overglazed. Pottery ware having too thick a glazed layer, particularly on the bottom; this thick glaze is likely to be crazed. Causes of this fault are incorrect dipping, the use of stop glaze of too high a density, or biscuit ware that is too porous, that is, underfired. Dodd.

overglaze decoration. A ceramic or metallic decora
tion applied and fired on the previously glazed surface of ceramic ware. ACG, 1963.

overgrinding. Commutation of ore to a smaller particle size than is required for effective liberation of values before con
tinuing treatment. Opposite of under
grinding. Pryor, 3.

overhand cut-and-fill. In this method, two levels are driven first connected, the lower and upper one by a raise, from the bottom of which mining is begun. The work proceeds by filling the mining out
door room, but in the filling, chutes are left through which the broken ore falls. In inclined seams the chutes, also inclined, have to be timbered. The lower-level drive is protected either by timbering or vault
ing, or by a fairly strong pillar of vein fillings. Stoping in the different cuts always proceeds upwards, but as a whole it pro
ceed between two levels, that is, in a horizontal direction. Overhand cut-and-fill, especially in mining irregular ore bodies of greater size, is also called back stoping. Slevy, 1, p. 405-406.

overhand stoping. a. One in which the ore above the point of entry to the stope is attacked, so that severed ore tends to gravitate toward discharge chutes and stope is self-draining. Pryor, 3. b. An over
dhand stope is made by working upward from a level into the ore above. McKinstry, p. 635.

overhand stoping, a. In this method, which is also widely used in highly inclined deposits, the ore is blasted from a series of ascend
ing parallel cuts. Both horizontal and vertical holes may be employed. Horizontal breast holes are usually more efficient and safer than vertical upper holes, although the latter are still used in narrow stopes in steeply inclined ore bodies. McAdam II, p. 137. b. The working of a block of ore from a lower level to a level above. Still timbering or the use of pillars charac
terize the method. Filling is used in many instances. Modifications are known as: back
dilling method; back stoping; block system; breast stoping; combined side and longwall stoping; cross method of work
ing; cross stoping; Delprat method; dry
dwell method; filling system; filling-up method; flat-back stoping; horizontal slic
ing; intermittent stoping; open-stope and filling; open-stope method; open-stope, timbering with pickiges; and filling overhand stoping. To avoid excessive rock falls, room and pillar with waste filling; sawtooth back stoping; side stop
ing; slicing-and-filling system; stoping-
and-filling; stoking in horizontal layers; tran
everse with filling. Fay. Compare under
derhand stoping.

overhand stoping and milling system. See combined overhand and underhand stoping. Fay.

overhand stoping in inclined floors. See rill stoping, b. Fay.

overhand stoping on waste. See overhand stoping, b. Fay.

overhand stoping with shrinkage and delayed filling. See shrinkage stoping.

overhand stoping with overburden and no fill
ing. See shrinkage stoping.

overhand stoping with shrinkage and simul
taneous caving. See combined shrinkage stoping and block caving. Fay.

overhaul. a. Describes a condition when a journey travels towards the haulage en
gine at a faster rate than the rope which then becomes slack and liable to foul the drum. Also applied to inspection, cleaning, and repairing of machines or plant. Also called overhaul. Nelson. b. The transporta
tion of excavated material beyond certain specified limits. Slevy, 1, c. In many highway contracts, a movement of dirt far enough so that payment, in addition to excavation pay, is made for its haulage.

Nichols.

overhauling (slab milling, scalping). Cutting surface layers from castings or slabs to reduce scale and surface defects. ASM Gloss.

overhead bare-wire system. A mine signaling system in which galvanized-iron signal wires are supported by insulators suitably attached to a strong overhead cable, usually attached to a supporting structure and properties can be restored by treatment, and in this respect it differs from benign. C.T.D.

overheating. Heating a metal or alloy to such a high temperature that its properties are impaired. When this original properties cannot be restored by further heat treat
ing, by mechanical working, or by a combi
cination of working and heat treating, the overheating is known as burning. ASM Gloss.

overhead shoveling. A tractor loader which digs at one end, swings the bucket overhead, and discharges at the other end. Nichols.

overhead traveling crane. A crane which traverses the whole width of a workshop between the rails on which it runs. Hammond, 1964.

overhead trolley conveyor. See trolley con

overheat. Said of metal which has been heated in preparation for hot-working, or during a heat-treating operation, to a temperature at which rapid grain growth occurs and large grains are produced. The structure and properties can be restored by treatment, and in this respect it differs from benign. C.T.D.

overhead position welding. Welding that is performed from the underside. ASM Gloss.

overhead-roping monorail. A system in which the cars are carried by bogies running on a taut wire rope instead of steel cables or flat-bottomed rails. Sinclair, p. 638.

overhead ropeway. See aerial ropeway, b. Fay.

overhead shovel. A tractor loader which digs at one end, swings the bucket overhead, and discharges at the other end. Hammond, 1964.

overlap auxiliary ventilation. To combine the forcing and exhausting systems, it is not necessary to provide two ducts, one forcing and one exhausting, throughout the length of the heading. An arrangement that serves the same purpose is the overlap system. In this system a main exhaust
ing duct is used within a convenient dis
tance of the face, often about 100 feet. Some of the intake air in the heading, before reaching the end of the forcing duct, is then blown on to the face. The advantages of both systems are thus obtained. Precautions must be taken against redundant ventilation by the forcing unit, to prevent concentration of dust, and in collieries, fire damp, at the face. The two ducts must overlap by a

overlap auxiliary ventilation. To combine the forcing and exhausting systems, it is not necessary to provide two ducts, one forcing and one exhausting, throughout the length of the heading. An arrangement that serves the same purpose is the overlap system. In this system a main exhaust
ing duct is used within a convenient dis
tance of the face, often about 100 feet. Some of the intake air in the heading, before reaching the end of the forcing duct, is then blown on to the face. The advantages of both systems are thus obtained. Precautions must be taken against redundant ventilation by the forcing unit, to prevent concentration of dust, and in collieries, fire damp, at the face. The two ducts must overlap by a
overlap auxiliary ventilation

minimum distance which, in practice, is usually taken as 30 feet. Roberts, 1, pp. 220-221. See also two-fan auxiliary ventilation limit.

overlap fault. A thrust fault in which the shifted strata double back over themselves. Also called layover fault.

overlap seal. A natural trap for the accumulation of oil or gas partially created by an angular unconformity in which the overlapping sediments are relatively impervious to the passage of these hydrocarbons. East Texas is a good example. A.G.I.

overlay. Scot. The material above the rock in a quarry. See overlay burden, b. Fay.

overlay tracering. A tracing on which the workings in a seam are shown. A series of such tracings allows the workings in several seams to be seen in their correct horizontal relationship. Also called layover tracing (undesirable usage). B. S. 3618, 1963, sec. 1.

overfound. a. In general, a load or weight in excess of the designated capacity. The term may be applied to mechanical and electrical installations, to loads on bridges and structures, and to excess loads on haulage ropes and engines. Nelson, b. To apply an excessive pressure to a drill string and bit. Long. c. Synonym for overweight. Enam. Dict.

overload. a. In general, a load or weight in excess of the designated capacity. The term may be applied to mechanical and electrical installations, to loads on bridges and structures, and to excess loads on haulage ropes and engines. Nelson, b. To apply an excessive pressure to a drill string and bit. Long. c. Synonym for overweight. Enam. Dict.

overload trip. A protective device on a circuit breaker or motor starter which cuts off the current if the current exceeds a set value. Nelson.

overlying beds. The beds situated above a specified seam. MUG.

over Panda burden. See the side, such as a dredge. Standard, 1964.

over Panda wheel. A vertical water wheel, the circumference of which is covered with buckets or cups that are turned by water that shoots over the top, filling the buckets on the farther side and acting chiefly by its weight. Called overside.

overside. Discharging over the side, such as a dredge. Standard, 1964.

oversize. a. To reduce a mineral pulp containing the lifting-dog assembly on a wire-line core barrel. Long. b. A synonym applicable to those size of drill rods, the dimensions of which exceed the DCDMA standard sizes designated as the W group. Long. e. Incorrectly applied to the size of core barrels and accessory parts, properly called large-diameter design. Long. f. A piece of equipment larger than specified or accepted standard size. Long.

oversize control screen; guard screen; check screen. A screen used to prevent the entry into a machine of coarse particles which might interfere with its operation. B.S. 3522, 1962.

oversize core. See the side, such as a dredge. B. S. 3618, 1963, sec. 1.

oversize holes. A borehole the diameter of which is greater than that reserved in the standard-diameter core. Long.

oversize goffers. A defect in the metal caused by a thin easily detached layer of metal which may be applied to mechanical and electrical installations, to loads on bridges and structures, and to excess loads on haulage ropes and engines. Nelson, b. To apply an excessive pressure to a drill string and bit. Long. c. Synonym for overweight. Enam. Dict.

oversize rod. Synonym for drill collar; guide rod. Long.

device. See hoist overspeed device.

overspray. The slip from the spray gun not deposited on the work. Also, spray application of a light coat of slip to an unfired porcelain enamel. ASTM C286-65. b. Process of spraying a second coat of an enamel directly over the wet or dry base. Enam. Dict.

oversized area, in strata control, a term used to describe an area where the force is concentrated on pillars. This type area is said to be overstressed or supershot. This supershooting is limited by the strength of the seam or pillar. Compare distressed area. Mason, u. 1, p. 143.

overstressing. In fatigue testing, cycling at a stress level higher than that used at the end of the test. ASTM Gloss.

overstrom table. Similar to a Wilfley table but of diamond shape (rhomboid), thus eliminating the waste corners. Liddell 2, p. 388.

over-the-road hauling. Hauling over public highways employing a haul unit commonly termed a truck. Various restrictions, such as weight, width of vehicle, safety features, guard against spillage, etc. must be considered in the design of a unit. Generally, over-the-road haul units are termed dump trucks. Compare off-the-road haul unit.

over-the-track car unloader. See car unload- er. ASA MM 415-1953.

oversize control screen; guard screen; check screen. A screen used to prevent the entry into a machine of coarse particles which might interfere with its operation. B.S. 3522, 1962.

oversize core. See the side, such as a dredge. B. S. 3618, 1963, sec. 1.

oversize holes. A borehole the diameter of which is greater than that reserved in the standard-diameter core. Long.

oversize goffers. A defect in the metal caused by a thin easily detached layer of metal which may be applied to mechanical and electrical installations, to loads on bridges and structures, and to excess loads on haulage ropes and engines. Nelson, b. To apply an excessive pressure to a drill string and bit. Long. c. Synonym for overweight. Enam. Dict.

oversize rod. Synonym for drill collar; guide rod. Long.

oversized device. hoist. See hoist overspeed device.

oversized area, in strata control, a term used to describe an area where the force is concentrated on pillars. This type area is said to be overstressed or supershot. This supershooting is limited by the strength of the seam or pillar. Compare distressed area. Mason, u. 1, p. 143.

overstressing. In fatigue testing, cycling at a stress level higher than that used at the end of the test. ASTM Gloss.

overstrom table. Similar to a Wilfley table but of diamond shape (rhomboid), thus eliminating the waste corners. Liddell 2, p. 388.

over-the-road hauling. Hauling over public highways employing a haul unit commonly termed a truck. Various restrictions, such as weight, width of vehicle, safety features, guard against spillage, etc. must be considered in the design of a unit. Generally, over-the-road haul units are termed dump trucks. Compare off-the-road haul unit.

over-the-track car unloader. See car unload- er. ASA MM 415-1953.

oversize control screen; guard screen; check screen. A screen used to prevent the entry into a machine of coarse particles which might interfere with its operation. B.S. 3522, 1962.

oversize core. See the side, such as a dredge. B. S. 3618, 1963, sec. 1.

oversize holes. A borehole the diameter of which is greater than that reserved in the standard-diameter core. Long.

oversize goffers. A defect in the metal caused by a thin easily detached layer of metal which may be applied to mechanical and electrical installations, to loads on bridges and structures, and to excess loads on haulage ropes and engines. Nelson, b. To apply an excessive pressure to a drill string and bit. Long. c. Synonym for overweight. Enam. Dict.

oversize rod. Synonym for drill collar; guide rod. Long.

oversized device. hoist. See hoist overspeed device.

overspraying. The slip from the spray gun not deposited on the work. Also, spray application of a light coat of slip to an unfired porcelain enamel. ASTM C286-65. b. Process of spraying a second coat of an enamel directly over the wet or dry base. Enam. Dict.

overthrust

miles. A.G.I. b. A thrust fault in which the hanging wall was the active element; contrasted with underthrust, but it is usually assumed to tell which wall was actually moved. A.G.I. c. The process of thrusting the hanging wall (relatively) over the footwall. Overthrust fault. The reverse fault with low dip, large hade. Fay.

overthrust block. The block above the overthrust plane. Synonym for thrust plane. Schieferdecker.

overthrust fault. A reverse fault with low dip, large hade. Fay.

overthrust fold. A recumbent fold of which the reversed middle limb has been completely sheared out as a result of the great horizontal translation. Schieferdecker.

overthrust plane. Synonym for thrust plane. Schieferdecker.

overthrust sheet of overthrust block. The block, above a low-angle fault plane, which has been displaced a great distance. Schieferdecker.

overthrust syncline. Single large mass caught between the walls of an overthrust. Schieferdecker.

overthrust time. The period beyond the normal shift when a workman, on request by the management, performs emergency tasks which are necessary for safety of efficient operation of the oncoming shift. Nelson.

overtopping. Flow of water over the top of a dam or embankment. Nichols.

overturn system. An endless-ropc system in which the rope runs over the cabs or the cars in the center of the rails. This system is generally adopted on undulating roads, where the tendency in a heavily loaded rope would cause the rope to lift in swivelies and derail tubs. It is also generally adopted in highly inclined roads, as the lashing chain, often adopted with this method of haulage, obtains a good positive grip on the rope and is easier to detach than a clip. The rope is kept from rubbing on roof supports by holding-down pulleys: six large diameter pulleys in circular cheeks, allowing chains or clips to be accommodated in the spaces between the pulleys. Six large diameter pulleys, of the hat or mushroom shape, often stared to provide reeves for chains and clips. Similar large pulleys direct the rope around curves. Compare undertub system. Sinclair, V., pp. 351-352.

overturn. The exchange of position in fall and spring of bottom and upper waters in a lake, caused by density differences due to temperature changes. A.G.I.

overturned. Having been tilted past the vertical and hence, inverted in outcrop; said of folded strata and of the folds themselves. Fay.

overturned fold. Synonym for overturned. A.G.I.

overturned limb. That limb of an overturn (overturned fold) that is overturned, that is, has a dip greater than 90°. Billings, 1854, p. 41.

overturning slip. A type slip commonly used at metal mines, but not often at coal mines because of increased breakdown. This slip consists of a rectangular receptacle for the material and a suspending frame of bail to an upper cuspiece of which is attached a suspension gear connecting the rope to the skip. Three guide shoes are generally provided at each side of the bail to keep it vertical. The skip body turns about a horizonal shaft at the lower end of the bail. Two rollers on the upper part are mounted on a shaft and cause the skip to tilt past the angle of 35° at the tipping point in the headgear, where rollers run on to the curbed guides. To prevent shocks in the case of an overwind the skips are fitted with overwind guides which glide along rollers fitted to the headgear above the tipping point. Sinclair, V., p. 73.

overventilation. Too much air in the mine workings. Fay.

overvoltage. The difference between the actual electrode potential when appreciable electrolysis begins and the reversible electrode potential. ASM Gloss.

overvoltage relays. Relays that serve primarily the same purpose as overcurrent relays except that they are connected in the line by potential transformers which measure the voltage across the lines. When an over-voltage exists the relay operates and opens the circuit breaker. Coal Age, v. 71, No. 8, August 1966, p. 270.

overwash. That portion of the uprush that carries over the crest of a form or of a structure. H&G.

overwash drift. The material which is washed over the crest of a glacier. Fay. Obsolete. See also outwash.

overweight. a. Aust. The settling down of the upper rocks when the base rocks are eroded away. Fay. c. Effect due to weight. Fay.

overwind. a. To hoist the cage into or over the top of the headframe. Fay. b. In hoisting through a mine shaft, failure to bring cage up to the top, as a result of unloading point at surface. Fay. c. A diamond bit in which overwind diamonds are indexed into the bit face or crown. Compare crowd, c.; overload. Long.

overwind device. device. See hoist overwind device.

overwind. One of the best known overwind consists of two vertical-screwed spindles each carrying two traveling nuts and chain driven from the drum shaft so as to rotate in opposite directions. The nuts are prevented from rotating by projections engaging with a fixed plate and therefore travel vertically and are caused to move in a circular motion. The upper nut takes care of overwinding and the lower nut of overspeeding. Matson, v. 2, pp. 459-460.

overwinding. a. Term applied to a continued pull on the rope or cable wound and attached so that it stretches past the top of a drum to the load. Nichols.

overwind switch. A switch which may be used on winders, flight conveyors, to cause the power to cut off from the driving motor, or engine, and the brakes to be applied. Such a switch may be either: (1) situated in the headgear and operated by the conveyance, (2) mounted on the automatic contrivance, or (3) operated by the depth or distance indicator. B.S. 3618, 1965, sec. 7.

overwind. A classifier of the free settling type in which the heavy material is removed by a double-screw, continuous flight conveyor, working up an inclined plane. Liddell 22, p. 392.

ovulite. Synonym for oolite, used in the sense of an individual spherite. A.G.I.

Owen process. A flotation process involving the use of the pulp in cold water to which a small percentage of eucalyptus oil, about 2 ounces per ton, is added. Fay.

Owen's borehole surveying instrument. A clockwork photographic apparatus which records clinometer and compass readings on sensitized paper. It is used during borehole surveying. Ham.

Owen's jet dust counter. An instrument similar to the kienometer but differing in that the air is being sampled undergoes humidification prior to being blown through the jet. The velocity of impingement is about 200 to 300 meters per second and the jet is rectified into a circular. The prior humidification of the air causes condensation of moisture upon the dust particles, so the saturated air is blown through the jet. A laminar flow is produced and the jet is directed at a non-magnetic mirror. Excess weight of the air to the jet causes a rotation. Fay.

Owen's process. A bottlemaking process in which the blank or partition mold is filled by a simple worm drive which rotates a pointer over a dial divided into four quadrants with an observation of air velocity the speed of revolution of the pointer is measured by a stopwatch and a calibration chart is referred to which relates air speed to pointer revolutions per second. Roberts, I., p. 54.

owharte. The name offered as a substitute for wilsonite which had been used as a mineral name previously. Owharite is a creamy-gray rhyolitic igneous rock with peculiar phenocrysts and lenses of streaked glass occurring in brown glass. Possibly a rhyolitic tuff. Hess.

owl-eye agate. An eye agate with only two eyes, and those resembling the eyes of an owl. Shipley.

owner's account men. Corn. Workmen paid by the day. Fay.

owning. Filling material obtained in the mine being mined. Stones, v. 1, p. 271.

owebeetle. A light, steel-gray sulfide-monotrite of silver and lead, possessing a metallic luster. B.S. 3618, 1965, possibly. 2AgS.8PbS.5Sb2S3. Acicular crystals or fibrous masses; possibly orthonathan. formerly called silverite. From Owyhee County, Idaho. English.

ozaicals. Synonym for wehwellite. Tom.
oxalic acid; ethanedioic acid

HO\textsubscript{2}COC\textsubscript{2}H\textsubscript{2}O:\textsubscript{2}; anhydrous, orthohombic; hydrate, monoclinic tablets or prisms; molecular weight (anhydrous), 90.04; poisonous; specific gravity (anhydrous, water at 17°C), 1.653 (at 19°C, water at 4°C), 1.632; specific gravity (hydrate), 1.653 (at 19°C, water at 4°C), 1.632; melting point (anhydrous), 180.5°C with decomposition; sublimes at 157°C; soluble in water; very soluble in alcohol; slightly soluble in ether; insoluble in benzene, in chloroform, and in ligroin. Used as a bleach, in dyeing, and as a precipitating agent for rare earths. Handbook of Chemistry and Physics, 45th ed., 1964, p. C-443; Crispin; CCC 6d, 1961.

oxanmite. A yellowish-white, transparent, orthorhombic ammonium oxalate, (NH\textsubscript{4})\textsubscript{2}C\textsubscript{2}O\textsubscript{4}H\textsubscript{2}O, found in guano. Tomkeieff, 1954.

ox-blood coral. A crescent-shaped lake formed in an oxblood coral. A dark, rich, deep-red coral; a greenish-red variety of oxblood coral. A variety of aliphite hydroxide. a. The firing of a kiln in such a condition that the impurities are oxidized during the melting period. A.G.I.

oxidation. a. The firing of a kiln in such a condition that the impurities are oxidized during the melting period. A.G.I.

oxidation period. The stage in the firing of clayware during which any carbonaceous matter is burned out, that is, the temperature range 400° to 850°C. It is important that all the carbon is removed before the next stage of the firing process (the vitrification period) begins, otherwise a black core may result. Dodd.

oxidation-reduction potential. The difference of potential measured in a cell having the oxidized and reduced form of an element on one side of the half-cell couple and the other. At the hydrogen electrode the H\textsubscript{2} gas must be maintained at 1 atmosphere pressure at all times, and it is not possible to accurate point of measurement.

oxeye agate. An eye agate with the characteristic change of color. Shipley.

oxeye azalea. An azalea with two eyes, and those resembling the eyes of the azalea. Pryor, 3.

oxides. Sediments formed by the precipitation of the oxidized form of iron and manganese; ferric oxide and manganese dioxide sediments. A.G.I.

oxidation. a. The firing of a kiln in such a manner that combustion is complete and in consequence the burning gases are amply supplied with oxygen which causes metals in clay and glasses to give their oxide colors. ACSG, b. Combination with oxygen; increase in oxygen content of molecular compound; increase in valency of electropositive part of compound, or decrease in electronegative part. Pryor, 3. c. A reaction in which there is an increase in valence resulting from a loss of electrons. ACSG, d. In fuel practice, the combination of oxygen with a substance, with or without the production of flame. Frank, 1965, p. 214. 436.

oxidation of coal. The absorption of oxygen from the air by coal, particularly in the crushed state; this engenders heat which can result in fire. Ventilation, while dispersing the heat, does not arrest the oxidation which increases rapidly with a rise in temperature. Fresh air should not gain access to the coal. See also gob fire. Nelson.

oxidation period. The stage in the firing of clayware during which any carbonaceous matter is burned out, that is, the temperature range 400° to 850°C. It is important that all the carbon is removed before the next stage of the firing process (the vitrification period) begins, otherwise a black core may result. Dodd.

oxidation-reduction potential. The difference of potential measured in a cell having the oxidized and reduced form of an element on one side of the half-cell couple and the other. At the hydrogen electrode the H\textsubscript{2} gas must be maintained at 1 atmosphere pressure at all times, and it is not possible to accurate point of measurement.

oxoacetylene flame. A gas flame produced with excess oxygen. ASM Gloss. Also called oxyacetylene flame.

oxohalogen. A halogen oxide; a. A mineral salt of the acid; b. The element or oxide itself; c. A halogen compound with the acid.

oxonite. A mixture of oxygen (O\textsubscript{2}) and acetylene gas (C\textsubscript{2}H\textsubscript{2}) in such proportions as to produce the hottest flame known for practical use. Oxyacetylene welding and cutting is used in almost every metalworking industry. Crispin.

oxycarbo. A variety of aliphite hydrocarbon containing oxygen. It is light yellow in color. Pryor, 3.

oxyceramite. A mineral formed by the combination of oxygen with most other elements, particularly at elevated temperatures, but not with those of group 0 of the periodic system, the inert gases: C, N, O, F, Ne, Ar, Kr, Xe, Rb, Cs, and Fr. Tomkeieff, 1954.

oxyceramic. Special ceramics made from oxides; a. Combination with oxygen; increase in oxygen content of molecular compound; increase in valency of electropositive part of compound, or decrease in electronegative part of compound. ACSG, b. Combination with oxygen; increase in oxygen content of molecular compound; increase in valency of electropositive part of compound, or decrease in electronegative part of compound. ACSG.

oxyceramic oxide. A compound of oxygen with another element. Oxides are formed by the combination of oxygen with most other elements, particularly at elevated temperatures, but not with those of group 0 of the periodic system, the inert gases: C, N, O, F, Ne, Ar, Kr, Xe, Rb, Cs, and Fr.

oxyceramic oxide ceramics. Special ceramics made from oxides; a. Combination with oxygen; increase in oxygen content of molecular compound; increase in valency of electropositive part of compound, or decrease in electronegative part of compound. ACSG, b. Combination with oxygen; increase in oxygen content of molecular compound; increase in valency of electropositive part of compound, or decrease in electronegative part of compound. ACSG.
oxyacetylene welding

oxyacetylene welding. a. Welding with an oxyacetylene flame. ASM Glot. b. Widely used method of welding in the porcelain enameling industry. In this method two gases, oxygen and acetylene, are combined in a blowpipe and used to heat the metals to be welded to the desired temperature. Enam. Dir.

oxybasithiophic. See basithiophic.Obsolete.

oxychloride cement. A plastic cement formed by mixing finely ground caustic magnesite with a solution of magnesium chloride. A.C.I.

oxyen. A metallic, chiefly bivalent element; normally colorless; odorless; tasteless; nonflammable; diatomic gas (O2). It is the most abundant of the elements on earth, occurring uncombined in air to the extent of about 21 percent by volume and is combined in water, in most common rocks and minerals (as oxides, silicates, and carbonates), and in a great variety of organic compounds (as alcohols, acids, fats, carbohydrates, and proteins). Oxygen has three naturally occurring nonradioactive isotopes of masses 16, 17, and 18 of relative abundance 2494 to 1. It is obtained industrially from liquid air by distilling off the nitrogen; or from the air by electrolysis; or in the laboratory by decomposing by heat of various oxidizable substances, including the diaphragm, causing abruptness of inspiration. Anxiety, and apprehension may occur and sometimes loss of lateral visual fields and ringing in ears. These preliminary symptoms are followed by general convulsions and unconsciousness. H&G.

oxyen lance. A length of pipe used to convey oxygen to the point of cutting in oxygen-lance cutting. ASM Glot.

oxyen poisoning. A condition usually brought on among workers engaged in underwater work or mine rescue work and caused by breathing pure oxygen at a depth in excess of about 13 feet below the surface of the water. When diving to depths of more than 33 feet, the oxygen in the cylinders of the diving apparatus must be diluted with nitrogen to make an oxygen/nitrogen breathing mixture which will be safe to breathe at the maximum depth of the dive. Preliminary symptoms of oxygen poisoning are twitching of the muscles of the face, fingers, and leg, followed by excessive sweating and a feeling of nausea. Final symptoms are convulsions and unconsciousness. First-aid treatment is fresh warm water and drinks of hot, sweet tea. McDadam, p. 162.

oxyen process. A process for making steel in which oxygen is blown upon or through a metal surface caused by a difference in temperature. Enam. Dir.

oxyen steel. The use of oxygen instead of air to convert molten pig iron into steel. The two gases in the proportion to form different furnaces, but the fastest one utilizes the direct oxidation effects of a relatively pure (99.5 percent) oxygen. See also L.D. steel process. Nelson.

oxyen toxicity. Pure oxygen cannot be breathed indefinitely at pressures greater than atmospheric. Following a safe period which becomes shorter as diving depth increases, symptoms of oxygen toxicity occur. These include involuntary fine twitches around the eyes and mouth that later extend to include larger muscle groups including the diaphragm, causing abruptness of inspiration. Anxiety, and apprehension may occur and sometimes loss of lateral visual fields and ringing in ears. These preliminary symptoms are followed by general convulsions and unconsciousness. H&G.

oxyen deficien督办. Oxygen deficiency indicator. This indicator is used by utilities, refineries, contractors, etc., to determine whether the atmosphere is deficient as a tank, manhole, or sew, contains sufficient oxygen to support life. A rubber tube and aspirator bulb introduce air samples into a flame safety lamp which is set up outside the tank or manhole. Extinguishment of the flame indicates that the atmosphere is too oxygen-deficient to be entered. Betts, p. 588.

oxyen-free copper. Electrolytic copper free from cuprous oxide, produced without the use of red and black or metallic deoxidizers. ASM Glot.

oxyen composi. Oxygen in which the temperature is atta.
oyster shells

percent SO

pd. d. Abbreviation for per, which is also p. 61. e. Abbreviation for pico used as a prefix. CCD 6d. 1961.
pack ice. Any large area of floating ice which has been driven closely together. Hy.

packing. a. The method of giving support to the roof by the insertion of waste rock, or by the building up of a space from which the coal has been extracted. TIME. b. Any material, usually rock, packed between the roof and the sides of a mine, or over the bottom of the coal in a drift. Standards, 1964. c. A dense packing of fine particles, such as sand, in a mold or casting in order to cause uniform shrinkage, with the result that porosity will be reduced. Standards, 1964. d. A method of packing, or of packing up, the waste rock. Ham.

packed. a. Covered with, or containing, a mass of, or pieces of, a particular kind of material. Standards, 1964. b. A large square pit. Fay. c. Flooded excavation in the waste area with stones and dirt. See also sinkhole. Nelson. d. Occurs in crushing plants when the material in the chamber is so compacted as to be nearly without voids. It occurs when free downward movement is inhibited. With gyratories the term also refers to an accumulation of sticky fines on the diaphragm. South Australia, p. 101. e. The spacing or density pattern of the mineral grains in a rock. Compress fabric. A.G.I. f. A Cornish term for the final dressing of tin or copper ore in a large vat or keeve filled with water. Fay. g. Filling, as of mortar containing small stones. Fay.

packing density. The bulk density of a granular material, for example, grog or crushed quartzite, when packed under specified conditions. A common method of test, particularly the sandy sands, involves the use of an AFA rammer. See also AFA rammer. Dodd.

packing expansion. The expansion of a material in its initial state when the applied stress is removed. Standards, 1964.

packing factor. The ratio of true volume to bulk volume. Also (1.0—porosity). VV.

packing gland. An explosion-proof entrance for conductors through the wall an an explosion-proof enclosure, to provide compressed packing completely surrounding the wire or cable for not less than one-half inch measured along the length of the cable. ASA C24.85: 1956.

packing mud. A mud that will flow as a silt or clay suspension, but will not support loads on the back of pack animals. Webster 3d.

packing sand. A very fine-grained sandstone so loosely consolidated by a slight calcareous cement as to be readily cut by a spade. Standard, 1964.

pack. a. A term used in the Western United States for a path or narrow road for the passage of packtrains only. Standards, 1964.

packingtheoretical. The theory that factaced pebbles have been made by rubbing against each other. Nelson.

pack wall. a. A dry-stone wall built along the side of a roadway, or in the waste area, of a coal or mineral mine. The wall helps to support the roof and also to retain the packaging material and prevent it spreading into the roadway. Fay. b. In metal mining, a permanent roof support built of timber with or without stone filling—a cog or chuck. Nelson.

Packtolith. Of or relating to the Packtolius river, in Lydia, or its gold-bearing sands. Webster 3d.

pagoda stone. A Chinese limestone showing a large square pit. Fay. f. A space or platform near the mouth of a shaft or excavation. Payne, 3. d. A way of working a claim, the ore is in bins, stores, or stacked on the surface, it is said to be in the paddock. Fay.

paddle and anvil. Archelon. A technique for shaping vessels by compaction when they are still somewhat plastic. At times, a cord-wrapped paddle or a textile-wrapped paddle is used for this purpose. Occasionally designs are carved in paddles. The resultant surface impressions on the vessels finished with several possible types of paddles are frequently used as surface finish categories in pottery classification. AGS, 1963.

paddle loader. A belt loader equipped with chain-driven paddles to move loose material to the belt. Nichol.

paddle mixer. A form of worm conveyor having two continuous spiral which form paddles; the shafts are compressing and the spirals opposite hand. B.S. 3552, 1962. See also paddle-type mixing conveyor. A.S.A. MH4.1-1958.

paddle wheel. a. A type of conveyor consisting of one or two inclined parallel paddle conveyor screws in a conveyor trough having a receiving tank and an overflow weir at the lower end and a discharge opening at the upper end. A.S.A. MH4.1-1958.

paddle-wheel agitator. A simple stirring apparatus by which the solids are kept in suspension by paddles. It is difficult to start if the sand packs around the blades and expensive, both in operating and in repair costs. Liddell 2d., p. 392.

paddle-wheel fan. A centrifugal fan with radial blades. Strook, 10.

paddling. The rough shaping of a piece of glass in a furnace by means of paddles or tools preparatory to the pressing operation for making optical glass blanks. ASTM C162.56.

paddock. a. A section of a large area of alluvial, being worked by hydraulic mining. Nelson. b. A small dump of ore held by tributors. Nelson. c. Flooded excavation in which an alluvial deposit floats, and which it digs for itself as it works along the deposit. Also called pond. Pryor, 3. d. Aust. An alluvial gold deposit. The Australians being keen horsemen, took to using the word in mining. Thus when ore is in bins, an alluvial deposit, on the surface, it is said to be in the paddock. Fay. e. A way of working a claim, the whole mass being taken out in the form of a large square pit. Pay. F. A space or platform near the mouth of a shaft or excavation for temporary storage of ore or wash dirt. Webster 3d. g. Aust. An excavation for wash dirt in shallow alluvium. Webster 3d. h. Aust. To store ore in a paddock. Webster 3d.

paddy. a. York. A portable battery-operated lamp attached to the front or rear of a pick-riding train. B.S. 3618, 1965, Sec. 7.

paint. A mixture of pigment with vehicle, intended to be spread in thin coats for decoration or protection, or both. Bureau of Reclamation. Staff. A. Term used in the Western United States for an earthly, pul- verulent variety of cinnabar. USGS Bull. 592-C. 1938.

Painted Desert beds. A series of orange-colored clayey sandstones followed by irregularly bedded, brightly colored variegated sandstones belonging to the Triassic system in Arizona. This lower group is followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

painter. Hand. One who paints designs on pottery or porcelain ware, usually by hand. Painted Desert beds. A series of orange-colored clayey sandstones followed by irregularly bedded, brightly colored variegated sandstones belonging to the Triassic system in Arizona. This lower group is followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

paint gold. A very thin coating of gold on a surface. A term used in the Western United States for an earthly, pul- verulent variety of cinnabar. USGS Western United States for an earthly, pul- verulent variety of cinnabar.

painting; sizing. The painting of the mine walls by means of a slurry of bentonite and water, followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

pair. A party of men working together as a unit.

pair production. The transformation of a mineral into a pair of new minerals.

paired terraces. Terraces that face each other across a stream at the same elevation. Last. pair of gears. N. of Eng. See gears. Fay.

paint gold. A very thin coating of gold on a surface. A term used in the Western United States for an earthly, pul- verulent variety of cinnabar. USGS Western United States for an earthly, pul- verulent variety of cinnabar.

painting; sizing. The painting of the mine walls by means of a slurry of bentonite and water, followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

paired terraces. Terraces that face each other across a stream at the same elevation. Last. pair of gears. N. of Eng. See gears. Fay.

paint thinner. See turpentine substitutes. Fay.

paint poll. A type of mud pot containing varie- gated, highly colored boiling mud, usually of cream, pink, or reddish tones. A.G.I.

paint thinner. See turpentine substitutes. Fay.

painter. Hand. One who paints designs on pottery or porcelain ware, usually by hand. Painted Desert beds. A series of orange-colored clayey sandstones followed by irregularly bedded, brightly colored variegated sandstones belonging to the Triassic system in Arizona. This lower group is followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

painting; sizing. The painting of the mine walls by means of a slurry of bentonite and water, followed by the Upper Painted Desert beds, probably of Jurassic age. C.T.D.

pair a. A mixture of pigment with vehicle, intended to be spread in thin coats for decoration or protection, or both. Bureau of Reclamation. Staff. A. Term used in the Western United States for an earthly, pul- verulent variety of cinnabar. USGS Bull. 592-C. 1938.

palaeophyre. Proposed by Gumbel for pic- rites which were considered by him to be similar to the rocks from the Cretaceous formation, originally named picrite by Tschermak. Gumbel called his specimens palaeopircites because they occurred in Paleocene strata. They are chiefly olivine and augite. More or less brown hornblende and biotite also occur. Fay.

palagonite. A yellow or orange isotropic mineraloid formed by hydration and other alteration (decarbonation, oxidation) of sideromelane (basaltic glass), and constituting a characteristic part of palagonite tufts. Also found as amygdale fillings in some basaltic lavas, and as an alteration of the glass skins of the pillows in pillow basalts. Two types, gelpalagonite and fluidalpalagonite, have been recognized. A.G.I.

palaeolithic. The usage of all these terms is confusing. Also, the group comprising the Paleozoic era is used to be incorrect. Also, the group comprising the Paleozoic era is used to be incorrect.

palaeolithologic map. A map showing litho- logic variations at some buried horizon or within some restricted zone. A.G.I. Supp.

palaeontological fact. A fact in the paleontological aspect of a particular sedimentary deposit, for example, nummulitic facies, crinoid facies, etc. Schiefertacker, 1939.

palaeocene epoch and series. The earliest epoch of the Tertiary period and the rocks formed during that time. The Palaeocene epoch is succeeded by the Eocene epoch. Most American geologists have until quite recently (1939) included rocks of this se- ries in the Eocene, so that the term Paleocene appears very infrequently in older writings. Palaeocene rocks are found on the continental margins and interior basins. Fossils are much like those of the Eocene epoch. Stites and Varney, 1923. Consider- ed by some to be part of the Eocene and by others to be transitional between Creta- ceous and Tertiary. A.G.I. Supp.

palaeoclimatology. The branch of science which treats of the climatological conditions during various geological periods in the past history of the earth. Schiefertacker.

palaeocurrent. Current, generally of water, that influences the structure or the processes or conditions in the geologic past. A.G.I. Supp.

palaeocology. The science of the relationship between ancient organisms and their environment. A.G.I.

Paleogene. The earlier of the two periods comprised in the Cenozoic era in the classifi- cation adopted by the International Geologic Congress and used by many Euro- pean geologists; it includes the Paleocene and Eocene epochs. Also the system of strata de- posited during that epoch. Compare Neo- gene. Not used in the United States. Fay.

palaeogeography. The geography of an area at some specified time in the past. A.G.I.

palaeogeologic map. Areal pattern of ancient outcrops (sub-crops) at a buried erosion surface (unconformity). Fay.

paleontology: paleogeology. A term used for maps and studies made of geologic condi- tions and events in some former period of geologic time. A.G.I. Supp.

palaeolithic. A term relating to the second pe- riod of the Stone Age following the Eolithic and preceding the Mesolithic, characterized by rough or chipped stone implements. Webster 3d.

paleolithologic map. A map showing litho- logic variations at some buried horizon or within some restricted zone. A.G.I. Supp.

palaeontological fact. A fact in the paleontological aspect of a particular sedimentary deposit, for example, nummulitic facies, crinoid facies, etc. Schiefertacker, 1939.

palaeocene epoch and series. The earliest epoch of the Tertiary period and the rocks formed during that time. The Palaeocene epoch is succeeded by the Eocene epoch. Most American geologists have until quite recently (1939) included rocks of this se- ries in the Eocene, so that the term Paleocene appears very infrequently in older writings. Palaeocene rocks are found on the continental margins and interior basins. Fossils are much like those of the Eocene epoch. Stites and Varney, 1923. Consider- ed by some to be part of the Eocene and by others to be transitional between Creta- ceous and Tertiary. A.G.I. Supp.

palaeoclimatology. The branch of science which treats of the climatological conditions during various geological periods in the past history of the earth. Schiefertacker.

palaeocurrent. Current, generally of water, that influences the structure or the processes or conditions in the geologic past. A.G.I. Supp.

palaeocology. The science of the relationship between ancient organisms and their environment. A.G.I.

Paleogene. The earlier of the two periods comprised in the Cenozoic era in the classifi- cation adopted by the International Geologic Congress and used by many Euro- pean geologists; it includes the Paleocene and Eocene epochs. Also the system of strata de- posited during that epoch. Compare Neo- gene. Not used in the United States. Fay.

palaeogeography. The geography of an area at some specified time in the past. A.G.I.

palaeogeologic map. Areal pattern of ancient outcrops (sub-crops) at a buried erosion surface (unconformity). Fay.

paleontology: paleogeology. A term used for maps and studies made of geologic condi- tions and events in some former period of geologic time. A.G.I. Supp.

palaeolithic. A term relating to the second pe- riod of the Stone Age following the Eolithic and preceding the Mesolithic, characterized by rough or chipped stone implements. Webster 3d.

paleolithologic map. A map showing litho- logic variations at some buried horizon or within some restricted zone. A.G.I. Supp.

palaeontological fact. A fact in the paleontological aspect of a particular sedimentary deposit, for example, nummulitic facies, crinoid facies, etc. Schiefertacker, 1939.

palaeocene epoch and series. The earliest epoch of the Tertiary period and the rocks formed during that time. The Palaeocene epoch is succeeded by the Eocene epoch. Most American geologists have until quite recently (1939) included rocks of this se- ries in the Eocene, so that the term Paleocene appears very infrequently in older writings. Consider- ed by some to be part of the Eocene and by others to be transitional between Creta- ceous and Tertiary. A.G.I. Supp.

palaeoclimatology. The branch of science which treats of the climatological conditions during various geological periods in the past history of the earth. Schiefertacker.
paleozoology. The science of fossil animals; its two subdivisions are invertebrate and vertebrate. J. G.

palermoite A mineral, (Li, Na), Sr Al9 (P0)8-

palladium amalgam. Synonym for potarite.

palladium. A soft, ductile, silvery-white or

palingenesis. a. The process of formation of

palladite A. Original spelling of palygorskite.

palimpsest. See palimpsest structure.

palimpsest structure. A structure of meta-
morphic rocks due to the presence of remnants of the original texture of the rock. Synonym for palimpsest. Holmes, 1928.

palingeneses. a. The process of formation of

new magma by the melting or fusion of country rocks with heat from another magma, with or without the addition of granitic material. A.G.I. b. The differential melting in the root parts of folded mountains, to form a pore liquid or ichor; usually used in the plural. Webster 3d.

Palladian disturbance. Post-Triassic di-

paleozoology. a. The study of the fossilized spores and pollen grains of the plants whose remains contributed to the forma-
tion of coal seams. Nelson. b. Used in a narrower sense for both meteoric and terrestrial, in which the latter have at least more iron oxides than silica. Cumberlandite is the chief example. Also called pallinoid. Fay.

pallid. a. Having a dull, flat, or dull yellow color; b. Having a light, delicate, or misty effect.

pallid gold. Same as porpezite, or gold, containing palladium up to 10 percent. Fay.

pallid iron. See pallarite. Fay.

pallarite. A depolymerized name for siderolites, contain-
ing fractured or rounded crystals of olivine in a network of nickel iron. Rice. Originally proposed by Gustav Rose for a meteorite that fell near Pallas, U.S.S.R. It has been used by Wadsworth in a wider sense for both meteoric and terrestrial, ultrabasic rocks, which in the former average about 60 percent iron and in the latter have at least more iron oxides than silica. Cumberlandite is the chief example. Also called pallinoid. Fay.

pallet. a. A board, small platform, or packag-
ing unit sometimes used, for example, in the transport of refractories or building bricks. Compare stillage. d. A pot-

palliating. A platform in the bottom of powder mixture used to preserve the powder from darkening. Fay.

pallet inspector. a. A person who inspects pallets (the ones on which green brick is stacked and transferred, and straightens those that are warped. D.O.T.1.

pallet molding. A method of forming bricks of forming bricks in sand molds, from which they are dumped on a board called a pallet; distinguished from aloof-molding. Standard, 1964.

pallette. See battleodore. Dodd.

palm. A piece of stout leather fitting the

palm of the hand, and secured by a loop to the thumb; this has a flat Indented

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather with a thun-
der edge fitted to the hand and secured by a loop to the thumb; this has a flat

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather fitting the

palm of the hand, and secured by a loop to the thumb; this has a flat Indented

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather with a thun-
der edge fitted to the hand and secured by a loop to the thumb; this has a flat

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather fitting the

palm of the hand, and secured by a loop to the thumb; this has a flat Indented

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather with a thun-
der edge fitted to the hand and secured by a loop to the thumb; this has a flat

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather fitting the

palm of the hand, and secured by a loop to the thumb; this has a flat Indented

shape. Same as attapulgite. A.G.I.

palm. A piece of stout leather with a thun-
der edge fitted to the hand and secured by a loop to the thumb; this has a flat

shape. Same as attapulgite. A.G.I.
pan

long; batea; plaque. Pryor, 3. g. See panning, a. Fay. b. A cylindrical vat of iron stone, or other substance, into which the cars ground with mullers and amalgamated. Fay. See also amalgamation pan. i. A copper or galvanized iron uter for washing gold ore and gravel so as to separate the heavy gold by a shaking motion. It corresponds to the cornishman's vanning shovel. Also called dish. Fay. j. To wash earth, gravel, or other material in a pan, as in searching for gold. Wehr, p. 3. k. To yield precious metal, as gold, in the process of panning. Webster 3d. l. The solid stratum of clay, pebbles, etc., underlying soil; hardpan; used chiefly in Great Britain. Standard, 1964. n. Fire clay or underclay of coal seams. Fay. n. Mind. Sheet-iron vessels holding one-fourth hundredweight, into which fillers rake the small coal. Fay. o. See prospecting dish. Nelson. p. A trough or section of a chain conveyor, gravity conveyor, or shaker conveyor. Nelson. q. A carrying spiral raft by which the framework of a belt or chain conveyor. Mason. r. S. Afr. A natural depression in ground, usually containing alluvial sand, gravel, or sandstone. Pryor. s. T. Shallow depression in the marsh surface occupied by higher plants. Also called saltpan; marsh pan. Schiefferdecker.

panbase. Samc as tretahedrite, CuSbSbS.Fay.

pan amalgamation. Amalgamation of silver or gold with mercury by grinding in a pan. Fay.

pan amalgamation process. Method of recovering silver and gold from their ores, in which a cast-iron pan or barrel is used for contacting a slurry of the crushed ore with salt, copper sulfide, and mercury; the released silver and gold form amalgam with the mercury. Bennett, 1962.

Pan-American ring. A group of breasts or rooms separated by a series of levels and winzes, and which is usually operated as a single unit. SMRB, Paper No. 61.

pan breaker. See subciel plow.

pancakes. The same as ribbon. Fay.

pancakes auger. An auger having one spiral web, 12 to 15 inches in diameter, attached to the bottom end of a slender central shaft. This type of auger is used as a removable deadman to which a drill rig or guy line is anchored. Long.

pancake forging. A rough, forged shape which may be obtained quickly with a minimum of tooling. It usually requires considerable machining to attain the finished size. ASM Gloss.

pancake ice. Pieces of newly formed ice usually between 1 and 6 feet in diameter. Hsy.

pancakes. Concrete discussed in stope support. They are cast at the surface, and are usually 30 inches in diameter by 4 wire rope. They are piled one on top of the others to form concrete columns for support. Hsy, p. 122.

panclastite. An explosive composed of liquid nitrogen tetritoxide mixed with carbon dioxide, and other liquid combustibles, in the proportion of 3 volumes of the former to 2 of the combustible. Fay.

panconcrete. Suitable coal suitable for use at saltworks, as under saltlumps. Fay.

pan conveyor. a. A conveyor comprising one or more endless chains or other linkages to which usually overlapping or interlocking pans are attached. The conveyor is also known as an apron conveyor. SMRB, Paper No. 342. MIH4.1-1958. b. Jigging conveyor; trough down which coal slides after severance and loading in dipping screen to separate it by shaking action. Pryor, 3. c. A trough conveyor or gravity conveyor. Nelson.

pan-edge. A runner mill for grinding or mixing granular material; steel supporting plates on which furnace bottom refractories are placed. Bureau of Mines Staff. p. A. A stream of molten iron in which the ground is laid in separate districts or panels, pillars of extra size being left between. Fay. b. A large rectangular block or pillar of coal. Fay. c. A group of breasts or rooms separated from the other workings by large pillars. Fay. d. A small portion of coal left uncut. Webster 3d. r. A method of working whereby the working area is divided into sections, each surrounded by solid strata and coal with only the necessary roads through the coal barrier. Also spelled panel. Mason. f. A group of working places, usually operated as a unit, and separated from other by large pillars of coal. Hudson. g. Eng. A division or main district of workings in a seam. SMRB, Paper No. 61. h. Eng. A bed of stone. SMRB, Paper No. 61. i. York. Any thin band of hard rock. Nelson. j. The working of coal seams in separate panels or districts, for example, a single unit panel. See also panel working. Nelson. k. Rectangle of live ore, defined by means of levels and wires, and then considered to be proved as regards volume for valuation purposes. In stopping, panel slicing is the process of mining out a panel either from above, below, or one side as described by a qualifying term. Pryor, 3. l. A heap of dressed ore. Fay.

panel barrier. The pillar of coal left between the adjacent panels. These pillars are often worked on the retreat after the coal in the panels has been extracted. In the panel system of bord-and-pillar mining, the panel barrier may be 22 yards (minimum) wide and about 300 yards apart. In longwall panel mining, the barriers may be made of sufficient width for extraction by a conveyor face on the retreat. Also called panel pillar. See also bolover experiment. Nelson.

panelling. Wood, etc., made into panels; also, panelwork. Webster 2d. See also panel, a.

panel point. A node on a truss chord, where a vertical member intersects with the chord. Ham.

pan-packed splittings. Disks or plates made up of splittings held together by force.
resulting from pressing freshly cleaved mica surfaces together. Skow.

panplain. A very level plain with a general slope toward the ocean. "Stakes and Stones, 1955.

pan scale. A product which settles out during the crystallization of salt from brine. It is composed, chiefly, of calcium sulfate but also contains some NaCl and various mineral impurities used for cattle feed and as fertilizers. CC 3d, 1942.

pannierite. A felsophric or vitrophyric igneous rock, typically a sodic quartz trachyte, containing essential anorthoclase and quartz, and perhaps diopside and cosyrite. Applied to a group of rocks intermediate between the rhyolites and dacites on the other. They differ from all these in having anorthoclase as the principal feldspar. Cosyrite, diopside, and probably titaniferous amphibole, occurs at the original locality on the Island of Pantelleria, in the Mediterranean Sea. Fay.

pan-pipe. Structural units molded in open half-cylinders shaped in an ogival curve accentuated at one side so as to interlock with the next tile. ACSG, 1963.

pantograph. A type of drawing instrument used for copying a drawing to any required scale. The term also applies to the hinged diamond-shaped form of a parallelogram, used for copying a drawing to any required scale. The term also applies to the hinged diamond-shaped form which, when perfectly deformed, exhibits a parabolic shape in carbon. A.G.I. Supp. parabola. The shape taken by the curve of a bending moment diagram for a uniformly distributed load on a beam simply supported. Ham.

papas diamond. Quartz. Shipley.

par. a. The nominal value of securities or certificates of value. It is also called nominal face par; face par. Webster 3d, b. The value or price at which securities or certificates of value are issued. Webster 3d.

par- or par-. In chemistry, these prefixes indicate: (1) an isomeric or polymeric modification as, paraacid, parakyanite, paraoxide, etc.; (2) a modification or a similar compound that is not necessarily isomeric or polymeric; as, paraphenylene; (3) a benzene di-derivative in which the substituted atoms or radicals are directly opposite each other on the benzene ring; that is, occupying positions 1 and 4; as, para-xylene; or (4) an inactive isomer produced by a combination of its dextro- and levorotatory modifications; as, paratauric acid. Abbreviation, p-. Standard, 1964; Webster 3d, b. A Greek prefix meaning near having a specific gravity of 0.92 to 0.94. In general, (85.6 to 74.1 percent) and having a spg- paraffin oil. b. Lubricating oil made by the refining of paraffin-base petroleum. Crude oil containing paraffin wax in solution; such oil is relatively high in hydrogen and low in carbon. A.G.I. Supp.

paraffin-base petroleum. Crude oil which carries solid paraffin hydrocarbons and practically no asphalt. Borg.

paraffin coal. A light-colored bituminous coal used for the production of oil and paraffin. Fay.

paraffin durt. The paraffin, or sour dirt of the Gulf Coast fields: a yellow, waxy substance resembling beeswax, which has often been regarded as indicating the proximity of an oil or gas reservoir. The term paraffin is probably a misnomer, and many have questioned the supposed relationship with petroleum. BuMines Bull. 201, 1922, pp. 29-30.

paraffin fluxes. The residuals obtained from paraffin-base petroleum are characterized by containing 14½ to 4 percent of hard paraffin scale, consisting to a predominance of saturated hydrocarbons (85.6 to 74.1 percent) and having a specific gravity of 0.92 to 0.94. In general, it may be said that the only a small percentage of residual coke and contain but little sulfur. Fay.

paraffin oil. a. Lubricating oil made by the
paraffin oil

paraffin series. Hydrocarbons having the general formula CnH2n+2, which form a large proportion of American petroleum; chemically inseparable, and flammable. See also butane; ethane; methane; propane. Nelson.
paraffin shale. Another name for oil shale.
paragenesis. A general term for the order of formation of associated minerals in time and space. As used by the geologist, the paragenesis is to trace out in a rock or vein the succession in which the minerals have developed. Fay.
paraepidote. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragons. Deproteinized rubber, gutta percha, rubber, etc. Schieffelkeser.
paragenetic. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragenetic. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragenetic. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragons. Deproteinized rubber, gutta percha, rubber, etc. Schieffelkeser.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.
paragonite. a. In petrology, a geosis formed by the metamorphism of a sedimentary rock. Fay. b. A geosis formed from a sedimentary rock by the intermediary action of an igneous magma to such an extent that a virtually new rock is formed. Fay.
paragonite. b. A trade name for a nonrotating rope of 12 x 6 over 3 x 24 construction. Ham.
paragonite. c. A term used, for example, which are to be fired electrically in one circuit. Nelson.

the rods to the spires. If a head telephone is placed in the circuit, the absence of sound in the telephone indicates that the two telephones are at the same potential. By this method the equipotential lines can be traced. Lewis, p. 316.

paramagnetic material. A material whose specific permeability is greater than unity and practically independent of the magnetizing force. ASM Gloss.

paramagnetism. a. The magnetism of a paramagnetic substance. That property by which the north pole of a magnet that is magnetized by induction is repelled to 180° by the north pole of the inducing magnet. Standard, 1964. b. The property possessed by a substance of producing a higher concentration of magnetism at some distance than is immediately within it. Portland, 1964. c. Permanent magnetism is practically absent and the susceptibility, which is magnetic susceptibility, is constant at any given temperature, but in most substances it is nearly inversely proportional to the absolute temperature. Compara diamagnetism. Holmes, 1920.

paramelanite. An oxide of copper occurring as a secondary mineral at the Copper Queen mine, Bisbee, Ariz. Dana 7, v. 1, p. 511.

paramagnetic. In crystallography, that rational multiple of the unit length of any crystallographic axis intercepted by a crystal plane which determines its position with reference to the fundamental form. Standard, 1964. A quantity constant in a special case but variable in different cases. A.G.I. standard.

parameter (lattice). In a crystal, the length, usually in angstrom units, of the unit cell along one of its axes or edges; also called lattice constant. ASM Gloss.

parametric equations. A set of equations containing controllable constants which define a set of curves or boundaries. Bumis, 1960, p. 2.

pararaph. A pseudomorph with the same composition as the original crystal, as calcite. Little aragonite.

pararaphomorph. The alteration of one mineral into another without change of composition. This can take place into hornblende in crystallization. It is also used in connection with metamorphism to describe such thorough changes in a rock that its old components are destroyed and new ones are built up. Fay.

paramagnet. In alpine orogeny, applied to folds and nappe structures which can be contrasted by the theoretical and technical features with the sedimentary mantle of an autochthonous massif and which have been relatively little displaced. Schoulerdecker.

pararaphomorph. A mobilized portion of an autochthonous granite which has moved higher in the crust or, more usually, into tectonic domains of lower pressure. The resulting pararaphomorph granite shows variable marginal relations, in some places migmatic, in others characterized by an aureole of thermal type. Schareder.

parawollastonite. Calcium form of CaSiO₃. Monoclinic. Wollastonite, with same composition, has been shown to be triagonal. Found in ejection blocks at Mani- vius, Italy; Crestmore, Calif. English.

parasite. A light-gray, highly phosphoric, extrusive igneous rock, with phenocrysts of leucite and augite (25 percent), in a groundmass of andesine, leucite, augite, orthoclase, magnetite, and apatite. The name is restricted to mesocratic extrusive rocks with more leucite than feldspar and more plagioclase than orthoclase. Johannsen, v. 4, 1938, p. 291.

pararaphomorph. That magma from which some other magma was derived. A.G.I. parent. See main hole. Long.

pararaphomorph. Of soils, the horizon of weathered rock or partly weathered soil material from which the soil is formed. Horizon C of the soil profile. A.G.I.

pararaphomorph. A. The original rock from which sediments were derived to form later rock. A.G.I. b. The rock from which parent materials of soils are formed. A.G.I.

pararausesite. An amphibole including green and bluish-green kinds of hornblende, occurring in stout lustrous crystals, or granular. CuNa₂Mg₃Al₂Si₅O₁₈(Fe³⁺). Monoclinic. Dana 17.

pararaphomorph. The process of applying a coat cement mortar to the back of the facing material or the face of the backing material, sometimes referred to as paring. A.G.I.

pararaphomorph. A fieldspathic, white, semitransparent body resembling Paros marble; usually cut. G.T.D.

parianite. Asphalt from the Pitch lake, Trinidad.

parisite. One of the most famous of ancient statuary marbles; from the island of Paros, Greece.

parkerite. An orthorhombic mineral, Ni₃ B₈S₄, commonly associated with richterite, pyrite, fluorite, albite, microcline, and aegirite. From Paros, Greece. Fay.

parian marble. One of the most famous marbles, fine-grained; described from travelers in Alaska in extreme cold weather. Fay.

parietal. A fine-grained, uncrystalline, sometimesskeletal, with a cream-colored; metallic luster. The Sudbury, Ontario, Canada, found in the Sudbury basin; usually associated with olivine, pyroxene, feldspar, and quartz; often in the form of thin sheets or foliated, and sometimes in the form of lenses or small bodies. Fay.

paroptile. A name given by Hunt to a rock salt in which each retort can be maintained accurately at 600° C (1,112° F). A cooling flask specifically distinguished (in a three-part flask) as top part, middle part, and bottom part. Skow.

part candles. Eng. The use of candles as well as safety lamps in a mine. Fay.

part-face blasts. Blasting a face in two stages when the height of the rock face is too great to blast in one operation. McAdam II, p. 245.

partially fixed. An end support to a beam or a column which cannot develop the full fixing moment is defined as partially fixed. Hy.

partially trimmed mica. Rifted mica that is part-trimmed to any degree, so that part of its width is removed by the relief of a variety of forces. Skow.

partial node. The point, line, or surface in a standing wave system where some characteristic of the wave field has a minimum amplitude differing from zero. Hy.

partial pressure. a. That part of the total pressure of a mixture contributed by one of the constituents. Stroock 10. b. See Dalton’s law. Hy.

partial pyritic smelting. Must furnace smelting of copper ores in which some of the heat is provided by oxidation of iron sulfide in a reverse reaction by combustion of coke. See also pyritic smelting. C.T.D.

partial roasting. Roasting carried out in order to eliminate some but not all of the sulfur in an ore. In copper smelting, the sulfur left after roasting combines with copper and some iron to form a matte. C.T.D.

partial subdivision. Any amount of subdivision which is less than full subdivision; as with solid or strip packing. Nelson.

particle. a. In mineral technology a single piece of solid material which can be defined as regards its size by triaxial measurement; by its mesh if below some 0.25 centimeter in average width and above some 50 microns; and by micromeasurement down to the resolving limits of a given magnifying system. Such a particle is not necessarily homogeneous. Also, in physics, the particle may be a molecule, atom or atomic component. Particle size distribution, assessed by screen analysis of sample through series of laboratory sieves, describes the percentage by weight of each size of particle in the range of screens used. Pryor, J. b. A minute constituent of matter having a measurable mass, such as a neutron, a proton, or a meson. L&L.

particle accelerator. Modern machines which accelerate subatomic particles to such great velocities that as these particles strike atomic nuclei, the nucleus of the atom may be altered or split. Among those now in use are the cyclotron, the linear accelerator, the Van de Graaff generator, the Proton synchrotron, and the Bevatron. H&G. See also accelerator.

particle diameter. The projected diameter is that of a circle which has the same area as the projected profile; the equivalent surface diameter is that of a circle with the same effective surface under stated circumstances and classified as a particle. Nelson.
particle diameter

795

particle size. a. In powder metallurgy, the particle-size reduction. The process of crushing particulated stones. Transparent stones with particulate fluidization. parido. Mex. Division of 'ores between part-

minus 0.2). Pryor, 3.

velocity of Stoke's law (Reynold's No. The Stokes diameter is that of a sphere of the same dimensions of a hypothetical particle such study of powders and defined as the di-

meter is that of a sphere of the same

c. cos. The manner in which a seam parts from its roof or pavement; it is a bad parting when they do not separate readily, a good parting when they do. Fay. d. A side track or turnout in a haulage road. Entry parting, the parting at the begin-

ning of an entry in a slope mine. Inside of wall parting, a parting some distance from the mouth of an entry, from which the cars are hauled out by a special mule or team. Wrong parting, a parting on which trips of cars are collected for hauling out by a rope-haulage system, or electric motor. Fay. e. cost. The line of demarcation between bedding planes. The term is also used to denote a thin layer of

TIME. f. A plane, usually parallel to the bed-

ding, at which a bed readily separates. B.S. 3619, 1964. see. g. A band of waste material dividing the mineral stra-

tratum. Austin. h. A natural, usually smooth, separation between strata. Hudson. i. A lamina, for example, ankerite or fusain, occurring on or at an angle to the bed-

planes, but which have become directions of horizontal beds. Pettijohn.
a peculiar lineargraining on the surface

of horizontal beds. Pettijohn.

parting step lineation. Sub-parallel thin layers occurring on or at an angle to the bed-

planes, but which have become directions of horizontal beds. Pettijohn.

parting slate. A thin layer of a typical linear grain on the surface of horizontal beds. Pettijohn.

parting wheel. See cutting-off wheel. Dodd. parting boy. In a cave, a man in its natural position spanning a passage from floor to ceiling and inclining more than 45° to the horizontal (not a fallen block). Schieder-

dercker. parting size. The separation size correspond-

ing to 50 percent recovery as read from a partition curve. B.S. 3552, 1962.

partition curve; distribution curve. A curve indicating, for each specific gravity (or size) fraction, the percentage of it which is contained in one of the products of the separation; for example, the reject. B.S. 3552, 1962.

partition density; trap cut point. The den-

sity corresponding to 50 percent recovery as read from a partition curve. B.S. 3552, 1962.

partition factor; distribution factor. The per-

centage of a specific gravity (or size) fraction recovered in one of the products of the separation; for example, the reject. B.S. 3552, 1962.

partitioning method. A resistivity method in which a special electrode configuration is used, consisting of five electrodes, instead of the usual number of four, to provide a check on the observations. Schieder-

dercker.

partition size. The separation size correspond-

ing to 50 percent recovery as read from a size partition curve. B.S. 3552, 1962.

partitioning. a. A plane on a pattern or a line on a casting corresponding to the separation lineation. Pat. b.概念 is used to denote a thin layer of

horizontallaminated sandstones. Pettijohn.

parting liquid. Liquids, such as tetrameth-

ylene, ethylene dibromide, pentachloro-

thiane, and trichlorethylene, that are used in the DuPont mineral separation process. See also DuPont process. Mitchell, pp. 475, 478.

parting-plane lineation. Sub-linear parallel

shallow grooves and ridges of low relief (generally less than 1 millimeter) on lami-

nation surfaces. Pettijohn.

parting powder. A powder made from chalk, bone meal, or similar nonsiliceous mate-

rial, suitably waterproofed, which is ap-

plied to objects to prevent them from sticking to the mold (or sand) surface. Fay.

partitioning. c. Thin layer of material dividing the mineral stratum. Pettijohn.

approximately 180° in compass direction, as in the case of a plunging anticline. Stokes and Varnes, 1955.

partly filled stope. See square-set stoping.

parts of line. Separate strands of the same rope or cable used to connect two sets of equipment.

part-swing shovel. A power shovel in which the upper works can rotate through only part of a circle. Nichols.

party. A group of men performing the geophysical field work necessary for a specific project or prospect, ordinarily using a single method, as a gravity party. A.G.I.

party chief. In seismic prospecting, the man who supervises the personnel of the crew and generally is in charge of interpretation of the data. Dobrin, p. 55.

party foreman. In seismic prospecting, the man who supervises the work a field party. Subordinate to a nonresident party chief, who is responsible for the interpretation of the data. A.G.I.

party manager. a. In seismic prospecting, his function is to handle the operational phases of the work, particularly those involving logistics and access in difficult or remote areas, giving the party chief more time for interpretation of the data. Dobrin, p. 55. b. In gravity and magnetic prospecting, the man in charge of the operating field party. A.G.I.

pass. A gap, defile, or other relatively low break in the flat it is called a flatting pass; if on between the rolls. When the bar passes on rolling mills, the passage of the bar becomes controlled. Nichols. e. A treatment of the whole sample in a mixture of glass or frit with white, is passivated and the continental Old Red Sandstone above. G.T.

pass. a. Opening in a mine through which coal (or ore) is delivered from a higher level. The pass may be solid coal (or ore) or more frequently in the waste area. At the lower end the pass may be provided with a chute through which the material is discharged into cars or trams. See also chimney; chute. Nelson. b. A passageway left in old workings for men to travel in from one level to another. Zern. c. A treatment of the whole sample in a sample divider. B.S. 1017, 1960, Pt. II. d. A working trip or passage of an excavating machine in removing overburden, B.G.I. i. In rolling mills, the passage of the bar between the rolls. When the bar passes on the flat it is called a flatting pass; if on the edge, an edge pass. Fay. g. The open space between two grooved rolls through which metal is processed. A.S.M. Gloss. h. The weld metal deposited in one trip along the axis of a weld. A.S.M. Gloss. i. A gap, debris, or relatively low break in a mountain range through which a road or trail may pass; an opening in a ridge. Ord. The interior of the shaft. Fay.

passage beds. The general name given to strata laid down during a period of transition from one set of geographical conditions to another; for example, the Downswana stage consists of strata intercalated (and in position) between the marine Silurian rocks below and the continental Old Red Sandstone above. A.G.I.

pass. a. In magnetic-particle inspection, the material is passivated and the continental Old Red Sandstone above. G.T.

passage. b. In gravity and magnetic operations of a field party. A.G.I. c. An underground tunnel or roadway or in positions like these, the material is passivated and the continental Old Red Sandstone above. A.G.I. d. In gravitation and surface mining, a complete excavator cycle or grading machine. Nichols. e. In magnetic-particle inspection, the material is passivated and the continental Old Red Sandstone above. A.G.I.

passage. a. A cavern opening having greater length than height or width, large enough for human entrance and larger by comparison than a lead. A.G.I. b. See pass. A.G.I. c. An underground tunnel or roadway in metalliferous mines. See also drive, d. Nelson.

passive. a. May be defined in two ways: (1) A metal which is normally active according to its position in the electromotive force series, or an alloy composed of such metals, when it exhibits an appreciably greater resistance to corrosion and behaves similarly to those having a noble potential in the electromotive force series. Chromium and stainless steel are passive in certain environments. H.S.G. b. Passive state of genetic equilibrium. Plastic equilibrium obtained by a compression of a mass. A.S.C.E. p. 1826.

passive resistant. A compound whose output waves are independent of any sources of power controlled by the actuating waves. H.S.G.

passive soil. The method or equipment by which information concerning a distance object is obtained by evaluation of sound generated by the object. H.S.G.

pastel color. sometimes a. Soft paste (pate dure), composed of such metals, when it exhibits a fresh and clean surface. It can occur as a fresh and clean surface. It can occur in certain types of lead or in the absence of a noble potential in a galvanic series. Fay.

pastel color. a. A transition of one mineral into another; for example, the changing of the chemically passive surface of a metal to a much less reactive state. Contrast with activation. A.S.M. Gloss. b. A type of inhibitor which changes the electrode potential of a metal, causing it to become more cathodic or electrolytic. B.U.Mines. Bull. 619, 1964, p. 206.

passive coefficient of earth pressure. The maximum ratio of the major principal stress to the minor principal stress. This is applicable where the soil has been compressed sufficiently to develop an upper limit of the major principal stress. A.S.C.E. 1962.

passive earth pressure. The maximum value of earth pressure. This condition exists when a soil mass is compressed sufficiently to cause its internal shearing resistance along a potential failure surface to be completely mobilized. A.S.C.E. 1962.

passive iron. Iron which has been immersed in concentrated nitric acid. It does not dissolve when subsequently immersed in dilute acid. Bismuth, cobalt, chromium, and nickel also exhibit this passivity to a lesser degree. Returns.

passive metals. Metals on which an oxide film forms, giving the metal a noble potential in a galvanic series, and thus exhibiting this so-called passivity; for example, chromium nickel, iron, and nickel also exhibit this passivity to a lesser degree. Returns.

passive resistance. a. In seismic prospecting, his function is to handle the operational phases of the work, particularly those involving logistics and access in difficult or remote areas, giving the party chief more time for interpretation of the data. Dobrin, p. 55.

passive earth pressure. The maximum value of earth pressure. This condition exists when a soil mass is compressed sufficiently to cause its internal shearing resistance along a potential failure surface to be completely mobilized. A.S.C.E. 1962.

passive soil. A compound whose output waves are independent of any sources of power controlled by the actuating waves. H.S.G.

passive soil. a. Soft paste (pate dure), composed of such metals, when it exhibits a fresh and clean surface. It can occur in certain types of lead or in the absence of a noble potential in a galvanic series. Fay.
pastel mold. A mold lined with adherent carbon, used wet for blown ware. ASTM C183-66.
paste-blowing machines. A machine for blowing light-walled hollowware. As a good finish is needed, the molds are coated with pastes before each blowing operation. C.T.D.
paste-mold process. See paste-mold blowing machines. C.T.D.
pastillage. Dot and line designs made with colored slip, which is dribbled from a container with a flexible base and a spout. C.T.D.
pasting. The operation of mudcapping. Fay.
pate coal. Scot. The bottom, or lowest, coal.
patapsco formation. The highest division of the Comanchean of the Eastern United States, consisting of brightly colored, often sandy clays with fossil plants. C.T.D.
patch burning. A term referring to special effects obtained in burning the surface of clay vessels. ACSG, 1963.
patent. In brickmaking, to remove the rough paste-mold process. See paste-mold blowing machines.
patent fuel. Eng. The fuel produced by the agglomeration of coal slack into lumps.
patent leveling. The same as stretcher leveling.
patent plate. Plate glass that has been ground and polished on both sides. C.T.D.
patent survey. An accurate survey of a mineral claim by a U.S. deputy surveyor as required by law in order to secure a patent (title) to the claim. Fay.
patent yellow. See basic lead chloride.
pattern. A metallurgical process consisting of a chloridizing roasting, leaching with water to remove base metals (some silver is dissolved and must be recovered), leaching with sodium hypochlorite for silver, and the precipitation of silver by sodium sulfide. The process was first carried out by von Paterna at Joachimsthal (Jachymov), Czechoslovakia. See also Joachimsthal process.
pattern burnishing. A term referring to special effects obtained in burnishing the surface of clay vessels. ACSG, 1963.
patternmaker. In the stonework industry, one who makes sheet metal patterns of shapes to which stone is to be cut for building purposes. D.O.T. 1.
patterns. a. A form of wood, metal, or other material, around which molding material is placed to make a mold for casting metals. ASTM C163-66. b. A full-scale reproduction of a part used as a guide in cutting. ASTM C163-66. c. A regular array of characters, such as an X-ray diffraction pattern. ASTM C163-66. d. As applied to diamond bits, the design formed by spacing and distributing the diamonds in a predetermined geometric arrangement on the crown of a bit. See also concentric pattern, eccentric pattern. Long e. The system followed in spacing boreholes. See also checkerboarded. Long.
pattern shooting. In seismic prospecting, the firing of explosive charges arranged in a definite geometric pattern. A.G.S.
pattinson agitator. An agitator of the Pachucan tank type in which the air is replaced by solution or water, under pressure from a centrifugal pump. Liddell 2d, p. 392.
pattinson process. A process for separating silver from lead, in which the molten lead is slowly cooled so that crystals poorer in silver solidify out and are removed, leaving the melt richer in silver. ASTM C163-66.
patina. Strictly, the green film formed on copper and bronze after long exposure to the atmosphere. By extension, the term is applied to a yellowish, bluish, or greenish film of valuable mineral must be proven beyond reasonable doubt; (4) the matter is taken up with the amalgam, and the proper notices must be published in the papers

patello. a. Mex. Cloth used by miners. Fay. b. Sp. Place where minerals are concentrated. The patio floor is one on which silver and lead is amalgamated. The patio process, dating back to the sixteenth century, was a crude chemical method of reduction, followed by amalgamation. See also arrastre. Pryor, 3.
patio process. A process for the recovery of silver by amalgamation in low heaps with the aid of salt and copper sulfate (magister). Thorough mixing is obtained in the usual form by having horses or oxen trample the mass. Liddell 2d, p. 495.
patouriode. An impure sulfide of vanadium, VSc, found in considerable quantities in Peru, and used as a source of vanadium. Dana 17.
patra. a. Mex. Cloth used by miners. Fay. b. Sp. Place where minerals are concentrated. The patio floor is one on which silver and lead is amalgamated. The patio process, dating back to the sixteenth century, was a crude chemical method of reduction, followed by amalgamation. See also arrastre. Pryor, 3.
pattern. A form of wood, metal, or other material, around which molding material is placed to make a mold for casting metals. ASTM C163-66. b. A full-scale reproduction of a part used as a guide in cutting. ASTM C163-66. c. A regular array of characters, such as an X-ray diffraction pattern. ASTM C163-66. d. As applied to diamond bits, the design formed by spacing and distributing the diamonds in a predetermined geometric arrangement on the crown of a bit. See also concentric pattern, eccentric pattern. Long e. The system followed in spacing boreholes. See also checkerboarded. Long.
pattern shooting. In seismic prospecting, the firing of explosive charges arranged in a definite geometric pattern. A.G.S.
and contain plant remains. C.T.D.

Paul floc test. Paul water test. See floc test.

Dodd.

Paul's diameter. This instrument weighs the air and is quite accurate for a portable instrument. It can be used for finding the amount of air pressure between points at various elevations without checking the setting of the pointer, or it can be checked against a mercury barometer and then used as a portable barometer. It is useful in making a survey of the drop in ventilating pressure throughout a mine. Lewis, pp. 692-693.

Pauling's rule. A principle of mineral chemistry. If the valency of a given positive ion is divided by the number of surrounding negative ions the resulting fraction is the contribution of the positive ion toward satisfying the valency of each negative ion. If a given negative ion is considered, it is found that the sum of the contributions from its neighboring positive ions is equal to, or approximately equal to, its valency. For alternative structures which obey this law remain open to a mineral of given composition and one of these always turns out to be the actual structure. It is often possible to determine the nonexistence of certain types of compounds otherwise possible according to the ordinary laws of valence.

Paul's exclusion principle. No two electrons in an atom can have the same four quantum numbers. Pryor, 3.

Paulite. Same as hypersthene. Shipley.

Pauloppost. A general term applied to changes that take place in igneous rocks immediately after their formation, the changing being a direct consequence of the consolidation of the magma, for example, by crystallization, serpenitization. Synonymous with deuteric. Holmes, 1920.

Paul water test. See floc test. Dodd.

pave. To cover immediately underlying coal or any other workable material. Arkell. b. The floor of a mine. Fay. c. Any construction as composed on a subgrade to reduce loading stresses and to protect it against the abrasive effects of traffic and weather. Nelson. d. Base rock, b. Long.

pavilion facets. The main facets on the pavilion of any cut stone. In the brilliant cut, there are usually five or even five-sided facets although some diamond cutters further distinguish four of these by the name of corner facet, step facet.

pavilion. The underside and corners of the brilliant-cut gem, which lie between the girdle and the collet. Hess.

pavior. A term used for floors. Arkell.

paving block. A stone in the stonework industry, one who splits large blocks of granite into smaller blocks for paving purposes, using an airhammer and drilling bit. Also called blockmaker. D.O.T.1.

paving breaker. An air hammer which does not rotate its steel. Nichols.

paving brick. Usually impure shales and fire clays pressed for this purpose. Desirable qualities in a paving brick are a fair degree of plasticity, good tensile strength, and suitable viscosity characteristics. Found in Ohio, Pennsylvania, Indiana, Illinois, New York, Maryland, Colorado. C.C.D 6d, 1961.

paving flag. A square hard stone slab, 2 inches or more thick, used for surfacing a footway. Hydraulically pressed precast reconstructed stone or concrete slabs are in common general use. Ham.

paving sand. A type of commercial sand which is divided into three general classes, that for concrete pavements, that for asphaltic pavements, and that for grouting. Sand for concrete pavements, according to the U.S. Bureau of Public Roads, should pass through a 1/4-inch screen, 5 to 25 percent should be retained on a No. 10 sieve, from 50 to 90 percent on a No. 50 sieve, and not more than 10 percent should pass through a No. 100 sieve. Not more than 3 percent of the weight should be matter removable by elutriation. For asphaltic pavement small amounts of organic matter are not objectionable in the sand. A sand should pass through a 1/4-inch screen, 95 to 100 percent through a No. 10 sieve, and not more than 5 percent through a No. 200 sieve. Grouting sand should pass through No. 10 sieve, 80 percent through a No. 20 sieve, and 5 percent through a No. 200 sieve. See also building sand, Brady, p. 121.

paving stone. Stone prepared, or suitable, for paving work. Standard, 1964. Usually in large flat slabs, or square blocks, such as Belgian block.

paving. A term applied to clay-fired stock bricks that are not of first quality but are nevertheless hard, well-shaped and of good color. Dodd.

pavonazzo marble. See pavonazzo. Fay.

pavonazzo; pavonazzo marble. A siliceous limestone of various shades of green, blue, or gray alternating with bands of white. Formerly, often used in southern Italy. So called from its resemblance to the plumage of a peacock; also called Phrygian marble. Fay.

pavonite. AgBisSis, monoclinic, for a Bolivian marble. Fay.

pavonite. AgBisSis, monoclinic, for a Bolivian marble. Fay.

pavonazzo; pavonazetto marble. A siliceous limestone of various shades of green, blue, or gray alternating with bands of white. Formerly, often used in southern Italy. So called from its resemblance to the plumage of a peacock; also called Phrygian marble. Fay.

pavonazzo; pavonazetto marble. A siliceous limestone of various shades of green, blue, or gray alternating with bands of white. Formerly, often used in southern Italy. So called from its resemblance to the plumage of a peacock; also called Phrygian marble. Fay.

pavonazzo; pavonazetto marble. A siliceous limestone of various shades of green, blue, or gray alternating with bands of white. Formerly, often used in southern Italy. So called from its resemblance to the plumage of a peacock; also called Phrygian marble. Fay.

pavonazzo; pavonazetto marble. A siliceous limestone of various shades of green, blue, or gray alternating with bands of white. Formerly, often used in southern Italy. So called from its resemblance to the plumage of a peacock; also called Phrygian marble. Fay.

pay. a. That portion of a formation which carries the profit of its contents. Fay. See also pay dirt. b. That portion of a vein which carries the profit of its contents. Fay. See also pay dirt. See also pay dirt; pay rock. c. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson. d. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson. e. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson.

pay gravel. A. Gravel containing sufficient heavy mineral to make it profitable to work. Nelson. b. In placer mining, a rich strip or lead of auriferous gravel. Fay.

pay limit. The portion of a vein which carries the profit of its contents. Fay.

pay load. a. In any wind, the portion of a formation in which the mining of ore is considered to become unpayable. There has been much discussion about mining below the pay limit for technical reasons, as a result of taxation, or to conserve natural resources. Beerman.

pay load. a. That portion of a vein which carries the profit of its contents. Fay. See also pay dirt. b. That portion of a vein which carries the profit of its contents. Fay. See also pay dirt. See also pay dirt; pay rock. c. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson. d. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson. e. Earth, rock, etc., that yields its valuable contents, A pay is always the weight of the coal, ore, or mineral handled as distinct from dirt, stone, or gangue. Nelson.

payable. There has been much discussion about mining below the pay limit for technical reasons, as a result of taxation, or to conserve natural resources. Beerman.

payable ore. A deposit composed on a subgrade to reduce loading stresses and to protect it against the abrasive effects of traffic and weather. Nelson. d. Base rock, b. Long.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

pay out. To slacken or to let out rope. Fay. Fay.

pay rock. Synonym for pay ore.

pay shoot. A portion of a deposit composed of payable ore. Fay.

pay streak. a. The areas of concentration of gold in placer deposits. Bateman. b. That portion of a vein which carries the profit of its contents. Fay. See also pay dirt. a. The areas of concentration of gold in placer deposits. Bateman. b. That portion of a vein which carries the profit of its contents. Fay.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

payoff. The portion of a formation which carries the profit of its contents. Fay. See also pay limit; pay rock. Fay.

pyrometric cone equivalent. V.V.

Pd. Chemical symbol for palladium. Hende-

pea brach. Eng. Grass cloth composed of small, quite pure black and gray pebbles, with little sand, probably only a few feet thick at base of Blackheath beds, Croydon, Surrey. See also anthracite coal.

peach. A dark blue or green altered rock; aggregate of quartz, accessory minor tourmaline, and some ore minerals, often with fluorite. A.G.I.

peach bloom. A glaze effect on pottery produced by the addition of copper oxide to a high-alumina glaze but requires very careful control of the kiln atmosphere. The bloom results from incipient devitrification of the glaze surface. Dodd.

pea coal. In anthracite only, coal small enough to pass through a mesh three-fourths to one-half inch square, but too large to pass through a 3/8-inch mesh. When broken, a coal is made, the size marketed as pea is sometimes larger than the above; known also as No. 6 coal. Fay.

pea gravel. A variant and seldom-used spelling of peen. Long.

pea gravel eyd. A local term used to describe a laminated shaly sandstone roof which has impressions at the laminations or partings, similar to peanut shells. The sizes of the indentations vary from about 1/4 to 2 inches. Hurlbut.

pea ground. Round grains of hydrated peroxide of iron, or silicate of iron, commonly found in cavities of Jurassic limestone. See also bean ore. Fay. b. Limonite occurring in a round grain about the size of a pea. Webster 3d.

pearl. A gem composed of calcium carbonate, formed in the shell of the pearl oyster. Crisius.

pearl ash. Potassium carbonate (K₂CO₃); especially, an impure product obtained by partial purification of potash from wood ashes. Webster 3d.

pearl compass. In determinative gemmology, an apparatus for discriminating between genuine and cultured pearls. A pearl is hung between the poles of a powerful electromagnet. A cultured pearl tends to rotate and is attracted according to the structure of its core, while a genuine pearl tends to remain stationary. Shipley.

pearl diatoms. See variable luster. Fay.

pearl endoscope. See endoscopy. Shipley.

pearl endoscopy. The method of examining material which consists of various diameters and the corresponding estimated weights of fine spherical pearls. Shipley.

pearlite. The lamellar mixture of ferrite and cementite in the microstructure of slowly cooled iron-carbon base alloys occurring normally as a principal constituent of both steel and cast iron. Webster 3d.

pearlite isomorph. A kind of iron. In general, pearlitic iron is gray cast iron consisting of graphite in a matrix of pearlite, that is, without free ferrite. In particular, perlite iron is a German proprietary name denoting an iron of low silicon content, which is caused to solidify gray by the use of heated molds. C.T.D.

pearlitic malleable. See malleable cast iron. ASM Gloss.

pearl mica. Same as margarite, b. Fay.

pearl opal. An opaque, bluish-white, porcelain-white, pearly-splashed, or pearly-splashed variety of opal. Same as cacholong. Fay.

pearl radiogram. The record on a photographic film or plate of X-rays transmitted through a pearl; an X-ray photograph of a pearl. Shipley.

pearl luster. A variety of opal. Fay. Synonym for ankerite.

pearlstone. Same as perlite, a. Fay.

pearl white. See bismuth oxichloride. Bennett 3d.

pea body. Applied to minerals having a luster like a pearl, such as talc, brucite, stibnite, and pyrite.

peafowl. A variety of obusidian. Schaller.

peary luster. A luster like that of a pearl and shown by some easily cleavable minerals. Huntbut.

pearly mixture of ferrite and cementite having a pearly appearance when lamellar. See also pearlite. Fay.

Pearson air elutriator. A downblast type of elutriator and used for determining the fineness of Portland Cement. Dodd.

peastone. Same as pisolithic. Fay.

peas. a. Applied to small pieces of ore, the weight of which may be estimated by the hand. Fay. b. N. of Eng. Lead ore in grain about the size of a pea. Standard, 1964.

peas. There are two types of pea, low moor (Flachmoor) and high moor (Hohmoor) pea. Low moor pea is the most common starting material in coal genesis. It therefore constitutes a causticoholob of low diagenetic degree. Peat is formed in marshes and swamps from the dead, and partly decomposed remains of the marsh vegetation. Stagnant ground water is necessary for peat formation to protect the residual plant material from decay. Peat has a yellowish brown to brownish black color, is generally of the fibrous consistency, and can be either plastic or friable; in its natural state it can be further; it has a very high moisture content (above 75 percent, generally above 90 percent). It cannot be distinguished from brown coal by the fact that the greater part of its moisture content can be squeezed out by pressure (for example, in the hand). Peat also contains more plant material in a reasonably good state of preservation than brown coal, and is a rich source of plant elements, such as roots, stems, leaves, seeds, etc., can commonly be seen in it without the unaided eye. The treatment of peatite waste slimes will make
peat

visible many of these plant tissues. Further, peat is richer in cellulose than brown coal (reaction with Fehling’s solution). Unlike brown coal, peat still contains cellulose, protected by lignin or cutin, which gives a reaction with chlor zinc iodide. Correspondingly, peat shows under the microscopic tissues which have not undergone either lignification, suberization or cutinization; this is not the case in brown coal. The reflectance of peat is low (about 0.3 percent). Microscopic examination is best undertaken with transmitted light. HCP, 1963, part I.

peat bed. An accumulation of peat. Pay.

peat blasting. A method enabling a road to be built above a peat deposit. Hard filling is first dumped over the route to a height equal to the accumulated depth of the peat, into which blast charges are inserted. By the action of blasting the peat is displaced outwards, the hard fillings sink into place and can then be consolidated. Ham.

peat bog. A bog containing peat; an accumulation of peat. Webster 3d.

peat charev. See charred peat. Bennett 2d, 1962, 3d.

peatery. A peat bog or peat bank. Webster 3d.

peat coal. b. A. Small usually round stone, especially when worn and rounded by the action of water. Webster 3d. b. A mass of material obtained in a form resembling pebbles. Webster 3d. c. A. A rock composed of rounded to subangular gravel composed of sand and pebbles. Fay.

peat dryer. A. See charred peat. Bennett 2d, 1962, 3d.

peat formation. A process of decomposition and alteration the bituminous and anthracite coals were formed. See also Hilt’s law. Nelson.

peaty. Resembling or containing peat; having the nature of peat. Standard, 1964.

peaty earth. Soil rich in peat or humus. Tomkeieff, 1954.

peaty pitch coal. Same as pitch peat; doppelite. Tomkeieff, 1954.

peas d’ orange. In ceramics, a decoration resembling that of a cant hook, but has the end armed with a strong sharp spike. Webster 3d.

pebble. A small usually round stone, especially when worn and rounded by the action of water. Webster 3d. b. A mass of material obtained in a form resembling pebbles. Webster 3d. c. A rock composed of rounded to subangular gravel composed of sand and pebbles. Fay.

pebble armor. A. The pebble armor of the desert. It is the first suggestion of the name of armoring (panzerung) of the desert as a result of lighter and finer materials being carried away through deflation or wind transportation, while coarser or heavier fragments are left behind. It was Walther, however, who by full descriptions and many excellent photographs showed the great importance of the process over vast areas in the arid regions. A.G.I. b. A. A pebble beach or bar. A.G.I. Supp.

pebble bag. A pit or quag formed by digging out a peat bog. Webster 3d.

pebble beater. A heat exchanger in which the name of armoring (panzerung) of the desert as a result of lighter and finer materials being carried away through deflation or wind transportation, while coarser or heavier fragments are left behind. It was Walther, however, who by full descriptions and many excellent photographs showed the great importance of the process over vast areas in the arid regions. A.G.I. b. A pebble beach or bar. A.G.I. Supp.

pebble bed. A bog containing peat; an accumulation of peat. Webster 3d.

pebble. A small usually round stone, especially when worn and rounded by the action of water. Webster 3d. b. A mass of material obtained in a form resembling pebbles. Webster 3d. c. A rock composed of rounded to subangular gravel composed of sand and pebbles. Fay.

pebble coal. A. Coal composed of rounded to subangular gravel composed of sand and pebbles. Fay.

pebble coke. A. Coal composed of rounded to subangular gravel composed of sand and pebbles. Fay.

pebble heater. A heat exchanger in which refractory pebbles (which may be made of mullite, aluminosilicate, zircon, or corundum) are used as heat carriers. One type of pebble heater consists of two refractory lined chambers joined vertically by a throat; both chambers are filled with pebbles, which descend at a steady rate, being discharged from the bottom of the lower chamber and returned to the top of the upper chamber. In the latter they are heated by a countercurrent of hot gases; in the lower chamber they give up this heat to a second stream of gas or air.

pebble jack. Zinc blende in small crystals or pebblelike forms not attached to rock, but found in clay openings in the rock. Pay.

pebble line. A physical shape of quicklime. Pay.

pebble mill. Horizontally mounted cylindrical mill, charged with flints or selected lumps of ore or rock. Usually long and high diameter. Priory, 3. See also ball mill.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble phosphate. Varieties of natural phosphate that are concretionary or alluvial in origin, hence gravellike. A.G.I.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble phosphate. Varieties of natural phosphate that are concretionary or alluvial in origin, hence gravellike. A.G.I.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble phosphate. Varieties of natural phosphate that are concretionary or alluvial in origin, hence gravellike. A.G.I.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble phosphate. Varieties of natural phosphate that are concretionary or alluvial in origin, hence gravellike. A.G.I.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.

pebble peat. A. Peat accumulating beneath translucent quartz and chalcedony pebbles embedded in the surface of well-drained soils in semiarid regions. Pebble peat is formed by moss and algae and varies in thickness from a thin film to about one-fourth of an inch. Tomkeieff, 1954.
pecotile jade

grayish mineral; tough, compact, and fibrous. It has been used as a material and is possibly of Alaskan Monoclinic. Mohs’ hardness, 5; specific gravity, about 2.87. Shipps.

Pedestal. The soil of humid regions, enriched in aluminia and iron. Accumulates in regions of high temperature and humid climate that are marked by forest cover. Compare pedocal. A.G.I.

pedestal boulder. A class of blocks, the mode of occurrence of which requires specific explanation. These are what may be called pedestal boulders, that is, blocks perched on pedestals of limestone or perched boulder. A.G.I. b. Isolated masses or rock above and resting on a smaller base or pedestal. USGS Bull. 790, 1927, p. 1.

pedestal riveter. A jam riveter and fixed dolly which are carried respectively on opposite side of a frame mounted on a stand. Ham.

pedestal rock. A residual mass of weak rock consisting with bedrock. See also pedestal boulder, b. A.G.I.

pedestrian-controlled dumper. A small dump truck controlled by a man walking alongside it. Ham.

pedal class. In crystallography, the class without any symmetry. A.G.I.

pediment. a. Steep rock slopes having roughly triangular shapes resembling architectural pediments. A.G.I. b. Gently sloping plains, ended by the foot of steep rock cliffs. A.G.I. c. A planed rock surface adjoining a rugged-faced mountain mass, part of an explanation. These are what may be called pedestal boulders. A.G.I. d. A smooth rock plain which forms part of the margin of intrusive masses. A.G.I. e. That portion of the surface of a receding slope, which is underlain by rocks of the upland and is either bare or mantled by a layer of alluvium not exceeding in thickness, the depth of steam during flood; it is essentially a surface of transportation, experiencing neither marked vertical downcutting nor lateral deposition, and displays a longitudinal profile normally concave, but which may be convex at its head in later stages of development. The formation may be found in regions of rising, stationary, or lowering base level. A.G.I. f. A sloping plain which lies at the foot of mountains not covered by alluvium material. See also mountain pediment; rock pediment. A.G.I. g. Gentl.

pedimentation. The bending of erosion surfaces followed in bedrock and generally veneered with fluvial gravels. They occur between mountain fronts and valley or basin bottoms and commonly form extensive bedrock surfaces over which the erosion products from the retreating mountain fronts are transported to the basins. A.G.I.

pedimentation. The bounding of erosion surfaces followed in bedrock and generally veneered with fluvial gravels. They occur between mountain fronts and valley or basin bottoms and commonly form extensive bedrock surfaces over which the erosion products from the retreating mountain fronts are transported to the basins. A.G.I.

pediment passes. The narrow, flat-topped tongs, which stand back from the general pediment, but still penetrating along the mountain sufficiently to meet another pediment slope extending into the mountain from the other side. A.G.I.

pediplane. Broad, rock-cut, thinly alluviated surface formed by the coalescence of adjacent pediments and desert domes. A.G.I.

pedon. The actual possession of a piece of land to the extent needed to give the owner room to work and to prevent probable breaches of the justice, but not necessarily to the extent of a mining claim. Fay.

pedon-genesis. The formation of soil from parent materials. A.G.I.

pedochemical prospecting. Synonymous with geochemical soil survey. Hauk. See also complex pegmatite.

pedology. The science which treats of soils, their origin, character, and utilization. A.G.I.

pedosphere. The part of the earth in which soil-forming processes occur. Schieber.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.

pegmatite. Those igneous rocks of coarse grain found usually as dikes associated with a large mass of plutonic rock of finer grain size. The absolute grain size is of lesser consequence than the relative size. A.G.I.
Pelagic limestone. A rock formed chiefly by the accumulation of the calcareous tests of pelagic or floating organisms. Normally, pelagic limestone is the product of calcium carbonate accumulation in relatively deep water (though not necessarily abyssal). A.G.I. Supp.

pelagic sediments. Pelagic sediments are found in deep water, far from shore. They are generally fine grained and range in color from white to a dark reddish-brown. These sediments may be either inorganic or organic in origin. Those which contain less than about 30 percent of organic remains are called red clay; those which contain more than about 30 percent of organic remains are known as ooze. Mero, pp. 106-107.

pelagic. A name given to certain manganese nodules obtained in deep-sea soundings. A.G.I.

pelagochthonious. A term applied to coal deposits formed from sub-pesident threads and driftwood. Tomkies, 1934.

Pelitian-Cretaceous process. A continuous process of dissolovg silver or gold or cyanide solution and simultaneously precipitating the precious metals with mercury in the same vessel, an electrical current assisting precipitation. Liddell 24, p. 495.

Pelitian furnace. A furnace for the calcination of fine pyritic or other sulfide ores. A.G.I.

pellete. A hypersthene-labradorite dacite similar to the lava of A.G.I. Supp.

Pelte type. In volcanology, activity characterized by production of a crater dome and an expanding cloud of gas and rock fragments. Hess.

Pelt's tears. Small drops of volcanic glass (generally basaltic) with pendant threads, or pairs of drops arranged in dumbbell fashion, thrown out during eruptions of fluid lava. American Geologist.

pelmicrite. Limestone similar to pelsparite except that the ratio of fossils and fossiliferous material is changed. A.G.I. Supp.

pelmorion. A variety of bitumen partly soluble in organic solvent and fusible at 120° C. It may be considered as a variety of polyelaterite. Tomkies, 1934.

pel-mell structure. Coarse deposits of water-worn materials in which there is an absence of bedding. A.G.I.

pelodie. Water-laid sandy clay, usually staked out by hand. A.G.I.

pelodie clay. Northumb. Pure and tough clay, of a variety resembling oolite; it is often called ball clay. Arkell.

pelodie coal. See pellis. A name proposed by W. F. Petty for a bituminous coal (Pelion coal) resembling English coal from near Monte Pelion, Tasmania. A.G.I.

pelite. A general term for clastic sediments composed of clay, minute particles of quartz, or rock flour. A volcanic ash of corresponding grade is called peltic tuff. Holmes, 1928.

pelitic. Pertaining to, characteristic of, or formed of pelite; composed of fine argillaceous sediment or clay. A.G.I.

pelitic granite. A granite rock derived from the metamorphism of argillaceous sediments. C.T.D.

pelitic hornfels. A fine-grained, nonfoliated metamorphic rock derived from a pelitic aluminous sediment. See also hornfels. A.G.I.

pelitic schist. A schistose metamorphic rock derived from a pelitic aluminous sediment. See also schist. A.G.I.

pelitic phyllite. An aggregate of calcite grains with a maximum diameter of millimeters in size. A.G.I.

pellon. A. A sandstone dike. Pettijohn.

pellon deposits. Those deposits found in deep water not far from shore and may be predominantly either organic or inorganic in origin. They are light-colored, reddish or brown, fine-grained, and generally contain some skeletal remains of planktonic organisms. The inorganic deposits are referred to as red clay and the organic deposits as ooze. Mero, pp. 72-73.

pellon division. A primary division of the sea which includes the whole mass of water. This division is made up of the neritic province which includes the water shallower than 200 meters, and the oceanic province which includes the water deeper than 200 meters. A.G.I. Supp.

pellon limestones. Rock formed chiefly by the accumulation of the calcareous tests of pelecypod or floating organisms. Normally, pellicaceous limestone is the product of calcium carbonate accumulation in relatively deep water (though not necessarily abyssal). A.G.I.

pellon wheel. An impulsive water turbine with buckets bolted to its periphery which are struck by a high velocity jet of water.
Pelton wheel

This turbine is most efficient under a head of from 900 to 1,000 feet or more. See also impulse turbine. Hem.

pencil. Pencils are composed of more or less finely powdered aluminum silicate with which are mingled other small particles of various minerals. Webster defines the term pencil as a rod, or a piece of that rod, used of fine mud. Rosenbush states that Naumann referred to pencil as those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.

pen. a. Scot. In longwall working, a narrow airway, more particularly an airway formed along the solid coal. Fay. b. A device to dam the water in a stream; a dam. Webster 3d.

pen. Sp. A large stone or rock in its natural state. Rock; cliff; a term used in Southwestern United States. Fay.

penalty. In connection with a contract for purchase of mineral concentrates by custom smelter, deduction from agreed price for failure to reach agreed assay value on or to eliminate specified contaminants; charged at so much per unit of mineral or metal contained in the concentrate, a penalty clause is one which imposes a penalty for failure to complete work to agreed specifications, such as purity. C. M. D.

pencil. A crystalline limestone which contains trinitite and calcite in approximately equal molecular proportions. C.T.D.

pencil. b. Metal composition used as a pencil core; consists of 70 parts lead, 30 parts bismuth, and 8 parts mercury. Cumm.

pencil. A term used for those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.

pencil. The process of rounding the edges of flat glass. Dodd.

pencil. A term used for those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.

pencil. A device for indicating or calibrating the apparent sensitivity of a radiographic technique. It usually consists of a strip of material of a thickness equal to a specified percentage of the thickness of the material under examination and containing holes of diameters having a specified relation to the thickness of the strip. A.S.M. Gloss.

pencil. A method of nondestructive testing for determining the existence and extent of discontinuities that are open to the surface in the part being inspected. The indications are made visible through the use of a dye or fluorescent chemical in the liquid employed as the penetrating medium. A.S.M. Gloss.

pencil. a. In mechanical mining, the arm which extends between the fullcram jack and the swivel or angle trough or turn. Jones. b. A swinging instrument used for measuring differences in the earth's gravitational field. The pendulum is very seldom used in geophysical prospecting, its chief application being in geodetic and scientific surveys to determine the absolute value of the earth's gravity field. Nelson. c. A body so suspended from a fixed point as to swing freely and for under the combined action of gravity and momentum. Also called a physical pendulum. A.G.I. A vertical bar so supported from below by a stiff spring as to vibrate to and fro under the combined action of gravity and the restoring force of the spring. Also called an inverted pendulum. A.G.I.

pencil. In Vermont, large wooden blocks covered with felt pads that are propelled forward by means of a crank and pitman. Used for polishing monumental stone. Fay.

pencil. A term used for those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.

pencil. a. In mechanical mining, the arm which extends between the fullcram jack and the swivel or angle trough or turn. Jones. b. A swinging instrument used for measuring differences in the earth's gravitational field. The pendulum is very seldom used in geophysical prospecting, its chief application being in geodetic and scientific surveys to determine the absolute value of the earth's gravity field. Nelson. c. A body so suspended from a fixed point as to swing freely and for under the combined action of gravity and momentum. Also called a physical pendulum. A.G.I. A vertical bar so supported from below by a stiff spring as to vibrate to and fro under the combined action of gravity and the restoring force of the spring. Also called an inverted pendulum. A.G.I.

pencil. A term used for those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.

pencil. The process of rounding the edges of flat glass. Dodd.

pencil. A term used for those sediments composed of the finest detecting portion, in which are clay, in others calcareous, and in still others are mixtures of clay and calcareous materials. Synonym for pencil; mudstone. A.G.I.
penetration per blow

or penetrometer is driven into the forma-
tion being tested by each blow delivered
by a specifc-size driverhammer allowed
to fall a given distance.

penetration rate. a. The actual rate of pene-
tration of drilling tools. B.S. 3618, 1963,
see. 3. b. See heat rate. Long. c. See drill-
ing rate. Frangsten.

penetration resistance; standard penetration
resistance; proctor penetration resistance.
a. Tn number of blows of a hammer of
specified weight falling a given distance
required to produce a given penetration
into soil of a probe or instru-
ment. ASCE P1826. b. The unit load
required to maintain constant rate of pene-
tration into soil of a probe or instru-
ment. ASCE P1826. c. The unit load
required to produce a specified penetra-
tion into soil at a specifed rate of a probe
or instrument. For a proctor nee
dle, the specifed penetration is 2/3 inches
and the rate is 1/2 inch per second. ASCE
P1826.

penetration resistance curve; proctor pene-
tration curve. The curve showing the rel-
ationship between the penetration resis-
tance and the water content. ASCE
P1876.

penetration speed. The speed at which a drill
can cut through rock or other material.
It depends on (1) the hardness of the rock
or soil, per blow, or rota-
tion, of the drill; (3) number of blows per
minute or speed of rotation; (4) the dis-

tance of the bit; and (5) the type and sharpness
of the bit. Hand-
held and air-percussive drills (200
inches per minute) require a speed of
2 feet per minute in soft to medium Coal
Measures rocks, and about 1 foot per
minute in medium to hard rocks. A drill
rig (3-inch-diameter bore) will give
about 2 feet per minute in medium to hard rocks. See also overall drill-
ing time. Nelson.

penetration. A test to determine the rel-
ative resistance of the rocks. Nelson.

penetration twin. A twin crystal in which the
two parts interpenetrate each other. Com-
pare contact twin. Fay.

penetrometer. a. A cone penetrometer having
the assemblage of a deflection dial indi-
cator mounted inside a proving ring,
which is coupled to the drill rod project-
ing above the ground. Force is applied
to the top of the proving ring, and the
amount required to drive the cone into
the formation being tested is recorded,
ina funnel, on the dial indicator. See also
cone penetrometer. Long. b. An instrument
which automatically records the depth
penetrated and the penetration rate. B.S.
3618, 1963, sec. 3. c. A test or an instrument for meas-
uring the consistence of semisolids (as pitch or grease) from the depth to
which a probe was driven, under gravity condi-
tions, or (2) a penetrometer. Webster 3d.

penetrometer, coal. An instrument to assess
the strength of a coal seam, its relative
workability, and the influence of roof
pores. Nelson. 

pentaborane. A liquid, BH5, with a hearing
point of -71° and a boiling point of 277°.
It is a flammable, non-toxic, organoborane.
Nelson.

pentacalcium trislumbstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium triolinate. See also triolinate.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.

pentacalcium trisulphstc. A compound for-
med by action of sea water on ancient shales in Laurin, Greece; Sierra
Gorda, Chile. American Mineralo-
 gist, 26, No. 4, April 1941, p. 293.
pentachloroethane; pentaline

pentachloroethane. Pentane. Dense, high-boiling; colorless; liquid; CHCl₃CCl₃; specific gravity 1.685 (at 15°C, referred to water at 4°C); boiling point, 159.5°C; freezing point, -22°C; refractive index, 1.505 (at 24°C); insoluble in water; used as a solvent for oil and grease in metal cleaning and for the separation of coal from impurities by denitrifying. See. C.C.D. Ed. 6, 1961, p. C.449.

pentagonal dodecahedron. In the isometric system, a form of pyritohedral symmetry, enclosed by five-twelve faces, each parallel to one axis and cutting the other two axes at unequal distances; a pyritohedron; pentahedron.

pentahydrate. Magnesium sulfate pentahydrate, MgSO₄.5H₂O, triclinic, artificial, but crystallizes in a less perfect form in which it can be distinguished by its octahedral cleavage. Also called nicopryte. C.T.D.; Dana 17.

pentane. A liquid hydrocarbon, C₅H₁₂, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentagonal marble. One of the most famous of the statuary marbles; from Nova-Alexandria, Poland. English.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.

pentane. A liquid hydrocarbon, CH₃C₂H₄, of the pentane system, a form of pyritohedral symmetry, enclosed by twelve five-sided faces, each face enclosed by two axes at unequal distances; a pyritohedron; pentahedron.
lodged. A boulder, believed deposited by a glacier, lying in an unstable position.

A.G.T. Not ground water. Ground water separated from an underlying body of ground water by unsaturated rock. A water table.

A.G.I. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

saturated water. Water percolating through unsaturated rock. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

saturated water. Water percolating through unsaturated rock. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

pervious stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.

unpermeable stratum. A water table usually of limited area maintained at a higher level than the water table. See ASCE P1826.
periblinité

of perblain. It consists of cortical tissue almost jellified in bulk but still showing indications of cell structure under the microscope. A.G.I. b. A distinction of teli- nite, a botanical origin (cortical tissue). A.G.I.

periclase. Natural magnesium oxide. MgO, found in some marble. Easily alters to brucite. Colorless to grayish white, yellow, brown, green to black; luster vitre- ous; hardness 3.5; specific gravity 3.5. Found in California, New Mexico; Euro- pe. Used in refractories (especially pref- phlegon). C.C.D. 6d, 1967.

periclinal. Dipping in all directions from an elevated center. See also quasiversal.

periclinal structure. Dipping on all sides from a central point or apex. Synonym for dome; quasieurial A.G.I. b. Beds dipping radially outward from or inward towards a center, to form a dome or basin. A.G.I.

pericline law. Triclinic crystal system twinning. The developing pinacoids of the twins are parallel, the crystallographic b axis acting as the twinning axis. Hess.

pericline twinning. Usually arranged in orthogonal pattern parallel and trans- verse to current direction with wave length up to 100 units and up to 30 centimeters high. Pettijohn.

pericline twin. A twin crystal, in the mono clin cleavage. Fay. a. The outer boundary of any plane figure. Peripheral objects, such as radial or circular object travels, expressed in feet per second; sometimes incorrectly called li- near travel by some drillers. Also called surface speed. Long. b. The speed at which any point on the face of a wheel is traveling when the wheel is revolving, expressed in feet per minute. A.S.C.G., 1963. c. That of particle or point at ext- reme radius of system as part of which it rotates, for example, ball in mill, tip of impeller. Fryor. d. See cutting speed. A.G.I. G.M. 6d.

peripheral-turbine pump. This pump—some- times called a regenerative pump—is clas- sified with centrifugal pumps, but is de- signed to develop several times the head obtained from a centrifugal pump having the same diameter impeller and speed. The maximum head developed does not have the same relation to the impeller diameter and speed of the centrifugal, and involves raising and backing of the im- peller vanes, fluid channels, and other factors. Pit and Quarry, 53rd, Sec. E, 1960.

peripheral ventilation. A mine ventilation system in which the upcast shaft for taking out the air is placed on the limits of the mining field or away from the downcast shaft. Also called transtional or one-way ventilation. Story, v. 1, p. 329.

dur. To diastegrate as a result of slow hydration on exposure to moist air; calcined dolomite diastegrates in this manner if stored for more than a short period. A.G.I.

perikelf. A whitish, adularialite albite, slightly iridescent. Fay.

peritite. An isotermal reversible reaction in which a liquid phase reacts with a solid phase to produce another solid phase on cooling. A.S.M. Glass.

peritectic reactions. The reactions between solid phases and still unsoftened por- tions of the liquid melt. Rice.

peritectol. An isotermal reversible reaction in which a solid phase reacts with a second solid phase to produce yet a third solid phase on cooling. A.S.M. Glass.

perikléwic method for preventing kiln scum. A process in which clay bricks, prior to their being set in the kiln, are coated with a combustible, for example, tar or a mixture of gelatin and flour; should sul- fur compounds be used on the bricks during the early stages of firing, the deposit will fall away when the combusti- ng gas passes through the unburned top of the kiln. A.S.C.G.

perikléwic. An imperfectly fired brick; a place brick. Fay.

perikleitos. A name from the Greek word for dark, and proposed by Turner as a col- lective term for the rocks usually called pyroxenites and amphibolites, which, more properly, are seen to be for the most part periodic arrangements the elements.

period. a. A major, worldwide, standard geologic time unit corresponding to a system. An interval of time characterized in some particular way. A.G.I. Supp. c. Time required for a re- current motion or phenomenon to com- plete a cycle and begin to repeat itself. A.G.I. Supp. d. The duration of one complete cycle of a periodic function; the reciprocal of the frequency of such a function. The independent variable is limited to time. A.S.M. Glass. c. The ele- ments between an alkali metal and the rare gas of next highest atomic number, inclusive, occupying one (a short period) horizontal row or two (a long period) horizontal rows in the periodic system. C.T.D. The time required for the power level of a reactor to change by the factor 2.718, which is known as e. L.S.L. periodic arrangement. An arrangement of elements in the order of their increasing atomic numbers. As a result of this ar- range ment the elements fall into nine natural groups (though group VIII), the members of each resembling each other very strongly. Crispin. See also periodic law; periodic system; periodic table.

periodic drier. A drier in which ware is fired, cooled, and unloaded to complete the cycle. The kiln is started and unloaded in contrast to a continuous drier. A.S.C.G., 1963.

periodic kiln. A kiln filled with ware, fired, and cooled; the cycle is repeated again; or any type of kiln which must be loaded, fired, cooled, and unloaded to complete the cycle. The kiln used for this type of kilns are updraft and downdraft. A.S.C.G., 1963.

periodic law. a. A law in chemistry dis- covered by Mendeleev. The physical and chemical properties of the elements are periodic functions of their atomic weights. Webster 3d. b. The physical and chemical properties of the elements depend on the structure of the atom and are for the most part periodic functions of the atomic number. Webster 3d. See also periodic arrangement; periodic system; periodic table.

periodic reverse. Pertains to periodic changes in direction of flow of the current in electrolysis. It applies to the process and also the machine which controls the time for both directions. Symbol, PR. A.S.M. Glass.

periodic system. A classification of the ele- ments, in nine groups (group O through VIII), which demonstrates that the physi- cal and chemical properties of an ele- ment and its compounds vary periodic- ally with the atomic number of the element. The system was perfected, as far as possible, from 1869 onwards, by Meyer and Mendeleev. C.T.D. See also periodic arrangement; periodic law; periodic table.

periodic table. An arrangement of elements based on the periodic law and proposed in various forms that are usually either short with only short periods (as in Mendeleev's original table) or long with long periods (as in most modern tables). Webster 3d See also periodic arrangement; periodic law; periodic system; periodic table.

periodic time. See period, d.

peripheral clearance angle. See clearance angle. A.S.M. Glass.

peripheral faults. Faults along the periphery of a geologically elevated or depressed region. A.G.I.
the perlites consist chiefly of zoanno-
clinopyroxene and amphibole with sub-
ordinate orthorhombic pyroxene, olivine,
and plagioclase. They are lower in aluminas and alkalies than the dior-
ites and gabbros, and lower in magnesia
and alkalis than the dior-
ites and gabbros. Found in Cali-
ifornia, Colorado, New Mexico, Nevada,
Oregon. Used as lightweight concrete ag-
gregate; as insulation for liquid fuels; cata-
vast support. CDC 6d, 1961.

perlite iron. See pearlite iron. C.T.D.

perlite. A volcanic glass having numerous
perlitic structure. A structure produced in
perlite iron. See pearlite iron. C.T.D.

permanent deformation. See set, z. Ro.

permanent adjustment. The adjustment of a
permafrost drilling. Boreholes drilled in sub-
permanent hardness of water. Water hard-
ness which cannot be removed by boil-
ing. See also hard water. Nelson.

permanent hard water. Hard water, which
cannot be softened by boiling; water con-
taining magnesium sulfate or calcium sul-
fate. Bennett 2d, 1962. Also called per-
manent water. The completed assembly of
tails, sleepers, fixings, and ballast form-
ing the finished track for a railway. Ham.

permanent water. The completed assembly of
tails, sleepers, fixings, and ballast form-
ing the finished track for a railway. Ham.

permanent water. The completed assembly of
tails, sleepers, fixings, and ballast form-
ing the finished track for a railway. Ham.

permanent monolith. A monument of a
permanent monument. A monument of a
permanent mold. A metal mold (other than
a mold made from a wax pattern) of two or more parts
which are on which the mine depends for
the final disposal of drainage. As they are
usually not moved during the life of
the mine, their location, installation, and
design require careful consideration.

permanent set. The permanent change of
shape of a plastic substance due to its
imperfections; that is, to the incompleteness of its recovery after
being stressed. Holmes, 1926.

permanent shuttering. A lining to formwork
towards concrete as a permanent shaft
support. Nelson.

permanent shuttering. A lining to formwork
towards concrete as a permanent shaft
support. Nelson.

permanent permeability. a. The permeability (or per-
viousness) of rock is its capacity for
transmitting a fluid. Degree of permea-
bility depends upon the shape of the pores, the size and shape of their
interconnections, and the extent of the interconnections. It is
measured in a vacuum, at which a fluid of standard viscosity can
move a given distance through a given interval of time.

Permigel. Gelatinous permissible explosive.
permignel. A solution of a naphthalene poly-
mer in toluene. Used as a permanent ce-
ment for cover glasses. Bennett 2d, 1962

permit. An artificial sodium aluminum silicate, NaAlSi3O8 (zeolite), obtained by melting aluminum silicate, sodium carbonate, and sand. A granular powder used for softening of water, as the so-
adium can be replaced by calcium, mag-
nesium, iron, or manganese. Dict. 

permeable. A. Means completely assembled
and conforming in every respect with the
design formally approved by the United
States Bureau of Mines for use in gassy
and dusty mines. BuMines Bull. 514, 1952,
Vol. 3. b. A machine or explosive is said
to be permissible when it has been ap-
proved by the United States Bureau of
Mines for use underground under pre-
scribed conditions. All flameproof machin-
ey is not permissible but all permissible
machinery is flameproof. B.C.I. c. A low-
flame explosive used in gassy and dusty
coal mines. Nichols. d. That may be per-
mitt: allowable; admissible. Webster 3d.

permissible blasting unit. An electrical device
for firing blasts, approved by the U.S.

permissible. See maximum permissible
dose. L&L.

permissible dustiness. See dust-free condi-
tions. Webster 3d.

permissible explosive. a. An explosive simi-
lar in all respects to samples that passed
certain tests made by the Federal
Bureau of Mines and installed and used in
accordance with the conditions pre-
scribed by the Bureau. See explosion-
proof motors. Fay.

permissible velocity. The highest velocity at
which water may be carried safely in a
channel or other conduit: the highest ve-
locity throughout a substantial length of
a conduit that will not scour. Selvey, 1.

permissible mine equipment. Permissible mine
equipment is that formally approved by the
U.S. Bureau of Mines after having passed
the inspections, the explosion test, and other requirements specified by the
Bureau. (All equipment so approved must
carry the official approval plate required
as identification of permissible equip-
ment. ASA M21-1963.

permissible mine locomotive. See electric
permissible mine locomotive.

permissible motors. A motor the same in all
respects as a sample motor that has passed
certain tests made by the Federal Bureau
of Mines and installed and used in
accordance with the conditions pre-
scribed by the Bureau. See explosion-
proof motors. Fay.

permite. A member of a geophysical
field party whose duty is to obtain per-
mission from landowners for the party
to work on their lands, or from public
officials for the party to work along high-
ways. A.C.I.

permitted explosives; permitted. a. Explosives
that have passed the Buxton tests
and placed on the British list of author-
ed explosives; implying that they are
reasonably safe to manufacture, handle,
transport, and use in safety lamp mines.
Upon detonation, a permitted explosive
(1) gives off the minimum possible quan-
tity of noxious gases, and (2) produces
a flame of the lowest possible tempera-
ture and shortest possible duration, to lessen
the risk of fire-damp ignition. The ex-
plorative contains cooling agents, such as
sodium chloride, and is not a combustible
material. The first British permitted list of explo-
sives was published in 1899. Nelson, b.

permitted explosive. One which has been
approved for use in coal mines where
there is any possible risk of igniting fire-
damp or coal dust. In Great Britain, an
explosive is approved by the Minister of
Power and placed on the Permitted List
after it has passed the official gallery
tests prescribed for the particular class of
explo sives to which it belongs. These
tests are carried out at the Safety in
Mines Research Establishment's Testing
Station at Buxton. McAdam II, p. 34.

perpendicular separation. The perpendicular
distance between the corresponding planes in
the two parts of a single body available as
a criterion for determining whether the
layer bed), when this body has been sepa-
rated by a fault, the planes on each side
of the fault being projected in the
purpose of measuring, if necessary.
perpendicular separation

Stokes and Yarns, 1955.

perpendicular slip. The component of the net slip perpendicular to the trace.

perpendicularly. perpendicularly throw. The distance between the two parts of a disrupted bed, slice, vein, or of any recognizable surface, measured perpendicularly to the bedding plane or to the surface in question. It is measured, therefore, in a vertical plane at right angles to the strike of the disrupted surface. Fay.

perpetuity. An annuity whose payments are supposed to continue forever. Fay.

periphery. a. Titanolitsite of Yt, Ce, with some Th, Ce, P2O5 (near chevronite); monoclinic (orthite habit). Snyder, 1940. b. Identified with tachelffinite. Crosby, p. 82.

Perrin's process. Process of dephosphorizing steel by inoculating the charge. About 0.03 percent, removing the normal, first high-phosphorus slag on the metal, and then agitating the steel with a fresh highly-basic slag. Bennett 2d, 1962.

persemantic. Used by Cross, Iddings, Pirson, and Washington to denote the relative amounts of groundmass and phenocrysts in porphyritic rocks, the ratio between groundmass and phenocrysts being less than 1.7. Jensen, e. t., 1929, p. 227.

Perthibecker furnace. A continuously working shaft furnace for roasting quicksilver ores having two fireplaces at opposite sides. The fuel is wood. Fay.

perian red. See Indian red. Fay.

persillicic. a. Containing more than 60 percent silica; said of some igneous rocks; same as, and much preferred to, acid, and acidic, which it is replacing. Fay.

b. Suggested to replace the term acid as applied to igneous rocks; for intermediate and basic the corresponding terms are mediosillicic and subsillicic. Rice.

persistence; afterflow. Of a cathode-ray tube, the decaying luminescence of the screen after the stimulus has been reduced or removed. NCB.

persistent. Continuous; ce bodies are often persistent in depth and metal contents. von Bernrath.

peritoneal equation. Systematic error arising with the current, usually due to time lag between event and recording. Pryor, 3.

personal error. Usually a biased error, but may be random, occurring under special conditions. Pryor, 3, p. 159.

peroneal. a. Pertaining to the hind leg. The maintenance of good relationships within an organization. By considering the well-being of the individual, it enables all those engaged in the undertaking to make their maximum contribution to the effective work of the organization. Nelson.

peronnel officer. A specialist adviser to mine management and officials on all questions affecting relations between the workers and the management. Nelson.

peronnel proximity survey. A survey of radiation conditions at positions occupied by workers near apparatus emitting radioactivity. NCB.

persorption. Deep sorption of gas by liquid.

persuader. A common term for crombar, lever, or some such article used as a manual aid in moving heavy objects. Crispin.

pertholite. A deep-seated igneous rock consisting of alkaline feldspar with less than 3 percent dark minerals. Feldspar, both orthoclase and albite, may be pertholite intergrown as aphyroite or as aphyroite. Hass.

pertholite. A leucocratic monzonite consisting almost entirely of perthitic feldspars (microperthite and antiperthite) plus accessory aegirine, augite, and opaque oxides. A.G.I.

periphery. A name given to the internal vibration of a concrete. Peric. See permeable. A.G.I.

peripheral bed or stratum that contains voids through which water will move under ordinary hydrostatic pressure. Fay.

perithecium. Porous or fissured rocks through which water can filter. Pryor, 3. b. A usually club-shaped implement for pounding, stamping, or grinding substances, especially in a mortar. Webster 3d. a. As a verb: to beat; to crush; to pound; to pulp; or to mix, as if with a pestle. Webster 3d. c. Any of various devices for pounding, stamping, or pressing. Webster 3d.

perlite. A colorless, white, gray, or occasionally pink mineral, LiAlSi2O5 or Li2O.Al2O3.SiO2I; white streak; vitreous luster; monoclinic. Seems speckled in appearance. Contains 59 percent lithium, sometimes with partial replacement by sodiuym or, less often, by potassium. Insoluble in acids. Specific gravity, 2.39 to 2.46. Mohs' hardness, 6 to 6.5. Found in Massachusetts, Maine; also in ceramics and glass; a source of lithium salts. CCD 6d, 1961; Dana 17.

petaloid. Resembling a flower petal in form, texture, and basic the corresponding terms are medio-petaloid and basic-petaloid, which it contains or is basic-petaloid. Rice.

petalite. A colorless, white, gray, or occasionally pink mineral, LiAlSi2O5 or Li2O.Al2O3.SiO2I; white streak; vitreous luster; monoclinic. Seems speckled in appearance. Contains 59 percent lithium, sometimes with partial replacement by sodiuym or, less often, by potassium. Insoluble in acids. Specific gravity, 2.39 to 2.46. Mohs' hardness, 6 to 6.5. Found in Massachusetts, Maine; also in ceramics and glass; a source of lithium salts. CCD 6d, 1961; Dana 17.

petate. Resembling a flower petal in form, texture, and basic the corresponding terms are medio-petaloid and basic-petaloid, which it contains or is basic-petaloid. Rice.

petrified. Of or pertaining to rock; rocky. Webster 2d.

petrochemicals. Aggregates or clusters of tabular crystals of barite, which form chiefly in sandstones, enclosing the sandy matrix within the crystals. A.G.I.

petroleum. Wood. See wood, b.; silicified wood. Fay.

petrify. To become stone. Organic substances, such as shells, bones, wood, etc., embedded in sediments become converted into stone by the gradual replacement of their tissues by the colloidal, with corresponding amounts of infiltrated mineral matter. Thus, not only the outward forms but even the minutest details of the organic tissues are preserved. Fay.

petrify. A stone or rock. Fay.

petro- Organism. A greenish-yellow hydrocarbon with a pearly luster, needle-like crystals, obtained by the distillation of petroleum residue at a red heat. Fay.

petrochemicals. A. Chemical compounds made
petrochemicals

with a petroleum hydrocarbon as one of their basic components; for example, am-

petrochemistry. a. The chemistry of rocks. AGI Supp. b. The chemistry of petroleum: disapproved by some geochemists. AGI.

petrofabric analysis. Synonym for petrofabric analysis. AGI.

petrofabrics. The study of spatial relations, especially on a microscale, of the units that comprise a rock, including a study of the movements that produced these elements. The units may be rock fragments, mineral grains, or atomic lattices. AGI.

petrogenesis. A branch of petrology which deals with the origins of rocks, and more particularly with the origins of igneous rocks. AGI.

petrogenetic. Those elements that are characteristically concentrated in certain rock types, as opposed to those concentrated in ore deposits (metallogenic). AGI.

petrography. See petrogenesis. AGI.

petrographer. One who is versed in or engaged in petrography, or the study of rocks. Fay.

petrographic; petrographical. Pertaining to or resulting from the study of rocks. Stokes and Varne, 1955.

petrographic microscope. A microscope specially fitted with optical and mechanical accessories for identifying and studying the properties of minerals in granular form or in thin sections of rock. Sinkers.

petrographic province. A natural region within which some or all of the igneous rocks present certain well-marked peculiarities in their mineralogical and chemical composition; structure, texture, etc., that set them apart from rocks of other petrographic provinces. Fay.

petrography. A general term for the science dealing with the description and systematic classification of rocks based on observations in the field, on hand specimens and on thin sections. Petrography is thus wider in its scope than lithology, but more restricted than petrology, which implies interpretation as well as description. Holmes, 1928.

petrol. The term used particularly in England to designate petroleum or its deriv- atives; as gasoline or motor spirit. Shell Oil Co.

petroleum. A neutral unstable substance that is practically odorless and tasteless and is insoluble in water, that is obtained from petroleum, and differs chemically from paraffin wax in containing unsatu-rated hydrocarbons or naphthenes as well as hydrocarbons of the methane series, and that is produced in several forms: as (1) a yellowish to light amber semisolid jelly, white paraffin; (2) a liquid known as petrolatum; and (3) liquid petroleum. Webster 3d.

petroleum distillation. The medicinal high-boiling petroleum oil of the United States pharmacopoeia. See also petrolatum. Fay.

petroleum. A liquid hydrocarbon mixture obtained from bitumen or asphalt. Fay.

petroleums. An internal-combustion reciprocating engine powered by motor spirit, which is fueled by electrical spark. See also diesel engine. Ham.

petroleum. Material occurring naturally in the earth composed predominantly of mixtures of chemical compounds of carbon and hydrogen with or without other nonmetallic elements, such as sulfur, oxygen, nitrogen, etc. Petroleum may contain or be composed of such compounds in the gases evolved on heating, and/or solid state, depending on the nature of these compounds and the existent conditions of temperature and pressure. API Glossary.

petroleum asphalts. A group of asphalt refined directly from petroleum. Most asphalt used in highway work is of this type. Shell 2d ed.

petroleum briquet. A briquet made of petroleum, soft soap, resin, and soda-lime wash. The mixture is hot rolled to solidify, run into molds and then heated in a furnace for about 15 minutes. Fay.

petroleum coke. a. The residue obtained by the distillation of petroleum. It usually shows the following composition: 5 to 10 percent volatile and combustible matter, 90 to 95 percent fixed carbon, from a trace to 0.3 percent ash, and from 0.5 to 1 percent sulfur. On account of its purity, it has found application in metallurgical processes and in making battery carbons and carbon pencils (electric carbons). Fay. b. Coke-like material used in cavities of igneous rocks intrusive into crypto- porous sediments. Tomkiewicz, 1954.

petroleum coke base carbon refractory. A manufactured refractory composed sub- stantially of calcined petroleum coke. ASTM C71-64.

petroleum engineman. Petroleum production, one who performs engineering work concerned with drilling of wells and production of oil or gas. May be known as gas engineer if worker is concerned only with natural gas production. D.O. 1.

petroleum ether; ligroin; benzine. a. The terms petroleum ether and benzine are obsolete synonyms. See also ligroin. CCD 6d, 1961. b. A mixture of hydrocarbons boiling from 40° to 60° C; a mixture of middle-boiling liquid alkanes. Handbook of Chemistry and Physics, 42d ed., 1960, p. 1581.

petroleum geologist. A geologist engaged in petroleum exploration or exploitation, or in research pertaining to petroleum. AGI.

petroleum geology. The branch of economic geology that deals with the problems of location, origin, migration, and accumulation of natural oil and gas. Stokes and Varne, 1955.

petroleum industry. A combination of a petroleum product and a soap or a mixture of soaps, suitable for certain types of lubrication. Hess.

petroleum naphtha. A generic term applied to a refined, partially refined, or unrefined petroleum products and liquid products of natural gas, not less than 10 percent of which distill below 26° F (−3° C), and not less than 95 percent of which distills below 46° F (240° C), when subjected to distillation in accordance with ASTM Method D 86. Test for Distillation of Gasoline, Naphtha, Kerosine, and Similar Petroleum Products. ASTM D 288-57.

petroleum-oil cement coal. Another name for oil shale. Tomkiewicz, 1954.

petroleum pitch. See pitch, p. Fay.

petroleum series. The petroleum series embraces gases, liquids, and solids. The chemistry is very complex, but most of the members belong to the man gas or par- fin series of compounds, C1H2.. CnH2n. Up to C4H10, they are gases at ordinary temper- ature; from C5H12 n they are solids. The gases are called natural gas; the liquids, petroleum; the thick, black tarry liquids, maltha; the petroleum or fractions, temperature, of tough leathery character, asphalt; the brittle coal-like substances, asphalite; and the natural paraffins, ozokerite. Stokes and Varne, 1955.

petroleum spirits; mineral spirits. A refined petroleum distillate with volatility, flash point, and other properties, making it suitable as a thinner and solvent in paints, varnishes, and similar products. The term turpentine substitute as applied to petro- leum spirits is to be condemned as false and misleading. In Great Britain, the term petroleum spirits is applied to a very light hydrocarbon mixture having a flash point below 32° F (0° C). ASTM D 288-57.

petroleum tar. A viscous black or dark brown product obtained in petroleum refining, which will yield a substantial quantity of solid residue when heated, or evaporated or fractionally distilled. The term tar should never be applied to materials de- rived from crude petroleum, or from coal, without the prefix petroleum. ASTM D 288-57.

petroleum tar sands. Native asphalt, solid and semisolid bitumen, and bituminous rock (including oil-impregnated rock and sands from which oil is recoverable only by special treatment after the deposit is mined or quarried). Williams.

petroleum to treat or impregnate with petroleum, or a petroleum product. Webster 3d.

petrologist. a. Another name for geologist. Tomkiewicz, 1954. b. A term proposed to cover the substances in shale, coal, etc. that are the oil when heated out of contact with air. Hess.

petrologist. A geologist who specializes in the study of rocks. AGI.

petrology. A general term for the study, by all available methods, of the natural his- tory of rocks, including their origins, present conditions, and history. Webster 3d.

petrology comprises petrography on the one hand, and petrogenesis on the other,
petrology

and properly considered, its subject matter includes ore deposits and mineral deposits in general as well as rocks in the more limited area in which that term is generally understood. Holmes, 1928.

petrilo-shale. Another name for oil shale.

petrophysics. The physics of rock behavior; in petroleum geology, the study of the physical properties of reservoir rocks. Schieflerdecker.

petrolaurate. A little-used term for oil shale. Haeu.

petrocalcites. An old name for extremely fine crystalline porphyrites and quartz porphyrites, and for those fine-grained aggregates we now know to be detrital glasses; also for the groundmasses of the former which though not glassy are yet not resolvable by the microscope into definite minerals. It was practically a confession by the petrographers that they did not know of what the rock consisted. See also felsite; microfelsite. Also called hornstone. Fay.

petrochemistry. See structural petrology. A.G.I.

petrolone. A machine for slitting rocks. Fay.

petrane. Hard, like stone; as, petrane phosphates or petrane marl. Standand. 1964.

petrunella. A variety of feldspar that is mixed with kaolin, and used by the Chinese in the manufacture of porcelain. Also spelled petrunye. Standard. 1964.

petta. A telluride of silver and gold, (Ag, Au). Sapp. d. In physical chemistry, a concentration of hydrogen ions in an aqueous solution. It is a convenient method to the base 10, of the reciprocal of the activity of the hydrogen-ion. See also pulverized fuel ash. Dodd.

petromeric. A machine for converting an alternating current into an alternating current of a different number of phases and the same frequency. Webster 3d.

petrologic. The derivation of a signal whose amplitude is a function of the deviation in phase of a single frequency-alternating quantity (voltage or current) from a similar quantity of fixed phase. ASM Gloss.

petrogram. A graph in which two or more of the variables' temperatures, pressures, and concentrations are plotted against one another, designed to show the relationships of the variables of the system for various phases of a heterogeneous system. A.G.I. b. The same as constitution diagram. ASM Gloss.

petroglyph. A device for measuring the difference in phase of two alternating currents or electromotive forces. Webster 3d.

phase rule; Gibb's phase rule to which the rotation, oscillation, or variation has advanced considered in its relation to a standard position or stage in which that term is generally understood. Holmes, 1928.

phase rule. A concordant intrusive in the crest of an anticline and trough of a syncline, hence in cross section, it has the shape of a doubly convex lens. A.G.I.

phaneite. A general term applied to wholly crystalline rocks, the constituents of which may be distinguished with the unaided eye. The adjective form phaneritic is currently used more frequently than the noun. A.G.I.

phantasm. A textual term applied to igneous rocks in which all the crystals of the essential minerals can be distinguished with the unaided eye; that is, megascopically crystalline. Compare cryptocrystalline; microcrystalline. Opposite of aphaniatic. Sloss and Vincent, 1935.

phanerocrystalline. See phaneritic. A.G.I.

phanerology. A machine for converting an alternating current into an alternating current of a different number of phases and the same frequency. Webster 3d.

phan赌. A positive action of force or current; in electrical systems, a phase relationship, indicating the trend of the dip but not necessarily coinciding with an actual boundary plane. Schieflerdecker.

pharmacodynamics. See pharmaceuticals. Used by Wadsworth to include all minerals employed in medicine. Fay. ph. macule. A white, hydrous arsenate of calcium, probably $\text{H}_2\text{CaAsO}_4\cdot\text{H}_2\text{O}$; monoclinic. Fay.

pharmacology. A hydrous, iron arsenate commonly occurring in green or yellowish-green cubic crystals. Also called iron sin.

phased. The angle by which the rotation, oscillation, or variation has advanced considered in its relation to a standard position or stage in which that term is generally understood. Holmes, 1928.

phase displacement. The angle by which the amount of difference of phase between two alternating currents of the same frequency is expressed. Standard, 1964.

phased detector. A device for measuring the difference in phase of two alternating currents or electromotive forces. Webster 3d.

phase rule; Gibb's phase rule. a. The number of degrees of freedom of a system that are identical in chemical composition and physical state. C.T.D.

phase angle. An angle expressing phase or phase difference. Webster 3d.

phase-balancing relay. Relays which protect an electrical system from faults occurring in any phase of a three-phase system. Quite often a fault current will not be large enough to trip the overcurrent relay but will operate the phase-balancing mechanism. Coal Age, v. 71, no. 8, August 1966, p. 270.

phase change. The appearance or disappearance of one or more phases. A.G.I.

phase contrast microscopy. An optical system in which the phase difference between an incident and a directed light is increased from about 90° to about 180° so that the two waves cancel out, causing a transparent object to appear to some extent light absorbing. Fay. 2.

phase control. The process of varying the point within the cycle at which anode conduction is permitted to begin. Coal Age, 1.

phase converter. A machine for converting an alternating current into an alternating current of a different number of phases and the same frequency. Webster 3d.

phase diagram. A graph in which two or more of the variables' temperatures, pressures, and concentrations are plotted against one another, designed to show the relationships of the variables of the system for various phases of a heterogeneous system. A.G.I. b. The same as constitution diagram. ASM Gloss.

phase displacement. The angle by which the amount of difference of phase between two alternating currents of the same frequency is expressed. Standard, 1964.

phased detector. A device for measuring the difference in phase of two alternating currents or electromotive forces. Webster 3d.

phase rule; Gibb's phase rule. a. The number of degrees of freedom of a system that are identical in chemical composition and physical state. C.T.D.
phase rule; Gibbs' phase rule

818 phosphate rock

its three physical phases there are no degrees of freedom and the system can exist only in one state (a single phase or con
(nature of the system (the number of variable factors, such as temperature, pressure, and concentration, of the components, which must be arbitrarily fixed in order that the condition of the system may be perfectly defined). C is the number of components of the system. F is the number of phases of the system. The Handbook of Chemistry and Physics, 45th ed., 1964, p. C-466; C.D. 64, 1961.

phenomenon. In gemology, an optical effect in visible light occurring in certain, but not in all, specimens of a species. See also adulardescence; asterism. Shipley.

phenomenon. A gemstone exhibiting an optical phenomenon. See also pheno

phenacite; phenakite. A natural beryllium silicate, Be3SiO6; colorless or yellow, red, or brown in color. White streak; vitreous luster; specific gravity, 2.5 to 2.6; Mohs' hardness, 3 to 3.5; rhombohedral. Found in Colorado, Montana, New Hampshire; U.S.S.R.; France; Norway; Mexico; Brazil. Used in gem stones. C.D. 64, 1961; Dana 17.

phenakite. See phenacite.

phenakite. a. A transparent or translucent stone of colorless to greenish or crystalline character, used by the ancient Chinese for windows. Webster 3d. b. A variety of mica with substitution of aluminium for magnesium and silicon. Webster 3d.

phenakite. a. Applied to certain conditions under which coal was formed, namely those of open waters into which the plant debris was swept from the adjoining land. Tomkies, 1954, b. Refers to vegetable matter deposited under water in contrast to that laid down on a wet substratum. Compare cryptphydrous. A.G.I.

phenakite. An artificial stone in which furnace slag is used in place of sand. Fay.

phenanlite. Phenoclasts are the larger, more conspicuous fragments in a rudaceous rock, a conglomerate or breccia, as distinct from the fine rock material (the matrix) in which they are embedded. Chalino-

phenanlite. a. A transparent or translucent stone of colorless to greenish or crystalline character, used by the ancient Chinese for windows. Webster 3d. b. A variety of mica with substitution of aluminium for magnesium and silicon. Webster 3d.

phenanlite. An artificial stone in which furnace slag is used in place of sand. Fay.
phosphate rock

cium phosphate largely in the form of apatite usually together with calcium carbonate and other minerals, that is useful in fertilizers and is a source of phosphorus compounds, and that occurs in the phosphorite deposits in the United States and in extensive deposits in Arkansas and the southeastern United States. *Webster 3d.*

**Phosphates.** Salts formed by combining phosphoric acid with an alkali. Sodium, potassium, ammonium, and calcium phosphates are used in fertilizers. See also phosphate rock. *Fay.*

**Phosphatic.** Pertaining to or containing phosphate minerals. *A.C.*

**Phosphatic deposits.** Beds containing calcium phosphate which are formed especially in areas of low rainfall, and which may be lenses or large beds. *C.M.D.*

**Phosphatic nodules.** Black to brown, rounded masses, variable in size from fractions of a millimeter to 30 or more centimeters. Usually consist of caprolites, corals, shells, and bones, more or less enclosed in crusts of collophane. From many locations in marine origin. Also covering the ocean floors at many locations around the world. *Bureau of Mines.*

**Phosphatic rock.** Same as basic slag. *Standard, 1964.*

**Phosphating.** Forming an adherent phosphate coating on a metal immersed in a suitable aqueous phosphate solution. *ASM Gloss.*

**Phosphide.** An oxygen-free compound of a metal with phosphorus. *Bennett 2d, 1962.*

**Phosphides.** Hydrogen phosphide; trifluorophosphide. *C.T.D.*

**Phosphorus hydride.** Colorless; poisonous; evil-smelling gas; P; analogous to ammonia; and usually burns spontaneously on air to form phosphorus pentoxide (P₂O₅). It has reducing properties and precipitates phosphides from solutions of many metallic salts. C.T.D. Molecular weight, 34.00; melting point, -133° C; boiling point, -87.7° C; and slightly soluble in cold water. *Handbook of Chemistry and Physics, 45th ed., 1964, p. 2,01-1.*

**Phosphoaluminate.** Synonym for pseudomallite. *Danne 6, p. 794.*

**Phosphatellite.** A white, pale green, or yellow hydrous phosphate of iron, manganese, and magnesium. *C.T.D.*

**Phosphatite.** A hydrous phosphate of zinc, iron, and manganese. *C.T.D.*

**Phosphates.** Any material which has been precipitated and has the property of luminescence is called a phosphor, regardless of whether it is extracted or not. *C.T.D.* Used in some porcelain enamels to provide colors, for instance, zinc green for green, mobility acid, etc. *Lee.*

**Phosphates; phosphorates; phosphoric acid.** To combine or to impregnate with phosphorus; to phosphorize oil. *Standard, 1964.*

**Phosphor bronze.** An elastic, hard and tough alloy, composed of 80 to 95 percent phosphorus, tin, with phosphorus up to 2.5 percent. *Nelson.*

**Phosphor copper.** An alloy made by fusing granulated copper with bone ash and charcoal; used in making phosphor bronze. *Standard, 1964.*

**Phosphor.** Any of various phosphorescent or fluorescent substances (as zinc sulfide activated with silver or copper or zinc silicate activated with manganese) that may occur as minerals or as synthetic substances; but are now usually produced synthetically. Used chiefly in fluorescent lamps, in cathode-ray tubes (as for television and radar), in instruments for detecting various radiation, and in luminous paints and inks. *Webster 3d.*

**Phosphorescence.** Luminescence that is perceptible with characteristic rate or decay after the exciting cause ceases. *Compare fluorescence. Webster 3d.*

**Phosphor copper.** A. To phosphorize or phosphorite; phosphorite. *Webster 3d.*

**Phosphorus.** P; symbol. Phosphorus (P₄): (1) white phosphorus or yellow phosphorus; colorless and transparent white to yellowish; isotropic; stable; does not undergo slow, luminous oxidation (phosphoresces) in moist air at room temperature; specific gravity of solid, 1.82 (at 20° C), and of liquid, 1.745 (at 44.5° C); ignites spontaneously in moist air, burning to phosphorus pentoxide (P₂O₅); ignition point, 34° C must be kept away from water; very poisonous; must be handled with forceps to avoid skin burns; converts to red phosphorus in sunlight; melts at 250° C in its own vapor; melting point, 44.1° C; boiling point, 280.5° C; insoluble in cold water; soluble in alcohol; soluble in benzene, in ammonia, in alcohols in ether, in chloroform, and in solutions of carbon disulfide. (2) red phosphorus; obtained by heating white phosphorus (yellow phosphorus) at 250° C; reddish-brown or violet-red; isotropic; specific gravity, 2.20 to 2.34; more stable than white phosphorus (yellow phosphorus); monophasic; ignition point, 260° C; melting point, 280° C; sublimes at 417° C (at 1 atm); very slightly soluble in cold water; soluble in hot water, in carbon disulfide, in ether, and in ammonia. (3) black phosphorus or violet phosphorus; obtained by heating white phosphorus (yellow phosphorus) under high pressure; violet to black; monoclinic; specific gravity of violet phosphorus, 2.36, of black phosphorus, 2.70, and of the range, 2.25 to 2.70; incombustible; melting point, 300° C; insoluble in water, in concentrated sulfuric acid, and in carbon disulfide and other organic solvents. *Handbook of Chemistry and Physics, 42d ed., 1960, p. 736.*

**Phosphor bronze.** A general term applied to copper dezoxidized with phosphorus. The most commonly used dezoxidized copper. *ASM Gloss.*

**Phosphorizing.** Combining or treating with phosphorus. *Bennett 2d, 1962.*

**Phosphorogen.** A substance which promotes phosphorescence in a mineral or other compound. *Hess.*

**Phosphorolite.** Wadsworth's name for phosphatic rocks, guano phosphates, apatite, etc. *Fay.*

**Phosphate.** Basically, a sedimentary rock composed chiefly of phosphorite. *Batesen.*

**Phosphorized copper.** A term applied to copper dezoxidized with phosphorus. The most commonly used dezoxidized copper. *ASM Gloss.*

**Phosphorizing.** Combining or treating with phosphorus. *Bennett 2d, 1962.*

**Phosphorogen.** A substance which promotes phosphorescence in a mineral or other compound. *Hess.*

**Phosphorescence.** Basically, a substance (phosphoresces) after being exposed to X-rays, cathode rays, or ultraviolet rays, or after having been rubbed, heated, etc. *Fay.*

**Phosphor bronze.** A hydrous phosphate of zinc, iron, and manganese. *C.T.D.*

**Phosphor copper.** An alloy made by fusing granulated copper with bone ash and charcoal; used in making phosphor bronze. *Standard, 1964.*

**Phosphorescence.** Any of various phosphorescent or fluorescent substances (as zinc sulfide activated with silver or copper or zinc silicate activated with manganese) that may occur as minerals or as synthetic substances; but are now usually produced synthetically. Used chiefly in fluorescent lamps, in cathode-ray tubes (as for television and radar), in instruments for detecting various radiation, and in luminous paints and inks. *Webster 3d.*

**Phosphorescence.** Luminescence that is perceptible with characteristic rate or decay after the exciting cause ceases. *Compare fluorescent. Webster 3d.*

**Phosphor bronze.** A. To phosphorize or phosphorite; phosphorite. *Webster 3d.*

**Phosphorus.** P; symbol. Phosphorus (P₄): (1) white phosphorus or yellow phosphorus; colorless and transparent white to yellowish; isotropic; stable; does not undergo slow, luminous oxidation (phosphoresces) in moist air at room temperature; specific gravity of solid, 1.82 (at 20° C), and of liquid, 1.745 (at 44.5° C); ignites spontaneously in moist air, burning to phosphorus pentoxide (P₂O₅); ignition point, 34° C must be kept away from water; very poisonous; must be handled with forceps to avoid skin burns; converts to red phosphorus in sunlight; melts at 250° C in its own vapor; melting point, 44.1° C; boiling point, 280.5° C; insoluble in cold water; soluble in alcohol; soluble in benzene, in ammonia, in alcohols in ether, in chloroform, and in solutions of carbon disulfide. (2) red phosphorus; obtained by heating white phosphorus (yellow phosphorus) at 250° C; reddish-brown or violet-red; isotropic; specific gravity, 2.20 to 2.34; more stable than white phosphorus (yellow phosphorus); monophasic; ignition point, 260° C; melting point, 280° C; sublimes at 417° C (at 1 atm); very slightly soluble in cold water; soluble in hot water, in carbon disulfide, in ether, and in ammonia. (3) black phosphorus or violet phosphorus; obtained by heating white phosphorus (yellow phosphorus) under high pressure; violet to black; monoclinic; specific gravity of violet phosphorus, 2.36, of black phosphorus, 2.70, and of the range, 2.25 to 2.70; incombustible; melting point, 300° C; insoluble in water, in concentrated sulfuric acid, and in carbon disulfide and other organic solvents. *Handbook of Chemistry and Physics, 42d ed., 1960, p. 6,280.*

**Phosphor bronze.** Copper that contains about 15 percent phosphorus. Used chiefly as a dezoxidizer for molten metals. *Herder.*

**Phosphorus disease.** A disease of workers in phosphorus, marked especially by necrosis of the jawbone. *Webster 2d.*

**Phosphor glass.** Glass made with phosphorus pentoxide instead of silica, which is used especially for hydroscopic acid is encountered. *Bennett 2d, 1962 Add.*

**Phosphor steel.** Steel in which phosphorus is the principal hardening element. Good
phosphorus steel

steel may contain 0.3 percent phosphorus, but the carbon must be very low. Fay.

phosphoiderite. A pinkish-red mineral -thi 1 perfect and 1 distinct cleavage, 2FeO-
CaO. 2H2O. Concentrations by optical
glass used in lamp-bulb manufacture.

Dodd.

photography (photography), photos-
tographic, miniature radiography).

The photos are produced on a fluorescent screen by X-rays. ASM Gloss.

photogeochemistry. a. The geologic interpretation of aerial photographs. A.G.I. b. The study and interpretation of photographs, normally for land, for the purpose of obtaining geologic information, and includes presentation of such information in appropriate form. A.G.I.

photogrammetry. Study of earth forms as revealed by aerial photographs. A.G.I.

photometer. In photographic mapping, an instrument for determining the direction of a ray from the central point of the camera lens to the image of any point on the photograph, by measuring the horizontal and vertical angles with reference to two perpendicular planes. Seelye, 2.

photogrammetry. The art of making surveys or measurements by the aid of photography. Methods utilizing horizontal, vertical, and oblique views are used, with and without the aid of the stereoscopic principle. See also stereophotogrammetry.

photographic borehole survey. A method of checking verticality and/or orientation of a long borehole. A compact camera inserted at a known depth takes a photograph of a magnetic needle and/or a clinometer. Instruments have been developed by Oehman, Owen, and Wright.

photometric method. A method of measuring intensities from two sources. These more accurate types are built around photographically sensitive detector of light

photometer. A device for measuring light at depths as great as 600 meters.

photons. A discrete quantity of electromagnetic energy. Photons have momentum but no mass or electrical charge. LASL.

photopic vision. When the process of seeing takes place through the operation of the retinal cones, we are able to fixate on the object of vision, that is, we can bring its image onto the fovea to see it clearly, and we can also distinguish color. In brief, we are in conditions normally experienced in daylight and vision is said to be photopic.

photoreceptor. Name applied to certain minerals that are visibly injured by light. Pearl, p. 108.

photoreceptor. A dust-sampling instrument containing a filter clip, as used in the F.R.U. hand pump. A miner's cap lamp provides the light source, which enables the dust sample to be evaluated on the spot and any dust suppressive measures can be undertaken immediately. See also dust sampling. Nelson.

photorecording. The complete absorption of a photon by an atom with the emission of an orbital electron (photelectron). The term is sometimes used to characterize photoelectric emissions which are ascribed to the electric (rather than the magnetic) vector of the photon. NCB.

photorecording. A property of certain transparent substances which enables the presence of strain to be detected by examination in polarized light. If models of complicated engineering structures are made of such a substance, the stress distribution in the structure may be resolved. See also nonmagnetic casing. Seeley, 3d.

photometer. A device for measuring the intensity of the light transmitted.

photometer. The instrument shows the intensity of the light transmitted. ASM Gloss.

photometric paper recorder. A small device for registering photographically the passage of flame. This must not be confused with the photographing of the flame on an aerial mapping. See Nelson, p. 108.

photometric connection. See also multihotgyroscopic instrument. Nelson.

photometer. An instrument for measuring the intensity of light, or for comparing intensities from two sources. The more accurate types are built around photographic electric cells. Shipler.

photometric. The complete absorp-
tion of a beam of light after it has passed through the paper, and the fall in intensity is a direct measure of the dust concentration. With dark dust, such as in coal mines, a rough indication of the dustiness may be obtained by comparison of the depth of tone with a graded series of samples which have been calibrated against some other standard. There are two methods of collecting samples for photometric estimation: (1) by passing the light through a filter paper as for gravimetric estimation, or (2) by impingement, as in the konimeter. Spalding, p. 329.

photometer. A device for measuring light at depths as great as 600 meters.

photometric estimation: (1) by passing the light through a filter paper as for gravimetric estimation, or (2) by impingement, as in the konimeter. Spalding, p. 329.

photometers. A photograph of a magnified image of a small object; a micrograph made by photography. Webster 3d.

photometric method. A method of measuring intensities from two sources. These more accurate types are built around photographically sensitive detector of light

photometer. A device for measuring light at depths as great as 600 meters.

photons. A discrete quantity of electromagnetic energy. Photons have momentum but no mass or electrical charge. LASL.

photopic vision. Spalding, p. 329.

phyllonite. A phyllonite is a rock composed of mica, quartz, and chlorite. These three minerals are the primary constituents of most phyllonites. The term is used to describe rocks that are composed of these minerals in various proportions. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phyllonite. A rock that is composed of mica, quartz, and chlorite. Tomtleif, 1954.

phytocollins. A black gelatinous hydrocarbon, related to dopplerite; found below a peat bed at Seaton. Fac. 23.

phytoelems. A dam consisting of plants and plant debris, may account for ponds and lakes in tundra regions. A.G.I. Supp.

phytogeneous. A genetic term for any dune, the form of which is controlled by the interaction of growing vegetation with eolian sand drifting; for example, upisoloid dunes and formedunes. A.G.I.

phytogenons rocke. Rocks formed from plant remains. Tomleiff, 1954.

phytolea. Coalified remains of plants. They are divided into merolemmas and laterite clastics. Tomleiff, 1954.

phytophils. A rock formed by plant activity or composed chiefly of plant remains. Tomleiff, 1954.

phytophile. The plant life division of phytops. A rock formed by plant activity or composed chiefly of plant remains. Also abbreviated PI. BuMin Style Guide, p. 11.

phytophoric rocks. Rocks formed from plant remains. Tomleiff, 1954.

phytohanka. The plant life division of plankton, including diatoms and algae. Unattached plants which are at the mercy of the currents. H.G.P.

Phyllocladus. A number, approximately 3.1416, or a transcendental number which has been multiplied by the diameter of a circle, will give the circumference. Symbol. a. Nicholas.

piano wire. A screen formed by piano wires stretched tightly, lengthwise, on a frame 2 to 3 feet wide and 4 to 8 feet high. The screen is set up at an angle of about 45° and crushed material is fed to it from above. The mesh size varies from about 4 to 16. Because there are no cross wires, and because the taut wires can vibrate, there is less tendency for blinding, but some elongated particles inevitably past the screen. Double.

pichco. A peak or sharply pointed hill or mountain. Because of the steep slopes of mountains in the desert region, picacho appears as the name of numerous mountains in southwestern Arizona. USGS Bull. 347-D, 1909.

pick. a. The steel cutting points used on a coal-cutter chain. See also coal-cutter picks.
b. A miner's tool for picking up the wick of a miner's lamp. Fay. c. An employee who removes slate or gangue from the coal in an anthracite breaker, or at a picking table. B.C.I. d. A mechanical arrangement for removing slate from coal. Fay. e. A sharp-pointed cutting tool used as an accessory to a miner. Fay. f. A sharp-pointed steel rod used in lifting wooden patterns from the sand after they have been rammed therein. Fay. g. A tool for piercing a mold; a piercer. Fay. h. A miner's needle, used for picking out the tamping of a charge that has failed to explode. Fay. i. A laborer who removes high-grade ore, scrap wood, or iron from coal. Fay. j. A spike-toothed shaft for breaking up clay to be fed to the hopper. Standard, 1954.

picking attendant. In anthracite coal mining, one who tends a mechanical separator that removes slate and rock from coal at a breaker, regulating flow of coal, checking operation of a breaker, and making adjustments and minor repairs to the machine. Also called breaker operator. D.O.T. 1.

picking belt. A mechanical arrangement for removing slate, or other material from the coal. Fay. A spike-toothed shaft for breaking up clay to be fed to the hopper. Standard, 1954.

picking belt. A chute along which workers are stationed to pick the slate from the coal. Fay.

picking conveyor. A belt or apron conveyor used to carry a relatively thin bed of material past pickers who hand sort, or pick the material being conveyed. ASA MH4.1-1958. See also picking belt.

picking eyes. Mining in which only the high-grade spots are taken out. Hoover, p. 36.

picking table. A 1/4-inch steel rod about 20 feet long, used to ram into the taphole, while casting, to dislodge obstructions preventing a good run. Fay.

picking room. Same as screen room. Korson. See picking station.

picking station. See recovery plant. J.C. 8200, 1964, p. 149.

picking table. A flat, or slightly inclined, platform on which the coal or ore is run, to be picked free from slate or gangue. Fay. See also picking conveyor. ASA MH4.1-1958.

picking-table basin, head. See slate-pick 'a.

picking table, circular. An apparatus used for the same purpose as a picking belt and consisting of a flat horizontal rotating annular plate. B.S. 3552, 1902.

picking-table man, head. See slate-pick 'a.

picking belt. A short conveyor which takes the coal from, and advances with, a face power loader or continuous miner, and which serves as a return conveyor over which it runs on a bogy. See also long piggyback conveyor. Nelson.

picking dip. A method of laying t'pick by which the bricklayer simultaneously picks up a brick with one hand and, with his other hand, enough mortar on the trowel to lay the brick. Sometimes called the eastern or New England method. A.G.C., 1961.

piece-cut core barrel. A double-tube core barrel in X-group sizes. The distinguishing feature of the Pickard barrel is that when blocked the inner barrel slides upward into the head, closing the water port and stopping the flow of the circulating liquid, and no additional drilling can be done without preparatory damaging the bit until the barrel is pulled and the blocked inner tube cleared. Long.

pick. A number, approximately 3.1416, or a transcendental number which has been multiplied by the diameter of a circle, will give the circumference. Symbol. a. Nicholas.

dressing. In stone cutting, a tool of the face of a stone with a sharp end. Standard, 1964.

picker. a. A small tool used to pull up the wick of a miner's lamp. Fay. b. An employee who picks or discards slate and other foreign matter from the coal in an anthracite breaker, or at a picking table. B.C.I. c. A mechanical arrangement for removing slate from coal. Fay. d. A hand chisel for dividing, held in one hand and struck with a hammer. See also dashu. Fay. e. Eng. A sharp-pointed cutting tool used as an accessory to a miner. Fay. f. A sharp-pointed steel rod used in lifting wooden patterns from the sand after they have been rammed therein. Fay. g. A tool for piercing a mold; a piercer. Fay. h. A miner's needle, used for picking out the tamping of a charge that has failed to explode. Fay. i. A laborer who removes high-grade ore, scrap wood, or iron from coal. Fay. j. A spike-toothed shaft for breaking up clay to be fed to the hopper. Standard, 1954.

picking, a. Operation performed between mine and mill in which waste rock, wood, detritus, steel (tramp iron), or any special material, is removed from the run-of-mine ore. Hand sorting. Usually done during transit of ore on belt conveyors, preferably after very large lumps and smalls have been screened off and the ore to be picked has been sufficiently washed to display a true surface. Also done on picking table, a rotating circular disc around which stand or sit the hand sorters who remove part of the ore fed radially from central point. Picking is also mechanized by such means as the LaPointe picker, and is aided by special lighting, radioactive detection, etc. Pyrom. J. b. S. Afr. Selective mining for high-grade ore, or in reference to 'mine ore, the picking of which is required to reduce production work in the later stages. Beeman. c. The falling of particles from a mine roof about to collapse. Fay. d. Picking the eyes out of a mine is to extract over a prolonged period an undue proportion of the richest ore, thus lowering the average grade of the remaining ore. See also derating. Fay. e. Rough picking, in which ore is sorted on the running ore. Webster 2d. f. A soft or not fully fired brick. Webster 3d.

pickling. The term was applied by Grabau to a large bed of reef limestones. Tomleiff, 1954.

pickling acid. A pickling solution used to remove oxides or other compounds from the surface of a metal by chemical means. Nelson.

pickling acid. A pickling solution used to remove oxides or other compounds from the surface of a metal by chemical means. Nelson.

pickling belt. A continuous conveyor (for example, in the form of a rubber belt or of a steel apron, steelplate, or link construction) on which raw coal or ore is spread so that selected ingredient may be removed manually. B.S. 3552, 1902.

pickling brush. A chute along which workers are stationed to pick the slate from the coal. Fay.

pickling conveyor. A belt or apron conveyor used to carry a relatively thin bed of material past pickers who hand sort, or pick the material being conveyed. ASA MH4.1-1958. See also picking belt.

pickling eyes. Mining in which only the high-grade spots are taken out. Hoover, p. 36.

pickling table. A flat, or slightly inclined, platform on which the coal or ore is run, to be picked free from slate or gangue. Fay. See also picking conveyor. ASA MH4.1-1958.

pickling-table basin, head. See slate-pick 'a.

pickling table, circular. An apparatus used for the same purpose as a picking belt and consisting of a flat horizontal rotating annular plate. B.S. 3552, 1902.

pickling-table man, head. See slate-pick 'a.

pickled. A. In picking, the condition of the picks as set in a cutter chain. In this respect, it may be a balanced or unbalanced cutter chain. The pick lacing is important as it may be a balanced or unbalanced cutter chain. The pick lacing is important as it
pickle basket

A skeleton or perforated container usually made of acid-resisting alloys such as monel metal used to hold acids during the pickling process. **ASM Gloss.**

**pickle basket**

A skeletal or perforated container usually made of acid-resisting alloys such as monel metal used to hold acids during the pickling process. **ASM Gloss.**

**pickle patch**

A tightly adhering oxide or scale coating not properly removed during the pickling process. **ASM Gloss.**

**pickle pine**

Small gelatin capsules containing chemicals used for testing the strength of pickling solutions. **ASTM C286-85.**

**pickle procedure**

Generally the complete cleaning operation performed in tanks or by sprays. **Bryant.**

**pickle state**

Discoloration of metal due to chemical cleaning without adequate washing. **Webster 3d.**

**pickle**

The process of chemically removing scale or oxide from metal objects to obtain a chemically clean surface prior to galvanizing or painting. This is usually done by immersion in an acid bath. For steels, the acids generally used are sulfuric and hydrochloric to which is added an inhibitor, the latter an organic material such as glue, starch, or one of the various proprietary compounds which are often organic derivatives containing nitrogen, oxygen, sulfur, or other elements of the fifth and sixth periodic groups. The addition is often about 0.03 percent in order to reduce or restrain the attack of acid on the metal and thus effect the removal of scale with a minimum loss of metal. **See also descaling.** **Ham.**

**pickle of timber**

Usually carried out by means of Bethell's full-cell process of creosoting. **Ham.**

**pickle meaning**

Coal-cutting machine which acts percussively, and cuts with a large chisel fixed at the end of a piston reciprocated by compressed air in much the same way as a rock drill is operated. **Kier, 1, p. 2.**

**pickleman**

Scot. A man who digs coal with a pick; a hewer; a miner. **Fey.**

**pickle method**

A method of ore dressing developed at Montanich, Mackinac at Leoben, Austria. **Osborne.**

**pickle miner**

In anthracite and bituminous coal mining, one who uses hand tools to extract coal in underground working places; also, cuts out a channel under the bottom of the working face of coal (undercutting) with a pick, working several feet back into the seam, and breaks down coalface with pick, or breaks holes with an auger bit for blasting, and inserts and sets off explosives in holes to break down coal; also, shovels coal into cars and pushes them to a laulageway. Also called hand cutter; hand Giner; hand pick miner; pick-and-shovel miner. **D.O.T. 1.**

**pickle mines**

Mines in which coal is cut with a pick; a hewer; a miner. **Fey.**

**pickle sharpener**

In mining and quarrying, a blacksmith who sharpens digging picks. **D.O.T. 1.**

**pickle tongs**

Tongs for handling hot metal. **Webster 3d.**

**pickle-up**

a. Synonym for lift, as applied to t-slotting drill rods from a borehole. **Lang, b. Mid.** To reduce the stock of coal. **Fay, c.** Applied to an angular crosscut, through which coal is hauled from one entry to another. **See also hosey, b. **Hess, d.** Transfer of coal from 2-34 to part or from part to tools during a forming operation. **See also gailing, d. **ASM Gloss, e.** Same as descriptor. **A.G.I. f.** A light truck. **A.G.I. g.** The amount of vitreous enamel slip (expressed in terms of dry weight per unit area) which is used during the pickling process. For ground coats, the pickup is usually 1.2 to 1.5 ounces per square foot. **Dodd.**

**pickle-ups**

In Alaska, nugget gold picked up during mining operations prior to sluicing. **Fay.**

**pickle poke bar**

A steel bar, usually of 34-inch stock and about 4 feet long, with each end sharpened, and fixed at an angle of 45°, the bends being 3 to 6 inches from each end. **Hess.**

**pickle**

A prefix that divides a base unit by 1 trillion (1012) or multiplies the unit by 1012. Same as micromicro- Abbreviation, p. 18. **B.L.**

**pickle coloring**

A brown variety of spinel containing chromium and iron. **Fay.**

**picklephone**

An etching reagent consisting of a 2 to 3 percent solution of picric acid in ethyl alcohol. It may be used for plain carbon and low alloy steels. **Osborne.**

**piece**

A piece weight, effective. **See effective piece weight.** **Mitchell, p. 102.**

**piecework**

a. Work paid for in accordance with the amount done rather than the time taken. **Pryor, 3. b.** The performance of underground work on the basis of an agreement between a miner and the mine manager. Payment may be made by the yard of advance of a heading or tunnel or per ton or cubic yard of coal or ore removed. In ripping work, payment may be made by the yard advance of excavation to a specified width and height; strip packing may be built at a certain sum per yard advance or cubic yard of filling. Mine managers prefer piecework as it requires less supervision and the incentive enables essential work being done quickly. Miners also prefer piecework as it usually means wages well above the day wage. **See also contract work.** **Nelson.**

**piedmont**

Lying or formed at the base of mountains; a piedmont district, plain, or ranges of hills. **Webster 3d.**

**piedmont alluvial plains**

Alluvial fans may become alluvial slopes of many square miles in area, and a continuous supply of material may result in uniting these slopes and covering an entire lowland with the debris of mountains, torrents, thus converting the isolated fans or slopes into great piedmont alluvial plains. All river-made plains are, of course, alluvial but the term is restricted here for the sake of distinctness. **A.G.I.**

**piedmont gravel**

That part of a glacier that debouches and spreads out at the base of a mountain, or a range which feeds its sources. **Standard, 1964.**

**piedmont lee**

A piedmont glacier. **A.G.I.**

**piedmontite**

See piemontite. **Dana 6d, p. 321.**

**piece**

A small fault scarp at the foot of a mountain range and essentially parallel to the range. **A.G.I.**

**piece work**

A synonym for piercing stone. **Standard, 1964.**

**piemontite**

A reddish-brown variety of epidote, characteristic of the Piedmont area, northwestern North Carolina. **Dana 17.** Also called manganoepidote.

piec. A term used sometimes circular form of column, constructed usually of concrete, hard brickwork or masonry, and designed to support heavy concentrated loads from arches or a bridge superstructure. Ham.

pier cap. The upper or bearing part of a bridge pier usually of concrete or hard stone, designed to distribute concentrated loads evenly over the area of the pier.

piercement. Salt plug that rises and penetrates rock formations to shallow depths. Wheeler.

piercement dome. A salt dome in which the salt core has broken through the overlying strata until, 1928, it reaches or approaches the surface. A.G.I.

piercement fold. Synonym for piercement fold; diapir fold. A.G.I.

piercer. a. A blasting needle. See also picker, g. Fay. b. In founding, a wire for venting a mold. Stant.

piercing process. See Mansmann process.

piercing shot. Scot. A short in the roof, or brushing, designed to bring down an increasing thickness of stone. Fay.

piercing stone. Or, a salt pig, used in the piercing process. Webster 3d, 1962.

pierrot lime. The correct spelling of zierlitkalk, a name originally applied to a wax-like natural hydrocarbon, Tambur, 1954.

pierrotization. Crystallization during powerful lateral compression (applied to the formation of the central granite of the Alps). Fortune, 1928.

pierzoceramal. Presence of piezoelectric materials, particularly quartz and Rochelle salt, when the crystal is strained. The detector is constructed of such crystals with intermetallic foil to collect the charge. An inertia mass is mounted on the top of the crystal stack which is included in a vacuum-tube circuit. A.G.I.

pierzoelectricity. The property exhibited by some asymmetrical crystalline materials, which, when subjected to strain in suitable directions, develop electric polarization proportional to the strain. Inverse piezoelectricity is the effect in which mechanical strain is produced in certain asymmetrical crystalline materials when subjected to an electric field. The strain is proportional to the electric field.

piezometer. An instrument for measuring pressure head, usually consisting of a small pipe tapped into the side of a closed or open conduit and flush with the inside, containing over the pipe, mercury, water column, or other device for indicating pressure head. Stantype.

piezometric. a. In hydrology, an imaginary surface that coincides everywhere with the static level of the water in the aquifer. Ham. b. The surface to which the water from a given aquifer will rise under its full head. A.G.I.

pigeon. a. A crude casting of metal (as iron or lead) convenient for storage, transportation, or melting; especially one of standard size and shape for marketing run directly from the smelting furnace. Compare ingot. Webster 3d. b. A mold or channel in the pig bed. Webster 3d. c. Pig iron, pig lead. Webster 3d. d. A flask having two or more tubulars which to smaller molds may be attached, and used especially to collect fractions during fractional distillation. Webster 3d. e. A metal casting used in remelting. ASM Gloss. I. A heavily shielded container (usually lead). Used to ship or store radioactive materials, usually isotopes. IBL. g. An air manifold having a number of pipes which distribute compressed air or water to a single large line. Nichols. h. A rest for blowpipe or punty during the gathering operation. ASTM G162-66.

pig. a. Raw aluminum cast into pig form as it comes from the furnace. Mentor. 1964.

pig and ore process. Modification of the open-hearth process of steel manufacture with pig iron and steel ore as the charge. Bennett 2d, 1962.

pig and scrap process. Modification of the open-hearth process of steel manufacture with pig iron and steel ore as the charge. Bennett 2d, 1962.

pig bath. To add pig iron to a molten charge too much decarburized in the acid open-hearth process. Fay.

pig bed. A series of molds for iron pigs, sometimes circular form of column, constructed usually of concrete, hard brickwork or masonry, and designed to support heavy concentrated loads from arches or a bridge superstructure. Ham.

pig iron. a. A form of column, constructed usually of concrete, hard brickwork or masonry, and designed to support heavy concentrated loads from arches or a bridge superstructure. Ham.

pigeon blood. A deep clear red; the gem color of the most highly prized specimens of the ruby. Hess.

piglet. Local name for carnelian or red and white agate from Cisco, Utah. Shipley.

pigeonhouse. a. A room driven directly into the coal seam from the edge of a strip pit. Fay. b. Any small poorly equipped coal mine. Fay. c. A hole in the shaft house floor through which the bucket or skip is raised or lowered. Hess. d. An opening left at the meeting of two sections of arch working, permitting the workmen to close the arch and to come out. The pigeonhole itself is closed from below. Stanfield.

pigeonhole checker. An arrangement of checkerbrick such that each course of brick is laid in spaced parallel rows with the brick end to end and each alternate course above and below has its parallel rows at right angles to the intervening course. A.R.J.

pigmalsome. A pyroceramic intermediate between clinoenstatite and diopside. A mixture of the following, (MgFe)$_2$SiO$_4$, and (MgAl)$_2$SiO$_4$ (SiO$_2$). A soft glassy material which may occur in the series between clinoenstatite and hedenbergite. It has a small and variable axial angle. From Pigeon Point, Minn. English.

pig foot. a. An iron clamp shaped like a pig's foot used to attach the jack to the feed chain of a continuous electric coal cutter. Fay. b. A pipe jack with a pig foot at one end. Fay.

pig furnace operator. One who melts and refines magnesiun crystal into pure magnesiun in a crucible furnace. Also called furnace tender. D.O.T. Supp.

piggyback conveyor. See long piggyback conveyor. Nelon.

pig handler. A laborer who removes magnesiun pigs from molds manually or with a shovel, wearing asbestos gloves; also, he stumps heat numbers on pigs with hammer and punch. D.O.T. 1.

pig iron. A steel furnace through which a pig is blown, in a crucible, an extra charge of pig iron. Standard, 1964.

pig iron. a. High-carbon iron made by reduction of iron ore in the blast furnace. ASM Gloss. b. Cast iron in the form of pigs. ASM Gloss.

pig iron. Commercial lead in large oblong masses or pigs. Fay.

pigment minerals. The most important are the red and yellow ochers and brown sienna, which consists of iron oxides with some impurities, and the brown umbers in which manganese oxide is also present. When the iron-oxide content is high the term oxide is used in preference to other. Nelson.

pigments. Inorganic colored substances used as bases in compounding ceramic colors, inks, paints, etc. The term is more particularly used to denote mineral bases as distinct from organic coloring matters such as dyes or stains, which are soluble in the water column. Fay. D.O.T.

pig metal. Metal, as brass or copper, in its first rough casting. Standard, 1964.

pike. a. A type of detector which depends upon the piezoelectric effect by which an electric charge is produced on the faces of a proper piezoelectric crystal, when that crystal is strained. Used in such detectors, detectors with intermetallic foil to collect the charge. An inertia mass is mounted on the top of the crystal stack which is included in the vacuum-tube circuit. A.G.I.

pikelectricity. The property exhibited by some asymmetrical crystalline materials, which, when subjected to strain in suitable directions, develop electric polarization proportional to the strain. Inverse piezoelectricity is the effect in which mechanical strain is produced in certain asymmetrical crystalline materials when subjected to an electric field. The strain is proportional to the electric field.

piezoelectric detector. In seismic prospecting, a type of detector which depends upon the piezoelectric effect by which an electric charge is produced on the faces of a proper piezoelectric detector, when that crystal is strained. Used in such detectors, detectors with intermetallic foil to collect the charge. An inertia mass is mounted on the top of the crystal stack which is included in the vacuum-tube circuit. A.G.I.
pigskin. A surface defect characterized by pigsty. A man delegated to the duty of picking. A man delegated to the duty of picking.
pillar-and-breast

that may seriously injure the mine, larger pillars are left and after the mine has been worked out, the pillars are "robbed" by mining through them. This method of working is used in the mining of salt and gypsum deposits. It is employed by working the bed in "lifts." Also called pillar-and-stall; post-and-stall; bord-and-pillar. Fay.

pillar-and-chamber. A pillar method of working often adopted in extracting a proportion of thick deposits of bituminous coal. The system may be adopted where the value of the mineral in the pillars is less than the cost of setting artificial supports. Nelson. See drifting back. Fay.

pillar-and-room. A system of mining whereby solid blocks of coal are left on either side of miner's workings to support the roof. See also pillar-and-stope. Fay.

greater intervals according to the size of crosscuts, and bords varies from 3 to 5 apart, and are connected at intervals by crosscuts or stentons for ventilation and roadways and their supports. McKinstry, p. 635.

as working the broken. The width of the narrow roadways are driven in the coal seam and the type of roof and the bord-and-pillar system. Woodruff, v. 3, p. 18.

pillars are left and after the mine has been worked out, the pillars are "robbed" by mining through them. This method of working is used in the mining of salt and gypsum deposits. It is employed by working the bed in "lifts." Also called pillar-and-stall; post-and-stall; bord-and-pillar. Fay.

pillar drive. A wide irregular drift or entry, in firm dry ground, in which the roof is

supported by pillars of the natural earth, or by artificial pillars of stone, no timber being used. Fay.

pillar extraction. The recovery or working away of the pillars of coal which were left during the first operation of working in the in the open method. Also called pillar mining. See also jenkins; jud; pillar robbing. Nel-a.

pillar bursting. Failures of remnants, promontories in the roof. Also called pillar bursts. See also jenkins; jud; pillar robbing. Nel-a.

pillar chopping. Also called robbing pillars; pulling pillars. Fay. b. Joining in slates, Denbighshire, Wales. Arkall.

pillar robbing. a. The process of extracting pillars. Also called robbing pillars; pulling pillars. Fay. b. Joining in slates, Denbighshire, Wales. Arkall.

pillar line. Air currents which have definitely coursed through an inaccessible abandoned area, or which have ventilated a pillar line or a pillar area, regardless of the methane content or absence of methane in such air. I.C. B.169, 1963, p. 9-9.

pillar methods of working. Methods of working coal seams, which have been given different names in different coalfields, such as stop-and-room in Scotland; bord-and-pillar in Durham, England; and single and double stalls in South Wales. There are various designs of pillar mining, but in general, there are two stages: (1) the driving of narrow roadways and thus forming a number of coal pillars, and (2) the extraction of the pillars—often on the retreating system. Pillar methods of mining are widely used in the United States, while the longwall method is favored in Great Britain. Pillar methods are also used for working stratified deposits of stone, slate, and other layered minerals. Nelson.

pillar mining systems. These include the room-and-pillar system, the block system, and the bord-and-pillar system. Woodruff, v. 3, p. 18.

pillar road. a. Roadways formed in coal pillars. Nelson. b. Working roads or inclines in pillars having a range of longwall faces or headings. Fay.

pillar robbing. a. The systematic removal of the coal pillars between rooms or chambers so as to regulate the subsidence of the roof. Also called pillar drawing. Fay. See also ball-and-pillow structure. Pettijohn.

pillar robbing and hand filling. See sublevel stoping, b. Fay.

pillars. a. The natural supports left in a mine for the purpose of supporting the roof. Also called stumps. Ricketts, p. 68.

pillar split. An opening or crossover driven through a pillar in the course of extraction. Groves, v. 6, p. 355.

pillar strength. The formula for pillar strength can be expressed as follows:

\[ S = C \left( \frac{L}{T} \right)^4 \]

where the coefficient, C, is directly dependent upon the diameter, L, of the pillar, the thickness of the roof, T, and the thickness of the roof, T.

pillar working. Working coal in much the same manner as with the pillar-and-stall system. Fay.

pillar. A. pillar method of working often adopted in extracting a proportion of thick deposits of bituminous coal. The system may be adopted where the value of the mineral in the pillars is less than the cost of setting artificial supports. Nelson.

pillar working. A system of mining whereby solid blocks of coal are left on either side of miner's workings to support the roof. See also pillar-and-stope. Fay.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.

pillow lavas. Also called pillows; pillow basalt, Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow basalt. Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.

pillow lavas. Also called pillows; pillow basalt, Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.

pillow lavas. Also called pillows; pillow basalt, Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.

pillow lavas. Also called pillows; pillow basalt, Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.

pillow lavas. Also called pillows; pillow basalt, Basalt in which large rounded masses of pillows of firm rock are abundant; the spaces between the masses are filled with friable rock in which cavities containing crystals are often present; commonly forms when lava flows meet water. Sintzing.

pillow block. A metal-cased rubber block that allows limited motion to a support or thrust member. Nicholls.

pillow lavas. A general term for lavas that exhibit pillow structure, occurring mostly in basic lavas (basalt to andesite) and especially in the sodium-rich basalts known as spilites. A.G.I.
pilot bob

center and projecting beyond the main face of the bit. Long. b. See plug bit; drill bit. Web. 3d. 21. 
pilot bob. The weight attached to a shaft submerged for the purpose of lowering the line down the shaft. B.S. 3618, 1963, sec. 1.

pilot burner. A small burner kept lighted to rekindle the principal burner when desired (as in a flash boiler). Webster 3d.

the light so maintained is called a pilot light or pilot flame. Fay.

pilot cable. A cable similar in construction to the pliable armor cable, having two, three, or more cores as required, the thickness of the insulation being appropriate to the lower working voltage. Mason, V2, p. 436.

pilot control. A feature of a remote control circuit which opens the control relay, and prevents it from closing, in the event of a short circuit in the main circuit. B.S. 3618, 1965, Sec. 7.

pilot drill. A small drill used to start a hole in order to insure a larger drill running true to center. Carlin.

pilot hole. a. A small hole drilled ahead of a full-sized, or larger borehole. Long. b. A borehole drilled in advance of mine workings to locate water-bearing fissures or formations. Long. c. A small tunnel drilled ahead of itself, and subsequently enlarged to the diameter required in the following full-size tunnel. Long.

pilot-hole cover. See cover, b. p. 146.

pilot lamp. A small electric bulb which lights when power is turned on in a circuit.

pilot method. The method of excavating a tunnel by driving a small tunnel ahead, and then enlarging its dimensions. Web. 3d.

pilot mill. A comparatively small mill created at a mine to work out the technique of operation before erecting the permanent plant. Hess.

pilot plant. A small-scale mill in which representative tonnages of ore can be tested under conditions which foreshadow (or imitate) those of the full-scale operation proposed for a given ore. Pryor, 9.

pilot reaming. A term for that part of a cylindrical or tubular member threaded on its outside surface, which controls a supply of oil under pressure to the piston of a serrormeter or relay connected to a large control valve, which it is desired to operate. Also called relay valve. C.T.D. 12.

pilot valve. a. A small hand-operated valve to admit liquid to operate a valve difficult to turn by hand. Fay. b. A relay valve that controls the operation of another valve. Webster 3d. c. A small balanced valve, operated by a governor or by hand, which controls a supply of oil under pressure to the piston of a servometer or relay connected to a large control valve, which it is desired to operate. Also called relay valve. C.T.D. d. A compressor, an automatic valve which regulates air pressure. Nichols.

pilot wedge. A half-cylinder member, about 5 inches long, countersunk to the lower end of a Hall-Row deflection wedge, by means of which the deflection wedge may be oriented in a specific manner in reference to a matching half-cylinder surface on the upper end of the wedge (drive wedge) and driven into the wooden plug placed about 8 feet below the point in a borehole where a deflection is to be made. Also called wedge pilot. Long.

pilz furnace. A circular or octagonal shaft furnace, maintaining or increasing its diameter toward the top, and having several tuyeres; used in smelting lead ores. Fay.

piners. The weight attached to a shaft lowered to the ground, create a deflection in the line down the shaft. B.S. 3618, 1963. sec. 7.

pincer. A clamp used on a flexible tube. Webster 3d.

pinchcock. A clamp used on a flexible tube to regulate the flow of a fluid through the tube. Webster 3d.

pinching out. When a lode or stratum narrows as if pinched by the overlying rock. Fay. See also pinching out; pinch.

pinch bar. A one who cleans broken pins (triangular prismatic-shaped pieces of fired clay) out of pins. See also pinching out; pinch.

pinchbeck metal. An alloy of 80 percent copper and 20 percent zinc. Fay.

pinchcock. A clamp used on a flexible tube to regulate the flow of a fluid through the tube. Webster 3d.

pinch. a. The binding action caused when borehole walls close in before casing is energized and driven. It increases when drilling in formations having a low compressional strength. Long. b. To caulk a diamond bit or to tightly in handsetting, causing the stone to break. Long. c. To force a diamond bit into an undisturbed core, thereby squeezing the bit and possibly damaging the outside or gage stones. Long. d. Eng. See pinch bar. SMRF, Paper No. 61. e. A compression of the walls of a borehole by an annular-shaped piece of fired clay or some other glazed ware that is being placed in saggars by glost-klink placer for firing. D.O.T.

pinch. b. A binding action caused when borehole walls close in before casing is energized and driven. It increases when drilling in formations having a low compressional strength. Long. b. To caulk a diamond bit or to tightly in handsetting, causing the stone to break. Long. c. To force a diamond bit into an undisturbed core, thereby squeezing the bit and possibly damaging the outside or gage stones. Long. d. Eng. See pinch bar. SMRF, Paper No. 61. e. A compression of the walls of a borehole by an annular-shaped piece of fired clay or some other glazed ware that is being placed in saggars by glost-klink placer for firing. D.O.T.

pinchbeck metal. An alloy of 80 percent copper and 20 percent zinc. Fay.

pinchcock. A clamp used on a flexible tube to regulate the flow of a fluid through the tube. Webster 3d.

pinching out. When a lode or stratum nar-
pinching out

row down and disappears. See also pinch, e. B.C. 1

pinching tong. In glaupaking, a pair of tools of which two dics that, when closed, form a mold for ornamental prudanta, which are thus made from sand molds. The eye of the base in the end of a pendant is made by a pin between the jaws of the tonga. Standard, 1964.

pinch out. An ore seam formed by the disappearance or wedging out of a porous, permeable rock between two layers of impervious rock. Williams. See also pinch, e. B.C. 1

pinch pass. A pass of sheet material through a pinch rolling mill. la glaupaking. a pair of pinchers, used for dislocating or breaking pieces of a material.

pinch test. A test for determining the dividing line between porosity and impermeability. ASM Glot.

pinch welding. Trimming the edge of a tubular part or shell by pushing or pinchng the flange or lip over the cutting edge of a stationary punch or over the cutting edge of a draw punch. ASM Glot.

pin cracks. Leic. Small fissures in coal seams filled with coal dust. See also pinch, e. B.C. 1

pinch concentrator. A revolving table on which are tapering spiral copper cleats or metal formed by electrodeposition, resulting from numerous small holes distributed throughout the metal. ASM Glot. pin im. To fill the interstices of masonry with small pieces of stone. Standard, 1964.

pinches. Smaller of pair of toothed wheels, for instance, the pinion geared to the driven crown wheel of ball mill. Pryor, 3. pinion gear. A drive gear that is smaller than the gear it turns. Nichols.

pink ash. A general term used to include a large number of alteration products of ilomite, spodumene, nepheline, scapolite, feldspar, and other minerals. A hydrous silicate of aluminum and potassium. Dana 17. b. A variety of muscovite used in ceramics. 6d. 1961.

pink ash. Penn. An anhrricate which, when burned, leaves a pink ash. Fay.

pink beryl. Same as morganite. Shipley.

pink bottom. A pink ash artificially colored by heating yellow or brown varieties. See also heated stone. Shipley.

pink sapphire. Pale to light-red corundum as distinguished from full red or dark red which is ruby. As yet there is no standard of determining the dividing line between these, the more highly transparent stones of light to fancy color being often classed as sapphire while much more a common paler stone it called Ceylon ruby. Shipley.

pink topaz. Topaz either naturally pink or artificially colored pink by heating yellow or brown varieties. See also pinked topaz. Shipley.

pink wollastonite. Lila-colored pyroxene (diopside) from the region of San Francisco, Calif. Schaller.

pinch conveyor. One which makes potter's pins for supporting glazed ware in saggars for firing in glost kiln. D.O.T. 1.

pin mark; point mark. A visible imprint on the back of ware left by processing tools; often used to identify a kiln. Shipley.

pinch tap. Topaz either naturally pink or artificially colored pink by heating yellow or brown varieties. See also pinked topaz. Shipley.

pinch timbering. A hard calciferous rock, used as bedding, roads and rough paving. Withen beds, Stoneram, near Horam. Arkell. b. Small stones used for filling the interstices of masonry, especially as in dry stone walls. Arkell.

pinolite. A yellowish, tetragonal mineral, MgO,BO2,5H2O; Mohs hardness, 3 to 4; and specific gravity, 2.29. Laurem. 70.

pinode. One of the lobes or segments when a leaflet of a pinnate leaf is itself more or less divided into parts in a pinnate manner. Nelson.

pinny land. Eng. Arable land where chalk comes close to the surface, as opposed to the deeper clay land, Wiltshire. Arkell.

pin. Scratch. A pattern formed by scratching lines through the raw g.aze with a sharp point. ACSG, 1963.

pin. Scratch. The thread on the outside surface of a cylindrical or tubular member. Long.

pinch timbering. A roof support method following the basic principle of brailing holes vertical or at an angle into the roof and anchoring rod bolts into a strong firm structure above the lower weak layers thereby suspending the weak roof on bolts from the strong roof above, and (2) the binding of several layers of weak strata into a beam strong enough to support its weight across the working place. The advantage of pinch timbering is that support can be provided by driving in or driving in the way of equipment and more freedom is provided for shuttle cars arranged in two ranks, one on each side of the racha. See also stigmata. Nelson.
pin timbering
and other equipment in tramming. See also rod bolting. Kentuckv, p. 145.

plastic. A vertical pin fastened at the bottom that serves as a center of rotation. Nichols.

plastic clamp. Designed for a hard lower jaw, a hinged and lockable upper jaw, and a socket between them to hold a tow ring. Nichols.

pin-to-box. The currently accepted term for a coupling, one end of which is threaded on the outside (pin) and the opposite end threaded on the inside (box). Formerly designated as a male-to-female coupling. See also sub. Long.

pin wheel. The currently accepted term for a coupling, both ends of which are threaded on the outside. Formerly designated as a metric-sae coupling. See also sub. Long.

pin-type slate conveyor. Two or more endless chains, each spaced at adequate intervals, which has affixed to it a series of pointed rods extending in a narrow pattern of rich ore extending down. Used principally in spraying or washing operations where the least amount of area of the product is contacted. ASA M174-1958.

pinwheel garnet. A garnet crystal that has been rotated during metamorphic movement. A.G.I. Supp.

