothing for your families?
Review the jobs you have at home. Why is your job?

- Why is it a good idea to divide up the jobs?
- Open if everybody in the family tried to do the same.
- Job, make beds, put up shelves, etc.) What would
- didn't do your job? (Bring out interdependence
- members.)

List of parents' jobs outside of the home.

- Number of different types of occupations.
- Discuss how they chose their jobs. Discuss freedom of
- choice in this country.

Isn't each family produce everything its members
- can make. Ever do this? (Review what children
- did in grades one and two, particularly about the Algonquin
- colonial family of Boston).

Children what they learned about how colonial

- thing Made;
- The Story of
- Mass Production
- Bailey/Film
- Associates.
Specialization means that one person does only one task or job and becomes skilled in its performance.

Specialization makes for interdependence.

Generalizes from data.

Cities usually have greater division of labor and specialization than small towns or farm areas.

Classifies data.
B. Cities have greater specialization than do smaller towns and rural areas.
56. Select a service specialist such as a doctor or dentist. Ask: What other specialists are needed to make it possible for him to do his work? List all of the things children can think of that he needs to do his work and the workers needed to produce them or to provide the services he needs. (e.g. tools needed to make tools and even medical books; those needed to make office furniture; those needed to make laboratory tests; those needed to provide heat for office; etc.) See Student Activity No. 4.

57. Have children select some object in the classroom (e.g. map) and make a list of all the specialists necessary to produce and distribute it. (e.g. surveyer, geographer, paper-maker, ink-maker, printer, etc.)

58. Have each child make a chart to show how he and his family are dependent upon many other people for the things they need. Or have a small group of children prepare a bulletin board entitled "We Depend Upon Many People."

59. Introduce the yellow pages of the local telephone directory and have each group take any five pages under that letter and list of the main headings of types of goods and services specialists. Then have children classify the specialists as produce goods or services.
service specialist such as a doctor or dentist. Ask: what specialists are needed to make it possible for this work? List all of the things children can do to make them possible or to provide the services he needs. (e.g. those that he needs to do his work and the workers needed to make tools and even medical books; those needed to make furniture; those needed to make laboratory tests; those needed to provide heat for office; etc.) See Student No. 4.

Children select some object in the classroom (e.g. map) and distribute it. (e.g. surveyer, geographer, paper-maker, printer, etc.)

A child make a chart to show how he and his family are upon many other people for the things they need. A small group of children prepare a bulletin board entitled: A. Upon Many People."

Appendix:
Student Activity #4

Children select some object in the classroom (e.g. map) and distribute it. (e.g. surveyer, geographer, paper-maker, printer, etc.)

A child make a chart to show how he and his family are upon many other people for the things they need. A small group of children prepare a bulletin board entitled: A. Upon Many People."

Telephone Directory.

Ask: Why is one so much larger than the yellow pages of the local telephone directory and a large city. (Or if children live in large city, the directory of their own city and that for a town or suburb.) Ask: Why is one so much larger than the yellow pages of the local telephone directory and a large city. (Or if children live in large city, the directory of their own city and that for a town or suburb.) Ask: Why is one so much larger than the yellow pages of the local telephone directory and a large city. (Or if children live in large city, the directory of their own city and that for a town or suburb.)
G. Division of labor and specialization make possible increased production.

G. Mass production assembly lines use division of labor and specialization to increase output per worker.

G. Output can be increased by a more efficient combination of productive resources (by the way in which production is organized).

G. Division of labor and specialization in any mass production system permits reduction of cost per unit produced.
C. Division of labor and specialization are found among different businesses and firms.

D. Division of labor and specialization is found within a business firm. An assembly line illustrates an extreme form of division of labor.
Discuss how businesses specialize in different types of goods or services. (e.g. auto plant to make autos, canning factory to produce canned goods; toy factory to produce toys; supermarket to sell food; hardware store to sell hardware; etc.) Ask: Why can more be produced when businesses specialize? What kinds of store do not specialize? What advantages do they have? What disadvantages do they have as against stores which specialize? Are decision-makers necessary? Then ask: What is a fable? What makes it different from other stories? Once the students realize that a fable is designed to teach a principle, read the fable of "Peter and the Fender Bender". After the story is read aloud, ask: What were some of the problems Peter and his friends faced? Are machines worthless without an adequate supply of materials and labor? What is the moral of the fable?

Set up an assembly line in class and produce a product. For example, plan to produce paper airplanes by an assembly line to reinforce concepts of division of labor and specialization. Be sure to prepare pattern for making parts of airplane ahead of time. You might wish to use three shifts in large classes, and let the others watch what happens as each shift operates. You will need one or more foremen for each shift. Be sure to make a paper product which has enough different parts so that you can have a number of people on the assembly line. For example, the airplane must be complicated enough so that a number of people can make different parts. Also you could use several lines which produce minor parts and which feed into the main assembly line. Build in some bottlenecks such as a bottleneck of materials for some part or a bottleneck of too few laborers at some point in the line. These bottlenecks can be worked out by having pupils suggest ways of overcoming them. They should enable children to understand the problems which arise in keeping an assembly line running smoothly, as well as the advantages of using assembly lines.

Also Ask: What would be the effect on each of you if output decreases because of shortages (or scarcity)? What would be the effect if someone on the assembly line were to fall down on his job? How would it affect the rest of you?

An alternative activity which would include many additional concepts, may be setting up a greeting card business. See Appendix for additional information.

Keep a record of production and the number of workers on the line for a set period of time during the period when there are bottlenecks and
G. Mass production factories need mass markets in order to be profitable.

G. Mass production assembly lines use division of labor and specialization to increase output per worker.

G. Mass production with its greater specialization and substitution
for the same period of time after the bottlenecks are eliminated. Divide the number of planes (or other objects) produced under each system by the number of workers on the line at that time. Put both figures on the chalkboard and ask: How does the organization of the assembly line affect the number of planes produced? Suppose each of those working on the line had been paid two dollars an hour. How would organization of the line affect costs of producing one plane?

64. If you make a complicated enough product so that some children will have difficulty in learning all of the operations, you might have these children try to make these products individually and time themselves as they do it. Then after the assembly line is working well, time the production of one object. Compare the two times. Ask: How do assembly lines affect output? Costs of producing one plane? (You may wish to take photographs of the assembly line in action and display them with a finished model in the school hall.)

65. Say: Suppose young children were willing to buy this kind of paper airplane they did not know how to make it but wanted it very much. Would it always be wise to get up an assembly line to produce them? Why or why not? How many would you have to sell in order to gain any advantage over producing the planes individually? (Try to bring out idea of need for big demand or market for goods if they are mass produced.)

66. Have children look for examples of assembly lines in their school (e.g. cafeteria assembly line).

67. Visit an assembly such as one in a dairy plant. Afterwards, discuss
of capital goods for labor permits reduction of costs per unit produced.

G. New technological developments bring improved efficiency to tools and machines and increased labor productivity.

G. Competition among producers affects how things will be produced in a private enterprise economy, since each producer will try to arrive at the most efficient use of productive resources in order to compete with others and make greater profits.

E. Owners of firms reduce costs and make greater profits by searching for purchasing mass product

G. Firms may compete with each other by cutting prices which means that they must compete in cutting costs of production in order to make a profit and stay in business.
for labor of costs per developments efficiency to s and increased y.

producer s will be vate enterprise ch producer e at the most productive re- to compete with reater profits.

 Owners of firms change ways of producing things (the how of production) in order to reduce costs to meet competition and so to make greater profits. Competition and the search for profits provide the incentive for purchasing the capital goods needed for mass production assembly line.
the assembly line including the degree of specialization, the amount of capital goods, the ways in which bottlenecks were avoided, the kinds of problems which could arise, etc. Compare to own assembly line and suggest ways in which they could have improved their own line. Ask: What provides the power to lift heavy objects and move objects (electricity)? What advantage does this provide over having men provide all of the power?

68. Ask: Why do you think this business firm goes to all of the expense of buying all of the expensive equipment for this assembly line? Pupils may say so it can produce more or at lower costs. If so, ask why. Why for example, it is interested in lower costs? Would it be as interested if it were the only company making this product? Why or why not? If there are competing companies, why do owners want to reduce production costs?

69. View the film What Is Automation. Ask: What effect does automation have on man? (Stress the fact that man has more leisure time—why this might be a problem.)

70. Hold a summarizing discussion to emphasize our level of technology as compared to some others children have studied in past years, to emphasize interdependence as a consequence of specialization, and to emphasize the way in which specialization and the use of tools and machines permits people to produce more and more complex goods and services.
G. Barter is inefficient; the development of a monetary system promotes exchange and so a division of labor and greater productivity.

G. The private enterprise system provides great freedom of choice for consumers; these choices are influenced by many factors.

IV. Consumers must make services to buy. choices.

G. (D) The price is the amount which must be paid to purchase the good or service. It is the money value of the good or service.
F. Unless goods can be exchanged easily, people must remain fairly self-sufficient. Money promotes exchange and so specialization a division of labor and the higher productivity which accompanies such a division of labor.

IV. Consumers must make choices of what goods and services to buy. A number of factors affect choices.

A. They must make choices because of limited incomes in terms of all the things they would like to consume.
71. Ask: Suppose we did not have a money system and had to turn to a system of barter. How easy would it be to use an assembly line system of division of labor? Any system of specialization and exchange goods or services which produce for goods and services which others produce? Does money make it easier to increase production?

72. Obtain copies of small catalogs printed by local companies or by mail-order houses. Inside each catalog place an order blank and a sheet of paper indicating the reasons for ordering goods and the amount of money that can be spent. The reasons and amount should vary for some of the catalogs. Distribute the catalogs to each child. (You could tear some of the catalogs and give each child only one section. However, be sure to include pages which children might use.)

Say: What is a catalog? How is a catalog used? Each child has been given a catalog with an order blank. Look at the order blank to see how the order blank is to be filled out. Illustrate briefly the process of filling out an order blank. Go over the headings. Be sure to make sure children understand the meaning of price.

Say: Attached to your order blank is a sheet of paper for you the people for whom you are to buy gifts and the amount of the money you have to spend. Read this statement carefully. Think carefully about your reasons for ordering goods, these will help you to make the best choices. Keep in mind how much you have to spend. The total amount you spend cannot exceed your budget.

Choose the items you wish to order and put them in the order blank.

Allow a short but sufficient amount of time for the children to order. After the majority of the children have finished, discuss the choices by saying: Did anyone order everything in the order? Why not? What did you have to do when you wanted two of something but could only afford to pay for one? Do consumers always make choices? Why? Write on the chalkboard children's reasons for making choices.
Before we did not have a money system and had to rely on a system of barter. How easy would it be to have a system of division of labor? Any system in which specialization and exchange goods or services which they goods and services which others produce? Why do it easier to increase production?

Letters of small catalogs printed by local companies or houses. Inside each catalog place an order sheet of paper indicating the reasons for goods and the amount of money that can be spent in ordering. And amount should vary for some of the children.

The catalogs to each child. (You could tear apart catalogs and give each child only one section. Sure to include pages which children might want)

Appendix:

Order blank and Instructions.

How is a catalog used? Each of you seen a catalog with an order blank. Look carefully the order blank is to be filled out. Illustrate process of filling out an order blank. Call attentions. Be sure to make sure children understand the price.

What is a catalog? How is a catalog used? Each of you been a catalog with an order blank. Look carefully the order blank is to be filled out. Illustrate process of filling out an order blank. Call attentions. Be sure to make sure children understand the price.

Read to your order blank is a sheet of paper telling whom you are to buy gifts and the amount of you have to spend. Read this statement carefully. Finally about your reasons for ordering goods. This will make the best choices. Keep in mind how much money spend. The total amount you spend cannot be more than. Choose the items you wish to order and write them blank.

Not but sufficient amount of time for the children to read. If the majority of the children have finished, begin a saying: Did anyone order everything in the catalog? At did you have to do when you wanted two things and afford to pay for one? Do consumers always have to? Why? Write on the chalkboard children's reasons why must make choices.
G. Prices can influence our choice-making.

G. Preference can influence our choice-making.

G. Prices can influence our choice-making.

G. Preference can influence our choice-making.

1. There are many choices.

2. Choices are money people.

3. Choices are preferences for goods and services.
There are many factors affecting consumer choice.

1. Choices are affected by prices.

2. Choices are affected by the amount of money people have.

3. Choices are affected by personal preferences for certain kinds of goods and services.
73. Ask: What kinds of things helped you to make a
decision? Write this list of reasons given by the children
board. Then in order to show that choices neces-
sitate what a family most wants to do, what it can afford,
and what can fit into its schedule; use the lesson relating to Mr. G
as detailed in the Appendix.

74. Say: The following examples of goods will help
clarify why we make certain choices as consumer
purchasers. One is market at 10 cents. The other box and marked at about two dollars. Ask: What are these? Both are ball point pens. How are they different? Suppose you went into a dime store and chose to buy a 10 cent pen. What might be your reasons for making that choice? Pupils will probably suggest price or cheap price. Ask more questions to bring out reasons, including quality and practical use. Write price on the chalkboard. Also ask: Suppose you had more money. Would you necessarily choose the cheaper pen? Why or why not?

75. Say: Suppose you went to a grocery store to buy
a snack and found that they only sold two kinds of candy bars at the same price. If these two candy bars were the two possible choices, which would you choose from what would be your choice? Why do you prefer one over the other?
inds of things helped you to make a choice? List of reasons given by the children on the chalkboard in order to show that choices necessarily reflect what one most wants to do, what it can afford, and what it can use the lesson relating to Mr. Green's paycheck in the Appendix.

Appendix: "Mr. Green's Paycheck".

Following examples of goods will help us to see more clearly how we make certain choices as consumers. Show two pens. One is market at 10 cents. The other is in a store at about two dollars. Ask: What kind of goods are ball point pens. How are they different? Both are ball point pens. How are they different? What might be your reasons for making this choice? probably suggest price or cheap price etc. If not, use the lesson on the chalkboard. Also ask: Suppose you had all you want. Would you necessarily choose the same why not?

If you went to a grocery store to buy a candy bar at they only sold two kinds of candy bars at the store. If these two candy bars were the two you had to choose from what would be your choice? Why do some people
4. Choices of related services

G. Quality influences consumer choices.

5. Choices of goods

G. Packaging may influence consumer choices.

6. Choices of aging.
4. Choices are affected by the feeling of relative need for goods and services.

5. Choices are affected by the quality of goods and services.

6. Choices may be influenced by packaging.
chose the first and other of you choose the second? What is influencing your decision? Write reason under "price" on chalkboard if it is not already there.

76. Ask: Suppose your family wants to buy a new car and also build an addition to the house. What things would you think about in trying to make a choice? Are any of these reasons different from those we have listed already? (add to list if necessary.)

77. Ask: Which would you choose to buy if you needed both: shoes or a school book? Why? Which would you buy if you had neither: a sled or a wagon? a sled or a toboggan? (Try to help children understand that choices will depend upon such factors as the relative need for objects and the degree to which the person making the decision likes different objects. Choices would not be the same for each child.)