Pibert lines. The same as Luderls lines.

plion. An elementary particle; the contraction of the pioneer wave. The advance vibration set up in the surface of a material due to the contraction of the molten material as it cools. Dodd.

pli body. A bit designed for attachment to pipe as a casing clamp is used on casing. See also casing clamp. Long. b. A pipe finisher. One who finishes the socket and spigot ends of moist clay sewer pipe sections. Also called corrugator; finisher, pipe. D.O.T. 1.

pipe blaster. A large bubble sometimes produced on the inside of handmade glassware by igniters or scale on the blowpipe. Dodd.

pipe clamp. a. A device similar to a casing clamp, used in the same manner on a pipe as a casing clamp is used on casing. See also casing clamp. Long. b. A pipe wrench constructed like a parmallce wrench. Long.

pipe coll. a. A device which measures only the density of the magnetic components of a slurry. This electromagnetic sensing unit is mounted on a section of rubber or sleeve steel pipe which is installed as a section of the slurry-carrying pipeline. All components are exterior to the pipe, and there is no obstruction to flow. The coil is used widely in magnetic tannita and heavy-media plants. By combining this device with other instruments, it is possible to continuously measure the ore-to-media ratio. See also automation. Nelson. b. Pipe used for heating, usually in (1) parallel lines connected to heaters at the end, forming a grid; or (2) in parallel lines with ends alternately connected to adjacent lines of bends, forming a so-called continuous coil. Strock, 10.

pipe constant. See pipe factor. Nelson.

pipe coupling. An internally threaded, short, sleevelike rod of ordinary steel used to join lengths of pipe. Sometimes incorrectly called pipe collar; pipe sleeve. Long.

pipe cutter. A tool for cutting wrought iron or steel pipes. The curved end which partly encircles the pipe carries one or more cutting disks. Freed of the cutter is regulated by a screw as the tool is rotated around the pipe. Crispin.

pipe air. Air conducted to workings or tunnel face through air pipes. See also auxiliary ventilation. Nelson.

pipe dog. A hand tool that is used to rotate a pipe whose end is accessible, consisting of a small, short steel bar whose end is bent at right angles to the handle, and then quickly returned, leaving a small space between the jaws to slip over the wall of the pipe. Fay.

pipe elevator. A device similar to a casing elevator, used to raise and lower outside-coupled pipe in a borehole. Long.

pipe factor. a. Correction made when drilling running ground, alluvial gravels, and sands. The volume actually extracted over the measured depth is compared with that which would be obtained over the true drill pipe area and distance, any discrepancy being due to inrush of sands or forces out of sand by the pumping action during drilling. Pryor, 3. b. The assumed cross-sectional area of a borehole when estimating the in situ volume of a core sample. Also called pipe constant. Nelson.

pipe finisher. One who finishes the socket and spigot ends of moist clay sewer pipe sections. Also called corrugator; finisher, pipe. D.O.T. 1.

pipelifter. See pipeman, a. B.S. 3618, 1963, p. 410. h. The central cavity formed by the contraction of the molten material as it cools. Dodd.

pipeline transport. Long distance pipelines

pipeline transport. See also pipeline transport.
pipeline transport

- unused for hydraulic transport of coal, grit, stone, copper concentrates and similar materials. Local transport in mines has been utilized in France. A 108 mile 10 inch sauger pipe line of the Pittsburgh Coal Company has been operating since 1939 carrying 4000 tons per day. Lewis, p. 223. See also pipeline transport.

- pipe metal. An alloy of tin and lead, and sometimes zinc, for making organ pipes. Webster 2d.

- pipe ore. Iron ore (limonite) in vertical pillars, sometimes of conical or hourglass form, imbedded in clay. Probably formed by the union of stalactites and stalagmites in caverns. Fay.

- pipe oven. A hot-blast oven in which the air passes through pipes exposed to the heat of burning gas in brick conduits. Fay.

- pipe passer. One who transfers green clay sewer pipes from skidman II at entrance of kiln to setter inside kiln. Also called kilnman. D.O.T. 1.

- pipe press. The name commonly applied to the machine used for molding sewer pipe. Fay.

- pipe prover. An apparatus for testing the soundness of a pipeline or system, usually by hydraulic pressure. Standard, 1964.

- pipe-rack drier. A drier in which pallets of pipe press are placed on neated pipes. ACSG, 1963.

- piperno. A local Italian name applied to the traditioal tuff of the Po River stream fields in the province of Naples, Italy. The rock is characterized by a eutaxitic structure and the presence of numerous stringers and lenticels of dark glass (fiamme) in a light-colored, porous, glassy matrix and generally considered to be a type of welded tuff. A.G.I.

- pipe-rock drier. A drier in which pallets of pipe press are placed on neated pipes. ACSG, 1963.

- pipette a. A small piece of apparatus with which fluids are transferred, measured, or absorbed in a beaker (operations) and which in the simplest form consists of a narrow glass tube into which the liquid is drawn up by suction and in which it is retained by closing the upper end. Webster 3d. b. As a verb, to transfer, to draw off, to measure, or to apply with a pipette. Webster 3d.

- pipette analysis. The size analysis of fine-grained sediment made by having samplpipette analysis. The size analysis of fine-grained sediment made by having samplers from a suspension with a pipette. A.G.I. Supp.

- pipette method. A method for the determination of particle size. See also Andreasen pipette. Dodd.

- pipe sampling. a. Sampling by means of a pipe, usually consisting simply of a small iron rod or receive of material where the larger pieces are not usually greater than 2 inches. This larger end of the pipe is generally sharpened to provide a cutting edge, and sometimes contracted in diameter so that the material once entered will not readily fall out when the pipe is lifted. Also called gun sampling. Truscott, p. 102d, b. Drivepipe. Nelson.

- pipette. A pink or mottled pink-and-white as an, ilaceous stone carved by the Indians into tobacco pipes. Compare cutlimate. Webster 3d.

- pipe string. The total amount of any given size of pipe used as standpipe, drivepipe, or casing in a bolehole. Long.

- pipe tap. A tap for making internal threads within pipe fittings. ASM Gloss.

- pipette. a. A small piece of apparatus with which fluids are transferred, measured, or absorbed in a beaker (operations) and which in the simplest form consists of a narrow glass tube into which the liquid is drawn up by suction and in which it is retained by closing the upper end. Webster 3d. b. As a verb, to transfer, to draw off, to measure, or to apply with a pipette. Webster 3d.

- pipectone. A pink or mottled pink-and-white ash-likeaceous stone carved by the Indians into tobacco pipes. Compare cutlinite. Webster 3d.

- pipe shank. A pipe shank. a. A mass of ore, generally parallel to the horizontal shaft of a mine, and sometimes of more or less irregular shape. B.S. 2116, 1931. b. See drivepipe. Nebon.

- pipe-shoe bit. A bit similar to a pipe bit, except that the set inside diameter is larger. Generally, it is used in a one-shot attempt to drill pipe through overburden into bedrock. A pipe-shoe hit is recovered only when the drivepipe is pulled out of the completed borehole. Long.

- pipe shrink. A term used to refer to the failure of pipe to expand during heating, or to contract during cooling, on the top of iron and steel ingots. See also pipe, a. Fay.

- pipe vein. a. A mass of ore, generally parallel to the horizontal shaft of a mine, and sometimes of more or less irregular shape. B.S. 2116, 1931. b. See drivepipe. Nebon.

- pipe-water. The diversion of the upper part of a stream by the headward growth of another stream. Same as beheading; stream capture; stream robbery. Fay.

- pipeline stream. One of two streams in adjacent valleys that has been able to deepen its valley more rapidly than the other, has extended its valley headward until it has breached the divide between them, and has captured the upper portion of the neighboring stream. Lees.

- pipeline transport. A device for sampleing a pile of ore, consisting simply of a small iron rod of material where the larger pieces are not usually greater than 2 inches. This larger end of the pipe is generally sharpened to provide a cutting edge, and sometimes contracted in diameter so that the material once entered will not readily fall out when the pipe is lifted. Also called gun sampling. Truscott, p. 102d, b. Drivepipe. Nelson.

- pipeline transport. a. Sampling by means of a pipe, usually consisting simply of a small iron rod or receive of material where the larger pieces are not usually greater than 2 inches. This larger end of the pipe is generally sharpened to provide a cutting edge, and sometimes contracted in diameter so that the material once entered will not readily fall out when the pipe is lifted. Also called gun sampling. Truscott, p. 102d, b. Drivepipe. Nelson.

- piping. a. The transfer of fluid from one place to another, by means of a pipe. Fay.

- pipe wrench. An instrument or device having serrated and attached to a handle. When one fixed and one adjustable jaw, both turner. D.O.T. I.

- piston. The working part of a pump, hydraul-

- piston clearance. Under or around a structure built on preventific foundations which will remove material from beneath the structure. See also water creep. Nelson. d. The movement of water leading to the development of channels. ASCE P1826. e. The tubular depression caused by contraction during cooling, on the top of iron and steel ingots. See also pipe, a. Fay.

- pistons. a. Eng. Thin tilelike stone, rubbing, Lower Lias, Keinton Mandeville. Arkell. b. Pipe lines. The working part of a pump, hydraulic cylinder, or engine that moves back and forth in the cylinder; it is generally equipped with one or several rings or cups to control the passage of fluid. It ejects the fluid from the cylinder, as in a pump, or receives it from the fluid, which causes a reciprocating motion, as in an engine. Long.

- pith. The natural cement of the central part of stem in grasses. The space remaining at the end of a cylinder when the piston has reached the position of its extreme travel toward that end. Long.
piston displacement. 1. A volume in cubic inches, gallons, or other units of measure swept out of a cylinder per stroke, or during a given period, by a piston. The amount of air displaced by moving all pistons of an engine or compressor from the bottom to the top of their stroke. Nichols.
piston drill. A heavy drill mounted either on a horizontal bar or on a short horizontal arm fastened to a vertical column. On the end of the rod is a chuck in which the drill steel is clamped. The pistons have a stroke of from 1 to 6 inches and deliver from 300 to 600 blows per minute. The cylinder is mounted on a carriage which can be moved back and forth by a feed screw. Lewis, p. 86. Piston drills have now been superseded by hammer drills.
piston drive-sampler. See piston sampler. Long.
piston extruder. See extruder. Dodd.
piston motor. An engine or motor in which the power delivered from air or steam is used to drive one or more reciprocating pistons connected to a crank shaft to produce rotational movement to drive a piston, pulley, or gearing connected to a device to be driven. Not to be confused with an internal-combustion-type reciprocating engine or motor. Long.
piston rod. A rod or shaft, rigidly coupled to a piston, that moves parallel to the piston and its enclosing cylinder. A rod by which the piston is moved or by which the movement of the piston is transmitted to an attached mechanism. Sometimes confused with connecting rod. Long.
piston sampler. A drive sampler equipped with either a free or a retractable-type piston that retreats up into the barrel of the sampler in contact with the top of the ground, that is, open-pit, mine, sample pit, etc. Bureau of Mines Staff, p. An excavation in the earth below the ground surface. D.O.T. 1, 1964. q. A defect similar to a dimple but slightly smaller. ASTM C286-65.
pit number. A name for mined mineral in contrast to sea amber. Shipley.
pit boss. a. One who has charge of the surface work at a mine as well as in a mine. Nichols. b. A mine manager. Pettijohn, b. In anthracite and bituminous coal mining, a foreman who is in direct charge of men in a specific portion of a mine. Synonymous with shift boss, in metal mining. Also called inside foreman; underground foreman. See also pit foreman. D.O.T. 1, c. One in charge of all operations at a strip coal mine. Webster 3d.
pit bottom. a. The bottom of a shaft and all the equipment and roadways around it. See also looptype pit bottom. Pettijohn, b. Synonym for dip bottom. Nelson. c. The bottom or lowest landing in a shaft. Fay, b. Eng. The entrance to a mine and the underground roads, in the immediate vicinity, whether at the bottom of the shaft or at any point in it in the lowest part of the surface at which the cages are loaded. Also called pit eye. Fay.
pit-bottom stop. Scot. A large solid block or pillar left around and to support the sides of a shaft. Fay.
pit brow. a. The pilhewhead, and in particular, the mouth of the shaft. Nelson, b. Lanc. The spot bank, at or near the top of a shaft. Fay, b. Eng. The entrance to a mine and the underground roads, in the immediate vicinity, whether at the bottom of the shaft or at any point in it in the lowest part of the surface at which the cages are loaded. Also called pit eye. Fay.
pit cages. The structure used in mine shafts for transport purposes. See also cage. Nelson.
pit-car loader. A short, electrically powered, lightweight elevator conveying designed for use in working places, to facilitate the loading of large cars or to aid in shoveling long distances. The loader shovels into the hopper end and the conveyor carries the coal to the car. D.O.T. 1.
pit-car oil. See summer black oil. Fay.
pitch. a. The angle at which a coal seam inclines below a horizontal line. Kuyper.
b. The grade of an incline or the rise of a seam. B.C.I. c. The solid or semifluid residue from the partial evaporation of tar. Kuyper. d. A bituminous mineral, a bituminous gangue such as free carbon, residual coke, etc. Nelson. e. The angular inclination of an ore body with respect to the surface, measured in degrees on the plane of the strike. Nelson. f. Of like, amount of deviation from the vertical taken by a section of a spiral, having some circular arc, spiraling in a helical, circular, or spiral path.
pitch opal. An inferior quality of common pitch Physicians. In coal mining, work done on pitch polishing. Polishing operations in which pitchy copper ore. Fay. pitch pest. A variety of peat resembling asphalt. Standard, 1964. b. English translation of the German term Pechtor later named dolerite. Tomkeeff, 1954. pitch pocket. A local shake that is filled with pitch; generally it is not extensive enough to affect the shearing strength of the wood greatly. However, if a large number of pockets are found in one stick, the shearing strength of the wood is reduced. Lewis, p. 39.
pitch polishing. Polishing operations in which pitch rather than felt is the resilient carrier for the polishing agent. ASTM C162-66. pitchstone. A volcanic glass characterized by a pitchy rather than glassy luster. They may be almost any color and have compositions comparable to a wide range of volcanic rocks. They contain a rather high percentage of water compared to other glassy rocks. A.G.I. pitchwork. In coal mining, work done on shares. Standard, 1964. See also pitch, h. pitch workings. Mine workings in steeply inclined seams. Fay. pitchy copper ore. A early name (petchers) for a dicalcium oxide of copper which looks like pitch. Fay. pitchy iron ore. A old synonym for giette. Fay. b. Synonym for trilite. Hey 2d, 1935. pitchy luster. Resembling the luster of a fresh surface of pitch. Shipley. pitchy rock. Eng. Rock impregnated with bitumen found in Shropshire coalfield. Tomkeeff, 1954. pitch coal. Soil obtained by mining, as distinguished from charcoal. Fay. pit committee. A. A joint committee of employer and workers dealing with the labor problems of a mine. Webster, 3d. b. A local term for mine committee. B.C.I. pit craters. A circular or ellipsoidal, steep-walled depression sunken below the gently sloping surface of a volcano and surrounded by a steeply scarped rim. Such craters are the result of collapse and have never been filled to overflowing with molten lava. They are commonly located on the flanks of shield volcanoes, such as the Mauna Loa and Kilauea, in Hawaii. Synonym for volcanic sink U.S.G.S Bull. 994, 1953, p. 17. pit Gunn. In order to allow for the friction of the sides of the guides and between the air and the sides in the shaft and for other small losses, it is usual to divide the total static torque at any point of the wind by 0.9 for a new shaft with rope guides, or 0.85 for an old shaft with rigid guides. This factor is generally referred to as pit efficiency. Sinclair, V., pp. 166-167.

pits eye. a. Bottom of pit shafts from which sky is visible. Pryor, 3. b. Eng. Bottom of the shaft of a coal mine; also the junction of a shaft and a level. Fay. Also called pit bottom, especially with regard to the lower levels. Standard, 1964.
pit grade. A layer of coarse coal left around a shaft to protect it from caving. Fay. pit flakes. Flints dug from chalk as opposed to gravel. pit foreman. In bituminous coal mining, a foreman who is in immediate charge of all the mining operations in his strip mine. Also called pit boss. D.O.T. 1.
pit gate. York. Any place in the immediate vicinity of a colliery at which miners hold meetings of their own in reference to wages, etc. Fay.
pit guide. An iron column that guides the cage in a mine shaft. Fay.
pitching. a. The parenchyma (usually) tissue occupying the central portion of a stem inside the pith. A.G.I. b. Eng. The soft part of the lode. Fay.
pit hand. In the iron and steel industry, a general term applied to workers who perform varied duties around the processing furnaces. D.O.T. 1.
pithead. a. Landing stage at top of shaft. Pryor, 3. b. The top of a mine shaft including the buildings, roads, tracks, plant, and machinery around it. See also pit brow. Nelson.
pithead baths; changehouses. A building situated convenient to the miners leaving the pithead, with washing facilities, accommodation for changing and drying clothes, and a canteen. In Great Britain, responsibility for pithead baths and colliery canteens rests with the National Coal Board. Nelson.
pithead frame. Scot. See headframe, a; pithead frame. Scot. Same as headframe. Fay.
pit lamp; pit light

An open lamp worn on a miner’s cap as distinguished from a safety lamp. Webster 3d.

pit limit. The vertical and lateral extent to which the mining of a mineral deposit by open-pit methods is economically carried. Cost of removing overburden or waste material versus the mineable value of the ore so exposed is usually the factor controlling these limits of a pit. Bureau of Mines Staff.

pitman. a. A man who examines regularly the condition of the shaft, guides, etc. He usually selects the weekends for his inspection when winding is at a minimum. Nelson. b. An earlier term for the man in charge of the pumps in the shaft. Nelson. c. A laborer who inspects refined copper emerging from crucible, for size and the presence of foreign materials. D.O.T. Supp. d. In the Blake type of jaw crusher, an eccentrically driven vertical link between the driving wheels and the tuggles which move the crusher's swinging jaw. Pryor, 3. e. Old term for connecting rod. Sanderson.

pitman arm. An arm having a limited movement around a pivot. Nichols.

pitmen. Men employed in shaft sinking or shaft inspection and repair. C.T.D.

pit mining. Surface mining in which the material mined is removed from below the surrounding land surface. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1935, p. 6.

pit mouth. Scot. The opening of a shaft at the top of the ground. Fay.

pitometer. An instrument that consists essentially of two pitot tubes one of which is turned upward, and the other downward, and that is used to record automatically the velocity of a flowing liquid or gas. Webster 3d.

pit's edge. See Pitot tube. Fay.

Pitot-static tube. When the Pitot tube and static tube are combined, they form the Pitot-static tube, and as such they can be used as an anemometer. The tubes are usually arranged concentrically. When the points of the two pitot tubes are directed opposite the ground level. Access is gained by stairs, which move the crusher's swing jaw. Nelson.

pit M11b. The vertical and lateral extent of the opening in a mine; pit space. Fay.

pit sampling. a. Use of small untimbered pits to gain access to shallow alluvial deposits or ore dumps for purposes of testing or valuation. Pryor, 3. b. Sampling shallow depositive means of trial pits, usually about 2 to 3 feet in diameter. In reasonably dry ground, depths of 50 feet or more may be reached. Pit sampling is often used to assist site investigations as it provides the maximum of information regarding nature of deposit and bedrock. Nelson.

pit sand. a. Sand usually composed of grains that are more angular; it often contains clay and organic matter. When washed and screened it is a good sand for general purposes. Zern, p. 145. b. Sand from a pit, as distinct from river or sea sand. Arkell.

pit shaft. Eng. Same as shaft. Fay.

pit shaft. The name given to the shaft into which the opening of the ravinne or ravinne in the head of a mine for coal production. Nelson. b. The extent of the opening in a mine; pit space. Fay.

pit slope. The angle at which the wall of a shaft, pit, or well dips as measured along an imaginary plane extended along the crest of the berm or from the slope crest to its toe. Compare slope, J. Bureau of Mines Staff.

pitted. a. A type of corrosion that develops cavities or pits in hot, lustrous metals that are not passivated. This type of corrosion is often used for gray or steel cookware, lead, leaded glass, etc. D.O.T. I. Depressed symmetrically shaped areas in the surface of steel. May have a black speck at the center. Blake.

pitting corrosion. Passive metals are resistant to a wide variety of corrosive media, but under certain conditions breakdown of the passive film may occur at various points. Depending on conditions, this may lead to complete breakdown of the passive film or the attack may concentrate on these initial areas, leading to rapid failure by pitting. Ham.

pit top. Eng. A bank or heap upon which mine waste is tipped or dumped. Fay.

Pittsburgh bed. The Pittsburgh coal which outcrops or occurs in thin seams in the vicinity of Pittsburgh and extends under a large area of western Pennsylvania and northern West Virginia. It belongs in the Carboniferous system, Pennsylvanian series, at the base of the Monongahela formation. Rice, Geol. Pittsburgh process. A process for the vertical drawing of sheet glass invented by the Pittsburgh Plate Glass Co. The sheet is drawn from the free surface of the molten glass, the drawing slot being completely submerged; the edges of the sheet are formed by rollers. This process has also been referred to as the Pennvern process. Dodd.

pit water. a. Water from the underground workings of a mine. B.S. 3552, 1962, b. Aust. The moisture contained in freshly mined coal, which is lost by exposure to ordinary atmospheric conditions. Fay.

pit wood. The various kinds of timber used as supports for underground workings. The extent of steel has reduced considerably the use of timber for support purposes. Nelson.

pitwork. Cornish pumps and other engineering appliances in and near mine pits. Pryor, 3. See also pit top. Fay.

pitwright. a. Scot. An engineer who attends to pit pumps, etc. Fay. b. See pumping engineer; mine carpenter. D.O.T. I.

pivot. A nonrotating axle or hingepin. Nichols.

pivotal fault. See hinge fault; rotational fault.

pivoted-bucket carriers. The highest type of combined elevator and conveyor. It consists of two long-pitch roller chains joined by crossbars on which are hung the buckets in such a way that they can be completely turned over. Pit and Quarry, 53rd, Sec. 6, p. 26.

pivot-bucket conveyor. A type of conveyor using pivoted buckets attached between two endless chains which operate in suitable guides or casing in horizontal, vertical, inclining, or a combination of these paths over drive, corner and takeup terminals. The buckets remain in the carrying position; they do not have to be inverted to discharge. ASA MH4-1-1958.

pivot shaft. A tractor dead axle, or any

tracks, trucks, derricks, or cableway hoists. These pits may reach depths of several hundred feet below the ground surface. Pryor, 3. b. A draw-in operation which is carried on as an auxiliary operation to passivate. This type of deposit is often used for gray or steel cookware, lead, leaded glass, etc. D.O.T. I. Depressed symmetrically shaped areas in the surface of steel. May have a black speck at the center. Blake.

pitting corrosion. Passive metals are resistant to a wide variety of corrosive media, but under certain conditions breakdown of the passive film may occur at various points. Depending on conditions, this may lead to complete breakdown of the passive film or the attack may concentrate on these initial areas, leading to rapid failure by pitting. Ham.

pit top. Eng. A bank or heap upon which mine waste is tipped or dumped. Fay.

Pittsburgh bed. The Pittsburgh coal which outcrops or occurs in thin seams in the vicinity of Pittsburgh and extends under a large area of western Pennsylvania and northern West Virginia. It belongs in the Carboniferous system, Pennsylvanian series, at the base of the Monongahela formation. Rice, Geol. Pittsburgh process. A process for the vertical drawing of sheet glass invented by the Pittsburgh Plate Glass Co. The sheet is drawn from the free surface of the molten glass, the drawing slot being completely submerged; the edges of the sheet are formed by rollers. This process has also been referred to as the Pennvern process. Dodd.

pit water. a. Water from the underground workings of a mine. B.S. 3552, 1962, b. Aust. The moisture contained in freshly mined coal, which is lost by exposure to ordinary atmospheric conditions. Fay.

pit wood. The various kinds of timber used as supports for underground workings. The extent of steel has reduced considerably the use of timber for support purposes. Nelson.

pitwork. Cornish pumps and other engineering appliances in and near mine pits. Pryor, 3. See also pit top. Fay.

pitwright. a. Scot. An engineer who attends to pit pumps, etc. Fay. b. See pumping engineer; mine carpenter. D.O.T. I.

pivot. A nonrotating axle or hingepin. Nichols.

pivotal fault. See hinge fault; rotational fault.

pivoted-bucket carriers. The highest type of combined elevator and conveyor. It consists of two long-pitch roller chains joined by crossbars on which are hung the buckets in such a way that they can be completely turned over. Pit and Quarry, 53rd, Sec. 6, p. 26.

pivot-bucket conveyor. A type of conveyor using pivoted buckets attached between two endless chains which operate in suitable guides or casing in horizontal, vertical, inclining, or a combination of these paths over drive, corner and takeup terminals. The buckets remain in the carrying position; they do not have to be inverted to discharge. ASA MH4-1-1958.

pivot shaft. A tractor dead axle, or any
pivot shaft

A type of hinge pin. Nicks at.

place. a. See in place; in situ. Fay. b. The part of a mine in which a miner works by going as near as possible to "working place." A point at which the cutting of coal is being carried on. Fay. c. Eng. A kind of cabin in which tools are kept in the mine, and in which a deputy eats his lunch. Fay.

placer. a. A place where gold is obtained by washing; an alluvial or glacial deposit, as of sand or gravel, containing particles of gold or other valuable mineral. In the United States mining law, mineral deposits, not veins in place, are treated as placers, so far as locating, holding, and patenting are concerned. Various minerals, besides metallic ores, have been held to be placers. Besides gold, the United States mining law, mineral deposits, not veins in place, are treated as placers, so far as locating, holding, and patenting are concerned. Various minerals, besides metallic ores, have been held to be placers. Besides gold, the following are considered placers.

placer claim. a. A mining claim located upon placer ground, gravel, or sand, which contains valuable mineral. In the mining law of some states, placer mining is applied. See also alluvial deposit.

placer gold. Gold occurring in more or less coarse gold-bearing gravel which can be obtained by washing the sand, gravel, etc., in which it is found. Craigie, v. 3, p. 1756. See also stream gold.

placer ground. Place where placer mining can be done, that is, where gold can be obtained in digging up the earth and washing it for the gold. Craigie, v. 3, p. 1757.

placer location. A location of a tract of land for the mineral deposits, or other valuable deposits upon or within it that are not found within lodes or veins in rock in place, and is a claim of a tract of land for the sake of the loose deposits on or near its surface. Ricketti, p. 1.

placer mining. a. The extraction of heavy mineral from a placer deposit by concentration in running water. It includes ground sluicing, washing gravel into a sluice, scraping by power scraper and excavation by dragline. Nyland, b. Extracting the gold then recoverable from placer miners, wherever situated—in dry channels and in channels for the time filled with water. It does not make the process any the less placer mining that the mineral is found in deep channels, in navigable streams, or in streams beds or creeks and valleys and may, in most instances, be collected by washing or amalgamation without milling. In other words, the term includes all forms of deposit excepting veins or lodes of quartz or other rock in place. Ricketti, p. 1. Designating one who engages in placer mining. Craigie, v. 3, p. 1756.

placer claim. a. A mining claim located upon gravel or ground whose mineral contents are extracted by the use of water, by sluicing, hydraulicking, etc. The unit claim is 1,220 feet square and contains 10 acres. Fay. b. Ground with defined boundaries within which contains mineral in the earth, sand, or gravel; ground that includes valuable deposits not fixed in the rock. See also claim; lode claim. Fay. c. The maximum size of a placer claim is 20 acres. Association claims of two or more persons may be located up to an area of 160 acres for eight persons. Placer claims must have a discovery. They should be staked, a location notice filed for the same as lode claims, stating the mineral for which the location is made. Lewis, p. 20.

placcl deposit. a. A mass of gravel, sand, or similar material resulting from the crumbling and erosion of solid rocks and containing nuggets of gold, platinum, tin, or other valuable minerals, that have been derived from rocks or veins. Fay. b. Debris, a. in a placer deposit, concentrated on the surface by moving water or air. Bateman. c. An alluvial deposit of ore, gravel, or sand derived from geologic or mechanical gravel or sand. Pryor, 2. See also alluvial deposit.

Bureau of Mines Staff.

b. A place at which placer mining is carried on. Craigie, v. 3, p. 1756.

placcl gold. Gold occurring in more or less coarse gold-bearing gravel which can be obtained by washing the sand, gravel, etc., in which it is found. Craigie, v. 3, p. 1756. See also stream gold.

placcl ground. Place where placer mining can be done, that is, where gold can be obtained in digging up the earth and washing it for the gold. Craigie, v. 3, p. 1757.

placcl location. A location of a tract of land for the mineral deposits, or other valuable deposits upon or within it that are not found within lodes or veins in rock in place, and is a claim of a tract of land for the sake of the loose deposits on or near its surface. Ricketti, p. 1.

placcl mining. a. The extraction of heavy mineral from a placer deposit by concentration in running water. It includes ground sluicing, washing gravel into a sluice, scraping by power scraper and excavation by dragline. Nyland, b. Extracting the gold then recoverable from placer miners, wherever situated—in dry channels and in channels for the time filled with water. It does not make the process any the less placer mining that the mineral is found in deep channels, in navigable streams, or in streams beds or creeks and valleys and may, in most instances, be collected by washing or amalgamation without milling. In other words, the term includes all forms of deposit excepting veins or lodes of quartz or other rock in place. Ricketti, p. 1. Designating one who engages in placer mining. Craigie, v. 3, p. 1756.

plain of marine denudation

containing a mixture of sodium and calcium feldspars, distinguished by their extinction angles; crystal; trincite. n. (V. Lehigh.) Doha. 27. F. C. 27. E. E. 24. 1962.

plagioclase feldspar. A porphyritic extrusive rock with phenocrysts of plagioclase feldspar and quartz in a groundmass of orthoclase and quartz. Also called delinite; plagiodolite. Webster 4d.

plagioclase. Having the cleavage of plagio-

plagioklase; plagiodol; plagiobrad; Having an oblique spiral arrangement of faces; specifically, a group of the isometric system characterized by 13 axes of symmetry but no center or planes. Webster 3d.

plagioplitic. Synonym for rhylolite. A.G.I.

plagionite. A sulfide of lead and antimony. PbSb2S6; Color, blackish, lead-gray; luster, metallic; monoclinic. Webster 3d; Dana 17.

plagiophyre. A term for rocks resembling ortho- hytrectes in texture, but containing plagioclase instead of orthoclase. The type of rock contains laths of andesine with interstitial chloritohydrine, iron ores, and in places, orthoclase. Compare leuco-
diorite.

plains. a. An extent of level, or nearly level, land; a region not noticeably diversified with mountains, hills, c. valleys. Fay. b. A flat, gently sloping or nearly level region of the sea floor. HEE. c. Relatively flat areas or plains from babbles and dirt during the melting process. ASTM C162-66.

plain clineometer. A clinometer having only its upper end threaded to fit drill rods. Also called end clinometer. See also clinometer. Compare line clinometer; wedge clinometer. Long.

plain coastal. A plain fronting the coast and generally representing a strip of recently emerged sea bottom. A.G.I.

plain concrete. Concrete with no reinforcement. See also mass concrete. Ham.

plain detonator. A detonator for use with a safety fuse. B.S. 3618, 1964, sec. 6. It consists of an aluminum tube closed at one end and provided with a fuse and safety fuse, the latter. The fuse is partially filled with water, the fuse and safety fuse, the latter. The fuse is partially filled with water, the safety fuse is then secured in position by indenting the detonator tube, the process being known as crimping. The combination of safety fuse and plain detonator is called a capped fuse. McAdam II, p. 52.

plain of formation. Formed by the undi-
turbed extension of beds which retain the original horizontality of deposition. River deltas, alluvial flats, fans, marshes, and slitted-up lakes are instances of such formations. A.G.I.

plain of marine abrasion. A plain formed beneath the sea by the erosion of the wave or tide action. A plain of marine abrasion; plain of marine erosion; plain of submarine erosion; wave-cut plain; wave-cut 
terrace, A.G.I.

plain of marine cut-terraces
planetesimal. One of numerous, small, solid planetary bodies which, according to the planetesimal hypothesis, had individual orbits about the sun and of which the planets were formed by aggregation. Fay.

planetesimal hypothesis. The hypothesis that the earth and the other planets were formed by collision and coalescence of planetesimals and have never been wholly molten. Fay.

planet gear. Gearing in which one gear wheel revolves round another. Mason.

plane trigonometry. Trigonometry that treats of the solution of plane triangles. Zen., p. 54.

planform. The outline or shape of a body of water as determined by the stillwater line. A.G.I.

planimeter. An instrument for measuring the area of any plane figure by passing a tracing point along its boundary line. Webster 3d.

planimetric method. A method of measuring grain size in which the grains within a definite area are counted. ASM Gloss.

planimetry. a. The determination of horizontal distances, angles, and areas by measurements on a map. A.G.I. b. The plan details of a map. Seeley, 2.

planning. Producing flat surfaces by linear reciprocal motion of the work and the table to which it is attached, relative to a stationary, single-point cutting tool. ASM Gloss.

planar. A bed of ore or workings or a vein in which the crystals are arranged in layers. Fay.

plant. a. The shaft or slope, tunnels, workshops, etc. b. A group of mines. c. The scheme as far as it determines the mining methods and machines properly exploited with efficiency, safety, and economy. Nelson.

plantation. Relating to the chiefly simple forms of floating and surface-dwelling organisms of the ocean waters. Schiefferdecker.
mining, the mechanical installations, machines, and their housings. Earthworks are sometimes loosely included. Pryor, S. D., 1962. Use of equipment. A large scale of derricks, railways, cars, etc., employed in tunnel work. Stauffer.

plant bed. A shale roof. Plante battery. A type of plant scrap. Scrap metal sometimes loosely included. mining, the mechanical installations, ma .

plant indicators; universal Ham.

and then spread. See also mixed at a central mixing station and makes or

mixed in a foundry or defective plant itself; for example, sprues and bides, silicides, or nitrides that in which temperatures in excess of 30,000° C. The usual purpose of a refractory coating applied in this way is to protect a material, for example, molybdenum or ca. when used at a high temperature. Dodd.

plaster. A material or mixture of materials that is applied in substantial thickness to surfaces for protective or decorative coating purposes. It is designated as gypsum, lime, gypsum-lime or cement-lime plaster, according to the composition. Taylor.

plaster base finish tile. Tlies whose surfaces are intended for the direct application of plaster. ASTM C43-65T.

plaster, hard-binded. Plaster made from overburned gypsum, which is dipped in alun solution and calcined a second time. Keene's cement and Portland cement are examples. See also gypsum cements. CCD 6d, 1961.

plastering. Same as mudcapping. Fay.

plaster mill. a. A machine consisting of a controller or set of rollers for grinding lime or gypsum to powder. Fay, b. A mortar mill.

plaster molding. Molding, wherein a gypsum-bonded aggregate flow in the form of a pattern, permitted to harden, and, after removal of the pattern, thoroughly dried. The technique is used to make smooth nonferrous castings of accurate size. ASTM G51.

plaster of Paris. A plaster made from gypsum by grinding and calcining, so called from its manufacture near Paris, France. With water, it forms a paste which soon sets. In Canada, this term has been adopted for gypsum in any form. Fay. Has a number of ceramic uses; probably the most important is in making molds, and dies. Also used as a glass batch material to replace part or all of the salt cake in combination with soda ash, as an additive to certain glasses, and as a mounting medium for optical glass. Lee.

plaster retarder. Any substance used to slow the setting of plaster. Blood, glue, dextrin, and hair are among the retarders used. CCD 6d, 1961.

plaster shooting. a. A surface of suns and stars. Neither solid, liquid, nor gaseous, could become the great energy-thrust product of placing a. water slurry is poured over a pattern, thoroughly dried. The technique is used to make smooth nonferrous castings of accurate size. ASTM G51.

plaster, hard-binded. Plaster made from overburned gypsum, which is dipped in alun solution and calcined a second time. Keene's cement and Portland cement are examples. See also gypsum cements. CCD 6d, 1961.

plastering. Same as mudcapping. Fay.

plaster mill. a. A machine consisting of a controller or set of rollers for grinding lime or gypsum to powder. Fay, b. A mortar mill.

plaster molding. Molding, wherein a gypsum-bonded aggregate flow in the form of a pattern, permitted to harden, and, after removal of the pattern, thoroughly dried. The technique is used to make smooth nonferrous castings of accurate size. ASTM G51.
plastic flow

plastic fracture. The breakage of a metal under tensile stress is the term applied when the fracture occurs as a function of time. Such movement is known as plastic flow. Spalling, c. A phenomenon in which the bottom sediments under a pond or lake move as a whole, rather than eroding as separate grains. Plastic flow occurs from the weight of water or from external forces, such as wind or currents. Hy. d. The permanent deformation, or change in shape without rupture, of a solid body subjected to a continuous force. A.G.I. e. In a glacier, the movement of glacier ice that takes place without shearing and cracking of the ice. A.G.I. f. The deformation of a metal by movement along the slip planes and at the grain boundaries, the effects varying according to the temperature at which the process is performed. Rolfe. g. The same as plastic deformation.

plastic fracture. The breakage of a metal under tensile load when being drawn out. See also cup-and-cone fracture, necking. Ham.

plastic igniter cord. A coalfire device for lighting a coal face. When the cord is ignited an intense flame passes along its length at a uniform rate and ignites the coal face, causing an ordinary safety fuse. Two types are made: The fast has a nominal burning speed of 1 per second per foot, the slow, a nominal speed of 10 seconds per foot. Nelson.

plasticity, a. The property of changing shape permanently when a force is applied to it, and of returning to its former shape when the force is removed. A.G.I. b. The property of a material that allows it to undergo permanent deformation without appreciable volume change or elastic rebound, and without rupture. Stokes and Vareni, 1955. c. A complex phenomenon which appears to be induced primarily by the pressure of gases causing surface flow at the moment, when under the action of heat, the molecules at the surface have attained a degree of freedom comparable with that obtained in a liquid. In the case of coal, a certain degree of plasticity is essential for the production of coke. A.G.I. d. See plastic flow; plastic limit; plastic soil; plastic state; plasticity index. ASCE P1826.

plasticity Index; Index of plasticity. The range over which the soil is plastic and is represented on a nomenclature chart as a semicircular area on horizontal and vertical axes. A.G.I. e. A compound added to a lacquer to counteract the tendency of the finished surface to become brittle. Shell Oil Co. c. An additive to improve the workability of concrete. Taylor.

plastic limit, a. The water content corresponding to an arbitrary point between the plastic and the semidrained states of consistency of a soil. ASCE P1826. b. Water content at which a soil will just begin to crumble when rolled into a thread approximately $1/8$-inch in diameter. ASCE P1826. c. The lowest water content at which the soil will show plasticity. A.G.I.

plastic making. This term includes all processes of shaping clay in the plastic condition. Plastics such as jiggering, jollying, and throwing. Dodd.

plastic modulus. A factor used in the plastic design of steel structures. It is a constant for each particular shape of section. See also plastic moment of section. Ham.

plastic range. The range of temperature during the cooking process within which the coking mass of coal is in a semifusible or plastic state. See also plastic pressing.

plastic refractory. A refractory material, tempered with water, that can be extruded and that has suitable workability to be ponded into place to form a monolithic structure. ASCE, 1963.

plastics. All synthetic resinlike materials which can be molded under the influence of heat or pressure. Anderson.

plastic shaping. See plastic making, Dodd.

plastic stillamine. An air-setting kyanite-base mixture, ready to use for patching walls, moldering shapes, etc. Bureau of Mines Staff.

plastic solid. a. A solid that undergoes change of shape continuously and indefinitely after the stress applied to it passes a critical point. Lewis.

plastic state. The range of consistency within which a soil exhibits plastic properties. Also called plastic range. ASCE P1826.

plastic strain. In the case of a single mineral, the term connotes permanent deformation accomplished by gliding within the crystal lattice without loss of cohesion. A.G.I. b. In rocks, which are composed of many crystals often belonging to several mineral species, the term is conveniently applied to any permanent deformation throughout which the rock maintains essential cohesion, and strength, regardless of extent to which local microfracturing and displacement of individual grains may have entered into the process. A.G.I. c. A term variously used but most commonly to designate the finished quartz body used in an oscillating circuit. See also crystal. AM. d. See set, z. Ram.

plastic tamping rod. A tamping rod of a tamped or stemmed, of a rigid nature, made from plastic possessing suitable dielectric properties, in order to be nonconductive to the building up of static charges of static electricity is unusual. c. Nelson.

plastic tooling. Dies, jigs, and fixtures for metal forming, boring, assembly, and checking, made at a saving of time and labor, of laminated and cast components, and cemented into highly stable industrial tools, chiefly with epoxy and some with polyester resins. Plastics are strong adhesive resins, particularly useful because of their low shrinkage factor. Polymers have a cost advantage and are easy to handle. Critchley.

plastic welding. Welding with steel <i>c</i>-iron in the plastic state as in the case in forge and pressure welding. Ham.

plastic yield. The term commonly applied to plastic deformation. Ham.

plate. a. Scot. A flat cast-iron or malleable-iron sheet laid at the shaft bottom or at a heading to establish height. Anderson. b. A plate of cast iron or steel bent and turned and moved about. A cast-iron plate with a circular ridge on which cars are turned at junction of roads. Fay. b. Eng. Black shale; a shale rock. Fay. c. A horizontal timber laid on a wall to receive a plastering framework. Standard, 1964. d. A sheet of copper coated with mercury for collecting gold. See also amalgamation, b. Fay. e. A lead miner's term for shale. Nelson. f. Eng. A rail, $4$ feet long, used at and near the face for the tubs. S.M.R.B., Paper No. 61. g. A flat-rolled metal product of some minimum thickness and width arbitrarily dependent on the type of metal. ASM Gloss. h. To cover over with gold, silver, or other metal, either mechanically or chemically. Webster 3d. i. A term variously used, but most commonly to designate the finished quartz body used in an oscillating circuit. AM. j. Plate glass. Standard, 1964.

plate amalgamation. Use of copper or copper-alloy plates coated with mercury to form a soft adherent film, in order to trap gold from crushed ore pulp as it flows over the plates. The resulting amalgam, containing up to the 50 percent of metallic gold, is periodically scraped off and more mercury is added to the film.

plate-and-frame filter. A filter press consisting of plates with a gridiron surface alternating with hollow frames; all of which are held by means of lugs, on the press framework. The corners of both frames and plates are cored to make continuous passages for pulp and solution; the filter cloth is placed over the plates. The pulp passage-way connects with the large, top opening of the plate and unloading ore, etc. Webster 3d. a. Fay. b. Eng. A rail, $4$ feet long, used at and near the face for the tubs. S.M.R.B., Paper No. 61. c. A diagram drawn to scale showing land boundaries and subdivisions, together with all data essential to the description of the several lots. A plat differs from a map in that it does not show additional cultural, drainage, and relief features. Seelye, 2. e. N.S.W. A line of a car in coal near its intersection with a shaft. New South Wales.

plATALARGAN. See alargan. Hess.

plateau. a. An upland, tableland, or elevated plateau. A. A plastic conducive to the building of soil; plastic state; plasticity index. ASCE P1826. b. Water content at which a soil will just begin to crumble when rolled into a thread approximately $1/8$-inch in diameter. ASCE P1826. c. The lowest water content at which the soil will show plasticity. A.G.I.

plateau. A material, usually organic, capable of imparting plasticity to nonplastics or improving the plasticity of ceramic mixtures. ASCE P1826. b. A compound added to a lacquer to counteract the tendency of the finished surface to become brittle. Shell Oil Co. c. An additive to improve the workability of concrete. Taylor.

plate limit. a. The water content corresponding to an arbitrary point between the plastic and the semidrained states of consistency of a soil. ASCE P1826. b. Water content at which a soil will just begin to crumble when rolled into a thread approximately $1/4$-inch in diameter. ASCE P1826. c. The lowest water content at which the soil will show plasticity. A.G.I.

plastic making. This term includes all processes of shaping clay in the plastic condition. Plastics such as jiggering, jollying, and throwing. Dodd.

plastic modulus. A factor used in the plastic design of steel structures. It is a constant for each particular shape of section. See also plastic moment of section. Ham.
plateau. Made up of ancient flows and lavas, a plateau is a nearly flat-topped elevation with a surface that slopes gently downward in all directions. Plateaus can be found in various parts of the world, including the Rockies, the Great Plains, and the Tibetan Plateau.

plate bearing test. A method by which the load bearing capacity of a soil or subsoil can be estimated. See also ultimate bearing pressure. 

plate cleaner. A device for cleaning raw coal which removes the difference in the coefficient of resilience or friction between clean coal and an inclined plate, commonly set between two parallel flat plates, and the plate to allow the clean coal to jump over a gap while the refuse falls through the gap. A plate cleaner is used to remove impurities from coal.

plate conveyor. A conveyor in which the carrying medium is a series of steel plates, each in the form of a short trough, joined together with a slight overlap to form an articulated band. The plates are attached either to one center chain or to two side chains. The chains connect rollers running on an angle-iron framework and transmit the drive from the drivehead which can be installed at intermediate points as well as at the head or tail ends. A plate conveyor can negotiate curves down to about 20 feet radius; available in widths 400, 540, and 640 millimeters with running speeds from 3 to 4 feet per second with a carrying capacity from 100 to 400 tons per hour. 

plate coordinates. In photographic mapping, rectangular coordinates measured on a photograph with reference to the principal point as origin. See also 2.

plate feeders. a. Short plate conveyors which are sometimes used instead of the usual measuring chutes in skip winding. They serve the same dual purpose, namely to measure a predetermined load of coal and discharge it into the skip. The feeders are placed side by side, adjacent to the shaft. The loading and discharge into the skip is automatically controlled. Plate feeders are used for a variety of purposes in mines on the surface and underground. Nelson. b. The mechanical plate feeder is a device for feeding material at a fixed and uniform rate. It is generally applied at the tail end of the conveyor or elevator which feeds a plant, but it can be applied to feeding any other unit. It relieves the pressure and drag, with the consequent unnecessary wear on the belt, which is ordinarily experienced if feeding from a hopper directly to a belt. It not only cuts maintenance costs by eliminating uneven wear, but increased output can be obtained by steady feeding. This type of feeder also handles wet aggregate. Pit and quarry. c. Plate feeders may be of the hopper type, where material is fed into the hopper at a predetermined rate, or they may be of the rotary type, where material is fed into the oscillator at a predetermined rate. Nelson. 

plate glass. Flat glass formed by a rolling and solidifying process, ground and polished on both sides, with a thickness of 1/8 inch. Standard, 1964.

plate oven. A double chamber, usually constructed of comparatively thin steel sheeting, stiffened around the edges with angles. Plates should be of such size that they can be conveniently handled in the oven, one part of which is used for heating split cylinders of sheet or cylinder glass before flattened into sheet glass, and the other chamber for annealing the sheet. Standard 3d.

platform. One who participates articles with a coating of precious or lustrous metal to form a plate or sheet. See also plating.

platforms. 1. See almanac in 1. D.O.T. 1. 2. See also D.O.T. 1. 

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. Standard, 1964.

plate mounted. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine.

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

platform. A laborer who spreads samples of precious metal to show the place of manufacture, fineness of the metal, etc. Standard, 1964.

platform. Refined iron run in molds and broken up for remelting or for use in a mix. Webster 3d.

plate mixer. A mixer for mixing the ore in a mill to produce the proper slurry consistency. Nelson.

plate nail. Eng. A nail or spike to fasten tram plates and rails to the sleepers. Fay.

plated. A. Doubled, or double, indicating the part of which is used for heating split cylinders of sheet or cylinder glass before flattened into sheet glass, and the other chamber for annealing the sheets. Webster 3d.

plate oven. A double chamber, usually constructed of comparatively thin steel sheeting, stiffened around the edges with angles. Plates should be of such size that they can be conveniently handled in the oven, one part of which is used for heating split cylinders of sheet or cylinder glass before flattened into sheet glass, and the other chamber for annealing the sheet. Standard 3d.

plate vibruster. A self-propelled mechanical vibrator having a flat base, which consolidates hard fill prior to construction. 

platform. A. A wooden floor on the side of a gangway at the bottom of an inclined seam, to which coal is run by gravity, and from which it is shoveled into mine cars. Fay. b. A scaffold. Fay. c. A plank or mesh steel-covered level area at the base of a drill tripod or derrick, used as a working space in front of a drill machine around the collar of the borehole. Sometimes the platform is large enough to act as a foundation and anchor for the drill machine. Also a similar floored area in the tripod or derrick on which a man stands while working in the tripod or derrick. See also floor; drill floor. Long. d. The place on top of a breast where the freshly mined coal is weighed by a weigh box just before it is dumped into the machinery. In the breaker, a flat or slightly inclined floor covered with iron plates onto which coal is run from the main screen bars and cleaned by platform men. Sometimes wood mat used in sets to support machinery on soft ground. Also called a pontoon. Nichols. 

plate. A laborer who spreads samples of precious metal to show the place of manufacture, fineness of the metal, etc. Standard, 1964.

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

platform. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

platform. A laborer who spreads samples of precious metal to show the place of manufacture, fineness of the metal, etc. Standard, 1964.

platform. Refined iron run in molds and broken up for remelting or for use in a mix. Webster 3d.

plate mixer. A mixer for mixing the ore in a mill to produce the proper slurry consistency. Nelson.

plate nail. Eng. A nail or spike to fasten tram plates and rails to the sleepers. Fay.

plated. A. Doubled, or double, indicating the part of which is used for heating split cylinders of sheet or cylinder glass before flattened into sheet glass, and the other chamber for annealing the sheets. Webster 3d.

plate oven. A double chamber, usually constructed of comparatively thin steel sheeting, stiffened around the edges with angles. Plates should be of such size that they can be conveniently handled in the oven, one part of which is used for heating split cylinders of sheet or cylinder glass before flattened into sheet glass, and the other chamber for annealing the sheet. Standard 3d.

plate vibruster. A self-propelled mechanical vibrator having a flat base, which consolidates hard fill prior to construction.

platform. A. A wooden floor on the side of a gangway at the bottom of an inclined seam, to which coal is run by gravity, and from which it is shoveled into mine cars. Fay. b. A scaffold. Fay. c. A plank or mesh steel-covered level area at the base of a drill tripod or derrick, used as a working space in front of a drill machine around the collar of the borehole. Sometimes the platform is large enough to act as a foundation and anchor for the drill machine. Also a similar floored area in the tripod or derrick on which a man stands while working in the tripod or derrick. See also floor; drill floor. Long. d. The place on top of a breast where the freshly mined coal is weighed by a weigh box just before it is dumped into the machinery. In the breaker, a flat or slightly inclined floor covered with iron plates onto which coal is run from the main screen bars and cleaned by platform men. Sometimes wood mat used in sets to support machinery on soft ground. Also called a pontoon. Nichols. 

plate. A laborer who spreads samples of precious metal to show the place of manufacture, fineness of the metal, etc. Standard, 1964.

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

platform. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine. 

plate metal. A bonded abrasive product attached to a steel plate, which is designed for attachment to a machine.

platform. A laborer who spreads samples of precious metal to show the place of manufacture, fineness of the metal, etc. Standard, 1964.

platform. Refined iron run in molds and broken up for remelting or for use in a mix. Webster 3d.
platform

platform gantry. A gantry constructed for carrying a portal crane or similar structure. Ham.

platform hoist. A power driven hoist having a capacity of 2 tons with a lifting height of about 2½ tons, which can be raised on a leading platform to a height of up to 200 feet. See also mobile hoist. Ham.

platform reef. A fixture used to hold work pieces or heavy metal plates for armored vessels. Standard, 1964.

platform truck; rack body truck. A truck with a flat open bed. Nicholas.

platinoid. A mineral consisting of a natural alloy of iridium and platinum and other related metals occurring usually in silver-white grains. Mohs hardness, 6 to 7; specific gravity, 22.6 to 22.8. Webster 3d.

platinilum. A mineral consisting of a natural alloy of iridium and platinum and other related metals occurring usually in silver-white grains. Mohs hardness, 6 to 7; specific gravity, 22.6 to 22.8. Webster 3d.

platinilume. An alloy containing 54 to 58 percent platinum, especially in its higher valence; as, platinic chloride. Compare platinous. Standard, 1964.

platinin. Gold. Said to be a native alloy containing 84.6 percent gold, 2.9 percent silver, 0.2 percent iron, 0.3 percent copper, and the remainder platinum. Hess.

platinothermal. To coat or combine with platinum, especially by electroplating. Standard, 1964.

platinothermite. A solid mixture of iron, aluminum, and platinum whose specific gravities are about 12 and the other of which is composed of osmium, iridium, and platinum whose specific gravities are over 21. Webster 3d.

platinum metal. Any of the six precious metallic elements including platinum and elements resembling it, chemical and physical properties that belong to group VIII of the periodic table and are often subdivided into two triads one of which is composed of ruthenium, rhodium, and palladium whose specific gravities are about 12 and the other of which is composed of osmium, iridium, and platinum whose specific gravities are over 21. Webster 3d.

platinum mining. A method of metal extraction by reducing ammonium chlorideplatinum that collects large volumes of oxygen, hydrogen, and other gases; used as a catalyst. Webster, 3d.

platinum. See alarum. Hess.

platt. Corn. An enlargement of a leaf near a stalk, and often at instant hoisting, waggons pass each other, etc. Same as plait, a. Fay.

platten. In glassmaking, to flatten out; make flat. Fay.

Plattcogene. See Pleocene. Fay.

Plattner's process. A process for extracting gold in which a charge of gold-bearing pulp is placed in a revolving iron drum lined with lead, and a stream of chlorine gas is conducted through the pulp, producing chloride of gold, which is soluble in water. See also chlorination process.

platy-figgy. Hard to split, a measure of ease of splitting of slate. A.G.I.

platy flow structure. See planar flow structure. A.G.I.

platy structure. A structure due to differential contraction during cooling, occurring in lavas and intrusions or as a series of fractures parallel to the cooling surface. Igneous rocks may be broken into thin plates or tabular sheets, which give them a stratified appearance, especially as seen in the field when the structure is exposed by weathering. Holmes, 1928.

plauentie. a. The type synite of Plauen, near Dresden, Germany. Holmes, 1928.

b. Those members of the syenite series which are rich in potash and have some plagioclase with the predominant orthoclase. Rice.

play. Idle, said of a mine not at work. See also playday. Fay.

c. A dried-up lake basin in an arid region. Fay.

playa lake. Wind-scoured basins are shallow, but they may cover large areas. They are characteristic of deserts. Basin of a playa is a shallow water basin, which may be dry yet may be the site of an evaporate lake, or playa. Fay.

playa lake. Wind-scoured basins are shallow, but they may cover large areas. They are characteristic of deserts. Basin of a playa is a shallow water basin, which may be dry yet may be the site of an evaporate lake, or playa. Fay.

playday. Eng. A day on which, on account of an accident, or other causes, mines are not worked. See also play. Fay.

play in. Lie. To commence hoisting or under-cutting a face of coal at the side of a heading. Fay.

play of color. The optical phenomenon consisting of flashes of different prismatic colors due to interference of light at thin films within or near the surface of a gem, and seen in rapid succession when the gem is moved, as in a cabochon. It partly causes the orient of pearls, but differs from change of color, dispersion, fire, and opalescence. Fay.

Piezocene. See Pliocene. Fay.

Pleistocene. The earlier of the two epochs comprised in the Quaternary period in the classification generally used. Also called Glacial epoch, and formerly Ice Age, post-Pliocene, and post-Tertiary. The series of sedimentary deposits deposited during that epoch, including both glacial deposits and ordinary sediments. Some geologists formerly used Pleistocene as synonymous with Quaternary and included it in all post-Tertiary time and deposits. Fay.
plenum. a. A system of ventilation in which air is drawn into an enclosed space, as a room or a caisson, so that the outward pressure of air in the space is slightly greater than the inward pressure from the outside, and leakage is outward instead of inward. Fay. b. A mode of ventilating a mine or a heading by forcing fresh air into it. Fay. c. Use of compressors to hold soil from slumping into an excavation. Nichols.

plenigrain. See pleonaste.

pleochroism. See pleochroism.

pleochroic hales. Dark-colored zones around small inclusions of non-actinic minerals that are found in certain crystals, notably biotite. C.M.D.

pleonaste (from pleonastite). a. The property of exhibiting different colors in different directions by transmitted polarized light. A.G.I. b. More precisely, the property of absorbing differently, light that vibrates in different directions in passing through a crystal. If the crystal is uniaxial the change of color is called dichroism; if the crystal is biaxial, the change of color is called pleochroism. A.G.I. c. The property of birefringent crystals (micas) to absorb various wavelengths of light differentially depending on the vibration direction of the light within the crystal. Thus a mineral displaying pleochroism shows various colors or tints when it is traversed by plane polarized light and the orientation of the crystal is varied with respect to the plane of polarization. It is a common and diagnostic property of many minerals and, easily observed under the petrographic microscope or a dichroscope. A.G.I.

pleomorphism. Synonym for polymorphism.

pleonaste. Same as ceylonite. See also spinel. Dana 17.

plot. a. Corn. "To cut a plot" is to make row(s), or square out a piece of ground by the side of the lode or shaft, for holding the broken ore or waste for other convenient purposes. Fay. b. To place survey data upon a map or plat. In past use, no clearly defined difference existed between plot and plat. It is suggested that a difference be established by limiting plot to the graphical representation of a survey, and plat to the cartographic operations involved in the construction of a map or plat. Nichols. c. A fold; usually applied to the surface of sea level. See also deflection, DSL and plot. It is suggested that a different be established by limiting plat to the end of a cutter loader for deflecting the cut coal onto the face conveyor. Nelson. d. Applied for removing or curtaining the dust and dirt off a belt conveyor and thus prevent it being carried back along the return belt. Nelson.

plotting. a. The making of a map or plot; the plotting of points, the laying down of lines, etc. Webster 3d.

plucking. a. Term used to describe the mid-length being completely destroyed and losing its significance. Stokes, v. 1, p. 140. b. Used as a proper noun in the phrase "plucking a V-shaped belt scraper" which are attached to the belt conveyor frame and which press against the return belt. They are intended to remove coal or other material which might stick to the return belt and be overcharged. See also plucking.

plough. a. A wheel attached to the end of a cutter loader for deflecting the cut coal onto the face conveyor. Nelson. b. Applied for removing or curtaining the dust and dirt off a belt conveyor and thus prevent it being carried back along the return belt. Nelson. c. Applied for removing or curtaining the dust and dirt off a belt conveyor and thus prevent it being carried back along the return belt. Nelson.

plough-deflector. a. A steel plate attached to the end of a cutter loader for deflecting the cut coal onto the face conveyor. Nelson. b. Applied for removing or curtaining the dust and dirt off a belt conveyor and thus prevent it being carried back along the return belt. Nelson.

plough-type machines. Ploughs may be divided into two classes: (1) Where the machine peels the coal to a depth of from 1 to 12 inches by knives of various designs and the cut coal is then loaded onto a heavy type scraper chain conveyor; and (2) where the machine peels a thin slice up to 2 inches in thickness, by knives attached to each end of a steel box and the coal is dragged along the face inside the box. From the speed of travel aspect, ploughs may be divided into (1) fast-moving types (about 80 feet per minute) which take a relatively thin slice, and (2) slow-moving types (10 to 20 feet per minute) which remove a thicker slice. The trend is towards the rapid plough working on the solid face. See also Anaheulabel; continuous mining, b; Lobbe Hotel. Nelson.

plowman. One who breaks up hard-packed clay in an open clay pit by operating a tractor which draws the plow over the bed of the pit. D.O.T. 1.

plows. The Atomic Energy Commission's program of research and development on peaceful uses of nuclear explosives. Possible uses include large-scale excavation, such as for canals and harbors; crushing ore bodies; and producing heavy tritium and isotopes. LBL.

plow steel. A high tensile steel used in the manufacture of hoisting ropes. Fay.

plucking. a. A cutter loader with knives or blades, which is pulled along the longwall face by a powerful chain. The broken coal is loaded against the knife of the cutter which, with the aid of hydraulic rams, holds the plough up to the coal face and causes it to bite into the coal as they are pulled along. The plough is a continuous mining machine. See also plough-type machines. Nelson. b. Applied to V-shaped belt scrapers which are attached to the belt conveyor frame and which press against the return belt. They are intended to remove coal or other material which might stick to the return belt and be overcharged. See also plucking.

pluck me. Nickname for a company store; given because of a tendency to overcharge. Korson.
plucky. Applied to stones that, under the influence of shock from a concussion or impact, split into large masses of stone to smaller size. By using a hammer drill, a row of shallow holes is made along the line where the break is desired, and the faces of the two iron strips flat on one side for contact with the wedge, and curved on the other to fit the walls of the drill. The plug is inserted in the hole and the plug and feather are placed between them. They are held together by a stopper. In some extremely rough rocks, a wedge is left inserted in the hole to prevent any increase in the fire content in the air. All the stoppers are plugged with sandbags in order to complete the seal of the sealed-off mine area. The plug is generally a tapered passageway of about 3 feet 6 inches square at the inby side of the stopping and 2 feet 6 inches square at the outby side. M. Adam, p. 143. b. Same as block hole. Fay.

plug hole stopping. A stopping in which the floor and the sidewalls of the passage are built of sandbags and the roof may be the roof of the roadway or covering boards used between the webs of steel arches, or preferable, corrugated steel sheeting used as lagging behind steel arches. The plug or passage is generally made tamping from the inby to the outby side. 8 inches square to 2 feet 6 inches square so that, in the event of an explosion, the plug of sandbags in the passage is subjected to a wedging action assisting to retain the plug in place. The plug hole may be plugged with sandbags or gravel. Though this is often at the top, it is sometimes placed to the side and reasonably spaced. S. N. Sinha, p. 207-208.

plug polisher. In metallurgy, one who polishes tube drawing plugs (metal die used to govern internal diameter of metal tubes during drawing operations), using a polishing machine. D.O.T. Supp.

plug shot. A small charge exploded in a hole to break up a stone of moderate size. Fay.

plug tap. A tap with chamfer extending from three to five times the diameter of the plug. ASM Gloss.

plug valve. A valve or cock opened or closed by the turning of a plug, usually conical in shape. Not to be confused with needle valve or globe valve. Long.

plug weld. A circular weld made by either arc or gas welding through one number of lap or in one position only. A plug weld, if properly made, may be only partially filled. Neither a fillet welded hole nor a spot weld is to be construed as a plug weld. Long.

plumbaginous. Containing plumagno, as from phonagno, schist; some crystalline
latter, that having the larger molecular volume is used in the calculation. Com-
pare minus minerals. Holmes, 1928.
plutonic. The portion of a powder sample retained on a standard sieve of specified number. Contrast with minus sam-
ple. See sight. See backsight. See lye, 2.
plutonic intrusions. Applied to large intru-
sions which have cooled at great depth and originated below the earth's crust to a depth of about 30 miles. Arkell.
plutonic cognate ejecta. Coarsely crystalline fragments consanguineous with the lavas of a given volcano, which solidified in depth, generally as dikes and sills, but were brought to the surface by pyroclastic eruptions. See cognate ejecta. Arkell.
plutonic metamorphism. The changes which occur in plutonic intrusions. See plutonic. A.G.I.
plutonic. a. Of igneous origin. A general name for those rocks which have crystallized in the depths of the earth, and have therefore assumed, as a rule, the granitoid texture. Fay. b. A general term denoting one of the three great subdivisions of rocks under a classification proposed by Read. It includes the granitic, mafitic, and metamorphic rocks; the great granitic complexes, the grano- schists, and schists. See plutonic rock. A.G.I.
plutonic cognate ejecta. Coarsely crystalline fragments consanguineous with the lavas of a given volcano, which solidified in depth, generally as dikes and sills, but were brought to the surface by pyroclastic eruptions. See cognate ejecta. Arkell.
plutonic rocks. Igneous rocks formed beneath the surface of the earth by the metamorphic replacement of an older rock. A.G.I.
plutonites. Igneous rocks of the coarse-grain size group. See plutonic. A.G.I.
plutonism. The obsolete belief that all of the rocks of the earth solidified from an original molten mass. Compare neptunism. A.G.I.
plutonium. a. A radioactive metallic element of the actinide series. Similar chemically to uranium, and usually produced in nuclear reactors as the long-lived isotope of mass number 239 (plutonium 239; half-life, 24,360 years) by spontaneous emission of an electron from neptunium obtained in turn from uranium 238. It is also found in minute quantities in pitchblende and other uranium-containing ores. It undergoes fission with the emission of a helium nucleus to form uranium 235, and is fissionable with slow neutrons to yield energy for power plants or atom bombs. Symbol, Pu; val-
ces, 5, 4, 5, and 6; and atomic number, 94. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-88, B-126. b. The second transuranium element of the acti-
ne series to be discovered. Seaborg, Mc-
Millan, Kennedy, and Wahl produced:
plutonium 238 in 1940 by bombarding uranium with deuterium nuclei (deuter-
ons) in a cyclotron. Natural plutonium in trace quantities occurs in uranium ores where it was formed by the irradiation of the uranium with the neutrons present. Plutonium is the most important trans-
uranium element, and the most important of its 15 known radioactive isotopes is plutonium 239. Plutonium is readily fis-

sionable with neutrons; it is available in quantity; and 1 pound equals about 10 million kilowatt hours of heat energy. Used as an important material in the in-
dustrial applications of nuclear power and as an ingredient of nuclear weapons. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-88, B-126. c. Silvery-
white metal; atomic mass or mass number given as about 239 and as 242; warm to the touch because of energy released by alpha decay; specific gravity, 15.92 to 16.04 depending on isotopic form; melting point, 639.5±2°C; boiling point, 3,250±19°C; soluble in concentrated hydrochloric acid, in hydrobromic acid, and perchloric acid; and insoluble in nitric acid and in concentrated sulfuric acid. There are six allotropic forms: (1) alpha plutonium; monoclinc; specific gravity, 19.84 (at 23°C); and stable below 122°C±2°C; (2) gamma plutonium; monokinetic; specific gravity, 17.70; and stable from 122°C±2°C to 206°C±5°C; (3) gamma plutonium; orthorhombic; specific gravity, 17.14; and stable from 206°C±3°C to 319°C±5°C; (4) delta plutonium; isometric; specific gravity, 15.32; and stable from 319°C±5°C to 451°C±4°C; (5) delta-prime plutonium; tetragonal; specific gravity, 16.00; and stable from 451°C±4°C to 476°C±5°C; and (6) epsilon plutonium; isometric; specific grav-
y, 16.31; and stable from 476°C±5°C to 695°C±3°C (the melting point). Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-126, B-203, B-204.
pluvial. a. Of a geologic age, resulting from the action of rain or sometimes from the fluvial action of rainwater flowing in stream channels. Webster 3d. b. Refers to a rainy period, particularly one outside of the Pleistocene glaciated region corre-
ponding in time to a glacial age; also such a period. A.G.T. Supp.
pluvial period. A period in which rainfall or precipitation is relatively abundant. Periods of less plentiful precipitation are corresponding in time to a glacial period. Stakes and Varees, 1955.
pluvial period. A period in which rainfall or precipitation is relatively abundant. Periods of less plentiful precipitation are called interpluvial periods. Stakes and Varees, 1955.
pluvial period. A period in which rainfall or precipitation is relatively abundant. Periods of less plentiful precipitation are called interpluvial periods. Stakes and Varees, 1955.
ply. a. One of several layers of fabric or of other material. Nichols, b. Staff. A thin band of sand, lying
immediately over a coal seam. Arkell. c. Scot. A rib or successive ribs, for example, of a handband with very thin silver. d. Scot. Limy pty, a limestone bed, Breich quarries, Edinburgh. Arkell.
ply. a. One of several layers of fabric or of other material. Nichols, b. Staff. A thin band of sand, lying
immediately over a coal seam. Arkell. c. Scot. A rib or successive ribs, for example, of a handband with very thin silver. d. Scot. Limy pty, a limestone bed, Breich quarries, Edinburgh. Arkell.
ply glass. Glassware, particularly for lamp shades and made of covering opal glass (usually on both sides) with trans-
parent glass of matched thermal expansion. Compare case glass. Dodd.
plymetal. Sheet consisting of bonded layers of dissimilar metals. ASM Gloss.
pluvial period. A period in which rainfall or precipitation is relatively abundant. Periods of less plentiful precipitation are called interpluvial periods. Stakes and Varees, 1955.
plywood. a. A pipe or tube through which a gaseous material is trans-
pored or vacuum system. ASA MH4.1 pneumatic. b. A general term denoting one of the three great subdivisions of rocks under a classification proposed by Read. It includes the granitic, mafitic, and metamorphic rocks; the great granitic complexes, the grano-

schists, and schists. See plutonic. A.G.I.
pluvial. a. Of a geologic age, resulting from the action of rain or sometimes from the fluvial action of rainwater flowing in stream channels. Webster 3d. b. Refers to a rainy period, particularly one outside of the Pleistocene glaciated region corre-
ponding in time to a glacial age; also such a period. A.G.T. Supp.

pluvial period. A period in which rainfall or precipitation is relatively abundant. Periods of less plentiful precipitation are called interpluvial periods. Stakes and Varees, 1955.
pneumatic filling

Stokes, 3d, p. 272.

pneumatic flotation cell. Machine in which the air used to generate a mineralized froth is blown into the cell, either through a perforated layer of froth near the bottom, or by pipes which bring low-pressure air to that region. Pryor, 3.

pneumatic feeding clutches. This clutch transmits power through friction shoes carried on the tube of cord and rubber construction. The pneumatic clutch is self-adjusting for wear due to the natural resilience of the rubber tube. Disengagement is complete and automatic when the air under pressure is released. The clutch is controlled by finger pressure on a valve. The valve can be installed at the place most convenient for the operator. Pit and Quarry, 3rd, Sec. D, p. 71.

pneumatic hammer. A hammer in which compressed air is utilized for producing the impacting blow. Bureau of Mines Staff.

pneumatic injection. A method for fighting underground coal fires developed by the U.S. Bureau of Mines. This air-blowing technique involves the injection of incombustible mineral, like rock wool or dry sand, through 6-inch bored holes drilled from the surface into interseck underground passageways in the mines. Bureau of Mines Staff.

pneumatic jig. a. Air jig, such as plumb, used in desert countries for concentrating ore. Pryor, 3. b. A jigging machine in which an air blast performs the work of separation of minerals. Standard, 1964, c. See Kirkup table; plunger jig washer. Nelson.

pneumatic lubricator. Synonym for line oiler. Long.

pneumatic method. In flotation, a method in which gas is introduced under slight pressure near the bottom of the flotation vessel, the device used for introduction being either a submerged pipe or a porous cloth, from the bottom of the vessel to the wall of a wind box. Gaudin 2d, p. 416.

pneumatic mortar. Mortar applied to a surface with a cement gun in the same manner as putty. Such mortar has a cube crushing strength of 3,000 pounds per square inch at 7 days and of 6,000 pounds per square inch at 28 days, with a water/cement ratio of 0.45. See also preload tank; prestressed concrete. Ham.

pneumatic pick, coal puncher. A compressed-air-operated hand tool used to excavate coal, ore, and rock, with a punch-injection method. Without the punch steel, its length is 18 inches and its weight about 24 pounds. It delivers about 2,500 blows per minute. The latest type is the watertight designed so that the air valve is operated by water pressure. The water assists in suppressing the dust made by the operation. Long.

pneumatic ram. A ram fed by a compressed-air pipeline. The piston is about 8 inches in diameter, has an area of 32 square inches and exerts a pushing force of up to 4,000 pounds. Nelson.

pneumatic riveter. A compressed air tool used for driving rivets. Ham.

pneumatic rod puller. An air-driven rod puller. See also rod puller. Long.

pneumatics. That branch of physics that treats of the mechanical properties of gases, such as their pressure, elasticity, density, and also of pneumatic mechanism; sometimes it includes acoustics. Standard, 1964.

pneumatic sewage ejector. A compressed air displacement pump for moving sewage. Ham.

pneumatic shaft sinking. a. Shaft sinking with the aid of a drop shaft fitted with an air-looked to form a working chamber. See also man look. Ham. b. The caisson sinking process now largely obsolete in mining practice. Nelson.

pneumatic stamp. Free-falling crushing weight, similar to stamp of stamp battery, save that the stem of each stamp forms part of a compressed-air cylinder through which it is raised. See also stamp battery. Pryor, 3.

pneumatic stowing. A system of filling mined cavities in which the crushed rock is carried along a pipeline by compressed air and then forced into the space to be packed, the intense pressure ensuring a very high density of packed material. For stowing shallow workings—up to 200 yards in depth—the stowing plant may be installed on the surface. The air pressure is about 60 pounds per square inch. For deeper workings, the plant may be installed underground, and the crushed rock taken down from the surface. The stowing pipes are about 5 to 6 inch diameter. The system is often employed if important surface structures require protection. The material used is from old dirt heaps, screen dirt and washery rejects. The material is crushed to about 25% of its original and preferably without the minus ½ inch material. See also low-pressure air stower. Nelson.

pneumatic table. An appliance for the dry cleaning of ore or coal. It consists of a perforated deck, with vertical ribs or ruffles, which is reciprocated and the motion transmitted to the wall of a wind box. Gaudin 2d, p. 416.

pneumatic tamper. Essentially a long-stroked piston with a mushroom-shaped foot about 4 inches in diameter. It operates on compressed air drawn from an air compressor. The compressed air is used to lift the piston and footpiece, and their combined weight, in fallins', supplies the impact. Caron, p. 380.

pneumatic tools. Tools operated by air pressure. Grubb.

pneumatic water barrel. A special type of water barrel invented by Galloway, for removing water from a shaft by sinking. By means of a hose connection to air pump, at the surface, a partial vacuum is created inside the barrel and the water lifts the valve and the hose. The hose is then detached and the barrel hoisted to the surface and discharged. Various types of sinking pipe were also used. Also called vacuum tank. Nelson.

pneumotriboscope. A breathing apparatus developed about 1906. The oxygen for breathing is generated by the reaction between the carbon dioxide and moisture in the exhaled air with the peroxides of sodium and potassium. It did not prove satisfactory as the air for rebreathing became unbearably hot. Nelson.

pneumatolitic metamorphism. Contact metamorphism in which the composition of rock has been altered by introduced magnetic material. A.G.I. Superv.

pneumatolysis. The alteration of rocks and the formation of minerals during or as a result of the emanation of gases and vapors from solidifying igneous rocks. Fey.

pneumatolytic. A term used in different combinations by various authors and perhaps best abandoned. It has been used to describe such processes as surface effects of gases near volcanoes; contact-metamorphic effects surrounding deep-seated intrusive without any knowledge of gas against the liquid state; that stage in igneous differentiation at which a dense, homogeneous effusion is supposed to be characterized by gas-crystal equilibria; and (very loosely) any deposit containing pneumatolitic minerals or elements, such as tarsmaline, topaz, fluorite, lithian, and tinstone, or any deposit presumed to have come from a gas phase. A.G.I.

pneumatolytic alteration. Rock alteration, that is, mineral substitution of rock resulting from pneumatolytic; between 60° and 600° C, according to European authors. Schieferdecker.

pneumatolytic clay. Clay that has been subjected to hot gases and liquids during its natural formation process. A.G.S., 1963.

pneumatolytic hornfels. A fine-grained, non-fissile rock, the product of contact metamorphism and pneumatolytic modification. See calc-silicate hornfels, hornfels; limonite; skarn; tectite. A.G.I.

pneumatolytic metamorphism. Contact metamorphism in which the chemical changes are largely the result of chemical activity of gases emanating from igneous bodies. Stokes and Vorres, 1955.

pneumatolytic stage. One of the successive stages of consolidation of magma during which there is equilibrium between crystal and gas phases. Schieferdecker.

pneumo-. A combining form taken from the Greek meaning lung, and used in connection with the terminology of geologic processes and effects involving gases and vapors. Stokes and Vorres, 1955.

pneumokoniosis; pneumonkoniosis. A disease of the lungs caused by habitual inhalation of dust containing particles of irritant mineral or metallic particles. It consists of irritant mineral or metallic particles. It results in which occurs in any work places where dust is prevalent, such as mines, quarries, foundries, and potteries. Also called miner's asthma; miner's lung. Also spelled pneumonkoniosis; pneumonkoniosis. G.C.V. Reference: anthracosis; silicosis, b. Webster, 3d.

pneumonkoniosis. See pneumokoniosis. Webster, 3.

pneumotribosintumulocreroplectronicolovolcanoconiosis. A pneumoconiosis caused by the inhalation of very fine silicate or quartz dust and which is especially intolerant of patients suffering from pneumatolytic. The processes attending the
pneumotectic deposit. A transitional form between magnatic and hydrothermal ore deposits, in which the effects of mineralizers are very apparent. Schieferdecker.

Pocket. a. Broadly, a localized enrichment; a crevice in a rock containing gold; a rich patch of gold in a reef. Nelson, b. A chamber, of a capacity equal to the space used at the shaft bottom for quick and accurate skip loading. See also shaft pocket, stamper chute. Nelson. c. A rich deposit of minerals, but not a vein. Gordon. d. S. Afr. A mass or body of rich ore, of small extent. Beeman. e. A receptacle from which coal, ore, or waste is loaded into wagons or cars. Fay. f. A ganister quarterm's local term for masses of rock, 30 to 50 feet in width, that are worked out and loaded, buttores of untouched rock being left between them to support the upper masses. Fay. g. A hole or depression in the wearing course of a roadway. Fay. h. A local accumulation of gas. Hudson. i. A bulge, top, or belly in a lode or bed. Arkell. j. A cavity, whether filled with air, water, mineral, or gravel. Arkell. k. A small body of ore; an enlargement of a lode or vein; an irregular cavity containing ore. Fay. l. A natural under-ground reservoir of water. Fay. m. A glen or hollow in the mountains. Fay. n. In pegmatites, the central openings lined with crystals, including those of gem species. Stewart.

Pocket-and-fender method. In pillar extraction, a method in which the pillars are mined in the same way as in the open-end method, except that a fender or a series of small coal stumps is left adjacent to the gob as the lift is advanced. After the lift is completed, the fender or stumps of coal are blasted, and sometimes part of this coal is recovered. Woodruff, v. 3, p. 61.

Pocket and fender method. A method of mining pillars in which a narrow pillar of coal, called the stump, is left along the goaf (worked-out space) to support the roof while driving the pocket. This coal acts as a protection for the miners. When the pocket has been completely mined, the stump is then blasted and the pocket is driven, and so on. Lewis, pp. 542-543.

Pocket clay. A highly siltaceous clay sometimes has a very thin organic mineral layer above a leached layer which rests upon an illuvial dark brown layer; developed under coniferous or mixed forest or under heath vegetation in a temperate to cold moist climate; iron oxide, alumina, and perhaps organic matter is removed from the A-horizon and deposited in the B-horizon. Pohlé-Croasdale in 1883. See also freezing method. Nelson. b. One in which brine at subzero temperature is circulated through bore holes to freeze running water through which a shaft or tunnel is to be driven, during development of waterlogged mine. Pryor, 3.

Pog. A tool formerly used for lifting the balls of ball clay. Dodd.

Pole and cross plate process. Recovering gold, silver, copper, and lead from ores by leaching with salt at a temperature of about 900°F. This leaching is accelerated with an additional constituent; the smoke, containing the volatilized chlorides, is electrically precipitated and the metal chlorides are then treated for metal recovery by fusion or electrolysis. Bennett 2d, 1962.

Pol. See polylithic. Fay.

Poldometer. An automatic weighing device for use on belt conveyors. The device feeds the material from a hopper in a uniform stream onto a short independent belt conveyor and from there onto the main belt or bin. The weight of material on the measuring belt actuates a scale beam which raises or lowers a gate controlling the rate of flow from the feed hopper to a certain predetermined load per foot of measuring belt. A meter records the travel of measuring belt and this figure multiplied by the weight per foot of belt as fixed by the scale beam gives the weight of metal handled in any given period. See also weightometer. Nelson.

Pol. See polylithic. polylithic. Same as bornite. Fay.

Pol. Said of a texture in igneous rocks which small crystals of one mineral are irregurally scattered without common orientation in larger crystals of another, for example, small olivines embedded in larger pyroxenes, as in some peridotites. Such rocks have a mottled luster. Also applied to rocks of the Perman and Triassic systems. An alternative spelling is poelitic. C.T.D.

Pol. See polylithic. polylithic. A metamorphic texture due to the development, during recrystallization, of a new mineral around numerous relics of the original minerals, thus simulating the poikilolithic texture of igneous rocks. When the included relics also reveal the original texture of the rock, the new texture is known as Holmes, 1928.

Pol. Suggested for a variety of opctic texture in which the pyroxenic matrix completely includes the plagioclase, but is not merely penetrated by them. Holmes, 1928.

Point. A. A predetermined direction for driving a roadway underground. The point is...
point

fixed by roof plug in the roadway. See also alignment. Nelson. b. One one-hundredth (0.01) part of a carat. When less than one carat, the weight of a point of a diamond is usually expressed in points, for example, 20 points equals 1/5 carat. I.C. 6200, 1964, p. 149. c. That edge of a boring tool that is used on a railroad frog; a railroad switch. Webster 3d. d. A device into which steam or water is introduced from frozen gravel to thaw it for mining or dredging. Webster 3d. e. Eng. The bearing or direction, in reference to the magnetic meridian in which an undergound road is driven. Fay. f. In quarrying, a type of wedge that tapers to a narrow, thin edge. Fay. g. The end or bottom of a borehole, as distinguished from the rattle or collar. Fay. h. The extreme terminal usually sharp or narrowly rounded part of something, as a pin, indicator, etc. that is usually formed by the gradual or abrupt decrease in width or thickness of the body which it terminates and that is typically used for piercing, pricking, indicating, or for some similar function; a usually sharp, tapering, or other material that is smoothly converging ends, tip. Webster 3d. i. A projecting usually tapering part of something: as (1) a piece of land, as a promontory, cape, projecting into a body of water; (2) a sharp prominence; apex; peak. Webster 3d. j. A tool used in trimming and smoothing rough stone surfaces. Webster 3d. k. A place considered as position only. It is a spot, or a place having a definite position but no dimensions; that is, it has no width or thickness. Jones, 2, p. 80. l. The extreme end of a cape, or the outer end of any land area protruding into the sea. Schierfedecker, m. To finish (as a wall) by filling in with new materials; often used with up. Webster 3d. n. To fill in with new material; often used with up. Webster 3d. o. Point as to point. Schieferdecker.

Shiple.

point. In general, the angle at the point of a cutting tool. Most commonly, the included angle at the point of a twist drill, the general purpose angle being 118 degrees. ASM Gloss.

point bar. One type of support for vitreous enameware used during the firing process. Dodd. See also burning bar.

point-bar sharpener. A small handheld tool used to sharpen the pins on point bars and somewhat similar to a pencil sharpener, but a great deal stronger. Hansen.

point bearing pile. See end-bearing pile. Fay.

point chalcedony. White or gray chalcedony point bearing.

point cutting. Reducing the diameter of wire, rod, or tubing over a short length at the end by swelling or hammer forging, turning, or squeezing to facilitate entry into a drawing die and gripping in the drawing head. ASM Gloss. b. The operation of chanferring or rounding in automatic machines the threaded end or the head of a bolt. ASM Gloss. c. The finishing of joints in a brick or masonry wall. Crispin. d. Eng. See wall, l. SMRB, Paper No. 61.

pointed point cut-through. A sharp-pointed rod attached to a graduated staff or vernier scale for measuring the elevation of the surface of flowing water. The point is lowered until the tip barely touches the water, forming a streak. Seeley, 1.

pointing. a. Reducing the diameter of wire, rod, or tubing over a short length at the end by swelling or hammer forging, turning, or squeezing to facilitate entry into a drawing die and gripping in the drawing head. ASM Gloss. b. The operation of chanferring or rounding in automatic machines the threaded end or the head of a bolt. ASM Gloss. c. The finishing of joints in a brick or masonry wall. Crispin. d. Eng. See wall, l. SMRB, Paper No. 61.

pointing tool. A small, round, metal tool with a sharp point, used by bricklayers for pointing and striking up joints and for removing mortar from the face of the wall. Crispin.

point mark. See pin mark. ACGB, 3.

point metal. Metal used for pointing pens and other instruments. Tasmania is the sole producer on a large scale of point metal cumberbium. Hess.

point of curvature (PC.). The point where the curve leaves the first tangent. Seeley, 2.

point of curvature (P.C.). The point where the curve leaves the first straight line drawn from the point of tangency common to two curves intersecting lines cross one another. Jones, p. 34.

decades. a. The absolute value of the ratio of a small strain to the corresponding axial strain in a body subjected to uniaxial strain; usually applied to elastic conditions. ASM Gloss. b. When a compressive force is applied to a body in one direction, other forces are induced in that body in directions at right angles to it. The ratio of the induced forces to the applied force is given by Poisson's ratio, which depends on the elastic constants for the body in question. Spalding. c. The ratio of lateral strain to corresponding axial strain for a material subjected to axial loading. Poison's ratio for an isotropic material at a stress below the proportional limit may be calculated: \[ r = \frac{1 - \nu}{2(1 + \nu)} \] where \( r \) is Poison's ratio, \( E \) is modulus of elasticity in tension or compression, \( G \) is modulus of elasticity in shear, psi. HOG.

poker man. A laborer who removes blue powder and ash residue from retorts after molten metal has been tapped. Also called scraper. D.O.T. Supp.
polar vibrator

The name by which internal concrete vibrator is commonly known. See also internal vibrator. Ham.

polar welding. The same as push welding. ASM Gloss.

pokkers and Jetters. Eng. Blocks or pulleys, which carry or support the connecting rods of engines. Fay.

dipolar. Due to mutual attraction between charged lattice points on mineral surface and counter-ions in solution. Can therefore be anionic or cationic. Pryor, 3, p. 7.

polar adsorption. Sorption of anions or cations by the same mechanism as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.

poker vibrator. The name by which internal vibrator is commonly known. See also internal vibrator. Ham.

poker welding. The same as push welding. ASM Gloss.
polishing

ASM Gloss. C.T.D.

polishing. Polishing out excavation behind timing already in place. Ham.

polishing boards. In mining, forepolishing boards, driven horizontally ahead of the support roof, which replaces the old roof running ground. In trenching, side boards wedged apart in pairs. Pryor, 3. See also forepoling.

polings. Polished instead of painted for lagging. Also spelled pollings. Fay.

polischliefer. Tippoli slate. Also called polishing slate. Dana 6d, p. 306.

polish. See glance, c. Long.

polished. See glazed, a. Long.

polished off. A diamond bit that has been dulled. Long. b. Finished or completed. Long.

polished plate glass. See plate glass. ASTM C162-66.

polished section. A section of material that has been ground in a plane. Laid on one face for examination, under a microscope, by reflected light. Compare thin section. A. B. D.

polished specimens. Selected pieces of ore or metal, or briquettes of particles bonded with lucite or other material, which have one ground surface smooth by means of abrasive powders and polishing laps. The powders include emery, aluminum oxide, and diamond dust. Electrolytic polishing is also used for preparing metal surfaces by making the metal the anode in an electrolytic bath. Pryor, 3.

polished wire glass. Wire glass, ground and polished on both sides. ASTM C162-66.

polishing. Smoothing metal surfaces through the use of abrasive materials. ASM Gloss. See also acid polishing; pitch polishing; electrolytic polishing; acid polishing; pitch polishing.

polish, a. In glassmaking, a hardwood block with a long iron handle by which to flatten glass. See also glaze. Also spelled, a. To dull a diamond bit. Standard, 1964, b. A polishing pad used in polishing plate glass after the grinding process. C.T.D.

polish, n. A type of polish found in some areas of Karst topography. Stokes and Varies, 1955.

polka-dot agate. Local name for translucent, almost colorless, chalcedony, with yellow, red, or brown circular dots. From Oregon. Shipley.

poll. a. Corn. The head or striking part of a miner's hammer. Fay. b. S. Wales. To clean the shaft of a well. Fay.

poll pick. A pick with a head for breaking away hard partings in coal seams or knocking down rock already seamed by blasting. Fay.

pollucite. A rare, hydrous cesium aluminum silicate, CsAl(SiO3)2. Exhibiting crystallizing in cubes or massive. Colorless; transparent; used as a gem stone. Found in pegmatite. Sanford; D.D. 11.

polonium. radium F. A radioactive metallic element that is chemically similar to tellurium and bismuth. It occurs in pitchblende and in other uranium-containing ores, in radium-lead residues, and in old radium ampules, but it is produced in much larger quantities by bombarding bismuth with neutrons in nuclear reactors. It emits a helium nucleus to form an isotope of lead. Symbol, Po; atomic number, 84; atomic mass, about 210; and valences, 2, 4, and 6. Also called radium F. Only about 100 micrograms of polonium occur in 1 ton of uranium ore, and its abundance is about 0.2 percent of that of radium. All 27 known isotopes are radioactive; their atomic masses range from 192 to 218; and polonium 209 is the most stable isotope, having a half-life of 103 years. Two allo-

poly-, a. Having more than one, in contrast to a parallelogram, which is the only quadrilateral that has two pairs of parallel sides and a single pair of sides congruent. Sometimes used as a substitute for natural gums as a binder and a thickening agent. Lee.

polyelaterite. Soft elastic bitumen which differs from pitch in its ease of solubility in organic solvents. It is also used for preparing metal surfaces with lucite or other material, which have one ground surface smooth by means of abrasive powders and polishing laps. The powders include emery, aluminum oxide, and diamond dust. Electrolytic polishing is also used for preparing metal surfaces by making the metal the anode in an electrolytic bath. Pryor, 3.

polyconic map projection. A map projection used for the topographic maps of the United States Coast Survey (now the U.S. Coast and Geodetic Survey, A.G.I.) and in a modified form is used for maps of large areas. Devised by F. R. Hassler, organizer and first superintendent of the U.S. Coast Survey (now the U.S. Coast and Geodetic Survey, A.G.I.).

polyethylene glycol. These water-soluble materials may be shaded line along with cobalt, color and glaze slips, and in extrusion. Lee.

polygenous. Originating in various ways or from various causes; formed at different places or from different parts; said specifically, in geology, of mountain ranges; opposite of monogenetic. Standard, 1964.

polygenetic. Composed of or containing several kinds of material; heterogeneous. The polycrystalline conglomerate. Standard, 1964.

polycrase series. See also euxenite. Crosby, v. 1, p. 262.

polyhymnite. Described as a gray to black metallic opaque mineral with cubic cleavage, 12Ag.Sb2S3; considered to be a mixture of argentite and tetrahedrite. Dana 6d, p. 306.

polysulfo. A natural silver sulfamontanite, Ag,Sb2Ss; color steel gray to iron black; strength black; harder metallic; hardness 2 to 3; specific gravity 6.0 to 6.2. Found in Nevada, Colorado, Idaho; Mexico, Chile, Europe. An ore of silver. CCD 6d, 1961.

polykrotor. Same as iolite. Shipley.

polychronic. Showing a variety or a change of color. Webster 3d.

polychronic decoration. A multicolor decoration. ASTM C742-60T.

polyconic map projection. A map projection having the central geographic meridian represented by one parallel, with the spacing for lines representing the geographic parallels is proportional to the distances apart of the parallels; the parallels are represented by arcs of circles which are not concentric, but whose centers lie on the line representing the central meridian, and whose radii are determined by the lengths of the elements of cones which are tangent along the parallels. All meridians except the central one are curved. This projection is neither conformal nor equal area, but it has been much used for maps of small areas because of the ease with which it can be constructed. It is the map projection used for the topographic map of the United States (U.S. Geological Survey), and in a modified form is used for maps of large areas. Devised by F. R. Hassler, organizer and first superintendent of the U.S. Coast Survey (now the U.S. Coast and Geodetic Survey, A.G.I.).

polycrystal. An end-member of the euzemite-polycrase series. See also euxenite. Croby, pp. 19-20.

polycrystalline. An apparently single crystal consisting of a regular intergrowth of different minerals. Spencer 20, M.M., 1953.

polycrystalline. Composed of many crystals; an aggregate, as distinct from a single crystal. Rollin.

polyester. Soft elastic bitumen which differs from elastomer by a nontacky consistency, more intensive fluorescence and complete insolubility in organic solvents. It is believed that these properties are due to a higher state of polymerization. Tomkiewicz, 1954.

polyleuclidean. Some water-soluble materials may be shaded line along with cobalt, color and glaze slips, and in extrusion. Lee.

polymorphic. Originating in various ways or from various causes; formed at different places or from different parts; said specifically, in geology, of mountain ranges; opposite of monogenetic. Standard, 1964.

polyphase. A silver natural sulfamontanite, Ag,Sb2Ss; color steel gray to iron black; strength black; harder metallic; hardness 2 to 3; specific gravity 6.0 to 6.2. Found in Nevada, Colorado, Idaho; Mexico, Chile, Europe. An ore of silver. CCD 6d, 1961.

polyphase. A silver natural sulfamontanite, Ag,Sb2Ss; color steel gray to iron black; strength black; harder metallic; hardness 2 to 3; specific gravity 6.0 to 6.2. Found in Nevada, Colorado, Idaho; Mexico, Chile, Europe. An ore of silver. CCD 6d, 1961.

polyphase. A silver natural sulfamontanite, Ag,Sb2Ss; color steel gray to iron black; strength black; harder metallic; hardness 2 to 3; specific gravity 6.0 to 6.2. Found in Nevada, Colorado, Idaho; Mexico, Chile, Europe. An ore of silver. CCD 6d, 1961.
polymignite. A very rare, weakly to moderately polymetamorphic rock which has been polymerized. A resin, with a plasticizer. See also polyethylene. Polymethylene. Polyethylene. Polymerized ethylene, CH₂=CH₂. Thermosetting plastics, fuse, and thermoplastics. Polymethylene. Series related to sulfuric and thiosulfuric acids, believed to have the structure H₂S₂O₇.

polymorphic. A polymorphous organism; also, one of the several forms of such an organism. Webster 3d.

polymorphism. The property of having or presenting many forms; especially, in crystallography, the ability of certain substances to crystallize with different axial ratios without change of chemical composition; thus, carbon as diamond crystallizes in the isometric system, and as graphite in the hexagonal system. Standard, 1964. See also allotropy.

polyphasic. A compound or mixture containing two or more phases, as a solution. See also polysyngony.

polyphase current. Webster 3d.

polyphase current. A condition in which the space lattice of two related minerals is completely altered to a new type. This is illustrated by the quartz-tridymite relationship. Compare polysyngony; polytropy. Hess.

polyvinyl acetate. A resin, with a plasticizer. Polyvinyl acetate. Water emulsions of this material are used extensively as adhesives for ceramics. In a plasticized form these resins are used in glass textile sizes to bond the individual filaments together. Lee.

polyvinyl butyral. A resin, with a plasticizer. Provides the intermediate in standard glass naphthalated sheet glass used in the manufacture of window glass. Lee.

polyvinyl chloride. A plastic material. Polyvinyl chloride. A plastic material.

polyvinyl chloride. A resin, with a plasticizer. Provides the intermediate in standard glass naphthalated sheet glass used in the manufacture of window glass. Lee.

polyvinyl chloride. A plastic material. Polyvinyl chloride. A plastic material.

polyvinyl chloride. A resin, with a plasticizer. Provides the intermediate in standard glass naphthalated sheet glass used in the manufacture of window glass. Lee.

polyvinyl chloride. A plastic material. Polyvinyl chloride. A plastic material.
Ponsard furnace

Ponsard furnace. A furnace in which the escaping combustion gases, passing through tubular flues, heat the incoming air continuously through the flue walls. Fay. Ponsard is used portable malleable iron, foundry satisfactory for the mounting of small metal-lurgical specimens. Originally in the form of a pot 1 ft. in diameter, under temperature and pressure it becomes as transparent as glass. It is tough, hard and resistant to the action of etching reagents, and adheres excellently to the specimen. Osborne.

Pontil. An iron rod used in glassmaking to make a pontil on a piece of glass. An ornamental knob, globular or pointed, that is formed at the lower end of a piece of glass and that, when it is removed, leaves a depression corresponding to the shape of the pontil. Oborne.

Pontil. An iron rod used in glassmaking to make a pontil on a piece of glass. An ornamental knob, globular or pointed, that is formed at the lower end of a piece of glass and that, when it is removed, leaves a depression corresponding to the shape of the pontil. Oborne.

Pontoon bridge. A temporary or permanent pontoon. a. A float supporting part of a structure, such as a bridge. Nichols.

Pontoon. A. A float supporting part of a structure, such as a bridge. N. of Eng. A boy who drives a pony in the mine workings. Fay.

Pontoon bridge. A temporary or permanent pontoon. a. A float supporting part of a structure, such as a bridge. Nichols.

Pontoon. A. A float supporting part of a structure, such as a bridge. N. of Eng. A boy who drives a pony in the mine workings. Fay.

Po. A. A float supporting part of a structure, such as a bridge. Nichols.

Pony. a. A synonym for pressure-relief valve. Long. b. The reduction in pressure effected by release of part of the confined liquid or gas through a pressure-relief valve. Long. c. In dry process enamelimg, a defect appearing as a small conical piece of porcelain either partially or entirely separated from the ware. ASTM C286-65. d. See lift, w. ACWG, 1963.

Pop. A defect characterized by randomly occurring, rough, pitted, circular shaped areas of around coat appearing in the first cover coat sheet porcelain enamel. ASTM C286-65. e. See lift, w. ACWG, 1963.

Porcelain. A pyroxene trachyte with or without subsidiary biotite and amphibole. Bureau of Mines Staff.

Porcelainite. A trade term for white stone-ware, jasper, or the like. Standard, 1944.

Porcelain balls. Spheres of fired clay body used as grinding media in ball mills. Porcelain balls must be hard, of nearly equal porosity and preferably, white. Balls wear down during use and should be replaced periodically. Enam. Dict.

Porcelain bricks. Hard fired white porcelain molded into bricks which are cemented on the inside of the steel shell of an enamel mill. The bricks used on the sides of the mill are so shaped as to closely conform with the contour of the steel shell. Enam. Dict.

Porcelain clay. See kaolin; kaolinite. Fay.

Porcelain color. A pigment such as is used in decorating porcelain. Fay.

Porcelain dishes. As used to hold temperature cones during cooking of furnace temperature......... Porcelain dishes used for the cooling of the hot metal. Sturk.

Porcelain enamel. Not to be confused with paint enamels or "baked-on" enamels, such as are used on automobile fenders, etc. Porcelain enamel is a glassy composition applied to metal and fused thereon at a low temperature. Sturk.

Porcelain enamel commercial quality steel sheet. Steel sheet, ordered or sold on the basis of specifications governing the use as a base for enameling or other vitreous coatings. Bennett 2d, 1962.

Porcelain enamel deep drawing quality steel sheet. Steel sheet, ordered or sold on the basis of specifications governing use as a base for enameling or other vitreous coatings, and also on the basis of deep drawing qualities. Bennett 2d, 1962.

Porcelain enamel sanitary ware. See sanitary porcelain.

Porcelain gilding. A process of applying gold to china, usually with turpentine, and firing it, resulting in the adherence of the gold to the china and the volatilization of the less permanent ingredients. The gold is then burnished. Standard, 1964.

Porcelainite. A trade term for stone-ware, jasper, or the like. Standard, 1944.

Porcelainite. A trade term for stone-ware, jasper, or the like. Standard, 1944.
porcelainized

Resembling potter's clay that has been fired; specifically in geology, applied to clay, shales, etc., which by the influence of heat have come to resemble clay ware or porcelain. *Standard*, 1964.

porcelain jasper. Burnt clay. See also porce- lainite. *Fay.*

porcelain lace. A decorative material formed by ribbons lace in porcelain slip and firing it. The threads of the fabric are consumed, leaving the pattern in a fine lace-like porcelain ware. *Standard*, 1964.

porcelain lined. A pump equipped with a ceramic-coated cylindrical shell lining the pump cylinder. See also porcelain liner. *Long.*

porcelain liner. A cylindrical shell, coated with a non-corrosive material, porcelain-like ceramic material, used as the liner of a pump cylinder to resist the abrasive and/or corrosive effects of a recirculated or mud-laden drill fluid, grit, etc. *Long.*

porcelain mill. A mill for grinding materials for porcelain. *ASTM C242-60T.*

porcelain opal. Milky white opal; more opaque than milk opal. *Shipley.*

porcelain oven. The firing kiln used in baking porcelain. *ASTM C242-60T.*

porcelain process. The method of producing glazed ware by which a ceramic body and clay are mated together in the same firing operation. *ASTM C242-60T.*

porcelain tile. A ceramic mosaic tile or paver. *ASTM C242-60T.*

porcelain oven. A ceramic oven used in firing porcelain. *ASTM C242-60T.*

porcelainized. Resembling potter's clay that has been fired; specifically in geology, applied to clay, shales, etc., which by the influence of heat have come to resemble clay ware or porcelain. *Standard*, 1964.

porcelainized. Resembling potter's clay that has been fired; specifically in geology, applied to clay, shales, etc., which by the influence of heat have come to resemble clay ware or porcelain. *Standard*, 1964.

porcelain linings. A cylinder, lined, coated porcelain, or other material, for use in pumps where apparently spontaneous combustion of the seams in the past. Also called porcelainized. *ASTM C242-60T.*

porcelain oven. The firing kiln used in baking porcelain. *ASTM C242-60T.*

porcelainized. Resembling potter's clay that has been fired; specifically in geology, applied to clay, shales, etc., which by the influence of heat have come to resemble clay ware or porcelain. *Standard*, 1964.

porcelainized. Resembling potter's clay that has been fired; specifically in geology, applied to clay, shales, etc., which by the influence of heat have come to resemble clay ware or porcelain. *Standard*, 1964.
porosity trap porosity on one or more sides of the reservoir. A.G.I.
porosity Full. In gem mining, a Ceylonese term for a mamoty or hoe with a handle about 6 feet long and a broad blade so curved that it can be dug through river gravel and will hold some of the finer material. Heu.
porous Containing voids, pores, cells, interstices, and other openings, which may or may not interconnect. See also porosity. Long.
porous formation Synonym for porous ground. Long.
porous ground Any assemblage of rock material as a result of fracturing, faulting, modification of deposition, etc., contains a high percentage of voids, pores, and other openings. Long.
porous, punctate Electrode consisting of a metal bar immersed in a saturated electrolyte solution that is contained in a porous pot. Scheider, Stecker.
porous stones Those crystalline or cryptocrystalline aggregates which permit the escape of solutions such as dyes between particles. See also stained stone. Shipley.
porous wheel A grinding wheel having an open or porous structure and a vitrified or resinous bond. ASM Gloss.
porphyrite A term which has been variously used for pre-Tertiary andesitic rocks, altered andesite rocks, and hypabyssal rocks of marked porphyritic texture and andesitic composition. The last usage is now customary. The phenocrysts are generally plagioclase (average composition that of andesite) and plagioclase, and the groundmass is holocrystalline and more coarsely grained than in andesite. To avoid confusion, some writers prefer terms such as diorite porphyry and andesite porphyry in appearance. Shipley.
porphyry A term used for porphyroblastic metamorphic rocks whether of igneous or sedimentary origin. See also halleflint; halleflintite; knotted slate; leptite; macaculose. A.G.I.
porphyry copper A term first given to an altered andesite rock in which coarse grains, often elongated, of small ferromagnesian minerals and pyrite may or may not interconnect. See also porosity. Faul.
porphyroclast A large rock fragment contained in mylonite. A.G.I. Supp.
porphyroclastic texture See porphyrogranulitic.
porphyrogranulitic texture A textural term given by Judd to dolerites which carry large porphyritic crystals of feldspar and augite in a base consisting of a mixture of lath-shaped feldspar crystals and small, irregular grains of augite. Johannesen, v. 1, 2d, 1919, p. 309.
porphyrogranulitic A textural term given by Judd to dolerites which carry large porphyritic crystals of feldspar and augite in a base consisting of a mixture of lath-shaped feldspar crystals and small, irregular grains of augite. Johannesen, v. 1, 2d, 1919, p. 309.
porphyry copper ore See porphyry copper.
porphyry copper deposit in which the copper minerals occur as discrete grains and veinlets throughout a large body of rock, which commonly indicates porphyry. It is a large tonnage, low-grade deposit. Bateman. b. In the commercial sense, the term is not restricted to ore in porphyry but is applied to deposits characterized by huge size, particularly with respect to horizontal dimension, uniform dissemination, and low-average-per-ton copper content. A.G.I.
porphyry copper ores See porphyry copper.
porphyry rocks Rocks of Wedgewood ware. See also pebble ware. Fay.
porphyroclastic Synonym for porphyroclast. Fay.
porphyroclastic texture See porphyroclast.
porphyroblast A term given to the pseudo-porphyroblastic crystals of rocks produced by thermal metamorphism. The corresponding texture is called porphyroblastic. Holmes, 1920. b. Large grains or crystals, commonly of feldspar, quartz, or calcite, developed in schists resulting from deformation of rocks originally containing phenocrysts. Also called metacryst. A.G.I.
porphyroblastic The texture of a recrystallized rock in which coarse grains, often euhedral or subhedral, are distributed in a finer grained matrix. A.G.I.
porphyroblastic texture See porphyrogranulitic.
porphyry A term used for porphyroblastic metamorphic rocks whether of igneous or sedimentary origin. See also halleflint; halleflintite; knotted slate; leptite; macaculose. A.G.I.
porphyry A term first given to an altered andesite rock in which coarse grains, often elongated, of small ferromagnesian minerals and pyrite may or may not interconnect. See also porosity. Faul.
porphyroclast A large rock fragment contained in mylonite. A.G.I. Supp.
porphyroclastic texture See porphyrogranulitic.
porphyrogranulitic texture A textural term given by Judd to dolerites which carry large porphyritic crystals of feldspar and augite in a base consisting of a mixture of lath-shaped feldspar crystals and small, irregular grains of augite. Johannesen, v. 1, 2d, 1919, p. 309.

porous formation Synonym for porous ground. Long.
portage group. Marine strata of Upper Dev-
positive gradient

Layer of water where temperature increases with depth. *Hy.

postcrystalline deformation. The deformation (tectonic movements) following the recrystallization of the rock. Schieferdecker.

post drill. An auger (or drill) supported by a post. *Fay.

postdissolution method. Penetrate inspection in which an emulsifier is required to render the penetrating agent water washable. *ASM Gloss.

post emulsification. The separation of an emulsion into two phases by the use of a suitable solvents. SmRB, Paper No. 61.

post glacial. Occurring after a period of glacial or ice age. *Fay.

postglacial. Occurring after a period of glacial or ice age. *Fay.

post hole Auger. A hand-held digging tool which enables bores to be sunk to about 20 feet in unsupported holes and deeper in cased holes. *Fay.

post hole digger. A. Large, auger type, mechanically or by hand, used for digging in unconsolidated ground and retrieving core samples. *Fay. b. Synonym for core auger. *ASM Gloss.

post mineral movement. The movement along a fault may pulverize some of the rock into a fine-grained gouge, which often looks and feels like clay. Postmineral movement along a mineralized zone forms a gouge containing pulverized minerals (from the vein itself). The planes thus formed constitute structural weaknesses in the rock, which in turn result in a condition of a series of openings are made in or near them. *Lewis, pp. 396-397.

post mineral movement. The movement along a fault may pulverize some of the rock into a fine-grained gouge, which often looks and feels like clay. Postmineral movement along a mineralized zone forms a gouge containing pulverized minerals (from the vein itself). A pot may either be open (the surface of the glass exposed to the furnace gases) or closed by an integrally molded roof, a mouth being left for charging and gas exit. A closed pot is also known as a covered or hooded pot. 

**Potable**. Drinkable. Webster 3d. Said of water.

**Potamology**. The science of rivers, which may be called botanyomology. A.G.I.

**Potassium**

- **Potassium**. A reactive metallic element of the alkali group (period 1) of the periodic system. It is soft; light; and silvery. It occurs abundantly in nature but is always combined with other elements. It is used extensively in photography, in the manufacture of glass, and in the preparation of potassium cyanide, potassium nitrate, and potassium chlorate. 
- **Potassium carbonate**. Slightly soluble in cold water; highly soluble in hot water. **Potassium chlorate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chloride**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chloride hemihydrate**. Colorless;* isomorphous with potassium and sodium chlorides. **Potassium dichromate**. Slightly soluble in cold water; soluble in hot water. **Potassium fluoride**. Slightly soluble in cold water; soluble in hot water. **Potassium hydroxide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium iodide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium permanganate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium peroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium phosphate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium carbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium bicarbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium hydroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium iodide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chloride**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chlorate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium cyanide**. Slightly soluble in cold water; soluble in hot water. **Potassium chloride hemihydrate**. Colorless; isomorphous with potassium and sodium chlorides. **Potassium dichromate**. Slightly soluble in cold water; soluble in hot water. **Potassium fluoride**. Slightly soluble in cold water; soluble in hot water. **Potassium hydroxide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium iodide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium permanganate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium peroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium phosphate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium carbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium bicarbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium hydroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium iodide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chloride**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chlorate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium cyanide**. Slightly soluble in cold water; soluble in hot water. **Potassium chloride hemihydrate**. Colorless; isomorphous with potassium and sodium chlorides. **Potassium dichromate**. Slightly soluble in cold water; soluble in hot water. **Potassium fluoride**. Slightly soluble in cold water; soluble in hot water. **Potassium hydroxide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium iodide**. Slightly soluble in cold water; readily soluble in hot water. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium permanganate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium peroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium phosphate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium carbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium bicarbonate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium hydroxide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium iodide**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium nitrate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chloride**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium chlorate**. Soluble in water; decomposes in concentrated hydrochloric acid. **Potassium cyanide**. Slightly soluble in cold water; soluble in hot water.
potassium cyanide. Colorless or white; in¬
molten state, very poisonous; KCN; molecular weight, 65.12; faint odor of bitter almonds; soluble in water, in ethyl alcohol, in methyl alcohol; grayish yellow; specific gravity, 1.52 (at 16°C); and melting point, 634°C. Used in the extraction of gold and silver from ores, the heat treatment of steel, and as a re¬

potassium dichromate; potassium bichromate. Bright, yellowish-red; transparent; K2Cr2O7; triclinic becoming monoclinic at 245.6°C; molecular weight, 294.19; bitter, metallic taste; soluble in water; and in alcohol; specific gravity, 4.57 (at 17°C); and melting point, 396°C; and it decomposes at 500°C. Used in the separation of heavy metals. CCD 6d, 1961; Molecular weight, 72.17; yellow; orthorhombic; KHS; delique¬
cent; specific gravity, 1.68 to 1.70; melting point, 495°C; decomposes in water; and soluble in alcohol. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-211.

potassium hydroxide; caustic potash. White, deliquescent solid having corrosive prop¬
erties, KOH. Soluble in water; absorbs carbon dioxide; has alkaline properties; melting point, 360°C; molecular weight, 56. Used in the solid as a drying agent for gases, and as an agent for absorbing acid gases; as an absorbent for carbon dioxide in mine-air analysis apparatus and in self¬
contained mine rescue apparatus. Cooper, pp. 319-320.

potassium iodide. White crystals, granules, or powder, KI; strong bitter saline taste; soluble in water, in alcohol, and glycerol; specific gravity, 3.123; melting point 723°C; decomposes below 240°C. Used as a cement for join¬
ing metal and other work by applying in the hot plastic condition. C.T.D. Also used in silversing mirrors. Merriman.

potassium magnesium chloride. See carnal¬
site. Colorless or white; orthorhombic or hexagonal; K2MgCl4; specific gravity, 2.703; melting point, 455°C; decomposes in air only at elevated temperatures and pres¬
sures. Used in the manufacture of glass and refractory material. CCD 6d, 1961.

potassium-sodium tartrate; Rochelle salt. KNaC6H4O6; colorless; orthorhombic; molecular weight, 220.25; specific gravity, 1.790; melting point, 70° to 80°C; loses H2O at 215°C; soluble in water; and very slightly soluble in alcohol. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-210. Used as a cement for join¬
ing metal and other work by applying in the hot plastic condition. C.T.D.

potassium sulfite. Colorless or white; orthor¬
hombic or hexagonal; K2SO3; bitter saline taste; soluble in water; insoluble in acetone, carbon disulfide, and in alcohol; specific gravity, 2.602; melting point 289°C or 1,077°C; molecular weight, 174.27; trans¬
formation temperature between the orthorhombic and hexagonal forms, 588°C; and boiling point, 1,689°C. Used in amylum manufacture and in glass manufac¬
ture. CCD 6d, 1961; Handbook of Chem¬

potassium tannate. K2TiO7; a ferroelectric material having a dielectric constant ex¬
ceeding 4000 at the Curie temperature (−260°C). Dodd.

potassium xanthogenate; potassium ethyl¬
thiocarbonate; potassium ethylxanthogenate; potassium ethylxanthate. See potassium xanthate. Bennett 2d, 1962.

potassium yellow prussiate; yellow prussiate of potash. Lemon-yellow; monoclinic; KFe(CN)6; molecular weight, 242.41; specific gravity at 25°C, 2.676 (at 17°C); dehydrates losing 3% at 60°C; melting point, 455°C; decomposes below 240°C. Used in enamels, in synthetic mica, in ceramics, and in the formulation of heavy and refractory material. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.

potassium fluoride. Colorless or white; iso¬
metric; molecular weight, 41.0; delique¬
cent; KF; sharp saline taste; soluble in water and in hydrofluoric acid; and is soluble in ammonia; insoluble in alcohol; specific gravity, 2.48; melting point, 846°C; and boiling point, 1,505°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-277.

potassium fluoride dihydrate. Colorless or white; monoclinic prisms; deliquescent; KF·2H2O; colorless; in water, in hydrofluoric acid, and in am¬
monia; soluble in alcohol; specific gravity, 2.48; melting point, 846°C; and boiling point, 1,505°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.

potassium iodate; potassium silicofluoride. Colorless or white; monoclinic prisms; deliquescent; KF·2H2O; sharp saline taste; soluble in water and in hydrofluoric acid; insoluble in alcohol; melting point, 41°C; molecular weight, 94.13; specific gravity, 2.454; and boiling point, 255°C. Used in etching glass. CCD 6d, 1961; Handbook of Chem¬

potassium nitrate; potassium nitrite; potassium perchlorate. Colorless or white; monoclinic prisms; deliquescent; KNO3; sharp saline taste; soluble in water and in hydrofluoric acid; insoluble in alcohol; melting point, 41°C; molecular weight, 94.13; specific gravity, 2.454; and boiling point, 255°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.

potassium nitrate. Colorless or white; monoclinic prisms; deliquescent; KNO3; sharp saline taste; soluble in water and in hydrofluoric acid; insoluble in alcohol; melting point, 41°C; molecular weight, 94.13; specific gravity, 2.454; and boiling point, 255°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.

potassium nitrate. Colorless or white; monoclinic prisms; deliquescent; KNO3; sharp saline taste; soluble in water and in hydrofluoric acid; insoluble in alcohol; melting point, 41°C; molecular weight, 94.13; specific gravity, 2.454; and boiling point, 255°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.

potassium nitrate. Colorless or white; monoclinic prisms; deliquescent; KNO3; sharp saline taste; soluble in water and in hydrofluoric acid; insoluble in alcohol; melting point, 41°C; molecular weight, 94.13; specific gravity, 2.454; and boiling point, 255°C. Used in etching glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-207.
pot
cay be colorful, but without fine play of color. Sh. 1954.
put halls. Refractory clays used for making the pots in which glass is produced. CCD 6:
pot die forming. Forming products from sheet or plate through the use of a hollow die and the movement of the formed piece to assume the contour of the die. ASM Glass.
potential. The words potential and voltage are synonymous and mean electrical pressure. The potential or voltage of a circuit, machine, or any piece of electrical apparatus means the potential normally existing between the conductors of such circuit or the terminals of such machine or apparatus. In Bureau of Mines practice: (1) any potential less than 301 volts shall be deemed a low potential; (2) any potential greater than 301 volts but less than 651 volts shall be deemed a medium potential, and (3) any potential in excess of 651 volts shall be deemed a high potential. Fay.
potential energy. The form of mechanical energy a body possesses by virtue of its position. If a body is being dropped from a height, e.g. from lower to higher, the body is losing potential energy, but if a body is being raised, then it gains potential energy. Morris and Cooper, p. 256.
potential drop. The difference in pressure between any two points in an electrical circuit, measured in volts. Morris and Cooper, p. 256.
potential drop ratio method; P.D.R. method. A variant of the resistivity method in which the potential drop ratio is determined. The difference of potential between two pairs of points in the ground is measured. Schieferdecker.
potential energy of deformation. See strain energy, c. Ro.
potential gradient. Potential gradient means an ascending or descending value of voltage related to a linear measurement, as a distance along the earth surface or ground. I.C. 7962, 1960, p. 23.
potential ore. Ore that is presumed to exist. Obolete, A.G.I.
potential temperature. The temperature a parcel of water would have if it were lifted from its position in the water column to the sea surface. The water would have a lower temperature due to the fact that it would undergo an adiabatic temperature change, as a result of changed pressure conditions, without any exchange of heat with its surroundings. Hyg. b.
potentiometer. a. A variable voltage divider. HBG. b. Apparatus used to measure multie potential differences. Pryor, 3.
potentiometric titration. Quantitative analysis in which changes of electromagnetic force are measured during titration, a technique especially adaptable for the direct study of corroding metals where both anodic and cathodic reactions are taking place. Morris and Cooper, p. 256.
potetole. A hood shaped like a pot, but with no bottom, which is placed in a tank furnace so that it reaches below the glass level. It protects the man gathering glass on its pipe or iron from furnace gases; also, the glass here is somewhat cooler than that in the main part of the furnace, where melting is taking place. C.T.D.
pot furnace. a. A furnace for melting glass in pots. ASTM C162-66. b. Any of the small vertical furnaces used to smelt batches (2 to 4 pounds) of enamel in a crucible. The crucible of molten material is removed from the furnace with aid of tongs, and the melted enamel poured from the pot into water for fritting purposes. Enam. Dict.

patterner. A term used in early metalurgical practice for an ore that becomes vitrified by heat, like the glazing of earthenware. See also MILLSTONE.

pottern ore. See potters' consumption.

potter's bronchitis. See potter's consumption.

potter's clay. a. A pure plastic clay, free from iron, and consequently white after burning. Fay. b. A clay adapted for use on a potter's wheel, for the manufacture of pottery. A.G.I.

potter's consumption. An acute bronchitis often occurring among pottery employees, eventually affecting the lungs. Also called potter's asthma; potter's bronchitis. Standard, 1964.

potter's earthenware. See pottery earthenware.

potter's flint. See flint, potter's.

potter's fractured. See flint, potter's.

potter's corn. Kidney. A thin kidney-shaped piece of horn or metal used, until the early 20th century, by pottery potters. To make dishes, a bat of prepared body was placed on a plaster mold and hand-pressed to shape with a piece of fired horn; the horn was used for final smoothing of the surface. Dodd.

potter's lead. See alquifou.

potter's mortar. See pottery mortar.

potter's red cement. A pozzolana type of cement consisting of crushed fired clay mixed with portland cement. See also pozzolana. Dodd.

potter's wheel. A rotating circular table, mounted on pillars on which holloware is made by the thrower. C.T.D.

pottery. a. A shop or factory where ceramic ware is made. Fay. b. All fired ceramic wares that contain clay when formed, except technical, structural, and refractory products. ASTM C42-60T. c. As a generic name, all fired clayware produced by a potter (a clay worker). ACGS, 1963. d. As a specific name, the low-fired porous colored body ware (in contrast to white or buff-colored earthenware). ACGS, 1963.

pottery body stains. Calcined oxide finely ground, for coloring ceramic bodies. Used as colors or designs for tile, terra cotta, chinaware, etc., where the pigment is a part of the ceramic body. CCD, 1961.

pottery-decoration designer. One who sketches patterns to be used in decorating pottery and makes finished drawings in color of terra cotta, chinaware, etc., where the pigments are reduced by pounding, grinding, etc. Dodd.

potting. The placing of pots, containing either raw material or the product, in the kiln or furnace. The use of this purpose of sintered alumina powder, within hermetically sealed cans, has proved successful. Potterville conglomerate. A conglomeratic formation at the base of the Pennsylvania (Upper Carboniferous) in the northern Appalachian region. See also Millstone grit. Webster, 1962.

pot. Containing pots. See also pot. Also applied to any roof in a coal mine which falls down in thick blocks. Fay.

pottery ore. Som. Brown iron ore, Brendon Hills. Apparently a color term once the two varieties of ore are black and potty. Arkell.

pot wagon. A vehicle used for transferring a pot from a pot arch to a pot furnace. ASTM C162-66.

powder explosions. These explosives contain still smaller quantities of liquid products, compared with plastic and semi-plastic explosives.

powder explosives. These explosives contain still smaller quantities of liquid products, compared with plastic and semi-plastic.

powdering. The placing of pots, containing either raw material or the product, in the kiln or furnace. The use of this purpose of sintered alumina powder, within hermetically sealed cans, has proved successful. Potterville conglomerate. A conglomeratic formation at the base of the Pennsylvania (Upper Carboniferous) in the northern Appalachian region. See also Millstone grit. Webster, 1962.

pot. Containing pots. See also pot. Also applied to any roof in a coal mine which falls down in thick blocks. Fay.

powder. a. Any of various units of mass and weight. As used in powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay. d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

pour. In founding: (1) the amount of material, as melted metal, poured at a time and (2) the act, process, or operation of pouring melted metal; as, make a pour at noon. Standard, 1964.

pouring. Melting metal from a furnace or a ladle to a mold. ASTM C162-66.

pouring basin. A basin on top of a mold to receive the molten metal before it enters the spout or downgate. A.M.S.

pouring gate. A channel in a mold through which to pour molten metal. Fay.

pouring. The placing of pots, containing either raw material or the product, in the kiln or furnace. The use of this purpose of sintered alumina powder, within hermetically sealed cans, has proved successful. Potterville conglomerate. A conglomeratic formation at the base of the Pennsylvania (Upper Carboniferous) in the northern Appalachian region. See also Millstone grit. Webster, 1962.

pot. Containing pots. See also pot. Also applied to any roof in a coal mine which falls down in thick blocks. Fay.

powder. a. Any of various units of mass and weight. As used in powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay. d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

powder. a. Any of various units of mass and weight. As used in powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay. d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

powder. a. Any of various units of mass and weight. As used in powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay. d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

pouring. Melting metal from a furnace or a ladle to a mold. ASTM C162-66.

pouring basin. A basin on top of a mold to receive the molten metal before it enters the spout or downgate. A.M.S.

pouring gate. A channel in a mold through which to pour molten metal. Fay.

powder used for the transfer of steel from furnace to ingot. These include ladle brick, molds, shovels, stopper heads, mold plugs, hot tops, and mortars used for the brickwork involved. A.I.S.T. No. 24.

powdered dynamite. A mixture, in a range of 0.1 to 1.0 g, of explosive which an oil commences to flow under stated conditions. Pryor, 3. b. The lowest temperature at which an oil can be poured. Shell Oil Co.

pound. a. Any of various units of mass and weight. As used in powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay. d. In powder metallurgy, particles of material, as melted metal, poured at a time and lying coalbeds. Fay.

pour point. a. Temperature at which an oil will flow after burning and mingle with clay to form ceramic ware. Made. Fay. b. A clay adapted for use on a potter's wheel, for the manufacture of pottery. A.G.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.

powdered glass. Various kinds of glass, which have been crushed fine, may be transported by air to fire a boiler or industrial heating furnace. B.C.I.
powder explosives

explosives, so that the spaces between the solid particles are not filled out entirely. As the result of this the density of the mass is 20 to 40 percent lower than that of plastic and semi-plastic explosives. Fraschel, v. 3, Art. 16:02, p. 9.

powder flowmeter. In powder metallurgy, a device for determining the flow rate of a powder. ASM Gloss.

powder house. A magazine for the temporary storage of explosives. Fay. See also magazine.

powder jack. See jack, d. Fay.

powder keg. A small metal keg for black powder.

powder metal: Powder house. A magazine for the temporary storage of explosives. Fay. See also magazine.

powder metal. A. A man in charge of explosives and mining, one who handles proper storage of explosives in powder house and blasting powder, usually having a capacity sufficient for 25 pounds of powder. Fay.

powder and blast. In powder to the long, and blast. Agent mixed with or incorporated in a powder to facilitate the pressing and ejection of the blast. Fay.

powderman. a. A man in charge of explosives in an operation of any nature requiring their use. Fay. b. In blasting, a man in charge of mixing and loading explosives and mining, one who handles proper storage of explosives in powder house as well as handling dyna- mite, caps, detonators, and fuses to miners as needed. At smaller mines, may deliver explosives to miners at working places. Also called powder monkey; powder nipper; powder supply man. D.O.T. 1. See also powderman helper.

powder metallized, powdered metal. As used in the diamond-drilling industry, the finely divided particles of iron, copper, nickel, zinc, molybdenum, etc., which, when mixed with a suitable binding material and subjected to processing by heat and pressure, may be used as a matrix material to form a bit crown. Long.

powder metal bit. Any diamond bit, mechanically set, in which finely divided metal powder is used as a matrix to hold the diamonds in place. Also called powder-bit; powder-set-bit; sintered-metal bit; Long.

powder metallurgy. In powder metallurgy, the art of producing and utilizing metallic powders of the reduction of massive materials and shaped objects. ASM Gloss.

powder-metal process. The process of mechanically setting diamonds in a bit in a matrix of finely divided metal powders. The metal powder is first cold-pressed to compact it in a bit mold or die and then is heated to allow the bonding alloy to melt and bond the diamonds and bit blank. Hot pressing or coining follows heating of the powder in some modifing the compact. ASM Gloss. Long.

powder method. A method for recording the planes in which a finely powdered crystal-line specimen selectively scatters X-rays of any given wavelength. Widely used for mineral identification. A.G.I.

powder mine. An excavation filled with powder for the purpose of blasting rocks. Fay. A miner or person employed at the powder house of a coal mine whose duty it is to deliver powder to the miners. Fay. b. Any of some metal mines, the person who distributes powder, dynamite, and fuse to the miners at the working faces. This is a nautical term, but is frequently used in the mining industry. Fay. c. In the v/cry industry, one who carries powder or other explosives to blaster and assists him by placing prepared explosive in hole, connecting lead wire to blasting machine, and performing other duties as directed. Also called blaster helper; powder carrier; powderman helper. D.O.T. 1. See also blaster; powderman.

powder nippers. See powderman, b. D.O.T. 1.

powder photograph. An X-ray diffraction photograph of a fine powder. Harribi.

powder pin. A term formerly used in the anthracite region to identify a wooden stick, similar to a rolling pin, with a knob on one end only, this stick was used to roll paper around in order to form a cartridge to receive the loose black powder used in blasting. Hess.

powder porosity. Ratio of volume of voids between particles, plus the volume of pores, to the volume occupied by the powder, including the porosity of the compacts. D.O.T. 1.

powder spreader. See bulk spreader.

powellite. Natural calcium molybdate (CaMoO₄) or Ca(Mo,W)O₄, in which a portion of the molybdenum is replaced by tungsten. Blush-green crystals contain 1.65 to 10.28 percent WO₃; specific gravity 4.35 to 4.32. Pearly-gray scales are more common and contain only traces of tungsten. Specific gravity 4.25. Found in Idaho, Michigan, Texas, Nevada, California; Siberia. A minor ore of molybdenum. CCD 6d, 1961.

powellizing process. A wood treatment consisting of impregnating the wood with a saccharin solution. It hardens the wood, and renders it fireproof to some extent. Liddell 2d, 1962.

power. a. Any form of energy available for driving machinery, equipment, devices; the ability of the steam engine, the horse, the steamboat, the windmill, the electric motor, etc., to do work. In general, any form of energy capable of producing a mechanical effect. Long.

power drive. Any form of energy capable of doing any kind of work; for example, steampower, and waterpower. Specifically, mechanical energy, as distinguished from electrical or hydraulic energy. Fay.

power equation. The power required to drive the air through a mines circuit is consumed mechanically in lifting water out of the mine, is lost in the kinetic energy of the air leaving the upcast, and is converted into heat in overcoming friction. This may be expressed as an equation: (Natural ventilation power) = (Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction).

power factor. One or more winches mounted on a tractor and used to manipulate large claws of bulldozers, scrapers, or other machinery. Nichols, 2.

power control winch. A high speed tractor mounted winch with one to three drums; used chiefly for maneuvering the late parts of bulldozers, scrapers, and rooters. Nichols.

power density. The ratio of heat generated per unit volume of a nuclear reactor core. LBL.

power distillate. The untreated kerogen condensates and still heavier distillates down to 28° Bé from Mid-Continent petroleum. Used as fuel in internal-combustion en- gines. Fay.

power drag scrapers. Either pit or bank ex- cavation can be handled economically by a power drag scraper. This machine consists of (a) a standard hopper; (b) a two-horse drum; (c) two long cables that attach to the front and rear of the scraper; (d) two sheave blocks mounted on the mast to guide the operating cables to the hoist. The tail-block is shifted manually from time to time, and the scraper in a wide arc until all the material within the operating radius has been taken out. BuMin. Bull. 23d, Sec. A, p. 29.

power drill. A drill actuated by steam, com- pressed air, or electricity. Hudson.

power-driven compressor. A compressor which is driven either by a belt or through gearing. Leat., 671, p. 671.

power earth auger. A mechanically operated auger for exploring and testing deposits which are not very hard. The drilling rig may be mounted on a lorry or caterpillar tracks when greater depths may be reached. Nickols.

powered supports. In fully mechanized coal mining, a system of pit props connected to a flexible armored conveyor by means of hydraulic rams. Roof beams mounted above the props are held by hydraulic pressure to the working roof. They are carried forward as the working passage adjoins the coal face above the conveyor and the cutting machine. The conveyor is pressed forward by the section by section behind the advancing cutter, and the props are then drawn forward by manipulating hydraulic valves. Pryor, 3.

power equation. The power required to drive the air through a mines circuit is consumed mechanically in lifting water out of the mine, is lost in the kinetic energy of the air leaving the upcast, and is converted into heat in overcoming friction. This may be expressed as an equation: (Natural ventilation power) = (Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction).

power excursions. See excursion. LBL.

power factor. a. The ratio of actual power in an alternating-current circuit measured in watts to the apparent power measured in volt-amperes. (Power factor = Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction). Spalding, p. 303.

power factor. b. The ratio of the actual power in an alternating-current circuit measured in watts to the apparent power measured in volt-amperes. (Power factor = Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction). Spalding, p. 303.

power factor. c. The ratio of actual power in an alternating-current circuit measured in watts to the apparent power measured in volt-amperes. (Power factor = Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction). Spalding, p. 303.

power factor. d. The ratio of actual power in an alternating-current circuit measured in watts to the apparent power measured in volt-amperes. (Power factor = Power used in lifting water) + (Power lost as kinetic energy) + (Power converted into heat against friction). Spalding, p. 303.
power factor

unit. Coal Age, 1. c. A clause frequently found in electric power contracts which sets forth that if a customer permits his average power factor of his load to fall below a specified value, a penalty charge will be made. This clause can readily be computed by adding the cost of power for an unfavorable month by as much as 20 to 30 percent. Power factor is often defined as the ratio of actual power to apparent power and is expressed usually as a percentage. Kentucky, p. 260.

power-factor meters. Meters which indicate the relation of the phase between the line current and the line voltage which actually is the same as the power factor of the load. Coal Age, v. 71, No. 8, August 1966, p. 270.

power. The amount by which the output power level in decibels exceeds the input power level in decibels. Thus, if the output power of a device is ten times the input power level in decibels. On the other hand, if the output power is the same as the input power level in decibels, each half of the face belt is pulled around a prop at one end of the face by means of a cage attached to a small electric winch. Triffa.

power rammer. A manually operated compacting machine weighing about 200 pounds, raised by an internal combustion mechanism and allowed to fall by gravity. See also forger rammer; mechanical rammer. Ham.

power ratio. The ratio of fan power to the power which would be required for leakless conditions is the square of the volume ratio. Roberts, I, p. 227.

power reactor. A nuclear reactor designed for use in a nuclear power plant, as distinguished from reactors used primarily for research on nuclear radiation or fissionable materials. LQR.

power reel. A reel that is driven by an electric motor or some other source of power, used to wind or coil strip or wire as it is produced from some other form of energy. See also power unit, b. A unit which converts AC or DC current to AC or DC voltages suitable for the operation of equipment. NDP.

power per unit band. The first approach by the quotient obtained by dividing (1) the power on the load being transmitted by a given system, at a given time and in a given frequency band, by (2) the width of this band as the width of this band approached zero. H86.

power plant. See power house. Jones.

power pack. a. In general, an electrically operated motor which is a self-contained package on the end, to supply power to face equipment, for example, self-advancing supports. The system is sometimes used on a circuit with a return leg, returning to a reservoir containing about 212 gallons of oil. The pump can supply 25 gpm at 2,000 lb of pressure, or 10 gpm at 5,000 lb per square inch, which allows a setting load of about 9 tons per prop. Nelson.
between the vertical stress P and the lateral Q. Pryor, 3.

practical shot. In coal mining, a shot for which the hole has been drilled in a direction selected with reasonable care, and that has been filled with powder and tamped with the same degree of care. Fay.

prairie shooting. An impact mill consisting of an impeller rotating clockwise at 1,500 revolutions per minute, a baffle plate moving anti-clockwise at 1,500 revolutions per minute, and another baffle plate that is stationary. *Dodd.*

prase. A translucent and dull leek-green variety of chaledonic quartz. *Fay.*

praseodymium. A pale yellowish metallic element of the rare earth group that occurs usually with cerium, lanthanum, and neodymium, and forms green salts. Used chiefly in the form of its salts in coloring glass-green-yellow. Symbol, Pr; valences, 3; molecular weight, 140.97; atomic number, 59; and atomic weight, 140.907. *Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-129, B-212.*

praseodymium oxide. A rare earth metal now called praseodymium in Canada and by many geologists in the United States. The Am. Comm. on Strat. Nomenclature recommends that the Canadian spelling be used and that the term Early Precambrian era and Late Precambrian era be substituted for Archean and Proterozoic. *A.G.I.*

Precambrian. Rocks older than the Cambrian age. With the Cambrian sediments, evidence of life first appeared. Name applied to the great shield shaped area of Precambrian rocks in northern Canada and parts of the northern United States. These ancient rocks are evident in many parts of the world. *Cunning.*

precementation process. In forming, the pressure introduced into the wet concrete prior to forming the part. *ASM Gloss.*

precious. Used by mineralogists to imply the finest variety of gems or minerals; for precious stones. Produced domestically in Oregon and Washington. Some turquoise is produced in Nevada and Colorado. Most precious stones are used in jewelry, and for industrial purposes, are imported. *Burger.*

precious topaz. A term still applied, by some jewelers, to genuine topaz to distinguish it from topaz-colored quartz, known as synthetic topaz. *Burger.*

precipitation. a. The process of separating a solid from a solution. b. The ejection of a solid substance out of the atmosphere, generally upon a precipice. c. The ejection of a solid substance from a supersaturated solution. See also crystallization. *Hawkes, 2, p. 233.*

precipitation barrier. Metal-rich water, as it moves away from the source of the metal, ordinarily comes into an environment where it is changing conditions that cause precipitation of part or all of the metal from the water. Precipitation barrier is a mechanism by which the metal is removed from solution by a kind of progressive aging. *ASM Gloss.*

precipitation heat treatment. Artificial aging in which a constituent is precipitated from a supersaturated solid solution. See also artificial aging. *Webster ASM Gloss.*

precipitation process. The treatment of lead ores by direct fusion with metallic iron or slag, or ore rich in iron; performed generally in a shaft furnace, reverberatory. It is often combined with...
preeutering...
prelubricated sealed bearings

lubricated renewable seal bearings, these bearings have provision for cleaning, renewal, and renewing of seals after manufacture. NEMA M61-1956.

premature blast. The detonation of an explosive charge earlier than warranted. It may occur with blackpowder and a similar function when fired with severe explosives. See also hangfire. Nelson. Premature explosion may be due to careless, accidental percussion, faulty fuse, or degenerated explosives. Pryor, 3.

premature block. An obstruction or block in a core barrel or bit that prevents the entry of core into the barrel before the bit can be advanced far enough to cut a paper-stitched core is used. The National Coal Board of Great Britain has commissioned the study of this problem and has recommended procedures for avoiding premature blocks.

premature shift. The shift on a conven- tionale mining pressure after having ex- amined the deposit and having made it accessible both in strike and dip. This work is executed almost entirely in the deposit and includes: (1) inclines and transfer stations with manways, (2) sublevel drives between the levels, and (3) various crosscuts, chutes, minor shafts, raise, winzes, and other works. Stokes, v. 1, p. 215.

premix. Aggregate which has been coated with bituminous binder before spreading. See also penetration macadam; tar macadam; Nelson.

premixed method. See prep-mix method.

prebranched dolomite; prebranchedcalcium. Magnes- sium borate, MgBO\cdot\text{OH}\cdot\text{H}_{2}O, monoclinic (?). From the salt deposit at Inger, Kazakhstan. Spencer 21, M.M., 1958.

prepacked coal; minilignite. A coal product which has been mechanically weighed and packaged for household use. Usually, strong paper or plastic bags are used. The National Coal Board of Great Britain has commissioned the study of this product and has recommended procedures for avoiding premature blocks.

prepacked concrete. Concrete made by in- jecting Portland cement and sand grout under pressure into the bottom voids of a compacted mass of clean, graded coarse aggregate of at least 1 inch maximum.

preparation. a. The treatment of ore or coal to reject waste. See also concentration; a; preparation plant; b. The process of preparing run-of-mine coal to meet market specifications by washing and sizing. Jones.

preparation boss. In bituminous coal mining, a foreman who is in charge of the operations of washing and sizing coal at the washing plant.

preparation coal. Physical and mechanical properties of coal are used to determine whether or not a given run-of-mine coal is suitable for a particular use. B.S. 3552, 1962. b. A machine tool having a reciprocating motion at right angles to the machine operator. D.O.T. 1.

preparation-getting machines. N. of Eng. Another name for the machines used for washing and getting phases of the cycle. Trist.

preparation plant. Strictly speaking, a prepara- tion plant may be any facility where coal is prepared for market, but by common usage it has come to mean a facility designed especially for the conversion of facilities where coal is separated from its impurities, washed and sized, and loaded for shipment. See also coal-preparation plant; coal washer, b.

preparation shift. The shift on a conventional mine or mining face during which the coal is machine cut, broken down, and the conveyor, etc., advanced in readiness for the coal-going shift. Sometimes there are two preparation shifts preceding the coal- going shift. Nelson.

preparatory work. Mining operations to fa- cilitate mining proper after having ex- amined the deposit and having made it accessible both in strike and dip. This work is executed almost entirely in the deposit and includes: (1) inclines and transfer stations with manways, (2) sublevel drives between the levels, and (3) various crosscuts, chutes, minor shafts, raise, winzes, and other works. Stokes, v. 1, p. 215.

press. a. A machine in which prepared coal, with or without binder, is subjected to pressure so that it is molded to the desired size and shape of a briquette. B.S. 3552, 1962. b. A machine used in the forming of ware. For example, a machine used in the forming of ware from sheet metal. The two are distinct. ASM Gloss. c. A machine used in the forming of ware from sheet metal. The two are distinct. ASM Gloss. d. Increase the ease of handling or forming the compact, or to remove a lubricant or binder before sin- tering. ASM Gloss.

pressing. In powder metallurgy, the heat- ing of a compact to a temperature lower than the normal temperature for final sintering. Usually, a green compact is heated in an inert gas or vacuum to a presintering temperature. During this treatment, the compact is heated in an inert gas or vacuum to a presintering temperature. The compact is then allowed to cool in air or vacuum.

pressing. In powder metallurgy, the heat- ing of a compact to a temperature lower than the normal temperature for final sintering. Usually, a green compact is heated in an inert gas or vacuum to a presintering temperature. During this treatment, the compact is heated in an inert gas or vacuum to a presintering temperature. The compact is then allowed to cool in air or vacuum.

pressite. An arrangement by which a gear level can be moved, but the resulting speed shift will not take place until the clutch or the throttle is manipulated. Nicholls.

preselective. An arrangement by which a gear level can be moved, but the resulting speed shift will not take place until the clutch or the throttle is manipulated. Nicholls.

press cake. The incorporated gunpowder or millcake, pressed and ready for granula- tion. Press cloth. See filter cloth. Dodd.

pressed amber. An amber substitute produced by consolidating a powdered amber under pressure, usually with linseed oil or other oil as a binder. Also called re- constructed amber. Shipley.

pressed bar. A compact in the form of a...
pressed amber

pressed brick. A high-grade brick used for \textit{capped} surface work. \textit{Crepin}.

pressed brick clay. A better grade clay than that usable for common brick. It must have a uniform color, must not warp or crack, and must not have low absorption when burned at a moderate temperature, and must be free from soluble salts. \textit{CDO 3d}, 1942, p. 192.

pressed cameo. Similar to molded cameo, but pressed. \textit{Shipley}.

pressed copal. Made like pressed amber, from fragments of copal. \textit{Shipley}.

pressed density. In powder metallurgy, the density of an unsintered compact. Sometimes called Green density. \textit{ASM Gloss}.

pressed distillate. The oil left in petroleum refining after the paraffin has been separated from the paraffin distillate by cooling and pressing. \textit{Webster 3d}.

pressed fuel. An artificial fuel prepared from coal dust, waste coal, etc., incorporated with other ingredients, as tar, and compressed in molds into blocks; briquettes. \textit{Fay}.

pressed glass. Glassware formed by pressure between a mold and a plunger. \textit{ASTM C162-66}.

pressed in ceramics. The workman who molds the handle, ears, and decorative reliefs to be applied to a pottery vessel before firing. \textit{Fay}.

pressed fit. An interference or force fit made through the use of a press. \textit{ASM Gloss}.

pressing. a. In metalworking, the product or process of shallow drawing sheet or plate. \textit{ASM Gloss}. b. In powder metallurgy, forming a powder-metal part with compressive force. \textit{ASM Gloss}. c. In pottery making, any hand operation in which masses of clay are formed into the finished article by means of the potter's wheel. \textit{Hess}. d. The operation of forming pressed glass. \textit{ASTM C162-66}. See also dry-pressing, hot-pressing.

pressing area. The clear distance (left to right) between housings, stops, gibs, gibways, or shoulders of strain rods, multiplied by the total distance from front to back. \textit{ASM Gloss}.

pressing crack. In powder metallurgy, a rupture in the pressed compact which develops during the ejection of the compact from the die; \textit{see also capping and lamination}. Sometimes referred to as a slip crack. \textit{ASM Gloss}.

pressing machine. a. A machine which forms ceramic shapes by forcing plastic or semiplastic raw materials into a die or mold. \textit{Bureau of Mines Staff}. b. A machine in which the whole forming operation is carried out by pressing the plastic glass by a plunger forced into a die or mold. The machine may be operated by hand or it may be fully automatic. \textit{C.T.D}.

press-pipe inspector. One who inspects green bodies in the greenware state for dimensional accuracy and consistency of clay. Also called green-pipe inspector. \textit{ASTM C33}.

press-to-log operator. In the fuel briquettes industry, one who tends an automatic machine that compresses sawdust into green-pipe fuel. \textit{C.T.D.} 

pressure. a. The load divided by the area over which it acts. \textit{ASCE P1826}. b. Force per unit area. \textit{AIM Gloss}. c. Force exerted by air per unit area, either gage or absolute. Atmospheric pressure is 14.7 pounds per square inch. \textit{Hartman}, \textit{p. 8}. d. As used in mine ventilation terminology, it is sometimes defined in a rather vague manner as the available energy content of the air, and the pressure difference between two points in a ventilation current as the energy lost due to friction between two points. \textit{Bobert}, \textit{I}, \textit{p. 165}.

pressure arch. The driving of a narrow roadway results in the development of a pressure arch over the excavation. The strata within the arch bend slightly and cease to support overlying beds, and the load is transferred to the solid coal or rock along the sides. The wider the roadway, the longer the span of the arch and its height at the crown. A similar but larger pressure arch is formed across a longwall face, with one leg resting on the solid coal and the other on the solid pack behind the coal face. \textit{See also abutment}.

pressure arch theory. The pressure-arch theory in roof action suggests that when a narrow heading is advanced, the layers of rock in the immediate roof deflect slightly and relieve themselves of the load of the overlying strata by transferring it to the sides of the opening over a small area, \textit{i.e.,} a pressure arch. The width of arch just short of that which the higher strata cannot span and transfer the load to the sides of the opening is called the maximum-pressure arch. The depth mainly influences the minimum width of the arch, \textit{i.e.,} it is important although the type of overburden also plays a part. The following formula has been developed for the minimum width of the maximum-pressure arch: \[ W = \frac{3(D + 20)}{2} \]

pressure balancing. When an area of a mine has been sealed off from the remainder of the workings by barriers or stoppings inserted at suitable points, it is important to prevent the circulation of air within the sealed area. This means that external air pressures must be equalized on all the seals. The object of equalizing the atmospheric pressures on the seals is attained by inserting or removing doors or brattice cloths at appropriate places. It is possible to make all the seals contiguous with a common airway by this means, so that, if they are not widely separated, they will be subjected to the same external atmospheric pressure. \textit{Roberts}, \textit{I}, \textit{p. 99}.

pressure box. An elevated cistern fed by a flume, ditch, or pipe, and supplying water under a head. \textit{Webster 3d}.

pressure bulb. The zone in a loaded soil mass bounded by an arbitrarily selected isolar of stress. \textit{ASCE P1826}.

pressure casting. a. Making castings with pressure applied to the molten metal in a mold as in injection molding, die casting, centrifugal casting, and cold-chamber pressure casting. \textit{ASM Gloss}. b. Making castings with pressure applied to the molten or plastic metal. \textit{ASM Gloss}.

pressure charger. a. A method of driving tunnels and sinking shafts through running sand by holding back the loose material by compressed air. The technique is now more applied to any great extent in mining. \textit{See also caisson sinking}. \textit{Fay}. b. An enclosed space arranged on the access side of a stopping, which seals off an area and is furnished with means of raising or lowering the air pressure within it. \textit{K.S. 3610}; \textit{1963}, sec. 2. c. If the mine area to be sealed off is extensive, and the seals are widely scattered, the fact that they are subjected to different pressures may be unavoidable. In this event, pressure chambers may be required on the outby side of seals. Since the pressures at which the seals cannot be made tight, due to broken or fissured ground. The principle consists of having an outer chamber by erecting a second stopping on the outby side of the seal. The air pressure in the intervening space is then controlled to prevent movement of air across the seal. \textit{Roberts}, \textit{I}, pp. 99-100.

pressure check. An imperfection; a check or crack in a glass or ceramic article resulting from too much pressure in forming. \textit{ASTM C33}.

pressure component. Any change in velocity with depth not accounted for by a change in temperature or in state, as described at the pressure component of the velocity gradient. \textit{H&G}.

pressure cracking. Cracking of the compact caused by releasing the pressure immediately after it has been shaped in a dry-press; the cause is sudden expansion of air that has been trapped and compressed in the pores of the compact. The fault has been largely eliminated by designing presses so that the plunger descends twice to its lowest level, of the coal originally deposited over the barren area. Prolonged pressure may be responsible for the deformation. \textit{Nelson}.

pressure drop. Pressure formed over the workings and at the remote areas, \textit{i.e.,} from the surrounding formations creating pressure on the pillars, walls, or other supports. Pressure blocks of large size may result from natural geological phenomena, such as faults, or may occur as a result of mining operations. \textit{Lewis}, \textit{p. 408}.
pressure cracking

the trapped air having time to escape be-
tween the stones and second pretensions. Didd.
pressure creoseling. The most effective method
of preserving timber by impregna-
tion with creosote under pressure in tanks.

pressure die casting. The usual die casting
process in which the molten metal is
forced into highly finished molds under
heavy pressure by plungered, compressed
air, or combined methods. See also preci-
sion casting. Ham.

pressure dome. a. Synonym for air dome.
Long. b. The bonnet on a steam boiler.

pressure drilling. A process of rotary drill-
in which the drilling fluid is kept under
pressure in an enclosed system.
Brantly, l.

pressure drop. The decrease in pressure
at which a liquid or gas is made to move
between the intake and discharge of a
pipeline or drill stem. Long.

pressure figure. a. A figure produced by in-
sec ting lines of parting, due to gliding
which the moving element responds to
pressure exerted by air. Commonly
employed rather than pressure, particu-
larly for differences which cause airflow.
Measured in inches (water). Also called

pressure hydrate. The most common variety
of ASTm designated Type S hydrated
lime. Synonymous with autoclaved lime.
Boynton.

pressure hydrophone. A hydrophone in which
the electric output substantially corre-
sponds to a component of the gradi-
ent (vertical derivative) of the sound pres-
sure. Hy.

pressure gradient transducer. Transducer,
such as a mica or hydrophone, in
which the moving element responds to
pressure difference rather than to pressure.
HOG.

pressure grouting. a. The act or process of
injecting, at high pressures, a thin cement
slurry or grout through a pipeline or bore-
hole to seal the pores or voids in the rock
or to cement fragmented rocks together.
Long, b. Forcing a slurry of cement and
sand into subgrade or embankment either
by use of compressed air or by hydraulic
pressure. Urquhart, sec. 2, p. 31.

pressure head. a. Hydrostatic head; column
of water required to balance the fluid
pressure being measured. Pryor, 3. b. The
head on any point in a conduit represen-
ted by the height of the hydraulic
gradeline above that point. Seely, 1.
c. Height of column of water equivalent
to pressure exerted by air. Commonly
employed rather than pressure, particu-
larly for differences which cause airflow.
Measured in inches (water). Also called
head. Ham.

pressure hydrate. The most common variety
of ASTm designated Type S hydrated
lime. Synonymous with autoclaved lime.
Boynton.

pressure head. a. The height of a liquid
column of water required to balance the
pressure being measured. Held.

pressure loss. the decrease in pressure
at which a liquid or gas is made to move
between the intake and discharge of a
pipeline or drill stem. Long.

pressure meter. a. a pressure-recording
device. Nelson.
b. a device for indicating in
the pipeline or drill stem the
pressure at which a liquid or gas is
made to move between the intake and
discharge of a pipeline or drill stem.
Long.

pressure method. In flotation, a method in
which the electric. output is
substantially increased by an increase in
the voltage. See also pressure
method.

pressure gradient. a. The difference in
vertical pressure; stone pressure. Long.
b. A dampener. Long.
c. The difference in vertical pressure
between the top of a charge
and the bottom of another,
under equal conditions.

pressure modification. Changes in water
pressure caused by wave action. Hy.

pressure monitoring. Forging done by a steady
pressure in a hydraulic press. Stan-
dard, 1964.

pressure pan. a. A machine for removing
solids from tailings, and the effluent can
be reused in the washery or plant. The
tailings are pumped into the filter under
pressure, filtration takes place and solids
are deposited in the chambers. Gradually
the resistance increases until a pressure of
100 pounds per square inch is necessary
to form more tailings into the press. At
this stage, the chambers are almost full of
solids. The feed is cut off and the press
opened to allow the cakes to fall onto the
conveyor beneath the chambers. The out-
put of the pressure filter is low. Nelson.
b. A filter in which pressure is applied to
increase the rate of filtration. B.S. 3532,
1962. c. A filter in which the liquid to be
filtered is forced through filtering mate-
rnal by a pressure greater than its own
weight in the filter. Fay. d. See filter.
Pryor, 3.

pressure per stone. a. The number of stones set
in the bit by the number of stones
set in the bit. The
pressure per stone; stone pressure. Long.

pressure per stone. Synonym for pressure
per diamond. Long.

pressure plate. a. A plate driven by
the flywheel or rotating housing, which
will close automatically. Also called pop
valve; pressure-release valve.

pressure plate. b. A container from which
creosote, zinc chloride, or other pre-
servative is forced through the drill stem
and into the open hole below the packer.
Ham.

pressure pretesting. A process in which a
hydrophone, used to control or re-
strict the flow of fluid so that the pressure of the fluid plus
the force exerted by a spring or lever is suffi-
cient to close the valve against the pres-

ure survey. An indirect method of test-
ing porosity and permeability of forma-
tions at elevations of borehole or drill holes.
With the method a "packer" is attached
to the end of the drill string and the
string is run into the hole. The packer
is then expanded to block off the hole and water
is pumped through the drill string at con-
tant pressure, the quantity being meas-
ured. The drill string is then removed and
into the open hole below the packer.
If the rock is tight and unfractured
no water can be pumped. The quantity
which can be pumped, at any given

pressure pretesting. a. The act or process of
injecting, at high pressures, a thin cement
slurry or grout through a pipeline or bore-
hole to seal the pores or voids in the rock
or to cement fragmented rocks together.
Long, b. Forcing a slurry of cement and
sand into subgrade or embankment either
by use of compressed air or by hydraulic
pressure. Urquhart, sec. 2, p. 31.

pressure head. a. Hydrostatic head; column
of water required to balance the fluid
pressure being measured. Pryor, 3. b. The
head on any point in a conduit represen-
ted by the height of the hydraulic
gradeline above that point. Seely, 1.
c. Height of column of water equivalent
to pressure exerted by air. Commonly
employed rather than pressure, particu-
larly for differences which cause airflow.
Measured in inches (water). Also called
head. Ham.

pressure hydrate. The most common variety
of ASTm designated Type S hydrated
lime. Synonymous with autoclaved lime.
Boynton.

pressure hydrophone. A hydrophone in which
the electric output substantially corre-
sponds to a component of the gradi-
ent (vertical derivative) of the sound pres-
sure. Hy.

pressure gradient transducer. Transducer,
such as a mica or hydrophone, in
which the moving element responds to
pressure difference rather than to pressure.
HOG.

pressure grouting. a. The act or process of
injecting, at high pressures, a thin cement
slurry or grout through a pipeline or bore-
hole to seal the pores or voids in the rock
or to cement fragmented rocks together.
Long, b. Forcing a slurry of cement and
sand into subgrade or embankment either
by use of compressed air or by hydraulic
pressure. Urquhart, sec. 2, p. 31.

pressure head. a. Hydrostatic head; column
of water required to balance the fluid
pressure being measured. Pryor, 3. b. The
head on any point in a conduit represen-
ted by the height of the hydraulic
gradeline above that point. Seely, 1.
c. Height of column of water equivalent
to pressure exerted by air. Commonly
employed rather than pressure, particu-
larly for differences which cause airflow.
Measured in inches (water). Also called
head. Ham.

pressure hydrate. The most common variety
of ASTm designated Type S hydrated
lime. Synonymous with autoclaved lime.
Boynton.

pressure hydrophone. A hydrophone in which
the electric output substantially corre-
sponds to a component of the gradi-
ent (vertical derivative) of the sound pres-
sure. Hy.

pressure gradient transducer. Transducer,
such as a mica or hydrophone, in
which the moving element responds to
pressure difference rather than to pressure.
HOG.

pressure grouting. a. The act or process of
injecting, at high pressures, a thin cement
slurry or grout through a pipeline or bore-
hole to seal the pores or voids in the rock
or to cement fragmented rocks together.
Long, b. Forcing a slurry of cement and
sand into subgrade or embankment either
by use of compressed air or by hydraulic
pressure. Urquhart, sec. 2, p. 31.

pressure head. a. Hydrostatic head; column
of water required to balance the fluid
pressure being measured. Pryor, 3. b. The
head on any point in a conduit represen-
ted by the height of the hydraulic
gradeline above that point. Seely, 1.
c. Height of column of water equivalent
to pressure exerted by air. Commonly
employed rather than pressure, particu-
larly for differences which cause airflow.
Measured in inches (water). Also called
head. Ham.

pressure hydrate. The most common variety
of ASTm designated Type S hydrated
lime. Synonymous with autoclaved lime.
Boynton.

pressure hydrophone. A hydrophone in which
the electric output substantially corre-
sponds to a component of the gradi-
ent (vertical derivative) of the sound pres-
sure. Hy.
pressure testing

pressure, is indicative of the degree of fracturing and permeability of the rock below the level of the packer. The quantity is also a function of the ground-water surface elevation. Woodruff, v. 1.

pressure tight. Leakproof under pressure. ASM Gloss.

pressure-tube anemometer. See pitot-static tube.

pressure-tube reactor. A nuclear reactor in which the reactor core, which is contained within a strong-walled container, is pressurized. A strong-walled container housing the core of most types of power reactors is pressurized. A. Any structure, area, or zone of pressurized water within is held higher than the near normal atmospheric pressure. Nelke, 1954.

pressurized. 2. Any structure or area in which the pressure within is held higher than the near normal atmospheric pressure. Nelke, 1954.

pressure vessel. A strong-walled container housing the core of most types of power reactors is pressurized. A. Any structure, area, or zone of pressurized water within is held higher than the near normal atmospheric pressure. Nelke, 1954.

pressure wave. a. A pressure produced by expanding gases moving at high velocity, the side component of which, equivalent to static pressure, may be recorded by a manometer at the side of the entry or mine passage. Rice, George S. b. Synonym for shock wave; compressional wave. A.G.I.; A.G.I. Supp.

pressure water loader. A cartridge loader in which the gun and shell are loaded in a workshop with the tensioned wires embedded in them and firmly anchored. See also pressurized. Fay.

pressurized. Any structure or area in which the pressure within is held higher than the near normal atmospheric pressure. Nelke, 1954.

pressurized. a. Any structure, area, or zone fitted with an arrangement that maintains nearly normal atmospheric pressure. Nelson, b. Any structure or area in which the pressure within is held higher than the pressure without. Bureau of Mines Staff.

pressurized stoping. Stoppings erected in the intake and return roadways of a district to isolate an open fire or spontaneous heating area. ASPE P1826.

pressure welding. Welding where pressure is used to hold the work to be welded. ASM Gloss.

pressure wires. Wires leading from various parts of the core and extensions to the parts have been designated as decompression, compression, virgin compression, expansion, rebound, and other descriptive names by various authorities. ASPE P1826.

pressure testing. A test to determine the strength of a material under pressure. A.G.I. Supp.

prickled. a. Any structure, area, or zone fitted with an arrangement that maintains nearly normal atmospheric pressure. Nelson, b. Any structure or area in which the pressure within is held higher than the pressure without. Bureau of Mines Staff.

prickled. Any structure, area, or zone fitted with an arrangement that maintains nearly normal atmospheric pressure. Nelson.

prickled. In ceramics, ornamented with dotted depressions made with a single point or with a comb. Standard, 1964.

prickled. a. A thin brass rod, once used to make a hole through the tamping of a charged shot hole, through which the blasting fuse could then be inserted. Pryor, s. b. A nonferrous tool for making a hole in the primer cartridge to receive the detonator. B.S. 3561, June, 1964. see also priming. S. Staff.

picketing. Marking or graving on a control of glass on the basis of an observation of intervals and the condition of the glass, and equipment inspections made at regular intervals. Pryor, 3.

piercing dirt. Same as holing coal. Tomkeeff, 1954.

prime of the country. A term sometimes given to the inhabitants of one discovered near the surface. Nelson.

primaries. A mineral, (K, Ba)2[Fe(Fe-2)O3].

prilon. A hydrous borate of calcium, 5CaO. Fe2O3.H2O.

prismatic. a. Globular, porous structure is safely transferred through the piles and underpinning, the weight of the structure will withstand its working load more effectively or with less deflection. Ham.

prismatic recrystallization. Recrystallization in a tectonite is ceased before deformation was completed. A.G.I. Supp.

pretectonic recrystallization. The predominant crystal recorded and marked on a chart. A system which enables break-downs to be anticipated and arrangements made to perform the necessary overhauls and replacements in good time. Nelson.

prevailing currents. The predominant or usual movement of water. Ham.

preventable accident. An accident due to carelessness. Such carelessness may be due to the nature of the worker, bad lighting, or fatigue. Spalding, p. 362.

preventive maintenance. A system of plant and equipment inspections made at regular intervals and the condition of the items recorded and marked on a chart. A system which enables break-downs to be anticipated and arrangements made to perform the necessary overhauls and replacements in good time. Nelson.

pressure vessel. A strong-walled container housing the core of most types of power reactors is pressurized. A. Any structure, area, or zone of pressurized water within is held higher than the near normal atmospheric pressure. Nelke, 1954.

pressure unloading. Use of air pressure to remove contents of a ball mill, tank, or reeking and in which the pressure on both sides of each stopping are made equal by the use of auxiliary fans. By making the air jet at the return fresh air does not reach the fire through one stopping and foul gases are not expelled at the other. A small regulator is used in the auxiliary fans to maintain equal pressures at all times. Nelson.

pressurized water reactor. A reactor in which the water is transformed from the core to a heat exchanger by water kept under high pressure to achieve high temperature and to prevent boiling in the core, and a secondary circuit is generated in a secondary circuit. LBL.

Preston density comparator. An instrument designed for use in the routine quality control of glass on the basis of an observation of intervals and the condition of the glass, and equipment inspections made at regular intervals. Pryor, 3.
primary

to include the present Paleozoic, late by Late Paleozoic; finally abandoned and now obsolete. Fay. D. Of ore, not enriched or oxidized by weathering or pyritization. A substance which is obtained directly, by extraction and purification, from natural raw material; for example, copper and antimony are coal-tar primary compounds. C.T.D.

primary blasting. a. Applied to the application of a explosion to or during the initial firing of solid rock, ore, or coal; blasting in situ. See also secondary blasting. Nelson.

primary boiling. a. The process of smelting alumina in an electric furnace that reduces the oxide to aluminum, which is cast into ingots for further processing. Nelson.

primary anomaly. See geochemical anomaly.

primary basalt. A presumed original magma, from which all other rock types are obtained. A.C.T. Primary basalt.

primary blast furnace. A machine which takes over the work of size reduction from blasting operations, and may be a gyratory or jaw breaker. Its capacity must be greater than the overall crushing plant capacity. In mines, primary ore crushing to about 6 or 8 inches may be performed underground. See also reduction ratio. Nelson.

primary breaker. A machine which takes its own electrical energy from the chemical action of its constituents. Examples of primary cells are the voltaic cell, the Daniell cell, LeClanche cell, and the dry cell. Morris and Cooper, p. 238. A group of flotation cells in which the raw feed is given a preliminary treatment, either or both of the products being subsequently retreated. B.S. 3552, 1962.

primary chemical. A chemical, which is obtained by extraction and purification from a natural raw material; for example, copper from coal. Fay. D. Of ore, not enriched or oxidized by weathering or pyritization. A substance which is obtained directly, by extraction and purification, from natural raw material; for example, copper and antimony are coal-tar primary compounds. C.T.D.

primary consolidation. The reduction in volume of a soil mass caused by the application of a sustained load to the mass and due principally to a squeezing out of water from the void spaces of the mass and deposited by a transfer of the load from the soil water to the soil solids. Also called primary compression; primary time effect. A.S.C.E P1926.

primary creep. See creep. ASM Gloss.

primary crusher. a. In comminution of ore, a primary crushing machine capable of accepting run-of-mine coarse ore and reducing it in size to somewhere between 6 and 34 inches. Heavy-duty connotes both the ability to handle large tonnages daily and to withstand or very rough treatment. Pryor, 3. b. The primary crusher in a series for processing shale or other rocks. See also secondary crusher. A.C.S.C, 1969.

primary current. a. In ore dressing, the first stage in which crushers take run-of-mine ore and reduce it to a size small enough to be taken by the next crusher in the series. Ordinarily, the Blake jaw crusher or a gyratory crusher is used. Newton, p. 59.

primary crystal. The first type of crystal that separates from a melt on cooling. ASM Gloss.

primary current distribution. The current distribution in an electrolytic cell that is free of polarized or charged areas. Stokes and Varnes, 1955.

primary detecting element. In flotation, that portion of the feedback elements which first either utilizes or transforms energy from the dispersed medium to produce a signal which is a function of the value of the directly controlled variable. Fuerstenberg, 1955.

primary dip. The dip or attitude assumed by a bedded deposit at the time of its formation. See original dip. Stokes and Varnes, 1935.

primary dissolution. See geochemical dispersion (anomalies) recognized as being of importance in prospecting are: (1) the geochemical province within which a chemical composition can be correlated with certain types of ore; (2) dispersion patterns formed by the fluids associated with metamorphic processes; and (3) dispersion patterns produced by the migrating gas phase at low temperature. Temperature dispersion patterns may include the end products of the processes of metamorphism, metasomatism and magmatic differentiation (final compositions in minerals in a molten magma). Lewis, pp. 299-300.

primary drilling. The process of drilling holes in a rock mass for the purposes of mining. See primary ventilation. Hawkes, 2, p. 10.

primary excavation. Digging in undisturbed soil, as distinguished from handling stoping. Nichols.

primary explosive; initiating explosive. Explosive or explosive mixture or detonator; used in primers and detonators to initiate explosion. Bennett, 24, 1962.

primary flow structures. Structures of either linear or platy nature developed in igneous rocks prior to or during consolidation. Stokes and Varnes, 1955.

primary foliation. That variety of platy flow structure that forms foliation. An interpretation placed for and is due to the parallelism of platy minerals. Stokes and Varnes, 1955.

primary gneiss. Applied to a rock that exhibits foliation, lineation, or other planar or linear structures, such as are generally characteristic of metamorphic rocks, but which because of the absence of observable granulation or reaction is considered to be gneiss. The qualifying adjectives trachitoid or gneissoid for coarse-grained rocks and trachytic or gneissose for fine-grained rocks are in use presently. For, the term gneiss should properly be employed only for metamorphic rocks. A.C.T.

primary gneissose. A bed, or locally, a rock which has been formed from coarse-grained or medium-grained igneous or metamorphic rocks, and which shows a well-developed planar structure. Stokes and Varnes, 1955.

primary horizon. The zone within which the rock layers show a distinct change from one type to another, such as the contact of the granite in which it is found, the magnetic flux necessary for the initiation of the machine or apparatus. C.T.D.

primary mineral deposits. A mineral deposit as defined at the same time the rock in which it is found, or the rock which in it is found, in contradistinction to a secondary mineral formed later than the rock. For example, biotite in a granite is a primary mineral. If the biotite is altered to chlorite, the chlorite is termed a secondary mineral, since its formation was later than that of the granite in which it occurs. Nelson.

primary mineral deposits. Mineral deposits formed from magmas; subdivided into syngenetic and epigenetic deposits. They are subjected to later weathering, erosion, and detritus and to possibly long-time changes that may transform. primary mineral deposits. Mineral deposits formed from magmas; subdivided into syngenetic and epigenetic deposits. They are subdivided into three groups: (1) syngenetic rocks, (2) sedimentary rocks, and (3) gneissic materials. Nelson.
primary mineral deposits
and residual or cètral ore deposits. Lewis, p. 273.

primary openings. Openings or voids exist-
ing when the rock was formed. In sedi-
mentary rock, primary openings are usu-
ally the result of the arrangement and
nature of the original sediment. A.G.I.

primary porosity is that which has remained prac-
tically unchanged from the time of ori-

primary ore minerals. Ore minerals are clas-
sed as primary or hypogene, and sec-
ondary or supergene. The former were
deposited during the original period or
periods of metasomatization during which
alteration products of the former as a
result of precipitation from percolating
water, are suspended, if any turbulence
exists at all; that primary slime is formed.
Taggari, p. 973.

primary solid solution. A constituent of
alloys that is formed by the substitution of an
atom of component B for atoms of a
component A in the crystal structure of A,
resulting in a new phase having the proper-
ties of both A and B. Strock, 10.

primary structure. a. The structure present
in a stratified rock, consisting of a primary
rock, a matrix which has been plastically
deformed, and a primary sedimentation
structure. a. The structure which ex-
ists at the time of solidification of a
magma. Taggari, p. 973.

primary-type coal. The type of coal which
contains both a coal matrix and a detrital
sandstone or siltstone. Bennett, 2d, 1962.

primary water supply. The principal or orig-
nal source from which drinking water is
obtained, as opposed to recirculated water.
Long.

primary wave. Same as longitudinal wave.
A.G.I.

primary zinc. Zinc produced by direct smelt-
ing or fusing. Bennett, 2d, 1962.

primary settlings. Subsidence in a surface
or that portion of a charge
which carries a detonator or is coupled
to Cordex fuse and which detonates
the charge. The term is used to describe
the part of the charge that is de-

primary source. If an operation produces
or recycles some or all of the waste
material, the waste is considered a
direct initiation. Nelson.

primary setting. The surface subsidence that
occurs before the surface is entirely
covered by water. Strock, 10.

primary settling. The surface subsidence that
occurs after a few months or years and
that usually constitutes 60 to 90 percent
of the total subsidence. It varies accord-
ing to the depth and thickness of the
settling zone. Briggs, 1.

primary situation. A mineral found in the
rock in which it was formed. Hess.

primary slime. Most ore reefs as mined
contain both primary and secondary minerals.
Kemmerer.

primary source. A primary source can be
defined as any operation that produces
at least one product that is completely
different from any products produced by
other operations. A.G.I.

primary-type coal. The type of coal which
contains a matrix of detrital sandstone or silt-
stone, and a primary sedimentation struc-

primary water supply. The principal or orig-
nal source from which drinking water
is obtained, as opposed to recirculated
water. Long.

primary wave. Same as longitudinal wave.
A.G.I.

primary zinc. Zinc produced by direct smelt-
ing or fusing. Bennett, 2d, 1962.

primary settling. The surface subsidence that
occurs after a few months or years and
that usually constitutes 60 to 90 percent
of the total subsidence. It varies accord-
ing to the depth and thickness of the
settling zone. Briggs, 1.

primary situation. A mineral found in the
rock in which it was formed. Hess.

primary slime. Most ore reefs as mined
contain both primary and secondary minerals.
Kemmerer.
priming valve. a. A safety valve on the working cylinder of a steam engine to discharge the priming. Standard, 1964. b. A valve connected with the discharge pipe of a force pump through which the pump may be primed.

primitive circle. In crystallography, the great circle in the plane of a stereographic projection. Fay.

primitive form. A crystal form from which other forms may be derived. Fay.

primitive period. With a periodic quantity, the smallest increment of the independent variable for which the function repeats itself. Hy.

primitive rocks. Rocks supposed to be first formed and containing no organic remains, being irregularly crystallized and aggregated without a definite plan such as granite, gneiss, and the like. See also primary. Fay.

Prince Rupert's drops. Drops of glass that have been highly strained by quenching; when the tail of one of these drops is broken the glass explodes to dust, but the drop itself is immensely strong. These drops were first made by Prince Rupert, nephew of King Charles I. Dodd.

principal axes. The principal axes cf an ellipsoid. The extensions of lines drawn in these directions, in the unstrained state, are stationary for small variations of direction. One of them is the greatest extent, the second is the smallest. A.G.I.

principal axes of strain. In elastic theory, the principal axes of the reciprocal strain ellipsoid. The extensions of lines drawn in these directions, in the unstrained state, are stationary for small variations of direction. One of them is the greatest extension, the second is the smallest. A.G.I.

principal axes of stress. The coordinate axes along which no shearing stresses exist. A.G.I.

principal axis. a. In the tetragonal and hexagonal systems, the vertical crystallographic axis; hence what is the same thing in uniaxial crystals, the optic axis. Fay. In the orthohombic and triclinic crystals, the axis of the principal zone; the axis with the shortest period, often the optic axis of the principal zone. In monoclinic crystals, the axis c, usually the axis of the principal zone excluding the symmetry axis; the symmetry axis b. A.G.I. b. In a transducer used for sound emission or reception, the reference direction for angular coordinates used in describing the directional characteristics of the transducer. In a two-axis transducer, the axis of symmetry or the direction of maximum response, but if these do not coincide, the reference direction must be described explicitly. Hy.

principal earthquake. The strongest of a consecutive number of earthquakes. Schlieffen.

principal meridian. a. A meridian line accurately located, and used as a basis from which coordinate lines of monuments, called guide meridians, for the use of surveyors. Standard, 1964. b. In public land surveying, the line established through the initial point of a system of coordinated township boundaries. See also base line.

principal moment of inertia. The moment of inertia of an area about either principal axis. Ro.

principal plane. Each of three mutually perpendicular planes through a point in a soil mass on which the shearing stress is zero. See also principal plane; minor principal plane; major principal plane; minor principal plane. ASCE P1826.

principal point. That point on an air survey photograph which is the intersection between the optical axis of the camera and the photographic plane. Ro.

principal section. In crystallography, the plane passing through the optical axis of a crystal. Standard, 1964.

principal stresses. The normal stresses on three mutually perpendicular planes on which there are no shear stresses. ASM Gloss.

principal tectonic. Synonym for synogenetic. A.G.I.

principle of Archimedes. See Archimedes' principle. Ham.

principle of moments. a. The algebraic sum of any number of forces is equal to that point, equals the moment of their resultant about that point. Grissip. b. A body will be in equilibrium when the sum of the clockwise moments equals the sum of the anticlockwise moments, or the algebraic sum of all the moments is zero. Morris and Cooper, p. 153.

principle of superposition. In order to determine the stress in a member due to a system of applied forces, the system can be split up into several component forces and their moments and reactions added in order to calculate the total stress. Ham.

principle of uniformity. Synonym for uniformitarianism. A.G.I.

prinsep. Eng. The distance between two rolling points. Plantsing in Derbyshire. An odd number to flow onto the top deck of the jig, allowing the upper stratum of the material to flow onto the top deck of the jig while the lower stratum enters the jig recess chamber. Mitchell, p. 139.

プリンスウォーカー. A dense-media process in which large-size coal is separated from the refuse in a flowing bed of small coal in a reciprocating launder. Refuse sinks to the bottom. The small coal is screened from the coarse refuse and returned to the head of the classifier by a drag conveyor. The floating large coal passes over skimmers in the trough to the discharge chute. Mitchell, p. 139.

prinse washer. A combination trough washer and jig in which the feed enters the unit through the e of the photographs. Rastil iation takes place. The stratified material overflowing the stationary trough is divided at the first opening in the shaking jig, allowing the upper stratum of the material to flow onto the top deck of the jig while the lower stratum enters the jig recess chamber. Mitchell, p. 431.

print. a. In founding, a projection on a a ragonite arranged with their principal prismatic layer. The nuclear and during firing; an item of kiln furni-

paper, using glass cutter. Positions design around ware, cutting off excess with scis-
sors and smoothing with . Reduces waste by removing defective portions of design with chemical solution and fitting in patch cut from design. D.O.T. Supp.

prinette. Pottery, the decoration of which is effected by means of transfer printing. Standard, 1964.

print. a. In crystallography, an open form of three or more similar faces parallel to a single axis; the shape of its cross section is usually rectangular or solid, as trapezoidal prism, rhombic prism, or dichroehal prism. A.G.I. b. In crystallography, any prism that is parallel to one of the c. Obsolete. A.G.I. c. The light liquid mobile volume of a single. The volume of a length of embankment or excavation. Seely, 1. d. A solid with ends that are similar, equal and parallel polygons, and with sides that are parallelograms. Jones, p. 116.

print. a. In optics, resembling the color formed by the reflection of light through a prism. Shiplay. b. In crystallography, having elongation in one direction, commonly parallel to one of the crystallographie axes; also parallel to the faces of a crystal, as prismatic cleavage. Shiplay.

prismatic compass. Surveyor's compass, usually portable and handheld in which the graduated radius is inscribed on the face of the needle that is attached is read through a prism while sighting. Pryor, 3.

prismatic glass. Glass that has been pressed or rolled to produce a pattern of prisms; these refract light passing through the glass. The term is sometimes, erroneously, applied to pressed tubing. See also lenst-fronted tubing. Dodd.

prismatic layer. A layer, in pearl or mother-of-pearl, composed of minute crystals of aragonite arranged with their principal axes perpendicular to the surface of the layer. Shiplay.

probable ore. A class of ore whose occurrence is not absolutely certain but is reasonably assured but not absolutely certain. Pryor, 3.

probable reserves. Areas of coal or mineral lying beyond the developed reserves but still close enough to be considered proved within ordinary probability. Where the acreage of probable reserves is known from maps or surveys, the tonnage of coal may be calculated as: (1) Theoretical tonnage = 101.37 x specific gravity of coal x tons per acre; and (2) workable tonnage — deduct 10 to 20 percent or more according to geological report and the area's known consistency. See also economic coal resource base.

probable. A small tube containing the sensitive element of electronic equipment, which can be lowered into a well to make measurements and data. Long, b. To conduct a search for mineral-bearing ground by drilling. Lang, c. To lower drill rods, etc., to locate obstructions and/or to determine the attitude of a piece of junk, a borehole. Long, d. Electrocute used in mining a potential difference. Schiesser, 4.

process flow sheet. A basic flowsheet indicating the main operational steps within the plant, the movement of the various materials between the steps, and the final products obtained, and often also the operating variables with which the plant must be capable of dealing at various points. B.S. 3352, 1962.

probing. a. A small needle used to detect radioactivity in a drill hole. Ballard. b. To thrust a pointed steel rod down into sand or soft clay to contact the sea or ore body. The point of the rod is examined for traces of coal or mineral. See also auger.

probing a hole. Using a probe attached to a Geiger counter to detect radioactivity in a drill hole. Ballard.

process metallurgy; production metallurgy. a. A series of chemical or metallurgical operations conducted to an end. Webster 3d. b. Term is used in mineral processing, large-scale beneficiation of ores. Processing, or dressing, operations may include crushing, sorting, sizing, grinding, classification, desliming, leaching, amalgamation, gravity treatment flotation, magnetic and electrostatic treatment, and pyrometallurgy. See also metallurgical process; mining process; wet process. ACS-G, 1963.

process annealing. In the sheet and wire industries, heating a ferrous alloy to a temperature close to, but below, the lower limit of the transformation range and then cooling, in order to soften the alloy for further cold working. ASM Gloss.

process tolerance. The dimensional variations of a part characteristic of a specific process, once the setup is made. ASM Gloss.

process. a. The series of chemical or metallurgical operations conducted to an end. Webster 3d. b. Term is used in mineral processing, large-scale beneficiation of ores. Processing, or dressing, operations may include crushing, sorting, sizing, grinding, classification, desliming, leaching, amalgamation, gravity treatment flotation, magnetic and electrostatic treatment, and pyrometallurgy. See also metallurgical process; mining process; wet process. ACS-G, 1963.

processes. The various artificial methods used to clean, size, and steel, and usually returned to steel manufacture of finished articles from iron and steel, and usually returned to steel manufacture of finished articles from iron and steel. Nelson.

process metallurgy. A nuclear reactor that gives comparative results. By weighing differences after long periods, the movement of the various materials between the steps, and the final products obtained, and often also the operating variables with which the plant must be capable of dealing at various points. B.S. 3352, 1962.

processing. In flotation, process lag is the delay or retardation in the response of the controlled variable at a point of measurement to a change in the manipulated variable. D.O.T. 1.

processing. A. The various artificial methods used to clean, size, and steel, and usually returned to steel manufacture of finished articles from iron and steel. Nelson.

process inspector. One who repairs flaws, such as blisters, bruises, and other surface marks, on enamelled metal parts. Removes enamel from broken surfaces, using a metal probe, and fills cavities with thick enamel underlaid with wax and rubbed in with fingers. Also called patcher; touchup man. D.O.T. 1.

process lag. In flotation, process lag is the delay or retardation in the response of the controlled variable at a point of measurement to a change in the manipulated variable. D.O.T. 1.

process. A. The various artificial methods used to clean, size, and steel, and usually returned to steel manufacture of finished articles from iron and steel. Nelson.

process annealing. In the sheet and wire industries, heating a ferrous alloy to a temperature close to, but below, the lower limit of the transformation range and then cooling, in order to soften the alloy for further cold working. ASM Gloss.
made in a variety of types suitable for all kinds of ceramic product. Dodd.

**Proctor penetration curve.** See penetration resistance. "ASCE P1826.

**Proctor penetration needle.** A quick and convenient method for testing the resistance of the soil to penetration at a standard rate of 1/4 inch per second. See also California-bearing ratio, Fay.

**Prodelta clays.** The fine muds or silts which make up the bottommost portion of cross-bedding. These are deposited in the delta offshore from a river delta. A.G.I.

**Productivity.** a. A term closely allied to, and may be expressed by, the O.M.S. of a face or collarily or metal mine. Productivity will vary with the degree of mechanization and other practices in the mining operation, it is a function of the "horsepower" of a suitable nature, at the disposal of each miner. See also intensive mining machine, Nelson.

**Productive.** Yielding payable ore. Fay.

**Producer gang.** A team of men employed in the production of coal or coke in air. It consists of a machine, a gunnery, and a coaling crew. The gunnery consists of a pivoted arm mounted on a horizontal shaft. The coaling crew consists of a team of men employed in the production of combustible gas to be contained with small proportions of hydrogen (obtained by the "water gas" reaction), metaling the coal, and carbon dioxide (resulting from conditions unfavorable for the complete combustion of coal to carbon dioxide). Franti, 1965, v. 2, p. 376.

**Producer gas.** Obtained by the partial combustion of coal or coke in air. It consists mainly of carbon monoxide and nitrogen, with small proportions of hydrogen (obtained by the "water gas" reaction), metaling the coal, and carbon dioxide (resulting from conditions unfavorable for the complete combustion of coal to carbon dioxide). Franti, 1965, v. 2, p. 376.

**Producer paper.** Paper ruled horizontally and vertically with equidistant lines to scale, for convenience in drawing engineering profiles in either direction. Standard, 1964.

**Profile shooting.** A refraction type of seismic shooting in which the shots and detectors are laid out on long lines. Successive shots are taken at uniform or almost uniform intervals along each line, and successive detector spreads are shifted about the same distance as the corresponding shot point so as to keep the range of shot-detector distances approximately the same for each shot. Generally, shots are received from opposite directions on each detector spread. The distance range is chosen so that when desired the second, arrivals will be refracted from a particular formation such as the basement, first, second, whenever possible. The proper distance is usually determined by time-distance plots based on the first arrival. Woodruff, v. 3, p. 447.

**Profile.** a. A vertical section of a soil showing the nature and sequence of its variations. Webster 3d. b. A drawing used in civil engineering to show a vertical section through a bit, borehole, etc. It is the sum of the products obtained by multiplying each element of the area dA by its coordinates with respect to those axes, x and y; it is therefore the quantity \( \int_{x_1}^{x_2} \int_{y_1}^{y_2} dx dy \).

**Profilograph.** An appliance for plotting the "water" reaction, which includes the design being cut from the material before fusing into the silk or a waxed paper backing. In silk screen printing, the design being cut from the material before fusing into the silk mesh is mounted on a waxed paper backing. In silk screen printing, the design being cut from the material before fusing into the silk mesh is mounted on a waxed paper backing.

**Profile shooting.** A refraction type of seismic shooting in which the shots and detectors are laid out on long lines. Successive shots are taken at uniform or almost uniform intervals along each line, and successive detector spreads are shifted about the same distance as the corresponding shot point so as to keep the range of shot-detector distances approximately the same for each shot. Generally, shots are received from opposite directions on each detector spread. The distance range is chosen so that when desired the second, arrivals will be refracted from a particular formation such as the basement, first, second, whenever possible. The proper distance is usually determined by time-distance plots based on the first arrival. Woodruff, v. 3, p. 447.
profigraph

to point the perimeter profile is plotted on a reduced scale. *Nelson.*

proficient. In an accurate and instrument for measuring the smoothness or roughness of a surface. As a diamond-edged stylus is moved across a surface, the arm, by moving a coil in an electric field, causes the generation of a current in proportion to the roughness of the surface, which is registered by an indicating needle. *Crispin.* See M.R.E. profilometer. *Roberts,* J., p. 61.

profitted. When one speaks of the interest on a mining investment, the rate mentioned ordinarily consists of the normal rate plus a substantial additional rate that represents the profit that should accrue in proportion to the hazardous nature of the mining project. In this sense, the rate of interest in most forms of mining should be high; to be satisfied with less than 10 percent annually would show a lack of acumen. *Hoover,* p. 157.

profit-and-loss account. Form used in presenting accounts which shows the gross balance over a working or trading period, plus the net balance and the expenditure. *Pryor,* 3.

profit-and-loss statement. A statement showing in detail the sum to be added to, or subtracted from, the net worth of a business as a result of operations during the fiscal period. *Hoover,* p. 448.

profit in sight. Profit from a particular proceeds, which are emitted at appreciable time intervals after fission has occurred. Prompt neutron exposure are over 99 percent of fission neutrons. *L.P.*

prone. The state of being inclined or disposed to by means of an illuminated scale. *Schieferdecker.*

promotion. A term that has been applied to an amorphous intermediate product in the process of kaolinization. *See also kaolinization.*

prolapsed bedding. A series of flat folds with near-horizontal axial planes contained entirely within the fold. *Petitjohn.*

prolonged. Secondary conditioner used in zinc industry. *Bureau of Mines Staff.*

promethium. A rare earth element discovered in the fission products of uranium. It is prepared in a cyclotron by bombarding promethium-142 with protons from a nuclear reactor and from nuclear reactor separations. Fourteen isotopes, promethium 141 to promethium 145, have been noted the longest-lived isotope, promethium 145, has a half-life of 18 years; and the most useful isotope, promethium 147, has a half life of 2.5 years. *Symbol,* Pm; *valence,* 3; *atomic number,* 61; *melting point,* 10,35° *C;* and boiling point, 200° C. *CCD 6d,* 1961; *Handbook of Chemistry and Physics,* 45th ed., 1964, pp. B-31, 4074. 

promising. Looking as if likely to turn out well; as in mining, a promising prospect. *Pryor,* 3.

promontory. a. A projecting tongue of land surrounded on three sides by a devoted general; b. A cape of comparatively high land. Also called headland; head. *Schieferdecker.*

promote. a. To encourage; introduce of finance for a mining venture. *Pryor,* 3. b. A reagent used in froth-floatation process, usually called the collector. *See also collector. Pryor,* 3. c. A substance which increases the activity of a catalyst. *C.T.D.*

promise. a. The state of being in proportion to the hazardous nature of the mining project. In this sense, the rate of interest in most forms of mining should be high; to be satisfied with less than 10 percent annually would show a lack of acumen. *Hoover,* p. 157.

prompt criticality. The rate at which the fission chain reaction is sustained solely by prompt neutrons; that is, without the help of delayed neutrons. *L.P.*

promptly. At the low point of the wave, and its attendant services, including the ore treatment plant. *Pryor,* 3.

project. In operational procedures, any set of actions directed toward a specific aim or objective. *Pryor,* 3.

project data. Basic information needed by engineers concerned with design, site development, machine and housing assembly, plant erection, contract supervision and coordination when planning, erecting and bringing into operation a new mine and its attendant services, including the ore treatment plant. *Pryor,* 3.

projected diameter. Of a particle, that of a circle which has the same area as the projected profile. *Pryor,* 3.

projected pipe. A pipe laid on the surface before the excavation of powders in which the opposite direction at the low point of the wave, and exhibit no motion at the midpoints between. *Hoover.*

projective. a. A plan showing the proposed direction and location of entries, shafts, faces, fan and waste courses. Such projections generally show the entire profile to be worked by any mine and all completed work, though the latter is not strictly projection. *Zern,* b. Synonym for exposure. *See also exposure. Long,* c. Synonym for projection. *See also projection.* d. In mapping, a geometric (or mathematical) system of constructing the true meridians and parallels, or the plane rectangular coordinates on a map. *Says,** y. e. A geometrically or mathematically derived portrayal of the surface of the earth with a minimum of distortion of distances, directions, shapes, and areas. *Hy.* f. The act or result of constructing a figure upon a plane or other two-dimensional surface that corresponds point for point with a sphere, a spheroid, or some other three-dimensional form. *Hy.*

projection welding. Resistance welding in which the welds are localized at projections, embossments, or intersections. *ASM Gloss.*

project plans. A series of plans of a proposed new mine or reconstruction which are drawn up for the purpose of obtaining approval of the project. *B.S.* 3618, 1965, sec. 1.

project. A term that has been applied to an amorphous intermediate product in the process of kaolinization. *See also kaolinization.*

projective. a. A plan showing the proposed direction and location of entries, shafts, faces, fan and waste courses. Such projections generally show the entire profile to be worked by any mine and all completed work, though the latter is not strictly projection. *Zern,* b. Synonym for exposure. *See also exposure. Long,* c. Synonym for projection. *See also projection.* d. In mapping, a geometric (or mathematical) system of constructing the true meridians and parallels, or the plane rectangular coordinates on a map. *Says,** y. e. A geometrically or mathematically derived portrayal of the surface of the earth with a minimum of distortion of distances, directions, shapes, and areas. *Hy.* f. The act or result of constructing a figure upon a plane or other two-dimensional surface that corresponds point for point with a sphere, a spheroid, or some other three-dimensional form. *Hy.*

Proof spirit. A. The stress that will cause a substance to break. B. A specified stress to be applied to a member or structure to indicate its ability to withstand service loads. 

Prop. a. Underground supporting post set across the lode, seam, bed, or other opening. Pryor, 3. b. In mining, a roof support, usually temporary. B.C.I. c. A timber set upright or at right angles to the dip, to support the roof rock. Fay. d. A strut or post in tunnel construction work, either vertical or raking, usually of round timber, used as a support, or stay. A raking strut is used to support the roof where it is necessary to support the roof several hundred such struts. Fay.

Propagation. In general, propagation is said to occur when the flame of an explosion travels over considerable areas of a mine in a horizontal plane and travels when cause is removed. Rice, George S.

Propagation anomaly. The difference between the actual propagation loss for a given length of water path and the nominal value of propagation loss identified with the distance covered by that path.

Propagation loss. The transmission loss associated with any given length of ray path in the water. Rice, George S.

Propagated blast. A blast consisting of a number of predetermined charges of explosives and only one hole primed, generally for the purpose of ditching, where each charge is detonated by the explosion of the adjacent one, the shock being transmitted through the wet soil. In this method, one detonator is fired in the middle of a line of holes is capable of bringing about the explosion of several hundred such charges. Fay.

Propeller. The rotating curved blade of a pump or fan, also an impeller. Nelson.

Propeller fan. A. Axial-flow ventilating fan used to blow fresh air into mine workings or to extract foul air. Pryor, 3. b. A fan having an impeller other than the centrifugal-type rotating in an oriﬁce, the air ﬂow into and out of the impeller not being conﬁned by any casing. B.S. 3618, 1963, sec. 2.