78. Say: Suppose you were given a choice between these two kinds of paper. (Show a piece of newsprint paper and a piece of smooth white notebook paper or a piece of good construction paper and a piece of thin, poor quality paper which children have shown in the past that they dislike. Say: This piece (show poor quality paper) is less expensive. Why might you choose this other piece (show good quality paper) instead? Help children see that quality influences their choices. Write quality on the chalkboard after the other reasons children have given for making choices.

79. Bring in additional samples to illustrate other factors which might influence choice, for example, bring in two packages of the same general type of product in very different kinds of packaging. Perhaps choose one which seems larger than another but includes only the same amount as the other product. Let children decide which one they or their mothers might choose and explain why.
G. Advertising is used to persuade consumers to make certain choices as against other choices.
Advertising is used to persuade consumers to make certain choices against other choices.
Discuss effects of packaging on consumer choice. Add this reason to the list on the chalkboard.

80. Say: We have discussed a number of factors that influence our decisions. Today we are going to see another important factor that influences consumer decisions in our community.

Obtain copies of issues of the community newspaper which contains full page ads of sales and prices of goods in local grocery stores. Obtain copies of other issues containing numerous advertisements of used cars for sale in the community (or use other products boys like.)

Divide the girls into groups of three or four. Give each group a grocery shopping list which includes goods that will vary in prices, as advertised in the paper by different stores. The lists should also include goods that will allow a choice in quality, brand, etc. (perhaps ads for turkey if it is close to Thanksgiving.) Give each group the same list so that comparisons can be made.

Give each group the same set of four different issues of the community newspaper. Each girl should receive one paper. The items on the list should be considered in order. For each choice the alternatives should be clipped from the paper and mounted on construction paper. The choice should be circled and the reasons for choosing each item should be listed.

Divide the boys into groups of three or four. Give each group a set of four different issues of the community newspaper. Have them each select the best car (or other product) to be used for the purposes written on a list.

After the groups have completed most of their "shopping", rotate members of groups by asking two members of each group to remain stationary and two members of another group to join the group for discussion of choices.
G. The private enterprise system provides great freedom of choice for consumers.

G. (D) Demand differs from wants in that when there is demand, there is a want backed up by the willingness to pay for the product.

G. Other things being equal, the lower the price, the greater the demand usually is; the higher the price, the

VII. Prices are affected in turn affect supply.

A. Demand is affected and prices are affected.
VII. Prices are affected by supply and demand and in turn affect supply and demand.

A. Demand is affected by the price of goods, and prices are affected by supply and demand.
After informal comparisons have been made, compare papers. Ask: What kinds of choices did you make today? Do customers have to make these choices? How does newspaper advertising affect choices?

81. Select sets of contrasting advertisements to of advertisements on children's choices. Give tunity to make decisions after viewing each that influenced their decisions.

\[ \text{good or service essential there is no good substitute for it.} \]
each one. Introduce the idea of demand as distinguished from wants. Tell the children to imagine that these are the only two candy bars in the city this week. Now ask how many children would pay five cents for a bar? 10¢? 15¢? 20¢? 25¢? (Raise until no one will pay the price.) Tell children that when we speak of our demand we mean that we will back up our wants with money up to a certain amount. Make a graph to illustrate the demand of the class for candy bars. Now say: Suppose I were to eat one bar myself and that I want to sell the other one rather than giving it away. Pretend that you are in my place. How much money would you ask for the bar in this class? Why? Now suppose that I were not to eat the first bar. I have two bars to sell. Could I get as much money for each? Why or why not? Could I get as much if I wanted to sell a whole box of candy bars in class? Why?

85. Say: Suppose I were to bring in (Name another object which you are sure pupils would like even better than a candy bar.) I want to sell it in class. How many would pay ten cents for it? 25¢?, etc. (Keep raising price named until no one will pay it) What is the demand in this class for this object at 10¢ etc? Make a bar graph to indicate the demand. Ask: How much could I sell this object for in this class? Now compare the two objects. Which could I sell for more? Why?

86. Suppose the cost of (name some currently popular cereal) is doubled. Do you think your mother would continue to buy it? Why or why not? (Could substitute another one that is cheaper.) Suppose the cost of salt were doubled. Would your mother continue to buy it? Why or why not? (If children do not understand the importance of salt, illustrate by by passing out popcorn Unsalted Popcorn which has not been salted. Children may say there is a substitute for salt. Perhaps let pupils have a very little taste of it, or tell them that it is bitter.) Ask: What difference do you see between these two goods? How does the difference
G. Demand affects the supply of goods and services by affecting the prices. Other things being equal, the higher the price for a good, the larger the quantity which will become available for sale.

G. (D) Competition exists where there are a number of seller and buyers of a product or service and no single seller can dominate or control the market price.

G. Firms may compete with each by cutting prices.

G. Firms may compete with each other by heavy advertising to make their products better known and so increase the demand for their product rather than for competing products.
The supply of goods by businesses. Other things being equal, the higher the cost of producing a good, the smaller the quantity which is available for sale.

C. Consumer demand, by affecting prices, affects what is produced.

where there exists a market for buyer and seller or service and no one can dominate the market price.

D. Business firms compete in selling the same goods; they try to gain consumers by advertising, by cutting prices, and by improving or changing products.
affect prices? (Difference between elastic demand and inelastic demand.) What factors besides possible substitutes might affect the demand for a good? (Ask further questions as needed to bring out difference between what people might think of as necessities and luxuries as well as difference in price.)

87. Now say: Suppose you are me. You want to sell another of one of these objects (hold up objects used in activity #86 and 87) in class tomorrow. Which object would you bring to class? Why? Suppose you produced both objects yourself. Which would you produce more of? Why? How would the class have affected what you produce?

88. Say: Suppose you have enough money to start any of the following businesses. How many of you would want to start a factory to produce horseshoes? Oil lamps? Hula Hoops? Smoke signal kits? How many of you would want to go into the business of raising horses to pull wagons? Why or why not? What kind of industry might you want to put your money into? Why?

89. Say: We have been looking at factors which affect consumer choice. Consumers frequently have to decide whether or not to buy a certain product (name one) from one company or another. These two companies are competing with each other in sales. Why might each wish to sell as many of his products as possible? What does the word competing mean? Why are they competing? (to make as great profits as possible). What ways have we found that businesses might compete with each other? (lower prices, advertising, quality improvement, packaging, etc.)
G. Firms may compete with each other by trying to improve the quality of their product or by product differentiation.

G. Firms may compete with each other by trying to introduce substitute products which will be more attractive to consumers or cheaper.

G. The money incomes people receive whether in the form of wages, interest, rents, or profits, is the main factor in determining how goods and services will be divided—who will get what part of the goods and services produced in a country.

G. There are other ways of deciding who should get scarce goods and services.

G. Wage rates are affected by the supply and demand for labor.

E. In general in incomes affect there could be such decision.
E. In general in our society, prices and incomes affect who gets what goods, but there could be other ways of making such decisions.

F. Supply and demand for labor affects wages and so the distribution of goods and services.
90. Ask: If I am selling two candy bars in class, what decides who will get them? (who has the money to pay the most for them.)
Ask: Could I as a teacher use some other way of deciding who would get the candy bars than giving them to the people who will pay the most? What ways might I use? (e.g. giving to person who needed it the most because underweight, giving it to person who is oldest or youngest, etc.) Now cut up several candy bars into small equal sections and give a piece to each child. Ask: What way did I use in deciding who would get the candy? Is it the system used in our society to decide who will get goods and services? What is the main way in which goods and services are divided up in our society? (Money income)

91. Say: Suppose your father or uncle were a . Name some occupation. He wants a new job, and so he looks in the want ads section of the Sunday newspaper. (Make sure that children understand what this section is.) Suppose that he finds the following list of ads looking for people in this occupation and this list of people who are looking for such jobs. (Project a sheet of paper on which you have placed parallel lists of help wanted and jobs wanted for the same occupation. This time have many more people wanting the job than there are jobs available.) Ask: How easy would it be for your father to get this job?
C. Other things being equal, the price of a good rises when the good is in short supply as compared to the demand for the good and falls when the supply of the good is larger than the demand at the existing price. (This is true for natural resources as well as for finished products.)

G. Supply and natural resources.

G (D) The costs of production include the prices which must be paid by the firm for all the productive resources needed in production.

G. The costs of production include...

G. Different parts of a city usually have different but interrelated function.

VII. Business firm increase profit by choosing a favorable location.

A. Some service industries such as religious and recreational organizations...
Supply and demand affect the prices of natural resources and so costs of production.

A. Some sections of a city are specialized; they may be devoted to retail stores, wholesale stores, manufacturing, or residential housing; such specialization results in part because of costs factors (of land) and access to potential consumers.
(Now project a sheet of paper showing many more jobs available than jobs wanted in the same occupation.) Would it be easier or harder for your father to get a job in this case? Why? In which case would he be more likely to get a higher wage? Why? (Help children understand that supply and demand affects wage rates as well as price for goods and services.)

97. Say: Suppose you are the producer of X. What resource do you need? What other producer needs this resource? How might the fact that he needs the resource affect you? What is likely to happen to the cost or price of the resource? Why? Suppose you could make your product from several different resources. Which would you use? One which is used to make other products or one not so used? (Let's say that both are in equal supply.) How would the possibility of a substitute resource affect the cost of the first resource? Why? Be sure the children understand the meaning of the term cost of production.

98. Review what pupils learned in earlier grades about the division of a city into sections specializing on different things. (e.g., second grade study of Moscow in unit on Soviet Urban Family; third grade study of New York, and of the Paris Community.) Review reasons for these divisions.
G. Some things can be produced better in one place than another because of climate, resources, access, people's skills, closeness to market.

B. Different parts of a country may specialize in the production of certain products. The location of particular industries depends upon such factors as the availability of all natural resources needed, labor, transportation facilities, and access to markets.

1. Some things can be produced more efficiently in one place rather than another because of climate, resources, access to resources, available labor, people's skills, and distance from and access to markets.
94. Review what pupils have learned in earlier grades about ways in which different places depend upon other places for goods and services. Why don’t they produce all of the things they need or want? Ask: What do you think might be reasons why a certain industry would grow up in a particular region? Suppose you wish to make flour. Where would you set up a factory? What would you need? (e.g. wheat—natural resources; labor as well as capital.) Suppose you built a factory to produce flour in a wilderness area? What problem would you face in addition to that of try to get resources and labor?

95. Project a transparency outline map of an "imaginary country" on the overhead projector. Scale and direction must be indicated on the map. Say: This is a map of an imaginary country which we will pretend is located somewhere on our earth. What would be a good name for this country? Title the map using the name suggested by one of the children. Say: Let’s make up the name of a resource which is located somewhere in this country. What shall we name the resource that we will be talking about? What shall we name the main-type of goods produced from (name resource)? Write the first appropriate names given for both the resource and goods on the chalkboard. Show the relationship between the resource and good produced from it with an arrow. Ask: Where might we find a large deposit of (name resource) in (name country)? How can we indicate this location on the map? Mark the resource location on the map using suggested symbols. Preferably shade or outline the location of the resource. Continue by saying: The two largest cities in (name country) are located here, and here. (Name them X and Y; use capital letter.) Mark cities using black circles with white centers. Place one city relatively close to the location of the resource. Place the other somewhat farther away from the resource location in the opposite direction. Label each city with a capital
G. Location of production is influenced by physical features which affect transportation and access to resources.

G. Location of production is influenced by access to markets.
letter. Say: There are many smaller towns in (name country). Three of them are located here, here and here. According to map, indicate the location of the towns by using one of the symbols approximately the same as the closest city. Place the second town opposite the first, a third town farthest from the resource, near a body of water. Give each town a name in the form of a letter. Ask: What must we add to our map to help others understand each symbol means? What do we call this form of key on the map? Say: We said that (name) is the main type of goods produced from (name resource). Carefully at the map, where might we expect to find it produced? The lesson might proceed as follows: City X is the most probably place where (name good) is produced. Why did you choose a city rather than a town? Why? Use transparency No. 7 of Everyday Economics. View Communities Trade Goods.

97. Again project the transparency of this "imaginary" city. Ask: In looking carefully at this map we had deduced that "X" was the most probably location for the production of (name good). In view of the influences of cost of production and location of the other resources used, what can we say about our choice as the location for production? Place mountains between city "X" and the resource deposits. Ask: Is there a chain of mountains be that there was a very high chain of mountains between "X" and the location for production, what alternative location would you choose? Why has "X" become an unlikely location?
There are many smaller towns in (name country). Three of them are located here, here and here. As you are speaking, indicate the location of the towns by using a black dot.

Place one of the small towns approximately the same distance from the resource as the closest city. Place the second town nearer the resource but in a direction opposite the first city. Place the third town farthest from the resource, near a border of the country. Give each town a name in the form of a small letter.

Ask: What must we add to our map to help others understand what each symbol means? What do we call this form of information? Place a key on the map. Say: We said that (name goods) were the main types of goods produced from (name resource). Looking carefully at the map, where might we expect to find (name goods) produced?

The lesson might proceed as follows: The children will probably answer city "X" which is the city nearest the resource. Assuming that "X" is selected, ask: Why do you think city "X" is the most likely place where (name goods) are produced from (name resource)?

Say: Town "a" and town "b" are just as close or closer to the location of (name resource.) Why did you choose a city rather than a town? etc.

See transparency No. 7 of Everyday Economics. View film, Why Communities Trade Goods.

In looking carefully at this map we had decided that "X" was the most probably location for the production of (name goods). In view of the influences of cost of transportation and location of the other resources upon the production of steel, what can we say about our choice of "X" as the location for production? Place mountains on the map between city "X" and the resource deposits. Ask: If we found that there was a very high chain of mountains between city "X" and the location for production, what alternative might we choose? Why has "X" become an unlikely location? How is
G. Some things can be produced better in one place than in another because of climate, resources, access to resources, available transportation, closeness to markets, labor supply, etc.
this related to transportation? How is it related to cost? Now remove mountains and draw in a river which flows next to the resource and through city "Y". Which city might be the best place to produce (name of product)? Why? Add a sea along the coast nearest the town "C". Say: If we found out that most of (name goods) were not used in (name of country) but shipped on to other countries across this sea, how might this change our idea of where (name goods) will be produced? Why?

99. Culminating Procedures

Have each child study one local producer and prepare a scrapbook on it. You may wish to give children a sheet containing directions such as those found in the appendix. Afterwards, place these booklets on display on the library table and let children prepare graphs showing them. Have one group of children prepare a graph showing the number of different firms which were owned individually, the number which were partnerships, the number which were corporations, and the number which were cooperatives. Have another committee prepare a map on which they locate all of the companies. (Afterwards discuss the map, noting any concentration of companies.) Have another committee examine the booklets to compare the number of workers in the different firms. They should prepare a chart to show their findings. Another committee might prepare a chart to show the number of firms which used assembly lines as against the number of firms which did not use assembly lines.
G. Business forms are organized as individual proprietorships, as partnerships, as corporations, or as producers' or consumers' cooperatives.