Propeller pump. This type of pump, often called axial-ﬂow, develops most of its head by the propelling or lifting action of the vane upon the liquid. The impeller is single-inlet with the ﬂow entering axially and discharging radially. The speciﬁc speed is usually above 9,000. The impeller closely resembles a ship's propeller. These pumps are built in horizontal or vertical casings, and are primarily used in handling sludge, de-watering pits, sewage pumping, and similar duties requiring large capacities and heads under 100 feet. Fitz and Quarry, 53d, Sec. E, p. 88.

Propeller shaft. Usually a main drive shaft fitted with universal joints. Nichols.

Propeller. In a revolving shovel, a shaft which transmits the power to the walking mechanism. Nichols.

Proportional limit. The greatest stress which a material is capable of sustaining, developing without any deviation from proportionality of stress to strain (Hooke's law). In the case of rocks, this stress limit and elastic limit are restricted to short-time tests as in tests of long duration they slowly and permanently deform, even if stresses below the short-time proportional limit. Stokes and Verrall, 1935.

Propeller plus integral control action. As used in ﬂotation, action in which the output is proportional to the linear combination of the input and the time integral of input. Fuerstenau, p. 549.

Propeller plus integral plus derivative control action. As used in the control of very large machines, in which the output is proportional to a linear combination of the input, to the time Integral of input, and to the time integral of change of input. Fuerstenau, p. 549.

Propelling. Measuring by weight or by volume the constituents before mixing of concrete, mortar, or plaster. See also batching plant. Ham.

Progress. A project plan, undertaking, or situation requiring action (as dealing with, managing, operating, carrying out) with reference to it. Webster 3d.

Propellant. A. A mixture given to sand or other granulated rock material used to prop the artiﬁcial crevice formed when underground formations are hydraulically fractured. See also hydraulic fracturing. A.G.I.

Propellent. See prop drawer.

Propeller pump. This type of pump is used in longwall mining of a coal seam, a face with no posts between the coal and the conveyor used to remove it. Pryor, 3.

Propeline. A. A coal miner or bituminous coal mining, one who operates props (posts) to support the roofs of underground working places, placing and wedging them at the most effective points. D.O.T. 1.

Proportional phis behind plus derivative action. As used in flotation, action in which the output is proportional to the particular speciﬁc species. These proportions vary with the refractive index of the gem species. Shipley.

Propeller. Term loosely used to mean the physical properties and optical properties of a gemstone or its substitute. Shipley.

Propeller pump. These include the cross-sectional area of a structural member, its moment of inertia, section modulus, and other mechanical properties essential for accurate design calculations. Ham.

Propellant. A. A mixture given to sand or other granulated rock material used to prop the artiﬁcial crevice formed when underground formations are hydraulically fractured. See also hydraulic fracturing. A.G.I.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.

Propellant. See prop drawer.
prospective. A colorless, tabular mineral with
propylitindon. The introduction of, or re-
propyllte. Originally, andesites formed at the
prop wood. Eng. Timber suitable for cut-
prop wall. Props that are fastened together
obtained from a small amount of paydirt
man. I. A specimen or sample of mineral
formation that may be capable of develop-
by working a sample of ore. Pay. h. A
which has not yet been made manifest.
sutwity survey. Pryor, 3. e. The name
search for deposits and is performed by
Long. d. Territory under examination for
plot of ground believed to be mineralized
in the mining district. of the Western United States. Stokes and
mineral wealth.
prospecting a. The search for outcrop: or
prospeedag disk pam dolley pot. A simple
prospect nice. A small group organized
prospect hole. a. Any shaft, pit, drift, or drill
hole made for the purpose of prospecting the
mineral-bearing ground. Fay. b. A
prospect shaft. A shaft sunk in connection
prospect hole adds nothing to the value
hole made for the purpose of prospecting
mineral property, the value of
insist of clay, talc, etc. Fay.
prospecting tour. A tour or journey of ex-
prospecting license. Authorization granted by
a government to an individual in some
countries, permitting him to prospect for
minerals and to register (stake) a claim.
Pryor, 3.
prospecting pan. Same as gold pan. Craigie,
v. 3, p. 1843.
prospecting tour. A tour or journey of ex-
ploration made in seeking regions or de-
posits that are rich in minerals, usually gold or
prospective ore. Ore that can not be included
in the category of basic or iron ore. Craigie,
v. 3, p. 1844.
prospecting. a. The search for outcrop: or
prospect nice. A small group organized
prospect hole adds nothing to the value
hole made for the purpose of prospecting the
mineral-bearing ground. Fay. b. A
prospect shaft. A shaft sunk in connection
with prospecting operations. Craigie, v. 3,
p. 1844.
prospecting plan. A preliminary printed statement
describing a business or other enterprise,
and distributed to prospective buyers,
investors, or participants; such as a de-
scription of a new security issue supplied to
prospective purchasers and giving de-
tailed information concerning the com-
pany's business and financial standing.
protactinium. A shiny, gray, metallic radioactive
element that is formed
in nature by the loss of an alpha particle
and a beta. Predicted as eka-tantalum,
protactinium shows close chemical resemblance to tan-
talum but differs from it in that the penta-
atomic (Pa) is exclusively basic with
no acidic characteristics. Symbol, Pa; va-
lence, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ity, 1,230° C; and boiling point, unknown.
ber, 91; atomic weight, 231; specific grav-
ity, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ity, 1,230° C; and boiling point, unknown.
ber, 91; atomic weight, 231; specific grav-
ity, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ity, 1,230° C; and boiling point, unknown.
ber, 91; atomic weight, 231; specific grav-
ity, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ality, 1,230° C; and boiling point, unknown.
ber, 91; atomic weight, 231; specific grav-
ity, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ity, 1,230° C; and boiling point, unknown.
ber, 91; atomic weight, 231; specific grav-
ity, 4 and 5; tetragonal; atomic num-
ber, 91; atomic weight, 231; specific grav-
ity, 1,230° C; and boiling point, unknown.
danger from molten or corrosive materials exists. Nelson.

protective clothing. The special items of clothing used to protect the protoclastic apparatus of the body, such as protective boots, miners' helmets, knee pads, and shirts. Occasionally, leather protective gloves and goggles may also be used. Nelson.

protective colloid. A colloid of considerable stability which is unaffected by small concentrations of electrolytes; referred to as hydrophobic. Hydrophobic sols are protected from the coagulating influence of electrolytes by the addition of very small quantities of the protective or hydrophobic colloid. Used in flotation to improve the depression of minerals which are not resistant to the floated portion. Has protective equipment. Electrical circuits and apparatus which provide protection against overloads or faults and include such devices as circuit breakers, earth leakage protection, overload trips, and relays. Ham.

protective filter. See filter, c. ASCE PI 1926.

protector block. A protector block is a lightfusing protective device used on telephone, telegraph, and signal systems to protect persons and equipment against lightning and foreign currents of a hazardous character. The common form of protector block includes a fuse for each side of the line and a small gap between each line and the ground. J. A. T. M. 1965.

protector lamp. Eng. A safety lamp, the flame of which is impossible to expose to the open air while lighting, as unlocking, or rather unscrewing it, extinguishes the light. Fay.

proteolite. A general term for hornfelsic rocks introduced by Baas, in 1852, and used by Bonney, in 1886, for andalusite hornfels. Compare cornubianite. Fay.

protosterone. An altered dolerite or basaltic rock containing purple-brown augite and primary brown hornblende, and characterized by the presence of secondary green hornblende and other alteration products. Holmes, 1928.

Protosterol. a. The younger of two Precambrian systems or eras. Synonym for Algonkian. Holme.

protostrophe. The movement of a piece of rock by the granulation of minerals of early formation, the granulation being due to the differential flow of the magma from which the fractured minerals were derived. Protobitumens are sub-divided into labile protobitumens and stable protobitumens. Tomkeieff, 1934.

protoclast. A rock possessing cleavage originally developed during metamorphism under water or cooling from magma, such as bedding, flow structure, etc. Compare metapelitic. Fay.

protoclastic. Applied to a structure of igneous rocks in which the constituent minerals show granulation and deformation, produced by differential flow of the magma before complete consolidation. A.G.I.

protoclastic structure. A structure produced by the granulation of minerals of early formation, the granulation being due to differential flow of the partly consolidated magma. See also protogine; protoclastic schist; granite gneiss; orthogneiss. A.G.I.

protoclastic. A rock in which protoclastic structure was produced by differential flow of partly consolidated magma. See also protogine; protoclastic schist; granite gneiss; orthogneiss. A.G.I.

protogine. Synonymous with the above.

protoginon. A compound used in the breathing apparatus to remove carbon dioxide from the expired air, and, if the air contains an oxidizing agent. Fay.

protolion. A crystalline calcium-magnesium carbonate in which the metallic ions occur in the same crystallographic layers instead of in alternate layers as in dolomite. A.G.I. Supp.

protogen. See protogine. Ham.

protogenous. a. Capable of supplying a hydrogen ion (proton), C.T.D. b. Of or pertaining to a first origin or production; specifically, of or pertaining to those crystalline rocks supposed to be formed by igneous action. Standard, 1964.

protogenous. A group name for original rocks as opposed to derived rocks, and including salt, igneous, and ore deposits. The term is no longer used. Holmes, 1928.

protogenous. Rocks to alpine gneissaceous granites which are considered to be either protoclastic or composite in origin. A.G.I.

protogenetic. Replaces the term for the process producing protoclastic structure. Schlafer.

protogenygen. a. A coherent crush breccia made of megascopically visible particles which are commonly lenticular in shape and which preserve faintly the primary structures of the parent rock. Protogenygen resembles conglomerate or arkose on weathered surfaces. Commonly shows innumerable megascopican gliding surfaces. Backlund clearly emphasizes the ease brecciation, pointing out the resemblance of the rock to conglomerate, and implying in the prefix proto that the rock was derived from a series of rocks of which mylonite and ultramylonite are representatives. A.G.I. b. Used for contact metamorphic rocks which have been mylonitised by movements on thrusts controlled by the contact surfaces between the intrusions and the country rocks. See also mylonite. A.G.I.

protoil. An elementary particie with a single positive electric charge, mass approximately 1,047 times that of the electron. The atomic number of an atom equals the number of protons in its nucleus. LQL.

protopetroleum. a. A name for a hypothetical material which may be present in petroleum. Tomkeieff, 1934. b. The primary source material of petroleum. A.G.I.

protosiderite. A sandstone which may be found between orthoquartzite and subgraywacke. A.G.I. Supp.

protoisolation. In older writings, any primary material too low in tenor to constitute ore but from which ore may be formed by enrichment. As commonly employed today, a protore is one that cannot be produced at a profit under existing conditions but that may become profitable with technological advances or price increases. Stokes and Varnes, 1935. b. Metalliferous material before it becomes ore through enrichment. Webster, 3d. c. The unchanged portion of any primary material that locally has been concentrated into ore, and that which by weathering may be so concentrated. Ballard.

protoliquefied. A compound used in the breathing apparatus to remove carbon dioxide from the expired air, and, if the air contains an oxidizing agent. Fay.

protoliquefied. The atomic number of an atom equals the number of protons in its nucleus. LQL.

protomarcite. Suggested by Loevlinson-Leasing for one of three types of igneous rocks, subdivided according to their genesis. Protomarcite is a product of the crystallization of magma, and is characterized by their great uniformity in composition and their relatively large volume. Compare syenite. Schlafer.

prototype. The stage following the basic idea and assists the inventor and manufacturer in solving the difficult details of the project. The prototype model which assists the inventors and manufacturers in developing the basic new principles or features of the machine but is adequate to conduct tests. The final stage is the production of parts, fitting assembly and factory testing before the first production model leaves the workshop. See also lead model, lead prototype. The oxide of any metal containing the least proportion of oxygen. Weed, 1913.

protona. The lowest of all animals, and have no definite organs. They are just...
Protozoa

like a piece of jelly in a strong case. Mason, V. I., p. 25.

Protozoans. Minute one-celled animals, most of which are invisible to the naked eye and occur universally in the surface layers of water. They are important because they can reproduce asexually or sexually. Several genera are capable of producing bioluminescence, usually of the sheet type. Hy., protractor, a. A device for measuring angles on drawings. Nichols. b. Any one of several goniometerlike devices used to determine the etch angle inside an acid tube. Long, p. 14.

Provitrinite. A variety of the major maceral of vitrinite. Further subdivision of the macerals is made into subvarieties. Fay.

Proving area. The establishment of the quantity and grade of coal or ore available for exploitation. Several genera are capable of producing bioluminescence, usually of the sheet type. Hy.

Proximate analysis. a. The determination of the compounds contained in a mixture as distinguished from ultimate analysis, which is the determination of the elements contained in a compound. Standard, 1964. Used in the analysis of coal. Fay. b. In the case of coal and coke, the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash. Unless otherwise specified, the proximate analysis does not include determinations of sulfur or phosphorus or any other elements other than those named. ASTM D 121-62. See also chemical constitution of coal.

Proximetry. a. A goniometerlike device for determining the optical density of the stain is used in the analysis of coal. Fay. b. In the case of coal and coke, the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash. Unless otherwise specified, the proximate analysis does not include determinations of sulfur or phosphorus or any other elements other than those named. ASTM D 121-62. See also chemical constitution of coal.

P.R.U. hand pump and densitometer. A dust sampling instrument consisting of a D.V.P. Mark 11 pump with a swept volume of 90 cubic centimeters. A filter paper is inserted into a bridge behind the inlet nozzle of the pump such that a circle of 1 centimeter diameter of the filter paper is exposed to the dust. The dust, while passing through the filter paper, produces a stain. The optical density of the stain is determined photometrically in a densitometer by the light that falls upon a galvanometer. The dust particle concentration is determined by a calibration factor. Its main disadvantage is that is underestimates the number of fine particles. See also photoelectric densitometer. Fay.

Pseudoparticle. A seal or button of glass impressed with a pattern, added as an ornament to the stems of glass vessels. Hagar.

Psephite. A coarse, fragmental rock composed of rounded pebbles; for example, conglomerates. Used as a pigment and in dyes. Mixed in oil, it is used in the fitting up of the body of an instrument. Stokes and Varner, 1955.

Psephite. A coarse, fragmental rock composed of rounded pebbles; for example, conglomerates. Used as a pigment and in dyes. Mixed in oil, it is used in the fitting up of the body of an instrument. Stokes and Varner, 1955.

psuedophyllite. Made up of small stones. Fay.

psuedoeylite. A mineral that re- plasce in the form of a crystal- line eruprive rock, so as to appear like a true vescular liquid or amygdule. Stand- ard, 1964, part I.

psuedo- As a prefix, implies something false, its meaning is modified by the subject to which it applies. Schwabe.

psuedoanticline. An upward buckling of the superficial layers of the ground due either to changes in volume brought about by pedogenic processes or to some other cause. Chalmer.

psuedoate. Bank attoll; shelf attoll. Atoll which rises back from the outer margin of rimless shoals. Siefreidercker.

psuedobinary system. a. A three-component or ternary alloy system in which an inter- mediate phase acts as a component. ASM Gloss. b. A ternary diagram. ASM Gloss.

psuedobolete. Probably a basic oxycodile of basalt and copper, 5Cu(OH)2-4AgCl. Tetral. Found only in parallel growth on boleite, frequently as Raised Crystaline mass. From Bolo, Lower Greensands. English.

psuedobrecia. a. An apparent breccia that develops as a result of weathering. A.G.I. b. An apparent breccia found in some dolomite limestones, probably formed by algal crusts. A.G.I. c. Particles of irregular or partially irregular shape, held together by a matrix of lighter color and coarser texture. The matrix is more argillaceous than the fragments and the clay crystals in the matrix may be wholly or partly dolomite. A.G.I.

psuedoatrolite. A titanium-iron oxide resemb ling andalusite, but having a coarser texture. From porphyry rocks, as andesite. Fay.

psuedocannel coal. Also called humic cannel coal. A nonbanded coal consisting largely of a mixture of transverse humic and sapropelic material. A.G.I.

psuedocellite. See blank carburizing. ASM Gloss.

psuedochryssolite. Synonym for moldavite (of Zippe). Fay.

psuedoconglomerate. a. A rock so broken up into displaced fragments and interpenetrated by intrusive or precipitated material as to appear like a conglomerate. Fay. b. A rock made up of rounded fragments and formed by cataclasis. A.G.I.

psuedocrococite. Quartz pseudomorphous after crocidolite. Same as tiger eye; hawk's eye. English.

psuedo cross-stratification. Inclined bedding which by unusual sorting, commonly in response to ripple mark migration, produces foreset beds that appear to dip into the current. Pettijohn.

psuedoeycite. A mineral nodule that re- placed another and has retained the growths of sulfide minerals which more or less closely simulate the eutectic texture in metal. See also graphic granite. A.G.I.

psuedofoam peat. Peat, which, in spite of its fibrous condition, is soft, noncoherent, plastic, and on drying, shows great shrink- age. See also fibrous peat; amorphous peat; woody peat; mixed peat. Tomkejeff, 1954.

psuedohexagonal. Of a crystal or axis, ap- proximating in form to the hexagonal type. Webster 3d.

psuedoimage. A name that may be applied to any mineral resembling jade in appearance, for example, bovenite. English.

psuedojadeite. a. A mineral similar to jadeite. From Tawmaw, Upper Burma. English. b. Name given to the molecule, (Ca,Mg,Fe)Al(SiO3)2, associated to be present sometimes in isomorphous replacement with the normal jadeite molecule, NaAl(SiO3)2.

psuedoleucite. Pseudomorphs of a mixture of nepheline, orthoclase, and analcime after leucite, found in the syenites of Arkansas, Montana; Brazil. Dana 17.

psuedomaschite. A hydrous phosphate of copper occurring in massive forms of bright green color, 5CuO.P2O5-2H2O, resembling malachite; monoclinic or triclinic. Larsen, p. 153.

psuedomorph. a. A crystal, or apparent crys- tal, having the outward form proper to another species of mineral, which it has replaced by substitution or by chemical alteration. Fay. b. One mineral that has replaced another and has retained the form and size of the replaced mineral. Bateman.

psuedomorphous quartz. Quartz under the forms of many of the mineral species, which it has taken through either the alteration or replacement of crystals of those species which it has replaced. A.G.I. The most common quartz pseudomorphs are those of calcite, barite, fluorite, and siderite. Silicified wood is quartz pseudomorph after wood. Fay.

psuedo mud cracks. See parting cast. Pettijohn.

psuedomud pseudomorph. See blank nitrizing. ASM Gloss.

psuedophyle. A green mineral resembling ser- pentine and mentioned as a possible jade substitute. Classified by Dana as a variety of peridotite. Monoclinic, Mohs' hardness, 2.5; specific gravity, 2.8; refractive index, 1.57 to 1.58; birefringence, 0.003.

psuedosparite. Limestone consisting of rel- atively pure Dolomite occurring as a primary constituent of a crystal- line eruptive rock, so as to appear like a conglomerate. Pettijohn.

psuedosphere. A spherulite in which the rays are composed of two different determinable substances, usually quartz and feldspar. Fay.

psuedosulfitation. Occasionally till deposits which have been overdironed by ice (drum- lins, etc.) exhibit a structure concentric with their surfaces and somewhat resembling stratification. This is not true bed- ding. It is caused in part by the plaster- ing of layer on layer by the ice and in part by shearing of the till by the great pressure of the ice. Stokes and Varnes, 1953.

psuedosymmetrical. Crystal structures in which the atoms are only slightly dis- placed from positions which would be in agreement with a higher symmetry. Thus, a monoclinic, pseudotetragonal mineral con- tains atoms only slightly displaced from positions which would be in agreement with a tetragonal symmetry. English.

psuedosymmetry. Apparent symmetry of higher grade than that proper to the minerals generally due to twinning. Also called mimery. Fay.

psuedotektke. A tektite that contains crystal- lites. Hau.

psuedotjeungite. A mineral very similar to thuringite, but with the composition A12O3.Fe2O3.2SiO2. Billans 17, M.M., 1946.

psuedolapaz. Quarts simulating topaz. From Striegen, Silesia, Poland. English.

psuedoviscosity. Viscous resistance offered by a slurry, sludge, mud or suspension of minerals in water as a pulp, due to the specific surface involved, with possibly an element of thixotropy under stated con- ditions of pH value, agitation, flow, tempera- ture and solid to liquid ratio. The pseudoviscous effect is distinct from vis- cosity due to molecular shear. Fey 3, 1959.

psuedowollastonite. Flow in which deforma- tion is at a constant rate. Lewis, p. 579.

psuedovolcconoma. Applied to a large, circular hole or crater generally not associated with any positive indication of recent vol- canic activity; for example, a crater of doubtful meteors origin which is thought to be the result of phreatic explosion or caldiron subidence. A.G.I.

psuedowollastonite. wollastonite heated above 1,180° C develops a basal cleavage, be- coming a pseudohexagonal calcium meta-
sillicate dimorphous with wollastonite, CaO•SiO₂. Also called beta-wollastonite; earlier called bourgeoisie. Larsen, p. 71; Mineralogical Magazine, v. 17, No. 82, April 1916, p. 336.

omain. All lands and waters in the government of the United States, including lands owned by the several states, as distinguished from lands owned by individuals and corporations. Eey.

land. In the United States, the portion of the public domain to which title is still vested in the Federal Government. A.G.I.

land and public use. There is a clear distinction between public lands and lands that have been severed from the public domain and reserved from sale or other disposition under general laws. Such reservation sever the land from the mass of the public domain and appropriates it to a public special use. Standard, 1964, p. 66.

limited liability company. An association of individuals, at least seven in number, who together subscribe the necessary means or capital, that is, money, property, or other credit, to engage in a joint undertaking.Truscott, pp. 250-251.

ineral land. Land belonging to the United States containing a deposit of mineral in some form, metalliciferous or nonmetalliciferous, in quantity and quality sufficient to justify expenditures in the effort to discover, mine, and purchase under the mining laws. Ricketts, 1.

on, A tool for widening the top of a wine glass in the handmaking process; from Italian word meaning a virgin. Dodd.

rcherite. A reddish-brown tabular or acicular orthorhombic mineral with 1 perfect cleavage, Bi₂O₃•V₂O₅•MnO₂ hardness, 4; and specific gravity, 3.2 to 3.6. Lassen, p. 412. A vanadium ore. Osborn.

rack. A wall or pillar built of waste rock to support the roof. Fay.

rking. Producing wrinkles or buckles in the surface of a billet. Fay.

namic, A wall or pillar built of waste rock to support the roof. Fay.

s and public use. The terms "public land" and "public use" are used in public legislative acts to describe the conditions under which public land may be leased or used for particular purposes. Fay.

hrome, a. Study of atmospheric humidity, the relative humidity, specific volume, weight ratio of moisture to air, dry-bulb thermometer readings, vapor pressure, dew point of moist air, and the effects of these parameters on the temperature readings of the two thermometers. Standard, 1964. Another name for psychrometry.

ometric. An instrument for measuring the vapor pressure and the relative humidity of the air. It consists of a dry-bulb thermometer and a wet-bulb thermometer, the latter having its bulb covered with a layer of muslin kept moist with water. The rate of evaporation from the moist muslin depends upon the quantity of moisture in the air. The more rapid the evaporation the greater the cooling, and hence the greater the difference in the temperature readings of the two thermometers. Standard, 1964.

cal quantities of moisture in the air. The name sometimes refers to mixtures of manganese minerals. Color, black; streak, brownish-black; luster, submetallic; Mohs' hardness, 5 to 6; and specific gravity, 3.7 to 4.7. Found in the United States (Arkansas, Virginia, and Georgia), India, Republic of South Africa, Cuba, and the U.S.S.R. An important ore of manganese. C.C.D 64, 1961.

also called psilomelane. A natural oxide of variable composition, CaO•SiO₂. Also called wolkmeite; earlier called bourgeoisite. Larsen, p. 71; Mineralogical Magazine, v. 17, No. 82, April 1916, p. 336.

nt, in an oxidizing atmosphere, in order to separate the ore. Fay.

nt, a. One who converts cast iron into wrought iron by puddling. Webster 3d. b. A rabble used in puddling. Webster 3d.

tium. A system of small pipes admitting compressed air to a tank containing zinc chloride, to effect a thorough solution for use as a timber preservative. Webster 2d. c. A machine for breaking up alluvial wash, consisting of a shallow tank in which arms rotate slowly. The coarse stones are forced down sluice boxes along which the gold settles. Nelson.

ting rolls through which puddle balls are passed to be converted into bars. Standard, 1964. Also called puddle train. Fay.

der's mine. In metallurgy, a fixing or settling for finishing the lining of a puddling furnace. A mineral, usually serpentine ore made to a paste with water. Standard, 1964.

uing or rolling of rolls for reducing squeezed puddle balls to puddle or muck bars. Fay.

dration of a bath of molten pig iron by hand or by mechanical means, in an oxidizing atmosphere, in order to oxidize the carbon, silicon, and manganese and thus produce wrought iron. C.T.D.

ning machine. U.S.; Aust. A machine used for mixing sulfuriferous clays with water to the proper consistency for the separation of the ore. Fay.

cess. Production of wrought iron from molten pig iron in an oxidizing atmosphere by mechanical means. Fay.

oize with water down sluice boxes along which the gold settles. Nelson.
pudding process

flows the circular pan in which stirring
rakes revolve, while the heavy fraction
containing the values sinks and is peri-
ously removed. Pryor, 3.

puddock. Scot. Cast-iron plate forming the
crossing of flanged mbe.car rails. Fay.

Pudding, for waterproofing, is cement
added to cemented to seal back water,
for example, in concrete tanks. Pryor, 3.

pudding. Blowing chips out of a hole
means of exhaust air from the drill.
Nichols.

pudded bar. In powder metallurgy, a cored
bar expanded by internal gas pressure.
Rolle.

pudded compact. A compact expanded by in-
ternal gas pressure. ASTM B 245-63.

puffer. a. A small stationary engine used for
hoisting material on construction work, in
operating a haulageway, or for hoist-
ing at shallow mines, especially in pros-
pecting and development work. Fay. b. See

puffer boy. a. A person employed to operate
an engine used for hauling loaded mine
cars through the workings. Fay. b. See the
operator of any small stationary hoisting en-

puffer man. N. of Eng. One who operates a
bituminous coal mining, one who oper-
ates the stationary engine used for hoisting
coal or rock in a shallow shaft, especially
for prospecting or development work. Also
called puffer; puffer boy; puffer tender.
D.O.T. 1.

puffing. a. A shift or task group informally recognized by
the group as a spokesman. Takes up matters
with management on behalf of the team.
(In some pits, used as a term of abuse.)

puffin. Eng. Travein, hard enough to
use for building, so called from its cavern-
ous structure. Arkell.

pug. a. Crushed strata or clay. See also bu-
cas. A large lump of ground up by a
coal cutter. Nelson. c. In metallifer-
ous mining, the parting of soft clay which
usually is a long longitudinal shaft fitted with knives which slice through
the clay, mixing it with water which is
added by sprays from the top. The knives
are canted to give some screw action,
forcing the clay along the barrel and out
with the aid of water. C.T.D. T.C.D.

pug mill. a. A machine for mixing water and
clay, consisting of a long horizontal
barrel within which is a long longitudinal
shaft fitted with knives which slice through
the clay, mixing it with water which is
added by sprays from the top. The knives
are canted to give some screw action,
forcing the clay along the barrel and out
one end. AISI, No. 24. b. See paddle-
type mixing converter. ASA MH 41-1958.

pug-mill operator. One who prepares
ground, sifted, and filtered clay for molding
by mixing it with water; in a rotary-type
miller called a pug mill. This machine is
frequently operated in conjunction with
an auger mill and a cutting machine, the
same worker tending the operation of all
three mule machines at the same time. Also
called clay pugger; mixing-mill operator.
D.O.T. 1. b. One who mixes ground
preheated materials and a portion of
hard coal in a pug mill to form a viscous mixture suit-
able for processing into pellets. Also called mixer;
pug miller; pug-mill tender. D.O.T. 1.

pugs. Scot. A stratum of hard coal in a free
coal seam of Lanarkshire. See also pug, f. Fay.

pug tub. See settler. Fay.

pulaskie. A foyaitic igneous rock, occurring
in dikes, and composed of cryptoperthite,
barkevikite, biotite, and augite, and ac-
cessory nepheline, sodalite, etc. It is a
neptunian, often in nepheline. Web-
ter 2d.

pulaskite. A phanerocrystalline rock com-
posed essentially of augite, leucite, and
anorthite. Holm, 1928.

pull. a. The linear advance resulting from the
pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of 8 to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
In British coal mining, a pull of 6 to 7 feet
are common, while the trend is towards
a pull of up to 9 feet has been achieved.
pull holes

Lewis, pp. 444, 447.
pulling, Eng. See posting.
pulling casing. Removing pipe from a drilled well.
pulling core, rope. Eng. A short, light hemp rope for pulling the ends of winding ropes over the pulleys.
pulling pillars. The common expression used for mining the coal in the pillars of a mine; robbing pillars. See also pulling stumps.
pulling stumps. The process of taking out the pillars of a coal mine. See also pulling piles.
pulling the plug. Can. Withdrawal of market support in a given stock by the once-interested broker promoter.
pulling up. One phase of forming clay objects on the potter's wheel in which a plastic clay lump is raised into a column by applying pressure with the hands. Bureau of Mines Staff.
pull lift. A modern sylvestor used on construction work in which a frame with a constant pull of three tons. It can be carried by one man. 

Ham.
pull-over mill; drag-over mill. A two-high mill in which the piece is rolled in one pass by exhausting the lungs and filling them with oxygen-enriched air. Fay.
pull shovel; dragshovel; hoe. A shovel with a hinge- and stick-mounted bucket that digs while being pulled inward. Nichols.
pull-up stakes. To strike camp; to remove from one place to another, as in search of new diggings. See also stake.
pullway. The path from the face to the loading point taken by the scraper of a scraper conveyor, unit. 

Nelson.
pull wheel. A large driving wheel or sprocket.
Nichols, 2.
pulmonary. Dusts harmful to the respiratory system. They include silica (quartz, chert); calcite (sulphate, talc, mica, siliimanite); metal fumes (nearly all); beryllium ore; tin ore; iron ores (some); coal (anthracite, bituminous). Hartman, p. 41.
pulmonary. A mechanical device designed to perform artificial respiration, in cases of asphyxia, electric shock, drowning, etc., by exhausting the lungs and filling them with oxygen-enriched air. Fay.
pulpy. A mixture of ground ore and water capable of flowing through suitably graded channels as a fluid. Its dilution or consistency is specified either as a solid-liquid ratio (by weight) or as a percentage of solids (by weight). Pryor, 2. b. Pac. Pulverized ore mixed with water; also applied to dry, crumbly ore. Fay. c. To reduce to a soft mass. Gordon.
pulp. a. A mixture of ground ore and water by which continual, short, intense surges of water are introduced under pressure into long holes or bore holes, and partly by the direct action of the steam on the water, without intermediate means of communication, called a vacuum pump. Webster, 3d. c. A type of steam siphon frequently used on construction work for pumping water. Buck. d. A displacement pump with valves for raising water by steam, packed with a small fractional pressure, and partly by the direct action of the steam on the water, without intermediate means of communication, called a vacuum pump. Webster, 3d. c. A type of steam siphon frequently used on construction work for pumping water. Buck.
pulser. A type of device that records an event on a scale. 

NCB.
pulser-coil discriminator. An electronic circuit which accepts only those pulses having amplitudes greater than a preset level and produces an output pulse of fixed amplitude (and sometimes of fixed width) for each input pulse accepted.

NCB.
pulser-coil method. The instantaneous value required for the leading edge of a pulse to rise from some specified small fraction to some specified larger fraction of the maximum amplitude.

NCB.
pulsion stone. a. A very large grindstone employed in pulp mills for crushing or grinding wood into fiber. Fay. b. S. Surin, b. ACSG, 1963.
pulverized coal. That which has been tumbled, comminuted, or ground to very small particles (as in fine powder or dust). Webster, 3d.
pulverization. a. In soil stabilization work, the breaking up of individual particles as suggested. Separation of the particles is the first step towards good dispersion of stabilization additives and moisture. Nelson. b. The reduction of metal to finely divided particles, particularly of sedimentary rocks by chemical means; or grinding) to very small particles (as in fine powder or dust). Webster, 3d.
pulverizer. A cultural term designating a silt- or clay-colored constituent of fine-textured rocks of constructional but not clastic origin. It corresponds to the term siltite of the clastic textural terms. A.G.I.
pulverization. a. Soil stabilization work. Pulverization means the separation of particles from each other rather than the breaking up of individual particles as suggested. Separation of the particles is the first step towards good dispersion of stabilization additives and moisture. Nelson. b. The reduction of metal to finely divided particles, particularly of sedimentary rocks by chemical means; or grinding) to very small particles (as in fine powder or dust). Webster, 3d.
to a fine dust by grinding mills. The latter are often air swept, the velocity of the air being so regulated that particles of coal, when sufficiently reduced, are carried away in finely pulverized coal particles of which about 99 percent are below 0.01 inch in diameter will burn very rapidly and will not undergo slag formation. Finely pulverized and conveyed from the mill by air into the boiler plant. Nelson.

Pulverized coal dust. Dust of which 95 to 98 percent will pass a 100-mesh screen and of which 75 to 95 percent will pass a 200-mesh screen. Quickly ground—quickly ground ash or furnace slag. A very finely divided volcanic ash or other ashes. Abl. Used as an abrasive; lightweight concrete aggregate. Found in New Mexico, California, Idaho, New Zealand; Haiti; or Mauritius. Also used as abrasive soaps. Stokes and Varner, 1955.

Pumicite. Lithified volcanic ash. See also pumice.

Pumicite. A highly porous igneous rock, usually containing 65 to 75 percent SiO₂ and 3 to 5 percent alkalies, 3 percent MgO, 3 to 5 percent Al₂O₃, 6 to 12 percent water, accumulated underground in low places, into a drainage ditch flowing to a natural outlet or pumping station. T. L.

Pump lift. Eng. The lower end of a plunger or pumping shaft. A Scottish oil shale which yields 16 to 22 gallons of crude oil per ton, together with 50 to 60 pounds of asphalt. Stokes and Varner, 1955.

Pumping engineer. A mixer used in soil stabilization materials, which can be burned as it issues from a suitable nozzle through the heating process. Used as an abrasive; lightweight concrete aggregate. Pumicite. A very finely divided volcanic ash or furnace slag. Abl. Used as an abrasive soaps. Stokes and Varner, 1955.

Pumicite. Lithified volcanic ash. See also pumice.
**pump lift**

*pump can suck up water. Theoretically, this should be about 34 feet at sea level; practically, the limit is about 26 feet. Long.*

**pump liner**

*A replaceable cylindrical or ceramic-coated metal sleeve installed in a pump cylinder inside of which the piston works. Long.*

**pump lining**

*Synonym for pump liner. Long.*

**pump load**

*The back pressure and/or resistance to flow of fluids that a pump must overcome to force a fluid to flow through a pipeline, drill string, etc. Long.*

**pumpman**

*Mineworker who operates mine pumps. Bureau of Mines Staff.*

**pump packing**

*The material placed around pump rod. The rod or system of rods (usually heavy beams) connecting the steam engine at the surface, or at a higher level, with the pump piston below. See also balance bob. Fay.*

**pump radiation**

*A flat iron ring that, when lapped with terred baize or coarse cloth, secures the joints of water columns. Fay.*

**pump rod**

*The rod or system of rods (usually heavy beams) connecting the steam engine at the surface, or at a higher level, with the pump piston below. See also balance bob. Fay.*

**pump station**

*a. In mining, chamber near the shaft at depth, where pump is installed. Also, the pressure im-
posed on the fluid ejected from a pump. Long.*

**pumping**

*A rigid iron ring that, when lapped with terred baize or coarse cloth, secures the joints of water columns. Fay.*

**pump slip**

*The leakage past the valves and the plunger in a reciprocating pump which should not be greater than 2 or 3 parts in 1000 of the bore. Leach, p. 636.*

**pump stroke**

*The distance through which the piston in a pump travels from one extreme position to the other within the cylinder. Long.*

**pump sump**

*A tank into which the circulating water gravitates and from which it is recirculated by means of a pump. B.S. 3552, 1962.*

**pump surge**

*Pulsating effect transmitted to a pipeline or drill string at the completion of each compression stroke of a reciprocating piston pump. Long.*

**pump tree**

*Eng. A cast-iron (wrought iron was formerly used) pipe, generally 9 feet in length, with a water column or set is formed. Fay.*

**pump**

*The action of ramming wet concrete or earth to drive the air out of it and thus to consolidate it. *Hann.*
pure oxides

theses represent their melting points. Osborne.

push button. A. A cylinder in which the body is elongated in one direction and shortened at right angles to this of such an amount that the stopper is handheld. A.G.I.

Pureba gas mask. An all-service gas mask that can be used in atmospheres containing up to 2 percent of carbon monoxide for a period of 2 hours. McAdam, pp. 62-64.

purifiers. In the destructive distillation of coal, iron vessels containing several layers of bog iron ore (Ferric oxide, Fe2O3) in granular form, mixed with moist sawdust to the whole porous, used to remove impurities, such as ammonia gas, sulfur dioxide, and hydrogen sulfide from coal gas. Cooper, pp. 396-397.

purins. Timbers spanning from truss to truss, and supporting the rafters of a roof.

pur. High purity iron. Osborne.

purple. purple. A synonym for true.

purple blende. An old synonym for kermesite.

purple clay. A fine-grained, plastic, Florida kaolin; it fires to a good white color. Dodd.

purple cock ore. Same as borine. Fay.

purple of Cassius. Produced by adding a mixture of starch and starch and carbonates to a very dilute solution of gold chloride; hydrated stannic oxide is precipitated, and the red gold chloride is reduced to stannous. The red to violet color is due to the precipitation of the finely divided gold on the surface of the stannous. C.T.D. Used in painting and staining porcelain and glass.

purple slate. See colored slates. AIME p. 793.

purple stone. See Cornish stone. Hes.

purple. Fault that occurs with a fault occasionally found in sheet glass as a result of the presence of sheet glass furnaces from which the glass was drawn. See also collet. Dodd.

g-party. Eng. To haul a tub to and from the face. When the tub is pulled by hand, it is called hand putting; when drawn by a pony, pony putting. In Cumberland, to pull a tub by hand is called trailing. Also called trail. SMRB, Paper No. 61. f. S. Afr. A pit or well. Putnam.

putty. A fine-grained, plastic, Florida kaolin; it fires to a good white color. Dodd.

puter grades. See helper grades.

puter man. One who operates an electric pusher that discharges coke from ovens; also, supervises charging of ovens with coal and levels the coal, using an electrically driven leveling bar. Also called pusher doorman, pusher engineer, and pusher operator. D.O.T. 1.

puter. a. The man in charge of haulage hands in a coal mine. Also called master hauler (hauler). C.T.D.

puter track. A building that is often used in a coal mine to convey the coal from the face to the tramway. The coal is delivered to the conveyor. Nelson.

put-down collet. A fault occasionally found in sheet glass as a result of the presence of sheet glass furnaces from which the glass was drawn. See also collet. Dodd.

put-downs. A. A tunnel or a number of such tunnels in a single kiln, instead of on the usual cars; when there are a number of such tunnels in a single kiln, it is known as a multipassage kiln. See also multipassage kiln.

put-down punt. The concave bottom of a glass wine bottle or other container. Dodd.

push. a. In mining, a laborer who pushes loaded mine cars on tracks from under-ground working places to haulage roads where they are picked up by a locomotive (train) at the bottom of the shaft, or slope bottom for hoisting. May, at bituminous mines, shift empty and loaded cars in and about the tipple where coal is prepared for market. Also called car puller; car shifter; headman; mate; puller; scaler; trammer. D.O.T. 1. b. In mining parlance, one who is engaged for the purpose of encouraging or hastening the movement of the ore. Also calledigger boss. Ricketts, T. A. A tractor that pushes a scraper to help it pick up a load.

push-brown conveyor. Two endless chains cross-connected at intervals by bars or rollers and driven by electric motors. See also pusher grades.

pusher grades. See helper grades.

pushing. Relay switch worked by pressure of finger, to initiate switch movement which controls an operating motor. Pryor, 3.

pusher man. One who operates an electric pusher that discharges coke from ovens; also, supervises charging of ovens with coal and levels the coal, using an electrically driven leveling bar. Also called pusher doorman, pusher engineer, and pusher operator. D.O.T. 1.

pusher grades. See helper grades.

pusher man. One who operates an electric pusher that discharges coke from ovens; also, supervises charging of ovens with coal and levels the coal, using an electrically driven leveling bar. Also called pusher doorman, pusher engineer, and pusher operator. D.O.T. 1.

pusher. a. A coal miner who takes empty tubs from a nearby junction to the working face and brings back the loaded ones. Except in small mines, man handling of tubs is now obsolete. Also called hurrier; hunt-er; kibbler. Nelson. b. One who hauls by hand. Mason. c. A small motor or steam engine. Mason. d. Underground worker who conveys coal by tram from working face to main underground haulage. Mason. 3. e. Eng. A man or boy who conveys coal from the working place to the tramway. Same as haulier; trammier; drawer, a. Fay. f. N. of Eng. In single place systems a man, usually a young lad, who conveys tubs between the workings and a flat. He may have a pony. Trist. g. See pusher. D.O.T. 1.

pusher filling. A miner who fills his tub, pushes it back to the nearest junction, and returns with an empty tub. Obsolete equipment. See also pusher filling.

pusher-out. See hanger-on, a. C.T.D.

pushing. A. A kind of pusher. Hes.

putter fill. A miner who fills his tub, pushes it back to the nearest junction, and returns with an empty tub. Obsolete equipment. See also pusher filling.

put-put. A gold-washing tray used in Madras. Fay.

putting. Eng. Ponies 10 or 11 hands high, trained in railroading, hauling, and switching cars. Fay.

put-to-stand. 5. Staff. Stoppage of coal accounted for as lost work. Fay.

putty. a. Tin oxide, sometimes mixed with lead oxide, used for polishing glass, metals, etc.

push-pull wave. A wave that advances by alternate compression and rarefaction of a medium, causing a particle in its path to move forward and backward along the direction of the wave's advance. In connection with waves in the earth, also known as primary wave, compressional wave, longitudinal wave, or P-wave. D.O.T. 1.

push-up. Alternative name for pushed punt. See also pushed punt. Dodd.

pusher. A bulldozer exerting pressure backward. A.G.I.

push welding; poke welding. Spot or projection welding in which the force is applied manually by one electrode, and the work or a backing bar takes the place of the other electrode. ASM Gloss.
In physics, putty powder is often used as a material for experimental work. See also work, put, and put work.

Put work, in solid-state physics, is defined as the work required to separate two nearest-neighbors of opposite charge in an ionic solid. The put work is equal to the electron affinity of the ion involved, multiplied by the charge on the ion.

Pyramidal. A. In crystallography, pertaining to a crystal system in which the faces are pyramids. B. In an oblate spheroid, having a greater polarization than a prolate spheroid.

P.V.C. Polyvinyl chloride.

Pyro- or pyr- are prefixes used in chemistry to denote a compound or process that involves heat. For example, pyrolysis is the process of decomposition of a material by heat, often in the absence of oxygen.
pyrolysis. A common expression for the compound tetraiodium pyrophosphate, \(\text{Na}_2\text{P}_2\text{O}_5\), either hydrous or anhydrous. A.G.I.

pyroxene. A mineral of the hydrocalcite group occurring in goldite submetallic scales also brownish with partly to greyish luster, 6.5MgO. FeO. CO. Li,AlO,; hardness, 2 to 3; specific gravity, 2.07; a silvery-white variety is known as iegromerite. Lassen, p. 80.

pyroxolite. A fire-red basic vadacite of manganese and lead, \((4,\text{Mn},\text{Pb})\)O.\(\text{V}_2\text{O}_5\); H.O; Orthorhombic; minute acicular crystals. From Lamn san, Sweden. English. A vanadium ore. Osbome.

pyrobitumina. a. A dark-colored, solid, infusible substance, associated with a matrix of silicified sand, in kerogen shales and which yield liquid and gaseous hydrocarbons on heating. A.G.I.

pyrobituminos. Yielding bituminous products on heating. Webster 3d.

pyrobituminous shale. Another name for oil shale. Tomkiewicz, 1954.

pyrobole. See pyrobole. A.G.I.

pyrocumulus. Trade name for pyroceram. A.G.I.

pyroclast. a. A fragmentary and usually devitrified glass; one equivalent material made in the United Kingdom under license known as Prosil. See also devitrified glass; Pyroil. Dodd.

pyroclastics. A complete series of sodium, calcium and niobium, \(\text{NaCaNb}_2\text{O}_6\).. Tantalum, rare-earth metals, and other elements may be present. Isometric. Color, brown to black; streak, light brown; Mohs' hardness, 5 to 5.5; specific gravity. 4.2 to 6.4. Forms a series with microcline. Koppite is a variety of pyroxene. Found in M airon; California, Colorado; Africa; Europe. One ore of niobium. Dana 17; C.C.D. 64, 1961.

pyroclase. Manganese hydrate, a mineral occurring in foliated forms with pearly luster, resembling brucite. It is white when fresh, but changes to brown and upon exposure to moisture. Trigonal. Fay.

pyroclastic. Produced by explosive or aerial ejection of material from a volcanic vent. Applied to the deposit as well as the texture formed. Stites and Varnes, 1955.

pyroclastic deposits. Deposits made up mainly of rock material that has been expelled aerially from a volcanic vent, such as agglomerate, tuff, and ash. The fragmental material is usually a great block to the finest dust or ash. Such deposits are usually designated according to the lavas to which they are related in composition. Stites and Varnes, 1955.

pyroclastic rocks. a. A general term for unconsolidated volcanic rock, including volcanic agglomerates, breccias, tuff, breccias, tuffs, conglomerates, and sandstones and shales. Any rock made up of unworked solid material of whatever size explosively or spherically ejected from a volcanic vent. Webster 3d.

pyroclasts. a. A general term for fragmented deposits of volcanic ejecta, including volcanic agglomerates, tuff, and ashes. Holmes, 1920. b. The term is not strictly the equivalent of fragmental volcanic since much of the superficial material of certain types of flows, such as lavas of Hawaii, is fragmental. Neither is pyroclastic material always the product of explosive eruptions, for Phlegraean Fields and also large amounts of pumiceous cinders are produced during the most quiet volcanic activity of the Kilauean type. It appears that the most careful usage would limit the term to detrital material which has been ejected mainly from a volcanic vent. A.G.I.

pyroclasticite. Crystallized from a molten magma. Webster 3d.

pyroelectricity. Positive and negative changes of electricity which simultaneously develop on different parts of the same crystal when its temperature is suitably changed, for example, in tourmaline. C.T.D.

pyroelectric material. A term introduced to designate minerals developed at high temperature in melts containing only a small proportion of volatile (hyperfusible or fugitive) constituents. The first stage of consolidation of magma, during which only pyrogenic and other gases were formed, is referred to as the orthomagmatic stage. Synonym for pyrogenic. Webster 3d.

pyrogenic rock. o. The anhydrous minerals of igneous rocks, usually developed at high temperature in magmas containing only a small proportion of volatile (hyperfusible or fugitive) components. Examples are the feldspars, pyroxenes, and olivines. A.G.I.

pyrogenic. A term essentially equivalent to igneous; formed through the effects of high temperature. A.G.I.

pyrogenic ore minerals. Ore minerals which crystallized from magmatic minerals of igneous rocks. Schieferdecker.

pyrogenic rocks. Used by Grabau for all rocks resulting from cooling of a molten magma. See also pyrolytic. Synonym for igneous rock. A.G.I.

pyrogenous. a. Formed by fusion; igneous, as pyrogenous rocks. Standard, 1964.

pyrogenous rock. Native magnesium disoxide, \(\text{MgO}\); a soft, iron-black or dark steel-gray mineral. Tetragonal. The principal ore of magnesium. Also used as an oxidizer and a decolorizer. C.T.D.; Webster 3d.

pyrolysis. Chemical decomposition by the action of heat. Barre 1; Mitchells, W."c.

pyrolytic. a. Pyrolysis is the decomposition of a material by heat; a pyrolytic coating is a thin coating produced by the breakdown of a compound on a hot surface. Some types of resin are made by the pyrolytic coating of an electrically resinoid and carbon. Pyrolytic coatings of BN, SiC, and graphite, have been applied to components for their protection during exposure to high temperatures.

pyrolytic graphitic. Graphite formed by pyrolysis of a carbonaceous gas. C.T.D.

pyrolysis. The decomposition of a coal, especially lignite, by heat in the absence of an atmosphere. Applied to the deposits as well as the effects of heat upon the magnetic properties of substances. Webster 3d.

pyrometer. An instrument for measuring temperatures above the range of thermometers usually by the increase of electric resistance in a metal when heated; by the generation of electric current by a thermal couple when acted upon by direct heat or focused radiation; or by the increase in intensity of light radiated by an incandescent body as its temperature increases. Webster 3d.

pyrometamorphic. Contact metamorphism. Hest.

pyrometers. a. An instrument for measuring temperatures beyond the range of thermometers usually by the increase of electric resistance in a metal when heated; by the generation of electric current by a thermal couple when acted upon by direct heat or focused radiation; or by the increase in intensity of light radiated by an incandescent body as its temperature increases. Webster 3d.

pyrometamorphic. Formed by metasomatic changes in rocks, principally in limestone, or near intrusive contacts, under influence of magmatic material above a high temperature and pressure. A.G.I.

pyrometamorphic deposits. Closely allied to hydrothermal deposits is the group known as pyrometamorphic. This group includes contact metasomatic deposits in limestone not the products of granite intrusives, but the inclusive term, pyrometamorphic, recognizes the fact that the group is not restricted to the vicinity of contacts. Although carbonate rocks are the typical hosts, a few pyrometamorphic deposits occur in schists and gneisses, and may not originally have been contained alkali earth carbonates. Calcium and magnesium, if not supplied by the host rocks, must have been introduced by ore solutions, as the distinguishing trait or the deposits is the presence of silicates of these elements. But shallow intrusive deposits may be regarded as hydrothermal deposits whose host rock was limestone. McKee, 1939.

pyrometamorphism. Contact metamorphism. Hest.

pyrometric cone. A small, slender three-sided pyramid made of ceramic or refractory material for use in determining the time-temperature effect of heating and in obtaining the pyrometric cone equivalent (P.C.E.) of refractory material. A.R.F. Practically all pyrometric cones are made in series, the temperature interval between successive cones usually being 20°C. The best known series are Segar cones (Germany), Orton cones (United States), and Staffordshire cones (United Kingdom). Dodd.

pyrometric cone equivalent. The number of...
pyrometric cone equivalent

that standard pyrometric cone whose tip would touch the supporting plaque simulta-
neously with a cone of the refractory material being investigated when tested in ac-
cordance with the Method of Test for Ceramic Envi-
ronmental. ASTM. ASTM Designation: C24. The terms fussion point, softening point, deformation point, and melting point have heretofore been loosely used for pyrometric cone equivalent. Abbrevia-
tion, PCE. ASTM C71-64.

pyrometry. The techniques and methods of measuring high temperatures; especially the art of using a pyrometer. Webster 3d. pyromorphite: green lead ore. A chloroph-
osphate of lead, Pb5Cl(PO4)3, a member of the apatite group. Hexagonal. A mineral of secondary origin; weakly radio-
active; yellow, brown, green, gray, or white; found in the oxidized zone of lead deposits. Some specimens of pyromor-
phite have been reported containing uranium. A.G.I.; Dana 17; Crosby. p. 131. pyromorphite: crystallizing from a molten state. Webster 3d.

pyromorphite. An explosive containing the ingredi-
ents of gunpowder, and also aniti-
mony, bismuth, and carbon tetrachloride and chromite, and flour. Fay.

type. The fiery-red garnet; a silicate of magnesium, iron, and aluminum, in a crystallizing in the cubic system. It is often perfectly transparent and then prized as a gemstone; red, yellow, or colorless. Fay.

pyropine. A variety of opal that by the absorption of melted glass is made trans-
lucent when hot, but becomes opaque again on cooling. Standard, 1964. Syno-
m for fire opal. Fay.

pyropine. A deep blood-red scaly mineral with 1 perfect and 1 less perfect cleavage, Mn3TiO6; Moth's hardness, 5; specific gravity, 4.94. Larsen, p. 94; Dana 6d, p. 1045.

pyropine. Alloys capable of pro-
ducing sparks when struck sharply at a certain angle; used as flints in lighters. Nelson.

pyropine. A variety of splatterite that gives off sparks or glows when cold and bared. Some pieces are so sensitive that the effect is obtained by scratching them with a fingernail. Hess.

pyropilite. A natural hydrous aluminum silicate, Al2SiO(OH)4, found in meta-
orphic rocks; monoclinic. Color, white, green, gray, brown; luster, pearly to greasy; good micaceous cleavage; specific gravity, 2.8 to 2.9; Mohs' hardness, 1 to 2. Found in North Carolina, California; Newfoundland; Japan. Used in ceramics, slate pencils, substitute for talc. Also called pencil stone. Fay; Dana 17; CCD 6d, 1961.

pyropilite. Same as pyrophyllite. A coarse, nearly opaque, variety of topaz. Fay.

pyrophosphate. Yellowish-white resin and wax that flows off specks or glows when cold, and pyropilites are frequently closely mixed, and are called pyrophytic brown coal. Stutter 1960, p. 120.

pyrophylite brown coal. Closely mixed resin and wax coal and brown coal. See pyrophilite.

pyrophylite. The irreversible de-
formation suffered by many ceramic ma-
terials when heavily stressed at high tem-
peratures. The term has been applied particularly to the slow deformation of fireclay refractories when loaded at high temperatures. Dodd.

pyroplastic. The physical state induced by soaking heat which permits a refractory body to be readily deformed under pres-
sure or by its own weight. Dodd.

pyroplastic deformation. The physical state induced by soaking heat which permits a refractory body to be readily deformed under pres-
sure or by its own weight. Dodd.

pyroplastic deformation. The irreversible de-
formation suffered by many ceramic ma-
terials when heavily stressed at high tem-
peratures. The term has been applied particularly to the slow deformation of fireclay refractories when loaded at high temperatures. Dodd.

pyrole. A brown, greenish-black resin that occurs in brown coal, near Aussig, Bohemia; specific gravity, 1.05 to 1.18. Fay.

pyroantracone. A chrysis or shell containing suffi-
cient hydrocarbons to burn with a bright flame, or one yielding volatile hydrocar-
bons or inflammable gas when heated. Fay.

pyroantracone. A device that, by a change in shape from its black oxide or during its temperature or, more correctly, the combined effect of time and temperature (which has been called heat work). The bat known pro-
duction point, deformation and a time and temperature (which has beencalled heat work). The bat known pro-
duction point, deformation point, and melting point have heretofore been loosely used for pyrometric cone equivalent. Abbrevia-
tion, PCE. ASTM C71-64.

pyroantracone. A device that, by a change in shape from its black oxide or during its temperature or, more correctly, the combined effect of time and temperature (which has been called heat work). The bat known pro-
duction point, deformation and a time and temperature (which has beencalled heat work). The bat known pro-
duction point, deformation point, and melting point have heretofore been loosely used for pyrometric cone equivalent. Abbrevia-
tion, PCE. ASTM C71-64.

duction point, deformation and a time and temperature (which has beencalled heat work). The bat known pro-
duction point, deformation point, and melting point have heretofore been loosely used for pyrometric cone equivalent. Abbrevia-
tion, PCE. ASTM C71-64.
of water, quantity of gas. Zimmerman, p. 87.

g. Quaquaversal. A small capacity water tunnel commonly used in the Middle East. Sandstrom.

Q factor. Q, the factor of merit, is the ratio of reactance to resistance and indicates the relative effectiveness of capacitor reactance with respect to resistance. It increases as the effective series resistance of the capacitor decreases. A high Q value thus indicates high capacity quality. For values greater than 10, Q is almost equal to the reciprocal of the power factor. Snow.

q shell. Seventh (outermost) electron shell.

square. A four-sided plane figure of any shape, having an area equal to the product of the sides multiplied by half the sine of the angle between them. Ham.

quadrature. A gruitone with a calcareous cement. Fay.

quantum. A. A block of pairs, each having four leaves, reeved with rope or cable and used to increase the lifting capacity of a crane. a. A square block and tackle. Long.

quacuum. Soft, wet, mired land that shays or yields under the foot. Webster 3d.

quakie. A bog that shays under foot, consisting of growing peat saturated with water. Snow.

quakies. A. A quarter of a circle; an arc. Webster 3d. b. Any of the four parts into which a plane is divided by two perpendicular lines. Webster 3d. c. A one-fourth part of the perimeter of the face of a bit crown. Long. f. A curved scale for measuring angles. Webster 3d.

quadrilateral. A. A four-sided plane figure of any shape, having an area equal to the product of the sides multiplied by half the sine of the angle between them. Ham.

quantitative survey. See ventilation survey.
quarry

A large open pit, or mine, in which stone or other material is extracted. The term is also used to describe the material extracted from such a deposit. The word "quarry" comes from the Old French "quarier," meaning "to divide" or "to separate." In its proper significance, a quarry is a stone mine and may be located on land or under water. Terms such as quarrying, quarrying machine, and quarry worker can be found throughout the text.

quarry bar. A horizontal bar supported at each end by legs and used to carry material. See also floor level.

quarry bird. A blasthole drill.

quarrying machine. Any machine by which to drill holes or cut tunnels in native rock; a gang drill, or tunneling machine, but most commonly a small form of locomotive, bearing rock-drilling mechanism, and operated from a heating car or locomotive. The term is also used to describe the metal component of a coal mining machine. See also constructional work.

quarrying. The activity of extracting stone or other materials from a deposit.

quarryman. A man employed at the face of a quarry, stripping, digging, excavating, and loading rock or economic product. Quarrymen can only be learned by experience. Nelson. b. One who operates a jackhammer to drill holes in quarry stone, and of whom wedges into the holes to break or split off slabs or blocks of stone. Also called hammerman; plug-and-feather driller; rockman; rock splitter. D.O.T. 1. In crushed rock quarries, a laborer who performs any one or combination of such duties as: loading rock into boxes or capes out of quarry pit; assisting in moving power shovels from one loading position to another; dumping rock from cars into crusher or storage bins; feeding rock into a crushe; tending belt conveyor that transports crushed rock from crushe to storage bins; loading crushed rock from storage bins into trucks or railroad cars. D.O.T. 1. d. In building stone quarries, as to clean and regularize the material by dressing it, to dress and ready it, to measure and weight it, to cut or break it, to load it, and to sell it.

quarrying machine. A machine employed at the face of a quarry, stripping, digging, excavating, and loading rock or economic product. Quarrymen can only be learned by experience. Nelson. b. One who operates a jackhammer to drill holes in quarry stone, and of whom wedges into the holes to break or split off slabs or blocks of stone. Also called hammerman; plug-and-feather driller; rockman; rock splitter. D.O.T. 1. c. In crushed rock quarries, a laborer who performs any one or combination of such duties as: loading rock into boxes or capes out of quarry pit; assisting in moving power shovels from one loading position to another; dumping rock from cars into crusher or storage bins; feeding rock into a crushe; tending belt conveyor that transports crushed rock from crushe to storage bins; loading crushed rock from storage bins into trucks or railroad cars by a large crane. Webster 3d.

quarryman. a. A man employed at the face of a quarry, stripping, digging, excavating, and loading rock or economic product. Quarrymen can only be learned by experience. Nelson. b. One who operates a jackhammer to drill holes in quarry stone, and of whom wedges into the holes to break or split off slabs or blocks of stone. Also called hammerman; plug-and-feather driller; rockman; rock splitter. D.O.T. 1. c. In crushed rock quarries, a laborer who performs any one or combination of such duties as: loading rock into boxes or capes out of quarry pit; assisting in moving power shovels from one loading position to another; dumping rock from cars into crusher or storage bins; feeding rock into a crushe; tending belt conveyor that transports crushed rock from crushe to storage bins; loading crushed rock from storage bins into trucks or railroad cars by a large crane.
quartz. a. A quartz rock derived from sandstone, composed dominantly of quartz, and characterized by such thorough inhomogeneity, e.g., through cementation with y-silica or through recrystallization, that it is essentially homogeneous and breaks with various grains and matrix or interstitial material with approximately equal ease. Such a stone possesses a very low degree of porosity and the broken surfaces are relatively smooth and vitreous as compared with the relatively high porosity and the rough surfaces of sandstone. ASTM C119-50. There are two types (1) metasandstone, a metamorphic rock usually derived from sandstone, and (2) orthoquartzyte, a sedimentary rock consisting of grains of silica sand, cemented slickly by at least 10 percent of precipitated silica. HW. b. Stone composed of silica grains so firmly cemented by silica that fracture occurs through the grains rather than around them. Balmuto B. 3. 630, 1965, p. 876. c. Accenta in a rock or sandstone by drillers, a very hard, dense sandstone. Land. d. A granulosaic metamorphic rock consisting essentially of crystals of quartz, e.g. Sandstone cemented by silica which has grown in optical continuity around each fragment. Holm. e. Quarzite. Of or consisting of quartz or quartz rocks. Fay. f. Quartz locustings. See banded quartz-hematite ore. Hess. g. Quartz keratophyre. A type of soda trachyte carrying accessory quartz. C.T.D. h. Quartz latency. The deposit of quartz in the form of veins or ore. Hess. i. Quartz monzonite. A plutonic rock containing accessory quartz. C.T.D. j. Quartz veins. A deposit of quartz in the form of veins or ore. Fay. k. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. l. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. m. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. n. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. o. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. p. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. q. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. r. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. s. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. t. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. u. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. v. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. w. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. x. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. y. Quartz vein. A deposit of quartz in the form of veins or ore. Hess. z. Quartz vein. A deposit of quartz in the form of veins or ore. Hess.
that the series may be represented as binary on a phase diagram. *ASM Gloss.*

**quaternary**. Consisting of four components. *Ref.*

**Quebec City** series. Same as Quebec group.

**quaternary**. The younger of the two geologic periods or systems in the Cenozoic era. Subdivision of the Tertiary and Pleistocene, hut Pleistocene is generally subdivided into Pleistocene and Recent. *G.I.*

**quaternary steel**. Steel composed of the usual elements, as nickel and chromium. *Webster 3d.*

**Quaternary.** The youngest of the two geologic periods or systems in the Cenozoic era. Includes beds from the Precambrian to the end of the Tertiary up to and including the Pleistocene. *ASM Gloss.*

**queen**. A fissure, joint, or small cavity, as in a rock or vein of quartz. Also called quarry lode. See also queery ground. *Fay.*

**queener.** A fissure, joint, or small cavity, as in a rock or vein of quartz. Also called quarry lode. See also queery ground. *Fay.*

**queensware.** Glazed English earthenware of better quality than porcelain. Also called *semi-porcelain.* *Webster 3d.*

**queenstone.** A hydrous basic mafic igneous rock consisting of olivine (harrangite known). *ASM Gloss.*

**quequetite.** See copiapite. *Larsen, p. 263.*

**queuey ground.** Ground in a loose, incoherent condition; often a small lode. *Fay.*

**quick**. A. Nov. Eng. A fissure, joint, or small cavity, as in a rock or vein of quartz. Also called quarry lode. *Fay.*

**quickage.** Aging induced by rapid cooling after solution heat treatment. *ASM Gloss.*

**quickness.** A. Generally means cooling steel from above the critical range by immersing in oil or water, in order to harden it. Also applied to cooling in salt and molten metal baths or by means of an air blast, or in oil. *Webster 3d.* B. To produce a condition where the character of metal is changed so that some or all of the martensitic structure is transformed to ferrite or bainite. *ASM Gloss.*

**quick-cool**. A. To cool suddenly (as heated steel) to a temperature in water or oil. *Webster 3d.* B. To produce a crust or a succession of crusts on (molten metal); each crust removed as it is formed. *Standard, 1964.*

**quickzag**. Aging induced by rapid cooling after solution heat treatment. *ASM Gloss.*

**quebracho.** Aqueous extract of a bark of the quebracho tree, contains up to 65 percent tannin. Used in froth-flotation as depressant. *Sinclair, W. E., pp. 254-255.*

**quebracbo.** Aqueous extract of a bark of the *quebracho* tree, contains up to 65 percent tannin. Used in froth-flotation as depressant. *Sinclair, W. E., pp. 254-255.*

**quebracho.** Aqueous extract of a bark of the *quebracho* tree, contains up to 65 percent tannin. Used in froth-flotation as depressant. *Sinclair, W. E., pp. 254-255.*

**quebrachol.** A manganese-garnet (spessartite) frit to a blast of air and water, or to pass through a series of boxes (four in number) the first three of which contain screening material consisting of wire mesh of different sizes. They are superimposed one above the other. A regular shaking movement results in the shortest fibers in the sample passing through from the top box to either box 2 or 3 according to its length, while the finest material falls into the bottom pan. After a two-minute test, the fiber in each tray is weighed and the results indicate the proportionate lengths of fiber contained in the product. *Sinclair, W. E., pp. 254-255.*

**quebracho.** Aqueous extract of a bark of the *quebracho* tree, contains up to 65 percent tannin. Used in froth-flotation as depressant. *Sinclair, W. E., pp. 254-255.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*

**quicklime.** A common name for an oxide of calcium made by calcining calcium carbonate (quicklime sizes). *ASM Gloss.*
quicklime sizes

ble or crushed—2½ inch and smaller, (3) ground, screened, or granular—½ inch and smaller, (4) pulverized—sub-
stantially all passing a No. 20 840-micron sieve. ASTM CS1-47.

quick sand, a. Sand saturated with water; (1) underground, quicksand tends to run with salt, softening and being rain-
ported at all points. Foroping with closely placed faceboards and the use of bottom boards is required; in major jobs freezing is adopted, and (2) at the sur-
face, quicksand has no bearing capacity, but can be proved in this respect by thorough draining. Nelson, b. Sand which is (or becomes, upon the access of water) quick, that is, yielding, easily moving, or, as say. Also called running sand.

quicksand. Containing or abounding in quicksand. Fay.

quicksanton. A hydraulic cement. A hydroalumina-calcium silicate or calcium sulfate-base ce-
ment that, because of its special composition and fineness of grind, sets in a shorter period of time than ordinary build-
er's or portland-type cements. Long.

quicksaw. A saw which has a quick-leveling head. Ham.

quicksilver. a. A common name for mercury; one of the metallic elements, remarkable for its low melting point, being liquid down to minus 40°F. Fay. b. To overlay with, or as if with quicksilver, especially to coat (glass) with an amalgam of quick-
silver an tin in making mirrors. Webster 3d. c. Symbol for Hg, the reflecting surface of looking glasses. Stand-
ard, 1964.

quicksand. A wooden box placed in a sloping position, and fixed upon rockers, in which gold-bearing gravel is washed, the quicksand being mercury in the lower part of the cradle. Fay.

quicksilvering. The process of coating with mercury. See also quicksilver, c. Standard, 1964; Fay.

quicksilver rock. An altered serpentine con-
sisting mainly of dark opal and chlorite-
dony and commonly associated with the ore in mercury deposits in serpentine.

quicksilver water. See quicksilvering. Fay. quick test. A shear test of a cohesive soil with a small knife inserted. Fay. c. Shear test. See also drained shear test; unconsoli-

quicksilver. A dilute solution of nitrate of mercury and gold, used in the process of water eiling. Fay.

quicksilvering. a. The degree of purity of gold

quicksand. a. A slow-burning fuse made formerly of the quill of a feather filled with powder-
dust, or of a shoe-shaped, bushing sitting around and splined or keyed to the drive rod or screw in a drill swivel head. It transmits pressure from the drive motor to the drive rod and causes the drive rod to be rotated. Long. c. Sometime. Inteirely used as a name for drive rod and/or drivescrew. Long.

d. A sleeve or hollow shaft that slides over, or revolves upon, a solid shaft; used in the design of some clutches or in a flexible coupling of the driving shaft and the driven shaft of two machines. Long. e. A hollow or tubular shaft, designed to slide or revolve, carrying a rotating member within itself. ASM Gloss. f. Quick shaft. A light drive shaft inside a heavier one, and turning independently of it. Nichols.

quicksand. Light carmine-red particles found in a limestone near Quincy, France; color apparently organic; a doubtful mineral. Dana ed., 1970.

quicksilvery electrode. A half cell with a platinum or gold electrode in contact with a solution saturated with quick-
hydromagnesite. (CaMg3(PO4)2(OH)2). Lowenheim.

quicksand. Equals quicksand. Webster 3d.

quicksand. a. A metric unit that equals 100 kilograms. Webster 3d. Abbreviation, q. Zimmerman, p. 87. b. Any of various units of weight, used especially in Latin American and Mediterranean countries, that equals from 100 pounds to about 130 pounds; e.g., the en. Webster 3d. f. Handbook of Chemistry and Physics, 45th ed, 1964, p. 710.

quicksand. a. A release of a claim; a deed of release; specifically, a legal instrument by which some right, or river. Also abbreviated r. Zimmerman, p. 92. Abbreviation for resistor. Zimmerman, p. 92. Symbol for ohm. Zimmerman, p. 76. i. Abreviation for rain. Also abbreviated r. Zimmerman, p. 88. j. In earthquake seismology, a phase designation applied to Rayleigh waves. Syno-
ym for Lg. A.G.I.

quicksand. a. A release of a claim; a deed
quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.

quicksand. a. A release of a claim; a deed
for production rate. Zimmerman, p. 163.
rabbler. a. An iron scraper serving for a rake in removing scoriae from the surface of melted metal. Fay. b. A charcoal burner's sharp metallic tool to remove coke from underneath to the base of a masonry fire by hand or mechanically. Webster 3d.

racking. a. An inclined trough for washing or racing. In S. Wales, a term for topping. Webster, 1954.

race. a. An aqueduct or channel for conveying water to or from the place where it performs work. The former is termed the head race, and the latter the tail race. Gray, 1935. b. See raceway. c. Eng. The space in which a winding drum revolves. Fay. d. To scrape or clean, as a grater to make it round and more abrasive. Standard, 1964. e. A small thread of spar or ore. Fay. f. Scot. A set or train of hitches coupled together. Fay. g. See flume. B.S. 3618, 1963. h. A groove along which some part of a machine moves, such as the annular ring in a ball bearing that guides and holds the balls in place. Long. i. The excessive speed at which an engine runs when the governor fails to control its speed. Long. j. Raceway. The term is applied to conduits, moldings, and other hollow material, often concealed, through which wires are fished from one outlet to another. Crispin.

rack. a. An engine or channel for conducting water to or from the place where it performs work. Fay. b. A device for vertical or horizontal transport of logs. Long. c. To move the drilling machine away from the borehole collar by sliding it on its base, using the rack-and-gear pinion to facilitate moving the machine. Long. d. To stack and arrange the drill rods in an orderly fashion in the tripod, mast, or derrick, or horizontally on a rack provided on the ground. Long. e. To place core on a rack. Long. f. See rem. ASM Gloss.

rack. a. An inclined trough for washing or separating ore. Nelson. b. A toothed or notched drill-bar-slide and meshing-gear pinion used to facilitate the moving of a drill to clear the borehole when hoisting or lowering the drill string; generally limited to larger, skid-mounted machines. Long. c. A framework of wood or metal for the orderly storage of core, pipe rods, etc., in a horizontal position. Long. d. Tilting table on which concentrates are separated from passing flow of finely ground pulp, system being arranged to be periodically self-flushing. Rack is an old term for concentration in sluice boxes. Also called reck;ragging frame. Pryor, 1930. e. A screen composed of parallel bars to exclude large particles. Long. f. 1. I. In placing a frame used for suspending and conducting current to one or more cathodes. See Journ. Amer. Luminet. 2. See race. See raceway. 3. See rack. 4. Long.

rack-a-rock. a. Mining explosive based on mixture of nitrocellulose, chlorate and nitrobenzene. Pryor, 1930.

rack back. To move the drilling machine from passing flow of finely ground pulp, system being arranged to be periodically self-flushing. Rack is an old term for concentration in sluice boxes. Also called reck; ragging frame. Pryor, 1930. e. A screen composed of parallel bars to exclude large particles. Long. f. 1. I. In placing a frame used for suspending and conducting current to one or more cathodes. See Journ. Amer. Luminet. 2. See race. See raceway. 3. See rack. 4. Long.

rack-a-rock. a. Mining explosive based on mixture of nitrocellulose, chlorate and nitrobenzene. Pryor, 1930.

rack back. To move the drilling machine from passing flow of finely ground pulp, system being arranged to be periodically self-flushing. Rack is an old term for concentration in sluice boxes. Also called reck; ragging frame. Pryor, 1930. e. A screen composed of parallel bars to exclude large particles. Long. f. 1. I. In placing a frame used for suspending and conducting current to one or more cathodes. See Journ. Amer. Luminet. 2. See race. See raceway. 3. See rack. 4. Long.
radial machineman

moving across the working face. Also called arcwall machineman. D.O.T. 1.

radial peeler. Laminar. A heavy coal cutter for use in headings and rooms in pillar methods of working. The machine weighs about 12 hundredweight and is usually mounted on a light carriage to suit the mine track. A percussive drill, with extension rods, makes a horizontal cut about 3½ feet deep and 15 feet wide at any height in the heading. The central column is tightened between roof and floor about 4½ feet from the face. The machine can also be used for drilling shoftering holes. Nelson.

radial pressure. The radial pressure of wire rope is a function of the rope tension, rope diameter, and tread diameter. The radial pressure can be determined by the following equation: \( P = \frac{F}{D} \) where \( P \) equals radial pressure in pounds per square inch; \( F \) equals rope tension in pounds; \( D \) equals rope diameter in inches; and \( t \) equals rope diameter in inches. ASA M11.1-1960, LBL.

radial ram. The angle between the tooth face and a radial line passing through the cutting edge of the cutter parallel to the cutter axis. ASM Gloss.

radial removal. The total variation in the radial distance of all cutter teeth in a plane of rotation. ASM Gloss.

radial striking. A method of caving by which all the ground around a central raise is caved by a series of slices or drum or drum in inches; and \( d \) equals rope diameter in inches. ASA M11.1-1960, LBL.

radial stress. The change in length per unit length in a direction radially outward from the charge. R. 1., 3536, 1937, p. 4.

radial vent. A radiation detector mounted on one side of the pipe. A radiation detector is mounted in a lead-shielded holder on one side of the pipe. Radiation pyrometers are used for measuring temperatures to 7,000°F. The device is used in automatic control systems in mineral dressing and the like. Nelson. p. 505.

radial ventilation. A ventilation system in which a number of downcast shafts are arranged to permit the entry of air into the working area. The downcast shafts are served by a common upcast shaft, which is divided into sections by means of air, or in drum holes to detect, and/or indicate the occurrence or the nearby presence of radioactive materials. All radiation detectors, whether gamma-ray, Geiger counter, Geiger-Mueller counter, or scintillation counter detector, are used for this purpose. Radiation detector. ASM Gloss.

radial zone. Sometimes known as compound ventilation. ASM Gloss.

radial dose. Accumulated exposure to radiation during a specified period of time. ASM Gloss.

radial energy. The energy of a given photon or particle in a beam of radiation, usually expressed in electron volts. ASM Gloss.

radial gauge. An instrument for measuring the intensity and quantity of radiation. ASM Gloss.

radial hazard. The danger to living things resulting from the presence of radiation, generally refers to the danger to health from exposure to radiation. Hem.

radial traverse. The process of emitting radiant energy in the form of waves or particles; also, the path of an electron, or other charged particle, through a medium. ASM Gloss.

radial velocity. A linear velocity perpendicular to the cutter axis. ASM Gloss.

radial velocity. A linear velocity perpendicular to the cutter axis. ASM Gloss.

radial virial. A device for metering fuel material. ASM Gloss.

radial zone. Sometimes known as compound ventilation. ASM Gloss.
radioactive dating

radioactive decay: The change of one element into another by the emission of charged particles from the nuclei of their atoms.

radioactive dating; radiocarbon dating. A method for determining the age of rocks and minerals through the study of the radiocarbon of carbon 14; a radioactive isotope of carbon; it has a half-life of 5,730 years.

radioactive decay: The change of one element into another by the emission of charged particles from the nuclei of their atoms.

radioactive dating: A method for determining the age of rocks and minerals through the study of the radiocarbon of carbon 14; a radioactive isotope of carbon; it has a half-life of 5,730 years.

radioactivity: The property possessed by certain elements, such as uranium minerals, of spontaneously emitting alpha, beta, and/or gamma rays; that disintegrates the nuclei of their atoms.

radioactive minerals: Six radioactive metals. See radnata. 41.

radioactive decay: The change of one element into another by the emission of charged particles from the nuclei of their atoms.

radioactive minerals: Six radioactive metals. See radnata. 41.
radiograph. A. A siliceous earth composed of radiolite. A variety of natrolite, especially radioisotope; radioactive isotope. A. An unproductive mine. Pryor, 3d.
radiography. A. A nondestructive method of inspection of solids by transmitted light. When the exciting current is energized, a current is induced in the detector coil, and this current is then amplified and displayed on a meter. The latter transmits readings of temperature and pressure at any point on the ground. This equipment can be used for weather forecasting under all weather conditions and at considerable heights.
radiology. The science of radioactive substances, X-rays, and other high-energy radiations. Specifically, the use of sources of radiant energy in the diagnosis and treatment of disease. Webster 3d.
radiometry. A. The science of radioactive substances, X-rays, and other high-energy radiations. Specifically, the use of sources of radiant energy in the diagnosis and treatment of disease. Webster 3d.
radiometric assay. A test with a radioassay unit to determine the isotopic composition of a sample. See also equilibrium, c; c-, c-.
radiometric ore sorter. A device for separating ore from gangue by the use of a radiation detector based on the absorption of gamma rays by the ore before and after primary crushing. Each sorter head comprises a light source and detection unit, and scintillation counter. Each rock particle first falls in front of the light source and the amount of light intercepted produces a signal proportional to the amount of light that passes through the rock. The signal is then amplified and the radiation from the rock is directed to the radioactive detector. The radioactive detector then measures the percentage of radiation from the rock and the ore is rejected or accepted by the sorter. This system is particularly useful for the detection of ore bodies that are difficult to see with other methods.
radiometric prospecting. Use of portable Geiger-Muller apparatus for field location of ore deposits. See also equilibrium, c; c-.
radiocell. See radiocell.
radiojod. See radiojod.
radiodex. Common opal of a smoky color. See also equilibrium, c; c-.
radioisotope. A. A white, hydrous calcium carbonate. See also equilibrium, c; c-.
radiometer. An F.M. apparatus using the principle of a radioisotope. See also equilibrium, c; c-.
radiometric assay. A test with a radioassay unit to determine the isotopic composition of a sample. See also equilibrium, c; c-.
radiometric ore sorter. A device for separating ore from gangue by the use of a radiation detector based on the absorption of gamma rays by the ore before and after primary crushing. Each sorter head comprises a light source and detection unit, and scintillation counter. Each rock particle first falls in front of the light source and the amount of light intercepted produces a signal proportional to the amount of light that passes through the rock. radius B

radius C. A name for polonium 214, a member of the uranium disintegration series; symbol, RaC; and half-life, 1.64 X 10^-4 seconds. NRC-ASA NI.1-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-80.

radius C*. A very short-lived radioactive element of the uranium disintegration series, formed by the decay of 0.04 percent of the atoms of radium C. It is on the 10th generation of elements formed in the decay of uranums 238. Symbol, RaC*; atomic number, 81; atomic weight, 211.3. Blatt and Lederer, 2, p. 208. Actinon, ThC* (thallium 208), and AcC* (thallium 207), and thallium (being thallium 210); emits beta particles and gamma rays; half-life, 1.32 minutes; and degrades to radium D (lead 210). Hesi; Glazstone, 2, p. 139.

radius D. A name for radium 210, a member of the uranium disintegration series; symbol, RaD; and half-life, 21 years. NRC-ASA NI.1-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-77.

radius E. A name for bismuth 214, a member of the uranium disintegration series; symbol, RaE; and half-life, 21 years. NRC-ASA NI.1-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-78.

radius E*. A name for thallium 206, a member of the uranium disintegration series; symbol, RaE*; and half-life, 4.50 minutes. NRC-ASA NI.1-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-80.

radius F. A name for polonium 210, a member of the uranium disintegration series; symbol, RaF; and half-life, 138.40 days. NRC-ASA NI.1-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-77.

radiometric. A mixture of black pitchblende, yellow uraninite, and orange gummite. Schaller.

radium. See uranium minerals. Pryor, 3.

radiation. Horizontal distance from the center of rotation of a crane to its hoisting hook. Nichol.

radiation safe load indicator. A freely suspended pendulum hanging from a crane jib over a board on which are marked the maximum safe load at any angle, together with the safe load for each radium. Hesi.

radius of curve. A term used in laying mine track and is the calculation as to which will connect two pieces of track at a desired angle of direction from each other with a smooth curve section. Bureau of Mines Staff.

radius of gyration. The value used when calculating the moment of inertia of a shaped form, which is the radius of a circle whose moment of inertia is equal to the moment of inertia of the shape. The value of radius of gyration is given the symbol \( r_g \). Tate. See moment of inertia of a circle for derivation of the relationship.

radius of influence of a well. The distance from the center of the well to the closest point at which the parametric surface is in its moment of inertia, the radius of gyration is given the symbol \( r_g \). Tate. See moment of inertia of a circle for derivation of the relationship.

radius of rupture. In crane tests, the average distance from the center of the explosive charge to the periphery of the crater at the surface. R. H. S. 255, 1954, p. 4.

radius ratio. The ratio of the radius of the smaller ion to that of the larger ion. It may not exceed 1. Harris.

radome. A protective cone for the radar equipment in the nose of an aircraft, rocket, or space vehicle. A high altitude in the skin temperature may exceed 500' C and ceramic radomes become necessary; alumina and zirconium glass ceramics have been used. Dodd.

radon; radium emanation. A. A heavy, radioactive group of elements in the thorium series (inert gases) of Radon. Used in medicine and radiotherapy. Symbol, Rs; atomic number, 86; mass number of the most stable isotope (atomic weight), 222; density of gas, 9.73 grams per liter; melting point, -71' C; and boiling point, -61.8' C. Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, p. 130. b. Radon is the heaviest known gas. Colorless as a gas; yellow to orange-red as a solid; opaque crystals; specific gravity of liquid, 4.4 (at -62° C); and of solid, 4.0; insoluble in water; and slightly soluble in alcohol and 18 percent nitric acid. All 18 known isotopes from radon 204 to radon 224 are radioactive. Radon 222; emanates from radium 222; is an alpha particle emitter; radon 220 or thoron; emanates from thorium; half-life, 5.45 seconds; and an alpha particle emitter; radon 219 or acton; emanates from actinium; half-life, 3.92 seconds; and an alpha particle emitter; radon 218; is a large gas ray emitter. One part of radon exists in 1 sextillion parts of air. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-81, B-131.

Radstockian. A subdivision of the Coal Measures—based mainly on the contained floras. In part it is represented by the Upper Coal series with coal seams of S. Wales; no coal seams in the Midland and N. Wales coalfields. Nelson.

raft. The coarse ore after crushing by Cornish rolls. Fay.

raffinate. The aqueous solution remaining after uranium has been extracted by the solvent; the tailing of the solvent extraction system. Newton, p. 440.

raft wheel. A revolving wheel with side buckets for elevating the raff. Fay.

raft yard. N. A measuring yard on the surface, in which the smiths, wrights, carpenters, etc. work. Fay.

raft. See boat coal. A.C.I.

raft foundation. A slab of mine timbering in which the timbers appear like roof rafters. Fay.

ragged. Pulling down loose coal at the face before loading or setting supports. Nelson.

rag. A groove or channel in a masonry joint or in a special masonry unit (raggle block), to receive roofing, flashing, or other material which is to be sealed in the masonry. ACSG, 1961.

ragging-off. Pulling down loose coal at the face before loading or setting supports. Nelson.

ragman. A kind of paving stone. Arkell.

ragged rolls. Rolls with rough surfaces to facilitate the gripping of the steel in the first stages of rolling as distinguished from the smooth-finishing rolls. Merrisvera, 4th, p. 426.

ragged rolls. Pulling down loose coal at the face before loading or setting supports. Nelson.

ragged rolls. Pulling down loose coal at the face before loading or setting supports. Nelson.
rain gauge. A device for measuring the depth of rainfall. It consists of a graduated cylinder or a funnel and a container to collect the water. The water is then measured to determine the amount of rainfall.

rainfall. The total amount of water that falls from the sky in the form of rain. It is measured in millimeters or inches and can vary significantly depending on the location and season.

rainwater. Water that has fallen from the sky in the form of rain. It is considered to be the purest form of water as it has not come into contact with the atmosphere or soil.

rain wash. The process by which rainwater erodes the surface of the ground, carrying away soil and other materials. It is a natural process that helps to shape the landscape over time.

rainwater. Water that falls from the sky in the form of rain. It is considered to be the purest form of water as it has not come into contact with the atmosphere or soil.

rain wash. The process by which rainwater erodes the surface of the ground, carrying away soil and other materials. It is a natural process that helps to shape the landscape over time.

rain water. The purest form of naturally-occurring water on earth. It is described as soft water because it is free of minerals and other impurities. Rainwater is typically used for drinking purposes.

rainfall. The total amount of rain that falls over a given area as measured in a rain gage. It is typically measured in millimeters or inches and can vary significantly depending on the location and season.

rain wash. The process by which rainwater erodes the surface of the ground, carrying away soil and other materials. It is a natural process that helps to shape the landscape over time.

rainfall. The total amount of rain that falls over a given area as measured in a rain gage. It is typically measured in millimeters or inches and can vary significantly depending on the location and season.

rain wash. The process by which rainwater erodes the surface of the ground, carrying away soil and other materials. It is a natural process that helps to shape the landscape over time.

rainfall. The total amount of rain that falls over a given area as measured in a rain gage. It is typically measured in millimeters or inches and can vary significantly depending on the location and season.

rain wash. The process by which rainwater erodes the surface of the ground, carrying away soil and other materials. It is a natural process that helps to shape the landscape over time.

raked shaft. See raise. Fraentzel.

raise & tier. a. Shales containing vein, or lode, rutting through the strata. See sherake, M. and n.

raise classifier. A type of mechanical classifier utilizing reciprocal rakes on an inclined plane to separate coarse from fine material contained in a ore pulp, overflowing the fine material and discharging the coarse material by means of an inclined raking system. Bureau of Mines Staff.

raise blade. A dozer blade or attachment made of spaced tines. Nichols.

raise classifier. A type of mechanical classifier utilizing reciprocal rakes on an inclined plane to separate coarse from fine material contained in a ore pulp, overflowing the fine material and discharging the coarse material by means of an inclined raking system. Bureau of Mines Staff.

rake blade. A dozer blade or attachment made of spaced tines. Nichols.

rake classifier. A type of mechanical classifier utilizing reciprocal rakes on an inclined plane to separate coarse from fine material contained in a ore pulp, overflowing the fine material and discharging the coarse material by means of an inclined raking system. Bureau of Mines Staff.

ram. a. To stem; tamp. Mason. b. Ore. Black ram, bog iron ore; gold ram, gold ore.

ramming mix. A ground refractory material for use as a raw mixture for packing sand, refractory, or other material into a compact mass. ASM Glass. d. The packing of molten sand around a pattern in a mold. Freeman.

ramming and patching refractories. Those which can be rammed to form a monolithic furnace, or specially shaped. Bureau of Mines Staff.

ramming bar. N. of Eng A beater. A tamping or stemming bar for rod. Fay.

ramming material. A coarsely-graded refractory batch which, when moistened, can be rammed into position, in a furnace hearth for example. The rammed mass becomes strong and monolithic by vitrification or sintering in place. Dodd.

ramp. a. A change in frequency underlaid by a portion of the light that has been scattered in its passage through a transparent liquid, solid, or gas, the characteristics of which determine the amount of change Webster, 3d

ramping. a. Stemming; tamping. Mason. b. Same as scaling.

ramping and patching refractories. Those which can be rammed to form a monolithic furnace, or specially shaped. Bureau of Mines Staff.

ramming bar. N. of Eng A beater. A tamping or stemming bar for rod. Fay.

ramming material. A coarsely-graded refractory batch which, when moistened, can be rammed into position, in a furnace hearth for example. The rammed mass becomes strong and monolithic by vitrification or sintering in place. Dodd.

ramp. a. A change in frequency underlaid by a portion of the light that has been scattered in its passage through a transparent liquid, solid, or gas, the characteristics of which determine the amount of change Webster, 3d

ramping. a. Stemming; tamping. Mason. b. Same as scaling.
A suffix that is a particle: normal-no normalization. A flusk is a common term for a glass beaker. A tank is a large vessel for storing or processing liquids or gases. A furnace is a device that uses heat to process materials. A cavity is a space or hollow area. A converter is a device that changes one form of energy into another.
range

Example The side building on the side of a lake may be ranged.
rare earth elements

rare earth hydrides. Yellow hydrides of rare-earth metals, containing two or seven elements, soluble in water, used in glass as a deactivator and as an ultraviolet absorber. (C.D. 64, 1964.

rare earth metals. A group of widely distributed metals, comprising scandium (atomic number 21), yttrium (atomic number 39), and 13 elements of atomic numbers 57 to 71, inclusive. These have the same arrangement of the two external shells of electrons in their atoms, and resemble each other very closely in their chemical and physical properties. Except for cerium, these metals are divided into three groups of the rare-earth metals, the cerium group, the lanthanum group, and the actinide group, which includes actinium, thorium, uranium, neptunium, lawrencium, and californium. Also sometimes included are beryllium and aluminum. (C.D. 64, 1964.

rare gases. A term for the noble gases, helium, neon, argon, krypton, xenon, and radon, which constitute group 0 of the periodic table. Each of these elements is an ordinary element except for the rare gases, inert gases, noble gases. The six gaseous elements, krypton, xenon, and radon, which constitute group 0 of the periodic table, are the rare gases. (C.D. 64, 1964.

rarefaction. The process or act of making rare or less dense; increase of volume, density. Rarefaction causes a colorless, odorless gas. Each of these six elements at ordinary temperatures is a colorless, odorless gas. Every rare element except for radon can be obtained from the atmosphere. (C.D. 64, 1964.

rare metals. A loose term for the less common and more expensive rare metallic elements. Included are the alkaline-earth metals barium, strontium, and beryllium, the transition elements, cobalt, copper, nickel, and the rare earth metals, and the noble gases, helium, neon, argon, krypton, xenon, and radon. Rare metals are called group 0 metals, for the elements are not earths and resemble one another in their atomic number, 18. (C.D. 64, 1964.

rate of action or of proportional plus reset action, the component or proportional plus reset signal. In any sequence of chemical reactions used to leach a product from its ore, the slowest in the chain. (C.D. 64, 1964.

rate of change. The determination of the rate of change of a characteristic decreases at a given point in a given time. A commonly used unit for expressing the sound pressure level rate of decay is the decibel per second. (C.D. 64, 1964.

rate of decay. The time rate at which the sound pressure level or any other stated characteristic decreases at a given point in a given time. A commonly used unit to express the sound pressure level rate of decay is the decibel per second. (C.D. 64, 1964.

rate of fuel. The rate of fuel is the term used in Jalisco for ore mining. (C.D. 64, 1964.

rate of penetration. The inclinon of profile gradeline from the horizontal, expressed as a percentage. (C.D. 64, 1964.

rate of reaction. The rate of reaction is the term used in Jalisco for ore mining. (C.D. 64, 1964.

rate of sound. The rate of sound is the term used in Jalisco for ore mining. (C.D. 64, 1964.

raw earth. A thin-walled hollow cylinder made of ceramic stoneware, glass, bone, tar, or metal, for the parking of absorption solutions. These are usually made in various sizes from about 1/4 X 1 inch (10.700) cubic feet) to 2 X 2 inches (170 cubic feet) and even up to 6 X 8 inches.

rass. a. A substance grading about halfway between lead, copper, and iron musings and having an oblong, rectangular, or oval horizontal section. See Fig.

rasping. A. A thin and flat shovels and looks like an oblique stroke of a sharp punch instead of a coal seam, often containing native silver. Fay.

rasping or grating. A. A file. Also called rasp-cut file. (C.D. 64, 1964.

rasp. a. An instrument used in a borehole for cutting out the top, or within the seam. The color of a rock formation in a unit of time, such as the basis of rating. (C.D. 64, 1964.

ratline. A lead-gray sulfide of lead, stored when not in use. See also reduction ratio. Ratline. South Australia, p. 101.

ratrake. A lead-gray sulfide of lead, stored when not in use. See also reduction ratio. Ratline. South Australia, p. 101.

ratrake. A lead-gray sulfide of lead, stored when not in use. See also reduction ratio. Ratline. South Australia, p. 101.

ratrake. A lead-gray sulfide of lead, stored when not in use. See also reduction ratio. Ratline. South Australia, p. 101.

ratio of reduction. The ratio of the upper particle size in the reduced material to the upper particle size of the feed material. B.S. 3132, 1962.

ratio of toluene ranges (height ratio). The ratio of the breadth of the peak of the toluene material to the height of the peak to the station to the height at the reference station. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.

rat-tail. Drilling or prospecting ahead in a oil well to sound out or test deeper formations before putting in casing. Heiskanen, 1947.
Ravage A. Ore that has undergone no treatment, such as burning or reduction, prior to being placed under the stamp mill. B.S. 3552, 1962. b. Mineral as severest preparation other than possibly screening. Bureau of Mines Staff.

Raybestos. Trademark for insulating material. See also Raybestos manula. hews. 1954

Rayleigh wave. A wave surface associated with the free boundary of a solid. The wave is of maximum intensity at the surface and diminishes rapidly as one proceeds into the solid. Therefore, it has a tendency to hug the surface of the solid. Such waves have been used quite effectively in detecting surface cracks and flaws in castings. HGC. Synonym for R-wave.

Rayon flash dryer. A suspension-type dryer which employs the principle of flash drying of fine coal. The coal is transported vertically through a drying column by a stream of hot gases. The source of heat for this system is usually an automatic stoker. In this system the hot gases are drawn into the drying column by the action of the fan connected to the cyclone collector vent. The coal to be dried is continuously introduced into the hot gas stream. Virtually instantaneous drying occurs. The dry and moisture-laden gases are drawn into the cyclone collector. The dry coal drops to the bottom of the collector and the moisture laden gases are drawn to the fan to the atmosphere. Kentucky, p. 320; Mitchell, p. 683.

Rayon mill. Grinding mill in which spring-loaded rollers bear against a horizontal revolving brush employed for surface preparation. 1934

Raymond standard bed A. A powdered sample of white sand, glass beads, or other non磁性 material, used to measure the bearing capacity of sand in which the pile load is applied. 1912

Raynor refractories A. A substance which undergoes chemical change when it comes into contact with another substance. Osborne.

Reaction. Physically, a force opposing a given force in terms of Newton's law. Chemically, either (1) change in pH value or, (2) molecular alteration. Type (1) is typified by the equation A + B = C + E and (2) a redox reaction by A + B + E (or...
reaction

reaction. See roasting and reaction process.

Reactor. a. A term used mostly in microscopic work, for the curious rims of hydrous alteration to the lines of material, that may be continuous, like the plagioclase or forsterite-fayalite series, or discontinuous like the olivine-pyroxene-ampfibole series. See also Bowen's reaction series. A.G.I.

reaction-determining. A process in which sintering and chemical reaction between two or more components take place simultaneously. For example, Si and C can be reaction-determined to produce SiC; compacted Si powder can be reaction-determined in Na to form SiNa. See also sintering.

reaction turbine. A steam or water turbine in which the jets or nozzles are on the moving part, as distinct from an impulse turbine which has only fixed jets. Hem.

reaction velocity. Rate of change in quantity of chemical reaction, the units of measurement being moles per minute per liter, for which see equilibrium constant. The rate of reaction depends on concentration of each reactant, and on the nature of the reaction and potential. It can be modified by mechanical, thermal, or electrical means. Some reaction machines (e.g., those used in condensation polymerization hydrolyses) may be described as reaction turbines.

reaction pair. Any two minerals, one of which is formed at the expense of the other by reaction with liquid, respectively, any adjacent pair in the discontinuous reaction series. A.G.I. Thus forsterite at high temperature is converted into enstatite at a lower temperature, by a chemical reaction involving the addition of silica from the magma. Forsterite and enstatite form a reaction pair.

reaction principle. a. The statement that the common minerals of igneous rocks have a reaction relation to one another, in contrast to the mere juxtaposition of different mineral aggregates. The minerals can be arranged in two series, the feldspars and one of the ferromagnesian minerals, such that in each second series, any number is derived from the preceding member by reaction with the magma and is capable of forming the following member by continued reaction with the magma. See also Bowen's reaction series. A.G.I. b. The conversion of one mineral species stable at high temperature into a different one at lower temperatures.

reaction process. See roasting and reaction process.

reaction rim. a. A term used mostly in microscopic work, for the curious rims of hydrous alteration to the lines of material, that may be continuous, like the plagioclase or forsterite-fayalite series, or discontinuous like the olivine-pyroxene-ampfibole series. See also Bowen's reaction series. A.G.I.

reaction series. Any series of minerals in an igneous rock, related in such a way, that each member of the series can be regarded as derived from the preceding member by reaction with the magma. The series may be continuous, like the plagioclase or forsterite-fayalite series, or discontinuous like the olivine-pyroxene-ampfibole series. See also Bowen's reaction series. A.G.I.

reaction-stirring. A process in which sintering and chemical reaction between two or more components take place simultaneously. For example, Si and C can be reaction-stirred to produce SiC; compacted Si powder can be reaction-stirred in Na to form SiNa. See also sintering.

reading. a. The act or process of enlarging a microscope, i.e., to enlarge a borehole. Long. b. A kind of chisel for cutting two V-shaped grooves from a round blasthole in the line of the desired rift. Webster 3d. See also reaming. b. Fay. c. Synonym for reaming bit. Long. d. Synonym for reaming shell. Long. e. Synonym for gage stone. Compare kicker. Long. f. A rotary cutting tool with one or more cutting elements called teeth, used for enlarging a hole to size and contour. It is supported principally by the metal around the hole it cuts. ASM Gloss.

reamer b2. a. A cutter just above a diamond bit, used to assure a full-size hole. Nichols. b. Synonym for reaming shell. Long.

reamer stone. See gage stone. Long.

ream. a. The act or process of enlarging a borehole. Long. b. A quarryman's term for the process of cutting grooves on opposing sides of drill holes in order to permit straight splitting of a stone. See also reamer, b. Fay.

reaming barrel. A heavy-wall tube or rod, 5 ft. or more in length, used for forming a reaming bit or as a connecting link between a reaming-bit assembly and the drill rods. The diameter of the reamed bit is slightly smaller than that of the attached reaming bit. Long.

reaming bit. A bit used to enlarge a borehole. Long.
reaming diamond. See gage stone. Long.

reaming pilot. a. See pilot, a. Long. b. A smooth bar used to guide a reaming bit or casing bit in the hole. B.S. 3678, 1963, Sec. 3.

reaming pilot adapter. An adapter or coupling in a reaming pilot assembly attached to the reaming pilot adapter. It passes through the reaming shell and casing bit to which it is attached, the pilot bit. Long. reaming ring. Synonym of reaming shell.

reaming shell. A short tubular piece designed to couple a bit to a core barrel. The outside surface of the reaming shell is provided with inset diamonds or other cutting media set to a diameter to cut a specific clearance for the core barrel. Also called core shell; reamer; reamer shell. Long.

reaming shell bit. A sleeve set with diamonds on the outer surface of the shell itself or in inset strips. Usually placed between the reaming shell bit and drill bit and made larger in diameter than the latter to maintain the gage of the hole. A casing reaming shell is similar but larger in diameter. See also core shell; swelled coupling. Cumming.

reaming stone. See gage stone. Long.

ream out. To enlarge by reaming. Long.

rear-dump scraper. A two-wheel scraper that dumps at the rear. Nicholls.

rear dump truck and dump truck. A truck or semitrailer that has a box body that can be raised at the front so the load will slide out the rear. Nicholls.

reaper. a. Vertical or nearly vertical strata, Mason. b. Staff. See edge coal. Fay.

recess. A groove or depression in a surface. See also chamfer. Rees.

receiver. An apparatus which serves to equalize the pulsations of the air as it comes from the compressor and causes a more uniform flow of air through the pipeline. A receiver of proper size placed near the compressor will prevent the discharge pressure at the compressor from reaching an abnormally high figure and thus bringing a heavy strain on the machine. Another function of a receiver near the compressor is to collect moisture and oil carried in the air. A receiver at the end of the pipeline prevents the pressure from dropping to an abnormally low figure in case of a sudden draft on the pipeline. Lewis, p. 682.

recrystallizing. Introducing spiegeleisen into the converter after the blow to add the desired element. Menzerum, 4th, p. 408.

rectangular. To form anew by running, as molten metal, into a mold; cast again; as, to recast a cracked bell. Standard, 1964.

reciprocating. Having a straight back-and-forth or up-and-down motion. Nichols.

reciprocating drill. A piston drill often referred to as a hammer drill. Ham.

reciprocating engine. An external or internal-combustion engine, which has a piston moving under pressure within a cylinder. Lea.

reciprocating feeder. a. A feeder in which the material is carried on a plate subjected to a reciprocating motion and so constructed that when the plate moves in the reverse direction the material remains stationary. The rate of feed is normally varied by adjusting the stroke of the reciprocating plate. B.S. 3552, 1962. b. A device used to empty a bin or hopper from the bottom by horizontal reciprocating action of its parts, usually after primary crushing. A.C.S.G., 1966.

reciprocating flight conveyor. A reciprocating beam or beams with hinged flights arranged to advance bulk material along a conveyor trough. A.S.C.E. M44-1958.

reciprocating pump. A pump consisting of a piston or plunger which lifts water to a higher level by a series of to-and-fro movements. See also pump. Nelson.

reciprocating rotating engine. A type of en-
reciprocating rotating engine

gine, from 5 to 50 horsepower, used for
hauling two double-cylinder reciprocating
screen dryer. Usually an in-
reciprocating slide-valve engine. One of the
most common types of steam engines; it con-
reciprocity theorem. The reciprocity theorem states that if, in any electric network com-
reed, clay beams. Inside the
reconstruction. The recovery of coal or ore
reconstructive transformation. Polymorphic
reconsolidation. The recovery of reconsolidated
record. To enter in the book of the proper
record. A device for saving waste enamel
recomposing rock. Consolidation or crum-
reconciled. An instruction which
recompression. A procedure
reconfiguring. A computer
reconstituted. A term applied to an artificial
gem composed of fused particles of a naturally
precious stone. Recomposed rub-
reconstructed amber. Same as pressed amber.
reconverted granite. Synonym for recom-
reconstructed ruby. Particles of genuine ruby
fused together. The term is often used in-
concerning synthetic rubies. See synthetic ruby.
reconstructive. To recon-
reconstructed sapphire. An incorrect name for
synthetic sapphire. Blue corundum has never
been reconstructed commercially, if
at all. See synthetic sapphire.
reconstructed stones. Stones made by fusing
small particles of the genuine stone. They differ from synthetic stones. See synthetic sapphire.
reconstructed turquoise. An imitation turqui-
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
record. To enter in the book of the proper
recovered grade. The mill-head grade less metallurgical losses. It must be determined by a metallurgical test if a close calculation is necessary. For preliminary esti-
mations without significant difference in the district will serve as a basis. McKinstry, p. 483.

recovery. a. S. Afr. The amount of gold or metal, expressed in weight, money, pennweights per ton, etc., which is obtained
from the treatment of ore. *Beerman.*
b. The proportion or percentage of coal or ore mined from the original seam or deposit. *Fay.*
c. A general term to designate the valuable constituents of an ore which are obtained by metallurgical treatment; as, the recovery was 90 percent.

recovery is better used in connection with
which are obtained by metallurgical treat-
ment. *Fay.*
d. The proportion or percentage of coal or ore mined from the original seam or deposit. *Fay.*

recovery plant. A plant designed for separat-
ing or recovering grades. *ASM Gloss.*

recrystallization. a. The formation of new
grain structure from that existing in cold-
worked metal, usually accomplished by
heating. *ASM Gloss.*

recrystallization annealing. Annealing cold-
worked metal to produce a new grain
structure without phase change. *ASM Gloss.*

recrystallization temperature. a. The approxi-
imate minimum temperature at which
complete recrystallization of a cold-worked
metal occurs within a specified time. *ASM Gloss.*
b. The temperature of first welding of certain materials. This term also generally includes phase changes in the solid
state, such as sintering, grain growth, and precipitation or exsolution phenomena. *ACSG, 1963.*

recrystallize. To purify a substance by re-

recrystallized silicon carbide. A refractory
made of about 98 to 99 percent SiC. *Bureau of Mines Staff.*

rectangle. A four-sided parallelogram having both opposite sides equal and parallel, and two opposite sides equal and parallel. *ASM Gloss.*

rectangular drainage pattern. The rectangular
pattern is characterized by right-angled
bends in both the main stream and its
tributaries. It differs from the trellis pattern
in that the former is more irregular; there is not such perfect parallelism of side streams; these latter are not necessarily as conspicuous as the former, and secondary
tributaries need not be present. Structural
control is prominent, as the pattern is
directly conditioned by the right-angled
joints of the rocks. *A.G.I.*

rectangular interference ripples. Interference
ripples with rectangular pattern. *Pettofjohn.*

rectangular kiln. A periodic kiln, rectangular

rectangular shaft. a. A shaft excavated to
serve as an exhaust passage for the air in the

red cake. The amount of gold
which usually are sandstones and shales,
thrown into the arc. *ASM Gloss.*

red cake. The vanadium concentrate in a
similar ore. *Fay.*

red beds. A layer of peat marking a sharp change in the character of the
peat and resulting from a profound change

recrystallized. a. The process by which electric
energy is transferred from an alternating-
current circuit to a direct-current circuit. *Coal Age,* 1.
b. The purification of a

rectifier. Equipment used in mines to convert
alternating current to direct current. *Bu-
tin Min. Staff.*

rectifier anode. An electrode of the rectifier
into which the current flows from the arc.

rectifier cathode. An electrode of the rectifier
which usually are sandstones and shales,
made of about 98 to 99 percent SiC. *ASM Gloss.*

recuperation or recovery of heat from the
rectifier. A pearly-white hydrated aluminum
silicate, similar to kaolinite. *Standard,*
recuperative furnace. a. A furnace for the
recuperation or recovery of heat from the
b. Preheating equipment, and the essential
gaseous reactants used for the purpose of transferring heat from
the waste gases of combustion to the hot
furnace have a recuperator. *ASTM C162-66.*

recuperative heating. See recuperator.

rectifier. a. A continuous heat exchanger
which is used to conduct the products of combustion, still hot
through blue walls. *ASTM C162-66.*
b. A system of thin-walled refractory ducts used for the purpose of transferring heat from
a furnace to cold air or gas. *HW.*
c. Preheating equipment for recovering
sensible heat from hot spent gases from a furnace and using it for heating incoming
charge or fuel gases; essentially, a low-pH,

rectifier. Equipment used in mines to convert
alternating current to direct current. *Bu-
tin Min. Staff.*

red cake. The vanadium concentrate in a
milking operation. *Ballard.*
red chalk

red chalk. a. Red ochre mixed with more or less clay. Fay. b. Eng. A thin bed of brick-red chalk occurring in the Cretaceous rocks of Lincolnshire and Norfolk. It is equivalent in age to the gault clay of southern England, and separates the carpholite chalk above. C.T.D. "red clay; red mud." A more or less brown to red deep-sea deposit, which usually contains manganese nodules or a film of manganese. It is the finest divided clay suspen- sion that is derived from the land and transported by ocean currents, accumu- lating far from land and at the greatest depths. It has a high proportion of volcanic material due to lesser dilution of this material owing to weakness of accumulation of the clay portion. The color is believed to be caused by oxidation. A.G.I. Also called brown clay.

red cobalt. An early name for erythrite. Fay.

red copper ore. Cuprite. Fay.

red copper oxide. See cuprite.

red crag. a. Eng. A division of the Pliocene of East Anglia. Arkell. b. A local group of richly fossiliferous sands which accumulated as shell banks in landlocked bays in the Pliocene Sea; restricted in distribution to the counties of Norfolk and Suffolk, England. C.T.D.

red cross. A class of high explo- sives characterized by the low-freezing point. Fay.

red cross extra. Trademark for a high-density, general-purpose ammonia dyna- mite of 20 to 60 percent strength. Used for quarrying, stripping, agricultural work, and general construction work. CCd 64, 1961.

redd. a. Eng. To clear away fallen stone or debris. caved, or lost because of junk in the hole. Tomkeieff, p. 60. d. Scot. To scour through, take down, or to rip. Fay. e. Scot. To clear out pillars of coal. Fay. e. Scot. Pit rubbish or debris. See also red, b. Fay.

reddle. A bed of shale, in the Carboniferous limestone, Hunts quarry, Porthwyvaen. Arkell.

reddleite. A hydrous phosphate of iron and manganese resembling scorodite in form. From redding, Conn. Fay.

reddle. A variety of ocherous red iron ore used for marking, especially sheep; red ochre. Also called red chalk and spelled riddle or riddle. Standard, 1964.

reddleman. A dealer in reddle or red chalk. Fay.

red dog. Material of a reddish color resulting from the combustion of shale and other mine waste in dumps on the surface. Bureau of Mines Staff.

reddeman. Scot. One who works at night cleaning up and repairing roadways, etc. Fay.

red earths. The characteristic soils of most tropics regarded as forming a group intermediate between the brown earths and the laterites. They appear to develop from crystalline rocks of metamorphic or igneous rocks, and closely similar soils extend over outcrops of these rocks beyond the metaliferous earths into more arid regions. These soils are characterized by the presence of free aluminum and ferric oxides, mixed with an equal or greater quantity of aluminum silicate clay. Tropical soils containing more than 30 percent of free sesquioxides in the clay fraction are usually regarded as impure laterites. Stokes and Varnes, 1955.

red edge. Numerous rouge pits located around the edges of a large sheet of polished plate glass. ASTM C162-66.
red rock

red rock. a. Drillers' term for any reddish sedimentary rock; may be shale, sandstone, or limestone. A.G.I. Supp., b. A red, predominantly granite like phryic rock of low porosity intimately associated with some large gabbroic masses, such as the Dulluth gabbro. A.G.I. Supp.

redruthite. Corn. Copper glance; same as chalcocite. Fay.

reduction. b. The conversion of a metal from a higher to a lower state of oxidation. Fay. c. The conversion of a metal to the metallic state by heating it in a reducing agent. Reynolds. d. The process of reducing. Reynolds. e. A reducing environment; for example, coal, coke, or other reducing agents. Newton, A.G.I. Supp.

reduction furnace. The furnace in which ores, particularly iron ores, are reduced by heating in contact with a reducing agent. Used to obtain metallic oxides by heating in contact with a reducing agent. Reynolds, A.G.I. Supp.

reduction officer. The term reduction is used for a train of gunpowder (fuse) in a reducing environment; for example, coal, coke, or other reducing agents. Newton, A.G.I. Supp.

reduction plant. A mill or a treatment place where the ore is converted to smelt before the mill and extraction plant is called the reduction plant. Reynolds, A.G.I. Supp.

reduction ratio. A. The reduction of levels. The calculation of reduced levels, usually expressed as a percentage of the average of the smallest aperture passing all of the feed to that passing all of the product. Another basis of expression is the ratio of the average size of feed to the average size of product. Taggart, p. 308. See also overall reduction ratio. b. The ratio of the variation of oxygen. Bureau of Mines Stall.

reduction roasting. Heating oxygen-containing ores below its melting temperature with a reducing agent. Used to obtain a compound of lower, or no, oxygen content or to obtain the metal. Bennett, 2d, 1962.

reduction scale. A form of scale used by surveyors to reduce chains and links to acres and rods by inspection, and also in mapping and drawing to different scales. Fay.

reduction value. a. A reducing agent. See also reducing atmosphere. b. A reducing medium. Reynolds.

reducing bushings. Steel, fiber, plastic, or wood inserts used to reduce the arbor hole of a grinding wheel to fit a smaller spindle. ACSG, 1963.

reducing conditions. Prevail in the kiln if there is not enough air available to make a complete combustion of the carbon particles and carbon compounds in the flame zone. Reynolds.

reducing fire. Smoky impure fire; opposite of oxidizing. Nod.

reducing frame. a. The inner core of the blowpipe flame, characterized by the excess of carbon or hydrocarbons of the gas, which, when reduced, tends to combine with the oxygen of a mineral brought into it. Fay. b. A gas flame produced with excess fuel. ASM Gloss.

reducing furnace. A furnace in which ores are reduced by heating in contact with a reducing agent. Reynolds, A.G.I. Supp.

reducing roasting. Heating oxygen-containing ores below its melting temperature with a reducing agent. Used to obtain a compound of lower, or no, oxygen content or to obtain the metal. Bennett, 2d, 1962.

reducing scale. A form of scale used by surveyors to reduce chains and links to acres and rods by inspection, and also in mapping and drawing to different scales. Fay.

reducing agent. a. A chemical which, at lower temperatures, lowers the oxidation potential of another batch chemicals. ASTM C162-66. b. One which readily parts with valence electrons and, by combining with the members of the valence shell of these electrons. Pryor, 3. c. A substance that causes reduction. ASM Gloss.

schieferdecker. A white, very soft resin, CaH4O, reeves. A North Carolina term for cross-grain. Stowe.
reference size. The separation size or the reference station. A station for which tidal differences in mines down to about 10 feet per second; also, a station for which independent daily predictions are given in the tide or current tables from which data is plotted. A.C.I.
reference velocity. A.G.I.
recommended by Tiddeman in 1889 to conical limestone masses, 200 to 300 feet high, more or less circular in ground plane and commonly surrounded by black shales. Also called knoll reef. It is more or less synonymous with reef core. Schieferdecker.
reference vs. The process of tying in points, which the bearings to other points can be
reeve culler. A type of cutting-off table. Dodd.
reef wall. An elongated reef core. Schieferdecker.
reef rock. See bedrock, b.
reef wash. 

current is obtained from the measurement of the torque which has to be applied to the wire to bring the vane back to its vertical position. The instrument is mounted on a tripod, and the arrangement is such that the torsion can be applied, at a point 2 feet away from the vane, by means of a shaft and bevel gearing. The instrument has been used to measure low air velocitiesthe in mines down to about 10 feet per minute and up to 180 feet per minute. Robert., i, p. 54.
reeve. b. In bitumen oil mining, one who works on electric locomotive, power being transmitted through electric cable wound around reel on locomotive, tending cable to see that it is wound up and fed from reel so that it will not pull or break from point where electric current is supplied. Also called nipper. D.O.T. I. A spool-shaped device (cathead) used as a hoist by winding or wrapping the attached rope or cable. Long. r. A device for hoisting that has been largely replaced by round ropes. A flat rope is used for the reel, which is wound on a wheel shaped like a clock spring. The reel is like a conical drum that increases in diameter by the thickness of the reel as each turn. Reels are more suitable for hoisting from a single level than from different levels. Lewis, p. 265. A deep-water anchorage or sea anchor.
reef. In the diamond mines, the barren shales, Larat and Bendigo, in 1851. To them a
refikite. a. White, very soft resin, CaH4O,
refinkite

found in the lignite of Montoirio, Abruzzo, Italy. Pay.

refined. free from impurities; to free from dross or alloy: to purify, as metals; to cleanse. Webster 3d. b. To treat cast iron in a refining furnace so as to remove the silicon. Webster 3d.

refined asphalt. Natural asphalt from which coarse mineral matter and water have been removed by heat treatment. Nelson.

refined coal tar. Coal tar from which moisture and more volatile constituents have been removed. Nelson.

refined iron. Wrought iron made by puddling pig iron. C.T.D.

refiner. A compartment of a glass tank fur-
refining heat. A medium orange heat, about
refining. a. The purification of crude metallic
refinery gases. These consist mainly of

reflecting levet. Surveyor's level with mirror
reflectance. The fraction of incident light re-
reflection. a, The bounding back of light rays

removed by heat treatment. Nelson.

in the refinery furnace so as to remove the

cleanse. Webster 3d. b. To treat cast iron

from dross or alloy: to purify, as metals; to

pig iron. C.T.D.

and afterwards quenched. Webster 2d.

and toughness to steel that is raised to it

655°C, which imparts fineness of

and silver. Fay. b. See fining,

products, as the refining of base bullion

and C4 hydrocarbons, with smaller propor-

and C 4 hydrocarbons. See also electrolytic copper and Hoopes process. C.T.D.

after the crude metals have been extracted

and afterwards quenched. Webster 2d.

and toughness to steel that is raised to it

655°C, which imparts fineness of

and silver. Fay. b. See fining,

products, as the refining of base bullion

and C4 hydrocarbons. See also electrolytic copper and Hoopes process. C.T.D.

refine the structure, particularly the grain

after the crude metals have been extracted

and afterwards quenched. Webster 2d.

and toughness to steel that is raised to it

655°C, which imparts fineness of

and silver. Fay. b. See fining,

products, as the refining of base bullion

and C4 hydrocarbons. See also electrolytic copper and Hoopes process. C.T.D.

refining heat. A medium orange heat, about

655°C, which imparts fineness of

and silver. Fay. b. See fining,

products, as the refining of base bullion

and C4 hydrocarbons. See also electrolytic copper and Hoopes process. C.T.D.

refraction. a. See also interference methanometer. Nelson. b. An instrument designed for measuring the refractive indices of various substances. Anderson.

refractories. Nonmetallic materials suitable for use at high temperatures in furnace construction. While their primary function is to resist high temperatures, they are usually called upon to resist other destructive influences such as, abrasion, pressure, chemical attack, and fuel gases in temperature. HW. China clay, ball clay, and fire clay are all highly refractory, the best qualities fusing at about

grooves to facilitate the reading of the liquid level. Dodd.

refracting. The melting of an electrodeposited followed by solidification. The surface has the appearance and physical characteris-
tics of being hot-dipped (especially tin or tin-alloy plates). ASM Gloss.

reflux. A distillate fraction having a certain boiling range which is introduced into fractionating equipment to bring about a cooling effect; resulting in a more intimate contact between the vapors and thus in more efficient fractionation. Shell Oil Co.

reflux valve. An automatic nonreturn valve which opens freely to permit fluid to pass in one direction but closes under its own weight when motion ceases or when the fluid commences to flow in a reverse direc-
tion. Also called check valve; returning valve. B.S. 3618, 1963, secs. 4.

refractor. a. When a train of waves ap-

proaches a shoreline at an angle, the wave crests are bent because the first portion to reach shallow water travels more slowly than the portion still advancing in the deeper water. This process of bending wave crests is known as refraction. A.G.I. b. The bending of wave crests by currents. A.G.I. c. A change of direction of a ray of light when it passes from medium to another of different optical density. A.G.I. d. The de-

reflection from a straight path by a light ray or a wave of energy in passing obliquely from one medium (as air) into another (as water, glass) in which its velocity is different. Webster 3d. c. The refraction of light passing through the earth's atmosphere. Atmospheric refraction includes both astronomical refraction and terrestrial refraction. A.G.I.

refraction. a. That part of the transmission loss which is due to the change in temperature, refractive index, and other properties of the medium. These losses arise from irregu-
larities in the medium. Hy.

refraction method. A seismic method of ge-
ophysical prospecting. Nelson.

refraction shooting. The detonation of heavy charges of explosive material, respectively shallower holes or pits. The effects may be measured over a wide area. The firing creates the shock waves in the seismic method of prospecting. Nelson.

refractive index. Ratio of speed of heat, light, or sound traversing a medium to that in the

air. Ratio of line of angle of incidence to

sine of angle of refraction of light refracted

from vacuum into a medium, as measured in a refractometer. Property used in identifi-

fication of translucent minerals by observa-
tion of their bending of an incident ray of

light. Pryor, 3.

refractors. Nonmetallic materials suitable for use at high temperatures in furnace construction. While their primary function is to resist high temperatures, they are usually called upon to resist other destructive influences such as, abrasion, pressure, chemical attack, and fuel gases in temperature. HW. China clay, ball clay, and fire clay are all highly refractory, the best qualities fusing at about
refractories

1.700° C. Other materials are silica, magnesite, dolomite, alumina, and chromite. Also silica, C.T.O.

refractoriness. The capacity of a material to resist high temperature. In the refractories industry, a product intended to function unaltered at elevated temperatures is referred to as a refractory equivalent. A comparative value used to determine the refractoriness of a material. Henderson.

refractories under load. A measure of the behavior of a small brick section when heated at a steady rate, normally 10° C per minute, to 1500° C, or 50 pounds per square inch. The temperature is noted when the brick has lost 5 percent in height by subsidence or shear. Francis, 1965, v. 2, p. 633.

refractory. a. A material of a very high melting point with properties that make it suitable for such uses as furnace linings and kiln construction. ASTM Gloss. b. The quality of resisting heat. ASTM Gloss. c. S. Afr. Ore difficult of treatment, usually containing a second metallic constituent. For example, a gold ore must be roasted to reduce gold sulfides to an oxide and permit the gold to be recovered. Beerman. d. A piece of pottery ware covered with a vaporable flux which adheres to and imparts to the skin to form a glaze on other articles. Fay.

refractory alloy. See refractory metal.

refractory bonding mortars. High-temperature bonding mortars containing various materials and exhibiting various properties, but primarily intended for providing structural bond between refractory units in high-temperature industrial furnace constructions.

refractory brick. a. A brick made from refractory material such as fire clay, basalt, diabase, olivine, and other refractory agglomerates of not less than cone 21. ACSB-1. See also fire clay.

refractory chrome ore. A refractory ore consisting essentially of chrome-bearing spinel with only minor amounts of accessory minerals and with physical properties that are suitable for making refractory products. ASTM C71-64.

refractory coating. A refractory material for the protection of the surfaces of refractory brickwork or of metals (for example, pyrometer sheaths or aircraft exhaust systems). Examples of such coatings include Al₂O₃, ZrSiO₄, MoS₂, and for the protection of metals refractory enamels. Refractory coatings for furnace brickwork are sometimes known as slags. Dodd.

refractory concrete. Concrete made with high-alumina or calcium-aluminate cement and a refractory aggregate to withstand very high temperature. Taylor.

refractory mortar. A finely ground preparation which becomes plastic and flowable when tempered with water and is suitable for laying and bonding refractory brick. A.R.I. For various types, see entries under air-setting fire clay; ground fire clay; and high-clay ACSC, 1963.

refractory ore. Ore difficult to treat for recovery of the valuable substance. A.R.I. See also refractory porcelain. That made to resist heat or acid, or both. Bureau of Mines Staff.

refractory stone. Consists of sandstone, quartzite, mica schist, soapstone, or other rock that will withstand a moderately high temperature without fusing, cracking, or disintegrating. It may be used in solid blocks or crushed and mixed with a binder to form bricks. BuMines Bull. 630, 1965, p. 866.

refractory ware. Usually hollow ware—a sagger, pyrometer tubes, crucibles, etc.; also refractory brick and shapes. Bureau of Mines Staff.

refractibility. The capacity of being fractured. See also refraction. Shipley.

refrangible. Capable of being refracted, as rays of light. Gage.

refrigerant. A substance which will absorb heat while vaporizing and whose boiling point and other properties make it useful as a medium for refrigeration. Strock, 10.

refrigeration. a. In special application to mining, cooling of air before release in lowest levels of deep, hot mine; also, expansion of compressed air for some purpose (an extravehicular suit if used, as discriminately). Fricke, 21. b. The process of absorption of heat from one location and its transfer to and rejection at another: place. Arbitrarily expressed in units of tons and is equal to the cool cooling load divided by 12,000 (a ton of ice in melting in 24 hours liberates heat at the rate of 200 British thermal units per minute, or 12,000 British thermal units per hour). Hartman, pp. 327, 331.

refrigeration plant. a. A surface plant to form the protective barrier of ice in the freezing method of shaft sinking. The cooling agent used is ammonia which, in its gaseous state, is compressed to about 120 pounds per square inch when it passes through the top of the conduction system and bottom of the liquid as liquid ammonia under pressure. It then passes through a regulator valve into the coolers where it immediately evaporates. The latent heat of evaporation is extracted from the brine circuit—the brine being passed through the finned tubes of the brine cooler. The ammonia gas then passes back for reuse. The brine emerges from the cooler at a temperature of about 4°F and is pumped down the boreholes to freeze the water around the shaft sinking. Neol. b. A surface plant to cool liquids. These liquids or ice are sent underground to cool the air in the shaft or headframe. By this method, the air in deep mines is cooled considerably and the working environment is improved. See also deep mining. Nelson.

refrigeration ton. The heat required to melt one hundred pounds (2000 pounds) of ice in 24 hours. The latent heat of ice being 144 British thermal units per pound; 1 refrigeration ton = \( \frac{144 \times 2000}{24} = 12,000 \) Btu/hr. Sinclair, p. 66.

refuge hole. A place formed in the side of an underground haulageway in which a man can take refuge during the passing of a train, or when shots are fired. Also called refuge stalls. Fay. See also manholes. Nelson.

regelial doctrine. The old doctrine that all mineral wealth was the prerogative of the crown or the feuonym lord. The conces- sion system, in which the state or the private owner has the right to grant concessions to leases to mine operators at discretion and subject to certain general restrictions, had its origin in this doctrine. Almost all mining countries of the world, except the United States, follow this system. Hoo, p. 335.

regal warming. A method of shaft sinking. The cooling agent used is ammonia which, in its gaseous state, is compressed to about 120 pounds per square inch when it passes through the top of the conduction system and bottom of the liquid as liquid ammonia under pressure. It then passes through a regulator valve into the coolers where it immediately evaporates. The latent heat of evaporation is extracted from the brine circuit—the brine being passed through the finned tubes of the brine cooler. The ammonia gas then passes back for reuse. The brine emerges from the cooler at a temperature of about 4°F and is pumped down the boreholes to freeze the water around the shaft sinking, Neol. b. A surface plant to cool liquids. These liquids or ice are sent underground to cool the air in the shaft or headframe. By this method, the air in deep mines is cooled considerably and the working environment is improved. See also deep mining, Nelson.

refrigeration ton. The heat required to melt one hundred pounds (2000 pounds) of ice in 24 hours. The latent heat of ice being 144 British thermal units per pound; 1 refrigeration ton = \( \frac{144 \times 2000}{24} = 12,000 \) Btu/hr. Sinclair, p. 66.

refuse collector. A device used in a washbox to remove the reject from the washing compartment, operated manually or automatically. B.S. 3552, 1962.

refuse extractor. A reject gate in the form of a rotary (or star) valve. B.S. 3552, 1962.

refuse rotor. A screw conveyor fitted at the bottom of some washboxes to collect the fine reject which has passed through the apertures in the screen plate. B.S. 3552, 1962.

regain. The ratio of normal moisture weight to the weight of material holding the moisture, expressed in percent. Strock, 10.

regalian doctrine. The old doctrine that all mineral wealth was the prerogative of the crown or the feuonym lord. The conces- sion system, in which the state or the private owner has the right to grant concessions to leases to mine operators at discretion and subject to certain general restrictions, had its origin in this doctrine. Almost all mining countries of the world, except the United States, follow this system. Hoo, p. 335.

regal warming. A method of shaft sinking. The cooling agent used is ammonia which, in its gaseous state, is compressed to about 120 pounds per square inch when it passes through the top of the conduction system and bottom of the liquid as liquid ammonia under pressure. It then passes through a regulator valve into the coolers where it immediately evaporates. The latent heat of evaporation is extracted from the brine circuit—the brine being passed through the finned tubes of the brine cooler. The ammonia gas then passes back for reuse. The brine emerges from the cooler at a temperature of about 4°F and is pumped down the boreholes to freeze the water around the shaft sinking, Neol. b. A surface plant to cool liquids. These liquids or ice are sent underground to cool the air in the shaft or headframe. By this method, the air in deep mines is cooled considerably and the working environment is improved. See also deep mining, Nelson.

refrigeration ton. The heat required to melt one hundred pounds (2000 pounds) of ice in 24 hours. The latent heat of ice being 144 British thermal units per pound; 1 refrigeration ton = \( \frac{144 \times 2000}{24} = 12,000 \) Btu/hr. Sinclair, p. 66.
regeneration. a. In mineral leaching, regeneration is the process of recovering the dense medium; recovered dense medium is called regenerated dense medium. Anhydrite produced by regeneration is anhydrite produced by the dehydration of gypsum. A.G.I. Supp.

regenerated crystal. A large crystal that has grown in a mass of crushed material like mylonite. See also integration. A.G.I. Supp.

regenerated dense medium; recovered dense medium. Medium obtained from the medium recovered and purified (wholly or partly) from contaminating fine coal and clay. B.S. 3552, 1962.

regeneration. a. In mineral leaching, regeneration is the process of recovering the dense medium; recovered dense medium is called regenerated dense medium. Anhydrite produced by regeneration is anhydrite produced by the dehydration of gypsum. A.G.I. Supp.

regenerative checking. Brick used in furnace regenerators to recover heat from hot outgoing gases, and later to receive this heat to cold air or gas entering the furnace, so called because of its checkboard pattern in which the bricks are arranged. HW.

regenerate furnace. In hydraulics, the condition of a river with respect to the rate of its flow as measured by the volume of water passing different cross sections in a given time. Webster 3d.

regenerators. a. A stream or system. The order or characteristic of a stream, in other words, its habits with respect to velocity and volume, form of and changes in channel, capacity to transport sediment, amount of material supplied for transportation, etc. Also applied to a stream which has reached an equilibrium between erosion and deposition, or, in other words, to a graded stream. USCS Bull. 730, 1923, p. 89.

regional. a. Extending over large areas in contradistinction to local or restricted areas. Fay. b. In gravity prospecting, contributions to the observed anomalies due to density irregularities at much greater depths than those of the possible structures, the location of which was the purpose of the survey. The term is also employed in an analogous sense in magnetic prospecting. A.G.I.

regional anomaly. The more localized departures in the earth's field from the values that would be predicted if the field were to originate with a single magnet oriented along the magnetic axis. These have magnitudes as large as 10,000 gammas, which is about a third the total intensity of the earth's magnetism. Fay.

regional geology. Geology covering a wide area. It comprises rock waste of all ages and soils. Fay.

regolith. The layer or mantle of loose, incoherent rock material, of whatever origin, that nearly everywhere forms the surface of the land and rests on the hard rocks or bedrocks. It comprises rock waste of all sorts, volcanic ash, glacial drift, alluvium, windblown deposits, vegetal accumulations, and soils. Fay.

regolite. A 12-inch scale divided into tenths and hundreds of a foot, used for accurate measurement in connection with a steel band which is graduated only in feet. See also band chain. Ham.

regional layer or mantle of loose, incoherent rock material, of whatever origin, that nearly everywhere forms the surface of the land and rests on the hard rocks or bedrocks. It comprises rock waste of all sorts, volcanic ash, glacial drift, alluvium, windblown deposits, vegetal accumulations, and soils. Fay.

regosol. Soil without definite horizon characteristics developing from deep unconsolidated rock or soft mineral deposits. Schieferdecker.

regradation. The process of forming a new graded level of equilibrium in a land surface by streams when an old one has become deformed. Fay.

regressive overlap. Synonym for offlap. A.G.I.

regressive ripples. A series of asymmetric current ripples with steep sides pointing in the direction of the current. Pettijohn.

regressive sand wave. A sand wave that migrates up-current. See also antidune. Pettijohn.

regular-lay right lay. Synonym for right regular lay. Long.

regular-lay left lay. Synonym for left regular lay. Long.

regular-lay right lay. Synonym for right regular lay. Long.

regional. a. A polygon having equal sides, and the angles between these sides are equal. Jones 2, p. 109.

regular system. The cubic system. C.M.D.
regular ventilating circuit

regular ventilating circuit. All places in the mine through which there is a positive flow of air (without the aid of a blower or of ventilation tubing. Grove. regulated feed. In contrast with choke feed, feed is regulated by means of a throttle below the full capacity of the crusher. South Australia, p. 101.

regulated split. In mine ventilation, a split where it is necessary to control the volumes in certain low-resistance splits to cause air to flow into the splits of high resistance. Build Mines Bull. 569, 1960, p. 18.

regulating course. A layer of stone placed way) to minimize interference with traffic. They are usually set in doors as additional cycle. Henderson.

regulating gate. A gate used to vary size of opening so as to control the flow of material. See also bin gate. ASA MH4.1-1958.

regulating rod. A nuclear-reactor control rod for making fine adjustments in reactivity. See also shim rod. L&L.

regulating unit. One which converts the output of one device into a step or proportional movement of the device which operates the process, usually by means of a relay. Pryor, 3, p. 32.

regulating valve. A device used on a centerless grinder to regulate speed and pressure on the part being ground. ACSG, 1963.

reiteration. In surveying, angular measurements taken before and after the heating. A.R.I.

rectangular bar. A 6-quart wine bottle. Dodd.

rectangular bed. A plough developed from the plough chains run in two tubes along the exhaust side of the plough. Nelson.

rectangular bin. A 6-quart wine bottle. Dodd.

rectangular frame. See frame for reinforcing molded brick, cement, or other mortars. ACSG. 1963.

rectangular panel. A plough developed from the plough chains run in two tubes along the exhaust side of the plough. Nelson.

rectifying furnace. The furnace in which metal ingots, billets, blooms, etc., are heated to bring them to the temperature required for hot-working. C.T.D.

rectification. The heating of a refractory to a temperature usually higher than that to which it has previously been subjected to determine its linear or volume stability by measurements taken before and after the heating. A.R.I.

rectification. Application of extra enamel in certain areas of the surface prior to firing. Bryant.

rectified brickwork. Brickwork embodying expanded metal, steel-wire mesh, hoop iron, or thin steel rods in the bed joints. Steel rods can also be bedded vertically through a properly bonded wall at the points where the vertical points intersect or, in conjunction with concrete grouting, as partially destressed metal. Ham.

rectified center. Designating a wheel with steel rings molded into the wheel structure near the hole for additional strength. ACSG. 1963.

rectified concrete; ferrocement. Concrete in which metal is embedded in such a way that the two materials act together in resisting forces. The reinforcing bars are very weak in tension compared with its strength in compression. Approximate values for comparison being: tensile strength, 600 pounds per square inch; compressive strength, up to 8,000 pounds per square inch. The idea, therefore, of a reinforced concrete lining for shafts or tunnels is to reinforce the sides subject to tension loading with steel rods. Mild steels have a tensile strength of about 60,000 pounds per square inch. Stress calculations are usually made on the assumption that the steel takes all the tensile forces and the concrete all the compressive forces. Nelson.

rectified concrete lining. Reinforced brick lining in which the continuous longitudinal vertical or collar joint is filled with grout as they are built. No masonry headings are used in this type of construction. Abbreviation, RGM. ACSG.

rectified masonry. Masonry in which metal reinforcing steel, grout, and/or mortar combined to act together in resisting forces. ACSG, 1963.

rectified products (abrasives). Bonded products with some type of mechanical addition as an integral part of the product to increase the strength of the product. ACSG, 1963.

rectified wheel. A grinding wheel in which some type of mechanical addition has been made as an integral part of the wheel to increase its strength. ACSG, 1963.

rectification. rods, bars, or fabric, usually of steel, embedded in concrete for the purpose of resisting particular stresses. They are not used as tendon steel. Among other materials used in reinforcement, bamboo has been applied successfully, and hesian is suitable for reinforcing molded plaster. See also reinforced brickwork; reinforced concrete. Ham.

rectangular wheel. A grinding wheel with iron, or thin steel rods in the bed joints. Steel rods can also be bedded vertically through a properly bonded wall at the points where the vertical points intersect or, in conjunction with concrete grouting, as partially destressed metal. Ham.

rectification. In surveying, angular measurements taken before and after the heating. A.R.I.

rectification. In surveying, angular measurements taken before and after the heating. A.R.I.

rectification. In surveying, angular measurements taken before and after the heating. A.R.I.
relative humidity. The amount of moisture contained by an atmosphere compared with the maximum amount that it could contain at the same temperature. A high relative humidity is detrimental to the efficient working of the human body, and becomes a problem in hot and deep mines. See also refrigeration plant, b. Nelson.

relative movement. In studying structural features, for example, the thickness of a formation is generally impossible to determine which block actually moved relative to some plane or point of reference, such as sea level, the equator, Rialto, the North Pole, or center of the earth. Thus, most displacements can be discussed only in terms of relative movement. That is, block A moved north relative to block B. A.G.I.

relative permeability. The ratio of the effective permeability to the maximum permeability of the medium. That is, block A moved relative to block B. A.G.I.

relative roughness. The dimensions ratio e/d where e is the average height of the surface irregularities and d is the diometer of the pipe. The physical interpretation of this functional equation is that the friction factors of pipes are the same if their flow patterns in every detail are geometrically and dynamically similar. The parameter indicates the height of the irregularity above the boundary surface only, hence it is apparent that, dependent on the value of e/d, if the boundary layer adjacent to the surface, the projection can either lie submerged within the boundary layer or else projected outside it. Roberts I, p. 12.

relative settlement. See differential settlement. Ham.

relative stability. Dating of events by means of their place in a chronological order of occurrence rather than in terms of years. Compare absolute time. Leit.

relative water content. See liquidity index. ASCE P1826.

relativity. A principle that postulates the equivalence of the description of the universe, in terms of physical laws, by various observers, or for various frames of reference. A theory that utilizes such a principle is called a relativity theory. An example is Einstein's restricted theory of relativity, in which the relativity principle applies to all inertial frames of reference. NRC-ASA N1.1-1957.

relaxation. a. Relief of stress by creep. Some types of tests are designed to provide information on the reduction of stress by relaxation. ASRM G11.

relief texture. Texture of a rock that its remainder is at height of the irregularity above the boundary surface only, hence it is apparent that, dependent on the value of e/d, if the boundary layer adjacent to the surface, the projection can either lie submerged within the boundary layer or else projected outside it. Roberts I, p. 12.

release fractures. Fractures that form perpendicular to the greatest principal stress axis in a specimen that is compressed and has yielded plastically while under hydrostatic pressure. On the assumption that these fractures form when the load is removed, they have been called release fractures. A.G.I.

release mesh. a. In liberation of specific mineral from its ore by comminution the opencast, the released mineral. A.G.I.

relief haulage. Single-track, high-speed mine haulage from one relief to the other. Each operator has his own track section between relay stations, and since no other haulage equipment is available except that section, he can run his motor wide open without fear of anything getting in his way. Side track at each relay station is provided to allow the operator to pick up or drop off loads or empties then make the return run. Kentucky, pp. 223-226. Also called interstage.

relief station. See pumping station. Merseeau, 4th, p. 199.

release mineral. A mineral formed during the crystallization of a magma as a consequence of an earlier phase failing to react with the liquid portion of a magma to form pyroxene may result in the enrichment of the liquid in silica, which finally crystallizes as quartz, the released mineral. A.G.I.

release rock. A rock that is a newly extruded volcanics and not a newly extruded volcanics. A.G.I.

relief. On a geologic map, the reliability of method. In geochemical prospecting, the reliability of a method refers to the probability of obtaining and recognizing indications of a mineralized district by the method being used. Reliability depends not only on whether a readily detectable target exists, but how effective the exploration method is in locating it, but also on the extent to which the anomaly is specifically related to ore and the extent to which it is possible that non-significant anomalies may confuse the interpretation. Hauk, 2, p. 323.

relief. When a block is stopped in such a manner that its remainder is at height of the irregularity above the boundary surface only, hence it is apparent that, dependent on the value of e/d, if the boundary layer adjacent to the surface, the projection can either lie submerged within the boundary layer or else projected outside it. Roberts I, p. 12.

relief. When a block is stopped in such a manner that its remainder is at height of the irregularity above the boundary surface only, hence it is apparent that, dependent on the value of e/d, if the boundary layer adjacent to the surface, the projection can either lie submerged within the boundary layer or else projected outside it. Roberts I, p. 12.

relief. Roberts I, p. 12.
relief

relief. a. The character of the surface of a mineral section as observed under the microscope. Webster 3d. b. The elevations on a topographic map. Webster 3d. On a topographic map these may be indicated by hachures, shading, or contour lines. The term may also be used to designate the difference in elevation between the hilltops or summits and the lowlands of a particular region. Stokes and Barnes, 1953. c. The result of the removal of tool material behind or adjacent to the cutting edge to provide clearance and prevent rubbing (heel drag). ASM Gloss.

relief angle. The angle formed between a relieved surface and a given plane tangent to a cutting edge or point on a cutting edge. ASM Gloss.

relief borehole. A borehole that is loaded and fired for the purpose of relieving or removing part of the burden of the charge to be fired. The borehole is drilled closely along a line, which are not loaded, and which serve to weaken the rock so that it will break along that line. Nichols. c. A port or passage way through which the core, as it advances into the inner tube of a double-tube core barrel, forced through the inner tube and outside of the barrel through the inner tube head. Long. d. A borehole drilled ahead of underground openings to tap and drain a water-bearing formation. Also called cover hole; pilot hole. Long.

relief blasting. Minute overbreak, cavernous, porous limonite occupying the site of a former grain of sulfide. A.G.I.

relief cutting. Also called contour topographic relief by contour lines, hachures, coloring, shading, or similar graphic methods. Webster 3d. b. Ordinarily used in the United States for hypsometric map. Straley, 2.

relief valve. a. A valve which will allow air or fluid to escape if its pressure becomes higher than the valve setting. Nichols. b. Synonym for pressure relief valve. Long. c. A valve which automatically allows air or fluid to escape when the pressure inside the system reaches a predetermined value. The valve is then closed when the pressure drops below a certain level. Long.

relieving. Buffing or other abrasive treatment of an embossed metal surface to reveal the base-metal color on the highlights contrasted to that of the finish in the recesses. ASM Gloss.

relieving arch. An arch built over a lintel, or similar opening in a wall, and intended to divert the superimposed load above the opening to the piers or abutments on both sides, thus leaving the lintel or flat arch from excessive loading. Also known as discharging arch; safety arch. ACSG.

relieving cut. In a round of shots planned for removing arches. See also relieving shot.

relieving hole. a. A borehole that is loaded and fired for the purpose of relieving or removing part of the burden of the charge to be fired. The borehole is drilled closely along a line, which are not loaded, and which serve to weaken the rock so that it will break along that line. Nichols. c. A port or passage way through which the core, as it advances into the inner tube of a double-tube core barrel, forced through the inner tube and outside of the barrel through the inner tube head. Long. d. A borehole drilled ahead of underground openings to tap and drain a water-bearing formation. Also called cover hole; pilot hole. Long.

rem. The quantity of any isolating radiation, such that the energy imparted to a biological system per gram of living matter has the same biological effectiveness as an absorbed dose of one rad of X-radiation. ASM Gloss.

remagnetization. Part of the magnetization of a body that does not disappear when the external magnetic field disappears. Schieferdecker.

remilling. The treatment of milling enamel or glazed reclaim collected from the spray booth. A further addition of clay is usually made to the material before remilling. Enam. Diet.

remingtonite. A hydrated carbonate of cobalt found in Maryland. Fay.

remnant. When a block of ground is stoned in such a way that at some time its remnant is surrounded on all sides by stoned ground, that remnant is termed a remnant. Sptaling.

remolded soil. Soil that has had its natural structure modified by manipulation. ASCE P1826.

remolding. Disturbance of the interval structural structure of clay or silt; when remolded, such material will lack shearing strength and gain compressibility. In consequence driven piles are not recommended in certain clays. See also thixotropic fluid. Ham.

remolding index. The ratio of the modulus of deformation of a soil in the undisturbed state to the modulus of deformation of the soil in the remolded state. ASCE P1820.

remolding sensitivity. The ratio of the unconfined compressive strength of a specimen of the same soil after remolding at altered water content. Also called sensitivity ratio. Ham.

remote control. a. The control of plant operation by personnel housed under conditions which can be remote, safe, and convenient from the plant. The control of both electrical and electronic automatic control. In the control room, various plants can be started up by pushbutton and the governing of these plants is automatic and hand. Hy. b. A term applied to apparatus, to denote that its operation can be controlled manually, from a distance, by electrical or other means. B.S. 3618, 1965, sect. 7. c. Regulation of machine group of interdependent machines, or of processes which can be remote, safe, and convenient from the plant. In the control room, various plants can be started up by pushbutton and the governing of these plants is automatic and hand. Hy.

remote control switch; pilot switch. A switch operating in a low voltage control circuit to open or close a contactor or other similar switch. A.S.T. 3618, 1965, sect. 7.

remote underwater manipulator. Used to study the ocean bottom (down to 2,000 feet) for prolonged periods (speed 3 mi/hr). It is equipped with television cameras and a mechanical arm and hand. Hy.

renewal. A very rare, strongly radioactive, orphorombic, yellow mineral, Pb(UO2), PbO, (OH), PbO2. May be derived from or contain uranium. Also called radite. Fr. a. Derived from or containing fossils derived from an older formation; as, remanite deposits. Standard, 1964. b. Recreated, as a glacier formed by the falling of fragments of ice (glacier remanite). Standard, 1964.

renewing. The breaking of coal into lumps and remolding. The application, by means of a crawel used as a clutch, of a coat of mortar. Taylor.

rendering. The breaking of coal into lumps with a minimum of smalls. The relative looseness of low explosives makes them suitable for rending coal since they lack the greater shattering power of high explosives. Mason, 1, p. 159.

rendezvous. A point of junction of intersecting thoroughfares, used by transport to assemble vehicles. B.S. 3618, 1965, sect. 7.

rendrake. A mineral, (Ca,Fe)3(Fe,Ge,Zn,Sn)3(S,As), reported to contain up to 8 percent germanium. Found in Republic of the Congo. Crosby, p. 36.

reniform. kidney-shaped; applied to certain minerals. Fay.

renk. a. An average or standard distance for the working of the plant. Pryor, 2.

Renn-Walz process. A method of reclaiming by melting the waste materials produced in the smelting of zinc and lead ores. This material, which cannot be treated in the blast furnace because of the presence of other metals, is brought up to 1,000° C in the preheating zone of the Renn-Walz process by reacting with the blank gases and this drives off CO2 from the carbonates. The process differs from the Krupp-Renn method in that it is a single-stage reduction process and in which the metals are in the oxide form. The metal vapors are oxidized by excess air and carried off in the flue gases, which are subsequently filtered. Osborne.

rent and royalty. a. The amount paid by a coal mining operator to the owner for each ton of coal mined and usually expressed in cents per ton. \textit{Bureau of Mines Staff}. b. In mining leases, words used internationa]tally to convey the same meaning. \textit{Rickett}, 11.

rep. a. A miner who repairs and enlarges underground roadways. He is a skilled man on excavation of roadways to neat lines and the setting of supports. The nature of his work usually means working on the afternoon or night shift, and he is paid either per shift or on piecework rate. He works with an assistant. \textit{Bennett}, 2d, 1962; \textit{SuPP}.

repl. a. A miner who repairs and enlarges underground roadways. He is a skilled man on excavation of roadways to neat lines and the setting of supports. The nature of his work usually means working on the afternoon or night shift, and he is paid either per shift or on piecework rate. He works with an assistant. \textit{Bennett}, 2d, 1962; \textit{SuPP}.

repairman. a. A workman whose duty it is to repair tracks doors, brattices, or to reset timbers, etc., under the direction of a foreman. \textit{Zem}, b. A repairer. Fay.

replicated. a. In crycrystalligraphy, three or more crystals united according to the same law. Fay.

replication. In survey, repeating angular measurement by unclamping lower plate of theodolite after first measurement and resighting on back station; then clamping this and freeing azimuth plate and again sighting on foresight, therefore doubling original observation. Fay.

repetition of beds. The duplication of beds of rocks through faulting or intense folding. \textit{Stokes and Varnes}, 1955.

replaceable hydrogen. Hydrogen atoms in acid molecule which can be replaced by those of metal. \textit{Pryor}, 3.

replaceable insulators. Diamond insulators and other geometric forms fastened to and/or supported by the bit blank by brazing or mechanical locking so that they may be replaced when diamond wear exceeds a specified amount. \textit{Long}.

replaceable pilot. A central interchangeable pluglike portion of a coring bit probing or leading the outer portion of such bits. \textit{See also pilot, Long}.

replacement. a. The process of practically simultaneous capillary solution and deposition by which a new mineral of partly or wholly differing chemical composition may grow in the body of an old mineral or mineral aggregate. \textit{A.G.I. Supp}. b. Same as metasomatism in mineralogy. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replaceable pilot. A central interchangeable pluglike portion of a coring bit probing or leading the outer portion of such bits. \textit{See also pilot, Long}.

replacement. a. The process of practically simultaneous capillary solution and deposition by which a new mineral of partly or wholly differing chemical composition may grow in the body of an old mineral or mineral aggregate. \textit{A.G.I. Supp}. b. Same as metasomatism in mineralogy. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.

replacement ore body. a. Mass of ore formed by the dissolution of previous minerals and their replacement by others. \textit{Sikimatos}.

replacement rock. a. Metal or the metals arranged in order of the magnitudes of their oxidation potentials. \textit{Ganow}.

replacement vein. a. A vein in which certain minerals have passed into solution and have been carried away, while other minerals from the solution have been deposited in the place of those removed. The process is called metasomatic replacement. Also called constitution vein. Fay.

replace switch. A device consisting of a united pair of iron plates hinged to shoes fitting over the rails to replace, or replace tracks doors, brattices, or to reset tracks. Also called retrack. \textit{BuMin Style Guide}, p. 61.
research reactor

used for training, materials testing, and production of radioisotopes. In Atomic Energy Commission usage, the term is limited to respect of deep-thrust level of 10 megawatts or less. L.O.L.}

residence. 1. In surveying, fixing of station not
workable or probable working, depending on
manner of prospecting for deposit. 2. See developed reserves; development sampling; economic coal reserves; ore reserves; probable reserves; workable. Nelson.

recess. A natural underground container of liquids, such as oil or water, and gases. In general, such reservoirs were found in local formation of strata, by changes of local conditions. These, however, are classifications in the broadest sense. A.G.I. b. Openings in the ground in which water is stored. Legrand. c. An artificially built, dammed, or excavated place for holding a reserve of water. Zern. d. Rock formations having productive possibilities, the pay section. Wheelers

reservoir. 1. Crude petroleum as it exists in the hole. Long. 2. In mining, a place for holding a reserve of water. Legrand.

reservoir rock. A porous and permeable rock in which commercially important oil and gas accumulations are found. See also cap rock.

reservoir oil. Crude petroleum as it exists in the hole. Long. 2. In mining, a place for holding a reserve of water. Legrand.

reservoir action (nonstandard). In flotation
processes, the component of control action in which the final control element is moved at a speed proportional to the magnitude of a proportional position action. This term applies only to a multiple action including proportional position action. Forrester, p. 549.

reset bit. A bit made by reusing the sound diamonds salvaged from a used bit and setting them in the crown attached to a new bit blank. Some new diamonds usually are added to those salvaged, since generally not all of the salvaged or recovered stones are reusable. Also called replacement bit.

resettable; resaltable. A salvaged diamond or used diamonds in good condition; hence, diamonds that can be used again by being reset in another tool or bit. Also called usable diamond; usable; usable stone. Long.

reset the chuck. Synonym for rechuck. Long.

resetting. A. The actual process of producing a reset bit. See also reset bit. Long. b. To rerun a cutting string into a borehole by placing it in a point at end lower in the hole. Long.

resident engineer. An engineer employed, usually in the field office rather than in the main office, to handle the employer's engineering work. Bureau of Mines.

residual. a. Characteristic of, pertaining to,
or consisting of residue. Remaining essentially in place after all but the least soluble constituents have been removed; said of the material eventually resulting from the decomposition of rock. Fay. b. Standing, as a remnant of a formerly greater mass of rock or area of land, above a surrounding one. This term has not been generally planated; said of some rocks, hills, mountains, mesas, plateaus, and groups of such features. Fay.

residual asphalt. Asphalt obtained by steam distillation of semisphagnetic or asphaltic petroleum. Bennett 24, 1962.

residual bond. A chemical bond that occurs in the solid and liquid states and manifests itself as that cohesion which holds distinct molecules to each other. It is much weaker than any of the three kinds of primary bond (covalent, ionic, metallic) and is sometimes regarded as physical rather than chemical. Gaudin, 2, p. 12.

residual boulder. A boulder of local origin produced by weathering. A.G.I. SupP.

residual clay. A clay deposit formed by the decay of rock in place. This type is abundant in the Southern States. Fay. b. See primary clay. Dodd.

residual concentration. Concentration of a valuable mineral after sampling and removal of valueless matter. A.G.I.

residual deposits. a. By the removal of soluble mineral material from the deposit by weathering, the portion of a magnetic effect remaining after removal of some type of residuum. Iron carbonates and silicates in the original rock may be converted into practically insoluble oxides, which form iron ores as rock weathers; silica may be leached from kaolin, leaving the insoluble hydrous aluminum oxide, bauxite, a most important aluminum ore. Such deposits are generally formed in warm moist climates and would not be found in areas which have been glaciated. Lewis, p. 276. b. See residual, a, as residual gravel, sand, clay, etc. Fay.

residual elements. Elements present in an alloy in small quantities, but not added intentionally. ASM Gloss.

residual errors. The differences between measured values and the most probable value. Uncertainty.

residual field. The same as residual magnetic field. ASM Gloss.

residual fuel oils. Topped crude petroleum or viscous residuum obtained in refinery operation. API Glossary.

residual gravity. In gravity prospecting, the portion of a gravity effect remaining after removal of some type of regional; usually the relatively small or local anomaly component of the total or observed gravity field. A.G.I.

residual gravity map. See local gravity map. Scheiderer.

residual liquids. Liquid of magma that remains after most mineral constituents have solidified. A.G.I.

residual magma. Synonym for ichor. A.G.I.

residual magnetic field. The magnetic field that remains in a structure after the magnetizing force is removed. ASM Gloss.

residual magnetism. a. In magnetic prospecting it is the remaining magnetic effect re-

remaining after removal of some type of regional; usually the relatively small or local anomaly components of the total or observed magnetic field. A.G.I. b. The
residual magnetism

magnetism remaining in a substance after the magnetizing force has been removed. A.G.I., p. 191; Pryor, J. 3.c. A property of a magnetic material, such as a ferromagnetic, that causes it to remain magnetized when the external magnetizing force has been removed. A.G.I. See remanence.

residual method. Method of magnetic-particle inspection in which the particles are applied after the magnetizing force has been removed. A.S.M. Glou.

residual minerals. The rock-forming minerals that are euhedral in the surface environment or unstable but react so slowly that they are not appreciably broken down. Hawker, p. 260.

residual ore. Residual ores are natural mineral pigments consisting of limonite, or hematite, mixed with varying proportions of clay. They range in color from yellow to chocolate brown and deep red; and in the trace are known as sienna,umber, and Indian red. They probably originate as colloid precipitates. A.G.I.

residual oil. a. The amount of liquid petroleum originating as colloid precipitates. A.G.I. b. Liquid or semiliquid products as asphaltum oil, liquid asphalt, black oil, petroleum tars, and residuum. CCD 6d, 1961.

c. Weathered material, including the soil, down to fresh, unweathered rock. Le-grand. A name given to a very dense, blackish to deep reddish-brown material, without definite organic structure, which appears as somewhat granular interstitial matter between individual microscopic ingredients in certain coals. See also desmite. Terns, 1954. d. The finely comminuted matter unresolvable in the thinnest sections by the best illumination under the highest powers of the microscope. Essentially characteristic of durains, it is generally opaque but not always. The essential characteristic is the impossibility of fragmentation into particles of one or two microns, or less. A.G.I. e. The material eventually resulting from the decomposition of rocks in place and consisting of the nearly insoluble material left after all the more readily soluble constituents of the rocks have been removed. See also residual, a. Fay. f. The residue left in the still after the distillation of crude oil has been completed, and not the residue from redistilled condensates. Also known as the cokings.

residual ore deposit. An accumulation of valuable minerals formed by the removal of unstable rock constituents by weathering or by leaching. Schilder.

residual placer. See residual ore deposit.

residual. The elements ordinarily present in steel in small quantities without definite intent on the part of the steel maker.

residual soil. Soil formed in place by the disintegration and decomposition of rocks and the consequent weathering of mineral materials. Presumably developed from the same kind of rock as that on which it lies. Fay.

residual stress. The stress which exists in an elastic solid body in the absence of, or in addition to, forces acting on the body by the external load. Such residual stress may be due to: (1) deformation, caused by cold-working, as in drawing or stamping; (2) change in the specific volume due to thermal expansion, a phase change or magnetostriiction; (3) by the joining together of structural parts by force, such as welding. Ham.

residual volume. In physiology—the amount of air that remains in the lungs even after the most forceful expiration. It normally amounts to between 1 and 1 1/2 liters. Note that the sum of the vital capacity plus the residual volume equals the total lung capacity. H.E.G.

residuals. Resulting from local rock decay; said of deposits of disintegration that have not been transported. See also residual, a. Fay.

residue. a. That which remains after a part has been separated or otherwise treated. ASTM STP No. 148-D. b. The waste or final material produced by the transformation of a natural substance under the conditions of a chemical process. c. The amount of valuable matter remaining in the ore after treatment, in percent or pennyweights per ton. Beerman. d. As applied to proximate analysis of coke, a calculated figure obtained by subtracting the sum of the percentages of moisture, ash, and volatile matter and ash from 100. B.S. 1016, 1961, pt. 16. e. See coke fracture. Roberts, L., p. 117, 1962.

residuate. a. The constituent petrological unit or maceral occurring as characteristic unresolvable granular and translucent groundmass in clara. A.G.I. b. Same as residuum, b. Terns, 1954.

resultant. That part remaining after any processing, such as separation. Shell Oil Cb, a. Weathered material, including the soil, down to fresh, unweathered rock. Le-grand. A name given to a very dense, blackish to deep reddish-brown material, without definite organic structure, which appears as somewhat granular interstitial matter between individual microscopic ingredients in certain coals. See also desmite. Terns, 1954. d. The finely comminuted matter unresolvable in the thinnest sections by the best illumination under the highest powers of the microscope. Essentially characteristic of durains, it is generally opaque but not always. The essential characteristic is difficult, the impossibility of fragmentation into particles of one or two microns, or less. A.G.I. e. The material eventually resulting from the decomposition of rocks in place and consisting of the nearly insoluble material left after all the more readily soluble constituents of the rocks have been removed. See also residual, a. Fay. f. The residue left in the still after the distillation of crude oil has been completed, and not the residue from redistilled condensates. Also known as the cokings.

resilience. The work which a body can do in springing back after a deforming force has been removed. It is measured by the elastic limit of the material, the resilience equals that proportion of the total work of deformation which the body can give back upon removal of the force. A.G.I. It is sometimes called elastic rebound. Stokes and Varnes, 1955.

resilient materials. The resilient type of coupling has many designs but essentially has torsional response to application or variation of the transmitted load. For the all-metal types, the resilient element may be in the form of laminated spring pads or a cylindrical grid member, connecting the driver and driven hubs. Resilience damp shock loads and also provides means of keeping gear teeth in contact, compensating for small errors in gear cutting. Other types use rubber or rubberlike material which may be in the form of a spider, segmental blocks, a number of balls or a molded disk with metal inserts, providing the connection between the driver and driven hubs. Pit and Quarry, 53rd, Sec. D, p. 67.

resin. a. A solidified and mainly amorphous product of secretions and excretions of certain trees, produced by condensation of a fluid on a loss of volatile oils. Resins represent a complex mixture of aliphatic and cycloaliphatic compounds, such as terpenes and oxygenresins, resin alcohols, resin acids, resenes (esters or lactones), etc. Resins are also are solubly distributed in alcohol, ether, or volatile oils and in this respect are distinct from gums (carbohydrates) which are soluble in water. Foss. sil resins may be subdivided into: (1) amber group resins—usually containing ter-

resin opal. A honey- to ochreous-yellow vari-

resinous MA Coal in which the attritus may consist of resinous cement. A term used in chemical elections. Zn resina, although some may have been contributed from the stems of other gymnosperms. Resins may be scattered and mixed at random with other constituents in the attritus, or be formed in the petals of the Medulloidea, although some may have been contributed from the stems of other gymnosperms. Resins may be scattered and mixed at random with other constituents in the attritus, or be formed in the petals of the Medulloidea, although some may have been contributed from the stems of other gymnosperms.

resin rodlets. A constituent representing resinous material of plants; most resin rodlets have been formed by the secretion of resin into canals or ducts by the surrounding epidermal cells. Mae. For the more familiar rods were formed in the petals of the Medulloidea, although some may have been contributed from the stems of other gymnosperms. Resins may be scattered and mixed at random with other constituents in the attritus, or be formed in the petals of the Medulloidea, although some may have been contributed from the stems of other gymnosperms.

resistivity. a. A measure of the electrical resistance, in ohms, of a substance. Nelson. b. The electrical resistance of the parts being welded are held and which are traversed by small vesicles or canals. They have infrequently been observed split lengthwise with an inner pattern of diakite forms included from either end toward a central flat-lying disk. When the rodlet is hollow, the space is commonly mineralized, kaolinite being a common filling. Common, but in relatively small quantity in banded bituminous coal. May occur genetically associated with anhydrite or fusain, or be scattered and mixed at random with other constituents in the attritus, or be formed in the petals of the Medulloidea, although some may have been contributed from the stems of other gymnosperms.

resistivity index. This quantity may be defined as follows: resistivity index = — , where I equals resistivity index, R, equals true resistivity of a rock, and R, equals resistivity of some rock containing oil or gas.

resistivity method. a. An electrical method of prospecting in which measurements are made directly by observing the ratio of voltage to current when a current is forced to flow through the section of ground to be tested. In the induction method, measurement of resistivity is indirect, the phase shifts or other electrical phenomena may be studied in the field. Resistivity surveys have been applied to several coal-mining problems. One in particular being the location of drift and of buried drift-filled channels. Nelson.

resistivity tests. A low voltage electrical test used in measuring the continuity of a non-conducting coating on a metallic base. A.G.S., S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resinous cement. A term used in chemical elections. Resembling resin, as opal, and some yellow varieties of sphalerite. Fay.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.

resistance welding die. The part of a resistance welding machine that is usually shaped to the work contour, with which the parts being welded are held and which conducts the welding current. A.G.S.
resolving power. In optical viewing, resonance method. A procedure to determine water breathing velocity as determined by the abnormally large response of a system having a natural vibration period to a stimulus of the same, or nearly the same, frequency. A.G.I.

resonance method. A procedure in which a transverse wave is imparted to the test object and excited over an appropriate range of frequencies. A displacement-type resonance with a real resonant frequency at which the thickness of the test object is equal to the half-wavelength of the ultrasound, and (3) inertial resistance introduced by the inertia of water which must be displaced during respiratory movements of the chest; and (4) miscellaneous factors such as the resistance of breathing bag fabric to inflation and deflation.

respiratory minute volume. The total amount of air moved in and out in the lungs in a minute.Minute volume is determined by multiplying the tidal volume times the frequency times the respiratory minute volume. Minute volume varies greatly with the body's activity. It is about 6 liters at complete rest and may be over 100 liters during very heavy work. Abbreviation, \( V_{\text{Em}} \).

respiratory quotient. a. The ratio of carbon dioxide expelled to oxygen consumed. It is a volume ratio. In other words, a normal adult will breathe only 0.07 X 0.9 = 0.063 cubic feet of carbon dioxide for every 1 liter of oxygen consumed. \( V_{\text{Q}} \).

respiration. The process of drawing air, or another breathing medium, into the lungs to supply oxygen and purify the blood. \( V_{\text{R}} \).

respirator. a. A device (as a gas mask) for protecting the respiratory tract (as against irritating or poisonous gases, fumes, smoke, dusts) with or without equipment supplying oxygen or air. Webster 3d. b. A device for maintaining artificial respiration. Webster 3d. c. The mining type is a fitting which covers the nose and mouth to prevent the entry of excessive quantities of dust. Tunnel miners and men at silver plants and blast furnaces also wear respiration. Sometimes a person who is known to be a smoker, or is associated with a smoker. \( V_{\text{R}} \).

respiratory cycle. One complete breath—an inspiration followed by expiration, involving any pause that may occur between the movements. \( HOG \).

respiratory exhalation. Resistance to underwater breathing has four components: (1) airway resistance caused by valves, length and diameter of tubing, and possibly external factors due to the density of the inspired gas at increased depth; (2) hydrostatic resistance caused by the difference in pressure between the mouth of the swimmer's center of breathing (most commonly believed to be at the bottom of his throat) and the level of the inlet or demand valve; (3) inertial resistance introduced by the inertia of water which must be displaced during respiratory movements of the chest; and (4) miscellaneous factors such as the resistance of breathing bag fabric to inflation and deflation. \( V_{\text{Em}} \).

respiratory state. The arrangement at the top and bottom of a shaft, or intermediate levels, for supporting the shaft cage while changing the tubs or cars. Also called chairs; catches; wings. \( V_{\text{R}} \).

resisting cable plug and socket. a. A plug and socket designed to be held together by an operating bolt, or screen and other equivalent device, the use of which enables the plug to be readily inserted or withdrawn. B.S. 3618, 1965, Sec. 7. b. A flameproof restrain plug and socket incorporates an interlock to ensure that the power connections are dead when they are separated, or until they make contact; the design is such that the enclosure is flameproof at all times when there is contact between the pin and tubes. B.S. 3618, 1965, Sec. 7.

restrictions. Used in mining, a system of earth fault protection in which the fault current is limited, without requiring the use of sensitive earth fault protection. B.S. 3618, 1965, Sec. 7.

resting. a. Striking a trimmed but unlit match. A device (as a gas mask) for protecting the respiratory tract (as against irritating or poisonous gases, fumes, smoke, dusts) with or without equipment supplying oxygen or air. Webster 3d. b. A sizing operation which is then extracted in a clean condition. \( V_{\text{R}} \).
resultant force. Two or more forces acting on a body may be replaced by a single force whose effect is exactly the same as the combined effect of the other forces. Such a force is called the resultant, while the other forces, to which it is equivalent, are called components. *Morris and Coope*, p. 194.

resultant field. The magnetic field which is the result of two or more magnetizing forces impressed upon the same area of a magnetizable object. Sometimes called vector field. *ASM Gloss.*

resultant force. Force, Two or more forces acting on a body may be replaced by a single force whose effect is exactly the same as the combined effect of the other forces. Such a force is called the resultant, while the other forces, to which it is equivalent, are called components. *Morris and Coope*, p. 194.

resultant field. The magnetic field which is the result of two or more magnetizing forces impressed upon the same area of a magnetizable object. Sometimes called vector field. *ASM Gloss.*

retort

treat by heating in a retort, as gold amalgam, to drive off the mercury and recover the gold. Fay, p. 910.

retort carbon. Retort carbon, or retort gas. Gas resulting from the heating of coal, for example, in the by-product process of coke manufacture. Ben-

retort gas. Gas resulting from the heating of coal in retorts, for example, in the by-

retort gas tar. Obtained as a condensation product in the hydraulic main, scrubbers, or condensers in the manufacture of coke for illuminating purposes. It is less fluid and contains less of the lighter hydro-

carbon gases, more naphthenes, and more free carbon than tar from other sources. Retort gas tar contains 20 to 40 percent of free carbon and yields on dis-
tillation from 50 to 75 percent of pitch, or, if the distillation is carried all the way to 95 percent of pitch of coke. Chemical and Metallurgical Engineering, v. 27, 1926, p. 161-165.

retort house design. Mersereau, 4th, p. 163.

return. a. Any airway in which vitiated or foul air flows from the workings to the upcast shaft and the unsupported workings are abandoned and left to cave in. Pryor, 3. d. A system of robbing pillars in which the line of pillars being robbed retreats from the shaft toward the boundary, these pillars being removed (robbed) as the work retreats. See also longwall retreat. Nelson. c. A stopping system in which sup-
porting pillars of ore are left in while the mine is worked out, that is, the pillars are removed by the advancing face without pillars back toward the shaft. A method of working a mine which is designed to allow a stope to cave soon after it is worked out, thus releasing the weight on the supports in adjacent stops. Lewis, p. 438. b. A meth-
od of extracting coal from a coal bed by driving a narrow near surface drift toward the boundary, then opening out a face and working the de-

retreating. a. To work rooms, and pillars of ore are removed by the advancing face without pillars back toward the shaft, drift, or main entry. See also longwall retreat. Nelson.

retreat. a. To work rooms, and pillars of ore are removed by the advancing face without pillars back toward the shaft, drift, or main entry. See also longwall retreat. Nelson. c. A stopping system in which sup-
porting pillars of ore are left in while the mine is worked out, that is, the pillars are removed by the advancing face without pillars back toward the shaft, drift, or main entry. See also longwall retreat. Nelson.

retrievable wedge. A type of wedge that can be retrieved or removed, that is, the pillars are removed by the advancing face without pillars back toward the shaft, drift, or main entry. See also longwall retreat. Nelson.

retrievable inner barrel. The inner barrel assembly, or a wire-line core barrel, designed for removal of samples or cores from a borehole without pulling the rods. Long.

retrievable wedge. See retractive wedge. Long.

retrieval. To recover or remove from a borehole to fish. Long.

retrieving ring. A catch ring on a retractive wedge that operates as a lifting device on the deflection barrel or bit, or the main body, or the main sheave or main drum or the wire line to which the wire line is attached. Long.

return. a. To fish. Long.

return circulation. See return water.

return drum. This device, or drum, is employed as a driving mechanism for the conveyer belt or as an electrically operated driving and holding device. The return drum is so designed that it can be stopped or brought to a complete stop by a signal from the operator, or by a signal from a switch in the conveyer system. The return drum is a driving device and can be stopped and brought to a complete stop. Long.

return roller. A small drum or roller used as a driving mechanism for the conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return roller. See also return drum, return water.

return water. The drill fluid that reaches the surface after it has been circulated through the rods and past the drill bit. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. See also return pipe, return water, return water, return water, return water, return water.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.

return water. The conveyer belt or as an electrically operated driving and holding device. The return roller is so designed that it can be stopped and brought to a complete stop. Long.
revdanskite; revdanskite
drou nickel silicate from Revda (Rev-
dinsk), Ural Mountains, U.S.S.R. Also
spoken revy, revdanskite, revdanskite, rev-
dankanite, and revdanikite. English; Hey
2d, 1955.

reveal. That portion of a jamb or recess vis-
ible from the face of a wall back to the
frame placed between jambas. ACGS, 1961.

revenue. The receipt or income of partic-
didate directly to be written off against in-

reverberate, a. To deflect. flame, heat, st in
a reverberatory furnace. Fay, b. To re-
duce by reverbrated heat; to fuse. Fay.

reverberation. a. The persistence of sound in
an enclosed space as a result of multiple
reflections after the sound source has stop-
ped. The sound that persists in an enclosed
space, as a result of repeated reflection or
scattering, after the source of the sound has
stopped. H&G, b. The sound that per-
dure from the face of a wall back to the
side of the charge. Firing may be with
having a roof that deflects the flame and
the index level of the pulse trans-
sducer. Hy.

reverberation strength. The difference be-
 tween the level of a plane wave producing
in a nondirectional transducer a response
equal to that produced by the reverbera-
tion corresponding to a range of one yard
from the effective center of the transducer
and the index level of the pulse trans-
mitted, on any bearing, by the same non-
directional transducer. Hy.

reversal. a. A reversal. A curve. A
regenerative furnace. ACGS.

reverberatory kiln. Dodd.

reverberatory kiln. Trade mark. See also Davis
revergen kiln. Dodd.

reversal (of dip). A local change of approxi-
mately 180° in the direction of the re-
versal of dips. A.G.I.

reversal (of dip). An offset from the dip due
to the energy destroyed and dissipates it in
the liquid condenser at heat. Two phases
of the stator supply are interchanged by
bringing back the driver's lever to the off
position and then to that for the opposite
direction of rotation. The amount of
braking depends upon the position of the
lever, since the lower the resistance in the con-
trolled, and therefore in the rotor circu-
it, the greater the rotor current and the
braking torque produced. When the di-
rection of rotation of the stator magnetic
field is reversed, the voltage between the
stator and the rotor is doubled and the
in-duction of current is adequate to pre-
vent breakdown. Sinclair, V, p. 120.

reversal current. The current that com-
posed of the arcs of two circles of the same
or different radii, the centers of which lie
on opposite sides of the curve. Zern, p.
455. b. A curve formed of two arcs in the
shape of the letter S. Ham.

reversal heating. A method of narrow
heading ventilation in coal mines by means
of a brattice partition. The air is led to
the face from the sides of the curve. In this
way, the work in the heading are placed in
relatively clean air. Nelson.

reversed flush boring. See counterflush bor-
ing. B.S. 3618, 1963, sec. 7.

reversed loader. A front-end loader mounted
on a wheel tractor having
a reverse redrawing. A second drawing opera-
tion in a direction opposite to that of the original drawing.

reversal mill. See double-ended pick.

reversing. a. A reversal. A curve. A
regenerative furnace. ACGS.

reversing beam. A method used in
reverse redrawing. A second drawing opera-
tion in a direction opposite to that of the original drawing.

reversing clutch. A forward-and-reversing
transmission which is shifted by a pair of
friction clutches. Nichols.

reversing contacts. Magnetically operated
switches controlled through a master con-
troller operated by a hand lever on the
control platform or desk. They may be of
the air break or the oil break type. Sin-
vil, p. 111.

reversing doors. The system of doors or shut-
ters on or near a surface radial-flow fan for
reversing the direction of the air passing
through the mine. B.S. 3618, 1963, sec. 2.

reversing machine. A molding machine hav-
ing a roof that deflects the flame and
the index level of the pulse trans-
sducer. Hy.

reversing mill. A type of rolling mill in
which the stock being mechanically worked
by rolling passes backwards and forwards
between the same pair of rolls, which are
designed so that core tends to float within
the barrel when the fluid is circulated
down the outside of the rods and returned
to the surface inside the rods. Long.

reverse circulation. The circulation of bie-
coupled and cuttings-removal liquids, drill-
ing fluid, mud, air, or gas down the bore-
hole outside the drill rods and upward in
side the drill rods. Also called counter-
current; countercurrent. Long.

reverse circulation core barrel. A core barrel
"926."
reversing mill

reversing between each pass. See also continuous mill; three-high mill, b. C.T.D. reversing mill, c. threethree-high mill. Fay.

reversing shaft. A shaft whose direction of rotation can be reversed by the use of clutches or brakes. Nichols.

reversing thermometer. A mercury-in-glass temperature measuring instrument constructed so that when the thermometer is suddenly inverted, a separation of the mercury column occurs. Subsequent reading at a known temperature permits computation of the temperature in situ. The procted thermometer gives a reading unaffected by pressure, an unprotected thermometer gives a reading influenced by pressure. The difference between the two corrected readings is a function of depth. Hy.

revet. To face, as with slabs of stone or with any kind of masonry; furnish with a revetment; to revet an embankment, wall, or building. Standard, 1964.

revetment. a. A facing, sheathing, or retaining wall, as of masonry or other materials, a wall sloped back sharply from its base. Nichols.

revetment Lang. See tölle. Fay.

revived. Having had its ability to cut down its bed renewed or augmented through in creasing the earth's crust by a uplift or tilt; said of certain streams. Fay.

revolving. Of a series of products or equipment designed to aid patient resuscitation by giving him oxygen to breathe instead of fresh air. See also Novox reviving apparatus; Novita reviving apparatus. McAdams, p. 93.

revolution. A time of major crustal deformation when folds and faults are formed. Often accompanied by the emplacement of plutonic rocks. A.G.I.

revolution counter. See automatic counter. Hansen.

revolver press. A type of press for the shaping of clay roof tiles. It consists of a pentagonal or hexagonal drum, mounted on a horizontal shaft and carrying press molds on each flat surface. As the drum rotates, discontinuously, each mold in turn is brought beneath a vertical plunger which consolidates a clot of clay in the mold. While the drum is stationary (turing pressing) a clot of clay is fed to the mold next due to arrive beneath the plunger. Dodd.

revolving pot. A rotating circular container from which a DOAS machine gathers glass. ASTM C162-66.

revolving screen. A screen consisting of a cylindrical (sometimes conical) screening surface mounted on a revolving frame for sizing coarse material; it is still commonly in gravel-washing, coal-washing, and stone dressing, but is not used extensively in ore dressing. Also called trommel. Newton, p. 72.

reversible. a. A digging machine in which the upper works can revolve independently of the supporting unit. Nichols. b. A machine that has the machinery and deck attached on a vertical pivot, so that it can swing independently of its base. Nichols. c. The most widely used machine for excavating and loading in pits and quarries. It is designed to operate a dipper against a face or bank, which it displaces as it moves forward, and power is applied so effectively that the dipper can be forced into hard materials. Taken altogether, the digging action is exactly suited to the average pit and quarry excavation problem. The revolving shovel, mounted either on crawlers or on rubber tire traction, is extremely mobile and a moveup takes only a few seconds. The digging, swinging, and dumping motions are coordinated into a speedy, flexible operating cycle. The front-end attachments give the machines versatility. Working range is limited only by the boom length. Pit and Quarry, 3rd, Sec. A, p. 91.

revolving shovel. The revolving shovel is the most widely used machine for excavating and loading in pits and quarries. It is designed to operate a dipper against a face or bank, which it displaces as it moves forward, and power is applied so effectively that the dipper can be forced into hard materials. Taken altogether, the digging action is exactly suited to the average pit and quarry excavation problem. The revolving shovel, mounted either on crawlers or on rubber tire traction, is extremely mobile and a moveup takes only a few seconds. The digging, swinging, and dumping motions are coordinated into a speedy, flexible operating cycle. The front-end attachments give the machines versatility. Working range is limited only by the boom length. Pit and Quarry, 3rd, Sec. A, p. 91.

rewashing tube. A hollow cylinder, concentric with the needle of a feeder, revolving in the glass. ASTM C162-66.

rewashing washing section. The rotary washing screen is cylindrical in shape and made of three sections— a scrubber, a sand jacket, and a gravel-screening section— mounted on a steel frame. Pit and Quarry, 3rd, Sec. B, p. 174.

reward claim. A. A prospecting claim; often shortened to reward. Fay. A tract grant to one who first discovers gold in a mining property. See also B.S. 3552, 1962.

rewarded. Said of components derived from an older formation and incorporated in a younger deposit. Schei dacker.

rezco process. A method for producing low temperature coke in which the retort is a brick-lined cylinder, 10 feet in diameter and 25 feet high. A charge of 34 tons of coke is carbonized downward by burning gas at the top, passing the combustion products through the charge. Carbonization takes 6 hours, and cooling, by recirculating of combustion gases, a further seven hours. The process requires a careful selection of grade of the coke, which is a blend of 33 percent of doubles and 67 percent of coals of low heating power with some resistance to the flow of gases through the charge. Francis, 1965, v. 1, pp. 160-161.

rheoidal folding. In 1883 Reynolds found that as the velocity of flow of water was increased, slip faces of colored liquid remained axially in the stream until a certain velocity was reached, when the color was mixed so thoroughly with the water and the flow became confused. The velocity at which the flow turned from streamline to turbulent conditions is called the critical velocity. Reynolds deduced the general expression: \[
V_D w = C, \quad \text{where } V \]

equals the critical velocity, D equals diameter of pipe, w equals density of the fluid flowing or weight per cubic foot, \( \overline{m} \) equals viscosity of the fluid, which depends on the temperature, and \( C \) equals a constant known as Reynolds number or criterion. That Reynolds number depends on the density, velocity, and viscosity of the fluid and the diameter of the pipe. Lewis, p. 707.

Rheoidal number. A dimensionless number proportional to the pipe diameter or the duct diameter and to the velocity and the density of the fluid and inversely proportional to the viscosity of the fluid. A Reynolds' number above 2,500 indicates turbulent flow and below 2,000, streamline flow. Strack, 10. Symbols, R and R. Webster 3d; Zimmerman, pp. 92, 267. Used in fluid flow calculations to estimate whether flow through a pipe or a conduit is streamline or turbulent. \( R = \frac{D D}{\overline{m}} \), in which \( R \) is Reynolds' number; \( D \) is the inside diameter of the pipe or conduit; \( U \) is the average velocity of flow; \( \overline{m} \) is the density of the fluid; and \( \overline{m} \) is the viscosity of the fluid. Different systems of units give identical values of Reynolds' number. Values below 2,100 correspond to streamline flow, and values above 3,000 correspond to turbulent flow. CCD 64, 1961.

realite mastic. A preparation of claretiere containing asbestos fiber; it is used for surfacing floors. Fay

rel. value. In paper-strip chromatography, ratio of distance moved by component in solution under set to that of transporting solvent. Pryor. 3.

rhambolite. See schenbrander. Dana, 7, 1, p. 124.

rhombomancy. The alleged divination by rod or wand when searching for minerals. Fay.

rhambophane. A very rare, weakly radio active mineral (Ge,Y,La,Dy)(PO,\( H_2 \))O; possibly tetragonal or hexagonal; brown, pinkish- or yellowish-white; found as thin incrustations in ore bodies. Crosby, pp. 186-187.

Rhætic beds. Certain fossiliferous shales and limestones of the Upper Trias of Europe. Also called avicula contorta zone. Schieferdecker.

reid folding. Folding accompanied by slip parallel to planes at an angle to the bedding or earlier developed foliation. A.G.I. Supp.

Rheanuma furnace. A combination of the Hanecastle and flue furnaces, for four hearths, and with a combination flue under the lowest hearth and one over the upper hearth. It has mechanical rabbles. Fay.

Rheish furnace. A zinc distillation furnace which is a modified type of the Silican furnace. Fay.

Rhenium. A rare, silver-white metal; resembles platinum; oxidizes only at high temperatures and is very resistant to corrosion. It occurs in very small quantities in columbite and in platinum and molybdenum ores. Rolfe. Symbol, Re; atomic number, 75; and atomic weight, 186.2. C.T.D. Metallic lustre; hexagonal; valences, 1, 2, 3, 4, 5, 6, and 7; melting point, 3,180° C or 3,167° 60 °C; boiling point, 5,627° C (estimated) or 5,900° C (estimated); specific gravity, 21.02 (at 20° C); insoluble in water and in hydrochloric acid; slightly soluble in sulfuric acid; and soluble in dilute nitric acid and in aqueous mercuric nitrate. Its density is exceeded only by that of platinum, iridium, and osmium, and its melting point is exceeded only by that of tungsten and carbon. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-131, B-212.

Rheolaph. A heart-lung produced by syn- genetic deformation, slumped and related processes, as opposed to turbolaphs which are produced by turbidity currents. Peatjohn.

Rheolave system; launder washer. A washer in which the raw coal and water is fed into the head of an inclined launder equipped with openings in the bottom for the discharge of the heavy, high-ash material, the lighter coal being discharged with the bulk of the water at the far end of the trough. The Rheolave has declined in popularity. Nelson.

Rheolave washers. Apart from the launder washer, there are three types of Rheolave washer: (1) the sealed launder type for coarse sizes, from which the reject falls against an upward current of water and is removed by a gate which controls the feed to a downward elevator; (2) a system of two, three or four superimposed troughs for washing fine coal below about 1/2 inch. The troughs are equipped with several bottom discharge devices. The separation of the heavy shale from coal and middlings takes place progressively until finally the pure shale is discharged from the lowest trough, and (3) a system for washing slurry consisting usually of two troughs one above the other and equipped with a number of Rheo boxes of the open discharge type but designed to minimize the loss of coal with the fine shale. Nelson.

Rhomorphism. A process of at least partial transformation by which a variable or an adjustable resistance may be introduced into a circuit to regulate the strength of a current. A.G.I. See field coil. A.G.I.

Rhostat. A. instrument for testing blasting machines by inserting definite resist-
ance equal to a known number of electric blasting caps of a standard-length wire, using one electric blasting cap as an indicator. Fay.

Rhostat rope. A simple rope consisting of 8 strands of cotton yarn, each 5800 ft, p. 130.

Rhotropic brilliancy. That portion of the brilliancy characteristic of nonface-centered cubic metals which is caused by the presence of a stress concentration or at low temperatures or high strain rates, that may be eliminated by prestraining under mild conditions. A.G.I. Supp.

Rhigolone. This term is archaic and should not be used. ASTM D 288-57.

Rhino. A group of massive bouded unfossiliferous gneisses, arkoses, and conglomerates; part of the Harlech series of the Cambrian system, exposed chiefly in the Rhino Mountains in Merioneth, North Wales. C.T.D.

Rhodium. A rare element of the light platinum group in group VIII of the periodic table; found only in association with rhodium platinum-thorium-molybdenum. Used for plating silver and silver plate to prevent tarnishing. Symbol, Rh; valences, 2, 3, 4, and 5; isotomic; atomic number, 45; atomic weight, 102.905; specific gravity, 12.41 (at 20° C); melting point, 1966° ± 3° C; boiling point, 3727° ± 100° C; insoluble in water; slightly soluble in acids and in aqua regia; and soluble in sulfuric acid plus hydrochloric acid and in concentrated sulfuric acid. C.T.D.; Fay. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-131, B-213.

Rhodium. Gold. Gold occurring naturally all-

Rhodol. An artificial resin (cellulose acetate) used to imitate amber; specific gravity about 1.28; refractive index about 1.49. Fay.

Rhodoite. A variety of garnet, 3(Mg,Fe)2O3Si3O12; characterized by its rose- color and brilliant luster. Composition corresponds to 2 molecules of pyrope and 1 of almandine. Isometric Sanford 17.

Rhodite. A rose-colored, triclinic mineral, MnSiO3, sometimes used as an ornamental stone. Also called manganese spar. Dana 6d, p. 564.

Rhodite. A word employed by Wadsworth to designate smelting materials or fluxes. Fay.

Rhomb. In crystallography, for rhomboids, for rhomb facets, Shipley.

Rhomb. Same as rhomb. C.T.D.; Fay; A.G.I.

Rhombocad bemyll. Applied to certain North- westem porphyries, whose phenocrysts of orthoclase resemble a rhombohedron. The orthoclase is rich in soda. Fay.

Rhombic. Four-sided; each side of equal length but not at right angles to each other. Shipley.

Rhombic. The ordinary dodecahedron, formed by twelve plane pairs of lozenge-shaped faces. Shipley.

Rhombocedarmite. See orthoscopic. Dana 6d, p. 592.

Rhombocedarmite. See rhombic. Shipley.

Rhombocad bemitt. Synonym for phlogopite. Fay.

Rhombocad bermite. An old name for feldspar. Fay.

Rhombof. A. A rhombic crystal. Fay.

Rhombosil. A. A rhombic crystal. Fay.

Rhombocad. B. Pertaining to, or belonging in that group of the hexagonal system which is characterized by a vertical axis of threefold symmetry and three horizontal axes of two-fold symmetry. Fay.

Rhombocad. B. See orthoscopic. Dana 6d, p. 592.