G. People in most societies of the world depend on people who live in other communities or countries for certain goods and services and for markets for their goods.

G. The parts of a system (including an economic system) are interconnected.

S. Interprets flow charts or models.

G. Economic models simplify the economy to make it easier to understand.

XI. All of the factors in our economic system are interconnected, and they affect the economic system we have studied.

XI. All of the factors studied fit together in our economic system to resolve certain questions of what and how much shall be produced, how they will be produced, and who will get what share of what is produced. Our economic system differs somewhat from other economic systems in the way in which these questions are resolved.

A. The major factors and components of a system affect each other. We have studied some of them and some of the ways they affect each other. In other words, we have studied a simplified model of our
99. Bring a radio to class. (it should be large enough to have different buttons to push or preferably dials to turn, and hopefully the back will be open so that pupils can see the various wires, etc.) Ask: What are the different parts of this radio which you can see? What would happen if you removed a part? How are these parts connected? What happens if you turn this knob? If you turn this knob? If you turn these two knobs together? Let pupils try. Could we draw a simple diagram on the board to show the main parts of this radio? (try to do so, keeping the diagram simple.) Point out that we could speak of the radio as a system made up of many parts connected in certain ways and acting together to do certain things. When we do something to one part, it affects other parts in certain ways and in the same way each time we do it. The pupil demonstrates. Ask: What is this system built to do. Have we included all of the ways in which parts are connected or act? Why not? Does the diagram still have some value in showing us something about the radio. Why?
G. The flow of income in a private enterprise system can be broken down into three general types of flows: Between business and the public (producers and consumers); between the government and both producers and consumers; and between both savers and investors.

G. In a private enterprise system, it is the market which serves largely to resolve the questions of: What and how much shall be produced? How shall it be produced? Who will get what products and services?

G. Government taxation and spending policies affect what and how much shall be produced and

B. An economic system if all wants are certain basic and out of this scale.

1. The market in the American

a. Consumer, and invest the market desires, c
A private system is faced with scarcity if all wants are considered. Each system resolves in some fashion or another certain basic economic questions arising out of this scarcity.

1. The market is the basic institution of the American economy.

a. Consumers, producers, workers, savers, and investors make free decisions in the market based on tastes and desires.
100. Now point out that pupils have been studying another kind of system—an economic system. It is made up of various parts which are connected in certain ways. What does the economic system do? (What is its purpose)? What are some of the major parts which they have studied? How are these parts connected? Have pupils make a simple diagram. Perhaps make a simple flow chart like the one put on the bulletin board earlier.

Now ask pupils what would happen if one part acted in a certain way. e.g. Producers reduce production, consumers hide money and don't buy, etc. How would it affect the other parts? Do pupils think they have listed all of the parts or connections? Why not? Can they think of any others? Is there any possible advantage to listing only the major parts and major connections?

Perhaps also have pupils think of some other models which they have made (such as plane models, models of cars, models of houses, etc.) How are such models simplified? Why? Ask pupils to think of building a house which they can plan in any way they like. Why might they want to make a rough model of it before they build it? Try to help pupils see what we mean by models and their advantages.

101. Now have pupils look at their diagram of our economic system. Ask: How are pencils (or some other object) made? Who decides how many to make? Why does he decide to make this many and not more or fewer? Who in the long run then affects the decisions as to how much and what will be produced in our society? How do producers affect this decision? What ways might be used to make pencils? (Discuss making by hand, by machine, etc.) Who decides how the pencils will be made? What will affect his decisions? How are pencils divided among the people of the country or community? How might the government affect the production of pencils?
who will get what goods and services.

b. These choices for production resources directly will be part of what

1. In a position product who ad fields changing production which profit encourage it productive service shifting consumer

2. Competes a priv each and the most resources others
the amount of money they have, on aspirations for income.

b. These choices affect supply and demand for products and services and productive resources; therefore, they affect indirectly what will be produced, how they will be produced, and who will get what part of what is produced.

1. In a private enterprise system decisions about what and how much to produce are made largely by producers who adjust production or enter new fields or production in response to changing patterns of consumer demand. Producers tend to produce those goods on which they can make the greatest profits. The profit motive not only encourages producers to produce, but it provides the incentive for the production of specific kinds of goods and services rather than others, thus shifting production in terms of consumer demands.

2. Competition among producers determines how things will be produced in a private enterprise economy, since each producer will try to arrive at the most efficient use of productive resources in order to compete with others and make profits.
the division of pencils? etc. (Review what pupils learned earlier about prices as you discuss these questions.) Now explain the meaning of market.

Review the concept of scarcity as compared to people's wants. Perhaps tell pupils that some people who study economics say that every system somehow or other arrives at certain ways of settling basic questions: What and how much shall be produced? How shall it be produced? Who shall get what is produced? And how much in total should be produced? Use questions to help them see that there may be no one group or person who makes these decisions, that many people making individual choices may affect production and distribution.
Economic systems differ as to how questions are resolved about what and how much to produce, how it shall be produced, and who shall get what goods and services.

2. Economic systems are resolutions and the are produced.

3. The money whether in est, rents factor in services w what part produced i

c. Government ta affect what, and who will

G. Economic systems differ as to how questions are resolved about what and how much to produce, how it shall be produced, and who shall get what goods and services.
3. The money incomes people receive, whether in the form of wages, interest, rents, or profits, is the main factor in determining how goods and services will be divided—who will get what part of the goods and services produced in a country.

c. Government taxation and spending policies affect what, how much shall be produced, and who will get what.

2. Economic systems differ in how these questions are resolved, including who makes decisions and the technology by which things are produced.
102. Ask: How does the economy of our community differ from that of other communities which we have studied in the past years? (Be sure to compare technology and relate to question: How should things be produced?)

103. Ask: What ways might there be of settling these basic questions other than those we found in our community? Let pupils think of possible ways. Say: Keep these ideas in mind as we study other communities this year. Let's find out if any of your ideas are carried out in other places.

ASSIGNMENT ON LOCAL COMPANY THAT PRODUCES GOODS

You are to study one local company that produces goods. It may be the company where your father works. Or maybe you know someone who works there.

Make a scrapbook about your company. Try if possible to visit your company. Remember to label things and to do neat, careful work.

Include in your scrapbook as many of the following materials as possible.

1. **Printed materials**—booklets, pamphlets, etc. from the company.
2. **Correspondence**—letters from company to you; copies of letters you set to company.
3. **Photos or drawings** of the company building.
   - Location of the company if possible marked on
Make a scrapbook about your company. Try if possible to visit your company. Remember to label things and to do neat, careful work.

Include in your scrapbook as many of the following materials as possible.

1. **Printed materials**—booklets, pamphlets, etc. from the company.
2. **Correspondence**—letters from company to you; copies of letters you set to company.
3. **Photos or drawings** of the company building.
4. **Location of the company**—if possible marked on a local map.

Investigate the economic facts about your company and include in your scrapbook reports, pictures, samples, maps, drawings, pamphlets etc. which tell about the following.

1. **Natural resources** used in this company's production.
2. **Tools and machines** used in this company's production.
3. **Labor**—people who produce the goods; types of jobs done; number of workers; any work done on an assembly line.
4. **Location**—try to find out why this company is located in this area.
5. **Advertising and sales**—collect advertising; find out other ways company tries to sell its goods.
6. **Type of company organization**—is it owned by a single person or family? Is it a partnership? Is it a corporation? Cooperative?
ASSIGNMENT ON LOCAL COMPANY THAT PRODUCES GOODS

7. Products made--include samples of goods or pictures of goods produced by this company, or include box fronts and labels, etc.

Try if possible to interview someone who works for the company. Write a report on what you learned or tape record the interview.