Rhombocad. C. A. Same as the hexagonal system, except that the forms are referred to three axes parallel to the faces of the fundamental rhombohedron instead of to the usual four axes. Fay. b. The trigonal division of the hexagonal system, the
rhombohedral system

forms being referred to the same three axes as above. Neither usage has been generally accepted. Fay.

rhombohedron. A crystal form bounded by six faces of rhombohedral outline. Fay.

rhomboideal. A parallelogram that does not have any right angles, and one pair of opposite sides differ in length from the other pair of opposite sides. Jones, 2, 99.

rhomboid. Shaped like a rhomboid, as a rhombohedral face. Shipley.

rhomboideal ribbon mark. Ribbon mark with a reticulate, rhombohedral pattern. Pettijohn.

rhombo-poryphy. A variety of néritne containing rhomb-shaped phenocrysts of alkali feldspar. A.G.I.

rhombo spar. Synonym for dolomite. Fay.

rhyobasalt. Suggested for rocks which are rhyacolite. Sanidine. Webster 3d.

rhyodacite. The extrusive equivalent of a rhyolite. The general name for fine-grained rhyolite glass. Obsidian. Shipley.

rhyolite breccia. A rock composed of angular fragments of solid ore of a vein; an elongated pillar left for support, or side. T.I.M.E. g. A stringer of ore in a lode. Fay.

rib, a. The side of a pillar or the wall of an entry. B.C. d. The solid coal on the side of a gallery or longwall face; a pillar or barrier of coal left for support. Fay. c. The solid ore of a longgated pillar left to support the hanging wall in working out a vein. Fay. d. Scot. A thin stratum, as of stone, in a seam; a ribb, or so-called ribb. Fay. e. A stringer of ore in a lode. Fay. f. The termination of a coal face. Where solid coal is left at the term last rib, end, or side, is used; and where the coal face ends at the gob, the term is used loose rib, end, or side. In J.E. a side wall in an anthracite mine. Korson. b. See buttocck.

rhythmic driving. In this type driving, the drilling, loading, and blasting are carried out in one shift and the mucking and transportation in the following one. This enables every man in his tasks and machines, which is a highly mechanized job to be necessary condition for making the best use of expensive equipment. It also reduces or eliminates the loss of time for ventilation that in rhythmic driving is caused out between two shifts. Langefors, P. 205.

rhythmic sedimentation. A regular interbanding of two or more types of sediment on sedimentary rocks due to a seasonal change in the conditions of sedimentation, such as alternation in the time of the dry periods. C.T.D. See also varved clay.

rhythmic succession. The constant repetition of a definite unit in a vertical range of rocks; has been observed throughout the British Coal Measures. See also Coal Measure unit, Nelson.

rhythmites. a. Rhythmically laminations. A.G.I. b. Individual units of rhythmic beds. A.G.I. c. The couplet of distinct types of sedimentary units in a stratified sequence of sediments, that for instance a unit bed or lamina in rhythmically bedded deposits implies no limit to the thickness of bed, lamina, or complexity, but the term should exclude groups of beds, such as cyclothem, and carries no time or seasonal connotation much as varve. Compare cyclothem; varve. A.G.I.

rib. a. A more or less wedge-shaped inlet, gradually widening and uniformly deepening from its head to the sea, showing no trace of an included basin. A.G.I. b. The term ria, from the Spanish, may be advantageously used to cover all types of subaerially carved troughs, including von Richthofen's fjord, or Alman, and liman types. A.G.I.

ria coast. See ria shoreline. Shipley.

ria shoreline. Shorelines formed by the partial submergence of a landmass dissected by numerous river valleys, may be called ria shorelines, after the ria coast of northwestern Spain, which was produced by the drowning of normal river valleys along a mountainous coast; thus used, the term ria is not restricted to the narrow meaning assigned to it by von Richthofen, who first used it in a genetic sense; but is employed in the broader sense in which it has been used by Gulliver and others. A.G.I.

ribb. a. The side of a pillar or the wall of an entry. B.C. d. The solid coal on the side of a gallery or longwall face; a pillar or barrier of coal left for support. Fay. c. The solid ore of a longgated pillar left to support the hanging wall in working out a vein. Fay. d. Scot. A thin stratum, as of stone, in a seam; a ribb, or so-called ribb. Fay. e. A stringer of ore in a lode. Fay. f. The termination of a coal face. Where solid coal is left at the term last rib, end, or side, is used; and where the coal face ends at the gob, the term is used loose rib, end, or side. In J.E. a side wall in an anthracite mine. Korson. b. See buttocck.

ribbon brake. A friction brake having a metal strap which encircles a wheel or drum and may be drawn tightly against it. Standard, 1964. A hand brake. Fay.

ribbon courses. Successive courses of roofing tiles laid to alternately greater and lesser exposures. Dodd.

ribbon diagram. Geologic cross section drawn in perspective and joining control points along a sinuous course. A.G.I. Shipley.

ribboned structure. It was noticed in some parts of the ice of a glacier, an appearance which cannot be more accurately described, that, by calling it a ribboned structure, formed by thin and delicate blue and bluish-white bands on the surface, which appears to the ice in a vertical direction or rather which, by their apposition, formed the entire walls of the bands was parallel to the length of the glacier and, of course, being vertical, they cropped out at the
ribboned structure

surface, and wherever that surface was illuminated and smoothed by superficial watercourses, their structure appeared with the beauty and sharpness of a delicately chiseled G.I. ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.

ribbon jasper. See ribbon process. A process whereby molten ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon process. A process whereby molten glass is delivered to a forming unit in a ribbon form. ASTM C162-66.

ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon form. ASTM C162-66.

ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.

ribbon jasper. See ribbon process. A process whereby molten ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon process. A process whereby molten glass is delivered to a forming unit in a ribbon form. ASTM C162-66.

ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon form. ASTM C162-66.

ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.

ribbon jasper. See ribbon process. A process whereby molten ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon process. A process whereby molten glass is delivered to a forming unit in a ribbon form. ASTM C162-66.

ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon form. ASTM C162-66.

ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.

ribbon jasper. See ribbon process. A process whereby molten ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon process. A process whereby molten glass is delivered to a forming unit in a ribbon form. ASTM C162-66.

ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon form. ASTM C162-66.

ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.

ribbon jasper. See ribbon process. A process whereby molten ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon process. A process whereby molten glass is delivered to a forming unit in a ribbon form. ASTM C162-66.

ribbon quartz. Quartz, usually from veins, is formed into ribbons. See also ribbon. Fay.

ribbon form. ASTM C162-66.

ribbon flight screw conveyor. A screw conveyor having a ribbon flight screw. See also ribbon conveyor. AIME, p. 792.
rider bricks. Refractory bricks, which may be used to support the checkerwork in a regenerator. ASTM C162-66.

riders. One of a series of arches which support the checkerwork in a regenerator. See also rider arch.

ride-the-tow. Scot. To slip or slide down the inclined plane or chute or to power arbitrary movements. Didd.

ridge. A long elevation or line of a slope to pond rainwater above it. A.G.1. c. A planer prop or deflecting chute. Pryor, 3. d. A shallow rocky place in the surf; the ripling washup on the edge of the surf; the ripling washup on the beach; used in northeastern states as a synonym for riffle. A.G.I. f. A quarryman's term for use along the rim of a pitched surface. Nichols.

ridge and trough. A submerged ridge and trough which form approximately parallel to beaches having a cross-shore current. J. Geol., v. 48, No. 5, July-Aug., 1940, p. 467-477.

ridges. a. A relatively narrow elevation which is prominent on account of the steep faces on either side. Where a rise is in a near horizontal bed, the term "ridge" may be used. A.G.I. b. A long elevation of the deep-sea floor having steeper sides and less regular topography than a rise. A.G.I. c. A narrow, elongated crest of a hill or mountain; an elongated hill; a range of hills or mountains. A.G.I. d. The ana climbing parallel to the adjacent pairs of amphi- lacerous pores (in the regular echinoids). A.G.I. e. Som. A fault filled with fault rock (slope material). A.G.I. f. A prominent part of the structure. A.G.I. g. A ridge or many ridges. Hy.

ridge roll. A curved piece for covering the ridge of a roof laid with roof tile. Fay. See rippled shingles, shingled.
rift

or excavating the rock. *See* also grain. *Nelson.*

J. In sedimentary rocks, the horizontal plane of stratification, or the bed of the rock. *Stauffer.* k. An obsolete foliation, either vertical (or nearly so) or horizontal, along which a rock splits more readily than in any other direction. *See also grain, a. Fay.* l. See fault trace. *Fay.* m. A crack, as in the midocean ridges. *MacCracken.*

rift structure. Two faults, more or less parallel, with adjacent wedge or block of rock separated. *Challinor.*

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Fay.* Also known as graben and trench fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Skow.*

rift, rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Stauffter.* Also called trough fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Washburn.* Also known as graben and trench fault.

rift time. a. The hours, days, etc. a drill rig is in the field. Also called setup time; rigging time. *Long.* b. Time devoted to the operator's working time. *Long.*

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Hamm.*

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Hamm.* Also called trough fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Stauffter.* Also known as graben and trench fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Stauffter.* Also known as graben and trench fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Stauffter.* Also known as graben and trench fault.

rift valley. A relatively long and narrow troughlike valley formed by the sinking of one block of the earth's crust, causing the remaining block to remain above sea level. *Stauffter.* Also known as graben and trench fault.
pile. Fay. b. To so mine ore that it runs down a slope to a chute or loading level. Ore is said to be rilled when the depression is a slope left in mining. Hess. c. A very small brook; a streamlet. Weh-ner 2.

rill-cast. Probably the same as furrow flute cast. See also furrow flute cast. Pettijohn.

rill-cut stopping. See rill stopping, b. Fay.

rill-cut vertical stopes. See rill stopping, b. Fay.

rill mark. Dendritic, bifurcating-upstream, rill common found on subaerial portion of beaches, sand bars, and sand flats formed by flow of thin sheet of water. Some rills show marks showing distributary pattern of down-current bifurcation. Pettijohn.

rill stope. Overhand stope so shaped that miners can stand on the ore they have severed, and work horizontally along the side walls of unbroken ore which confine the excavation. The stope is carried as an inverted stepped pyramid, its apex ending in a winze which leads to the trimming level, down to which ore gravitates or is excavated. Pryor 3.

rill stopping. a. A method of stopping, such as overhand, inclined, or pyramidal, in which the ore is cut back from the winzes in such a way that an inverted pyramid-shaped room is created, with its apex in a winze and base at the level. Sometimes called pyramidal stopping; inclined cut and filling; rill-cut vertical stopes; overhand stopping in inclined floor; rill-cut stopping. Fay. c. Cut-and-fill stoning in which slices are cut-and-fill in which slices are inclined to the horizontal. The slope of the slices is preferably such that both ore and waste will slide to the stope; otherwise these materials must be moved by scrapers or by hoisting. Lewis, p. 470.

rimstone. A basin formed within a rim built-up of calcite precipitated from slowly overflowing water. Schieferdecker.

rincon. Sp. Recess in a mountain or cliff such as would be formed by a river bend. Shakespe.

rine pan. A pan in which salt water is evaporated to obtain salt. Fay.

ring. a. A complete circle of tubbing plates around a circular shaft. Fay. b. Troughs placed in shafts to catch the falling water, and so arranged as to convey it to a certain point. Fay. c. Newc. A gutter cut around a shaft to catch and conduct away the water. Fay. d. S. A circular piece of wrought iron, about 8 inches deep, placed on the top of a skip of coal to increase its capacity. Fay. e. See wedging crib. Pryor. 3. a. A refractory ring that floats on the molten glass in a pot to keep any scum from the gathering area within the ring. Compare floaters, d. Dodd. g. The part of the mold that forms the rim of pressed glassware. Dodd. h. An arch of refractory bricks forming part of a furnace roof and unbounded with the adjacent arches. Dodd. i. A saggar without a bottom. Sometimes called a ringer. See also saggar. Dodd. j. The sound produced when two bricks are knocked together, or when one brick is struck with a hard object. A.R.I.

ringagae. Agate with concentric rings but with less distinct color contrasts than eye agate. Shakespe.

ring and circle shear. A cutting or shearing machine with two rotary-disk cutters driven in unison, and especially with a circle attachment for cutting inside circles or rings from sheet metal, where it is impossible to start the cut at the edge of the sheet. One cutter shaft is inclined to the other to provide cutting clearance so that the off-fall (or outside) remains flat and usable. See also circle shear. ASM Gloss.

ring arch. One composed of a series of straight, unbounded, rows, one brick wide. Bureau of Mines Staff.

ring complex. See ring dikes. C.T.D.

ring crib. Eng. A wedging crib upon which cutting is placed, involving a gutter or ring cast round the inner edge, to collect any water that may run down the walls of the shaft. Fay.

ring crusher. a. A type of hammer mill with a high-speed horizontal shaft upon which a series of steel rings are swung. ACG, 1963. b. Limpet mill, beater mill, or hammer mill, in which the beaters are loosely swinging rings. Pryor. c. See hammer mill, c. A. C. G.

ring-cut. Some six holes in a ring around one central hole used to carry cavity forward. Pryor, 3.

ring dikes. An arcuate, rarely circular dike with steep dip. Larger ring dikes may be many miles long, hundreds or thousands of feet thick; radius of arc is generally from one to 10 miles; although some ring dikes may form a nearly complete circle or ellipse, more commonly they encompass one-fourth to three-fourths of the circle or ellipse. A.G.I.

ringed out. A diamond bit in the face of which has been gouged a circular groove deeper than, and at least as wide as, the diameter of one row of the inset diamonds. Long.

ringens. a. A chart divided into five (5) shades or graduations of darkness as a means of designating the blackness of smoke emitted from industrial chimneys. The charts have been standardized and are used in the ceramic industry in compliance with the Clean Air Act of 1953 in which dark smoke is defined as grade 0, and lighter than, shade 2 on the Ringelmann chart. Dodd.

ring fault. A steep ring-shaped fault, complete or incomplete. Challinor.

ring hole. An opening in a tank through which glass is gathered. ASTM C-162-66.

ring holes. The group of boreholes radially drilled from a common-center setup. See also horizons; radical drilling. Long.

ring induction method. An inductive method in which the primary coil and the measuring coil are concentric. Schieferdecker.

ringing. The audible or ultrasonic tone produced in a mechanical part by shock, and having the natural frequency or frequencies of the part. Noise, decay rate of the tone may sometimes be used to indicate quality or soundness. ASM Gloss.

ring kiln. See kiln. A limelike made by digging a conical pit, filling it with alternate layers of limestone and fuel, and covering the top with sod. Schiefer, 1904.

ring lifter. Synonym for core lifter. Long.

ring main. Closed loop of piping, including provision for entry of material, circulation boost and controlled withdrawal points; used for circulating solids such as pulverized coal fuel, or fluids such as lime slurry, continuously without settlement or chokeup. Pryor, 3.

ringing. Ringlike ridges commonly appearing in a line, the higher side is upcurrent. Incomplete rings, forming semicircles with celerities downstream are common. Considered a species of saltation mark produced by fish vertebrae. Pettijohn.

ring mold. See neck mold. Dodd.

ring ore. Fragments of gangue covered with regular deposits of other minerals. See also orephere. Fay.

ring pipe. A circular pipe in which a large wheel is revolved for tempering clay. Fay.

ring riser. A riser block with openings matching those in the press bed. ASM Gloss.
ring-roll crusher

ring-roll crusher. A type of crusher in which high-speed rolls act on the inside circumference of a vertical cylinder to powder raw material like clay. Enam. Dict.

ring-roll grizzly. A sturdily built grizzly for handling large pieces of ore. This type of grizzly is incorporated into a series of grooved rollers moved mechanically or alternatively by the sliding ore. Underhill, p. 197.

ring press. A press consisting of rolls of unequal diameter, revolving one within the other and in the same direction. B.S. 3552, 1962.

ring-size. Particle size where the piece of ring-shaped occurrence. In some areas altered rocks have been found as a halo over an ore body. Fay, 1972.

ring roll grizzly. A sturdily built grizzly for handling large pieces of ore. This type of grizzly is incorporated into a series of grooved rollers moved mechanically or alternatively by the sliding ore. Underhill, p. 197.

ring section. Narrow, peripheral section cut from a glass article for optical examination. ASTM C162-66.

ring-shaped occurrences. In some areas altered rocks have been found as a halo over an ore body. Fay, 1972.

ring-type reaming shell. A reaming shell the inside diameter of which is set into a cast- or powder-metal band encircling the outside surface of the shell. Hy.

ring-type wedge. A deflecting wedge having a short metal sleeve attached to the uppermost edge of the wedge. The diameter of the sleeve is the same as that of the lower, full-circle part of the wedge. Long.

ring wall. The inner firebrick wall of a blast furnace. Standards, 1929.

ringlute. A very rare, weakly radioactive, monochlorine, yellow-brown to straw-yellow complex silicate of Sm, Cs, and Ti with small amounts of Th; formulas have been given as NaO.3CaO.7(OH)2.3SnO3.13Li2O.6SnO3.13FeO.6 and 3FeO.6SnO3.13FeO.6 TiO2.9SnO3.13FeO.6. Found in kalarite and in the Khibine (Kola) Peninsula, U.S.S.R. Related to ringlute; contains 13 percent bismuth. Weed, 1918.

ringmash. The coal micrometre of gate road to increase headroom. See also dint. Fraenkel.

ringmash. To cut or blast down the roof or earth material so that it can be broken by tractor-drawn rippers or similar equipment. Pryor, 1972.

ring miner. A detachable cutting bit, screwed or driven onto shank of drill steel used in preparing ground for blasting. Pryor, 1972. See also detachable bit.

ring current. A strong surge of current of short duration flowing seaward from the shore. It usually appears as a visible band of water near the shore, and it is the return movement of water piled up on the shore by incoming waves and wind. Schieffeler, 1972.

ring paste. Moor peat in the advanced state of decomposition. In its ripened form it is dollopetrite. Stutzer and Nos, 1940, p. 91.

ring ridges. A colorless, rose, violet, or yellow anhydrous chloride of ferrous iron, potassium, and sodium, FeCl3.3KCl.NaCl. Coarse, granular masses. Rhombohedral. From the so-called "Hartz Mountains," Germany. English.

ring scale. A Swedish standard scale for the estimation of slag inclusions in iron and steel. This scale contains 12 categories of micrographs, designed to show different typical fields of view, and arranged in groups according to the form and distribution of the inclusions and numbered according to their quantity. In the practical application, the appearance of the specimen under the microscope is compared with the micrographs in the scale. Osborne.

ringed water. A tool for removing slates, or edging them. Mason.

ringing. The relative ease of removing a substance from a metal surface with a liquid such as water. Enam. Dict.

ring roll grizzly. A sturdily built grizzly for handling large pieces of ore. This type of grizzly is incorporated into a series of grooved rollers moved mechanically or alternatively by the sliding ore. Underhill, p. 197.

ring underfill. A practice of tapping a (grinding) wheel while freely suspended from the arbor head, or free standing to the periphery, to determine whether the wheel is cracked. ACGS, 1965.

ring valve. See valve.

ring wash. A general term applied to pregnant leach liquors, the discharge wash used after the adsorption cycle, which moves pregnant liquor still in the column onto the next absorption column in the series. Term also applied to water rings after elution cycle, and before acid rinse, Fay, 1972.

ring waters; spray water. Water used to remove fine particles from larger sizes. B.S. 3552, 1962.

rio. A bismuthiferous variety of tenanthite; contains 13 percent bismuth. Weed, 1918.

rio into process. Heap leaching of curiferous sulphides after their liberation to sulfates on prolonged atmospheric weathering. Pryor, 1972.

rip. a. To bring down rock in a roadway to increase headroom. See also dint. Fraenkel.
b. Mid. To cut or blast down the roof or top; also, to take up the floor or bottom. Fay, c. See brush. Mason. d. Turbulent water produced by conflicting tides or currents; generally, a vertical oscillation. See also swell. Fraenkel.

ririparian. Of, pertaining to, situated, or dwelling on the bank of a river or other body of water. A riparian owner is one who owns the banks of a riparian right is the right to control and use water by virtue of the ownership of the bank or banks. See also riparian rights.

ririparian rights. The rights of a person owning land containing or bordering on a watercourse or other body of water in or to its banks, bed, or waters. At common law a person owning land bordering a non-navigable stream owns the bed of the stream and may make reasonable use of its waters. Webster 2d. Rights of a landowner to water or border his property, including right to prevent diversion or mine of upstream water. Nichols.

ririp. A detachable cutting bit, screwed or driven onto shank of drill steel used in preparing ground for blasting. Pryor, 1972. See also detachable bit.

ririp current. A strong surge of current of short duration flowing seaward from the shore. It usually appears as a visible band of water near the shore, and it is the return movement of water piled up on the shore by incoming waves and wind. Schieffeler, 1972.

ririp past. Moor peat in the advanced state of decomposition. In its ripened form it is dollopetrite. Stutzer and Nos, 1940, p. 91.

riripolit. A mineral of the chlorite group. Monoclinic. It is essentially a hydrated silicate of magnesium and aluminum with ferrous iron. See also chloroth and prochlorite.

ririppability. A measure of the ease or difficulty with which a rock or earth material can be broken by tractive-drawn rippers or rigid steel tines into pieces that can be economically moved by other equipment, usually scrapers. Bureau of Mines Staff.

riripper. a. Coal miner's wonder of gate road to increase headroom. Also known as brusher; stoneman; reaper. Pryor, 1972.
b. An implement for breaking down the roof at the ripping lip, or where the roof has sagged on a road or through difficulty with which a rock or earth material can be broken by tractor-drawn rippers or rigid steel tines into pieces that can be economically moved by other equipment, usually scrapers. Bureau of Mines Staff.
ripper

a. An accessory that is either mounted or towed on the rear of a tractor and generally used in place of blasting as a means of loosening compacted soils and soft rocks for subsequent loading by a shovel. The teeth, long-angled teeth that are forced into the ground surface, ripping the earth loose to loosening compacted soils and soft rocks used in place of blasting as a means of

ripple bed. A machine for cutting stone into slabs by slapping it on a bed under a gang of saws. Standard, 1964. b. The act of breaking, with a track-driven ripper or long-angled steel tooth, compacted soils or rock into pieces small enough to be economically excavated or moved by other equipment as a scraper or dozer. Bureau of Mines Staff. c. The breaking down of the roof in mine roadways to increase the headroom for haulage, traffic, and ventilation. See also brushing, d; second ripplings. Nelson. Eng. See canch; b. S.M.R.E. Paper No. 61.

ripple blasting. Where coal seams are worked by the longwall method it is necessary to maintain roadways leading to the face. These roadways should be of sufficient height to permit the easy passage of men and equipment, and also to allow that some of the stone above the coal must be removed. This operation is known as rippling, or, unless the roof strata are very soft, blasting will be required. The main considerations in rippling blasting are to keep the sides of the roadway square, and to obtain good fragmentation of the stone so that it can be removed easily. Therefore special care must be taken in placing the shot holes. However, the use of efficient breaking-off bars and props will greatly assist in squaring-up the sides of the roadway and the ripping lip. MacAdam II, p. 114.

ripple face support. A timber, or timber and steel structure, to provide support at the ripping lip. There are various types; one consists of bent corugated steel bars behind which wooden planks are wedged; another consists of adjustable stretchers which are fitted across the roadway. See also horsehead; S.M.R.E. Bar. Nelson.

ripple lip. a. The edge of the rippings at the face of a roadway. When enlarging a roadway, the ripping lip is the end of the enlarged section and where work is proceeding. See also forepiling girders. Nelson. b. The point where the track meets the lip, marked by a short, heavy projection from the roadway. See also scioning lip. MacAdam II, p. 114.

ripple mark. a. The wavy surface of some beds of sandstone and mudstone, produced by gentle movements in shallow water when these rocks were in a soft condition. Fay. b. Periodic undulations of primary origin at interface between fluid and granular material; usually on a small scale; many varieties. See also sand waves, c. Pettijohn.

ripple mark index. The ratio of wavelength to amplitude of a ripple mark. A.G.I. Pettijohn.

ripple mark. a. The wavy surface of some beds of sandstone and mudstone, produced by gentle movements in shallow water when these rocks were in a soft condition. Fay. b. Periodic undulations of primary origin at interface between fluid and granular material; usually on a small scale; many varieties. See also sand waves, c. Pettijohn.

ripple marks of oscillation. Ripple marks formed by oscillating movement of water such as may be found along a sea coast outside the surf zone. They are symmetrical, with sharp or slightly rounded ridges separated by more gently rounded troughs. Last.

ripple marks. a. Small waves on the surface of a body of water which are produced by oscillatory movements of water, for example, those caused by wind, by the rise and fall of tide, or by the passage of waves. C.T.D. b. See ripples, a. Nelson.

ripple scion. A long, thin, slender, straight, transverse ripple mark. Pettijohn.

ripple voltage. The alternating component of a substantially unidirectional voltage. Coal Age, 1.

rippled. See dragged. Dodd.

ripples. The ratio of wavelength to amplitude of a ripple mark. A.G.I.

ripple drift. Current bedding or marked beds on the bed of a stream from ripples on the water surface. Standard, 1964. See also ripple mark. Fay.

ripple.s. The ratio of wavelength to amplitude of a ripple mark. A.G.I.

ripple cross-lamination. Cross-lamination of small thickness, usually less than 2 centimeter, formed by migrating ripple mark. Pettijohn.

rippled. See dragged. Dodd.

roll doors. Scot. The entrance from a shaft into upper workings. Fay.

roll face. A face advancing towards the rise of the seam. Briggs, p. 23.

roll heading. A heading driven to the rise in a long-way workings. See also heading, e. Fay.

roll level. Scot. The upper of two parallel level roads. Fay.

roll of arches. The vertical distance between the level of the spring lines and the highest point of the under surface of an arch. H.W.

roll of tide. In oceanography, the vertical distance of high-water level, at a given place, above a fixed datum (usually low water of ordinary spring tides at the place). C.T.D.

roller. a. A shaft excavated from below upward. Fay. See also raise; b. No. 61. p. 312. Symbol for aluminum metal. Dodd.

roller brick; end runner. A runner brick with a hole near one end of its upper face and (generally) a short tubular projection from this hole to lead molten steel into the bottom of an ingot mold. See also runner brick.

roller split. Eng. The proportion of the ventilating current sent into the rise workings of a mine. Fay.

roll up. Som. A sudden rise in the dip of a coal seam. Arkell.

rolling. a. An excavation carried from above upward for use as a riser. Standard, 1964. b. Eng. The horizontal division of the stratum, from which the blocks of stone are hewed; Portland quarries. Arkell. c. The
river mining. Mining or excavating beds of existing rivers after deflecting their course, or by dredging without changing the flow of water.  
river pebble. Applied in Florida to a certain class of phosphatic pebbles, or concretions, found in river beds, formerly distinguished from land pebble phosphate. Fay.  
river piracy. The diverting of the waters of one stream into another by natural means. Stokes and Varnes, 1955.  
river quartz. A name given to rounded, waterworn masses of quartz found in stream gravels. See also unfauceted quartz. AM, 1.  
river right. Same as creek right. Fay.  
river run gravel. Natural gravel as found in deposits which have been subjected to the action of running water. See also alluvial deposits. Nelson. b. See column pipe. Fay.  
rising tide. Synonym for flood tide. Schiefer.  
rising shaft. Excavating a shaft upwards from mine workings. See also rise; staple shaft. Nelson. b. See column pipe. Fay.  
rising-head test. A soil permeability test in which the rate of flow at a constant head is observed. Institution of Mining and Metallurgy. Symposium on Openpit Mining, Quarrying, and Alluvial Mining. London, 16-19 November, 1964.  
rising main; delivery column. a. The length of a rising main; delivery column being preferred. Zern, p. 145.  
river terrace. A river terrace always consists of a plain and an accompanying escarpment. The terrace plain is approximately horizontal and usually slopes both with the grade of the stream and away from the riverbed which it faces. On the side toward the stream the ground is bounded by an escarpment, the two together making the terrace; the opposite side of the plain is usually bounded by more elevated land, either an older and higher terrace or the true valley wall. A.G.I.  
riveter. A man who forms the head of a rivet, generally with a pneumatic rivet hammer. Ham.  
rivet snap. A punch having a recess in its head shaped to the form of the rivet. See also pneumatic riveter. Ham.  
rivet steel. A soft kind of mild steel, used for rivets. Fay.  
rivet test. A test on the steel used for rivets, in which a bar is bent through 180°; if any cracks are formed, the steel is rejected. Ham.  
rivet tester. A trained workman who can detect sound or loose rivets by testing them with a hammer. Ham.  
riveting. See landscape marble. Fay.  
riveting. The process of driving in rivets. Fay.  
riveting machine. A machine used to heat a road surface by blowing a flame or hot air upon
road heater

it before remaking the surface. See also plastic heater.

road work. Eng. Repairing and maintaining roads. Fay.

roadway. A level, Maon.

road-making plant. Various type of specialized plant used solely for road construction, including such machines as plows, mixers, rollers, paving machines, gritters, and mixers. Ham.

roadman. a. A man employed on the laying and maintenance of railroad tracks underground. See also block layer. Nelson. b. A person whose duty is to keep the roads in repair. D.O.T. 1.

road material. See road metal. Fay.

road metal. Rock suitable for surfacing either dirt or macadamized roads, and for foundations of asphalt and concrete roads. Sanford.

road making method. A method of preparing aggregates for bituminous surfaces in which the aggregates and bitumen are combined on the road, using the penetration or mixed-place method. Pit and Quarry, 33rd, sec. E, p. 70.

road mix. Surface. A surface made by mixing aggregates and asphaltic binder mechanically in place on the road, spreading uniformly coated aggregate and compacting it into place by rollers. Inspection and Testing Laboratory of the California State Highway Department.

road oil. A. Oil or petroleum residue intended for cold application to road surfaces. Inst.

roadway cable. An electric cable designed to transmit power from a central generating plant or small hydroelectric plant to points of use. Fay.

road tar. A product prepared by treating coal tar from one-half to 12 tons. Ham.

roadway cable. A. Oil or petroleum residue intended for cold application to road surfaces. Insti-

tute of Petroleum, 1961. b. An asphaltic residual oil or a blend of such oil with distillates which do not volatilize readily. It is used for dust laying or in the construction of various types of highways. Shell Oil Co. c. Nonasphaltic road oil is a nonhardening petroleum distillate or residual oil used as a dust-laying oil. It has sufficiently low viscosity to be applied without preheating. API Glossary.

road roller. A live-roller-driven roller of any weight from one-half to 12 tons. Ham.

roadside pack. A pack built alongside a roadway. See also roadside pack. Nelson.

roadbed. A. A natural or artificial shore where good holding ground for anchors and some protection from heavy seas. Hy.

roadster. Low profile model of a scraper or a truck. Nichols.

roadstones. Stone used for road metal. Fay.

road tar. A product prepared by treating coal tar in such a manner that it conforms to a specification which defines its appli-
cability for some branch of road work. Ben-

nett 24, 1962.

roadway. a. An underground drivage. It may be a heading, gate, stall, crosscut, level, or tunnel and driven in coal, ore, rock or in the waste area. It may form part of long-wall or bord-and-pillar workings or an exploration heading. A roadway is not stoped or inclined. See also roadway support. Nelson. b. Aust. An underground passage, whether used for haulage purposes or for travel to and from the working. Fay.

roadway cable. An electric cable designed for use in mine roadways. It may be either rubber insulated, rubber and armor, or armored or paper insulated. Nelson.

roadway consolidation. To bind the floor dust together with water and calcium chloro-
ride flakes, or other chemical, to form a

firm plastic carpet. See also dust consolid-
a tion. Nelson.

roadway support. A timber, steel, concrete, or other eperation in a roadway to: (1) ensure safety for working (falls of ground), and (2) maintain the maximum possible roadway size by resisting the tendency of the masses of rock, soil, silters, rollers, paving, finishers, gritters, and mixers. Ham.

roaster slag. Slag resulting from the calcina-
tion, usually with oxidation, of a roasted ore. Fay.

roasting. a. Heating an ore to effect some chemical change that will facilitate smel-
ing. C.T.D. b. The operation of heating sulfide ores in air to convert to oxide. Fay.

roaster. a. A contrivance for roasting or a furnace for domestic use. See also roasting, amalgamating, or smelting ore. Fay.

roaster furnace. A furnace where the metal is heated to a high temperature and then partly fused, whereby the charge is carried over the furnace by use of a gas. Fay.

roasting and reduction process. The treatment of lead ores by roasting to form lead oxide, and subsequent reducing fusion in a shaft furnace. Fay.

roasting furnace. A furnace in which ore is roasted. Fay. b. A furnace in which finely ground ores and concentrates are roasted to eliminate sulfur; heat is pro-
vided by the burning sulfur. The essential feature is that the ore be introduced to the charge. This is done by having a shallow bed which is continually rumbled. Many types have been devised; multiple hearth is deemed sufficient to support the roof. Fay.

roasting kiln. A kiln for roasting ore. Fay.

roaster oven. An oven used for loading and unloading ore. C.T.D.

roast. A form of roasting furnace, built in compartments or stalls open in front, with flues running up and down both sides for the purpose of creating a draft. Fay.

Robbins-Messiter system

roa. a. To extract pillars previously left for support; or, in general, to take out ore or coal from a mine with a view to immediate product, and not to rebuild. Fay. b. A system of mining referred to as second mining. Hudson. b. To remove ore pillars without re-
gard to maintaining the mine workings; usually preparatory to closing a mine. Ballard. c. To get coal from where it should not normally be got. Macon. d. To remove some of the pillars for use elsewhere. Nichols.

robbed out. Cumb. Work away; said of a mine of part of a mine from which the pillars have been removed. See also hol-

los. Fay.

roasted. a. In anthracite and bituminous coal mining, a pillar or gob which breaks down and rips out with a pick, pillars of coal left to support the roof in rooms when the usual mining was being done. Also called a pillar robber. D.O.T. 1. b. An extra cathode or cathode extension that reduces the current density on what would otherwise be at a high current-density area on the work. ASM Gloss.

robbing. a. Removing timber from a mined-out stope in order to use it again elsewhere. Stoes. v. 1. p. 262. b. Extraction of the pillars of ore left to support workings dur-
ing normal mining. Fryer, J. C. Scot. Re-
ducing the size of pillars; taking as much as possible off pillars, leaving only what is deemed sufficient to support the roof. Fay.

robbing an entry. See drawing an entry. Zem.

robbing. pilar. a. The cutting away of coal left to support the roof after breasts have been worked out, often resulting in cave-

robb coal. Staff. Miners' term for a coal seam which varies considerably in thickness or in quality in a short distance. Tomkiesf, 1554.

Robertson kiln. Several types of tunnel kiln were designed by H. M. Robertson but the most commonly used is the kiln for salt-glazing; the salt is introduced via fireboxes in the side walls and the finished products are extracted in the cooling zone. Dodd.

Robey oven. A down-draft type of pottery bottle oven. See also bottle oven. Fay.

Robbiette process. A heat treatment process carried out in a substantially closed fur-

nace, in which a fluid fuel is burnt to par-
tial combustion with a gas containing 70 percent or more of oxygen to produce a non-oxidizing atmosphere. The treatment is conducted in a furnace through which the heating gas and metal are passed in opposite directions. The fuel and air are introduced at the entry of the furnace, and passed to the cooler, entry, end of the furnace and burnt to sub-

stantially complete combustion. The treatment is conducted for about seven hours in a furnace of the Robbins-Messiter system. A. F. Blaine.

Robbins-Messiter system. A. A system of mining for use in which material arrives on a con-
veyor belt and is fed to one or two wing conveyors. This part of the system moves so as to form a long ridge; reclaimed by raking the material over the ridge, then moving slowly forward and shifting mate-

937
Robinson and Rodger system. A method of obtaining sound steel by fluid compression of the ingot in the mold. The molds are divided in the center, a removable packing piece being placed between the halves of the mold. The packing piece is removed when the metal has set, and the mold is placed horizontally in the press, pressure being applied to the ingot at both ends.

Robinsonite. A lead sulfantimonite, PbS·Sb2S3·FeS, black, triclinic, and as artificial crystals, used in Nevada. Speaker, 19, M.M., 1952.

Robinson and Rodger system. A method of obtaining sound steel by fluid compression of the ingot in the mold. The molds are divided in the center, a removable packing piece being placed between the halves of the mold. The packing piece is removed when the metal has set, and the mold is placed horizontally in the press, pressure being applied to the ingot at both ends.

rochelime. Eng. Lime in the lump after it is removed from the oven. Arkell.

roche alum. Synonymous with Roman alum. Fay.

rochitic. SmO3E. SmO3E3 of an impure form of spinel. Fay.

roche limestone. A limestone that is not easily soluble in water. Fay.

roche cliff. A mafic alkalic granite consisting of aegirine, quartz, albite and microcline. Speaker, 2, p. 487.

rochelle salt. A salt (potassium sodium nitrate) that is used in photography. Fay.

rochelle alkaline. The association of mineral deposits with certain rock types. If mineral producing localities are considered individually, valuable generalizations can often be made, but sweeping generalizations are unreliable. Nichols, 2. i. in the Lake Superior region, crude copper ore as it comes from the pits. The concentrate obtained is called mineral, and contains about 65 percent metallic copper. Fay.

rockasphalt. A form of thin beds and veins in coal. Arkell.

rock asphalt pavement. A wearing course of asphalt, with or without the addition of other bituminous materials. Fay.

rock associations. The association of mineral deposits with certain rock types. If mineral producing localities are considered individually, valuable generalizations can often be made, but sweeping generalizations are unreliable. Nichols, 2. i. in the Lake Superior region, crude copper ore as it comes from the pits. The concentrate obtained is called mineral, and contains about 65 percent metallic copper. Fay.

rockallite. A mafic alkalic granite consisting of aegirine, quartz, albite and microcline. Speaker, 2, p. 487.

rock-asphalt pavement. A wearing course of asphalt, with or without the addition of other bituminous materials. Fay.

rock associations. The association of mineral deposits with certain rock types. If mineral producing localities are considered individually, valuable generalizations can often be made, but sweeping generalizations are unreliable. Nichols, 2. i. in the Lake Superior region, crude copper ore as it comes from the pits. The concentrate obtained is called mineral, and contains about 65 percent metallic copper. Fay.

rock burst. The process of rock bolting consists of: (1) anchoring the bolt in the hole; (2) applying tension to the bolt to split the rock under compression parallel to the bolt; and (3) placing the bolts in such a pattern that they will properly support the rock structure. Rock may be supported by bolts in five ways: (1) suspension; (2) beam building; (3) reinforcement of arched opening requiring support; (4) reinforcement of an opening otherwise self-supporting; and (5) reinforcement of walls against shear and compressive action. Lewis, pp. 61-65. See also roof bolting.

rock bottom. A. There are also: the fundamental principle. Fay.

rockburst. A. A beam not accompanied by ganging stuff. Fay.

rock coal. A. See rough coal. Tomkies, 1946.

rock alum. A. See Roman alum. Fay.

rock asphalt pavement. A wearing course of asphalt, with or without the addition of other bituminous materials. Fay.

rock associations. The association of mineral deposits with certain rock types. If mineral producing localities are considered individually, valuable generalizations can often be made, but sweeping generalizations are unreliable. Nichols, 2. i. in the Lake Superior region, crude copper ore as it comes from the pits. The concentrate obtained is called mineral, and contains about 65 percent metallic copper. Fay.

rock crevice. A. See crack. Fay.

rock depth. A. See depth. Fay.

rock density. A. See density. Fay.

rock displacement. A. See displacement. Fay.

rock deposit. A. See deposit. Fay.

rock depositing. A. See depositing. Fay.

rock burst. The process of rock bolting consists of: (1) anchoring the bolt in the hole; (2) applying tension to the bolt to split the rock under compression parallel to the bolt; and (3) placing the bolts in such a pattern that they will properly support the rock structure. Rock may be supported by bolts in five ways: (1) suspension; (2) beam building; (3) reinforcement of arched opening requiring support; (4) reinforcement of an opening otherwise self-supporting; and (5) reinforcement of walls against shear and compressive action. Lewis, pp. 61-65. See also roof bolting.

rock bottom. A. There are also: the fundamental principle. Fay.

rockburst. A. A beam not accompanied by ganging stuff. Fay.

rock-bottom. See rocky coast. Schiefer.

rock breacher. A. A jaw breacher or gyration breaker. Nelson. b. See rock splitter; sledge. D.O.T. 1. c. Usually applied to a class of machines, of which Blake's rock breacher is a type, and in which the rock is fractured between two jaws, both movable, or one fixed and one movable. It is common to use a rock breaser instead of hand spalling to prepare ore for further crushing. Fay.

rockbreak. A. See rockbreaking. Fay.

rockbride. A. See rockbridge. Fay.

rockbridge. A. See rockbreaking. Fay.

rock-bottom. See rocky coast. Schiefer.
not likely to occur until a depth of 1,500 to 5,000 feet below the surface is reached.

Lewis, p. 37. c. The occurrence of the rupture, in a manner such that a large portion of the local accumulated strain energy is released in a short period of time. Types of failures are from splitting off of small slabs of rock from a mine wall or face to the collapse of large pillars, roofs, or other massive portions of the mine structure. The conditions which influence rockbursts in mines are:

(1) The area of the excavation; (2) the steep roof span; (3) stress pattern and concentration; (4) type of rock involved; and (5) directions of planes of weakness in the rock; and (6) the dip of the mineral deposit. The heaviest rock bursts are attributable to pillar failure. Lewis, pp. 622-623.

rock bursts. A soft yellowish rock cement. Roman cement. See also Roman rock cleavage. As originally to S,000 feet below the surface. Rockbursts influence rockbursts in mines:

(1) The area of the excavation; (2) the steep roof span; (3) stress pattern and concentration; (4) type of rock involved; and (5) directions of planes of weakness in the rock; and (6) the dip of the mineral deposit. The heaviest rock bursts are attributable to pillar failure. Lewis, pp. 622-623.

rock cleavage. As originally defined, rock cleavage is any fracture or fracture structure by virtue of which a rock has the capacity to break along certain well-defined surfaces more easily than along others. Geologists usually employ the term for secondary structures produced by metamorphism or deformation rather than for original structures, such as bedding or flow structures. Stokes and Barnes, 1955.

rock cone. A machine for drilling rock or slate. The drill point is made of tungsten, which is subject to wear in hard rock and must be replaced periodically.

rock contractor. In anthracite coal mines, a contractor who contracts for mine work, as distinguished from a miner; a certain price per ton for performance of advance. D.O.T. 1.

rock core. The cylindrical column of rock cut out by a rotary core drill. See also core drill.

rock cover. Thickness of consolidated rock above the roof of an opening (equivalent to the sum of the thickness of weathering or of other soil). A.G.I.

rock crusher. a. A machine for reducing rock or ore. b. A machine for reducing rock or ore, containing rock or ore, and containing any other material which is to be reduced or ground.

rock drill. a. A machine for drilling rock for coal mining, one who works in a mine, or who is employed in the laborious work of moving dusting machinery from room to room in low roof mines. The unit is mounted on skid bars which can be extended with rubber wheels. Hopper, blower, motor and winch are included with the unit and the hopper can be connected remotely to a blower by means of a quick-acting clamp. Combats coal dust explosions in active work areas of coal mines. Assures that a dusting machine that distributes rock dust over the interior surfaces of a coal mine by means of air from a blower or pipeline or by means of a mechanical conveyance, to prevent coal dust explosions. Also called rock dust distributor. A.S.A. C42.85, 1956. See rock dust man.

rock dust. a. The dusting of underground areas with powdered limestone to dilute the coal dust in the mine atmosphere thereby reducing explosion hazards. B.C.I. a. A very widespread control measure used in coal mines to combat explosive dusts. By machine, inert (combustible) dust is sprayed, dry or wet, on the roof, floor, and sides of the mine, thereby reducing the explosibility of settled coal dust. The U.S. Bureau of Mines requires rock dusting to within 40 feet of the face. The successful dusting of settled dust samples after rock dusting must constitute 65 percent or more by weight, with an increase of 1 percent for each 0.1 percent methane present. A dust as nearly inert, physiologically, as possible, should be employed in rock dusting; limestone (calcium carbonate) is most widely used. Hartman, p. 67.

rock dusting machine. A machine consisting essentially of a flexible hose fed by a powerful blower. It is used in forcing rock dust, usually powdered limestone, onto the face, wall, or roof of a mine, thereby making the coal dust nonexplosive. Bureau of Mines Staff.

rock dust man. In coal mining, a laborer who sprays rock dust, by hand or with a machine, throughout mine workings as a precautionary measure. Also called rock dust tender; rock dust sprayer. D.O.T. 1.

rock dust testing kit. This kit is designed to determine the explosibility of coal dust prior to rock dusting, the fineness of the rock dust
rock-dust testing kit

as it comes from the pulverizer, and the percentage of combustible matter present in rock and coal dust mixtures after rock dusting. Betts, p. 374.

rock-dust zone. A section of a mine entry the ribs, roof, and floor of which have been coated with rock dust. Rice, George S. rocker. a. A small digging bucket mounted on two rocker arms in which auriferous alluvial sands are agitated by oscillation, in water, to collect gold. A shortened term for rocker shovel; rocker arm shovel. Bureau of Mines Staff. b. Used for testing placer deposits, and for working pockets and small placer deposits. The gold-bearing gravel is placed on the screen; gold and fine sand are washed through the screen, and the stones remaining are cleaned out. A chute directs the material to the upper end of the bottom, which may be covered with small tufts of grass or hay. Waste material passes over a tailpiece at the end of the rocker. Rockers range in length from 6 to 12 feet, and in bottom width from 14 to 20 inches, with holes in the screens from ¾ to 1 inch in diameter. The slope of the rock should be adjusted to the angle of the beam of gravel in place in 10 hours if the ground is easily rocked. Lewis, pp. 380-381. c. A portable shuffling machine, by prospectors and fossickers in treating alluvial mineral deposits. Also called rocking cradle. Pryor, 3. d. A glass bottle that has a faulty, convex bottom. Dodd.

rocker arm. a. A lever resting on a curved base so that the position of its fulcrum moves as it comes from the pulverizer, and the percentage of combustible matter present in rock and coal dust mixtures after rock dusting. Betts, p. 374.

rock factor. See resistance to blasting. Frantekl.

rock failure. Up to a certain value of stress which is known as the elastic limit, the deformation is purely elastic and the mass will return to its original shape if the stress is removed. Above this stress value the material is permanently deformed; it acquires permanent set. Finally, if the stress is still further increased, the material ruptures or fails, and the rock is completely crushed, only complement is formed, but if the rock is fractured by the impact of a point or wedge there may be more residue than complement. Roberts, I. pp. 111-112.

rock flow. a. The movement of solid rock down the end of the rocker. Rocks range in length from 6 to 12 feet, and in bottom width from 14 to 20 inches, with holes in the screens from ¾ to 1 inch in diameter. The slope of the rock should be adjusted to the angle of the beam of gravel in place in 10 hours if the ground is easily rocked. Lewis, pp. 380-381. c. A portable shuffling machine, by prospectors and fossickers in treating alluvial mineral deposits. Also called rocking cradle. Pryor, 3. d. A glass bottle that has a faulty, convex bottom. Dodd.

rock gravel. a. A tongue-like body of angular boulders, resembling a small glacier, gen- eral features of which are similar to those of a cliff, steep slope, cave, or arch. Ray.

rock fracture. When rock is broken by crush- ing or impact, the resulting fragments can be divided into two components: (1) the complement, comprising a wide-size dis- tribution in accordance with a probab- ility law, and (2) the residue of large incompletely broken pieces. The relative proportions of complement and residue de- pend upon the mode of fracture. If the rock is completely crushed, only comple- ment is formed, but if the rock is fractured by the impact of a point or wedge there may be more residue than complement. Roberts, I. pp. 111-112.

rock frott. Fused lava so inflated with gas bubbles or steam bubbles as to be foamy. When hardened it becomes vesicular or scoriaceous lava. Standard, 1964.

rock fan. a. A cross section of any one of the ravines in its middle course shows a V- shaped profile, somewhat rounded at the lower angle; cutting into the base of the mountain front nearly all of the ravines broaden and their floors become distinctly convex, that imitating the form well-known in alluvial fans, though rarely match in an eroded surface of solid rock. These convex floors will be called rock fans. A.G.I. b. Forms closely re- sembling alluvial fans but developing by the process of cutting or impact on a rock cliff. A.G.I.

rock fill dam. An earth dam built of any broken rock or similar material which may be available. Ham.

rock filling. a. Waste rock, used to fill up worked-out slopes to support the roof. Weed, 1922. b. See overhand stoping, b. Pay.

rock flour. Very finely powdered rock mate- rial formed by the grinding up of rocks beneath a glacier, deposited as part of the till, and not washed or blown away and deposited elsewhere as stratified drift or loess. Also called glacial meal; rock meal. Fay. See also silt. ASCE P1826.

rock flow. a. The movement of solid rock when it is in a plastic state. Last. b. The term given to a slope failure when there is a general breakdown of the rock mass. When such a rock mass is subjected to shear stresses, it breaks down the cement or to cause crushing of the angu- larities and points of the rock blocks, the blocks work out in irregular shapes and the mass will flow down the slope, or will

rock hole. A short staple shaft driven from a lower to a higher coal seam and used for the gravity transfer of coal to the haulage road in the lower seam. See also roof hole. Woodruff, 3. p. 539.

rocket formation. A part of the lithosphere that is more or less directly (or structurally and hence, genetically) from other parts. To a considerable ex- tent, a formation is an arbitrary unit. A.G.I.

rocket forming. Refers to minerals occurring in ordinary rocks as opposed to minerals occurring only in veins, ore deposits, etc. A.G.I. Supp.

rocket-forming mineral. A mineral that is com- mon and abundant in the earth's crust; one making up large masses of rock. Au- thorities do not agree on any specific num- ber but from 20 to 30 minerals are considered as being the most important. Stokes and Varnes, 1955.

rocket foundation. A foundation which is car- ried down to the solid rock. The rock is cut and dressed level, loose and decayed portions are removed and holes filled with concrete. The crushing stresses on the rock can be ascertained by tests and the bearing pressure should not exceed one- eighth of the value. Nelson.

rock fracture. When rock is broken by crush- ing or impact, the resulting fragments can be divided into two components: (1) the complement, comprising a wide-size dis- tribution in accordance with a probab- ility law, and (2) the residue of large incompletely broken pieces. The relative proportions of complement and residue de- pend upon the mode of fracture. If the rock is completely crushed, only comple- ment is formed, but if the rock is fractured by the impact of a point or wedge there may be more residue than complement. Roberts, I. pp. 111-112.

rock frost. Fused lava so inflated with gas bubbles or steam bubbles as to be foamy. When hardened it becomes vesicular or scoriaceous lava. Standard, 1964.

rock gravel. a. A tongue-like body of angular boulders, resembling a small glacier, gen- eral features of which are similar to those of a cliff, steep slope, cave, or arch. Ray.

rock gypsum. Massive, coarse-grained crystalline to fine-grained gypsum. Webster 3d.

rock hardness. The resistance of rocks to the intrusion of a foreign body. Stocts, v. 1, p. 103.

rockhead. a. The boundary between super- facial deposits (or high alludes) and the under- lying solid rock. B.S. 3818, 1964, sec. 5. b. Another name for bedrock. Nelson. c. Section of a bedrock or bedrock equivalent unit strata next to the surface. Fay. d. Chesa. The uppermost stratum of the rock salt beds. Wilkerson.

rock hole. A short staple shaft driven from a lower to a higher coal seam and used for the gravity transfer of coal to the haulage road in the lower seam. See also roof hole. Woodruff, 3. p. 539.

rock house. In the Lake Superior region, the building (usually the one over the shaft or the elevator) in which selecting rock from the mine is dumped from the ore skip (or bucket) and is screened, crushed, and stockpiled in a bin, ready for shipment to the mill. Weed, 1922.

rocking. a. The process of separating ores by washing an inclined tray. See also rocker. Fay.

rocking bob. See bob. Fay.

rocking cradle. Short sluice, hand-oscillated; a machine used with scraper loaders equipped for repetitive motion in hand boring. See also Dodd.

rockmen. The slate-getters in slate mines, in the Lake Superior region, a. During the formation of a washout, the vegetable material may slip towards the erosion channel and the figures so formed are filled with sandy sediment giving rise to wall-like masses of rock or rock riders within the seam. Nelson. b. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock rolla. Inverted ridges of rock, usually overlying or enclosing a coal seam, especially in the Lake Superior region. D.O.T. 1.

rock soap. A pitch-black or dull black variety of garnet. Fay.

rock silk. A silky variety of asbestos. Fay.

rock salt. Common salt, NaCl, occurring naturally. Mohs' hardness 2.5; specific gravity 2.1 to 2.5. Some 35 percent of the annual output is made into soda-ash, soap, glass and chemicals. Other important uses are paper pulp, rayon, bauxite, hydrochloric acid, chlorination, ceramics, fertilizers, and tanning industries. See also halite. Pryor, 3.

rock seated. A blade projecting down from the roof. Schieferdecker. A.G.I.

rock pressure. a. In petroleum geology, the pressure under which fluids, such as water, oil, gas, and underground water technology, the more appropriate term reservoir pressure. Stokes and Varnes, 1955. b. The compressive stress within the body of underground geologic material. Stokes and Varnes, 1955. The pressure exerted by surrounding solids upon the supports of underground openings, including the roof and walls of the overlying material, residual unrelieved stresses, and pressures associated with swelling clays. Stokes and Varnes, 1955. c. Synonym for ground pressure. Long.

rock pressure burst. A sudden and violent failure of rock masses under stresses exceeding the strength of the rock. The classification and nomenclature of these occurrences are not clear and are based largely on effects and not on the basic causative factor. See also pressure bump; rock bump; rock burst. Nelson. rock pulverizer. A rock breaker; stone crusher. Standard, 1964.

rock quarzite. The clastic rock consisting of quartz grains, as Brazilian pebbles. Called also quartz rock. Standard, 1964.

rock riders. a. Durin the formation of a washout, the vegetable material may slip towards the erosion channel and the figures so formed are filled with sandy sediton giving rise to wall-like masses of rock or rock riders within the seam. Nelson. b. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock rill. See also sllovel loader. Nelson.

rock rolla. Small mass of rock overlying or enclosing a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock ruby. A fine red variety of garnet. Webster 2d.

rock salt. Common salt, NaCl, occurring naturally. Mohs' hardness 2.5; specific gravity 2.1 to 2.5. Some 35 percent of the annual output is made into soda-ash, soap, glass and chemicals. Other important uses are paper pulp, rayon, bauxite, hydrochloric acid, chlorination, ceramics, fertilizers, and tanning industries. See also halite. Pryor, 3.

rock sharp. Said of rock that is not crushed or broken by the miner during handling. See rock loader. D.O.T. 1. See also box helper. D.O.T. 1.

rocky. See slate. E. commune.

rocky. See also sllovel loader. Nelson.

rock salt. A silvery variety of asbestos. Fay.

rockslide. The downward and usually rapid movement of newly detached segments of the bedrock sliding on bedding, joint, or fault surfaces or any other plane of separation. Also, the rock mass that has attained its present condition by such a movement. Stokes and Varnes, 1955.

rock salt. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock salt. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock salt. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.

rock salt. A mass of rock, overlying or enclosed in a (coal) seam. Usually somewhat continuous or repetitious in occurrence and parallel with the seam. Bureau of Mines Staff.
rock splitter. In the stonework industry, one who splits large blocks of building granite, marble, and sandstone into slabs or smaller blocks, by drilling holes into the stone and then driving wedges into them until the stone breaks along the line of drilled holes. Also called rock breaker; rock driller.

rock surface. Means an exposed surface of a rock before the excavation of the mine openings. See also free field stress.

rock stress. The problem of determining the stresses which exist in the earth's crust has long been of interest to engineers and geologists. Many mining problems are directly concerned with stresses which may cause collapses or openings to collapse. Two phases of occurrence of rock stresses are important: (1) the stresses existing in the rock before the excavation of the mine openings, that is, the free field stress, and (2) the indirect stresses caused by the mine openings. See also free field stress. Lewis, p. 611.

rock temperature. The rate of increase of temperature with depth is highly variable over the earth, but averages 1° F per 100 feet. Long. b. The temperature of the rock in a mine can be measured by means of a maximum recording thermometer within a metal tube of proper diameter for placing in a drill hole. The tube is sealed into the borehole for 3 or 4 hours until the thermometer has reached the temperature of the rock. The tube is then removed and the thermometer reading noted. Another method is to fill an insulated tube with water only. After the tube is removed from the drill hole, the temperature of the water is quickly read with an accurate thermometer of small size.

rock-water. B.S. 3618, 1964, sec. 6. b.

rock temperature. a. The formational temperature at depth. The rate of increase of temperature with depth is highly variable over the earth, but averages 1° F per 100 feet. Long. b. The temperature of the rock in a mine can be measured by means of a maximum recording thermometer within a metal tube of proper diameter for placing in a drill hole. The tube is sealed into the borehole for 3 or 4 hours until the thermometer has reached the temperature of the rock. The tube is then removed and the thermometer reading noted. Another method is to fill an insulated tube with water only. After the tube is removed from the drill hole, the temperature of the water is quickly read with an accurate thermometer of small size.

rock tram engineer. In anthracite coal mining, one who operates an aerial tram for handling material, slate, and refuse from surface of mine to dump. D.O.T. 1.

rock tunnel. A tunnel, drift, or covecut driven through rock usually consisting of one coupled with another; also through barren rock in metal mines. Fay.

rock turquose. A matrix of turquoise with small grains of turquoise embedded in it. Fay.

rock type. The megascopically recognizable individual rock type, such as gneiss, sandstone, siltstone, shale, slate, or schist. Rock type is subdivided into characteristic rock units of rock, such as andesite, clastic, durain, fusain; being names explicitly applied to visible portions of the bituminous rock and applicable only to hand specimens. A.G.I.

rock weight. a. Material making up a talus or scree. Also see mass, or bedsrock produced by weathering. Mather.

rock weight. S. Afr. One ton of rock in place equals approximately 2200 lbs. Horizontally, therefore, the weight of an ore reserve covering a stipping of width of 3 feet is 12,000 tons at 100 percent payability. In case the reef dips downward, the resulting quantity must be divided by the cosine of the angle of dip. Beerman.

Rockwell. A unit of hardness as determined by a Rockwell hardness tester. See also Rockwell hardness. Compare Rockwell hardness. Long.

Rockwell hardness. A measurement of metal hardness which interprets resistance to penetration by indentation. Bureau of Mines Staff.

Rockwell test. See Rockwell machine. Long.

Rockwood. a. A brown, compact variety of asbestos, resembling fossil wood. Standard, 1964, Synonym for mountain wood. Fay. b. A locality in Tennessee where sedimentary iron ore is found. There, therefore, a name for a type of ore. A.G.I.

rock wool. A fibrous insulating material produced by blowing steam or hot air through a molden mass of rock, such as argillaceous limestone. According to the U. S. Bureau of Standards, rock wool is the most efficient fireproof, chemically stable insulator known today. Compare mineral wool, slag wool, and glass wool. C.C.D., 3d, 1942, p. 442.

rocky coast; rock-bound coast. A coast consisting of rocks. Schieferdecker.

rocky Mountain ruby. Garnet, Shipley.

rod. a. A bar, the end of which is for the purpose of measuring the average velocity of flow of a stream or river. Ham.

rod coupling. a. Name for a double-pin thread coupling used to connect two drill rods together. Long. b. A clamp or other device for uniting the rods that carry the tools used in boring artesian wells, oil wells, etc. Fay.

rod cover; rod sleeve. A cylindrical fireclay shape having an axial hole and terminating in a spigot at one end and a socket at the other. The refractory sleeves are used to protect the metal stopper-rod in a steel-casting ladle. (In the United Kingdom, six sizes of rod cover are standardized in B.S. 2496; in the United States, three qualities are specified in ASTM-C435.

rod drop. The distance of slump or sag in a long string of rods when released from the drill chuck. Long.

rodman. a. One who uses or carries a surveyor's leveling rod; elevator plug. See also elevator, i; elevator plug. Long.

rod float. A wooden rod with a weight at its lower end and designed to float vertically with most of its length submerged, for the purpose of measuring the average velocity of flow of a stream or river. Ham.

rod friction. a. The drag created in the flow of the drilling liquid which acts to oppose the horizontal component of the force on the rod. LeTourneau, p. 340.

rod gun. Synonym for rod puller. Long.

rod guide. a. An appliance attached to the drilling rod in oil wells that serves to prevent the rod from oscillating or knocking against the sides of the borehole. Fay. b. A swelled coupling, or other mechanical device for centering the drill rod string in a borehole. Long.

rod iron. A coarse-grained, gabrolike rock associated with dunite, containing diassilicate and gossanosite. Altered varieties containing chrome and olivine are recognized, Holmes, 1928.

rod iron. A coarse-grained, gabrolike rock associated with dunite, containing diassilicate and gossanosite. Altered varieties containing chrome and olivine are recognized. Holmes, 1928.

rodman. a. One who uses or carries a surveyor's leveling rod. Also called rodder. Long.
rodman

rod mill. A mill for rolling rod. ASM Gloss. b. A mill for grinding, somewhat similar to a ball mill, but employing long steel rods instead of balls to effect the grinding. ASM Gloss.

rod millman. One who grinds clinker, phosphate rock, ore or coal in a revolving cylinder partially filled with round steel rods; also, he tests a product for fineness by observing how much material is left on sieve of determined mesh, and regulates amount of material entering the mill accordingly. D.O.T. 1.

rodlay. Eng. A rude platform near the shaft's mouth for a night fire. Fay.

rodometer. An instrument devised by Prof. Cady of Wesleyan University to find the hand and pitch, etc., axes of quartz by measuring the frequency of the piezoelectric axes of quartz by Cady of Wesleyan University to find the relative biological effectiveness of radiation dose in biological matter. It is designed to connect one size rod to another of smaller size. From Franklin, A.G.I. 3618, 1963, sec. 3. Used in separating minerals by their specific gravity, and in microchemical determination of alkaloids. C.C.D. 64, 1961.

rod puller. Various mechanisms, essentially a rod-string tool. Used to remove a lost drill rod or casing from a borehole in underground workings where a small drill with- or without a hoist is used. Long.

rod pulling. The removal of the drilling rods from a borehole. Long.

rod puller. A pin-to-box sub used to connect one size rod in a string to a larger or smaller size. Long.

rod reducing bushing. A pin-to-box sub used to connect one size rod to a larger or smaller size. See also sub. Long.

rods. a. Eng. Vertical or inclined timbers for holding in the roof or floor of a mine. b. Power transmission lines. Also, the number of lengths of drill rod (two or more standard 10-foot lengths coupled together and handled and stacked as unit lengths) needed to reach the bottom of the borehole. Long.

rod reaming shell. A reaming shell designed to be coupled directly to a drill rod. See also rod bit. Long.

rod reducing bushing. A pin-to-box sub used to connect one size rod in a string to a larger or smaller size. Long.

rod reaming shell. A reaming shell designed to be coupled directly to a drill rod. See also rod bit. Long.

rod vibration. The eccentric and oscillatory movements of the drill string while being rotated in a borehole. Compare rod slap. Long.

rod wax. A light yellow, pasty mass consisting of an emulsion of high-balling oils with solid hydrocarbons; it collects in considerable quantities around the rods and casing in some of the Pennsylvania wells. Fay.

rod whip. See rod slap; rod vibration. Long.

rod wig. An annular rubber disk with sticking mud from rods as they are pulled from the borehole. Long.

rodlight. Whips, basic hydride silicic and sulfate of lead and calcium, 2PH3SiO3(Ca,Mn,Sn)4+. Compact, fibrous, Orthorhombic (?). Analagous to bauxite. From Franklin, N.J.; Langhan, Sweden. English.

roemerite; roemerite. A rust brown to yellow hydrated sulfate of ferrous and ferric iron, Fe2O3(sO4)x14H2O; hardness 3 to 3.5; specific gravity 2.52; Dana 7d, 8, 89, 520-521.

roentgen. The quantity of X-ray or gamma-ray radiation, such that the associated corpuscular emission of primary 0.0197923 grams of an air producer, in air, ions carrying one electrostatic unit of charge of electricity of either sign. ASM Gloss.

roentgen equivalent mass. A unit of absorbed radiation dose in biological matter. It is equal to the absorbed dose in rods multiplied by the relative biological effectiveness of the radiation. Abbreviation, rem. 159L.

roentgen equivalent physical. An obsolete unit of radiation dosage, superseded by the rad. Abbreviation, rep. 159L.

roentgenogram; radiograph. A photograph made with X-rays. Webster 3d.

roentgenography. See roentgenogram. Webster 3d.

roening. See roentgenogram. Webster 3d.

roeding. See roentgenogram. Webster 3d.

robbing. See roentgenogram. Webster 3d.

rolling. A machine which makes use of an airstream at a pressure of 4 atmospheres for atomizing molten pig iron into minute particles. The molten metal is forced into an airstream formed by an annular slit in a steel cyclone is atomized, the particles falling into a water bath and subsequently dried. Fay.

roheisenzunder process. An aqueous solution of mercuric-barium iodide; clear, yellow liquid; very refractive; and specific gravity, 3.5. Used in separating minerals by their specific gravity, and in microchemical determination of alkaloids. C.C.D. 64, 1961.

rollback group. A type of meteorites belonging to the pallasites. See also pallasite. Hess.

rollo process. Trade name; a process for the production of a refractory coating, on metal or on ceramic, by atomizing directly from the fused end of a rod of the coating material, for example, Al2O3 or ZrO2; the molten particles are blown against the cool surface that is to be coated. Dodd.

rolanda cement. Tradename; a high-alumina cement. See also high-alumina cement. Dodd.

roll. a. A local thickening of roof or floor strata, causing thinning of a coal seam. B.S. 360, 1962, sec. 2. b. Variously used to describe minor deformations or dislocations of a coal seam, for example, faults with small displacement to small monoclinic folds, to wolds or ridges projecting from either the roof or floor into the coal, and to fillings of stream channels or low area cutting downward into the coal. A.G.I. c. A lenticular mass of shale, usually covered by a thin layer of coal, extending downward from the overlying strata into a coalbed and sometimes almost completely replacing the coal. A.G.I. d. The appearance of other types of mineral deposits in places where the bed or vein thickens or thins. Stokes & Werner, 1955, ch. 6, Dodd.

roll types. A variety of rake. See rake 3 and 4. Fay.
roll

wheel of a roller. Nichols. k. A cylinder, with a shaft for mounting it so that it may rotate, used to support or guide a portion of a belt or chain. If the shaft is designed to be mounted so that it will not rotate, a pole includes the bearings that permit the rotation of the cylinder on the shaft. NEMA MB-1-1956. l. A cylindrical body set in bearings (usually fixed) and used singly or in pairs or sets for crushing or squeezing. See also roll. Webster 3d. Fay. m. One of two cylinders or grooved rollers between which material is drawn, followed by a series of rolls of a rolling mill. Fay. n. A heavy metal cylinder for flattening mottled plate glass into sheet glass. rollback. See crawling. Bryant. roll bending. Curving sheets, bars, and sections by means of rolls. See also bending rolls. ASM Gloss. roll compacting. The progressive compacting of metal powders by the use of a rolling mill. ASTM B 249-65. roll crusher. A type of secondary or reduction crushe. Dow. n. A unit of a heavy frame on which two rolls are mounted. These rolls are driven so that they rotate toward one another in the manner of the rollers in a clothes wringer. Each roll shaft has its own pulley and is driven independently, but both rolls should have the same peripheral speed. Rock fed in from above is nipped between the moving rolls, crushed, and discharged at the bottom. Newton. p. 61. See also double-roll crusher; single-roll crusher. rolled asphalt. A road surface consisting of asphalt, mineral aggregate, and sand. A very hot and rolled until it is quite solid. See also mastic asphalt. Ham. rolled compact. A compaction made by passing metal powders continuously through a rolling mill, so as to form relatively long thin pieces of compact material. ASTM B 249-65. rolled edge. The edge of a plate or saucer is said to be rolled if its diameter is greater than the general thickness of the rim of the ware. Dodd. rolled glass. a. Flat glass that has been rolled so that one surface is patterned or textured. Compare roughcast. b. Dodd. b. A term also applied to optical glass that has been rolled into plates at the time of manufacture. See also transfer glass. Compare transfer glass. Dodd. rolled gold. The same as gold filled except that the proportion of gold alloy to the weight of the entire article may be less than 1/20th. Fineness of the gold alloy may not be less than 10K. See also gold-filled. ASM Gloss. Fay. rolled metal. Refers to metal such as silver or stainless steel which has been clad with a layer of gold or other metal by cold rolling. The thickness of the coat. BuMines Bull. 630, 1965, p. 716. rolled加班. Pubbles which have been worn by transportation in water to a comparatively smooth and round shape. Skiplay. rolled plate. A thin plate of gold spread upon a heavy metal by cold rolling. The metals in the bar and then rolling the whole out into plate, forming a thinner plate of that of the ware bar as gold-rolled. Also called rolled gold. Fay. rolled-steel joint. An I-beam made from a single piece of steel passed through a hot rolling mill. Ham. rolled steel sections. Steel sections which have been produced by hot rolling at the steel-works, for example, rolled steel joists, channels, angle sections, etc. See also steel arches. NELSON, 1956. rolled cutter. a. A broad pulley or wheel fixed to the floor, roof or sides of roadways to prevent a haullage rope running against the ground which would cause excessive friction and wear of rails and sleepers. The cutter consists of a high carbon quality tubular steel barrel with a pressed steel or malleable iron frame with end castings which contain a reservoir of oil. Nelson. b. A heavy vehicle used for compacting soil, earth fill, and top layers of spoil dumbs to increase the density and bearing capacity of the material. See also compaction. Nelson. c. A round part free to revolve about its center and roll on its outer surface. The face may be straight, tapered, crowned, concave, or flanged. ASA MH4.1-1958. d. A component part of a roller chain in which it may serve only to reduce frictional losses occurring in the chain mechanisms. Rollers may also serve as the rolling support for the chain and the load being conveyed. ASA MH4.1-1958. e. An indefinite term, sometimes considered to be one of a series of long-created, large waves which sweep upon the coast, as after a storm; also, a long, high swell. Schiele-decker. f. A blown cylinder for making windows and the nearly hand-process. ASTM C162-66. g. A small, soft rubber roller used for applying transfers and decalcomanias to enamelware. Enam. Dict. roller-butt machine. A machine for making, from stiff-plastic clay, bats for a final pressing process in the method of roofing-tile manufacture. Dodd. roller bearings. Hard steel cylinders in bearings which have very low frictional resistance. Flower. roller-bit. a. A rotary boring bit consisting of two to four-cone-shaped, toothed rollers which are the cutting portion of drills or drill rods. They are used in hard rock in oil well boring and other deep holes down to 15,000 ft. Although their penetration speed is somewhat slow, roller bits last longer which is a very important factor in deep drilling. See also drag bit. Nelson. b. A type of rock-cutting bit used for drilling We-inch-size or larger holes. See also drag bit. Ham. c. A type of rock-cutting bit used for drilling We-inch-size or larger holes. See also drag bit. Nelson. d. Also called roller bit. Long. roller-bit drilling. See crushing drilling. roller chain. a. Generally, any spool-driven chain machine used of links connected by hinge pins and sleeves. Nichols. b. Specifically, a chain whose hinge pins are protected by an outer sleeve or roller that is free to turn. Nichols. roller cone bit. a. Synonym for roller bit. Long. b. A cone-shaped type of roller bit whose cutter cones arranged to cut an annular ring leaving an uncut section in the center as core. Long. roller conveyor. A series of rolls supported in a frame over which objects are advanced manually, by gravity or by power. ASA MH4.1-1958. roller-cutter bit. a. A rotary bit fitted with two or more hardened steel or tungsten-carbide-tipped rollers of cylindrical or conical form. Variously known as two-cone bit, three-cone bit, four-cutter bit, etc. B.S. 3168., 1965, see 3. b. Synonym for roller bit. Long. roller drain. See roller mark; roller scraper. Surface blemish on porcelain or china ware caused by contact with the rollers. Dodd. roller mill. See Chinese mill. Pryor, 3. roller repairman. See wheelman. D.O.T. 1. roller rock bit. a. Rotary bit fitted with two or more hardended steel or tungsten-carbide-tipped rollers of cylindrical or conical form. Variously known as two-cone bit, three-cone bit, four-cutter bit, etc. B.S. 3168., 1965, see 3. b. Synonym for roller bit. Long. roller-scraper. See roller mark. Dodd. roller screen. See revolving screen. roller stamping. A process by which, for example, the percentage of weight and the size of powders: w = a/d. exp( b/d ), where w is the weight percent of all material having diameter less than d, a and b are constants. Other equations were deduced relating to specific surface and to the number of particles per surface. E. N. B. 17-24. Such kilns are rare. Hill. roller alat conveyor. A flat conveyor employing rollers for slats. ASA MH4.1-1958. roller spiral. An arrangement of curved sections of roller conveyor arranged helically and over which objects are lowered by gravity. ASA MH4.1-1958. roller's plasticity test. A method for the assessment of plasticity on the basis of the stress/defomation relationship when clay cylinders are loaded. Dodd. roller stamping die. An engraved roller used for impressing designs and markings on surfaces. ASM Gloss. roller straightening. A process for straightening rod, tubing, or extruded shapes which uses rollers to pass the material through an elutriator to correct minor deviations in the sections as the material passes through. The procedure is essentially a series of bending operations. Light Metal Age, v. 16, No. 9, October 1958, pp. 17-24.
rolley, N. of Eng. A kind of truck running upon wheels for carrying tubs or boxes, and drawn by horses along underground roadways. Fay.

roller man. See incline repairman. D.O.T. I.

rollway, N. of Eng. The underground road on which rollers are conveyed. A gangway. Fay.

rollerway man. Eng. A man who attends the rolleyway and keeps it in order. He also supervises the movement of cars at shaft windings. Fay.

rollerway pillar. Eng. Pillars usually of larger size than the ordinary ones, formed to support a haulage road. SMRB, Paper No. 61.

roll feeder. a. A smooth, fluted, or cleated roller or drum which rotates to deliver packages, objects or bulk materials. ASM Gloss.

roll forging. Forging with rotating dies that are not full round, the desired shape, either straight or tapered, being produced by a groove in the dies. ASM Gloss.

roll forming. Metal forming by the use of power-driven rolls whose contact determines the shape of the product. Sometimes used to denote power spinning. See also spinning. ASM Gloss.

roll grinding machine. A special type of cylindrical machine for grinding cylindrical rolls to be used in rolling metals, paper, or rubber. A.C.S.G., 1963.

roll hammerer. One who punches designs on polished steel rolls used in fabricating decorative sheet glass. D.O.T. Sujé.

rolling. Reducing the cross-sectional area of metal stock or otherwise shaping metal pieces of rolling rolls. ASM Gloss. See also roll train. Fay.

rolling and quartering. A sampling method in which the sample is formed into a disc or a regulate flat heap by placing it upon a rubber or other smooth sheet and, by lifting the corners of this sheet in proper rotation, reducing the sample to one fourth of its original height. Fay.

rolling and quartering. A sampling method in which the sample is formed into a disc or a regulate flat heap by placing it upon a rubber or other smooth sheet and, by lifting the corners of this sheet in proper rotation, reducing the sample to one fourth of its original height. Fay.

rolling chain conveyor. One or more endless roller chains on which packages or objects are carried. ASA MH4-1-1958. Fay.

rolling cradle. A rod slide equipped with rollers that contact the rod and are adjustable for the position of the rod being pulled or lowered into an angle borehole. Long.

rolling cutter bit. Synonym for roller bit.

rolling friction. a. The resistance offered by a hub wheel as it rolls over the steel rails, or the resistance offered by a shaft turning in the ball or roller bearing. Morris and Cooper, p. 189. b. The resistance developed when a spherical body is rolled over a plane surface. Rollen and ball bearings are used to reduce rolling friction. Crispin.

rolling, or land surface much varied by many hills and valleys. Fay.

rolling incline-bending. Small scale cross-bedding related to ripple-mark migration; asymmetrical with more pronounced lee-side accumulation than in unilateral rolling strata. See also unilateral rolling strata. Pettijohn.

rolling mills. a. An establishment in which metal is made into sheets, bars, rails, or rods by working it between pairs of rolls. Standard, 1964. b. A pair or set of rolls between which metal is reduced in thickness or formed into beams, rails, etc.; a roll train. Standard, 1964. c. Machines used to produce certain desired shapes as the metal passes between rotating rolls mounted in a framework comprising a basic unit called a stand. Cylindrical rolls produce flat shapes; grooved rolls produce round, square, and structural shapes. Among rolling mills may be listed the billet mill, blooming mill, breakdown mill, plate mill, sheet mill, slabbing mill, strip mill, and tenner mill. Pettijohn.

rolling mills. Used to decrease the cross-sectional area of metal stock and produce certain desired shapes as the metal passes between rotating rolls mounted in a framework comprising a basic unit called a stand. Cylindrical rolls produce flat shapes; grooved rolls produce round, square, and structural shapes. Among rolling mills may be listed the billet mill, blooming mill, breakdown mill, plate mill, sheet mill, slabbing mill, strip mill, and tenner mill. Pettijohn.

rolling of glass. A term sometimes used instead of crawling. Dodd.

rolling resistance. a. The tractive resistance caused by friction between the rails and wheels, and forms the major resistance on level tracks. See also tractive force. Nelson. b. The sum of the external forces opposing motion over level terrain. Carson, p. 72.

rolling strata. A little-used term for ripple cross-lamination. Also called wavy bedding. Pettijohn.

rolling-up curtains weir. A type of frame weir, the frame which is upright, being rolled up from the bottom. Ham.

roll jaw crusber. A crusber of the same general type as the Blake or Dodge, but the moving jaw being a pair of flat plates a fixed distance apart. Liddell 2d, p. 357.

roll mill. In ore dressing, one who tends rolls that are used to crush ore, which has already been broken into small pieces in a crusber, to a fine size preparatory to the extraction of the valuable minerals. D.O.T. 1.

roll-mass. A series of similar marks appearing in line in direction of flow made by a rolling object. Rolling is commonly combined with the action of the mass. Nelson.

roll mill. In ore dressing, one who tends rolls that are used to crush ore, which has already been broken into small pieces in a crusber, to a fine size preparatory to the extraction of the valuable minerals. D.O.T. 1.

roll mill. In ore dressing, one who tends rolls that are used to crush ore, which has already been broken into small pieces in a crusber, to a fine size preparatory to the extraction of the valuable minerals. D.O.T. 1.

roll mill. In ore dressing, one who tends rolls that are used to crush ore, which has already been broken into small pieces in a crusber, to a fine size preparatory to the extraction of the valuable minerals. D.O.T. 1.

roll mill. In ore dressing, one who tends rolls that are used to crush ore, which has already been broken into small pieces in a crusber, to a fine size preparatory to the extraction of the valuable minerals. D.O.T. 1.
Roman ocher

Roman pearl. A sphere of opalescent glass with interior coated with essence of orient and gold. Shipley.

Roman tile. A roofing tile that is channelwise and placed ridgewise over the junction of adjacent channels. Dodd.

Roman vitriol. Same as blue vitriol. Fay.

root holler. In bituminous coal mining, one who reinforces roofs of mine haulageways, and knocks or pries down any loose strata. Nelson.

root movement vitriol. A finely fissile, compact, homogeneous argillite or clay slate. Fay.

root pressure. The pressure which the overlying rocks exert on the support of the mine workings, also ground pressure. Stoss, v, 1. p. 137.

root rock. The roof forming the ceiling of a cave passage, chamber, etc. A.G.I.

root salt. The rock salt beds. Fay. b. The wedging and straining, and knocks or pries down any loose strata. Nelson.

root stow. Scot. The stone immediately above a coal seam. See also roof, a. Fay.

root stringer vitriol. A layer of firedamp under the roof of a mine workings. See also ground pressure. B.S. 3618, 1963, sec. 1.

root stones. Scot. The stone immediately above a coal seam. See also roof, a. Fay.

root support. A laborer who inspects and estimates the rock strata of the roof of a mine. Nelson.

root test. Top testing. In the simplest testing of roof, the roof is considered as a single object. The loose roof will give off a dull or hollow sound as compared with solid top. Nelson.

root-testing tool. Usually a wooden pole with a metallic ball at the upper end. Groce.

root trimmer. See roof cot. In metal mining and in the quarry industry, a laborer who inspects roofs and walls of working places in underground mines and quarries; a man who knocks or pries down any loose strata, lumps or blocks of stone or rock with a bar to prevent dangers of their falling and

Also called raise driller; stopenman; timberman. D.O.T. Supp.

roof bolting. A system of roof support in mine workings. Bolts from 3 to 8 feet long are drilled upward in the roof and bolts of 1 inch diameter or more are inserted into the holes about 2 feet above the top by a split cone or similar device. The bolt end protrudes below roof level and is used to support roof bars, girders, or simple steel plates pulled tight up to the roof by a nut on the bolt head. The bolts are put up to a definite pattern, which is to clamp together the several roof beds to form a composite beam with a strength considerably greater than the sum of the individual beams acting separately. See also slot- and wedge bolt; rock bolting. Nelson.

roof bolts. A. L. Fisher and the slabs of roof are driven into walls or roof of underground excavations to strengthen the pinning of rock strata. They are inserted in a drilled hole and expanded by means of a wedge which opens a sleeve surrounding it (the sleeve bolt), or which slides in a half-sleeve (the sliding wedge bolt). Use of roof bolts eliminates the need for timbering. Betti, p. 376. Same as rock bolt.

roof control; strata control. The scientific study of rock behavior when undermined by mining operations and the most effective measures to control roof movements. The subject is comprehensive and includes the systematic measurement of the movement of strata and the forces and stresses involved. An attempt is made to correlate the data with rock types and nature of excavation. The control of the roof control means higher productivity and safer mining operations. See also rock mechanics. Nelson.

roof cut. A machine cut made in the roof immediately above a coal seam. A cut if sometimes made in a soft band of dirt over the coal which gives increased height in thin seams. This roof is made with a turreted coal cutter. Nelson.

roof cutting; gas cutting. It is a common occurrence to hear miners talk of gas cutting the top and causing it to weaken; however, this condition is seldom encountered. There are some seams which gas does cut. The roof, generally where top coal is left in gasy seams. The most common cause of roof cutting is its exposure to air. Gunite or painting of the top helps a considerable amount. B.S. 3618, 1963, sec. 1.

roof drill. Various hydraulically operated expandable or sliding sleeve type bolts. Two men PIA fasten up to 200 bolts per shift. Units are available in both standard and special control means varying requirements in different mines. Betti, p. 374.

roof-trimming tool. Roof trimming tool that is tenacious, and when allowed to fall breaks down in large blocks or frames of stone. Freil.

roof trimming. A small, steeply inclined stone drivage from top of an underground passage. Fay.

roof grout. Same as blue vitriol. Fay.

roofing granule. A. A.G.I. roofing granule; roofing grit. A roofing granule that is small, steeply inclined stone drivage from a lower to an upper coal seam or for exploration in disturbed ground. Nelson.

roofing slate. A roofing granule that is small, steeply inclined stone drivage from a lower to an upper coal seam or for exploration in disturbed ground. Nelson.

roof pendulum. A roofing granule that is small, steeply inclined stone drivage from a lower to an upper coal seam or for exploration in disturbed ground. Nelson.

roof pendant. Older rocks projecting down together the several roof beds to form a composite beam. Nelson.

roof trimmer

injuring workmen. Also called bar loosener; barman, roof loosener; roofman.

roof-up. See roof hole. Nelson.

roof work. A term applied to a vein worked roof-up. See roofing hole. Nelson.

room. A place abutting an entry or airway where coal has been mined and extending from the entry or airway to a face. T.C. 801, 1960, p. 1. b. Space driven off an entry in which coal is produced. Rooms may vary in width from 14 to 45 feet and in depth from 30 to 300 feet, depending on depth of overburden, underground conditions, and seam thickness. B.C.I. c. A working places (rooms) to determine responding to stope in a steep vein. A chamber. Compare stope. Fay, d. A heading, or short room, Fay. e. A weight of 7 tons of coal, or 5½ chaldrons by measure. Fay.

room-and-pillar. A system of mining in which the distinguishing feature is the winning of 50 percent or more of the coal or ore in the first working. The coal or ore is mined in rooms separated by narrow ribs or pillars. The coal or ore in the pillar is won by subsequent working, which may be likened to top slicing, in which the room is caved in successive blocks. The flat working in rooms is an advancing, and the winning of the rib (pillar) a retreat-working method. The rooms are driven parallel with one another, and the room faces may be extended parallel, at right angles, or at an angle to the dip. This method is applicable to flat deposits, such as coal, iron ore, lead, zinc, etc., that occur in bedded deposits. Many resemble the County of Durham system; double-entry room-and-pillar mining; double-room system; double-stall mining; single-stall; pillar-and-stall; post-and-stall; room-and-stoop; single-entry room-and-pillar mining; single-stall working; square work; stall-and-breast; and triple-entry room-and-pillar mining. Fay.

room-and-pillar mining. In coal and metal mining, supporting the roof by pillars left at regular intervals. Lewis, p. 424.

room-and-stall. Scot. A system of working coal with long narrow pillars; less usually a system of working with extra large pillars in narrow rooms. Similar to pillar-and-stall. Fay.

room boss. In bituminous coal mining, a foreman who inspects the working face in the room entry. Chambers and narrow rooms. Similar to pillar-and-stall. Fay.

room entry. a. Name applied to pairs of headings that are especially provided for allowing of ripping dirt when road ripping or dinting is necessary. These headings are driven from which pillars are formed to the ribs, and then burned on the retreat. Mason, v. 1, p. 109. b. Any entry or set of entries from which rooms are turned. A panel entry. U.S. Bituminous Federal Mine Safety Code—Bituminous Coal and Lignite Mines, Pt. I Underground Mines, October 8, 1961.

room neck. A short passageway, from the mine entry, to the room in which the miners work. Fay.

Rootes blower. Low-pressure rotary air compressor. Nichols, loc. cit. A device used to displace the air from the ordinary tuyeres, and caused the increasing amount of air in the blast to be expelled from the tuyeres. Nichols.

root crack. A crack in either the weld or the heat-affected zone at the root of a weld. A.G.I.

root deposit. A ledge or vein from which alluvial tin may have been derived. Fay.

root face. The unbeveled portion of the groove face of a joint. A.G.S. Glass.

root hole. A very heavy hook designed to catch and tear out big roots when it is dragged along the ground. Nichols.

rootlet bed. See seat earth, a. B. S. 3618, 1964, sect. 5.

root-mean-square value. The root-mean-square value of an alternating current or voltage. It is the square root of the mean value of a series of instantaneous values taken over a complete cycle. When an alternating current or voltage is specified, it is almost invariably the root-mean-square value that is used. Also used of quantities which alternate over longer periods, for example, month or year. Also see effective value. Abbreviation, R.M.S. CTD.

root of weld. The points, as shown in cross section, at which the bottom of the weld intersects the base-metal surface. It may be coincident with the root of joint. A.G.S. Glass.

root opening. The distance between the parts at the root of the joint. A.G.S. Glass.

root pass. The first bead of a multiple-pass weld. A.G.S. Glass.

root penetration. The depth to which weld metal extends into the root of a joint. A.G.S. Glass.

root sealer band. Same as root pass. A.G.S. Glass.

root zone. a. The place where the axial plane of a recumbent fold becomes steeper and dips beneath the surface of the earth. A.G.I. b. The place where a low angle thrust fault becomes steeper and disappears beneath the surface of the earth. A.G.I.

root zone. A very heavy hook designed to catch and tear out big roots when it is dragged along the ground. Nichols.

root zone. A series of buttons or buttons attached to an endless wire rope or cable for the purpose of conveying or retarding the movement of bulk materials or objects along a stationary trough. Nichols. A.M.I. 1936. b. A conveyor consisting of a rope with disks or buttons attached at intervals, the upper flight running in a trough. The coal or other material is dropped into the trough, and the conveyor is either actuated by the weight of the coal in the trough when the trough is inclined forming a retarding conveyor, or moves the coal along the trough where the gradient is insufficient or adverse. In the one case a brake is provided in the other, the sprockets are actuated by a motor.

rope. A winding or hoisting; a draw. Rope is designated by its lay, material of construction (steel, fiber, etc.), maximum diameter across strands, and number of strands. If the diameter has 6 strands and 19 wires per strand. Patented rope is made of galvanized wire. See also rope. 3. See fiber rope; wire rope. Nelson.

rope and button conveyor. A series of buttons or buttons attached to an endless wire rope or cable for the purpose of conveying or retarding the movement of bulk materials or objects along a stationary trough. Nichols. A.M.I. 1936. b. A conveyor consisting of a rope with disks or buttons attached at intervals, the upper flight running in a trough. The coal or other material is dropped into the trough, and the conveyor is either actuated by the weight of the coal in the trough when the trough is inclined forming a retarding conveyor, or moves the coal along the trough where the gradient is insufficient or adverse. In the one case a brake is provided in the other, the sprockets are actuated by a motor.

rope boring. In this system, rigid rods are replaced by a steel rope to which the boring tools are attached and allowed to fall by their own weight. The surface set-up is practically the same as for rod drilling, the difference being in the attachment to the rod of the walking beam. The rope passes from a drum over a pulley in the derrick and through a rope clamp, above which is a temper screw which is turned attached to a walking beam. The temper screw allows the drill to fall as the boring proceeds and is turned back and the rope retrimmed higher up. No device is necessary with rope boring to give the twist to the steel in the bunch, as is the case with the bunch blow. The lay of the stranded rope accomplishes this. As the tools are being raised the rope is in tension and its spiral lay tends to straighten out and stretch, but when the chisel strikes the bottom of the hole, the tension is off, the rope assumes its natural lay. A knot and a twist is inserted to the chisel. Mason, v. 1, p. 54.

rope capping. The attachment of the bunch to the heading or to any of the chains of the cages. See also capping. Nelson.

rope core. A component of stranded ropes is the core, which may be either of fiber or of wire. In winding ropes it is generally made of manila, steel, or hemp. The function of the core is to sup-
rope core

port the strands and prevent them from bearing hard against one another. An even more important function is as a store for lubricant for the interior of the rope and drum; when it is saturated with lubricant, Sinclair, V, p. 8.

rope fastening. The most suitable fastening rope drum. Any drum, powered or otherwise, provides. Steel ropes suspended in ver-

rope driving. The transmission of power by means of rope gearing, as distinguished from belt drive. Crispin.

rope driving. A replacement of belts by ropes for driving machinery. Fay.

rope driver. In bituminous coal mining, a foreman who looks after the haulage cable and the equipment of trains of cars by whose duty it is to see that cars are coupled and uncoupled properly, and to inspect ropes, chains, links, and all coupling equipment. A trip rider. Fay. d. See brakeman. D.O.T. 1.

rope road bolt. A steel wire rope, with wedge heads fixed to its ends, used instead of the normal steel rod in roof bolting. The rope has a diameter of about 1/4 inch and a length from 15 to 20 feet. The method is largely in the experimental stage. Nelson.

rope socket. A drop forged-steel device, with heads fixed to its ends, used instead of the normal steel rod in roof bolting. The rope has a diameter of about 1/4 inch and a length from 15 to 20 feet. The method is largely in the experimental stage. Nelson.

rope system drill. Synonym for cable drill. Fay.

rope trip. A trip of cars handled by a rope. Fay.

rope way. a. A line or double line of suspended ropes, usually wire, along which articles of moderate weight may be trans-

portation on slings, either by gravity or power; much used in mining districts for transportation to watercourses or to steam-railway lines. Standard, 1964. An aerial tramway. Fay. b. See aerial ropeway. Nelson.

rope furnace. A long reverberatory furnace over the hearth of which a series of plows or rakes is drawn by a continuous cable, moving the ore steadily from the feed to the discharge end. Fay.

rope lava. Same as pahoehoe. Fay.

rope-making. Aifdef the netting end of the deflection wedge, the outside diameter of which is the same as the diam-

rope-bit pilot. A plug to keep a rope bit concentric while milling off Hall-Rowe defecting wedge top ring or rope-bit dropper. Long.

rope copper. The same as rosette copper. Fay.

rope-cut. A form of gem cutting, which, in its most symmetrical shape, consists of a hemisphere covered with 24 regularly disposed, triangular facets and a flat base. Variations include Dutch rose, half Dutch rose, Armenian rose, double Dutch rose, cross-rose, and the briollette which may be considered a modified double rose. Hess.

rope diagram. A circular or semicircular dia-

rope fastening. An appliance used in cable drilling for recovering ropes that may have been accidentally dropped in the borehole. Fay.

rope diameter. The diameter of a steel wire rope is the maximum obtainable measure-

ment across the outer edges of the strands. The size of fiber ropes is usually specified by their circumference. Modern steel wire winding ropes are large and heavy and may be 21/4 inches in diameter locked coil for a moderately deep shaft. Nelson.

rope driving. a. Percussive method in which a string of tools is raised in the drill hole by a rope which is given a loose turn or two around a powered horizontal wind-

lass, and is eased to let the tools fall free. Drills vertically, if necessary, to consider-

able depths. Usually employed for rela-

tively shallow alluvial bores with portable rig. Pryor. 3. Sometimes called jump drill-

ing, in which drill is raised and dropped. Fay. b. Synonym for churn drilling. Fay.

rope drop. A replacement of belts by ropes for driving machinery. Fay.

rope drum. Any drum, powered or otherwise, on which rope is wound; for example, the drum of a winding engine. Fay.

rope plucking. The sudden jerking or twitch-

ing of a haulage rope due to the rope laps slipping to a smaller diameter on the drum. A severe plucking of a rope may be felt faintly more than 800 yards distance from the engine. See also overhaul. Nelson.

rope rider. a. A man whose duty it is to see that cars are coupled properly, and to inspect ropes, chains, links, and all coupling equipment. A trip rider. Fay. d. See breakman. D.O.T. 1.

rope spear. A fishing tool having a shaft either by gravity or water pipe. Fay. b. A diamond so small that it can be cut little if at all. Webster 3d.

rope spear. A trip of cars handled by a rope. Fay.

rope tripod. A tripod of cable by which coal is hauled from the mine. He

ropehouse. In salt manufacturing, an evapor-

ating house. Fay.

rope lay. A lay that is length of rope in which one strand makes one complete revo-

lution about the core. ASA M11.1-1960, p. 31.

rope makes. In the asbestos products industry, one who makes asbestos wicking and square braided rope using carding machine, roper, and roper machine. Fay.

rope plucking. The sudden jerking or twitching of a haulage rope due to the rope laps slipping to a smaller diameter on the drum. A severe plucking of a rope may be felt faintly more than 800 yards distance from the engine. See also overhaul. Nelson.

rope plucking. The sudden jerking or twitching of a haulage rope due to the rope laps slipping to a smaller diameter on the drum. A severe plucking of a rope may be felt faintly more than 800 yards distance from the engine. See also overhaul. Nelson.

rope plucking. The sudden jerking or twitching of a haulage rope due to the rope laps slipping to a smaller diameter on the drum. A severe plucking of a rope may be felt faintly more than 800 yards distance from the engine. See also overhaul. Nelson.

rope plucking. The sudden jerking or twitching of a haulage rope due to the rope laps slipping to a smaller diameter on the drum. A severe plucking of a rope may be felt faintly more than 800 yards distance from the engine. See also overhaul. Nelson.
rose porcelain. Chinese hard porcelain brilliantly decorated with a red enamel.

rose quartz. Crystalline quartz with a rose color, due probably to titanium in minute quantity. The color is destroyed by exposure to strong sunlight. Used as a gem or as an ornamental stone. See also Bohemian ruby.

rose ring. Synonym of deflecto-wedge ring.

rose steel. A steel that shows a peculiar fracture and texture in the interior, different from that near the surface. Standard, 1964.

rose topaz. The yellow-brown variety of topaz having a fine red color. C.M.D.

rosenbuschite. A complex zirconium silicate mineral; it is a fission product of the uranium and is used in the manufacture of hard ceramic materials. Standard, 1964.

rosenbuschite. To the form of two rosettes joined at their centres. A.G.I.

rosenbuschite. A method used in quantitative petrography involving the estimation of the volumes of the component minerals in a rock by the measurement of aggregate intercrop on a polished surface or on a microscope slide. C.T.D.

roselite. A yellow variety of roseline.

roseline. A resin and apply a coat to the right.

roseline oil. An oil obtained from destructive distillation of rosin. API Glossary.

roselite. A resin and apply a coat to the right.

roseline oil. An oil obtained from destructive distillation of rosin. API Glossary.

roseline oil. A yellow variety of roseline.

roseline oil. A yellow variety of roseline.

roseline oil. A yellow variety of roseline.

roseline oil. A yellow variety of roseline.

rotary bucket drill. A 12- to 96-inch-diameter posthole augerlike device, the bottom end of which is equipped with cutting teeth similar to those on a flat-spiral auger. The device is used to rotate-drill large-diameter shallow holes to obtain samples of soil lying above the ground-water level. Long.

rotary bucket drill. A rotary-type drill on which a rotary bucket is Fastened to the Kelly bar. The bucket is equipped with a high-speed cutting blade or a bucket.

rotary drill. A system of boring, using usually hollow rods, with or without the production of rock cores. Rock penetration is achieved by the rotation of the cutting tool. The rods are used extensively in exploration, particularly when cores are required. It is the usual method in the search for underground water. See also Diamond drilling; rotary drill. Nelson.

rotary driller. A breaking machine for coal or ore. It consists of a trommel screen with a heavy cast steel shell fitted internally with lits which progressively raise up and convey the coal and stone forward and break it. As the material is broken the undersize passes through the screen, so that excessive degradation does not occur. See also Bradford breaker.

rotary drill. A 12- to 96-inch-diameter posthole augerlike device, the bottom end of which is equipped with cutting teeth similar to those on a flat-spiral auger. The device is used to rotate-drill large-diameter shallow holes to obtain samples of soil lying above the ground-water level. Long.

rotary drill. A rotary-type drill on which a rotary bucket is fastened to the Kelly bar. The bucket is equipped with a high-speed cutting blade or a bucket.

rotary drill. A system of boring, using usually hollow rods, with or without the production of rock cores. Rock penetration is achieved by the rotation of the cutting tool. The rods are used extensively in exploration, particularly when cores are required. It is the usual method in the search for underground water. See also Diamond drilling; rotary drill. Nelson.

rotary drill. A breaking machine for coal or ore. It consists of a trommel screen with a heavy cast steel shell fitted internally with lits which progressively raise up and convey the coal and stone forward and break it. As the material is broken the undersize passes through the screen, so that excessive degradation does not occur. See also Bradford breaker.

rotary drill. A 12- to 96-inch-diameter posthole augerlike device, the bottom end of which is equipped with cutting teeth similar to those on a flat-spiral auger. The device is used to rotate-drill large-diameter shallow holes to obtain samples of soil lying above the ground-water level. Long.

rotary drill. A system of boring, using usually hollow rods, with or without the production of rock cores. Rock penetration is achieved by the rotation of the cutting tool. The rods are used extensively in exploration, particularly when cores are required. It is the usual method in the search for underground water. See also Diamond drilling; rotary drill. Nelson.

rotary drill. A breaking machine for coal or ore. It consists of a trommel screen with a heavy cast steel shell fitted internally with lits which progressively raise up and convey the coal and stone forward and break it. As the material is broken the undersize passes through the screen, so that excessive degradation does not occur. See also Bradford breaker.

rotary drill. A 12- to 96-inch-diameter posthole augerlike device, the bottom end of which is equipped with cutting teeth similar to those on a flat-spiral auger. The device is used to rotate-drill large-diameter shallow holes to obtain samples of soil lying above the ground-water level. Long.

rotary drill. A system of boring, using usually hollow rods, with or without the production of rock cores. Rock penetration is achieved by the rotation of the cutting tool. The rods are used extensively in exploration, particularly when cores are required. It is the usual method in the search for underground water. See also Diamond drilling; rotary drill. Nelson.

rotary drill. A breaking machine for coal or ore. It consists of a trommel screen with a heavy cast steel shell fitted internally with lits which progressively raise up and convey the coal and stone forward and break it. As the material is broken the undersize passes through the screen, so that excessive degradation does not occur. See also Bradford breaker.
rotary bucket drill

one or more mining cars simultaneously to discharge coal. They may rotate either 180° or 360°.

rotary dump cars. A small standard car in which the car body, of about 2 cubic yards capacity, is mounted on a turntable in the car frame. The car body may be swung by hand to dump either side or either end. Pit and Quarry, 33rd, Sec. A, p. 112.

rotary dumper. A steel structure which revolves a mine car and discharges the contents, usually onto a bunker or onto a screen. See also tippler. Nelson.

rotary excavator. Earth-moving machine with vertical wheel which carries digging buckets, peripheral. These loosen soil and deliver to short conveyor loader, the assembled load being mounted on caterpillar track. Capacity up to 5,000 tons hourly. Also called wheel excavator. Pryor, 3.

rotary fault. A fault in which some straight lines on opposite sides of the fault and outside of the dislocated zone, parallel before the displacement are no longer parallel, that is, where one side has suffered rotation relative to the other. A.G.I.

rotary feed table; disk feeder. A feeder comprising a horizontal rotating circular plate mounted under the mouth of a hopper and arranged with an adjustable plough to control the rate of flow of material over the edge of the plate. B.S. 3552, 1962.

rotary furnace. Horizontally mounted cylinder rotating between trunnions through which gas or oil flame is introduced. Pryor, 3.

rotary-hearth kiln. A circular tunnel with a to-and-fro movement of a piston within a case, as distinguished from those in which the liquid-propelling parts are on parallel shafts driven in unison. ASM Gloss.

rotary-percussive drills. The drilling effect of these machines is obtained by a combination of percussion and cutting action, which implies high-pressure feed and a powerful rotating movement. Bits are either the regular chisel type or in a modified version raked negatively to the direction of rotation. The drilling method in which the impingement point is not conical with that employed in the United States, particularly in drilling for oil which is called rotary percussion drilling, but uses a roll-type bit. Fraenkel, V. 1. Art. 830, p. 19.

rotary riser. Synonym for rotary drill. Long.

rotary type. A positive-displacer cant pump in which the liquid-propelling parts arecams, gears, impeller wheels, etc., rotating within a case, as distinguished from those pumps that move liquids by means of the tooth-and-socket friction of a piston within a cylinder. Compare centrifugal pump. Long.

rotary rig. Synonym for rotary drill. Long.

rotary rig engineman. In petroleum production, one who supplies power for drive works (power distribution center for raising and lowering or rotating drill pipe or casing in a well), pumps, and other mechanical equipment of a rotary rig for drilling gas and oil wells. Also called gas or diesel engine engineer. D.O.T. 1.

rotary screen. a. A screen for sizing aggregate. b. A cylindrical smelter that depends on slow rotation about a horizontal axis for agitation of the molten material. Nelson.

rotary shovelfooth. A snowplough with a rotating blade which throws the snow forward and similar machines, it is a pierced rectangular plate bent into a cylinder. Ham. b. Sex trommel. A. Nelson.

rotary sorting table; circular grading table. A circular plate conveyor to effect a preliminary grading of coal and removal of stone by hand. A screened-out fraction of the run-of-mine coal is delivered to the table by chute from a conveyer. As the screen of coal revolves on the table, the various grades of coal and the dirt are raked into positions where they are dispersed by pleuches into chutes. The operators are positioned on the inner and outer edges of the table and the coal is
not handled but only raked. See also picking conveyor. Nelson.

rotary speed. The speed at which the drill steers. Usually measured in revolutions per minute. Long.

rotary shaker. A swaying machine consisting of a power-driven ring that revolves at high speed causing rollers to engage cam surfaces and force the shaker hammerlike blows upon the work at high frequency. Both straight and tapered sections can be produced. See also swinging ASM Gloss.

rotary swivel. Synonym of water swivel or mud swivel. Long.

rotary table. a. The geared rotating table that propels the Kelly and the drill stem when drilling a borehole with an oilfield-type rotary rig. Also called rotary; table; turntable. Long. b. The mechanism used to rotate the rig when drilling a borehole with an oilfield-type rotary rig. Also called rotary; table; turntable. Long.

rotary table feeder. A rotating horizontal circular table to which material flows from a round bin or hopper opening and from which it is discharged by a bow. AS A M H 14-1958.

rotary tippler. a. A machine that loosens and mixes soil and vegetation by means of a high speed rotor equipped with tines. Nichols.

rotary tippler. See tippler. Nelson.

rotary tool; rotary tools. Drilling equipment used on rotary tools: drilling, when drilling, and when drilling, the commonly accepted usage of the term is that applied to equipment used on drills having a rotary table, such as the rig normally used in oilfield work. Long.

rotary vase feeder. A rotor of cylindrical outline having circular drum plates or vanes rotating on a horizontal axis, for controlling the flow of bulk materials. AS A M H 14-1958.

rotary vibrating tippler. A tippler designed to overcome the tendency for coal or dirt to settle at the bottom of mine cars. When the tippler is in the inverted position, the car rests upon a vibrating frame which gives it a high-speed vertical jolting motion which frees any material tending to stick inside the car. Nelson.

rotating-armature generator. A generator having stationary field magnets, and the a.c. current is collected from slip rings connected to the windings of the armature or rotor. This machine is used normally in small sizes only, and either permanent magnets used for the field or an external d.c. supply obtained from main or batteries. Mason, V. 2, p. 423.

rotating casing screw conveyor. A screw conveyor in which the tubular casing rotates at a different speed or in an opposite direction to the conveyor screw. See also screw conveyor. AS A M H 14-1958.

rotor. a. Alternator. An alternating-current generator that is very convenient for modern power generation on a large scale. The main current which is not made at high voltage, is conveyed through fixed connections, the alipping carrying only the alternating current. The main windings can be insulated and braced against normal or excessive mechanical forces due to the load. Mason, v. 2, p. 423.

rotating-platform kiln. See rotary hearth kiln. Dodd.

rotating sampler. A soil sampler that rotates to cut and obtain a sample, as opposed to a drive sampler that is pressed into the material to be sampled. Long.

rotational cylindrical folding. Subsequent folding that has distorted the axial planes of cylindroidal folds without destroying their cylindroidal character. AGI Supp.

rotational failure. See slope failure, s. Leuti, p. 627.

rotational fault; hinge fault; pivotal fault; scissors fault. A fault where there has been pronounced rotation of the fault blocks. Nelson.

rotational shear. One of four types of slope failure. Failure by rotational shear produces a movement of an almost undisrupted segment along a circular or "spoon-shaped" surface and occurs in compactive, uniform material. This material would not be affected by geological planes of weakness. Failure of this type can occur from causes which either in- crease the shear stresses or which decrease the shear strength of the material. Wood- ruff, v. 3, p. 539.

rotational slide. A slide of homogeneous earth or clay in which the slip surface of failure closely follows the arc of a circle. Nelson.

rotational speed. The speed at which a drill string and attached bit is turned. Long.

rotational wave. See shear wave. h. Hy.

rotation diagram. A petrographic diagram in which the fabric axes are rotated to the desired position. Rotation is generally done in order to similarly orient the fabric of different diagrams for comparison purposes. Bureau of Mines Staff.

rotation firing. Crushing a small piece of rock with a first explosion, and timing other holes to release their burdens toward the space made by that and other preceding explosions. Also called row shooting. Nichols.

rotation recorder. An instrument for measuring any slight rotation of a bridge support under load. See also spread recorder. Ham.

rotation speed. Same as rotational speed. Long.

rotches; rotes; roota. S. Staff. A soft and moderately friable sandstone. Also called rooth; roth; Fay.

rotches. A reciprocating-type screen used in the tail screening operation in rock salt mining. Fay.

rotches. A reciprocating-type screen used in the tail screening operation in rock salt mining. Fay.

rotlegand filter. Drum-type vacuum filter in which membrane is a belt, which leaves the drum at discharge point and is returned via pulleys. This arrangement facilitates automatic cake take from both sides, also discharge. Pryor, 3.

roto finish. A tumbling method using special chips and chemicals. Fay.

rotocast. Fay. A cast or casting; a circular electric decorating kiln for pottery ware. Dodd.

rotostrat. Tra's name; a reciprocating air- jet system of drying bricks and tiles. Dodd.

rotostrat. Any unit that does its work in a machine by spinning, and does not drive other parts mechanically. Nichols.

rotostem process. A steamer process using the principle of rotation as in the Kaldor. It has two lances, one above the bath surface using low-pressure oxygen to burn CO from the bath, while the other blows oxygen on to the bath at high pressure, to obtain oxidation as in the L. D. It was developed at Oberhausen in Germany. Nelson.

rotus. A machine having having becoming honeycombed in the course of melting and which is in an advanced state of disintegration. Schie- nensteine. A soft, light, earthy substance consisting of silica in fine grains, resulting from the decomposition of siliceous lime- stone. Fay. Used for polishing. Gordon.

rouge. Finely divided, hydrated iron oxide, used in metal buffing and polishing. Lee. Also used in the final polishing operation on plate glass. The average grain size lies between 1 and 10 microns. Lee.

rouge antique marble. See rose antique mar- ble. Fay.

rouge flambé. A red glaze first made by the Chinese; the color is due to colloidal copper produced in the glass by firing under reducing conditions. Dodd.

rougemontile. A phanerocrystalline rock containing arority and titequartzite, with small amounts of olivine and iron ores. Holmes, 1926.

rouge. An imperfection; traces of rouge remaining in an incompletely polished glass surface. ASTM C162-46.

rouge. A coating of pebbles set in cement on a wall for glass that has been polished so that the surface is textured. Compare rolled glass. Dodd. c. Plastering made of lime mixed with shells or pebbles and used for covering buildings, usually by be- ing thrown from a trowel forcibly against the wall. Webster 3d. d. To roughen the surface of (pottery) before firing. Stand- ard 1964.

rough coal. Term used among Scottish miners for black, free coal of good quality. Also called rock coal; rock coal. Tomkies, 1954.

roughened finish tile. A tile whose plane surface is treated by mechanical means, such as wire cutting or wire brush- ing, to give increased bond for mortar, or to provide a rougher cell. Flotation cells in which the bulk of the gangue is removed from the ore. Fay.

rougher cell
rough way. Corn. A quantity term to designate mesh storing. a. Same as ragstone.

roughness. a. Relatively finely spaced surfaces, made by the roughing out of the work, and resulting from light fracturing, or careless rock formations. Long.

roughing. Upgrading of run-of-mill feed either to produce a low-grade preliminary concentrate or to reject valueless tailings at an early stage. Performed by gravity on roughing tables, or in flotation in roughing circuit. Pryor, S.

roughing hole. A hole to receive slag from a blast furnace, or molten iron when it is undergoing chemical reaction inside it. Pigg.

roughing in. a. The process of pulling the drill string from a borehole, performing an operation on the string (such as changing a type of bit, replacing string, etc.). Long.

roughing out. The process of pulling the drill string from a borehole, then running the drill string into the borehole. Long.

roughing rolls. The rolls of a train which first receive the pile, ingot, bloom, or billet, and partly form it into the final shape. Also called breaking-down or roughing-down rolls. Fay.

roughing stand. The first stand of rolls through which the reheated billet passes, or the last stand in front of the finishing rolls. ASM Gloss.

roughing tool. The ordinary tool used by machinists for removing the outer skin and generally for heavy cuts on cast iron, wrought iron, and generally for heavy cuts on cast iron, wrought iron, and steel. Standard, 1964.

rough lumber. Lumber undressed as it comes from the saw. Crispin.

rough manufacturing. Machining without regard to finish, usually to be followed by a subsequent operation. ASM Gloss.

round. a. See reamer, b. See below.

round edge slip. See slip stone.

rounded. a. Fay.

rounded stone. A carbon the sharp corners and edges of which have been worn off through use so that the stone is rounded. Long.

rounded face bit. A bullnose bit; also, any bit having the cutting face of which is rounded, such as a single- or double-round nose bit. Long.

round hole. A hole to receive slag from a blast furnace, or molten iron when it is undergoing chemical reaction inside it. Pigg.

round pocket shovel. See shovel, bor. Cusson, p. 179.

round scoop. Scoop. A space at the shaft bottom where coal is stored. Fay.

roundstone. a. Small. roughround stones collectively, used for paving; cobblestone. Fay. b. A rounded rock fragment of any size larger than a sand grain; a group name for pebbles, cobbles, or boulders, any and all of these. Stakes and Verne, 1955. c. A diamond crystal with an arched facet. Hai.

round strand rope. A rope composed of a number of strands, generally six in number. Not a rope, either as a rope or laid to or laid to the rope around a core, hemp, sisal, or manilla, or, in a wire-cored rope, around a central core, and often covered with wire. Sinclair, V, 3. p. 5.

round table. A type of lacing table used for supporting cut holes, i.e., grinding and polishing, now largely superseded by the continuous system. ASTM C162-66.

round trip. Drilling operations maintained on a 24-hour basis. Long.

round valued. The process of pulling the drill string from a borehole, then running the drill string into the borehole. Long.

round вал. The process of pulling the drill string from a borehole, then running the drill string into the borehole. Long.

royalty. a. As used in an oil and gas lease, a percentage of the production reserved by the owner for permitting another to use the property. Rickett, I. b. A lease by bit, emptying the core based, etc., and the lease the privilege of mining and
operating the land in consideration of the payment of a certain stipulated royalty on the mineral produced, creates the relation that is created whatever is paid for the occupation and use of the premises, and not the mineral rights or mine equipment, the royalty is called a rent. A mineral, FeSO₄·4H₂O, isomorphous with hematite which reflect a ruby red. rubber. a. Guide; binder; conductor. Mason. b. Scat. A rubber pump rod to slide on, or for hitches to rub on going round sharp curves. Fay. c. A bucking iron or bucking hammer. See also bucking. d. A gold-quartz amalgamator in which the slime is rubbed against amalgamated copper surfaces. Fay. e. Derb. Fine scythestone; micaceous sandstone. Arkell. f. A building brick made from a sandy clay and lightly fired so that it can be readily rubbed to shape for use in gaged work. The crushing strength of such a brick is about 1,000 pounds per square inch. Dodd.

rubber belt. A belt for conveying coal or other pay load. It consists essentially of a rubber cover, impregnation and fabric. The fabric may be cotton fabric multiply, solid woven fabric, cord, nylon, or other synthetic fiber, with steel wire reinforcement. See also conveyor. Nelson.

rubber blanket. A sheet of rubber as used as auxiliary lining. AM Gloss.

rubber bond. A bonding material whose principal constituent is natural or synthetic rubber. AM Gloss.

rubber-bushed couplings. Consists of two flanged hubs, one equipped with rubber-bushed holes, the other equipped with the rubber bushings. To prevent excessive wear, the rubber bushings are bushed with nonferrous bushings which provide satisfactory contact and wearing surfaces. Pit and Quarry, 53rd, Sec. D, p. 66.

rubber clay. A fine grain, white to light colored clay used as a filler in rubber. Rubber clays must be very low in free silica, and certain compounds of manganese, iron, and copper. Bureau of Mines Staff.

rubber conveyor belt. A conveyor belt consisting of a central stress-bearing carcass for transmitting power enclosed in rubber covers to protect the carcass from abrasion and atmospheric changes. The carcass usually consists of plies of cotton duck fabric, but other constructions that are cotton cords, steel cables, and woven fabrics of synthetic fibers, such as rayon, nylon, orlon, dacron, glass, and asbestos. The rubber covers are furnished in various thicknesses and qualities of rubber compounds. ASA MH4.1-1958.

rubber-covered steel conveyor. A steel conveyor band with a covering of rubber which is vulcanized to the steel with a special adhesive. The thickness of rubber on the underside is 2 millimeters and on the carrying side it may vary from 3 to 10 millimeters. The conveyor is relatively cheap and normally used for heavy work on tramway roads. Nelson.

rubber forming. Fishing where rubber is used as a functional die part. Processes in which rubber is employed only to contain the hydraulic fluid should not be classified as rubber forming. AM Gloss.

rubber-lined pipes. Pipes prepared for handling corrosive liquids in such processes as acid leaching. Also, pumps and handling ore pulp. Pryor, 3. Rubber linings make it possible to use the rubber material to aid in the cleaning of the acid absorption or the return belt.

rubberized steel belt. A rubberized steel belt designed to use the rubber expands and releases the sticky fragments. Nelson.

rubber return idlers. Rebuilding ideas utilizing a roll or rolls covered with or composed of a rubber material to aid in the cleaning or shock absorption of the return belt. NEMA MB1-1961.

rubberstone. A sharp-grit iron or Indiana sandstone used for sharpening shoe knives; also known as shoe stone. Fay.

rubber-tired haulage. The underground use of tractors and dump truck haulage, battery or diesel type, and battery driven shuttle cars. Nelson.

rubber wheel. A grinding wheel made with a rubber bond. AM Gloss.

rubberizing. A process of rubberizing steel for use in gaged work. The crushing strength of such a brick is about 1,000 pounds per square inch. Dodd.

rubbers. a. Fr. A crystalline variety of quartz harder and more resistant to wear than the variety called quartz. 1. See brick, c. ACSG, 1963.

rubberized tractors. A tractor prepared for handling corrosive liquids in such processes as acid leaching. Also, pumps and handling ore pulp. Pryor, 3. Rubber linings make it possible to use the rubber material to aid in the cleaning or shock absorption of the return belt.

rubberized steel belt. A rubberized steel belt designed to use the rubber expands and releases the sticky fragments. Nelson.

rubber return idlers. Rebuilding ideas utilizing a roll or rolls covered with or composed of a rubber material to aid in the cleaning or shock absorption of the return belt. NEMA MB1-1961.

rubberstone. A sharp-grit iron or Indiana sandstone used for sharpening shoe knives; also known as shoe stone. Fay.

rubber-tired haulage. The underground use of tractors and dump truck haulage, battery or diesel type, and battery driven shuttle cars. Nelson.

rubber wheel. A grinding wheel made with a rubber bond. AM Gloss.

rubber把握. A building brick made from a sandy clay and lightly fired so that it can be readily rubbed to shape for use in gaged work. The crushing strength of such a brick is about 1,000 pounds per square inch. Dodd.

rubber belt. A belt for conveying coal or other pay load. It consists essentially of a rubber cover, impregnation and fabric. The fabric may be cotton fabric multiply, solid woven fabric, cord, nylon, or other synthetic fiber, with steel wire reinforcement. See also conveyor. Nelson.

rubber blanket. A sheet of rubber as used as auxiliary lining. AM Gloss.

rubber bond. A bonding material whose principal constituent is natural or synthetic rubber. AM Gloss.

rubber-bushed couplings. Consists of two flanged hubs, one equipped with rubber-bushed holes, the other equipped with the rubber bushings. To prevent excessive wear, the rubber bushings are bushed with nonferrous bushings which provide satisfactory contact and wearing surfaces. Pit and Quarry, 53rd, Sec. D, p. 66.

rubber clay. A fine grain, white to light colored clay used as a filler in rubber. Rubber clays must be very low in free silica, and certain compounds of manganese, iron, and copper. Bureau of Mines Staff.

rubber conveyor belt. A conveyor belt consisting of a central stress-bearing carcass for transmitting power enclosed in rubber covers to protect the carcass from abrasion and atmospheric changes. The carcass usually consists of plies of cotton duck fabric, but other constructions that are cotton cords, steel cables, and woven fabrics of synthetic fibers, such as rayon, nylon, orlon, dacron, glass, and asbestos. The rubber covers are furnished in various thicknesses and qualities of rubber compounds. ASA MH4.1-1958.

rubber-covered steel conveyor. A steel conveyor band with a covering of rubber which is vulcanized to the steel with a special adhesive. The thickness of rubber on the underside is 2 millimeters and on the carrying side it may vary from 3 to 10 millimeters. The conveyor is relatively cheap and normally used for heavy work on tramway roads. Nelson.

rubber forming. Fishing where rubber is used as a functional die part. Processes in which rubber is employed only to contain the hydraulic fluid should not be classified as rubber forming. AM Gloss.

rubber-lined pipes. Pipes prepared for handling corrosive liquids in such processes as acid leaching. Also, pumps and handling ore pulp. Pryor, 3. Rubber linings make it possible to use the rubber material to aid in the cleaning or shock absorption of the return belt.

rubberized steel belt. A rubberized steel belt designed to use the rubber expands and releases the sticky fragments. Nelson.

rubber return idlers. Rebuilding ideas utilizing a roll or rolls covered with or composed of a rubber material to aid in the cleaning or shock absorption of the return belt. NEMA MB1-1961.

rubberstone. A sharp-grit iron or Indiana sandstone used for sharpening shoe knives; also known as shoe stone. Fay.

rubber-tired haulage. The underground use of tractors and dump truck haulage, battery or diesel type, and battery driven shuttle cars. Nelson.

rubber wheel. A grinding wheel made with a rubber bond. AM Gloss.
rubble

f. Eng. A hard chalk used in making paths. Webster 2d, g. in roadbuilding, rough stones of irregular shapes and sizes, and large masses either naturally or artificially, as by geological action, in quarrying, or in stone cutting or blasting. Hess. b. Aust. One as it is broken from the deposit. Hess.

rubble ashlars. Ashlar with rubble backing.

rubble concrete. Concrete in which large blocks of stone, roughly squared, are placed and arranged roughly in courses so that they break joint both horizontally and vertically. The stones are placed with not less than 6 inches of space between them so that the concrete may be properly rammed. Care is taken that all voids are filled with concrete. Hess.

rubble drain. A trench filled with stones selected so as to fill the trench, yet to allow the flow of water through it. Ham.

rubble drift. A coarse agglomeration of angular debris and large blocks set in an earthy matrix of glacial origin. Dunn.

rubblesman. In the quarry industry, a foreman who directs and supervises the work of drilling and splitting stone. D.O.T. 1.

rubble masonry. a. Uncut stone, used for rough work, foundations, backing, etc. Origin: b. Rough, unshaped stone laid in irregular courses. Fay.

rubble-mound structure. A mound of random-shaped and random-placed stones projected over the top until after the gold and fine gravel have been seat through the grizzly. Hess.

rubble ashlars. Ashlar with rubble backing.

rubble blend. Synonym for pyrargyrite; proustite; ruby, as well as in any gem species yielding mica. Hess.

rubby sulfur. Transparent red lacquer somewhat resembling deep red color, and also for zincite with the same characteristics. Fay.

ruby brown. A common term meaning red, for a red variety of iron ore. Fay.

ruby brown. Another name for Cassel brown. Bureau of Mines Staff.

ruby ashlars. Ashlar with rubble backing.

rubby sapphire. A term sometimes used for almandine sapphire or amethystine sapphire. Fay.

ruby, sapphire. A term sometimes used for almandine sapphire or amethystine sapphire. Fay.

ruby. Gem variety of corundum, Al2O3; transparent, red. Mohs' hardness 9; specific gravity 4. Pray, 3.

ruby asnelae. An abrasive similar to white corundum as well as in any gem species yielding mica. Hess.

ruby black. A black sand grain. Consolidated rocks of this type are suitable for use as a reductant, for the production of non-magnetic iron ores. Fay.

ruby cactus. A term applied to girasol ruby with a chatoyant effect. Although a true cat's eye is theoretically unbreakable in ruby, as well as in any gem species yielding asterias, a well-defined single band of light occurs rarely. See also girasol. Shipley.

ruby copper. An early name for cuprite, from its color. Fay.

ruby cuprite. See cuprite.

ruby glass. Glass having a characteristic red color resulting from the presence of colloidal gold, copper, or cobalt. To produce a true ruby, a batch containing a small quantity of gold is first melted and cooled; at this stage, the glass is colorless, but when greatly heated, it develops a red color as colloidal gold is formed. For copper ruby, produced in the same manner but with copper substituted for the gold, the batch must contain zinc and must be melted in a non-oxidizing atmosphere. The most common ruby glass today is synthetic ruby glass, recommended for batch contains 2 percent Se, 1 percent CdS, 0.1 percent As2O3 and 0.5 percent C; the formula is believed to be reducing. Dudd.

ruby juice. Transparent red lacquer sometimes used for coating pavement of stones. See also lacquer back. Shipley.

ruby matrix. Any rock embedded with red corundum; especially that which consists of smaragdite and red corundum found in Clay County, N.C., and sometimes cut cabochon. Shipley.

ruby sand. Sand, colored red by garnets. Fay.

ruby silver. Dark ruby silver is pyrrhotite and light ruby silver is proustite. Dana 17.

ruby spinel. That variety of maganese spinel, MgAl2O4, which has the color but none of the other attributes, of true ruby. Also called spinel ruby, a deceptive misnomer. C.M.D.

ruby, standard. Also called ruby arsenic; ruby of arsenic; ruby of sulfur. Fay.

ruby zinc. A popular name for transparent sphalerite of a deep red color, and also for zincite with the same characteristics. Fay.

rubyaceous. a. The texture of the rubble rocks in which the grain is larger than that of a sand grain. Consolidated rocks of this type are suitable for use as a reductant, for the production of non-magnetic iron ores. Fay.

ruby, C.M.D. A red or brownish-red variety of sapphire, crystilized sphalerite. Standard, 1964. See also ruby zinc. Fay.

ruby cactus. A term applied to girasol ruby with a chatoyant effect. Although a true cat's eye is theoretically unbreakable in ruby, as well as in any gem species yielding asterias, a well-defined single band of light occurs rarely. See also girasol. Shipley.

rudyte. Eng. A common term meaning red, for a red variety of iron ore. Fay.

rudite. A division of Eulamlibranchia comprising extinct chiefly Cretaceouis bi-valve mollusks with one valve elongate, conical and thick-silled and the other small and fitting like a lid on the first. Webster 5th.

rudite. A Middleton for use as a red dye. Arkell.

rudite. A division of Eulamellibranchia comprising extinct chiefly Cretaceous bivalve mollusks with one valve elongate, conical and thick-silled and the other small and fitting like a lid on the first. Webster 5th.

rudite. Synonym for rudite. A.G.I.

rueping process. An empty-cell process of preparing red iron ore. Fay.

rufugroove cast. A groove cast with a feather pattern, that is, a groove with lateral wrinkles that join the main cast in
rugged groove cast

the downcurrent direction at an acute angle. Pettijohn.

Ruggles-Colby dryer. Rotary dryer or kiln, in which material is worked through a horizontal cylinder counter to drying by heat blown through by fan. Pryor, 3.

ruggles. A depression made by oxidation of iron pyrites with the formation of felnite and brown powder, in the Gould at Barnwell near Cambridge. Arkell.

Ruhstrahl-Herasus (R-H) method. See vacuum degassing.

ruin. Eng. A term occasionally employed in familiar description for certain minerals whose sections or cut faces exhibit the appearance of ruined buildings, as ruin agate, ruin marble. A variety of marble. See also ruin agate, Varient of agate. See also ruin. Eng. A term occasionally employed in ruin. Ferruginous nodules processed through a horizontal cylinder counter to drying by heat blown through by fan. Pryor, 3. A machine for removing mud and holding it together is made by pouring melted metal into molds; foundry. Standard, 1964.

ruin on agate. Brecciated Mexican onyx (aragonite). Schaller.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.

ruin ore. Having the form or appearance of ruins, as certain minerals. Fay.

ruin marble. A variety of marble. See also ruin. Dana 6d, p. 189.
progresses. Webster 2d. k. One who operates or manages anything, as a machine, especially, the driver of a locomotive. Standard, 1964. l. A story of a place or scenes, described or illustrated, as a map, table, chart, etc. Standard, 1964. m. A horizontal channel through which molten metal flows from one receptacle to another. ASM Gloss. t. The portion of the gate assembly that connects the downgate, sprue, or riser with the casting. ASM Gloss. t. Parts of patterns and finished castings corresponding to the described portion of the gate assembly. ASM Gloss.

runner bar. Iron casting attached to a circular grinding runner or head for abrasive material that breaks off readily and falls away. See also guide runner; cross poling. Ham.

runner brick. A fireclay shaped, square in section, used for open-hearth runner brick. A.R.I.

runner brick. A freemasonry square in section and about 1 foot long, with a hole about 1 inch in diameter along its length and terminating in a spigot at one end and a socket at the other end. A number of such refractory pieces, when placed together, form a passage through which, during the bottom pouring of steel, the molten metal can pass from the center brick to the base of the ingot mold. See also center brick. Dodd.

runner brick press. A press for forming shapes having holes through them, particularly for open-hearth runner brick. A.R.I.

runner cast. An imperfection in plate glass resulting from the gate assembly. ASM Gloss. runner case. See bottom, b. Fay.

runner-on. See bottomer, b. Fay.

runner-on log. A timber whose pilings driven to protect an excavation from collapse. See also guide runner; cross poling. Ham.

runner stick. A slightly tapering, round stick, used as a pattern for the opening through which molten metal is to be poured into a mold. Standard, 1964.

running. The act or process of operating a drill, drilling with a bit, or lowering casing, drivepipe, or drill string into a borehole. Long. b. Earth and rock that will not stand, especially when wetted, and falls, sloughs, or sloughs into a borehole or a workplace in a mine. Long. c. A trade term used to cover the overall process of converting quicklime to a milk or slurry. Fay.

running block. See traveling block. Long.

running bond. A term applied to overlapping stretches, and also to English and American bond. Bureau of Mines Staff.

running bridge. Aust. A platform, on wheels, that serves as a center for a shaft in process of sinking, and on which buckets or skips are landed. See runner, d. Fay.

running coal. A term applied to a very friable coal which disintegrates and flows into the workings. Nelson.

running dry. The act of drilling without circulating a drilling fluid. Long.

running fit. Any clearance fit in the range used for parts which rotate relative to each other. Actual values of clearance resulting from stated shaft and hole tolerances are given for nine classes of running and sliding fits for 21 nominal shaft sizes in ASA B4.1-1955. ASM Gloss.

running ground. a. Inescapable or easily caved wall of excavations. Pryor, 3. b. Ground which is incoherent, for example, soils, sand, peat, moss, or waterlogged material. It may be soft or plastic, such as wet clays. All such deposits deform readily under pressure and relief is obtained by aperturing into openings, such as mine workings. The miner uses the term running ground to indicate the difficulty of support and sometimes of danger. See also forepoling; quicksand; mudrush. Nelson. c. Superincumbent material that breaks off readily and falls away. See also center brick. Dodd.

running hill. A lime kiln that is fed from above, and delivers continually below. Standard, 1964.

running lift. Light mine pump used in sinking which can be raised or lowered in shaft as required. Pryor, 3.

running off. In founding, the opening of the taphole of a blast furnace and allowing the molten metal to flow out to the moulds. Standard, 1964.

running-on. Name sometimes applied to a batch type extrusion machine of the type more commonly called a stub. See also stupid. Dodd.

running roll of flexible rope. 6 strands, 12 wires each, and 7 hemp cores. H.G.C., p. 130.

running sand. a. An unconsolidated sand. See also run, e. Long. b. Quicksand. Fay.

running sheave. A sheave used as a single-pulley running block. Long.

running stone. A diamond that cuts well with the grain. Hess.

running the drum. Eng. The lowering or sinking of a cylinder or drum through quick ground, to secure the upper part of the drum, with a running rope. Fay.

running-off. a. That portion of the rainfall that is not absorbed by the deep strata; is utilized by vegetation or lost by evaporation or may find its way into streams as surface flow. Nelson. b. The collapse of a coal face into itself while it is being cut. Used in Britain. Fay.

running-off pit; spill pit. Catchment to which spillage can gravitate should it be necessary to dump contents of such mill machines classifiers, slurry pumps. Provided with reclaiming pump so that contents can be returned to appropriate part of flow line. Pryor, 3.

run-of-mine. a. The raw coal (or ore) as it is delivered by the mine cars, skips, or conveyor or by dumping. Synonym: ore, raw. b. Raw ore. Fay.

run-of-mine a. The raw coal (or ore) as it is delivered by the mine cars, skips, or conveyor or by dumping. Synonym: ore, raw. b. Raw ore. Fay.

run splint. a. The strap which is placed around a borehole when it is in the process of straightening. See also center brick. Dodd.

run-to-waste. Drill cuttings that are not collected or saved as a sludge sample and are allowed to collect in the sump; also, the
The sudden weighting of the roof begins. A sudden movement of a large number of miners causes the roof to collapse, thus destroying some of the pieces. The joint is made by packing an intimate mixture with a stiff paste of ground coats of high Na₂O:140, ratio.

rutherfordine

Rutherfordine. A hard, brittle, silvery-white, polyvalent, rare metallic element in group VII of the periodic system. It is one of the platinum metals and resembles osmium but is more resistant to corrosion (as by oxidizing acids). It occurs in platinum ores, especially in iridomine. Used chiefly in hardening platinum and palladium alloys. Symbol: Ru; relative atomic mass: 101.07; specific gravity: 12.41 (at 20°C); hexagonal (alpha); four allotropic crystal forms: (1) alpha rutherfordine; (2) beta rutherfordine; (3) gamma rutherfordine; and (4) delta rutherfordine; transformation temperatures, 1,035°C, 1,200°C, and 1,500°C; melting point, 2,250°C or 2,650°C; boiling point, 3,900°C or 4,150°C; insoluble in water, in aqua regia, in acids, and in alcohol; a soluble in fuming nitric acid and in aqua regia. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-2, B-122, B-215; Bureau of Mines, 1964.

rutherfordine

A very rare, strongly radioactive, possibly thorochrome, yellow mineral, (UO₂)(CO₃), in earthy masses and
in cubic pseudomorph after uraninite composed of aggregates of minute fibers; from east Africa; found associated with microcrystalline radial lath minerals. Movements of rutherfordite are mixtures containing uranium silicates and oxides. Not to be confused with rutherfordite.

rutilated quartz. Quartz penetrated by needles of rutile. Fay.

rutilite. A weakly radioactive, tetragonal mineral consisting of titanium dioxide, TiO₂, commonly in prismatic crystals; reddish-brown to red; sometimes yellowish, bluish, yellow, or colorless; a variety of rutile. It is the most common metallic mineral. Another tetragonal, TiO₂, with different facial angles is called anatase or octahedrite. Ordinarily, TiO₂ is known as brookite. Crossby, p. 132; Larsen, p. 77.

rutile. Ceramic. Trade designation for 92 percent TiO₂, brown powder; specific gravity, 4.57 melting point, 1,790° C; particle size (average), 44 microns maximum; insoluble in water and in alkalis; slightly soluble in dilute mineral acids; and soluble in hot concentrated sulfuric acid. Used in glasses, in floor tiles, and in artware and dinnerware bodies. C.C.D 64, 1961.

rutite. An equigranular, medium-grained, dark pink igneous rock composed essentially of feldspar, microperthite, minute, and sodalite, with minor amounts of nepheline, biotite, graphite, magnetite, and amphibole. There is 42 percent microcline, 46 percent sodalite, ± nepheline, 12 percent hornblende, and traces of titanite and apatite. Johannes, c. 1, 1938, p. 46.

rusting. See rusting on a job. Hofman.

rusty. Broken strata found in close proximity to a fault. See also fault smash. Nelsen, p. 37.

R-value. The partial dispersion ratio of a glass expressed as (n-x)²/(n-x)²x where n is the refractive index at wavelengths equivalent to the spectral lines C, D, and F. Compare Abbe number. Dodd.

R.W.F. lamp. Essentially a flame safety lamp with an inlet tube through which a sample of mine air may be introduced through an aspirator. A probe enables a sample of air to be drawn from a height of up to 75 feet with the lamp held at eye level. A small magnifying glass is fitted to facilitate the estimation of the gas cap. It is also used to detect a firedamp layer near the roof. Nelson.

ruddy. See rider. Arkell.

rufous. A volcanic rock consisting of about 75 percent feldspar, the remainder being principally aluminia. Its main use, after a heat treatment, is in lightweight brick. Loeb.

Rutherford’s theory. A mine subsidence theory that is a variant or extension of the vertical theory. In this theory, allowance is made for movements beyond the mined area, but the dip of the beds is considered to be of little or no influence. Rutherford maintained that if rock is undercut, it will stay undisturbed if cohesion exceeds gravity and will fall if gravity exceeds cohesion. Friggs, p. 37.

8

s

sandblasting. An abbreviated prefix meaning symmetrical in the names of organic compounds. For example, dichloroethylene. Webster 3d. b. Abbreviated prefix meaning secondary, especially in the names of organic radicals. For example, s-butyl. Webster 3d.

sandblaster. A hump-shaped piece of metal used as a support for a load above. Fay.

sandblast. A steel block over one of the towers of a suspension bridge or aerial ropeway providing a bearing surface for the suspension rope passing over it. Hem, f. An item of kit furniture. It is a piece of refractory material in the form of a bar of triangular cross section. It is also called a brake or a friction block.

sandblasting. The destruction of property (as tools of production or materials) or deliberate slowing down of work or interference with production in any way during the strike. Webster 3d. b. Willful effort by indirect means to hinder, prevent, undo, or discredit (as a plan or activity); deliberate subversion. Webster 3d.

saddleback. Having a granular texture resembling that of soil sugar; said of some sandstones and marbles. Webster 3d.

saddleback. A marble having a granular crystalline structure like that of soil sugar. Fay.

saddlewood. The anodes used in cathodic protection against corrosion. Hem.

saddlewood. Reducing the extent of corrosion of a metal in an electrolyte by coupling it to another metal that is electronically more active in the environment. ASM Glei.

saddlewood. Old Chinese name for the ore calamine. Webster 3d. b. Will and sang de bœuf. See also rouge flambe; sang de bœuf. Dodd.

saddlewood. A ridge connecting two higher elevations; a low point in the crestline of a ridge. A minor upfold along the axis of a syncline; a minor downfold along the axis of an anticline. Webster 3d. b. A hump-shaped piece of rock with a smooth back, in-securely attached to adjacent strata. Also called saddleback. Hudson, c. steel block over one of the towers of a suspension bridge or aerial ropeway providing a bearing surface for the suspension rope passing over it. Hem, f. An item of kit furniture. It is a piece of refractory material in the form of a bar of triangular cross section. It is also called a brake or a friction block. See also saddle, c. Fay. b. Two timbers placed so as to form an inverted V and used as a support for a load above. Fay.

saddleback. A. Eng.; Scot. A roll or undulation in the mof or pavement of a wenn. Also given as s. Zimmerman, p. 170.

saddleback. The upper part of a two-piece furniture. It is a piece of refractory material in the form of a bar of triangular cross section. It is also called a brake or a friction block. See also saddle, e. Fay. b. Will and sang de bœuf. See also rouge flambe; sang de bœuf. Dodd.

saddleback. A. Ridge connecting two higher elevations; a low point in the crestline of a ridge. A minor upfold along the axis of a syncline; a minor downfold along the axis of an anticline. Webster 3d. b. A hump-shaped piece of rock with a smooth back, insecurity attached to adjacent strata. Also called saddleback. Hudson, c. steel block over one of the towers of a suspension bridge or aerial ropeway providing a bearing surface for the suspension rope passing over it. Hem, f. An item of kit furniture. It is a piece of refractory material in the form of a bar of triangular cross section. It is also called a brake or a friction block. See also saddle, e. Fay. b. Two timbers placed so as to form an inverted V and used as a support for a load above. Fay.

saddleback. A. Eng.; Scot. A roll or undulation in the mof or pavement of a wenn. Also given as s. Zimmerman, p. 170.

saddlehead. See saddle, b. Fay. b. Will and sang de bœuf. See also rouge flambe; sang de bœuf. Dodd.
saddle boss. The thickened or domed end of a downswelled butt.
saddle joint. Huckle joint. Arkell.
saddle rail. A rail used to make up and repair harnesses, etc., for the draft animals at a mine. Fay.
saddle shoes. A. A bedded vein that has the form of an anticline; an inverted saddle has the form of a syncline. See also saddle, b. Fay, b. An opening at the crest of a sharp fold in sedimentary rocks, occupied by ore. Bateman.
saddle supports. Poles placed in saggars for holding articles to be fired in the glost oven. C.T.B. Clay props placed between piles which were packed on edge in a kiln. ASCG, 1963.
saddle-shaped. Having the form of an anticline fold. West.
saddle vein. Saddle-shaped ore deposit formed between sedimentary beds in the crests of mostly dome-shaped, antiformal structures. Schieffeldecker.
saddle. Forming a seamless ring by forging a pierced plate over a mandrel (or saddle) as was created by the miner or employee. Nelson.
saddle boss. The thickened or domed end of a downswelled butt.
saddle joint. Huckle joint. Arkell.
saddle rail. A rail used to make up and repair harnesses, etc., for the draft animals at a mine. Fay.
saddle shoes. A. A bedded vein that has the form of an anticline; an inverted saddle has the form of a syncline. See also saddle, b. Fay, b. An opening at the crest of a sharp fold in sedimentary rocks, occupied by ore. Bateman.
saddle supports. Poles placed in saggars for holding articles to be fired in the glost oven. C.T.B. Clay props placed between piles which were packed on edge in a kiln. ASCG, 1963.
saddle-shaped. Having the form of an anticline fold. West.
saddle vein. Saddle-shaped ore deposit formed between sedimentary beds in the crests of mostly dome-shaped, antiformal structures. Schieffeldecker.
saddle. Forming a seamless ring by forging a pierced plate over a mandrel (or saddle) as was created by the miner or employee. Nelson.
saddle boss. The thickened or domed end of a downswelled butt.
saddle joint. Huckle joint. Arkell.
saddle rail. A rail used to make up and repair harnesses, etc., for the draft animals at a mine. Fay.
saddle shoes. A. A bedded vein that has the form of an anticline; an inverted saddle has the form of a syncline. See also saddle, b. Fay, b. An opening at the crest of a sharp fold in sedimentary rocks, occupied by ore. Bateman.
saddle supports. Poles placed in saggars for holding articles to be fired in the glost oven. C.T.B. Clay props placed between piles which were packed on edge in a kiln. ASCG, 1963.
saddle-shaped. Having the form of an anticline fold. West.
saddle vein. Saddle-shaped ore deposit formed between sedimentary beds in the crests of mostly dome-shaped, antiformal structures. Schieffeldecker.
saddle. Forming a seamless ring by forging a pierced plate over a mandrel (or saddle) as was created by the miner or employee. Nelson.
saddle boss. The thickened or domed end of a downswelled butt.
saddle joint. Huckle joint. Arkell.
saddle rail. A rail used to make up and repair harnesses, etc., for the draft animals at a mine. Fay.
saddle shoes. A. A bedded vein that has the form of an anticline; an inverted saddle has the form of a syncline. See also saddle, b. Fay, b. An opening at the crest of a sharp fold in sedimentary rocks, occupied by ore. Bateman.
saddle supports. Poles placed in saggars for holding articles to be fired in the glost oven. C.T.B. Clay props placed between piles which were packed on edge in a kiln. ASCG, 1963.
saddle-shaped. Having the form of an anticline fold. West.
saddle vein. Saddle-shaped ore deposit formed between sedimentary beds in the crests of mostly dome-shaped, antiformal structures. Schieffeldecker.
saddle. Forming a seamless ring by forging a pierced plate over a mandrel (or saddle) as was created by the miner or employee. Nelson.
saddle boss. The thickened or domed end of a downswelled butt.
saddle joint. Huckle joint. Arkell.
saddle rail. A rail used to make up and repair harnesses, etc., for the draft animals at a mine. Fay.
saddle shoes. A. A bedded vein that has the form of an anticline; an inverted saddle has the form of a syncline. See also saddle, b. Fay, b. An opening at the crest of a sharp fold in sedimentary rocks, occupied by ore. Bateman.
saddle supports. Poles placed in saggars for holding articles to be fired in the glost oven. C.T.B. Clay props placed between piles which were packed on edge in a kiln. ASCG, 1963.
saddle-shaped. Having the form of an anticline fold. West.
saddle vein. Saddle-shaped ore deposit formed between sedimentary beds in the crests of mostly dome-shaped, antiformal structures. Schieffeldecker.
saddle. Forming a seamless ring by forging a pierced plate over a mandrel (or saddle) as was created by the miner or employee. Nelson.
safety cap

or cap made of rigid material, designed for the protection of the heads of workmen. If worn in a mine equipped with electricity, the material should contain no conductive fuses. Also called safety cap. Grove. C. See tin hat. Long.

safety joint. A course-threaded joint in the head of a double-tube core barrel. If the threads lodge in the borehole, the safety joint, inner tube, and core can be removed by backing off at the safety joint, thereby facilitating the subsequent fishing job. Long.

safety lamp. In coal mining, a lamp of an approved type and which is relatively safe to use in atmospheres which may contain flammable gas. Lately, the term tends to be restricted to oil-burning safety lamps, which are issued to deputies and used for fireproof tests. See also cap lamp. An oil safety lamp; gas; electric cap lamp. Nelson.

safety-lamp mine. In Great Britain, a coal mine in no part of which below ground is the face of any stoping or mining other than commissioned legally lawful. Nelson.

safety latch. A latch provided on a hook or elevator to prevent it from becoming detached prematurely. Compare safety hook. Long.

safety lock. An offset swivel coupling that supports the tail ends of the rods when whippingstock. Long.

safety officer. A certificated colliery official who works directly under the colliery manager and also in close consultation with other mine officials. He investigates and reports on every serious accident. He keeps the manager informed on all safety problems and makes recommendations. Nelson.

safetyograph. A circuit tester which consists of a hand-driven generator and a direct-reading ohmmeter mounted together in a strong case. This instrument is perfectly safe, since the testing current developed by the low-voltage generator cannot exceed 12 milliamperes even at excessive handle speeds. Medusa, Ill., pp. 64-65.

safety platform. a. A platform built in a derelict depository and which must be the deck to handle elevators, casing, drill rods, etc. See also safety pack. b. A platform in a hinged-door opening over a shaft while being sunk, especially where blasted materials are to be thrown down. After the hoist is hoisted, the hinged door is closed to prevent any material from falling back onto workmen in the shaft. Bureau of Mines Staff.

safety plugging. A system in high-pressure devices such as boilers, which melts at a predetermined temperature. Pryor. 3.

safety plunger. A rubber plug placed over the face of working places to afford protection for the workmen at the face. It must be set as a line timber and with equal care. At least two safety posts should be set at the face of each working place, not more than 3 feet back from the face. Kentucky, pp. 136-137.

safety poster. A pictorial form of appeal to workmen to exercise care and observe recognized or stipulated safety precautions. The poster is usually displayed at the pithead, canteen, or office. Nelson.

safety powder. A test used for short-flame explosives before the introduction of permissible explosives. Fay.

safety prop. Eng. See temporary prop; safety post.

safety rod. A standby control rod to shut down a nuclear reactor rapidly in emergencies. LBL.

safety roto. A cage-winding device fixed at the upper grade of an inclined face and having its cage attached to the head of the cage-winding or cutter to assist in overcoming frictional resistance of the cutter or loader while in operation against the grade. Bureau of Mines Staff.

safety shoe. A well-built shoe of leather or rubber provided with a steel-toe or other strong, stiff toe. Grove.

sag. a. A depression in a mine floor or roof. After the bucket is, hoisted, the hinged door is closed to prevent any material from falling back onto workmen in the shaft. Bureau of Mines Staff.

sagging. a. A depression in a coal-seam face. Fay. c. To cause to curve downward in the middle usually as a result of improper loading or supporting. Webster 3d, d. The difference between the sagging path of a conveyor belt actually taken due to the imposed load of material and its own weight, and the theoretical path projected to the top of the supporting idler rolls. This sag is limited by proper correlation of idler spacing and belt tensioning. ASA M4H 1938. See closure. Spalding, p. 159. f. See rod sag. Long. g. A broad, gentle, shallow basin, for example, the Michigan and Illinois Basins. A.G.I. h. Downwarping of beds near a fault that is opposite to that of frictional drag. A.G.I. i. A decrease in the section thickness of a casting caused by insufficient strength of the mold sand of the cope or of the core.

sag and swell. The undulating topography characteristic of sheets of till. The till usually is thick enough to contain all traces of former topography, and the postglacial drainage is then controlled by the top configuration of the till. Stiles and Yarns, 1955.

sag bolt tension. The minimum tension in the overstressing of the cable which becomes necessary to prevent excessive sag of the belt between belt idlers. ASA M4H 1955.

sag bolt. Bolts installed at the early warning to measure roof sag. A sag bolt is a 12-foot unit put in without a bearing plate. It is securely anchored in the 12-foot horizon with the aid of a heavy nut, and extends about 2 inches from the hole. Three 1/4-inch strips of colored pressure-sensitive tape are wrapped around the extending section of the bolt, beginning with green at the roof line, then yellow and red. The color bands provide a simple, economical means of detecting roof sag at a glance. Coal Age, v. 71, No. 8, August 1966, pp. 86-87.

sag correction. A tape correction applied to the apparent length of a level base line to counteract the sag in measuring tape. Ham.

sapphire. A quartz crystal which contains acicular crystals of rutile. A.G.I.

sapphire quartz. Quartz containing acicular crystals of rutile or sometimes similar crystals of black tourmaline, goethite, stilbite, asbestos, actinolite, hornblende, and epidote. Standard, 1964.

saggar. A fireclay box, usually oval (23 x 17 inches) in which pottery ware can be set in a kiln. The object is to protect the ware from contamination by the kiln gases and the name is generally thought to be a corruption of the word safeguard. Since the bottle oven has become obsolete as a kiln for the firing of pottery and porcelain wares, the name has become increasingly used in the industry, the use of saggers has been largely displaced by the setting of tiles of kiln furniture. See also kiln furniture. Dodd.

saggar-makers' bottom-knocker. The man whose job it was to beat out, by means of a heavy wooden tool, a wad of grogged fireclay to form a bottom for a saggar; a saggar is now virtually extinct. See also saggar. Dodd.

sagitt. Sheet glass shaped into three-dimen-
sagged

sagged tower. A pair of floating lightweight sheaves which give support, at a suitable point, to the ropes leading away from the winding drums. The sheaves are located at a point about one-third of the length of rope between the drum and winding pulleys, measured from the drum. A small drum near the top is sometimes used to alleviate the tension and dampen out the rhythmic swing of the rope. Nelson.

sagittal plane. A plane through a metamorphic rock composed essentially of pyroxene and calcite. Holmes, 1920. A curious rock from near Lake Sagvand, Norway, that is composed mainly of hornblende and magnesium. A little colorless mica and pyrite are also present. The name was given by Peterson. Fay.

salammunite. A very rare, weakly radioactive, monoclinic, colorless mineral. (Mg,Fe) 2 (La,Pr) 2 (PO 4,CO 3) 4 four in barite-dolomite rock with bastnaesite, barite, dolomite, quartz, and hematite. Crosby, p. 108-109.

salina. A sulfur-yellow basic chloraroseinate of lead, 12PbOAg 2(OH) 3 AgCl. Aggregates of this scale. Monoclinic. From Langban, Sweden. English.

Saint Anne marble. A deep blue-black, white-vinriled marble from Biseme, Belgium.

Saint Bienne marble. A yellow stone veined with brown or red; from the province of Var, France. Fay.

Saint Peter's sandstone. An eocene Ordovician formation in the Midwest.; United States. The Saint Peter's sandstone is a formation both, around the periphery of the dome. Webster 3d. c. In ceramics, a box in which castings are made. Webster 3d.

Saint Stephen's stone. A white or grayish chalcedony with tiny red spots so close together that the whole stone, at a distance is a uniform rose-red. Hess.

saicas. A solid mass of iron, frequently weighing many tons, that is deposited and partially replaces the firebrick hearth in the bottom of a blast furnace after long periods of operation. Hender.

saline coal. Total coal-mine output less tonnage rejected or consumed during conveying and mixing. D.O.T.

saline output. The total tonnage of clean coal produced at a mine as distinct from that measured from the pithed output. It is the tonnage of coal as weighed after being cleaned and classified in the preparation plant. Nelson.

salander. A slip in which castings are made. Webster 3d.

salan. A very rare, weakly radioactive, monoclinic, colorless mineral. (Mg,Fe) 2 (La,Pr) 2 (PO 4,CO 3) 4 four in barite-dolomite rock with bastnaesite, barite, dolomite, quartz, and hematite. Crosby, p. 108-109.

salt. A salt spring or well; a saltworks. Fay.

salters. See sagger. Fay.

salt structure. A general term for loadcasts and related structures. Pettijohn.

salt tower. A pair of floating lightweight sheaves which give support, at a suitable point, to the ropes leading away from the winding drums. The sheaves are located at a point about one-third of the length of rope between the drum and winding pulleys, measured from the drum. A small drum near the top is sometimes used to alleviate the tension and dampen out the rhythmic swing of the rope. Nelson.

salmansite. A manganese-containing metamorphic rock composed essentially of pyroxene and calcite. Holmes, 1920. A curious rock from near Lake Sagvand, Norway, that is composed mainly of hornblende and magnesium. A little colorless mica and pyrite are also present. The name was given by Peterson. Fay.

salmonite. A very rare, weakly radioactive, monoclinic, colorless mineral. (Mg,Fe) 2 (La,Pr) 2 (PO 4,CO 3) 4 four in barite-dolomite rock with bastnaesite, barite, dolomite, quartz, and hematite. Crosby, p. 108-109.

saline. A sulfur-yellow basic chloraroseinate of lead, 12PbOAg 2(OH) 3 AgCl. Aggregates of this scale. Monoclinic. From Langban, Sweden. English.

salen. A box in which castings are made. Webster 3d.

salina. A. A pond, pool, or marsh containing salt water diked in from the sea. Stand.

saline sewage. A. A method of shaping ware by winding with machine (sagger preparation). D.O.T.

saline soil. That is inadequately supported during the firing and may cause the fault. Fay. The permanent distortion, or subsidence, of vitreous enamelware that is inadequately supported during the firing and may cause the fault. Fay.

saline water. D.O.T.

saline weathering. A. The flow of enamel through vessels and related structures. Webster 3d.

salina. A. A box in which castings are made. Webster 3d.

saline point. A. A point of land projecting sharply from the shore. Hy.

saline deposits. This group covers a variety of chemically formed rocks characteristic of certain well-defined environments, for example, lagoons, inland lakes, relic (landlocked) seas, etc. It includes chlorides, sulfates, borates, nitrates, etc., occuring as products of precipitation, usually in regular beds or layers, but lacking stratification in the accepted sense. Apart from such developments per se, certain of common salts. Fay. c. In some plays the amount of mineral substances (common salts and others) left by evaporating water is so great as to encrust the entire area, sometimes to a depth of several inches. Such an area is then called a saline. A.G.I. d. In Louisiana, a body of water lying behind a barrier. A.G.I.

salina. A. A box in which castings are made. Webster 3d.

saline or salt water. Fay. b. Applied to minerals having the taste of common salt.

saline character. Any of certain so-called common salts. Fay. c. In some plays the amount of mineral substances (common salts and others) left by evaporating water is so great as to encrust the entire area, sometimes to a depth of several inches. Such an area is then called a saline. A.G.I. d. In Louisiana, a body of water lying behind a barrier. A.G.I.

saline dome. A. An upwelling of the earth's surface on the continental shelf, in which saline water is of such density that it will not mix with fresh or brackish water, but both, around the perimeter of the dome. Fay.
sali
t

dome

The center is barren of vegetation, constituting a nucleus of salt. See also salt dome; dome, c. A.G.I.
saline lakes. See salt lakes. C.T.D.
saline soil. See mud volcanoes, A.G.I.
saline residue. One of a class of deposits formed by evaporation of surface bodies of water and consequent precipitation of the salts dissolved in them. Common salt and gypsum are examples. Stokes and Stas. 1935.
salero. a. A dealer in salt; an owner of a salt mine or works. Fay. b. Sp. Applied to ores requiring much salt in amalgamation.
saline. a. A general term for salt mines of rock salt, salt springs, salt springs, salt rock. Rickett's, 1 b. As used by Congress, includes not only salt springs but all salt lands of every characteristic. Fay.
saline soil. A soil containing excessive quantities of the neutral or non-saline soluble salts. Stokes and Stas. 1935.
Salina formation. A series of nonmarine strata which succeed the Niagara stage in the Silurian system of North America. Red shale and lime mud deposits containing rock salt and gypsum are included in the formation. The strata are found in New York (Syracuse), Michigan, and Pennsylvania. Also called Salina formation.
saliferous. Yielding salt, as a salt bed. Standard. 1964.
salt. The total amount of solid material in grams contained in one kilogram of seawater when all the carbonate has been converted into oxide, the bromine and iodine replaced by chlorine, and all organic matter completely oxidized. Expressed as grams per kilogram of seawater or parts per million, respectively. Standard. 1964.
salt bridge. An instrument for determining salinity of water (a salimeter) by measuring the electrical conductivity of the water sample with a wheatstone bridge. H.G.C.
salimeter. An instrument which measures conductivity of a water sample. This conductivity is measured at the point that a sample of known salinity can be converted to an expression of salinity for the unknown. Wyllie. p. 164.
salite; salite. A variety of monoclinc pyroxene, grayish green, deep green to black in color; obtained from Sala, Sweden. Dana. 6th ed. p. 352; Webster 3d. 1961.
saliter. Used by Wadsworth to include all salts and saline materials. Fay.
salitre. A swampy place where certain salts, salt water, or brine are extracted in the dry season. Standard, 1964.
salivation. A mild form of mercury poisoning similar to the symptoms between the analization points. By efficient ventilation, the wearing of gloves, and perhaps respirators, the symptoms are often not great. See also mining diseases. Nelson.
salmon. Corn. a. A chamber in a mine. Fay. b. A stage in smelting. Fay. c. A boarded cistern for water to run in along the bottom of an adit. Fay. d. The floor or stage on which the ladders rest in a shaft. Fay. Also spelled solar, sollar, and soller, soller being preferred. Thomson. 1912; inching bottle. Dodd. e. Marine salt, sea salt; a name used as early as the 17th century by the chemist van Helmont. Kaufmann.
salt. An underfiring brick (in allusion to its color). Dodd.
saline bricks. A class of underfiring brick embracing those not hard enough for outside walls, and including soft, saline backing-up, pale, light, chimney, filling-in, inside walls and roundtop brick. Stewart, 1964. Sometimes referred to as rauft or place brick.
salimeter; salimeter; salimeter. A type of hydrometer with scale reading 0° S in water and 100° S in fully saturated brine, the scale indicating the percent of saturation. Kaufmann.
Saloplin. Middle and Upper Silurian (restricted) rock salt. Kaufmann.
salpeter. Rock salt. Kaufmann.
salts. Eruptions of hot scalded mud from small on-off vents, or in volcanic districts, and often accompanied by steam and at high temperature. Fay.
sal-soda. Washing soda. Used in glass manufacture Crystals.
salt. a. To accidentally or purposely introduce extra, amorphous, off-coloring, or mor- mileral into a sample, such as a sludge sample, to be assayed. Long. b. To add an accretion of material to a sample. Long. c. To enrich, a mine, artificially, usually with fraudulent intent by secretly placing valuable mineral in some of the working places. Webster 3d. d. The generic term salt, applied to any one of a class of similar compounds formed when the acid hydrogen of an acid is partly or wholly replaced by a metal or a metallic radical. Kaufmann. e. The specific chemical, sodium chloride, NaCl. Kaufmann. f. A slang term for money. Kaufmann. g. An alchemical name for the earth, or the principle of solidity or fusty. Kaufmann. h. A saltcellar, salt dredge, sa'iahaker, or salt dish. Kaufmann.
salt acid; hydrochloric acid; muriatic acid. H.Ci. Kaufmann.
salt antiflame. An antiflame in which the core is composed of salt rock. It is elongate whereas a salt dome is essentially circular in plan. A.G.I.
mutations. a. The variable or leaping movement of saltation, b. The variable or leaping movement of saltation. c. A process by which a particle, picked up by the stream current, is flung upward after which being too heavy to remain in suspension, drops to the stream bottom again at the downstream. A.G.I.
saltation marks. Marks and the casts thereof, made by an object proceeding along a saltatory path. Related to saltation is saltation transport.

salt bath. Mixture of salts (for example, sodium nitrate and chloride) used to heat, harden or temper metals. Peters. 3. salt block. a. Eng. A salt factory where the evaporating process is used; saltern. Standard, 1964. b. An installation of vacuum pans or gradiniers for producing salt by evaporation. Kaufmann.
salt blocks. Evaporated salt or fine rock salt mechanically compressed into dense blocks, usually 20 pounds in weight, for stock feeding. A specially compressed block for strengthening refrigerating briquets is marketed under the name Kooler Kubes. Kaufmann.
salt bottom. A flat piece of relatively low-lying alluvium. Webster 3d.
salt brick. Compressed salt of approximately brick shape and size, for animal nutrition. Kaufmann.
salt cake. Usually an inverted glass U-shaped tube filled with a sodium-chloride solution, the two legs of which dip into the concentrated brines of electricity, forming an electrochemical cell. Kaufmann.
salt. Plants of the genus Atriplex growing in arid saline soils, particularly in Australia. A plant of this genus is found in California under the name Australian salt bush, or Greasewood. Kaufmann.
salt cak. Impure sodium sulfate (90 to 99 percent NaSO₄) obtained as a byproduct: (1) from production of hydrochloric acid; (2) by crystallization from natural brines, such as the Bear Lake (Gale) brine; (3) from the coagulation bath for viscose rayon; and (4) by the Hargreaves process. Impurities vary according to the source. Used in ceramic glazes CCD ed. 1961.
salt catcher. A long cylindrical tube attached to the bottom section of a vacuum pan, into which the full-size crystals settle. Kaufmann.
salt cote. A salt pit, or salt house. Kaufmann.
salt deficiency. A condition sometimes suffered by miners in hot and deep mines and workers in steelworks, due to excess
Salt deficiency can cause various health problems, leading to decreased water retention and altered fluid balance in the body. Correcting sodium chloride deficiency is essential for maintaining proper electrolyte balance and hydration. A healthy diet, with sufficient dietary sodium chloride, is crucial for maintaining normal fluid balance and proper function of the nervous and muscular systems.

Salt is essential for the proper functioning of the body. It helps regulate fluid levels, maintain proper body functions, and support overall health. A diet lacking in sodium chloride can lead to health problems, so it's important to ensure adequate intake. A healthy balance of dietary sodium is crucial for maintaining normal fluid levels, supporting proper body functions, and promoting overall health.

A healthy balance of dietary sodium is crucial for maintaining normal fluid levels, supporting proper body functions, and promoting overall health.
Webster & S. Handbook of Chemistry and Physics, 1964, p. B-133. 2. Two allotropic forms: (1) alpha samarium; hexagonal; specific gravity, 7.536; and stable up to 917° C. (2) beta samarium; specific gravity, 7.40; and stable up to 917° C to the melting point; ignites in air at 847° C; boils out at 1,900° C; insoluble in water; and soluble in acids. Bond, b. of Chemistry and Physics, 45th ed., 1964, pp. B-133, B-215.

Samarium oxide. Sm₂O₃ has a melting point of 2,350° C. This material has a high thermal neutron cross section, making it usable as a nuclear control rod material. It is also used as a phosphor activator.

Samarikite. A moderately to strongly radioactive, orthorhombic mineral, (Y₂O₃)(Ce, Er, Ce, Th)₂(C₂O₄)·xH₂O. It is a black, sometimes with a brownish tint; surface is often brown or yellowish-brown due to alteration; found in granite pegmatite, commonly associated with columbite; other associates are monazite, magnetite, sinter, beryl, bastite, manamite, eucalyptus, albite, topaz, and garnet; also found as a detrital mineral placer deposits. Crosby, pp. 39-40.

Samarium ware. See terra sigillata. Dodd.

Sample. a. Representative fraction of a body of material, removed by approved methods, guarded against fraudulent adulteration, and tested or analyzed in order to determine the nature, composition, percentage of specified constituents, etc., and possibly their reactivity. Bulk samples are large (several tons), so taken as to represent the ore for sampling and treatment. Channel samples, cores, chips, grab, panning, stope samples, etc., are small crops, made primarily to establish the var: s: of the ore reserve. Pryor, 3. b. A section of core or a specific quantity of material which is taken from the whole from which it was removed. Long. c. To select or take at random a sample. Fay. d. To try or test. Fay.

Sample breaker. In ore dressing, a laborer who pulverizes samples of ore to required fineness so that they may be analyzed to determine their composition. Also called breaker. D.O.T. 1.

Sample cutter. Scot. A steel tube with teeth at the end for cutting crops of mineral in boring. Fay.

Sample divider. A mechanical device that cuts out a (1) certain fractional part of ore to be used as an assay sample; or, for example, split shovel, riffle sample, Brunton's mechanical sampler, and Vein's sampler. Fay. b. One whose duty it is to select the samples for an assay, or to prepare the material to be assayed, by grinding and sampling. Fay. c. A laborer who collects samples of materials and products, such as coal, coke, tar, cokes, coke oven, and sewer water, from various parts of coke plant and prepares them for laboratory analysis by crushing, screening, mixing, weighing, and identifying them. May be designated according to location, as sampleman, oveza, etc. Fay. d. In metallurgy, one who prepares samples of scrap metal for laboratory analysis by crushing, weighing, and dividing. D.O.T. Supp. e. In ore dressing, smelting, and refining, (1) one who tends mechanical devices which cut out sample of entire shipment of ore by diverting a small portion of the ore from the full stream flowing into bins after being crusted, or (2) one who prepares samples of ore for assaying by the following method: Removes samples of ore, using automatic sampling machine; pours wet sample through a self-propagating sample size and filters it to remove liquids; scrapes residue into pan and dries it in oven; prepares dried sample and reduces it in splitter; screens specific amount of dried sample through series of screens of varying mesh size mounted in mechanical shaker and computes proportions of ore left on each screen; and records results of screen tests and places small amount of sample in labeled envelope for assaying. See also mill sampler. D.O.T. Supp. D.O.T. 11.

Sample grinding. In ore dressing, a laborer who powers samples of ore to required fineness for laboratory analysis by crushing, screening, mixing, and dividing. D.O.T. Alp. d. In metalworking, a laborer who selects small amounts of coal or ore from different sections of a mine, groups of cars, etc., and puts them in a sample box, and prepares samples. He bags and marks samples with record of location, and forwards bags to laboratory for analysis. Also called mind sampler; sample taker. D.O.T. 1. g. A specific device for recovering samples of ore. See also sampler. Long. h. An instrument designed to take samples of the flame or other explosion gases at predetermined intervals during an explosion. Rice, George S.

Sample hopper. Sampling hopper. In sampling, the process whereby a sample is collected. Fay. c. Separation of a fraction of the sample. Fay. d. In ore dressing, the process of removing a sample from a moving stream. Fay.

Sample preparation. The process when a sample is obtained from a sample by particle size reduction, mixing, and sampling. Fay. The methods may be divided into manual, mechanical; and automatic. Fay.

Sample preheater. Hydrous phosphate and chloride of copper, calcium, and sodium, NaCa₃(CO₃)₂Cl,5H₂O, as blue crusts of minute orthorhombic crystals. Spencer 16, M.M., 1943.

Sample log. Strip of graph paper showing units of depth on which the geologist notes cores, samples, describes the rock formations; penetrated by drilling.

Sampling. a. See pan, a. Long. b. In coal and coke sampling, the process whereby an analysis sample is obtained from a sample by particle size reduction, mixing and sampling. Fay. c. A laborer who collects samples of materials and products, such as coal, coke, tar, cokes, coke oven, and sewer water, from various parts of coke plant and prepares them for laboratory analysis by crushing, screening, mixing, weighing, and identifying them. May be designated according to location, as sampleman, oveza, etc. Fay. d. In mining, one who selects small amounts of coal or ore from different sections of a mine, groups of cars, etc., and puts them in a sample box, and prepares samples. He bags and marks samples with record of location, and forwards bags to laboratory for analysis. Also called mind sampler; sample taker. D.O.T. 1. g. A specific device for recovering samples of ore. See also sampler. Long. h. An instrument designed to take samples of the flame or other explosion gases at predetermined intervals during an explosion. Rice, George S.

Sample splitter. A mechanical device for proportionally reducing the physical size of a sample. See also Jones splitter. Long.

Sampling. a. A mechanical device for selecting a continuous (fractional) part of ore to be used as an assay sample; as, for example, split shovel, riffle sample, Brunton's mechanical sampler, and Vein's sampler. Fay. b. One whose duty it is to select the samples for an assay, or to prepare the material to be assayed, by grinding and sampling. Fay. c. A laborer who collects samples of materials and products, such as coal, coke, tar, naphtha, benzol, and sewer water, from various parts of coke plant and prepares them for laboratory analysis by crushing, screening, mixing, weighing, and identifying them. May be designated according to location, as sam- pleman, oveza, etc. Fay. d. In metallurgy, one who prepares samples of scrap metal for laboratory analysis by crushing, weighing, and dividing. D.O.T. Supp. e. In ore dressing, smelting, and refining, (1) one who tends mechanical devices which cut out sample of entire shipment of ore by diverting a small portion of the ore from the full stream flowing into bins after being crusted, or (2) one who prepares samples of ore for assaying by the following method: Removes samples of ore, using automatic sampling machine; pours wet sample through a self-propagating sample size and filters it to remove liquids; scrapes residue into pan and dries it in oven; prepares dried sample and reduces it in splitter; screens specific amount of dried sample through series of screens of varying mesh size mounted in mechanical shaker and computes proportions of ore left on each screen; and records results of screen tests and places small amount of sample in labeled envelope for assaying. See also mill sampler. D.O.T. Supp. D.O.T. 11.

Sampling action. In a feedback control system, the operation or action by which a feedback control device effectuates a change in the value of the variable being measured,
sampling action

is established intermittently, the correction being made intermittently also. NCB.

sampling barrel. A device for displacing soil in proportion to the volume of the sample. The cross section of the tube is made smaller as possible since a quantity of soil equivalent to the volume of the tool must be displaced when the sampler is forced into the ground. A well-designed tool has an area ratio of about 20 percent. Nelson.

sampling errors. a. Biased. arise from consistent error as indicated in sampling, reducing, and evaluation. They are consistently wrong in the same way. Pryor, J. B. Random, as liable to show too much or too little of the quality being scrutinized. They tend to cancel out. Pryor, J.

sampling pipe. A small pipe built into and serving as a fulcrum for the walking chain conveyor which conveys it to and from the sampler.

sampling tools. A group of tools designed for the specific purpose of collecting samples of soil, water, gas, or other material. These tools range from simple hand-held devices to large, complex, automated systems. Nelson.

sampling. a. Weisnckem's name for a glazy phase of andesite that contains bromelite, augite, magnetite, and a few large plagioclase s and garnets. The rock is related to the andesites, as are the limburgites to the basalts. Hess.

sampling. A white, barium metasilicate, BaSiO₃; tetraclinic. Grade tabular crystals. From Mariposa County, Calif. English.

sampling device. a. Separate grains or particles of detrital rock material, easily distinguishable by the unaided eye, but not large enough to be called pebbles; also, a loose mass of such grains that has been displaced by wind or water. Nelson.

sampling error. a. A deviation from the true value of a measured quantity due to the nature of the sampling process. Nelson.

sand. a. A material consisting of fragments of rock or processing of completely friable rock or stone in the Bridgport sand. Arkell.

sand blast. a. Abrasive cleaning by the impingement of small particles having an average weight of 120 to the carat. This term is very loosely applied. J. C. 8200, 1964, p. 149. b. Rock chips and other waste produced by blasting action. Nichols.

sand. Any term sometimes applied to pocketlike deposits of glacial sand and gravel extending down into a coal seam which has been extended in all directions. They are a result of glacial erosion and deposition subsequent to the accumulation of the coal. Stute and Nae, 1949, p. 402. b. A bag filled with sand or small debris and used for the building of pack walls, checks, or for filling cavities behind timber, steel, or concrete roadway linings. The bags are made of cheap hessian material and usually measure 53 by 1 inches when empty. Also called debris bag. Nelson.

sandstone. In many mines a rapid and efficient means of erecting stoppings and walls for the control of ventilation near the face. The walls of doors and air crossings in the workings are often entirely of interlocked sandbags. This method minimizes the use of brattice and spars to extend haulage headings. Prayor, 3rd.

sand. A bath of salt formed by currents in rivers and at their mouths, or of sand formed along beaches by tidal action. Webster 3d.

sand. a. A bath of sand in which laboratory vessels to be heated are partly immersed and used for the building of pack walls, checks, or for filling cavities behind timber, steel, or concrete roadway linings. Webster 3d.

sand. a. Abrasive cleaning by the impingement of small particles having an average weight of 120 to the carat. This term is very loosely applied. J. C. 8200, 1964, p. 149. b. A bag filled with sand or small debris and used for the building of pack walls, checks, or for filling cavities behind timber, steel, or concrete roadway linings. The bags are made of cheap hessian material and usually measure 53 by 1 inches when empty. Also called debris bag. Nelson.

sand. A bath of salt formed by currents in rivers and at their mouths, or of sand formed along beaches by tidal action. Webster 3d.

sand. A bath of sand in which laboratory vessels to be heated are partly immersed and used for the building of pack walls, checks, or for filling cavities behind timber, steel, or concrete roadway linings. Webster 3d.

sand. a. A bath of sand in which laboratory vessels to be heated are partly immersed and used for the building of pack walls, checks, or for filling cavities behind timber, steel, or concrete roadway linings. Webster 3d.
sandpile

driving and withdrawing a wooden pole, and is sometimes used as a means of pre-
paring right angles in the soft soil. Webster's Id.

sand. A tabular cavity from a few inches to
many feet in depth formed by erosion in
calcareous rocks and often filled with
gravel and sand. Webster's Id. Also
A. A general term for the sand delta
formed at the mouth of a glacial stream
as it meets a large body of water (standing
water of a glacial lake or into the sea).
A.G.I.

sand pump. a. A piston-type blower. Also
called American pump. Long. b. A pump,
usually a centrifugal-type, capable of
handling sand and gravel-laden liquids
without clogging or wearing unduly. Also
called sludge pump. Long. c. A cylinder with
a valve at the bottom, lowered into a
drill hole from time to time to take out
the accumulated slimes resulting from
the action of the drill on the rock. Also
called shell pump; sludger. Fay. d. A
pump for lifting tailings at ore-dressing
tables. Niebel.

sand-pump dredger. A long pipe reaching
down from a vessel to the undercarriage of the
plants. Fay. e. See sludger. Nelson. c.

sand plain. A general term for the sand delta
formed at the mouth of a glacial stream as
it meets a large body of water (standing
water of a glacial lake or into the sea).
A.G.I.

sand plume. A general term for the sand delta
formed at the mouth of a glacial stream as
it meets a large body of water (standing
water of a glacial lake or into the sea).
A.G.I.

sand pump. a. A piston-type blower. Also
called American pump. Long. b. A pump,
usually a centrifugal-type, capable of
handling sand and gravel-laden liquids
without clogging or wearing unduly. Also
called sludge pump. Long. c. A cylinder with
a valve at the bottom, lowered into a
drill hole from time to time to take out
the accumulated slimes resulting from
the action of the drill on the rock. Also
called shell pump; sludger. Fay. d. A
pump for lifting tailings at ore-dressing
tables. Niebel.

sand-pump dredger. A long pipe reaching
down from a vessel to the undercarriage of the
plants. Fay. e. See sludger. Nelson. c.

sand sheet. The region of main accumulation
of sand. A.G.I.

sandstone. A structure consisting of
clay-colored cemented sand produced by
water dripping from the roof of a cave and
sandstone. See also calcite-cemented sand.

sandstone. A cemented or otherwise com-
posed detrital sediment composed pre-
donimately of quartz grain, the grades
of the latter being those of sand. Min-
eralogical varieties such as feldsparitic
and glauconitic sandstones are recognised,
and also argillaceous, silicious, calcareous,
ferrous, and other varieties according
to the nature of the binding or cementing
material. A.G.I.

sandstone balls. See pillow structure. Pettijohn.

sandstone dike. a. A tabular-shaped body
composed of sandstone ranging in thick-
ness from a few inches to several
inches, and in length up to several
miles, which cuts across structure and
bedding of the enclosing rocks. May be
formed by fissure filling or by injection of
sand into a fissure from below. A.G.I.
b. A vein of sandstone or mudstone pene-
trating coal seams from either the floor
or roof, both as irregular bulbous masses
and vertically or steeply dipping sheets.
It frequently extends from roof to floor.
See also clastic dike. A.G.I. c. A body of
sandstone contained in a crosscutting
fissure; related to sandstone sills, a prod-
uct of quicksand intrusion. Pettijohn.

sandstone grit. a. In geology, a coarse,
angular-grained sandstone. Fay. b. In
commerce, a sandstone well adapted for
abrasive purposes and easily and neces-
sarily having a coarse grain. Fay.

sandstone opal. A contraction of sandstone
boulder opal, opal-like thin layers of opal
in which thin layers of opal occur in
boulders between layers of sandstone and
soft clays. The variety occurred in the
form of pipes from the thickness of a
needle to 1 inch or more, running through
a free sandstone; it was thick enough to
cut into well-shaped cabochons. Shipley.

sandstone pipes. See cylindrical structures.
Petitjohn.

sandstorm. See dust storm. Heus.

sand streak. Linear, parallel, low ridges with
symmetrical cross-section that form at
interface of sand and air or water and are
parallel to direction of flow. Petitjohn.

sand-struck brick. See soft-mud brick. ACSG.

sand thickness. In ordinary usage the
distance between the top and bottom of
the oil and gas producing zone of a rock
stratum. This one speaks of having 50
feet of sand, meaning a paying horizon
50 feet thick. The term is often used al-
thought the stratum is not technically
sandstone. Williams.

sand trap. a. A device for separating sand
and other heavy or coarse particles from
a cuttings-laden drill-circulation fluid
overflowing the collar of a borehole. Com-
pare shaker. Long. b. A device, often a
simple enlargement, in a conduit for ap-
proaching the sand, silt, etc., carried by the
water and generally produced in the mud-
ishing them from the conduit. Jolly. c.
An inclined trough across which the mud
flows at intervals. During the pres-
tage of the pulp to slurry, any heavy
particles, such as sand, settle to the bot-
tom. Also called American pump. Long.

sand washers. An apparatus for separating
sand from earthy substances. Fay.

sand waves. a. Cross-bedding may be consid-
ered in connection with ripple marks,
because it probably represents many in-
stances one phase of a phenomenon called
sand waves, which are nothing more than
current-made ripple marks of mammoth
proportions. Sand waves appear to be
formed instead of ripple marks when the
current is overloaded with sediment. The
trends are often 15 to 35 feet apart and
rise from 2 to 3 feet above the troughs.
A.G.I. b. A large, ripple-like structure
formed by water currents of high velocity.
Sand waves may be symmetrical, asym-
metrical, or irregular in shape. In the cur-
rents of high velocity, the sand waves
move down current and at slightly lower
velocity, they move upstream. C.T.D.

sand wheel. A wheel about 16 feet in diam-
eter fitted with mild steel buckets around
the circumference and used for removing
sludge or slag out of a sump to stack it at
a higher level. Sand wheels are sometimes
used to raise the tailings to the top of a
dredge. The trend is away from wheels and
towards bucket elevators. Nelson.

sandwich kiln. A tunnel kiln designed for
rapid firing; the height of the setting is
small compared with the width and the
firing is from above and below the set-
ting. Dodd.

sandwich rolling. Rolling two or more strips
of metal together to form a metallurgi-
cally bonded composite sheet. ASM Gloss.

sandy gravel. Gravel containing 50 to 75

sandy sand. Sand dotted with darker spots.
Shipley.

sandy soil. A soil in which sand is the basic
constituent. The sand contributes to the
strength by means ofTogglelock, that is, the
internal friction between particles. Nel-
son.

sandstone. A general term for the sand delta
formed at the mouth of a glacial stream as
it meets a large body of water (standing
water of a glacial lake or into the sea).
A.G.I.

sandstone. A general term for the sand delta
formed at the mouth of a glacial stream as
it meets a large body of water (standing
water of a glacial lake or into the sea).
A.G.I.
saupepropic coal

saupepropic coal is a well-defined angular to subangular particle of light brown to nearly white. See also rubie cat's eye. Saupeprophitoides

sapphire glass. Sapphire is glass that closely resembles unknown gemstones in refractive index, specific gravity and optical hardness up to 10 and three fourths.}

sapphire quartz. A very rare blue-brown variety of petrified melonite occurring at Salzburg, Austria, used as a semiprecious gem stone. Also known as azure.

sapphire, a. Ceram. A common term applied to a variety of star sapphire. Sapphire, a. A term often applied to the sapphire cat's eye. An inclusion of small aegirine-augite, and biotite in a groundmass.

sapphire coal. A rare aluminosilicate of magnesium occurring as disseminated blue grains and occasional monoclinic crystals. C.M.D. Synonym for basanite. Blue chalcedony.

sapphire. The breaking away of blocks of rocks by the flaking and breaking of water at the head of a glacier; also, the undermining and overthrowing of solid rock by the agency of a river or other slowly moving water that is undermining the underlying softer layers. Stokes and Vann, 1955.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.

sapphire, b. Single crystal alumina; sapphire bouks can be made by the Verneuil process and can be used in the manufacture of optical glasses. Prout, 3.
sarmentite. A hydrous arsenate and sulfate.

sargent tube. Synonym for acid bottle. Long.

sardonyx. A variety of chalcedonic quartz.

Sardinian orogeny.

sardinianite. A variety of anglesite, PbSO₄.

sycophagm. A kind of limestone, wed by Infiltell MOW. Synonym.

saprovininik.

sapratel. A pale yellow

sartorite. A monoclinic mineral, Pb₂(N₂O₅).

sarsen stone. Synonym for graywether. A.C.I.

sarsen. Eng. A large loose residual mass of stone.

sarrancolin marble. One of the most beautiful marbles. The prevailing colors are red, white, brown, and green, in veins and blotches; from the Valley of Aare, in the French Pyrenees.

sarsen. Eng. A large loose residual mass of stone left after the erosion of a once continuous bed or layer; specifically, one of the large sandstone blocks scattered over the English chalk downs. Also called druid store. Webster 3d.

sarsenite. A hydrous arsenate and sulfate.

saturated. a. Rock or soil is saturated with water where all its interstices are filled with water. A.G.I. b. In petrology, applied to minerals capable of crystals growing from rock magmas in the presence of an excess of silica. Such minerals are said to be saturated with regard to silica and include talkspar, pyroxenes, amphiboles, micas, tourmaline, fayalite, spessartite, almandine, and accessory minerals, such as spinel, zircon, topaz, apatite, magnetite, and ilmenite. Applied also to igneous rocks composed wholly of saturated minerals. A.G.I. c. In fatty acids and other organic compounds, a structure in which each carbon valence is combined either with a distinct atom or by polylinkages. Pryor, 3. d. A term applied to total void or pore space. ASCE P1826.

saturated aggregate, suface-dry. Aggregate which has been in contact with water vapor at that temperature. The amount of water vapor which will saturate a given volume of air increases with temperature. Therefore, if saturated air is cooled, the excess water vapor condenses in the form of mist. See also adsorption humidity. Visible saturated columned. Saturated columned. This is a solution in which crystals form in contact with a solvate saturated with respect to both potassium chloride and mercuric chloride on the standard electrode scale of 0.245 V.

saturated minerals. Those minerals capable of crystallizing from rock magmas even in the presence of silica such as quartz or cristobalite which do not contain necessary silica. A.G.I.

saturated rock. Those rocks that contain such silicate minerals that they are not under satu- rated minerals. A.G.I.

saturated solution. A solution of a solute at a particular temperature is one which contains as much of the solute as it can dissolve at that temperature, in the presence of solid particles of the solute. Cooper.

saturated steam. Steam at the boiling temperature or pressure at which it exists. Dry saturated steam contains no water particles in suspension. Wet saturated steam does. Strock, 10.

saturated unit weight. The wet unit weight of a soil mass when saturated. ASCE P1826.

saturated. a. The extent to which a solution contains solute, as expressed in percent concentration. B. The extent to which a gas is dissolved in a liquid or solid. A.G.I.

saturate. a. A rock or soil is saturated with respect to water if all its interstices are filled with water. A.G.I. b. In petrology, applied to minerals capable of crystals growing from rock magmas in the presence of an excess of silica. Such minerals are said to be saturated with regard to silica and include talkspar, pyroxenes, amphiboles, micas, tourmaline, fayalite, spessartite, almandine, and accessory minerals, such as spinel, zircon, topaz, apatite, magnetite, and ilmenite. Applied also to igneous rocks composed wholly of saturated minerals. A.G.I. c. In fatty acids and other organic compounds, a structure in which each carbon valence is combined either with a distinct atom or by polylinkages. Pryor, 3.

saturated. a. Rock or soil is saturated with water where all its interstices are filled with water. A.G.I. b. In petrology, applied to minerals capable of crystals growing from rock magmas in the presence of an excess of silica. Such minerals are said to be saturated with regard to silica and include talkspar, pyroxenes, amphiboles, micas, tourmaline, fayalite, spessartite, almandine, and accessory minerals, such as spinel, zircon, topaz, apatite, magnetite, and ilmenite. Applied also to igneous rocks composed wholly of saturated minerals. A.G.I. c. In fatty acids and other organic compounds, a structure in which each carbon valence is combined either with a distinct atom or by polylinkages. Pryor, 3. d. A term applied to total void or pore space. ASCE P1826.

saturable. a. The extent to which a solution contains solute, as expressed in percent concentration. B. The extent to which a gas is dissolved in a liquid or solid. A.G.I.

saturate. a. A rock or soil is saturated with respect to water if all its interstices are filled with water. A.G.I. b. In petrology, applied to minerals capable of crystals growing from rock magmas in the presence of an excess of silica. In fatty acids and other organic compounds, a structure in which each carbon valence is combined either with a distinct atom or by polylinkages. Pryor, 3.
Savox apparatus. A self-contained, oxygen-breathing escape apparatus that weighs about 40 pounds, and is carried on the wearer's chest by means of shoulder straps and a body belt. It will give complete respiratory protection in any atmosphere to which the operator is exposed. It consists of a breathing reservoir chamber that supplies the user with pure oxygen at a pressure that is above atmospheric pressure. The user breathes through a flexible tube connected to the chamber, and the oxygen is supplied by a compressor that is powered by the wearer's body. The reservoir chamber is located in the user's backpack, and can be refilled with oxygen from an external source.

Saxony. A slate, originally a dark grey or greenish-black slate, that is quarried in the Saxony region of Germany. It is a fine-grained, foliated rock that is composed of micas, chlorite, and amphiboles. It is usually black or dark green in color, and has a smooth, glossy surface. The slate is used for roofing, flooring, and wall cladding, and is also used as a construction material.

Saw. Eng. A tool (or removing irregularities from surfaces). A hand tool used for cutting, filing, or shaping wood, metal, or other materials. It is typically used to remove irregularities from surfaces, or to cut through material.

Saw bite. A bit having a cutting edge formed by sawing. a. The cutting of blocks of stone and the like with a cutting instrument. b. To cut with a cutting instrument.

Saw cutting. The process of cutting stone or other materials with a cutting instrument, such as a saw or a drill. This process is used to shape or cut stone, metal, or other materials to a desired size or shape.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawman. In metallurgy, one who cuts metal rods to specified lengths as they emerge from a continuous casting machine, using an automatic saw that moves parallel to the rods. D.O.T. Sup. 49.

Sawney. Mid. To lower full trams down a mine with a rope or chain passing round a prop, etc. Fay.

Sawing. a. The cutting of blocks of stone and the like with a cutting instrument. b. To cut with a cutting instrument.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawcut. a. In granite works, a workman who cuts or chops granite blocks or slabs. b. To cut or chop granite blocks or slabs. Fay.

Saw cutters. a. In granite works, a workman who cuts or chops granite blocks or slabs. b. To cut or chop granite blocks or slabs. Fay.

Sawing. a. The cutting of blocks of stone and the like with a cutting instrument. b. To cut with a cutting instrument.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.

Sawing. a. The act of sawing. b. A cutting tool used for cutting wood or metal.
webbing plows 

scalloping

...
scandium. a. Refers to a mineral when the plates are small, for example, tridymite. b. In mineralogy, consisting of scales or tabular crystals. 

scandium oxide; scandia. White; molecular formula \( \text{Sc}_2\text{O}_3 \).

scans. a. A mark left by abrasion, or such marks collectively; said specifically of geological processes, as, the scarrings of the glacier. b. A weld joint between two metal pieces that have notch or beveled. c. A piece of timber of thickness 1 to 1/2 inch. d. Small number as 1 to 2, 3, etc., used for shading in texts.

scanser. A group of minerals forming an amorphous gross, varying from that of aluminum oxide to that of aluminum oxide with calcium carbonate, or that of aluminum oxide and sodium carbonate. The group formula is \( (\text{Na}_2\text{O},\text{Al}_2\text{O}_3,\text{SiO}_2,\text{O}_2) \), from vertical wafes in sandstone, usually found in the region of the waputik or in Alaskan sandstone. Also known as trinite. c. A piece of timber of thickness 1 to 1/2 inch.

scanted scantling. a. The dimensions of a stone in scanning line. b. In founding, an imperfect casting, or a casting that is not reduced to a regular outline. c. To cut so as to form a scarf joint.

scaped. a. In the iron & steel industry, one who scatters slag. b. A weld joint between two metal pieces that are notched or beveled. c. A phenomenon which occurs when a sound wave travels outward from a source into the sea; the energy producing a primary directional wave and also secondary waves which travel in other directions.

scatter. a. An acoustical discontinuity comparable to a notch in a detector. b. A weld joint between two metal pieces that have notch or beveled.

scatter coefficient. See coefficient of scatter.

scatter factor. See factor of scatter.

scatter losses. That part of the transmission loss which is due to scattering within the medium or due to roughness of any reflecting surfaces.

scatter pole. Ordinary by using a gas torch. The operation permits surface defects to be cut from the piece. b. A weld joint in which one plate of the joint is inclined with respect to the main axes of the members. c. A piece of timber of thickness 1 to 1/2 inch.
...while the other performs the simultaneous operation of the Nielsen method to induce inhalation. The method is the least satisfactory of the two methods of artificial respiration. Med. Am. pp. 89-90

...schellerite. A whitish, gray; yellow, green, granular and massive; lead-gray color. Also called humite. See also scheelite. Schaumberg, Daimond. Rock-crystal from Schaumberg, Germany, Shipley. Schaumberg, Daimond. Rock-crystal from Schaumberg, Germany, Shipley.

...scheelite. A whitish, gray; yellow, green, lead-gray color. Also called humite. See also scheelite. Schaumberg, Germany. Schaumberg, Germany. Schaumberg, Germany. Schaumberg, Germany. Schaumberg, Germany. See also scheelite. Schiller spar. A manganiferous variety of periclasite, monazite, alvite, beryl, garnet.
ashIleemo. * tromp 4 daftness down in Schlumberger pholoclhoometer. This instru-
mant measures simultaneously the amount of varying density in a field of flow. Schlumberger dip meter. This dip meter measures both the amount and direction of dip by readings taken in the borehole, and can be operated by using either potential or resistivity measurements. The instrument has a long cylindrical body in two parts, the lower part moving tele-
scopically into the upper. Three long 
springy metal strips, arranged symmetri-
cally round the body, have their upper and lower ends attached to the upper and lower parts of the body respectively. These springs press outwards and make contact with the walls of the hole. Sin-
clair, III, p. 107.

Schoemaker logs. Records obtained from instrument developed by the Schu-
emer brothers for use in borehole log-
ging. Such records are the gamma-ray log, lastrolog, microlog, and neutron log. B.S. 3616, 1963, sec. different depth in fluid, especially as shown by special apparatus. HSG b. A method of apparatus 
for determining the position of two points moving tele-
scopically. This method measures simultaneously the amount of varying density in a field of flow. HSG:

ging. Such records are the gamma-ray log, lastrolog, microlog, and neutron log. B.S. 3616, 1963, sec. different depth in fluid, especially as shown by special apparatus. HSG b. A method of apparatus 
for determining the position of two points moving tele-
scopically. This method measures simultaneously the amount of varying density in a field of flow. HSG:
scintillate. a. Burning with brilliant sparks. For example, white-hot iron when ex- posed to a current of air. b. A very small light flash caused in certain natural or synthetic crystals by radioactive rays or particles. c. An instrument for measuring the scintillation counter in which the photoelectric effect of the scintillation counting tubes is utilized and measured to give a measure of intensity of radiation. 4 G.I. scintillation counter. A sensitive instrument for detecting radiation, such as uranium, radium, and thorium. It uses a transparent crystal which gives off a minute flash of light when struck by a gamma ray, and a photomultipler tube which produces an electrical impulse when the light from the crystal strikes it. The scintillation counter has advantages over the Geiger counter as it is more sensitive, more compact and can distinguish between types of radiation. The instrument responds to gamma rays emitted from the minerals mentioned and charts their intensity. It is used in aerial geophysical prospecting and the resulting maps are used as guides for more detailed ground investigation. It is also being developed, inter alia, for steering the new fast naval cutters. See also coal-seam-probing. Nelson.

scintillation probe. An electronic logging device consisting of a scintillation-type gamma-ray detecting unit built into a container small enough to be lowered into a borehole. Long.

scintillator. A generic name of a scintillation counting device. Long.

scintillograph. A device for measuring radiations. A.C.G.I.

scintillograph. A device for measuring radiations. A.C.G.I.

scintillograph. An instrument for measuring radiation. A.C.G.I.

...lightsconalite. A hydrous phosphate, 4COML. Epidote sand. 11e5erea process. A process for direct reduction of iron pyrites which depends on the dissociation of pyrites in the absence of air, and in the presence of carbon, with the formation of iron and carbon dioxide. It is claimed that iron yields of more than 95 percent have been obtained.

11111110110. Light...
scew
ashes or earth above. Also called Scotch kiln. Dodd.
scew kiss. An updraft kiln usually having no permanent parts. It is built of unfired brick and is fired with wood, coal, gas, or oil. ACGS, 1963.
scew kiss. The kiln for loading coal into tubs, or cars. Fay.
scewling. The outer layer, usually wet clay, of a scew kiss applied to make the kiln gastight. ACGS, 1963.
scew. A device used to a limited extent to load out solid blocks of coal. The scow proper is a flat steel plate which is moved underneath the undercut and blocks the coal by means of a hoist and tall rope. The coal is then wedged down on the scow, and the solid block is hauled by means of the hoist and a head rope to a delivery point where it is transferred to cars. Fay.
scew a brow. Forest of Dean. To drive a heading a little in front of the work. Fay.
scew bowl. Forest of Dean. Ancient ironstone quarries and mine workings. Arkell.
scew car. British. In a clay column formed at the end of the heading or level by guesswork. Fay.
scew coated. (slushers) Air is apparently worked out. No iron or steel scrap is used in the process using 50 percent steel scrap in the open-hearth furnace. Also called go-devil, a. Fay.
scew box plough; Haarmann plough; Kema plough; Gesto scraper box. A layout of rope-drawn scraper boxes with knives on the face side. They are drawn to and fro, and raised against the face by guides controlled by rams. A haulage of 250 horsepower must be installed in a semi-permanent engine room; has a rope diameter of 1.5 inches and a speed of 3 feet per second. No conveyor is required as the coal is scraped by both to the loading point. The maximum workable seam thickness is 20 inches on gradients of 0 to 30 degrees; maximum length of face, 220 to 275 yards; and average per shift, 65% to 8 feet. Nelson.
scew bucket. a. One of the excavating bowls or buckets which form a part of a scraper. Hem. b. In coal mines, the scraper bucket is the bottommost, thickest, and roundest, faced, rounded, sided box, with a hinged back. The hinge operates in a forward direction so that on the return journey on the coal face, the back opens allowing the box to remain empty. On the loading journey, the coal closes the hinge and the material is moved forward or scraped to the point of discharge. Also called scoop. See also scraper loader. Nelson.
scew chaser. One of a number of men whose business is to follow the scraper (go-devil) in the petroleum pipes, and give instant notice if a clog occurs. Standard, 1964. He follows the oil pipe surface and detects the location of the go-devil by sound, especially where pipes are vaporized. See also go-devil, a. Fay.
scew conveyor. a. A mechanical device for conveying coal, rock, ashes, clay, etc., in a shallow trough by means of a scraper or scraper chain conveyor, which is attached to a rope or chain. Fay. b. A conveyor consisting of chain-drawn scraper flights running in a trough through which the material is to be transported. Also called drag-link conveyor; rig conveyor; chain conveyor. B.S. 3152, 1962.
scew hoist. A power-driven hoist that operates a scraper to move material (generally ore or coal) to a loading point. A.C.A 604.58: 1956.
scew loader. a. A machine used for loading coal or rock by pulling an open-bottomed scoop back and forth between the face and the loading point by means of ropes, sheaves, and a multiple drum hoist. The filled scoop is pulled on the bottom to an apron or ramp where the load is discharged onto a car or conveyor. Jones. b. A combined scraper and transporting machine. Originally towed by a tractor, but now diesel-electric with direct current motor in each wheel. Pryor, 3. c. A double-drum winch with two steel ropes. The tail rope passes over the top of a tall shae at one end of the face or road, brought back and attached to the scraper bucket; the pull is coupled directly to the front end of the bucket. The bucket is hauled forward before charging and manganese ore is used instead of iron ore for oxidizing the carbon. The cutting edge of the steel made by this process is claimed to be as high as that obtained by the pig-and-scrap process and yields are said to be higher. Osborn.
scew diamond. See diamond scrap. Long.
scew scraper. a. A rod for cleaning out shotholes prior to charging with explosives. A ¾-inch copper rod with the ends fastened and turned at right angles to the line of the rod is usually used. See iron steel scraper is allowed in a mine. See also stoker. Nelson. b. A steel tractor device used to move earth in surface mining; local name for a cutting machine operator's helper. B.C.I. c. A machine used in mines for cleaning the dust out of the boshole. Fay. d. A mechanical contrivance used at collieries to scrape the culm or slack along a trough to the face side. They are drawn to and fro, or waste for short distances. No conveyor is required as the coal is scraped by both to the loading point. The maximum workable seam thickness is 20 inches on gradients of 0 to 30 degrees; maximum length of face, 220 to 275 yards; and average per shift, 65% to 8 feet. Nelson.

scratch. A calcareous, earthy, or strong substance which scrapes from seawater in boiling it for salt. Fay.

scratch-brush finish. See Butler finish.

scraping. a. The breaking up of metal casthouse, mica. Sk 2W.

sc rape hoist operator. In the iron and steel industry, one who operates a skip hoist and digs into the loose coal or stone until the escaping pulp. Fay.

scraper. a. One who removes scrap from bin, pit, or chute to skip pit, and charges tue material removed into a skip at regular intervals. Fay. b. A local name given to men who pick up the ore left on dumps. Fay.

scraper box. A new piece of strip-mine equipment that handles the jobs of breaking coal, loading, and hauling. Features of the scraper ripper include ripping teeth on the lip for breaking the coal and a flight conveyor for carrying the broken coal away from the lip. As the ripper teeth bite into and loosen the coal, the conveyor sweeps the loose coal upward and prevents buildup ahead of the lip. Coal Age, v. 71, No. 8, August 1966, p. 232.

scrap hoist operator. In the iron and steel industry, one who operates a skip hoist to carry scrap material to the furnaces. D.O.T. 1.

scrapings, enamel. Enamel recovered from a coal. Fay.

scraper loader

and digs into the loose coal or stone until full and then rides to the discharge point. When empty, the bucket is drawn back by the tail rope. The haulage motors are from 5 horsepower upwards and rope speed about 100 feet per minute. The load capacity of a scraper loader ranges from 30 to 80 tons per hour depending on conditions. The loader is used for transporting and loading coal on longwall faces; for removing and loading stone in tunnels, and for stowing dirt on longwall faces. Also called slusher. Nelson.

scrap-out man. In the coke products industry, a laborer who follows coke-drawing machine, removing the coke remaining in ovens, using a long iron rod (scrap). Also called coke-drawing machine helper. D.O.T. 1.

scrap packer. N. of Eng. A machine-operated dragline and scoop, for removing stone from the gateway and packing it in the goaf. Also called slusher. Trinit.

scrap plough; porte et guidain plough. One scraper ripper picks rope-drawn and unguided along the face. A 30-horsepower haulage advances with the face, which is made concept to eliminate the need for guides. Speed, 3 to 4 feet per second. Suita ble seam conditions; thickness, 12 to 24 inches at gradients of 0° to 35° (preferably 15° to 25°); and maximum length of face, 65 yards. Nelson.

scrapshaw. A new piece of strip-mine equipment that handles the jobs of breaking coal, loading, and hauling. Features of the scraper ripper include ripping teeth on the lip for breaking the coal and a flight conveyor for carrying the broken coal away from the lip. As the ripper teeth bite into and loosen the coal, the conveyor sweeps the loose coal upward and prevents buildup ahead of the lip. Coal Age, v. 71, No. 8, August 1966, p. 232.

scraper ripper. A new piece of strip-mine equipment that handles the jobs of breaking coal, loading, and hauling. Features of the scraper ripper include ripping teeth on the lip for breaking the coal and a flight conveyor for carrying the broken coal away from the lip. As the ripper teeth bite into and loosen the coal, the conveyor sweeps the loose coal upward and prevents buildup ahead of the lip. Coal Age, v. 71, No. 8, August 1966, p. 232.

screen. a. One who attends the grizzly, shaking, or vibratory, and either screen box. a. A container in which diamond screens are inserted and the medium passes through a sieve or screen collects and is retained. Long. b. Incorrectly used as a synonym for shaker; also, for shale shaker. Long.

screen chute. A discharge chute equipped with a screen section, either stationary or vibrating, to remove the finer portions or on the mold. Compare fettling, d. Dodd.

screening bottom coal. Lifting coal that has been left by an undercutting machine. Zern.

scraps. Excess body removed during the shaping of pottery ware, together with any broken, unfired pieces. Scraps are usually returned to the blunger for reuse. Dodd.

screened trailing cable. A flexible cable provided with a protective screen or a screen of tinmed copper wire, or other conducting material, applied (1) to enclose each power core separately (individual screen-
screened trailing cable

screening paste. An oil suspension of enamel

screening machine. An apparatus having a

undersize) as a result of screening. Pryor,

screenroom. That part of a breaker where

screen loading chute. A type of chute with a

bar screen or grizzly bottom which

permits fines to fall onto the conveyor belt

first, providing a cushion for the larger

screen lighting. See ceramic ink.

screening machine. An apparatus having a

shaking, oscillatory, or rotary motion, used

for screening or lifting coal, stamped

ore, and the like. Fay.

crushing. A stage in bituminous-

coal-crushing in which units for crush-

screening screw. A standard test for enamel

screenings crushing. A stage in bituminous-

crush coal in a given dry fraction through

screens to small, commercial sizes, such as

1- to 5%-inch stoker coal or screenings.

D.O.T.

screw feed; screwfeeder. A device

screw fan. See axial-flow fan, a. B.S. 3618,

screw conveyor. a. A conveyor screw revolv-

screw conveyer. a. A conveyor screw revolv-

screw-down mechanism. That mechanism on

a mill for lowering and raising the rolls

accommodate the distance between them
to the re-erection of the article being

screwed flanged joint. These flanges have

plain faces; the joint is made by fitting a

washer of insertion rubber which is com-

pressed by tightening evenly with the

bolts disposed around it. Merson, V, 2, p. 627.

screw elevators. Vertical screw elevators are

used for handling pulpervulent materials.

A typical installation for delivering bulk

cement into a plant consists of a screw

bell. One in which a spiral

spiral worm. Nelson. b. A fishing tool shaped like a

crow's-foot; fishing tool; spiral worm. Nelson. b. A fishing tool shaped like a

screw casing. A threaded lap-welded well

casing. Fay.

screw casing. A threaded lap-welded well

casing. Fay.
screw feed. A long cylindrical nut, threaded.

screw feeder. An auger-type screw to transfer material from one bin to another. ACSG, 1963.

screw feed swivel head. A diamond-drill swivel head, equipped with a device consisting of a system of gears, ratchets, friction devices, or some combination of these members, that controls the same or which the drill stem and bit are fed into the rock. Also called feed head; gear-feed head; mechanical-feed swivel head; screwfeed head. Long.

screw feeding swivel head. A diamond-drill swivel head, equipped with a device designed to raise and lower the head as the drill stem is advanced in the ground by means of a winch or capstan. Ham.

screw shackle. A long cylindrical nut, threaded.

screw shank. A long cylindrical nut, threaded internally with a right-hand thread at one end and a left-hand thread at the other, used to connect and tighten together the ends of two rods forming a brace or tie. Ham.

screw thread. Helical ridge of uniform section, formed on inner or outer surface of cylinder (straight thread); conical spiral on inner or outer surface of cone (taper thread). Right-hand thread winds in clockwise screwing direction when viewed end-on. Rolled threads are cold-pressed, and cut-threads chased. Tolerance is total permissible variation of size. Pitch is distance between adjacent points measured parallel to axis. Lead is distance advanced in one complete turn. Threads per inch are reciprocal of pitch in inches. (Angle of thread) is that between flanks, measured in axial plane. Pryor, 3.

screw-threaded adapter. A rigid coupling or sub. When coupled to the drive rod of a screwfeed swivel head of a diamond drill (in place of a chuck), it acts as a device by means of which drill rods can be coupled directly to the screwfeed drive rod. Also called rod adapter. Long.

screw-type mixing conveyor. A type of screw conveyor consisting of one or more conveyor screws, ribbon flight or cut flight conveyor screws with or without auxiliary paddles. See also screw conveyor. A.S.A.MH.1-1958.

scribe. An instrument used by surveyors for marking posts, trees, etc. Fay.

scribing. Scoring the dry enamel coat with a sharp tool. Generally combined with a brushing operation. Bryant.

scrip. a. Credit slip or tickets issued by a mining company to its employees before payday in lieu of cash. The scrip drawn is charged against the pay of the employee, and is exchangeable for commodi- 
ties at the company store at its face value. Fay. b. A document created by legisla- 
tive enactment authorizing the holder there- of is entitled to acquire public nonmineral land, in the certain quantity therein named upon its surrender to the officers of the land office for the district of land subjected to sale and wherein the se- lected lands may lie, or as otherwise pro- 
vided by the law authorizing its creation. Sometimes called indemnity certificates or land warrants. Ritter, I.

scrofdle. To variegate, as pottery ware, in different colors by the use of various colored clays. Standard, 1964.

scrog. a. A helical projection on a drill rod or stem to remove the cuttings from the tool. B.S. 3618, 1964, sec. 6. b. A powered- 
driven rotary head consisting of iron rings or segments. When supplied with steel shot, this head is used to smooth the surface of granite in the process known as ironing. A.I.M.E., p. 328.

scrogge. S. Wales. Overlying strata loosened or broken by workings underneath. Prob- ably a variation of scrunge, to squeeze. Fay.

scroil. Core. a. Thin, sometimes calcareous or siliceous rock attached to the wall of a lode. Fay. b. Core. Loose ore at the point where a lode is disturbed by a cross 
mine. Fay.

scrubber. Device in which coarse and sticky ore, clay, etc., is washed free of adhering material and disintegrated. The main forms are the wash-screens, wash trommel, log washer and hydraulic jet or monitor. Scrubbers or scrubbing towers are also used to separate soluble gases from extracting liquids, or to remove dust from air by washing. Pryor, 3.

scratch. S. Wales. Overlying strata loosened or broken by workings underneath. Prob- ably a variation of scrunge, to squeeze. Fay.

scrubstone. Eng. A provincial term for a variety of calciferous sandstone. Fay.

scum. a. Impure or extraneous matter that rises or collects at the surface of liquids, as vegetation on stagnant water, or dust on a bath of molten metal. Sometimes incorrectly used for word froth in flotation. Fay. b. A surface deposit sometimes formed on clay building bricks. The deposit may be of soluble salts present in the clay and carried to the surface of the brick during drying; it is then known as dry scum. The deposit may also be formed during kiln firing, and may consists of soluble salts in the clay or by reaction between the sulfur gases in the kiln atmosphere and minerals in the clay bricks; it is then known as kiln scum. Compare efflorescence. Dodd. c. Undissolved batch constituent floating as a layer above the molten glass in a pot or tank furnace. Dodd. d. Areas of poor gloss on a vitreous body, caused by the presence of a layer of scumming, a. Water-soluble salts which ap- pear on the surface of ceramic ware after drying or firing. Bureau of Mines Staff, b. A defect characterized by areas of poor gloss on the surface of porcelain enamel. A.S.C. 1963. I. A surface defect appear- ing as dull patches on otherwise bright sur- faces of glasses, glass, or porcelain enamel. A.S.C. 1963. g. Eng. A thin skin of temper, formed over the whole of the top of the Portland series, at the base of the Purbach beds, Long. d. Surface deposits may be of soluble salts present in the clay bricks; it is then known as kiln scum. Compare efflorescence. Dodd. c. Undissolved batch constituent floating as a layer above the molten glass in a pot or tank furnace. Dodd. d. Areas of poor gloss on a vitreous body, caused by the presence of a layer of

desert wind winnow the tossed sands. Pryor, 3.

scyphite. A mica-hornblende phylolite, named from Loch Scye in Sutherlandshire, Scot-
lan. It contains mica, biotite, and olivine; it is predominantly igneous in origin, containing green horn-
blende and other mafic minerals. These include serpentine pseudomorphs after olivine set poikilitically in large ampli-
bolite crystals associated with large bronze mica. Leitch.

scythestone. A whetstone suitable for sharpen-
ing scythes. Fay.

sea. a. An ocean, or alternatively a large body of (usually) salt water less than an ocean. A.G.I. b. Waves caused by wind at the place and time of observation. A.G.I. c. State of the ocean or last face in regard to waves. A.G.I.

sea amber. Amber which has been scooped from the ocean or found on the beaches. Another amber found on the seashore. Tomkeieff, 1954.

sea arch. A cleft in a sea cliff excavated in without support, see also double-seal manhole cover. Fay.

sea cavern. See sea cave.

sea cave. A cleft in a sea cliff excavated in

sea
current. The currents that constitute part

sea
cavern. See sea cave.

sea cave. A cleft in a sea cliff excavated in

sea
current. The currents that constitute part

sea
cavern. See sea cave.
as the heat is conducted away by the surrounding cooler strata. Mason, v. 1, p. 286. d. Closing pores in anodic coating, then less absorbent. ASM Gloss. c. Plugging leaks in a casting by introducing thermosetting plastics into porous areas and subsequently setting them in place. ASM Gloss. sealing coat. Bitumen or road tar either pure or as an emulsion, applied to form a thin film over a road surface. Ham.

sealing glass. A glass that is suitable for use in sealing a glass envelope of an electronic valve, for example, to metal. The usual basis for the selection of such a glass is matching its thermal expansion and contraction with that of the metal over the range of temperature from that at which the seal is made to room temperature; however, a glass that is sufficiently soft (for example, a lead glass) can accommodate considerable stress at a glass-metal seal by slowly yielding. See also glass-to-metal seal. Dodd.

sealing surface. The portion of the finish which makes contact with the sealing glasses or line. See also finish, d. ASTM C-162-66.

sealing-wax flow. See convolute bedding. Pettijohn.

sea mud. Pieces of wood full of resin found in brown coal. When ignited they burn, melting and giving off soot and an aromatic odor like sealing wax. A.G.I.

seal off. The use of a cement or other sealant to prevent the escape of explosive gases or other explosives along and in a seam or other voids or cracks. Mason, v. 2, p. 388.

seat. a. The underclay or fireclay on which the coal beds lie. See also seat clay. b. Fireclay. Fay. c. Stratum underlying the valuable seam. Nelson. d. A submarine mountain rising below the sea bottom. Often unobserved on land but observed at sea as a seaquake. Earthquake of which the origin is used for socket. See also socket, d. Long. e. A synonym for seat, cage seat. Fay. d. A synonym for seat. Mason.

d. Synonym for seat. Mason.

e. A synonym for seat. Mason.

seat earth. A white, hydrous borosilicate of sodium, potassium, and magnesium. Minute spherulites composed of radiating fibers. From Sealers Lake, Calif. English. See also earth. B.C.I.

seat earth. A stratum or bed of coal or other combustible material which the coal forests flourished. Nelson.

d. A synonym for seat earth. Mason.

seaquake. Earthquake of which the origin lies below the sea bottom. Often unnoticed on land but observed at sea as shocks felt on board ship. Synonym for submarine earthquake. Schiefferdecker.

search coil. A. Sensitive device, using the mine-detector principle, for locating ferromagnetic material which is to be removed from the earth's magnetic field. It typically monitors a stream of ore passing along a conveyor belt, which it stops when iron is detected. Fay. b. Coll. That is used in electroradiometric methods for measuring the magnetic field that is associated with the electric current. Schiefferdecker.

seaquake. Earthquake of which the origin lies below the sea bottom. Often unnoticed on land but observed at sea as shocks felt on board ship. Synonym for submarine earthquake. Schiefferdecker.

search syndicate. Search syndicates, like prospecting clubs, deal mainly with mines in the earlier stages of discovery and development, but they have a stronger type of organization and a firmer financial backing. Such a syndicate should have capital sufficient to carry on a campaign over several years. Hooe, p. 251.

seamite. A transparent, pale yellow seam. a. A stratum or bed of coal or other combustible material which the coal forests flourished. Nelson.

seam blast. A blast made by placing powder or dynamite under or between the solid wall and the stone or coal intended to be removed. Mason.

seam contour. A line drawn on a plan joining points on the floor or roof of a seam which have the same height above a prescribed datum. B.S. 3618, 1964, see 1.

seamident. Joining sheet metal parts by interlocking bends. ASM Gloss.

seamless-ring rolling. Hot rolling of a circular blank, with rotating electrodes, to form a weldless, circular ring by continuous compressive forces exerted by a main roll on the outer diameter against a pin on the inner diameter. ASM Gloss. May be obtained by appropriate contouring of the pin and roll. The height of the ring is controlled by auxiliary rolls. ASM Gloss.

seam-out. A shot that merely blows out a soft stratum in the coal or escapes through a seam without loosening the main mass of coal. In Arkansas, called squal-out. Fay.

seam structure. The physical characteristics of a seam. It refers to the seam thickness, and to the seams, splits, partings, and bands of dirt or inferior coal. The seam structure will influence the method of working, the choice of face machines, machine cutting, and shotfiring. The graduation and dirt produced will depend on the seam structure. See also cleat. Nelson.

sea mud. A rich saline deposit from salt marshes and seashores. Fay.

seam welding. a. Arc or resistance welding in which a series of overlapping spot welds is produced with rotating electrodes, rotating work, or both. ASM Gloss. b. Making a longitudinal weld in sheet metal or tubing. ASM Gloss.

seam. a. The layer or stratum of a coal bed at which the different layers or strata of coal are easily separated. Fay. f. See seam ident. Mason.

g. Mark on ceramic ware or glass indicating work, or both. ASM Gloss. b. Making a longitudinal weld in sheet metal or tubing. ASM Gloss.

seaquake. Earthquake of which the origin lies below the sea bottom. Often unnoticed on land but observed at sea as shocks felt on board ship. Synonym for submarine earthquake. Schiefferdecker.

sea state. Numerical or written description of ocean surface roughness. Hy.

seasteam. Amber, Shipley.

seal earth. a. The underlay or fireclay on which a coal seam rests. Also called sealing earth. Perry. b. The floor of a mine. Fay. c. The foundation or framework on which a structure rests, for example, on a coal seat, cage seat. Fay. d. A synonym for socket. See also socket, d. Long. e. The surface against which the closure parting is worked is usually cut off. Long. f. A place prepared on the siege of a gash pot furnace for the support of heat. See also top seal.

seal earth. a. A layer of remnant old soil, usually containing abundant rootlets, underlyng a coal seam. See also fire clay. B.C.I.

seal earth. b. A layer of remnant old soil, usually containing abundant rootlets, underlyng a coal seam. See also fire clay. B.C.I.

sea water. a. A layer of remnant old soil, usually containing abundant rootlets, underlyng a coal seam. See also fire clay. B.C.I.

sea state. Numerical or written description of ocean surface roughness. Hy.
seated. a. Placed in position. See also socket, d. Long. Closed by pressing the closure part of a valve against its seat. See also seat, e. Long.

seating. To fit into the point of support for a heavy load. Ham.

seating block. A block of fire clay refractory shaped to support a boiler. Dodd.

seating curve. The curve at the bottom of the tooth gap on a roller chain sprocket. ASM.

seated. a. Placed in position. See also socket, d. Long. Closed by pressing the closure part of a valve against its seat. See also seat, e. Long.

seawater batteries. Silver-zinc batteries acti-...
secondary dispersion. Geochemical dispersion occurs when a particle of ore is broken up into smaller particles, so that the surface area available for chemical reactions is increased.

secondary crusher. Crushing and pulverizing machines next in line after the primary crusher. This group of machines includes the finer types of jaw crushers and gyratory crushers, and also crushing rolls, hammer mills, and edge runner mills.

secondary crushing. In ore dressing, the secondary crushing is the second stage of grinding in which the discharge from the primary crusher is broken down to a size suitable for feed to the fine grinding machines. Newton, p. 38.

secondary drilling. The process of drilling; the so-called "poppers" for the purpose of breaking the large masses of rock thrown down by the primary blast. Fay.

secondary enlargement. The deposition around a nucleus, in optical continuity with it, of material of the same composition as the nucleus. Under proper conditions, good crystal faces may be developed in this way. A.G.I.

secondary enrichment. An enrichment of a vein or an ore body by material of later origin, often derived from the oxidation of decomposed, overlying ore masses. Nelson, p. 958. The property exhibited by some fire clay and high-alumina refractories of developing permanent expansion at temperatures within their useful range; not the same as overfiring. H.W.

secondary fan. Any fan installed underground to ventilate tunnels or workings where the air current is sluggish. See also auxiliary fan.

secondary fertilizer components. Fertilizer components, other than primary, essential to proper plant growth, for example, calcium, magnesium, sulfur, phosphates, copper, zinc, and boron. Bennett.

secondary filtration. Fertilizer components, other than primary, essential to proper plant growth, for example, calcium, magnesium, sulfur, phosphates, copper, zinc, and boron. Bennett.

secondary grinding. Further comminution of material already reduced to sand sizes in rod or ball mills. Prager, 3.

secondary hardening. Tempering certain alloy steels at certain temperatures so that the residual austenite is greater than that obtained by tempering the same steel at some lower temperature for the same time.

secondary hardness. Further increase in hardness produced on tempering high-speed steel after quenching. C.T.D.

secondary haulage. That portion of the haulage system which collects the ore from the various gathering-haulage delivery points and delivers it to the main haulage system. Wheeler, p. 3.

secondary interstices. Those developed by processes that affect the rocks after they had been formed. A.G.I.

secondary lead. Lead deposited from salvage of wornout end-product items, such as battery plates, cable covering, pipe and sheet, which at one time was roasted, remelted, and refined in secondary smelters to produce refined lead or various lead-base alloys. A.G.I.

secondary mineral. A mineral resulting from the alteration of a primary mineral. Thus, original sulfides by oxidation change to sulfates, carbonates, and oxides, and these by hydration become hydrous forms of the same. Fay. A mineral that was formed later than the rock in which it is found. See also primary mineral. Nelson.

secondary mineral deposits. Primary mineral deposits are eventually subjected to alterations through weathering, both chemical and mechanical, and give rise to secondary deposits which are divided into three groups: sedimentary rocks, secondarily enriched ore deposits, and residual or detrital ore deposits.

secondary mineral matter. In a cosi or isom, the material brought in solution by percolating waters and deposited in cracks and joints, subsequent to the formation of the coal. Nelson.

secondary openings. Voids produced in rocks subsequent to their formation through agencies, such as solution, weathering, or movement. A.G.I.

secondary ore. The alteration or secondary concentration products of primary ore. A.G.I.

secondary orebody. Porphyry developed after the formation of a deposit and resulting from subsequent replacement, solution, or weathering. A.G.I.

secondary production. See middlings.

secondary precipitation. Other than the primary radiation emitted by any irradiated material or of materials accumulated by organisms. The term was also used in the past as one of the series—primary, secondary, Tertiary, and Quaternary—to designate one of a series of successively formed groups or rocks. In this sense, it is no longer employed but the term Tertiary and Quaternary have been retained as period names in the time scale. Stokes and Varnes, 1955.

secondary processing. The process of growing the primary settling in surface subsidence in which the surface subsides gradually. This period may continue for many years or even decades. Compare primary settling. Stokes, v. 1, p. 497.

secondary shaft. The shaft which extends a mine below the bottom of the primary shaft but not in line with the primary shaft. Spalding.

secondary shooting. In quarrying, the reduction in size or dimension of blasted rock by additional or secondary blasting. Streeter, p. 17.

secondary slime. See slimes. Prager, p. 817.

secondary source. If an operation violates or disperses dust, it is a secondary source. Hatman, p. 59.

secondary sulfide zone. A zone developed only over the area of a deposit where limited data are collected. See also subordinate station. Hy.

secondary stratification. Stratification developed after the minerals already deposited are thrown into suspension and redeposited. A.G.I.

secondary structure. Structure in a sedimentary rock which developed penecontemporaneously with sedimentation or shortly thereafter. Refers to an accretionary structure of chemical origin. A.G.I.

secondary sulfide zone. In many metalliferous deposits, particularly those of copper, there is found below the zone of oxidation, a second zone containing sulfide minerals that have precipitated from down-trickling solutions containing metals leached from the oxidized zone. This secondary sulfide zone generally marks the change from oxidizing to reducing conditions, such as the level of ground water, at the time of secondary deposition. The sulfide zone is often greatly enriched and may constitute economically recoverable ore whereas the original primary deposit may not. Stokes and Varnes, 1955.

secondary twinning. Twinning produced subsequently to the original formation of a layer of crystalline material, under a pressure, causing the inversion of the atomic
pattern of the crystal structure in certain lamellae. The cause of parting is Slippery, second foot. A mineral vein which was discovered after the original or discovery vein on which the claim was based. Also called incidental vein. Nelson. The extra- lateral rights of secondary veins in a claim depend on the dip of the original vein on which the claim was located; that is, extralateral rights are allowed on the secondary veins if they dip in the same general direction as the original vein, but they are not allowed if the secondary veins dip in the opposite direction. Lewis, pp. 33-34.

second water. Water entering the mine from other workings, as opposed to water inherent in the area worked by the mine. B.S. 3618, 1963, sec. 4.

second wave. Synonym for distortional wave; equivoluminar wave; shear wave; S-wave; transverse wave. A.G.I.

secondary wave. A term or synonym for wave; equivoluminar wave; shear wave; S-wave; transverse wave. A.G.I.

-secondary bye. A convenient unit in storage computations. A.G.I.

-secondary wave. A wave; an expression at constant volume is k²[A].(13].

second quality fire clay brick. A trade term, usually indicating fire clay brick of the best quality, but not broken or twisted. Briggs, p. 162.

section bar. A core barrel, the length of which can be increased by coupling unit sections together. See also extension core barrel. Long.

sectional change. An increase or decrease of intensity and/or change of direction of the total magnetic field over a period of many years; usually given as average gammas.

second ripplogs. The first back rippings on a seam. Seely, p. 114.

second outlet. An emergency exit from the roadway. Nelson.

second quality fire clay brick. A trade term, usually indicating fire clay brick of the best quality, but not broken or twisted. Briggs, p. 162.

second outlet. An emergency exit from the roadway. Nelson.

second order. A term used in a second order reaction. Pryor, 3.

second working. a. The recovery of pillar coal by the multiple entry system has com- pleted. Hudson. b. The recovery of pillar coal by the first working. Fay. In coal mining, unless the pillars of coal are left permanently to support the surface, they are removed. This phase of mining is called the second working or pillar working. Where the pillars are removed the greater portion of the coal is produced in the second working. Compare first working. Also called pillar working. Kentucky, pp. 334-335.

sectional belt conveyor. A belt conveyor so arranged that it can be lengthened or shortened by the addition or the removal of interchangeable increments or parts. NEMA MBI-1961.

sectional mining. A water tank built up of standardized pieces, each having external flanges which are bolted together in an assembly for varying sizes of tank. Ham.

-sectional-type conveyor. A conveyor that is lengthened or shortened by adding or removing intermediate sections. NEMA MBI-1956.

section boss. A more or less loosely used term applied to the assistant mine foreman in charge of an area, although used in law in some states in lieu of assistant foreman and certified as such. B.C.I.

section factor. See section modulus. Ro.

section foreman. In anthracite and bitumi nous coal mining, a foreman who has complete charge of a section of mine. Also called section man. D.O.T. 1. See also assistant.

section man. See section foreman. D.O.T. 1. A section is a mechanical sectioning device that pertains to the cross section of a beam. The section modulus with respect to either principal central axis is the moment of inertia with respect to that axis divided by the distance from that axis to the most remote point of the section. The section modulus largely determines the flexural strength of a beam of given material. Ro.

section of rectifier unit. A part of a rectifier unit with its auxiliaries which may be operated independently. Coal Age, 2.

sector. Any area enclosed within a circle in- clude the arc of a circle.

sector gate. A roller gate in which the roller is in the form of a sector of a circle instead of being cylindrical. Ham.

sector. A part of a rectifier unit with its auxiliaries which may be operated independently. Coal Age, 2.

sector gate. A roller gate in which the roller is in the form of a sector of a circle instead of being cylindrical. Ham.

sector gate. A roller gate in which the roller is in the form of a sector of a circle instead of being cylindrical. Ham.

sector gate. A roller gate in which the roller is in the form of a sector of a circle instead of being cylindrical. Ham.

second-foot-day. The volume of water repre- sented by 1 foot per second. See lye.

second-class lever. A lever whose force is exerted between the fulcrum and the point where it is applied. Nichols.

second-class ore; mill ore. An ore that must be given some preliminary treatment, such as concentration, nickel, etc., before a marketable grade or a grade suit- able for further treatment can be ob- tained. See also first-class ore. Nelson.

second derivative. The magnetic field inten- sity or of one of its components with re- spect to the vertical coordinate. Schierer-decker.

second-foot-day. The volume of water repre- sented by 1 foot per second for 24 hours. It is 88,400 cubic feet, or nearly 2 acre-feet (actually 1.9853); a convenient unit in storage computations. Seely, 1.

second mining. a. The recovery of pillar coal after first-mining in chambers has been com- pleted. Hudson. b. The recovery of pillar after development of block pillars by the multiple entry system has com- pleted a panel. Bureau of Mines Staff.

second moment of area. The correct term for the moment of inertia (I) of the plane cross-section of a body. A.G.I.

second or back explosion. Aust. Supposed to be due to the ignition of gases developed from highly heated coal dust, and gases sucked out of the faces of coal by the partial vacuum resulting from the pri- mary explosion, or liberated by fall of roof. Compare retraction wave. Fay.

second order reaction. Chemical treatment in which the rate expression at constant volume is k = the velocity constant. Pryor, 3.

second order reaction. Chemical treatment in which the rate expression at constant volume is k = the velocity constant. Pryor, 3.

second surface. A smooth surface when cut with a knife, without breaking off in pieces. A.G.I.

section bar. A core barrel, the length of which can be increased by coupling unit sections together. See also extension core barrel. Long.

sectionalizing switch. A sectionalizing switch is used for connecting and disconnecting (or both) adjacent electric circuits. See A.G.I.

sectional mining belt conveyor. A belt con- veyor so arranged that it can be length- ened or shortened by the addition or the removal of interchangeable increments or parts. NEMA MBI-1961.

sectional tank. A water tank built up of standardizd pieces, each having external flanges which are bolted together in an assembly for varying sizes of tank. Ham.

sectional-type conveyor. A conveyor that is lengthened or shortened by adding or removing intermediate sections. NEMA MBI-1956.

second working. a. N.S.W. The second-class ore that is prepared for examination. See A.G.I.

second working. a. The recovery of pillar coal by the first working. Fay. In coal mining, unless the pillars of coal are left permanently to support the surface, they are removed. This phase of mining is called the second working or pillar working. Where the pillars are removed the greater portion of the coal is produced in the second working. Compare first working. Also called pillar working. Kentucky, pp. 334-335.

sectionalizing switch. A sectionalizing switch is used for connecting and disconnecting (or both) adjacent electric circuits. See A.G.I.

second-rip. See first-rip. Seely, 1.

second rippings. The first back rippings on a roadway. Nelson.

second order reaction. Chemical treatment in which the rate expression at constant volume is k²[A](B).

second rippings. The first back rippings on a roadway. Nelson.
secular change per year for intensity values and minutes per year for directional values. Hy. sedimentary variation. A relatively large, slow change in part of the earth's magnetic field caused by the internal state of the planet. It is reversible and is expected from a simple but not quite uniformly polarized sphere. A.G.I. secondary dikes. A dike that is injected into a hot country rock; contact generally irregular, close-welded, the grain generally equal throughout, either finer or coarser at or near the margin. This is a characteristic mode of occurrence for pegmatites and aplites. J. Geol., v. 30, No. 2, Feb.-Mar., 1922, p. 165.

separate explosives. The explosives are a type of plastic explosives with a balanced oxygen content which satisfy very high requirements for safety. They are built up on a non-explosive, hydrophilic gel also containing oxygen-emitting salts and solid high explosive. They also contain water. In spite of the high degree of safety against accidental initiation they detonate easily with a blasting cap of normal strength. They have about the same density as the plastic nitroglycerine explosives. Fraenkel, 3, Art. 16:01, pp. 35, 37.

security risk. Operation in which there is an unusual possibility of theft of valuable property, or danger to personnel or plant, or of leakage of classified or secret information of great importance. Pryor, 3.

sedimentary. Formed in place, without transport, by the disintegration of the underlying rock or by the accumulation of organic material; said of some soils, etc. Fay.

sediment. a. Solid material settled from suspension in a liquid. A.G.I. Supp. 2. Solid material, both mineral and/or organic, that is in suspension, is being transported, or has been carried from its site of origin by air, water, or ice and has come to rest on the earth's surface either above or below sea level. A.G.I. Supp.

sedimentary. A descriptive term for rock formed of sediment, especially (1) clastic rocks, (2) chemical or biological precipitates, (3) rocks formed of fragments of other rock transported from their sources and deposited in water, or (2) rocks formed of material in suspension or from solution, as rock salt and gypsum, or from secretions of organisms, as most limestone. Webster 3d.

sedimentary ash. a. Mineral matter introduced into the coal substance during its accumulation. See also extraneous ash. Nelson. b. Ash in coal derived from the mud mixed up with plant debris during the coal formation. Tomkeieff, 1923, p. 34.

sedimentary clay; secondary clay. A clay that has been geologically transported from the site of its formation and redeposited elsewhere. The English clay balls or example, are secondary kaolins. Compare primary clay. Dodd.

sedimentary environment. The geographical, physical, chemical, and biological conditions under which a sediment accumulates. Clauer.

sedimentary ore. Ore formed by the chemical reaction of iron in solution with other materials, in which it comes into contact, especially lime. Mersonau, 4th, p. 383.

sedimentary peat. Peat formed under water, principally in lakes, and largely made of algae and other aquatic plants. Tomkeieff, 1954 and Dons.

sedimentary petrology. The science of laboratory investigations of sediments, their description, and classification. Also called sedimentography. Schieferdecker.

sedimentary rocks. Rocks formed by the accumulation of sediment in water (aqueous deposits) or on land (extrusive deposits). The sediment may consist of rock fragments or particles of various sizes (conglomerates to silt), suspended or dissolved in the water, or (certain limestones and coal); of the product of chemical precipitation of evaporites (salt, gypsum, etc.); or of mixtures of these materials. Some sedimentary deposits (5%) are composed of fragments blown from volcanoes and deposited on land or in water. A characteristic feature of sediment deposits is a layered structure known as bedding or stratification. Each layer is a bed or stratum. Sedimentary lycics as deposited lie flat or nearly flat. Fay.

sedimentary surf. A tuff containing a subordinately high percentage of detritus derived from either during or after deposition, for example, the finer deposits of some mud flows, or all products by the chemical precipitation of evaporites (salt, gypsum, etc.); or of mixtures of these materials. Some sedimentary deposits (5%) are composed of fragments blown from volcanoes and deposited on land or in water. A characteristic feature of sediment deposits is a layered structure known as bedding or stratification. Each layer is a bed or stratum. Sedimentary lycics as deposited lie flat or nearly flat. Fay.

seed charge when selecting materials for stabilized road construction and concrete. Soil, after pretreatment, is shaken up in water and allowed to settle out. The change in specific gravity of the suspended matter with time is measured, and the equivalent diameter is calculated from Stokes' law. Also see organic test. How.

sedimentation trend. The direction in which the sediments were laid down. Uranium mineralization often follows such trends, due to increased porosity, carbon precipitants, etc. Ballard.

sedimentation unit. A layer or deposit formed under conditions of essentially constant flow and sediment discharge; distinguished from like units by change in grain size above and below. Issel. Sediment transport rate or sediment load. Issel. Sedimentography. Schieferdecker.

seed test. A test used to determine the quality of seed. Issel.

seed. A small charge of material used to initiate precipitation. A.S.M. Gloss.
seed core; seed and blanket core

A reactor core which includes a relatively small volume of the blanket (seed) surrounded by a much larger volume of natural uranium or thorium (blanket). As a result of neutron capture, the seed, neutrons are supplied to the blanket. In this way the seed causes the blanket to furnish a substantial part of the core power. LBL.
seed gypsum. Gypsum beds of loose small crystals. New South Wales, p. 54.
seep. A spot where a fluid (as water, so after, or gas) contained in the ground oozes slowly to the surface; and often forms a pool; a small well. Webster 3d.
seepage. a. A quantity of a fluid that has seeped through porous material (as soil). Webster 3d. b. (pepera 23). The slow movement of gravitational water through the soil. ASCE P1826. c. Naturally occurring movement of crude oil, gas, or bitumen to the earth's surface. Institute of Petroleum, 1961. 6. Movement of water through soil with a change in the position of definite channels. Nichols. e. Seepage into a body is referred to as influent seepage; that away from a body, as effluent seepage. Searle, 1.
seepage force. The force transmitted through the soil grains by seepage. ASCE P1826.
seepage line. See line of seepage. ASCE P1826.
seepage velocity. The rate of discharge of seepage water through a porous medium per unit area of void space perpendicular to the direction of flow. ASCE P1826.
S.E.G. Abbreviation for the Society of Exploration Geophysicists, a professional organization of geophysicists primarily engaged in exploration for oil and gas and other minerals. Williams.
Segner core. A small cone made of a clay and talc mixture which softens at a definite, known temperature. Segner cones are used for the approximate determination of temperatures in furnaces (for example, melting furnaces) and in volcanology, to determine the approximate temperature of molten lavas. A.G.I.
Segner formula. A procedure commonly used for the representation of the composition of a ceramic glaze. The chemical composition is recalculated to molecular fractions and the constituent oxides are then arranged in three groups: the bases, which are made equal to unity: $R_2O$, $R_2O_3$, for example, (O.J)NiO:O.2CaO:O.5 Al_2O_3-0.2 Al_2O_3 (3.SiO_2-0.7SnO_2).
Segner's porcelain. A German porcelain composition of 30 percent feldspar, 35 to 40 percent quartz, 30 to 35 percent kaolin. It is covered with a glaze prepared from 40 percent feldspar, 55 percent kaolin, 35 parts whiting, 54 parts flint. It is biscuit fired at a low temperature and glazed after firing.
Segner's rules. A series of empirical rules for the prevention of crazing and peeling. To prevent crazing, the body should be adjusted as follows: decrease the clay, increase the free silica (for example, frit), replace coarse plastic clay with fine plastic clay to decrease the feldspar, grind the flint more finely, biscuit fire at higher temperature. Although the body can be adjusted to increase silica and/or decrease fluxes, replace some $SiO_2$ by $B_2O_3$; replace fluxes of high equivalent weight by fluxes of lower equivalent weight. To prevent peeling, the body should be adjusted in the reverse: direction. Dodd.
Segregate. See segregate. Fay.
Segment. a separated part; an individual piece. Kinney.
Segmentation or A sprang arch having the contour of a segment of a circle. Dodd.
Segmented sluice gate. See radial gate. Ham.
Segmental wheel. An abrasive wheel that is covered with a glaze prepared from 83.5 parts feldspar, 26 parts kaolin, 40 percent quartz, 30 to 35 percent kaolin, and other minerals. Williams.
Segment die. A die made of parts that can be separated for the ready removal of the workpiece. Synonymous with split die. ASPH Gloss.
Segmented belt. A coated abrasive belt made of sections spliced together. Segmentation is necessary to obtain belts wider than 50 inches, the widest coating width. ASGC, 1963.
Segmented. Bonded abrasive sections of various shapes to be assembled to form a continuous or intermittent circular grinding surface. ASGC, 1963.
Segregation. a. A term which refers to the occurrence of different physical characteristics in different physical characteristics. B.S. 3552, 1962. d. Partial segregation of a previously mixed batch of material into its constituent parts which is induced either naturally or by special processes such as centrifuging, and usually persists throughout subsequent heating and working operations. C.T.D. c. The involuntary separation of particles of different sizes. Webster 2d. See also segregated vein. Fay.
Segregated vein. A vein in which the filling is believed to have been derived from the adjacent country rock by percolating water carrying the dissolved mineral matter into the fissure. Fay.
Segregation survey. The survey of a mining claim located on lands classified as agricultural. Fay.
Segregation survey. Same as segregated vein. Fay.
Sele. a. Stationary inertia oscillation of the water of a lake, bay, or marginal sea. Synonym for standing wave. Schiebeacher. b. In oceanography, an apparent tide in a lake (originally observed on Lake Geneva) due to the periodic oscillation of the water when excited by wind. C.T.D.
Self-dune. A long, sharp-crested dune extending in the direction of the wind that constructed it. Mathen.
Seignette electric. See Sieme.
 Seligette salt. See Rochelle salt (potassium acid tartrate). Crystals of this composition are markedly piezoelectric and were used, for this property, before tita- nite ceramics were introduced. The term Seignette electric is still used in Western Europe and in the U.S.S.R. to signify ferroelectric. Dey.
S.E.I. photometer. In this instrument the internal comparison lamp is set to a stand- ard brightness as indicated by a photome- ter and not by reference to a voltmeter or ammeter. Roberts, 11, p. 32.
Semi. a. Pertaining to, characteristic of, or produced by earthquakes or earth vibra- tions, as, seismic activity. See seismicity. b. Describing a record of the amplitudes of seismic waves generated by earthquakes or natural or explosive sources, to map subsur- face structure. Wheeler.
Seismic activity. See seismology.
Seismic analysis. A quick, easy, and inexpen- sive method of determining the consoli- dation of overburden. The process is based on the principle that sound or shock waves travel through different sub- surface materials at varying speeds and along different paths. By this method the operator can determine whether over- burden can be ripped or whether it will need to be drilled and blasted. Coal Age, 71, No. 8, August 1966, p. 219.
seismic belt. One of the broad, more or less well-defined, elongate tracts in which most earthquakes originate. Stokes and Bennett.

seismic drill. Synonym for seismograph drill. Long.

seismic explosives. Special forms of blasting gelatin, gelatin, and ammonia gelatin dynamos. They are used in geophysical prospecting. The initiation of shock waves is achieved by the firing of an explosive charge at a known point. The disturbance must start at the beginnings of the test shoot consistently at their characteristic rate of detonation under unusually heavy water pressure. Lewis, p. 109.

seismic focus. The place of origin, within the seismic region. Arca in which earthquakes frequently occur. Varnes, 1955.

seismic method. A geophysical prospecting method based on the fact that the speeds of propagation of shock waves through the earth vary with the elastic constants and the densities of the rocks through which the waves pass. A shock wave is initiated by firing an explosive charge at a known point (the shot point) and recorded at the time of the travel times taken for selected shock waves to arrive at sensitive recorders (geophones). There are two main divisions of development of operations, that is, the reflection method and the refraction method. The seismic method has not been applied to any great extent to elucidate mining problems, partly due to the high cost. It has been used to investigate the base of drift deposits, and drill-filled channels have been successfully outlined. Nelson.

seismograph. A device for recording seismic waves in which the waves are converted into electrical impulses which vary with time and are recorded as a continuous velocity log or an electric seismogram. A.G.I.

seismograph placing method. A method of geophysical prospecting in which vibrations are set up by firing small explosive charges in the ground. Precise measurements of the resulting waves are taken, from which the nature and extent of underlying strata are determined. Deborin, p. 9-90.

seismic reflection method. In this geophysical prospecting technique, the structure of the subsurface is mapped by reflection using the times required for a seismic wave (or pulse), generated in the earth, to return to the surface after reflection from the formations themselves. The reflected waves are used by detecting instruments responsive to ground motion, which are laid along the ground near the shot. Seifert.

seismic reflection. In refraction shooting, the detecting instruments are laid down at a distance from the shothole that the shock wave can be measured compared to the depth of the horizon to be mapped. The explosion travels over long horizontal distances through the earth and the time required for travel gives information on the velocity and depth of certain subsur-

seismic region. Area in which earthquakes are frequent. Schieferdecker.

seismic refraction. An exceptionally long wave caused by water displacement following a submarine earthquake. Synonym for tsunami; tidal wave. Schieferdecker.

seismic shooting. The initiation of shock waves in the rocks by the firing of an explosive charge at a known point. The disturbance must start at the beginnings of the test shoot consistently at their characteristic rate of detonation under unusually heavy water pressure. Lewis, p. 109.

seismic survey. An exploration technique utilizing the variation in the rate of propagation of shock waves through different media. It is used primarily to delineate subsurface geologic structures of possible economic importance. Seismic surveying is employed most frequently by the petroleum industry. Long.

seismic waves. A disturbance caused by an earthquake. Earth tremors produced by a mechanical disturbance on the surface or underground, and are utilized in the seismic method of geophysical exploration. Three types of waves are produced: (1) longitudinal or P waves; (2) transverse or S waves; (3) surface or Raleigh or L waves. The speed of propagation is characteristic for each type of rock, depending on its density and its compactness. In sandy clay, the speed of the P wave is about 4,000 feet per second; in sandstone, 8,000 feet per second; and in igneous rock up to 22,000 feet per second. Nelson.

seismist. A. Geophysical science which is concerned with the study of earthquakes and measurement of the elastic properties of the earth. A.G.I. c. Also called seismic recording instruments. Also called jackknife rig; rotary shot drill; seismic drill; shothole drill. Long.

seismograph. A collared, tapered, V-thread-coupling drill rod used on seismograph drills. Long.

seismograph shooting. The process of seismology to his work, for example, oil exploration, earthquake detection, and analysis. Nelson.

seismology. The science of earthquakes and attendant phenomena. Schieferdecker. A. A geophysical science which is concerned with the study of earthquakes and measurement of the elastic properties of the earth. A.G.I. c. Also called seismic recording instruments. Also called jackknife rig; rotary shot drill; seismic drill; shothole drill. Long.

seismometer. An instrument buried in the ground which transforms the mechanical effects of earth shocks into electrical energy. This is transmitted by a circuit to a recording station, which records the impulses. Ham. b. Detecting device which receives seismic impulses. Nelson. c. Wire bound securely around the end of a seismic record. Electrical amplifiers are usually connected to the geophone. The instrument can be used for listening. A rate of 3 or more microseisms a second indicates probable tremor. Nelson. d. To protect rope ends by binding with yarn, marline, or seizing; seize. a. To bind wire rope with soft wire, to prevent it from unraveling when cut. Nelson. b. To freeze. Long. c. To cohere or stick to an inadequately lubricated moving part, such as the bearing of a machine, to prevent it from running. Nelson. d. To protect rope ends by binding with yarn, marline, or seizing; seize. Long.

seismometer. A device for recording the velocity of vibrations in the earth's crust. A.G.I.

seismometer spacing. Distance between seismometer stations. Schieferdecker.

seismometer spread. Number of seismometers placed along a straight line, that record the transmitted energy of the seismic waves. Ham. c. Also called seismic record. Nelson.

seismoscope. An instrument which indicates that an earthquake has occurred. Considered by some as equivalent to seismograph. A.G.I.

seize. a. To bind wire rope with soft wire, to prevent it from unraveling when cut. Nelson. b. To freeze; bind; freeze. Long. c. To cohere or stick to an inadequately lubricated moving part, such as the bearing of a machine, to prevent it from running. Nelson. d. To protect rope ends by binding with yarn, marline, or fine wire. Long.

seizing. a. Stopping of a moving part by a mating surface as a result of excessive friction caused by galling. ASM Gloss. b. Wire bound securely around the end of a machine part, such as a bearing or a journal, to prevent it from wearing or becoming loose. Nelson. c. Securing by wire two parallel portions of a submarine wire. Ham.
Seleng conform process

Seleng process. See Uigeo-Selen process, ASM Gloss.

selective. Haury's name for a rock consisting of chert or selenite dispersed through an intimate mixture of amphibole and feldspar, but it has been since applied to so many different rocks of the same type unselect. Sometimes used as a synonym for select group.

selective filling. Hand filling, during which the miner rejects stone or dirt and loads select. Sometimes used as a synonym for select group.

selective freezing. A process involved in the selective freezing of a mixture of amphibole and feldspar, but this phenomenon is not applicable where the valuable minerals rather than the gangue. Sometimes used to mean differential flotation.

selective flotation. a. Generally refers to the selective flotation of a mixture of amphibole and feldspar, but this phenomenon is not applicable where the valuable minerals rather than the gangue. Some times used to mean differential flotation.

selective grinding. Grinding in such a manner as to cause one ingredient of the ore to be crushed preferentially to others. B.S. 3552, 1962.

selective heating. Heating only certain portions of an ore body in mining operations. Nelson.

selective reflectance. Refracting or reflection by a substance, such as an opaque gem, of light of only certain wavelengths, the others being absorbed. This cause of color in gems is a sort of selective absorption.

selective replacement; preferential replacement. Replacement of one mineral in preference to or more rapidly than another. A.G.I.

selective scruff feed. A drill scavenged with the whole feed, in its various parts, sets of feed gears and a shifting mechanism, whereby the driller can easily select and engage the pair giving the desired rate of feed. B.S. 3552, 1962.

selective wetting. In mineral processing, designation of wetting that is selective rather than the gangue. Sometime used to mean differential flotation.

self-annealing. sulfur and tellurium chemically, Symbol, Se; atomic weight, 79.96. C.T.D.

self-acting retarder. A rectifier of the dry-contact type. It is built up of a number of units each consisting of a disk or plate of nickel-plated steel or aluminum, one surface of which is sprayed with a thin coating of metallic selenium. The rectifier consists of a number of these plates forming a stack when clamped over an insulating sleeve; the stacks are connected in series or in parallel to give the necessary current and voltage. The a.c. supply is generally connected through a transformer to give the required d.c. voltage with the load in series with the rectifier; the current then passing through the nickel-steel to the selenium but not in the reverse direction. The transformers and rectifiers may be oil-immersed, and contained in a tank mounted on wheels to run on the pit road. The efficiency of this type rectifier is over 80 percent. Sinclair, 9, pp. 243-246.

self-acting lime. A. Wadsworth's name for rocks composed of gypsum or anhydrite. Fay. b. A mineral, SeO, reported as white needles more or less massive, hymphatic, and ferruginous at Cacharua, Argentina. Dana, 7, u. 1, p. 595.

self-acting door. A ventilation door consisting of two halves, so constructed that they are forced apart centerly by the trams as they come in contact with the converging beams which operate them. The door halves move on small pulleys which run on inclined rails so that after the passage of the tram the doors close by gravity. Nelson.

self-aligning plane. An inclined plane upon which the weight of or force of gravity acting on the full car is sufficient to overcome the resistance of the mine. In other words, the full car, running down, pulls the other car (empty) up. Fay.

self-aligning rope haulage. Gravity rope haulage. A system of rope haulage used for transporting material on the surface and to transfer loaded cars from one elevation to a lower one in mines. Slope must be sufficiently steep so the loaded cars will pull the empty cars up the grade. Lewis, p. 225.

self-advancing supports. Power-operated sup ports. An assembly of self-advancing supports, usually of steel hydraulic supports, on a long- wall face, which are moved forward as and when the face is advanced, by means of a ram coupled to the heavy steel face con veyor. Nelson. Also called walking props.

self-aligning carrying belt. A kind of conveyor which controls and limits the side runout of the carrying belt within practical limits by means of a swivel mechanism. NEMA MB1-1961.

self-aligning return idler. A belt idler which controls and limits the side runout of the carrying belt within practical limits by means of a swivel mechanism. NEMA MB1-1961.

self-bonding. A term applied to metals such as lead, tin, and zinc, which recrystallize...
self-annealing

at air temperature and in which little strain hardening is produced by cold working. C.T.D.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-cleaning gradient. The gradient at which flow in a pipe of a particular diameter will carry away all solids in it. This gradient must not be too steep nor too gradual, and is usually laid down under bylaws affecting drains and sewers. Ham.

self-contained breathing apparatus. A self-sufficient breathing unit which permits freedom of movement, unencumbered by air hoses. It offers the wearer respiratory protection in atmospheres either oxygen-deficient or too highly toxic to permit the use of gask masks or respirators. The operation or air is supplied in compressed form or by chemical generation and the wearer’s exhalations are removed to the surrounding atmosphere. The equipment is devised to afford protection for special lengths of time, time, with the standards set by the U.S. Bureau of Mines. The two hour apparatus is used for mine rescue and recovery operations, and shorter units for apparatus for industrial uses and auxiliary equipment. Bests, p. 165.

self-contained cooling unit. A combination of apparatus for room cooling complete in one package; usually consists of compressor, condenser, fan motor, and air filter. Requires connection to electric line. Strick, 10.

self-cleansing gradient. A self-cleansing gradient. The gradient at which flow in a pipe of a particular diameter will carry away all solids in it. This gradient must not be too steep nor too gradual, and is usually laid down under bylaws affecting drains and sewers. Ham.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

self-centering chuck. A drill chuck that, when closed, automatically positions the drill rod in the center of the drive rod of a double-drill swivel head. Long.

semiautomatic control. A system to control an intermediate between the selvage. a. Coal intermediate between the selvage. a. Eng. Joint or parting in a stone surface. Should the driver still defer the power supply.

shoulder. a. In coal mining, every effort to reduce dust, and the instantaaneous cam position being directly related to the position of the cage.

surface. Should the driver still defer the power supply. This can be largely prevented if the glaze is semiconducting as a result of the incorporation of metals oxides, such as Fe₂O₃, Fe₃O₄, MnO₂, CaO, Co₃O₄, Cu₂O, or TiO₂; SiC and carbon have also been used as semiconducting constituents. Dodd.

socket. See Coalite. C.T.D.

semiconducting glaze. Porcelain insulators that are covered with a normal glaze are liable, particularly if the surface gets dirty, to surface discharges which cause radio interference and may lead to complete flashover and interruption of the power supply. This can be largely prevented if the glaze is semiconducting as a result of the incorporation of metals oxides, such as Fe₂O₃, Fe₃O₄, MnO₂, CaO, Co₃O₄, Cu₂O, or TiO₂; SiC and carbon have also been used as semiconducting constituents. Dodd.

semiconductor. Crystal system in which, though the electrons are ionically bound, a slight rise of temperature frees the valence electrons so the system becomes a conductor. Amorphous germanium. Conduction of electricity proceeds in one direction only. Pryor, 3.

semiconductive casting. See dc (direct chill) casting.

semicontinuous mill. One that incorporates some stands in tandem, either for roughing or finishing, an example being a semi-continuous wire rod mill with a continuous roughing train and a looping finishing train. Osborne, p. 358.

semicircular. Having a semi-continuous wire rod mill with a continuous roughing train and a looping finishing train. Osborne, p. 358.

semicircular fermentor. A fermentor with a semicircular cross section.
semimatt finish. An enameled or glazed surface that is not altogether rough to the touch, and having a slight glossy appearance. Enam. Die cut-off.
sensible horizon. The visible horizon. *Ham.*

sensible earth fault protection. A system of earth fault protection in which the fault current is recognized by a device which generally requires amplification in order to operate an earth fault relay. In the distribution system, the limitation of the leakage current may be affected by either (1) inserting a current limiting coil between the neutral point of the system and earth (single-point earthing), or (2) connecting, in each circuit to be protected, all phases, in star, through current limiting devices, each star point being connected to earth through an earth leakage protective device (multipoint earthing). B.S. 3618, 1963, sect. 7.

sensitive explosive. See explosive sensitive.

sensitivity. The property in a high explosive of permitting it to be exploded by a shock. The more insensitive an explosive is, the stronger detonator it requires to develop the full strength. *Fay.*

sensitivity to propagation. Sensitivity to propagation of an explosive can be ascertained by a method called the Arder double cartridge, or A.D.C. test. The A.D.C. test consists of firing an explosive cartridge, standard detonator and determining the maximum length of the gap across which the detonation wave will travel without attachment to the first cartridge or receptor, cartridge. Both the primer and the recepto cartridge should be of the same composition, and of the same diameter, length, and weight. *McAdam II,* pp. 19-20.

sensitization. A very small amount of hydrophilic sol (1 or 2 gal). It is used to protect a hydrophobic sol (such as gold or amine sulfide) from the coagulation which results when the sol is placed in a medium in which the sol is nonsoluble. The small amount either coagulates the hydrophobic sol or makes it more sensitive to the action of an electrolyte. This phenomenon is known as sensitization and is thought to be due, in many cases, to the action of the hydrophilic colloid as a colloidal electrolyte. *Mull.*

sensitometric. The science of measuring the sensitivity of photographic emulsions. In practice, it includes the quantitative measurement of the relation between the image produced on a photographic material and the original to which it has been subjected, including exposure and development. *ASM Gloss.*

septarian nodule. Under primary concretions the term may be used to describe nodules of volcanic ash. *Stokes and Varnes, 1955.*

separation density. The effective density at which a separation has taken place, calculated from a specific-gravity analysis of the products; commonly expressed as either partition density or equal errors in a separation. B.S. 3552, 1962.

separation valve. Eng. A massive cast-iron plate suspended from the roof of a return airway through which all return air from a separate district flows, allowing the air to always flow past or underneath it. Used in the event of fire, the force of the blast closes it against its frame and prevents a communication with other districts. The blast being over the weight of the valve causes it to return to its normal position, allowing the ventilation to continue. *Fay.*

separatory. a. A machine for separating, with the aid of water or air, materials of different specific gravity. b. A separator parts two or more ingredients, both valuable, while a concentrator saves but one and rejects the rest; but the terms are often used interchangeably. *Fay.* b. Any machine for separating materials, as the magnetic separator for separating metallic from nonmetallic, or the developing separator for separating materials held within photographic materials. c. A screen, especially a revolving screen for separating things like stones or coal into sizes. *Standard, 1964.*

separation. a. Indicates the distance between any two parts of the vessel (tube, bottle, vein, etc.) disrupted by a fault. Horizontal separation is separation measured in an E-W direction, while vertical separation is separation measured along a vertical line. *Billings,* 1954, p. 136. b. Treatment of ore to separate values (concentrates) from tin. *B.S.* 3525, 1962.

separation coal. Eng. Coal that has been prepared to remove combustible material. *McAdam II,* pp. 19-20.

separation density. The effective density at which a separation has taken place, calculated from a specific-gravity analysis of the products; commonly expressed as either partition density or equal errors in a separation. B.S. 3552, 1962.

separatory. a. A machine for separating, with the aid of water or air, materials of different specific gravity. b. A separator parts two or more ingredients, both valuable, while a concentrator saves but one and rejects the rest; but the terms are often used interchangeably. *Fay.* b. Any machine for separating materials, as the magnetic separator for separating magnetic from nonmagnetic, or the developing separator for separating materials held within photographic materials. c. A screen, especially a revolving screen for separating things like stones or coal into sizes. *Standard, 1964.*

separation coal. Eng. Coal that has been prepared to remove combustible material. *McAdam II,* pp. 19-20.

separatory. a. Indicates the distance between any two parts of the vessel (tube, bottle, vein, etc.) disrupted by a fault. Horizontal separation is separation measured in an E-W direction, while vertical separation is separation measured along a vertical line. *Billings,* 1954, p. 136. b. Treatment of ore to separate values (concentrates) from tin. *B.S.* 3525, 1962.

septarian nodule

occur in the form of lenticular nodules with or without an appreciable concen-
tration of material parallel to the long axis of the beds, continuous for long distances. Clay
ironstone, an impure carbonate of iron, occurs in this type of deposit.

These latter often crack on drying and consequent shrinkage, the cracks extend-
ing 7 mm within outward. In these cracks, calcite is subsequently deposited, whereby
the nodule is divided into septa of a white or yellowish color. On being cut
and polished, these often form beautiful and unique objects. To such the name
septarian nodule is commonly given.
A.G.I.

septarian texture. A concretionary nodule in-
tersected within by cracks often filled with a later mineral. Schierferdecker.

septaria. A roughly spheroidal concretion,
generally of limestone or clay ironstone,
cut into polyhedral blocks by radiating and intersecting cracks that have been
filled (and the blocks cemented together) by veins of some material, generally cal-
cite. Plural, septaria. Also called sep-
tarian boulder; septarian nodule; turtle
stone. Fay.

septavalent; heptavalent. Having a valency
of 7, as with chlorine and manganese in
perchlorates and permanganates. Pryor, 3.

septemsite. Synonym for amesite. See also

septemberite. A group name for the amesite-
seedrites; the name refers to the activity of
272 of the metallic ion in question; for exam-
ple, sodium metaphosphate and ethylene-
diaminetetraacetic acid (EDTA). Bennett
et al., 1962 A444; CDC 6d, 1961.

seracs. When two or more sets of crevasses
intersect, the surface of the glacier
is torn into a broken mass of jagged ice
pinnacles known as seracs. Stokes and
Varnes, 1955.

sericite. A peachblossom red acid meta-
silicate of manganese, calcium, sodium,
and potassium, 15 (Mn, Ca) 0.3 (Na, K ) 20.20Si-

sericite. A typical product of complete sericitization
of a complete welding cycle except weld
time or heat time. A$M Gloss.

sequence control. A method of control where-
by, once a sequence has been initiated, a
number of electrical circuits will auto-
matically function in a prescribed order.
B.S. 3618, 1965, sec. 7. b. The electrical
arrangement whereby in a system of con-
veyor belts the conveyor nearest to the
main discharge point starts first and the
auxiliary conveyors are automatically
started at 5 to 10 second intervals, the
furthest away starting up last. With se-
quence control (1) attendants are not
required at each of the terminal drives
of individual conveyors, and (2) the
staggered starting brings on the electrical
load gradually. See also actuated roller
switch. Nelson. c. Sequence control in
which centrifugal devices are driven by
the conveyor belt, by a sprocket and
chain from a large sprocket wheel, or by a
flexible drive from a special pulley from
the conveyor belt. Their speed, therefore,
is proportional to that of the belt; con-
tacts or microcontacts are opened or
closed at definite predetermined speeds.
Belt conveyors are connected to conveyors
and leading between 150 and 450 feet
per minute, but should be as low as possible in
that case. Their use is then less, although
a wider belt is required to deliver the

sequence interlock. An interlock provided
for automatically functioning in a prescribed order, and which
prevents a circuit from being operated
unless the preceding circuit has com-
pletely its part in the sequence. B.S.
3618, 1965, see.

sequence starting. An arrangement whereby
the starting of one belt conveyor starts
all of its feeder conveyors in a predeter-
mined manner. The purpose of sequence
starting is to prevent spilling at transfer
points and to reduce the power demand in
a system. NEMD Jagger, 1961.
See also power sequence; pilot sequence;

sequence welding. In resistance welding, a de-
vice used for controlling the sequence and duration of any or all of the elements
of a complete welding cycle except weld
time or heat time. A$M Gloss.

sequence; sequestration; sequestering agent.
A sequestering agent forms soluble com-
pounds with trivalent cations or with metals having a valency
of 7, as with chlorine and manganese in
perchlorates and permanganates. Pryor, 3.

series circuit. A circuit in which all the compo-
nents are connected in series. Electrical
agents are connected in such a manner
that only a single battery, or other source
of electricity, is used in the circuit.

Series connection. When the various parts of
a circuit are connected in sequence so
that the current passes through each of
them in turn, they are connected in series
and the total electromotive force is found
by adding together the electromotive forces
of the individual parts. Mason, V, p. 386.

series contacts. A circuit arrangement which
is connected in series with an armature. Pryor, 3.

series of igneous rocks. See igneous rock
series. A.G.I.

series parallel circuit. A method of connect-
ing together a number of devices which
are to be fired electrically in one blast.
The detonators are connected in the same
manner as the currently accepted
method. King, 1955; C.T.D.

series resistors. Gneiss containing sericite in the
place of the ordinary more coarsely
crystalline muscovite. Fay.

sericite schist. Mica schist whose mica is
sericite. Sericite is also used as a prefix
to many names of metamorphic rocks
containing the mineral.

sericitization. a. A type of hydrothermal al-
teration which results in a complete loss
of soda and a large gain in silica, potash,
perhaps pyrite and other substances. The
typical product of complete sericitization
is a finely granular aggregate of sericite,
quartz, mica, and sericite, which usually
forms a very incompetent rock. Sericitized
rocks are often white to light yellow in
color and are usually soft. Leufl, p. 695.
b. Development of sericite in schists and
other rocks due to metamorphism.

series circuit firing. A method of connecting
together a number of detonators which are
to be fired electrically in one blast. Each
detonator is connected to the adja-
cent detonator to form a continuous circuit having two free ends which are
then connected to the firing cable. In
British coal mines, all rounds of shots
must be connected electrically in series.

The result is a much lower resistance
having a high electrical resistance, requiring high
voltage at the exploder which in turn increases the chance of misfires due
to current leakage. See also parallel circuit
firing. Nelson.

Series connection. When the various parts of
a circuit are connected in sequence so
that the current passes through each of
them in turn, they are connected in series
and the total electromotive force is found
by adding together the electromotive forces
of the individual parts. Mason, V, p. 386.

series conveyor. A conveyor system in which
the belts from a number of drives are
connected to a single drive, and the
conveyors are started and stopped in
sequence. Nelson.

series drain. A drain in which the various parts
of a system of pipes or conduits are
connected in series and are started and
stopped in a predetermined plan.

series firing. The firing of detonators in a
round of shots by passing the total sup-
ply current through each of the deto-
nators. Compare parallel firing. B.S. 3618,
1962. See also series circuit firing.

series motor. Electric motor with field wind-
ings in series with armature. Pryor, 3.

series welding. A method of connecting
together a number of devices which
are to be fired electrically in one blast.
The detonators are connected in parallel
in a number of groups and these

sequence interlock. An interlock provided
between a number of manually controlled
electrical circuits, which are required to
function in a prescribed order, and which
prevent a circuit from being operated
unless the preceding circuit has com-
pleted its part in the sequence. B.S.
3618, 1965, see.

sequence starting. An arrangement whereby
the starting of one belt conveyor starts
all of its feeder conveyors in a predeter-
mined manner. The purpose of sequence
starting is to prevent spilling at transfer
points and to reduce the power demand in
a system. NEMD Jagger, 1961.
See also power sequence; pilot sequence;

sequence welding. In resistance welding, a de-
vice used for controlling the sequence and duration of any or all of the elements
of a complete welding cycle except weld
time or heat time. A$M Gloss.

sequence; sequestration; sequestering agent.
A sequestering agent forms soluble com-
pounds with trivalent cations or with metals having a valency
of 7, as with chlorine and manganese in
perchlorates and permanganates. Pryor, 3.

series circuit. A circuit in which all the compo-
nents are connected in series. Electrical
agents are connected in such a manner
that only a single battery, or other source
of electricity, is used in the circuit.

Series connection. When the various parts of
a circuit are connected in sequence so
that the current passes through each of
them in turn, they are connected in series
and the total electromotive force is found
by adding together the electromotive forces
of the individual parts. Mason, V, p. 386.

series copper-refining process. See Hayden
process; Smith process; Randolph process.
Liddell 2d, p. 695.

series firing. The firing of detonators in a
round of shots by passing the total sup-
ply current through each of the deto-
nators. Compare parallel firing. B.S. 3618,
1962. See also series circuit firing.

series motor. Electric motor with field wind-
ings in series with armature. Pryor, 3.

series of igneous rocks. See igneous rock
series. A.G.I.
parallel groups in turn connected in series. See also parallel series circuit. Nelson.

series parallel firing. The firing of detonators in a round of shots by dividing the total number between two or more branches, each containing a certain number of detonators wired in series. B.S. 3618, 1964, sec. 6. series refracting. See Haydon process. series shots. A number of loaded holes connected and fired one after the other. In contradistinction to simultaneous firing, where the charges are connected electrically, and are all exploded at one time. Staz, R.E.

series ventilation. A system of ventilating a number of faces consecutively by the same air current. B.S. 3618, 1965, sec. 2. series welding. A method of resistance spot, seam, or projection welds simultaneously by a single welding transformer with the molten metal forming a series circuit. ASM Gloss.

serpentine. a. A hydrous magnesium silicate, Mg$_3$Si$_2$O$_5$(OH)$_4$, of greenish-black, but only as pseudomorphs. It is always of secondary origin. The translucent varieties are used for ornamental purposes; those with a fibrous habit (chrysotile) are called asbestos. Commonly green, greenish-yellow, or grayish-green. The variety includes at least two distinct minerals, antigorite and chrysotile, very difficult to distinguish. Most asbestos is chrysotile. Fay; A.G.I.; Dona 17. b. In petrology, a metamorphic rock serpentine composed of serpentine in the whole or a part of the mineral serpentine. Fay.

serpentine jade. A variety of the mineral serpentine, resembling bowenite, occurring in China; used as an ornamental stone. C.M.D.

serpentine marble. See chrysotile. C.M.D.

serpentine rock. A rock generally having a full green color and often spotted or mottled, resembling the spots of a serpent's skin. Meniscus, 9th, p. 302.

serpentine; serpentine. Occasionally it happens that a variable or periodically shifting currents extend a spit first in one direction, then in another; as a spit of sea mud, etc. Fay, S.M.

serpentine tale; serpentinithke. A mineral between serpentine and talc in composition, Mg$_3$Si$_2$O$_5$(OH)$_4$, and physical characters. From silification of dolomite in anhydrite bed of the Werra salt deposits, Thueringia, Germany. Spencer 21, M.M., 1958.

serpentine ware. a. A hard, green-spotted or mottled pottery, often called serpentine. Webster 3d. b. A variety of Wedgwood ware. See also pottery. Fay.

serpentine, color constancy. Almost wholly of serpentine minerals derived from the alteration of previously existing olivine type rocks. A.G.I.

serpentinization; serpentinization. The conversion of ferromagnesian minerals or rocks into aggregates of the serpentine minerals. A.G.I.

serpilite. A bluish-green mineral occurring in association with chrysotile, H$_2$O, Tabular, and in tufts with 1 very perfect cleavage: Larsen, p. 179.

Serpillite grit. A minor subdivision of the Glenlyon Formation of Cambrian age in the Northwest Highlands of Scotland, characterized by the occurrence of the organism serpulites, by some geologists regarded as a very large colonial echinopod, by others as merely a segmented worm. C.T.D.

serpentine. Notched or toothed on the edge; saw-toothed. Webster 3d. Frequently applied to mountain ranges. Fay.

serpentine. (An edge) cut into a line of teeth. Nichols.

serpentine saddle. A refractory support for pot-metal or char. Fay, S.M.

serpentine texture. A term denoting saw-toothed contacts between minerals. A.G.I.

serpentine. A bonding clay for foundry sands. Other.

servant. One who carries and carries out the will of the master or of a mine operator in the execution of the work not only as to whether or not to be accomplished but also as to the means to be employed, is a servant and not an independent contractor. Ricketts, 1.

serve. To furnish; supply; as, the gas wells serve the town with light and heat. Webster 2d. Gas is said to serve when it issues more or less regularly from a fault; a break, etc. Fay.

service-employee. A. A person employed by an employer or company and member of staff. A.G.I.

service agreement. Contract between employer or company and member of staff. Pryor, 3.

service compartment. The section of a mine shaft in which are located the water pipes, the pipeline for compressed air, the cable for the winding gear, and signaling and similar arrangements. Stoices, v. 1, p. 508.

service cistern. An apparatus for exercising control over the rate of inflow of water into a tank of which it is a part. Fay.

service shaft. A shaft employed solely for the hoisting of men and materials to and from underground. Nelson.

service tee. A pipe tee having inside thread on one end and on branch, but outside thread on other end of run. Also known as street tee. Stroke, 3.

service valve. A valve controlling almost wholly of serpentine minerals derived from the alteration of previously existing olivine type rocks. A.G.I.

service water. Water supplied to mines, etc. A.G.I.

set. A. A put together, as a group. Fay, 5. A group of mines under lease. Webster 2d. a. A flat steel bar; a kind of wrest. Webster 2d. i. A piece placed temporarily upon the head of a pile that cannot be reached directly by the weight or hammer. Webster 3d. g. A train of mine cars; a trip. Fay, v. 1. To mine the sides off and trim up a heading. Fay, v. 1. N. of Eng. To load a tub unfairly by placing the aggregate of the coal on the top of it and leaving the bottom part mostly empty. Fay, k. N. of Eng. The natural giving way of the roof for want of support. Fay, i. To make an agreement with miners to do certain work; for example, to set a stall. Fay.

set casing. The cementing of casing in the sides of an excavation, shaft, or tunnel. Also called sett. Webster 3d. See also one-piece set; two-piece set. See also A.G.I.

settle. To settle, as in the case of a miner or of a mine. See also sett. Webster 3d.

sett. A. A group of mines under lease. Webster 2d. a. A flat steel bar; a kind of wrest. Webster 2d. i. A piece placed temporarily upon the head of a pile that cannot be reached directly by the weight or hammer. Webster 3d. g. A train of mine cars; a trip. Fay, v. 1. To mine the sides off and trim up a heading. Fay, v. 1. N. of Eng. To load a tub unfairly by placing the aggregate of the coal on the top of it and leaving the bottom part mostly empty. Fay, k. N. of Eng. The natural giving way of the roof for want of support. Fay, i. To make an agreement with miners to do certain work; for example, to set a stall. Fay.

set cement. A bonding clay for foundry sands. Other.

set cistern. An apparatus for exercising control over the rate of inflow of water into a tank of which it is a part. Fay.
hole. The cement is introduced between the casing and the wall of the hole and then allowed to harden, thus sealing off intermediate formations and preventing fluids from passing into the hole. It is customary to set casing in the completion of a producing well. Williams.

set casing shoe. DCDMA name for a casing shoe set with diamonds. Often used for a one-shot attempt to drill casing down through overburden to bedrock. Also called casing-shoe bit. Compare casing-bit; casing shoe. Long.

set coal. a. Used among British miners for coking purposes. b. The part of a small lump of coal that remains after the coal has been reduced to a fine powder. Synonym for setting.

set i.d. Also called bore; center bore; inside gage; inside set diameter of a core bit. Usually written set i.d., or inside set diameter. Long. Also called setting ring; ring gage; setting gage; setting rod; ring gage; setting gage; Long.

set hammer. The flat-faced hammer held on a handle used by a blacksmith when shaping or smoothing a surface by aid of his striker's ledge. Long.

set i.d. Synonym for set inside diameter.

set inside diameter. The minimum inside diameter of a set core bit. Usually written set i.d. in drilling industry literature. Also called bore; center bore; inside gage; set. Long.

set off. Eng. The part of a connecting rod to which the bucket rod is attached. Set.

set of turns. A group of gas retorts or chambers. Also known as a slip. ASTM C286-65.

set outside diam. The maximum outside diameter of a set bit. Usually written set o.d. in drilling industry literature. Also called outside gage; set o.d. Long.

set reaming shell. A reaming shell, a portion of the reaming shell; it is used to check the setting diameter of a bit or reaming shell. Also called spigot gage; bit ring gage; setting ring; ring gage; setting gage. Long.

set rod. A special diamond-drill rod used to hold a deflecting wedge in a borehole. Long.

set ring. A ringlike sleeve the inside diameter of which is the same as a specified inside diameter of a core bit. Also called setting ring; ring gage; setting gage. Long.

settime; set time; set. The time required by a freshly mixed paste of cement and water to acquire an arbitrary degree of stiffness as determined by specific tests for initial and final set. Taylor.

settled. a. See settlement. b. See settlement ring; settling ring.

settled production. The production of an oil well which, apart from the normal progressive annual diminution, will last a maximum of one year. Turrsets. Fay. b. N. of Eng. See cage shutts. Also spelled settle boards. Fay.

settle. a. A term used to indicate the amount of vertical deformation, that takes place in a kiln full of bricks. Fay. b. To clear of dregs and impurities by causing them to sink. Webster 2d. c. To cause to sink; to depress; to render close or compact. Webster 2d. d. To sink or drop as sediment, especially of ooze or dust. Schiefer, dacker.

settle blow. The stage in the blow-and-blow glassmaking process when glass is forced into a finish or ring mold by air pressure. Dodd.

settle boards. a. N. of Eng. Iron plates or sheets forming the floor of a heapstand, to admit of the tubs being pushed and turned about with facility. Turnsets. Fay. b. N. of Eng. See cage shutts. Also spelled settle boards. Fay.

setting. a. The downward movement of a specific gage in a set core bit. Also called setting gage; setting ring.

setting rate. A compartment term referring to the time required for the glass surface to come within a specified range of the glass-pressure range. A short time implies a fast setting rate, and a long time implies a slow setting rate. ASTM C1200-85.

setting rod. A diamond-drill rod used to hold a deflecting wedge in a borehole. Long.
structure, due to compression of the soil below the foundations. Uniform settle-
ment of a reasonable amount is not harm-
ful to normal structures. Damage is liable to occur when different parts settle by
different amounts—known as differential
displacement. N.L. b. The gradual low-
ering of the superincumbent strata in
mines as the co. 1 or stratified mineral is
extracted. See: ; to subsidence; differential
displacement; seat of settlement. Nelson.
settlement clerk. One who calculates pay-
ment.
shack. Derb. An irregular ore deposit. See also self-open. Fay.

shackamite. A variety of analcite trachyte with phenocrysts of rhombic feldspar. A.G.I.

shackle. a. A connecting link or device for fastening parts together. Usually in such a manner as to permit some motion. Critpin. b. A connecting device for lines and drawbars which consist of a U-shaped section pierced for cross bolt or a pin. Nichols. c. A short wrought iron or manganesee steel chain for connecting mine cars to form a journey or train, for transport by rope haulage or locomotive to and from the pit bottom. He attaches the cars at the junction to form trains for the locomotive or rope haulage. Another idea is to limit the pit bottom for loading into the cage. Nelson.

shade. a. A color that has been darkened by shadow photometer. See Rumford's shading. b. A common method of showing shading. Fay. c. A short wrought iron or manganese steel chain for connecting mine cars to form a journey or train, for transport by rope haulage or locomotive to and from the pit bottom. He attaches the cars at the junction to form trains for the locomotive or rope haulage. Another idea is to limit the pit bottom for loading into the cage. Nelson.

shading. a. A common method of showing relief on maps. The map is shaded so that the inclinations appear as if illuminated with parallel rays of light from a given angle and viewed from a post vertical. Form the topographic forms are thus shown by the shadows they cast. Stokes and Varnes, 1955. b. A pleasing effect produced in enamel by applying, thus shown by the shadows they produce. The topographic forms are noted with parallel rays of light from a point vertically above. The map is shaded so that the inclinations are shown. A.C.T.D. c. The upper zone of the blast furnace. Mersereau, 4th, p. 399.

shaft allowance. The difference between the excavation diameter and the finished diameter in a mine. Nelson.

shaft bottom. See loop-type pit bottom; pit bottom; a; single approach pit bottom. Nelson.

shaft cable cleat. A clamp fixed to a shaft wall or to a run to support vertical cables in a shaft. B.S. 3618, 1965, sec. 7.

shaft capacity. The output of ore or coal that can be expected to be raised regularly during the mine. Weed, 1922.

shaft caving: air lock. The structure enclosing the top of a shaft designed to prevent short circuiting of air into or out of the shaft. B.S. 3618, 1963, sec. 2.

shaft cave. A looted or abandoned shaft or shafts. A.G.I.

shaft collar. See collar set; collar structure. Nelson.

shaft column. A length of pipes installed in a mine shaft for pumping, compressed air, or hydraulic stowing. Nelson.

shaft crane. Hand-rock crane in upcast shaft, set to reduce larger lumps of ore to convenient size for delivery to skip by way of leading pocket. Pryor, 3.

shaft deformation bar. A useful contrivance for measuring the deformation in the cross section of a rock mass. It consists of a length of 1½-inch pipe fitted at one end with a micrometer and at the other end with a hard steel cone. The micrometer should have a range of 3 to 4 inches and should fit into a bushing in the pipe in some manner. It can also be removed from the bar for safe keeping or during transport. Isaacson, p. 207.

shaft drill. The drilling of small shafts up to about 5 feet diameter with the shot drill. In shafts from 4 to 6 feet diameter have been sunk by core drilling. A ring 4 inches wide is formed by roller bits similar to oilfield rotary drilling. Six tricone cutters are used and a large core is formed. A special tool is drilled in the core and a small explosive charge fired to break it for removal. In some cases, it is rumbled bodily. Nelson.

shaft driver. See hoistman. D.O.T. 1.

shaft feeder cable. A cable mounted in a shaft to transmit electrical power to the shaft bottom and/or to an intermediate level. B.S. 3618, 1965, sec. 7.

shaft furnance. A high furnace, charged at the top and tapped at the bottom. Fay. The iron blast furnace is the most important example of a shaft furnace. Newton, p. 275.

shaft head. See cage guides; fixed guides; rope guides. Nelson.

shaft horsepower. A. Actual horsepower produced by the engine after deducting the heat loss of exhaust flue gases, and loss due to friction. Fay.

shaft house. A building at the mouth of a shaft, where ore or rock is received from the mine. Weed, 1922.

shaft inset. The point where a horizontal tunnel intersects a shaft. See also inset. Nelson.

shaft kiln. A vertical kiln charged at the top and discharged at the bottom. If solid fuel is used it is fed in with the charge, but shaft kilns can also be fired with gas or oil by burners placed directly on the bottom of the shaft. Such kilns are used for the calcination of flint, dolomite, fire clay, etc. Dodd.

shaft lighting. The lighting of shafts at landing stations is often found to be far from ideal. Work in the cages, during loading and unloading, and examination of shaft equipment by the provision of fittings to provide a directional flux distribution in such a way that light is thrown forwards from the pit bottom or inset roadway into the shaft area. There must also be adequate illumination on a vertical plane at the shaft inset. Roberts, II, p. 122.

shaft lining. The timber, steel, brick, or concrete structure fixed around a shaft to support the walls. In modern shafts, a concrete lining is generally favored as a shaft lining support. Nelson.

shaftman. a. A miner; one who inspects shaft timbering, guides, guards, and parts from time to time or by climbing down manway, replacing and repairing damaged or defective shaft timbers, cage guides and guards, and other parts; and tightening joints of compressed air, steam, and water pipes. Also called shaft tender; sheavenman. D.O.T. 1. b. See shaft sinker. D.O.T. 1.

shaft mine. a. One where ore or coal is reached by a vertical shaft which may...
shaft mine

vary in depth from less than 100 feet to several thousand feet. Kentucky, p. 329.

b. A mine in which the main entry or access is by means of a shaft. Compare mining (passageways) from the surface.

shaft miner. See shaft miner, b. Dodd.

shaft pillar. a. A large area of a coal seam which is left unworked around the shaft bottom to protect the shaft and in the surface buildings from damage by subsidence. All roadways in the shaft pillar are narrow and coal faces are not opened out until the limit line of the shaft pillar is reached. The area of shaft pillar is considerably greater than the surface area requiring protection. Nelson. Also called high pillar. Fay. b. A solid block of ore left around the shaft where it crosses the lode, for protection against earth movement. Pryor. 3.

shaft plumbing. a. The operation of transferring one or more points at the surface of a vertical shaft to plum line positions at the bottom of the shaft; a method to

shaft raising. See raising.

shaft set. a. Supporting frame of timber, shaft siding. The station or landing-place arranged for the full and empty tubs at the bottom of a shaft. Fay. b. A working face or station in a vertical shaft, a landing or station from which coal is loaded and unloaded

shaft plumbing. a. Ore storage, excavated at depth, which receives trammed ore pending removal by skip. Pryor. 3. b. Loading pockets of one or more compartments for different classes of ore and for waste built at the shaft stations. They are cut into the walk on one or both sides of a vertical shaft or in the hanging wall of an inclined shaft. Lewis, p. 257. c. See measuring chute. Nelson.

shaft rating. See raising.

shaft rent. a. Rent paid for the use of a shaft for mining the minerals from another property. Fay. b. Interest on capital invested in sinking a shaft. Fay.

shaft section. A drawing or log giving details of the structure and the nature of strata intersected by a shaft. B.S. 3618, 1965, sec. 1.

shaft set. a. Supporting frame of timber, maintaining proper support of the sides of the shaft and the gear. Composed of two wallplates, two end plates, and dividers which form shaft into compartments. Pryor. 3. b. A system of mine timbering similar to square sets. The shaft sets are placed from the surface downward, each new set supported from the set above until it is blocked in place. New wallplates are installed on the upper end of the set above by hanging bolts. Blocking, wedging, and lagging complete the work of setting this set. At stations the shaft posts are made much longer than usual to give ample head room for unloading timber on the shaft set. C.T.D. b. See also Weibach triangle, a. Pryor. 3.

shaft signal recorder. A device which records, on paper or otherwise, the signals given by the bankman and the onetower and the movement of the order drum. B.S. 3618, 1965, sec. 7.

shaft signal recorder. a. A device which records, on paper or otherwise, the signals given by the bankman and the onetower and the movement of the order drum. B.S. 3618, 1965, sec. 7.

shaft sinking. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Excavating a shaft by the method of sinking drill. Bureau of Mines Staff. Compare raise.

shaft sinking drill. A large-diameter drill with multiple rotary- or thrust-cutting bits used for shaft sinking. An adaptation from oil well drills Engineering and Mining J., p. 378.

shaft sinking power supply. A supply of compressed air at a working pressure of about 100 pounds per square inch. At a new mine where two shafts are being sunk, the power installation may comprise eight slow-speed water-cooled compressors with a total output of about 2,000-2,500 cubic feet per minute. A new machine which compresses 20,000 to 30,000 cubic feet per minute. Nelson.

shaft sinker. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Called shaft drifter. D.O.T. 1.

shaft sinking. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Excavating a shaft by the method of sinking drill. Bureau of Mines Staff. Compare raise.

shaft sinking drill. A large-diameter drill with multiple rotary- or thrust-cutting bits used for shaft sinking. An adaptation from oil well drills Engineering and Mining J., p. 378.

shaft sinking power supply. A supply of compressed air at a working pressure of about 100 pounds per square inch. At a new mine where two shafts are being sunk, the power installation may comprise eight slow-speed water-cooled compressors with a total output of about 2,000-2,500 cubic feet per minute. A new machine which compresses 20,000 to 30,000 cubic feet per minute. Nelson.

shaft sinker. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Called shaft drifter. D.O.T. 1.

shaft sinking. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Excavating a shaft by the method of sinking drill. Bureau of Mines Staff. Compare raise.

shaft sinking drill. A large-diameter drill with multiple rotary- or thrust-cutting bits used for shaft sinking. An adaptation from oil well drills Engineering and Mining J., p. 378.

shaft sinking power supply. A supply of compressed air at a working pressure of about 100 pounds per square inch. At a new mine where two shafts are being sunk, the power installation may comprise eight slow-speed water-cooled compressors with a total output of about 2,000-2,500 cubic feet per minute. A new machine which compresses 20,000 to 30,000 cubic feet per minute. Nelson.

shaft sinker. a. Excavating a shaft downwards, usually from the surface, to the workable coal or ore. High sinking rates are possible by (1) mechanical mucking; (2) increased winding capacity; (3) improved concrete supply and placing; (4) improved surface layout; and (5) improved methods of blasting. Nelson. b. Called shaft drifter. D.O.T. 1.

Nelson. b. Excavating a shaft by the method of sinking drill. Bureau of Mines Staff. Compare raise.

shaft sinking drill. A large-diameter drill with multiple rotary- or thrust-cutting bits used for shaft sinking. An adaptation from oil well drills Engineering and Mining J., p. 378.
shaker conveyor 984

shaly sandstone

shaker-conveyor engine. A reciprocating engine operated by compressed air which is used to impart the reciprocating motion to a shaker conveyor panline. Jones.

shaker screen. A screening medium mounted in a rectangular frame, supported in a horizontal or slightly inclined position, and reciprocated longitudinally by a crank or eccentric. The unique feature that differentiates the shaker from all other screens is that the load applied to the screen is transferred to the medium by the shaking motion of the screen. Mitchell, p. 134.

shaking conveyor. A machine for loading coal, ore, or rock usually in headings or tunnels. It consists of a wide flat shovel which is forced onto the surface; for a glossy or livery appearance; then, squeezing the pad; and observing if a rapid apparent drying and subsequent cracking of the soil occurs. ASCE P1226.

shale. A. A laminated sediment, in which the constituent particles are predominantly of the clay grade. Holmes, 1928. b. Shale includes the indurated, laminated, or fissile claystones and siltstones. The cleavage is that of bedding and such other secondary cleavage that is approximately parallel to bedding. The secondary cleavage has been produced by the pressure of overlying strata and plastic flow. A.G.I. c. One of the impurities associated with coal seams; this term should not be used as a general term for washery rejects. B.S. 3552, 1962.

shale-and-clay feeder. One who keeps conveyor belt that feeds dry mill constantly loaded with shale and clay. Also called clay-and-shale feeder; clay conveyor; shale conveyor; shale-and-clay conveyor man; shale feeder. D.O.T. 1.

shale assay ton. In the assay of oil shale, the oil distilled is usually measured in cubic centimeters. To obviate the need of conversion to gallons per ton the shale is weighed in units of 239.66 grams, or 1 gallon per short ton. The weight is, of course, only an approximation, as the specific gravity of the oil varies. Hess.

shale crescents. Crescents formed by shale filling the troughs of ripple mark. Pettijohn.

shale cutter; shale planer. A mechanical excavator sometimes used for getting clay from deposits that are both hard and friable, and that will maintain a steel face for a long period. The purpose of the machine is an endless chain that carries a series of cutters which bear downwards on the clay to a depth of about two inch thick. The machine makes semi-circular sweeps into the clay face before being moved forward or sideways. Dode.

shale dust. The dust obtained by drying and grinding shale. Rice, George S.

shale naphtha. Naphtha obtained from oil shale. Fay.

shale oil. A crude oil obtained from bituminous shales, especially in Scotland, by submitting them to destructive distillation in special retorts. Fay.

shallow. Has a bottom yielding oil on distillation. This term was formerly used as signifying argillaceous rock. Fay.

shallow pipe. A hollow bore hole drilled from red burning hard clay with a distinct fissile structure. Vitrification, from 1,350° to 1,250° C, and salt glazing is successful only at highest temperature. Hess.

shale pit. A dumping place for coarse material screened out of rotary drill mud. Fay.

shale planer. See shale cutter. Dode.

shale screen. See shaker, c. Long.

shale, and. shale screen. A reciprocating mud circulating system of a rotary drill. Nichols. b. A cylindrical stieve or vibrating table that removes the drill cuttings from the circulating mud stream. Wheeler. c. See shaker, c. Long.

shale spirit. Coals of boiling fractions obtained in the refining of crude shale oil. Fay.

shale nature. Shakeness is the property of lustrous rocks, not so smooth and having concave or shelly surfaces in a general way parallel to the bedding planes. A.G.I. c. Having the bedding not far below the surface or top; not deep. Standard, 1964.

shale cave. A cave close to the ground surface. A.G.I.

shallow investigation laterolog. The main use of this log is to provide data on the resistivity of a porous zone (immediately behind a mud filter cake) which is fully flushed by mud filtrate to correct induction log readings. It may also be used in conjunction with a porosity log and other focused devices to give a suite of logs which, in theory, can be unequivocally interpreted. The so-called "grand slam" technique. This log is also called the laterolog B, or more often LLS. Williams, p. 92-93.

shallow vein zone deposits. These deposits are formed at depths probably not greater than 1,000 feet below the surface and within a temperature range of from 50° to 200° C. They are found as tabular veins, irregular veins, and veins in quartz, and as ledges and irregular replacement deposits; they constitute a very important class of deposits, being the source of the world's silver, all of its mercury and important quantities of gold, copper, lead, and zinc. Williams, p. 92-93.

shallow water. Water of a depth less than one-half the length of the waves concerned. Fay.

shallow-water blackout. A carbon dioxide accumulation or excess in a breathing system, as a shaly sandstone or limestone. HBG.

shallow well. A shaft sunk to pump surface or top; not deep. Standard, 1964.

shale. A type of sediment; shale is a sediment, or rock, composed of, or resembling shale, having the characteristic structure and fissility of shale, as a shale sandstone or limestone. Fay. b. Brittle ground. Fay.

shale blues. Term used among Scottish miners to denote coal rock. Fay.

shale sandstone. Arkose of a shale base.
shaly sandstone

with a fissile structure. Bureau of Mines Staff.

shandy-gaff. Shakes or benches, from one to the other of which one is thrown successively in raising it to the level above, or for raising water. See also shambles.

shammel. a. A stage for shoveling ore upon, or for raising water. See also shambles.
b. To work a mine by throwing the material excavated onto a stage or in the "cast after cast" method, which was the usual way before the art of regular mining by means of shafts had been introduced. Fay.

shanty. A mineral, Ni2PbSi, rhombohedral, with X-ray pattern distinct from parkerite and from the system Ni5Si2PbSi. From Trial Harb., Tasmania. Spencer 13, M.M., 1952.

Shanks's classification. A classification of igneous rocks based on crystallinity, degree of saturation with silica, degree of saturation with alumina, and color index. A.G.I.

shandy-gaff. Aus. Shovel-filled coal. Coal that is cut only by a shovel without screening, hence containing an excess of fines; run-of-mine coal. Fay.

shared. a. A pit or shaft. Fay.
b. To work a mine by throwing the material excavated onto a stage or bench or for raising water. See also shambles.

c. A curved, spicularike fragment of volcanic glass. A.G.I.

d. A share of stock of a corporation. ASCG.

e. A share on a piece of paper certifying that the owner possesses one of a number of equal parts of the business. Hooe, p. 246.

Sharon quartzite. A quartzite occurring in Ohio and dated as the prototype of all quartz refractories. A quoted analysis is: 98.7 percent SiO2, 0.3 percent Al2O3, 0.3 percent Fe2O3, and 0.3 percent alkalies. Dodd.

sharp bit. a. A bit in which the exposed acute edges and points of the diamonds have not been worn off, dulled, or blunted by use. Long. b. A newly set and unsharpened bit. Fay.

sharpening stone. a. Any natural or artificial stone with grit used for putting an edge to steel tools. Mersonerau, 4th, p. 268.
b. Hand-used stones that include scythe-stones, whetstones, oil stones, water stones, razor stones, holystones, and rubbing stones. AIME, ps 13-14.

c. The art or skill of sharpening. Dodd.

sharp gay. Eng. Firedamp that explodes suddenly within a safety lamp without showing any perceptible cap. Gas is sharp when at its most explosive point. Fay.

sharp gravel. Angular flint gravel. Arkell.

sharp finish. See finish. Dodd.

sharp fire. Combustion with excess air and short flame. ASTM C162-66.

sharp lime. Derb. A very hard limestone, containing small lumps burnt clay in the vicinity of Horsetown. Arkell.

sharpLinde. Green to blue, monoclinic mineral, 2CaO.2SiO2.4H2O; fibrous. Lar sen, p. 137. Possibly identical to plancheite, the formula being 6CaO.5SiO2.15

sharp. 1. A fine-grained sandstone, free from mud, grit, and angularity problems. Developed by Shock for a sedimentary rock made up of angular particles more than 2 millimeters in size. Fay.

shatter index. The percentage of a specially prepared sample of coke remaining on a 4.75-mm sieve. Fay.

shatter test. An empirical test for coke or briquettes which gives an indication of the resistance of the cone to breakage. A 50-pound sample of test material over 2 inches in size is dropped four times from a height of 6 feet onto an iron plate. It is then screened and each fraction recorded as a percentage of the total sample. Moul.

shatter zone. Applied to a belt of country in which the rock is cracked in all directions, resulting in a network of small cracks or fissures. Fay.

shatterproof glass. Layers of glass cemented to clear plastic sheets to prevent shatter. Fay.

shatterproof. B. Staff. Burnt clay in the vicinity of burnt coal. Arkell.

shattuckite. Green to blue, monoclinic mineral, 2CaO.2SiO2.4H2O; fibrous. Lar sen, p. 137. Possibly identical to plancheite, the formula being 6CaO.5SiO2.15

shavings. A. Staff. In the stoneindus. industry, one who trims the outline edges of granite blocks, using an abrasive saw. D.O.T. 1.

shaving. A. As a finishing operation, the accurate removal of a thin layer by drawing a cutter in a straight-line motion across the work surface. A.S.M. Gloss. b. Trimming parts like stampings, forgings, and tubes to remove uneven shaped edges to improve accuracy. A.S.M. Gloss.

shave. 2. A gas-fired chamber kiln; one of the main features being that the proportion of the hot gases past beneath the kiln floor to improve the temperature distribution from top to bottom of the setting. Dodd.

shaver. A. In making a cast in a coal seam that has been percut. Standard, 1964, p. 90.

shear. a. To make vertical cuts in a coal seam that has been percut. Standard, 1964, p. 90.
b. See shearing. Fay.
c. Mode of failure of a body or mass whereby the portion of the mass that the side of a plane or surface slides past the portion on the opposite side; important property in soil stability. ASTM D1696. See also shear tests. Nelson. d. That type of force which causes or tends to cause two contiguous particles of a solid to slide relative to each other in a direction parallel to the plane of contact. ASM
Shear

A type of cutting tool with which a material in the form of wire, sheet, plate, or rod is cut between two opposing blades. ASM Gloss. I. The type of cutting action produced by rake so that the direction of chip flow is other than normal to the cross section to the cutting edge. ASM Gloss. II. To make into shear steel by condensing blister steel and making it homogeneous. Standard, 1904. b. Application to material of external force (stress) parallel to the cross section concerned. Shear strength (I) is

\[ f = \frac{Z}{A} \]

where BM is the bending moment and Z is the section modulus. Pryor, 3.

Shear angle. In metal cutting, the angle that shear takes place with debris. Shear bursts frequently have not taken stress, throwing still more small lateral movements aka: innumerable shear fractures. See also shear fractures. A.G.I. Shear bursts. a. A fracture that results from stresses which tend to shear one part of a specimen past the adjacent part. Contrast with tension bursts. Billings, 1954, p. 93. b. A fracture in which a crystal (or a polycrystalline mass) has separated by sliding or tearing under the action of shear stresses. ASM Gloss.

Shearing. a. The vertical side cutting which, together with horizental under-cutting, constitutes the attack upon a face of coal. Fay. b. Making a vertical cut or groove in a coal face, stope, or bogie, as opposed to a kerf, which is horizontal cut. B.C.I. Called in Arkansas a cut or cutting. Fay. c. The term given to vertical cut drops are made in coal headings only to provide an additional free face, since in heading work it is usual to employ deeper cuts than on longwall faces, and the shots in headings are much lighter. McAdam II, p. 96. d. The deformation of rocks by cumulative small lateral movements along: innumerable parallel planes, generally resulting from pressure, an inducing职权, shear cleavage, minute plagioclase, and other metamorphic structures. Fay.

Shearing force; sliding force. a. A straining action wherein tangentially applied forces tend to produce a skwing type of deformation. Shearing force is usually accompanied by normal forces produced by tension, thrust or bending. McGraw Hill Encyclopedia of Science and Technology, p. 17, 1969, p. 243. b. A force such as the force on rivets securing two plates together, for example, boilers and bridges. Morris and Cooper, p. 141.

Shearing jib. A jib of a coal cutter or cutter loader which makes a vertical or shear cut in the coal, ore, or rock. Nelson.

Shearing-machine operator. See shearers.

Shearing of rocks. Shear zones, which are common in metamorphic rocks, are indicated by bands of crushed rock (cataclase, etc.) and by the development of such minerals as chlorite. See also strain-slip cleavage. J.T.D.

Shearing strain. See strains.

Shear stress. See also shear fractures. A.G.I. Shear leg. A vertical line parallel to the longitudinal tensile or compressive bending stress in wide beam flanges diminishes with the distance from the web or web; this stress diminution is called shear lag. Ro.

Shear legs. a. High wooden frame placed around an engine or pumping shaft fitted with small pulleys and rope for lifting heavy weights. Zett.

Shear strain. Angular displacement of a structural member due to a force acting across
shear strain

it, measured in radius. See also shear modulus. Ham.

d. The stress or load at which a material fails in shear. Nelson. b. The internal resistance offered to shear stress. a. The shear force operating on a material. c. The shear stress acting on a material. d. The shear value of a material. e. The shear failure of a material.

shear stress. a. The stress or load at which a material fails in shear. Nelson. b. The internal resistance offered to shear stress. a. The shear force operating on a material. c. The shear stress acting on a material. d. The shear value of a material. e. The shear failure of a material.

Shear tests. Tests to determine the shear properties of soil samples. The shear test or the triaxial compression test may be performed in the laboratory, but the vane test is more suitable for the in situ soils in a borehole. Nelson.

shear wave. a. The same as transverse wave. Slichter. b. A wave, usually in a solid, which causes an element of the solid to change its shape without at the same time undergoing a change in volume. Also called rotational wave. Hoy.

shear zone. a. In geology, a zone in which the rocks are fractured and sheared and stretched in a plane of weakness resulting in a change in volume. Also called a shear zone. b. The same as a shear zone. c. A zone of fractures or shear fractures that has been sheared and displaced by a shear zone. d. A rock mass that has been sheared and displaced by a shear zone.

sheared. Sheared or sheared-out refers to a rock mass that has been sheared and displaced by a shear zone.

sheared-out. Sheared or sheared-out refers to a rock mass that has been sheared and displaced by a shear zone.

sheathed. A sheath or a sheath around a rock mass that has been sheared and displaced by a shear zone.

sheathed. A sheath or a sheath around a rock mass that has been sheared and displaced by a shear zone.

sheeted vein. A group of closely spaced, distinct parallel fractures filled with mineral matter and separated by layers of barren rock. Fay. Sheeted vein deposit. An ore deposit occupying a group of closely spaced, distinct parallel fractures or fractures separated by narrow plates of country rock. After metatilization, a composite vein or a replacement lode results characterized by a band structure. Schieferdecker.

sheeted zone. A zone of closely spaced fractures whether mineralized or not. A.G.I.

sheet glass. a. Flat glass made by sheets of surface water, and both its volume and its velocity will be the same at all points equally distant around the’summit. Erosion accomplished by sheets of running water, as distinct from streams, is sheet (or sheetflow) erosion. A.G.I. b. Lowering of land by nearly uniform removal of particles from its entire surface by flowing water. Nichols.

sheeters. Light steel poling boards driven down to protect trench sides from collapse. Ham.

sheetgood. Under certain conditions, sand-laden water flowing over an erodible plain tends at first to divide into small streams like those of pure water on an indestructible surface, yet, since the streams formed in this way begin to overland themselves and thus check their own flow, this tendency is soon counteracted and the water is directed elsewhere. Thus the ultimate tendency is toward movement in a more or less uniform film or sheet and the term sheetflow has come into use in notes and conversation. A.G.I.

sheet lode. a. A line of closely spaced, or closely spaced cracks. Bateman. b. A thin, smooth parting of a mineral and hence a variety of luster, as pearly and silky luster indicate. Shipley. c. A thin, smooth parting of a mineral and hence a variety of luster, as pearly and silky luster indicate. Shipley.

sheet-ground. A term used in the Lower Mississippi Valley for a widespread deposit of silt and sand that is continuous with the levee sand. A.G.I.

sheeted deposit. A mineral deposit (as a group of closely spaced, distinct parallel fractures) that is separated by narrow plates of country rock. After metatilization, a composite vein or a replacement lode results characterized by a band structure. Schieferdecker.

sheeting caps. A row of caps placed on blocks about 14 inches high placed on top of the drifts or when constructing the permanent floor in the stopes. Round poles are then laid lengthwise of the stopes on the ground.
sheeting caps

the sheeting caps and are covered with
lacing. Lewis, p. 498.

sheeting driver. An air hammer attachment
that fits on plank ends so that they can be
driven without splintering. Nicholls.

sheeting. A. Change type. Head spurs, used
to set ditch banking. Nicholls.

sheet. See sheet. Fay.

sheet iron. See sheet. Fay.

sheet-iron gang. Anti-Molly Maguire vigi-
lantes. Kors.

sheet-iron pitch. The inclination of a coal
seam at which loose coal will not move
on the natural bottom, but at which it
will slide or can be easily pushed along
on iron slides placed on the bottom
in the chambers or rooms. Fay.

sheet metal. See sheet. Fay.

sheet metal gauge. A gauge used for measuring
the thickness of sheet metal. Crispin.

sheet mica. Mica that is relatively flat and
sufficiently free from structural defects to
enable it to be punched or stamped into
specified shapes for use by the electronic
and electrical industries. Sheet mica is
classified further as block, film, and splittings.
Skow.

sheet minerals. Those minerals belonging to
the phyllosilicates having sheets of linked
SiO$_4$ tetrahedra. Includes the mica, chlo-
rite, and most of the clay group of min-
erals. c. A.C.I.

sheet pavement. Continuous road surfacing,
such as asphalt, tarmacadam, or con-
crete. Ham.

sheet pile. A wall of sheet metal, reinforced cement,
pressed concrete, or steel driven vertically into the ground
or seabed and anchored back at one or two levels. See
also guide pile. Ham.

sheet piling. a. A diaphragm made up of
members or of interlocked with
like members to form a diaphragm, wall,
or bulkhead. H.G.

sheet-iron wall. A wall formed of sheet
which may be of cast-iron or,
anchored back at one or two levels. See
also guide wall. Ham.

sheet-iron winch. A winch having a drum
or drum and a sheave for winding
rope or chains around. Fay.

sheetquit. A steeltube from which air or
other gas at high pressure is discharged
with explosive force in a shothole; as
used with a special kind of mechina
rock encountered in well boring. Fay.

g. A hollow structure or vessel. A.M. Glas.

shell core. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A core barrel. Long.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.

shell core. A. A shell-molded sand core. ASM
Gloss. k. A tabular casting used in making
mechanical parts of cast iron, steel,
and other metals.
shell marl

apparently also to some extent of precipitated carbonate of calcium and the hard parts of minute organisms. Fay.

shell molding. Forming a mold from thermostating resin-bonded sand mixtures brought in contact with preheated (300°F) to 500°F) metal patterns, resulting in a firm shell with a cavity corresponding to the outline of the pattern. Also called Coring Glass. Shell-natron.

shell-natron. A commercial compound used as a carbon dioxide absorbent in diving. A.G.I.

shell-perm process. A method of reducing the flow of water through a permeable soil into an excavation, by injecting the soil with bituminous emulsion containing a coagulant, which will solidify in the ground. See also permeability. Hart.

Shell phosphate process. A wet scrubbing process for removing hydrogen sulfide from fuel gases in which a solution of tripotassium phosphate removes H2S from gases, particularly underpressure, and without appreciable effect upon carbon dioxide. The hydrogen sulfide is regenerated by boiling, and sulfur may be recovered in a Claus kiln. The plant consists of a reactant tower, or a bubble-cap tower, for absorption, preferably underpressure, and a bubble-cap tower for regeneration of the absorption solution. The regen

shell pump. A simple form of sand pump or sludger consisting of a hollow cylinder walled on one side with a ball or clack valve at the bottom, used with a flush of water to remove debris. Webster 3d. See also sand pump; sluiter.

shells. The outer walls of tile. ASTM C483-63T.

shells of the earth. Concentric shells composing the interior of the earth. Scheider.

shellstone. Eng. A china stone from Cornwall, consisting of sea shells containing too much iron (as brown mica) for use as a flux in pottery glazes but of potential value in sewer pipe glazes. See also china stone. Dodd.

shell wall. Ring wall. The wall of freestall of the type from which the outer steel casing of a hobbled stove. See also hot blast stove. Dodd.

shelly. a. A name applied to coal that has been so crushed and fractured that it breaks up easily into small pieces. Broken ground. Fay. b. A laminated roof that sounds hollow and breaks into thin layers of slate or shale. Zern.

shelly formation. A thin and generally hard stratum encountered in drilling. See also shell. A.G.I.

shelly stone; shelly metal. Eng. Laminated stone liable to flake; fissile stone; marl containing flakes of limestone, Northumberland. Cheshire, Northamptonshire. Arkell.

shelly cove. a. A cove formed from without, for example, by the wind or by waves. Scheider. b. A cove formed within the rock, mostly by solution. Scheider. c. A cove only partially under

sheer. A. Eng. An old term denoting a district of about eight or nine bight bords. Thus a "sheth of bords," or a "shet of pillars." Fay. b. N. of Eng. To course the air in the workings. See also coating. Fay. c. N. of Eng. The rib of a childern wagon. See also sheaths. Fay.

shelting the air. N. of Eng. Ventilating the goafes in a systematic way. Fay.

shelves. The most stable areas of the craton that are hydrologically flooded by marine waters. A.G.I.

shelving. The effect produced in the refractory lining of a glass tank furnace by successive erosion of the horizontal joints between the tank blocks. Dodd.

shelving stone; shelyngstone; shilling stone. Corn.; Som. Slate; a roofing slate or tile. Arkell.

shepherd. Aust. A miner who preserves legal rights to a claim while doing the minimum possible amount of developing. Nelson.

sherardizing. A galvanizing process in which the metal to be coated is heated, with or without tumbling, in contact with zinc; the metal to be coated may or may not be used. Webster 2d. Also called sheuch. Fay. b. Scot. A shaft or coalpit. Fay.

shiel. a. In mining or tunneling, a framework or screen of wood or iron protecting the workers, pushed forward as the work advances. Standard, 1964. b. A metal diaphragm used in tunneling under rivers, or in water-bearing ore. Loose material under cities. The shield may be cylindrical and include the entire tunnel section, or it may be a roof shield and support the roof only. Sherard. c. Precambrian nuclear mass of a continent around which and to some extent upon which the younger sedimentary formations have been deposited. Webster 3d. d. A layer or mass of material used to reduce the passage of ionizing radiation. See also biological shield; thermal shield. L&L.

shield basals. Basaltic accumulation of smaller size than the flood basals, arising from the confluence of lava flows from a large number of small, closely spaced volcanoes. The flows coalesce into masses hundreds to thousands of square miles in size. Synonym for multiple vent basalt. A.G.I.

shielded arc welding. Arc welding in which the arc and the weld metal are protected by an atmosphere of shielding gas, the products of decomposition of the electrode covering, or a blanket of fusible flux. A.G.I.

shielded carbon-arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a carbon electrode and the work. Shielding is obtained from the combustion of a solid metallic fuel fed into the arc or from a blanket of flux on the work or both. Pressure may or may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

shielded metal-arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a covered metal electrode and the work. Shielding is obtained from decomposition of the electrode covering, which is used and filler metal is obtained from the electrode. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

shielded monoelectrode. See guard electrode log. A.G.I.

shielded stud welding. An arc-welding proc

shelter hole. In coal mining, a niche in the rib along a haulage road into which one may step to inspect the seams. Grose.

SHELFON. A stopped-up portion of the steel mill. Fay. An expression used when an explosion of firedamp has taken place in the pit. See also squat lads! Fay.

sheltered. The broken-down roof of a coal mine. Fay.

shetr. a. Eng. An old term denoting a district of about eight or nine bight bords. Thus a "sheth of bords," or a "shet of pillars." Fay. b. N. of Eng. To course the air in the workings. See also coating. Fay. c. N. of Eng. The rib of a childern wagon. See also sheaths. Fay.

sheling the air. N. of Eng. Ventilating the goafes in a systematic way. Fay.

shelves. The most stable areas of the craton that are hydrologically flooded by marine waters. A.G.I.

shelving. The effect produced in the refractory lining of a glass tank furnace by successive erosion of the horizontal joints between the tank blocks. Dodd.

shelving stone; shelyngstone; shilling stone. Corn.; Som. Slate; a roofing slate or tile. Arkell.

shepherd. Aust. A miner who preserves legal rights to a claim while doing the minimum possible amount of developing. Nelson.

sherardizing. A galvanizing process in which the metal to be coated is heated, with or without tumbling, in contact with zinc; the metal to be coated may or may not be used. Webster 2d. Also called sheuch. Fay. b. Scot. A shaft or coalpit. Fay.

shiel. a. In mining or tunneling, a framework or screen of wood or iron protecting the workers, pushed forward as the work advances. Standard, 1964. b. A metal diaphragm used in tunneling under rivers, or in water-bearing ore. Loose material under cities. The shield may be cylindrical and include the entire tunnel section, or it may be a roof shield and support the roof only. Sherard. c. Precambrian nuclear mass of a continent around which and to some extent upon which the younger sedimentary formations have been deposited. Webster 3d. d. A layer or mass of material used to reduce the passage of ionizing radiation. See also biological shield; thermal shield. L&L.

shield basals. Basaltic accumulation of smaller size than the flood basals, arising from the confluence of lava flows from a large number of small, closely spaced volcanoes. The flows coalesce into masses hundreds to thousands of square miles in size. Synonym for multiple vent basalt. A.G.I.

shielded arc welding. Arc welding in which the arc and the weld metal are protected by an atmosphere of shielding gas, the products of decomposition of the electrode covering, or a blanket of fusible flux. A.G.I.

shielded carbon-arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a carbon electrode and the work. Shielding is obtained from the combustion of a solid metallic fuel fed into the arc or from a blanket of flux on the work or both. Pressure may or may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

shielded metal-arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a covered metal electrode and the work. Shielding is obtained from decomposition of the electrode covering, which is used and filler metal is obtained from the electrode. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

shielded monoelectrode. See guard electrode log. A.G.I.

shielded stud welding. An arc-welding proc
shiel ded stud welding

weis wherein coal se is produced by heating with an electric arc drawn between a metal stud or similar part, and the work to be welded, until the surface to be joined are properly heated, when they are brought together under pressure. Shiel ded work is obtained from an inert gas such as helium or argon. (See page 92.)

shiel ded glass. A protective glass for use in nuclear engineering; although it is transparent to visible light, it absorbs high energy electromagnetic radiation. Such glasses contain a maximum proportion of oxides of heavy elements, for example, PbO, TaO, NbO, WO. (See page 92.)

shields. Large areas of ancient rocks that have remained relatively stable through most geologic time. (See page 92.)

shie d volcano. A broad, gently sloping volcano in extent, built chiefly of overlapping and interfering basaltic lava flows. Typical examples are the volcanoes, Mauna Kea and Kilauea, on the Island of Hawaii, and the great basaltic volcanoes of Iceland. (See page 92.)

shield shift. See top shift. (See page 92.)

shif tm en. Men engaged on a time-wage basis working at various jobs. Also called company men. (See page 92.)

shift work. Work performed at a mine and paid for by day wage as opposed to by piece rate. (See page 92.)

shift boss. The foreman in charge of a shift of men. (See page 92.)

shift least. Term for the Devonian slates used for brickmaking in the Plymouth and Torquay areas of England; the word is a dialect form of shale. (See page 92.)

shift men. See piece work. (See page 92.)

shingle. A flat roof of roofing tile. (See page 92.)

shingle blast. A vehicle for squeezing puddled iron. (See page 92.)

shingle rampart. See gravel ridge. (See page 92.)

shingle structure. Arrangement of veins en echelon in the Lower Chert of shingles on a roof. (See page 92.)

shingles. Minute fish scales that sparkle in reflected light; they are liable to occur in gemstones. A mounted or unmounted stone, usually a diopside, characterized by its high refractive index. (See page 92.)

shimmy die. See flat edge trimmer. (See page 92.)

ship newspaper. A special paper used for composition and publication of newspapers. (See page 92.)

shipping. Shipment by rail, ship, or plane. (See page 92.)

shipping structure. A series of thrust sheets lying against one another like the shingles of a roof. Also called imbricature structure. (See page 92.)

shipping. A machine for squeezing puddled iron. (See page 92.)

shipping. As applied to the degree of luster of minerals, means those which produce an image by reflection, but not one well-defined, as celadonite. (See page 92.)

ship plate. See suspension, a. (See page 92.)

ship and galley tile. A special quarry tile having an indented pattern on the face of the tile to produce an antislip effect. (See page 92.)

ship auger. An auger having a simple spiral (helical) body and a single cutting edge, with or without a screw on the end but without a spur at the outer end of the cutting edge, used to obtain soil samples and water levels. (See page 92.)

ship class. A floating steel box fitted to close the entrance to a lock, dry dock, or wet dock, or to gate chambers. (See page 92.)

ship liners. Longitudinal lining plates for ball mill of wedge-like shape. The thin edge of each wedge underlies the thick edge of the preceding plate in direction of revolution. (See page 92.)

ship polarscope. A geomorphologic polarscope suitable for use in the hand without use of microscope or other magnifier. Can be used in determinative geomorphology to detect glass laminae and to differentiate between singly and doubly refractive gemstones. A mounted or unmounted stone is held in an enclosed compartment, by a device which permits its being observed in various positions, affording rapid determination. (See page 92.)

ship observations. Meteorological and oceanographic data taken for a specific location, observed from a ship underway or at anchor. (See page 92.)

shipper. A. An official who inspects the coal in the rail cars. They are shipped to market. (See page 92.)

shop work. Work performed at a mine and paid for by day wage as opposed to by piece rate. (See page 92.)

ship. The term for a vessel of any size. (See page 92.)

shipper. A. An official who inspects the coal in the rail cars. They are shipped to market. (See page 92.)

shipper. An instrument used for placing an endless rope on its rollers in cases where it gets off the wheel. (See page 92.)

shipper shaft. In a dipper shovel, the hinge on which the stick pivots when the bucket is opened or closed. (See page 92.)

shipping. Measuring for shipping. (See page 92.)

shipping. Measuring for shipping. (See page 92.)

shipping. Measuring for shipping. (See page 92.)

shipping. Measuring for shipping. (See page 92.)

shipping. Measuring for shipping. (See page 92.)

shock loss. Losses resulting from changes in direction of flow or area of duct. They also occur at the inlet end of a blast system, at splits or junctions of two or more currents of air, and at obstructions in air. See shock-proof.

shock-proof. As applied to the currently carrying parts of an electric system, excepting trolley wires, taken to mean that contact with such parts is prevented by the use of grounded metallic coverings or sheaths. See shock-silver.

shock-silver. A rather generous name for steels used for tools that are required to withstand much pounding. There are two general types, one containing chromium, vanadium, and a small amount of molybdenum, with usually fairly high manganese; the other type contains up to 2 percent of silicon, with usually some molybdenum. The silicon steels are used for punches and other purposes as coining dies. Brady, 4th ed., 1940, p. 426.

shock wave. A wave of air and dust which, in some cases, travels ahead of the flame of a coal dust explosion. It may occur when an ignition takes place near the closed end of a mine roadway, and the reaction products behind the flame cannot escape freely. The wave sent out through the air by the discharge of the shot initiating an explosion. This wave travels with the velocity of sound and produces to the human ear the noise like the boom of a cannon. Rice, George S. 1964.

shod. Fay. Also spelled shoad. Fay.

shoe. A. Pieces of steel fastened to a mine or rock. Nelson. i. A ground plate forming a link of a track, or bolted to a track link. Nichols. i. A support for a bulldozer blade or other digging edge to prevent cutting down. Nichols. i. A cleanup device used to pull the buckets of the ditching machine. Nichols. i. A boat-shaped ingot of syce silver weighing about 68% ounces. Standard, 5. i. A metal block used in a variety of bending operations to form or support the part being processed. A.G.I. n. In glassmaking, a crucible with open end, placed in a furnace, in which the blowers heat the ed. i. and purges. Webster 2d. o. A hollow refractory shape that is placed in the mouth of a glass pot and used for forming the blowing iron. Dodd.

shoestring claim. A mining claim in the form of a long narrow strip. Fay.

shoestring location. A location of a long and narrow strip of mineral land. Rickett, I.

shoestring sands. A narrow and relatively long body of sandstone, sludge, or other deposit, as described from the Pennsylvanian system of east-central Kansas. They originated as channel fillings, bars, beaches, etc. A.G.I. b. A type of lenticular formation in which a porous, permeable sandstone lens or streak is surrounded by pervious rock, frequently shale. Such stratigraphic traps are difficult to locate because of the absence of significant structural relief. Williams.

shionite. A melanocratic syenite often containing a small amount of nepheline; the principal minerals are augite and orthoclase. Other minerals that may often be present in varying small amounts are olivine, plagioclase, sodalite, and analcime, with accessory apatite and opaque oxides. A.G.I.

shoofly. A. Miner's work train. Korsan, b. Any crosstie between a haulage-way and airway through which cars are run. See also shank, a. Fay.

shoofly. a. To break coal loose from the seam by the use of explosives; loosely used, also as applied to other coal breaking devices. B.C. 2. To break down by airblasting. B.S. 3618, 1964, sec. 6. c. To explode a charge in blasting operations. Hudson. d. To detonate an explosive. Long. c. Incorrect spelling of chute. Long. i. A body of ore, usually of elongated form, extending downward in an inclined or downward direction in a vein. Also called ore shoot. Long. g. The payable section of a lode; an enriched portion of a continuous ore body.

**Shooting**

An instrument granting permission to conduct a geophysical survey; to shoot an area or prospect. A.G.I.

**Shooter**

The man who fires a charged hole after satisfying himself that the place is free from firedamp. A shot firer. Fay. b. In the petroleum industry, one who shoots oil wells with nitroglycerin to loosen or shatter the oil-bearing formations. Fay. c. Tamping the sandstone, A.G.I., Supp. d. See blast. D.O.T. 1. c. The shooter is that person on a seismographic crew who has some or all of the following duties: (1) loading the shot-holes; (2) damping the shots; (3) firing the shot; and/or (4) care of explosives and shooting equipment. A.G.I.

**Shooting**

a. Eng. Blasting in a mine. Fay. b. In the petroleum industry, one who shoots oil wells with nitroglycerin to loosen or shatter the oil-bearing formations. Fay. c. Tamping the sandstone, A.G.I., Supp. d. See blast. D.O.T. 1. c. The shooter is that person on a seismographic crew who has some or all of the following duties: (1) loading the shot-holes; (2) damping the shots; (3) firing the shot; and/or (4) care of explosives and shooting equipment. A.G.I.

**Shooting off-the-solid**

Mining the coal by explosives to carry explosives, materials, and equipment for preparing, loading, tamping, and firing explosive charges. A.G.I.

**Shooting valve**

The control valve provided for the purpose of admitting compressed air to an airblasting shell and of venting residual air, in the shell and hose, to atmosphere. B.S. No. 1264, 1954, sec. 5. shooting off-the-solid. Fay.

**Shooting of ore**

A body of ore with relatively small horizontal dimensions and steep inclination in the place is free from firedamp. A shot

**Shooting on-the-free**

The use of a small charge of powder to blow down the face of the coal after it has been undercut as distinguished from "shooting off-the-solid." Fay.

**Shooting rights**

The right to enter upon land and make a geophysical survey. Williams.

**Shooting the gob**

N. Staff. Working the coal in the pillars of inclined coaledbacks by blasting. Fay.

**Shooting truck**

In seismic operations, a truck equipped to carry explosives, materials, and equipment for preparing, loading, tamping, and firing explosive charges. A.G.I.

**Shoran**

A high-frequency radio wave location system using microwave pulses used for offshore and airborne prospecting operations. Two stations are located at fixed points, the third is on the mobile station whose location is desired. The fixed stations broadcast pulses, the mobile station rebroadcasts them, and the round trip time is measured by means of cathode-ray screens to an accuracy of ±25 feet. A.G.I.

**Shore**

a. Eng. A studded or thurrying stage. Zern. b. Min. A term used in prospecting to indicate particularly the course of ore, which is flatter. See thrusting stay. Nelson. c. Any considerable and somewhat irregular mass of ore found in a vein, usually fractured. Johnson. Sheet hardening is front hardness in front of the scale of hardness of rocks as determined by the Shore scleroscope test. The test utilizes the drop and rebound method using a diamond-tipped hammer. This scale avoids the limitations of Mohs' scale of hardness and gives a better assessment of rock hardness. Welsh quartzitic sandstones have an average hardness of 85 Shore; the quartz and ironstone bands between 90 and 102 Shore and shales between 35 and 55 Shore. Nelson.

**Shore hardness tester; scleroscope**

A procedure for the determination of the hardness of a surface by dropping a ball from a fixed height above the surface and noting the height of rebound. This technique was first proposed by A. F. Shore in 1906. Although primarily for the testing of the hardness of metals, it has also been applied to a limited extent in the testing of ceramics. Dodd.

**Shoreline**

a. The line of intersection of the sea with the land. The region immediately to the landward of the shoreline is called the coast, and seaward from this line, the shore. Thus, cliffs and deltas are coastal features while wave and tide processes and retreat along the shore. A.G.I.

b. A more or less concave, wavy line which appears in the boundary of the fired enamel, similar in appearance to the shore of a lake which has receded and deposited silt in water conditions, most frequently found in sheet-steel, acid, and glass enamels, may be caused by too rapid drying of the wet enamel coating or insufficient enamel setup. A shoreline is commonly thought to be the direct result of a too high concentration of sulfate salts in the enamel milling. Enam. Dict.

c. Shoreline cycle; cycle of marine erosion; marine cycle. The sequence of coastal forms as waves and tide processes attack the coast. Shoreline showing a regular seaward movement in consequence of sedimentation. Schieferdecker.

**Shoreline of advance**

See shoreline of progradation. Schieferdecker.

**Shoreline of emergences; emerged coastal A coast, havin glandesture a relative raise. Schieferdecker.**

**Shoreline of progradation; shoreline of advance; prograded coastal; accretion coastal**

Shoreline showing a regular seaward movement in consequence of sedimentation. Schieferdecker.

**Shoreline of retrogradation; abrasion shoreline**

Shoreline produced by the cutting back of the shore in a line of cliffs. Schieferdecker.

**Shoreline of submergence; submerged coastal**

A coast having undergone a relative lowering. Schieferdecker.

**Shoremant, dredge**

In metal mining, one who buries anchor logs (deadmen) in the earth, attaches wire cables, and performs their duties to keep dredges in the digging positions. D.O.T. 1.

**Shore platform**

On a rocky shore, the tendency is to produce a horizontal or gently sloping platform, the outer edge of which corresponds to the ground level of the cliff that its surface is bare at low water. This platform often is called a scar, and its inner edge is known as the brecor, which falls freely down a graduated tube.
shore sceroscope

of glass from a constant height. The hardness of the surface under test is measured by the height of the rebound. In one type of this instrument the rebound of the hammer is measured with the point of a scale so that the height of rebound is recorded. See also sceroscope hardness test. Ham.

shore terrace. a. A coastal terrace that is cut in rock or built up of gravel or sand. Webster 3d. b. See marine terrace. Schie- fer.

shore up. To stay, prop up, or support by braces. Fay.

shoring. Timbers braced against a wall as a temporary support. Also, the timbering used to prevent a sliding or exhuming of the surface. Crisis.

short. Cut with a pick, as in undercutting coal. Fay.

short. a. Said of roof shale that tends to break up or crush under pressure into small fragments and which will not hold in any span over a few inches. Also called tender. Retriek & Marshall, pp. 36-37. b. Brittle; friable; breaking or crumbling readily; inclined to flake off; said of coal. Fay. c. Said of a roof that has very little structural strength. TIME. d. Term applied to a clay body that has little plasticity or to a glaze that quickly sets. Dodd.

short and rough. Unmellowed, as by weathering, with edges and corners of brick, as distinguished from mild and tough. Standard, 1964.

short awn. A direction more than 45° to the center of the awn of the glume in the coal. Also spelled horn. TIME. Compare long awn.

short circuit. A short circuit is an abnormal connection of relatively low resistance, whether made accidentally or intentionally, between two points of different potential in a circuit. ASA M2.I-1963.

short cleft. Forest of Dean. Cleft with pronounced cross fracture or cleat. Arkell.

short coal. See short.

short column. A column so short in relation to its cross section that, if overloaded, will fail by buckling rather than by buckling. See also long column. Ham.

short-delay blasting. a. A method of blasting with small charges where the delay is set with a very short delay interval between them. It enables shots to assist one another as in simultaneous firing and also each shot or group of shots establishes a free or semifree face for the following group of shots. Nelson. b. Method of blasting by which charges are caused to explode in a given sequence with time intervals of 0.001 to 0.002 second. Frankel.

short-delay detonator. a. A detonator in which the interval of time delay is incremental in milliseconds. B.S. 3618, 1964, sec. 6. b. The original 1-second delay detonators are no longer used and the choice now lies between the 5/4-second type and those known as short-delay deto- nators. The new type gives better fragmen- tation of rock and consequently better loadings. Jones.

short finish. An imperfection in plate glass, resulting from incomplete polishing. ASTM C95-68.

short fire. See underfire. a. Fay.

short flame. A strongly aerated flame, such as a blast of air blown through and well mixed and delivered at high speeds with turbulent flow. Francis, 1965, v. 2, p. 406.

shorflame explosive. See permissible explo- sive. Fay.

short fuse. a. Any fuse that is cut too short. b. The practice of placing a blast, the fuse on the primer of which is not suffi- ciently long to reach the top of the charge. The primer, with fuse attached, is dropped into the charge while burning, and tamping may, or may not, be attempted. It is an exceedingly dangerous practice. Fay.

short glazed. See starved glaze. Dodd.

short hole. a. A blasthole or charge that is not properly stopped and that is likely to release the molten charge prematurely. Henderson. b. See blasthole; grout hole. Long.

short-hole drill. A blasthole or grout-hole drill. Long.

short-hole work. Diamond drilling where the length of borehole generally does not exceed 100 feet. Long.

shortitude. A double carbonate of sodium and calcium, NaCo3(2CaCO3), as hemimor- phic orthorhombic crystals from Wyoming. Satterlee, 15.2.1940.

short leg. One of the wires on an electric blasting cap, which has been shortened so that when placed in the charge, the two splices or connections will not come op- posit each other and make a short cir- cuit. Fay.

short point. Refers to luster less than 8 feet in length. Crispin.

shortness. A form of brittleness in metal. It is defined as cold, hot, and red, to indicate the temperature range in which the brittleness occurs. ASM Gloss.

short nipple. One whose length is a little greater than that of two threaded lengths or somewhat longer than a close nipple. It always consists of some unthreaded portion between the two threads. Strock, 3.

short out. Outcrops. Outcrops that do not extend for the full length of the claim have ex- tralateral rights allowed, but only between planes through the ends of the outcrop and parallel with the boundaries of the claim. Sidelines may become the endines in these cases. Lewis, p. 33.

short-period delay, millisecond delay. An electric blasting cap that explodes one- fiftieth to one-half second after passage of an electric current. Nickel.

short periods. The time required to drill a few holes for trolley hangers or a few short block holes, or one or two holes for bringing down a piece of loose roof. Bu- mines. Coal Mine Inspectors’ Manual, June 1966, pt. 3-21j, p. 81.

short-range order. Identical first-neighbor coordination of atoms. Typical of glassy structures. V.V.

short run. To be forced by adverse condi- tions or core blockage to pull the drill string before the core barrel being used is filled to capacity with core. Compare long run. Long.

defined by terms of visible size. Sinclair, W. E., p.288. There may be particles of nonfibrous serpentine and the fibers may vary from microscopi- cally thin filaments to crudey bundles of fibers of appreciable thickness. Included may be particles of nonfibrous serpentine ranging from a palpable powdery to mate- rials of visible size. Similair, W. E., p. 286. f. The product that is retained on a specified screen in the screening of a crushed or ground material. ASTM C162-66.

short section. A section of land according to the United States Governmental Survey which contains less than 640 acres. Williams.

short shot. Colloquialism for weathering (or loose-footing layer) shot in seismic prospect- ing. A.G.I.

short-term engagement. Engage- ment, men are taken on by the day, week, or month; there is little encourage- ment given them to become permanent employees, and discharges are frequent. Spalding, p. 370.

short-time rating. The maximum electrical load which a device can carry for a specified short time without exceeding the specified temperature rise limitations under pre- scribed conditions of load. It is usually limited by the limitations of established standards. Coal Age, 1.

short shot. A unit of weight that equals 20 short hundredweights or 2,000 avoidoridis pounds. Used chiefly in the United States, in Canada, and in the Republic of South Africa. Webster 3d.

shortwall. a. The reverse of longwall, fre- quently used to mean the face of a room. Zern. b. A method of mining in which comparatively small areas are worked sepa- rately, as opposed to longwall; for example, room and pillar. B.C.I. c. A length of coal face intermediate between a stall and a normal longwall face. A shortwall face may be any length between about 5 and 30 yards and is generally employed in pillar methods of working. Rooms and stales may also be classified as shortwall faces. See also shortwall development. Nelson.

shortwall coal cutter. a. A machine for undercutting coal which has the cutter bar fixed in relation to the main body of the machine. It sumps and cuts across a face in a more or less continuous motion, ex- cept when it becomes necessary to stop to change the position of the rakes used to move the machine through the action of rope drums, or when difficulties in cutting are experienced. Jones. b. This coal cutter has a long, rigid chain jib in line with the body of the machine and cuts across a heading from right to left, being drawn across by means of a steel wire rope. This machine cannot be readily fitted from one heading to another unless a power-propelled jib is available, otherwise each heading requires its own shortwall cutter. A shortwall cut- ter will make a 6-foot cut across a 15-foot heading in 20 minutes, including lumping in and out of the cut. Maun, p. 106.

shortwall development. A system of coal working sometimes employed in seams 4 feet or under in thickness, with the aid of a shortwall development. A system of coal working sometimes employed in seams 4 feet or under in thickness, with the aid of a shortwall development. A system of coal working sometimes employed in seams 4 feet or under in thickness, with the aid of a shortwall development.
shortwall development

yards wide, are driven at 50 to 70 yards centers, with crosstabs to assist coal transpor-
t and ventilation. The ripping are used to form roadway packs. The short-
walls are driven to the boundary and the coal pillars worked by longwall retreating.

shortwall working. N. of Eng. An enlarged
version of rib-and-stall working with faces of
30 yds. long. In its execution, the coal pillars are made at both ends of the face. Trist.

shortwall working. N. of Eng. An enlarged
version of the shortwall working. In some collieries, the coal pillars are worked by
longwall retreating. Trist.

shot blasting. A method similar to sand-
blasting, except that spherical meter-size
spherical stones with radiating structure and
d. Spheres of steel and aluminium into the
circulation downward through the rods or pipe
connected to the core barrel and bit of
a drill. Fay.

shot break. In seismic exploration, the elec-
trical impulse which records the instant of
explosion. A.G.I.

shot charger. In bituminous coal mining, one
who charges explosives in drill holes to
prepare them for blasting. D.O.T.1.

shot copper. Small, rounded particles of na-
tive copper, somewhat resembling small
shot in size and shape. Fay.

shot-core-drill operator. See diamond-
drillers, d. A.G.I.

shot data. Seismic calculations are usually
reduced to a convenient reference surface
or plane. These calculations simulate a
condition where the charge is shot on the
reference surface and the energy is also
recorded at the reference surface. Fay.

At this reference surface, the time-depth
charts have their origin. A.G.I.

shot deep. The distance from the surface to
the charge. In the case of small charges
the shot depth is measured to the center
of the charge, expressed in feet. In the
case of large charges, the distances to the
top and to the bottom of the column
of charge are frequently given, and
may be reduced to effective shot
depth to give the equivalent of a con-
centrated charge. A.G.I.

shot drill. A core drill generally employed
in rotary-drilling boreholes of less than
3 inches to more than 6 feet in diameter
in hard rock or concrete, using chilled-
steel shot as a cutting medium. The bit
is an annular-shaped, flat-face, steel cylin-
der with one or more diagonal slots cut
in the bottom edge. As the bit and at-
tached core barrel are rotated, small
quantities of chilled steel shot are fed, at
intervals, into the drill stem with water.
The shoot works its way under the flat
face of the bit and thus away the rock
at the bit rotates. At intervals, the core
is removed from the borehole in somewhat
the same manner as in diamond core-
drilling operations. Also called adamantine
drill; calyx drill; chilled shot drill. Long.

shot-drilled shafts. Shafts of up to 5 feet in
diameter drilled through rock to a maxi-
mum depth, usually by means of a shot
drill. The latter makes use of shot
for cutting a circular groove in the
rock being penetrated from which solid
cores are extracted. Ham.

shot-drill hole. Borehole produced by a shot
drill. Long.

shot drilling. The act or process of drilling
a borehole with a shot drill. See also shot
drill. Long.

shot firer. a. A man whose special duty is to
fire shots or blasts, especially in coal
mines. A shot firer may also be a shooter.
Fay. b. In a colliery, a quali-
fied miner who tests for gas before firing
explosive shots. Fay. c. In Great
Britain, the shot firer has charge of op-
erations which are a potential source of
gas danger in mines, and it is there-
fore imperative that he be thoroughly
competent for his job. He must be ap-
pointed in writing by the manager, who
is entirely responsible for seeing that the
shot firer is in every way qualified for his
duties. Mason. d. A. of Eng. Also called
shotman. d. N. of Eng. An official whose
sole responsibility is to charge, stem, and
fire known undercut coal for filling. See
also shotfirer. Long.

Shot Firer. A multiple shot permissible blast-
ing unit introduced in 1946, known as
Capacitor Type Permissible Shot Firer.
Weighing approximately one pound and
about the size of an ordinary flashlight,
the non-electrical unit is simply placed
in a belt hook which permits its being car-
ried under supervision of the shot firer.
If ignited, the firer is to be fired without
moving the unit from the belt. It is
Capacitor operated, eliminating depend-
ence on a source of operation for electri-

shot-firing cable. A simple electric generator
depending for its action on electromagnetic induction. Morris and Cooper, p. 235.

shot firing. a. The action of detonating or
igniting a charge of explosive, usually in a
drilled hole. B.S. 3618, 1964, sec. 6.
b. The firing of an explosive charge in a
drilled hole to break the material to a
suitable size for loading. Nelson.

shot-firing cord. A conductor cable used for completing the circuit be-
tween the electric blasting cap (or caps) and the blasting unit or other source of
electric energy. ASA C42.85:1956.

shot-firing cable. A pair of insulated copper
conductors which lead from the expoder
to the detonator wires. It may be either
twin-core (both conductors contained in
the one cable) or single-core (each con-
ductor contained in a separate cable).
Twin-core cables having cores of 4
strands, each 0.018 of an inch in dia-
meter (4/0018) with a resistance of ap-
proximately 9 ohms per 100 yards, are
commonly used. Actual choice of cable
must depend upon conditions of use and
the relevant regulations. Nelson.

shot-firing cable tests. The methods of testing
two-shot-firing cable are identical.
Two tests are applied, one for insulation
and one for continuity, and where large
sections are involved, one after being fired, as in tunnel, wellhole, and
quarry blasts, tests are made before

1004

shot examiner. a. In Iowa, a shot firer. Hess.

shot firer. b. Coal mined by blasting; shot off the
solid. Fay.

shot feed. A device to introduce chilled-steel
shot, at a uniform rate and in a quantity
proportional to the charge of granite,
flowing downward through the rods or pipe
connected to the core barrel and bit of
a drill. Fay.
shot-firing cable

every blast. For the cable insulation test, an approved circuit tester or ohmeter is connected to one end of the cable, the two conductors at the other end being separated so that current should flow and the resistance should be infinite. For the continuity test, the two far ends of the cable should be joined. The tester should show that the current is complete, or if an ohmeter is used, this should show the correct resistance of the shot-firing cable. Nelson.

shot-firing circuit. Extends from the exploder along the shot-firing cable, detonator wires, and finally the detonator. The shot-firing circuit is the path taken by the electric current from the exploder when a shot is detonated. Nelson.

shot-firing curtain. A steel chain mat suspended from the roof about 9 to 12 feet from the face of an advancing tunnel to limit damage to equipment and danger from flying debris when shot firing at the face. It consists of a steel frame with chains suspended about 6 inches apart. See also blasting curtain. Nelson.

shot fires. The firing of a number of shots in a tunnel, or shaft sinking occasion only. It also saves the time of recharging shot holes. In Great Britain, the practice of firing in rounds is increasing and nearly every blast. For the cable insulation test, the correct resistance of the shot-firing ohmeter is used, this should show the continuity test if an ohmeter is used, this should show the resistance should be infinite. For the continuity test, the two far ends of the cable should be joined. The tester should show that the current is complete, or if an ohmeter is used, this should show the correct resistance of the shot-firing cable. Nelson.

shot hole. a. A hole drilled for the purpose of shot firing. B.S. 3618, 1964, sec. 6. b. A borehole filled in coal, ore, or rock, usually from 3 to 9 feet in length (underground) for breaking down the material by means of explosives. See also blasting. Nelson. c. The borehole in which an explosive is placed for blasting. Fay. See also blast hole. d. A borehole drilled with a shot drill. Long. e. See shot point.

shot hole bridge. When an obstruction in the shot hole makes it difficult or impossible to get the charge deeper, the hole is said to be bridged. A narrow diameter in the hole due to a resistant bed often makes it difficult to get the charge deeper in the hole. A mechanical device is the market that purposely bridges the hole at a shallow depth in order that the hole may be filled. A.G.I.

shot hole casing. Light weight pipe, usually about 4 inches in diameter. A typical joint of casing is 10 feet long and has threaded connections at both ends. The primary use of casing is to prevent the shot hole from caving and bridging. The lightweight casing may be considered as a expendable item. A.G.I.

shot hole drill. Drills for shot holes are two general types: (1) the rotary drill and (2) the churn drill. The chimney drill is similar to the larger cable-tool type. It is seldom used except in areas where underground cavities hamper the flow of the circulating fluid used in rotary methods. The rotary methods can be divided into (1) percussion and (2) hydraulic feed. Both types pro-

005

Schieferdecke.

shot rock. The term used to describe the surface finish of building limestone that is deeply scored by using steel-shot abrasive with gang-saws. A.I.M.E, p. 330.

shotter. Bedded pebbles and sand; glacial outwash gravels. Arkell.

shotting. The production of shot by pouring molten metal in finely divided streams. Solidified spherical particles are formed during the descent and cooled in a tank of water. A.S.M. Gloss.

shottby gold. Small granular pieces of gold resembling shot. Fay.

shoulder. a. The graded part of a road on each side of the pavement. Nichols. b. The side of a horizontal pipe, as the shoulder of the center line of an arc. A line formed by the intersection of the face or leading surface of a bit crown and the straight-wall side surface of the crown. Long. d. A ledge formed by an abrupt change in the course of a borehole. Long. e. A ledge or projection on drill rods, couplings, pipe, or bits formed at points where an increase in diameter occurs. A.G.I. f. The butt of a threaded part. Long.

shoulder cutting. S. Staff. Cutting the sides of the upper lift of a working place in a thick coal coallier next the rib, preparatory to breaking the coal. Fay.

shouldering. The splay at the top right-hand and bottom left-hand corners of a single-lap roofing tile. Dodd.

shoulder nipple. A nipple of any length, which has a portion of pipe between two pipe threads. As generally used, however, it is a nipple about halfway between the length of a close nipple and a short nipple. Strock, 3.

shoulder stone. The diamonds set in a bit at or along the line formed by the intersection of the face or leading surface of a bit crown and the straight-wall side surfaces of the bit crown or shank. Compare kerf stone. Long.

shoved moraine. See push moraine.

shovel. a. Any bucket-equipped machine used for "scooping" and loading earth or material, as a "shoveling" a strip mine. May be designated according to type of power, as electric-shovel crane.

shovel craneman. In bituminous coal mining, a man whose duty is to record the dynamite charge in seismic exploration. See also blasting.

shovel cranean

1006

shroud laid rope

craneman; steam-shovel craneman. Also called stripping-shovel craneman. D.O.T. 1.

shovel dozer; dozer shovel. A tractor equipped with a mounted bucket that can be used for pushing, digging, and truckloading. Nichols.

shoveler. a. In anthracite and bituminous coal mining, the man who shovels coal, slate, or refuse into mine cars or containers at working places, along haulage ways, or at other places underground and at the surface of the mine. May be designated according to material shoveled, such as coal shoveler. D.O.T. 1. b. A man below ground who shovels ore into cans. Hess. c. See mucker. D.O.T. 1.

shovel front. In power-shovel nomenclature, the shovel front is composed of a main boom and a secondary boom known as the dipper stick at the outer end of which is the dipper or shovel bucket. Carson, p. 38.

shovel frame. The loading machine mounted on driven wheels by which it is forced into the loose rock at the tunnel face. A bucket hinged to the chassis, scoops up the material which it éléments over and discharged behind the machine. There are two types: (1) the bucket is discharged directly into a mine car behind the machine, and (2) a short conveyor, built into the loader, receives the discharged material and conveys it back into a car or conveyor. See also mechanical mucking. Nelson.

shovel sample. A small flat sample of porcelain enamel obtained at the smelter by allowing the molten enamel to run onto a steel shovel during the discharging of the smelter to the quench tank. The shovel sample is air quenched and examined for smoothness, uniformity, and color. Dodd.

shovel trough. In a derrick, the shovel part of the loading mechanism which is advanced into the coal pile or retracted according to the adjustment of the operating carrier. Jones.

shoe. a. The pale blue, lambent flame on the top of a common candle flame, indicating the approach to an outcropping dipping lode with strong walls. Pryor, 3. 

shred. a. The decrease in volume of a soil or fill material through the reduction of voids by mechanical consolidation, superimposed loads, or natural consolidation. Nelson. b. The settling or reduction in volume of earthen fills, cement slurries, or concrete on setting. Long. c. Synonym for outage. Long. d. In bitmaking by the powder-metal processes, the difference between the dimensions of the finished bit crown and those of the bit mold. Long. e. The reduction in dimensions of a ceramic shape caused by drying or firing. -g. Bureau of Mines Staff.

shrinkage cavity. A void left in cast metals as a result of solidification shrinkage. ASM Gloss.

shrinkage crack. a. One of a series of cracks, or of filled-up cracks, often seen on rock surfaces. They have resulted from the drying and shrinking of the layer while it was plastic mud. Synonym for sun crack. Freeman. 1964, b. Hot tears associated with shrinkage cavities. ASM Gloss. Cracks due to restrained shrinkage. Fay. c. See desiccation cracks; syneresis cracks. Pettijohn.

shrinkage cavity index. The numerical difference between plastic and shrinkage limits, ASCE P1726.

shrinkage limit. The shrinkage limit of a soil is that moisture content, expressed as a percentage of the weight of the oven-dried soil, at which a reduction in moisture content will not cause a decrease in the volume of the soil mass, but at which an increase in moisture content will cause an increase in the volume. Pettijohn. 1955.

shrinkage ratio. The ratio of a given volume change, expressed as a percentage of the dry volume to the corresponding change in water content above the shrinkage limit, expressed as a percentage of the weight of the oven-dried soil. ASCE P1826.

shrinkage rule. A measuring ruler with graduations expressed to compensate for the change in the dimensions of the solidified casting as it cools in the mold. ASM Gloss. shrinkage spalling. The shearing off of the face of a refractory as the result of stresses set up within the refractory by the shrinkage of the exposed face. AISI, No. 26.

shrinkage stope. One in which only part of a stope is drawn off when the stope has been mined out in successive slices, working upward. AISI, No. 24.

shrinkage stoping. a. The first appearance of a float, indicating the approach to an outcropping vein or seam. See also blossom. Zorn. b. See also surface occurrence of mineral. Hoffmann.

shrinkage test. A quantitative approximation is obtained as follows: (1) all course mineral and ore components are removed from the sample and water added and mixed until the soil is plastic; (2) the plastic soil is filled into wooden or metal trays of similar shape and size, and the length of the sample measured; and (3) the sample is allowed to dry out slowly and completely and the length again measured. The linear shrinkage is then expressed as a percentage. The formula used is (Original length - length after test) x 100

Original length

Also, the clay content = 5 x linear shrinkage (percent). Nelson.

shrinkage water. That part of the water of plasticity which contributes to drying shrinkage. ASGC, 1963.

shrinkage with waste fill. See shrinkage stoping, b. Fay.

shrink fit. A fit which allows the outside member, when heated to a practical temperature, to assemble easily with the inside member. ASM Gloss.

shrink forming. Forming metal wherein the inner fibers of a cross section undergo a reduction in a localized area by the application of heat, cold upset, or mechanical restraints, which are then removed mecanically induced pressures. ASM Gloss.

shrink head. A very large riser intended to fill up the casting while it was plastic mud. Synonym for sun crack. Freeman.

shrink-on method. Method of securing a tight fit either by casting molten metal on to a relatively cool shank or by driving an insulating shank into a heated bushing. Pryor, 3.

Shropshire method. See longwall method, b. Fay.
shutoff. a. A movable sliding door, fitted within the outer casing of a Guibal or other closed fan for regulating the size of the opening to suit the ventilation and secure economical working of the machine. Fay. b. A slide covering one or more arbor tracings, and forming a regulator for the proportionate division of the air current between two or more circuits of a mine. Fay.

shuttering. a. The casing to contain concrete during the period of setting and hardening. For the concrete lining of a circular shaft, the shuttering for 5-foot lifts usually consist of two 2½ feet high rings of ¾-inch steel plate with release segments. Nelson. b. A common name for formwork and which also include permanent shuttering. Ham.

car. A vehicle on rubber tires or caterpillar tracks and usually propelled by electric motors, electrical energy which is supplied by a battery or generator, by storage batteries, or by a power distribution system through a portable cable. Its chief function is the transfer of raw materials, such as coal and ore, from loading machines in trackless areas of a mine to the main transportation system. ASA C42.85:1956. The introduction of shuttle cars in the United States originated the term "trackless mining." See also rubber-tired haulage; trackless tunneling. Nelson.

car, explosion-tested. A shuttle car equipped with explosion-tested equipment. ASA C42.85:1956.

shuttle-operator. a. Any conveyor, such as belt, curved or straight or any system used to connect a track in parallel with the armature, that is, in shuttle, Mason, V. 2. p. 416.

shuttle. a. S. Staff. The crushed and broken-down roof of a seam of coal. Fay. b. S. Staff. Old workings. See also goaf, a. Fay.

shutdoor. A term denoting the work that has been completed, as pieces of brick. Dodd.

shut-door. One of the rate provisions in drilling contracts, specifying the compensation to the independent drilling contractor when drilling operations have been suspended at the request of the operator. Williams.

shut. See chute. Fay.

shut-height. For F-4 press, the distance from the top of the bed to the bottom of the slide with the stroke down and adjustment up. In general, it is the maximum die height that can be accommodated for normal operation, taking the bolster plate into consideration. ASCG, Gloss.

shut-in. In geology, a narrow gorge cut by a superposed stream across a ridge of hard rock, for which reason it is often cut on each side of the ridge. Standard, 1964.

shutoff valve. A device by means of which the flow of gas or fluid can be shut-off—at least temporarily with the intention of metering or regulating the flow. Long.

shut. Scot. Mobile or hinged supports for the sides of a shaft landing. Also called keps; keeps; chairs; doors; seat. Fay.

shutter. a. A movable sliding door, fitted within the outer casing of a Guibal or other closed fan for regulating the size of the opening to suit the ventilation and secure economical working of the machine. Fay. b. A slide covering one or more arbor tracings, and forming a regulator for the proportionate division of the air current between two or more circuits of a mine. Fay.

shuttering. a. The casing to contain concrete during the period of setting and hardening. For the concrete lining of a circular shaft, the shuttering for 5-foot lifts usually consist of two 2½ feet high rings of ¾-inch steel plate with release segments. Nelson. b. A common name for formwork and which also include permanent shuttering. Ham.
}

sidal. A layer of rocks underlying all continental areas that range in thickness at the top to gradation at the base. The thickness is variously placed at 30 to 35 kilometers. The sequence derives from the original interbedding, silica and alumina. Specific gravity, about 2.7. A.C.I.

sidelines. Clay or other ceramic materials consisting of silica and alumina. Bureau of Mines Staff.

silica. A mammalian term derived from (si) for silica, (a1) for alumina, and (ma) for magnesia, and applied as a compositional term to a layer within the section which occupies a position intermediate between sial and sima. A.G.I.

Siberian garnet. A rare but incorrectly used term for blue zircon or for greenish spinel. Shipley.

Siberian ruby. A name sometimes erroneously applied to the dark ruby spinel found with the rubies of Siam. Fay.

Siberian ametyst. A long-established trade term for the deep red, almost red violet or purple amethysts although amethysts now found in the Ural Mountains, U.S.S.R., are characterized by the less desirable light violet color. Shipley.

Siberian jade. Nephrite from Siberia, fine almost emerald-green qualities being found in the Lake Baikal region. Shipley.

Siberian ruby. Rubellite; a red variety of tourmaline found in Siberia, U.S.S.R. Fay.

Siberian tourmaline. Light violet-red (rubellite) to violet tourmaline from the Ural Mountains, U.S.S.R. Shipley.

Siberian. A violet-red variety of rubellite. See also Siberian ruby. Fay.

siccative. A medium which promotes the drying of oils used in underglaze or overglaze coloring. ASCG.

Sicilian amber. Simetite. Shipley.

sickness. a. A scum that forms on the surface of mercury that retards amalgamating, caused by grease, sulfides, arsenides, etc. Gordon. b. The flooding of mercury. See also flooded. Fay.

sikkier, see sikkier. Fay.

sickly, dry-mica. Crude mica cobbled, ruffled, and dressed with a tuckle to eliminate major flaws. It has irregular outlines and beveled edges. Skow.

sicklerite. A dark brown hydrous phosphate of iron and manganese with lithia, Fe6Mn0.4P105.3 (Li,H),O. Orthorhombic (?). In cleavable masses. From Pala, San Diego County, Calif. English.

sick mercury. Mercury which has become contaminated so that it has neither a clean bright surface nor a spherical shape when in globules. Effect produced by sulfur, oil, tale, graphie, sulfides of antimony, bismuth, arsenic, or iron. Fay.

sickle. a. A scythe. Fay.

side. The more or less vertical face or wall of coal or goaf forming one side of the machine. Fay.
side

side adits. A side passage sometimes made when the main adit is choked with waste rock. Fay.
side arch. A brick with the two largest faces symmetrically inclined towards each other from 200 to 500 feet directly to port or starboard. Fay.
sidearm. A short bar connected to, and extending outward at a right angle from, a drill column and on which a small diamond or other-type drill can be mounted. Compars crossarm. b. Long.
sidebars. See bars. Hess.
side basse. A transverse direction of the line of dip in strata. Fay.
side blowing converter. A Bessemer converter in which the airblast is admitted through the sidewall near the bottom of the converter. Bennett 2d, 1962.
sideboard. a. A board which is used in timbering the sides of a heading. See side trees. b. Ham. b. Board applied to either side of a building or structure, extending from the foundation to the ceiling (or roof). Dow.
side boon dredge. Similar to the hopper dredge except that the discharge, instead of going down a hopper or directly back into the sea, is carried in a discharge pipe hung from a boom, a distance of from 200 to 500 feet directly to port or starboard of the vessel, and there discharged into the atmosphere, dropping vertically from a height of about 50 feet onto the surface of the sea. The drag heads of the dredge provide a channel, and the excavated earth is spread over a wide area on either side, without the necessity of hauling it to the sea. Carion, 2, p. 63.
side casting. Filling stop, also called side box. A casting made in a situtation from which it is taken. Nichols, 2.
side chain. A chain hooked onto the sides of cars running on an incline or along a grade, which holds the cars together in case the coupling breaks. Fay.
side construction tile. A tile designed to receive its compressive stress at right angles to the axes of the cells. ASTM C63-65. b. Tile designed for use in interior construction. ASTM C63-65.
side discharge shovel. A shovel loader, driven by compressed air or by electricity, for loading loose coal or rock. A 21-cubic-foot-capacity bucket, hinged to the chassis, digs, lifts, and discharges the material sideways onto a scraper or belt conveyor; suitable for stable holes, pillar methods of working, and general repair work. Nelson.
side dumper. An ore, rock, or coal car that can be tilted sidewise and thus emptied. Fay.
side entrance manhole. A deep manhole in which the access shaft is built to one side of the inspection chamber. Ham.
side eater. See either brick. Dodd.
side guide. See guard. a. Fay.
sidehill. A slope that crosses the line of work. Nichols.
sidehill cut. A long excavation in a slope that has a bank on one side, and is near original grade on the other. Nichols.
side-hitching. The practice of hitching which the mule is hooked by its harness to the side instead of the front of a loaded car to give it enough momentum to slide onto a cage. Korton.
side-lasting. S. Staff. The widening of an abandoned gate road, and making it part of the new side of work. Fay.
side lap. The distance by which the side of a roofing tile overlaps the joint in the course of tiles next below. Dodd.
side lengths. See lengths. Fay.
side line. a. The line connecting the dredger to the side of the vessel, and there discharged. b. A line which passes through the sidewall near the bottom of a building or structure and extends from the foundation to the ceiling (or roof). Dow.
side pocket. Alternative name for slag pocket as applied to glass-tank furnaces. See slag pocket. Dodd.
side ramps. A curved rodlike fishing tool with a serrated surface to help grip or hold an object lost in a borehole. Long.
side real. In a day, one complete revolution of our globe on its axis, as determined by transit of a fixed star (23 hours, 56 minutes, 4.0906 seconds of local mean time). In a year, one revolution around the sun (365.2564 solar days). Pryor, 3.
siderite. Native iron found in petrified wood. Nichols.
side shot
not intended to be used as a base for the extension of the survey. A side shot is usually made for the purpose of determining the position of some object which is to be shown on the map. A.G.I.
side skew. A brick modified so that one side is different from the other 90° to the largest faces. A.R.I.
side slicing. See top slicing combined with core casing. Fay.
side split. The emission of sparks through the sides of a burning fuse. Fay.
side state. a. On a road job, a stake on the line of the outer edge of the proposed pavement. Nicholls. b. Any stake not on the centerline. Nicholls.
side stopping. See overhead stopping, b. Fay.
sideway. A slight lateral movement of a structural frame in its own plane due to the action of a horizontal force such as wind pressure or to unsymmetrical loading. Ham.
sidewall. a. The lateral force against the borehole walls resulting from the buckling or sag in the drill rods at one or more points along the length of the borehole. The lateral force developed when the area covered by the bit is not uniformly hard. Long
sidetrack. When tools have been lost in the drill hole and fishing for their recovery is without success, the lost equipment is sometimes drilled by. The lost tools are forced out successively, the lost equipment is sometimes sidetracked. A.G.I.
sidetracking. 'The act or process of deflecting away from a normal, a tendency to drift or wand. Fay.
siebe-Gorman self-rescuer. A British-made self-rescuer consisting of a hermetically sealed, quick-release canister with inhalation and exhalation valves fitted to the top, a head strap, a rubber mouthpiece, a chin rest, and a note clip. It is carried on the miner's belt and weighs only 22 ounces. The air enters at the perforated diaphragm in the bottom of the canister, passes through layers of filters before it reaches the mouthpiece. The complete respirator is held in position by the head strap. Medadm, pp. 67-68.
siegburgite. A foalash from the brown coal near Rhenish, Germany; it varies in color from golden yellow to brownish-red, and is partly soluble in alcohol and ether. Fay.
seige. The floor of a pot furnace, often called bench. ASTM C162-66.
siegene. A member of the linneanite series with the formula, (Co,Ni),S4. Dana 7, p. 262.
siemens furnace. A reverberatory furnace, called bench. ASTM C162-66.
siemens. A highly refractory material, produced by Siemens and Halske process. A metallurgical process for the recovery of copper. Copper sulfides are dissolved by solutions of ferric sulfate containing free sulfuric acid, and the solution is then electrolyzed in a tank having a diaphragm. Copper is deposited and ferric sulfate regenerated. Liddell 2d, p. 495.
siemens direct process. A process for making wrought iron directly from iron ore, without the previous production of pig iron. Standard, 1964.
siemens furnace. A reverberatory furnace, heated by gas, with the aid of regenerators. Fay.
siemensite. A highly refractory material, produced by the fusion of chrome, bauxite, and magnesite, in the open electric arc furnace. Osborna.
siemens process. The production of steel in a reverberatory furnace by oxidation of the impurities by oxides added (either the rust on scrap, mill scale, or pure oxide). It may be carried out either on acid or basic lining. See also open-hearth process. Liddell 2d, p. 495; Fay.
siemens process. Siemens process. In the Southwest and the Pacific States. Local.
siemens marble. One of the most highly esteemed of marbles for interior decoration. The Bourelius marble is a granite, which is usually variegated with white and violet or purple. From Monte Arenti, in Montagnola, Switzerland.
sierra. Sp. A saw, a chain of hills or mountains; used as part of the name of many mountain chains, as Sierra Nevada, Local.
sierra Leone. A diamond from the Sierra Leone District in Africa. Long.
sieurin process. A process for manufacturing sponge iron, in which layers of high-purity ore, coal, and lime are heated in closed crucibles. After cooling, the porous cake of powdered metal is removed from the crucible and crushed for further processing. Bennett 2d, 1962.
sieve. a. Any screen that it used to separate particles according to size. Fay. b. The screen or grating fixed in a stamp box. Fay. c. Vessel, the bottom of which is porous, with apertures of defined size and shape, allowing contents to be retained as overflow or sieved through as undersize. The chief laboratory work are rings 8 inches in diameter with woven wire cloths to specified. Jones. d. A term applied when a borehole has been sidetracked. A.G.I. sieve fraction. The determination of the percentage of particles which will pass through a standard sieve of specified size. Amer.
sieve analysis. a. The determination of the percentage of particles which will pass through screens of various sizes. Britany 1. See also sieve analysis.
b. In powder metallurgy, particle size distribution; usually expressed as the weight percentage retained upon each of a series of standard sieves of decreasing size and the percentage passed by the sieve of finest size. Synonymous with sieve classification. ASTM Gloss. c. A test to determine particle size distribution in a soil. A set of sieves may contain the following sizes: 1/4 inch, 3/8 inch, 1/2 inch, 3/4 inch, 1 inch (of aperture), No. 7, 14, 25, 36, 52, 100, 200 (number of apertures to the linear inch). A set is complete with lid and receiving pan, and can be 9, 12, or 18 inch diameter sieves. See also sieve analysis. Fay.
sieve fraction. In powder metallurgy, that portion of a powder sample which passes through a standard sieve of specified size.
sieve fraction

number and is retained by some finer sieve of specified number. ASM Gloss.

sieve mesh. a. Standard opening in sieve or screen. B. A heavily wire mesh made of four boundary wires (warp and woof). The laboratory mesh is square and is defined by the shortest distance between two parallel wires as regards aperture (quoted microns or millimeters), and by the number of parallel wires per linear inch as regards mesh. Sixty (60) mesh equals sixty (60) wires per inch. Pryor, 3. b. The length of the side of a hole in a sieve. See also mesh, f. Fay.

sieve mesh. The length of the side of a sieve in a sieve. See also mesh, f. Fay.

sieve scale. Term applied to the list of screen apertures, taken in order from the coarsest to the finest. Pit and Quarry, 53rd, Sec. B, p. 115.

sieve shakers. Mechanized devices on which a nest of laboratory sieves can be shaken or electrically vibrated during the size analysis. See also mesh, f. Fay.

sieve sizes. Screens are standardized in British Standard 410, and sieve size diamond powders in British Standard 1907. Osborne.

sieving. a. Grading in accordance with particle size and shape by means of sieves or screens. Pryor, 3. b. The operation of shaking loose materials in a sieve so that the finer particles pass through the mesh, and the coarser remain on it. Also called sifting.

sieve. See sieve fraction.

sifting. See sieving, b.

 sightings. b. Operating signal hammers and bells. Fay.

sight. a. A bob or weighted string hung from an established point in the roof of a mine or tunnel entry or room. Fay. b. The operation of sighting or transit when making a survey. Fay. d. Any established point of a control or transit for use. Established control or transit sight. See also sight. Fay.

sightings. b. The arrangement in use for signaling in mine signal systems, both. See hoist signal system.

signaling system. a. A method of communicating by means of light, sound, or electrical currents, for telegraphic or telephonic purposes. See also mesh, f.

signal bell; signal hammer. Scot. A bell or other apparatus for signaling in mine shafts or on haulage roads. Fay.

signal code. See hoist signal code.

signal code, hoist. See hoist signal code.

signal phase. A hard, brittle, nonmagnetic intermediate phase with a tetragonal crystal structure, containing 30 atoms per unit cell, space group F4m/m, occurring in many binary and ternary alloys of the transition elements. The composition of this phase in the various systems is not the same and the phase usually exhibits a wide range in homogeneity. Alloying with a third transition element usually enlarges the field of homogeneity and extends it deep into the ternary system. ASM Gloss.

signal recorder; methanometer. See butane flame methanometer. Nelson.

signal bell; signal hammer. Scot. A bell or other apparatus for signaling in mine shafts or on haulage roads. Fay.

signal code, hoist. See hoist signal code.

signal phase. a. A hard, brittle, nonmagnetic intermediate phase with a tetragonal crystal structure, containing 30 atoms per unit cell, space group F4m/m, occurring in many binary and ternary alloys of the transition elements. The composition of this phase in the various systems is not the same and the phase usually exhibits a wide range in homogeneity. Alloying with a third transition element usually enlarges the field of homogeneity and extends it deep into the ternary system. ASM Gloss.

signal recording methanometer. See butane flame methanometer. Nelson.

signal bell; signal hammer. Scot. A bell or other apparatus for signaling in mine shafts or on haulage roads. Fay.

signal code. See hoist signal code.

signal code, hoist. See hoist signal code.

signal phase. a. A hard, brittle, nonmagnetic intermediate phase with a tetragonal crystal structure, containing 30 atoms per unit cell, space group F4m/m, occurring in many binary and ternary alloys of the transition elements. The composition of this phase in the various systems is not the same and the phase usually exhibits a wide range in homogeneity. Alloying with a third transition element usually enlarges the field of homogeneity and extends it deep into the ternary system. ASM Gloss.

signal recording methanometer. See butane flame methanometer. Nelson.

signal bell; signal hammer. Scot. A bell or other apparatus for signaling in mine shafts or on haulage roads. Fay.

signal code. See hoist signal code.

signal code, hoist. See hoist signal code.

signal phase. a. The composition of this phase in the various systems is not the same and the phase usually exhibits a wide range in homogeneity. Alloying with a third transition element usually enlarges the field of homogeneity and extends it deep into the ternary system. ASM Gloss.

signal recording methanometer. See butane flame methanometer. Nelson.
silica fire clay

silica brick, and fire clay of various proportions; often called silica cement. HW.

silica flour. A sand additive, containing about 99.5% silica. It is produced by suspending quartz sand in large ball mills to a meth size of 80 to 325. ASM Gloss.

glass. The porous material consisting of pure silica dioxide. Used as a dehumidifying and a dehydrating agent. Bennett 26, 1962.

glass. a. Vitreous silicon dioxide, (SiO2); quartz glass; pure silicon dioxide, (SiO2); glass. ASTM C162 &-b. Fused quartz, occurring in shapes masses on the surface of the Libyan Desert, in Moravia, Czechoslovakia, and in parts of Australia; believed to be of meteoric origin. See also tektites. C.M.D.

calcite. Wadsworth's word for rocks composed of silica, such as diatomaceous earth, triplite, quartz, lydite, jasper, etc. Fay.

modulus. Fractional rate of SiO, in a hydraulic cement. In Portland cement this modulus usually lies between 2 and 3. A cement with a low silica modulus can be expected to have high early strength, but if this modulus is high, the final strength will be the greater. Dodd.

ramming mix. Usually a sized mixture of garnet, often with sand, silica flour, fire clay, bentonite, or combinations of them. Bureau of Mines Staff.

refractories. Refractories made from silica, such as diatomaceous earth, quartz, lydite, jasper, etc. Fay.

rock. a. A rock containing a high proportion of silica or quartz, for example, Dinas rock, which may contain 50 percent silica. Nelson. b. N.S.W. Usually refers to a clean hard quartzite suitable for making silica firebrick. New South Wales, p. 66.

sand. Sand very high in SiO2; hence a silica refractories. Refractories made from silica.

sol. Colloidal silica in the form of a dispersion stabilized by silicate and silicic acid. Fay. A. pools used extensively for sandblasting, for the initial grinding or surfacing of plate glass, and as a cutting medium for gang saws on stone. AIME, p. 15.

calcite. Suggested by Shrock for sedimentary rocks composed of siliceous minerals. Fay.

silica deposits. A group of natural earth materials including chert and flint and the deep-sea oozes which are formed of the skeletons of such organisms as radiolarians, diatoms, and sponges. Stokes and Varmus, 1955.

dust. Dust arising from the crushing or other dry working of sand, sandstone, trap, granite, and other igneous rocks are included in this class. Siliceous dusts are not soluble in the body fluids, and when introduced into the respiratory tract in the form of particles of the proper size and in sufficiently high concentration produce nodular growths that often result in a form of pneumoconiosis that has been known as silicosis or "stone cutters" consumption. Pi and Quarry, 53rd. Int. B, p. 252.

earth. A general term including both diatomaceous earth (diatomite) and radiolarian earth (radiolarite). A.G.I.

fire clay. A fire clay composed mainly of fine white clay mixed with clean, sharp sand, found in pockets. Nelson.

fire clay brick. Fire clay brick contains appreciable quantities of uncombined silica and usually low in fluxing constituents. A.R.I.

ocean. These are pelagic deposits which contain a large percentage of siliceous skeletal materials produced by planktonic plants and animals. The siliceous oceas are subdivided into two types on the basis of the predominance of the forms represented, namely: (1) diatom ooze, containing large amounts of diatom frustules, the siliceous frustules of planktonic algae, and (2) radiolarian ooze, containing large proportions of radiolarian skeletal forms formed by planktonic animals. H.O.G.

refractory. A refractory material that in the fired state, contains not less than 78 percent but less than 92 percent SiO2, the remainder being essentially Al2O3. Semisilica and subhypersilica refractories are also comprised within this definition. Dodd.

rocks. Rocks which are chiefly formed by sponges and small marine animals called Radiolaria and small plants called Chrysophyceae. Fay.

shale. A hard, fine-grained rock of shaly structure generally believed to be

behind the leaking tubing, is highly impervious. Nelson.

wet-pan charger. See wet-pan charger. T. J.

bricks. See silica brick.

calcite. See sand calcite.

clay. A clay containing appreciable free silica in particles which may or may not be visible to the naked eye. When visible particles of silica are present in large amount, the term sandy is often used. A.G.S.B., 1.

siliceous deposit. A group of natural earth materials including chert and flint and the deep-sea oozes which are formed of the skeletons of such organisms as radiolarians, diatoms, and sponges. Stokes and Varmus, 1955.

dust. Dust arising from the crushing or other dry working of sand, sandstone, trap, granite, and other igneous rocks are included in this class. Siliceous dusts are not soluble in the body fluids, and when introduced into the respiratory tract in the form of particles of the proper size and in sufficiently high concentration produce nodular growths that often result in a form of pneumoconiosis that has been known as silicosis or "stone cutters" consumption. Pi and Quarry, 53rd, Int. B, p. 252.
siliceous shale

siliceous sinter. See fiorite. Fay.
siliceous. a. In petrology, containing silica in
dominant amount. Fay. b. In chemistry, containing silicon as the acid-forming ele-
ment. Fay.

Fay. siliceous hydrated silica. Applied to the
jelly-like precipitate obtained when a so-
dium silicate solution is acidified. The formu-
la Na2SiO3 is often used for conven-
tion but no such compound has been iso-
lated, and SiO.nH2O is the proper formula.
The proportion of water varies with the
conditions of preparation and decreases
gradually during drying and ignition, until
relatively pure silica, SiO2, remains. During
drying, the jelly is converted into white
amorphous powder or lumps. In this form,
the material has great surface area and
absorbing power. Used for decolorizing
(bleaching) oils, fats, and waxes; as a cat-
ayst, a carrier or base for other catalysts
and for chromatographic adsorption; and
recovery of gases and vapors including
moisture from air or gas streams. The ad-
sorbent properties may be regenerated by
heating to 150°C. See also silica gel. The
term silicic acid is also sometimes applied
to various hypothetical acids of silica, such
as H2SiO4 (orthosilicic acid. See ortho-
silicic acid), Na2SiO3, etc. CCD 64, 1961.
Two types of silicic acid are metasilicic acid
and dicalcic acid. Metasilic acid: H2SiO3;
molecular weight, 76.10; colorless; amor-
phous; decomposes at room tempera-
ture; insoluble in water; and soluble in
ammonia, in hydrofluoric acid, and in hot
alkalies. Dicalcic acid: H2SiO4; molecular
weight, 138.16; colorless; crystalline; de-
composes at 150°C on heating; insoluble
in water; and soluble in ammonia and
in hydrofluoric acid. Handbook of Chem-
B-134, B-217.
silicate. A binary compound of silica with a
metal. Osborne.
silicates. A group of special ceramic mate-
rials. Used chiefly in the form of alloys (as fer-
silicon), in combination with ceramic
materials in cermets, and as a semiconduc-
tor (as in transistors) and element in
photovoltaic cells. Symbol, Si; valence, 4;
solvent, water; hardness, 5; specific gravity,
2.33; atomic weight, 28.086; specific gravity,
2.32 to 2.34 and 2.33 (at 25°C); melting point,
1,410°C; 1,350°C; insoluble in water and in
hydrofluoric acid; and soluble in hydrofluoric acid and nitric acid
mixed. Webster 3d; Handbooks of Chem-
B-134, B-217. Silicon constitutes 25.7 per-
cent of the earth's crust by weight. Never
found uncombined in nature but occurs
abundantly as the oxide and as silicates.
This relatively inert element is not af-
fected by most acids, except hydrofluoric
acid, but it is attacked by halogens and
dilute alkalies. Handbook of Chemistry
B-134, B-217.
silicon alloys. Silicon bronze is a noncorro-
ding alloy with copper and tin. Silicon cop-
per (70 to 90 percent silicon) is an al-
loy is added to molten copper or brass
to remove oxygen. Silicon iron is a
grain-refining iron, or crystalization resis-
tant. See also ferrosilicon. Fryor, 3.
silicon and selenium rectifiers. Silicon
and selenium power conversion units are
an economical means of obtaining direct cur-
tent power from the excitation of syn-
chronous motors, magnets, magnetic chick,
arc lights, etc. The basic unit consists of
a three-phase, insulated transformer and
silicon rectifier diodes or selenium rectifier
stacks, enclosed in a ventilated steel cabi-
net. To this can be added the proper
accessories, alternating current and direct
current switchgear, voltage regulator, re-
generative protective panels, off-and-on
pushbuttons, meters, etc. Both convection
cooling and forced draft cooled units are
available. In most large industrial
applications, it has been found economical
to use forced draft cooled rectifier units.
Rectifier equipment using silicon diode basic
modular design requires less floor space,
is credited with higher effi-
ciency, and permits better voltage regula-
35.
silicon borides. Two compounds have been
reported: SiB6, oxidation resistant to 1,570°C;SilB12, ignition point 1,930°C. A
special refractory has been made by react-
ing silicon and boron in air, the product
containing 85% silicon and 15% boron.
One matrix; it is stable in air at 1,550°C
and has good thermal shock resistance.
Dodd.
silicon bronze. An alloy of copper and usu-
ally 1.5 to 3.0 percent silicon with small
amounts of various third elements (as zinc,
tin, or magnesium). Webster 3d.
silicon fur. See flue silicon. CCD 64, 1961.
silicones. A high-silicon, low-carbon
ferromanganese. Also called manganese
294.
silicones. See manganese alloys. CCD.
silicon. A tetravalent nonmetallic element
that occurs in combined form as the most
abundant element of the earth's crust.
It can be obtained as brittle, hard, lustrous,
steel-gray crystals with the lattice of a
diamond, as a glassy diamondlike, or as
dark brown powder. Usually prepared by
reducing sil-
ica with carbon in an electric furnace.
Used chiefly in the form of alloys (as fer-
silicon), in combination with ceramic

silicon dioxide. See silica. ACSG, 1963.
silicones. Group name for semi-inorganic poly-
mers made up of a skeleton structure of
alternate silicon and oxygen atoms with
various organic groups attached to the sil-
icon. Silicones range from low-molecular-
weight volatile materials to cyclic, linear,
and cross-linked high-molecular-weight po-
ylmers. Produced to the basic forms of
fluids, resins, and elastomers, they are also
further compounded to yield greases, rub-
ber, protective coatings, and foambale
powders. Silicones are heat stable; service-
able over a wide temperature span; water-
repellant; and resistant to oxidation and
weathering. Used in surface treatments for
glass and ceramic. CCD 64, 1961.
silicon ester. The first chemical compound
manufactured in which silicon replaces
carbon in a molecule in the realm of or-
ganic chemistry. One carbon atom in an
alcohol molecule is replaced by silicon.
One of the latest developments in the
manufacture of highly refractory materials
is the mixing of refractory powders with
silicon citer. This operation produces a
workable body which will not shrink dur-
ing drying and firing. Rosenthal.
silicon iron. A cast iron containing 0.7 to
14 percent silicon. Has low magnetic
hysteresis, used for sheets for transformer
cores and those containing the higher per-
centages of silicon are used as cathodic
protection anodes. Bureau of Mines Staff.
silicas. To unite or cause to unite with
silicon, as in the combination of iron with
silicon in certain metallurgical processes.
silicosis. Diffusing silicon into solid metal,
usually steel, at an elevated temperature.
ASM Gloss.
silicon nitride. A grayish powder, Si3N4
(can be prepared as crystals); sublimes at 1,900°C;
Molybdenum, 9-4; resistant to oxid-
ation, various corrosive media, molten alum-
num, zinc, lead, and tin. Used in abrasives
and in rocket nozzles. An important refrac-
tory. CCD & 64, 1961.
silicon-oxygen tetrabromide. A complex
ion composed of a silicon ion surrounded by
4 oxygen and 4 bromine ions. Used in
3 to 4 units, is represented by the symbol
(SiO)4Br4, is the diagnostic unit of silicon
minerals, and is the central building unit
of nearly 50 percent of the materials of the
earth's crust. Last.
silicon spiegel; silicospiegel. A. A spiclei-
gen containing 15 to 20 percent manganese
and 8 to 15 percent silicon used in making
certain special steels. Webster 3d. b. A
silicon steel. A variety of steel containing
0.5 to 5 percent silicon. It is very hard,
but brittle, and is used in the form of sheets
for making cores for electromagnets,
transformers and motors and generator armatures. Bureau of Mines Staff.
silicon ware. A slightly glazed stoneware
silicosis
ica dusts by those, as stonecutters, asbestos workers, miners, regularly exposed to such dusts. J. Ind. Med. 56, 1954. Also pneumoconiosis; simple silicosis. Nelson.
silicate. A finely ground-plastic clay of high luster. A metal fracture in which the broken metal surface has a fine texture. A naturally occurring cubic modification of BiO3 as greenish, waxy masses from Durango, Mex. Spencer 17, M.M., 1946.
sillet. D. Place where any fluid bed or mass of sediment, or any material, has been deposited in a mine in hydraulic mine-filling. Fay.
sillet. Trademark for heating element consisting principally of SiC; to maintain a constant resistance for a long period, silicon is included in the batch and the shaped rods are fired in a controlled atmosphere to cause some nitridation and/or carbonation. Dodd.
silic. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground- plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Inclusions now generally conceded to be tiny needles of rutile, although some authorities still mention calcite as negative crystals. Shipley.
sill. A finely ground-plastic clay of high luster. Microscopically small inclusions in ruby or sapphire; surfacethe reflections which produce a whish sheen resembling the sheen of silk fabric. Silurian

The third in order of age of the geologic periods comprised in the Paleozoic era, in the nomenclature in general use. Also, silver medals deposited during that period. (The above usage, in which the term is restricted to the period following the Cambrian, the Devonian, is the one now prevalent. Formerly, Silurian included what is now called Ordovician, and it has been used by some geologists to include the Cambrian also.

Fay.

silver. A white metallic element in Group I of the periodic system; sonorous, ductile, very malleable, and capable of a high degree of polish. It is not oxidized in air, and has the highest thermal and electrical conductivity of any substance. Occurs massive, or as anbesert or filiform shapes. Native silver oxide has variable admixture of other metals: gold, copper, or sometimes platinum. Used for coin, jewelry, etc. Symbol, Ag; atomic weight 107.86; specific gravity 10.5 at 20° C. C.T.D.

silver amalgam. A solid solution of mercury and silver crystallizing in the cubic system. The percentage of silver is usually about 26 percent, but in the variety argentum it reaches 66 percent. It is of rare occurrence, and is found scattered either in mercury or silver deposits. C.M.D.

silver b还原. Eng. A compact oolite, the best silver lead ore. The name given to galena. C.M.D. and is found scattered either in mercury or silver deposits. C.T.D.

silver glance. The native silver sulfide, argentite. Fay.

silver halides. Silver bromide, AgBr; silver iodide, Ag I; silver chloride, AgCl; and silver fluoride, AgF. The bromide and chloride are sensitive to light and are of basic importance in photography. C.M.D.

silvering. a. A plating or covering of silver or an imitation of it, as applied to any surface; as, the silvering on the back of a mirror. Standard, 1964. b. The art or process of coating surfaces with, or as with, silver. Standard 1964.

silver jaspis. Same as owyheeite. English.

silver lead. Lead containing silver. Pryor, 3.

silver lead ore. The name given to galena containing silver. When 1 percent or more of silver is present, it becomes a valuable ore of silver. Also called argentiferous galena. C.M.D.

silver luster. Because silver tends to tarnish, silver luster is, in fact, made from platinum, with or without the addition of gold. Dod.

silver marking of glasses. Silver cutlery, or other relatively soft metal, will leave a very thin smear of metal on pottery ware if the glaze is minutely pitted. A glaze may have this defective surface as it leaves the kiln, or it may subsequently develop such a surface as a result of inadequate chemical durability. The fault is also known to Dodg.

silver mill. The mill or metallurgical plant used in treating silver ores by either the solvent or dry process. F. hydroxide. Bennett 24, 1962.

silver mill. Occurs native, alloyed with gold as a solvent of argenticite. The main source is argentiferous ores of lead, zinc, copper, silver, and copper. Pryor, 3.

silver ore. Slightly soluble in ethyl alcohol. An explo.

silver ore. Sometimes found native. See also antimony; amalgam; argentite; bronzin.

dine; cerargyrite; dyscrasite; electrum; embolite; freibergite; freieslebenite; hessite; iodinite; krennerite; mizangite; petzite; proustite; stephanite; stefeldite; stromeyerite; xanthoncite. Fay.

silver oxide. Black; black on exposure to light in the presence of organic matter; odorless; bitter, caustic metallic taste; corrosive; soluble in cold water; more soluble in hot water; soluble in glycerol; slightly soluble in ether; very slightly soluble in absolute alcohol; specific gravity at melting point, 121° C; and it decomposes at 104° C. Used as a reagent in chemical laboratories and in glass manufacture. C.C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-218.

silver powder. Provides the most convenient method of introducing silver into glass; a solution of the compound is poured over the batch. A very low concentration of silver produces a colorless glass which, upon reheating, can be struck to a yellow.

silver ore. Brittle. See stephanite.

silver ore. Sometimes found native. See also antimony; amalgam; argentite; bronzin.
dine; cerargyrite; dyscrasite; electrum; embolite; freibergite; freieslebenite; hessite; iodinite; krennerite; mizangite; petzite; proustite; stephanite; stefeldite; stromeyerite; xanthoncite. Fay.

silver zinc battery

the electrolyte, very little free liquid being present. The plates contain no paste. Neither the paste nor any air or moisture is required and the cells are claimed to be unaffected by prolonged charge or discharge. The most noticeable characteristics of the silver-zinc cell are those of its very low rate of weight and the small size and weight, when compared with other types in general use. They are less than half the size and less than one-third the weight of conventional type batteries of the same capacity. Roberts, II, p. 246.