These scrapbooks are due on _____________. You may have help from Mother and Dad in gathering your materials, in arranging interviews and in visiting the plant.
PURCHASE OF MANHATTAN ISLAND

The Dutch set up the first colony in New York. The governor gave the Manhattan Indians a number of trinkets. (They were worth about $24 in our money.) In return the Indians gave him the right to settle on Manhattan Island.

A TRADE

Last night after school, Susan lost her best peerie shooter to Brad in a game for keeps. Susan's friend Ellen had several peerie shooters, so she said she would trade one to Susan for five of Susan's cat eyes. How Susan had a shooter again and Ellen was happy to have more marbles too.

DIFFERENT SETS OF DIRECTIONS FOR ORDERING FROM CATALOGS

Set 1
You are to buy gifts for the following people:
1. Little brother -- age 3
2. Little sister -- age 6
3. Big brother -- age 12
4. Big sister -- age 16
5. Mother and Dad
6. A twin -- who, of course, is your age.

YOU HAVE $30.00 TO SPEND

Set 2
You are to buy gifts for the following people:
1. Baby sister age 1 and half
2. Big brother -- age 15
3. Big sister -- age 11
4. Mother
5. Dad
6. A friend who is just your age.

YOU HAVE $25.00 TO SPEND.

Set 3
You are to buy gifts for the following people:
1. Baby brother -- age 1
2. Big sister -- age 12
3. Mother
4. Dad
5. Grandma
6. A cousin who is just your age.

YOU HAVE $20.00 TO SPEND.

GREETING CARD COMPANY ACTIVITIES

Lesson I

1. Discuss purpose of company (produce greeting cards: production-division of labor custom.)

2. Organize company
   a. Discuss organization chart (shows responsibility of each person and, thus, his contribution to the company.) Stress-all parts needed to accomplish the purpose of the company.
   b. Discuss function to be performed in each area.
   c. Have applications filed. (See sample)
   d. Name the company-have children give suggestions and vote.

3. Trade Mark
   a. Discuss what a trade mark is
   b. Show samples of trade marks
   c. Design a trade mark - this may be in the form of a contest. The winner will be given an award at conclusion of project.

Lesson II

1. President meets with Board of Directors (Teacher:) to review applications. (Interviews are held, if necessary.)

2. President and Board select three possible trade marks and the company votes on these.

Lesson III

1. Assign each task and go over each job in detail. (Each person should be given a job description.)
Lesson IV

1. Reports of sales forecasts
2. Production Department provides estimates of material requirements
3. Treasurer determines money needed to buy materials to start production. (This should include a nominal amount for materials readily available such as school supplies.)
   a. Treasurer makes arrangements for loan. (See sample loan application.) Teachers may act as bank.
4. Advertising Department makes posters and distributes advertising materials.

Lesson V

1. Designers should have designs ready for production: samples should be prepared for salesmen.
2. Artists should be preparing custom cards.
Lessons VI, VII, VIII

Production of cards.

Lesson IX

1. Make arrangements for selling and set up of merchandising.

Sale of greeting cards.

Lesson X, XI

2. Final day of production

Lesson IX

Production of cards.

Lessons VI, VII, VIII
There was once upon a time a Fisherman who lived with his wife in a miserable hovel close by the sea, and every day he went out fishing. And once as he was sitting with his rod, looking at the clear water, his line suddenly went down, far down below, and when he drew it up again, he brought out a large Flounder. Then the Flounder said to him, "Hark, you Fisherman, I pray you, let me live, I am no Flounder really, but an enchanted prince. What good will it do you to kill me? I should not be good to eat, put me in the water again, and let me go." "Come," said the Fisherman, "there is no need for so many words about it - a fish that can talk I should certainly let go, anyhow," with that he put him back again into the clear water, and the Flounder went to the bottom, leaving a long streak of blood behind him. Then the Fisherman got up and went home to his wife in the hovel.

"Husband," said the woman, "have you caught nothing to-day?"
"No," said the man, "I did catch a Flounder, who said he was an enchanted prince, so I let him go again." "Did you not wish for anything first?" said the woman. "No," said the man; "what should I wish for?" "Ah," said the woman, "it is surely hard to have to live always in this dirty hovel; you might have wished for a
small cottage, he will certainly give us that." "Ah," said the man, "why should I go there again?" "Why," said the woman, "you did catch him, and you let him go again; he is sure to do it. Go at once." The man still did not quite like to go, but did not like to oppose his wife either, and went to the sea.

When he got there the sea was all green and yellow, and no longer smooth; so he stood and said:

"Flounder, flounder in the sea,
Come, I pray thee, here to me;
For my wife, good Ilseabil,
Wills not as I'd have her will."

Then the flounder came swimming to him and said: "Well, what does she want then?" "Ah," said the man, "I did catch you, and my wife says I really ought to have wished for something. She does not like to live in a wretched hovel any longer; she would like to have a cottage," "Go, then" said the Flounder, "She has it already."

When the man went home, his wife was no longer in the hovel,
When he got there the sea was all green and yellow, and no longer smooth; so he stood and said:

"Flounder, flounder in the sea,
Come, I pray thee, here to me;
For my wife, good Ilsabil,
Wills not as I'd have her will."

Then the flounder came swimming to him and said: "Well, what does she want then?" "Ah," said the man, "I did catch you, and my wife says I really ought to have wished for something. She does not like to live in a wretched hovel any longer; she would like to have a cottage," "Go, then" said the Flounder, "She has it already."

When the man went home, his wife was no longer in the hovel, but instead of it there stood a small cottage, and she was sitting on a bench before the door. Then she took him by the hand and said to him "Just come inside. Look, now isn't this a great deal better?" So they went in, and there was a small porch, and a pretty little parlour and a bedroom, and a kitchen and pantry, with the best of furniture, and fitted up with the most beautiful things made of tin and brass, whatsoever was wanted. And behind the cottage there was a small yard, with hens and ducks, and a little garden with flowers and
fruit. "Look," said the wife, "is not that nice"! "Yes," said the husband, "and so we must always think it--now we will live quite contented." "We will think about that", said the wife. With that they ate something and went to bed.

Everything went well for a week or a fortnight, and then the woman said,"Hark you, husband, this cottage is far too small for us, and the garden and the yard are little; the Flounder might just as well have given us a larger house. I should like to live in a great stone castle: go to the Flounder, and tell him to give us a castle." "Ah, wife," said the man, "the cottage is quite good enough; why should we live in a castle?" "What!" said the woman: "just go there, the Flounder can always do that." "No, wife," said the man, "the Flounder has just given us the cottage, I do not like to go back so soon, it might make him angry." "Go," said the woman, "he can do it quite easily, and will be glad to do it; just you go to him,"
they ate something and went to bed.

Everything went well for a week or a fortnight, and then the woman said, "Hark you, husband, this cottage is far too small for us, and the garden and the yard are little; the Flounder might just as well have given us a larger house. I should like to live in a great stone castle: go to the Flounder, and tell him to give us a castle." "Ah, wife," said the man, "the cottage is quite good enough; why should we live in a castle?" "What!" said the woman: "just go there, the Flounder can always do that." "No, wife," said the man, "the Flounder has just given us the cottage, I do not like to go back so soon, it might make him angry." "Go," said the woman, "he can do it quite easily, and will be glad to do it; just you go to him."

The man's heart grew heavy, and he would not go. He said to himself, "It is not right," and yet he went. And when he came to the sea the water was quite purple and dark-blue, and grey and thick, and no longer so green and yellow, but it was still quiet. And he stood there and said,

"Flounder, flounder in the sea. Come, I pray thee, here to me; for my wife, good Ilsabil, Wills not as I'd have her will."
"Well, what does she want, then?" said the flounder. "Alas," said the man, half scared, "she wants to live in a great stone castle."