Silver ore. The oldest manual method of artificial respiration on record, dating back to 1556. The cycle of operations is as follows: Lay the patient flat on his back and place a roll of clothing under his shoulders to ensure that the head is thrown well back and the respiratory tract is clear. Pull the patient's tongue forward and fix it in that position. Kneel at the patient's feet and grasp his arms immediately below the elbows. Swing forward and press his arms steadily and firmly downwards and forwards against the lower ribs, thus lifting the upper part of the abdomen. Maintain a steady pressure for 2 seconds to force air out of the lungs and simulate the movement of expiration. Then, after a pause, bring the patient's arms steadily backwards until they are in line with the body and the elbows are almost touching the ground. Hold the arms in the extended position for 3 seconds. In this position the chest cavity is extended, air enters the lungs, and the movement stimulates the natural inhalation movement of breathing. McAlpine.

simile. If a given charge will break a crater of double the linear dimensions and it is desired to break a crater of double the linear dimensions, then the charge dimension must be doubled or its volume (weight) cubed. If, however, linear dimensions in each case are divided by \( \sqrt[3]{W} \), then this should yield the same scaled values. The cube root of the weight of explosive is usually denoted by \( r \) and is given for convenience the dimensions of feet. Linear distances are scaled by dividing by \( r \), areas by \( r^2 \) and volumes of weight by \( r^3 \).

similer. A golden-colored variety of brass. Also called Mannheim gold; Prince Rupert.

siminosacco filter. A trade name for a rotary vacuum disk filter used in the final stages of coal preparation. It is continuously operated and designed for the filtration of froth concentrate from flotation plants and for the treatment of flocculated slurries. Nelson.

Simons theory. A theory of drilling to include the effects of drilling by percussion and by vibration (oil well) bit, cable tool, and pneumatic hammer. The formula developed is for rate of penetration of a given chisel-type bit into brittle rock. The rate of drilling may be defined by the following equation:

\[
R = \frac{NA}{d^2}
\]

where \( R \) equals rate of advance of bit, \( N \) equals number of wings of bit, \( f \) equals number of impacts per unit time, \( d \) equals diameter of the bit, \( A \) equals cross-sectional area of crater at periphery of drill hole. Lewis, A. G. I.

siminosyne. Synonym for bloodcote. Dana 64, p. 546.

simple alloy steel. An alloy steel containing one alloying element, as for example, simple nickel steel. See also ternary steel. Fay.

simple beam. A simply supported beam. Ham.

simple bending. The bending of a beam which is freely supported, having no fixed end. Ham.

simple cross-stratification. Lower bounding surface of cross-stratified unit is a nonerosional surface. Patschott.

simple curve. A curve having but one radius. Zorn, p. 455.

simple engine. A reciprocating engine from which steam or compressed air is exhausted to atmosphere after expansion in one cylinder only, Ham.

simple explosives. These explosives consist of one simple chemical compound. The explosive heat is liberated with the breaking down of the molecules and the atoms recombining to form water, carbon dioxide, nitrogen, and other gases and possibly solid substances such as carbon. To this group belong explosives in the proper sense of the word, such as nitroglycerin, nitroglycerine, trotyl, and cyclonite (RDX). Fraenkel, v. 3, Art. 16:01, p. 29.

simple mineral. A mineral found in nature, as distinguished from rocks, which, in the scientific sense, are mixtures of minerals. Standard, 1964. Calcite and hemate are simple minerals, while granite is a mixture of three simple minerals—quartz, feldspar, and mica. Fay.

simple ore. Ore that yields a single metal. Schieffelacker.

simple pegmatite. A pegmatite of simple mineral composition and corresponding to the last products formed during the main stage of magmatic crystallization, without replacement by pneumatolytic-hydrothermal agencies introducing rare elements. Schieffelacker.

simple pneumoconiosis. Pneumoconiosis of the lungs that can be related to the amount (and possibly the nature) of the dust breathed by miners over the years. See also complicated pneumoconiosis. Nelson.

simple sound source. A source that radiates sound uniformly in all directions under free-field conditions. Hy.

simple split seam. A coal seam which has separated into two layers of coal some distance apart vertically. See also multiple split seam. Nelson.

simple steel. A steel consisting chiefly of iron and carbon. Other elements are always present, but are not essential to the formation of the steel. The content of carbon may be very small. Often called carbon steel. Fay.

simplex kiln. A type of annular kiln in which two barrel-arch galleries are each divided by transverse walls into eight or nine chambers, each of which has grates at the corners for the hand firing of solid fuel. This kiln can be used for the firing of facing bricks, roofing tiles, firebricks, or (because the flue system permits each chamber to be isolated) blue engineering bricks. Dodd.

simplex pump. A reciprocating single- or double-action piston pump having one water cylinder. Long.

simplexite. Hydroz hydravandate of calcium, CaV;SO;H; monoclinic, as dark-green plates and warty aggregates with UV colors in crevices in sandstone from Pea nut mine, Montrose County, Colo., and localities in Colorado and Utah. Spencer 21, M.M. 1958.

simple silicosis. Silicosis which is not complicated pneumoconiosis. Nelson.

simulated insert bit. A core bit in the face of which are deeply cut, closely spaced waterways to produce the superficial ap-
simulated insert bit

ledge as a single bench the full height of the quarry face. Fay.
single crystal alunias. A product recrystal-
ized from a molten bath. The crystals are of
high purity alumina and each grain is essen-
tially a single complete crystal. ACGS, 1963.
single cut sprocket. For double-pitch roller
chain, a sprocket having one set of ef-
teffect teeth. JFM.
single-cycle mountain. A mountain that has
been folded and then destroyed without
re-elevation of any important part. Stokes and
Varner, 1933.
single-cycle reactor system. See direct-cycle
reactor system. LBL.
single entry. A system of opening a mine by
driving a single entry only, in place of a
single plow. A method of mining in which
one man works in each place on
the joint edge of one member is
kept open. Fay.
single fire. The process of maturing an un-
-fired ceramic body and its glaze in one
operation in contradistinction to double
fire. Fay.
single fire ignition. In the form of a .1 from one side.
single figback. An aerial ropeway in which
the steel.
single freshmen. A work plan for mining in a
core of the opening in the direction of the
quarry face. Fay.
single4 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.
single5 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.
single6 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.
single7 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.
single8 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.
single9 groove weld. A groove weld in which
the joint edge of one member is
beveled from one side. ASM Gloss.

Long.
single-layer roofing tile. This term includes
pantiles, double roman tiles, flat interlock-
ing tiles, and Pooles tiles. Dodd.
single-ply roofing. A method of roofing using
sheet metal in one layer. Fay.
single race. A conveyor in which
one man works in each place on
the joint edge of one member is
kept open. Fay.
single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.
single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.

single reduction. A gear set that causes one
rotation in contradistinctim to double refrac-
tion. Fay.
single-road stall

single-roll breaker. A coal crushing machine in which the roll teeth crack downward; or the lump and the roll itself comprises the coal against the breaker plates. Teeth of two or more designs are used on the same roll, some for the slugging, cracking, or blow action and others for a pulling and splitting force. The breakers are not easy to stall by choking, since they will pass a heavy overload, partly because of the action of a relief mechanism, with which they are all equipped. Mitchell, p. 196-197.

single roll crusher. A crushing machine consisting of a rotating cylinder with a corrugated or toothed outer surface which crushes material by pinching it between the teeth and stationary breaking bars. ACSG, 1963. Compare double roll crushe.

double-round nose. A mill possessing batteries of one side only. ASM Gloss. See also double round nose.

double-screened ground refractory material. A refractory material that contains its original gradation of particle sizes resulting from crushing, grinding, or both, and from which particles coarser than a specified size have been removed by screening. ASTM C71-64.

double-stage compressor. A machine designed to compress air or gas against pressures exceeding 60 pounds per square inch. See also single-stage compressor. Ham.

double-stage pump. A centrifugal pump with a lift of 100 feet per stage. Ham.

double-tube core barrel. Long. A core barrel consisting of a single length of tubing, the core and the inside surface of the cylinder, a type seldom used for pressures exceeding 60 pounds per square inch. Coal Age, 1964.

double vein. A single ore deposit of identical origin, age and character throughout. A single small vein is weighed and measured by the same law and entitled to the same consideration as the mother lode, and very often is far more valuable in the eyes of the miner. Rickets, pp. 123-24.

double-U groove weld. A groove weld in which each member is beveled from the same side. ASTM Gloss.

single speed floating control system. In floatation, floating control in which the magnitude of the actuating signal. Fuerstenau, p. 549.

single stall. A single small vein is weighed and measured by the same law and entitled to the same consideration as the mother lode, and very often is far more valuable in the eyes of the miner. Rickets, pp. 123-24.

single-U groove weld. A groove weld in which each member is beveled from the same side. ASTM Gloss.

single way rectifier circuit. A circuit in which the alternating current between each terminal of the alternating-voltage circuit and the rectifying element conducts in one direction only, to it flows in both directions. Coal Age, 1. single welded joint. Any joint welded from one side only. ASTM Gloss.

double roll breaker. A coal crushing machine in which the roll teeth crack downward; or the lump and the roll itself comprises the coal against the breaker plates. Teeth of two or more designs are used on the same roll, some for the slugging, cracking, or blow action and others for a pulling and splitting force. The breakers are not easy to stall by choking, since they will pass a heavy overload, partly because of the action of a relief mechanism, with which they are all equipped. Mitchell, p. 196-197.

single roll crusher. A crushing machine consisting of a rotating cylinder with a corrugated or toothed outer surface which crushes material by pinching it between the teeth and stationary breaking bars. ACSG, 1963. Compare double roll crushe.

single screen. A borehole survey made to determine the average velocity of airflow along a mine roadway by anemometer. A velocity reading is taken at the center of the airway and the result is multiplied by the center constant to give the average velocity of flow. Alternately, the reading is taken along a midway line at a position some 1/7 to 1/3 of the width of the airway, measured from the side. At this position the mean velocity is obtained, so that no constant is required. Roberts, I, p. 49. Compare division method; traversing method.

single stage compressor. A machine designed to compress air or gas against pressures exceeding 60 pounds per square inch. See also single-stage compressor. Ham.

single-stage pump. A centrifugal pump with a lift of 100 feet per stage. Ham.

double-tube core barrel. Long. A core barrel consisting of a single length of tubing, the core and the inside surface of the cylinder, a type seldom used for pressures exceeding 60 pounds per square inch. Coal Age, 1964.

double stage. A single small vein is weighed and measured by the same law and entitled to the same consideration as the mother lode, and very often is far more valuable in the eyes of the miner. Rickets, pp. 123-24.

double-U groove weld. A groove weld in which each member is beveled from the same side. ASTM Gloss.

single way rectifier circuit. A circuit in which the alternating current between each terminal of the alternating-voltage circuit and the rectifying element conducts in one direction only, to it flows in both directions. Coal Age, 1. single welded joint. Any joint welded from one side only. ASTM Gloss.

single spot method. One of three recognized methods of determining the average velocity of airflow along a mine roadway by anemometer. A velocity reading is taken at the center of the airway and the result is multiplied by the center constant to give the average velocity of flow. Alternately, the reading is taken along a midway line at a position some 1/7 to 1/3 of the width of the airway, measured from the side. At this position the mean velocity is obtained, so that no constant is required. Roberts, I, p. 49. Compare division method; traversing method.

single stage compressor. A machine designed to compress air or gas against pressures exceeding 60 pounds per square inch. See also single-stage compressor. Ham.

single-stage pump. A centrifugal pump with a lift of 100 feet per stage. Ham.

double-tube core barrel. Long. A core barrel consisting of a single length of tubing, the upper end of which may be threaded to fit a drill rod or a head, which also contains a drill-rod thread. The lower end puts to a standpipe, or casing down through overburden by rotation or by driving, chopping, or washing operations, employed singly or in combination. Long. a. A single small vein is weighed and measured by the same law and entitled to the same consideration as the mother lode, and very often is far more valuable in the eyes of the miner. Rickets, pp. 123-24.

single stage. A single small vein is weighed and measured by the same law and entitled to the same consideration as the mother lode, and very often is far more valuable in the eyes of the miner. Rickets, pp. 123-24.
sinker bar

to give force to the upward jar in well-drilling with cable tools. Webster 3d.

sinker bar guide. Bars of iron (usually 4) fitted to wooden tools in order to increase their girth and render it impossible for the drill to deviate. Fay.

sinker drill. a. A single-blade drill, ranging in weight from 25 to 80 pounds, that can be held in the hand but is frequently mounted. This drill has found wide application in sinking shafts and is made in several sizes, each suited for a particular kind of work. Also called plunger drill. Lewis, p. 209.

sinker hammer. A forged hammer type commonly used in shaft sinkings. Also called sinker. Webster 3d. c. A hammer used for striking a shock to a reference point, a piece of slack to be seized, a tumbler to be turned, or a similar purpose, usually of forged metal and driven into the hinge of the door to which it is fastened. The hammer is usually used with an adze or jack, and is also called sinker hammer or sledge hammer. Nelson.

sinker hoistman. In metal mining, one who operates — small power hoist hoist to raise rock and lower supplies in shaft sinking operations. D.O.T. 1.

sinker bar. a. Dross, slag. Webster 3d. b. To become sintered. See also sinter.

sinter. a. The process by which a mass of particles is agglomerated by heating without thoroughly melting) mixtures relatively high in alumina but usually containing associated minerals such as diaspore and various silicates. Commonly made of iron but sometimes microcrystalline. Also called alunina, manufactured. ACSG, 1963.

sintered carbides. Sintering as used in powder metallurgy consists of mixing metal carbide powders having different melting points, and then heating the mixture to a temperature approximating the lowest melting point of any metal included. In sintered carbides, powdered cobalt, having the lowest melting point, acts as the binder holding together the unmelted particles of the hard carbides. Compare cemented carbides. C.T.D. Supp.

sintered carbide-tipped pick. The pick generally used in coal cutters and cutter loaders, in which the sintered tip is brazed in various ways to the shank of the pick. In the external tip type, which is widely used, the sintered tip is brazed externally to the shank, which is usually a forging. It is self-drilling and as the tip wears down, the cutting edge maintains its shape and clearance. In the slotted type, the tip is brazed into a slot cut in the shank of the pick. In the inserted type, the sintered carbide takes the form of a rod inserted into a hollow in the shank of the pick which is a forging. These picks are widely used in the soft coal mines in Germany. See also coal cutter picks. Nelson.

sintered filter. A filter made from sintered aluminum or the equivalent, forming a firm mass in a piston pump. Compare ceramic filter. Dodd.

sintered glass. Glassware of controlled porosity used for filtration, separation, etc. It is made by carefully heating powdered glass so that the surfaces of the particles begin to melt and adhere to one another. Dodd.

sintered matrix. A bit-crown diamond-embedding metal or alloy produced by a sinter powder-metal process. See also sinter; sinter bit. Long.

sintered metal. See sintered matrix. Long.

sintering. a. The agglomerating of small particles to form larger particles, cakes, or masses in case of ores and concentrates, whereby powdered metal is compacted in a mold or other shape, usually by applying heat and pressure to a mixture of powdered metals, without thoroughly melting the particles or alloy produced by a sinter powder-metal process. See also sinter; sinter bit. Long.

sintering furnace. A heating furnace used for sintering. Webster 3d. c. To heat a mass of fine particles for a prolonged time below the melting temperature. Compare agglomeration. ASM Gloss. d. A ceramic material or mixture fired to less than complete fusion, resulting in a more compact or fine particle mass; in ores, the process involved. ASTM C242-60T. e. A chemical sediment deposited by a mineral spring, either hot or cold. Siliceous sinter, consisting of silica, is called geyserite and fumarite; calcareous sinter, consisting of calcite, is called travertine and tufa; and a mixture of both, and onyx marble. Fay. f. A process commonly used in making diamond bits, cutting the mixture in a diamond-set mold or die and the temperature raised to a point just below melting, thus fusing the entire mass together. Also called sintered. Long.
sintering

which causes adjacent particles of material to cohere, at a temperature below that of complete melting. *HW, d. A process in which a mixture with coke and ignited, the coke providing the heat to produce semi-molten lumps of ore, which can be more efficiently smelted in the blast furnace than the fine ores which would cause operational difficulties. See also conditioned sinter. Nelson.

sintering furnace. In powdered metallurgy, a furnace used to heat metal powders or compacts during the presintering or sintering operations. The heating and subsequent cooling may be carried out in a controlled inert or reducing atmosphere, or in a vacuum. Role.

sinter-machine operator. In ore dressing, smelling, and refining, one who burns out sulfur and other volatile impurities in iron, lead, or zinc ore prior to smelting. Also called burner man. D.O.T. Supp.

sintering. The action or operation of a sinter. Fay.

siphonage. A schist in which magnesia chloroiodite (sindolinite) is the chief constituent. See also schist. A.G. No. Eng. To settle or subside without breaking, as a mass of coal after undercutting and removal of the props. Standard, 1954.

site. a. The area investigated or selected for mining works. See also site investigation. Nelson. b. The location selected where a borehole is to be drilled, engineering work conducted, or a structure erected. Also called location. Long. c. In ion exchange, position where ions are attached to resin (uramin hydrometallurgy). Fay.

site exploration. a. The investigation and testing of the surface, subsoil, and any obstruction at a site to ascertain the full information necessary for designing a complete structure with its foundations. Ham. b. See site investigation; site exploration; site investigation.

site exploration; site investigation. The soil and geological examinations at a new mine site to obtain detailed information for the design and construction of surface works. At a large and important site, the following investigations may be necessary: (1) a geological survey to determine the nature, thickness, and dips of the superficial deposits; (2) a geophysical survey to obtain data regarding the subsurface geology; and (3) a drilling program and possibly a few trial pits for sampling and fixing bedrock. The amount of investigation will depend on the nature of the terrain and magnitude of surface works. See also geophysical survey; soil mechanics; site profile; c; foundation sampling. Nelson.

site plan; location plan. A plan, drawn to a suitable scale, showing the location of proposed shafts or opencast operations. It would show the area to be requisitioned, area to be worked (if opencast), grid of 100-foot squares with ground levels, all existing roads, railways, proposed access roads (in red), water and gas mains, powerlines, sewers, and proposed spoil dumps or topsoil dumps. The information shown is valuable to land and works contemplators. Nelson.

site rivet. A rivet which is driven on a construction site. See also shop rivet. Ham.

size. a. Eng. The extent of the displacement of the throw of a sheet or plate of ore, say, 100 tons and smaller, into a vacuum. Also called location. Fay. c. In brickmaking, plasticity, a tempered clay. Standard, 1964. d. A solution used to treat the surface of pottery ware or of plaster molds. Moldmakers' site is commonly a solution of soft soap. Decorators' size is traditionally based on boiled linseed oil; after its application, and after it has become tacky, the lithograph is applied and brushed down. Dodd.

size distribution. The division of a sample into size fractions with defined limits, the proportions of the fractions being expressed as percentages of the total sample, commonly with an indication of the ash percentage (and other characteristics, if required) of each fraction. B.S. 3552, 1962.

size assorter. One who inspects and racks finished tile according to color and size marking prior to further classification by boardman II. D.O.T. 1.

size-distribution curve. A graphic representation of the size analysis of a mixture of particles of various sizes, using an ordinary, logarithmic, or other scale. B.S. 3552, 1962.

size fraction. Portion of a sample of sand lying between two size limits, the upper being the limiting and the lower the retaining mesh. Pryor, 3.

size-frequency analysis. Determination of the statistical distribution of sizes of particles in powder or colloidal systems. Bennett 2d, 1962.

size of weld. a. The joint penetration in a groove weld. ASM Gloss. b. The lengths of the nominal legs of a fillet weld. ASM Gloss. c. The breaking of large coal, ore, or stone by primary breaker or of smaller sizes by grinding. See also reductive method.
size reduction

size selector. A device attached to the intake of sampling instrument to remove the bulk of the particles above 5 or 10 microns in size and thus the sample more representative of the health hazard size range of dust, mainly 5 microns and smaller. Nelson.
sizing. a. Secondary forming or squeezing operations, required to square up, set down, flatten, or otherwise correct surfaces, to produce specified dimensions and tolerances. See also restricting. ASM Gloss. b. Some burnishing, broaching, drawing, and shaving operations are also called sizing. ASM Gloss. c. A finishing operation for correcting ovality in tubing. ASM Gloss. d. In powder metallurgy, final pressing to impart. ASM Gloss. e. See screening. Pryor 2. f. The process of separating mixed particles into groups of particle size, and cutting up these groups into groups in which all particles range between definite maximum and minimum sizes. Mitchell, p. 128. g. Division of a material into products between nominal size limits. B.S. 3552, 1962. h. The operation of separating an aggregate of particles into sizes on a series of screens. When performed so as to show percentage of each size in a sample, called sizing analysis or screen analysis. See also size, b. Pryor, 3. i. See painting. Kentucky, p. 145.
sizing punch. A punch used for prising of the uninterred compact during the sizing operation. Osborne.
sizing screen(s). A screen or set of screens normally used for dividing a product (for example, washed coal) into a range of sizes. Also called grading screen(s) and classifying screen (s) (undesirable usage). B.S. 3552, 1962.
J. J. list. A pneumatic table of American development for the separation of materials of different specific gravity. It is rated at 15 tons per hour for ¾ to 1½ inch coal and 160 tons per hour for 2- to 4-inch coal. A sizing ratio of 2:1 is desirable the maximum range of sizes which the table can separate in one operation. Nelson.
skall. Scot. A quantity of air allowed to take a short cut to rejoin the main current; air finding its way into the return air course rather than the designed way. See also scale, a. Fay.
skailing air. Scot. Brushing out the foul air between all of this same size, into fresh air into the gaseous workings. Fay.
skars. See scars. Arkell.
skars. a. Scandinavian ore, carrying magnetite. Skarn-minerals include iron-garnets, iron-talc, hornfels, and other minerals. These are generally metamorphosed nearly entirely of lime-bearing silicates and derived from nearly pure limestones and dolomites in which large amounts of silicon, aluminum, iron, and magnesium has been introduced. See also calcareous schist, hornfels; lime; serpentine; pneumatolytic hornfels; tactite. A.G.I. skate-wheel conveyor. A type of wheel conveyor making use of a series of skates which are mounted on the shafts or axles or mounted on parallel spaced bars on individual axles. S.A.A. MH4-1958.
skeating rail. Skeating deal. a. Eng. A rail or timber fixed as a check to guide tubs around a curve. SMRB. Paper No. 61. b. Eng. A rail or deal fixed to roadway props to prevent their displacement by derailed tubs. SMRB. Paper No. 61.
skepodphyr. Suggested by Crou, Eddings, Pirson, and Washington for the texture of pyrope in which the phenocrysts are scattered more or less uniformly through the groundmass. Obolone. Johan- sen, v. 1, 1959, p. 212.
skeletone. a. A refractory block having an inclined face, or a course of such blocks forming the top of a wall, from which an arch or furnace may be sprung; also known as springer. D.O.T. 1.
skelebrick. A brick with one narrow side inclined so that the two large faces are unequal in size. VY.
skelebridge. A bridge spanning a gap at an oblique line and which is, therefore, longer than the width of the gap. Hone small islands and crags, formed by glacial action. Schieberdecker.
skeletone. a. A term for a process of metasomatic transformation of a rock or rock type under conditions that are not sufficient to produce new minerals. MORLEY, G. B. A. 1928.
skeletone structure. A mineral structure showing crystal outlines with emplacements that are not filled with the mineral. Schieberdecker.
skeletone texture. The texture of a rock or rock containing crystals. A.G.I. skeletone tubing. A temporary method of supporting a circular shaft sinking. It consists essentially of iron curved rings. Each ring consists of segments of wrought iron, 3 to 5 inches deep, ¾ to ¾ inch thick, and from 6 to 8 feet in length. The segments are bent to the curvature of the shaft and bolted together, each ring being subjected to the ring above. Lagging or backing beds are wedged before the rings. Every fourth ring or so is supported on steel strata bolts driven into holes drilled vertically at intervals, usually of about 4 feet, behind it. The banks consist of compacted, stable soils, primarily to prevent initial yield at the top. Compare bore sheathing; tight sheathing. Car- son, p. 244.
skeletone. The resulting network of accurate survey lines which have been obtained by triangulation. Him.
skeletone crystals. Hollow or imperfectly developed crystals formed by rapid crystallization. Fay.
skeletone sheathing. Consists of a continuous wood frame with sheathing planks placed vertically at intervals, usually of about 4 feet, behind it. The banks consist of compacted, stable soils, primarily to prevent initial yield at the top. Compare close sheathing; tight sheathing. Carson, p. 244.
skeletone. a. Proposed by Goodspeed for shaping the observed data to extend farther to one side of the average than to the other. Hinde, 1929.
skeletone. The term is generally reserved for a stratum, Hampshire. Arkell. c. A term for a process of metasomatic transformation of a rock or rock type under conditions that are not sufficient to produce new minerals. SCHIEBERDECKER, A. 1928.
skeletone. A rail or deal fixed to roadway props to prevent their displacement by derailed tubs. SMRB. Paper No. 61.
skeletone. a. Eng. A term for a process of metasomatic transformation of a rock or rock type under conditions that are not sufficient to produce new minerals. SCHIEBERDECKER, A. 1928.
skeletone. A rail or deal fixed to roadway props to prevent their displacement by derailed tubs. SMRB. Paper No. 61.
skeletone. A rail or deal fixed to roadway props to prevent their displacement by derailed tubs. SMRB. Paper No. 61.
hillsot, a drag. Webster 3d. b. A brake for a power machine, as a crane. Webster 3d. c. A horse, pole, or log, used in pairs or sets to form a roadway or runway, as for an incline from a truck to the ground, which is constructed over which certain coal cutting machines travel along the working faces. Fay. e. A metal slide placed under a mine car wheel temporarily to restrict the speed of a truck on a descending grade. B.C.I. f. A metal plate placed under a shaft to control the shaft while cutting. B.C.I. g. The sledlike platform forming the base on which a machine or structure and skid or fixed axles, or fixed upon which certain coal cutting machines travel along the working faces. Fay. c. A device on the taphole through which the cast from the furnace by which slag is automatically removed, as at the top of iron, or at the bottom, and diverted to ladles or pots. Fay. d. An iron bar for holding back the slag in pouring molten metal. Webster 3d. e. A tool for removing scum, slag, and dross from the surface of molten metal. Webster 3d. f. A Virginia term used in Missouri for a shallow hole. Webster 3d. g. A tool for removing scum, slag, and dross from the surface of molten metal. Webster 3d. h. To slide into place or adjoin. Long. i. A metal plate placed under a shaft to control the shaft while cutting. B.C.I. j. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. k. A Virginia term used in Missouri for a shallow hole. Webster 3d. l. A metal plate placed under a shaft to control the shaft while cutting. B.C.I. m. A Virginia term used in Missouri for a shallow hole. Webster 3d. n. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. o. A Virginia term used in Missouri for a shallow hole. Webster 3d. p. A Virginia term used in Missouri for a shallow hole. Webster 3d. q. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. r. A Virginia term used in Missouri for a shallow hole. Webster 3d. s. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. t. A Virginia term used in Missouri for a shallow hole. Webster 3d. u. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. v. A Virginia term used in Missouri for a shallow hole. Webster 3d. w. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. x. A Virginia term used in Missouri for a shallow hole. Webster 3d. y. To stack molded bricks with places between to allow ventilation for drying. Webster 3d. z. A Virginia term used in Missouri for a shallow hole. Webster 3d.
skip loader I. In metal mining, one who loads ore into skip (large-capped, canted cars from shafts; side pack, storage bins) at different shaft stations in mine, operating a mechanical device to open cars, load or unload, and close the gates of the loading place. Also called skipman; skipper.

D.O.T. I.

skip loader II. In metal mining, one who dumps ore from mine cars directly into skip in mines not equipped with skip yards. See skip loader I. D.O.T. I.

skipper. In bituminous coal mining, one who controls the skip hoist by which a skip car containing coke, limestone, or ore is raised or lowered from an inclined run to an incline on the shaft. Also called siding-over.

SMRB, Pape No. 61.

skip loader I. In metal mining, one who loads ore into skips. A (mine) shaft especially pre-skips. a. Metal buckets, usually opening at the pillar. To take a slice off the rib of the furnace. D.O.T. I.

skip feeder. A system of windings in vertical or steeply inclined shafts, in which skips replace cages. A skip is often loaded from a measuring chute positioned at the shaft bottom. Skip winding is often adopted where an increased output is required from a small-diameter shaft and which could not be obtained with cages.

skirt board. A vertical strip placed at the side of a conveyor belt to prevent spillage or to increase capacity. Nichols.

skirt. Cornish term for a pump. Fay.

skirt-type core spring. A core lifter, usually operated at the tips of cathodic electrodes, and referred to a stall or roadway working a slice or lift of coal along the side of a pillar. Nelson. b. Eng. A place driven alongside a fall of stone or an old fallin place. More especially applied to a bed in the broken or abandoned workings. Also called siding-over.

skirt plates. Steel sideplates which overlap the conveyor belt slightly and which assist in settling the coal on to the belt at the tail end or at a transfer point. Nelson.

skirt man; skirrrman; skittering. a. Used in pillar extraction and for widening out a coal road. Fay. b. A skip ot slice taken off the rib of the furnace top and dumped into the changing cast. Nichols.

skirtiNg. a. Used in pillar extraction and for widening out a coal road. Fay. b. A skip ot slice taken off the rib of the furnace top and dumped into the changing casts) in a straight line produced by regular intermittent impingement on bottom.

skirtiNg. a. Used in pillar extraction and for widening out a coal road. Fay. b. A skip ot slice taken off the rib of the furnace top and dumped into the changing casts) in a straight line produced by regular intermittent impingement on bottom.

skimming. a. Used in pillar extraction and for widening out a coal road. Fay. b. A skip ot slice taken off the rib of the furnace top and dumped into the changing casts) in a straight line produced by regular intermittent impingement on bottom.

skipping. b. As defined; as in just mentioned. Nichols.

d. Bagging. a. A rock produced by low-grade metamorphism of an argillaceous sediment with an alteration of chert. See also hornblende. A.G.I.

slabbing. a. The fusing of ceramic tiles to fireplace surrounds, etc., to provide a permanent unit. Dodd. b. A form of failure of refractories, also known as shelving. Dodd. c. Close tightening between sets of tiles. Fay. d. Lay, or folds, of a afterbar. Also called slabs. Fay. e. Cutting a slice or slab from the side of a pillar. See also slab, e. Fay.
slabbing out: swaging out. A drill hole pattern suitable for a wide rectangular tunnel, for example, 8 by 15 feet wide. The entire face is first drilled to the proper depth, and then the rock is broken by using the first or cut holes providing a free face for the remaining shots. The face is then slabbed in successive lifts or slabs from one side to the other. Nelson.

slabbing machine. a. A power-driven mobile cutting machine which is a single-purpose cutter in that it cuts only horizontal kerfs at variable heights. Also called arcwall machine. ASA C44.65 1956 b. A coal cutting machine designed to make cuts in the side of a room or entry pillar preparatory to skipping or slabbing the pillar. Jones.

slabbing method. A method of mining pillars in which successive slabs are cut from one side or rib of the pillar after a room is finished, until as much of the pillar is removed as can safely be recovered. This system has the disadvantage that the open area is always increasing and the loaders are working away from the solid pillars toward the goaf. Lewis, p. 543.

slab mill. A primary mill which produces slabs. ASM Glass.

slab pile. A pile built up wholly of flat bars or slabs. See also chunk pile. A Commonly used to describe the dab pile. A pile built up wholly of flat bars or slabs. See peripheral milling. ASM Glou.

slab NTILLING. See peripheral milling. ASM Glass.

slag pocket. 1. A reserved pocket of molten slag used to receive excess slag. This is usually done when cupola slag is being poured. 2. A slag reserve pocket at the base of a blast furnace hearth to receive excess slag. 3. The bed of slag in a reverberatory furnace or a basic open-hearth furnace. 4. The coating of slag, or scum, on the surface of a pool of molten metal. 5. A pocket of molten slag present at the base of a metal container.

slag. 1. The nonmetallic, partially molten materials that separate from the metal in the metal-making processes. 2. The nonmetallic, partially molten materials that separate from molten iron in furnaces. 3. The nonmetallic, partially molten materials that separate from the molten metal in the processes of steelmaking. 4. The nonmetallic, partially molten materials that separate from molten metal in the processes of metalworking, particularly the metalworking processes of the iron and steel industry.

slag breaker. slag handler, and slag yardman. Also called slag breaker. slag handler, and slag yardman. See also slag pot.

slag buggy. Local U.S. A very large pot for holding slag obtained in the smelting or ore. It is mounted on a railway truck or the like, so as to permit easy dumping. Standard, 1964. See also slag pot.

slag car. Iron vessel on wheels used to transport molten slag from furnace to dump. Also called slag buggy. Pryor, 3.

slag cent. Artificial ceements produced by grinding blast furnace slag and mixing it with lime, portland cement, or dehydrated gypsum. See also portland blast-furnace cement. Ham.

slag furnace. A furnace designed for obtaining lead by reducing slag. Fay.

slag, blast-furnace. See blast-furnace slag.

slag buggy. Local U.S. A very large pot for holding slag obtained in the smelting or ore. It is mounted on a railway truck or the like, so as to permit easy dumping. Standard, 1964. See also slag pot.

slag car. Iron vessel on wheels used to transport molten slag from furnace to dump. Also called slag buggy. Pryor, 3.

slag cent. Artificial ceements produced by grinding blast furnace slag and mixing it with lime, portland cement, or dehydrated gypsum. See also portland blast-furnace cement. Ham.

slag, blast-furnace. See blast-furnace slag.

slag buggy. Local U.S. A very large pot for holding slag obtained in the smelting or ore. It is mounted on a railway truck or the like, so as to permit easy dumping. Standard, 1964. See also slag pot.

slag car. Iron vessel on wheels used to transport molten slag from furnace to dump. Also called slag buggy. Pryor, 3.

slag cent. Artificial ceements produced by grinding blast furnace slag and mixing it with lime, portland cement, or dehydrated gypsum. See also portland blast-furnace cement. Ham.

slag furnace. A furnace designed for obtaining lead by reducing slag. Fay.

slag, blast-furnace. See blast-furnace slag.

slag buggy. Local U.S. A very large pot for holding slag obtained in the smelting or ore. It is mounted on a railway truck or the like, so as to permit easy dumping. Standard, 1964. See also slag pot.

slag car. Iron vessel on wheels used to transport molten slag from furnace to dump. Also called slag buggy. Pryor, 3.

slag cent. Artificial ceements produced by grinding blast furnace slag and mixing it with lime, portland cement, or dehydrated gypsum. See also portland blast-furnace cement. Ham.

slag, blast-furnace. See blast-furnace slag.

slag buggy. Local U.S. A very large pot for holding slag obtained in the smelting or ore. It is mounted on a railway truck or the like, so as to permit easy dumping. Standard, 1964. See also slag pot.

slag car. Iron vessel on wheels used to transport molten slag from furnace to dump. Also called slag buggy. Pryor, 3.

slag cent. Artificial ceements produced by grinding blast furnace slag and mixing it with lime, portland cement, or dehydrated gypsum. See also portland blast-furnace cement. Ham.

slag furnace. A furnace designed for obtaining lead by reducing slag. Fay.

slag, blast-furnace. See blast-furnace slag.
slag pocket

the bottom of the downcast of an open-hearth steel furnace, or of a glass tank furnace, designed to trap slag and dust free of valuable metals before they enter the regenerator. Dodd.

slag pot. A vessel for the disposal of slag at furnaces. Slag pots are mounted on wheels and handled by hand, while the larger ones are mounted on trucks for mechanical transportation. See also slag hug and slag car. Fay.

slag runoff. Tagging off excess slag after the ore boil in the basic open-hearth process of smelting. Bennett 2d, 1962 Add.

slag wool. An aggregate of fine filaments of slag produced by blowing a blast of air or steam through a stream of molten blast furnace slag; used for heat insulation in high-temperature furnaces, etc. Also called mineral wool. C.T.D.

slate-back. a. There are many successive ridges of bituminous coal, in which the direction of the slate changes, and often with narrow strips of marl enclosed between successive ridges. Such bands of slate are known by the appropriate name of slates in New Jersey. A.G.I. b. Swamp land, overgrown with dense underbrush. Local in the Northeast. A.G.I. c. An open or cutout tract in a forest strewn with debris, as from logging; also such debris. A.G.I. d. Eng. A mass of coal crushed and shattered by a movement of the earth's crust. Fay. e. Eng. A trough or hollow filled with fractured coal. Pembroke. Also called slatch. Arkell.

slate, b. A sheet of slate or other kind of flat material. Wright.

slate, c. A thin plate of slate or other kind of flat material. Wright.

slate, d. A form of black slate or other kind of flat material. Wright.

slate, e. A form of black slate or other kind of flat material. Wright.

slate, f. A sheet of slate or other kind of flat material. Wright.

slate, g. A thin plate of slate or other kind of flat material. Wright.

slate, h. A form of black slate or other kind of flat material. Wright.

slate, i. A thin plate of slate or other kind of flat material. Wright.

slate, j. A form of black slate or other kind of flat material. Wright.

slate, k. A thin plate of slate or other kind of flat material. Wright.

slate, l. A form of black slate or other kind of flat material. Wright.

slate, m. A thin plate of slate or other kind of flat material. Wright.

slate, n. A form of black slate or other kind of flat material. Wright.

slate, o. A sheet of slate or other kind of flat material. Wright.

slate, p. A thin plate of slate or other kind of flat material. Wright.

slate, q. A form of black slate or other kind of flat material. Wright.

slate, r. A thin plate of slate or other kind of flat material. Wright.

slate, s. A form of black slate or other kind of flat material. Wright.

slate, t. A sheet of slate or other kind of flat material. Wright.

slate, u. A thin plate of slate or other kind of flat material. Wright.

slate, v. A form of black slate or other kind of flat material. Wright.

slate, w. A sheet of slate or other kind of flat material. Wright.

slate, x. A thin plate of slate or other kind of flat material. Wright.

slate, y. A form of black slate or other kind of flat material. Wright.

slate, z. A sheet of slate or other kind of flat material. Wright.
slate shooter
one who drills holes into the slate roof of houлагeways, and charges and sets off explosives to blast down slate to increase crown and to remove a layer of roof. D.O.T. 1.

slate splitter. In stone work industry, one who splits slabs of slate into desired thickness for roofing. D.O.T. 1.

slatestone. A slab of slaty rock, the surfaces being determined by the cleavage. Chiefliner.

slat gate. A gate, for controlling water, composed of two upright grooved posts with boards between the posts of slate being removed or added to regulate the height of water. Fay.

slat gate. A gate, for controlling water, composed of two upright grooved posts with boards between the posts of slate being removed or added to regulate the height of water. Fay.

slate. Characteristic of, pertaining to, resembling, or consisting of slate; having the characteristic cleavage and texture of slate. Fay.

slate cannon coal. Laminated cannel coal. Fay.

slaty cleavage. a. That variety of foliation typical of slates but found in many other kind of rocks. Generally, the result of parallel arrangement of platy or sheet-like minerals. See also foliation. A.G.I. b. A parallelism of the flakes in slate causing the tendency to split with ease in one direction. This is the outstanding characteristic of slates. Fay. c. A slate coal. Tomketeif, 1954.

slaty gate intermediate between a slate and a quartzite. Kemp, 64, p. 238.

sleddar. a. In bituminous coal mining, one who digs out dirt, rock, or coal with a long-handled heavy hammer used with water to slurry the debris. Fay.

sleeper block. See throat, a. b. c. Dodd.

sleipper. A leg of wond or other material toed as a support: as (1) a horizontal strip of wood that is driven between every other slice from 18 to 36 feet apart. Long.

slip. a. Smooth or even on the surface; smooth and glossy. Standard, 1964. b. Britt. Soft and trouble—one, as applied to the condition of the floor in steep seam. Fay. c. Fine scrate with smooth bound-

slickensides. a. The str;ations, grooves, and lines or markings formed by or on fracture of pottery. Standard, 1964.

slickensides. a. The striations, grooves, and lines or markings formed by or on fracture of pottery. Standard, 1964.

sliding blockwork. A method of break water construction using sloping nearly vertical courses of concrete blocks, which can be lowered into position much more easily than in coursed blockwork. Ham.

slice bar. A thin, wide iron tool for cleaning clinkers from the grate bars of a furnace. Fay.

sliced blockwork. A method of break water construction using sloping nearly vertical courses of concrete blocks, which can be lowered into position much more easily than in coursed blockwork. Ham.

slicing. In continuous mining, slicing consists of driving up some 4 to 6 places the set ordesired distance, which may be 1,000 feet or more, and then pulling the pillars on retreat. After completion of one slice, the unit moves over and mines another along the gob. Coal Age, 71, No. 8, August 1966, p. 185. See also top slic-

sliceknives. a. Ore in a state of fine subdivision; synonymous with slime. Also called stick-

slicks. a. Ore in a state of fine subdivision; synonymous with slime. Also called stick-

slicer. A leg of wood or other material toed as a support: as (1) a horizontal strip of wood that is driven between every other slice from 18 to 36 feet apart. Long.

slice under ore with back caving in rooms. See top slicing and cover caving. Fay.

slice under ore with back caving in rooms. See top slicing and cover caving. Fay.

slickensides. a. The striations, grooves, and lines or markings formed by or on fracture of pottery. Standard, 1964.

slickensides. a. The striations, grooves, and lines or markings formed by or on fracture of pottery. Standard, 1964.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.

slickness. Cal. A word sometimes used to designate the debris (tailings) discharged from hydraulics. Fay.
slicker. A small implement used in a foundry for smoothing the surface of a mold. 

slicek. A term used in western part of the United States for boulders of specular iron ore found in gold placers. Bureau of Mines Staff.

slicek hole. A hole column loaded with explosive, without sprinking. Nichols.

slicek top. A device for mechanically performing arithmetic operations, such as multiplication and division of the numbers engraved on it. G.T.D.

slide. A series of nine classes of running and sliding minerals. S.D. 2.

a. A narrow vein of ore. Standard, 1964. b. The effect on plastic clay of moving over its surface a smooth metal blade; the combined action of pressure and movement tends to bring water, soluble salts, and fine clay particles to the surface. If sliding occurs as a result of movement of the knife or scoop in a plug, it causes lamination as the affected clay surfaces do not readily knit together again. Direct.

slide sheet. a. Steel sheet laid at rail intersections, on which tracks are skidded around, thus avoiding need for switching points. Worker who handles these tracks is called a slider. Also called flat sheet. Prior, 3, p. 172. b. Thin steel plate spread on a trenched floor before a blast, to make hand mucking easier. Nichols.

slide stone; slick stone. A smooth stone used for smoothing and polishing. Arkell.

slide top. In coal mining, a term used to describe the roof of the coal vein when it is very smooth. Kentucky, p. 179.

slide. a. An upright rail fixed in a shaft with corresponding grooves for steadying the cages. See also guide. Fay, b. A trough used to guide and to support rods in a tripod when drilling an angle hole. Also called rod slide. Long, c. As used by churn drillers, a fault plane or opening encountered in a hole that deflects the bit and/or drill hole. Long, d. The bottom of a gold-washing cradle. Standard, 1964. e. Corn. A vein of clay intersecting and dislocating a vein vertically; or, the vertical dislocation itself. Fay. f. The descent of a mass (as of earth, rock, or snow) down a hill or mountain side. Webster 3d. g. The track left by a slide. Webster 3d, b. An accumulation of loose gravel and detached boulders washed down from the mountains. Fay. i. A small dislocation in a rock mass. Standard, 1964. j. Sudden movement of earth and rocks down a steep slope; a landslide. A.C.I. Supp. k. Slides are considered by some to have large lateral displacement in contrast to slumps which are local or restricted displacements. See also slump, d. Pettijohn. 1. Main reciprocating member of a mechanical press, guided in a press frame, to move the press frame within it, to give length without altering the adjustment of the whole column of the press. Also called sliding suction. Fay.

sliding angle. Angle at or above which rock in movement will continue to slide, but less than the angle needed to initiate movement from rest. Some angles on clean steel are:

fory, 2.

sliding-bit kiln. See pushed-bit kiln. Dodd.

sliding caisson. See ship caisson. Ham.

sliding fits. A series of nine classes of running and sliding minerals. S.D. 2.

sliding friction. Sliding friction is the resistance offered when one body slides over another body. The amount of friction or resistance is dependent on the laws of friction. Morris and Cooper, p. 180.

sliding gate. A crest gate which has a high frictional resistance to opening and is therefore suitable only for small gates. See also roller gate. Ham.

sliding iron. See lowering iron. Long.

sliding jaws. A sliding joint used in rope drilling to apply a match to the bit at each upward stroke. B.S. 3618, 1965, sec. 2.

sliding panel weir. A frame weir which has wooden rails sliding between pairs of grooved uprights. Fay.

sliding scale system. A system which regulates the cost of coal by a system of price. Was in existence in some district agreements from 1870 to about 1910. It had many critics. Nelson.

sliding shoe. A metal plate which slides partially or totally for devices used in connection with the device must move or slide on the bottom. The shovel trough of a buckel and certain types of swivels or angle troughs use this device. Jones.

sliding rail. Said of a driver when he places one foot on the rail in front of the car, and the other foot on the bumper, and with his right hand holds on to the car and allows his foot to slide on the rail. Fay.

sliding wedge method. The wedge theory by which the passive or active side pressures acting on a retaining wall may be determined either graphically or by calculation. Standard, 1964.

slime. a. A material of extremely fine particle size encountered in ore treatment. ASM, p. b. A mixture of minerals and some insoluble compounds that forms on the anode in electrowinning. A.M. c. A product of wet grinding containing valuable ore in particles so fine, as to be carried in suspension by water; chiefly used in the flotation. Fay. A. M. A mudlike substance formed of ore in an almost impalpable powder, mixed with water; usually plant. Standard, 1964. d. Primary slime are: extremely fine particles derived from ore, associated rock, clay, or altered rock. They are usually found in old dumps and in ore deposits which have been exposed to climatic action; they include clay, alumina, hydrated iron, near colloidal common earths, and weathered feldspars. Secondary slimes are very finely ground products from the true ore. Pryor, 3.

slime box. See slime pit. Fay.

slime coating. In mineral processing, adherence of an impalpably fine layer of particles of another (for example, calcite on galena), therefore hindering or preventing true surface reaction in leaching or flotation. Pryor, 3.

slime delivery. In ore dressing, smelting, and refining, a laborer who washes slime from cloth strainers, electrolysis tanks, and collection barrels into a settling tank, using a water spray preparation to recover of precious metals from slime. Becoming obsolete. D.O.T. 1.

slime leaching. A leaching method in which the slime and the leach solution are agitated in one or more agitators until the ore minerals have been dissolved. Some agitators have mechanically-driven paddles or elevators inside an agitation tank which serve to keep the pulp in circulation until dissolution is complete. The tanks must be either continuous or intermittent. Newton, p. 420.

slime pit. A tank or large reservoir of any kind into which the slimes are conducted in order that they may have time to settle,
slime, sludge. A pulp of fine mud from slinging. Another name for over-grinding in slim-bole *Mimi sod as*. Use of the slime water: Water defiled in washing ore.

b. A lifting hold consisting of two or more heavy weights for raising them. Zern. block of rock in the roof, as the b. The principal cleat in coal.

required to reach depths of more than a graphic test hole; structure test hole. strat tests. stratigraphic test. Standard, 1964.

ity. A ropelilie device used to give additional support in the drill derrick without sagging. a. A joint in the coal upon which a particle of rock will slide or present with larger particles. B.S. 3552, 1966.

slime, sludge. A. The pulp of fine mud from a drill hole. *See slime, c and d.*

table. a. A table for the treatment of slime; a baffle. Fay. b. A shaking table used in gravity concentration. *See also strata.*

slime table. Characterized by special ridges and shallow pools in which stratification is gently produced. *See also strata.*

slime. A Casiterite too finely ground to be readily concentrated by the use of gravity treatment. Usually associated with hydrated iron. *See also strata.*

slime washer. A vanner, concentrator, or similar machine, used in the separation of fine slimes. *See also strata.*

slime water. Water defiled in washing ore. *See also strata.*

slight. a. Oil driller's term for diamond-drill borehole 5 inches or less in diameter. Long. b. Oil-production drill holes begun about 7 inches in diameter at the surface andbottomed in the oil zone with a 4-1/2-inch-size bit. Long. c. Drill hole of the smallest practicable size, often boren for stratigraphic test. A.G.I. §49. h. A hole drilled with less-than-normal diameter tools. Used primarily for seismicショーカーズ, and structure tests, and more rarely for strat tests. *See also seismic shotheole; stratigraphic test hole; structure test hole. Wilkins.*

slime-hole drilling and casing. Use of the smallest feasible drill hole and casing size. *See also strata.*

slime-hole systems. Name applied to lighter-type boring rigs used where holes are not required to reach depths of more than a few thousand feet. The Rigsky system is of this type. Sinclair, II, p. 235. A Wyoming. Another name for over-grinding in a b-adamite ore. *See also strata.*

slimeback. A joint or crevice that bounds a block of rock in the roof, as the upper surface of a pothole or kettle bottom. Fay.

slip, slippage. a. A rope or chain put around stones or other objects to raise them. Zern. b. A lifting hold consisting of two or more strands of chain or cable. Nichols. c. A. A joint or crevice that bounds a block of rock in the roof, as the upper surface of a pothole or kettle bottom. Fay.

slip, slippage. a. A rope or chain put around stones or other objects to raise them. *See also strata.*

slippery. a. Ark. A joint in the coal upon which a particle of rock will slide or present with larger particles. *See also strata.*

slip, slippage. a. That variety of foliation which takes place along planes having a very low air-shrinkage coefficient. Según the assumption that it is liable to fail along a circular arc. Long. A type of clay containing such a high percentage of fluxing impurities and of such a texture that it melts at a relatively low temperature to a greenish or brownish glass, thus forming a natural glass-croscrope. *See also slip line. A.G.I. Gloss. c-w. of the parallel lines on the crystal and in which the load is suspended by a chain attached to the side of a drill. See also strata.*

slip, slippage. a. That variety of foliation which takes place along planes having a very low air-shrinkage coefficient. Según the assumption that it is liable to fail along a circular arc. Long. A type of clay containing such a high percentage of fluxing impurities and of such a texture that it melts at a relatively low temperature to a greenish or brownish glass, thus forming a natural glass-croscrope. *See also slip line. A.G.I. Gloss. c-w. of the parallel lines on the crystal and in which the load is suspended by a chain attached to the side of a drill. See also strata.*
slip, enamel

**Dip.** From the mill after wet grinding operation. *Bauxite Dict.*

**Slips.** S. Ref. Sled runners, upon which a slip is dragged from the working breast to the tramway. *Pay.*

**Slip.** The layer or face of a sand wave. The foreset laminations of a cross-bedded layer are slip-face accumulations. Also referred to as slip slope. *Petitjean.*

**Slip fiber.** One of the three recognized *fams* in which asbestos fiber is found in rock deposits. In this, the fibers are found lying flat between the enclosing rock walls of the cracks. The fibers lie in a direction parallel to the scan and in this way it is virtually matted together between the rock walls irrespective of fiber length. Normally, slip-fiber occurrences are found in fractures, cracks and slips in chrysotile or anthophyllite asbestos rock formations, sometimes associated with stockwork chlorite mineralization around arsenic oxide deposits. *Sixtair, W. E.*, *p. 39.*

**Slip fiber sample hole.** Another name for anthophyllite *fim* in Sixtair, W. E., *p. 25.*

**Slip fit.** A loosely defined clearance fit between parts assembled by hand without tooling, and which can be readily disassembled by separating the parts. The parts have a considerable amount of movement in relation to one of the other. *Nam.*

**Slipfold.** Synonym for shear fold. *AGI.*

**Slip forming.** Forming parts with both stretch flanges and shrink flanges in two operations. *ASMA Gloss.*

**Slip glaze.** a. Glaze consisting primarily of a readily fusible clay or silts. *ASTM C242-60.* b. A glaze produced with slip clay. See also slip clay. *Fay.*

**Slip grip.** A hold or grip on a drill rod, casing, or pipe by means of serrated-face steel wedges or slips. *Long.*

**Sliphead.** A hook, generally on a hinge, which can be readily disconnected by withdrawing a cotter bolt that holds it in position. *Fay.*

**Sliphouse.** The department of a pottery factory where the clays and other constituents are dispersed in water and blended to produce the slip. *Dodd.*

**Slipping.** Elongating an excavation by breaking one or more walls. *Higham, p. 86.*

**Slipping cut.** In blasting underground, a cut used in a wide tunnel or cavern in which each successive vertical line of shots (round) breaks to the face made by the previous round, so that the relieving cut moves across the end being blasted. Also known as slabling cut; swing cut. *Pryor, 3.*

**Slip-lens reference gallery.** Theory involving the resistance to deformation offered by a hard phase dispersed in a ductile matrix. *ASMA Gloss.*

**Slip joist.** a. A contraction joint between two adjoining sections of wall, or at the horizontal bearing of beams, concrete slabs, and mattress concrete slabs to allow slight movement in relation to one of the other. *Ham.* b. A split connection loose enough to allow its two parts to slide on each other to change shaft length. *Nicholls.*

**Slip lens.** A heat-resistant trough placed over a fire. It is evaporated from slip placed on the trough. This method of dewatering has been replaced by filter presses. *Douglas.*

**Slip lines.** Lined streets. Lines which appear on the polished surface of a crystal or crystalline body which has been stressed beyond the elastic limit. They represent the intersection of the surface by planes on which shear stress has produced plastic deformation. *Douglas.*

**Slip maker.** See clay maker. *D.O.T. 1.*

**Slip maker.** See clay maker. *D.O.T. 1.*

**Slip ondulé.** A fibrous material often noted as a translucent pale green coating along fault planes in serpentine deposits. *Sixtair, W. E.*, *p. 16.*

**Slip slope.** See slip face. *Petitjean.*

**Slip smear.** A tool for extracting tubing from a borehole. *Fay.*

**Slip stabs.** See pottery body stains. *CCP 61, Paper No. 51.*

**Slipstone.** A small wedge-shaped silicified rock, with rounded edges. It is held in the hand and used for whetting gouges. *Crispin.*

**Slip stains.** See pottery body stains. *CCP 64, 1961.*

**Slip streamer.** A streamer through which pottery slip is passed. *Fay.*

**Slip surface.** The surface along which an earth bank is liable to fail under load. *Ham.*

**Slip surface of failure.** In a bank of homogeneous earth or clay, the slip surface of failure closely follows the arc of a circle which usually intersects the toe of the bank. Stability depends upon fixing the position of the center of rotation of the slip surface along which the greatest shearing resistance would be required for equilibrium. *D.O.T. 1.*

**Slip things.** S. Staff. The more or less vertical planes of clearance in coal. See also clearing plane. *Fay.*

**Slip trailer.** A device for squeezing out or flowing lines of slip on a clay surface. Sometimes known as bull trailer. *ASCG, 60.*

**Slip trailing.** See trailing. *Dodd.*

**Slip trouble.** Scot. Difficulties encountered in clearing due to slips. *Fay.*

**Slip-type core lifter.** A device used like a core spring, consisting of a series of tapered wedges contained in slotted recesses in the sides of a core. As the cutters in slitting; a slicer. *Standard, 1964.*

**Slip-waist.** a. Closely spaced surfaces along which differential movement takes place in ASA B41.1953. *ASMA Gloss.*

**Slip plane.** a. Closely spaced surfaces along which differential movement takes place. *Billings, 1954.* b. Synonym for glide plane; gliding plane. *AGI.*

**Slip process.** See wet process, b. *ASTM C242-60.*

**Slip-pump man.** One who pumps slip (semi-fluid clay) from mixing machine directly to caster, turning valves to start slip flowing and observing gage to determine if pressure is correct. *D.O.T. 1.*

**Slip-rock mass.** One who pumps slip (semi-fluid clay) from mixing machine directly to caster, turning valves to start slip flowing and observing gage to determine if pressure is correct. *D.O.T. 1.*

**Slipware.** Pottery decorated by the application of slips. *ASCG, 1963.*

**Slipway.** A concrete or masonry slip sloping down to the water's edge, which supports a vessel under construction or repair. See also traversing slipway. *Ham.*

**Slit.** a. A communication between two levels. *Fay.* b. A short heading put through to connect two other headings. *Zern.*

**Slit-side solid sampler.** A solid-tube sampler with a slight worm twist on the bottom and an offset slit in the side. When rotated, the lip of the slit scrapes a sample from the side of a borehole. *Long.*

**Slitter.** A thin strip of chip of wood or other material which is fed through a single roller. *Ham.*

**Slitting.** A term used for the sawing of colored stones. Usually accomplished with a thin, hard metal blade, similar to which revolves vertically. The operation proceeds grinding. *Shipley.*

**Slit-pouch.** A circular saw used in preparing rock specimens. The cutting edge incorporates a diamond dust and the thin steel disk revolves at high speed. *Pryor, 3.* A gemmater's slitting mill. *Fay.*

**Slitting.** A rotating disk used by gemmatters in slitting; a slicer. *Standard, 1964.*

**Slitting mill.** A shot put into a large mass of coal detached by a previous blast. *Fay,* p. 612.

**Silver.** A defect consisting of a very thin, elongated piece of metal attached by only one end to the parent metal into whose surface it has been rolled. *ASMA Gloss.*

**Sliver.** a. A defect consisting of a very thin, elongated piece of metal attached by only one end to the parent metal into whose surface it has been rolled. *ASMA Gloss.*

**Sliver pump mass.** One who pumps slip (semi-fluid clay) from mixing machine directly to caster, turning valves to start slip flowing and observing gage to determine if pressure is correct. *D.O.T. 1.*
**Slashing loss**

Any horizontal movements in the soil. It consists of a tiller house in a water-tight, brick cylinder about 2.5 inches outside diameter and 3 inches thick. When it the tip of a pendulum contacts a precision-wound resistance coil forming one half of a Wheatstone bridge. The other half of the bridge, together with a potentiometer, resistors, switches, and batteries is contained in a control box. The tiller, which is lowered into an observation well, is connected by cable to the control box. Carson, p. 30.

**Slope level.** A batter level. Standard, 1964.

**Slope man.** A worker who grades slopes of excavations with hand tools. Webster, 3d.

**Slope mine.** A mine opened by a slope or incline. Fay. B. A mine with an inclined opening used for the same purpose as a shaft or a drift mine. It resembles a tunnel or a drift, or a shaft, depending on its inclination. Kentucky, p. 330.

**Slope roul.** Scot. A road driven at an angle less than a right angle with level course. See also slope derrick.

**Slope stability.** The resistance of any inclined surface, as the angle of repose, to cut, or to failure by sliding or collapsing. Bureau of Mines Staff.

**Slope stake.** A stake set at the point where the finished side slope of an excavation or embankment cuts the surface of the ground. It is usually placed on a line at right angles to the center line and passing through the station point. Selye, 2. B. A stake marking the line where a cut or fill meets the original grade. Nichols.

**Slope staking.** Marking the ground surface by pegs at points where proposed new slopes in cut or fill coincide with the original surface. Ham.

**Slope tender.** See slope engineer. D.O.T. I.

**Slope test.** A test to determine whether, and to what extent, the course of a well deviates from vertical. Williams.

**Slope wash.** Soil and rock material that is being or has been moved down a slope predominantly by the action of gravity assisted by running water, that is not concentrated into channels. The term may also designate the process by which such material is moved. Stokes and Varnes, 1955.

**Slipping.** A loss occurring when there is a fluid in the pores of the rock. This loss

**Sludge.** A deposit that is formed by the settling of suspended material from waste water. Dawson.

**Slurry.** A mixture of liquid and solids that is pumped through a pipeline. It is used as a transfer conveyor from a lower age conveyor to the outside. NEMA MD1-1961.
arises from the relative movement of the fluid and solid as the elastic waves pass through it. Fay, p. 171.

slot. a. A narrow, vertical opening generally too small to permit traverse by a man. A.C.I. b. A notch. To hole; to undercut or channel. Fay.

slot-and-wedge bolt. A special rod designed for use in roof bolting. It consists of a mild steel rod, threaded at one end, the other end being split into halves for a length of about 3 inches. When the bolt is driven into the hole, a wedge opens the split end thus forming the anchorage. See also wedge-and-sleeve bolt. Nelson.

slotted. A method of moving large quantities of material with a bulldozer. Each trip is made in the same path and thus the spoilage from the sides of the blade builds up along each side and afterwards all material pushed into the slot is retained in front of the blade and bigger loads are handled. Nelson.

slotted duct sampler. A new instrument for sampling airborne dust and developed by the National Coal Board, Great Britain. It consists of a wide horizontal duct through which the mine air enters and on that duct plates will be deposited on the duct floor according to their falling speeds derived from Stokes' law. The instrument combines the duties of monitoring and measuring airborne dust concentrations in mine roadways. See also pipeline. Nelson.

slotteding. a. York. Coal cut away in the process of bolting. Often used in the plural. Sometimes called bug dust in the United States. Fay. b. Cutting a narrow aperture or groove with a reciprocating tool in a vertical shape or with a cutter, broach, or grinding wheel. ASM Gloss.

slotted wheel. A thin grinding wheel, usually organic bonded, used for cutting slots or grooves in the workpiece. ACSG, p. 7.

slot weld. Similar to plug weld, the difference being that the hole is elongated and may extend to the edge of a member without closing. Fay.

slough. Fragments of rocky material from the wall of a borehole which either fall into and entrap the core or are washed out of the hole with the return; fragments of material resulting from the enlargement of a borehole. Lang.

sloughing-off cone. Large cone (for example, Callow) in pulp flow-line designed to remove fine slimes as overflow while delivering a thickened spigot product containing the coarser particles. Pryor, J. A.

slow. a. Corn. The outcrop or back of a lode. This generally applies to the appearance of a lode in a marly place. Crop- ping out is a Welsh, also East and North of England term; but it is never used in Cornwall. Fay. b. A gallery in a mine; a mine level; especially applied to dump places. Standard, 1964.

slow burning device. An appliance for use in conjunction with the Lilly controller for controlling the landing speed of less than 5 feet per second when men are being unloaded. One such dial of the Lilly controller, an auxiliary dial is bolted to carry a slow-banking cam engaging near the end of the wind with a roller arm. The action of the appliance depends on the relative movement of this roller and that of the piston in an oil dashpot-cylinder. Sinclair, V., pp. 209-210.

slow feed. See slow gear. Lang.

slow-feed gear. See slow gear. Lang.

slow gear. a. When applied to a screwfeed-type drill, the pair of feed gears in the feed mechanism that advances the bit the least amount for each revolution of drill drive rod and/or the coupled drill stem; for example, 400-feed gear is slower than a 100-feed gear. Compare feed ratio. Lang. b. When applied to speed at which the drill motor rotates the drill stem, the transmission gear position giving the lowest instant number of bit revolutions per minute; thus, slow gear corresponds to low gear in an automatic transmission. Lang.

slow igniter cord. It consists of a plastic incendium composition extruded around a central coppery or lead rod, the core designed to give greater strength, and the whole is then enclosed in a thin extruded plastic sheath. Lang.

slow-reading thermometer. Consists of a thick-wall glass test tube containing a thermometer, the bulb of which is embedded in cork or paraffin wax. The open end of the tube is corked and the whole is protected by rubber rings. When employed in the measurement of strata temperature, this is inserted to the back of a 30-foot borehole and allowed to remain there for 24 hours. The thermometer is read, without removing it from the tube, immediately after withdrawal. Roberts, i. p. 138.

slow test. See consolidated-drained test. ASCE P1286.

slow wheel (archaic). The surface perfecting equipment d...
sludge sample

sometimes used for sampling purposes. Little reliance can be placed on the assay of the sludge itself. It is not regularly saved for assay, except occasionally when drilling in weathered or friable ore zones. Sludge samples are then used to collect sludge samples. Nelson.

sludge sampler. a. An individual responsible for collecting and preparing drill cuttings for the purpose of examining, assaying, chemical analysis, or storage. Also called sampler. Long. b. A device used to collect and to split drill cuttings. See also riffle. Long.

sludge samples. Samples of mud from a rotary drill, or sand from a churn drill, or fine materials from diamond drilling used to obtain information about the formation being drilled. Long.

sludge sampling. Process of collecting and preparing drill cuttings as samples. Long.

sludge splitter. See riffle, a. Long.

sludge spinning. The act of or process of becoming sludgebound. Compare, mud up; a. Long.

sludging. The act of or process of becoming sludgebound. Compare, mud up; a. Long.

sludge water. See return water. Long.

sludge splitter. See rifle, a. Long.

sludging. The act of or process of becoming sludgebound. Compare, mud up; a. Long.

sludge sampler. a. An individual responsible for collecting and preparing drill cuttings for the purpose of examining, assaying, chemical analysis, or storage. Also called sampler. Long. b. A device used to collect and to split drill cuttings. See also riffle. Long.

sludging. The act of or process of becoming sludgebound. Compare, mud up; a. Long.
slumping

Slumping. When the soil and earthy material on a steep slope become charged with water, the angle of repose is greatly increased. At the same time the water makes them more mobile. Under these circumstances the material slides down the slope. Such movements are known as slumping or sliding. If the movement is on a large scale it is a landslide.

slump. Marks and structures made by dry or wet sand avalanching down the lee side of a sand dune. Pettijohn.

slump cones. Cones formed by the slumping of a large mass of material such as earth, clay, or sand. Pettijohn.

slump test (laboratory). A test for the consistency of a fluid material in terms of the amount of material subsided in a standard beaker when it is carefully filled to a given level and allowed to settle. Pettijohn.

slump test (laboratory). A test for the consistency of a fluid material in terms of the amount of material subsided in a standard beaker when it is carefully filled to a given level and allowed to settle. Pettijohn.

slurry. A mixture of finely divided solid and water, such as a suspension of clay, cement, or ore, capable of being pumped to a desired location. Pettijohn.

slurry pond. Any natural or artificial pond or lagoon for settling and draining the solids from washery slurry. B.S. 3552, 1962.

slurry screen. A screen to recover a granular product from the circulating water in a washer, usually after a preliminary concentration of the solids and with or without the use of water sprays. B.S. 3552, 1962.

slurry slump. A slump in which the moving mass disintegrates into a quasi-liquid slurry. Pettijohn.

slush. a. To fill mine workings with sand, culm, etc., by hydraulic methods. See also hydraulic mine filling. Fay. b. Sand or silt. Kortum. c. To move or waste filling with a scraper. (slusher) hoist. Bureau of Mines Staff. d. The term "slusher" is also applied to gravity settling of sludge and slurry. See also sludge.

sluice box. Container about the polishing wheel in which the materials are immersed in the polishing agent. Slipher.

slush-fitted pump. A pump equipped with a sliding sleeve or with other means that permit the sleeve to operate within the pump cylinders. Pettijohn.

slurrying. The process of filling in joints with slurry. Oboob.

slurry pond. Any natural or artificial pond or lagoon for settling and draining the solids from washery slurry. B.S. 3552, 1962.

slurry screen. A screen to recover a granular product from the circulating water in a washer, usually after a preliminary concentration of the solids and with or without the use of water sprays. B.S. 3552, 1962.

slurry slump. A slump in which the moving mass disintegrates into a quasi-liquid slurry. Pettijohn.

slush. a. To fill mine workings with sand, culm, etc., by hydraulic methods. See also hydraulic mine filling. Fay. b. Sand or silt. Kortum. c. To move or waste filling with a scraper. (slusher) hoist. Bureau of Mines Staff. d. The term "slusher" is also applied to gravity settling of sludge and slurry. See also sludge.

sluice box. Container about the polishing wheel in which the materials are immersed in the polishing agent. Slipher.

slush-fitted pump. A pump equipped with a sliding sleeve or with other means that permit the sleeve to operate within the pump cylinders. Pettijohn.

slurrying. The process of filling in joints with slurry. Oboob.

small mine

not more than 30 persons below ground.

small ore. Eng. Copper, lead, and zinc ore
dressed to a small size; also called smalls.

small punch. Same as washer mica. Skow.

b. Small particles of mixed ore and

small ore. Eng. Copper, lead, and zinc ore
dressed to a small size; also called smalls.

small stone. a. In mineral exploration
drilling, a diamond bit set with 100-per-
carat size or smaller diamonds. Long.
b. In petroleum drilling, a diamond bit set
with 10-per-carat size or smaller diamonds. Long.

small thi. Eng. Tin recovered from slimes.

small. a. Potash-cobalt glass made by fusing
pure sand and potash with cobalt oxide,
grinding, and powdering; a blue powder.
Used in ceramics as a pigment and for
coloring glass. CCD 64, 1961.

small flint. An arsine of cobalt, often con-
taining nickel and iron. Also called smal-
tite; gray cobalt; tin-white cobalt. Fay.

smallite. Probably skutterudite; the
small flint. An arsine of cobalt, often con-
taining nickel and iron. Also called smal-
tite; gray cobalt; tin-white cobalt. Fay.

small. a. A volatile flux for glazing ware.

smalt. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.

smaltine. a. Smart fire. N. of Eng. A severe,
though small, fire.

smaltite. b. Smaltine. An arsenide of cobalt,
often containing nickel and iron. Also called
smaltite; gray cobalt; tin-white cobalt. Fay.
smithite 1034  smooth shoreline

changes to orange red. A sulfarsenite of silver. Monoclinic; tabular, flattened pyramidal. From Binnenthal, Switzerland. Eng.

Smith-McAlary mud sampler. With this device the digging and hoisting mechanisms are separated. This fact improves overall performance even under bad working conditions. The sampler consists of a spring-loaded bucket arranged so that only after the device rests squarely on the bottom. The bucket is carried on a heavy metalbride which slides on a gooseneck, and it is heavy springs on the frame bear on the movable bridle. In the set position the springs are held by two catchers which fit into a pair of holders and these are triggered when the device strikes bottom. On release, the springs on the bridle and push the bucket down into the sediment. At the same time as these are triggered, a release bar moves so that hoisting the weight goes on the wire and the two halves of the bucket are drawn together taking a sample of the sediment. 

Smith process. a. A variation of the series system of copper refining in which the plant is melted horizontally, the top surface of each one acting as cathode, the lower as anode. Linen diaphragms must be placed between the plates to catch the slime. When these diaphragms break and allow the slime to drop on the cathode, it is caught by the bottom of the tank and short circuits without dismutating the tank. Liddell 2d, p. 496. b. A process for the production of sponge iron, which is carried out in vertical shafts, similar to coke ovens in design. The crushed ore or iron oxide material is mixed with carbonaceous material and charged into the bottom of the shaft. The material is heated and cooled by means of horizontal flues. It is preheated in the upper part of the oven by the waste gases, which leave the bucket and which have a heavy spring at the bottom. The device rests squarely on the bottom. The bucket is carried on a heavy metalbride which slides on a gooseneck, and it is heavy springs on the frame bear on the movable bridle. In the set position the springs are held by two catchers which fit into a pair of holders and these are triggered when the device strikes bottom. On release, the springs on the bridle and push the bucket down into the sediment. At the same time as these are triggered, a release bar moves so that hoisting the weight goes on the wire and the two halves of the bucket are drawn together taking a sample of the sediment.

Smith refractometer. A very small gemmological instrument. See also Rayner refractometer; Tully refractometer. Shipley.

shelter smokestack. D.O.T.

smooth drilling. a. A rock formation in which a high recovery of core can be attained at a high rate of penetration. Long. b. A rock formation in which fast rotation of the drill stem, a fast rate of penetration, and a high recovery of core is achieved with vibration-free rotation of the drill stem. Lang. 

clearing smoke. The agriculturist whose chief business is clearing off the crop is a suit for damages. Hoot), p. 257.

smoke. The exhalation, visible vapor, or material that escapes or is expelled from a burning substance during combustion; applied especially to the volatile matter expelled from wood, coal, peat, etc., together with the solid matter which is carried off in suspension with it. That which is expelled from metallic substances is generally
called fume or fumes. See also fume and metallurgical smoke. Fay.

smooth faced. a. A rock formation in which fast rotation of the drill stem, a fast rate of penetration, and a high recovery of core is achieved with vibration-free rotation of the drill stem. Lang.

smoke blender. A helmet which encloses the head and to which is attached an air hose through which air is pumped to the wearer's b. bellows placed at the fresh air base. A smoke helmet is not normally used by a rescue team, but for building fire seals and for firefighting operations. See also breathing apparatus. Nelson.

smokeless coal. For the first time in steam coal, otherwise a low volatile bituminous coal. Tomkelli, 1954.

smokeless powder. A powder used as a propellant in guns which makes very little smoke when exploded. Standard, 1964. See also smokeless powder. Fay.

smokeless powder. Nitrocellulose containing 13.1 percent nitrogen. Produced by blending materials of lower (12.0 percent) and slightly higher (13.2 percent) nitrogen content; converting to a dough with an alcohol-ether mixture; extruding; cutting; and drying to a hard, horny product. Small amounts of stabilizers (amines) and plasticizers are usually present, as well as apparatus modifying agents (nitrotoluene and nitroglycerin salts). CCD 6d, 1961.

smokeoven. a. An air entry adsorbed driven room window. Fay. b. A room especially constructed in which noxious gases may be generated and confined for the purpose of testing breathing apparatus. Fay.

smoke shade. A scale of tints, ranging from 0 to 10, used for comparison of the smoke of different varieties of coal, which are graded according to the amount of unconsumed carbon in their smoke, the lightest color indicating the most valuable. Standard, 1964.

smoke stick. A means of making a smoke cloud to measure the velocity of air. Fuming sulfuric acid or anhydrous tin tetrachloride are favorite smoke producers. Zern.

smokestone. Cairngorm. Webster 2d.

smoke technique. A technique used to measure only very low-speed air velocity. The release of smoke enables the fluid motion to be observed with the eye. If the smoke is timed over a measured distance along an airway of constant cross section then the velocity of flow can be determined. Usually a spot reading, that of maximum velocity, is obtained. Roberts, 1, p. 53.

smoke test. A test for the efficiency of drains carried out with smoke. Ham.

smoke tester. One who tests efficiency of Cotterill plant and is skilled in the method by determining rate of discharge of gases and solids from smelter stacktop. D.O.T. 457. p. 11.

smoke tube. To determine the presence of moving air, the direction of flow, and the approximate velocity of flow, the smoke
tube method is commonly used, particularly in metal mines. The device consists of an aspirator bulb which discharges air through a glass tube containing a smoke-generating reagent. Usually pumice stone saturated with anhydrous tin or titanium tetrachloride is employed. The dense white cloud of smoke released when the bulb is squeezed travels with the air current; the approximate air velocity in a mine airway is determined by timing how long the cloud takes to travel between two points.

smoke washer. A device in which smoke is forced upward against a downward spray of water in order to remove the solid particles in the smoke. Webster 3d.

smoke zone. The area surrounding a smelting plant in which the smoke or fumes damage vegetation, or in which it may be classified as a public menace or nuisance. Fay.

smoking. The first stage of biscuit firing during which all water is expelled from the greenware. ACGS See also watering-coal.

smoky pit. Mid. An upcast shaft with a furnace at the bottom of it. Fay.

smoke quartz. A smoky, two-colored crystal variety of quartz; from the Cairnsmore Mountain in Scotland. Fay.

smoky topaz. A smoky quartz used for jewelry.

smooth. a. Wales. The line of face, as of a stall cr. Fay. b. Wales. A plane of cleavage more or less vertical. Fay. c. The vibration-free rotation of a drill stem. Long. d. A dull diamond bit. Long. e. Finely ground, as applied to a flat glass surface, prior to polishing. ASTM C13-2-66.

smokeless gunpowder. A powder used as a propellant in guns which makes very little smoke when exploded. Standard, 1964. See also smokeless powder. Fay.

smooth drilling. a. A rock formation in which a high recovery of core can be attained at a high rate of penetration. Long. b. A rock formation in which fast rotation of the drill stem, a fast rate of penetration, and a high recovery of core is achieved with vibration-free rotation of the drill stem. Lang.

smokey is a glazing machine operator. D.O.T. 1.

smoother bar. A drag that breaks up lumps behind a leveling machine. Nichols.

smoke finn file. Tile whose surfaces are not altered or marked in manufacture but left as a plane surface as formed by the die. ASTM C493-65T.

smokey head. York. A flat iron tool, heated to the appropriate temperature for smoothing asphalt surfaces and sealing points. Ham.

smokey mill. A flat iron tool, heated to the appropriate temperature for smoothing asphalt surfaces and sealing points. Ham.

smoothing iron. A flat iron tool, heated to the appropriate temperature for smoothing asphalt surfaces and sealing points. Ham.

smoothness. A glass tube containing a smoke-generating reagent. Usually pumice stone saturated with anhydrous tin or titanium tetrachloride is employed. The dense white cloud of smoke released when the bulb is squeezed travels with the air current; the approximate air velocity in a mine airway is determined by timing how long the cloud takes to travel between two points.

smokey is a glazing machine operator. D.O.T. 1.

smooth shoreline. See graded shoreline. Schieferdecker.
smooth wheel roller

smudge. Obscured with, rubbish, mud, or silt, as the suction pipe of a pump. Fay. 

smother kiln. A kiln in which the smoke is smothered to blacken the pottery within. Standard, 1964.

S.M.R.E. bar. Primarily a roadhead support consisting of two special rolled steel joists welded together longitudinally to form one composite bar. The finished weight of the bar is 16 1/2 pounds/feet and after heat treatment, quenching, and tempering, the tensile strength is raised to 47 tons per square inch with the steel remaining ductile. Fay. 

S.M.R.E. firedamp recorder. This methane recorder is a combination of the principles used in the Kingrose and McLuckie detectors. Two combustion chambers are used, each of which operates every 6 minutes, the operation being staggered so that 20 determinations are made per hour. Samples are drawn into the instrument by means of a vacuum pump. After the operation of the pump and the combustion filaments being controlled by cans on a shaft driven by the motor. Pressures are measured by an aneroid cell and recorded on a clockwork driven drum. Roberts, I. P. 1954.

smudge. See smudge coal, b. Tomkeieff, 1954.

smudge coal. a. Coal partly deprived of its bitumen, and consisting of such coal as is the same for all angles of incidence and the ratio of the sine of the angle of incidence to the sine of the angle of refraction is the same for all angles of incidence and is equal to the index of refraction. Hy. 

S-N diagram. A plot showing the relationship of stress, S, and the number of cycles, N, before failure in fatigue testing. ASTM. 

smock. a. Scot. A sprang or drag for hutches, or waggons, from the main line into a siding. Fay. b. The latch or catch of a car coupler; trip rider. Fay. c. A hole driven into a toe hole prior to its next rolling process. A.S.M.G. b. Any crooked surface defect in a plate, resembling a snake. A.S.M.G. c. A flexible mandrel used in the inside of a shape to prevent flattening or collapse during a bending operation. A.S.M.G. d. Progressive longitudinal cracking in continuous flat glass operation. ASTM C162-66. b. Variation in width of sheet during the sheet-glass drawing process. Also called making. ASTM C162-66. e. See building, d. Long. snake fashion. A method of boxing core. Beginning in the upper-right-hand corner of the core box the core is run from right to left in the first row, from left to right in the second row, etc., until the box is filled. Long.

snakeholes. a. A borehole driven horizontally or nearly so, and for the purpose of a level with the quarry floor. Fay. b. A borehole driven under a boulder for containing a charge of explosives. Lewis, p. 159. 

d. A hole driven into a toe hole prior to its next rolling process. A.S.M.G. 

snatching. a. A method of blasting boulders to break them up, by boring a hole under a boulder and firing a charge in it; this is more efficient but slower than using plater shots. See also plater shooting. Ham. b. Drilling under a rock or face in order to blast it. Nichols. c. A horizontal hole on the quarry floor. Pryor, 3.

snatch block. a. A single-rope sheave set in a housing provided with a latch link, which may be opened for admission for a rope or line without the necessity of threading the end of the rope through the block. Long. b. A block or sheave with an eye through which lashing can be passed for fastening to a scaffold or pole. Ham. c. In a case where holes are bored in a piece of metal to be tentered to lines or objects by means of a hook, ring, or shackle. Nichols. d. A sheave in a case having a pull hook or ring. Nichols.

snatch plate. A thick steel plate through which a hole about one-eighth of an inch larger than the outside diameter of the drill rod on which it is to be used is drilled. The holes are not quite horizontal but are inclined slightly downward so that the bottoms will be a few tenths below grade. Lewis. e. A horizontal plate through the core box the core is run from right to left in the upper-right-hand corner so that it can be opened and re-sealed to the closure of the borehole. Fay. f. See bulldog, d. Long.

snag grinder. In the iron and steel industry, a laborer who cleans and rough finishes the surface of castings and large metal objects with a flexible abrasive wheel mounted in a counterbalanced frame. Also called casting finisher, snagger, snag, frame finisher, operator, and swing grinder. D.O.T. 1.

snag. a. The product formed by the twisting and breaking of a hole prior to its next rolling process. A.S.M.G. b. Any crooked surface defect in a plate, resembling a snake. A.S.M.G. c. A flexible mandrel used in the inside of a shape to prevent flattening or collapse during a bending operation. A.S.M.G. d. Progressive longitudinal cracking in continuous flat glass operation. ASTM C162-66. e. See building, d. Long. snake fashion. A method of boxing core. Beginning in the upper-right-hand corner of the core box the core is run from right to left in the first row, from left to right in the second row, etc., until the box is filled. Long.

snakeholing. a. A method of blasting boulders to break them up, by boring a hole under a boulder and firing a charge in it; this is more efficient but slower than using plater shots. See also plater shooting. Ham. b. Drilling under a rock or face in order to blast it. Nichols. c. A horizontal hole on the quarry floor. Pryor, 3.

snaking glaze. A decorative effect obtainable on pottery ware by the application of a glaze of high surface tension. Dodd.

snag statement. A monthly statement by a coal company on which a crooked line may thus be removed from the borehole a short distance out of the hole and may thus be removed from the borehole and the collar of the borehole, and one edge is fastened to a securely anchored chain. Nichols.

snapping time. Mid. A short period of rest during a shift in which a miner takes his lunch. Fay.

snatch block. A single-rope sheave set in a housing provided with a latch link, which may be opened for admission for a rope or line without the necessity of threading the end of the rope through the block. Long. b. A block or sheave with an eye through which lashing can be passed for fastening to a scaffold or pole. Ham. c. In a case where holes are bored in a piece of metal to be tentered to lines or objects by means of a hook, ring, or shackle. Nichols. d. A sheave in a case having a pull hook or ring. Nichols.

snake fashion. A method of boxing core. Beginning in the upper-right-hand corner of the core box the core is run from right to left in the first row, from left to right in the second row, etc., until the box is filled. Long.

snakeholing. a. A method of blasting boulders to break them up, by boring a hole under a boulder and firing a charge in it; this is more efficient but slower than using plater shots. See also plater shooting. Ham. b. Drilling under a rock or face in order to blast it. Nichols. c. A horizontal hole on the quarry floor. Pryor, 3.

snake line. A line used to skid a drill rig from place to place using a block and tackle. Pryor, 3.

snapping time. Mid. A short period of rest during a shift in which a miner takes his lunch. Fay.

snag. a. The product formed by the twisting and breaking of a hole prior to its next rolling process. A.S.M.G. b. Any crooked surface defect in a plate, resembling a snake. A.S.M.G. c. A flexible mandrel used in the inside of a shape to prevent flattening or collapse during a bending operation. A.S.M.G. d. Progressive longitudinal cracking in continuous flat glass operation. ASTM C162-66. e. See building, d. Long. snake fashion. A method of boxing core. Beginning in the upper-right-hand corner of the core box the core is run from right to left in the first row, from left to right in the second row, etc., until the box is filled. Long.

smothered to blacken the pottery within. Standard, 1964.

smother kiln. A kiln in which the smoke is smothered to blacken the pottery within. Standard, 1964.

smudge. See smudge coal, b. Tomkeieff, 1954.

smudge coal. a. Coal partly deprived of its bitumen, and consisting of such coal as is the same for all angles of incidence and the ratio of the sine of the angle of incidence to the sine of the angle of refraction is the same for all angles of incidence and is equal to the index of refraction. Hy. 

S-N diagram. A plot showing the relationship of stress, S, and the number of cycles, N, before failure in fatigue testing. ASTM. 

smock. a. Scot. A sprang or drag for hutches, or waggons, from the main line into a siding. Fay. b. The latch or catch of a car coupler; trip rider. Fay. c. A hole driven into a toe hole prior to its next rolling process. A.S.M.G. 

snatching. a. A method of blasting boulders to break them up, by boring a hole under a boulder and firing a charge in it; this is more efficient but slower than using plater shots. See also plater shooting. Ham. b. Drilling under a rock or face in order to blast it. Nichols. c. A horizontal hole on the quarry floor. Pryor, 3.

snakeholing. a. A method of blasting boulders to break them up, by boring a hole under a boulder and firing a charge in it; this is more efficient but slower than using plater shots. See also plater shooting. Ham. b. Drilling under a rock or face in order to blast it. Nichols. c. A horizontal hole on the quarry floor. Pryor, 3.

snag statement. A monthly statement by a coal company on which a crooked line may thus be removed from the borehole a short distance out of the hole and may thus be removed from the borehole and the collar of the borehole, and one edge is fastened to a securely anchored chain. Nichols.

smooch. a. A small chimney used for ventilation. Fay.

smokey block. A single-rope sheave set in a housing provided with a latch link, which may be opened for admission for a rope or line without the necessity of threading the end of the rope through the block. Long. b. A block or sheave with an eye through which lashing can be passed for fastening to a scaffold or pole. Ham. c. In a case where holes are bored in a piece of metal to be tentered to lines or objects by means of a hook, ring, or shackle. Nichols. d. A sheave in a case having a pull hook or ring. Nichols.

smog. See smudge coal, b. Tomkeieff, 1954.

snore; windbore

snore; windbore. A cylinder of cast iron, terminating in an egg-shaped or flat-bottom strainer which is submergged in the punch, and is opened by the force of the包容. The water drawn up into the punch is that relatively free from straw, dirt, and debris, No. 8 of Fig. 1.

snorehole. The hole in the lower part of windbore of a mining pump, to admit the water, Fay.

snout. The suction end of a mine pump fitted with a strainer. Ham. b. An intake; a suction pipe. Fay. c. A filter fitted to the inlet of a suction pipe. Also called strum; strainer. See also on more; on air. B.S. 3016, 1963, sec. 4. d. The lower part of the pipe which admits the water to a mine pump; the nose or wind bore. C.T.D.

snowdrift. A term used in Missouri for a snow sampler. A set of light jointed tubes fitted to the inlet of a suction pipe. Also called strum; strainer. See also on more; on air. B.S. 3016, 1963, sec. 4. d. The lower part of the pipe which admits the water to a mine pump; the nose or wind bore. C.T.D.

snowed. a. A term used in Missouri for a snow sampler. A set of light jointed tubes fitted to the inlet of a suction pipe. Also called strum; strainer. See also on more; on air. B.S. 3016, 1963, sec. 4. d. The lower part of the pipe which admits the water to a mine pump; the nose or wind bore. C.T.D.

soil. The part of a crownfed glass tank furnace between the gauge wall and the first pair of ports; also known as the refining zone. See also galble wall. Dodd.

soil plow. In the steel industry, a refractory lined furnace for the reheating of ingots. Dodd. b. In the glass industry, a furnace for bringing pots of glass to a uniform temperature. Dodd.

soil. A pit in which wet clay is allowed to soak preparatory to molding. Fay.

soil. N. of Eng. A pair of about 3 feet in length, by which boys pull tugs along the roads. A draft rope or chain. Fay.

soap. a. A salt of higher fatty acids (stearic, palmitic, oleic mainly) with an alkali or metallic hydroxide. It is a milky colloidal suspension. In water soaps hydrolyze slightly and become weakly alkaline to red ink. COO" + H₂O = ROOH + OH". If water is acid, the fatty acid is precipitated, making soap unsuitable for conditions in which weathered detritus are used. Ions of calcium and heavy metals precipitate sodium and potassium soaps and limit their use in hard or mineralized water. Pryor, 3. b. A brick approximating a standard straight cut longitudinally so that its cross section is approximately square. AISI No. 24. See also pum, c.

soap. b. To hold the kiln at one temperature serving water drained off rocky mounds. Eng. Smooth sandstone or shale. Arkell.

soapstone. a. As used loosely by miners, well defined by the terms used by soapstone, soap, and soapstone. b. A soft unctuous rock, containing soapstone. b. A phase of a heating operation consisting of a cast-iron plate revolving in a vertical plane on a horizontal axis, and having an inclined sample spot surpassing the flange. The ore to be sampled comes to the sampler by way of an inclined chute and impinges upon the flange of the sample. whenever the sample spot comes in line with the ore stream, the ore passes through the plate, and into the sample; at all other times the ore is deflected from the plate and drops into the reject. Generally, the sampler makes from 10 to 30 revolutions per minute, and the size of the cut (generally one-fifth) depends upon the width of the sample spot. Newton, Joseph. Introduction to Metallurgy, 1935, pp. 466-467.

soak. a. Aust. A natural receptacle for conserving water drained off rocky mounds. Fay. b. To hold up at one temperature for a standard straight cut longitudinally so that its cross section is approximately square. AISI No. 24. See also pum, c.

soak. a. A New York and Pennsylvania term applied by blast-furnace quenchers to the process of forcing a break in the absence of an open seam. Fay. b. Increasing the height of an undercut by picking or blasting down the coal, just above the undercut. Inferior Oilite, Burton Bradstock, Dorsetshire. Arkell.

soak-drive conveyor. A conveyor in which a snub pulley is used. NEMA MBI-1956.

snub pulley. An idler pulley so mounted as to increase the arc of contact between a belt and a drive pulley. When used in a wrap drive, it has the added function of changing the direction of the return belt travel. NEMA MBI-1961.

snubrock. b. In the glass industry, a process in which soaps are used as collectors for the flotation of those minerals that do not have a metallic luster and appearance. Oleic acid and sodium oleate are most commonly used. Some metallic minerals that are recovered by soap flotation are oxidized copper minerals, iron oxides, manganese oxides, rhodochrosite, magnesite, and scheelite. Newton, pp. 103-104.

soak. b. The joints of stones, which are filled with saponaceous or talcaceous mineral. Fay.

soak. a. A device fastened to the end of a rope by means of which the rope may be fastened to a structure, or opened or closed. Zern. b. In blasting, the hole left after firing. This may
sodium carbonate

be due to incomplete explosion in which case any attempt to drill into the socket is highly dangerous. Such a socket should be about 20% bore diameter by its length, but this relation, by means of a wooden stick and not drilling should be done in its close vicinity. Prior to, and during boring and lifting tools that have been dropped in well boring. Standard, 1964.

drill bedrock, at which the bottom end of a string of casing or drivepipe is set. Long, e. To lower eating or dig into, and seat it in, a borehole. Long, f. An over-shot. Long, g. A fishing tool designed to entangle and grasp a cylindrical object. Long, i. To spring a borehole. See also camouflet. Long, i. See cappel; bootleg. Nelson, j. The female portion of a plug-and-socket connection in an electrical circuit. C.T.D.

sodium

sodium. a. The normal carbonate of sodium, \( \text{Na}_2\text{CO}_3 \); usually blue. Isometric. Dana 17.
b. Augite containing \( \text{Na}_2\text{CO}_3 \) up to 1.7 percent by weight. Called, sulfur, and aegirine-augite, as zoned crystals and single crystals. Spencer 20, M.M., 1955.
d. Soda blasting powder. See B Blasting Powder.
e. Soda boil. A feldspar containing more than 10% soda, or sodium hydroxide. Shell Oil Co.
f. Sodaclase. Proposed by Johannsen for the sodic plagioclases from Ano to Anm, commonly called albite. The latter term would be reserved for the pure end-member. Oberle, A.G.I.
g. Soda feldspar. A sodium-aluminum silicate occasionally used as a refractory raw material in the manufacture of porcelain enamels, giving a softer enamel when used to replace potash feldspar in equal weights. Enam. Dict. See also albite; barbierte. C.T.D.
h. Soda-granite. See natron-granite. Fay.
j. Soda limestone. The water of which contains a high content of soda salts (chiefly chloride, sulfate, and acid carbonate). These salts also occur as an efflorescence around the lakes. C.M.D.
k. Soda lime. A granular mixture of calcium hydroxide, with soda, with potassium hydroxide, or with both, and sometimes with other substances (as kieselguhr). Used to throb moisture and acid gases, especially carbon dioxide, as in gas masks. Webster 3d.
l. Soda line-sinter process. Discovered by the Aluminum Company of America for recovering alumina from red mud. The red mud is mixed with soda ash (\( \text{Na}_2\text{CO}_3 \)), and ground limestone, and sintered in a rotary kiln at temperatures of 1,600° to 2,000° F. This breaks up the sodium aluminum silicate and forms an insoluble calcium silicate and sodium aluminate. This is leached with water to recover the sodium silicate, which is then treated in the same way as in the Standard Bayer process. Newton, p. 443.
m. Soda lifter. See crown glass, a. C.T.D.

sodium acetate

sodium aluminate

White powder, \( \text{NaAl(OH)}_4 \); molecular weight, 81.97; atomic weight, 22.9898; specific gravity, 2.892° C; boiling point, 883° C or 929° C; ordinarily does not ignite in air below 115° C; floats on water; may or may not ignite spontaneously on water; decomposes water liberating hydrogen and forming sodium hydroxide; decomposes alcohol, and insoluble in ether and in benzene. It is the sixth most abundant element on earth, and it constitutes 2.6 percent by weight of the earth crust by weight. It is the most abundant alkali; sodium chloride or salt is the most common natural compound, and sodium is produced commercially by electrolysis of fused anhydrous sodium chloride. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-139, B-219.

sodium acetate

Sodium salt of acetic acid. \( \text{NaC}_2\text{H}_3\text{O}_2 \); used in analytical chemistry, as a fluxing agent. Also used as a setting-up agent for acid-resistant enamel slips. When used in this capacity, it allows easier control of the slip than can be obtained by the use of alum or sulfuric acid, because of its tendency to stabilize the mobility and yield values. Sodium aluminate may also be used as a substitute for sodium silicate and sodium carbonate in whiteware slips. Its use gives increased dry strength, superior drying and finishing characteristics, and increases the stability of the slip condition as to mobility and casting behavior. Lee.

sodium-alumina fluoride

See cryolite. C.M.D.

sodium aluminate

sodalite

soda ash

Sodium carbonate used as a flux in assaying. Statistical Research Bureau.

soda feldspar

A silicate of sodium and aluminum with some chlorine, \( \text{Na}_2\text{AlSi}_3\text{O}_8\); usually blue. Isometric. Dana 17.

soda pyra.

A feldspar containing more than 10% soda, or sodium hydroxide. Shell Oil Co.

sodium nitrate

See sodium nitrate. CCD 6d, 1961.

sodium nitrate

Sodium nitrate. \( \text{NaNO}_3 \); widely used as a fluxing raw material in enamels, usually in conjunction with soda ash. A small percentage is beneficial in oxidizing any organic impurities. Enam. Dict. Also called chile nitre; chile salt-peter.

sodium orthoclase

Those apparently monoclinic feldspars with notable amount of soda may be called soda orthoclase. When the soda equals or exceeds the potash, the crystals exhibit triclinic symmetry and a soda microcline. Spencer 20, M.M., 1955.

sodium pragite

sodium richterite

To replace the name asto-

sodium spar

A feldspar containing more than 10% soda, or sodium hydroxide. Shell Oil Co.

sodium syenite

A syenitic igneous rock containing an excess of soda feldspar or feldspathoid. Compare potash syenite. C.M.D.

sodium tate.

A very strong, strongly radioactive, oxygen-containing alkali earth cation. Commonly found in pegmatites associated with potassium feldspars. Also found as fissure fillings with curite and sklodowska.

soda

See green sand, b. D.O.T. 1.

sodium

A soft, bright, silvery metallic element in group 1 of the periodic system. One of the alkali metals. Sodium does not occur in the free state in nature, because of its high reactivity, but it is widely distributed as the chloride, nitrate, etc. Symbol, Na (from the Latin natium); valence, 1; isometric system, number, 11; atomic weight, 22.9898; specific gravity, 0.971 (at 20° C); melting point, 97.8° C; boiling point, 883° C or 929° C; ordinarily does not ignite in air below 115° C; floats on water; may or may not ignite spontaneously on water; decomposes water liberating hydrogen and forming sodium hydroxide; decomposes alcohol, and insoluble in ether and in benzene. It is the sixth most abundant element on earth, and it constitutes 2.6 percent by weight of the earth crust by weight. It is the most abundant alkali; sodium chloride or salt is the most common natural compound, and sodium is produced commercially by electrolysis of fused anhydrous sodium chloride. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-139, B-219.

sodium carbonate

Sodium salt of carbonic acid. \( \text{Na}_2\text{CO}_3 \); molecular weight, 84.01; specific gravity, 2.25986; decomposition point, 970° C; melting point, 851° C; boiling point, 1,220° C or 1,272° C; ordinarily does not ignite in air below 115° C; floats on water; may or may not ignite spontaneously on water; decomposes water liberating hydrogen and forming sodium hydroxide; decomposes alcohol, and insoluble in ether and in benzene. It is the sixth most abundant element on earth, and it constitutes 2.6 percent by weight of the earth crust by weight. It is the most abundant alkali; sodium chloride or salt is the most common natural compound, and sodium is produced commercially by electrolysis of fused anhydrous sodium chloride. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-139, B-219.

sodium acetate

White powder, \( \text{NaC}_2\text{H}_3\text{O}_2 \); molecular weight, 62.02; specific gravity, 1.216; boiling point, 112° C; melting point, 170° C. C.T.D.; molecular weight, 62.02; specific gravity, 1.216; boiling point, 112° C; melting point, 170° C.

sodium carbonate

White powder, \( \text{NaC}_2\text{H}_3\text{O}_2 \); molecular weight, 62.02; specific gravity, 1.216; boiling point, 112° C; melting point, 170° C.

sodium carbonate

White powder, \( \text{NaC}_2\text{H}_3\text{O}_2 \); molecular weight, 62.02; specific gravity, 1.216; boiling point, 112° C; melting point, 170° C.
sodium antimonate

192.74; slightly soluble in hot water and in alcohol; insoluble in dilute alkalies and in mineral acids; and soluble in tartrate acid and in dilute hydrochloric acid. Used as an opacifier in enamels for glass and as an ingredient of acid-resisting, sheen, and metallic enamels. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-220. Melting point, 1,427° C.

sodium bisulfate; sodium-hydrogen sulfate. Colored; triclinic; NaHSO3; molecular weight, 120.06; aqueous solution is strongly acid; melting point, 2,443° C (at 15° C); decomposes above 315° C; soluble in water; slightly soluble in alcohol; and insoluble in ammonia. Used in the preparation of inorganic salts. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224.

sodium chlorate. Colorless; orthorhombic; NaClO3; molecular weight, 126.51; water of crystallization, 3H2O; melting point, 400° C; soluble in water and in alcohol; and soluble in dilute acids. Used in ceramics to produce colored glazes and in the manufacture of fluorescent uranium glass. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224.

sodium chloride; sodium chloride. White; hexagonal; NaCl; molecular weight, 58.44; NaCl; occurs in nature as the mineral halite; somewhat hygroscopic; Mohs' hardness, 2.5; soluble in water and in glycerol; very slightly soluble in alcohol; specific gravity, 1.695 (at 15° C); boiling point, 1,413° C or 1,490° C. Used in ceramics and in the manufacture of fluorescent glass. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-222. Sodium chloride is commonly used as a flux in acid-resistant enamels, as a flux in enamels for glass, and in vitreous enamel frits. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-241, B-222.

sodium chloroaurate; sodium-gold chloride. Sodium-gold chloride, Colorless or white; deliquescent; isomeric; NaCN; molecular weight, 49.01; poisonous; soluble in water and in ammonia but insoluble in alcohol. Used in the process of pickling sheet iron for enameling. The cyanide forms complex iron salts which are removed in the neutralizing bath. Lee. Sodium dichromate; sodium dichromate. Colorless; orthorhombic; Na2CrO7; molecular weight, 120.06; water of crystallization, 1H2O; melting point, 1,427° C. Used as an opacifier in enamels for glass and in mineral acids; and soluble in dilute acids. Used in ceramics to produce colored glazes and in the manufacture of fluorescent uranium glass. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224.

sodium diuranate; uranium yellow. A. Yellow-orange; Na2U2O7; molecular weight, 311.03; slightly soluble in water; and soluble in dilute acids. Used in ceramics to produce colored glazes and in the manufacture of fluorescent uranium glass. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224.

sodium fluoride; sodium g licine. Colorless or white; isometric. NaF; molecular weight, 25.38; odorless; soluble in water and in alcohol; and insoluble in alcohol. Can be used in the treatment of dental caries. Lee. Sodium glycinate; sodium glycine. Colorless or white; isometric. Na2C4H6O7; molecular weight, 144.19; is used as a flux in enamels for glass and in vitreous enamel frits. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-222.

sodium nitrate; sodium nitrate. White; monoclinic; NaNO3; molecular weight, 84.00; cooling, slightly alkaline taste; soluble in water; insoluble or slightly soluble in ethyl alcohol; stable in dry air; decomposes in moist air; specific gravity, 2.159 or 2.20; and loses CO2 at 270° C. C.C.C. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-222. Used in ceramics and as a baking powder. Bennett, p. 311; CCD 6d, 1961. Also used as a deflocculant in special castings slips, in preparing cobalt body stais, as a body wash to increase body gloss, and in impregnating solutions for enameler's steel. Sodium carbonate (Na2CO3) has more general use as a flux in enamels for glass and in vitreous enamel compositions. Lee. Sodium nitrite; sodium nitrite. Colorless or white; monoclinic; NaNO2; molecular weight, 61.99; specific gravity, 2.08; soluble in water; and decomposes on heating. Used in etching glass. C.C.C. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-221. Sodium nitroprusside; sodium nitroprusside. Colorless; cubic; Na2[Fe(CN)5(NO)]Cl; molecular weight, 281.70; water of crystallization, 3H2O; melting point, 138.07 (at 15° C); decomposes at 150° C with evolution of nitrogen; and decomposes in water and in alcohol. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-222.

sodium oxalate; sodium oxalate. Colorless; monoclinic; Na2C2O4; molecular weight, 88.04; water of crystallization, 1H2O; melting point, 208° C; insoluble in water; and soluble in dilute acids. Used in the preparation of single crystals. Osborn.
sodium-graphite reactor

A nuclear reactor that uses liquid sodium as coolant and graphite as moderator. LBL.

sodium metasilicate nonahydrate; sodium phosphosphate glass; Graham's salt. Colorless; glass; (NaPO₄); molecular weight, 611.17; very soluble in water; and insoluble in organic solvents. A sequestering agent, a dispersing agent, and a deflocculating agent. Used to sequester alkaline-earth ions and heavy metal ions, to disperse clays and pigments, to soften water, and to prevent scaling and corrosion of pipes. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-223.

sodium oleate. White or yellow; Na₂C₁₂H₂₄O₂₃; molecular weight, 337.37; soluble in water; and insoluble in alcohol; and slightly soluble in ether. Used as a dispersing agent and a deflocculating agent. Used to disperse clays and pigments, to soften water, and to prevent scaling and corrosion of pipes. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224. Also used in enameling stock to prevent rust while drying and also as a settling-up agent. Lee.

sodium nitrate. Sodium nitrate and combustible material to give a range of gelatinous explosives of varying strengths. The nitroglycerin content may be from about 30 to 80 percent. Vander. There are two conflicting temperature and pressure processes for lead ores and copper ores. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-223. Also used in flotation for the same purpose. Hansen.

sodium nitrite. Colorless to yellow; NaNO₂; molecular weight, 69.00; hygroscopic; specific gravity, 2.168 (at 0° C); melting point, 271° C; decomposes at 320° C; soluble in water, in ethyl alcohol, in methyl alcohol, and in ammonia. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-222. Used as a milling aid, or as an addition after milling, to enamel ground coats to prevent rust while drying and also as a settling-up agent. Lee.

sodium nitrate. Sodium nitrate and combustible material to give a range of gelatinous explosives of varying strengths. The nitroglycerin content may be from about 30 to 80 percent. Vander. There are two conflicting temperature and pressure processes for lead ores and copper ores. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-223. Also used in flotation for the same purpose. Hansen.

sodium oxide; sodium monoxide. Na₂O; molecular weight, 511.58; slightly bitter taste; water; and slightly soluble in alcohol. Used as an opacifier in glass and porcelain. Lee. Specific gravity, 1.815; melting point, 240° C; decomposes at 220° C; insoluble in water; and slightly soluble in alcohol; and slightly soluble in ether. Used in ore flotation. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224. A solution of high alkali content. Used in water as a cleaning compound or it is compounded with other cleaning agents for the same purpose. Hansen.

sodium perchlorate; Orvite. Colorless; hexagonal; NaClO₄ or 2Na₂O·SO₃; molecular weight, 243.14; completely transparent; odorless; hexagonal; Na₂O₂; molecular weight, 64.01; specific gravity, 1.937. Used in electric fuses to prevent the formation of any easily reducible ingredients, such as lead oxide. The function of sodium nitrate, when used in glass batches, is to oxidize organic matter and to prevent the reduction of some of the batch constituents. Lee.

sodium silicate. Sodium silicate is used as a plasticizer for glasses, as a fluxing agent for enamels, and in cement manufacture. McClelland.

sodium silicate. Sodium silicate is used as a plasticizer for glasses, as a fluxing agent for enamels, and in cement manufacture. McClelland.

sodium citrate. Sodium citrate is used as a fluxing agent for enamels, as a cleaning agent, and in cement manufacture. McClelland.

sodium silicate. Sodium silicate is used as a plasticizer for glasses, as a fluxing agent for enamels, and in cement manufacture. McClelland.
temperature of the inspired air exceeds this the heat is extracted by these sodium phosphate recrystallizes on cooling. Used as a cooling agent in the cooling of the Proto self-contained breathing apparatus. Caldwell, C.D., 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224.

sodium pyrophosphate; tetrasodium pyrophosphate. White or colorless; Na₄P₂O₇; colorless; molecular weight, 144.19; specific gravity, 2.112; melting point, 275° C; and soluble in water. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-224. Added to glass batches as a source of soda and to prevent scumming. It is necessary to use a reducing agent with it. Lees.

sodium sesquicarbonate; natrona; trona; urao. Clinic; Na₂CO₃.NaHCO₃.2H₂O; molecular weight, 302.23; colorless; amorphous; deliquescent; and soluble in water. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-222, B-246. Added to glass batches as a source of soda and to prevent scumming. It is necessary to use a reducing agent with it. Lees.

sodium sulfate; sodium sulfate, anhydrous; sodium sulfate pentahydrate; sodium hyposulfite. Colorless or white; translucent; monoclinal; molecular weight, 142.04; odorless; bitter saline taste; specific gravity, 2.175; cloudy or clear liquids; range of solubility, or cloudy or clear liquids; range of freezing point, slightly below that of water and cold alcohol; insoluble in many organic solvents. Used in medicine: water-proofing and gelling agent; as stabilizer in plastics. C.D. 6d, 1961.

sodium stannate; sodium hydroxostannate. Sodium with fatty odor; NaOOCSnH₂; soluble in hot water and alcohol; slowly soluble in cold water and cold alcohol; insoluble in many organic solvents. Used in medicine: water-proofing and gelling agent; as stabilizer in plastics. C.D. 6d, 1961.

sodium stearate. White powder with fatty odor; NaOOC(CH₂)₁₇CO₂H; soluble in hot water and alcohol; slowly soluble in cold water and cold alcohol; insoluble in many organic solvents. Used in medicine: water-proofing and gelling agent; as stabilizer in plastics. C.D. 6d, 1961.
soft-burned lime

cined at relatively low temperature. It is characterized by high porosity and chemical reactivity. Boynton.

soil clay can be easily molded in the hand and dug with a spade. Hem.

soft coal. a. Bituminous coal as opposed to anthracite. Hem., p. 531. b. Term in use among British miners for (1) bright bituminous coal which breaks easily and (2) vitrain or clairain. Tomkiewicz, 1954.

soften. To heat ore so that the minerals are softened or melted. Miner.

softening point. a. Certain materials do not soften. To heat ore so that the minerals are softened or melted. Miner.

softening temperature. The temperature, un-

soft-fired ware. Clay products fired at low temperatures, resulting in undesirable characteristics. Miner.

soft inclusion. A. Part that of a mineral de-

softing point. a. Certain materials do not have a definite melting point but soften over a range of temperatures. Certain refractory substances, the softening point is measured as the pyrometric cone equivalent (P.C.E.) which is the number of the standard pyrometric cone whose tip would touch the supporting surface simulta-

softing. a. Treatment in which metal is heated below critical point and then slowly cooled. Prior, 3. b. Of lead, the removal of antimony and other impurities. Fay.

softening point. a. Certain materials do not have a definite melting point but soften over a range of temperatures. Certain refractory substances, the softening point is measured as the pyrometric cone equivalent (P.C.E.) which is the number of the standard pyrometric cone whose tip would touch the supporting surface simulta-

soft ore. A. Soft or incoherent hematite, as opposed to the hard specular variety. From English. J. Am. Ceram. Soc.

soft pitch. fritted porcelain. A type of porce-

soft pitch. Pitch showing a penetration of more than 10. Fay.

soft pottery. brick made by a process of forming relatively wet clay (20 to 50 percent water content) in molds. When the inside of the molds are sanded, the product is called sand-strock brick. When molds are wetted with water to prevent stickling of the clay, the bricks are called water struck. ACSG, 1983.

softening. a. Treatment in which metal is heated below critical point and then slowly cooled. Prior, 3. b. Of lead, the removal of antimony and other impurities. Fay.

softening point. a. Certain materials do not have a definite melting point but soften over a range of temperatures. Certain refractory substances, the softening point is measured as the pyrometric cone equivalent (P.C.E.) which is the number of the standard pyrometric cone whose tip would touch the supporting surface simulta-

softening point. a. Certain materials do not have a definite melting point but soften over a range of temperatures. Certain refractory substances, the softening point is measured as the pyrometric cone equivalent (P.C.E.) which is the number of the standard pyrometric cone whose tip would touch the supporting surface simulta-

soft porcelain. A. Porcelain which is applied arbitrarily to anything phosphatic that is not distinctly hard rock. Fay.

soft rock. a. Soft inclusion. A. Part that of a mineral de-

soft rock. Rock that can be removed by air-operated hammers, but cannot be handled economically by a pick. A.G.I. Loosely used to describe diabase, and diabase rock, a variety of diabase that is especially hard and resistant to chemical weathering. Fay.

soft shale. Soft and poorly consolidated shale, and shaly strata which are either laminated or distorted with thumb pressure, generally shows a tendency to delamination. Such shales are generally given a dull sound when tapped or dropped on a hard surface. Skow.

soft solders. Alloys of lead and tin used in soldering. Tin content varies from 63 to 31 percent. The remainder is mainly lead, but some type contain about 2 percent antimony and others contain cadmium. The best-known types are tinman's solder and plumber's solder. C.T.D.

soft structure. Development of joints and cleats is most pronounced in low volatile bituminous coals. Such coals are very friable. The type rock is composed of finely divided rock debris, of whatever origin, mixed with decomposing vegetal and animal material, which nearly everywhere forms the surface of the ground in which plants grow or may grow. Fay. c. In agriculture, loose surface material capable of supporting plant growth, and having properties resulting from the integrated effect of climate and living matter. Hawker, 5. d. In geology, any loose surface material o'er-laying solid rock. Hawker, 5. e. To the pedolo-

soil category

soft soil. A general term applied to soils of low carbon content which do not tend to stick. Grinnell.

soft structure coal. Development of joints and cleats is most pronounced in low volatile bituminous coals. Such coals are very friable. The type rock is composed of finely divided rock debris, of whatever origin, mixed with decomposing vegetal and animal material, which nearly everywhere forms the surface of the ground in which plants grow or may grow. Fay. c. In agriculture, loose surface material capable of supporting plant growth, and having properties resulting from the integrated effect of climate and living matter. Hawker, 5. d. In geology, any loose surface material o'er-laying solid rock. Hawker, 5. e. To the pedolo-

soil analytical methods. The method of newsgeo-

soil analytical methods. The method of newsgeo-

soil analytical methods. The method of newsgeo-

soil analysis. The method of geochemical prospecting which consists of taking soil samples and analyzing them for the various hydroxides and other gases and waters, minerals, or other rare components which they may contain. Fay.

soil cap. The earthy material that often covers naturally the rock surfaces of the crust. Standard, 1964.

soil catena. A related sequence of profile types created by changes from one drainage condition to another. These changes are usually transitional. Hawker, 2, p. 101.
soil cement. The addition of cement to a soil, as a binding agent, and converting it into a weak form of concrete. See also cement stabilization. Nelson.

Nelson.

soil classification. The tests are of two main types, namely: (1) mechanical analysis, performed by sieving or sedimentation, to determine the size-distribution of the constituent particles; and (2) index property tests, for soils passing a 30-mesh B.S. sirve, by means of which the type is deduced from the moisture content at standard consistencies. See also index properties. Nelson.

soil climate. The nature of the air between the soil particles, water content and condition, etc. Chaldfine.

soil core. A cylindrical sample of soil for the study of soil structure. Undisturbed cores may be obtained by the use of special appliances, which allow soil cores of usual 1 1/4 inch or 4 inch diameter being extracted. The core barrel, forming part of the coring tool, is detachable and is connected to a core hermetically sealed for delivery to the laboratory. The natural moisture content and other properties are preserved for examination. Individual soil cores, up to 3 feet in length, may be obtained and continuous coring if necessary. See also soil sample. Nelson.

soil creep. A very slow movement of rock fragments down even, gentle slopes. It is this that makes some streams muddy even during periods of dry weather. A.G.I.

soil density. Normally expressed as pounds per cubic foot. Although soil density is measured initially on moist soil, the result is always converted in terms of dry density. Nelson.

soil drainage. A discharge of ground water through evaporation directly from the soil or rocks. A.G.I.

soil formation. The process whereby fragmented material resulting from rock weathering is transformed into a medium that can support plant growth. Hawkes.

soil-forming factors. Factors, such as parent material, climate, vegetation, topography, organisms, and time involved in the transformation of an original geologic deposit into a soil profile. ASCE P1826.

soil horizon. A layer of soil, approximately parallel to the surface, which differs from adjacent layers in chemical and physical properties; the principal horizons from the surface downward are (1) the topsoil, A horizon, or leached horizon; (2) the subsoil, B horizon, or horizon of accumulation; and (3) the parent material, C horizon, from which the upper horizons were formed. Hawkes.

soil mechanics. The subject embracing the study of soil properties, soil classification, consolidation, and strength; the flow of water through various soils, and the effects of load and pressure upon them. The father of soil mechanics is Dr. Karl von Terzaghi, and this new branch of science was initiated in 1936 by the First International Conference on Soil Mechanics and Foundation Engineering at Cambridge, Mass. See also earth pressure; site exploration. Ham. b. The science of the mechanical properties of mass of loose or unbound particles, particularly of their composition, shear resistance, and effects of water. Applied in highway and foundation engineering and other problems depending on support by stability of and variances in loose surface materials. A.G.I.

soil-moisture relations. Any method used to determine the soil in the process of soil stabilization. See also plant mix; travel mixer. Ham.

soil moisture. The water content of the soil zone. It is divided by the soil scientist into available and unavailable moisture. Available moisture is water readily abstracted by root action and limited by field capacity and the wilting coefficient. Unavailable moisture is water held so firmly by adhesion or other forces that it cannot usually be absorbed by plants rapidly enough to produce growth. It is commonly limited by the wilting coefficient. Stokes and Varne, 1955.

soil physics. The organized body of knowledge concerned with the physical characteristics of soil and with the methods employed in their determination. ASCE P1826.

soil preliminary classification. A classification made at the site to recognize the main types, such as gravels, sands, silts, clays, and peat. The clays may be described as soft, stiff, or firm, but the same clay can change into other groups by change in its water content. See also soil classification. Nelson.

soil profile. The vertical section of a soil, showing the nature and sequence of the various layers, as developed by deposition, weathering, or both. ASCE P1826. b. Succession of zones or horizons beginning at the surface that have been altered by normal soil-forming processes of which leaching and oxidation have been particularly important. A.G.I. Supp. See also soil horizon. A.G.I. c. A section, at a spot or along a centerline, indicating the various strata as disclosed by boreholes, trial pits, or geophysical surveys. The section shows all deposits likely to have a bearing on the stability of surface works. Quarries, cutting, and excavations often provide a ready-made soil profile. Nelson.

soil sample. a. A small sample of the soil, representing the area from which it was removed. Long. b. Any sample which is reasonably representative of a soil deposit. Undisturbed soil samples are preferred. Where the strata are to change laterally, the sampling positions are spaced so as to indicate the change. See also soil core. Nelson.

soil-sample barrel. A tubular device designed for taking samples of soil. Long.

soil sampler. a. A tube driven into the ground so as to obtain an undisturbed soil sample. In sands, such tubes would be fitted with a core catcher of mon- nomad standard test. Ham. b. One of a number of different mechanical devices used for taking samples of undisturbed soil or at certain locations. See also Shelby tube; sand-barrel sampler; split-tube barrel; soil sampling tube; sampling tool. A tool for obtaining an undisturbed sample of the soil. It consists of a cylindrical mild steel tube with a fitting at the top for boring rods and a hardened steel cutting nose. It provides for a sample 4 1/4 inch diameter, while a length of 15 inches is usually sufficient. The tube is forced into the ground without rotation until it is full. Then the soil is cut at the bottom either by a blade or by rotating the tool to shear the soil at the base. See also sampling area ratio.

soil science. The science which treats of soils. Synonym for pedology. Schiererdecker.

soil series. A group of soils having horizons similar as to differentiating characteristics and arrangements in the soil profile and developed from a particular type of parent material. Except for texture, especially of the A-horizon, the morphological features of the soil profile, as exhibited in the physical characteristics and thicknesses of the soil horizons, do not vary significantly with a series. These characteristics include especially structure, color, and texture (except the texture of the A-horizon or surface soil) but not these alone. The content of carbonates and other salts, the reaction (or degree of acidity or alkalinity), and the content of humus are included with the characteristics which determine series. The soil series must not only have definite soil profile features, but also occupy an area on the landscape. Stokes and Varne, 1955.

soil shredder. A machine employed in soil treatment completely touching half drums which rotate in opposite directions, and break up the soil. Ham.

soil stabilization. Chemical or mechanical treatment designed to increase or maintain the stability of a mass of soil or otherwise to improve its engineering properties. ASCE P1826. See also bituminous stabilization; cement stabilization; pulverization.

soil stabilizer. A chemical which can alter an engineering property of a natural soil to suit an intended use of the soil. Refers to chemicals which convert clayey soils or sandy soils to satisfactory traffic-bearing materials. CCD 6d, 1961.

soil structure. The arrangement and state of aggregation of soil particles in a soil mass. See also flocculent structure; honeycomb structure; single-grained structure. ASCE P1826.

soil survey. A detailed investigation of the soils at a site, including boreholes and tests to determine their nature, thickness, strength, and depth to bedrock. See also site investigation; site exploration. Ham. b. Geophysical prospecting term for the chemical analysis of systematically collected samples of soil and weathered rock. Hawkes, 2, p. 3.

soil suspension. A highly diffused mixture of soil in water. ASCE P1826.

soil test. a. Synonym for soil sampling. Long. b. The laboratory procedure followed in...
soil test

1043

In the glass industry the term is particularly applied to blocks that extend more than the depth of the glass in a furnace.

solar. a. A platform in a Cornish mine shaft usually of soft rock or soil. Webster 3d. b. A colloquialism among surveyors to mean an observation on the sun. Fay.

solar salt. Salt obtained by solar evaporation artificially. Applied to a dormant or decaying volcanic vent from which steam and vapors are emitted; also, a district or area in which volcanic emanations are given off from fissures and small vents. Compare fumarole; mofette; solfata.

solarian. Applied to a dormant or decaying stage of volcanic activity characterized by the emission at the surface of gases and vapors of volatile substances. Holmes, 1928.

solid. a. Coal that has not been undermined, weathered out, or otherwise prepared for blasting. Used in the expression, "shooting off the solid." Fay. b. That part of the coal which cannot be blown out by a single shot, or the coal beyond the loose end. Used in expressions describing holes drilled for blasting, such as "10 feet into the solid," or "on the solid." Fay. c. Unmined; ungot. Mason. d. A rock having few open pores, cracks, or joints and relatively unaffected by the weakening effects of weathering. Long. e. Diamond from cracks disarranged with large open cavities. The rock near underground openings that stands well without artificial support. Long. f. Anything which can be measured in three dimensions. That is, a solid has length, breadth, and thickness. Jones, 2, p. 116. h. State of matter in which the constituent molecules or atoms are sufficiently restricted in their relative movement to result in a definite shape and volume. Compare liquid. g. A solid cast to form between the surface of the mold and the tree. Petrijohn.

soil casting. Forming ceramic ware by inverting a body slip into a porous mold, usually with a permanent joint and usually are used to connect two shafts to make a permanent joint and usually are designed to be capable of transmitting the full load capacity of the shaft. They couple has no flexibility, either torsional, angular or axial, hence it is limited to those installations where rigid connections...
solid cutters. Cutters made of a single piece of material rather than a composite of two or more materials. ASM Gloss.

solid deposits. Rocks other than drift deposits. Rocks underlying superficial deposits, specifically occurring solid fuels, and (2) manu factured solid fuels. Webster 3d. Solid fuels are any fuel that is a solid; such as wood, peat, lignite, bituminous, and anthracite coals of the natural variety and the prepared varieties as, pulverized coal, briquettes, charcoal, and coke. These are divided into two broad classes: (1) naturally occurring solid fuels, and (2) manufactured solid fuels. Newton, p. 247.

solid geology. The geological features of the rocks underlying superficial deposits, specifically excluding these latter. A solid geological map, as opposed to a drift map, shows the whole outcrops as they would appear if all the superficial deposits were removed (though the larger tracts of alluvium are often shown even on solid maps). Chaldiner.

dilution. The process of changing from a liquid or gas to a solid, as, for instance, the solidification of molten alumina to solid in the synthesis of corundum. Shipley.

dilution range. Temperature range over which mixtures (alloys, fluxes, etc.) in constitution solidify between two solidus and liquidus temperatures. Fay, p. 112.

dilution shrinkage. The decrease in volume of a metal during solidification. ASM Gloss.

solid loading. Filling a drill hole with all the explosive which can be crammed into it, except for stemming space at top. Nichols.

solid man. A British Geological Survey map which shows the solid or stratified hard rocks, the plan view being on the assumption that all superficial deposits are removed; the deposits of alluvium along river courses are, however, shown. See also drift map. Nelson.

solid masonry wall. A wall built of solid masonry units in which the joints between units completely filled with mortar. ASCII.

solid masonry unit. A unit whose net cross sectional area in every plane parallel to the bearing surface is 75 percent or more of the total cross sectional area measured in the same plane. ASTM C83-5ST.

dil ultrasound. A wave consisting of a single elevation and neither followed nor preceded by another elevation or depression of the water surface. Schierederke.

solubility. The extent to which one solute is capable of forming solid solutions with another. This varies widely between different types of solutes, some of which are mutually soluble in all proportions, while others are practically insoluble in each other. ASM Gloss. The concentration of a solid solute in a saturated solution is called the solubility of the solute. B.S. 3618, 1964, sec. 5.

soltanochah soil. A soil occurring most commonly under arid conditions, but may also be found in semiarid and subhumid regions. Usually found in depressions where it has originated by evaporation under shallow ground-water conditions. The typical salts of solonchaks are sulfates and chlorides of sodium, calcium, and magnesium. These often appear as a white efflorescence at the surface which is liable to be dissolved and temporarily washed downward when it rains. Hawkes, 2, p. 1050.

solonetz soil. A soil occurring most commonly under arid conditions, but may also be found in semiarid and subhumid regions. Usually found in depressions where it has originated by evaporation under shallow ground-water conditions. Characterized by sodium carbonate as the predominant salt and a dark-colored B horizon which is strongly alkaline in character. Hawkes, 2, p. 1050.

sollum. The complete filling of the waste area behind a longwall face with stone and dirt. The packing operation may be by hand or by mechanical means, for example, pneumatic stowing. See also double packing; strip packing. Nelson.

solidus. In a constitution or equilibrium diagram, the locus of points representing the temperatures at which various compositions finish freezing on cooling or begin to melt on heating. ASM Gloss.

solid water. Scot. Water sufficient to fill the pump barrel at each stroke. Fay.

solid web. The web of a steel beam consisting of a rolled section or a plate as distinct from a lattice. Ham.

solid workings. Scot. In stopp-and-room workings, the first working or room driven into the solid coal. Distinguished from pillar work or pillar drawing. Fay.

solid wove conveyor belt. A construction of conveyor belt consisting of multiple plies of fabrics woven into one piece, which is done on looms designed for this purpose. Hips are placed on the belt to show the number of plies, which range from two to ten. Impregnating and coating treatments are frequently employed. ASM M161-1958.

solid woven fabric belts. A rubber belt in which the plies are interwoven and thus have no voids. Adhesive compounds may be used to improve the properties of the covering material. The belt is claimed to give greater strength for less thickness and weight. See also conveyors. Nelson.

solidification. a. The process of slow flowage from higher to lower ground of masses of waste saturated with water. See also mud stream. A.G.I. b. The movement of explosives and rock waste chiefly by frost action. Mather.

solidified peat. Peat whose character is determined by soil horizon rather than amount of rainfall. Tomkietzky, 1954.

soldering. Large stones used in pitched work. Hans.

solidification wave. A wave consisting of a single elevation and neither followed nor preceded by another elevation or depression of the water surface.

soluble products of weathering. Consist of those constituents that are released by the decomposition of primary minerals and that are not required in the formation of insoluble secondary minerals. Haukari, 2, p. 88.

soluble salts. Salts, particularly sulfates of calcium, magnesium, and sodium, present in some clays. When the clay is dired these salts migrate to the surface. In the pottery clay this gives trouble during glazing; in the wet process of body preparation, however, these salts are mostly removed by filtering. If present in clay building materials, soluble salts can cause efflorescence and scumming.

solum. The upper part of the soil profile, above the parent material, in which the processes of soil formation are taking place. In mature soils, this includes the A- and B-horizons. Stokes and Barnes, 1953.

soil. a. The substance dissolved in a solution, as distinguished from the solvent. solubility. ASM STP No. 148-D.

solution. a. The change of matter from the solid state or the gaseous state into the liquid state by its combination with a liquid. When unaccompanied by chemical change, it is called a physical solution; otherwise, a chemical solution. Standard, 1964. b. The result of such change; a liquid combination of liquid and a non-liquid. Standard, 1964.

solution breccia. Breccias formed, for example, where the lime carbonate of a cherty limestone is removed by solution, the chert fragments gathering together as the mass settles. Stokes and Barnes, 1953.

solution cavities. A mode of mineral formation in which percolating solutions have filled cavities in rocks with valuable minerals; cavities formed in certain rocks, such as limestones, where portions have been dissolved by percolating waters. See also mineralisation. Nelson.

solution ceramics. A type of ceramic coating. In the original process, metal salt is sprayed on the hot surface that is to be coated. A subsequent development refers to the application of a coating of vitreous enamel or thermoplastic resin to the surface that has been flame-onged with the solution; this is claimed to result in a vitreous enamelled surface having improved resistance to thermal shock. Crispin.

solution grooves. More or less parallel furrows that sometimes develop on inclined and base confined ore bodies, and are believed to be homogeneous rocks like limestone and marble. They always tend down the slope, for they are made along the direction of ground water, so as to make a fall line in the upper part of the weathering zone. Stokes and Barnes, 1953.

solution heat treatment. Heating a metal to a suitable temperature, holding at that temperature long enough to allow one or more constituents to enter into solid solution, and then cooling rapidly enough to hold the constituents in solution. The alloy is left in a metastable, unstable state and may subsequently exhibit quench cracking. ASM Gloss.

solution injection. Artificial cementing of loose soils or strata to increase their load-bearing capacity. Ham.

solution pipe. One who regulates, by opening and closing pipe valves, the amount of cyanide solution flowing from solution tanks into leaching tanks or vats in which finely ground, gold-bearing ore is treated with cyanide to dissolve the particles of free gold. The resulting gold-bearing solution is later run through boxes containing zinc shavings to precipitate the gold thereon. C.O.T. 1. b. See leacher. D.O.T. Supp.

solution potential. The potential of the anode during a process; otherwise, a chemical solution. Standard, 1964.

solution plane. A direction in a crystal of relatively easy solubility (as when the substance is tetrahedrite; see also solution potential). Chemical action along solution planes in minerals is often observed in schillaction. Webster 3d.

solution potential. Electrode potential where the half-cell reaction involves only the metal electrode. Webster 3d.

solution pressure. The pressure by which the particles of a dissolved substance are driven out of the solution; and which when equal to the osmotic pressure establishes equilibrium to that the concentration of the solution becomes constant. Webster 3d.

solution subside. The subsidence of parts of a formation into hollows or pockets of an iron or subaqueous solution. The solution is caused by water percolating through the upper formation. Chaline.

solve. A chemical compound consisting of a dissolved substance and its solvent. Crispin.

solve. A. The chemical union of a dissolved substance and its solution. A.G.I. Supp. b. Association or combination of molecules of solvent with ions of solute. In the case of micelles, adsorption of dispersion medium by lyophilic sol in such wise as to form sheeted groups which do not readily coalesce. Crispin.

solve process: ammonia-soda process. Manufacture of sodium carbonate (or soda ash, Na2CO3) from salt (sodium chloride), ammonia, carbon dioxide, and limestone by an ingenius sequence of reactions involving recovery and reuse of practically all the ammonia and part of the carbon dioxide. Limestone is calcined to quicklime and carbon dioxide. The carbon dioxide is dissolved in water containing the ammonia and salt, with resulting precipitation of sodium bicarbonate. This is separated by filtration, dried, and heated to form normal sodium carbonate. The liquid from the bicarbonate filtration is heated and treated with lime to regenerate the ammonia. Calcium chloride is a major byproduct, along with sodium carbonate. C.D. 6d, 1961.

solution. b. A substance used to dissolve another substance; for example, the water in a solution of salt in water. Crispin.

solution extraction. a. A method of separating one or more substances from a mixture, by treating a solution of the mixture with a solvent that will dissolve the required substances, leaving the others. It is used in purifying certain fuels. Ham. b. In uranium technology, selective transfer of metal salts from aqueous solutions or pulp, to immiscible organic liquid. Pruyr, 3. c. See liquid-liquid extraction, a. CCD 6d, 1961.

solubility. In a phase or equilibrium diagram, the locus of points representing the temperatures at which the various compositions of the solid phase coexist with other solid phases, that is, the limits of solid solubility. ASM Gloss.

sonar. The method of testing by underwater sound, the presence, location, or nature of objects in the sea. The word sonar is an acronym derived from the expression SOnAr NAvigation and Ranging, HBQ.

sonar background noise. The total noise which interferes with the reception of the desired signal. This noise is then transmitted to the final receiving element, such as a recorder or the ear of a listener. Hy.

sonar device. Numerical groups which define sonar conditions for echo ranging in certain areas. Hy.

sonar thumper device. A complete continuous seismic profiling system consists of the sonar thumper unit, sonar recorder, transducer fish, receiving hydrophone, preamplifier if necessary and variable filter. Sonar thumper units are available from 100 watt-second models up to 13,000 watt-second (experimental models). The standard thumper consists of a storage or bank and a transducer. Thumpers are used for marine geological studies and dredging surveys. The power supply output is fed to the capacitor bank which is discharged into the transducer producing a precisely repeatable pressure pulse in the water. HBQ.

sondelle. A metamorphic rock composed of cordierite, quartz, garnet, tourmaline, biotite, etc. Holmes, 1928.

sonde. A circular container in which electrodes are set. The sonde is supported during logging in a suitable center of the borehole. Wyllie, p. 98.

sonic. a. Pertains to phenomena involving
sonic frequency in the audio range—from about 20 to 15,000 cycles per second. ASM Glo.
sonic b. Of, pertaining to sonic sounding waves, as in sonic depth finding. Hy.
sonic depth finder. An instrument which measures time interval between the transmission of a signal within the instrument and its reflected return from the bottom. This time interval is then expressed as a function of water depth. Hy.
sonic frequencies. Range of underwater sound, generally taken as from 0.02 kilo-
sonic gage. See acoustic strain gage. Nelson.
sonic log. An acoustic log continuously recording travel time of sound from surface to an instrument lowered down a bore-
sonic microscope. Species of fishes, marine mammals and Crustacea which may produce noise of sufficient intensity and frequency to interfere with sound trans-
sonic strain gage. An inspection instrument, which
sonicgauge. An ultrasonic testing instrument
sonogage. A type of echosounder that generates sound waves and records their re-
flections from inhomogeneities beneath a sedi-
sonority. See musical loudness. Hy.
sonorous. Property of emitting sound on percusion or deformation. This is usually mainly in alloys of tin and copper. Aluminum emits a clear sound on percusion, and bar tin gives rise to a peculiar crackling sound, known as tin cry, when it is bent. This phenomenon is con-
sidered to be caused by the sliding of the tin crystals. Is.
sonoroscope. A type of echosounder that generates sound waves and records their re-
flections from inhomogeneities beneath a sedi-
sorbed. A black substance, consisting essen-
tially of carbon from the smoke of wood or coal, especially that which adheres to the inside of the chimney, containing also ammonia salts. Fay.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
sorbed asphalt. See asphaltic sorbent. Sonstadt.
to size or specific gravity by natural processes, mainly by the action of running water. Stoker and Varnes, 1955. e. The separation of coal or ore or minerals into a material of economic value and dirt, particularly by hand. Nelson. 1. Removal by hand of selected pieces of material and/or particles that have become detached from the kiln furniture; sorting is usually done with a small pneumatic tool.

**sorting**

**sorting coefficient.** a. A coefficient used in describing the distribution of grain sizes in a sample of unconsolidated material. It is defined as $S_0 = \frac{VQ_1}{Q_3}$ where $Q_i$ is the diameter which has $i$ percent larger than itself. H&G. b. Diameter having 25 percent smaller and 75 percent larger than itself, and $Q_2$ is that diameter smaller than itself and 25 percent larger than itself, and $Q_2$ is that diameter having 25 percent smaller and 75 percent larger than itself. H&G. c. Dimensionless measure for degree of sorting. Schlesfederhocker.

**sorting table.** a. Any horizontal conveyor where operators, along its sides, sort bulk materials, impurities, and/or products by a conveyor. ASA MH4.1-1958. b. Tables on which rough diamonds are sorted. H&G. c. A table having a series of grooves parallel to the length of the table, with vitirol; also, vitirols. Webster 3d.

**sos.** Staff. To sink into the floor under sorting table. sorting hammer. A hammer for breaking up ores in sorting. Standard, 1964.

**sorting particle.** See particle sorting. Benham.

**sorting table.** Any horizontal conveyor where operators, along its sides, sort bulk materials, impurities, and/or products by a conveyor. ASA MH4.1-1958. b. Tables on which rough diamonds are sorted. H&G. c. A table having a series of grooves parallel to the length of the table, with vitirol; also, vitirols. Webster 3d.

**source.** a. Having an acid or tart taste; applied to minerals having the taste of sulfuric acid. Fay. b. In ceramics to macerate and render fit for plaster or mortar; wave of lime. Webster 3d.

**source.** a. In seismic prospecting either (1) the point of origin or shot from which elastic waves are propagated; (2) the formation, horizon, interface, or boundary at which the seismc wave is refracted and/or reflected and returned to the surface. In earthquake seismology, the point of origin of an earthquake. In neutron logging, the source of neutrons at one end of the logging tool. A.G.I. b. A radioactive material packaged to produce radiation for experimental or industrial use. L.O.L.

**source area.** The area from which the sedimentary material is derived. Schlesfederhocker.

**source container.** The container housing a sealed source in a radiation process, and providing radiation shielding and security devices. NCB.

**source holder.** The holder which provides the immediate mounting and shielding of a sealed source and is fitted within the source container. NCB.

**source material.** In atomic energy law, any material, except special nuclear material, which contains 0.05 percent or more of uranium, thorium, or any combination of the two. L.O.L.

**source-receiver product.** In seismic prospecting, the product of the number of detectors per foot of line times the number of shots fired simultaneously. A.G.I.

**source rock.** The geological formation in which oil, gas, and/or other minerals originate. A.G.I.

**sourdough.** a. Old-fashioned and seasoned prospector. Pryor, 3. b. A miner who has

**sourdough**

acoustic frequencies to travel great distances. $H_y$

**sound energy density.** At any point in a sound field the sound energy contained in a given infinitesimal part of the medium divided by the volume of that part of the medium. $H_y$

**sound field.** A field region containing sound waves. HOG.

**sound hammer.** a. Knocking on a roof to see whether it is sound or safe to work under. Fay. See also roof testing. b. Rapping on a pillar to signal a person on the other side of it, or to enable him to estimate its width. Fay. c. See sounding the roof. Nelson. d. A rough method of judging by sound the direction and distance apart of two roadways diverging in road to meet each other. The sounding is made by giving two slow and three sharp knocks on the solid coal which is answered in similar manner from the opposite roadway. The method is sometimes called chap. Nelson. e. Subsurface investigation by observing the particle displacement of the solid coal which is answered in similar manner from the opposite roadway. F. The measurement of the distance between a given point on the surface of the water and the bottom directly beneath. This may be accomplished by a weight attached to a line or by sonic means. $H_y$

**sound in test.** The hand lead used in sounding. Ham.

**sound rod.** A closed pipe, 1 inch in diameter, with a flush joint and a driving tip, used in sounding. See also sounding. Long.

**sound sounding.** a. Tapping the rock roof with a metal testing bar to ascertain whether or not it is strong and safe. Hudson. b. A dam or barrier in a stream in which the frictional resistance to the passage of water is high. Such a dam permits little water to pass through it and is said to be "sound." Sinclair, 14, p. 2. c. Syonym for solid, as applied to diamonds and rocks. Long. d. An oscillation in pressure, particle displacement, particle velocity, etc., in a medium having internal forces; that is, elastic viscous, or the superposition of such propagated oscillation. $H_y$

**sound absorption.** Sound absorption is the change of sound energy into some other form, usually heat, as it passes through a medium or strikes a surface. $H_y$

**sound channel.** Sound waves in the surface layers of the ocean tend to be refracted downward due to decrease of temperature with depth. In deep waters the sound wave is refracted toward the bottom directly beneath. This may be accomplished by a weight attached to a line or by sonic means. $H_y$

**sound intensity.** In a specified direction at any point, the average rate of sound energy transmitted in the specified direction through a unit area normal to this direction at the point considered. $H_y$

**soundness.** a. The freedom of a solid from cracks, flaws, fissures, or variations from an accepted standard. It is a measure of the freedom of cement from expansion on setting as measured by the LeChatelier test. Taylor. b. A hydrated lime is sound when it contains no particles of unhydrated lime, water-burnt lime, or any other similar type liable to decompose in subsequent processes, causing either expansion or localized high temperature. Stowell. c. As applied to portland cement, refers to its volume stability after it has set. Compare unsoundness. c. Dodd.

**sound pressure.** At any point in a medium, the instantaneous pressure that is present in the presence of a sound wave, minus the static pressure at that point. $H_y$

**sound pressure level.** In decibels, of a sound is 20 times the logarithm to the base of the ratio of the pressure of this sound to the reference pressure. The reference pressure must be explicitly stated. $H_y$

**sound transmission quality.** Water is excellent medium for sound transmission. Sound travels faster with greater energy loss in water than in air. Acoustic methods thus are best known for transmission of intelligence through live water man. Sound velocity in seawater is dependent on wavelength. $H_y$

**sound velocity.** The rate at which the sound travels through the medium. Velocity is equal to the square root of the quantity elasticity divided by density. $H_y$

**sound wave.** a. Sometimes used incorrectly, ably with shock wave; technically, a wave motion in the air which affects the human ear. Sound as a wave of compression it heats the water as it passes through the water man. Density and compressibility of the medium influence the velocity of sound; increasing density due to temperature, salinity, and pressure changes increases the velocity. High frequency waves above 10,000 cycles per second have very short range because absorption is high. Low frequency waves have greater range. $H_y$

**sound wave.** c. Same as longitudinal wave. Lewis. p. 313.

**source.** Having an acid or tart taste; applied to minerals having the taste of sulfuric acid. Fay. b. In ceramics to macerate and render fit for plaster or mortar; wave of lime. Webster 3d.

**source.** a. In seismic prospecting either (1) the point of origin or shot from which elastic waves are propagated; (2) the formation, horizon, interface, or boundary at which the seismic wave is refracted and/or reflected and returned to the surface. In earthquake seismology, the point of origin of an earthquake. In neutron logging, the source of neutrons at one end of the logging tool. A.G.I. b. A radioactive material packaged to produce radiation for experimental or industrial use. L.O.L.

**source area.** The area from which the sedimentary material is derived. Schlesfederhocker.

**source beds.** Rocks in which oil or gas has been generated. A.G.I.

**source container.** The container housing a sealed source in a radiation process, and providing radiation shielding and security devices. NCB.

**source holder.** The holder which provides the immediate mounting and shielding of a sealed source and is fitted within the source container. NCB.

**source material.** In atomic energy law, any material, except special nuclear material, which contains 0.05 percent or more of uranium, thorium, or any combination of the two. L.O.L.

**source-receiver product.** In seismic prospecting, the product of the number of detectors per foot of line times the number of shots fired simultaneously. A.G.I.

**source rock.** The geological formation in which oil, gas, and/or other minerals originate. A.G.I.

**sourdough.** a. Old-fashioned and seasoned prospector. Pryor, 3. b. A miner who has
sour dough

lived in Alaska more than one season.

sour gas. Slang for either natural gas or a gasoline contaminated with odor-causing sulfur compounds. In natural gas the contaminant is usually hydrogen sulfide, which can be removed by passing the gas mixture through carbonate solutions containing special metal or organic activators. In gasoline, the contaminant is usually mercaptans, which are removed in the doctor treatment by ethylene oxide with a phobic catalyst. The improved sour gas or gasoline is known as sweet gas.

souring.

southing. A distance measured southwards.

Southerndown beds. A local series of massive Southead; used in South Wales and forming part of the English. Also called salamander, bear, or shad-rach. Fay.

sowback. The same as hogback or horseback; a kum or drumlin. Fay.

sow block. In forging, a removable block set into the hammer anvil to lessen the wear of the anvil. ASM Gloss.

Sowthistle thimble. A dust-sampling instrument. In this apparatus, a paper thimble, after being dried at 105° C and weighed, is fastened to the tapered end of a ground glass tube, which, in turn, is fitted into a copper holder. When the thimble has been rejected, the sample is retained, and the process is then repeated. Fay.

sour oil; sour gas. Crude oil containing an odor-causing contaminant, usually mercaptans or hydrogen sulfide in varying proportions, which give it an unpleasant smell. Fay.

souring. A process by which the gas or gasoline is denatured by the addition of certain chemicals, which do not have a noticeable odor, to the odor-deadening agent. Fay.

South African. Whole-stone diamonds having outside faces that are smooth, as contrasted with outside faces of a Congo diamond; also applied to diamonds produced in South African mines not having to those found in the Sierra Leone, Congo, Brazil, etc. Long. South African jade. Same as garnet jade.

Southern Down beds. A series of massive and in part conglomeratic limestones found in South Wales and forming part of the Lower Carboniferous. It is composed of coal and lenses of Carboniferous limestone lying through the Liasic sea; C.T.D. southerly. The direction in which the wind blows. Fay. southerly drift. See drift. Fay.

southerlandite. A hydrous phosphate, (Mg,Fe)O(SiO3)2OH, a green, fibrous monoclinic, (7) a, an alteration product of sericellite from Divino, Brazil. Spencer, 18. M.M. soviet. A standard 22 carat gold, containing 91.7 percent gold and 8.3 percent copper. Osborn.

sow. a. Mold of larger size than a pig.
spall

thus broken are called spalls. Also spelled spallier. Eng. A pickman; a workman. M. An instrument for breaking off small flat pieces of rock, formerly by means of fire setting. Rock under excessive tension may also spall, that is, throw off its surface slabs.

Sandston. b. Breaking off of rock, mineral, or metal from its surface. Hard breaking of ore values away from gangue. Chipming to shape of masonry. Pp. 344, 346. c. The cracking of a refractory product or in severed cases, the breaking away of individuals or faces. The principal causes are: thermal shock, crystalline inversion, a steep temperature gradient, slag adhesion at the working face with a consequent change in properties, or pinching due to inadequate expansion allowance. See also holpate spalling test; patent spalling test. Dudd. d. The chipping of vitreous enamelware in consequence of internal stress. Dudd.

spalling of refractories. The cracking or rupturing of a refractory unit, which usually results in the detachment of a portion of the unit. A. See also structural spalling; thermal spalling.

spall. A slaty, whitish mineral, used as a flux for metals.

spall. a. The horizontal distance between the sides supports or solid abutments along sides of a roadway. See also abutment; chipming to shape of masonry. Pp. 344, 346. b. The horizontal distance between the supports of a bridge, arch, beam, or similar structural member. See also effective span. Har.

spandrel. A wedge-shaped segment of a segment. Pp. 80, 82. See also segmental arch, beam, or similar structural member.

spangle. A slaty, whitish mineral, used as a flux for metals.

spange. A term formerly used for fine purple amethyst of unknown origin, marketed through Spain.

spangle. a. A tube of tale or soapstone from Aragon, Spain. Fay.

spangle. See from Spain, especially that of the Basque tops. Har.

spangle. Emerald, Emerald of the finest quality (presumably from South America).

spangle. See from Spain, especially that of the Basque tops. Har.

spangle. A lath; a chip. Fay.

spangle. a. Fired clay roof tile that, in section, is a segment of a circle; the tile tapers along its length so that the lower end of one tile will fit over the upper end of the tile below. Compare Italian tiles. Dudd.

Spanish topaz. A trade name for orange-brown quartz, the color resembling that of the topazin topaz. It is often an amethyst which has been heat-treated. C.T.D. Also called false topaz. See also sintered spars.

span. a. Expressed almost, almost any transparent or translucent, readily cleavable, crystalline mineral having a vitreous lustre, as calcaspars, fluoraspars, feldspar, heavy spar, etc. Fay. b. A Cornish name for quartz. Fay. c. Applied locally by miners to small clay veins found in coal teams. A.G.I.

spare. a. A nonmetallic tin ore occurring in small granules. Osb.

spare. a. Tin ore in granges. Osb.

spark plug. A rich mix of port, and cement. Webster 3d.

spark plug. A rich mix of port, and cement. Webster 3d.

sparker. A geological research device which usually consists of numerous electrically charged metal plates mounted in a parallel array, the spaces between the plates being occupied by inert gas. Ionizing radiation causes sparks to jump between the plates along its path through the bubble chamber; cloud chamber, LBL.

spark. A method of rendering a block of stone by holding a sample on a grinding wheel and producing sparks. An experienced opera-

tor can detect differences in carbon content of steel of 0.05 percent in the range up to 0.35 percent and 0.10 percent in the range from 0.35 to 0.60 percent. Har. standoff. A. Uniform upper Paleocene. A.G.I.

spare-ground. Pecked, See stippled. Dudd.

sparry. Resembling, consisting of, of boundstone. Fay.

sparry coal. Scotch. Coal, the backs or joints of which are filled with calcite. Fay.

sparry iron. Siderite or chalcopyrite. Webster 3d.

sparry iron ore. Siderite. Har.

sparry iron ore. A lode filled with spar, for example, fluoraspars, calcspar, or heavy spar. Fay.

sparry vitrain. A field term to denote, in accordance with an arbitrary scale established for use in describing banded coal, a frequency of occurrence of vitrain bands comprising less than 15 percent of the total coal layer. Compare abundant vitrain; dominant vitrain; modern vitrain. Fay.

sparry vitrain. A field term to denote, in accordance with an arbitrary scale established for use in describing banded coal, a frequency of occurrence of vitrain bands comprising less than 15 percent of the total coal layer. Compare abundant vitrain; dominant vitrain; modern vitrain. Fay.

spassite. A Cornish name for garnets. Fay. b. See also struc-

ture. Fay.

spastic. A. An old name for zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay.

spatial. A Cornish name for zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.

spatial. Applied to notionally deformed ooliths. Pettijohn, 2d, 1957, p. 97. C.M.D.

spatial. A variety of calcite containing some manganese. Fay. See also spatial iron. A. Name given to zincite. C.M.D.
spatula. A long, narrow instrument of metal.

spatting machine. A machine for spattling.

special. See speL;1a1 rounds. Long.

spear wedge. Aust. A long wooden wedge used for entering iron tubbing and which helps to pack up the space between the tubbing and the rock. Also called spare.

spear plates. Eng. Wrought-iron plates bolted to the sides of spears where joined together.

spear points. A marcasite in twin crystals resembling the head of a spear. Webster 3d.

speard. Aust. A long wooden wedge used for entering iron tubbing and which helps to pack up the space between the tubbing and the rock. Also called spare.

spear. See special rounds. Long.

special dynamite. Brand name applied to a series of ammonia-type dynamites. They are more economical, less flammable, and relatively safer than nitroglycerin dynamites. Used in open-pit mining, in quarrying, in construction projects, and in general blasting. CCD 6d, 1961.

special flexible rope. A wire rope composed of 6 strands of 37 wires each. Lewis, p. 40.

special gelatin. Brand name applied to a series of an ammonia-gelatin-type dynamites. Used in open-pit mining, in underground mining, in quarrying, and in construction projects. CCD 6d, 1961.

special hydrated lime. See Type 8 hydrated lime.

special improved plow. Wire with a tensile strength of 110 to 120 tons per square inch (175 to 190 kilograms per square millimeter). Ham.

special improved plow. Steel with a tensile strength of 90 to 100 tons per square inch (130 to 145 kilograms per square millimeter). A.G.T.

special nuclear material. In atomic energy, it includes plutonium, uranium 233, uranium containing more than the natural proportion of uranium 235 (or more than 0.72 percent of uranium 235), or any material artificially enriched by any of these substances. I.S.F.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-143.

special oxides. See oxide ceramics. Dodd.

special place. Aust. A place where coal cannot be won so easily as in ordinary working places; for example, development work, headings, etc. Fay.

special purpose sampling. The American Society for Testing and Materials divides coal sampling into "commercial sampling" and "special purpose sampling." Special purpose sampling procedures apply when special accuracies are required, and four to nine times the number of increments required in the commercial procedures reduce the expected limits of error of the gross sample by one-half to one-third. Compare commercial sampling. Mitchell, p. 81.

special purpose tile. A tile, either glazed or unglazed, made to meet or to have specific physical or ornamental characteristics, such as size, thickness, shape, color, or decoration; keys or lugs on backs or sides; special resistance to staining, frost, alkalies, acids, thermal shock, physical impact, high coefficient of friction, or electrical properties. ASTM C242-60T.

special rounds. Spears used to designate a very high quality or grade of drill diamonds. Long.

special shapes. Refractories molded into shapes, the size and contour of which differ from the series of standard shapes. ASTM C242-60T.

special steel. A steel containing alloys which provide special properties such as resistance to corrosion or to heavy load. Also called alloy steel. Hartman, p. 8.

special species. All organisms, of either animal or vegetable kingdom, which possess in common, a set of constant characteristics and the whole of which form a distinct and well-defined type would constitute a species. See also genus. Nelson.

specific adsorption. Selective adsorbing action. Pryor, 3d.

specific absorption. A detailed study: ment of particular. Crispin.

specific demagnetization. A measure of the vibrational energy absorbed by the rock and may be considered to be a measure of the internal friction. It is determined by the sharpness of resonance which is evident when a specimen is vibrated through a range of frequencies centered on the fundamental longitudinal resonant frequency. Damping of the dry type (coulomb damping) is commonly assumed to be independent of the velocity, and this is independent of the frequency, and is some- what insensitive to moisture content. Lewis, pp. 516-570.

specific energy. In cutting or grinding, the energy expended or work done in solidifying a unit volume of work material, usually expressed as inch-pound per cubic inch or horsepower per minute per cubic inch. ASM Gloss.

specific extraction of rock broken. Quantity of broken rock (ore) in volume or weight per foot drilled or fired per pound of explosive (cubic yard per pound, ton per pound; or, cubic yard per foot drilled, ton per foot drilled. Frantell.

specific gravity. The weight of a substance compared with the weight of an equal volume of pure water at 4° C. Anderson. b. The ratio between the weight of a unit volume of a substance and that of some other substance which is considered as the standard conditions of temperature and pressure. For solids and liquids, the specific gravity is based upon the volume at the standard, the true specific gravity of a body is based on the volume of solid material, excluding all pores. The bulk or volume specific gravity is based upon the volume of a whole, that is, the solid material with all included pores. The apparent specific gravity, bulk specific gravity (specific mass gravity), c. Ratio of densities of a gas and air. Measured on dry air = 1. Hartman, p. 8. In oceanography, the specific gravity is considered numerically equal to the density. Hartman.

specific gravity hydraulic meter. A hydrometer indicating the specific gravity or relation of the weight of a given liquid per unit volume to the weight of the same volume of water. Compare hydrometer; Marsh funnel; Twaddell hydrometer. Long.

specific gravity of solid. This is measured in a calibrated glass bottle with special precautions against the inclusion of air. Such test is applied in many soil problem computations. See also pyrometer. Hart.

specific gravity of solids. The ratio of the weight in air of a given volume of soil solids at a stated temperature to the weight in air of an equal volume of distilled water at a stated temperature. ASCE P1826.

specific heat. a. Heat required to raise the temperature of a unit weight of air 1° F. Usually, the specific heat at constant pressure is used in air conditioning. Measured in British thermal units per pound per degree F. Hartman, p. 8. For ordinary concrete and steel it is 0.22 and 0.12 British thermal unit per pound per degree F., respectively. Taylor. b. The ratio of the amount of heat required to raise a unit weight of a material 1 degree to the amount of heat required to raise a unit weight of water 1 degree. Brantlly, 2d, c. The heat in calories required to raise the temperature of 1 gram of a substance 1° C., Webster 3d.

specific humidity. The mass of moisture per unit mass of dry air, expressed in gram per liter. Lewis, p. 127. Absolute humidity, or weight of water vapor contained per unit weight of
specific humidity
c'ry air. Measured in grams, or pound per pound. Hartman, p. 8.
specific permeability. The permeability measured by the ratio of the flow of a fluid through a porous medium to the force by which it is opposed. Institute of Petroleum, 1961, p. 20.
specific population. Number of particles in unit volume of pulp. Pryor, 4.
specific power. a. The power generated in a nuclear reactor per unit mass of fuel. Expressed in kilowatts of heat per kilogram of fuel, LBL. b. The same as unit power. ASM Gloss.
specific resistance. Same as resistivity. Wyllie, p. 2.
specific retention. As applied to a rock or soil, the ratio of the volume of water which, after being saturated, it will retain against the pull of gravity to its own volume. It is stated as a percentage. AGI.
specific speed. a. A factor by which the performance of any particular design of impeller for a centrifugal pump or water turbine can be computed. It is the speed in revolutions per minute at which a geometrically similar impeller of suitable diameter will be able to deliver one gallon per minute at one foot head in the case of a pump. In a water turbine, the specific speed is that at which a geometrically similar runner of suitable diameter will turn to develop one horsepower under a head of one foot. Ham. b. The speed in revolutions per minute at which a geometrically similar pump would deliver one gallon of water per minute against a head of one foot. Steven, 4, p. 67.

specific surface. a. The surface area per unit of volume of soil particles. ASCE P1626.

b. The ratio of the total surface of a substance (as an adsorbent) to its volume; surface area (as of a finely divided powder) per unit mass. Webster 3d.
specific surface area. The ratio between the total surface area of a number of particles and their total weight, usually expressed in square centimeters per gram. Taylor.
specific-volume anomaly. The difference in specific volumes of the sample under the conditions which prevailed in situ and the conditions if at salinity 35°/00 and temperature 0° C. Hy.
specific weight of sediment. The dry weight per unit volume of the sediment in place. See also dry density. Nelson.
specific yield. As applied to a rock or soil, the ratio of the volume of water which, after being saturated, will yield by gravity to its own volume. This ratio is stated as a percentage. Nash.
spezifische Dimensionen. Die Dimensionen zu dem denen die masonry units or constructions are required to conform. Actual (measured) dimensions may differ from the specified dimensions by permissible variations. ASM Gloss.
spezimen. a. A small mass of coal, rock, ore, mineral, or soil, which, given, roughly, an ideal shape, is used to determine density. L & L. b. The same as specimen hunting. Another name for high grading (the theft or handsome minerals, particularly the specimen, which masonry units or constructions are required to conform. Actual (measured) dimensions may differ from the specified dimensions by permissible variations. ASM Gloss.

1051

case of ore in particular, the specimen should admit of the identification of the various minerals present. A specimen cannot be virtually identical with the sample. Nelson, b.

Properly speaking, a sample of anything; but among miners it is often restricted to selected fragments, as fine pieces of ore, crystals, or pieces of quartz containing visible gold. Fay, c. A lump of gold intermixed with quartz or very rich in gold. Gard. c.
speclmen boss. An employee whose duty is to watch carefully, in all parts of the mine, for the appearance of high-grade mineral, and when it is likely that such spots will be opened up he should be the first man at the face after the blast. His job is to prevent high grading (the theft of valuable samples). Hoo, pp. 494-495.
specimen hunting. Another name for high grading. Hoo, p. 490.
specimen. In mineral dressing, unusually rich pieces of ore or characteristic constituents thereof in coarsely crystalline form—not representative samples. Pryor, 4.
speck. A small piece all of a different color weighing up to 1 or 2 ounces. Gordon.
speckling. a. Walking over the ground on the chance of picking up a lump of gold on the surface. Gordon. b. The discoloration of an enamel surface due to foreign particles of dirt or scale imbedded themselves in the enamel. This trouble may often be avoided by the use of burning equipment in good condition and proper care in the painting operation. Enam. Dict.
speckled ware. A decorative finish with particles of one color appearing in a uniform background of another color or shade. ASM Gloss.
specks, black. In the enameled surface, may be caused by the accidental introduction of foreign particles or by minute bubbling formations in the sheet-iron ground coat during the early stages of firing the first firing. Steven, IV, p. 67.
speckstone. Adapted from speckstein, "bacon stone"; an early name for talc, because it feels greasy. Fay.
speckstone. A two-handled frame for carrying the surface. Gordon. b. The discoloration of an enamel surface due to foreign particles of dirt or scale imbedded themselves in the enamel. This trouble may often be avoided by the use of burning equipment in good condition and proper care in the painting operation. Enam. Dict.
spectrograph. An instrument to detect very small amount of light, such as light of different colors of different chemicals and thus measure the quantity of the chemical present. It consists of a light source, an optical prism for providing monochromatic light, that is, light of a single wavelength only, and a device for measuring the intensity of the light beam after it has passed through the solution. Traces of aluminum in steel may be determined in this way. See also X-ray spectrometer. Newport.
spectrographer. A person who constructs or uses a spectrograph. Webster 3d.
spectroscopy. Instrument in which collimated light is directed through a narrow slit onto either an optical prism or a diffraction grating, exhibiting its spectrum. The elements from which light emanates have characteristic patterns which aid in their identification. Pryor, 3.
spectrum. A band of light showing in order of succession the rainbow colors or isolated bands or colors corresponding to different wavelengths, as seen through a spectrograph or photographed in a spectrograph. Spectroscopy as a science is the study of the visible spectrum or of measuring wavelengths of rays of a spectrum. Webster 3d.
spectrophotometer. An instrument to detect very small amount of light, such as light of different colors of different chemicals and thus measure the quantity of the chemical present. It consists of a light source, an optical prism for providing monochromatic light, that is, light of a single wavelength only, and a device for measuring the intensity of the light beam after it has passed through the solution. Traces of aluminum in steel may be determined in this way. See also X-ray spectrometer. Newport. Also called spectrophotograph. Webster 3d.
spectroscope. Instrument in which collimated light is directed through a narrow slit onto either an optical prism or a diffraction grating, exhibiting its spectrum. The elements from which light emanates have characteristic patterns which aid in their identification. Pryor, 3.
spectrometer. A device for measuring the intensity of the light of a single wavelength only, and a device for providing monochromatic light, that is, light of a single wavelength only, and a device for measuring the intensity of the light beam after it has passed through the solution. Traces of aluminum in steel may be determined in this way. See also X-ray spectrometer. Newport. Also called spectroscope. Webster 3d.
spectroscopic analysis. Analysis by obtaining the spectrum of a substance and matching the lines in the spectrum with known wavelengths of lines in the spectra of the elements. The analyst can be made quantitative by comparing intensities of the spectral lines. AGI.
spectroscopy. a. Qualitative or quantitative analysis by visual or photographic assessment of a spectrum of the substance. In emission spectroscopy, the material is made incandescent in an electric arc; in X-ray work it is bombarded by X-rays and the interference is recorded by a camera, or Geiger-Muller tube. Transmission spectroscopy in sorption spectroscopy the substance is dissolved and the effect on a beam of visible or ultraviolet light is measured by use of a photodiode cell. Pryor, 3. b. The art or technique of using the spectrograph. Webster 3d.
spectrometer. An optical instrument similar to, but more versatile than, the simple spectroscope. Scales are provided for reading angles. A wavelength spectrometer is one designed or equipped in a manner to measure the wavelengths at which absorption bands occur in an absorption spectrum. Shipley.
spectrometry. The art or process of using the spectrometer or of measuring wavelengths of rays of a spectrum. Webster 3d.
spectrum density

unity gain responding to the oscillation, per unit bandwidth; that is, the limit for vanishingly small bandwidth of the quotient of the mean-square amplitude divided by the bandwidth. Hy.

spectrum intervals. Sometimes used to designate frequency bands separated by intervals either linear or a logarithmic frequency scale. Hy.

spectrum level. With a specified signal at a particular frequency, the level of that part of the signal contained with a band one octave second wide, centered at the particular frequency. Ordinarily this has significance only for a signal having a continuous distribution of components within the frequency range under consideration. The phrase spectrum level cannot be used, but must appear in combination with a modifier, as, for example, pressure, velocity, voltage, etc. Hy.

spectrum pattern. A graph showing the relative response of a sonar transducer as a function of frequency for various specified bearings. Hy.

specular, as, specular iron ore, which is a hard variety of hematite. See also specularite. Fay.

specular coal. Same as pitch coal. Fay.

specular gloss (45°). An operational definition of this property, relevant in the surface evaluation of glazed or enamelled surfaces, is as follows: the ratio of reflected to incident light, times 1,000, for specified apertures of illumination and reception with which the surface of an object in contact with a five percent white card. See also specular; hematite.

specular iron ore. A variety of hematite with brilliant black color and metallic lustre. Fay. 1964.

specular hematite; specular iron; gray hematite. An iron oxide, Fe3O4, occurring in tabular or disseminated crystals of gray color and splendid metallic lustre. Contains 70 percent iron. Also called micaceous hematite if occurring in foliated or micaceous masses. See also hematite. Spergerite.

specular reflection. Reflection of light from the surface only, as distinguished from reflection of light from positions below the surface. Shipley.

specular schist. See iritibrite. Fay.

speculation. The outlay of money in an enterprise offering the hope of high reward in return for the incurring of high risk. Hoop, p. 322.

speculum alloy. Copper and tin alloyed in a 2:1 proportion, forming a hard, silvery metal capable of being highly polished; used in manufacture of mirrors, optical instruments, etc. C.T.D.; Sprag.

specular metal. A hard brittle alloy of two parts copper and one part tin. It takes and retains a high polish and is therefore much used for reflectors. Sprag.

Spedding's flint mill. A means of illumination invented about 1750 in which a steel wheel, in diameter and driven through a gearwheel and pinion pressed on a flint and generated an abundance of sparks and emitted considerable light. The mill was carried and operated by a boy accompanying each miner. Mason, u. i. p. 231.

sped. a. Corn. A quick, but wasteful way of dressing, or other coarse cleaning of copper ore, by an iron grate in a swift current of water. Fay. b. The length of belt, chain, cable, or other linkage which passes a fixed point within a given time. It is usually expressed in terms of feet per minute. In the case of the rolling chain conveyor, the load is moved at a rate double the chain speed. In screw conveyors, the speed is expressed in terms of revolutions per minute and the speed at which the material is conveyed is dependent upon speed, pitch of the screw, type of flight, angle of inclination, nature of material, etc. ASA MH4!-1958.

speed of travel. In welding, the speed with which a weld is made along its longitudinal axis; is usually measured in inches per minute or spots per minute. ASM Gloss.

speed reducer. A device for gears, totally enclosed by a motor and the machinery which it will drive, to reduce the speed of the shaft, with which power is transmitted. Belt and chain conveyors are typical examples of machinery employing speed reducers. Spence automatic desulfurizer. An improved type of de-sulfurizing equipment for removing sulfur without burning copper and one part tin. It takes and retains a high polish and is therefore much used for reflectors. C.T.D.

speedy moisture tester. A calcium carbonate method for the quick determination of moisture. A moisture gage calibrated to give direct values of moisture content percent of soil samples. Nelson.

spell. a. A rest period for crews at furnace, reverberatory type, or a period of work in stock house, etc. Fay. b. The length of belt, chain, cable, or other linkage which passes a fixed point within a given time. It is usually expressed in terms of feet per minute. In the case of the rolling chain conveyor, the load is moved at a rate double the chain speed. In screw conveyors, the speed is expressed in terms of revolutions per minute and the speed at which the material is conveyed is dependent upon speed, pitch of the screw, type of flight, angle of inclination, nature of material, etc. ASA MH4i-1958.

spence. a. A white basic hydrous phosphate of zinc, ZnO(2OH)2Zn(OH)2.3H2O. Radiating masses of compact lamellar monoclinic crystals. From Salmo, British Columbia, Canada. English. b. Carbide and sill-idge of Fe and Ni; FeNi. OCT. Arti- ficially produced in 1955.

Spence shale. A subdivision of the Middle Cambrian at Mount Stephen in the Canadian Rockies, famous for its remarkable fossils. C.T.D.

spend. a. To break ground; to continue working. Fay. b. To exhaust by mining; to dig out; used in the phrase, to spend ground. Standard, 1964.

spent fuel; depleted fuel. Nuclear-reactor fuel that has been irradiated to the extent that it can no longer effectively sustain a chain reaction. Fuel becomes spent when its fissionable isotopes have been partially consumed and fissile and fission products have accumulated in it. LBL.

spent shot. A blasthole that has been fired, but has not done its work. Fay.

Spergen limestone. See Salem limestone. C.T.D.

sperrylite. A porous variety of leucitite containing small crystals of melanite. Holmer, 1929.

Sperrylite. A tin-white mineral, PtAs, black streak; metallic lustre. Of very rare occurrence but of interest as the only native compound of platinum. Contains 32.57 percent platinum; 43.5 percent arsenic, with some replacement of platinum by rhodium and palladium. Specific gravity, 10; Mohs' hardness, 6 to 7. Found in Wyoming, North Carolina, Nebraska; Canada. C.D.; 6d, 1961.

sperrylite. A process for manufacturing white lead which begins with softened and desolvized lead, preferably containing some bismuth, cast in the form of anodes. These anodes are placed in the Sperry white-lead cells. Direct current is used to dissolve the lead from the anodes, with diaphragms separating the anolyte and the catholyte. Carbon dioxide is passed into the solution, white lead (basic lead carbonate) is produced, and no cathode deposit is formed. The impurities in the anodes remain on the anodes as a slime blanket. If the slime blanket falls off, the impurities will contaminate the white lead; on the other hand, if the slime blanket is allowed to become too thick, the electromagnetic force across the blanket will increase to a magnitude other than lead from the face of the blanket. The Sperry process slimes is washed, dried, and milled to the bismuth refinery. BuMines Bull. 556, 1956, p. 106.

sperrylite. See sperrerlite. Fay.

specular. a. Manganite, garnet, MnAl2(SiO4)2.C.T.D.; Dana 17. b. A diorite or gabbro; a gabbro. Some gabbroic min-erals are hornblende or augite or both, with plagioclase (usually anodesine) field-
sphalerite; zinc blende; blende; black jack.

sphagnum peat. Peat composed mainly of

sp gr Abbreviation for specific gravity. BuMin

spew. The cauliflowerlike blowout or outcrop

of a lode that extends beyond the limits of the defined vein deeper down. Fay.

spewing. An exudation of soft material through gravelly or broken stuff bedded on

mud, soft wet clay, or the like. Webster 2d.

sphagnum peat. Peat composed mainly of

sphalnite. Zinc blende; blende; black jack.

Zinc sulfide, ZnS, cubic crystal, black to brown in color, resinous. Mohs' hardness 3.5 to 4.0, streak white to mid-brown, specific gravity 3.9 to 4.2. Pryor, 3.

sphene. CaSiO₃TiO; melting point 2,425°C. This mineral usually has been found in the ceramic color known as chrome-tie pink. See also chrome-tie pink.

sphenoïd. a. In crystallography, an open form in the monoclinic system, consisting of two modified paralleloids with interaxial angle of 90° and one other only by a twofold symmetry axis perpendicular to their line of inter-

section and bisecting the spherical angles between them. Compare dome. A.G.I. b.

A diaphenoid. A.G.I.

sphenoïlite. A term invented to distinguish the special form and relations of intrusion at Las Parroquias, Mex. A rock mass of the injected class, partly concordant with a thick sill, and partly discordant. The country rocks have been displaced and even overturned. Fay.

Sphenoëtes. A fernlike tree of the coal for-

mating at a point, source, such as a shot

of a semicircle about its diameter. Pryor, 3.

spherite. a. The preferred spelling for sphaer-

ite. b. Derived from the Greek spherikos, spherical.

sphered. a. A spindle-shaped crystallite be-

longing to the sphalerite group. B. A.G.I. Supp.

spheredal. a. A descriptive term applied to igneous rocks that break up on cooling into spherical masses analogous to basaltic columns; also, used as a synonym for orbicular, as applied to certain gran-

ites. Fay. b. A weathered mass of any rock which are mounted felt polishing pads. ASTM C286-65. 1. Sometimes used as a trademark for rocks used exclusively for rock polishing. Fay. 2. See also spider and slips. Long. d. A contrivance consisting of a frame or skeleton having radiating arms or members, as a casting forming the hub and spoke to which the rim of a wheel or pulley is secured. See also spider web. Fay. e. A wheelless casting consisting of a rim and radial spokes on which are mounted felt polishing pads. ASTM C162-66. g. Assembly of radiating tie rods on the top of a furnace. ASTM C162-66. h. A defect characterized by a star-shaped fracture pattern that eman-

ates from a central area, usually on the surface of the pipes. ASTM C286-65. i. Sometimes used as an alternative to center brick. See also center brick. Fay. j. See also spider web. Long. k. A pipe which rotates on its shaft in a rotat-

ing case. Nichols.

spheroidal. a. A spindle-shaped crystallite be-

longing to the sphalerite group. B. A.G.I. Supp.

spheron. a. In geology, a term applied to sphalerite rock in the form of smooth, compact masses that are long and more or less cylindrical in shape. B. B. A.G.I.

spheronic. a. A term derived from the Greek for spherical, as applied to various minerals and rock masses that have a spherical form. B. A.G.I.

spheroïd. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.

spheroïd. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.

spheroid. In geology, a term applied to a mass of spheroidal particles. In general, any figure differinu but not much from a sphere. In geodesy, a mathematical figure

spheroid. In general, any figure differing but

little from a sphere. In geodesy, a mathemat-

ical figure closely approximating the geoid in form and size, and used as a surface of reference for geodetic surveys. A.G.I.

spheroidal. a. A descriptive term applied to igneous rocks that break up on cooling into spherical masses analogous to basaltic columns; also, used as a synonym for orbicular, as applied to certain gran-

ites. Fay. b. A weathered mass of any rock which are mounted felt polishing pads. ASTM C286-65. 1. Sometimes used as a trademark for rocks used exclusively for rock polishing. Fay. 2. See also spider and slips. Long. d. A contrivance consisting of a frame or skeleton having radiating arms or members, as a casting forming the hub and spoke to which the rim of a wheel or pulley is secured. See also spider web. Fay. e. A wheelless casting consisting of a rim and radial spokes on which are mounted felt polishing pads. ASTM C162-66. g. Assembly of radiating tie rods on the top of a furnace. ASTM C162-66. h. A defect characterized by a star-shaped fracture pattern that eman-

ates from a central area, usually on the surface of the pipes. ASTM C286-65. i. Sometimes used as an alternative to center brick. See also center brick. Fay. j. See also spider web. Long. k. A pipe which rotates on its shaft in a rotat-

ing case. Nichols.

spheroidal. a. A term derived from the Greek for spherical, as applied to various minerals and rock masses that have a spherical form. B. A.G.I.

spheroïd. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.

spheroid. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.

spheroidal. a. A descriptive term applied to igneous rocks that break up on cooling into spherical masses analogous to basaltic columns; also, used as a synonym for orbicular, as applied to certain gran-

ites. Fay. b. A weathered mass of any rock which are mounted felt polishing pads. ASTM C286-65. 1. Sometimes used as a trademark for rocks used exclusively for rock polishing. Fay. 2. See also spider and slips. Long. d. A contrivance consisting of a frame or skeleton having radiating arms or members, as a casting forming the hub and spoke to which the rim of a wheel or pulley is secured. See also spider web. Fay. e. A wheelless casting consisting of a rim and radial spokes on which are mounted felt polishing pads. ASTM C162-66. g. Assembly of radiating tie rods on the top of a furnace. ASTM C162-66. h. A defect characterized by a star-shaped fracture pattern that eman-

ates from a central area, usually on the surface of the pipes. ASTM C286-65. i. Sometimes used as an alternative to center brick. See also center brick. Fay. j. See also spider web. Long. k. A pipe which rotates on its shaft in a rotat-

ing case. Nichols.

spheroidal. a. A term derived from the Greek for spherical, as applied to various minerals and rock masses that have a spherical form. B. A.G.I.

spheroïd. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.

spheroid. A homogeneous sphalerite formed of minute crystals branching outward from a center. Standard, 1964, see also sphalerite. Fay.
sandstone beds that show crossbedding on a small scale, which is complicated by intricate interfacing of fine-bedding planes. Frequently seen in sawed stone, especially where the cross-bedding is slightly oblique or irregular. It is very like the grain of wood that shows in a planed board. Fay.

spigot. a. A large timber driven into the ground to support the roof or sides in advancing a tunnel. L&L. b. A bye channel. C.T.D. c. Release over a dam or similar obstruction. Webster 3d.

dspline. a. An isometric crystal, typically magnesium aluminate, MgAlO$_3$. The magnesium is usually replaced by ferrous iron, or manganese, and the aluminum by ferric iron and chromium. Spinell is red, yellow, or grey, with a mixture of these colors, and is used as a gem. Fay; Dana 17 b. A mineral group of general formula, AB$_2$O$_3$. They occur typically as products of contact metamorphism of impure dolomite limestones, and less commonly, as accessory minerals in impure rocks of basic composition. A.G.I.

spinning. To rotate the bit or drill stem or to make a turn to advance the attached drill string. Long. b. The number of times the drive rod of a gear-feed drill head must turn to advance the attached drill string 1 inch. Long.

spiral. A mass of igneous rock solidified in the vent of a volcanic vent. Fay.

spinel. a. An isometric mineral, typically magnesium aluminate, MgAl$_2$O$_4$. The magnesium is usually replaced by ferrous iron, or manganese, and the aluminum by ferric iron and chromium. Spinell is red, yellow, or grey, with a mixture of these colors, and is used as a gem. Fay; Dana 17 b. A mineral group of general formula, AB$_2$O$_3$. They occur typically as products of contact metamorphism of impure dolomite limestones, and less commonly, as accessory minerals in impure rocks of basic composition. A.G.I.

spindle emery. A mixture of spinel (pleonaste hycrite), corundum, and magnetite, the corundum being present in variable proportions and sometimes entirely lacking. It is usually a heavy, black, fine-grained aggregate with dark grey crystals of corundum appearing in the best varieties. A.I.M.E., p. 7.

splinter. In the asbestos products industry, a chain-end conveyor in which the chains pins are extended in a vertical plane, usually of enlarged diameter in that portion above the chain on which special revolvable fixtures can be rotated, for the purpose of spraying or cementing road boards or sliding shoes to support the chain and product. A.S. of MIH4-1938.

spindle breaker. Old name for gyration crusher. Fryer, 3.

spindle speed. a. Same as bit rotational speed. Long. b. The number of times the drive rod of a gear-feed drill head must turn to advance the attached drill string 1 inch. Long.

spillway. a. A passage, as a paved apron or channel, for surplus water over or around a dam or similar obstruction. Webster 3d. b. A bye channel. C.T.D. c. Release overflow for water impounded in a dam. Pryor, 3.

dispel. a. A large timber driven through weak, loose beds. See also dispel. Pryor, 3. b. Any of the thick laths or poles driven ahead of the main timbering to support the roof or sides in advancing a level in loose ground, or to support the sides of a shaft when sinking through a stratum of loose ground. Fay. c. The tapered male part of an inlet joint. Fay. d. The tapered male part of an inlet joint. Fay. e. The tapered male part of an inlet joint. Fay.

spillway. a. A passage, as a paved apron or channel, for surplus water over or around a dam or similar obstruction. Webster 3d. b. A bye channel. C.T.D. c. Release overflow for water impounded in a dam. Pryor, 3.

spill. a. Any of the thick laths or poles driven ahead of the main timbering to support the roof or sides in advancing a level in loose ground, or to support the sides of a shaft when sinking through a stratum of loose ground. Fay. c. The tapered male part of an inlet joint. Fay. d. The tapered male part of an inlet joint. Fay. e. The tapered male part of an inlet joint. Fay.

spin. To rotate the bit or drill stem or to make a turn to advance the attached drill string. Long.
spinning

spinning. An operation by which round hollow wire-ware is formed by pressing metal sheets or light plates to molds or forms rectangular in shape. The process is also being called a spinning lathe. See also metal-working. Henderson.

spinning cable. A flexible wire or planter fiber cable or rope used as a spinning chain. See also spinning chain. Long.

spinning fiber. Abbein suits suitable for the spinning of abetos fabrics. A.G.I.

spinning line. a. A chain or rope used as a wrench in attaching and detaching drill pipe sections. Nichols. b. A line wound around a threaded pipe, so that a pull will rotate the pipe to fasten or unfasten it. Long.

spinning rope. A plant-fiber rope used for the same purpose as a spinning chain. See also spinning chain. Long.

spin out. To unscrew lengths of drill rod, casing, or pipe in attaching and detaching drill sections. Nichols.

spin up. To screw lengths of drill rod, casing, or pipe by mechanical means, using a spinning chain, cable, or rope in conjunction with power derived from the cathead or other rotating device. Long.

S-P interval. In earthquake seismology, the time interval between the first arrivals of longitudinal and transverse waves, which is a measure of the distance from the earthquake source. A.G.I.

spinahtarposcope. Screen coated with zinc sulfide or other fluorescent substance, on which scintillations are observable when exposed to the sun, burns; and that the same purpose as a spinning chain. See also spinning chain. Long.

spin out. To unscrew lengths of drill rod, casing, or pipe by mechanical means, using a spinning chain, cable, or rope in conjunction with power derived from the cathead or other rotating device. Long.

spin out. To unscrew lengths of drill rod, casing, or pipe by mechanical means, using a spinning chain, cable, or rope in conjunction with power derived from the cathead or other rotating device. Long.

spiral. a. A spiral coal chute that mechanically crushes ores. Also used in concentrating crushed ores. From chrome sands, rutile, ilmenite, chrome mica, and lepidolite from crushed ores. Also used in concentrating such ores. A.G.I.

spiral. One of the minute cones formed on the surface of a liquid lava stream by the action of the current. Tomkeieff, 1954.

spiral balls. A device to withdraw broken coal from small-size coal by centrifugal force aids the separating effect of sluice action. See also Humphreys spiral. Pryor, 3.

spiral breaker. Spiral chutes, built into large steel pipes, are used widely in staple shafts in horizon mining. They are kept filled with coal and therefore, breakage is reduced considerably. See also telegraph. Nelson. b. A continuous curved trough over which bulk material or objects are guided while being lowered by gravity in a substantially helical path. A.S.A.

spiral classifier. See Akins classifier. Pryor, 3.

spiral coal cleaner. A spiral chute in which the plate is inclined towards the center of the spiral. The stone tends to flow down centrally, the coal tends to slide off to the side. The spiral are seldom used as coal cleaners. Nelson.

spiral concentrator. A classifier, consisting of five or six tight spirals, in which centrifugal force aids the separating effect of sluice action. See also Humphreys spiral. Pryor, 3.

spiral conveyor. See roller spiral; screw conveyor, a. Also called bocca. Long.

spiral core. A piece of core the outside surface of which is rifled. See also rifle, a. Long.

spiral curve. A grade of gradually increasing radius which allows an easy transition between a circular arc and a straight on a road or railway. Ham. b. In railroad or highway surveying, a curve of progressively decreasing (or increasing) radius used in joining a tangent with a simple circular curve or in joining two circular curves of different radius. Also called transition curve. Seeley, 2.

spiral drum. A kind of conical winding drum. Fay.

spiral groove. See rifling, c and d. Long.

spiral gunner. A screw device, attached to a long escalator, for removing the bolting and deposit there either in the track of the machine or at the side clear of the face. It is designed in two types, that is, end discharge and side discharge. See also gun stower. Nelson.

spiral hole. A borehole that follows a cork-screw like course. Compare rifle, a. Long.

spiral magma. One who operates a battery of spirals (mechanical devices that separate slate from small-size coal by centrifugal force); and regulates spirals so that they too much small lack (fine coal) does not go in refuse. D.T.

spiral structure. Probably same as snow-ball structure. Term also applied to organic burrows. See also snow-ball structure.

spiral tunnel. A method of gaining grades in a tunnel by driving the tunnel on a constant and circular line. Stauffer.

spiral Vane Disk Cutter. Trade name for a cutter loader incorporating a new type of striker head. The first model consists of section plates welded together to form a composite whole spiral. The disk is made in different sizes to give a cist diameter of from 31 to 72 inches with a maximum web depth of 30 inches. A single spiral is used for the softer coals and a double spiral for hard coals. A plough attached to the machine throws the coal onto the conveyor. Nelson.

spiral worm. A device to withdraw broken rods from a borehole. It is lowered down the hole and the screw turned round until it grips the broken rod below the joint. See also crow's foot; screw ball. Nelson.

spirals. a. The tube carrying the train to the charge in a blasthole. Also called bell or rush, because the train is formed slowly as spires of charge are used for the purpose. A kind of fuse. Fay. b. Leic. Coal of a hard, dull, starchy nature, and difficult to break. Fay. Spherolite smoke helmet. A helmet in which the crown and frontpiece are blocked out of rawhide, and the front shield is fitted with two mica windows in hinged aluminum frames. It has a twin-tubed air feed on each side of the helmet and a valve for the escape of carbonic acid. Air is supplied through armored hose from a double-acting bellows or blower worked by a lever. The hose, which contains fluid and an air bubble. When level the air bubble centers itself on an etched line, on the tube. Bureau of Mines Staff.

spirit of copper. Acetic acid obtain by distilling copper acetate. Fay.

spirits of heart's blood. An aqueous solution of ammonia, the name being derived from the old method of obtaining ammonia by heating the hoofs and horns of animals. Osborne.

spirits of verdigris. Acetic acid. Osborne.

spirits of vinegar. Dilute acetic acid. Osborne.

spirits of wood. Methyl alcohol. Osborne.

spirogyna. A genus of freshwater green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.

spiroklysm. A genus of fresh water green algae (family Zygnemataceae) which manes in still waters and slow streams. Sonoran, Mexico; monoscopic. Hey, M.M., 1964; Fleischer.
**spit**

**spitfouf.** A glaze defect of the pinhole type developed in the decorating kiln, due to evolution of minute gas bubbles from body or glaze. *A.S.T.M. C242-60T.* b. A defect in the surface of a piece of ceramic ware caused either by the breaking of a blister in the glaze or by the breaking out of a part of the surface of the clay. *A.G.I.*

**spitted fuse; lighted fuse.** Slow-burning fuse which has been cut open at the lighting end for easier ignition. A small quantity of the plastic explosive used in the hole is sometimes inserted in the cut. *Fytor, 3.*

**spitting.** a. Lighting the fuse for a blast. *Fay.* b. An action or appearance on the surface of slowly cooled, large masses of melted silver or platinum, in which the crust is forcibly perforated by jets of oxygen, often carrying with them drops of molten metal. *Standard, 1964.* Also called spitting rock. *A.G.I.*

**splitzasten.** A series of hopper-shaped or peaked boxes for separating mineral-bearing slimes according to fineness, in which the width of each box is double that of its predecessor, while the lengths increase by arithmetical progression. *As used in flotation, it is the froth-separating compartment of mechanical-agitation-type flotation machines.* Also called spits. See also funnel box. *Fay.*

**splitzisten.** Hydraulic classifiers shaped like the splitzasten, but having provision for pressure water to flow upward from near the apex, thus improving efficiency of separation. *Fytor, 3.*

**splash cup.** A cup at the top of some stalagmite or splate hanging from the ceiling. *BuMines Bull. 587, 1960, p. 2.*

**splitzkaften.** A series of hopper-shaped or peaked boxes for separating mineral-bearing slimes according to fineness, in which the width of each box is double that of its predecessor, while the lengths increase by arithmetical progression. *As used in flotation, it is the froth-separating compartment of mechanical-agitation-type flotation machines.* Also called spits. See also funnel box. *Fay.*

**splashletten.** Hydraulic classifiers shaped like the splitzasten, but having provision for pressure water to flow upward from near the apex, thus improving efficiency of separation. *Fytor, 3.*

**splashman.** A laborer who shovels charcoal over the surface of molten copper being poured from a reverberatory furnace into a tilting ladle to prevent excess oxidation of metal. *D.O.T.1.*

**splash stalagmite.** A stalagmite having whorls of upstanding petaline protruberances in many stories. *Schaferdecker.*

**splash zone.** The area which undergoes the splashing effect of the breakers. *Schaferdecker.*

**spray.** a. Spread; said of arches whose straight or bent apex, thus improving efficiency of separation. *Fytor, 3.*

**spay.** a. Spread; said of arches whose straight or bent apex, thus improving efficiency of separation. *Fytor, 3.*

**splay, splay.** a. Spread; said of arches whose straight or bent apex, thus improving efficiency of separation. *Fytor, 3.*

**splay.** a. Spread; said of arches whose straight or bent apex, thus improving efficiency of separation. *Fytor, 3.*

**spleen-dent.** Applied to the degree of luster of a mineral, reflecting with brilliancy and giving well-defined images, as hematite or some other ore. *A.G.I.*

**spleen.** A variety of bituminous coal that ignites with difficulty owing to its slaty structure, but makes a clear, hot fire. *A.G.I.*

**spleen.** a. A joint made in a broken haulage rope. It is a skilled job and the rope ends are unaided for a length on each side of the break and reformed to a definite pattern. In British coal mines, a splice is not allowed on a winding rope. *Nelson.* b. Generally used to designate an insulated connection of wires of an electric cable after it has been cut. *B.C.I.* c. To unite two ropes by interweaving the strands. *Bureau of Mines Staff.* d. A joint made by splicing. *Bureau of Mines Staff.*

**splice bar.** See fishplate. *Ham.*

**splice box.** An enclosed connector permitting short sections of cable to be connected together to obtain a portable cable of the required length. *A.S.A. C428;1936.*

**spliced.** Applied to sections they punch them out and are overapped at that point by another parallel one. *Fay.*

**splicer.** a. A group of men assigned to a shift or inside a whole pulley which allows axial sliding but not rotation. *Macon.*

**splitz coal.** A miner’s term long used in Eastern United States for certain hard dull coals with a distinctive type of fracture. Splitz coals are irregular and black just like unweathered rough fracture, grayish black in color and of granular texture. Splitz coals are band coals. Coals containing more than 5 percent of anthranxylon and more than 30 percent of opaque attirnute determined by microscopic examination are classed as splitz coal. The content of anthranxylon and opague matter is determined perpendicularly to the bedding. *Bernewitz.*

**spilitery fracture.** Breakage which produces elongated splinterlike fragments. *Shipley.*

**splitz.** a. A divider for an air current. *C.T.D.* b. To divide the air current into separate circuits to ventilate more than one section of the mine. *B.S. 3618, 1963, sec. 2.* c. Any division or branch of the ventilating current. *Fay.* d. The workings ventilated by that branch. *Fay.* e. A current of air which has been separated from the main intake to ventilate a district in a mine. The proportion of air allowed in a split varies directly with the size of the district and the number of men working in it. *Nicol.* f. A breakpage separated by a considerable interval from the other branches of a coal bed. *Fay.* g. To divide a pillar or post by deviating them one or more roads. *Fay.* h. A layer of coal which has separated from its parent seam. Seam splitting is often detrimental as it may develop a new faulting which diverges from a longer dilatation at an acute angle. *Schaferdecker.*

**splitz.** a. A divider for an air current. *C.T.D.* b. To divide the air current into separate circuits to ventilate more than one section of the mine. *B.S. 3618, 1963, sec. 2.* c. Any division or branch of the ventilating current. *Fay.* d. The workings ventilated by that branch. *Fay.* e. A current of air which has been separated from the main intake to ventilate a district in a mine. The proportion of air allowed in a split varies directly with the size of the district and the number of men working in it. *Nicol.* f. A breakpage separated by a considerable interval from the other branches of a coal bed. *Fay.* g. To divide a pillar or post by deviating them one or more roads. *Fay.* h. A layer of coal which has separated from its parent seam. Seam splitting is often detrimental as it may develop a new faulting which diverges from a longer dilatation at an acute angle. *Schaferdecker.*

**splitz.** a. A divider for an air current. *C.T.D.* b. To divide the air current into separate circuits to ventilate more than one section of the mine. *B.S. 3618, 1963, sec. 2.* c. Any division or branch of the ventilating current. *Fay.* d. The workings ventilated by that branch. *Fay.* e. A current of air which has been separated from the main intake to ventilate a district in a mine. The proportion of air allowed in a split varies directly with the size of the district and the number of men working in it. *Nicol.* f. A breakpage separated by a considerable interval from the other branches of a coal bed. *Fay.* g. To divide a pillar or post by deviating them one or more roads. *Fay.* h. A layer of coal which has separated from its parent seam. Seam splitting is often detrimental as it may develop a new faulting which diverges from a longer dilatation at an acute angle. *Schaferdecker.*

**splitz.** a. A divider for an air current. *C.T.D.* b. To divide the air current into separate circuits to ventilate more than one section of the mine. *B.S. 3618, 1963, sec. 2.* c. Any division or branch of the ventilating current. *Fay.* d. The workings ventilated by that branch. *Fay.* e. A current of air which has been separated from the main intake to ventilate a district in a mine. The proportion of air allowed in a split varies directly with the size of the district and the number of men working in it. *Nicol.* f. A breakpage separated by a considerable interval from the other branches of a coal bed. *Fay.* g. To divide a pillar or post by deviating them one or more roads. *Fay.* h. A layer of coal which has separated from its parent seam. Seam splitting is often detrimental as it may develop a new faulting which diverges from a longer dilatation at an acute angle. *Schaferdecker.*

A breakpage separated by a considerable interval from the other branches of a coal bed. *Fay.* g. To divide a pillar or post by deviating them one or more roads. *Fay.* h. A layer of coal which has separated from its parent seam. Seam splitting is often detrimental as it may develop a new faulting which diverges from a longer dilatation at an acute angle. *Schaferdecker.*

split seam. A coal seam that has separated into two or more layers which may, or may not, rejoin some distance away. See also multiple splitting. Nelson.

split shovel. A device for sampling a coal seam that is cut with thin fine ore, consisting of a fork in which the prongs are separate scoops, each scoop being the same width as the open spaces between.

split spread. In seismic prospecting, a partition of diffractors symmetrically disposed on two sides of the shot point, A.G.I.

split sprocket. A two-piece sprocket that can be assembled on a shaft without removing the shaft bearings. Nichols.

split switches. Any form of mine switch using switch points or latches. Kiter, 2, p. 36.

split system. Historically, a system of providing warm air heating and radiating heater. Also used for other combinations, such as hot water steam, steam warm air, etc. Strick, 10.

splitter. One employed in the mica industry whose duty is to separate mica into thin sheets. Fay.

split the air. Same as split b.

split timber. Logs split to form two pieces.

splitting. a. Parting of a coalbed into two or more benches separated by other rocks. A.G.I. b. In mine ventilation, the practice of connecting airways in parallel by dividing the total air flow among them. Hartman, p. 127.

splitting limits. Of a parcel of mineral or metal being sold, agreed limits of difference between purchase values between which buyer and seller will adjust and deal without further external arbitration. Fay.

splitting method. A method of mining pillarary seldom followed at present. A room is first driven from which pillars may be split off into smaller blocks. The pockets are turned at right angles and are driven into the blocks. This method is really a kind of pillaring. Lewis, p. 543.

splitting of air. See ventilation, splitting.