"Go to it, then, she is standing before the door," said the Flounder.

Then the man went away, intending to go home, but when he got there, he found a great stone castle. "Is this not nice," said the wife. "Yes," said the husband, "and so we must always think it -- now we will live quite contented." "We will think about that." said the wife. With that they ate something and went to bed. But the wife was not satisfied, and greediness let her have no sleep, for she was continually thinking what there was left for her to have.

The man slept well and soundly, for he had run about
a great deal during the day; but the woman could not fall asleep at all, and flung herself from one side to the other the whole night through, thinking always what more was left for her to be, but unable to call to mind anything else. At length the sun began to rise, and when the woman saw the red of dawn, she sat up in bed and looked at it. And when, through the window, she saw the sun thus rising, she said, "Cannot I too, order the sun and moon to rise?" "Husband," she said, poking him in the ribs with her elbows, "wake up!" Go to the Flounder, for I wish to be even as God is", The man was still half asleep, but he was so horrified that he fell out of bed. He thought he must have heard amiss, and rubbed his eyes, and said,
"Alas, wife," said the man, falling on his knees before her, "the
Flounder cannot do that; he can make an emperor and a pope; I beseech
you, go on as you are, and be Pope," Then she fell into a rage, and
her hair flew wildly about her head, and she cried, "I will not endur
this, I'll not bear it any longer; will you go this instant?" Then
he put on his trousers and ran away like a madman. But outside a gre
storm was raging, and blowing so hard that he could scarcely keep
his feet; houses and trees toppled over, the mountains trembled, rock
rolled into the sea, the sky was pitch black, and it thundered and li
lighted, and the sea came in with black waves as high as
church-towers and mountains, and all with crests of white foam at the
top. Then he cried, but he could not hear his own words.

"Flounder, flounder in the sea,
Come I pray thee, here to me;
For my wife, good Ilsabil,
Wills not as I'd have her will."

"Well, what does she want, then?" said the Flounder. "Alas;
said he, "she wants to be like unto God." "Go to her, and
you will find her back again in the dirty hovel." And there they are
still living to this day.
Mr. Green's Paycheck

Use a flannel board as a means of visualizing and vivifying the elements involved and an informal story format to attract interest and hold attention. In preparation for this activity, the children could be asked to draw, cut out magazines, and mount illustrations. The first picture placed on the flannel board would be that of a man identified as Mr. Green. On Friday afternoon after work, Mr. Green receives his weekly salary check for $150. This would be the second item to appear on the flannel board. On Saturday morning, Mr. Green goes to his neighborhood bank (a bank building is the third picture) to cash his check. He receives 30 five-dollar bills (play money which the teacher has had mimeographed and has had the children cut into separate bills and which has been lined up on the flannel board as the fourth stage in the sequence.) The Greens have borrowed money from the bank to buy a house (the fifth illustration is of a home). Mr. Green takes $30 of the money to make his mortgage payment at the end of the month. At this point, a member of the class could be asked by the teacher to come up to the flannel board and to remove the picture of the house and six of the five-dollar bills. This is money that cannot be spent for other purposes. The Greens have also borrowed money from the bank to buy a car (an automobile is the sixth cut-out). Mr. Green takes $20
Mr. Green decides to deposit $15 in the family savings account (an illustration of a savings pass book) and $5 in the Christmas Club (a picture of Santa Clause) to be used for gifts next December. Again a third and fourth child could walk to the front of the room and take the savings pass book and three bills and the Santa Claus picture and one bill from the flannel board. When Mr. Green gets home from the bank, he gives Mrs. Green (a cut-out of a mother) $25 for groceries (a photograph of a supermarket) and $10 to pay for the Electricity bill. (drawing of an electric lightbulb.) Two more children pull off the grocery and electricity mountings and five and two bills respectively. After Mrs. Green returns from shopping at the supermarket in the early afternoon, she and Mr. Green ask their children (a picture of a boy and girl is pressed upon the flannel board) to decide whether they would like to go to a restaurant for hamburgers, french fries and milkshakes or eat
Mr. Green decides to deposit $15 in the family savings account (an illustration of a savings pass book) and $5 in the Christmas Club (a picture of Santa Clause) to be used for gifts next December. Again a third and fourth child could walk to the front of the room and take the savings pass book and three bills and the Santa Claus picture and one bill from the flannel board. When Mr. Green gets home from the bank, he gives Mrs. Green (a cut-out of a mother) $25 for groceries (a photograph of a supermarket) and $10 to pay for the Electricity bill. (drawing of an electric light bulb.) Two more children pull off the grocery and electricity mountings and five and two bills respectively. After Mrs. Green returns from shopping at the supermarket in the early afternoon, she and Mr. Green ask their children (a picture of a boy and girl is pressed upon the flannel board) to decide whether they would like to go to a restaurant for hamburgers, french fries and milkshakes or eat left-overs at home and attend a drive-in movie. The teacher could pause at this stage and hold up cut-outs of eating places and an outdoor theater and ask the children which choice they would make if they were the Green children. The class could be told that either of the treats, the restaurant meal or the price of admission to the theater and bags of popcorn, would cost $5. Assuming that the class elects the show, a picture of an outdoor theater could be dis-
played just long enough for another pupil to whisk it away with an accompanying five-dollar bill. On Sunday, the Greens attend church (a drawing of a church is placed on the flannel board). They make their usual $5 contribution for church and Sunday School. And, the church cut-out and a single bill are detached simultaneously.

Now the class could be asked how much money the Green family has left out of its weekly pay check. The children would count the remaining bills and arrive at a figure of $35. The teacher would then bring out a string long enough to reach across the entire width of the classroom. The string could be tacked on each side of the room so it would be just above the heads of the children. On this string, pupils would fasten a host of illustrations depicting other items for which the Greens might spend the remaining $35. They might make a down payment on a portable television set for their family room, or a piano so the children could begin taking lessons, or a vacation camping trailer, etc. They could buy a small record
And, the church cut-out and a single bill are detached simultaneously.

Now the class could be asked how much money the Green family has left out of its weekly pay check. The children would count the remaining bills and arrive at a figure of $35. The teacher would then bring out a string long enough to reach across the entire width of the classroom. The string could be tacked on each side of the room so it would be just above the heads of the children. On this string, pupils would fasten a host of illustrations depicting other items for which the Greens might spend the remaining $35. They might make a down payment on a portable television set for their family room, or a piano so the children could begin taking lessons, or a vacation camping trailer, etc. They could buy a small record player for the children, or a complete table tennis set, or new outfits for the boy and girl, etc.

Through this approach, the class should discover easily the idea of unlimited wants and limited resources. The Green family will always have many things for which it can spend its income. But it will also have a budget within which it must operate.

Students Activity #2

Producers and Consumers

[Diagram of various activities related to producers and consumers]
Do you know what a consumer is? You are a consumer. Everyone is a consumer. A consumer is a person who uses goods or services. People eat food. People wear clothing. People go to doctors if they are sick. So everyone is a consumer.

When you eat something, you are using it up. When you wear something, you are using it up. You are consuming goods. We consume some goods quickly, such as when we swallow food. We consume some goods slowly, such as when we drive a car or live in a house.

When you go to a doctor to find out why you are sick, you are consuming a service. When you are in the classroom, your teacher helps you to learn. You are using her services. These services are used up at the same time they are produced. Services cannot be stored.

Of course, someone has to produce the goods and services you consume. Someone makes you eat. Someone makes you wear something. Someone helps you to know more. Do you remember who makes useful things or helps you to learn? He is called a producer.