Nelson.

splitting samples. To reduce a bulk sample to a representative sample by quartering or by riffle box. Nelson, 2d, 1962.

splitting, a. Laminite of mica with a maximum thickness of 0.0012 inch split from blocks and thin. Skow. b. Lanc. Two horizontal level headings driven through a pillar, in pillar workings, in order to mine the pillar coal detached by a previous blast. Fay.

splitting shot. Ark. A shot put into a large mass of coal detached by a previous blast. See also block hole. Fay.

split-tube barrel. Synonym for split-barrel sampler.

long.

split-tube sampler. Synonym for split-barrel sampler.

split wires in my mine. Provision for strokes per minute. Pit and Quarry, 53rd, sec. E, p. 82.

spodumene. White, pale green, emerald green, pink, or purple mica, LllAI(2SiO3); white streak; vitreous luster. Contains 8.4 percent lithium oxide with some other elements; insoluble in acids. Hiddenite and kunzite are gem varieties.

Specific gravity, 3.13 to 3.20; Mohs' hardness, 6.5 to 7; spodumic. Found in North Carolina, Colorado, Montana, and South Dakota; Brazil, Malagasy Republic. A source of lithium, and used in ceramics and glass with some gold and alumina. Also called triphane. Sanford; Dana 17; CCD 64, 1961.

split-wire a. The overburden or nonore material removed in gaining access to the ore or mineral material in surface mining. Also called waste. Bureau of Mines Staff. b. Debris or rock material from a coal mine. Zern. c. Eng. A stratum of coal and dirt mixed. Fay. d. Dirt or rock which has been removed from its original location. Nichols.

split-bank. a. A term common in surface mining to designate the accumulation of overburden; also, underground refuse piled outside; that part of the mine from which the coal has been worked away and the space more or less filled up with waste. B.C.I. b. To leave coal and other minerals that are marketable in the mine. B.C.I. c. Eng. The place on the surface where spoil is deposited. Also called spoil heap.

spoil dam. An earthen dike forming a depression in which returns from a borehole can be collected and retained. Long.

spoil heap; dump; tip. The pile of waste material from a mine. B.C.I. c. Eng. The place on the surface where spoil is deposited. Also called spoil heap.

spoil-heap fire. The heating and burning of small coal, carbonaceous shale and perpendicular iron pyrites in spoil heaps. Nelson.

spoil pool. The reservoir formed by a spoil dam in which the returns from a borehole are collected and are retained. Compare sludge pit, Long.

spoll a. See cuttings. Long. b. The debris or waste material from a mine. Long.

spolb. a. A form of coal characterized by a porous condition, which is the result of the decomposition or reduction of a compound within the coal. The term is applied to forms of iron, the platinum-group metals, titanium, and zirconium. ASM Gloss, b. Halfway point in the Kroll process. Kroll.

c. The smoothing out, with a moistened sponge, of slight surface blemishes on pottery ware before it is dried. Also called sponging. Dodd.

spoon. a. See ceramic sponge. Kroll.

spoon iron. Either porous or powdered iron produced directly without fusion, as by heating iron ore or an oxide with charcoal, or with a reducing gas. ASM Gloss.

spoon iron powder. Ground and sized spoon iron, which may have been purified or annealed or both. ASTM B243-63.

spooning. One who removes or cleans the surface of a spongy iron or in the operation in which a sponge is used. A.G.I.

spooning. Smoothing the surface of clay ware with a sponge before firing. Rosenwald.

spooning. A sediment or rock in which the remains of sponges are an important constituent. A.G.I. Supp.

spoon. a. In powder metallurgy, a porous mass of metal powder particles, usually existent in reduced oxides. Henderson. b. Applied to a vesicular rock structure of the partitions between the vesicles, and thus resembling a sponge. Schildroth.

spoon enamel. Vitreous enamelware that is famous because of local high concentrations of bubbles. Dodd.

spoon iron. See reduced iron Fay.

spontaneous. a. Self-starting. 1ason. b. Used to describe the driving potential which causes electric current to flow in the boreholes. These currents are not in any way deliberately induced by the well-logging equipment. Also called self-potential; S.P. c. Wyllie, p. 41.

spontaneous chipping. See spalling.

spontaneous combustion. a. The heating and slow oxidizing reaction of coal and other coaly material initiated by the absorbed oxygen of the air. The two main factors involved are: (1) a coal of a suitable chemical and physical nature; and (2) sufficient broken coal and air leaking through it to supply the oxygen needed. The heat generated is retained, with consequent rise in temperature. See also gob fire; gob stink; hydrogen sulfide; open fires. Nelson. b. The outburst of fire in combustible material (such as oily rags or damp hay) that occurs without the direct application of a flame or a spark. It is usually caused by slow oxidation processes (such as atmospheric oxidation or bacterial fermentation) under conditions that do not permit the dissipation of heat. Webster 3d.

spontaneous fission. Fission that occurs without an external stimulus. Several heavy isotopes decay in this manner; for example, curium 242. LBL.

spontaneous ignition. See liquefaction. ASCE P182.66.

spontaneous pneumaticosis. This disease or accident refers to the forced entry of air into the chest cavity. It results from an overexpansion of the lungs. HPG.

spontaneous potential method. An electrical method in which a potential field caused by spontaneous electrochemical phenomena is measured. Synonym for self-potential method; spontaneous polarization. A.G.I.

spontaneous spalling. Spalling. A.G.I.

spool-type roller conveyor. A type of roller conveyor in which the rolls are of conical or tapered shape with a diameter at the ends of roll larger than at the center. ASM MI-14.1-195C.

spoon. a. Tool for cleaning dust or sludge from quarry blasting holes. Also called scraper. See also spalling.

spoon. a. A form of metal characterized by a porous condition, which is the result of the decomposition or reduction of a compound within the coal. The term is applied to forms of iron, the platinum-group metals, titanium, and zirconium. ASM Gloss.

spoon iron powder. Ground and sized spoon iron, which may have been purified or annealed or both. ASTM B243-65.
spoon

or buffalo horn, in which earth or pulp may be delicately tested by washing to detect gold, amalgam, etc. Fay. c. See spotted coal. a. A slender rod with a cup-shaped projection at right angles to the rod, used for scraping drillings out of a borehole. For scraping, or similar instrument, for cleaning the sludge out of shallow drill holes. This spoon is usually made of a 1/4- to 1/2-inch iron rod, with a spoon-shaped end. Steauffer.

spoon end. The edge of a coal basin when the coal seam spoons, that is, rises to the surface after growing thinner as it approaches its termination. Also called spoon. Fay.

spooner. In bituminous coal mining, a laborer who scoops drillings out of boreholes in which explosives are to be charged for blasting down coal, using a slender iron rod with a cup-shaped projection bent at right angles to the handle. D.O.T. 1.

spooning. Many mineral raw materials, such as petroleum, cementation water (water containing dissolved copper or iron sulfates or other metallic compounds), or brine are extracted by pumping through boreholes. In spooning, a long spoon (a hollow cylinder with a bottom equipped with a clap valve, or ball valve, and open above) is attached to a cable which is let down into the boreholes where the cylinder fills with the liquid; this is emptied out after the cylinder is raised. Steeves, v. 1, p. 63.

spoon out. To thin out; said of a coal seam. Kerson.

spoon test. Test ladle specimen taken during various stages of melting and fining. ASTM C162-66.

sporangia. A spore case. A.G.I.

sporangia, or spore cases. A.G.I.

sporangiom. A colloidal form of aluminum hydroxide, Al(OH)₃, occurring as one of the constituents of bauxite. Also called diasporegellite; clachite; aluminog. Engl.

sporogelite. A colloidal form of aluminum hydroxide, Al(OH)₃, occurring as one of the constituents of bauxite. Also called diasporegellite; clachite; aluminog. Engl.

spotty. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spoil-bolting. When one or just a few roof bolts are used at spout locations. Bureau of Mines. Instructions for Disaster, Fatality, Accident, and Miscellaneous Health and Safety Reports, April 1966, Chapter 113, p. 63.

spoon coolers. Low capacity, semiportable refrigeration units of 150,000 to 500,000 BTU/hour cooling capacity that are used in cooling sites of limited extent, such as an underground enginehouse or the face of a development. The refrigerant used is nontoxic, and an electric or compressed-air drive is applied to a reciprocating compressor. Roberts, I, p. 155.

spoon drilling. Making an initial indentation in a work of art prior to casting, to serve as a centering guide in a subsequent machining operation. ASM Gloss.

spoon facing. Making a flat seat for a bolt head, nut, or other similar element at the end of and at right angles to the axis of a previously machined ASM Gloss.

spoon level. The reduced level of any survey point. Ham.

spoon log. A log or marker placed to show a truck driver the spot where he should stop to be loaded. Nicholls.

spooned. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spotty ore. Ore in which the valuable material is concentrated irregularly as small particles; for example, coarse gold in low-grade rocks. Nelrun.

spout. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spout road. Scot. A chute so steep that the material from a spout mineral slides down to the haulage level. Webster 3d.

spout delivery pump. A pump similar to a diaphragm pump which is not capable of delivering water above its own height. See also force pump. Ham.

spout hole. S. Wales. A short sidings or points which trams are loaded in the mine. F.

spoutman. One who directs the pouring of slag from ladle through spout into a reverberatory furnace used for melting. D.O.T. Supp.

spout mouth. Scot. A place on a level road where the material from a spout (or chute) is filled into the cars. Fay.

spout road. Scot. A chute so steep that the mineral slides down to the haulage level. Fay.

sprag

or buffalo horn, in which earth or pulp may be delicately tested by washing to detect gold, amalgam, etc. Fay. c. See spotted coal. a. A slender rod with a cup-shaped projection at right angles to the rod, used for scraping drillings out of a borehole. For scraping, or similar instrument, for cleaning the sludge out of shallow drill holes. This spoon is usually made of a 1/4- to 1/2-inch iron rod, with a spoon-shaped end. Steauffer.

spoon end. The edge of a coal basin when the coal seam spoons, that is, rises to the surface after growing thinner as it approaches its termination. Also called spoon. Fay.

spooner. In bituminous coal mining, a laborer who scoops drillings out of boreholes in which explosives are to be charged for blasting down coal, using a slender iron rod with a cup-shaped projection bent at right angles to the handle. D.O.T. 1.

spooning. Many mineral raw materials, such as petroleum, cementation water (water containing dissolved copper or iron sulfates or other metallic compounds), or brine are extracted by pumping through boreholes. In spooning, a long spoon (a hollow cylinder with a bottom equipped with a clap valve, or ball valve, and open above) is attached to a cable which is let down into the boreholes where the cylinder fills with the liquid; this is emptied out after the cylinder is raised. Steeves, v. 1, p. 63.

spoon out. To thin out; said of a coal seam. Kerson.

spoon test. Test ladle specimen taken during various stages of melting and fining. ASTM C162-66.

sporangia. A spore case. A.G.I.

sporangia, or spore cases. A.G.I.

sporangiom. A colloidal form of aluminum hydroxide, Al(OH)₃, occurring as one of the constituents of bauxite. Also called diasporegellite; clachite; aluminog. Engl.

sporogelite. A colloidal form of aluminum hydroxide, Al(OH)₃, occurring as one of the constituents of bauxite. Also called diasporegellite; clachite; aluminog. Engl.

spotty. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spoil-bolting. When one or just a few roof bolts are used at spout locations. Bureau of Mines. Instructions for Disaster, Fatality, Accident, and Miscellaneous Health and Safety Reports, April 1966, Chapter 113, p. 63.

spoon level. The reduced level of any survey point. Ham.

spoon log. A log or marker placed to show a truck driver the spot where he should stop to be loaded. Nicholls.

spooned. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spotty ore. Ore in which the valuable material is concentrated irregularly as small particles; for example, coarse gold in low-grade rocks. Nelrun.

spout. a. To mark the site at which a borehole is to be drilled, a piece of equipment placed, or a structure built. Long. b. To set a drill or piece of machinery at a preselected site. Long. c. An inclusion in a diamond. Long. d. To direct to the exact loading or dumping place. Nicholls.

spout road. Scot. A chute so steep that the material from a spout mineral slides down to the haulage level. Webster 3d.

spout hole. S. Wales. A short sidings or points which trams are loaded in the mine. F.

spoutman. One who directs the pouring of slag from ladle through spout into a reverberatory furnace used for melting. D.O.T. Supp.

spout mouth. Scot. A place on a level road where the material from a spout (or chute) is filled into the cars. Fay.

spout road. Scot. A chute so steep that the mineral slides down to the haulage level. Fay.

sprro
spray

spray lance. The pipe from a hand sprayer carrying the jets through which a road binder is spread. See also spray bar. Ham.
spray lime. A specially milled dry hydrate of lime of very fine particle size of about 98 percent passing a No. 325 mesh screen. Boynton.
sprays. Appliances to damp deposits of dust in dumps and workings before shotfiring and loading operations. Water sprays are also used along dusty roadways. Various types of mist projectors and atomizers are used and effect considerable improvement, but the dust trapped consists chiefly of the coarser particles. In many dump workings, a water pipe system extends throughout the workings and sprays employed at all loading and other dump operations. Sprays are also used to suppress dust at coal and ore processing plants. See also whale-type sprayer, Korson.
spraying screen. A screen used for the re-spraying machine. A machine which applies with a sprag. Korson.
sprag. In foundry work, stiffening length of the sinking sand mold. Pryor, 3.
sprag bar. A pipe with jets spraying binder on to a road from a tank in which the binder is spread under pressure by a pump. Ham.
spray-booth. A spray-booth is generally a galvanized iron chamber with an exhaust system, a means for collecting the waste spray, and the front open for spraying. PC
c. A surface machine which spreads dusted material with its blades. Nelson. g. A machine traveling on railroad tracks and traveling over 100 pounds escapes. Rapid progress has been made in the development of superior types of spray guns during the last few years. Hansen.
spray gun. The primary requirements for an enamel spray gun are light weight, simplicity, good atomization, a constant flow of enamel and resistance to wear. The operation of a spray gun depends upon a flow of enamel slip through a control orifice, called the fluid tip and the air cap through which the air at a pressure of 60 to 100 pounds escapes. Rapid progress has been made in the development of superior types of spray guns during the last few years. Hansen.
spraying. The application of enamel slip or glaze to a surface by means of a spray gun. ACGB, 3.
spraying machine. A machine which applies a spray under pressure on mine timber supports to preserve and fireproof them. It may also be used for linewashing and water spraying of dust. The machine is mounted on wheels and operated by compressed air. Spraying screen. A screen used for the removal of sprays to prevent solids present among or adhering to larger particles. AS. 1952, 1962.
spraying. The act of checking a mine car with a sprag. Karson.
sprag road. A mine road having such a sharp grade that sprags are needed to control the descent of the cars: they are two-, three- or four-sprag road. See also sprag, b. Fay.
sprague and henwood core barrel. A core barrel which is mounted on ball bearings inside a diamond drilling bit and capable of taking rock cores down to 1 inch diameter. Ham.
spragging. In anthracite and bituminous coal mining, a laborer who rides trains of cars and controls their free nose by riding down gently sloping inclines by throwing switches and by poking sprags (short, stout, metal or wooden rods) between the wheel spokes to stop them. D.O.T. 1.
spraying. The act of checking a mine car with a sprag. Karson.
spragging. In foundry work, stiffening length of the sinking sand mold. Pryor, 3.
sprig. In foundry work, stiffening length of the sinking sand mold. Pryor, 3.
sprigged ware. Pottery that is decorated by the application of low-relief clay ornamentation, sometimes formed in molds. ACGB, 1963.
sprigging. The decoration of pottery vases, etc., by affixing clay figures, usually classical, to form a bas-relief; the figures are pressed separately from the vase and are made to adhere to the ware by means of clay slip. DOD.
spills. In metalurgy, metal powder particles of cylindrical form, little longer than their diameters. Henderson.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
sprigging. To enlarge the bottom of a drill hole by small charges of a high explosive in order to make room for the flare charge; to chamber. See also rotation recorder. Ham.
spring auxiliary cylinder

springback. a. The elastic recovery of metal after stressing. ASM Gloss. b. The degree to which metal tends to return to its original shape or contour after undergoing a forming operation. ASM Gloss. c. In flash, upset, or pressure welding, the deflection in the welding machine caused by the upset pressure. ASM Gloss.

giving beams. Eng. Two short parallel timbers built into a flash pumping engine house, one level with the engine house, for catching the beam, etc., and preventing a smash in case of a breakdown. Zern.

giving constant. Force for unit elongation of spring core lifter. Synonym for core spring.

giving deposits. Minor deposits formed by springs of migmatic origin that are of little economic importance but of considerable scientific interest. Silica and the sulfides of arsenic, antimony, lead, copper, and mercury are sometimes deposited in these springs, as are also gold, silver, fluorite, and barite. Lewis, p. 275.

giving dog. Scot. Same as spring hook. Fay.

giving springs. See skewback. Dodd.

springer. See skewback. Dodd.

spring deposits. Minor deposits formed by springs of migmatic origin that are of little economic importance but of considerable scientific interest. Silica and the sulfides of arsenic, antimony, lead, copper, and mercury are sometimes deposited in these springs, as are also gold, silver, fluorite, and barite. Lewis, p. 275.

giving dog. Scot. Same as spring hook. Fay.

springer. See skewback. Dodd.

spring deposits. Minor deposits formed by springs of migmatic origin that are of little economic importance but of considerable scientific interest. Silica and the sulfides of arsenic, antimony, lead, copper, and mercury are sometimes deposited in these springs, as are also gold, silver, fluorite, and barite. Lewis, p. 275.

giving dog. Scot. Same as spring hook. Fay.

spring dog. Scot. Same as spring hook. Dodd.

giving point. The point at which the intrados of the arch meets the interior face of the sidewalls or abutments. Stauffer. b. The line joining the springings on both sides of an arch.

giving line. a. The horizontal line drawn at the point of origin of an arch; or at the point where the intrados of the arch commences. See also skewback. Dodd.

springing a hole. See springing.

giving drill holes. The operation of enlarging the bottom part of a drill hole by exploding small successive charges. The purpose is to prevent the chamber so that more explosive can be concentrated in the bottom of the hole. Frankel.

springing points. The points at which the undercut of an arch commences. A.R.I. spring latch. The latch or tongue of an automatic switch, operated by a spring at undercurve of an arch commences. A.R.I. spring loaded. Held in contact or engagement by springs. Nichols.

spring loaded roller conveyor. a. A type of roller conveyor where the ends of each roller is supported on a spring. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958.

spring plug. A plug. Fay.

spring plunger. a. A molder's rod for making sprue holes. Fay.

spring pointed roller. a. A type of roller conveyor where the ends of each roller is supported on a spring. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958.

spring points. The points at which the undercut of an arch commences. A.R.I. spring latch. The latch or tongue of an automatic switch, operated by a spring at undercurve of an arch commences. A.R.I. spring loaded roller conveyor. a. A type of roller conveyor where the ends of each roller is supported on a spring. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958.

spring points. The points at which the undercut of an arch commences. A.R.I. spring latch. The latch or tongue of an automatic switch, operated by a spring at undercurve of an arch commences. A.R.I.

spring range. The average semidiurnal range of tide at time of syzygy. Hy.

spring rail. a. A horizontal beam to give the reciprocal motion to the rods in hand boring. The pole is from 25 to 30 feet in length and it is made of plant larch. The arrangement is slow and only used for shallow holes and where mechanical power is not available. Nelson.

spring range. The average semidiurnal range of tide at time of syzygy. Hy.

spring roll. a. A horizontal beam to give the reciprocal motion to the rods in hand boring. The pole is from 25 to 30 feet in length and it is made of plant larch. The arrangement is slow and only used for shallow holes and where mechanical power is not available. Nelson.

spring roll. b. A horizontal beam to give the reciprocal motion to the rods in hand boring. The pole is from 25 to 30 feet in length and it is made of plant larch. The arrangement is slow and only used for shallow holes and where mechanical power is not available. Nelson.

spring roller. A horizontal beam to give the reciprocal motion to the rods in hand boring. The pole is from 25 to 30 feet in length and it is made of plant larch. The arrangement is slow and only used for shallow holes and where mechanical power is not available. Nelson.

spring roller lever. A horizontal beam to give the reciprocal motion to the rods in hand boring. The pole is from 25 to 30 feet in length and it is made of plant larch. The arrangement is slow and only used for shallow holes and where mechanical power is not available. Nelson.

spring rings. Over springing the hole results in the disadvantage of causing cushioned blasting, and the full force of the explosive is not reached. Lewis, p. 161. Also called bullying; chambering; shanking a hole. See also spring spring. a. Fay. d. In certain types of rock jointing planes, such as are found in most sedimentary and some igneous rocks, particularly granite. The principle of springing is to drill a borehole with a heavy burden and then replace the burden by placing of a large final charge. McAdam II, pp. 148-149.

springing a hole. See springing.

spring drill holes. The operation of enlarging the bottom part of a drill hole by exploding small successive charges. The purpose is to prevent the chamber so that more explosive can be concentrated in the bottom of the hole. Frankel.

springing line. a. The horizontal line drawn at the point of origin of an arch; or at the point where the intrados of the arch commences. See also skewback. Dodd.

springing lifter case. Synonym for core-lifter case. Long.

springing line. a. The horizontal line drawn at the point of origin of an arch; or at the point where the intrados of the arch commences. See also skewback. Dodd.

spring loaded roller conveyor. a. A type of roller conveyor where the ends of each roller is supported on a spring. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958.

spring points. The points at which the undercut of an arch commences. A.R.I. spring latch. The latch or tongue of an automatic switch, operated by a spring at undercurve of an arch commences. A.R.I. spring loaded roller conveyor. a. A type of roller conveyor where the ends of each roller is supported on a spring. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958. b. A section of roller conveyor supported on springs. ASA MHI.1-1958.
spud

ing tool used to clear a space around tools stuck in a borehole. Long, f. A cable-tool drill bit. Long, g. An anchorage during dredging provided by a steel post underneath a dredger which can be lowered by oil operators, denotes the first abrasion which tests and cones are observed. Criss, 1963, p. 989. 4 sq.cm Abbreviation for square centimeter. BuMin Style Guide, p. 62.

spud bit. a. A mud or diamond-point bit used to drill through overburden or soil down to bedrock. Long. b. A broad, dull, chisel-faced drill tool for working in earth down to rock with a churn or cable-tool drill. Long.

spudding-in. A term applied to a borehole that has been started and the hole has reached bedrock and/or the standpipe has been set. Long.

spudding. a. The operation, in rope drilling, of boring through the subsoil at the start of a hole. B.S. 3618, 1963, sec. 3. b. In diamond and/or rotary drilling, a general term applied to drilling through overburden with a fishtail bit, drag bit, or diamond-point bit. Long. c. Sinking a conical hole, or caving with a churn- or cable-type drill rig. Long.

spudding bit. a. A broad dull drilling tool! for working in earth down to the rock. Standard, 1964. b. A heavy chisel bit used in percussion drilling to drill through subsoil. B.S. 3618, 1963, sec. 3. c. See spud bit. Long. d. The bit used to start the hole. When the hole is deep enough, regular drilling tools are substituted. Williams.

spudding boreholes. The working of a cable drill up and down on a short length of what is known as the superfluous deposits down to bedrock. This section of hole is cased. Nelson.

spudding drill, churn drill. A drill that makes a very accurate and dropping a chisel bit. Nichols.

spudding drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spudding in. In a churn drill, the winch that controls the drilling line. Nichols.

spudding in. a. As employed and understood by oil operators, denotes the first entry of the soil by the drill or that of first entrance of drill into the ground. Rickett, II. b. See spud, d. Long.

spudding tools. Tools used to begin a borehole in earthy materials with a diamond- or rotary drill; also, the drilling tools used by oil operators to make a churn drill. Long.

spud drill. Synonym for churn drill. Long.

spud drill, churn drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spud-in. A mud or diamond-point bit used to drill through overburden or soil down to bedrock. Long. b. A broad, dull, chisel-faced drill tool for working in earth down to rock with a churn or cable-tool drill. Long.

spudding-in. A term applied to a borehole that has been started and the hole has reached bedrock and/or the standpipe has been set. Long.

spudding. a. The operation, in rope drilling, of boring through the subsoil at the start of a hole. B.S. 3618, 1963, sec. 3. b. In diamond and/or rotary drilling, a general term applied to drilling through overburden with a fishtail bit, drag bit, or diamond-point bit. Long. c. Sinking a conical hole, or caving with a churn- or cable-type drill rig. Long.

spudding bit. a. A broad dull drilling tool! for working in earth down to the rock. Standard, 1964. b. A heavy chisel bit used in percussion drilling to drill through subsoil. B.S. 3618, 1963, sec. 3. c. See spud bit. Long. d. The bit used to start the hole. When the hole is deep enough, regular drilling tools are substituted. Williams.

spudding boreholes. The working of a cable drill up and down on a short length of what is known as the superfluous deposits down to bedrock. This section of hole is cased. Nelson.

spudding drill, churn drill. A drill that makes a very accurate and dropping a chisel bit. Nichols.

spudding drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spudding in. In a churn drill, the winch that controls the drilling line. Nichols.

spudding in. a. As employed and understood by oil operators, denotes the first entry of the soil by the drill or that of first entrance of drill into the ground. Rickett, II. b. See spud, d. Long.

spudding tools. Tools used to begin a borehole in earthy materials with a diamond- or rotary drill; also, the drilling tools used by oil operators to make a churn drill. Long.

spud drill. Synonym for churn drill. Long.

spud drill, churn drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spudding-in. A term applied to a borehole that has been started and the hole has reached bedrock and/or the standpipe has been set. Long.

spudding. a. The operation, in rope drilling, of boring through the subsoil at the start of a hole. B.S. 3618, 1963, sec. 3. b. In diamond and/or rotary drilling, a general term applied to drilling through overburden with a fishtail bit, drag bit, or diamond-point bit. Long. c. Sinking a conical hole, or caving with a churn- or cable-type drill rig. Long.

spudding bit. a. A broad dull drilling tool! for working in earth down to the rock. Standard, 1964. b. A heavy chisel bit used in percussion drilling to drill through subsoil. B.S. 3618, 1963, sec. 3. c. See spud bit. Long. d. The bit used to start the hole. When the hole is deep enough, regular drilling tools are substituted. Williams.

spudding boreholes. The working of a cable drill up and down on a short length of what is known as the superfluous deposits down to bedrock. This section of hole is cased. Nelson.

spudding drill, churn drill. A drill that makes a very accurate and dropping a chisel bit. Nichols.

spudding drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spudding in. In a churn drill, the winch that controls the drilling line. Nichols.

spudding in. a. As employed and understood by oil operators, denotes the first entry of the soil by the drill or that of first entrance of drill into the ground. Rickett, II. b. See spud, d. Long.

spudding tools. Tools used to begin a borehole in earthy materials with a diamond- or rotary drill; also, the drilling tools used by oil operators to make a churn drill. Long.

spud drill. Synonym for churn drill. Long.

spud drill, churn drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.

spudding-in. A term applied to a borehole that has been started and the hole has reached bedrock and/or the standpipe has been set. Long.

spudding. a. The operation, in rope drilling, of boring through the subsoil at the start of a hole. B.S. 3618, 1963, sec. 3. b. In diamond and/or rotary drilling, a general term applied to drilling through overburden with a fishtail bit, drag bit, or diamond-point bit. Long. c. Sinking a conical hole, or caving with a churn- or cable-type drill rig. Long.

spudding bit. a. A broad dull drilling tool! for working in earth down to the rock. Standard, 1964. b. A heavy chisel bit used in percussion drilling to drill through subsoil. B.S. 3618, 1963, sec. 3. c. See spud bit. Long. d. The bit used to start the hole. When the hole is deep enough, regular drilling tools are substituted. Williams.

spudding boreholes. The working of a cable drill up and down on a short length of what is known as the superfluous deposits down to bedrock. This section of hole is cased. Nelson.

spudding drill, churn drill. A drill that makes a very accurate and dropping a chisel bit. Nichols.

spudding drill. A petroleum production industry, one who uses a lightweight, portable drilling rig (spudder) for the drilling of shallow wells, or a regular cable drilling rig to drill the first few feet of a well. Also called spudder or spud drill. D.O.T. 1.
squareman

square measure. Includes the following: 144 square inches (sq in) equal 1 square foot (sq ft); 9 square feet equal 1 square yard (sq yd); 160 square yards equal 1 square rod (sq rd); 160 square rods equal 1 acre (A); 640 acres equal 1 square mile (sq mi); and 36 square miles equal 1 township (town). Crispin.

square-mile-foot. A unit of measure representing the volume of water one foot deep over an area of one square mile. See also acre-foot. Ham.

squareness. Ratio of magnetization at (1H) to magnetization at (H), where H is the field strength of the completed hysteresis loop. Long.

square set. A set of timbers composed of a cap, gir, and post. These members meet so as to form a solid 90° angle. They are so framed at the intersection as to form a compression joint, and join with three other similar sets. The posts are 6 or 7 feet high while the caps and girds are 4 to 6 ft high. Long. This system of framing can be adapted to large or irregular ore bodies. Sills are laid in trenches cut in the floor of the stope if the stope is to be caught up from the level below. If no stoping is to be done immediately below, and if the ground is hard, sills may be omitted and the posts set directly in hitches in the floor or on footboards. Caps and girds are placed on top of the posts, a line of caps being at right angles to a line of girds. Square sets vary in dimensions at different mines, but in general should give a clear opening of at least 5 feet each way between posts to afford sufficient working space in the stope, and a clear height of 6½ feet is about the minimum height desirable. Lewis, pp. 42-44.

square set and fill. See square-set stoping. Fay.

square-set block caving. A method of block caving in which the caved ore is extracted from the ore body in drifts supported by square sets. A retreating system is adopted. Nelson.

square-set slicing. See top slicing and cover caving. Fay.

square-set stopes. A method where square-set timbering is used to support the ground as the ore is extracted. It is often used for mining wide ore bodies particularly where the conditions are irregular and where walls and ore masses are weak. The first tier of timber sets is termed the sill floor and the uppermost the mining floor. Fay.

square-set stoping. A method of stoping in which the walls and back of the excavation are supported by regular framed timbers forming a skeleton enclosing a series of connected, hollow, rectangular prisms in the space thus occupied by the excavated ore and providing continuous lines of support in three directions at right angles to each other. The ore is caved out in rectangular blocks just large enough to provide room for standing a set of timber. The essential timbers comprised 4 by 4 inch, standard square timbers, respectively termed posts, caps, and girds. The posts are the upright members, and the caps and girds are the horizontal mem-

squeer an-out. A special mixture of oils used to suspend enamel color in paste form for silk screen work, etc. This oil will burn off during the firing process. Enam. Dict. b. A liquid mixture of organic materials used as the vehicle in a squeegee paste. ACSG, 1963.

squeegee. A mixture of squeegee oil and finely divided inorganic materials such as color oxides and fluxes. ASTM C286-65.

squeegee process. The term squeegee oil is used, particularly in the United States industry, for the mixture of oils used to suspend a ceramic or enamel color for silk-screen printing. Similarly, the term squeegee paste is used for the mixture of oils, colors, and flux in this process of decoration. See also silk-screen process.

squeeze. a. A crushing of coal with the roof moving nearer to the floor. Lewis, p. 543. b. The settling, without breaking, of the roof over a considerable area of working. Also called creep; crush; pinch; nip. Fay. Webster 3d. c. The gradual upward movement of a broken rock as a result of pressure during folding or other movements. A.G.I. g. A result of pressure during folding or other movements. A.G.I. g. A pinch of the vien in passing through hard bands of rock. Gordon. b. To inject a grout into a borehole under high pressure. Long. i. The plastic movement of a soft rock in the walls of a borehole or mine working that reduced the diameter of the opening. Long. j. Pumping cement back in a borehole. Long. k. Squeeze in diving is due to the effect of increasing external pressure upon the ears and sinuses, the face plate or the swim suit uncompensated by an equal increase in pressure from within. The incidence of squeeze is very low. It is recognized by beginning pain in the ears and sinus areas, or by a feeling of tightness within the nose covering, usually within the first few feet of descent. This pressure differential decreases with increased depth. Face squeeze can easily be prevented by exhaling into the face plate. HBC.

squeegee job. The high-pressure grouting of a borehole. Long.

squeezer. a. A machine for reducing the paddle ball to a compact mass, ready for the hammer or rolls. Also called alligator. Fay. b. The mechanical device for squeezing a part of the oil external pressure from the spray iron ball and thoroughly mixing the remainder among the fibers. Mersenneau, 4th, 6th.

squeeze rivet. A single stroke compressed air cylinder for closing rivets through the medium of a toggle mechanism. See also pneumographic riveter. Ham.

squeezers. A mine tub controller which acts by squeezing the tub or the wheel. Macon.
squeeze time

squeeze time, In resistance welding, the time between the initial applications of pressure and current. ASM Gloss.

squeeze up. A small excrescence of lava on the surface of flow (usually a basaltic flow) produced by the extrusion of viscous lava through an opening in the crust. It may be bulbous, linear, or irregular in shape. Linear squeezeups result from the rise of viscous lava into fissures or cracks, usually they project a few inches to a foot or two above the flow surface. A.C.I.

squeezing. The slow increase in weight on pillars or solid coal eventually resulting in such things as crushing of the coal, heaving of the bottom and the driving of pillars into soft floor or top. The cause normally is leaving pillars or other support which, after considerable area is opened up, prove to be inadequate, permitting the top to settle gradually with transfer of the weight to active planes and solid coal. Coal Age, v. 71, No. 8, August 1966, p. 200.

squeezing-box. A metal cylinder having at its bottom an orifice through which a mass of plastic clay is forced in the shape of a long roll, from which handles may be cut, as for jugs. Standard, 1964.

squib, a. A thin tube filled with black powder, forming a slow-burning fuse to explode a charge of black powder. B.S. 3618, 1964, sec. 6. b. A firing device that will burn with a flash which will ignite black powder. Nichols. c. A small charge of powder exploded in the bottom of a drill hole, to spring the rock, after which a heavy shot is fired. A springing shot. Pay. d. In well boring, a vessel, containing the explosive and fitted with a time fuse, that is lowered into a well to detonate the nitroglycerin charge. Pay.

squib, electric. See electric squib.

squib shot. A blast with a small quantity of high explosives fired at some point in the borehole for the purpose of dislodging some foreign material which has fallen into it. Pay.

squid. A building brick with one end chamfered on both edges so that the brick can be used at an oblique quoin. Dodd.

squibul. s. Steel sheet or thin steel. Vein cut by a dike and thereby thrown out of alignment on the two sides of the dike. Arkell.

squirrel cage fan. A centrifugal blower with forward-curved blades. Strock, 10.

squirrel-cage motor. An alternating current electric motor with many applications. The rotor is made of strong parallel copper or aluminum bars on the perimeter, joined to end rings of the same metal. Ham.

squirt. Forcing lead by hydraulic pressure into the form of rods or pipes. Pay.

squitting. A stage in the heating of clay after considerable area or orifice through which a long roll, from which handles may be cut, as for jugs. Pay. d. In well boring, a vessel, containing the explosive and fitted with a time fuse, that is lowered into a well to detonate the nitroglycerin charge. Pay.

s-surface. One of numerous parallel surfaces of bedding or folding which indicate di- rectional properties in rocks; it may be warped. A.G.I. Supp.

stab. a. To guide a pipe, casing, or drill rod so that the threads will engage properly. Long. b. To recover a drill tool lost in a borehole by using a spear-shaped or pointed fishing tool. Long. c. In adding to a drill string, the action of lining up and catching the threads of the loose piece. Osborne.

staffer. In the working of oil and gas wells, the person whose duty is to guide the joints suspended by a rope from the derrick to connect with other joints, placed in the well. Ricketts, 1.

stag hole. Usually a short hole drilled, charged, and fired to shatter the rock near the collars of the cut holes. Nelson.

stable bitumens. Stabilized bitumen derived from primary bitumens by metamorphism, occurs in coals and kerogen shale. Stabile bitumens are subdivided into two groups, polymerbitumens and kerobitumens. Tomkiew, 1954.

stable protobitumens. Organic material that resists decay, for example, waxes, resins, branching spores, leaf cuticle, that is likely to be preserved as amber or in tarbanite and kerogen. Ham.

stability, a. The resistance of a structure, spoil heap, or a clay bank to sliding, overturning, or collapsing. A structure is only as stable as its foundations and those in turn upon the soil or rock on which they are constructed. Soil stability, such as mountain slopes, spoil heaps, and embankments, depends on the bearing strength of the material and that is a function of internal strength and cohesion. See also angle of repose; differential settlement. Nelson. b. Resistance to deformation under cyclic loading. ASTM C162-66, c. Chemical durability, resistance to weathering. ASTM C162-66, d. Thermodynamic, a phase is said to have stability if a slight perturbation in the variables defining the system, temperature, pressure, or composition does not result in the appearance of a new phase. A.G.I.

stability field (critical level). The temperature and pressure within which a mineral is stable. A.G.I.

stable soil base. A base of soil stabilized by mechanical or chemical stabilization. Ham.

stable soil. A soil base of secondary bitumens, among others, as a result of changes brought about by saprophytic agents. Such products are termed secondary bitumens, and are usually structureless. Stable protobitumens only show marked

stable protobitumens. Stabilized bitumens. Stabilized bitumen derived from primary bitumens by metamorphism, occurs in coals and kerogen shale. Stabile bitumens are subdivided into two groups, polymerbitumens and kerobitumens. Tomkiew, 1954.

stable protobitumens, sometimes freely rotating, slightly larger than the outer diameter of a core barrel and mounted directly above the core barrel back head. Also called ferrule; clustered coupling. Long. b. A minnamon for guide rods. Long. c. Any lightweight closure, additional used as an agent in soil stabilization. See also processing; spotting; soil stabilization. Ham.

stabilizing treatment. Any treatment intended to stabilize the structure of an alloy or the dimensions of a part. ASM Gloss.

stable. a. Not readily decomposed or deformed. Nelson. b. A short drivage, room, or space excavated at the end of a long wall face to accommodate a co. cutter or cutter loader. The stable provides room for turning the machine where this is necessary, and also enables the machine to start its cut across the face. Nelson. c. An elongated recess in a mine roadway, near the pit bottom, and divided into compartments to accommodate horses or pit ponies. Nelson. d. Chemically, in a balanced state, it is not easily upset. Structurally, resistant to overturning. Of emulsion, resistant to breakdown into its component phases.

stable boss. a. A man placed in charge of the stables and of the animals employed at a mine. Pay. b. The same as barn boss. Korson.

stable coast; stationary coast. A coast showing in no time or space any appreciable raise or subsidence. Schierer.,der.

stable equilibrium. Bodies are said to be in stable equilibrium when they tend to return to their original position of equilibrium after being slightly displaced. Morris and Cooper, 67.

stable graviorimeter. A graviorimeter having a simple weight on a spring such that the sensitivity is high so that a small scale can be used. A.G.I.

stable hole conveyor. A short belt or other conveyor for use in stables in advance of the longwall face. The conveyor is usually about 18 inches wide and driven at the tail end by a combined electric motor and drive pulley. The unit can be transported by sliding on steel skids, and is useful where coal or stone has to be moved short distances in confined spaces. See also shortwall. Nelson.

stable isotopic. A nuclide that does not undergo radioactive decay. LBL.

stable lead; nonradioactive lead. Any of the nonradioactive isotopes of lead; Lead 206, 23.6 percent of natural lead, and the stable end-product of the uranium disintegration series; lead 207, 22.6 percent of natural lead, and the stable end-product of the actinium disintegration series; and lead 208, 52.3 percent of natural lead, and the stable end-product of the thorium disintegration series. Glauston, 2, pp. 133, 134, 136, Handbook of Chemistry and Physics, 45th ed., 1964, p. B-77.

stable protobitumens. This term includes waxes, spores, and pollen exines, cuticle, cork tissue, primary resin waxes, and surface waxes of algae. Also included are products derived from nonbituminous matter and unstabilized protobitumens, among others, as a result of changes brought about by saprophytic agents. Such products are termed secondary bitumens, and are usually structureless. Stable protobitumens only show marked

1063

sur-remplis) and is then heat treated. Dodd.

s-surface. One of numerous parallel surfaces of bedding or folding which indicate directional properties in rocks; it may be warped. A.G.I. Supp.

stage hole. Usually a short hole drilled, charged, and fired to shatter the rock near the collars of the cut holes. Nelson.

stabilization. To make soil firm and to prevent it from moving. Nichols.

stabilized coupling and coupling built up to reaming-shell size by welding on an abrasion-resistant metal, applied in ridges parallel to the long axis of the drill rod. Long.

stabilized soil base. A base of soil stabilized mechanically or chemically, or with a bituminous binder. See also soil stabilization. Nelson.

stabilizer. a. A hardened, splined bushing
stable protobitumens

changes in coals with less than 30 percent volatile matter. I.H.C.P., 1963, part I.

stable relict. A relict that was not only stable under the conditions prevailing while it was formed but also under the newly imposed conditions, a stable protobitumen. See also protobitumen.

stable-type gravimeter. A gravity meter which uses a high order of optical and/or mechanical magnification so that a change in position of a weight or associated property is measured directly. See also gravity meter.

stand. See standard.

stading. H. Two horizontal lines in the reticle of a theodolite arranged symmetrically above and below the line of sight. They are set at such a distance apart that they subtend a particular known angle at the eye of the observer, generally about 0.1 radian. An intercept of L feet on a vertical staff means that the staff is at a distance of 100 L feet plus or minus an additive constant from the instrument. The figure 100 is known as the multiplying constant. See also compensating diaphragm; tachometer; eye piece.

stadias. Mathematical tables from which may be found, without computation, the horizontal and vertical components of a reading made with a transit and stadia rod. Fay, 3.

stage grinding. Repeated on the coarsest grind between grinding stages. Stage addition in sizing sequence. VV.

stage, and then used to calibrate micrometer which the depth of water in a canal, dock, or river can be read. Individual stage measurements are obtained by the following procedure: The mill scale, at a temperature of 1,450°C in a rotary furnace. Though fusion does not occur, the iron oxide penetrates the limestone completely and rapidly, and forms dicalcium ferrite. Osborne, p. 482.

stage 2. A landing, as a bridge pier or similar support. Staffordshire cones. Pyrometric cones. See also pyrometric cone.

Staffordshire kiln. A particular design of traditional kiln used in ironstone workings. Fay.

staff cutter. Oxygen cutting of stacked metal plates arranged so that all are cut over by a single cut. ASM Gloss.

staff effect. The impulse of a heated gas to rise in a vertical passage, as in a chimney, a small enclosure, or building. Stock, 16.

stacker. a. A machine for blending ore that beds the ore. Mason. b. To stand and rack drill rods in a drill tripod or stick. Long, c. In a blast furnace, the cone-shaped section rising from both to throat. Also called shaft; smallwall. Pryor, p. 387. d. A chimney. Fay, e. A shaft furnace. Fay. f. To build up coal, ironstone, etc., into heaps on the surface for winter or other use. Fay. g. In gas works, a row of benches containing retorts. Fay. h. In the old method of making white lead, one of the pillars of best lead in stonepits, or of horse dung or spent tanner's bark. Standard, 1964. i. Eng. A measure of fuel consisting of 108 cubic feet. Standard, 1964. j. Any structure or part thereof that contains a flue or flues for the discharge of gases. ACSG, 1963. k. A lofty columnar rock on the shore or shore face. Also called pillar; needle; chimney rock.

stack cutting. Oxygen cutting of stacked metal plates arranged so that all are cut over by a single cut. ASM Gloss.

stack joins. A joint formed by welding or riveting. Osborne, p. 482.

stacker conveyor. See stacker. ASA MH4-1-1958.

stack height. The height of a convector enclosure measured from the bottom of the enclosure to the top of the outlet. Stock, 16.

stacking fault. A missing plane in a stacking sequence. VV.

stack out. Mid. To dam off or shut up the entrance to a mine; especially by building a wall of stone, coal, and clay in front of it. Fay.

stack welding. Resistance spot welding of stacked plates, all being joined simultaneously. ASM Gloss.

stage grinding repeated on the coarsest grind between grinding stages. Stage addition in sizing sequence. VV.

stage, and then used to calibrate micrometer which the depth of water in a canal, dock, or river can be read. Individual stage measurements are obtained by the following procedure: The mill scale, at a temperature of 1,450°C in a rotary furnace. Though fusion does not occur, the iron oxide penetrates the limestone completely and rapidly, and forms dicalcium ferrite. Osborne, p. 482.

stage 2. A landing, as a bridge pier or similar support. Staffordshire cones. Pyrometric cones. See also pyrometric cone.

Staffordshire kiln. A particular design of traditional kiln used in ironstone workings. Fay.

staff cutter. Oxygen cutting of stacked metal plates arranged so that all are cut over by a single cut. ASM Gloss.

stacker. a. One who stacks coal, etc. Fay. b. Leic. A miner who looked after the unloading of the coal on the bank, on behalf of the miners, in the earlier days of mining. Fay. c. A conveyor, mounted on a long steel beam, for carrying tailings beyond the stern of a gold or tin dredge to avoid silting it up. Nelson. d. A machine for blending ore that beds the ore. Mason. e. One who controls conveyor belt moving molts containing molten lead through water spray to stamping and discharge tables. D.O.T. Supp. f. A conveyor adapted to piling or stacking bulk materials, packages, or objects. See also apron conveyor; belt carrier; flight conveyor; portable conveyor; stacker conveyor. g. A fixed or pivotally mounted boom conveyor. ASA MH4-1-1958. h. With a blower or blower fan, used to blow air through the stockin conveyor in a manner similar to a wing tripper to build layered piles or bed coils or to blow to the stack in conveyor. See also boom conveyor; portable conveyor; wing belt tripper. Stock, 16.

stocker conveyor. See stacker. ASA MH4-1-1958.

stack height. The height of a convector enclosure measured from the bottom of the enclosure to the top of the outlet. Stock, 16.

stacking fault. A missing plane in a stacking sequence. VV.

stack out. Mid. To dam off or shut up the entrance to a mine; especially by building a wall of stone, coal, and clay in front of it. Fay.

stack welding. Resistance spot welding of stacked plates, all being joined simultaneously. ASM Gloss.

stage grinding repeated on the coarsest grind between grinding stages. Stage addition in sizing sequence. VV.

stage, and then used to calibrate micrometer which the depth of water in a canal, dock, or river can be read. Individual stage measurements are obtained by the following procedure: The mill scale, at a temperature of 1,450°C in a rotary furnace. Though fusion does not occur, the iron oxide penetrates the limestone completely and rapidly, and forms dicalcium ferrite. Osborne, p. 482.

stage 2. A landing, as a bridge pier or similar support. Staffordshire cones. Pyrometric cones. See also pyrometric cone.

Staffordshire kiln. A particular design of traditional kiln used in ironstone workings. Fay.

staff cutter. Oxygen cutting of stacked metal plates arranged so that all are cut over by a single cut. ASM Gloss.

stacker. a. One who stacks coal, etc. Fay. b. Leic. A miner who looked after the unloading of the coal on the bank, on behalf of the miners, in the earlier days of mining. Fay. c. A conveyor, mounted on a long steel beam, for carrying tailings beyond the stern of a gold or tin dredge to avoid silting it up. Nelson. d. A machine for blending ore that beds the ore. Mason. e. One who controls conveyor belt moving molts containing molten lead through water spray to stamping and discharge tables. D.O.T. Supp. f. A conveyor adapted to piling or stacking bulk materials, packages, or objects. See also apron conveyor; belt carrier; flight conveyor; portable conveyor; stacker conveyor. g. A fixed or pivotally mounted boom conveyor. ASA MH4-1-1958. h. With a blower or blower fan, used to blow air through the stockin conveyor in a manner similar to a wing tripper to build layered piles or bed coils or to blow to the stack in conveyor. See also boom conveyor; portable conveyor; wing belt tripper. Stock, 16.
stage micrometer

ter set in ocular or eyepiece of micro-
scope. Pryor, 3.

stage micrometer. A precise method of orienting underground workings in which plumblines are transferred down a deep shaft in stages, one stage being marked by a stake or a pillar. While shaft sinking is in progress, the lines can also be employed to orient the shaft itself and to keep it plumb. B.S. 3018, 1963, sec. 1.

stage pumping. Draining a mine by means of two or more pumps placed at different levels; each of which raises the water to the next pump above or to the surface. Fay.

stage treatment. In mineral processing, development of the desired condition of the particles by defined states, such as comminuted to successively fine sizes separatedly coupled with staged concentration or gangue elimination, between such stages of communication. Pryor, 3.

stage winding. Winding, usually staggered blastholes. When shot firing a. temporary flooring or scaffold, staged to the central or horizontal idler is placed on one side so that the increments on a line of intermittent fillet welds on each side of a joint so that the increments on one side are not opposite those on the other. Contrast with chain- intermittent fillet welding. ASM Gloss.

staggered holes. To arrange boreholes in a row, in such a manner that those in one row are placed opposite the spaces between the holes in the next row. Long.

staggered idlers. An arrangement where the idler rollers of a belt conveyor is such that the central or horizontal idler is placed between two rows, and is staggered to a triangular pattern to distribute the burden. A similar pattern is often adopted in quarry wellhole blasting. Nelson.

staggered-tooth cutters. Milling cutters with alternate flutes of oppositely directed helices. ASM Gloss.

staging. a. A temporary flooring or scaffold, or platform. Zern. b. One or more working platforms, fixed at defined levels in deep trenches or similar excavations, on which excavated earth is thrown by shovel. Ham.

stagnalite. A general term, to include both stalactite and stalagmite, for formations produced by dropping water. Heiss.

stagnant ice. Glacier ice that has ceased to move and received no accretion from the center of accumulation; it wastes away in place. Stokes and Varney, 1955.

stalactite (steelstone). The German name for some pyromagnesite carbonate of iron, because a kind of steel is readily made from such ores without passing through the blast furnace. Fay.

stalagite (steelstone). The German name for some pure crystalline carbonate of iron, because a kind of steel is readily made from such ores without passing through the blast furnace. Fay.

stalagmite. A pointed piece of a liquid is measured by weighing a number of drops or by counting the number of drops obtained from a given volume of the liquid. Laws.

stall. a. A working place in a coal seam for one miner or one miner and his helper in the longwall stalls method of working. The empty tub or tram is brought into the face and loaded then removed by hand or by horses. The narrow coal drivages in place and-stall are also termed stalls. See also narrow stall; stallman. Nelson. b. S. Staff. A working place in a mine, varying in length from a few feet to 80 feet or more, according to the thickness of the seam and system of working adopted. A room. Fay. c. A working place in a mine. Fay.
system of compartments; a modification of pillars-and-stall. Nelson.

stall. Angl. Eng. A road along which the mineral worked in a stall is conveyed to the main road. Fay.

stall. in a stall, in the capacity of a butty or contractor. Fay.

stall angle. critical angle. The blades of axial-flow fans are of aeroflite section, which when inclined at a small angle (known as the angle of attack) to the air stream produces a large lift or raising force for a small drag, or retarding force. The lift force is the useful one which gives the thrust to the air in an axial-flow fan. The lift increases with increase in the angle of attack until a point is reached when the lift begins to fall. This angle is called the "critical" or "stall angle." - Sinclair, 1, pp. 101-102.

stallman. A collier who works at the face of a narrow stall or a longwall stall. He is paid according to a piece list of so much per ton of coal loaded out and for other work. A stallman usually has a mate or boy working with him. Nelson.

stall. A steel containing 3.5 percent silicon and often used in electrical parts subject to alternating magnetic fields because of its low core losses due to hysteresis. See also permalloy. Nelson.

stall roasting. The roasting of ore in small enclosures of earth or masonry walls. The enclosures are called stalls and may be open or closed. Fay.

stamp. a Scot. A hole or mark in the roof of a narrow stall or a longwall stall. It is used to show the grain. Webster 3d. f. To break partially cut through, or broken off to a stall. Webster 1. Eng. A section of a bloom nicked, or broken off to a stall and room. Kidman. d. Eng. See let into. SMRB, Paper No. 61. e. Eng. A hole or mark in the roof of a narrow stall or a longwall stall. It is used to show the grain. Webster 3d. f. To break partially cut through, or broken off to

standard conditions

stand. a. Two or more lengths of drill rod or casing pulled together and handled as a unit length of rod. They are taken from a borehole and set upright in a drill tripod or derrick. See also double; forge; treble. Long. b. A drill floor. Long. c. To allow a cement slurry to remain undisturbed in a borehole until it hardens or sets. Long. d. To set a string of casing in a borehole. Long. e. G. Brit. A somewhat variable unit of measurement for coal tar varying from 2½ to 3 longcubits (320 to 336 cubic feet). Nelson.

standage room. A length of roadway provided near the shaft-bottom to stock loaded mine cars and/or empty cars, (1) during peak hours when the coal reaches the pit bottom or (2) during emergency periods, such as plant breakdown at the surface, therefore, permitting coal production to continue in case of general, the standage room accommodates 45 minutes to 1 hour's winding capacity. See also bunker core. Nelson.

standard. a. Something that is set up and established as a rule for the measure of quantity, weight, extent, variation, etc. especially, an original specimen measure or weight (as the international prototype meter, kilogram, and liter of water) or an official copy of such a specimen used as the standard of comparison in testing other weights and measures. Webster 3d. b. The fineness of the metal used in coins and the legally fixed weight each coin should have when first minted. Webster 3d. c. A metal casting in the shape of a U, which is fixed to the upper plate of a theodolite and carries the trunnions for the telescope. Ham.

standard air. Atmospheric air having a specific weight of 0.075 pound per cubic foot. Note: The specific weight of 0.075 pound per cubic foot corresponds to atmospheric air at a temperature of 68° F, a barometric pressure of 30 inches of mercury, and a relative humidity of 25 percent. A.S.C.E P1826. 31 parts A1203. Dodd.

standard air density. In mine ventilation, the standard density of air for mine ventilation work is considered to be 0.075 pound per cubic foot. This is based upon the weight of 1 cubic foot of dry air at 70° F at a sea-level pressure of 29.9 inches of mercury. Bum.Bull 589, 1960, p. 4.

standard bit. a. Commonly, although incorrectly, used as a synonym for bevel-wall bit. Long. b. A bit for rock drilling. Long. c. A number of which are as specified in standards accepted by the drilling industry. Long.

standard black. A ceramic; a quoted composition is 30 parts Co3O4, 56 parts Fe2O3, 48 parts O2, 8 parts NiO, and 1 parts Cu2. Long.

standard compaction. See compaction test. ACSF 1626.

standard equations. In refrigeration, an evaporation temperature of 5° F, condensing temperature of 86° F, liquid tem-
standard conditions

perature before the expansion valve of 77° F, and suction temperature 14° F. Strock, 10.

standard copper. Practically any brand of 99.5 percent, or higher, fineness. Fay.

standard costing. A system which attempts to relate performances and actual results to standards in the field of productivity and labor costs. One defect disclosed was that the presentation of statistics was too late to effect speedy and effective control. See also method study. Nelson.

standard deviation. A measure of accuracy or precision, calculated as the square root of the variance. B.S. 1017, 1960, Pt. 1.

standard dolomite brick. See dolomite brick.

standard electrode potential. The reversible electrode potential where all reactants and products are at unit activity. ASM Gloss.

standard error. The standard deviation of many samples of the mean. This reveals the amount of inconsistency between the sample and an average sample. B. S. 1017.

standard gage. A width of 4 feet 8½ inches between the inner edges of the rails. It is the recognized gage for main line railroad in Great Britain, Europe, Australia, and the United States. Nelson.

standard gold. A legally adopted alloy for coined gold. In the United States, the alloy contains 10 percent copper. ASM Gloss.

standard height. Aust. A given height of scam, say 3 feet, below which the miner is paid so much extra for every inch short of the standard height. Fay.

standard ignition test. A method developed for testing coal dust to obtain the limits of explosibility. Rice, George S.

standard impinger. For many years, the Greenough-Smith impinger was the routine dust sampling instrument in this country. It is still relied upon as a standard, but because of its size and weight, is little used underground today. Hartman, F. A.

standardization. An agreement between engineers or authorities on certain tests, dimensions, qualities, and tolerances of a certain machine, product, or process, and to adopt same in engineering or mining practice. Standardization offers many advantages in the mining industry such as interchangeability of machine parts and a reduction in stocks of spares. Nelson.

standardization correction. A tape correction applied to a tape which is not of the correct length when filled at the correct tension under a standard temperature. Ham.

standard mineral. A hypothetical mineral composition, as used in the calculation of the norm. Synonym for normative mineral. A.G.I.

standard mix. Concrete mixed in the proportions of 1 cement, 2 sand, and 4 of coarse material. See also aggregate; concrete.

standard of ventilation. An adequate amount of ventilation to dilute and render harmless all noxious and flammable gases to such an extent that all roads and work-ings in a mine shall be kept in a fit state for working or passing therein. Mason, v. 1, p. 183.

standard parallel. In public land survey, a parallel of latitude, other than the base line, passing through a selected township corner on a principal meridian, and established for the purpose of limiting the convergence of range lines that intersect it from the south. Selya, 2.

standard penetration resistance. See penetration resistance. B.S.C.E No. 1826.

standard penetration test. a. A soil-sampling procedure to determine the number of blows by a driven hammer or in falling a distance of 30 inches per blow, needed to drive a standard sampling spoon 1 foot. The first 6 inches of penetration is disregarded, but the blows required to drive the sample the ensuing foot are counted. Long. b. See penetration test. Nelson.

standard pile. See grade pile. Ham.

standard pipe. a. A coupled pipe conforming to the dimensions or tolerances specified as standard by the API. Long. b. As used by plumbers, etc., pipe conforming to specifications adopted as standard by the wrought pipe makers in 1886. Long.

standard plough. The original coal plough; a heavy double-ended machine with fixed blades. It length is 6½ feet and height varies from 14 to 31 inches. The depth of cut can be varied from 2 to 6 inches. From this relatively slow-moving machine has been evolved the rapid plough. Nelson.

standard potential. The reversible electrode potential for an electrode when all products and reactants are at the standard state or at unit activity. Sanders, 2d.

standard practice. In progressive plant, systems, procedures to determine the number of men, tools, or any other unforeseen impediment. Nel-

standard resistivity. A term applied to machines, tools, or any other unforeseen impediment. Nelson.

standard rig. a. A well-drilling machine that can be used as a standard or a unit, expressed on a scale in which the potential for the standard hydrogen electrode is zero. This is the potential used in preparing the electro-motive force series. BuMines Bull. 619, 1964, p. 206.

standard solution. One which contains a known weight of a substance in a given volume of solution. Long.

standard surface factor. See surface factor. Dodd.

standard time. Mean local time of one meridian as used throughout a defined country or zone. For Great Britain this is Greenwich mean time. Pryor, 3.

standard wire gage. Gage number defining the diameter of wire. Abbreviation, SWG.

standby. A piece of equipment held in readiness to replace a piece that may become inoperative. Long.

standby face. A spare conveyor face, of normal length, which could be used to another face cease production due to faults, washouts, roof collapse, water, gas, or any other unforeseen impediment. Nelson.

standdown. In Great Britain, the sending of miners home because they cannot be usefully employed due to any reason outside the control of the management. In some cases, coal mining awards confine this right to certain occurrences, for example, breakdown of plant or machines. Nelson.

standing fire. A fire in a mine continuing to burn without being extinguished. Long.

standing gas. A body of fire known to exist in a mine continuing to burn for a long time; often many years. Fay.
standing gas

exist in a mine, but not in circulation; sometimes fenced off. Fay.

standing ground. Eng. Ground that will stand of drill rods. See stand, a. Long.

standing joint. A relatively short length of pipe joints, the space between the pin and box-thread shoulders before wrenching up. Long.

standing loss. The distance from the charge to the material to be penetrated. Higham, p. 50.

standing pipe. a. A relatively short length of pipe driven into the upper soil-like portion of the overburden at the first step of capping or spudding-in a borehole. Also called conductor; conductor pipe. Long. b. A short piece of pipe wedged or cemented into a borehole after completion to act as a marker and keep collar free of cave. Long. c. The first length of casing inserted in a borehole. Also called conductor; conductor pipe. Also called conductor, in drilling, a pipe closed at both ends and used to form the inside diameter of a spoon bit. G. T. B. c. A large vertical pipe or water tower which serves as a reservoir, and is used to store water, to ensure a uniform pressure in a supply system. Crispin. B.

standing shot. The result of a small or undercharged shot wherein the coal is slightly loosened so that it is easily mined by pick. The term is a misnomer, as it applies to the result and not the "shot" or "charge." Fay.

standoff. a. A short length of core attached to mine locations often fluctuates on account of pumping operations. See also water table a; held water; water-bearing strata; strata; water percolation. Fay. d. See stanking. B.S. 3618, 1963, sec. 4.

standoff distance. The distance from the charge to the material to be penetrated. Higham, p. 50.

1068

stannopalladinite. A cubic alloy of tin and palladium, PdSn, with some Pt and Cu.
stannopalladinite

stannous. Of, pertaining to, or containing tin in the bivalent state; for example, stannous oxide (SnO). Webster 3d; CCD 6d, 1961.

staple. a. A shaft that is smaller and shorter than the frocic rig; usually a join and one of different levels. Webster 3d. b. Eng. A small pit. Webster 2d. Used in coal mining. The American Society for Testing Materials, in a recent report, defined a pit a hole in which coal is being placed on the pointed supports in one end and having a disk of sheet iron riveted to the other; used to steady a core and gage the thickness of the metal. Standard, 1964.

staple fiber. See fiber. ASTM C152-66.

staple shaft. a. An underground shaft, which does not penetrate to the surface. Psallen, b. A relatively small vertical pit connecting a lower seam to an upper seam. It corresponds to a rise or winze in metal mining. The seam in question is in a bore in which a spiral chute or an auxiliary winder system with a single cage and counterweight is used. Standard, 1964. c. A method of wedging down coal across the working face. Fay.

star agate. A gem cutting a star-shaped figure. Fay.

star almandine sapphire. Purplish star sapphire which is usually named star ruby. Shipley.

star amethystine sapphire. Violet star sapphire which is usually named star ruby. Shipley.

star antimony. Refined metallic antimony characterized by crystalline patterns resembling stars or fern leaves on its surface. Also called star metal. Webster 3d.

star chart. Used as depressant in flotation process.

star characte. Alkaline starch (starch dissolved in dilute sodium hydroxide) is a flocculating agent used in purifying the water in coal cleaning plants. Also known as amylum. Pryor, 3.

star chloride. See nitrostar. Bennett 2d.

star chrysoberyl. Applied to chrysoberyl specimens which have some an indefinite unsymmetrical star with two of the three streaks which made up the star closer to one another than either is to the third streak. Shipley.

star connection. A method of connecting the windings of a three-phase machine, in which one end of each of the phases is connected to the same point and the other three ends are connected each to its own slip ring. The line voltage in star is 1.732 times that in delta, and the line current in delta is 1.732 times that in star. Mason, pp. 291-293.

star-delta starter. A starting switch for an alternating current motor which, in the one position, connects the windings in star for starting and, in the other position, reconnects the windings in delta when the motor has gained speed. C.T.D.

star doublet. Assembled stones which imitate star sapphire or ruby, consisting usually of (1) a calocholc top of some asceritated stone, usually decolorized rose quartz; (2) a thin mirror of sapphire or ruby color, sometimes indented with intersecting lines; and (3) (usually) an unpolished domed back of some transparent to translucent substance which imitates the back of the genuine stone. Star sapphire has also been imitated by coating the back of decolorized rose quartz with a brilliant coloring substance; also called laster back. Starlite, Shipley.

star dresser. A tool for the dressing of abrasive wheels; it consists of a series of star-shaped metal cutters separated by washers, freely mounted on the spindle of a holder. Also sometimes known as a Hunteing dresser. Dodd.

star drill. A tool with a star-shaped point used for drilling in stone or masonry. Cripin.

star facets. a. Small triangular faces or planes of gems cut on the upper part of the bezel, terminating in the table. Here, b. The light triangular facets that bound the table of a round, brilliant-cut gem between the main bezel facets. Bureau of Mines Staff.

star feeder. A rotating feeder consisting of a horizontal shaft fitted with radial blades running within a close-fitting cylindrical chamber provided with an inlet and an outlet. Also called star valve (undesirable usage). B.S. 3552, 1962.

starkeyite. First described from the X-ray pattern as FeSO₄•H₂O, and later shown to be MgSO₄•4H₂O. Named from the locality, Starkey mine, Madison County, Montana. Spencer 24, M.M., 1895.

star key. A defect similar to star marks, and showing in the burned ware in a series of small hairlines radiating from a common center, due to the influence of cold burning points, or slight impact upon the unburned ware. Enam. Dict.

star metal. Synonymous with star antimony. Fay.

star observation. In surveying, location or orientation of a station by means of stars. Webster 2d. Used in "coal mining. The Star Peak group. A group which comprises three great limestones with three interposed quartzites, the total thickness of which is in the 10,000 feet in the Triassic rocks of Neva- da; succeeds the Kokpito group. C.T.D. star pinner. Sets small cylinders bearing four potter's pins in center of saggers to support four columns of small ware. B.D.T. 1.

star pinner. Sets small cylinders bearing four potter's pins in center of saggers to support four columns of small ware. Webster 3d.

star reamer. A star-shaped tool for regulating the diameter of, or straightening a bore. Fay.

star rectifier circuit. A circuit which employs six or more rectifying elements with a connecting period of time. The star circuit is used in rectifiers plus the commutating angle. Coal Age, 1955.

starred glaze. Term sometimes applied to a glaze that has partial or complete star-shaped crystals appearing on the surface; the cause may be sulfuring. See also sul- furing. Dodd.

star shaped. A defect of glazes characterized by stellate figures. C.T.D.

star ruby. An asteriated variety of ruby. Webster 3d.

star ruby sapphire. Pink, purple, or violet star sapphires. Shipley.

stars. A defect similar to star marks, and showing in the burned ware in a series of small hairlines radiating from a common center, due to the influence of cold burning points, or slight impact upon the unburned ware. Enam. Dict.

start. N. of Eng. A lever for working a gin to which the horse is attached. Fay.

star starter. a. A drill used for making the upper part of a hole, the remainder of the hole being made with a drill of smaller gage

34075
starlet

known as a follower. Fay, b. Penn. The miner who ascends to the battery to start the conveyer. Fay, c. See battery start-
er. D.O.T. 1. d. Protective equipment to ensure that an electric motor does not receive too high a current when starting. Ham.

starling bar. A steel reinforcing bar embedded in the concrete and projecting through a construction joint to bind adjoining masses of concrete together. Ham.

starlet rods; stub rods. Rods left projecting from concrete, in order to locate and pro-
vide continuity with other reinforcement. Taylor.

starting nozzle. An electrode which is used in establishing the initial arc. Coal Age, 1.

starting barrel. A short (12 to 24 inches) core barrel used in core boring operations when the distance between the drill chuck and the bottom of the hole or to the rock strata in which a borehole is to be col-
nared is too short to permit use of a full 5- and 10-foot-long core barrel. Long.

starting casing barrel. A short piece of casing to which a core bit and shell are at-
tached and used under the same condi-
tions as a starting barrel. See also starting barrel.

starting sheet. A thin sheet of metal used as the cathode in electrolytic refining. ASM Gloss.

starting submergence. In an air lift, the dis-
tance below the static head at which the air picks up water. Lewis, p. 687.

star topaz. Yellow star sapphire. Shipley.

starved ripples. Only isolated crests of ripple marks are present. See also incomplete

starved glaze. The poor quality of the glazed surface of ceramic ware if insufficient glaze has been applied; also sometimes called short glazed. Dodd.

starved ripples. Only isolated crests of ripple marks are present. See also incomplete

star zircon. See asteriated zircon. Shipley.

Stussano furnace. Indirect fire furnace, with electrodes entering the furnace through the sides. Bennett 2d, 1962.

Staussfort deposits. A series of saline minerals found in the Eastern Saxony, Germany, which include halite, anhydrite, kleiserite, gypsum, and boracite. Fay.

Staussfortite. A massive variety of boracite found in East Germany. It resembles a fine-grained white marble; sometimes has a subcolumar structure. Fay; C.T.D.

Staussfurt silt. Seeabraum salts. Kaufmann.

station. a. A device representing the same phenomenon; for example, thermostat, a device to maintain a constant temperature, etc. B.S. 3618, 1963, sec. 2. b. The force per unit area acting on the surface of a solid boundary parallel to the flow. The static pressure is constant in all directions and is the component normal to the direction of the flow. Roberts, 1, p. 2.

c. The pressure exerted by a fluid in all directions; the pressure which would tend to burst the container; the pressure exerted by the fluid if stationary. Strock, 10.

d. The pressure at a point is the pressure that would exist at that point in the absence of sound waves. H.B.G. I. in meteorology the pressure which produces wind or storm. Bull, 589, 1960, p. 32.

stationary. That branch of mechanics dealing with the relations of forces that produce equilibrium among material bodies. Web-

static tubef. A device giving contactless control of a circuit, for example, a transistor, thyatron, saturable reactor, etc. NCB.

static tube. A shaped, solid nose, on the downstream side of which a number of small holes are positioned, around the circumference. The holes are so placed that the pressure in the tube is that of the

charge heads. Cation, p. 211.

static level. a. The position of the water table when not influenced by pumping. Leyrand.

static load. a. The basal pressure exerted by the weight of a mass at rest, such as the load imposed on the bottom by the weight of the drill-stem equipment or the pressure exerted on the rocks around an under-
ground opening. Long. b. The load on the superimposed rocks. Also called dead load. Long. b. A load that is at rest and exerts downward pressure only. Nichols.

static magnification. The ratio between the pulse of the indicator and the respective pulse of the gravity center of the station-

static metamorphism. In geology, metamor-
phism produced by the internal heat of the earth. It may be accompanied by appreciable deformation. Used in contradi-
tion to dynamic metamorphism which involves stresses principally due to thrust. Fay.

static method. See Young's modulus of elas-
tics, p. 365.

static moment. The static moment of a section about an axis, YY, is also termed the first moment of the area about the axis. Ham. It is the sum of the products obtained by multiplying each component of an area, A, by its distance, X, from YY. See also moment of inertia. Ham.

static penetration test. A penetration test in which the testing device is pushed into soil with a measurable force, as distinct from a dynamic penetration test in which the testing device is driven into the ground by blows from a standard hammer. See also penetrometer; penetrometer, soil. Ham.

static pressure. a. The difference, in consist-
tent units, between the absolute pressure at a point, and the absolute pressure of the ambient atmosphere, being positive when the pressure at the point is above the ambient pressure, and negative when below. B.S. 3618, 1963, sec. 2. b. The static pressure exerted by the weight of a mass on a unit area, such as pounds per square inch or tons per square foot. Long. c. The force per unit area acting on the surface of a solid boundary parallel to the flow. The static pressure is constant in all directions and is the component normal to the direction of the flow. Roberts, 1, p. 2.

d. The pressure exerted by a fluid in all directions; the pressure which would tend to burst the container; the pressure exerted by the fluid if stationary. Strock, 10.

e. The static pressure at a point is the pressure that would exist at that point in the absence of sound waves. H.B.G. I. in meteorology the pressure which produces wind or storm. Bull, 589, 1960, p. 32.

statics. That branch of mechanics dealing with the relations of forces that produce equilibrium among material bodies. Web-

statement of performance. A statement de-
scribing the scope and duty of a plant in terms, for example, of the tonnage of coal treated per hour, the processes used, the separations effected and sizes produced; sometimes also used to express the results of plant operation. B.S. 3552, 1962.
undisturbed airstream. Unlike the Pitot tube, the measured pressure is affected considerably by the position of the stem of the tube in relation to the pressure holes and the distance between these holes and the nose tip. The static tube is considerably more sensitive to yaw than is the Pitot tube. See also Pitot tube; Pitot-static tube. Roberts, I., p. 40.

static zone. Suggested for the zone which extends below the level of the lowest point of discharge, and in which the water is stagnant or moves with infinitesimal velocity. Fay.

station. a. The excavation adjoining the shaft at each of the different levels, where men and material are removed or delivered. Agham, p. 35. b. An enlargement of a shaft or gallery on any level, thus affording room for landing at any level. Robert, I., p. 40. and at the same time provides space for receiving loaded mine cars that are to be sent to the surface. Empty cars and material to be used in the mine are taken from the cage at this place. Also, a similar enlargement of shaft or level to receive a ballastation, pump station (pump station), or tank (tank-station). Fay. c. Any fixed point underground beyond which nacked lights may not be carried. Fay. d. Any fixed point in a mine where deputies or foremen meet to report upon the condition of their respective districts. Fay. e. An opening into a level heading out of the side of an inclined plane. Fay. f. See underground station. Agham and Mair, 1963. g. In surveying, the point at which an instrument is planted or observations are made. Webster 3d. h. Reference point in surveying, marked by a readily seen indentation in metal plate set permanently in concrete, or by suspending plug drilled into roof of underground working. Fryor, 3. i. Any one of a series of stakes or points indicating distance from a point of beginning or from a designated point, that is, a marked point on the ground, over which an instrument is to be used. A length of 100 feet, measured along a given line, which may be straight or curved, or curved line whose position is indicated by its total distance from a starting point, or zero point. For example, station 4+147.2 identifies a point 447.2 feet from the starting point, the distance being measured along a given line. Seeby, 2. m. The location on a conveyor or conveyer system where bulk material or objects are received or loaded onto the conveyor or are discharged from the conveyor. ASA M2.1-1958.

stationary dredge. A fixed vessel with equipment for digging, washing, and concentrating alluvial deposits. See also dredge. Nelson.

stationary dredger. A bucket ladder dredger which is not self-propelled, the dredged material from which is discharged into either a barge or a pipeline. Ham.

stationary engine. An engine located on a fixed foundation, as distinguished from a portable engine. Crispin.

stationary gravel. The simplest of all separating devices and the cheapest to install and maintain. It consists of a series of fixed bars or rails spaced the required distance apart in order that the "underline" may drop through. The use of a stationary gravel is limited to coarse screening of dry material (aperture 2-inches and larger), although it is sometimes used with openings as small as 3/4 inch, the efficiency dropping off in proportion. It is not satisfactory for point sticky material. Pit and Quarry, 53rd, Sec. B, p. 118.

stationary jaw. The fixed jaw of a safety clamp or wrench. Compare anvil and jaw. Long.

stationary mass. Main element of every seismograph. A heavy weight in one way or another suspended or supported and which by its own inertia remains at first quiescent during the earthquake. Schieferlecker.

stationary piston drive sampler. A piston-type sampler in which the position of the piston relative to the sample remains constant during the sampling operation. Long.

stationary split. Synonym for stationary jaw. Long.

stationary wave. A wave of essentially stable form that does not move with respect to a selected area or an object, such as a fixed shoreline. Sometimes called standing wave. A.G.I.

stationary equipment. Stationary equipment is installed in a given location and is not moved from its location in performing its function. This includes equipment such as substations, pumps, and storage-battery charging equipment. Webster 3d.

station error. See deflection of plumbline. Stewart.

station forearm. In metal mining, a laborer who supervises the haulage and handling of ore, timber, and mining supplies at a shaft station. D.O.T. 1.

stations. Points on the center line of a tunnel, permanently marked. These stations may be outside of the tunnel and used for projecting the center line into the tunnel, or they may mark the center line inside the tunnel. Slaugter.

station yards haul. Equals the number of cubic yards obtained by the number of 100 feet stations through which it is moved. Nichol.

statistical analysis. Classification, judging and evaluation of numerical data derived from observations made under suitable control. Fryor, 3.

statistical uniforMity. A term describing that variation in quality of materials of manufactured goods which is stable and determinate, so that statistical analysis and prediction can be applied to it. See also representative sample; level of control. Ham.

statistics. The collection, tabulation, and study of numerical facts and data. In industry, statistics will indicate trends which would be almost impossible to establish by other means. The statistical method is useful in: (1) estimating the real value of work done, goods, or machines in terms of useful service and maintenance costs; and (2) estimating and forecasting profits and markets. Nelson.

stator. In a torque rotary, a set of fixed vanes that change the direction of flow of fluid entering the pump or the next unit. Nichols.

staurolite. a. A silicate of aluminum and iron with chemically combined water, Fe2Al6O10(OH)8, (SiO4)4. b. A strong rubber rod which is in contact with the crest gate of a dam and is compressed between gate and structure to form a watertight joint. Ham.

stauronite. a. A silicate of aluminum and iron with chemically combined water, Fe2Al6O10(OH)8, (SiO4)4. b. A length or bar of a material used for sculpture. The best qualities are white and free from markings. Fay.

stauosphere. The dust-bearing portion of the atmosphere. Ham.

stay. a. Eng. A prop, strut, or tie for keeping anything in its place. Zern. b. A diagonal brace or tie bar to stiffen or prevent movement of a structural component. Ham.

stay bolt. A type of combination reamer and tap, used exclusively in locomotive-blower work. Crispin.

stay pole. A pile driven or cast in the ground to anchor a land tie. Ham.

steady grade. A term used to describe the grade of a conveyor or conveyor system which is limited to self-propelled, but is still used at many small mines. See also Bradford breaker; resonance screen; screen; Nelson.

steady gradient. A term used to describe the grade of a conveyor or conveyor system which is limited to self-propelled, but is still used at many small mines. See also Bradford breaker; resonance screen; screen; Nelson.

steady gradient. A term used to describe the grade of a conveyor or conveyor system which is limited to self-propelled, but is still used at many small mines. See also Bradford breaker; resonance screen; screen; Nelson.
stb per day  

std cf  

std cu ft  

steatite  
A very thin bands of ironstone. Nelson.

steadite  
a. Eutectic consisting of iron phosphide and iron, as a constituent of gray cast iron. English. b. A basic calcium silicophosphate, [Fe3O4·(CaO·2SiO2)], occurring as yellow, hexagonal needles in basic slag. English.

Steat's brittleness  
a condition of brittleness that causes transcristalline fracture in the coarse grain structure that results from prolonged annealing of thin sheets of low-carbon steel previously rolled at a temperature below 1,300° F. The fracture usually occurs at about 45° to the direction of rolling. ASM Glas.

steady  
A support for blocking up a stone that is to be worked. Standard, 1964.

steady flow  
a. A constant flow, that is, the same volume in equal units of time. Also called permanent flow. Nelson. b. A steady flow exists when the velocity, pressure, density, and temperature of the liquid at a given point in the system do not change in time. If these quantities do vary with time at a point in the system, then unsteady flow results. Roberts, 2.

steady-flow process  
One in which the fluid is continually in motion in a linear direction through a conduit. Hartman, p. 32.

steady head tank  
In connection with use of moderate pressure hydraulic water (for example, in classification of ore by gravity), a reservoir set above the draw-off points of the system, which maintains a full supply of water at a set height and therefore constant pressure. Pryor, 3.

steady point  
A pointed steel bar which can be locked in a clamp, and used to brace a drill frame against the ground. Nichols.

steady rest  
In cutting or graining, a stationary support for a long workpiece. ASM Glas.

steel down  

steelite  
Chiastolite. Shipley.

steam  
Water in the form of vapor; aqueous vapor; the gas into which water is changed by boiling. It is colorless and transparent until it begins to condense. Standard, 1964.

steam accumulator  
A vessel to smooth out violent steam loads on a boiler. While the steam density is relatively low the accumulator is charged and acts as a buffer when sudden steam demands occur. A similar device is maintained by a specially developed type of shell boiler of the thermal storage type. Nelson.

steam anthracite  
in anthracite only, coal small enough to pass through bars set 6 to 8 inches apart, but too large to pass through bars set 3 to 5 inches. Steamboat coal prepared at different collieries varies considerably in size. Comparatively few colliers prepare steamboat coal except to fill special contracts or orders. Fay.

steamboat coal  
rolls in an anthracite breake; which are set farthest east to break the coal into steamboat coal. Standard, 1964.

steam boiler  
A vessel or plant for generating steam. There are two basic types of boiler in use, the fire-tube type (Lancashire boiler) and the water-tube boiler (Babcock and Wilcox boiler). The most common and simplest boiler is the Lancashire which was developed in 1844 by Fairbairn, who put in the second flue, from the original Cornish boiler of Treve-thick. The Lancashire boiler is now gradually giving away to the Economic boiler. Nelson.

steam coal  
a. Coal suitable for use under steam boilers. Webster 3d. b. Coal which is intermediate in rank between bituminous coal and anthracite. English.

steam condenser  
a device primarily used to condense exhaust steam from an engine or turbine into water. A condenser it used to: (1) reduce the exhaust steam pressure by condensation and thus reducing back pressure on the engine; (2) return the feed water to the boiler at as high a temperature as possible. The condenser may be of the surface or jet type. Nelson.

steam curing  
The rapid curing of precast concrete units; this can be done at high pressure in an autoclave or at atmospheric pressure in chambers or tunnels. Dodd.

steam dredger  

steam drill  

steam engine  
a reciprocating engine, worked by the force of the steam on the piston; the steam expands from the initial pressure to the exhaust pressure in a single stage. The steam engines of Savonius, in 1898, and of Newcomen, in 1705, were designed to pump water from mines. Nelson.

steam extruder  
a laborer who cleans dirt and corrosion from contacts of anodes, starting sheets, and electrical conductors to prevent these accumulations from breaking electrical contacts during electrolytic refining of copper, using high-pressure steam hose. D.O.T. 1.

steam gas  
Highly superheated steam. Webster 2d.

steam hammer  
a heavy hammer, moving between vertical guides, actuated by steam pressure. Crispin.

steam-heating engineer  
in bituminous coal mining, one who operates a steam locomotive to haul railroad cars in and out of a strip mine. D.O.T. 1.

steam-hole test  

steam infusion  
The injection of steam into the coal seam by infusion tubes, connected to a small boiler or by high-pressure pipework, to suppress the dust in situ. The technique and equipment are some-what similar to water infusion. Due to technical, safety, and other problems, this is generally believed to be inferior to Nelsen.

steam jet  
a. A blast of steam issuing from a nozzle. Fay. b. A system of ventilating a mine by means of a jet of steam at high pressure; kept constantly blowing off from a series of pipes in the bottom of the intake shaft. Fay. c. A jet of steam to moisten the intake air current and thus keep the coal dust in the mine wet. Zenn.

steam jet refrigeration  
a method of cooling involving the use of steam nozzles to reduce the pressure in a water chamber so that the water boils at a low temperature; since heat is drawn from the water, it is thus cooled. Strock, 10.

steam main  
a horizontal pipe for carrying live steam from a boiler to radiators, a steam engine, or other steam consuming device. Crispin.

steam metal  
Any copper alloy specially designed to endure exposure to steam. Webster 3d.

steam overlay  
a. A mechanic excavator having a single large bucket, 1/2 to 8 cubic yards, at the end of a long beam carried in an revolving shawl. Also called steam shovel. C.T.D. b. See excavator. Pryor, 3.

steam point  
See point, d. Fay.

steam press  
a press actuated by steam pressure for truing the shape of green fire clay brick A.R.I.

steam pressed brick  
See pressed brick.

steam pressed-dried brick  
Represed brick made from a cull of clay from an auger machine equipped to evacuate the air from the extruding chamber. A.I.S. No. 24.

steam rack drier  
a room equipped with pipes containing steam erected so as to allow the stacking of pallets of green, wet ware for drying. ACSG, 1963.

steam-reduced asphalt  

steam rig  
Synonym for steam drill. Long.

steam shovel  
a. An excavating machine in which a large dipper is operated by steam power. Standard, 1964. Used for stripping purposes and in open-pit mining, especially for iron and coal. A similar shovel is now operated by electricity, gasoline, and diesel engines. Fay.

steam shovel mine  
a strip mine in which steam shovels or other power shovels are used for loading cars. Hess.

steam sizes  
a coal product which passes through a 1/4-inch-diameter hole. Compare seam, Nelson.

steam stamp  
a crushing machine consisting of a vertical stamp shaft which is forced down to strike its blow, and lifted up preparatory to striking the next, by a steam piston. Fay.

steam tempering  
The treatment of clay (particularly brick clay) with steam to develop its plasticity for the shaping process and, as an additional advantage, to reduce the time required to dry the shaped bricks. The clay generally reaches a temperature of 70° to 80° C. Also known as hot por¬
tempering. Dodd.

steam thawing  
a method of dredging permanently frozen ground in Alaska and the Yukon territory in which steam is forced through pipes which are fitted with steel points on one end and a driving head on
steam thawing

the other end so that the pipes can be hammered into the frozen gravel. Thawing by steam is a slow and costly process.

steam trap. An apparatus for allowing water or air to pass but preventing passage of steam. Strock, 10.

steam turbine. A machine in which high-pressure steam is made to do work by acting on, and rotating, blades in a cylinder. It is used for large stationary engines in power stations. Its comparative efficiency is high. Nelson.

steam winders. The most common type of steam winder at work today is the two-cylinder double-acting horizontal engine driving direct on the drum shaft. These engines are made with cylinders up to 42-inch diameter and 84-inch stroke, possess the merit of simplicity and ease of control. The two cylinders act on cranks set at 90° to each other and are large enough for either to start the engine from rest against full load, since one may happen to stop at dead center (that is, with the piston at the end of its stroke, not in any position of no turning moment on the crank). Mason, v. 2, p. 420.

steatite. Steatite of aluminum, calcium, magnesium, and zinc are used chiefly as die lubricants for dry-pressing certain ceramic products.

steatite ash. Steatite ash can be used as a blending material in the manufacture of whiteware.

steatite porcelain. A vitreous ceramic whiteware for technical application in which magnesium metasilicate, (MgO•SiO2), is the essential crystalline phase.

steatite. Massive form of the mineral talc, MgSiO3(OH). The chief sources are in the United States, France, Italy, India, Norway, and Austria. The natural rock can be machined and the shaped parts fired for use as ceramics. A far greater proportion is ground and shaped in the usual way with a clay bond to produce low-loss electronic elements. It is used as a raw material for cordierite, 

electroceramics and refractories. Dodd.

steatite ceramic. Any ceramic whiteware in which magnesium metasilicate, (MgO•SiO2), is the essential crystalline phase. A.C.S.B. 4.

steatite talc. A vitreous ceramic whiteware for technical application in which magnesium metasilicate, (MgO•SiO2), is the essential crystalline phase. A.S.T.M. "Gloss.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.

steam steel. Ware made from a body containing steatite; used where great accuracy of size and resistance are needed. C.T.D.
steel grit, the finer being used for soft iron where a finely ground surface is desired. In some operations the sizes of steel grit may be adjusted to give the desired surface and in other cases silica sand should be mixed with the steel grit. Hansen.

steel jack. A hinged clamp on the bottom steel rails, roils, or ties, is fixed in a vertical shaft to guide the cage and prevent it swinging. See also fixed guides. Nelson.

steel jacks. a. This support is in effect a screw jack and is especially suitable in mechanical mining. Under headers at the face, or near the face, steel posts or jacks are used for legs or upright timbers, then usually replaced with wood as the equipment advances. As a safety post this type of support is very good if a wooden block is used on the top end to avoid slipping on the roof rock. Also called steel post. Kentucky, p. 142. b. Same as spelterite. Fay.

steel lines. Lines visible in the enamel surface which follows the roll direction of the steel. May also result from scratches in the metal surface. Bryant.

steelmaking. The process of making steel from solid pig iron, with or without admixture with steel scrap. The processes used are the Bessemer, open-hearth, electric, crucible, high-frequency induction, and duplex. C.T.D.

steel mill. a. Eng. An early-type apparatus for obtaining steel in a ferro of mine, consisted of a revolving steel wheel, to which a piece of flint was held, to produce sparks. See also flint mill, a. Fay. b. A mill where steel is manufactured. Also called steelworks. Webster 3d.

steel money. N. of Eng. Payment made to faceworkers who have to handle steel straps instead of timber planks. Trist.

steel needl. An instrument used in preparing blasting holes before the safety fuse was invented. Fay.

steel nippers. See nippers, a. Fay.

steel ore. A name given to various iron ores and especially to siderite, because it was supposed to be especially adapted for making steel by the earlier and direct process. See also stahlstein. Fay.

steel plate. A steel product obtained by the rolling or thickness of steel slabs. The slabs are reheated to rolling temperature, about 2,250°F and the thickness reduced in a hot roughing mill. Steel plates may be up to 75 inches and between 1/2 and 41/2 inches thick. Nelson.

steel plates. Steel upright or post to support the nether roof at a longwall or other face. It usually incorporates a yielding device. See also hydraulic prop; mechanical clamping prop; self-advancing supports. Nelson.

steel rectangular shaft supports. A shaft support consisting of H-beams, I-beams, angles, or channels. The design is somewhat similar to that used for timber. Boits, rivets, and fastening angles are used to connect and secure the steel beams. The fastening angles are riveted to the beams. The addition of galvanized-iron corrugated wall sheets (or lagging) form a secure and fireproof shaft. See also post and roof, roof post, a; banton, a; wall plate; lagging, a. Nelson.

steel ring. Ring or horseshoe shaped support made for use in long, flat roofs and as a support for the arch ring. Fryer, 3. See also steel arches.

steel separation doors; safety door; emergency door. A steel door specially erected for the purpose of being closed only in an emergency, such as a fire or explosion. Steel is necessary to secure strength and avoid destruction by fire. Steel doors may also be used as protection in the back of doors in the vicinity of the pit bottom or fan drift. Nelson.

steel sets. Used in main entries of coal mines and in shafts of metal mines in the United States. The sections are I-beams for caps and H-beams for posts or wall plates, the H-section giving equal stiffness in two directions at right angles to each other. Steel sets of various shapes are coming into wide use in European coal mines where pressures are so great that timber would not be satisfactory. Lewis, p. 51. See also tunnel support.

steel sheet pilings. Filling composed of interlocking rolled steel sections driven vertically into the ground with guide wailings in place before excavation starts. Ham.

steel slab. Steel which has been rolled in a slabbing or coiling operation. The slabs, which may weigh up to 11 tons, are descaled, that is, the surface flaws are removed by the use of oxyacetylene torches to provide a smooth surface of steel plate. Nelson.

steel support. A straight or curved length of steel, usually of H- or channel section, used for support purposes in mine roadways, faces, or shafts. A steel support (1) possesses a high degree of permanency or long service; (2) ensures a minimum area of excavation for given dimensions in the clear; and (3) it is fireproof. In return airways and shafts, a chrome-nickel-copper steel is sometimes used to counteract the corrosive air. For high-strength roof bars best results are obtained by the use of heat-treated low-alloy steels of the carbon manganese type. See also S.M.R.E. bar; steel arches. Nelson.

steel tapes. Thin bands of varying lengths wound into round leather cases and graduated in feet and inches on one side and links on the reverse. They require careful handling as they are easily snapped by twisting and kinking. Mason, v. 2, p. 713.

steel tunnel support. Tunnel-support systems made of steel are roughly of five types; (1) this type is usually made in two pieces for maximum speed of erection, lowest first cost, and lowest erection cost. It is sometimes used in three or five pieces to give the desired conditions and with the following methods of attack: heading and bench, top heading, and full face. This type is especially applicable to circular and high-sided tunnel sections where only a light roof support is needed; (2) this type is used for undercutting; (3) this type may be blended to give the desired support in tunnels with bad rock conditions required quick support; and full face. In return tunnels for heavy loads associated with squeezing conditions. Lewis, pp. 54–56.

steel wire reinforced belt. A rubber belt in which the cords are replaced by high carbon steel wide strands. The wires are copper plated and rubber coated to provide maximum adhesion to the rubber cover. Nelson.

steel wire rope. See wire rope. Nelson.

steel wool. Fine threads of steel matted together into a felt or cloth for polishing or cleaning surfaces of wood or metal. Crispin.

steelworks. See steel mill.

steelyard. Weighing machine in which rigid steel bars is pivotted about a fulcrum placed close to one end, from which the weight and object are supported. Weights are moved over the long portion, which is graduated appropriately. Pryor, 3.

steeling: stellng. The brick or stone lining of a shaft. Fay.

steenstrupine. A silicate and phosphate with the formula (La,Ga,Na)(Al,Fe,Mn), (Si,P), (0.45). Steenberg.

steep seams. See edge coal; rearers, Fay.

steeply inclined, in, and also to prevent the bottom from heaving. A full circle with ribs closely spaced is heavily lagged for heavy loads associated with squeezing conditions. Lewis, pp. 54–56.

steepenteunsafe. A silicate and phosphatic, with fluoride (Fe, Ca, and Na). Nelson, 1, p. 74.

steep fault. Fault dipping at an angle of 45° or more. Synonym for high-angle fault.

steep gradient. In general, in coal mining, an inclination of a roadway, working, or other portion of a mine greater than 1 in 4. Nelson.

Steinkopf. See Steinkopf.

steep drift. In some mines, a dip of from 40° to 60°. Streets, t. 1, p. 56.
steer

steer. Leic. Steep; highly inclined; dips fast. Fay.

steering brake. A brake which slows or stops one side of a tractor. Nichol.

steering clutch. A clutch which cannot disconnect power from one side of a tractor. Nichol.

Stefan-Boltzmann Law. The energy radiated in unit time by a black body is given as

\[ E = \sigma T^4 \]

where \( E \) is the energy radiated, \( \sigma \) is the Stefan-Boltzmann constant, and \( T \) is the absolute temperature of the body. \( E \) is the energy radiated in unit time by a black body.

steeple. In coal, primarily the vascular tissues of the axis of a vascular plant. It consists of two parts: the xylem which carries water from the roots, and the phloem which carries the food. Hess.

stel. Sprag. Mason.

stellar coal. See stellarite. Fay.

stellarite. A variety of galena with part of the lead replaced with antimony and arsenic. Standard, 1964.

stel. In coal, primarily the vascular tissues of the axis of a vascular plant. It consists of two parts: the xylem which carries water from the roots, and the phloem which carries the food. Hess.

stem. a. Eng. A narrow road driven to protect the loose strata of the face from fall. Fay.

stemming. The brick or stone lining of a shaft to prevent the loose strata of the sides from falling. Fay.

stemmannite. A variety of galena with part of the lead replaced with antimony and arsenic. Standard, 1964.

stele. In coal, primarily the vascular tissues of the axis of a vascular plant. It consists of two parts: the xylem which carries water from the roots, and the phloem which carries the food. Hess.

stemming stick. A steel or timber prop. A steel or timber prop. Fay.

stemmer. a. A series of alloys containing cobalt, chromium, tungsten, and molybdenum in various proportions; very hard material used in British coal mines. Also called tamping rod; beater. See also scraper; stem; stem vegetation. Nelson.

stem vegetation. Nelson.

stemming. The brick or stone lining of a shaft to prevent the loose strata of the sides from falling. Fay.

stemming stick. A steel or timber prop. A steel or timber prop. Fay.

stemmer used in British coal mines. Also called tamping rod; beater. See also scraper; stem; stem vegetation. Nelson.

stemmer used in British coal mines. Also called tamping rod; beater. See also scraper; stem; stem vegetation. Nelson.

stem. a. Eng. A narrow road driven to protect the loose strata of the sides from falling. Fay.

stem. b. Newc. A narrow road driven to connect two winning places. SMRB, Paper No. 61. c. A narrow road driven to connect two winning places. SMRB, Paper No. 61. d. A narrow road driven to connect two winning places. SMRB, Paper No. 61. e. A narrow road driven to connect two winning places. SMRB, Paper No. 61. f. A narrow road driven to connect two winning places. SMRB, Paper No. 61. g. A narrow road driven to connect two winning places. SMRB, Paper No. 61. h. A narrow road driven to connect two winning places. SMRB, Paper No. 61. i. A narrow road driven to connect two winning places. SMRB, Paper No. 61. j. A narrow road driven to connect two winning places. SMRB, Paper No. 61. k. A narrow road driven to connect two winning places. SMRB, Paper No. 61. l. A narrow road driven to connect two winning places. SMRB, Paper No. 61. m. A narrow road driven to connect two winning places. SMRB, Paper No. 61. n. A narrow road driven to connect two winning places. SMRB, Paper No. 61. o. A narrow road driven to connect two winning places. SMRB, Paper No. 61. p. A narrow road driven to connect two winning places. SMRB, Paper No. 61. q. A narrow road driven to connect two winning places. SMRB, Paper No. 61. r. A narrow road driven to connect two winning places. SMRB, Paper No. 61. s. A narrow road driven to connect two winning places. SMRB, Paper No. 61. t. A narrow road driven to connect two winning places. SMRB, Paper No. 61. u. A narrow road driven to connect two winning places. SMRB, Paper No. 61. v. A narrow road driven to connect two winning places. SMRB, Paper No. 61. w. A narrow road driven to connect two winning places. SMRB, Paper No. 61. x. A narrow road driven to connect two winning places. SMRB, Paper No. 61. y. A narrow road driven to connect two winning places. SMRB, Paper No. 61. z. A narrow road driven to connect two winning places. SMRB, Paper No. 61.

Step up. To increase the voltage of (a current) by means of a transformer. Webster 3d.

Step vein. A vein alternately cutting through the strata of country rock and running parallel with them. In Australia, it is called step reef. Fay.

Stepwise longwall. N. of Eng. A variant of gateway longwall in which faces 12 to 40 yards in length are stepped, each face being 4 to 6 yards in advance of the adjacent one. Trit.

Stereochrome. Branch of chemistry which deals with the optical behavior of atoms in a molecule, and their spatial or steric arrangement. Pryor, 3.

Stereo graphic projection. a. A stereoscopic projection of a crystal. Fay. b. Diagram in graphic form with three axes, used to give three-dimensional representation on a plane surface. Pryor, 3.

Stereo graphic projection. In mineralogy, a projection made on a plane through the center of a sphere by projectors from the South Pole. Fay.

Stereo comparator. An apparatus for determining the specific gravity of powders or porous materials. Osborne.

Stereo metric map. In photographic mapping, an instrument for accurately measuring the three space coordinates of a point by stereoscopic evaluation of two images of the same point contained in two overlapping photographs taken from two different exposure stations. Seelye, 2.

Stereo gram. a. A stereo graphic projection of a crystal. Fay. b. Diagram in graphic form with three axes, used to give three-dimensional representation on a plane surface. Pryor, 3.

Stey. Steep; highly inclined. Fay.

Stey. Steep; highly inclined. Fay.

Sterling silver. A silver alloy containing at least 92.5 percent silver, the remainder being unspecified by usually copper. ASM Gloss.

Sterlingite. A hydrous magnesium silicate, Mg₅Si₃Fe₂Ca₂(Si₂O₇)(OH). Cracked; in the United States, apparently rare. English.

Sterilization. a. A process of destroying all forms of life from objects. b. The process of destroying all forms of life from objects. c. The process of destroying all forms of life from objects. d. The process of destroying all forms of life from objects. e. The process of destroying all forms of life from objects. f. The process of destroying all forms of life from objects. g. The process of destroying all forms of life from objects. h. The process of destroying all forms of life from objects. i. The process of destroying all forms of life from objects. j. The process of destroying all forms of life from objects. k. The process of destroying all forms of life from objects. l. The process of destroying all forms of life from objects. m. The process of destroying all forms of life from objects. n. The process of destroying all forms of life from objects. o. The process of destroying all forms of life from objects. p. The process of destroying all forms of life from objects. q. The process of destroying all forms of life from objects. r. The process of destroying all forms of life from objects. s. The process of destroying all forms of life from objects. t. The process of destroying all forms of life from objects. u. The process of destroying all forms of life from objects. v. The process of destroying all forms of life from objects. w. The process of destroying all forms of life from objects. x. The process of destroying all forms of life from objects. y. The process of destroying all forms of life from objects. z. The process of destroying all forms of life from objects.

Stereo radiography. A technique for producing paired radiographs which may be viewed with a stereoscope to exhibit a shadowgram in three dimensions with various sections in perspective and spatial relation. ASM Gloss.

Stereo topographic map. See stereoscopic map. Seelye, 2.

Sterile coal. Eng. Black shale or clay on top of a coal seam. Fay.

Sterility coal. That part of a coal seam which, for various reasons, is not mined. B. S. 3618, 1965, sec. 1.

Sterling. Having a standard of value or fineness established by the British government; said of English money of account and of gold and silver; as, pounds sterling; sterling plate. Standard, 1964.

Sterling silver. A silver alloy containing at least 92.5 percent silver, the remainder unspecified by usually copper. ASM Gloss.

Sterenberga. A salt of silver, S₂,Fe₃,As₂. It contains 42.6 percent sulfur, 54.2 percent silver, and 55.4 percent iron. Fay.

Sternt. Scot. Rough; coarse-grained or crystalline, for example, stony limestone. Fay.

Sterrettel. Supposedly Al₃(PO₄)₂(OH),.SH₂O, it is probably ScPO₄·2H₂O; its structure is probably that of the metamorphic type; eganite and sterrittite are identical. American Mineralogist, v. 45, No. 1-2, January-February 1959, p. 257; Fleischer.

Sterno metal. An alloy of three parts copper, two parts zinc, and a small proportion of iron and tin; stronger and cheaper than gunmetal. Standard, 1964.

Stetefeldite. A somewhat uncertain compound composed of silver, iron, copper, antimony, sulfur, and water. Fay.

Stefefeld furnace. A furnace for the chloridizing and roasting of silver ores, and also for roasting fine copper ore low in sulfur. Provision is made for an auxiliary fire place. Fay.

Stevansite. A hydrous magnesium silicate, [Mg₅Si₃Fe₂Ca₂](Si₂O₇)(OH). Cracked; in the United States, apparently rare. English.

Stevenson's formula. A formula by which the height of waves can be calculated. See also fetch. Ham.

Stewartite. a. A colorless to yellow hydrous manganese phosphosilicate, 3MnO·PO₄·2H₂O. Triclinic. Fibers or minute crystals. From Stewart mine, Pala, Calif. English. b. A steel-gray fibrous variety of bort containing iron and, therefore, magnetic. From Kimberley, Republic of South Africa. English.

Stewarts bor. See bort, c. Hess.

Stibianite. Stibianite is the inner of three composing the remainder which, for various reasons, is not mined. B. S. 3618, 1965, sec. 1.

Stibiocolumbite. Name proposed for the stibiocolumbite from Mt. Grande, Calif, because the amount of niobium is greatly in excess of that of columbite; a steel-gray fibrous variety of bort containing iron and, therefore, magnetic. From Kimberley, Republic of South Africa. English.
stibiolite. A brown, yellow, reddish-yellow talc talcoid of antimony, \( \text{Sb}_2 \text{O}_3 \), \( \text{Ta} \), \( \text{Nb} \), \( \text{O}_3 \). Orthonorbic, hemimorphic, hemi-English.

stibioeolumbite. The ancient name for antimony and

stiblum. The ancient name for antimony and

stiblite. Synonym for stibiconite. Dana 6d, p. 36.

stichtite. A lilac basic hydrous carbonate of

sticky. A technique used in trench

sticking up. The process of joining together,

sticky coal. A. Coal strongly adhering to a hard stratum of rock above or below it; also called frozen coal. Fay. A coal seam which does not separate cleanly from the roof and fragments of the roof adhere to the top coal as it is worked. A sticky coal results in a high proportion of shale in the run-of-mine coal. Also called ditched or Nature.

sticky limit. The lowest water content at which a soil will stick to a metal blade drawn across the surface of the soil mass. ASC E 1956,

stiff frame. See redundant frame. Ham.

stiff frame. See redundant frame. Ham.

stiff plastic process. A process of brickmaking,

stiffness. The ability of a metal or shape to

still. a. To become fixed or lodged in a

stillage. A small platform on which shaped

still loading. A technique used in trench

stillings. 

stillings. a. N. of Eng. The walling of a shaft within the tubbing above the first hard stratum underlying quicksand. Fay.
b. A stand, as for holding vats or caasks, or for unburned pottery while it is drying. Standard, 1964.

c. To cut off

d. To cease work

e. Eng. To cease work

still mud machine. A brick machine for making

still well. A. A combination to a main body of water by a small inlet; such an arrangement is suitable for a recording

stilpnomelane

identical with typical chalcodite. The name stilpnomelane has a priority over chalcodite. The ferrous mineral does exist; for it, the varietal name ferrostilpnomelane is appropriate. Hey 2d, 1955.

stilpnomelane

1078

stocking end

word used to describe a system (for example, sampling method) which has in it an element of randomness. Pryor, 3.

stocking. A line of stock of a type appropriate to a chimney but of greater irregularity of outline. Nelson. b. Eng. Coal, or ore, stored at the surface during slack trade, or in reserve for an extra demand at any time. Fay. c. The average tonnage sent out of a working over a given period, say a week, and, although the useful rock as distinguished from the waste. Fay. e. An irregular, metalliferous mass in a rock formation; as a stock lead in orestone. Fay. f. A body of igneous rock that is smaller than a batholith and intruded upward into older formations and that in ground rough is roughly circular or elliptical but in cross section may increase downward. Webster 3d. g. A core of small wet coal, with a hole through for the air blast, made between the tuyere and the front of a forge. Webster 2d. h. A holder for a threaded die. Webster 3d. i. The proprietorship element in a corporation divided into shares and represented by transferable certificates and giving to the owners a pro rata interest in the assets, the earnings, and except when withheld in the charter, in the voting power of the business. Webster 3d. j. The mixture of ore, coke, and limestone charged into the furnace, or stored in bins at the stock house. Fay. k. A sharply domed body of intrusive igneous rock that projects from a body of plutonic rock that covers less than 40 square miles, has steep contacts (general dip in a given direction), and, although generally discordant, may be concordant. A.G.I. m. In forging, the portion of metal cut from the bar that has been allotted to a given number of forgings. Henderson. n. A body of nonfusible iron, such as quicksilver, that is contained or contained in another body of fusible iron. Nelson. o. A body of lead ore in limestone. Fay. p. A body of limestone or other rock containing in it an ore that is of sufficient quantity to cause explosion or to be otherwise dangerous. Hudson. q. A holder for a threaded die. Webster 3d. r. A holder for a threaded die. Webster 3d. s. A builder holding together the main reinforcing bars in reinforced concrete. Ham. t. A cloth made of silk or other material, used for covering the face and protecting the face from the heat of the blast furnace. Webster 3d. u. A builder holding together the main reinforcing bars in reinforced concrete. Ham. v. A cloth made of silk or other material, used for covering the face and protecting the face from the heat of the blast furnace. Webster 3d. w. A builder holding together the main reinforcing bars in reinforced concrete. Ham. x. A cloth made of silk or other material, used for covering the face and protecting the face from the heat of the blast furnace. Webster 3d. y. A cloth made of silk or other material, used for covering the face and protecting the face from the heat of the blast furnace. Webster 3d. z. A cloth made of silk or other material, used for covering the face and protecting the face from the heat of the blast furnace. Webster 3d.
stocking end

stockpile. a. The ore accumulated at the surface when shipping is suspended. Standard, 1964. An accumulation of ore or mineral built up when demand slackens or when the treatment plant or beneficiating section is temporarily unequal to handling the mine output; any heap of material formed to create reserves for loading or other purposes. Nelson. c. Material dug and piled for future use. Nichol, 2.

c. A fixed outer rail against which the rope ends are suspended. Fay.

stock salt. Rock or evaporated salt, with or without added trace minerals, used for feeding stock. Kaufmann.

stock unloaders. A laborer who unload ore, coke, or stone from cars on trestle. Fay.

stockwork. An ore deposit of such a form that it is worked in floors or stories. It may be a solid mass of ore, or a rock mass so interpenetrated by small veins of ore that the whole must be mined together. Stockwork is classified from tabular or sheet deposit (veins, beds), which have a small thickness in comparison with their length and breadth. Diction in the main plane of the deposit (that is, in strike and dip). Taken from German term stockwerk. See also polystock.

stockyard. A space reserved on the surface near the materials shaft for the temporary storage of steel, timber, and other bulky items of supplies for mine use. The yard is surfaced and a mine car is used therein.也可用于writing.

stoichiometric. A chemical compound, or a batch for synthesis, is said to be stoichiometric when the ratio of its constituents exactly is demanded by the chemical formula. Of more interest in the field of special ceramics are non-stoichiometric compounds. See also non-stoichiometric Dodd.

stoichiometric chemistry. Quantitative chemical relations during reaction. Pryor, 3, p. 20.

stroke. Unit of kinematic viscosity. The cgs unit of kinematic viscosity being that of a fluid which has a viscosity of one poise and a density of one gram per cc. Webster 3d.

stroke. A hole, as in a reverberatory furnace, for introducing a rabble or other tool for stirring. Standard, 1964.

stroke. A mechanical appliance for feeding coal, coke, or other fuel into a boiler or furnace. In hand-stoking, the man who shovels the fuel into the furnace is known as the stoker. Also called underfoot stoker; vibrating grate. Nelson.

stoker. A screen size of coal specifically designated, often in fine equipment. B.C. & B. This coal can be of any rank and the stoker is usually designed to fit the physical characteristics of the coal. The flue gas content in the selection of coal for stoker use are: size limits, size consist, uniformity of ash content, calorific fusion characteristics, ash, sulphur and volatile matter percentages. Mitchell, p. 123.

Stokes diameter. Equivalent free-falling.

Stokes' law. a. A formula expressing the rates of settling of spherical particles in a fluid. A.G.I. b. Gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity, \( V = \frac{2g\rho_{d}(d-d)}{9\eta} \), where \( g \) is gravitational acceleration, \( d \) is the radius of the sphere, \( d \) and \( d \) are the densities of the sphere and of the medium respectively, and \( \eta \) is the coefficient of viscosity. \( V \) will be in centimeters per second if \( g \) is in centimeters per second per second; \( a \) will be in centimeters; \( d \) and \( d \) will be in grams per cubic centimeter; and \( \eta \) will be in dynes-seconds per square centimeter, or poises. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-58. c. The wavelength of light emitted by such material is longer than that of the radiation used to excite the fluorescence. In modern language, the emitted photons carry off less energy than is brought in by the exciting photons; the details accord with the energy conservation principle. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-58. See also elutriator; sedimentation test.

Stokes' stretcher. The simplest type of stretcher used for underground first aid. This basket-type stretcher acts as a splint for the whole body and is constructed of tubular steel and strong wire mesh. Used for lifting or lowering injured persons in difficult places. McAdam, p. 104. This type of stretcher is used in metal mines or in coal mines where the coalbed has a steep pitch.

stoking. In powder metallurgy, presintering or sintering in such a way, that the compacts are put through the furnace at a fixed rate by manual or mechanical means; also called continuous sintering. ASM Gloss.

stolzite. A mineral, PbWO₄, consisting of a native lead tungstate isomorphous with wolframine and probably with scheelite and powellite. Webster 3d. Tetragonal. Dana 17.

stomach. a. Mid. To set a prop or sprag with a. Level. As in a fragment of pebble or larger size. Fay. b. A short line are hung, or to serve as a bench for. Fay.

stone. a. A variety of halotrichite. Standard, 1964. Also called rock butter. Fay. b. A sort of alum. Fay. c. A kind of clay said to have been used instead of brick. Fay.

stone carver. In stonework industry, one who carves out figures or designs in full or broken rock. Webster 3d.

stone brick. A hard brick or firebrick made in Wales. Webster 3d.

stone butter. A. A variety of halotrichite. Standard, 1964. Also called rock butter. Fay. b. A kind of clay said to have been used instead of brick. Fay.

stone carver. In stonework industry, one who carves out figures or designs in full or broken rock. Webster 3d.

stone-concentration. Synonym for diamond concentration. Long.

stone content. Synonym for diamond content. Long.

stone crusher. a. A machine for breaking stone, as for road building. When used

used, while in Michigan copper mines "rock" is the common expression. Fay. g. Commonly, although incorrectly, used as a synonym for diamond. Long.

stone blind. A variety of sandstone. Fay.

stone-block paving. Paving consisting of stone slabs accurately cut to a rectangular shape in order to obtain a minimum joint thickness. Ham.

stone crash. Land abounding in stones, especially a subsoil of small stones or finely broken rock. Webster 3d.

stone dunch. Eng. Hard, sandy underclay, or fragments that have been taken from coal. Fay. a. A machine for breaking coal, coke, or other fuel into a boiler or furnace. In hand-stoking, the man who shovels the fuel into the furnace is known as the stoker. Also called underfoot stoker; vibrating grate. Nelson.

stone dunch. Eng. Hard, sandy underclay, or fragments that have been taken from coal. Fay. a. A machine for breaking coal, coke, or other fuel into a boiler or furnace. In hand-stoking, the man who shovels the fuel into the furnace is known as the stoker. Also called underfoot stoker; vibrating grate. Nelson.

stone dust. a. A material in which a stonecutter's ax is used, consisting of fragments or filings. Him. b. A sort of alum. Fay. c. A kind of clay said to have been used instead of brick. Fay.

stone elevator. In coal mines where the coalbed has a steep pitch.

stone elevator. In coal mines where the coalbed has a steep pitch.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stonedust barrier. A device erected at strata to stoniedust dust. a. In coal mines any inert dust stoniedust dropout. See rollout.

stone reparer
called sticker. D.O.T. 1.
stone rubber. In stonework industry, who
rubs down the surface of finished blocks
for a better building lime and sand-
stone with abrasive to remove defects and
marks left by hand and machine tools.
Also called stone finisher. D.O.T. 1.
stones. a. Detached particles of rock usually
smaller than 10 inches (256 millimeters)
in diameter. Stones are classed as gravel
b. Containing or composed of stones,
stone Sawyer. See circular sawyer, stone;
c. A crystalline inclusion present as a fault in glass; stones may re-
main as a fault in glass; stones may re-
d. The assembly carrying the return roll-
of the pot to the return section. Fay.
stone saw. A stone-cutting apparatus having
no teeth, being a simple iron
knife. Long. b. The number
of near-
put up called sticker. D.O.T. 1.
stone sawdust. Comb. Sandy fireclay.
stone scraper. A man who squares or
shapes stones, as for building. Standard,
1964.
stone scraper. a. In stonework industry, one
who trims roughing grade slate to largest
blocks, which allows the pickup of a trimming
machine fitted with rotary cutting knives.
b. Any cleat or beam to check the
motion of stones wks. Wire smaller than No. 14 put up
in 12 Isound coils, which are about 8
inch; low fire shrinkage; enough plasticity
and toughness for shaping; no lime or
Fe-bearing concretions; and very little coarse
moisture. Fay.
stone weight. Synonym for diamond content.
Long.
stone wire. Wire smaller than No. 14 put up
in 12 pounds coils, which are about 8
inches inside diameter. Zern.
stope (1082)

**stopping**

The act of excavating ore, either above or below a level, in a series of steps. In its broadest sense stopping means the act of excavating ore, either by working upward (overhand or downward) or by rooms in flat deposits. It covers the breaking and removal of the ore from underground openings, except those driven for exploration and development. The removal of ore from drifts, crosscuts, shafts, winzes, and raises, which are excavated to explore and develop an ore deposit, is incidental to the main purpose for which stopes are driven and is not a stopping operation. Exploratory and development openings are driven to prepare a mine for extraction of the ore by stopping. *BuMines Bull. 390, 1936*, p. 3. b. In civil engineering, an enlargement. *Fraenkel*. c. The loosening and removal of ore in a mine either by working upward (overhead or overhead) or downward (underhand). *A.G.I. Supp.* d. A method of intrution of light acid magma into heavier basic rocks at Ascutney Mountain, Vt. Blocks of the older rock are wedged loose overhead, settle in the magma, and are assimilated at depth. Thus, the magma works its way upward. *A.G.I.* e. A process whereby plutonic rocks are emplaced. Magna engulfs blocks of the overlying country rock, these blocks sink into the magma, and are presumably assimilated at depth. The magma in this way can eat its way upward. *A.G.I.* 1. See stope, b. *Fay.*

**stoping and filling.** See overhand stopping, b. *Fay.*

**stoping drill.** A small air or electric drill, usually mounted on an extensile column, for working stopes, raises, and narrow workings. *Fay.*

**stoping methods.** The classification of stopping methods adopted by the U.S. Bureau of Mines. *BuMines Bull. 390, 1936*, p. 3. b. In civil engineering, stopping includes (1) stopes in flat deposits; (2) caved stopes with pillar supports which includes naturally supported this includes open stoping with open stopes in small ore reserves and other areas. *Bierman.* i. A hand-size air drill mounted on a column or other support. *Nichols.* 2. See stope drills. D.O.T. 2.

**stopper.** A. A stopping drill. *Fay.* b. A light percussion type rock drill, a stope (an underground opening from which ore is extracted in a series of steps). Also called stoper. D.O.T. 1.

**stoping and filling.** See overhand stoping, b. *Fay.*

**stoping head.** A. The round-ended refractory (fire-clay or graphite) shape that terminates the stopper-rod assembly in a steelcasting ladle and controls the rate of flow of metal through the nozzle. *Dodd.* b. A movable refractory shape for the control of the flow of glass in the channel leading from a glass tank furnace to a revolving pot of a suction machine. *Dodd.* c. A refractory closure for the mouth of a covered glass pot or for the working hole outside an open pot. *Dodd.*

**stopper grinder.** One who grinds bottle necks and stoppers on a grinding lathe to produce a perfect fit between the two. D.O.T. 1.

**stopper hole.** In a puddling furnace, the hole through which the puddle raffle is introduced. *Webster 2d.*

**stopper maker.** One who forms and finishes fire clay stoppers for open hearth ladles, using a stopper press and a finishing machine. D.O.T. 1.

**stopping.** Stopping includes, or more commonly, a masonry or brick wall built across old headings, chutes, airways, etc., to confine and compress the air or to close off access to certain passages, and also to lock up the gas in old workings, and in some cases to smother a mine fire. *Fay.* b. A permanent wall built to close off the unused or no longer needed crossties to prevent the air from short circuiting. *Lewis*, p. 544. c. A dam or seal to isolate old working containing water or injurious gases. *See also inrush of water. Nelson.* d. The filling up of any cracks in biscuit pottery ware prior to the glotfiring. *Dodd.*

**stopping builder.** In bituminous coal mining, one who builds walls of concrete, stone, or brick and mortar, to close off old passageways or haulageways underground, to maintain ventilation in new workings. D.O.T. 1.

**stopping distance.** See braking distance.

**stopping off.** a. Depositing a metal like copper in localized areas to prevent carburization, decarburization, or nitriding in the vicinity of the stops. *ASM Gloss.* b. Filling in a portion of a mold cavity to keep out molten metal. *ASM Gloss.*

**stopping valve.** a. A valve used for controlling the flow of a liquid or gas by turning it on or off. b. A valve shutoff. *Fay.* c. In a steam boiler, a valve which serves to isolate the boiler from the common
steam range when it is laid off for cleaning or repair. Maun, v. 2, p. 339.

storage; memory device. The element of a computer system that retains information that is temporarily stored and is required for reference. N.C.B.

storage battery. A. A combination of secondary cells or accumulators which when charged may be used for a considerable time after as a source of electric current. There are a number of types and makes. Large one find use in operating mine-haulage motors, while a portable type is used in the electric safety lamp. Fey, b. See secondary cell, a. Morris and Cooper, p. 233. c. See accumulator. Nelson.

storage battery locomotive. A. An underground locomotive powered by storage batteries which is cheaper than one driven by compressed air, or by electric power supplied from an overhead wire. Ham. b. See battery locomotive. Nelson.

storage battery-type electric mine locomotive. See electric mine locomotive.

storage tanks. Large circular steel tanks for storing water, located near the well or near the refineries. Maun, 4th, p. 199.

Stora-Kaldo process. See Kaldo steel process.

store. A mine surface building where spare replacements, protective clothing, fuel, etc., are stored and issued for use when required. Nelson.

store-energy welding. Welding with electric energy accumulated electrostatically, electromagnetically, or electrochemically at a relatively low rate and made available at a higher rate required in welding. ASM Glist.

storekeeper. A man appointed at a mine to see to the issue of stores and to ensure that materials are readily available when required. Guided by the manager, he aims to avoid the accumulation of excessive quantities of slow moving articles. Nelson.

store-hole. A pebble beach built up by storm waves at exceptionally high tides, immediately above the level reached by still higher tides. Challenge.

store delta. a. A deposit of a type that has found considerable use for the determination of the viscosity and thixotropy of clay slips. Dodd.

storemometer. A rotating cylinder viscometer of a type that has found considerable use for the determination of the viscosity and thixotropy of clay slips. Dodd.

storm-paved. A gently inclined paved bank to a breakwater. Ham.

storm sewer. A sewer which is wholly empty but which is designed to carry the overflow of storm water. Ham.

storm surge. A rise or piling up of water against shore, produced by wind stress and atmospheric pressure differences in a storm. Schiefferdecker.

storm water. The water which runs off a catchment area after a heavy rainfall. Schiefferdecker.

storm-water tanks. Tanks which receive excessive storm water and allow grit or other solid material to settle before the water is drained off into a stream or river. Ham.

storm wave. A rise of the sea over low coasts not ordinarily subject to overflow; it is caused primarily by wind, and has no relation to the tide brought about by gravitational forces except that the two may combine. More than one-fourth of all the loss of human lives in tropical cyclones has been caused by these inundations and not by the winds directly. A.C.I.

Storrow whirling hygrometer. A hygrometer in which the two thermometers are mounted side by side on a brass frame and fitted with a loose handle so that it can be whirled in the atmosphere to be tested. The instrument is whirled at some 200 revolutions per minute for about one minute and the readings on the wet- and dry-bulb thermometers recorded; used in conjunction with Glashier's or Marvin's hygrometrical tables. It gives more consistent and accurate results than the ordinary instrument. Nelson.

stove side. That side facing the direction from which a glacier moves, a rock or hill in its track; as, the stove side of a crag; opposite of lee side. Standard, 1964.

stove coal. a. In anthracite only; two sizes of stove coal are made, large and small. Large stove, known as No. 3, passes through a 2 & 1/4 inch mesh and over a 1-7/8 to 1-1/4 inch mesh; small stove, known as No. 4, passes through a 1-7/8 to 1 inch mesh and over a 1/4 to 1 inch mesh. Only one size of stove coal is now usually made. It passes through a 2 inch square mesh and over 1-3/8 inch square mesh. Zern. b. See anthracite coal stowes.

stoved salt. Stoved open-pan salt. Kaufmann.

stowing. The process of placing the load on the frame of a ship. Barta.

stowage. Scot. A kiln, as for firing pottery or drying manufactured glass. Harker, 4th, 2d. c. See hot-blast stowe. Dodd.

stow road. Scot. An abandoned road in which the debris of a vein thrown back of a miner and which supports the roof or hanging wall of the excavation. Zern. c. See solid packing. Nelson.

stowing systems; stowing molds. The temporary boards or sheets to hold the material stowed by pneumatic or hydraulic machines in the waste area. The forms sometimes use one board as a core and one, which are moved forward as the stowing of each track is completed. Nelson.

stoving methods. Methods of stowing coal or ore deposits in which systematic stowing of the worked out areas is part of the system. See also coal mining methods; filled stops; solid stowing; strip packing. Nelson.

stoving molds. See stowing forms. Nelson.

stowing. A. Method of mining in which all the material of the vein is removed and the waste is packed into the space left by the mining. Fey. b. The debris of a vein thrown back of a miner and which supports the roof or hanging wall of the excavation. Zern. c. See solid packing. Nelson.

stows. Seven pieces of wood set on the surface of mining property which were fastened together with pins of wood; two stows are called soul trees; two; stow-board; two, hank benches; and one, a spindle. Davey. Nelson.

stowce. A windlass. Fay.

stowplates. Metal plates or sheets, usually closed, used in the manufacture of stove, four sizes, 14, 16, 17, and 19. E. C. M. 1886, p. 1028.

stowce. Fay.

stowce. Wallace.

stradow. See stowage.

straightaway. It is said to be set up or stowed up. Zern.

straightaway; best-hardening finish. Finish produced by hardening a paint or varnish coating by means of heat, for example, with a brush or lamp. Also called baking finish. Bennett, 24, 1962.

stow. a. To pack away rubbish into caves or old workings. Fey, b. To go into to stow away the waste; to put debris into the waste. Maun, 4th, 2d. Eng. To fill a place with stone or debris. SMRB, Paper 61, 1964, p. 200 revolutions per minute for about one minute.

stowaway. Newc. A place into which rubbish is put. Also spelled stowboard. Fay.

stowce. a. A windlass. Fey. b. Derb. A wooden landmark, placed to indicate possession of mining ground. Also spelled stowce. Fay.

stowing. a. A method of mining in which all the material of the vein is removed and the waste is packed into the space left by the mining. Fey. b. The debris of a vein thrown back of a miner and which supports the roof or hanging wall of the excavation. Zern. c. See solid packing. Nelson.

stowce. Nelson.

stowce. Barta.

stowace. Nelson.

stowce. Fay.

straddle shot. Shot with the shotpoint in the center of the seismometer spread. Schiefferdecker.

straddle asE*g. Face milling a workpiece on both aides at once by using two cutters simultaneously.

st. P. Abbreviation for strain point. See also strain point. Dodd.

straddle pipe. In gas manufacture, a bridge pipe connecting the retort with hydraulic main. Fay.

straddle shot. Shot with the shotpoint in the center of the seismometer spread. Schiefferdecker.

straight arch. See jack arch. 4.1.S.1. No. 24.

straightaway. In stripping, a pit that follows the direction of the stope projected on an oriental horizon plane. Woodford, p. 3-4.

straddle.
straight bit, Eng. A flat or ordinary chisel for boring. 

straight brick. A rectangular shape, 

straight coal. S. Staff. An excavation made 

in thick coal, having the solid coal left on 

the top of it. Also called straight stall. 

Fay. 

straight-cut gang frame. In quarrying, a saw 

that uses an annular diamond bit in 

air night compressor. A compressor with 

a straight-res 

straight polarity. Arc welding circuit arrange-

ment in which the electrode is connected 

and properly elastic strain energy and can be 

recuperated as work rather than heat. 

Boo. 

strain strain. A porosity refractory shape for 

use in foundries to control the flow of 

metal and to keep slag and sand inclu-

tions out of the casting. High shock resistance is required. 

Dodd. 

strain gage. a. An electrical, mechanical, or 

optical device used to measure the strain 

of rock, cumulative loading of support props, 

opening cracks, etc. Pryor, S. b. An elec-

tronic mechanical device which transmits 

small displacements to changes in 

resistance which are proportional to the dis-

placement. Strain gages are used in ocean 

bottom pressure measuring equipment. 

HOG. 

strain gage, electric resistance. The basic 

principle of this was enunciated by Lord 

Kelvin in 1854 when he applied tension to 

the fine wires as observed that their resistance increased with tension. 

This was first used for measuring strain in 

1930 by Carlson, who investigated strain in concrete structures, using fine steel 

wires. A further advance was the bonding of wire to a metal structure so that the 

wire automatically absorbed the deformation of straining hammers. During the 

Second World War this type of gage was used with outstanding success by the 

Royal Aircraft Establishment, Farnborough, in England, for laboratory and flight testing of 

complex aircraft structures. The foil strain gage is bonded to the structure 

by an adhesive, reliable operation being possible between 300° and 350° C. 

1090
strain gage, electric resistance

See also electric resistance strain gage. Ham.

strain gage, vibrating wire. This consists of a wire stretched between knife edges, one being free to move longitudinally. The wire is maintained vibrating at a fixed frequency by an excitation method. The knife edges are held firmly against the gage under test, a change of strain in the wire being detected in the wire and hence its natural frequency. This gage is used in conjunction with a reference instrument of fixed frequency; electrical impulses from both instruments are superimposed to produce beats having a frequency equal to the difference between the frequencies of the two instruments. Changes in the frequency of the test gage caused by variations in strain result in identical changes in the beat frequency. The joint output from these two instruments is applied to the plate of a cathode-ray tube, leading to an oscillation of the electron beam with a frequency equal to that of the higher of the two frequencies, with an amplitude which increases and decreases with the same frequency as that of the beats. Dodd.

strain hardening. An increase in hardness and strength caused by plastic deformation at temperatures lower than the recrystallization range. ASM Gloss.

strain sheet. a. A skeleton drawing of a structure, as a roof of true or a bridge, showing the strain to which each member will be subjected. Fay. b. A quarrymen’s term for granite sheets produced by compressive strain. Fay.

strain slip cleavage. a. A variety of cleavage occurring in certain low-grade metamorphic rocks, due to differential movement or slip along each of a nearly parallel series of closely packed shear planes. Between each pair of shear planes, the rocks are puckered into sigmoidal microscopic folds, the outer limbs of which merge tangentially into the shear planes. Holmes, 1929, b. The phenomenon is commonly seen in cataclastic rocks, and must not be confused with the partial exsolution of zoned crystals. Holmes, 1929. strain sheet. a. A skeleton drawing of a structure, as a roof of true or a bridge, showing the strain to which each member will be subjected. Fay. b. A quarryman’s term for granite sheets produced by compressive strain. Fay.

strain slip cleavage. a. A variety of cleavage occurring in certain low-grade metamorphic rocks, due to differential movement or slip along each of a nearly parallel series of closely packed shear planes. Between each pair of shear planes, the rocks are puckered into sigmoidal microscopic folds, the outer limbs of which merge tangentially into the shear planes. Holmes, 1929, b. The phenomenon is commonly seen in cataclastic rocks, and must not be confused with the partial exsolution of zoned crystals. Holmes, 1929. strain sheet. a. A skeleton drawing of a structure, as a roof of true or a bridge, showing the strain to which each member will be subjected. Fay. b. A quarryman’s term for granite sheets produced by compressive strain. Fay.

strata gases
flow and rock porosity and fissures also allow gas migration. The principal strata gases are methane, carbon dioxide, nitrogen, sulfur dioxide, hydrogen sulfide, and radon. (See p. 22-43.)

strata temperature. The strata temperature is determined by the surface temperature, the diffusivity of the strata and the emissivity of the surface. With rocks of high thermal conductivity, and thus, high diffusivity, the strata temperature in temperature with depth is small, that is, the geothermic gradient is low. Where rocks have low thermal conductivity, in coal measure strata, the geothermic gradient is steep. See also geothermic gradient. Roberts, I. p. 139.

strategic mica. Ruby and nonruby block mica. Good-stained or better qualities, grade No. 6 or larger; ruby-stained A/B quality, grade No. 6 or larger; ruby and nonruby film, first and second qualities, grade No. 4 and smaller; muscovite and phlogopite splittings; and phlogopite block of high heat quality. Skow.

stratified. Formed or lying in beds, layers, or strata. Foy.

stratiform. See composite cone. A.G.I.

stratified rocks. a. Derivative or stratified rocks may be fragmental or crystalline; those which have been mechanically formed are all fragmental; those which have been chemically precipitated are generally crystalline; and those composed of organic remains are sometimes partially crystalline. Synonym for sedimentary rocks. A.G.I. b. Rocks arranged in layers. Shell Oil Co.

stratigraphic bore. Exploratory boreholes drilled primarily to determine geological sequence and type of rock formations in a given region. See also structure drilling. Nelson.

stratigraphic control. The apparent localization of mineral deposition by stratigraphic features. A.G.I.

stratigraphic geology. See geology. Fay.

stratigraphic heavy. a. For normal faults, the width of the gap between two parts of a disrupted bed, measured in the direction of the faulted bedding plane. Schieffel- decker. b. For reserve faults, the width of the overlap between two parts of a disrupted bed, measured in the direction of the faulted bedding plane. Schieffelder.

stratigraphic hole. A borehole drilled specifically to obtain a detailed record of the character and composition of the rock formation penetrated and not for the purpose of locating a mineral deposit. Long. See also record hole.

stratigraphic separation. See stratigraphic throw. A.G.I.

stratigraphic sequence. Any stratum (not complicated by overthrusting or over- folding) is younger than the strata below it and older than the strata above it. This original succession from older below to younger above is referred to as stratigraphic sequence. Nelson.

stratigraphic test hole. A borehole drilled for stratigraphic information, including lithology, porosity and permeability. It is drilled to determine potential productivity zone, and thus may result in production. See also seismic shtothole; thin hole; and earth or other structures that may serve as a conductor, such as pipelines. This condition may cause an electric current to flow in pipelines that form a parallel path with the track system. Such current is called stray current. BuMinex Bull. 570, 1937, p. 17. Electric current that is introduced in the earth by leakage of industrial currents. Schieffelder.
stray sand

stone, separated by a short interval from a more persistent member by a break or other change in lithology. A.G.I.

streak. A band of color in the surface of the powder of a mineral as obtained by scratching the surface of the mineral with a knife, file, or the tooth of a needle by rubbing it on an unpolished porcelain surface. Fay. b. The characteristic white or colored streak a mineral makes when rubbed against a streak plate. Bureau of Mines Staff.

streaked. Having some of the mineral constituents so arranged as to give the rock a striped or streaked appearance. In the eruptive rock, this structure is often produced by the ting of the mass in a partially cooled condition. It is best seen in obsidian, rhyolite, and quartz porphyries. Fay.

streak-out ripples. See flame structure. Pettijohn.

stream. A continuous unidirectional current of gas, liquid, or solid material moving along a steady, curved path, or in one or more directions. Spalding.

stream plate. A piece of unglazed porcelain for testing the streak of minerals. Fay.

streamers. Irregular, generally platy lentils of streaking. Synonym for streaming. See also streak.

stream-down sluice. A sluice box placed to receive the material rejected from the tables of a dredge. Fay.

stream-elevated ore. See also stream ore.

streamfretting. That process by which rock material is forced downstream by pushing, by rubbing it on an unpolished porcelain surface, and containing minerals, such as quartz, pyrite, chlorite, sericite, carbonates or food plants during periods of overflow. Consequently, the deposits are pocketed and grade laterally into sandy material. The pockets, however, yield a fine plastic clay, but different pockets vary greatly in composition. Stokes and Hayes, 1955.

stream-down sluice. A sluice box placed to receive the material rejected from the tables of a dredge. Fay.

streamer. a. Corn. To separate or clean ore by washing. Fay. b. A body of flowing water, whether in an open or closed conduit; a jet of water as from a nozzle; or air. The Gulf Stream is an example. See also c. A steady current in water or air. The energy content in relation to its weight. Nichols. c. The force developed by the explosive. Kentucky Act. 1624. The stress at which rock ruptures or fails. BuMiner Bull. 587, 1960, p. 2. e. The limiting stress that a rock or mineral can sustain without failing by rupture or continuous plastic flow. Ruption strength or breaking strength refers to this stress as a stress of rupture. If a body deforms plastically continuously after a certain stress has been reached without any increase in stress, this is also called strength. See also fundamental strength; ultimate strength. A.G.I. f. A term to indicate relative thickness in mineralogic glass. ASTM C162-66.

strength of current. The number of amperes flowing through a circuit. Analogous to the tonnage of gallons per minute in a water pipe. Crispin.

strength of materials. The science that deals with the effects, forces causing changes in the size and shape of bodies. Crispin.

strength. a. Force per unit area, often thought of as force acting through a small area within a plane. It can be divided into components, normal and parallel to the plane, called normal stress and shear stress, respectively. True stress denotes the stress where force and area are measured at the same time. Conventional stress, as applied to tension and compression tests, is force divided by the cross-sectional are. Nominal stress is the stress computed by simple elasticity formulas, ignoring stress raisers and distortion at the plastic limit in a notch bend test, for example, it is bending moment divided by minimum section modulus. ASM Gloss. b. The intensity at a point in a body of the internal forces or components of force which act on a given plane through the point. As used in product specifications, stress is calculated on the basis of the original dimensions of the cross section of the specimen. A.G.I. c. The force that results in strain. A.G.I. Supp. d. Resistance of a body to compressional, tensional, or torsional force. A.G.I. Supp. e. Any condition of tension or compression existing within the glass, particularly due to incomplete annealing, temperature gradient, or inhomogeneity. ASTM C162-66.
the distribution of stress. 

stress concentration factor. K. The ratio of the greatest stress, in the region of a notch or other stress raiser as determined by advanced theory, photoelasticity, or direct measurement of elastic strain to the corresponding nominal stress. ASM Gloss.

stress corrosion cracking. Failure by cracking under combined action of corrosion and stress, either external (applied) or internal (resulting from mechanical stresses) may be either intergranular or transgranular, depending on metal and corrosive medium. ASM Gloss.

stress diagram. See stress-strain diagram. Ro.

stress difference. The algebraic difference between the maximum and minimum principal stresses. A.G.I.

stress-strain diagram. A graph on which the stress is divided by the length over which it is measured and expressed in inches per inch. C.T.D.

stress field. The solid figure formed by surfaces bounding vectors drawn at all points of the cross section of a member and representing the unit normal stress at each such point. The stress solid gives a picture of the stress distribution on a section. Ro.

stress-strain curve. A curve similar to a load extension curve, except that the load is divided by the original cross-sectional area of the test piece and expressed as tons or pounds per square inch, while the extension is divided by the length over which it is measured and expressed in inches per inch. C.T.D.

stress-strain diagram. a. A graph on which is plotted stress vs. strain. Such a graph may be constructed in any test during which increments or continuous measurements of both stress and strain are made. It is commonly constructed for the comparison, tension and torsion tests. It is usually necessary for the determination of deformation energy, elastic limit, modulus of elasticity, modulus of rigidity, percent elongation, and other related properties. H.B.G. c. The curve obtained by plotting unit stresses as ordinates against corresponding unit strains as abscissas. Also called stress diagram. Ro.

stress-strength ratio. The ratio of the actual stress in a specimen to the stress at which it resists further increase. B.S. 3618, 1963, sec. I.

stress strain; opposite of antistress minimum. Webster 3d. See also Stokes stretcher; Neil-Robertson stretcher; Briggs stretcher carriage; Croxale stretcher carriage; McAdam, pp. 105-107.

stress-strain bond. A form of bond in which the brick or aslar are laid lengthwise in successive courses, so that the joints of one course are at the middle of those of the adjacent courses. Standard, 1964.

stretching. A process for straightening rod, tubing, and shapes by application of tension at the ends of the stock. The products are elongated a definite amount to remove warpage. ASM Gloss.

stretching bond. The laying of brick in a wall as stretchers with broken vertical joints. A.R.I.
stretch point. The greatest stress at which a material exhibits a specified elongation under load. Hast.

striation. That which forms when the inverted limb of an overturned or recumbent fold becomes so stretched that it ruptures. Webster 3d. See stretch or very small grooves. Pettijohn.

strich. A minute groove or channel; a threadlike line; a narrow band (as of color) especially when one of a series of parallel grooves or lines. Webster 3d. See also striate. Fay. A very low intensity generally of interest only in optical glass. See also cori, b. ASTM C162-66.

striated, Streaked, or with lines or grooves running, more or less parallel to each other. Gordon.

strait crystal. One with strie on the surface of a face or faces. Skipley.

striation. a. A very fine parallel line marking the surface or cleavage face of a mineral. Fay. b. A channel or scratch made in rock scoring. Standard, 1964. c. A scratch or small channel gouged by glacial action. Bedrock, pebbles, and boulders may show striation, a. The course or bearing of the outcrop of a bedrock. Gordon. Also used in the application of the term to the strike of bedding, schistosity, etc. Lewis, p. 352.

strike. a. The development of opacity or a Mike and lead, lode, or vein, as of ore. Standard, 1964. See also strike, b. A combined effort among workmen to compel the employer to the conduct of his business until completed and the mortar set. A.G.I. d. A very small lead, lode, or vein, as of ore. Standard, 1964. See also strike, b. Also called running bar; running head. See also running bar. Webster 3d.

stringer. Kentucky. Also called running bar; running head. See also running bar. Webster 3d.

stringer. A long horizontal member in a bridge or tunnel. Sand.

string course. A distinctive, usually projecting course in a brick wall; its purpose is aesthetic. Dodd.

string dryer. A tunnel-type dryer, particularly for drying bricks placed intermittently. See also running bar. Webster 3d.

stringer. A balk set between the heads of props and the balks or girders of ported members. Platt.

string. a. Pieces of pipe, stringing, or other downhole drilling equipment coupled together and lowered into a borehole. Compare string strap, tool. b. A drill string term for the drilling bit, jar, drill stem, rope socket, and other tools connected to the lower end of a drill string. Standard or percussion drilling. Also used for the rig and complete drilling equipment. A.G.J. c. A measurement of depth of a drill hole obtained by stringing over the length of cable from the drilling floor to the crown, or top of the drilling director or derrick. A.G.I. d. A very small lead, lode, or vein, as of ore. Standard, 1964. See also string, b. a. Eng. A balk set between the heads of props and the balks or girders of ported members. Platt.

string (stringer) head. A continuous weld bead made without appreciable transverse oscillation, in contrast with weaved bead. ADM Gloss.

string course. A distinctive, usually projecting course in a brick wall; its purpose is aesthetic. Dodd.
strip-pit limits

stripping-pit limits

stripper. A nearly depleted well whose in-

stripper punch. In powder metallurgy, a

stripper, hand. One who paints stripes and
decorative edges on glass, enamel, or
ceramic products using small hand brushes.

stripper. a. See strip, b. Fay. b. Shipping a Mg. Aust. The forming of a jig, 
die cavity and later moves farther into
disturbing. Fay.

stripping. Punch. In powder metallurgy, a

striping-pit limits

stringer. k. In wrought materials, an elo-

cated configuration of microconstituents
or foreign material aligned in the direc-
tion of elongation. More commonly, the term is as-
sociated with elongated oxide or sulfide
inclusions in steel. ASM Gloss.

stringer lead. A small ore body—generally, a
vein leading to a more valuable one.

D.G.I.

stringer lode. A shattered zone containing a
new, small ore body. Generally practiced only
where the coal seams are laid bare by the stripping of the surface soil
and rock strata. Operation are reporting
more and more to this form of mining as
it greatly reduces cost of production, especially those in iron ore.
It is esti-
mated that for every ton of anhidrite that is stripped instead of mined, ten men
are deprived of work. Stripping also elimi-
nates the cost of timbering, hauling, pumping, ventilating, and complicated
safety provisions. Kenna. The operation of
removing the overburden prior to
working the mineral in a quarry or open
pit mine. Bureau of Mines Staff. c. The loading or clear-
ing away of coal from a longwall face
after shotfiring. Nelson. d. Openpits min-
ing. See strips. e. See striping the quarter
area encompassing the pay material, its
area beyond the limits of the ore pit to
includes area of pay material plus enough
area of overburden or thin layers
removed from a coal face. See also strip,
which is otherwise obscure. Standard, 1964.

stripper, hand. One who paints stripes and
decorative edges on glass, enamel, or
ceramic products using small hand brushes.

strip foundation. A continuous founda-
tion for a wall or for several piers or columns
which are commonly designed. See also plumb-
ing. Nelson. b. The use of stretched
strings in awkward underground workings
to provide survey lines and basis for off-
sets. In the lost thread method of survey,
string or thread is paid out as a meas-
uring device as a traverse line is walked.

strip, n. 1. The removal of a surface layer or deposit,
from a coal face. See also strip pit. 2. The filling of prepared coal from the face.

strip, a. In coal mining, to remove the
earth, rock, and other material from a
seam of coal, generally by power shovels.
Generally practiced only where the coal
seam lies close to the earth’s surface.

B.C.I. b. To remove from a quarry, or
other open working, the overlying earth
and disintegrated or barren surface rock.
Fay. c. To mine coal, alongside a fault,
or barrier. Fay. d. To fill prepared coal
from a coal face. Mason. e. To complete
the filling of prepared coal from the face.
Mason. f. Can. To remove soil and vege-
tation interfering mineral deposit. Hoffman.
g. To remove overburden or thin layers
of pay material. Nichols. 2. h. A shallow
cast ingot of brass for rolling into sheets.

stripping-pit limits

working approaches to the pit. Bull. Mines

stripping ratio. The unit amount of spoil or
which may be removed to gain ac-
to a similar unit amount of ore
or mineral material. Bureau of Mines Staff.
struggles. A strip mine.
stripping salt. See abraum salts. Kaufmann.
stripping shovel. See shovel crane-
n. D.O.T.:
stripping-shovel operator. In bituminous coal
mining, one who operates a power shovel in
a strip mine to strip back overlying ground
and to load coal into cars. Also called
boom cat; coal-loading-shovel en-
stripping solution. In solvent extraction, the
aqueous solution used to re-extract the
uranium from the pregnant solution. New-
ten, p. 440.

stripping systems. The removal of the over-
burden and mining of the ore in one or
more layers. The top layer (face being broken
by blasting and the broken ore loaded by
hand, shoveling machine, or steam shovel.
The name "boxes" or "bench-open-pit working"
has been suggested. Fey.

stripping the quarry. The removal of all dirt
and disintegrated material from the quar-
ry face. Nelson.

stripping yard. The place where glass plates
are polished and engraved before grinding and
polishing. ASTN C162-66.

strip pit. A coal or other mine worked by
stripping. An open-pit mine. FAY.

strip sample. A sample, in the form of a
notch or groove, cut from roof to floor of
a coal seam, or hanging wall to footwall
of a vein. See also groove sample. Nelson.

strip steel. Flat rolled steel from the finishing
rolls in a hot strip mill. Strip steel may be
made to specified thickness in thinsness
from 0.049 to 0.25 inch. The strip
is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
be up to 60 inches wide and ranges in
thickness from 0.049 to 0.25 inch. The
strip is wound into coils by downcollets,
is comparable to times of importance in meteorological and biological processes, this isotope is one of the principal radioactively active species in terms of activity and in fusion products that are a few months to a few years. Since it is a bone seeker, it is metabolized in much the same manner as calcium; it is generally considered the most hazardous component of fallout; it is the cause of much of the concern for the fallout problem; and it is the adsorbable, Kapton polyethylene is claimed for use where one or more faces will be exposed in the finished wall and for which specifications include requirements on color, finish, and other properties affecting appearance. This classification includes facing brick, structural clay facing tile, ceramic glazed facing building tile, architectural terra cotta and ceramic veneer. ASTM C43-65T.

This classification includes facing brick, structural clay facing tile, ceramic glazed facing building tile, architectural terra cotta and ceramic veneer. ASTM C43-65T.

The term 'structural' is often used to signify a material or a design that is not intended to carry loads. Typically, structural materials are used in the construction of buildings, bridges, and other large-scale projects. Structural materials are designed to resist loads and stresses, and they are typically made from strong and durable materials such as steel, concrete, or wood. Structural materials are used in a wide range of applications, from simple construction projects to complex engineering designs. Structural materials must be designed and manufactured with careful consideration of the forces and stresses that they will experience in service. This is accomplished through the use of mathematical models, computer simulations, and laboratory testing. The choice of structural materials depends on the specific application and the desired performance characteristics. ASTM C71-64t. ASTM C43-65T. ASTM C71-64t.
structure - 1093

stall covering - 1099
stull dirt; stull rock. Material supported upon the stulls. Fay.

stull stopes. Stopes in which the roof is supported by audacious pillars or concrete columns. Storey, v. 1, p. 394.

stull piece. A piece of timber placed slanting over the back of a level to prevent rock falling into the level from the stopes above. Standard, 1964.

stull timbering. The support of walls in shrinkage stopping by setting stulls. Nelson, 

stun. A comparatively horizontal passage-dull timbering. The support of walls in narrow veins frequently or less than the normal amount of (such) an element or radical; not used systematically. Webster 3d.

sub Abbreviation for subbituminous A.

subA. A prefix denoting under, below, or less than, that of soda and potash combined, or rather for stiflim, which is contrasted with the negligible erosive forces under the sea. Hy.

subaccretion. The erosion of land masses and peneplains; arroyo cavitation. A.G.I. This is contrasted with the negligible erosive forces under the sea. Hy.

subAer. Deposit laid down on a land surface. Schiefederker.

subaerial erosion. The erosion of land masses and peneplains; arroyo cavitation. A.G.I. This is contrasted with the negligible erosive forces under the sea. Hy.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.

subaqueous. Peat deposit formed at moderate elevation under the influence of a cold-temperature climate. Tomkeeff, 1954.

subaqueous mining. Surface mining in which the material mined is removed from the bed of a natural body of water. American Institute of Mining and Metallurgical Engineers. Technical Publication No. 604, 1954.
subaudible noise

variably a period of increased microseismic activity precedes any large-scale ground movement or failure. *Inaction*, 1954.

subaerial a. A layer of material laid on the natural ground under a road base for purposes of subsoil. b. The lowest part of a base. *Crupin."

subbituminous c. A coal. Both weathering and nonagglomerating subbituminous coal have less than 11,000 or more, and less than 13,000 British thermal units (moist, mineral-matter-free). *Subbituminous B coal. Both weathering and nonagglomerating subbituminous coal having 9,500 or more, and less than 11,000 British thermal units (moist, mineral-matter-free). *ASTM D388-38.

subbituminous C. Both weathering and nonagglomerating subbituminous coal having 8,300 or more, and less than 9,500 British thermal units (moist, mineral-matter-free). *ASTM D388-38.

subdivision. See group level. *Stokes, e. 1, p. 228.

subdrift caving. See sublevel caving. *Nelson.

subdrifting and caving. See top slicing combined with ore caving. *Fay.

subdrilling. Refers to the breaking of the base i.e., where boreholes are drilled one foot = several feet below the level of the quarry floor. *Striefker, p. 16.

subglacial. Formed or deposited beneath a glacier. *Fay.

subglacial. Applied to a lithic wacke or lithic arenite containing less than 10 percent matrix. *A.G.I.

subglacial. Formed or deposited beneath a glacier. *Fay.

subgrade. a. The natural ground below a road, track, or siding. *Nelson. b. The surface produced by grading native earth, or cheap imported materials, which serves as a base for a pavement. *Fay.

subgrade surface. The surface of the earth or rock prepared to support a structure or a pavement. *Fay.

sublevel caving. A stopping method in which relatively thin blocks of ore are cavled out by successively undermining small panels. The ore deposit is developed by a series of sublevels spaced at vertical intervals of 15 to 20 feet or more, and occasionally more. This is not all done before stoping operations are begun, but usually only one or two sublevels are developed at a time, beginning at the top of the ore body. The sublevels are developed by connecting the raise, or undercutting or roof, and then undermining the ore by cutting and mining the ore body, or driving horizontal or near-horizontal stopes, and removing the waste. *Fay.

1 sublevel stoping: *Fay.

sublevel backstopping. See sublevel stoping.
sublevel caving

was shoveled into cars and trammed to the raise, but in recent years it is dropped to the raise by means of belt conveyors. These lower sublevels are developed and caved back until the entire block has been mined. This method is used when the ore body is divided into sublevels; the broken ore falls into the sublevels and may be transported by trams. The ore is usually block caved, but in some instances is caved by crosscuts, which are extended from the sublevels and empty in the slice above it. The ore body is developed first by a series of sublevel drifts below the main haulage level. These sublevels are often 20 to 25 feet apart vertically but in some instances are 40 to 50 feet apart. They are connected by a starting raise at one end of the level and by a main raise for entrance to the next level at the other end. Chute raises connect the haulage level to the lowest sublevel, at which the ore is excavated in open stopes, which ore is blasted and drawn through a gathering level in the country rock below. Used with strong ore and strong walls. The method is used with both vertical and horizontal drifts, the latter separated by comparable distances. Vertical pillars may be left between stopes on the same level, and horizontal ones to separate the main haulage. After the block is mined out, the pillars may collapse after the mine is abandoned, leaving all the ore free. Sublevel back stoping, a method of mining best developed in the Mitchell slicing system. See top slicing combined with ore caving. Fay.

sublevel drive. A drive often made in a section, especially in gently inclined deposits, which divides the deposit into narrower panels and zones. They are narrower, and the support and equipment for them is more simple than that required in level drives. Stocks, c. 1. p. 233.

sublevel method. See sublevel stoping, b. Fay.

sublevel slicing. See top slicing combined with ore caving; sublevel method. See sublevel stoping, a. Like a submarine cavern: submerged are midis. An arc-welding process wherein coalescence is produced by heating with an electric arc or area between a bare metal electrode or electrodes and the work. The work is shielded by a blanket of granular, fusible material on the arc. The metal is obtained from the electrode and sometimes from a supplementary welding rod. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

submerged channel. A channel of which grades continually downwards. Hy.

submerged closed. See Benthic Division, Hy.

submerged layer. a. To cause to pass from the solid state to the vapor state by the action of heat and again to condense to solid form. Webster 3d. Used to dry a substance, to purify, or to dehydrate by heating a containing mixture. Webster 3d.

submerged mining theory. The theory that a vein was filled first with metallic vapors. Fay. submergence. See surface float. Hy. submergence phenomena. Any objects which are more or less constantly beneath the surface of the water, usually rarely exposed and filled with air, and which ore is obtained from the electrode and sometimes from a supplementary welding rod. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

submerged object. Any object which is submerged is an object which comes to rest totally or partially beneath the surface of the water and remains there until it is removed or destroyed. Hy.

submerged thalweg. See submarine thalweg. Hy.

submerged weight. The weight of the solids in air minus the weight of water displaced by the solids per unit of volume of soil mass; the saturated unit weight minus the unit weight of water. ASCE 1926.

submerged wall. A wall of refractory material below the level of the molten glass in a tank furnace and separating the melting zone from the refining zone. Dodd.

submergence. a. In an air lift, the distance below the water level, during pumping, at which the air picks up water. Lewis, p. 457, b. A term which implies that part of a mass has become inundated by the sea but does not imply whether the sea rests on the land or the land rests on the sea. A.G.I.

submersible pump. A centrifugal pump, usually driven by electricity, which can be used in submersible applications in which the pump is totally enclosed and fully protected and its position in a shaft or borehole
submersible pump

subsoil

subsoil content. A fault whose detailed location has been mostly determined by previously existing planes of weakness. Nelson.

subsequent ore deposit. See epigenetic deposit.

subsequent stream. Subsequent, which Jukes used in a descriptive sense, has been used similarly in a restricted and technical sense for streams that have grown headward by retrogressive erosion along belts of weak structure, and also for streams which, having been thus developed in one cycle, persist in the same courses in a following cycle. See also longitudinal valley. A.G.I.

subsequent valley. The valleys on the soft rocks which are opened up after the birth of the streams are called subsequent valleys by Schuenck. A.G.I.

subsequent valley. The valleys on the soft rocks which are opened up after the birth of the streams are called subsequent valleys by Schuenck. A.G.I.

subsequent valley. From the surface resulting from collapse of deep workings. Pryor, 3.

subsoil. A sinking down of a part of the earth's crust. Fay. b. The lowering of the strata, including the surface, due to underground excavations. See also maximum subsidence. Nelson.

subsoil. A soil below a subgrade or fill; that is, the portion of a soil profile occurring below the water table. Fay.

subsoil. A soil below a subgrade or fill; that is, the portion of a soil profile occurring below the water table. Fay.

subsoil. A soil below a subgrade or fill; that is, the portion of a soil profile occurring below the water table. Fay.

subsoil. Subsoil is the area affected by sub-"-sidence over areas where minerals or other substances have been removed. The area is larger than the mined-out area below. A.G.I.

subsoil. Subsoil is the area affected by sub-"-sidence over areas where minerals or other substances have been removed. The area is larger than the mined-out area below. A.G.I.

subsoil. Subsoil is the area affected by sub-"-sidence over areas where minerals or other substances have been removed. The area is larger than the mined-out area below. A.G.I.

subsoil. Subsoil is the area affected by sub-"-sidence over areas where minerals or other substances have been removed. The area is larger than the mined-out area below. A.G.I.
subsolling

soil, clay, etc., for aerating, draining, and moistening the soil. Fay.

subsoil plow. A one-tooth ripper designed for agricultural work. Also called pan breaker. Nichols.

subsoil. a. The part of any structure which is below ground, more particularly the foundations. The latter may take

many forms, according to the nature and bearing strength of the ground. Ham.

b. The lower portion of a structure upon which something else is built up. Gipson.

subsoil. a. Underground; the zone below the surface whose geologic features, principally stratigraphic and structural, are interpreted on the basis of drill records and various kinds of geophysical evidence. A.G.I. Supp. b. An underground work-place. Long. c. The underside of a glass blank or sheet of glass. Kinney.

subsoil. a. The surface in the interstices of the zone of aeration that open directly or indirectly to the su'face and hence communicate with the atmosphere. A.G.I.

subsoil. a. Same as structure contours and so-called to distinguish them from contours representing the surface of the ground. Stokes and Varnes, 1935.

subsoil. a. Correlation of rock units and structures that do not appear at the surface, by means of well logs, mine maps, and geophysical data. Stokes and Varnes, 1955.

subsoil. a. Formation of isolated particles that sludge beneath the surface metal. This results from the preferential reaction of certain alloy constituents with oxygen, nitrogen, and sulfur. A.G.I.

subsoil. a. Currents flowing below the surface. Currents normally flow at a speed different from that of the surface currents and may have a different set. Hy.

subsoil. a. The removal of the surplus water from the interior of the soil, by means of natural drainage (for a gravelly soil), or by artificial drains placed under the surface. See also catch-wate drain. Nelson.

subsoil. a. A submerged float attached by a line to a surface float which reveals its movement. See pipping, c. Nelson.

subsoil. a. A body of flowing water, core drilling, and geophysical prospecting. A.G.I.

subsoil. a. See subsurface waste disposal.

subsoil. a. A plane surface representation, generally in horizontal projection, of geologic data or features beneath the earth's surface. There are many types of subsurface maps, including contour maps, isopachous maps, and maps showing variations in lithology, or proportions of rock types in strata. Hy.

subsoil. a. Waste disposal in which manufacturing wastes are disposed of in porous underground rock formations. Disposal wells should be at least 200 feet deeper than the deepest water-bearing formation, and they must be sealed with cement from top to bottom. Also called subsurface injection. Bureau of Mines Staff.

subsoil. a. Value of the water that exists below the surface of the solid earth. A.G.I.

subsoil. a. A horizontal bar used in the subterranean surveying by tacheometry. It is held at a distant point and its distance, direction, and length and the angle which it subtends at the observer's eye. See also tacheo-

metry. Ham.

subsoil. a. The state of being placed beneath something else; specifically, in geology, the deposit. In stratigraphy, the deposit is exposed in descending series. Standard, 1964.

subsoil. a. The bedrock beneath a surficial deposit. Fay.

subsoil. a. Being or lying under the surface. Fay.

subsoil. a. A stream of boiling water that passes through a very large inter-

stice, such as cave, cavern, or a zone of large communicating interstices. A.G.I.

subsoil. a. Same as semitransparent. Shipley.

subsoil. a. Imperfectly or partially transparent; semitransparent. Webster 3d.

subsoil. a. A region of conver-

gent currents marked by rapid increase in surface water density with distance to-

ward poles. Water sinking farther from the equator is more dense and will sink to greater depth. Hy.

subsoil. a. Having a domelike form due to intrusive intrusion into the rocks beneath; said of some domes in strata and of the consequent deformation of the surface and the resultant form of the topography. Fay.

subsoil. a. Not quite vitreous. Webster 3d.

subsoil. a. Deposit. According to European nomenclature, a mineral deposit of mag-

matic origin formed at moderate or shal-

low depth, that is under epiprecular condi-

tions, very often in Tertiary or Quater-

nary lavalas; a term sometimes substituted for the pocket deposit. Schirderdecker.

subsoil. a. Below weathering. Pertaining to the consolidated material—bedrock or a highly weathered layer—on or near the surface. This velocity is distinctly greater than that in the weathered zone. A.G.I.

subsoil. a. A yellow or reddish-brown resin-

ous substance. A.G.I. 

subsoil. a. A method of a seismic wave in a bed immediately under-

lying the low-velocity weathered layer or rock, beneath which the velocity is greater than that in the weathered zone. A.G.I.

subsoil. a. A yellow or reddish-brown resin-

ous substance. Schieferdecker.

subsoil. a. It occurs in considerable quantities on the coast of the Baltic Sea, and in the bituminous coals of Southern Franklin. A.G.I. Also called elektro. Fay. 

subsoil. a. At the bottom of a cutting edge or tooth which tends to pull it into the ground as it is moved. Nicholls.

subsoil. a. A method of mapping glassware, the parison is made by sucking molten glass into a mold, the final shape being subsequently produced in a blow-mold. The process is also known as vacuum-and-blow. See also parison.

subsoil. a. A painted or painted surface. Corn. A honeycombed or porous stone. Fay.

subsoil. a. A method of mapping glassware, the parison is made by sucking molten glass into a mold, the final shape being subsequently produced in a mold. A.G.I.

subsoil. a. The part of any structure which is below ground, more particularly the foundations. The latter may take

many forms, according to the nature and bearing strength of the ground. Ham.

b. The lower portion of a structure upon which something else is built up. Gipson.

subsoil. a. Underground; the zone below the surface whose geologic features, principally stratigraphic and structural, are interpreted on the basis of drill records and various kinds of geophysical evidence. A.G.I. Supp. b. An underground work-place. Long. c. The underside of a glass blank or sheet of glass. Kinney.

subsoil. a. A painted or painted surface. Corn. A honeycombed or porous stone. Fay.

subsoil. a. A method of mapping glassware, the parison is made by sucking molten glass into a mold, the final shape being subsequently produced in a mold. A.G.I.
sucker rod. a. The pump rod of an oil or artesian well. Fay.
b. A rod of steel or wrought iron, used in connections so that it may be joined to other rods and so form a string by which to operate a pump in an oil well.
suction sand. a. A deep well oil pump used widely in the United States for extracting oil. The pump is fixed at the foot of the well and consists of a working barrel and hollow plunger operated by a line of rotating hooks from a walking beam at the surface. Nelson.

sucking. Loss of volatile oxides, particularly lead oxide, from a glass by volatilization during glazing in unsealed saggers or adjacent to nonvitreous kiln furniture, the vapor being sucked into the porous refractory. The fault is prevented by washing the inside of saggers with glaze or in saggarless firing, by the use of kiln furniture of low porosity. Dodd.

suction meter. An anemometer that measures wind velocity by the degree of exhaustion caused by the blowing of the wind through or across a tube. Standard, 1964.
suction boiler. Synonym for sand pump. See also sand pump, a. Long.
suction box. The strainer at the foot of the suction pipe of a pump or of a suction hose. Standard, 1964.
suction blad. See backblad, a.
suction casting. See vacuum casting. Henderson.
suction chambers. If the pressure within the sealed-off mine area is less than that outside, it is necessary to reduce the pressure within the chamber. This is done by using an ejector or fan to draw air through a pipe in the outer wall of the chamber, a second pipe, fitted with a control valve, serving as an intake. Adjustment of the valve gives regulation of the pressure against the intake. The function of the suction chamber is to provide a trough of low pressure between the sealed area and the intake, so that air which would otherwise be drawn into the sealed area, through fissures and pores surrounding the seal, is drawn instead into the chamber. Roberts, J., p. 100.
suction cutter. a. In dredging, use of pump fed by pipe with power-rotated cutting blades to lift spoil. Pryor. b. In alluvial dredging, use of power-rotated cutting shoe to detach minerals from deposits followed by their delivery by suction and elevation through a centrifugal pump. Pryor, 3.
suction-cutter dredger. A dredger in which rotary blades dislodge the material to be excavated, which is then removed by suction as in a sand-pump dredger. C.T.D.
suction dredge. a. Essentially a centrifugal pump mounted on a barge. Carson, p. 29. b. A dredge in which the material is lifted by pumping through suction pipe. Fay.
suction dredger. a. A dredger which digs by means of powerful suction pumps, the semiliquid spoil thus raised being frequently discharged through a floating pipeline. Ham. b. See sand-pump dredger. C.T.D.
suction fan. A fan which sucks or draws the air towards it through airways or air pipes. The term generally used is exhaust fan. Nelson.
suction food. The lead or height to which water can be raised on the suction side of a pump by an influence of atmospheric pressure. Normal atmospheric pressure will sustain in a vacuum, a column of mercury 30 inches high, or a column of water 30 by 13.6 divided by 12, equally 34 feet in height. Therefore, theoretically, a pump should be able to draw water from a depth of 34 feet. Because of constructional imperfections, mine pumps are not usually placed at a greater height than 20 to 25 feet above the surface of the water in the pump. Nelson. See also lift pump.
suction hose. The flexible, reinforced hose that runs from the drill sink to the intake port on a pump. Long.
suction head. In pump nomenclature, exists when the liquid level is below the pump centerline and/or when a gage on the suction side is above the pump centerline. Pit and Quarry, 33d, sec. E, p. 87.
suction pipe. a. That part of a pump where the water enters. Fay. b. See snore; strainer. Nelson.
suction pressure. Pressure in the suction line or evaporator of a refrigerating system. Struck, 10.
suction primer. A pump auxiliary to a steam pump, used to exhaust the air from the main pump. Standard, 1964.
suction process. Any process where glass is gathered by vacuum into the mold. ASTM C162-66.
suction pump. A common pump in which the liquid to be raised is pushed by atmospheric pressure. The vacuum is obtained by a vacuum machine, usually in the form of a suction pump. Webster 3d. Theoretically the suction pump will lift water about 34 feet, but practically only a little over 20 feet can be counted on, because of leakage and other losses. Webster 7.
suction pyrometry. High velocity thermocouple. An instrument for the determination of the temperature of moving gases when it differs considerably from that of their surroundings; the hot gases are drawn rapidly past the junction of a fine wire noble metal thermocouple. Such an instrument is used, for example, in the determination of the temperature of hot kiln gases passing through setting of relatively cool bricks. Dodd.
suction rate. See absorption rate.
succitive dikes. A dike which has been forced quickly into a crack otherwise opened, by fault or earthquake relieving strain, aided by gravitational suction, owing to the condensation by cooling of the gases from the magma, contacts generally fairly straight and not close welded. J. Geol. v. 30, No. 2, Feb.-Mar., 1922, p. 165.

suitable. A variety of hypersthene basalt. A.G.I.
suitability. The name given to a floating mass of decaying vegetable matter, originating from the impenetrable mass which accumulates on the Upper Nile and where it hinders navigation. It formed an obstruction 20 miles long and about 20 feet deep, when it becomes so compact that it will support an elephant. Ham.
suitability drawdown. A rapid lowering of water levels by gravity caused by tidal variations. See also drawdown. Ham.
suckly partings. Term used among Lanca-shire miners for isolated lumps or broad lenticular bands of fusain in coal. Tomkies, 1934.

sutiklinna. An early type of updraught inter-mitted kiln. The fire boxes were below the kiln floor which was perforated for the upward passage of the hot gases. Fry.
sugar. A fault on lead crystal glass resulting from inadequate control during acid processing and not being crystalline on the surface of the glass. Dodd.
sugar of lead. Lead acetate. Fey.
sugar sand. A sand-like material that breaks up into granules resembling sugar. Arkell.
sugar stone. Eng. An ironstone in Norfolk, so-named from its rich brown color. Arkell.
sugar test. A quality test for cement. See also Merriman test. Dodd.
sugar tube. A device to measure the degree of dryness of mine air. It was first used on the Rand and consists of a tube containing about 30 grams of crystallized sugar. A known volume of mine air is aspirated through the tube. The sugar is dissolved and the dust is caught on a filter paper which is incinerated to give the weight of dust. The instrument thus measures airborne dustiness on a mass basis. See also dust sampler, gidget impinger, and unit dust hithet clientele, Nelson.
sugar-tube method. A dust sampling technique which measures airborne dustiness on a mass basis. A sugar tube consists of a glass tube 2½ inches in diameter and 5½ inches long. It is filled by a suitable pump to a mass hole. The dust is retained in the sugar tube, which is then stopped and sent to the laboratory for analysis. R.I. 2392, 1922.
sugary cut. Undue roughness of the edge of flat glass resulting from faulty cutting. Dodd.
sugary quartz. A granular and somewhat friable and massive variety of quartz. Same as sucrose spar. Fay.

S.A.G. Process. A German method for the shaping of highly grogged fire clay refractories; the body is added as a slip and shaping is by a compressed-air rammer. The name derives from the originators: Scheidhauer und Geissel A. G. Dodd.

suite. a. A series of objects or things related
suite through origin or composition and claded together for purpose of study. Minerals and rocks are commonly treated in suites. Stache and von seew (of himeam rocks). See consanguinity.

Mkt. of lune. See walfamtime. Compound with the structure R methyalte. A name given by Stache and von seew (of himeam rocks). See consanguinity.

Mkt. of almohm. A chemical teagent added indrmia.g nib. On silts where the sulfate. a. A salt or an ester of sulfuric acid, John to gray, acidic, andesitic porphyrites 373.

water softening plants. Cooper, pp. 372-463. Used in water for the temoval of organic substances, such as cylinder oil. Used in metal and ceramic cleaning and in the electroplating and refining of metals. CCD 6d. 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-277.

suite. A name given by Stuche and von John to gray, acidic, andesitic porphyrites. See lune.

suite. To convert into sulfate, as by roasting sulfuric acid. Fay.

suite. The chemical reaction that takes place in many roasting operations in which sulfur-containing materials are heated, carbon disulfide and in carbon tetrachloride; and colorless. Aquous solutions are high in chloride giving pH values lower than that of solutions of these also in carbon tetra-

suite. A compound of sulfur with more than one element. A salt or an ester of hydrogen sulfide. Except for the sulfides of the alkali metals, the metallic sulfides are usually insoluble in water and occur in many cases as minerals. Webster 3d.

suite ore. Ore in which the sulfide minerals predominate. Bailer.

suite zone. That part of a lode or vein not yet oxidized by the air or surface water and containing the unaltered sulfide. Fay.

suite. In conditioning a flotation pulp, addition of soluble alkaline sulfides in aqueous solutions. Sodium sulfide is usually insoluble in water and occurs in many cases as minerals. Webster 3d.

suite zone. That part of a lode or vein not yet oxidized by the air or surface water and containing the unaltered sulfide. Fay.

suite. A salt or ester of sulfuric acid; a compound containing the radical, SO4.

suite. A byproduct of the paper industry used as a cheap temporary bond, for example, for silica refractories; it has also been used as a plasticizer in making building bricks. It generally contains 50 to 70 percent of the lignin-sulfonate of Na, Ca, or Mg. Manufactured with 15 to 30 percent of a mixture of sugars; the ash content of the NFs type is very low but that of the Na type may amount to 30 percent.

suite. A hydraulic cement made with a mixture of high alumina cement and gypsum (or hydrite). Dodd.

suite. A mineral in which sulfur and antimony are united chemically with a metal. Weald, 1922.

suite. An ore mineral of any metal or metals with which sulfur and arsenic are united chemically. Wedd, 1922.

suite. Reaction which introduces one or more sulfonic acid groups either by direct use of H2SO4 or by means of a mercaptan (=SH), followed by oxidation. Pryor, 3.

suite. A hydrophilic group known as HS-. In the sulfate 

suite. A hydrophilic group known as HS-. In the sulfate ester O. SO4 an oxygen link is provided, See sulfonic acid.

suite. Elements that occur preferentially in minerals free of oxygen (or fluoride or chlorine), that is, mostly as sulfides, tellurides, tellurides, arsenides, antimonides, intermetallic compounds, native elements, etc. This group includes some of the chalcophile and some of the siderophile elements as classified by Goldschmidt. A.G.I.

suite. a. This brittle, odorless, nonmetallic element in group VI of the periodic system, exists in two stable crystalline forms (alpha sulfur and beta sulfur) and in at least two amorphous forms and two liquid forms. In every physical state, whether solid, liquid, or gaseous, elemental sulfur gives off more than one allotrope, the relationships of which are not yet well understood. Alpha sulfur converts to beta sulfur at 94.5°C or 55.5°C on heating. This transformation is reversi-

suite. A hydrophilic group known as HS-. In the sulfate ester O. SO4 an oxygen link is provided, See sulfonic acid.
sulfur

sulfur with oil of vitriol. Colorless - dark brown depending on purity, highly corrosive, dense, oily liquid. H₂SO₄, molecular weight 98.07, density of liquid 1.84, boiling point 338° C.; density of gas 21.9 grams per liter; specific gravity of liquid, 1.4337 (at 0° C); density of gas, 21.927 grams per liter; viscosity, about 0.13 centipoise.

sulfur burner. A furnace in which sulfur is burned as an electrical inductor. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-246. b. Iron pyrite occurring in coal seams. Also iron sulfide (pyrite) occurring in concretionary form of the sulfide of iron occurring as both pyrite and marcasite. This material seizes to crystallize or grow within the coal as a result of the action of waters bearing sulfuric acid acting upon pyritic minerals. The element occurs naturally in association with volcanos and hot springs, and in cap rocks in salt domes. Extensively produced from pyrites and pyritic minerals, either directly or as a byproduct, also as byproduct in gas striping. Sulfuric acid, hydrogen sulfide, and sulfur dioxide (paper making), and in vulcanizing compounds, fungicides and insecticides. Used in die casting to cover a pot of molten magnesium to prevent burning. Sulfuric acid. Combinations of sulfur with oxygen. SO₂, SO₃, SO₄, SO₃, and SO₄. Pride.

sulphur. See also pick a dot dol sulfur print. Exhibition of sulfur contents and locations in a polished specimen of steel or iron, by pressing against it after paper moistened with acid and a lead salt. H₄S is generated and blackens the paper at the point of contact. Pryor, 3.

sulfuric acid. Colorless tritium crystal or liquid; SO₄; molecular weight, 96.06; specific gravity, 1.84; boiling point, 336° C.; density of gas, 21.927 grams per liter; viscosity, about 0.13 centipoise.

sulfurization. Colorless to dark brown, depending on purity, highly corrosive, dense, oily liquid. H₂SO₄, molecular weight 98.07; density of liquid, 1.84, boiling point, 338° C.; density of gas, 21.9 grams per liter; specific gravity of liquid, 1.4337 (at 0° C); density of gas, 21.927 grams per liter; viscosity, about 0.13 centipoise.
sundance series. marine jurassic clays

sundown splatter. a characteristic effect
shocked on some of the old luster pottery
made in Sunderland, England; after the
luster had been applied it was splattered
with a second medium which caused the
formation of irregular patches on the
bar luster. Dodd.

sundial. the hypothetical amphotile end
member. NaCastrAs(SiAs)(OH). Hey, MM, 1964; Fletcher.

sundried brick. see adobe brick. ACSG, 1969.

sung. the quantity of heat from the
sun tending to heat an enclosed space.

sunny observations. in surveying, fixation of
longitude and/or latitude of a station, or
orientation of a survey line, by use of
theodolite. to relate Sun's altion, sidereal
time and theodolite's location. Pryor, 3.

suns. the same as fire opal. Standard, 1906.
sunshine. a name of a soft grade of paraffin
wax with a low melting point. It can be
burned in an ordinary miner lamp
with a nail (usually copper) in the wick
and gives little smoke. Also called miners'
sun. sunken part. see dig-down part. Nickle.
sunken shaft. a shaft which is driven from
the top downwards (vertical or inclined).
Prangell.
sunlight. a name of a soft grade of paraffin
wax with a low melting point. It can be
burned in an ordinary miner lamp
with a nail (usually copper) in the wick
and gives little smoke. Also called miners'
sun. sunken part. see dig-down part. Nickle.
sunken shaft. a shaft which is driven from
the top downwards (vertical or inclined).
Prangell.
sunlight. a name of a soft grade of paraffin
wax with a low melting point. It can be
burned in an ordinary miner lamp
with a nail (usually copper) in the wick
and gives little smoke. Also called miners'
sun. sunken part. see dig-down part. Nickle.
sunken shaft. a shaft which is driven from
the top downwards (vertical or inclined).
Prangell.
sunlight. a name of a soft grade of paraffin
wax with a low melting point. It can be
burned in an ordinary miner lamp
with a nail (usually copper) in the wick
and gives little smoke. Also called miners'
sun. sunken part. see dig-down part. Nickle.
sunken shaft. a shaft which is driven from
the top downwards (vertical or inclined).
Prangell.

supercharger. A blower that increases the intake pressure of an engine. Nichols. p. 215

superheated steam. Steam above a temperature at which an equilibrium can exist between it and another phase having more internal energy, without obtaining the high-energy phase. ASM Gloss. p. 448

superheater. b. Heating molten metal above the normal casting temperature so as to obtain more complete refining or greater fluidity. ASM Gloss. p. 832. c. The heating of a vapor, particularly saturated (wet) steam, to a temperature much higher than the boiling point. This is done in power plants to improve efficiency and to reduce condensation in the turbine. LIV. Gloss. p. 830

superimposed. a. Applied to ores or ore minerals that have been formed by generally decreasing pressure; Ores formed by downward enrichment. Compare hypogene, c. Fay.

superimposed environment. Solution of metal by water from the upper part of an ore deposit and its redeposition below, causing the environment of the underlying ore. Bateman.

superimposed sulfide enrichment. A process of enrichment near the surface originating in the primary ore acquires increasing metal values as a result of the chemical reaction between descending metal-bearing solutions with the primary (or hypogene) sulfides, whereby secondary sulfur compounds are formed. Also called secondary sulfide enrichment. Schieferdecker.

superimposed zone. The zone in which superimposed sulfide enrichment occurs. Schieferdecker.

superior. a. To heat a vapor not in contact with its own liquid so that it remains free from suspended liquid droplets. Webst 3d. b. Heat added to a substance after melting is complete. Leet. c. Sensible heat in a gas above the amount needed to keep it a gas. HOG.

superheating. a. Heating a phase above a temperature at which an equilibrium can exist between it and another phase having more internal energy, without obtaining the high-energy phase. ASM Gloss. b. Heating molten metal above the normal casting temperature so as to obtain more complete refining or greater fluidity. ASM Gloss. c. The heating of a vapor, particularly saturated (wet) steam, to a temperature much higher than the boiling point. This is done in power plants to improve efficiency and to reduce condensation in the turbine. LIV. Gloss. d. To place one thing upon another. Kinney.

superimposed ac. A form of current in which an ac component is superimposed on a dc component.
Superimposed lens. A dispersion pattern formed in the rock by dissolving and reprecipitation of materials in subsurface waters. 

Superimposed load. In foundation work, it implies all loads other than dead load. 

Superimposed stream. There can be no doubt that the present courses of the streams were determined by conditions not found in rocks through which the channels are now carved, but that the beds in which they now occur were formed in the regolithic rock when the district last appeared above the sea, have been swept away. While Powell applied the term first to the valley only, later writers have applied it also to the streams which occupy such valleys. Synonym for superposed stream. 

Superintendent. a. The mining engineer or manager of a coal or metal mine. He is in immediate charge of all operations concerned with the development and mining of the coal or ore. See also mine superintendent. Nelson. b. The person who shall have, on behalf of the operator, immediate supervision of one or more mines. Jokes, c. One who supervises; a director; an overseer. Ricatto, i. 

Superintendent, colliery. In anthracite and bituminous coal mining, one who supervises and is responsible for all activities of mining and preparing coal for market at a mine. Also called colliery boss. D.O.T. 

Superintendent-of-tanks. One who supervises the feeding and maintenance of glass-melting furnaces (tanks), and the operation of reheating ovens (lehrs) for fire-glazing glass articles. Directs unloading and storage of raw materials and crushing and washing of waste glass (cullet) used as ingredients in the manufacture of new glass. D.O.T. 

Superior official; higher official. An official between the owner and the manager of a coal mine. It includes both officials in the direct line of command and functional or specialist officials. See also agent. Nelson. 

Superintendent pattern. A dispersion pattern developed more or less directly over the bedrock source. Hawkins, 2, p. 152. 

Superintendent. See methane drainage. Roberts, i, p. 80. 

Superlattice. An ordered arrangement of atoms in a crystal lattice to form a lattice superimposed on the normal solid-solution lattice. A.S.M. Glass. 

Superphosphate. Trade name for activated charcoal. Hess. 

Superpose. A classification applied to high-temperature, high-pressure A.S.M. Enam. 

Superpose. A mechanism, invented by Proctor, which simulates making, dumping, and storing steam used in plastering and giving protection to its peened or smooth surface treatment of metal is used to ripen eggs and as a research and production mechanism. Paint, see also superposition. 

Superposition. a. A principle stating that if a body is subjected to several stresses acting simultaneously, then each stress produces its own strain or strains, and these strains may be superimposed to give the complete state of strain of the solid. Similarly, two separate stress distributions in a body, due to the application of two separate stresses, may be superimposed to give the stress distribution due to the simultaneous application of those two stresses. Isaacson, pp. 16-17. b. The order in which rocks are placed above one another. Pay. c. A principle which simplifies structural calculations and which can be used for solving the forces acting in a redundant frame. Ham. 

Superpushing. Using extra large pushers, or two or even three standard units in tandem, in order to increase the speed and size of loading. Nichols, p. 8-30. 

Super-refractory. Refractory capable of withstanding unusually high temperatures and/or other severe conditions of operation. Bennett 2d, 1962. 

Supersaturated solution. A solution is said to be supersaturated when it contains in solution more of the solute than can hold at that temperature in the presence of the crystals of the solute. Cooper. 

Supersaturation. Higher concentration of a solute in a solution than would correspond to its solubility at a given temperature; a metastable condition, as the excess solute in solution when the solution is seeded by introducing a crystal of the solute. Bennett 2d, 1962. 

Supersonic. Pertains to phenomena in which the speed is higher than that of sound. Not synonymous with ultrasonic; see also supersonic frequency. 

Supersonic testing. See ultrasonic inspection. Osborne. 

Supplanted. See overgrown. Mann, v, 1, p. 141. 

Suppletion. The deformation upper part of an evolving stratum magma. Wegg-Larsen's term for the upper nonmagmatic phase of an evolving stratum magma. 

Supplied-air respirator. An atmospheric-supplying device which provides the wearer with a supply of air from a source that is outside of the contained area. The worker's range of operations is always limited by the length of the air hose which brings him the uncontaminated air. Only those with manual or motor driven blowers are approved for immediately harmful or oxygen-deficient atmospheres. One which have no blower, or which recycles the expired air of completed synthesis are recommended for trenched work, point spraying, etc., where gases and dusts are of sufficiently high concentration to permit the wearer's escape in case of accident. With the addition of special mask-hoods or helmets, the air supply system respirator has been adapted for protection against abrasive blasting. Best, 1961. 

Supplies department. A department which aims to ensure that the requirements of the mine, in matters of equipment and stores, are fulfilled; that the various articles of the necessary quality and as far as possible, of standard design and price. In addition, the quantity of physical stores held at the mines is controlled, thus avoiding the tying up of capital unnecessarily. A further function is to ensure that spare parts, vital to production, are always available. See also storekeeper. Nelson. 