A producer who makes goods is a producer of goods. A producer who makes services is a producer of services. A man who makes a book you are using is a producer of services.
PRODUCERS AND CONSUMERS

What is a consumer? You are a consumer. A consumer uses goods or services. Someone grows the food you eat. Someone makes the clothes you wear. Someone helps you when you are sick. Someone helps you to know more.

Do you remember what we call a person who makes useful things or who does useful work for others? He is called a producer.

A producer who makes useful things is a producer of goods. A producer who does useful work for others without producing a good is a producer of services.

A doctor who helps people get well does useful work for others, but he does not produce the medicine he gives people. The doctor is a producer of services. A teacher who helps you to learn is doing useful work, but she does not produce the book you are using. She is a producer of services.

One has to produce the goods and services you consume. Someone grows the food you eat. Someone makes the clothes you wear. Someone helps you when you are sick. Someone helps you to know more.
Division of labor makes people, cities, and nations need each other. For this reason, people, cities, and nations must trade with each other. Transportation is needed for trading. The faster and cheaper the transportation, the better the people can divide the labor.

Money is also important to use money that can be used for other goods and services. Transportation and money make specialization and trade easier.

1. What idea did the barber and the carpenter have?

2. Which of the men made the best trade?

3. Who made the worst trade?

4. Why is barter of goods for other goods so difficult?

5. Why is barter of goods for money easier?
People, cities, and nations need transportation. Transportation is needed to move people, goods, and ideas. Cheaper transportation makes it easier to move things and ideas.

Money is also important for trading because it is easier to use money than to trade goods and services for other goods and services.

Transportation and money are keys to better division of labor.

A Fable

Peter and
The Fender Bender Machin
Once upon a time on the island of the sea, . . .
lived a panda named Peter who was very, very sad.
One afternoon the mailman delivered a package to Peter,
which came from his Uncle George.
"I wonder what's in it," said Peter as he read the letter from Uncle George.

The letter read as follows:

"I have sent you a marvelous wondrous machine that bends fenders. All you have to do is put in some straight pieces of steel and this marvelous machine will make fenders by bending the steel. The metal get bent into fenders so nice that people will love them and pay a very high price.

Now you should be happy and have lots of luck,

Dear Peter,
I've sent you a marvelous wondrous machine that bends fenders for.
by bending the steel. The metal gets bent into fenders so nice that people will love them and pay a very high price.

Now you should be happy and have lots of luck, since you are the only panda who owns such a marvelous machine."

Dear Peter,
I've sent you a marvelous wondrous machine that bends fenders pink, purple and green.
Peter tore off the paper which wrapped the machine. He began to sing a song:

"I'll be rich, I'll be rich -- the wealthiest panda you have ever seen.
This machine that bends fenders, I'd be willing to bet,
Will get me more money than other folks get.
Down with the bad times! I'm up on my luck!
There it is, this wondrous machine--the most marvelous tool that you've ever seen.
Buttons and levers to pull and to punch, are placed on a thing all sticking out in a bunch.
I'll be rich - I'll be rich - you just wait and see!"
All of a sudden, he thought to himself "Which button do I push to make this thing go?! I can't run this machine, because I just don't know! How can I bend fenders?
Then what would I do with the fenders I bent?
I'll be in a spot, the same as my cousin Jim, who got a machine that made sixteen tires at once!"
this thing go?! I can’t run this machine, because I just don’t know! How can I bend fenders?

Then what would I do with the fenders I bent?

I’ll be in a spot, the same as my cousin Jim, who got a machine that made sixteen tires at once!"
"Jim thought he was smart, but he really wasn't because no matter how many tires he made, there was no one to use them. Not one single man in Hub-Bub could use them. For you see, here on our island there aren't any cars."
could use them. For you see, here on our island there aren't any cars."
"And then there is Mr... who lives down the road. He has a machine that makes engines from souls."
"But who needs an engine with nothing to drive? Who needs a bent fender?", said Peter. "Just having me, the fender bender in Hub-Bub, hasn't changed anything. I still have no luck."

Peter thought, and he thought and he thought.

"There's nothing to do with this thing that I've got. Willy and Jimmy can't use their's either. We'll never escape from our down and out luck. Oh! Oh! What can we do?!"
Then Peter got the answer, "If we get together, we could make beautiful cars. I could make the fenders and Jim could make the tires and Willy could make the engines. We'd make the most beautiful cars that you have ever seen!"
Then Peter got the answer, "If we get together, we could make beautiful cars. I could make the fenders and Jim could make the tires and Willy could make the engines. We'd make the most beautiful cars that you have ever seen!

But getting together is going to be a problem. I can't ever work with Willy because he's a ninny. I can't ever work with Jim because he's a jerk.

Well, my fender machine is of no use to me unless Willy and Jimmy will help me, you see."
So Peter went to see Willy and Jimmy, the two men who needed a fellow with fenders to bend.

"If we get together, the three of us guys could make lots of cars in just any old size."

"What do you say? Do you think it might work?"

"It might just at that", said Jim. "First I'll make the tires with my tire machine. Then you bend the fenders, pink, purple and green. Willy can make all the engines we need. We'll make the most marvelous cars that you've ever seen."
of cars in just any old size."

"What do you say? Do you think it might work?"

"It might just at that", said Jim. "First I'll make the
tires with my tire machine. Then you bend the fenders, pink,
purple and green. Willy can make all the engines we need.
We'll make the most marvelous cars that you've ever seen."
"You can't do it that way", said Willy.

"Make tires first, it just isn't right. First we'll make engines and then we'll make tires and then we'll bend fenders for our wonderful cars."

"No! No!" piped up Peter, face getting red. "Not engines at first, the fenders instead."

"You're stupid!" said Jim. "How can you have fenders without any tires."
then we'll bend fenders for our wonderful cars."

"No! No!" piped up Peter, face getting red. "Not engines at first, the fenders instead."

"You're stupid!" said Jim. "How can you have fenders without any tires."

"You're such a big idiot. You can't make your tires go round and round without a big engine."
"How will we ever start making our cars?" asked Peter as he looked up and gazed at the stars. "We don't have the stuff to fix our machines. No rubber for tires, no steel for engines and fenders."

"Then I feel, without any rubber and steel, we'll just have to throw our machines out the door. We'll never get rich, and we'll always be poor."

"How will we ever start making our cars?" asked Peter as he looked up and gazed at the stars. "We don't have the stuff to fix our machines. No rubber for tires, no steel for engines and fenders."

"Then I feel, without any rubber and steel, we'll just have to throw our machines out the door. We'll never get rich, and we'll always be poor."
and gazed at the stars. "We don't have the stuff to fix our machines. No rubber for tires, no steel for engines and fenders."

"Then I feel, without any rubber and steel, we'll just have to throw our machines out the door. We'll never get rich, and we'll always be poor."
"Besides, who can run the machines that we've got? I can't run mine. I don't even know how to make the thing start or how to bend fenders or put in the parts," said Peter. "I can't run mine either," said Jim. "Neither can I," said Willy. "Maybe the workers who live on the island could run our machines. But workers will want to get paid some wages, and I haven't any wages to give them." "Can't think of a thing; I guess we're just stuck," said Peter, so dejected and down on his luck.
"Maybe the workers who live on the island could run our machines. But workers will want to get paid some wages, and I haven't any wages to give them."

"Can't think of a thing; I guess we're just stuck"
said Peter, so dejected and down on his luck.
So my dear children, our fable must end
of Peter, his machine and no fenders to bend.

Fables have morals from which we can learn.
So, when it's your turn, tell us what you have
learned about Peter and his fender bender machine.

The End