Supple vehicle. A carriage or car for taking in materials alongside a production conveyor. A recent development, the carriage is capable of carrying a load of about 1 ton over the normal run of conveyors to heights of 1 in 4. It runs on pneumatic tires and is driven by a diesel engine. The narrow, flat rear wheel of the vehicle, or "feet," enables it to run in the space normally available alongside a gate conveyor. In addition to the...
supercritical fluid. a. A fluid that is superheated above its critical temperature, becoming a single phase that cannot be separated into two phases by pressure or temperature changes. 

surface alteration. b. The characteristic of having a surface that is not a perfect mirror, but has some degree of roughness or texture.

critical temperature. The temperature at which a fluid phase changes from a gas to a liquid, or vice versa, when pressure is held constant.

supercritical. Relating to or denoting fluid states of matter whose density is greater than their critical density, typically in the range of 10% to 30% above their critical pressure, where their behavior is no longer solely governed by classical thermodynamics.

surface. a. The interface between two phases or materials, such as the surface of a solid versus a liquid or gas.

supercritical fluid. b. A fluid that is in a state where it behaves as a single phase, with properties that are different from those of a pure gas or liquid.

surface. c. The outer layer of a material that is exposed to the environment, interacting with it and providing a boundary between the material and its surroundings.

supercritical. c. Pertaining to or denoting a state that is above the critical point of a substance, where the distinction between liquid and gas phases becomes indistinct.

surface. d. The boundary between two different phases, such as the boundary between the gaseous phase and the liquid phase.

supercritical. d. In a fluid state where the density is higher than the critical density, the fluid may not form distinct liquid and gas phases.

surface. e. The boundary where two or more materials meet, such as the boundary between a metal surface and the surrounding air.

supercritical. e. Refers to the state of a fluid where it is at a high enough density to be considered neither purely a gas nor a liquid.

surface. f. The outer layer of a material, where it is exposed to the environment and interacts with it.

supercritical. f. Pertains to fluids that are in a state where their behavior is significantly different from classical fluids, having properties that are influenced by both their density and temperature.

surface. g. The boundary where two materials meet, such as the boundary between a metal and the surrounding medium.

supercritical. g. Pertains to fluids that are in a state where they are not in the conventional phases of gas or liquid, but a single phase.

surface. h. The interface between two phases, such as the interface between a liquid droplet and the surrounding gas.

supercritical. h. Refers to fluids that are in a state where their properties are influenced by both their density and temperature, leading to unusual behaviors.

surface. i. The boundary where two or more materials meet, such as the boundary between the body of the Earth and the surrounding atmosphere.

supercritical. i. Pertains to fluids that are in a state where they do not conform to classical thermodynamic behavior.

surface. j. The outer layer of a material, where it interacts with its surroundings.

supercritical. j. Refers to fluids that are in a state where they exhibit properties that are distinct from typical gases and liquids.

surface. k. The interface between two phases, such as the boundary between a solid and a gas.

supercritical. k. Pertains to fluids that are in a state where they are not in their conventional phases of gas or liquid.

surface. l. The outer layer of a material, where it is exposed to the environment.

supercritical. l. Refers to fluids that are in a state where their behavior is significantly different from classical fluids.

surface. m. The boundary where two materials meet, such as the boundary between a metal and the surrounding medium.

supercritical. m. Pertains to fluids that are in a state where they are not in the conventional phases of gas or liquid.

surface. n. The outer layer of a material, where it interacts with its surroundings.

supercritical. n. Refers to fluids that are in a state where they exhibit properties that are distinct from typical gases and liquids.

surface. o. The interface between two phases, such as the boundary between a liquid droplet and the surrounding gas.

supercritical. o. Pertains to fluids that are in a state where they do not conform to classical thermodynamic behavior.

surface. p. The outer layer of a material, where it is exposed to the environment.

supercritical. p. Refers to fluids that are in a state where they exhibit properties that are significantly different from classical fluids.

surface. q. The boundary where two or more materials meet, such as the boundary between a solid and a gas.

supercritical. q. Pertains to fluids that are in a state where they are not in the conventional phases of gas or liquid.

surface. r. The outer layer of a material, where it interacts with its surroundings.

supercritical. r. Refers to fluids that are in a state where they exhibit properties that are distinct from typical gases and liquids.

surface. s. The interface between two phases, such as the boundary between a liquid droplet and the surrounding gas.

supercritical. s. Pertains to fluids that are in a state where they do not conform to classical thermodynamic behavior.

surface. t. The outer layer of a material, where it is exposed to the environment.

supercritical. t. Refers to fluids that are in a state where they exhibit properties that are significantly different from classical fluids.

surface. u. The boundary where two materials meet, such as the boundary between a solid and a gas.

supercritical. u. Pertains to fluids that are in a state where they are not in the conventional phases of gas or liquid.

surface. v. The outer layer of a material, where it interacts with its surroundings.

supercritical. v. Refers to fluids that are in a state where they exhibit properties that are distinct from typical gases and liquids.

surface. w. The interface between two phases, such as the boundary between a liquid droplet and the surrounding gas.

supercritical. w. Pertains to fluids that are in a state where they do not conform to classical thermodynamic behavior.

surface. x. The outer layer of a material, where it is exposed to the environment.

supercritical. x. Refers to fluids that are in a state where they exhibit properties that are significantly different from classical fluids.

surface. y. The boundary where two or more materials meet, such as the boundary between a solid and a gas.

supercritical. y. Pertains to fluids that are in a state where they are not in the conventional phases of gas or liquid.

surface. z. The outer layer of a material, where it interacts with its surroundings.

supercritical. z. Refers to fluids that are in a state where they exhibit properties that are distinct from typical gases and liquids.
surface damage

1106

surface resistance. The surface resistance of an extended solid. These waves readily penetrate the overburden to an appreciable depth, but they are reflected only from sharp discontinuities in the overburden. See also separate system. Ham.
surface roughness. See roughness, a. A.S.M. Gloss.
surface roughness. Runoff that has not passed below the surface of the land during its journey to the outlet of the drainage area considered. A.G.
surface relief. Salinity of the surface waters varies in all the oceans in relation to latitude, the meridian, and the water phase. Perry.
surface tension. Product of the surface energy and the surface tension coefficient. Ham.
surface trespass. A trespass on a water surface used for drinking or washing purposes. Long.
surface wave. An elastic wave in which the displacement amplitude decreases rapidly with increasing distance from the source. These waves readily penetrate the overburden to a certain depth, but are reflected only from sharp discontinuities in the overburden. See also separate system. Ham.
surface water. a. Water running into underground workings from the surface of the ground. b. Water that rests on the surface of the lithosphere, A.G.
surface water drain. Any pipe laid in the ground for the purpose of carrying away surface water. See also separate system. Ham.
surface wave. A wave in which the energy is confined to the surface of a liquid where it is directly propagated without a water phase. Hal.
surface wave. A surface wave in which the energy is confined to the surface of a liquid where it is directly propagated without a water phase. Hal.
surface water. a. Water running into underground workings from the surface of the ground. b. Water that rests on the surface of the lithosphere, A.G.
surface water drain. Any pipe laid in the ground for the purpose of carrying away surface water. See also separate system. Ham.
surface wave. A wave in which the energy is confined to the surface of a liquid where it is directly propagated without a water phase. Hal.
surface water. a. Water running into underground workings from the surface of the ground. b. Water that rests on the surface of the lithosphere, A.G.
surface water drain. Any pipe laid in the ground for the purpose of carrying away surface water. See also separate system. Ham.
surface wave. A wave in which the energy is confined to the surface of a liquid where it is directly propagated without a water phase. Hal.
surface water. a. Water running into underground workings from the surface of the ground. b. Water that rests on the surface of the lithosphere, A.G.
surface water drain. Any pipe laid in the ground for the purpose of carrying away surface water. See also separate system. Ham.
surface wave. A wave in which the energy is confined to the surface of a liquid where it is directly propagated without a water phase. Hal.
surfacing

surfing

surf tide. Surface active agent, a substance that affects the properties of the surface of a liquid by concentrating in a layer near the surface. Brantly. 1.

surf. Terra used among British miners for (1) a cylindrical or barrel-shaped hopper, or (2) pressure exerted by a pent-up gas resulting in its escape with or without subsequent combustion.

surficial. Characteristic of, pertaining to, formed on, situated at, or occurring on the surface and unconsolidated residual, alluvial, or glacial deposits lying on the bedrock. Fay. The name is applied to both the undecomposed and unconsolidated materials at the earth's surface, such as stream alluvium, glacial deposits, and unconsolidated residual, alluvial, or glacial deposits lying on the bedrock. Also, the geological term for the unconsolidated material at the earth's surface. Surficial deposits consist of unconsolidated material that has been transported by the action of water, wind, or other agents and is deposited on the earth's surface. Surficial deposits include materials such as sand, silt, and clay. Surficial deposits are often referred to as unconsolidated deposits because they have not been subjected to the process of consolidation, which is the hardening of sediments as a result of compaction and cementation. Surficial deposits are often found in areas that were previously covered by bodies of water, such as lakes and oceans, and are deposited as the water recedes. Surficial deposits are also found in areas where wind or other types of erosion have removed the overlying consolidated deposits. Surficial deposits are important resources for human activities, as they can provide a source of water, sediment, and other materials for use in construction, agriculture, and other industries. Surficial deposits are also important for understanding the history of the earth, as they can provide evidence of past environments and conditions. Surficial deposits are often studied using techniques such as sedimentology, geochronology, and paleoecology.
The text on the page is a continuation of the previous discussion on suspended solids. It includes the following definitions and explanations:

- **Suspended solids**: Solids that can be separated from the water by settlement or filtration.
- **Suspended load**: The portion of load that remains in suspension.
- **Suspended roax**: A method of roasting where the material is suspended in a fluid medium.
- **Suspended solids**: Particles that are suspended in a fluid and do not settle out under gravity.
- **Suspended solids conveyor**: A type of conveyor used to transport material that is suspended in a fluid.
- **Suspended solids concentration**: The concentration of suspended solids in a fluid.
- **Suspended solids transport**: The process of transporting suspended solids in a fluid medium.

The page also includes definitions of terms related to the mining industry, such as:

- **Suspended solids in mine**: The concentration of suspended solids in mine water.
- **Suspended solids in water**: The concentration of suspended solids in a water stream.
- **Suspended solids in air**: The concentration of suspended solids in the air.
- **Suspended solids in soil**: The concentration of suspended solids in soil.
- **Suspended solids in sediment**: The concentration of suspended solids in sediment.

The text also contains references to specific locations and sources, such as:

- **DOD**: Department of Defense
- **Bennett 2d**: Refers to the 2nd edition of a work by Bennett

The text is a continuation of a larger discussion on the properties and behavior of suspended solids in various environments.
swage test

swage tool. An electric test, carried out with low voltage, for verification of such de-
lays in a vitreous enamel as produce blistering or other blemishes. Dodd.

swage. 2 A. A New. A thick layer of stone or re-
forced clay at the bottom of the ware. Fay
b. T. Pease. Impressed clay or black-
shale. Compare upset swage. Arkell

swage, A depression in a roadway usually
caused by the Dung of weight of the roof from above. Arkell; Lane Sub-
sequent of weighting of the roof. Fay &
Aust. A part of personal belongings car-
rried in a bag. J. Wall. 2 A. Tool used in
smelting. Webster 3d. A man used to haul
away hot waste. Gray & Smith.

swaged. It is produced in diameter by use of a
swage. A part of the Christmas tree
swally; swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
swallet. 1. A tool used in repair collapsed
or damaged caesure. Williams. A tool used
in shape of a hollow. Fay.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

sway. A sideways movement, such as side-
ways of a许多人 or a reduction on
metal products, such as rod and tubing by
forging, squeezing, or hammering. See also rotary swage. A. S. M. Gloss.

swamp. A. Aust. A mire, a bog, or a place
where travels in search of employment; so called because he car-
rries his swag, or bundle of clothes, blanket,

swale. A. Local depression in the floor of an
entry or room. Grove.

swallet. A. Eng. An underground stream;
also, an opening through which a stream
appears on the surface. Webster 3d. A
also called swale. Fay. b. An in-

swamp block. A large rectangular block
of cast iron used by a blacksmith. It is pierced through with numerous holes;
the iron is heated, swaged, placed in a box of sand, and allowed to cool. The
resulting block is then broken into smaller pieces by hammering.

swaged. Reduced in diameter by use of a
blacksmith's swages, hence the name. This
process is used to reduce the size of a metal object, usually by hammering.

swaging. A hammering process, but the same
result may be attained by pressing forcing or
by spinning. Fay.

swag. A. A bundle of clothing, or a pack of
articles. Webster 3d: Fay.

swag. b. A bundle of clothing, or a pack of
articles. Webster 3d: Fay.

swag. c. A tool used in repair collapsed
or damaged caesure. Williams. A tool used
in shape of a hollow. Fay.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.

swallet. 2 A. A part of the roof. Fay &
Aust.

swallet hole. A. G. I. A gouge-shaped hole
brought about by the settling of the mine roof. Fay.

swally. A trough, or syncline, in a
swallow hole. A. A natural cavern formed
in the roof of a mine yard for the workings
of a mine. Grove.
sweeps. A. The dust of workshops, of the sawdust ejected by the sawing processes. B. A machine used to remove dust from a surface. C. A local enlargement or thickening in a coal seam. D. A soil or rock that can expand freely in a direction perpendicular to the heating surface. A.G.I.

sweet coal. Eng. Term in use among miners for low volatile bituminous coal.

vent formation of channels as pulp flows radially across the surface.

providing a rotating brush which prevents the dust from becoming airborne.

swimming pool reactor. A furnace used for the manufacture of producer gas.

swing-bowl. A type of furnace used in the manufacture of producer gas.

swing-day. Synonym for change-day.

swing-frame mill. A machine in which the shaft is driven by a steam engine.

swing-frame regulator. A simple method of regulating the flow of a stream of water.

swing-day. Synonym for change-day.

swing-elevation. The distance in degrees which a shovel must swing between digging and dumping points.

swing cut. A slabbng cut.

swing day. Synonym for change-day.

swing hammer. A type of hammer used in the mining industry.

swinghammer. A type of hammer used in the mining industry.

swing-back. A type of hammer used in the mining industry.

swing back. A Weller tool for locomotive.

swing-electrode controller. This controller is made up of three fixed electrodes consisting of groups of parallel plates of non-conducting alloy to form an electrode pair. A reasonable time is allowed the discoverer to explore the vein or lode to find out its strike and thus enable him to lay his claim.

swing boat. Swinging boat. Mid. Before the introduction of cages and guides, skipping or skidding coal, and also the men, were raised and lowered swinging looee in the shafts. See also butt. Fay.

swing-electrode controller. This controller is made up of three fixed electrodes consisting of groups of parallel plates of non-conducting alloy to form an electrode pair. A reasonable time is allowed the discoverer to explore the vein or lode to find out its strike and thus enable him to lay his claim.

swing-back. A type of hammer used in the mining industry.
swinging field magnetization

Swinging field magnetization. A magnetic field which is the result of two or more magnetizing forces impressed upon the sample so that each field is rotated in a controlled sequence and which permits magnetic-particle inspection after one processing. ASTM Gloss.

Swinging gate. An instrument of the steady deflection type, where speed is read off directly from the scale of the instrument. This is most useful for measuring low speeds, since it permits a spot reading. This instrument does not integrate and is used extensively in work connected with the ventilation of building interiors, and to a fair extent underground. Robert's, I, p. 39.

Swinging plate. An amalgamated copper plate hung in a sluice to catch float gold. Fay.

Swinging-lib crane. A crane with one horizontal boom on which there is a counterweight. It can swing through a full circle. See also titan crane; tower crane. Ham.

Swinger loader. A tractor loader that digs in front, and can swing the bucket to dump to the side of the tractor. Nichols.

Swing loose. Ark. To gradually loosen over time. Fay.

Swing shift. a. Workday from 4 p.m. to 12 p.m. to 8 a.m. to 4 p.m. Nichols. c. Workday from 3 a.m. to 11 a.m. to 11 p.m. to 3 a.m. Nelson.

Swing roller. In a revolving shovel, one of several tapered wheels that roll on a circular track. At the weight of the vane is constant, the angle of inclination will be dependent upon the rate of change of velocity in ducts and the rate of air discharge from ventilating grills. Roberts, I, p. 76.

Swing shift. A jack used to replace derailed cars on a railway track. Fay.

Swing soft. The marks on the bottom of a pot formed by cutting from the wheel. ACSG, 1964.

Swivel. Pure, uncoated, luster silver of various sizes, usually having a banker's or assayer's seal stamped on them; used by U.S. 261, "specimen of exchange and reckoned by weight. The larger, sometimes called shoes, are boat shaped and weigh about one pound troy. Standard, 1964.

swivel coupler. a. A coupling where one link is made so that it can be rotated independently of other links. When this coupling is used, one or more cars can be rotated on a revolving dump without unloading from the surface. Zern. b. A coupling that gives complete freedom to a deflecting wedge-setting assembly. Long.

Swivel head. a. The assembly of a spindle, chuck, feed nut, and feed gears on a swivel head drill machine that surrounds, rotates, and advances the drill rods and drilling stem. On a hydraulic-feed drill the old gear uses are replaced by a hydraulically actuated piston assembly. Also called boring head; drill head; drilling head; gate. Long. b. In a diamond drill, the mechanism that rotates the Kelly and drill string. Nichols. c. See drill head.

Swivel head gear. The box gear mounted on the outside of the drive quill in the swivel head of hydraulic-feed, and/or some types of gear-feed, diamond drills. The gear meshes with, and is driven by, a miter gear on the drill motor shaft. Long.

Swivel holding plug. Same as holding plug. Long.

Swivel hook. a. A hoisting hook suspended from a freely rotating (bearing) part in such a manner that the rotation of the drill rods is not transferred to the hoist cable or vice versa, when the rods are pulled or lowered. Long. b. A hook with a switch control to its base or eye. Nichols.

Swivel neck. Synonym for a washer or a mud seal. Long. Also called gooseneck.

Swivel sockets. Another name for jars. Stoesz, v, p. 77.

Swivel trough. A short, adjustable angle trough, which permits turning the conveyor panline any amount up to 10°, either to the right or to the left. The position of the swivel is controlled by a roof jack and a pendulum. Jones.

Swivel-rolled stake. A bench vice which may be rotated on its base to bring the work which it holds into better position. Crispin.

Swivel type. Also an old term for certain alluvial deposits found in coal measures. Fay.

Swivels. The marks on the bottom of a pot formed by cutting from the wheel. ACSG, 1964.

Swivel coupling. a. A coupling where one link is made so that it can be rotated independently of other links. When this coupling is used, one or more cars can be rotated on a revolving dump without unloading from the surface. Zern. b. A coupling that gives complete rotary freedom to a deflecting wedge-setting assembly. Long.

Swivel coupler. a. A coupling where one link is made so that it can be rotated independently of other links. When this coupling is used, one or more cars can be rotated on a revolving dump without unloading from the surface. Zern. b. A coupling that gives complete freedom to a deflecting wedge-setting assembly. Long.
syenogabbro. An intrusive rock that contains syenodiorite. A term based on the form of sylvester. A hand-operated device for with-
sylvite; sylvine. The principal ore of Was-
sylvine. The name for krennerite. It is of minerals, (Au,Ag)Te2. Conesponds to broic minerals. An orthoclase gabbro. The
mediate however, be called monzonite, a term which should,
fuss from quartz, that is, for phaner-
crystalline igneous rocks intermediate in
free from quartz, that is, for granites for rocks like the latter, but
of medium grain size, oc-
syenite. Fay. Of medium grain size, oc-
product near volcanoes. It is a source of
synchronous timing
angle to each other. These disks rotate with the same speed in the same direction
and are so set to be widest apart at the bottom. Feed is from the center, and
the material is gradually crushed at
near the edge, then thrown out by centrifugal force. Liddell 24, p. 358.
symplectic. The term produced by the
intergrowth of two different minerals. Pegmatic, granophyric, poikilitic, ophtlue,
and bauxitic textures are included un-
der this term. See also symplektite. Stokes and Vernes, 1955.
symplektite. A secondary intergrowth of two
minerals which are interwoven or plaited,
together, one of the minerals usually hav-
ing a vermicular shape. The texture so
produced is described as symplektic, and
is found in certain igneous and metamor-
phic rocks. Commonly the intergrowth is
symplectic.
symphylite. A pale indigo or green prismatic
monoclinic mineral with perfect cleavage,
3FeAs2O5.8H2O, forming 3FeAsO4.10(OH)2;
specific gravity, 2.96. Larsen, p. 181.
symphonic minerals. See diagnostic min-
ucleus.
synodinite. It is essentially vertical. McKinstry, p. 641.
synonym. An intrusive rock that contains
orthoclase in addition to the normal gabb-
broic minerals. An orthoclase gabbro. The
plutonic equivalent of trachybasalt. A.G.I.
sylvite. a. One of the gold telluride group
of minerals, AgTl2. Corresponds to the same general formula as calaverite and
krennerite. It is usually associated with
igneous rocks and, in veins, with native
gold. Monoclinc. Steel-gray to silver-
white in color. Brilliant metallic luster becoming dull on exposure. Contains 99.2
percent gold, 13.3 percent silver. Specific
gold.
syphoxite. A rare, weakly radioactive,
orthorhombic or monoclinic min-
eral, (Ce,La)(Ca,Co)AsO4, usually found
in pegmatites associated with auriferous,
microline, astrophyllite, fluorite, gado-
linite, xenotime, cordylite, and cathaplite.
May be related to paratite. Crosby, p. 110.
synthetic TIM-P. See also monzonite, a term which should,
syntecton. A space in a seam from
which the coal has been eroded and its
material. A.G.I.
synthetic TIM-P. See also monzonite, a term which should,
synthetic TIM-P. See also monzonite, a term which should,
synthetic TIM-P. See also monzonite, a term which should,
synchronous timing

at the proper time in relation to the voltage to insure a balanced current wave; (2) each is exactly the same as the preceding one essentially identical to the first; and (3) the last half-cycle is of opposite polarity to that of the first. I.C. 8075, 1962, p. 64. Used in metallic-synclinal responses to reagent combinations to obtain the maximum possible recovery of ore or metal. Nelson.

syncline. A term now generally applied to mineral or ore deposits formed contemporaneously with the enclosing rocks, as contrasted with epigenetic deposits, which are of later origin than the enclosing rocks. Holmes, 1920.

synclinal deposits. Deposits formed contemporaneously with the parent rock and enclosed by it. There are two types of synclinal deposits, the igneous and the sedimentary. Some examples are nickeliferous sulfides, nontitaniferous magnetite, diamond, chromite, and corundum. Lewis, p. 273.

synclinal igneous deposits; magmatic segregations. Deposits formed by the solidification of basic magmatic material and occur as dikes and irregular masses. Lewis, p. 273.

synclinal ore deposit. Term generally applied to ore (mineral) deposits formed contemporaneously with the enclosing rocks. Schiefler-decker.

synclinal pattern. A dispersion pattern formed at 1 station so tiny that the matrix in which they occur. Synclenetic patterns include those developed (1) in igneous rocks during the crystallization, (2) in residual soil, gossan, or leached rock as a residual product of weathering, and (3) in glacial till, as clastic material mechanically transported and deposited by glacial action. Haukés, 2, p. 26.

synclinal sedimentary deposits. Include placer deposits and beds like the Clinton hematite ores, which are simple sedimentary rocks containing sufficient valuable minerals to be mined profitably. Lewis, p. 273.

synclinite. Applied to a texture of rocks in which they occur. Synclenetic patterns include those developed (1) in igneous rocks during the crystallization, (2) in residual soil, gossan, or leached rock as a residual product of weathering, and (3) in glacial till, as clastic material mechanically transported and deposited by glacial action. Haukés, 2, p. 26.

syncline. A fold in rocks in which the strata dip inward from both sides. Fay, b. A trough-shaped curve of the strata. Gordon.

synclinal axis. In geology, the central line of a syncline, toward which the beds dip from both sides. Fay.

synclinal bend. An upwardly concave flexure in which the beds of one limb dip relatively steeply toward the apex (line of greatest flexure) and the beds of the other limb dip gently away from it. Stites and Barnes, 1955.

synclinal closures. Structural basins and canyons, usually of downcurrent sense, because when these are represented by structure contours, these contours are closed. Stokes and Barnes, 1955.

synclinal mountain. See anticlinal mountain.

A.G.I.

synclinal valley. a. The plication of the earth's crust produces alternating depressions and elevations, unless the folds are pressed together into a loop, or some. The depressions are synclinal valleys. A.G.I. b. Synclinal valleys are those which follow synclinal axes. A.G.I.

syncline. A fold in rocks in which the strata dip inward from both sides toward the axis. Opposite of anticline. Fay.

syncline. Same as synclinorium. Fay.

synclinorium. a. A compound syncline; a closely folded belt, the broad general structure of which is synclinal. Also called syncline. Fay. b. A major syncline composed of many smaller folds. Ballard.

syndacty. A hold pattern for synthetic detergents. See also detergents, synthetic.

syndactyl. A group of persons or concerns who combine under a usually temporary agreement to carry out a particular transaction, such as underwriting a bond issue. Webster 3d.

syndicate. Person who works with a, party of men who combine under 'a usually temporary agreement to carry out a particular transaction, such as underwriting a bond issue. Webster 3d.

synclinal mountain. See anticlinal mountain.

syndet. Abbreviated form for synthetic detergent.

synclinal axis. In geology, the central line of a syncline, toward which the beds dip from both sides. Fay.

syndrome. Any of a large number of chemicals formed from a basic substance by rigidly proportioned raw materials by crystallization during slow cooling of a melt or by solid-state reactions. A.G.I.

synthetic faults. Subsidiary faults parallel to the master fault. A.G.I.

synthetic gem. One artificially made from chemicals. Schaller.

synthetic hematite. Manufacturers' misnomer for various metallic imitations of hematite, Shiple.

synthetic hematite. Misnomer for various metallic imitations of hematite, Shiple.

synthetic mica. Any of a large number of micac formed from a basic substance by rigidly proportioned raw materials by crystallization during slow cooling of a melt or by solid-state reactions. A.G.I.

synthetic mineral. An artificial substance having all the properties of a mineral. Hurlbut.

synthetic ore. A term used by the Bureau of...
siderite. An obsolete term for meteorites.

Syrian asphalt. A valuable pitch found in Syria.

Syracuse salt. A series of chief-salt-bearing formations.

Syphonic incinometer. An instrument widely used for measuring the temperature in gas and oil wells or boreholes. The device is low-cost, highly accurate, and portable. Pryor, 3, p. 159.

Syntetite. A trade-mark name for synthetic sapphire, also known as synthetic sapphire. See synthetic ruby.

Synthetic stone. A reproduction of a stone, either naturally occurring or man-made. Nelson.

Synthetic sapphire. A synthetic gemstone that resembles the natural mineral sapphire. Ricketts, I.

Systematic error. An error that is always present and affects the results in a consistent manner. Zimmerman, p. 111.

Systematic timbering. Placing mine timbers in a manner that is systematic and uniform, allowing for efficient and safe mining operations. Nelson.

Systematic sampling. The taking of samples in a systematic manner, ensuring that each sample represents a specific portion of the population. Zimmerman, p. 107.

Systematic error. a. A cumulative error that is always in the same direction. b. A constant error. Zimmerman, p. 111.

Synthetic sapphire. A trade-mark name for synthetic sapphire, also known as syntetite.

Synthetic ruby. A synthetic gemstone that resembles the natural mineral ruby. Ricketts, I.

Systematic error. e. See bias error. Zimmerman, p. 135.

Systematic error. g. See bias error. Zimmerman, p. 145.

Systematic error. h. See bias error. Zimmerman, p. 150.

Systematic error. i. See bias error. Zimmerman, p. 155.

Systematic error. k. See bias error. Zimmerman, p. 165.

Systematic error. m. See bias error. Zimmerman, p. 175.

Systematic error. o. See bias error. Zimmerman, p. 185.

Systematic error. s. See bias error. Zimmerman, p. 205.

Systematic error. w. See bias error. Zimmerman, p. 225.

table cutter. A lapidary who cuts tables or plane faces on diamonds or other precious stones. Fay.

table diamond. A relatively flat diamond used as the form of diamond used in the manufacture of table cut diamonds. Fay.

table feeder. See rotary table feeder. ASA M674-1958.

Table flotation. Flotation process practiced on a shaking tabe, which is an inclined, vibratory screen, conditioned, and fed to table as thick slurry. Flotation particles become g' measurable, held together by minute air bubbles and edge adhesion. These roll across and are discharged nearly opposite feed end process being helped by jets of low-pressure air from piping set across table. Tablings work along deck to discharge material.

Tableland. a. A plateau, or elevated region of flat or undulating country rising to heights of 1,000 feet, and more, above the level of the sea. See also plateau. Fay. b. In geography, any flat or comparatively level tract of land considerably elevated above the general surface of a country. A.G.I. c. A flat or undulating elevated area; a plateau or mesa. A.G.I.

tableman. a. In the stonework industry, one who lays out and marks marble slabs to prior to their being cut, using a rule, straightedge, and crayon or chalk. D.O.T. L. b. See screenman. D.O.T. 1. c. In ore dressing, screening, and refiling, one who tends concentrating tables used in treating pulp (mixture of finely ground ore and water) to separate valuable minerals from a matrix of waste gangue, etc. See also undercurrent. Hess.

tablemount. a. A platform or plate on which coal is put into a mine shaft for temporary purposes. Fay. b. A small pillar of coal. Fay. c. A small pillar of coal. Fay. d. Veinstone; gangue, etc. Fay. e. Scot.

table reef. An isolated coral reef or island, many miles from an octahedron by cutting to opposite sides of a country. A.G.I. 

table spar. Tabular spar. See also wollastonite. Fay.

table stone. The typical form thus described which results from the use of a relatively higher table of the same size prior to their being cut, using a rule, straightedge, and crayon or chalk. D.O.T. 1.

table trap. See screenman. D.O.T. L.

table water. See also wollastonite. Fay.

table way. The form of cut which results from the use of a relatively high table of the same size prior to their being cut, using a rule, straightedge, and crayon or chalk. D.O.T. 1.

tableway. All utensils and decorative articles used for table service. ASTM C242-60.

tableting. Separation of two materials of different densities by passing a dilute suspension over a slightly inclined table having a reciprocating motion or shake with a slow forward motion and a fast return. Bennett 216, 1946. Add.

Tablet marble. A beautiful transparent limestone, composed of innumerable laminae, thin as paper, and formed by deposition from a calcareous sea-water containing opaline siliceous material. Tabliz marble. Fay.

Table water. See sugar chlorides. C.C.S., 1961.

table water. See also wollastonite. Fay.

Tack coat. A thin coat of hot road tar or bitumen emulsion applied over a road surface to improve adhesion with the subsequent single or two course bitumen final surfacing. See also wearing course. Fay.

tack coat. A thin coat of hot road tar or bitumen emulsion applied over a road surface to improve adhesion with the subsequent single or two course bitumen final surfacing. See also wearing course. Fay.

tack coat. A thin coat of hot road tar or bitumen emulsion applied over a road surface to improve adhesion with the subsequent single or two course bitumen final surfacing. See also wearing course. Fay.

tack coat. A thin coat of hot road tar or bitumen emulsion applied over a road surface to improve adhesion with the subsequent single or two course bitumen final surfacing. See also wearing course. Fay.

Tack aluminas. Corundum (> 95.9 percent Al2O3) supplied by Aluminum Company of America, grade 4fO4, for refractories, contains < 0.25 percent MgO and 61% for electroceramics, contains < 0.05 percent Na2O. Dodd.

Tablet crossing-bedding. A cross-bedded unit with a flat base and flat top forming a tabular body. Pettijohn.

Tabular deposit. A flat tablike or stratified bed, for example, a coal seam. Nelson.

Tabular structure. A tendency in certain igneous or crystalline rocks to separate into plates or laminae. It differs from stratification in manner of origin. Standard, 1964.

Tabi-cut. This is a modified double-spiral cut. As regards the advantage it is inferior to the proper double spiral. The benefits of the Taby cut are, however, that the holes are here located vertically below one another on one and the same line. This facilitates drilling and mechanization of the drilling. Langford, pp. 245, 247.

tacharanite. A mineral (Ca,Mg,Al,Si)Al3O6. It is a green to greenish-bluish, birefringent mineral, and birefringence is generally deeper than 100 fathoms, too thin of which has a compactly smooth platform. Schieferdecker.
tackey

Making tack welds. ASM Gloss.
tack. v. An assemblage of ropes or wire cable; and pulleys arranged for hoisting or conveying materials. Putters in former times also used a tail

tackle block. Synonym of block and tackle.
tackle; tackers, Leic. a. Small chains put around the top of loaded tubs or buckets, to keep the coal from falling out. Fay, b. Short chains formerly used for raising and lowering men in a shaft. Three men generally sat at them at one time. See also bant; bont; Fay.
tackler skip. s. Staff. A kind of box in which men used to ride in a shaft; used also for carrying minerals. See also paddy pan; bant; bont; a. Fay.
tack rivet. A rivet which carries no load but is inserted for convenience of construction. Ham.
tack welds. Small, scattered welds made to hold parts of a weldment in proper alignment. While the final welds are being made, ASM Gloss.
tacoma process. An electrolytic method for removing carbon from iron. Fohl.
taconite; taconyte. a. The cherty or jaspery form and which may be hematite or magnetite, or a combination of the two especially hard, lean iron ore that has its rock that encloses the Mesabi iron ores in Minnesota. In a somewhat more general sense, it designates any bedded ferruginous chert of the Lake Superior district. Stokes and Varney, 1933. b. In Minnesota practice, it is any grade of extremely hard, lean iron ore that has its iron either in banded or well disseminated form and which may be hematite or magnetite, or a combination of the two within the same or body. Cumming.
taconite ore. A type of highly abrasive iron ore now extensively mined in the United States. Sandstrom.
taconyte. See taconite.
tactical planning. The short-term or day-to-day planning at a mine to maintain the scheduled output. The planning does not cease with the layout of faces; it also includes the necessary services, such as housing, supplies, etc. See also strategic planning; ventilation planning. Nelson.
tactile. A general term for rocks of complex mineralogy formed by the contact metamorphism of limestone, granite, or other carbonate rocks into which foreign matter from the intruding magma has been introduced by hot solutions. Stokes and Varney, 1933.
tadjerfte. A black, semiglasy, crustlike stony meteorite composed of bronze and olivine.
tadpole nests. An early name used for interterence ripple mark. Pettijohn.
tajuglainite. In Besborodko's classification, a mixed rock with more than 65 percent granite; one with 35 to 63 percent is a migmatite and with less than 35 percent, an injection gneiss. A.G.I. Supp.
taeniolite. A white, colorless, or tinged with blue basic silicate of potassium, lithium, and magnesium, KLiMgSiO4F2 (Ark.). Crystals thin, elongated strips; friable masses. Monoclinic, belonging to the mica group. From Nararsaul, Greenland; Magnet Cove, Ark. English.
tagline. A line from a crane boom to a clamshell bucket. Fay.
tagged. Said of atoms rendered radioactive (labeled), the movements of which can then be traced by use of Geiger tube. Pryor.
tagged atom. See tracer. LOL.
tagg's method. A graphical method of determining the ratioistic of the ground. A.G.I.
tagline. A line from a crane boom to a clamshell bucket that holds the bucket from running out of position. Nichols.
tailing pit. See catchpit. Fay.
tailing machine. Aust. A machine or apparatus for dressing the tailings and for obtaining gold from the detritus from other ore-dressing apparatus. Fay.
tailing out. See dying out. Fay.
tailing pond. Area closed at lower end by constraining wall or dam to which mill effluents are run. Clear water may be returned. After settlement in dam, via penstock(s) and piping. Pryor.
tailings. a. The part of a deposit, or any incorpo-ration, or fluid material separated as refuse, or separately treated as inferior in quality or value; leavings; dregs; dross; The sand, gravel, and cobbles which pass through the sluices in hydraulic mining were formerly generally designated as tailings, but of late years, in a wall; a tailing. Standard, 1964. a. The tail of a shovel deck. Nichols. e. The anchor end of a cable excavator. Nichols. f. A barrier or barrier formed behind a small island or a skerry. Also called trailing spilt; banner bank. Siefiedercker.
tail tower. The anchor for a track cable, or the turn point for a backhaul line in a cable excavator. Nichols, 2.
tail back. Eng. When fire damp ignites and the flame is elongated or creeps backward against the current of air, and possibly causes an explosion of a large body of gas, it is said to tail back into the workings. Fay.
tail bay. That part of a canal which is immediately downstream of the tail gates. Ham.
tail beam. H. It. A joint or beam which abuts against the header joint. Crispin.
tailblock. a. The boom foot and idler sprocket assembly on a ladder dither. N.E. b. The block used to pull a sluizer to the face. Bureau of Mines Staff.
tail chain. a. A chain used in mine haulage; also, tail rope. Korson. b. Scot. A chain by which a horse hauls either the wagons. Putters in former times also used a tail chain. Fay.
tail crab. In mining, a crab or winch for operating a tail rope. Standard, 1964.
tailend. a. That part of a mining belt conveyor which consists of the tail section and when required, a bel tail, a telescopic section, and a loading station. NEMA MBI-1961. b. The end of a conveyor in the vicinity of the delivery point. See also tension end. Nelson.
especially in state and United States legis-
lations. Often, they have been called
mining debris or simply debris. Fay, b.
The gangue and other refuse material re-
sulting from the washing, concentration,
or treatment of ground ore. Webster 3d.
c. Those portions of washed ore that are
regarded as too poor to be treated fur-
ther; used especially of the debris from
stamp mills or other ore-dressing ma-
chinery. As used in the mineral industry
(cocumulates) that is to be smelted.
Standard, 1964. d. The inferior leavings
or residue of any product; foots, bottoms.
Including the residue after most of the
valuable ore has been extracted. Fay, e.
The term tailings has been construed as
including slag. Fay, f. The term tailings
as used in the mineral industry is used in
the plural form. Fay, g. Material applied
to sectional residue, for example, table tail-
ings, which is the residue from shaking
screens and tables. This material may be
recreated or retrieved. Nelson. h. The
waste rock after the asbestos fiber has
The decomposed offcut of a vein or bed.
Fay, j. Borehole returns allowed to run
to waste; the parts of the drill cut-
tings that are discarded. Long, k. The reject
from froth flotation cells. B.S. 3552, 1962.

tailings dam laborer. In ore dressing, smelt-
ing, and refining, a laborer who performs
the functions of a belt or chain conveyor
which carries in it the tailings; a channel
for conveying away from the processing
plant. Nelson.
tailings machine. A machine for sifting the
tailings and collecting the foots from the
conveying system after it has passed through
the washer. Nelson.
tailings man. A general term applied to a
worker who tends equipment used to dis-
perse of tailings (worthless material) after
valuable minerals have been removed by
crushing and concentration processes. The
material used, which varies with each individual mill;
pumps, bucket elevators, desliming cones,
and screens and tables. Also called labor-
tailings machine. A machine for sifting the
tailings and collecting the foots from the
conveying system after it has passed through
the washer. Nelson.
tailings man. A general term applied to a
worker who tends equipment used to dis-
perse of tailings (worthless material) after
valuable minerals have been removed by
crushing and concentration processes. The
material used, which varies with each individual mill;
pumps, bucket elevators, desliming cones,
and screens and tables. Also called labor-
tailings sampler. See mill sampler. D.O.T.
tailings settling tank. A vessel to remove solids
from the tailings effluent as in a coal
washery. The tank is about 60 feet in
diameter and 10 feet deep. The tailings
are fed in at the center with a flocculant.
As the suspension travels from the center
to overflow at the perimeter of the tank,
the solids settle out and the clear water
effluents, is collected, and returned to
the washer for reuse. Nelson.
tailings thickener operator. See thickener

tailings wheel. A wheel carrying buckets or
compartments on the periphery and used
in conveying liquid, pulp, or sand from a
lower to a higher level. Nelson.
tail joist. A joist which has one end ter-
minal against a header joist. Crispin.
tailoring. A light carried at the back end of
either the tail pulley or the tail sprocket.
Jones.
tailrace. a. A trough or channel through the
tailings; a channel for con-
tinuing water away from any plant or
structure. See. b. A trough or channel used for
moving pumps in shafts. Fay.
tail-rope coupler. In bituminous coal mining,
one who works on a tail-rope haulage
system, removing haulage-cable hook from the
rear of a cage or scraper loader, or to
at the tail pulley. Zern.
tail-rope engineer. In bituminous coal min-
ing, one who operates a hoisting engine
driving a. See the tail pulley. B.S. 3618, 1963.
b. The rope that is used to draw the empties back into a mine
in a tail rope haulage system. B.S. 3757, 1963.
c. A counterbalance rope attached beneath the
cage when the cages are hoisted in bal-
ance. Zern. d. A hemp rope used for
moving pumps in shafts. Fay.
tail-rope rider. In bituminous coal mining,
one who works on a tail-rope haulage
system, removing haulage-cable hook from the
rear of a cage or scraper loader, or to
at the tail pulley. Zern.
tail-rope system. A method of haulage in
which one rope—the main rope—is
attached to the front end of a trip of cars
and another rope—the tail rope—is
attached to the rear end of the trip.
This is operated by a hoisting engine and two
tails. a. Can. Portion of tailings containing
some mineral which cannot be economic-
ally removed. This is commonly separated as
it leaves the treatment plant so that rec-
covery can be known and controlled at
time. Hoffman, b. Corn. Refuse tin
thermally treated at high temperatures to
be treated again. See also tailing. c. See de-
pleted uranium. L. E. H.
tail-rope system. A method of haulage in
which one rope—the main rope—is
attached to the front end of a trip of cars
and another rope—the tail rope—is
attached to the rear end of the trip.
This is operated by a hoisting engine and two
take the air

current. Fay. b. Applied to a ventilating fan as working well, or working poorly. Fay.

takeup. a. In a belt-conveyor system, a tensioning system as a carriage-mounted weight free to run downhill; or a take-up pulley with weights hanging vertically near the end of the belt. Pror, :fr. L. *tangere*, to touch. Pror. 3. b. Any device for taking up slack or removing the looseness of parts due to wear or other cause. Griehn. c. See chain takeup. JTM.

take up bottom. Ark. To remove rock from the floor of a roadway to increase the height. Also called bottom brushing. Fay.

takeup pulley. An idler pulley so mounted that its position is adjustable to accommodate changes in the length of the belt as may be necessary to maintain proper belt tension. NEMA Bulletin 1964.

taking. Eng. A mineral-land lease. See also take b, tack. Fay.

taking-in-test. Removing a small amount of ore from the furnace to determine its quality. Mertensia, 6th, p. 414.

taking timber necessary to support timber improvements. The term applied to a miner which means all the timber he might need to take the working of his mine possible. Ricketts, 1.

talbot pror. A process for protecting the surface of a coal deposit in order to prevent the escape of combustible gases. Friedlander, 1955. This is a pig and ore process, although scrap is occasionally added. It depends upon the rapid oxidation of the impurities contained in the pig iron by a liquid, highly ferruginous slag and is carried out in the basic open hearth furnace, generally of the tilting type. The essential feature of the process is to retain a certain amount of metal in the furnace (1) to dilute the impurities contained in the additions of pig iron, and (2) to supply the heat necessary to keep the slag very fluid. A tilting furnace of 200 tons capacity or over is ordinarily employed, and from about one-quarter to one-third of the finished steel is tapped out at one time. This having been done, additions of iron or oxide lime and line are made, and after they are properly melted and incorporated in the slag, molten pig iron is run in. A violent reaction takes place and most of the phosphorus and silicon are eliminated in a few minutes, a large part of the slag running out of the furnace. The bath is then adjusted as a practice in ordinary practice, a part tapped, and the cycle of operations repeated. Osborne.

talbot pror. A process for protecting the inside of cast iron pipes with a coating of sand and bitumen. Ham.

talc. A very fine-grained magnesium silicate, Mg$_3$Si$_2$O$_5$(OH)$_6$, usually occurring as a natural alteration of magnesium silicate rocks or in metamorphosed dolomites. Compact variety near the feed faces; massive varieties end.

called steatite in distinction to the foliated varieties which are called talc. Monocline. Color, white, apple green, gray; lustre, pearly, high resistance to acids, alkalies, and heat; Mohs' hardness, 1 to 1.5; specific gravity, 2.7 to 2.8. Found in New York, North Carolina, California, Vermont, Georgia, Maryland, Virginia, Nevada, Montana, Texas, Washington, United in cermics; in gas burning, in electrical insulation. French chalk is a variety used for crayons. Also called potstone; soapstone. Dana 17; Fay; CCD 6d, 1961.

talcoid. Resembles talc, as talcoid shist. Fay.

talcose. Containing talc, as potstone, steatite, and talcose granite. Fay.

talk schist. Schistose rocks consisting chiefly of talc and quartz. Talc is also prefixed to several other rock names. Fay.

talcum. The same as talc and soapstone. Fay. 19. Some days or a day's output of coal. Fay.

talking. Term applied to a series of small bumps or ripples within the walls. Bumping, talking, and spitting are signs that the rock is beginning to yield to the stress and indicate a change in conditions within the rock. Spalding, p. 76.

tall oil. The oily mixture of resin acids, fatty acids, and other materials obtained by acid treatment of the alkaline liquors from the digesting (pulping) of pine wood. Used in drying oiled, in sizing oiled, in emulsifiers, in flotation agents, in driers, in oil well drilling muds, in core oils, in lubricants, and in asphalt derivatives. CCD 6d, 1961.

tallow drop. A style of cutting precious stones in which the stone is stoned on one or both sides. Fay.

tamba. Precious stone placed by the miner who loaded the car. Also called tally. Fay.

tam-o-shanter. A very large hat, sometimes of straw, sometimes of felt, and nonferrous melting refractories. C.T.D.

tammar. A kind of muscovite. Fay.

tammarite. A melanocratic dike rock, containing augite and barkevikite as the chief mafic minerals, and talcose or nannophyllite as an accessory; as the chief felsic constituent; in addition, small amounts of orthoclase or plagioclase may be present. The type is thus a lamprophyric facies of nepheline basalts. Holmes, 1929.

tanaragite. A monocline, colorless, vitreous luster, Na$_2$Si$_2$O$_4$·6H$_2$O, found at Tarapaca, Chile; a secondary mineral formed principally under acidic conditions by the oxidation of sulfides in aluminous and alkali-rich environments. Dana 7, v. 2, pp. 460-467.

tanbark. A coarse-leafed plant. The chief member of the oil-bearing strata in the Mexican oilfields, of Lower to Middle Cretaceous (Washita or Cenomanian) age; includes the Escamela limestone above and the Maltratra limestone below. C.T.D.

tanmaz. Trade name for a premium grade mullite refractory made from the best grade of calcined Indian Kyanite to which a mineralizer is added. The term also increases the mullite content of the bond. Al$_2$O$_3$ 88 percent. Specific uses are glass melting superstructure and feeder parts, ferrous and nonferrous melting refractories, crown and lining for linings for all types of furnace and kiln. CCD 6d, 1961.

tamakh. A Malayan term for black incrustation found on auriferous quartz. Fay.

tammit. A doubtful mineral, possibly an artificial alloy, especially Fe and W. Ferrotungstite; crookinite (crookinite also the name of a Cu,Ti telluride). Dana 6d, p. 1049.

tam-o-shanter. A very fine-grained, soft, brittle, natural stone found in Scotland. It is used in the United States as an axstone and for sharpening knives. Fay.

tamping. a. To tightly pack a drilled hole with a mallet of metal. See tamper. b. To tamp down or pound down ballast on a railway track, or road metal. See also packing. C.T.D. d. To pound or press soil to compact it. Nichols. c. See stem. B.S. 3618, 1964, see tamper.

tamper. A. In bituminous coal mining, one...
tamper

who fills drill holes in which explosives have been charged, by machine driller or miner, with clay or some other tamping material, using a tamping bar. Also called shot tamper. B.O.T. 1. b. One who tamps. Standard, 1964, c. An implement for tamping; a tamping iron or tamping bar. Standard, 1964. Sometimes made of wood, copper, or iron with a copper tip. See also tampering bar. Fay. d. It is to stop compaction of soil in spots not accessible to rollers. Nichols.

tamping. a. The act of inserting and packing explosives and stemming in a shot-hole. See also stemmer. Nelson. b. The act of packing a drilled hole around a cartridge with fine dirt from the floor of a mine before blasting, to prevent a misdirection of the force of the blast. Korson. c. The material placed over a charge in a borehole, to better confine the force of the explosion to the lower part of the hole. Stauffer. Drilling down, as of a broom handle for tamping or this purpose. Ham. b. A piece of wood or hickory (in Kentucky) used for tamping or holding down, as of a charge. Burmin Style Guide, p. 62.

tamping bar. a. A rod made of wood for pushing cylindrical cartridges in holes. Metal rods must never be used for this purpose. Ham. b. A piece of wood used instead of tamping material to close up a loaded blasting hole.Standard, 1964.

tamping plug. A plug of iron or wood used instead of tamping material to close up a loaded blasting hole. Standard, 1964.

tamping rod. See stemming rod. B.S. 3618, 1964, sec. 6.

tamping roller. a. One or more steel drums, flanged or not, used for rolling and compacting soil in spots not accessible to rollers. Nichols. b. A revolving cylinder containing stones used to tamp a roadway. Georgia 1964, sec. 6.

tamul. Trade name for a refractory made of sintered synthetic mullite grain; Al₂O₃, 68.21 percent. Available in refractory heat setting cements, air setting cements, hydraulic setting cements, and ramming mixes. Used in refractories for glass melting superstructure, ferrous and nonferrous metal melting, construction of high temperature furnaces and kilns using all types of fuel. CCD 64, 1961.

tandum. a. A double-axle drive unit for a truck or grader. A bogie. Nichols. b. A tandem axle unit in which one part follows the other. Nichols.

tandum die. The same as follow die. ASM Gloss.

tandum-drive. A three-axle vehicle having two driving axles. Nichols.

tandum-drive conveyor. A conveyor having a belt in which upper one is driven and lower one is discharging simultaneously. The upper one is usually one-third the diameter of the lower one and is loaded at a pocket halfway down the shaft. The lower skirt is loaded at the shaft bottom and skips and tamps in the conveyorway pocket. Thus, the rope on the winding drum is only equal to half the full depth. See also two-stage hoisting. Nelson.

tandum hydroseparator. A two-celled hydro-separator with troughs. The raw coal feed is conveyed through a trough by water under pressure where the refuse stratifies to the bottom. The action in the first cell is that of a forceful upward current which results in the removal of the heavy refuse. In the second cell a lighter current permits the settling of lighter and smaller refuse. The refuse settles to a perforated cell deck where it joins the slowly moving slate belt of the discharge. Refuse discharge is controlled by a refuse gate or hinged plate at the end of the cell bed. Kentucky, p. 308.

tandum mill. A rolling mill consisting of two or more stands arranged so that the metal being processed travels in a straight line from one stand to another, without, in continuous rolling, the various stands being synchronized so that the strip may be rolled in all stands simultaneously. Contrast with single-stand mill. ASM Gloss. See also continuous mill.

tandum ram. A ram with two rolls of similar diameter running on the same track. Ham.

tandum support system. A trade name for a longwall steel support system. It consists of two 50 ton chocks in line at right angles to the face and linked together with double-acting ram. In operation, the front chock is lowered and advanced with the conveyor and ram to the roof, the rear chock is then lowered and brought forward. Nelson.

tandum unit plant. A longwall conveyor face with two face conveyors of different capacities, one delivering on to the other—tandum fashion. The layout has the disadvantage that the whole tonnage of coal must be transported along the second conveyor, and any breakdown on the second conveyor will affect the output of the entire face. Nelson.

tandum welding. Arc welding in which two or more electrodes are in a plane parallel to the line of travel. ASM Gloss.

tanette. A small timbers fixed in a particular manner for supporting the sides of headings in soft ground. Fay.

tank. a. A large vessel or receptacle, made of wood or metal, intended to contain a fluid as gas or water; as water tank, gasoline tank. Used as a synonym for vat. Fay. b. A subterranean reservoir into which a pump delivers water for another pump to raise. Fay. c. A melting unit, in which the container for the molten glass is constructed from refractory blocks. ASTM C162-66.

tank building. The act or process of storing oil, etc., in a tank. Fay. b. The price charged for storage in a tank. Fay. c. The capacity of a tank or tanks. Fay. d. The water residue deposited in lixiviating vats or tanks. Fay.

tank block. A refractory block used in the lower part of a glass tank furnace. These blocks are normally made of sillimanite, mullite, or corundum; they are frequently made by electrofusion of the refractory, which is then cast in a mold to form a highly crystalline, virtually non-porous, block which is very-resistant to attack by the molten glass. Dodd.

tank car. Railroad cars equipped with large steel tanks for transporting crude oil. Mercereau, 4th, p. 199.

tancker. A vessel constructed for the special purpose of carrying liquids in bulk form. Shell Oil Co.

tank furnace. a. Essentially a large, box-shaped refractory material holding from 6 to 200 tons of glass, through the sides of which are cut ports fed with a combustible mixture (producer gas and air, coke oven gas and air, or oil spray and air), so that flame sweeps over the glass surface. With the furnace is associated a regenerative or recuperative system for recovering part of the heat from the waste gas. C.T.D. b. See tank. ASTM C162-66.

tank glass. a. Glass melted in a tank as distinct from a pot. ASTM C162-66. b.
tank glass

Tank glass suitable for tank melting. ASTM C162-66.

tank reactor. A nuclear reactor in which the core is in a closed tank, as distinct from an open pool reactor. Commonly used as research and test reactors. L. Dod.

tank sprayer. A pressure-sure tank mounted on wheels for impregnating timber. Ham.

tank station. See station. Fay, p. 646.

tannic acid. (C₇H₅O₇)₄Na, tannin. A yellow amorphous powder or lustrous crystalline scales, soluble in water, alcohol or glycerol and slightly soluble in ether. It is used as a reagent and in the treatment of births. Enam. Diet.

tannin. A complex organic compound of carbon, hydrogen, and oxygen produced by metabolism in trees and plants. Sodium tannate is used to some extent as a de- flocculant for clay sludges. Dodd.

tantalum. At. symbol, Ta; molecular weight, 180.948; specific gravity, 13.6. Dodd.

tantalum bond. A complex organic compound of carbon, hydrogen, and oxygen produced by metabolism in trees and plants. Sodium tannate is used to some extent as a de- flocculant for clay sludges. Dodd.

tantalum carbide. TaC; molecular weight, 106.02; specific gravity, 5.08 (at 27° C); decomposes in moist air; melting point, 2420° C; boiling point, 4270° C; decomposes in water and in acids except hydrofluoric acid; and soluble in hydrofluoric acid and in fused potassium-hydrofluoride sulfate. Used in the production of tantalum metal. C.C.D., 64, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-228.

tantalum pentachloride; tantalum chloride. Tantalum tetrachloride; tantalum tetachloride. Tantalum dichloride; tantalum chloride. Pale yellow; vitrous luster; crystalline; TaCl₅; molecular weight, 358.21; specific gravity, 3.68 (at 27° C); decomposes in moist air; melting point, 216° C; boiling point, 221° C; soluble in water and in acids except hydrofluoric acid; and soluble in hydrofluoric acid and in fused potassium-hydrofluoride sulfate. Used in the production of tantalum metal. In optical glass, in special glass having a high index of refraction for camera lenses; as an intermediate in the preparation of tantalum carbide, and in electronics. C.C.D., 64, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-228.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide. A complex organic compound of carbon, hydrogen, and oxygen produced by metabolism in trees and plants. Sodium tannate is used to some extent as a de- flocculant for clay sludges. Dodd.

tantalum boards. Several boards are known, including the following: Ta₂O₅, Ta₂O₅, 50° C; specific gravity, 3.25; thermal expansion, 3.5 x 10⁻⁵/°C; Ta₂O₅, 14.5° C; Ta₂O₅, melts incongruently at 2650° C; specific gravity, 13.6. Dodd.

tantalum, tantalum oxide. A complex organic compound of carbon, hydrogen, and oxygen produced by metabolism in trees and plants. Sodium tannate is used to some extent as a de- flocculant for clay sludges. Dodd.

tantalum oxide. Two oxides are known: Ta₂O₅, melts incongruently at 3090° ± 50° C; Ta₂O₃, which loses nitrogen at 1900° C. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide. A complex organic compound of carbon, hydrogen, and oxygen produced by metabolism in trees and plants. Sodium tannate is used to some extent as a de- flocculant for clay sludges. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.

tantalum pentoxide; tantalum oxide. Colorless; orthorhombic; Ta₂O₅; molecular weight, 161.89; specific gravity, 5.6; melting point, 5200° C; very hard material. Dodd.
taper-lock sprocket

tapered bushing for rigid mounting on a shaft. JEM.

taper off. Con. To stop work temporarily.

taper of thread. Measurement in inches of taper or slope for a 1 foot length of the thread. Brandy, Zick, and Johnson.

taper pin. A straight-sided pin that is smaller at one end than at the other. Nichols.

taper reamer. A reamer whose fluted portion is smaller at the front end than at the back, red to produce a hole with a specified taper. ASM.

taper rope. A rope that has a gradually diminishing diameter from the upper to the lower end. The diameter of the rope is decreased by dropping one wire at a time at a regular intervals. Both round and flat ropes may be made tapered, and such ropes are intended for determining a vessel with a view to proportioning the diameter of the rope to the load to be sustained at different depths. Brantly, 2.

taper shank. Part of a tool, conical in shape, which fits a driving member, usually with a tongue on its end. ASM Gliss.

taper chamfer. A chamfer of seven threads in nine threads in length. ASM Gliss.

taper-type dropper. A device by which a thread is roughened by wire cutting. Much used in the mud process of boreholes. Long.

tape-triangulation method. A mine roadway consisting of a short piece of casing cemented in the collar of a borehole at the upper end of which is affixed a gate or feed. Also called disk. Fay. To let water out of a mine by tapping the place where the water is confined. Fay.

tappet. a. A sliding member working in a guide, interposed between a cam and the push rod or valve system which it operates, to change side thrust on the latter. C.T.D. The collar under which the cam is inserted so as to lift the stamp. Fay. b. Removal of molten metal from a furnace, ASM Gliss. b. Melting metal from a furnace. ASM Gliss.

tappening. a. Opening the outlet of a melting furnace to remove molten metal. ASM Gliss. b. Melting metal from a furnace. ASM Gliss.

tapping assembly. A mechanical device consisting of a set of pins or tapping cements. See ASR. Fay. Also called disk. Fay.

tapping bar. See tap bar. Fay.

tapping clay. A plastic clay used in plugging holes. ASM Gliss. b. Melting metal from a furnace. ASM Gliss.

tapping old workings. Boring a hole into old workings to release gradually any accumulated gas. Fay. The borehole tapping may be followed by driving an advance heading into the area. This is dangerous if the heading is extended, borehole tapping is kept in advance of the face to prevent the sudden break-through of water. See also inrush of water. Nelson.

tapping the hollows. Eng. Allowing water or gas, or both, to flow out of old or abandoned workings, often under a great pressure. See also tapish. Fay.

tapit hen. A 3 quart wine bottle. Dodd.

tape-triangulation method. A mine roadway area measurement method in which the tape is stretched diagonally across the roadway. Offsets to the roof, floor, and sides are taken at right angles to the tape and on both sides of it. Alternatively, the floor of the cross section is divided into equal increments and vertical offsets to the roof are made at each division. Horizontal offsets to the sidewalks are made from the nearest vertical offsets. The measurements so obtained are plotted to scale and the area of the resulting diagram determined from the plot. Roberts, 1, p. 59.

taphophylax. Imprints of dead animal bodies. Pettijohn.

tapish. a. In mineralogy, the thin film of color, different from that of a fracture, which gives the outer surface of some minerals a color. Fay. b. To break in “at unawares” with his horse. Fay. c. In a puddling furnace, a slag坝 that is allowed to form at the top of the charge.Webster 3d.

tappet. a. A sliding member working in a guide, interposed between a cam and the push rod or valve system which it operates, to change side thrust on the latter. C.T.D. The collar under which the cam is inserted so as to lift the stamp. Fay. b. Removal of molten metal from a furnace, ASM Gliss. b. Melting metal from a furnace. ASM Gliss.

target. a. Sliding weight on leveling rod used in surveying to enable staffman to read the staff reading being recorded by the line of collimation. In underground leveling, head on hanging plumbline used for the base and wearing courses of rods, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. A type of leveling staff provided with a sliding target, which can be moved by the staffman, under direction from the leveller, to a position in which it is in line with the line of sight of the level, the staff reading being recorded by the staffman. C.T.D.

target strength. Measure of reflecting power of the target. Ratio, in decibels, of the target echo to the echo from a 6 foot diameter perfectly reflecting sphere at the same range and depth. H. W. R. E.

tarmac. a. Asphalt that is made artificially from grit or crushed stone and bonded with tar. See also bituminous macadam; premix. Benson.

tarmac. b. Material used for the surface and wearing courses of roads, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. See also tar pavier. Ham.

tarmac. c. A small round-rimmed lake in an ice-gouged basin on the floor of a cirque or in a glaciated valley. Mathes.

tarmac. d. A reddish-brown glaucophane metasilicate of barium and iron, {Ba,Co,Na} 2 [(Fe 3+Fe 2+) 2Ti(SiO 4)] (OH) 2, with a little Ti replacing Si; apparently to be considered as a sorosilicate. Radiating, fibrous aggregates; orthorhombic. From Can- dogna, Piedmont, Italy. English.

tarmakite. Described as a massive yellowish-white, toothed, sometimes wavy, hydrous Al phosphate with iron and potash. Dana 6d, p. 846.

tarnish. a. Colorless to pale yellow basic phosphate of zinc, Zn 3 (PO 4 ) 2 (OH) 2. Rounded crystals often aggregated into sheaves. Tschirch, From Broken Hill, Northern Rhodesia. English.

tar-chaser. See chaser, tar.

tar distillate. A fraction in petroleum refining containing heavy oils and paraffin. H. H. N. E.

tare. a. The weight of a mine car when empty. B.C.I. b. To weigh mine cars when empty in order to determine the weight of coal in a car when the loaded car is weighed, done at specific intervals in order that a tonnage basis may receive proper credit for coal which they have loaded. B.C.I. c. Al- lowed weight for weight rating in which goods are moved. The difference between gross and net weight. Pryor, 3.

tar gun. a. Sliding weight on a rotating rod used in surveying to enable staffman to read line of collimation. In underground leveling, head on hanging plumbline used for the base and wearing courses of rods, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. A type of leveling staff provided with a sliding target, which can be moved by the staffman, under direction from the leveller, to a position in which it is in line with the line of sight of the level, the staff reading being recorded by the staffman. C.T.D.

tarnish. a. The reflecting power of the target. Ratio, in decibels, of the target echo to the echo from a 6 foot diameter perfectly reflecting sphere at the same range and depth. H. W. R. E.

tarmac. a. Asphalt that is made artificially from grit or crushed stone and bonded with tar. See also bituminous macadam; premix. Benson.

tarmac. b. Material used for the surface and wearing courses of roads, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. See also tar pavier. Ham.

tarmac. c. A small round-rimmed lake in an ice-gouged basin on the floor of a cirque or in a glaciated valley. Mathes.

tarmac. d. A reddish-brown glaucophane metasilicate of barium and iron, {Ba,Co,Na} 2 [(Fe 3+Fe 2+) 2Ti(SiO 4)] (OH) 2, with a little Ti replacing Si; apparently to be considered as a sorosilicate. Radiating, fibrous aggregates; orthorhombic. From Can- dogna, Piedmont, Italy. English.

tarmac. a. Colorless to pale yellow basic phosphate of zinc, Zn 3 (PO 4 ) 2 (OH) 2. Rounded crystals often aggregated into sheaves. Tschirch, From Broken Hill, Northern Rhodesia. English.

tar-chaser. See chaser, tar.

tar distillate. A fraction in petroleum refining containing heavy oils and paraffin. H. H. N. E.

tare. a. The weight of a mine car when empty. B.C.I. b. To weigh mine cars when empty in order to determine the weight of coal in a car when the loaded car is weighed, done at specific intervals in order that a tonnage basis may receive proper credit for coal which they have loaded. B.C.I. c. Allowed weight for weight rating in which goods are moved. The difference between gross and net weight. Pryor, 3.

tar gun. a. Sliding weight on a rotating rod used in surveying to enable staffman to read line of collimation. In underground leveling, head on hanging plumbline used for the base and wearing courses of roads, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. A type of leveling staff provided with a sliding target, which can be moved by the staffman, under direction from the leveller, to a position in which it is in line with the line of sight of the level, the staff reading being recorded by the staffman. C.T.D.

target strength. Measure of reflecting power of the target. Ratio, in decibels, of the target echo to the echo from a 6 foot diameter perfectly reflecting sphere at the same range and depth. H. W. R. E.

tarmac. a. Asphalt that is made artificially from grit or crushed stone and bonded with tar. See also bituminous macadam; premix. Benson.

tarmac. b. Material used for the surface and wearing courses of roads, consisting of graduated broken stone or gravel coated with tar or asphaltum mixture. See also tar pavier. Ham.
Tarnish. Trade name for a mullite super refractory sand. See also tautomer.

Tauriscite. A doubtful mineral possibly epsomite. Hey, M.M., 1964; Fleischer, C12(OH)2.31/21120; massive, in anhydrite.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

T-bolt. A bolt with a T-shaped head, made to fit into a T-shaped slot in a drill

ferrous and nonferrous metal melting and heat treating, linings and crowns for high temperature furnaces and kilns firing all kinds of fuel, kiln furniture. CCD 6d, 1961.

task. The number of tons or the amount of ore or material to be loaded either by mechanical loaders or by hand loaders. Also called score. Bur-Mines Bull. 231, 1966.

Tasmanian alexandrite. A trade name for the counter of Tasmania. Shipley.

Tasmanian topar. Colorless to light blue topaz from Tasmania. Shipley.

Tasmanian zircons. Yellow-brown to dark red zircons from Tasmania, the former becoming colorless by heating. Shipley.

tasmanite. A reddish-brown, resinous mineral, disseminated in scales through a laminated shale or slate; it has a specific gravity of 1.18 and yields oil on distillation. Also called resiniferous shale and yeast shale. Shipley.

tasmanite shale. Same as tasmanite. Tomkeieff, 1934.

tassette. Fr. A small, sharp-pointed infusion of tannin, soluble in water. Chief constituents are complex phenols; also present are turpentine, resin, toluene, xylene, and other hydrocarbons. Used in oil flotation and in asphaltic compositions. CCD 6d, 1961.

tailing. a. The coating of piles used for permanent work with prepared acid-free tar. The tar is obtained from the high temperature carbonization of coal in horizontal retortors. Nelson, b. The act of coating (or, as a pipe) with tar. Bureau of Mines Staff.

tar runner. See chaser. tar, D.O.T. 3 Supp. 1965, p. 120.

tar sand. a. Barbedo name for sand impregnated with petroleum which dries up to viscous or solid bitumen. Tomkeieff, 1934. b. These consist of heavy petroleum oils, or bitumen, impregnating sand or clay near the surface of the earth. Vast quantities exist, notably at Athabasca in North Alberta, Canada, and in Iran. Franci, 1965, v. 1, p. 320.

tar sprayer. A member of a team of skilled hands responsible for the various operations of spraying tar on a road. Hamm.

tasco. A fire clay from which melting pots are made. Also spelled taesco. Standard, 1964.

Tassie. Trade name for a mullite super refractory sand. See also tautomer. Descriptive term for amphoteric substances, or substances that can react as acids or bases, or both. Schaller.

tavorite. Hydrous lithium ferric phosphate, LiFe(PO4)OH2, as yellow fine-grained aggregates from Brazil. Spencer 26, M.M., 1935.

tawlite. A granular igneous rock composed essentially of soda and pyroxene. Fay.

taxite. Having separated, during cooling, into small portions differing in texture, color, or composition, and hence having a false appearance of being elastic; said of some volcanic rocks, especially if banded. Fay.

taxite. Serpentine from Chester County, Pa. Schallier.

Taycor. Trade name for a corundum base super-refractory made of sintered high purity alumina. Al2O3, 98.0 to 99.0 percent. Available in bonded brick and shapes and also heat, air setting and hydraulic setting cements, patches and ramming mixes. Outstanding resistance to abrasion, load and iron oxide slag attack at high temperatures. Used as rills in boiler heating furnaces and 20 to 24 hour sulfur service where iron oxide slag is a problem; lining for ferrous melting in electric furnaces, direct arc and induction types; high temperature furnaces of all types including crowns, linings, kiln furnishing, and mantles. CCD 6d, 1961.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

Taylor producer. A furnace used for the manufacture of producer gas. Fay.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.

Taylorite. A dense iron oxide; a variety of epidote, Cr2O3, 11.16 percent. Massicot, p. 103.
T-bolt

swivel head; by means of it the swivel head can be turned to any angle of inclination to drill a borehole. Also, a similar bolt made to fit into a T-slot in the bed of a machine, for the purpose of holding a piece of metal to be machined or to fasten a machine to its base. Long.

tc Abbreviation for thermocouple. Zimmerman, p. 108.

Tef Abbreviation for trillion cubic feet. Divallum.

tchernohblite. An algal sapropelic deposit found in the vicinity of Chernomkho, and which has been interpreted as an aggregation of peaty matter washed from other deposits. A.G.I.

tchernozem. Literally, black mold; the local name for the black earth that covers the whole of the Aralo-Caspian plain, and much of the South of Russia in Europe; interesting from its close resemblance to the regur or so-called cotton soil of India. It is evidently one of the most recent deposits, and of alluvial origin. Synonym for tchernoshem; chernozem. A.G.I.

tch. Abbreviation for technical cohesive strength. Webster 3d.

technical language. Webster 3d. b. The terminology of a particular subject; technical language. Webster 3d.

technical cohesive strength. Fracture stress in a notch tenile test. Often used instead of merely cohesive strength to avoid confusion among the several definitions of cohesive strength. ASM Gloss.

technique. The manner of handling details in the execution of an undertaking. Kinsey.

technologist. A specialist in technology. Webster 3d.

technology. a. The science of the application of knowledge to practical purposes; and general science. Webster 3d. b. The terminology of a particular subject; technical language. Webster 3d.

tectogene. A. A deeply downfaulted belt of sediments within a eugeosyncline. A.G.I. b. A large downfold of the granitic crust (sial) beneath an orogenic belt. A.G.I.
tectogenesis. A term sometimes used instead of orogenesis for folding and thrusting, to avoid any implication that actual mountains were necessarily formed. Challinor. tectonic. Applied to deformed angular constituents of a rock whose shapes have been modified by magmatic corrosion. Schieferdecker.
tectonics. Pertaining to rock structures and topographic features resulting from deformation of the earth's crust; also earthquakes not caused by volcanic action, landslides, or collapse of caverns. Mather.
tectonic. A term used to include angular coarse rocks formed as the result of tectonic movement. Included in this category are fault breccias, especially those associated with great overthrust sheets, and fold breccias or rieubreccia. A.G.I.

tectonic conglomerate. A coarse clastic rock produced by deformation of brittle closely jointed rocks. Rotation of the joint block and granulation and crushing sometimes produce a rock that closely simulates a normal conglomerate. Synonym for crush conglomerate. A.G.I.
tectonic earthquake. Earthquakes caused by faulting within the upper layers of the earth's crust, usually at depths of 5 to 30 miles. Hooe and Long.
tectonic geology. Used more or less synonymously with structural geology. On the whole, these terms have a stronger tendency to restrict this term to rock deformation during earth movements; the latter is apparent in the use of the term structural geology, even if the use is not
telescoping conveyor

A type of conveyor, the length of which may be varied by telescoping frame members. See also extendible conveyor.

telemeter. Zone or environment of ore deposition characterized by lesser intensity than epidemal and generalized by retronotes from an igneous source. McKinsty.

telemetric deposits. Ore deposits produced at or near the surface from ascending hydrothermal solutions and representing the terminal phase of its activity. AGI.

televised or radio-transmitted communication system. Pryor, 3.

telford. Being or related to a road pavement having a surface of small stone rolled hard and smooth and distinguished from macadam road by its firm foundation of large stones wedged tightly in the interstices. Webster 3d.

telfore. To furnish (a road) with a telefroid pavement. Webster 3d.

telfon process. See metallizing. Dodd.

tellinite. This term was proposed by W. J. Telfordize to furnish (a road) with a telnottellante. A simple device, perhaps fabricated from a strok of stone wedged tightly in the interstices. Webster 3d.

telforite. To furnish (a road) with a telfordite. Webster 3d.

telfoonkeen process. See metallizing. Dodd.

tellite. This term was proposed by W. J. Telfordize to dignitate a vitrinite showing cellular structure. The Nomenclature Sub-committee of the International Committee for Coal Petrology decided in 1957 to use the term telinite only for the cell walls seen in vitrinite. Only in this manner can it be reliably included among the macerals. Telinite shows more or less clearly defined cell structure (wood, periderm, etc.) sometimes deformed. The cells are generally filled with collinite, but the structure is better shown when the cells are either empty or filled by material such as resinite, fine micritine, clay minerals, etc. I.H.C.P., 1963, part 1.

tellite. Same as provitrain. See also telain. Tomkiesie, 1954.

teller. See tab. Marion.

telinite. a. A simple device, perhaps fabricated on site, for indicating selected conditions of loading, flow, etc., in a plant. Flashing light, hooter, bell, meter moving along scale are among such arrangements showing height of liquid in a tank, loading on conveyor belt, location in bin, failure of slotted, or failure of sealing tanks. Pryor, 3. b. A device for keeping a check on employees (as factory hands, driver, check takers), especially the time clock. Webster 3d. c. A wind direction indicator in the form of a ribbon or similar piece of material. Webster 3d. d. A device serving as a warning on a railroad. Webster 3d. e. A small overflow device serving as a warning on a railroad. Webster 3d. f. A small overflow device serving as a warning on a railroad. Webster 3d. g. A small overflow device serving as a warning on a railroad. Webster 3d. h. A device serving as a warning on a railroad. Webster 3d. i. A device serving as a warning on a railroad. Webster 3d. j. A device serving as a warning on a railroad. Webster 3d. k. A device serving as a warning on a railroad. Webster 3d.

teluric-current prospecting. A geophysical prospecting technique utilizing natural telluric currents as a source instead of artificial current. Steel is sent into the ground. Dobrin, p. 8.

teluric current. Natural electric currents that flow from the telluric zones in large sheets. Methods have been developed for using these currents to make resistivity surveys. Synonym for earth currents. AGI.

telurite. A binary compound of tellurium usually with a more electropositive ele-

ment or radical. Webster 3d. Often rich in gold and silver. Fay.

telluric ocher. The mineral tellurite, TeO₃. Fay.

tellurides. Ores of the precious metals (chiefly gold) containing telluride. Gordon.

telluriferous. Yielding or containing tellur-

tellurite. A mineral, TeO₃, that consists of tellurium dioxide and occurs sparingly in tufts of white or yellowish crystals. Webster 3d.

tellurium. An element in group VI of the periodic system. Silvery-white; metallic lustre; metallic characteristics; orthorhombic or hexagonal; Mohs' hardness, 2.3; specific gravity, 6.24 (at 20° C); melting point, 499.5° ± 0.3° C; boiling point, 909° or 989.9° ± 3° C; soluble in sulfuric acid, in nitric acid, in potassium hydroxide, and in potassium cyanide solution; and insoluble in water. Occasionally found in native form. Obtained from anode slime produced in the electrolytic refining of concentrate lead. Used as a coloring agent in glass and ceramics. Symbol, Te; valences, 2, 4, and 6; atomic number, 52; and atomic weight, 127.60. Symbol, Te; valences, 2, 4, and 6; atomic number, 52; and atomic weight, 127.60. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.

telluric currents. Natural electric currents that flow on or near the earth's surface and are used for using these currents to make earth currents as a source instead of artificial current. Standard, 1964.
tempered more than strain disks. See also strain disk, ASTM C162-66. I. Term sometimes employed in referring to tempered glass. See also: ASTM C1041; glass.

**temper.** a. Degree of hotness or of coldness measured on one of several arbitrary scales based on some observable phenomenon, as the expansion of mercury on heating, for example. The degree of a material substance that is a linear function of the kinetic energy of the random motion of its molecules. The degree of a vacuum that depends upon the density of the radiant energy within it. Abbreviations and symbols, temp; T; t; T. t. Compare absolute zero. See also absolute temperature; Celsius; centigrade; critical temperature; Fahrenheit; Kelvin temperature scale; Rankine scale. Webster 3d. b. The heat content of a body as measured on a definite scale. In oceanography both the centigrade and Fahrenheit scales are used. Temperature of seawater usually is determined to an accuracy of ±0.02° C. Hy.

**temperature coefficient.** A numerical value indicating the relation between a change in temperature and a simultaneous change in some other property (for example, solubility). Specifically, the factor a in the equation Rc = RO (1 + at) in which Rc equals the resistance of a constant at t° C, and RO equals its resistance at 0° C. Webster 3d. b. The change in reactor reactivity occurring when the operating temperature changes. The coefficient is positive when an increase in temperature increases the reactivity and negative when an increase in temperature decreases the reactivity. Negative temperature coefficients are desirable because they help to stabilize reactor power excursions. L.R.

**temperature colors.** Colors shown to the eye by incandescent bodies at different temperatures. Bureau of Mines Staff.

**temperature dew point.** Temperature at which condensation of water occurs; a saturation temperature. Measured in degrees F. Hartman, p. 9.

**temperature, dry bulb.** Temperature indicative of the dry thermometric temperature; a measure of the sensible heat content of air. Hartman, p. 9.

**temperature gradient.** a. The rate of change of temperature with distance in a specified direction. Also called lapse rate. A.O.I. b. A curve showing the temperature at different distances from the hot face, in refractory wall. Bureau of Mines Staff.

**temperature gradient furnace.** A laboratory electric resistance furnace in which the heating element is wound around the furnace tube in such a manner that there is a steady temperature gradient along the axis of the furnace. Such a furnace is useful in the ceramic laboratory in that it will expose a long test piece placed within the furnace to different temperatures at different points, so that the effect of various firing temperatures can be studied in a single operation. Dodd.

**temperature logging.** The measurement of temperature in boreholes by use of a delicate thermometer that will record temperature differentials of as much as 0.01°F for thin coal seams in coal mines according to the thermal conductivity of the rocks concerned. This type logging has proved useful in discriminating between coal and sandstone and also in cased holes in conjunction with gamma-ray logging. Sinclair, III, p. 105. Also widely used in oil fields for locating position of water bearing zones, casing leaks, etc. Bureau of Mines Staff.

**temperature profile recorder.** A portable unit consisting of a recording element, 6-volt power supply, amplifier, and a recording. The recorder is geared to a drum containing an electrical cable to which the feed is fastened. When the feed is lowered into the water, the paper on the recorder is set in motion accordingly. Depth is measured by the amount of wire paid out. This device is used in shallow water, particularly in lakes. HOG.

**temperature recorder.** In an explosive copper sulfate (CuSO4·5H2O), magnesium sulfate (MgSO4·7H2O), sodium chloride (NaCl), and ammonium chloride (NH4Cl), all of which act as cooling agents either by giving off water or by volatilizing. They also tend to reduce the sensitivity of the explosive. Cooper, p. 345.

**temperature-regulating equipment.** Any equipment used for heating and cooling the rectifier together with the devices for controlling and indicating its temperature. Cool Age, 1.

**temperature-saturation (t-s) diagram.** This is the plot of temperature vs. salinity data of a water samples. The result is a diagram which makes it possible to identify the water masses within the column, its stability, to read off its value and to estimate the accuracy of the temperature and salinity measurements. Hy.

**temperature standards.** For normal measurement 0° C (regarding gas properties). For thermodynamics and physical properties either 18° C or 25° C as defined in each stated case. L.R.

**temperature steel.** Reinforcement which is introduced into a concrete slab or other member in order to minimize any cracks arising from shrinkage or from temperature stresses. Ham.

**temperatures stress.** Stress in a structural member due to a rise or fall of temperature. See also: temperature steel. Ham.

**tempering machine.** A machine for giving the desired consistency of workpieces. B.S. 3552, 1962.

**tempering wheel.** A wheel mounted on a shaft and revolved in a pit after the manner of an arrastre, for kneading and tempering clay, mortar, plaster, or other materials. Standard, 1964.

**tempering.** a. Reheating a quench-hardened or normalized ferritic alloy to a temperature below the transformation range and then cooling at any rate desired. ASM Gloss. b. Thorough mixing of clays with water, etc., to form a plastic paste for molding. C.T.D.

**tempering bar.** See forging. Fay.

**tempering furnace.** A furnace for heating articles in the process of tempering. Standard, 1964.

**tempering oil.** An oil that is used for tempering metal. Shell Oil Co.

**tempering oven.** An oven for heating lath in the process of annealing; a leer. Standard, 1964.

**tempering sand.** Foundry sand wetted to the proper dampness for molding. Bennett 2d, 1962.

**tempering tub.** A combined pan and vertical pug mill for the preparation of clay for brickmaking. The mixing pan is about 7 feet in diameter, a central vertical shaft carrying the mixing blades; the shaft continues downward as the shaft of the pug mill. In some districts of England, this equipment is known as a sludge pan. Dodd.

**tempering unit; tempering pan; cooling unit.** A vessel intermediate between the pug and the press used to regulate the temperature of the charge. B.S. 3552, 1962.

**tempered lead.** Lead hardened by addition of metallic-alkali-earth metals and/or lithium; usually made by electrodeposition the alkali-earth metal into a fused lead cathode. Bureau of Mines Staff.

**tempered safety glass.** A single piece of specially heat-treated glass, with a stress pattern such that the piece when fractured reduces to numerous fragments with no large jagged edges. See also safety glass. ACSG, 1965.

**tempered strain disk.** A disk that has been hardened and subsequently tempered by a second lower heating. Fay.

**temperer.** One who or that which tempers specifically, a machine for mulling and thoroughly working potter's clay, brick clay, mortar, plaster, or other materials. Standard, 1964.

**tempering bars.** See forging. Fay.

**tempering furnace.** A furnace for heating articles in the process of tempering. Standard, 1964.

**tempered steel.** A machine for giving large steel plates a uniform and thorough tempering without permitting them to become hot. A steel plate, usually by pressing them between hot masses of iron, or by firmly clamping them between jaws or plates while immersing them in a tempering bath, Standard, 1964.

**tempering mortar.** Softening mortar by adding water at a rate below the transformation range, and subsequently tempering by a second lower heating. Fay.

**tempering water.** Water used to give the desired consistency of workability to a mix. A.R.I.

**tempering wheel.** A wheel mounted on a shaft and revolved in a pit after the manner of an arrastre, for kneading and tempering clay. Standard, 1964.

**tempered glass.** Glass which has been rapidly cooled from above the annealing point to induce residual compressive stresses in the surface. VV.

**temper screw.**
temper screw

temper time. In resistance welding, that part of the postweld interval during which the current is suitable for tempering or heat treatment. ASM Gloss.

template. a. A form for building tunnel inverts. Steffaur. b. A pattern device used as a guide to mark points at which holes are to be collared in face drilling. Long. c. A full-sized mold, pattern, or frame, shaped to serve as a guide in forming or testing calculus or shape. Taylor. d. A pattern or guide of any of various kinds used in manufacturing as usually thin metal pattern for laying out and scribing a workpiece. Also, a gage or pattern for checking dimensions, locations, or contours as on castings. Webster 3d. e. A pattern plate, cut to the shape or profile required on a finished surface, by which the surface is marked off or indexed during machining or other operation. Also called templet. C.T.D.

temporary adjustment. An adjustment, such as levering or focusing, made to a surveying instrument at each setup. Ham.

temporary baseline. The valley flat (food plain) is a sort of baseline, through which the first flat developed by a stream is necessarily the lowest level to which it may grade into the valley bottom. It is the lowest level to which the stream can bring its valley under the conditions which made the flat is developed. It is, therefore, a temporary baseline, and serves as the limit below which tributary valleys may not cut.

temporary hardness. of water, that which can be removed by boiling out the CO₂, therefore, it is also hard water. Nelson.

temporary hardness. Water hardness which can be destroyed by boiling. See also hard water. Nelson.

temporary installation. An installation made for a limited time only, generally in the area between the loading point and the working face, but also in other locations where portable or mobile equipment is installed for a limited time. A temporary installation is limited to a period of six months. Bureau, Coal-Mine Inspectors Manual, June 1966, pt. 3-B, p. 53.

temporary prop; policeman; safety prop. a. A temporary prop. According to the Federal Mine Safety and Health Administration, a prop shall be used temporarily in the face of a working face, but also in other locations where portable or mobile equipment is mounted on an inclined roadway (with sufficient weights) to move up or down a pulley round which the rope of an end is permitted, but yield strength is the common basis for elastic design. Tensile strength may also be some indication of allowable severity of hot and cold working processes. HBG; b. Tensile strength of a material is usually greater than its breaking strength, but it is below the maximum true stress developed by the material. Tensile strength is a common index for strength comparison of a material. It may be directly used in design where some plastic deformation is permitted, but yield strength is the common basis for elastic design. Tensile strength may also be some indication of allowable severity of hot and cold working processes. HBG.

tension. a. The force or strength with which the particles of a mineral or rock hold together or resist separation. The terms commonly used to describe the tenacity of a mineral are friable, brittle, sectile, malleable, flexible, elastic, and tough. Stokes and Varnes, 1953. b. The adhesion possessed by a substance, or its toughness. Gordon.

tension element. (Eng.) See frontal hammer. Fay.

tender. a. Said of rock that tends to break up or crush under pressure into small fragments, and which will not hold in any span over a few inches. Also called porphyry and porphyritic. Far and Walsh, pp. 36-37. b. The formal offer by the tenderer to carry out the work described in the drawings and/or specification for a certain sum of money. See also agreement; schedule of rates. Nelson.

tendon. A stretched element used in a concrete mixture to act as a system of control to impart pressures to the concrete. Taylor.

tenmol. A plate containing iron compounds sometimes used by studio potters; it is lustrous black except where it is thinned and has oxidized to a red color. Dodd.

tenoufite. A natural sulfarsenide of copper and iron, (Cu₄Fe)₄As₂S₄, found in metallic veins. Isometric. A variety of fahlore. Flint gray to iron black; luster, metallic in scales, dull to strong. Found in Colorado, Idaho, Utah, Montana; Canada; Europe. An important ore of copper and silver. Also called copper ore. H&B. Rock specifically noted for its tenacity in a standard testing machine with special tension grips which allow rock cores to be safely handled. The machine is equipped with the load with the axis of the test piece. The rate of loading is 100 pounds per minute. For rocks of nonuniform nature this test yields erratic results, and tenacity strengths determined from rupture tests are preferred. Lewis, p. 370. See also Brazilian test.

tension. a. In subsidence, the amount of lengthening per unit r, measurement. Nelson. b. In engineering, a pulling force or stress; metals in tension are strong, while concrete and masonry are weak. Nelson. c. A system of forces tending to draw apart the parts of a body, especially of a belt, a line, or a cord, or a sheet, combined with an equal and opposite system of resisting forces of cohesion holding the parts of the body together. The stress caused by pulling; opposite of compression and distinguished from torsion. Standard, 1964. d. Sometimes used in a face system of resisting forces of cohesion holding the parts of the body together. C.T.'s.

tension carriage. A bogie or frame carrying a pulley round which the rope of an endless rope haulage passes to be tensioned or tightened. The bogie moves on rails and may be kept just heavy balance by weight bars or placed on an inclined roadway (with sufficient weights) to move up or down

tensile modulus of elasticity. The tangent or secant modulus of elasticity of a material in the tension test. The relationship between tensile stress and tensile strain. Also called modulus of elasticity in tension and often merely modulus of elasticity. HBG.

tensile strength. a. The ultimate strength of a material subjected to tensile loading. The maximum tensile stress developed by a material in the tension test. It is calculated by determining the tensile stress corresponding to the maximum load observed in the tension test. For ductile metals, tensile strength of a material is usually greater than its breaking strength, but it is below the maximum true stress developed by the material. Tensile strength is a common index for strength comparison of a material. It may be directly used in design where some plastic deformation is permitted, but yield strength is the common basis for elastic design. Tensile strength may also be some indication of allowable severity of hot and cold working processes. HBG.

tension test. a. A test in which specimens are subjected to an increasing tensile pull until they fracture. A stress-strain curve is plotted and the limit of proportionality, proof stress, yield point, ultimate tensile stress, elongation and reduction in area, determined. Red. D. Rock specifically noted for its tenacity in a standard testing machine with special tension grips which allow rock cores to be safely handled. The machine is equipped with the load with the axis of the test piece. The rate of loading is 100 pounds per minute. For rocks of nonuniform nature this test yields erratic results, and tenacity strengths determined from rupture tests are preferred. Lewis, p. 370. See also Brazilian test.

tenacity. a. The force or strength with which the particles of a mineral or rock hold together or resist separation. The terms commonly used to describe the tenacity of a mineral are friable, brittle, sectile, malleable, flexible, elastic, and tough. Stokes and Varnes, 1953. b. The adhesion possessed by a substance, or its toughness. Gordon.

1127

tension modulus. (Eng.) A prop set temporarily in ad-

temporal shaft support. A timber or steel lining inserted for a limited period until the permanent shaft support is put in to replace it. See also skeleton tubbing. Nelson.

temporal splice. According to the Federal Coal Mine Safety Act, is considered to be one that does not have a rubber or neoprene bearing or bonded over the splice and bonded to the cable jacket. I.C. 8149, 1963, p. 16.

temporary support. a. In striking a shaft or driving a tunnel, one that is erected immediately after breaking the ground to give support; that is, until it is no longer needed or until it is replaced by a permanent support. Stoces, p. 264-972 0-68-72 0.

t. N. of Eng. A certain weight of coal agreed upon between lessor and lessee, upon which a royalty is paid. A ten varies between 48 and 50 tons, or 18% New-

carriage. A bogie or frame carrying a pulley round which the rope of an endless rope haulage passes to be tensioned or tightened. The bogie moves on rails and may be kept just heavy balance by weight bars or placed on an inclined roadway (with sufficient weights) to move up or down

tensile modulus of elasticity. The tangent or secant modulus of elasticity of a material in the tension test. The relationship between tensile stress and tensile strain. Also called modulus of elasticity in tension and often merely modulus of elasticity. HBG.

tensile strength. a. The ultimate strength of a material subjected to tensile loading. The maximum tensile stress developed by a material in the tension test. It is calculated by determining the tensile stress corresponding to the maximum load observed in the tension test. For ductile metals, tensile strength of a material is usually greater than its breaking strength, but it is below the maximum true stress developed by the material. Tensile strength is a common index for strength comparison of materials. It may be directly used in design where some plastic deformation is permitted, but yield strength is the common basis for elastic design. Tensile strength may also be some indication of allowable severity of hot and cold working processes. HBG.
tension carriage

according to the tension in the endless rope. A tension device is necessary to take up any slack rope created in varying loads on the haulage system. Nelson.

tension-control cylinder. A hydraulic piston and cylinder mechanism that can be attached to a drill feed-off line and adjusted to allow the drill stem to feed downward while maintaining a constant pressure on the drill string. See also tension drilling. Long.

tension correction. The correction which must be applied to a tape if it is being used at a tension different from that at which it was standardized. See also tape correction. Ham.

tension drilling. Drilling with part of the weight of the drill string supported by the drill string head or suspended on a drilling line, as opposed to drilling with the entire weight of the string imposed on the bit. Long.

tension end. The tail end or receiving end of a belt conveyor. It consists of a return drum carried in a boxlike structure. A scraper, trough, or brush is attached to remove as much as possible of the spillage on the bottom belt before it passes on to the return drum. The tension end is drawn back by two Sylvesters attached to staking anchor props; this enables adequate and continuous tension to be imparted to the belt. Sinclair, V, p. 287. See also drivehead.

tension fracture. A fracture that is due to tension which separates rock strata; unlike gravity or normal fault, since strata may be uplifted or the block of gap caused by fall of intervening section to lower level when fissure opened. Pryor, 3.

Tension Flange. The side of a beam which is in tension, being the lower side in the general case of a simple beam supported at both ends. Ham.

tension fracture, a. A fracture that is the result of stresses that tend to pull material apart. Billings, 1954, p. 93. b. See subsidiary fracture. Ham.

tensioning device, belt. A device fitted to a belt conveyor which automatically takes up any slack or stretch in the belt. A gravity takeup device is sometimes fitted immediately behind the driving unit, thus eliminating slack which would otherwise occur. The main disadvantage of gravity takeup is that it gives the belt three entire lengths. Nelson.

tension jack. A type of jack equipped with a jack screw for wedging against the roof, which also has a ratchet device for applying tension on a chain to be attached to the tail or foot section of a belt conveyor. The jacks and tension chains pull the tail section back until the belt is at the proper tension. Jones.

tension point. A point that is a tension fracture. See also tension fracture. A.G.I.

tension linkage. A chain application in which linear motion is not continuous in direction. Jones.

tension pulley. Aust. A pulley around which an endless rope passes mounted on a revolving drum. A movable bearing line and that the slack of the rope can be readily taken up by the pull of the weights. Fay.

tension splice. A splice that is reliable. J&M.

tension zone. The surface area affected by tensile strain. See also compression zone; Ham.

tensile strain. A strain caused by a tensile stress. Set also compression zone; Ham.

ten wheeler. See six wheeler.

tenter. Eng. A man who has the control or direction of a knitting machine. Rolfe.

Terne furnace. A modification of the open hearth furnace in which the essential reactions in the refining of scrap steel gradually increase in cross section until they are as large as the hearth itself, thus practically eliminating turbulent flow in the furnace. This is claimed to result in increased output and reduced fuel con-
Terni furnace

terrosin. Same as fichtelite. Tomkiew, 1954.
terp morden. An artificial mound or hill of earth. Schieferdecker.
terrettacite. A mineral made from the carbon of general formula Ca₄(SO₄)₂H₁₀, made from gypsum ground down on one side and downward on the other side. Terraces and their bounding slopes are formed in a variety of ways, some being aggradational and others degradational. Fay, b. A flume in marble, commonly cored out and used up. Webster, d. A raised portion of an ancient riverbed or a bank on which alluvial deposits may be found. Nelson, c. A bench in a quarry or opencasting mining. Nelson, e. A ridge, a ridge and hollow, or a flat bench built along a ground contact. Nichols, f. N.S.W. High level river gravels. New South Wales.
terraced. A. A level or nearly level plain, generally narrow in comparison with its length, from which the surface slopes upward on one side and downward on the other side. Terraces and their bounding slopes are formed in a variety of ways, some being aggradational and others degradational. Fay, b. A flume in marble, commonly cored out and used up. Webster, d. A raised portion of an ancient riverbed or a bank on which alluvial deposits may be found. Nelson, c. A bench in a quarry or opencasting mining. Nelson, e. A ridge, a ridge and hollow, or a flat bench built along a ground contact. Nichols, f. N.S.W. High level river gravels. New South Wales.
terrance. Any clay, usually impure, which underlies a terrace or occurs on the slopes of valleys, basins, or on slopes of other types. ACSB-I.
terraced flute cast. Flute casts with external scaling resembling differentially weathered bedding laminations. In reality, a cast of differentially eroded laminations is produced by undermining shale and unrelated to internal structure of the cast. Petitjohn.
terraced stalagmite. A stalagmite having marginal less horizontal terraces. Schieferdecker.
terrace epoch. In geology, the earlier part of the Recent or Holocene epoch; so-called Terrasian; a time of general formation of terraces in the drift-filled valleys of the region glaciated during the preceding Pleistocene epoch. Fay.
terraces placers. Placer deposits on levels above the present streams. A.G.I.
terrace coefficient. A terrace coefficient is a number expressing the ratio of actual ground displacement by plastic waves to that which the same waves would produce in rock. The terrace coefficient for rock is thus 1; for unconsolidated materials it ranges upward to as high as 30, depending on the thickness of the material. Leet 2, p. 73.
terrace concave. A correction applied to observed values obtained in geophysical surveys in order to remove the effect of variations in the earth's topography in the vicinity of the sites of observation. Synonym for topographic correction. A.G.I.
terrane. A. A group of strata, a zone or a series of rocks; used in the description of rocks in a general, provisional, or nomenclatural sense. Fay, b. A region considered in relation to its fitness for some purpose; an extent of ground or territory. Standard, 1964.
terrae. Of or relating to the earth. Webster 3d.
terrae pooderous. Literally, heavy earth; another name for heavy spar or barite. Fay.
terrae. In the system of strata, a zone or a series of rocks; used in the description of rocks in a general, provisional, or nomenclatural sense. Fay, b. A region considered in relation to its fitness for some purpose; an extent of ground or territory. Standard, 1964. Also spelled terrace. Fay.
terrae althea. See others. Fay.
terrae sigillata. A porous red clayware characterised by moulded decorations of the same colour as the inglazed surface. Originated on the Isle of Samos. ASCG, 1963.
terrae siles. See infusorial earth. Bennett 2d.
terrae. Small chips or pieces of stone, usually marble or limestone, about one-half or three-fourths of an inch in diameter, made by crushing and screening. Terraezo chips are used with portland cement in making floors, which are smoothed down and polished after the cement has hardened. BulIMines Bull. 565, 1960, p. 894.
terrae. A. A land area; the earth; terrain. Webster 3d. b. In surveying, the surface of the ground. Webster 2d.
terrae. An embankment of earth with a broad, level top. Webster 3d.
terrae. A. A broad, level top. Webster 3d. b. A raised portion of an ancient riverbed or a bank on which alluvial deposits may be found. Nelson, c. A bench in a quarry or opencasting mining. Nelson, e. A ridge, a ridge and hollow, or a flat bench built along a ground contact. Nichols, f. N.S.W. High level river gravels. New South Wales.
terrae. Deposits laid down on land, especially the black, often oily, coal or oil containing. Fay. Some geologists also include deposits laid down in lakes and rivers, and hence consider the term to be opposed to marine and not to water in general. Stakes and Varnes, 1955.
terrae. The early of the two geologic periods comprising the Cenozoic era, in the classification generally used. Also, the system of strata deposited during that period. Fay.
terrae. A plastic explosive which consists of the constituents, blasting gelatin + BNT + sodium nitrate + ammonium perchlorate. The explosive has a relatively low rate of detonation and is very insensitive, on which account care must be taken to ensure that its initiation is extremely powerful. It is preferably employed in loose rock. Franck, v. 5, Art. 16:02, p. 25.
terrae. An of stains, usually losing character if mixed with other pigments. Webster 2d.
terrae. Produced from or of the earth; in geology, derived from the land; said of marine deposits formed of material washed from the land, and transported by water, or by wind, to a body of water, or by wind, to a body of water, or to wind or water. Tomkiew, 1954.
terrae. Glauconite, or the similar mineral celadonite, used as a grey pigment by artists. The best preparations are very permanent, but of small intimacy, losing character if mixed with other pigments. Webster 2d.
terrae. Produced from or of the earth; in geology, derived from the land; said of marine deposits formed of material washed from the land, and transported by water, or by wind, to a body of water, or to wind or water. Tomkiew, 1954.
terrae. Glauconite, or the similar mineral celadonite, used as a grey pigment by artists. The best preparations are very permanent, but of small intimacy, losing character if mixed with other pigments. Webster 2d.
test cone. A test piece cut or molded from a test borer. See diamond driller. D.O.T. I.
test. a. A cupel, or cupelling hearth, for re-
testeras. Mex. Uprights in a mine, whether
test core. Core removed from a concrete
structure by diamond core drilling and
tested in a laboratory to determine the
strength and other physical properties of
the concrete. Also, core removed from a
borehole drilled in search of oil and used
to determine the quality of the core and
whether oil is present. Long.
test-correction chart. See capillarity-correction
chart. Long.
test cube. A 6- or 4-inch cube of concrete is
used in Great Britain as a specimen to
test the quality of the concrete. A compres-
sive test is generally taken at either 7 or
28 days age, the methods of casting and
testing being described in British Stand-
ard 1681. See also slump test. Ham.
b. A person responsible for carrying out
ventilation, dust or other tests. Nelson.
c. Service company representative who
supervises drill stem testing operations.
Wheel.
testera. A small square stone or tile used in
tessellated. a. A surface divided in squares,
or natural divisions. Fay. b. Composed of
small square stone or tile used in making
glass, or terra cotta variously cofored and
arranged in artistic design: inlaid; mosaic;
tessera. A small square stone or tile used in
making mosaic pavements, walls, etc.
C.D.
tesseral. In crystallography, the same as iso-
tesseral system. Isometric or cubic system.
C.M.D.
tessla. A version of the tenmoku glaze; it is
tessellated as tessellated pavement. Standard,
1964. b. Arranged in artistic design: in-
laid; mosaic; in-plated or enameled. Fay.
tesseract. An apparatus for proving
the physical characteristics of the materials
penetrated can be established as in foundation test-
ing soil and rock from which the physical
characteristics of the sampled formations
can be established. Wheeler 3d.
a. A procedure or a reaction used to identify
a characteristic by heating it to a
sufficiently high temperature at which they evolve
explosive vapors; an oil test. Fay.
test box. Drilling to test oil, gas and rocks
when considering foundations of buildings,
dams and heavy plant. Pryor.
test-borer helper. See diamond-driller helper.
D.O.T. 1.
test borer. A used by foundation
engineers, the act or process of
sinking holes into the overburden
(some-times referred as a test borer),
with rotary or drive sampling equipment
for the purpose of recovering samples from
which information on the physical char-
acteristics of the materials penetrated can
be obtained; also applied to the sample
obtained by the test borer. Long. b. Synonym
for borehole; drill hole; drilling. Long.
test core. A test piece cut or molded from a
sample of refractory material that is to be
tested for refractoriness. Pryor 2.
test core. Core removed from a concrete
diamond core drilling and tested in a labora-
tory to determine the strength and other physical properties of
the concrete. Also, core removed from a
borehole drilled in search of oil and used
to determine the quality of the core and
whether oil is present. Long.
test-correction chart. See capillarity-correction
chart. Long.
test cube. A 6- or 4-inch cube of concrete is
used in Great Britain as a specimen to
test the quality of the concrete. A compres-
sive test is generally taken at either 7 or
28 days age, the methods of casting and
testing being described in British Stand-
ard 1681. See also slump test. Ham.
b. A person responsible for carrying out
ventilation, dust or other tests. Nelson.
c. Service company representative who
supervises drill stem testing operations.
Wheel.
test tube. a. A tube for simple tests; usu-
ally a plain tube of thin glass closed at one
end, but sometimes having a foot, a
graduated scale, or other modification.
Webster 3d. b. Synonym for acid bottle.

test well. a. One that determines not only the
presence of petroleum oil, but its
commercial value, considering its
performance and accessibility. The
information resulting should be such as a
prudent and experienced investor would desire to
know before expending his capital in
labor, or improvements for the profitable
working of the property. Ricketts, II.
b. An exploratory well for water. Bureau of
Minet Staff.
test zone. The section of the mine loaded
with coal dust for a given explosion test.
It is most frequently used in connection with
the number of the range required by com-
plete symmetry. Webster 3d.
tetradymite; telluric bismuth. A natural tel-
luride of bismuth, BiTeS, frequently contain-
ing sulfur and selenium. Trigonal. Color and streak pale steel gray, luster,
metallic; Mohs' hardness 1.5 to 2; spe-
cific gravity, 7.5. Found in California,
Colorado, Arizona, Montana, New Mexico,
Virginia; Canada; Utah and bismuth. Fay.
A.G.G.; C.D, 64, 1961.
tetraethyllead; lead tetraethyl. a. The impor-
tant constituent of antiknock gasoline; Pb-
(C2115)4. Crispin. b. Colorless; liquid; spe-
ific gravity, 0.444 (at 16°C); boiling point
precious metals. Shipley.
tetrachloroethane. Same as carbon tetra-
chloride, CCl4 containing four atoms of
chlorine. Webster 3d.
tetraclorothane. A chloride
(as carbon tetrachloride, CCl4) containing
four atoms of chlorine. Webster 3d.
tetrazhaimy latticir bismuth. A natural tele-
luride of bismuth, BiTeS, frequently contain-
ing sulfur and selenium. Trigonal. Color and streak pale steel gray, luster,
metallic; Mohs' hardness 1.5 to 2; spe-
cific gravity, 7.5. Found in California,
Colorado, Arizona, Montana, New Mexico,
Virginia; Canada; Utah and bismuth. Fay.
A.G.G.; C.D, 64, 1961.
tetrazhaimy lead tetraethyl. a. The impor-
tant constituent of antiknock gasoline; Pb-
(C2115)4. Crispin. b. Colorless; liquid; spe-
ific gravity, 0.444 (at 16°C); boiling point
precious metals. Shipley.
tetrachloroethane. Same as carbon tetra-
chloride, CCl4 containing four atoms of
chlorine. Webster 3d.
tetragonal

which crystals have one fourfold symmetry axis. *Habitus.*

tetragonal system. That system of crystals in which the forms are referred to three mutually perpendicular axes, two of which are of equal length and the third either longer or shorter. Fay.

tetrahedral. Pertaining to the tetrahedron, a four-sided form of the cubic system. Schairer.

tetrahedrite. A mineral, the part with Sb greater than As of the tetrahedrite-tennantite series, Cu,Sb(As)3(S). Silver, zinc, iron, and mercury may replace part of the copper. Isometric. An important ore of copper and silver. Color, grayish-black to black; luster, metallic; streak, black to brown; Mohs' hardness, 3 to 4; specific gravity, 4.6 to 5.1. Found in Montana, New Mexico, Arizona, Utah; Mexico; Europe; South America. Synonym for gray copper ore; falsehood. *A.G.I.*; *Fay*; *CCD* 6d, 1961.

tetrahedron. A crystal form, in the isometric system, enclosed by four faces having equal integers for one, three axes. Fay.

tetrahedron, S104. A silicon atom surrounded by four oxygen atoms. Each oxygen must either receive an extra electron or be shared by two tetrahedra. *V.V.*

tetrahexahedron. A crystal form of the isometric system bounded by twenty-four equal triangular faces, four to each face of the cube. Fay.

tetra sodium pyrophosphate. (Na3P2O7) or *tetranitronilin.* C21H11(NO2)4NH2; a nitration product of aniline; melting point, 170° C; explosion point, 187° C; insoluble in water and in sulfuric acid; and slightly soluble in hydrochloric acid. *C.T.D.*; *Fay*; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-74, B-139, B-229; Malleable; metallic; luster; soft enough to be cut with a knife; toxic; two allotropic forms: (1) a yellow thallium in planar or hexagonal, and stable below 235° C; and (2) beta thallium, isometric, and stable from 235° C to the melting point, 303.5° C; and 20 known isotopes (thallium 191 to thallium 210). Obtained from the roasting of pyrites in the marine products of sea water and from the smelting of lead ores and zinc ores. Used in low-melting glasses and in glazes having a high index of refraction. *Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-74, B-139, B-229; Handbook of Chemistry and Physics, 46th ed., 1964, p. B-229.

thallium acetate. A variety of flint glass of great density and refracting power; made by adding thallium in place of lead. Standard, 1964.

thallous oxide. Of pertaining to, or containing thallium in the univalent state; for example, thallous oxide (TIO); *Webster* 3d.

thallium. a. In physical geography, a term adopted into English usage signifying the line of greatest slope along the bottom of a valley, that is, a line drawn through the lowest point of a valley in a downward slope. It thus marks the natural direction of a watercourse. *A.G.I.* b. In hydrodynamics, the line joining the two banks of a stream channel. *A.G.I.* c. By many geomorphologists, the term is used as a synonym for volcano profile. *A.G.I.* d. The center line of the principal navigational channel of a waterway constituting a boundary between political subdivisions. *H.W.G.*

Thanelian. Lower upper Paleocene. *A.G.I.*

thausnite. A white submetallic fibrous mineral with a trace of cleavage, 3CaO.CO2.
thaumasite

\[ \text{SO}_3\cdot\text{SiO}_2\cdot\text{H}_2\text{O} \]; Mohs' hardness, 3.5; specific gravity, 1.87. *Larsen*, p. 78.

thaw house. A small building, designed for thawing dynamite, of such size as to provide enough thawed dynamite for the day's work. Thawing houses should be heated either with hot water or steam in such a manner that the explosives cannot come in contact with the heated metal or lie directly over the heated metal. *Fay*.

thawing. a. A method of working permanently thaw pipe; thawing pipe. A string of pipe heated with hot water or steam. See also steam thawing. Lewis, pp. 394-395. b. In dynamiting, warming to the point of thawing the frozen material with a supplementary steam thawing plant. Lewis, p. 603.

thaw kettle. A double kettle, built somewhat like a farina boiler, having two compartments, one outer compartment, which is filled with hot water and which entirely surrounds the inner compartment that contains the dynamite to be thawed. It is equipped with a lid for retaining the heat. *Fay*.

thaw pipe; thawing pipe. A string of pipe heated with hot water or steam, that is frozen in a borehole drilled into permafrost, through which water is circulated to thaw the ice and free the drill rods. *Long. See also thawing.*

thaw sheel operator. In the coke plants industry, one who thaws frozen materials in railroad cars by heating sections of sheel where cars are spotted. *D.O.T. Supp. Title 22.* This is a temporary humic degradation matter. *IHCP, 1963, part I.*

The Industrial Revolution. Began during the second half of the eighteenth century. The factors which led to it were the use of coal in the manufacture of iron (developed at Coalbrookdale Foundry in Shropshire, England, in about 1740) and James Watt's great invention the steam engine. *Nelson.*

thenardite, volatile salt. A natural anhydrous sulfate of sodium, Na\(_2\)SO\(_4\), appearing in saline lakes. *Orthorhombic. Color, white to brownish. Found in Arizona, California, Chile, Spain, and Germany. Dana, 17; Sanford; CDC 64, 1961.*

Thenar's blue. See cobalt aluminite.

thenar. The area of skin in which a sighting telescope, equipped with a vertical and a horizontal circular plate graduated in degrees and minutes, together with verniers or other devices giving still finer readings, is mounted so as to rotate about a leveling base, the whole being equipped with spirit level. In (ground) angles between observed points can be read, also slopes from instrument to such points. A graduated scale is mounted between trunnions and can be rotated in the vertical plane, thus facilitating repetition of the observations face-right and face-left, and cancellation of slight errors of axial alignment of the instrument. *see also face right; face left. *Pryor, 3.*

Theoretical. Theoretical. That depression which can be produced by a perfect fan. B.S. 3610, 1963, sec. 2.

Theoretical yield. The maximum yield (as shown by the washability curve) of a product with a specified percentage of ash. B.S. 3610, 1963, sec. 2.

Theory of machine. Comprises the study of the relative motion between the parts of a machine and the study of the forces which act on those parts. *See also machine design. Nelson.*

Thermal. A granular igneous rock composed essentially of andesine, nepheline, pyroxene, with or without a little hornblende, biotite, or olivine. *Fay.*

Thermal. Hot or warm; applied to springs of andesine. *Fay.*

Thermal. The amount of heat that a clay product will absorb, usually expressed in Btu per °F. *AGC, 1963.*

Thermal conductivity. The quantity of heat which will pass through unit area of a material in unit time, when unit difference in temperatures is maintained across the faces of a unit thickness of it. *Taylor.*

Thermal cutout. A device fitted in hydraulic power systems, which will interrupt the current when it reaches a definite moment of inertia spins and also part of the otherwise of the blades. See also manometric efficiency. *Taylor.*

Thermal acceptance ratio. A physiological method of ascertaining the effect of a given climate upon workers, which is based on the ratio between the heat actually lost by the body via the skin, lungs, etc., and the maximum which can be lost in the prevailing conditions. *Roberts, I., p. 136.*

Thermal agitation. All the constituent atoms (or atomic groups of molecules of a substance at any temperature above absolute zero are in ceaseless motion, and this motion in the form of translation, vibration, and rotation forms the thermal agitation of the substance). *Newton, Joseph. Introduction to Metallurgy, 1938, 15.*

Thermal admittance. A method for determining transformations in a metal by noting the temperatures at which thermal arrests occur. This is manifested by changes in slope of the plotted or mechanically traced heating and cooling curves. When such data are secured under nearly equilibrium conditions of heating and cooling, the method is commonly used for determining certain critical temperatures required for the construction of equilibrium diagrams. *ASM Gloss.*

Thermal barrier. The zone where temperature is hit in the melting end of a glass tank furnace. *Dodg.*

Thermal boring. Use of high-temperature flame to fuse rock in drilling. Heat comes from ignition of kerosene with oxygen or other fuel system, at bottom of drill hole, and waste water around compund air heater may be used to flush out the products. *Pryor, 3.*

Thermal breeder reactor. A breeder reactor in which the fission chain reaction is sustained by thermal neutrons. *See also breeder reactor. LBL.*

Thermal capacity. a. Heat required to raise the temperature of a body one degree centigrade. *Bennett, 24, 1962.* b. The amount of heat that a clay product will absorb, usually expressed in Btu per °F. *AGC, 1963.*

Thermal column. A channel incorporated in some research reactors to supply thermal neutrons for experimental purposes. It consists of a large body of moderator located adjacent to the core or reflector of the reactor. Neutrons escaping from the reactor enter the thermal column where they are slowed down to thermal energies (about 2,000 meters per second). *LBL.*

Thermal conductivity. The quantity of heat which will pass through unit area of a material in unit time, when unit difference in temperatures is maintained across the faces of a unit thickness of it. *Taylor.*

Thermal Diffusion. A method of separating gases by passage of a mixture of those gases through a porous solid. The solid is heated at one end and cooled at the other. *ASM Gloss.*

Thermal emissivity. The property of a body to emit heat energy as a black body. *Fay.*

Thermal efficiency. The ratio of the electric power produced by a powerplant to the thermal input. *Mishell, p. 649. See also McNally-Vissac dryer; multilouvre dryer; Raymond double dryer; cascade coal dryer; flash coal dryer; fluidized bed dryer.*

Thermal efficiency. The ratio of the electric power produced by a powerplant to the thermal input. *Mishell, p. 649. See also McNally-Vissac dryer; multilouvre dryer; Raymond double dryer; cascade coal dryer; flash coal dryer; fluidized bed dryer.*

Thermoelectric or electromotive force. The electromotive power produced by a powerplant to the thermal input. *Mishell, p. 649. See also McNally-Vissac dryer; multilouvre dryer; Raymond double dryer; cascade coal dryer; flash coal dryer; fluidized bed dryer.*
thermal emissivity

or heat transfer coefficient, of a rock surface is the rate at which heat will flow from the rock to air, per unit area for one degree temperature difference. This varies with color and other surface characteristics. Roberts, I., p. 41.

thermal endurance. The relative ability of glassware to withstand thermal shock. ASTM C162-66.

thermal exhaustion. The underwater swimmer is extremely sensitive to moderate changes in water temperature in both directions because water is a much better heat conductor than air. At present there is no equipment to protect a man against moderately warm water. Heat prostration may occur during exercise in water around 86° F and at rest in water around 96° F. A much commoner stress is water colder than 65° to 72° F. Many types of clothing have been devised to protect against cold water. Unfortunately most have obvious handicaps such as loss of protection when wet inside, limitation of motion, squeeze and chafing of the skin and marked buoyancy changes of depth and lack of mechanism to rid oneself of sweat and excreta. H.G.

thermal expansion. The increase in linear dimensions and volume which occurs when materials are heated and which cannot be balanced by contraction of an equal amount when the materials are cooled. H.W.

thermal expansion factors for glass. Factors that have been proposed to be used for the calculation of the coefficient of linear expansion of a glass on the assumption that this is an additive property. Dodd.

thermal fatigue. Fracture resulting from the presence of temperature gradients which vary with time in such a manner as to produce cyclic stresses in a structure. ASM Gloss.

thermal glass. A glass in which boron oxide replaces silica in excess in ordinary lime soda glass. Has low coefficient of expansion, can be heated and cooled rapidly. See also Pyrex. CCD 64, 1961.

thermal gradient. In the earth, the rate at which temperature increases with depth below the surface. A general average seems to be around 30° C increase per kilometer of depth, or 150° F per mile. Leet.

thermal growth. See thermal ratcheting. VV.

thermal insulating cement. A prepared composition, in dry form, comprising granular, flaky, fibrous, or powdery materials which, when mixed with a suitable proportion of water to develop a plastic consistency, and applied and dried in place, forms a coherent covering that affords substantial resistance to heat transmission. ACSG, 1963.

Thermalite yong. Trade name; a lightweight concrete made from Portland cement, sand, and pulverized fuel ash; the binder is well mixed with water and a small proportion of aluminum powder is then added, which causes gas bubbles to form. Blocks of the cellular material are then autoclaved. The material is a development of the Swedish material yong. Compare yong. Dodd.

thermal metamorphism; thermometamorphism. Thermochemical conversion in which heat is the principal agent causing reconstitution. A.G.I.

thermal neutron; slow neutron. A neutron in thermal equilibrium with its surrounding medium; they have been slowed down by a moderator to about 2,000 meters per second from the much higher initial speeds of neutrons released by fissioning. L&L.

thermal piercing. See fusion piercing; jet piercing.

thermal precipitator. An instrument for obtaining information regarding the number of particles present in unit volume of a dust cloud; the concentration of particles in any given area or volume which, when mixed with a suitable pro-

on the heat of the combustion of methane. H&G.

thermal recovery. A petroleum recovery process. L&L.

thermal reactor. A nuclear reactor in which the fission chain reaction is sustained primarily by thermal neutrons. Most reactors are thermal reactors. L&L.

thermal radiation. Same as resistance. Strock, 10.

thermal separation. The separation of minerals and metals by heat. The method is used, for example, to remove impurities from rock salt. The crude salt is first exposed to radiant heat. The impurities absorb the heat and become warm, while the rock salt transmits the radiant heat and remains cool. The substance particles adhere slightly to a belt covered with heat sensitive resin, while the salt remains free. Separation takes place at the end of the belt. The cool salt is thrown into one container, while the adhering impurities drop directly into another. Nelson.

thermal shield. A dense shield, located just outside a reactor, between the reflector and the biological shield, to reduce radiation to the pressure vessel and biological shield. L&L.

thermal shock. The development of a steep temperature gradient and accompanying high stresses within a structure. Thermal shock (repeated heating and cooling) of a refractory may cause it to break apart or spall. This can be prevented by careful operation to avoid sudden temperature changes. ASM Gloss.; Newton, p. 264.

thermal shock failure. Fractures or crazing produced by sudden cooling (quenching) of the porcelain enamel surface by application of water or other cold liquids. Spot-cooling of a large hot piece is more severe than quenching of the whole area. Bryant.

thermal shock resistance. The ability to withstand sudden heating or cooling, or both without cracking or spalling. Bureau of Mines Staff.

thermal sintering. In metallurgy, molding by sintering, without prior compacting. Gaynor.

thermal spalling. The chipping or spalling of ceramic ware by repeated heating and cooling. Bureau of Mines Staff.

thermal sintering and refracting. The spalling of a refractory unit caused by stresses resulting from nonuniform dimensional changes of the unit produced by a difference in temperature. ASTM C71-64.

thermal spring. A spring that brings warm water to the surface. This is termed a warm spring or hot spring. Temperature usually 15° F or more above the air temperature. Leet.

thermal stresses. Stresses in metal, resulting from nonuniform temperature distribution. ASM Gloss.

thermal structure. The temperature variation with depth of sea water. H.y.

thermal unit. A unit for the comparison or the calculation of quantities of heat. Abbreviation, tu. See also British thermal unit. Compare calorie. Webster 3d.

thermal value (volatile matter); volatile thers. The calorific value in therm per ton of dry coke, of the gas given off when dry coke, ground to pass a 36 mesh U.S. test sieve, is heated under standard conditions. B.S. 1016, 1951, Pt. 16.

thermal water. The mineral-charged water that issues from a hot spring or geyser. A.G.I.

thermal boring. a. A method of boring holes in concrete under the high temperature generated by a burning steel tube, known as a lance. This is packed with steel wool, through which a jet of suitable gas flows to ignite the end of the lance and keep it burning. H.B. "Slate" is the name for jet piercing. Strewfark, p. 153.

thermal drilling. See jet piercing. Nelson.

thermalic conversion. The conversion of heat into electricity by boiling electrons from a hot metal surface and condensing them on a cooler surface. No moving
thermodynamic conversion

thermistor. An electrical resistor made of a material whose resistance varies sharply in a known manner with the temperature. Thermistors are commonly used for shipboard oceanographic temperature measurement, as their resistance response to unit temperature change and their great sensitivity. H.G.

thermouthy. Test. A test to determine the durability of optical glass in contact with molten salts. From broken or polished surfaces, they are together with a quantity of water, are subjected to a series of temperature cycles, each of 12 hour duration, from $15^\circ$ to $60^\circ$ C in air saturated with water vapor for a period of 12 days. Dodd.

thermoelectric conversion. The conversion of heat into electricity by the use of thermocouples. LBL.

thermoelectricity. Electricity involved in thermoelectric phenomena. Specifically, electricity accumulated or put in motion by thermoelectric action. Webster 3d.

thermoelectric metals. Metals or alloys used in thermocouples for measuring high temperatures. Platinized nickel, copper, rhodium, etc., are much used. Crispin.

thermograph. A self-recording thermometer which gives a continuous trace of air temperature on a rotating drum worked by clockwork. It is mainly used for recording variations in temperature rather than actual temperatures. Ham.

thermoluminescence. The property possessed by many minerals of emitting visible light when the released energy stored as electron displacements in the crystal lattice is given off in a flask. This instrument is used at sea! The two sections are connected by an electric cable and flexible shaft, supported between the two junctions. L&L. Abbreviation, TC. Zimmerman, p. 110.

thermocouple. Two conductors of different metals joined together at both ends, producing a loop in which an electric current will flow when there is a difference in temperature between the two junctions. LBL. Abbreviation, thermocouple.

thermodynamics. Study of transformation of energy into other manifested forms and of their practical application. The three laws are: (1) Conservation of energy; energy may be transformed in an isolated system, but its total is constant. See also energy; (2) Heat cannot be transformed directly into work at constant temperature by any cyclic process. See also entropy; and (3) Heat capacity and entropy of every crystalline or solid becomes zero at absolute zero ($0^\circ$ K).

thermodyne test. A test to determine the durability of optical glass in contact with molten salts. From broken or polished surfaces, they are together with a quantity of water, are subjected to a series of temperature cycles, each of 12 hour duration, from $15^\circ$ to $60^\circ$ C in air saturated with water vapor for a period of 12 days. Dodd.

thermoelectricity. Electricity involved in thermoelectric phenomena. Specifically, electricity accumulated or put in motion by thermoelectric action. Webster 3d.

thermoelectric metals. Metals or alloys used in thermocouples for measuring high temperatures. Platinized nickel, copper, rhodium, etc., are much used. Crispin.

Dodd.
thick band. A field term that, in accordance with an arbitrary scale established for use in describing banded coal, denotes a vitrinite band ranging in thickness from 3 to 50 millimeters (about 1/2 inch to 2 inches). Compare this band; medium band; very thick band. A.G.I.

thick-bedded. In sandstone quarrying, a term used to describe open-bed seams a few inches to 1 foot in thickness. See also medium thick-bedded.

thickening. a. The process of concentrating or concentrating the proportion of water in a pulp. Nelson. b. As used in commerce, a method of concentrating the solids from ore solutions or water, using thickeners, preparatory to recovery of the metal or minerals by precipitation or other means. Also called millman. D.O.T. Supp.

thick stock. Slabs of stone employed for wainscoting, scotting, flooring, etc. Fay. thic- The iron ring, used for in the Coal Measures. Tomkiewicz. thic. SMO. In flotation process, collector agent of low solubility in water, usually used in copper or galena flotation. Pryor. thic. SMO. In flotation process, collector agent of low solubility in water, usually used in copper or galena flotation. Pryor.
third-class lever

third-class lever. A lever to which force is applied between the fulcrum and the work

thirdband assistant. Aust. A boy who helps the machinist and his assistant with a

third quality fire clay brick. A trade term, usually indicating fire clay brick of the

Hath's Chem. Dict.
Thorium

fill holes and blisters in Masonry surfaces and to prevent further destruction of steel reinforcing. COD 6d, 1961.

thorium. A radioactive, silvery-white, metallic element. COD III of the periodic system. The most stable of its 13 radioactive isotopes (thorium 232) is the lead contained in 52.3 percent of lead 208. NRC-ASA N.1.-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. 281.

thorium dioxide; thorium oxide; thor; thorionite (uranium-free). White; isometric; ThO₂; molecular weight, 179.18; specific gravity, 6.32 (at 24° C); decomposes slightly in dilute sulfuric acid and in hydrochloric acid; and insoluble in concentrated sulfuric acid. Made of thorium dioxide and magnesium-thorium alloys and in high-temperature ceramics. Handbook of Chem. Eng. 54th ed., 1964, p. B-201; COD 6d, 1961.

thorium minerals. These include monazite, a rare earth of cerium with some thorium; the silicate thorium (Th₂SiO₄); and the oxide thorium (ThO₂). Pryor, 3.

thorium nitride. Three nitrides have been reported: ThN, Th₂N₂, and Th₃AlN. Dodd.

thorium sulfides. Three sulfides have been reported: ThS₀, ThS₁, and ThS₂.

thorium thread; and half-life, 3.64 days. NRC-ASA N.1.-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-82.

thorofare. In geology, a channel cut across a spit or barrier beach. Fay.

thorogoninite. A lead-containing variant of thorium, ThS₀, in which there is a partial substitution of (OH) for (SO₄) with the formula (Th(SO₄))(OH). Instructural with thorium; differs from thorite in being secondary in origin, in being formed by the alteration of primary thorium minerals including thorite itself, in occurring as fine-grained aggregates that are not metamict but crystalline, and in containing essential water. American Mineralogist, vol. 38, No. 12, November-December 1953, p. 1107. b. Altered mackintoshite. Crosby, p. 48.

thorone. A name for radon 220, a member of the thorium disintegration series; symbol, Th; emits alpha particles; and half-life, 5.5 seconds. Also called emanation; thorium emanation. See also emanation. NRC-ASA N.1.-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-81.

thorotungsite. A very rare, moderately to strongly radioactive mineral, possibly 3WO₂. Th₄O₄. H₂O. Found in small deposits of canisterite as an alteration product of wolframite or scheelite; possibly orthorhombic. Crosby, p. 48.

thorough joints; upright joints. Eng. Vertical joints affecting all the strata, as opposed to cracks or loosen, Oölite quarries, Northamptonshire. Arkell.

Thorsteinson. A formula for assessing the probable solubility of a lead frit: the sum of the bases expressed as PbO divided by the sum of the acid oxides expressed as SiO₂ should not exceed 2. Dodd.

thorvite. A silicate mineral belonging to the muscovite group. (K,Na)₂(Ca,Mg,Fe)₃Al₂Si₅O₁₀(OH)₂. It is the only mineral rich in scandium and may contain 42 percent Sc₂O₃. It is a very rare, weakly radioactive, monoclinc mineral; grayish-green when fresh; white to reddish-gray by alteration; found in pegmatites associated with monazite and euxenite; also found with fayalite, stibnite, monazite, and possibly ferganian. Bukines Bull. 585, 1960, p. 715; Crosby, p. 110-111.

Thorwalsen's law. With decreasing geological age, there is an increase in the complexity of the heavy mineral suites. A.G.

Tlouet. A sodium-containing variant of thorite, Th₂SiO₄, in which there is a partial substitution of (OH) for (SO₄) with the formula Th₂(SO₄)(OH). Instructural with thorium; differs from thorite in being secondary in origin, in being formed by the alteration of primary thorium minerals including thorite itself, in occurring as fine-grained aggregates that are not metamict but crystalline, and in containing essential water. American Mineralogist, vol. 38, No. 12, November-December 1953, p. 1107. b. Altered mackintoshite. Crosby, p. 48.

thorite. A name for thorium 208, a member of the thorium disintegration series; symbol, Th; emits alpha particles; and half-life, 1.4 X 10⁵ years. Thorium occurs in radioactive minerals thorite (Th₂SiO₄) and thorite (Th₂(PO₄)₄). Symbol, Th; valence, 4; atomic weight, 232.038; specific gravity, 11.7; often pyrophoric; its tarnishes ignite when heated in air. Measuring point uncertain, variously reported between 1,700° C and 4,845° C, or 1,900° C; boiling point, about 4,000° C or 4,250° C; is soluble in a solution of nuclear power; insoluble in water or slowly attacked by water; readily soluble in hydrochloric acid; soluble in sulfuric acid. Used in maniles for portable gas lights, in high-temperature ceramics, in nonstic optical glass, as nuclear fuel, to control the growth rate of tungsten (thoriated tungsten) as a catalyst, and in electronics. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-231; B-246; COD 6d, 1961.

Thorite. Has limited use in ceramic bodies and containers for molten Ce. Dodd.

thorite. A name for thorium 208, a member of the thorium disintegration series; symbol, Th; emits alpha particles; and half-life, 1.4 X 10⁵ years. Thorium occurs in radioactive minerals thorite (Th₂SiO₄) and thorite (Th₂(PO₄)₄). Thorium occurs in radioactive minerals thorite (Th₂SiO₄) and thorite (Th₂(PO₄)₄). Symbol, Th; valence, 4; atomic weight, 232.038; specific gravity, 11.7; Dodd.
thread. Long. A. Spiral-shaped groove forming a screw. Long. f. To couple screw-threaded parts. Long. thread cutter. Fig. A tool to cut screw threads on a pipe or bolt. Long. b. A name sometimes applied to a diamond crystal having the shape of an octahedron. Long.

thread grinding. The use of bonded abrasive products to form threads on a piece. ASCG, 1963.

thread guide. Porcelain thread guides are satisfactory for use with cotton, wool, or silk; manmade fibers, for example, rayon and nylon, are more abrasive and stiffer; alumina or synthetic sapphire thread guides are used. Dodd.

thread-lace scoria. Synonym for reticulite. A.G.I.

thread protector. A short-threaded ring to be used in a situation where a couple of threads have to be fastened to the other without damaging the arch. Moreover, it is also a vantage that each half can sink in relation to abutments and at its crown, with the advantage that each half can sink in relation to the other without damaging the arch. Moreover, it is statically determinate. Ham.

three-blanket method. An arrangement used for blacksmithing, in which there are as many layers of blanket between the stretcher and the patient as there are on top of the patient. This method is very effective in underground first aid in keeping the patient warm and reducing the shock while waiting to be transported to the surface. McAdam, pp. 101-102.

three-dimensional dip. In seismic prospecting, the true dip of a reflection or refraction is determined from elevations determined at three fixed points. Ham. c. The problem of determining dip and strike of a plane surface using three known points not in a straight line. Bureau of Mines Staff.

three-product washing. A method in which the cleanest fraction of the coal with an ash content of 1 to 2 percent (for hydrogenation, etc.) is separated; the remainder giving coal with an ash content of 10 to 15 percent (for boiler firing, etc.) and finally incombusitable shale. Nelson.

three-quarter coal. A mixture of lump and nut coal. Fay.

three-shift cyclic mining. A system of cyclic mining on a longwall conveyor face, with coal cutting on one shift, hand filling through and through. Wales. Mining bituminous coal without regard to the size of the lumps. See also through coal. Fay.

througher. a. A tool used to cut screw threads on a pipe or bolt. Long. b. A name sometimes applied to a diamond crystal having the shape of an octahedron. Long.

drilled high voltage for transmission of power, yet the individual circuits provide normal low voltage power. In effect, this is the Edison three-wire system, wherein the rails form the neutral third wire. The third wire (mine track) carries only the unbalance of the loads on the two separate circuits. Kentucky, pp. 220-221.

threshold. a. In geological prospecting: the limiting anomalous value below which variations represent only normal background effects and above which they have significance in terms of possible mineral depositions. Fay. b. In analytical chemistry: the limiting sensitivity of an analytical method. Haukès.

three-sections of drill pipe handled as a unit. Nichols.

throat. a. The part of a blast furnace at the top of the stack. Dodd. b. The zone, decreased cross section found between the port area and the furnace chamber in some designs of open-hearth steel furnace. Dodd. c. The submerged passage connecting the metal to the end of the top of the stack; the refractory blocks forming the sides of the throat are known as throat blocks, deeper blocks, or large blocks, the refractories for the top are the throat cover. Dodd. d. The least thickness of a weld, the calculation of its strength being based on the thickness at the throat. Ham.

throat depth. On a resistance welding machine, the distance from the center line of the electrodes to the throat surface. Ham.

threado-meter. A meter of shock while waiting for one passage cut through a body. Ham.

threado-meter. A meter of shock while waiting for the threado-meter to work. Ham.

threado-meter. A meter of shock while waiting for the threado-meter to work. Ham.

threado-meter. A meter of shock while waiting for the threado-meter to work. Ham.

threado-meter. A meter of shock while waiting for the threado-meter to work. Ham.

threado-meter. A meter of shock while waiting for the threado-meter to work. Ham.
throughput

throughput. Quantity of material (ore or selected fraction) passed through the mill or a section thereof in a given time or at a specified rate.

through wall. A stone passing entirely through the thickness of a wall; a bond stone; a B. I. 1966, pp. 686.

through ventilation. The normal ventilation produced in a mine as the air flows from the intake to the return, as opposed to ventilation produced locally by auxiliary fans. Nelson.

through weld. A weld of appreciable length made either by welding through the unbroken surface of one member of a lap or tee joint, joining that member to the other. ASM Gloss.

c. The amplitude of shake of a vibratory screen, concentrating table; jigger conveyor, etc. Nelson. d. The projection of broken rock during blasting. See also also flyrock. Nichols.

e. The longest straight-line distance moved in the strike or circle of a reciprocating or rotary part. Nichols.

f. The moisture content of a freshly dug coal face. Nichols.

g. The distance from air supply opening measured in the direction of air flow, from the opening to the point where the air velocity is 50 feet per minute. Stock, 1966. h. A fault; a dislocation. Fay. i. The amount of vertical displacement up (upthrow) or down (downthrow) produced by a fault; sometimes, loosely, a dislocation not vertical, the direction being specified by a fault plane; some fault planes have a nearly vertical throw component and a horizontal throw component; striatigraphic throw. Fay. j. Synonym for deviation. Long. k. Lateral displacement, also throw or slip, of a section as a result of faulting. See also bedding displacement, also throw or slip.

throw away bit. A bit that is discarded when worn. a. Faulted or broken up by a fault. Nichols. b. A bearing that permits a clutch throwout collar to slide along the clutch shaft without rotating with it. Nichols.

thrust. a. A thrusting fault that is characterized by a low angle of inclination with respect to a horizontal plane. A.G.I. b. A reversed fault heading at a high angle. B. J. Th. c. The length of a throw fault in which the fault plane is horizontal, or nearly so, are called long-throw faults, or if the translation of the thrust blocks is very great, thrust nappes. Stokes and Varnes, 1955.

thrust plate. The plane of a thrust or reversed fault. Fay.

thrust plate, a. The upper and/or the lower race parts of the thrust bearing in the thrust block or cage on the drive rod in a diamond-drill swivel head. Long. b. Incorrectly used as a synonym for thrust wheel; Long.

thrust race. See thrust plate. Long.

thrust washer. A washer that holds a rotating part from moving in an axial direction. Long.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrusting house. A building in which clay is molded. Also called clay warehouse. Standard, 1964.

c. The amplitude of shake of a vibratory screen, concentrating table; jigger conveyor, etc. Nelson. d. The projection of broken rock during blasting. See also flyrock. Nichols.

e. The longest straight-line distance moved in the strike or circle of a reciprocating or rotary part. Nichols.

g. The distance from air supply opening measured in the direction of air flow, from the opening to the point where the air velocity is 50 feet per minute. Stock, 1966. h. A fault; a dislocation. Fay. i. The amount of vertical displacement up (upthrow) or down (downthrow) produced by a fault; sometimes, loosely, a dislocation not vertical, the direction being specified by a fault plane; some fault planes have a nearly vertical throw component and a horizontal throw component; striatigraphic throw. Fay. j. Synonym for deviation. Long. k. Lateral displacement, also throw or slip, of a section as a result of faulting. See also bedding displacement, also throw or slip.

thrust bearing. a. A bearing, sliding on a clutch jacket that carries the engine and disengagement mechanism. Nichols. b. A bearing that permits a clutch throwout collar to slide along the clutch shaft without rotating with it. Nichols.

thrust block. The antifriction part of the thrust yoke attached to the drive rod in the sixteen known isotopes (thulium 161 to thulium 176). Handbook of Chemistry and Physics, 45th ed., 1964, p. B-60, 1966. See also thulium 170.

thrust block or cage on the drive rod in the sixteen known isotopes (thulium 161 to thulium 176). Handbook of Chemistry and Physics, 45th ed., 1964, p. B-60, 1966. See also thulium 170.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.

thrust yoke. The part connecting the piston rod of the feed mechanism on a hydraulic-feed diamond-drill swivel head to the thrust block, which forms the connecting link between the yoke and the drive rod, by means of which link the longitudinal movements of the feed mechanism are transmitted to the swivel-head drive rod. Also called back end, cage, thrusting house, thrust wheel, etc. Nelson. See also thrust block, thrust yoke.
thwacker. One that thwacks; specifically, a wooden implement with which the half-dried pantile is beaten into thwacking knife. A knife used for trimming tiles are given their final curved shape.
thwack. To beat (a half-dried pantile) into thwacking. One process for the removal of hydrogen sulphide (H2S) and the recovery of sulphur from artificial gas in which the gas is scrubbed with a solution of soda ash whose alkalinity is partly neutralized; 96 percent of H2S is said to be thus removed and the gas is then passed through boxes containing iron hydroxide to remove the other 2 percent H2S. The foul scrubbing liquid is passed through boxes containing iron hydron cement which contains winning lamine. Shipley.
thumb marks. In gemmology, the rhythmic or rippled markings or fractured surfaces of monoclinic plates which may be of various colors. It has been cut as ornamentals or curio stones. From U.S.S.R. Shipley.
tick. Credit. Korson.
tickell roundness number. An index of the shape of a particle in terms of the ratio of the actual value of the projection of the grain to the area of the smallest circumscribing circle. Dodd.
ticket. a. Scot. An old measure for coal. The Campbelltown ticket weighs about 300 pounds. Fay. b. A sealed bid for ore to be sold. Webster 3d. c. The numbered check which the miner puts on his loaded car to inform the weighmaster to whom the coal belongs. See also tag; tally. Fay. d. Can. Slang: the cost of a mining property or enterprise. Hofman.
ticketing. a. In mining districts, a periodical sale of ore to the highest bidder by ticket. Standard, 1964. b. See Teth. 1146.
ticket hole. A small cavity in a rock; a vug. Fay.
tidal air whistle. A small whistle used for training operators in the various methods of artificial respiration. The air whistle is inserted in the patient's mouth and sounds when the patient is exhaling or inhaling. In this way the movements of artificial respiration are timed by the patient's respiratory reactions, and the operator quickly develops the required slow, steady, and smooth rhythm of operations. McDamp, pp. 92-93.
tidal basin. Portion of a tidal-flat area, drained by ebb tides by the channel system of a tidal flat. The tidal basin as a single tidal unit. Schierdecker.
tidal bedding. Deposits produced by tides especially where currents of high tides are stronger than those of low tides flowing in the opposite direction. Thus, high tide deposits a layer of coarse sediments that the low tide destroys. Hett.
tidal bore. As a tide wave approaches the shore it becomes steeper. If this occurs in an estuary in which the tide ebbs and flows, this happens the tide wave sweeps up the river. This is the tidal bore which bears the characteristics of a shock wave. Hett.
tidal channel. A major channel followed by the tides. Schierdecker.
tidal (force) correction. Correction for the effect on gravity of the sun and the moon, including the effect of the tides of the solid earth. Schierdecker.
tidal current. The periodic horizontal movement of water accompanying the rise and fall of the tide and due to the tide producing forces. Schierdecker.
tidal current eyes. The complete oscillation of the flood and ebb through all phases of the tide from high water to the next succeeding high. The generation of semidiurnal tide approximates 12.42 hours, while that of a diurnal tide approximates 24.84 hours.
tidal difference. Difference in time or height of a high or low water between a subordinate station and a reference station.
tidal divide. Divide between two adjacent channel systems. Schierdecker.
tidal dock. A dock having no gates to segregate it from outside tides. Ham.
tidal flat. A flat, soggy area, which emerges during low tide and is characterized by the simultaneous deposition of clay and sand by tidal waters. Ham.
tidal flat area. A relatively extensive area of unconsolidated sediments, the greater part of which is alternately covered and uncovered by the tides. Schierdecker.
tidal inlet. a. A natural inlet maintained by tidal flow. A.G.I. b. Loosely, any inlet in which the tides flow and flow. Also called tidal outlet. A.G.I.
tidal lag. The delay between high tide or low tide in an estuary and the subsequent level of adjacent ground water. Ham.
tidal lamination. A lamination in channel, tidal-flat, and deposits caused by the tides. Schierdecker.
tidal marsh. See tidal flat. A.G.I.
tidal prediction. The calculation of times and heights of high and low water. Tidal predictions generally are published by the hydrographic departments of various countries for various reference stations throughout the world. In the United States they are published by the U.S. Department of Commerce, Coast and Geodetic Survey. Ham.
tidal prism. The volume of water required on the flooding tide to produce the rise of water level in a bay, estuary, fiord, etc. Ham.
tidal range. The differences in height between consecutive high and low waters. Ham.
tidal river. A river up the course of which the tides are noticeable for a considerable distance. Schierdecker.
tidal water. a. In astronomical usage, restricted to the periodic variations of sea level produced by the gravitational attractions of the sun and the moon. A.G.I. b. A tidal wave caused by a submarine earthquake or volcanic eruption, properly called a tsunami; a tidal wave. c. Sometimes used for a large sea wave caused by a hurricane wind or a severe gale, properly called a storm surge. Ham.
tidal wedge. Tidal channel, narrowing or shallowing at downstream end, in which either the ebb or the flood current dominates. Schierdecker.
tide. Rise and fall of the surface of the sea due to the gravitational pull of the moon, generally taking tidal predictions. Schierdecker. In the open sea, this rise may not exceed 2 feet, whereas in the shallow seas bordering continents it may be more than 20 feet and in narrow tidal estuaries from 40 to 50 feet. Since the moon travels in its orbit in the same direction as the earth, a period of about 24 hours, 25 minutes will elapse between successive occurrences when the moon is vertical above a given meridian. The interval between successive high tides will therefore be 12% hours longer than this. Schierdecker.
tide crack. Line of junction between an immovable ice foot and fast ice, the latter being subject to rise and fall of the tide. Schierdecker.
tide curve. A graphic representation of the rise and fall of tide in which time is
tide curb

represented by the abscissas and the heights by the ordinates. For a normal tide curve there approximates a sine or cosine curve. Hy.

tide gage. An apparatus used for predicting the rise and fall of the sea, or the ebb and flow of channels. tidal lands. Technically lands overflowed during flood tide, but the term, by reason of the ease with which the latter can be used to describe that portion of the continental shelf between the shore and the limit of normal high water. A.C.S.G.

tide irrigation. A method of raising water to where it can be utilized by artificial means, such as by use of pumps. A.C.S.G.

tide line. See mean tide level, a.

tide pumping. When track is not adequately drained and water enters rails through cracks in the tie plates. A metal plate used under rails to hold them to gage. Webster 3d.

tie. a. A beam serving the purpose similar to a fend-off beam, but fixed at the opposite side of the shaft or inclined road. Fay. b. The stone ties or stay rods that are sometimes used on the side of the tower opposite the hoisting engine, in place of, or to reinforce the engine braces. Fay.

tie band. Eng. A piece of rope used in securing long timbers or rails when being sent down in the cage. Fay.

tie bar. a. A bar used as a tie rod. Webster 3d. b. A rod between two railway switch rails to hold them to gage. Webster 3d.

tie casing. A covering wall rock or mine opening. Fay.

tie demarcation. A metal plate used under rails to hold them to gage. Webster 3d. c. A bar used as a tie rod. Webster 3d. d. A rod between two railway switch rails to hold them to gage. Webster 3d.

tie detent. A metal plate used under rails to hold them to gage. Webster 3d.

tie plate. A metal plate used under rails where they rest on ties. The rail is spiked down in the cage. Fay.

tie point. Point of closure of a survey either on itself or on another survey. Seeley, 2.

tie pumping. When track is not adequately drained and water enters rails through cracks in the tie plates. A metal plate used under rails to hold them to gage. Webster 3d.

tie rod. a. A tie, taking the form of a steel rod, often provided with a screw thread at each end to engage with a member subjected to thrust. Ham. b. A round or square iron rod passing through or over a furnace brick and having buckles at each end to assist in binding the furnace together. Fay. c. For forging or forming presses, the same as strain rods. A.M. Glass.

tier of pumps. See tyer. Fay.

tier. a. Sp. Earth, land, soil, ground; t. arcillas, clay ground. Fay. b. Sp. Region of the earth; t. adentro, the interior of a country. Fay. c. Sp. Any rock or mineral; t. blanca (Mex.), a calcareous tufa; t. de balut, fullers earth; t. de fluor (Ven.), a bed of reddish clayey earth; t. de porcelana, china clay; t. pesada, heavy spar. Fay. d. Mex. heavy ore. Fay.

tie plate. A metal plate used under rails to hold them to gage. Webster 3d.

tier saw. A saw for giving bricks curved out in a construction. Weaver 3d.

tier of ore. See tyer. Fay.

tier, fights. A turbulent water body produced on the opposite side of the shaft or inclined road. Fay.

tier race. A very rapid tidal current in a narrow channel or passage. Hy.

tier level. See mean tide level, a.

tier race. A very rapid tidal current in a narrow channel or passage. Hy.

tier rip. A turbulent water body produced on the opposite side of the shaft or inclined road. Fay.

tier rip race. A very rapid tidal current in a narrow channel or passage. Hy.

tier gage. An apparatus used for predicting the rise and fall of the sea, or the ebb and flow of channels. tidal lands. Technically lands overflowed during flood tide, but the term, by reason of the ease with which the latter can be used to describe that portion of the continental shelf between the shore and the limit of normal high water. A.C.S.G.

tier saw. A saw for giving bricks curved out in a construction. Weaver 3d.

tier saw. A saw for giving bricks curved out in a construction. Weaver 3d.

tile. a. A flat or curved piece of fired clay, stone, concrete, or other material used especially for roofs, floors, or walls and often for such work of an ornamental nature. Webster 3d. b. A small, flat piece of dried earth or earthenware, used to cover vessels in which metals are fused. Webster 3d. c. Rectangular refractory shapes in sizes larger than brick and usually typified by thinness with respect to length and width. A.R.I. d. A ceramic surfacing unit, usually relatively thin in relation to its thickness, fired from clay or a mixture of clay and other ceramic materials, called the body of the tile, having either a glazed or unglazed materials, called the body of the tile, having either a glazed or unglazed exterior surface. A.R.I.

tile. a. A flat or curved piece of fired clay, stone, concrete, or other material used especially for roofs, floors, or walls and often for such work of an ornamental nature. Webster 3d. b. A small, flat piece of dried earth or earthenware, used to cover vessels in which metals are fused. Webster 3d. c. Rectangular refractory shapes in sizes larger than brick and usually typified by thinness with respect to length and width. A.R.I. d. A ceramic surfacing unit, usually relatively thin in relation to its thickness, fired from clay or a mixture of clay and other ceramic materials, called the body of the tile, having either a glazed or unglazed exterior surface. A.R.I.
tile
tiles and characteristics. See also structural clay tile. ASTM C242-60T.
tile copper. Obtained by roasting and refining the metal bottoms that collect under the regular wash in smelting certain impure ores; usually cast in flat, rectangular plates, hence its name. See also bottoms, b. Standard, 1964, Fay.
tile designer. One who designs individual tiles and layouts designs for tile walls and floors. D.O.T. 1.
tile field. A field or yard, as at a pottery, for keeping earth. A compact clay soil. Standard, 1964.
tile designer. One who designs individual tiles and lays out designs for tile walls and floors. D.O.T. 1.
tile field. A field or yard, as at a pottery, for keeping earth. A compact clay soil. Standard, 1964.
tile designer. One who designs individual tiles and lays out designs for tile walls and floors. D.O.T. 1.
tile field. A field or yard, as at a pottery, for keeping earth. A compact clay soil. Standard, 1964.
tile designer. One who designs individual tiles and lays out designs for tile walls and floors. D.O.T. 1.
tile field. A field or yard, as at a pottery, for keeping earth. A compact clay soil. Standard, 1964.
tile designer. One who designs individual tiles and lays out designs for tile walls and floors. D.O.T. 1.
tile field. A field or yard, as at a pottery, for keeping earth. A compact clay soil. Standard, 1964.
tile designer. One who designs individual tiles and lays out designs for tile walls and floors. D.O.T. 1.
timber

timberline. The upper limit of aboreal growth in mountains or in high latitudes. Webster 3d.

timberman. a. In mining, one who frames timbers; timber boss; timber foreman. D.O.T. 1.
b. The craft of the worker who is skilled in notching, erecting, and securing timbers sets in mine workings. The craft of the timberman is gradually becoming extinct with the advent of power tools, and steel as a support. See also repairer. Nelson. c. See timberer. Fay. d. See roof bole. D.O.T. Supp. e. One who installs precut timbers. Bureau of Mines Staff.

timber pickling. A method to assist timber in gaining moisture. Various pre-servatives are used such as creosote, zinc chloride, sodium fluoride, and other chemicals. See also brush treatment; guniting; b; open-tank method; pressure process; full impregnation process; seasoning timber. Lewis, p. 71.

timber puller. a. A piece of equipment used in removing subterranean posts or timbers in a mine. The timber puller should be constructed so that the operator will be under safe roof while removing the timbers. A Syntliner is an example of this type appliance. Also called timber drawer. Kentucky, p. 151.

timber rights. The right to cut timber on the public domain for use in the mining industry. Fay.

timber rooker. A chemical used to assist the timber in gaining moisture. Also called timber pickler. D.O.T. 1.

timber trolley. A strong carriage of low height for the purpose of carrying timber and other materials to the face. Jones.

timber treater. The upper limit of aboreal growth in mountains or in high latitudes. Webster 3d.

timber bending machine. A machine to raise and hold timbers in place while supporting posts are being set after cut to length by the miner's power- saws. And, A.M.R.24(1956).

timber setting. A tunnel support consisting of a roof beam or arch, and two posts. Nelson.

timber jack. A jack to raise and hold crossbars against the roof while props are being inserted. A.M.R.24(1956).

timber ladder. In metal mining, one who loads on a cage timbers, lagging, timber, track ties, and sand, ordered from underground. D.O.T. 1.
time-distance curve

time signal. A signal sent by telegraph or radio indicating an exact instant of time; in geophysics, the time signal is used to indicate the time of explosion in a shot-hole. Compare time break. A signal sent from the Naval Observatory to regulate timepieces. A.G.I.

time scale. An important member of the Precambrian succession in the Canadian Shield, in Ontario, and in the Pontiac series. G.T.D.

Time-distance graph. In refraction seismic computations, a plot of the arrival times of refracted events against the shot point to detector distance. The reciprocal slopes of the segments plotted are the refraction velocities. If the refraction bed is dipping, the time-distance graph may be constructed. If it is possible to extrapolate this graph to the origin on the time and distance coordinates, it becomes a travel time curve. A.G.I.

Time scale. A Clerk who records all details of payment of surface and underground wages. A.G.I.

Time signal. A small, shallow flutes de-veloped on flat surfaces of limestone, southwest of Minn. A.G.I.

Time study. A detailed investigation under-ground, in shafts, or on the surface, in which the average time taken to do each operation of a complete cycle is recorded. Time studies will disclose whether face, haulage, or winding operations can be improved by reducing idle times and whether the equipment and power services are adequate at all times to provide for the full employment of machines throughout the shift. See also motion study. A.G.I.

Timber. Any dry inflammable material such as might be used for kindling a fire. A.G.I.

Tinder. Any impure variety of jasenomite. A.G.I.

Tin. A soft, ductile, silvery-white metallic element in the 4th group of the periodic system, Na20.2/3203.5H20. Lar.

Tin bath. Molten tin into which sheets of iron are dipped in order to form tinplate. A.G.I.

Tinbride. See stannic chloride. A.G.I.

Tin. A colorless or white mineral without cleavage, Na0.2BO2.5H2O. Lar., p. 68. A pulverulent variety of borax, with 32 percent water. Same as natural borax; moh's. Fay.

Tin-cany safety lamp. A Davy lamp placed inside a tin can or cylinder having a glass in front, airholes near the bottom, and open-top. Fay.

Tin. See stannic chloride. A.G.I.

Tin. A special alarm clock which can be set as a coating, to protect iron and copper, and in solder, bronze, and tin-bronze. Corn. A sloping table used in tin frame. Corn. A thin flat mass of tinstone or, common tin, must. Fay.

Tin disease. See tin pest. A.G.I.

Tinder ore. An impure variety of jamesonite. A.G.I.

Tin dewatering. The extraction of tin-bearing ore from placers by means of dredges. In large-scale operations, tin or gold dredges may handle up to 30 cubic yards of gravel per 24 hours and dig 135 feet below pond level. A.G.I.

Tin. The actual excavating tool or point of a grab bucket, scraper loader, dragline or excavator bucket. A.G.I.

Tin. A color designation. A faint trace of a hue which modifies another hue, as a coat with tin, as to tin iron; tinplate. A.G.I.

blue with a tinge of green, that is, blue tinged with green or, stated differently, very slightly greenish-blue. Shipley.
tin glass. A name formerly applied to bis-
tin glaze. An opaque glaze of stannic oxide,
tingualite. A dike rock composed of alkalic feldspar, nepheline, alkaline pyroxene, and amphibole. The rock is commonly porphyritic and the mafic constituents have a characteristic cruciform orientation in a textural variety of phonolite. A.G.I.
tingualite. Applied to the texture of tingua-
tin hat. A head covering made of reinforced

Also incorrectly used synonymously with the term tin cut. Shipley.
tin mill. Plant for manufacturing tin and

of cassiterite comes from alluvial work-
tinnel. a. The point at which loaded mine cars

tipped solid cutters. Cutters having a body of

tippler. a. Scot. The covering on rock in a

tipped, d. See slate picker. B.C.I. b. The dump; a cradle dump. Fay. c. Aust. The tracks, trestles, screens, etc., at the entrance to a colliery where coal is creened and loaded. See also tipper, b; tip. Fay.
tipple boss. In bituminous coal mining, a

the term tin cut. Shipley.
tin pot. a. A vessel for holding molten tin in the

of cassiterite comes from alluvial work-
tin, roofing. Terneplate made with a 25 per-
tin telluride. Gray; isometric; SnTe; nifilecu-
tint. a. The act, operation, or process of

corrosion. Zern.
tin sweat. See sweat, d. ASM Gloss.
tin telluride. Gray; isometric; SnTe; molecular

tin spar. Synonym for cassiterite. Fay.

tin telluride. Gray; isometric; SnTe; nifilecu-

Titanate. A. Titanium. Standard, 1964, b. Titanate. Any of various compounds (as titanate (titane) that are multiple oxides of titanium. Standard, 1964. A. Titanate. A. Any of a group of electroceramic materials generally based on the compound barium titanate but often with the addition of other titanates, zirconates, stannates, or niobates. These ceramics are notable for their high dielectric constant (360 to 600, including over 10,000 compared with a value of 5 to 10 for the more common ceramic materials); because of this property they find use in capacitors. Titanate ceramics are also used where piezoelectric properties are needed, that is in transducers. Does not contain titanium metal.

Tin hydride. Gray-black; metallic; TiH2; hexagonal, stable below 980° C; and (2) beta titanium, isometric, stable from 880° C to the melting point. The metal occurs in rutile, ilmenite, and for titanium dioxide. A compound produced by fusing titanium dioxide with carbon or calcium carbonate. Has a melting point in the range of 3140 to 3160° C. This very hard refractory is used for wear-resistant applications and where good thermal shock resistance is needed, as in bearings, nozzles, and special refractories under extreme neutral or reducing conditions. See also Goliat crane. Hom.

Titanium. A very hard metal; white, yellowish, or yellowish red; a very widespread mineral constituent of the earth's crust. Used in shipbuilding. A. Titanium. Gray-black; metallic; TiH2; hexagonal, stable below 980° C; and (2) beta titanium, isometric, stable from 880° C to the melting point. The metal occurs in rutile, ilmenite, and in the form of titanate (titane) primarily and it is the ninth most abundant element in the crust of the earth. Used as an alloying agent with aluminum, molybdenum, manganese, iron, and other metals. Alloys of titanium are used as aircraft and missile parts because it have weight, strength, and the ability to withstand temperature extremes, and in ship parts because it resistant to seawater corrosion. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-241, B-233. Titanomagnetite. See titanium dioxide. C.D. 6d, 1961.

Titanium carbide. A compound produced by fusing titanium dioxide with carbon or calcium carbonate. Has a melting point in the range of 3140 to 3160° C. This very hard refractory is used for wear-resistant applications and where good thermal shock resistance is needed, as in bearings, nozzles, and special refractories under extreme neutral or reducing conditions. See also Goliat crane. Hom.

Titanium dioxide. Tetragonal; refractive indexes, 2.493 and 4.17; and ranges from 3.82 to 3.95; Mohs' hardness, 5.5 to 6.0; insoluble in water in most acids; and soluble in hot concentrated sulfuric acid and in alkalies. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-233, B-245. Titanium dioxide is said to contain or octahedrite: Brown, blue, and black; tetragonal; refractive indexes, 2.493 and 4.17; and ranges from 3.82 to 3.95; Mohs' hardness, 5.5 to 6.0; insoluble in water in most acids; and soluble in hot concentrated sulfuric acid and in alkalies. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-233, B-245.

Titanium dioxide is said to contain or octahedrite: Brown, blue, and black; tetragonal; refractive indexes, 2.493 and 4.17; and ranges from 3.82 to 3.95; Mohs' hardness, 5.5 to 6.0; insoluble in water in most acids; and soluble in hot concentrated sulfuric acid and in alkalies. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-233, B-245. Titanium dioxide is said to contain or octahedrite: Brown, blue, and black; tetragonal; refractive indexes, 2.493 and 4.17; and ranges from 3.82 to 3.95; Mohs' hardness, 5.5 to 6.0; insoluble in water in most acids; and soluble in hot concentrated sulfuric acid and in alkalies. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-233, B-245. Titanium dioxide is said to contain or octahedrite: Brown, blue, and black; tetragonal; refractive indexes, 2.493 and 4.17; and ranges from 3.82 to 3.95; Mohs' hardness, 5.5 to 6.0; insoluble in water in most acids; and soluble in hot concentrated sulfuric acid and in alkalies. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-233, B-245.
titanium metal

weight 47.9; specific gravity 4.5. Bureau of Mines Staff.

titanium minerals. Main commercial ones are rutile (TiO₂) and ilmenite (FeTiO₃). Used in paints, pigments, fillers for plastics, steel metallurgy, welding, enamels, smelting and other uses. Titanium metal where strength, lightness and corrosion-resistance justify cost. Pryor, 3.

titanium oxide. TiO₂; used as an opacifier, particularly in vitreous enamels, and as a constituent of some ceramic colors. Titania and titinate electroceramics, for use in the radio-frequency field, are based on this oxide and its compounds. Titania occurs in three crystalline forms: anatase, brookite, and rutile. Dodd.

titanium peroxide. See titanium trioxide.

CCD 6d, 1961.

titanium silicide. TiSi₂; 2.120 C, specific gravity 4.2. This special ceramic has good resistance to attack by basic and oxidizing atmospheres but not to thermal shock. Dodd.

titanium sponge. The metal product from reduced titanium tetrachloride with magnesium in the Kroll process. It is called sponge because of its sponge-like appearance. Sodium reduced metal also is referred to as sponge. BuMines Bull. 630, 1965, p. 976.

titanium trioxide; titanium peroxide. Yellow; TiO₂; and is soluble in acids. Used in dental porcelain and in dental cements and in yellow tile. CCD 6d, 1961.

titanium magnetite. A titaniferous magnetite (titanomagnetite) containing TiO₂ in solid solution, as distinct from limonematite with exsolution ilmenite. See also mogenenate. Spencer 21, M.M., 1958.

titanous. Of, pertaining to, containing, or derived from titanium. Used especially for compounds in which titanium is trivalent. Webster 3d.

titan process. A process of concentrating iron ore which comprises the steps of effecting a dry, thermal partial reduction of the iron in the ore to the metallic state to a degree or reduction of between 50 and 80 percent, subjecting the reduced product to a magnetic separation and recovering the iron-oxide concentrate. Odhner.

tiffle. The solidifying range of a liquid fatty acid. Pryor, 3.

tiffy (of soap). The melting point of the fatty acids derived from a fat or oil. Lounenheim.

tiffy ore. A portion of ore set aside for the payment of rental or royalty on mineral lands. Fay.

tide. The right to enter, develop and work a claim on mineral deposit. See also claim; lease. Nelson.

titration. a. A determination of the reactive capacity, usually of a solution. Especially, the analytical procedure of successively drawing from a burette measured amounts of a reagent (as a standard solution) to a desired point (as a color change or a large change in potential of the solution) reached. Webster 3d. b. The operation of taking base or volume analysis. See also volumetric analysis. Nelson.

TIV. Abbreviation for total indicator variation. ASM Gloss.

tizan. Mex. A bond in a monastery. See also diente, b. Fay.

TKP Abbreviation for tetratiosilicic pyrophosphate. See also potassium pyrophosphate. CCD 6d, 1961.

TNT Abbrreviation for trinitrotoluene. CCD 6d, 1961.

tm Abbreviation for ton. Zimmerman, p. 110.

TNA Abbreviation for tetrantinoline. CCD 6d, 1961.

TTT Abbreviation for trinitrotoluene. CCD 6d, 1961.

TNT Abbreviation for trinitrotoluene. CCD 6d, 1961.

TNT ammonium nitrate explosive. An explosive containing ammonium nitrate sensitized with trinitrotoluene. A proportion of aluminium powder or calcium silicide may be added to increase power and sensitivity. It is susceptible to moisture, and under wet conditions, is used only in a watertight container. See also A.N., fuel oil explosive. Nelson.

tofback mark. Eng. Unlaminated marl with lumpy fractures in contrast to bleefheat marl, Lancashire. Arkell.

toefrock. See toefstone. Fay.

toef-eye. Eng. Shelly pink limestone in the Corbula Beds of the Purbeck Beds at Durlston Bay. So called because full of the small gastropods Fascichilus manelli which resemble eyes when seen in transverse section. Compare rabbit-eye. Arkell.

toefstone. a. Eng. A kind of traprock. Fay. b. A term used in mining to distinguish ore samples from others or to indicate the passage over a certain ore body. Fay. c. A term used in the Kroll process. It is called sponge because of its sponge-like appearance. Nelson.

toefin. A quarry term for the wedging-in of the end of a granite sheet under an overhanging joint, probably in consequence of the faulting of the sheets along the joint. It is also applied to the overlapping of lenticular sheets. Fay.

toefilite. A biotite-hornblende porphyryite, with garnets, that forms dikes in mica schist and gneiss near Meran, Tirol, Austria. Fay.

toe-in. A tcphoid term for the wedging-in of the end of a granite sheet under an overhanging joint, probably in consequence of the faulting of the sheets along the joint. It is also applied to the overlapping of lenticular sheets. Fay.

toefoearth. In geology, cold joints intersecting the sheet stratically or that portion of the sheet striking with the sheet, in some different from them in strike 45° or more. Fay.

toefooearth. A name given by Brögger to certain feldspath syenitic rocks, from Tönberg, Norway, that are close relatives of the anorthosites. They differ from the anorthosites in their smaller percentage of lime and higher percentage of alkalies. Fay.

toefoo soil. The distance from the inner end of the hole to the adjacent free face measured at right angles to the direction of the hole; or that part of the hole which is filled with powder; or that part of the team to be broken lying between the powder and a free face. Zerr, p. 608.

toefoo tool. The junction between the face of a weld and the base metal. ASM Gloss.

toefoo tool. The forward, lower end of a tangential forest bed. Name derived from depo- sition at the toe of a tangential forest. Fay.

toe-to-toe drilling. The cutting of large diam- ter blasting holes in quarries and open- cast pits. They are put down vertically from top to bottom of the quarry face. Deck loading is often adopted with half to two-thirds of the total charge at the toe of the hole or that portion of the hole containing wall adjacent to various stones or stonelike objects likened in color or shape to toads (batrachites, bafonites, crapoidus). Arkell.

toe-to-toe drilling. A process of concentrating iron ore which comprises the steps of effecting a dry, thermal partial reduction of the iron in the ore to the metallic state to a degree or reduction of between 50 and 80 percent, subjecting the reduced product to a magnetic separation and recovering the iron-oxide concentrate. Odhner.

toe-toe drilling. The drilling of large diameter blasting holes in quarries and open- cast pits. They are put down vertically from top to bottom of the quarry face. Deck loading is often adopted with half to two-thirds of the total charge at the toe of the hole or that portion of the hole containing wall adjacent to various stones or stonelike objects likened in color or shape to toads (batrachites, bafonites, crapoidus). Arkell.
tofo

tofu a. Made to gage, or a size as specified, especially as applied to the outside surface of a vessel, and naming both the number of shells and the inside diameter of a borehole. Long. b. To determine, by measurement of the capacity, quantity, or dimension. Long.

toggle action. Application of crushing force so that the distance moved diminishes, without change of input strength, between gage and set. Thus greatest speed of movement of the approaching faces is applied with weakest thrust and vice versa. Pryor, 4.

toggle joint. A joint having a central hinge like an elbow, and operated by applying the power at the junction of motion, as from horizontal to vertical, and giving enormous mechanical advantage; a mechanism common in many forms of presses, and in stone crushers. Standard, 1964.

toggle mechanism. A mechanism utilized to apply heavy pressure from a small applied force, such as in a jaw breaker, and other machinery. Hams.

toggle press. A mechanical press in which the slide is actuated by one or more toggle links or mechanisms. ASM Gloss.

tola. A unit of length used in early geodetic surveys and equal to about 6.4 English feet; became the legal standard of length in France, and from it was derived the French meter. A.G.I.

token. a. Aust. A metal or leather ticket stamped with a distinctive number, fastened to a skip so as to indicate to the weighman who mined the coal. A ticket; tally. Fay. b. Wales. A thin bed of coal. A ticket; tally. Fay.

tolite. A variety of algal coal the name of which was later changed to sppromyrite. Tomassi, 1954.

tommy bar. A short rod used as a lever or handle for turning a jackscrew or a spanner by being inserted loosely in the hole provided for the purpose. Long.

tommy dodd. Aust. A series of small pulleys, with vertical axes placed between the rails at a curve, so as to keep an endless rope in place. Fay.

tonomography. A division of radiography dealing with the photography of a particular plane in an object while leaving out undesired detail in other planes. Although this technique was developed for medical radiography, it is recommended for certain purposes in work with metals where it is essential that the location of faults be exactly known. Osborn.

ton. a. Any of various units of weight: (1) a unit that approximates 2,000 pounds avoirdupois; (2) a unit used chiefly in England; (3) a unit used in the United States, Canada, and the Republic of South Africa; (4) a unit of interest in shipping for ships that equals 100 cubic feet; (5) a unit of volume for cargo freight usually considered to be 40 cubic feet; also called a freight ton; a measurement ton. Webster 3d, b. A unit of weight for large quantities. In Great Britain, the short ton is used in metal mining; the long ton in coal mining; and the metric ton in foods and to avoid confusion the short ton. C.T.D. Usually not abbreviated, but abbreviations are t and tn. BuMin Style Guide, p. 67; Webster 3d.

tonalite. A coarse-grained igneous rock, quartz-mica diorite. Two varieties are distinguished: soda tonalite, with albite in excess of anorthite, and lime tonalite, with anorthite in excess of albite. Compare adammellite. C.T.D.

Tonnawanda. Middle Middle Silurian. A.G.I. Supp.

tonca copper-molybdenum iron. See pure iron. Mercureau, 4th, p. 482.

tone. That attribute of a color which determines its position in a scale from light to dark. Thus white, and also light gray, are light tones, and dark gray the dark tone of the same color sensation; pink is a light tone of red, and maroon a dark tone. A light tone is usually known as a tint, a dark tone as a shade. Shipley.

tonelada. Sp. Term meaning ton. The ton of Castile equals 2,022.2 pounds avoirdupois; the Mexican and Spanish American ton equals 2,038.88 pounds avoirdupois; the metric ton, 1,000 kilograms equals 2,046.5 pounds avoirdupois. Fay.

tongue. A hand, repeatable, serrated metal insert in pipe tongs, which comes in contact with and grips the outside of a pipe, casing, or drill rod. Also called tong key. Loomis, 2.

tonguld. The portion of a forging billet, usually on one end, that is gripped by the operator's tongs. It is removed from the part at the end of the forging operation. Common to drop-hammer and press-type forging. Standard, 1964.

tong key. Synonym for tong long. Die.

tongue outcrop clay. A fire clay associated with the better bed coal, Yorkshire, England. The raw clay contains about 65 percent SiO2, 22 percent Al2O3, 1.5 percent Fe2O3, and 1.6 percent MgO. Standard, 1964.

tongue outcrop clay. A fire clay associated with the better bed coal, Yorkshire, England. The raw clay contains about 65 percent SiO2, 22 percent Al2O3, 1.5 percent Fe2O3, and 1.6 percent MgO. Standard, 1964.

tongue. a. A pair of curved arms pivoted to each other, scissor fashion, so that a pull will grip an object between them. Nicholas. See also pipe grip; pipe tongs; pipe wrench. Fay. b. A two-legged instrument used for picking something up or for holding material while it is being worked. Also called a pair of tongs. Crispis. c. One of the various tools or wrench devices that can be made to fit and grasp drill rods, casing, or drivepipe. Compare chain tongs. Long. d. Any of the various tools consisting to two pivoted or hinged legs designed to grasp hot metal, such as a hammer-drill bit, while it is being worked. They are made in several sizes and forms essential to a toolie or a blacksmith. Long. e. In gum cutting, a set of jaws by which the dop is firmly held in order to press the stone against the wheel. Standard, 1964.

tongue. Drawbar of a towed vehicle. Nicholas, 2. b. A piece of iron or steel
tongue
projecting from the stem of a stamp head. Fay.
c. A long narrow strip of land, project-
ing into a body of water. Schier-

from a body of water. Schier-
tongue joint. In welding, a split joint formed
by inserting a wedge-shaped piece into a
corresponding split piece and welding
the edges together. Long. tooler. a. The operator on a cable
tool. A tool holder. Compare descri-
er. Long. c. A toolstone-grade diamond
inset in a metal shank and used to trim
the face of a grinding wheel. Long.
tongue plate. An adjustable plate which con-
trols the quantity of feed entrapped by the
rolls of a double-roll press. B.S. 3552,
1962.
tongue test. A test by which crystals or crys-
talline gemstones, all of which are
genuine or synthetic, can be distinguished
from glass which feels warmer in com-
parison, when held to the tongue. Shipley.
tongue tile. In a port, the projection partition
between gas and air streams. ASTM
C162-66.
tong up. To couple lengths of drill rod, pipe,
or casing, using tongs to grip and screw
the members together. Long.
ton br. Abbreviation for tons per hour. Bu-
tool. A blasting explosive consisting of a
mixture of nitrocellulose with a nitrate and
sometimes a nitro compound. Webster 3d.
ton-kilometer. A unit of measurement often
used for the work done in transport. The
number of ton-kilometers is the weight in
tons of material transported multiplied by
the distance in kilometers driven. Stoes.
1. p. 156.
ton mile. In railroading, a standard measure of
traffic, based on the rate of carriage
per mile of each passenger or ton of
ton MPH. A system recently developed that
permits calculating how hard an earth-
moving tire should work and how much
work it is doing. The Ton MPH for any
tire is determined by multiplying the mean
load and average speed. The resulting
figure provides an index to the work a
tire can do. The operator determines which type of tires
he should use to get top performance
within his means. Coal Age, v. 71, No.
8, August 1966, p. 234.
tonnage. The amount of ore handled per day.
The amount of ore in sight. Fay.
tongue notch. Ceramic tool bits for use in the
machining of metals of various types: car-

for correlation. B.S. 2618, 1964, sec. 5.
tool box. The same as powder box. Korion.
tool box. A key miner, specifically one
who rests on his tool box while his laborer
does his work. Korion.
tool dresser. a. The driller's helper on a cable
A churn driller's helper. Compare descri-
er. Long. c. A toolstone-grade diamond
inset in a metal shank and used to trim
the face of a grinding wheel. Long.
tool surface. Term used to describe the
surface finish of building limestone that
has fine parallel grooves. AIME, p. 330.
tooler. A stonemason's chisel 2 to 4 inches
broad. Stoces v. 1, p. 166.
tool extractor. An implement for grasping
and withdrawing drilling tools when
broken, detached, or lost in a borehole.
A fishing tool. Also called tool grab. Long.
tool grab. See tool extractor. Long.
tool grinders. In a stone-cutting industry, one
who grinds the cutting tools for stone-cutting
machines and lathes to a keen edge of the
tools desired that the Rock. Long.
tool heat treater. One who hardens and
charges tools, dies, and fixtures. Bureau
of Mines Staff.
toolmaker. A workman skilled in the making
of jigs, fixtures, gages, etc. Cripin.
tool marks. a. Sole marks produced by en-
teracting with the point of the drill. Long.
tooling. A process of shaping or forming a
metal object. Long. tool point. The point at
which drill-stem is transferred to the
bottom of the mine and to bring down tools
and instruments. J&M.
tool post. The space between two sprocket'
tooth. J&M.
tool post. The space between two sprocket'
tooth. J&M.
tooling. Leaving a section of brickwork
after the other is finished so that the
brickwork to follow can be bonded into it. It consists of allow-
ing alternate courses to project a sufficient
distance to assure a good bond with the
portion to be built later. Cripin.
tool post. On a face mill, the chamfered
cutting edge of the blade, to which the flat
is sometimes added to produce a shaving
effect and improve the finish. ASM Gloss.
tool profile. The outline of a sprocket tooth
as projected on a plane through the
sprocket axis and the center of the tooth.
J&M.
tooth. A projection on a tooth, such as a
saw tooth. Cripin.
tooth. A projection on a tool, such as a
saw or file, designed to provide a cutting
action. ASM Gloss. b. A projection on the
circumference of a wheel, designed to engage corresponding projections on an-
other wheel and thereby transmitting
force. ASM Gloss. c. Roughness in a clay;
corne, grain, structure. ACSG, 1963.
tooth base. a. The inner part of a two-piece
tooth on a digging bucket. Nichols.
b. Occasionally, the socket in which a tooth
fits. Nichols.
tooth brake. Jaw brake. A brake used to hold
a shaft by means of a tooth or teeth
engaging with fixed sprockets. Not used for
slowing or stopping. Nichols.
toothed roller bit. Synonym for roller bit.
toothed-shoe cutter. A drivepipe or casing
shoe with a serrated or toothed cutting
edge. Long.
toolmaker. A person whose duty it is to carry
powder, drills, and tools to the various
levels of the mine and to bring such tools
and drills as have been purchased by use
for the surface. See also nipper, a. Fay.
toothed. A masonry unit projecting from the
face of a mortar joint with a special tool other
than a trowel. ACSG.
toothed. The point at which drill-stem
or tooth. J&M.
toother. A man who sharpens churn-drill bits;
b. A churn driller's helper. Compare descri-
er. Long.
tooth plate. An adjustable plate which con-
trols the quantity of feed entrapped by the
rolls of a double-roll press. B.S. 3552,
1962.
tongue test. A test by which crystals or crys-
talline gemstones, all of which are
genuine or synthetic, can be distinguished
from glass which feels warmer in com-
parison, when held to the tongue. Shipley.
tongue tile. In a port, the projection partition
between gas and air streams. ASTM
C162-66.
top and apex

of the miner's terminology prior to the adoption of the federal mining law, but were words used by legislators to convey the intent of the formulators of that law.

Top and bottom process. See Orford process.

topaz cat’s eye. Yellow gisarolite (often chemically incorrectly) which theoretically can exhibit a more or less well-defined light line, or chatoyancy.

Shipley.

topazelles. See. A brecciated, contact rock near granite contact, and formed of topaz, tourmaline, quartz, and some rarer accessory minerals, also called topazz rock.

Topaz. A rock resulting from contact metamorphism, made up of an aggregate of fragments of quartz and tourmaline, cemented by a mixture of quartz and topaz. Also called topaziz rock. Fay.

Topaz glass. Topaz-colored glass. One variety of this glass is then lowered. Dodd.

Topaz opalescence. A light which is then lowered. Dodd.

Topaz topography. A. The science of surveying the surface of the earth, its relief, and the art of delineating them on maps. Standards, 1964.

Topaz topography. A. The science of surveying the surface of the earth, its relief, and the art of delineating them on maps. Standards, 1964.

Topping a. The contents of a loaded mine, as undertaken by the land surveyor. Ham.

Topographic correction. See terrain correction.

Topographic deserts. Deserts deficient in rainfall either because they are located far from the oceans or are the center of continents, or because they are cut off from rain-bearing winds by high mountains.

Topographic high. Frequently used in the oilfields to indicate the higher elevations, regardless of age; opposite of topographic low, which indicates a lower elevation. Compare geologic high. Fay.

Topographic influence. In geology, a features stage characterized by a smooth, nearly level surface of deposits, lakes abounding in slight depressions, shallow streams, and drainage systems not well established. Standard, 1964.

Topographic low. See topographic high. Fay.

Topographic map. A. A representation on paper that is designed to portray certain selected features of a section of the earth's surface plotted on some form of projection and to a certain scale that primarily depicts the relief of the country mapped but shows also, its drainage and cultural features, and that delineates all features in true latitude and longitude and therefore, all parts in a right, vertical, relative position. Stokes and Barnes, 1935. b. A map showing the topographic features of a land surface generally by means of contour lines. A.G.I. 1964.

Topographic maturity. In geology, a stage of maximum diversity of form when valleys have greatly increased, and the river channels are widely opened. Standard, 1964.

Topographic old age. A geologic stage in which there is a featureless surface differing from the earliest stage in having a system of drainage streams, separated by the physical features of a district swelling hill. Standard, 1964.

Topographic quadrangle. Map upon which is shown a small portion of land with elevations indicated by a series of contour lines each passing through a specified altitude; the curvature and crowding together of the contour lines indicates the nature of the terrain. Sinkens.

Topographic unconformity. If the invading glaciers disappear before they carry their erosion beyond youth, the area will show two kinds of topography: (1) the mature upland incised by (2) the new glacial valleys, and these two topographic phases will be out of harmony with one another, that is, they will be topographically unconformable. Their relation will be that of topographic unconformity. A.G.I.

Topography. A. The science of surveying the physical features of a district or region and the art of delineating them on maps. Fay. b. The physical features of a distinct or region, such as are represented on maps, taken collectively; especially, the relief and contour of the land. Fay. c. The configuration of a surface including its relief. May be applied to a surface such as the sea bottom or a surface of given characteristics within the water mass. Hy.

Topper crude petroleum. A residual product remaining after the removal of oil, gasoline, and some of the volatile components of crude petroleum. ASTM D288-57.

Topping a. The contents of a loaded mine
topple. S. Wales. From tophole. A working toppling. Eng. The first top rod. Scot. The rod connecting the upper-top-reef deposits. Deposits on the reef flats. top pouring. See direct teeming. ZIodd. top ply; top leaf; tops. Scot. The uppermost topset bed. Gently inclined strata deposited top slid* A method of stoping in which the ing for a road or grade. Nichols. d. A top sliding and cover caving. A mining method that entails the working of the ore body from the top down; panel slicing; prop slicing; and transverse slicing with caving. top slicing combined with ore caving. A method in which the ore body is worked from the top down; panel slicing; prop slicing; removing pillars and allowing roof to cave; slicing under mine of timber in panels; square-set slicing; top slicing and caving; and transverse slicing with caving. top strata. A timber mat is used in almost all cases. Other terms used for this system are: slicing system; crosscut method (combined with removal of pillars); horizontal slicing (designed to leave ore from top down); panel slicing; prop slicing; removing pillars and allowing roof to cave; slicing under mine of timber in panels; square-set slicing; top slicing and caving; and transverse slicing with caving. top技术人员. See headman. D.O.T. 1. toptop slicing. A method of stoping in which the ore is extracted by excavating a series of horizontal rooms. The ore is removed by blasting out the timbers, bringing the capping or overburden down upon the broken ore. The slices which have been previously covered with a floor or mat of timber to separate the caved material from the solid ore beneath. Succeedingly lower slices are mined in a similar manner up to the overlying mat or roof, which consists of an accumulation of broken timbers and lagging from the upper slices of caved capping. After removing the slices and caved this mat follows the mining downward, filling the space occupied previously by the ore. * Bull.Mines Bull. 290, 1936, p. 15. Much timber is required for top slicing, and a low-cost, adequate supply of low-priced timber is necessary. Top slicing is also applied to the extraction of pillars between stopes and for cleaning operations in caved ore by hand. Lewis, pp. 465, 502-503. See also block caving.

tor. Eng. a. A rounded mass of rock left in an elevated position by the decay of surrounding parts. Sometimes called boulder. Fay. b. A rocky pinnacle or peak; a high peak. Fay.
tor. Eng. a. A rounded mass of rock left in an elevated position by the decay of surrounding parts. Sometimes called boulder. Fay. b. A rocky pinnacle or peak; a high peak. Fay.
with the grain, producing the most desirable cubical product. *Fit and Quarry*, 53rd, Sec. B, p. 35.
tornado
torcho, torc&utm.
torhode occlusion. A rare, weakly radioactive, possibly monomineral, gem 3 to olive mineral, R/Fe(OH) (SiO4), where R=Co, (La,Nd), Al,Fs,Mn,Mg,Ca. Found in contact zones at Bastnas, Sweden. *Crosby* p. 112; *Hep* 2d, 1855.
torlose load cast. A sole mark formed by elongate ridges which pinch and swell along their trends; unlike flute casts, the downcurrent terminations are bulbous or tear-drop shaped. *Petitjohn*.
torpedo. a. An encased explosive charge slid, lowered, or dropped into a borehole and exploded to clear the hole of obstructions or to open communications with an oil or water supply. Also called bullet. b. A charge of explosive contained in a narrow cylinder, which is lowered into an oil well to the required depth and then fired. The object is to fracture the oil-bearing rock and thus increase the flow of oil. *Nelson*. c. A core barrel containing explosives, which is lowered by a line into a quarry blasthole which has been bored into the ground. It is permitted to be used in place on a line, and exploded when crushed under a locomotive wheel; used as a signal. *Webster 3d*.
torpedo crown. A torpedo or noncoring bit. *Long*.
torque. a. An engineering term defined as the product of a force times its lever arm. It is usually made by plotting the twisting moment of a given section of a structure, that section rotates about some point in its plane. This point, which does not move during rotation, is the torsional center of that section. It is sometimes defined as though identical with the flexural center, but the two points do not always coincide. *Coin*.
b. A measure of the ability to produce a twist in the wire, thereby showing its ductility. *Zero*.
torsional center; center of twist; center of torsion. See *Reec* torsion anemometer. *See Reec* torsion anemometer.
torsional shear test. A shear test in which the relative twist specimen of solid circular or annular cross section, usually confined between two bearings, is subjected to an axial load and to shear in torsion. *Inplace* torsion shear tests may be performed by pressing a device to the drive or annular plate against the soil and measuring its resistance to rotation under a given shear load. *Nelson*.
torsional anemometer. See *Reec* torsion anemometer. *Torsional bar. A geophysical prospecting instrument for locating gravity anomalies, and its use is generally confined to shallow and local gravity investigations. See also graviometer. *Nelson*.
torsion break. A break in the drill core caused by an accumulation of chips at the bit face. When drilling is stopped to rechuck, these chips grip the core, and the core is twisted and broken. *Compare torsion fracture. Long*.
torsion fracture. A spiralized crack in a drill core caused by a local torque in a blocked bit or core barrel. *Compare torsion break. Long*.
torsion anemometer. A seismograph with a torsion anemometer. *See Reec's torsion anemometer.*
torsion anemometer. A torsion anemometer. *See Reec's torsion anemometer.*
torsional shear test. A shear test in which the Georgia terrane is uplifted. *Webster 3d*.
torso. A decorative effect produced on a lead glaze by dusting metal oxides (MnO2,CoO, or CuO) over the surface and firing. *Bod*.
tortal. Mex. The flat circular heap of ore spread out on the floor of the patio in a circle about fifty feet in diameter and a few inches in thickness, ready for amalgamation in the patio process. *T. rendida*, *T. para* may be washed. *Fay*.
tortoise. A term sometimes applied by miners to such structures as pods, bolls, kettles, and other rocks that tend to fail easily from the roof of a coal mine. *See also camel back. A.G.I.*
tortolleshell. A term sometimes applied by miners to such structures as pods, bolls, kettles, and other rocks that tend to fail easily from the roof of a coal mine. *See also camel back. A.G.I.*
tortuous flow. See turbulent flow. *Nelson torbybile. A light-colored igneous rock that is a nepheline type containing albite. Related to *white. Hes*.
toscanite. Proposed by Hathaway for a group of cations, effusive rocks in Tuscany, Italy, that are characterized mineralogically by the presence of basic plagioclase, as well as orthoclase, and by occasional quartz. They range from 62 to 75 percent of anorthite and are inclined to have leucitic and dacite. *Compare detritalite. Fay*.
tossing. See *tossing. Fay*.
tossetting. t. The operation of raising the grade or purity of a concentrate by violent stirring, followed by packing, in a kieve or open dolly tub. Chimming is a similar process on a smaller scale. *C.T.D.; Fay*.
b. An operation in tin refining in which the molten metal is lifted in a ladle and poured back in a fine stream to oxidize impurities. *Webster 3d*.
tossetting, tin. Oxidizing impurities in molten tin by pouring it from one vessel to another in air, forming a process that is mechanically separable. *A.G.I. Tossetting, tin. See torsing.
total acidity. A measure of the capacity of water to produce chemical change by acid reaction. It is the total amount of acid held in solution or the sum of the quantities of both the ionized and the un-ionized portions of actual acid and the potential quantity of acid that can be formed from mineral salts held in solution. Total acidity is customarily reported in equivalent parts per million (ppm) by weight of calcium carbonate. The indicated total acidity of mine water found by currently accepted methods of analysis generally is greater than the actual total acidity. *T. P. 710, 1947, p. 2.*
total analysis of coal. See ultimate analysis, c.
total bit load. A drilling term describing the total amount of any load or pressure, whether it be anticipated or not, that is applied to a bit when it is in use. *Long*.
total bit pressure. See total bit load. *Long*.
total cap lag. A blasting term describing the
total energy. The total energy at any section is the sum of the static, kinetic, and potential energies at that section. Hartman, p. 74.

total hardness of water. All waters contain two forms of hardness, that is, temporary (or carbonate) hardness and permanent (non-carbonate) hardness. The combination of the two is referred to as total hardness. See also hard water. Nelson.

total head. a. Energy lost by friction of water in a moving fluid consists of the sum of the kinetic and potential energies at any section. Hartman, p. 74.

1153

touchup man

toughness. The toughness of a material is a measure of its ability to absorb energy before fracturing. It is often determined by testing the material in a process known as fracture toughness testing, where a sharp crack is introduced into a specimen and the material is subjected to tensile stress. As the stress increases, the crack grows until the material fails. The toughness is then determined by the amount of energy absorbed during the process. Hartman, p. 123.

total heat. The total heat of atmospheric air is the heat contained in the same amount of dry air (known as sensible heat) plus the latent heat of the contained water vapor. Hartman, p. 125.

total load. The total load on a pump is the sum of the dynamic head (the suction and discharge heads), the static head, and the friction head. Lewis, p. 687.

total lung capacity. The total lung capacity of a person is the maximum volume of air that can be exhaled after a maximum inspiration. It is the sum of the residual volume, the tidal volume, and the inspiratory capacity. Lewis, p. 687.

See also modified Atkinson formula. Nelson.

total sediment load. All the sediment being moved by the stream, that is, suspended and bedload. USGS Prof Pap 462-P.

See total ventilation power. The water gage reading in the fan house, which can be converted into pound pressure per square foot by multiplying by 0.2. Nelson.

total ventilation pressure. The water gage reading in the fan house, which can be converted into pound pressure per square foot by multiplying by 0.2. Nelson.

tough, pise (archeol.). Walls built of straw-tempered, sun-dried clay without forming clay into bricks; this type of construction, used in ancient times in the Near East, is now being used today; it is similar to some forms of adobe construction. ACG, 1963.

tough. The exact state or quality of texture and consistency of well-reduced and refined copper. Fay. b. Copper of the above quality; also called tough cake. Fay. c. Having the quality of being strong or firm in texture, but flexible and not brittle; yielding to force without breaking; capable of resisting great strain without coming apart. Webster 3d.

tough alumina. A relatively impure regular alumina (90 to 96 percent alumina) of blocky shape. ACG, 1963.

tough cake. Refined or commercial copper. See also tough; a. Fay.

toughen. To remove the last remaining quantities of foreign metals from copper in refining, as by polishing. Standard, 1964.

toughened glass. Glass that has been rapidly cooled so that the surface layers are in compression, and which therefore has increased mechanical endurance and, if the glass does break, it will shatter into small, granular fragments rather than into large and dangerously jagged pieces. Dodd. See also tempered glass.

tough underpinning. A material is tough when it strongly resists a tearing stress (muscovite, the native metals, such as gold and copper). Stokes and Varnes, 1955, p. 149.

toughness. a. A property of a material that denotes, nominally, an intermediate value between softness and brittleness. Tenacity tests show a tough material to have a fairly high tensile strength accompanied by moderate values of elongation and reduction of area. Generally, a tough material also shows high values in the notched bar impact test. Henderson. b. The amount of force required to deform a body to its rupture point. A.G.I. c. All diamonds, including carbides, are brittle, and fractures that indicate resistance to pressure are apt to be broken under vibration or sudden shocks. Toughness can be used to measure the resistance to shock; the most resistant is greatest in carbons, ballas, borons, and corungos in No. 1 grades, in that descending order. See also hardness. Cummins.

toughness index. The ratio between the index of plasticity and the flow index of a soil. Hem.

toughness of refractories. Resistance to crumbling, abrasion, or to coarse particles being dislodged from the brick structure. Bureau of Mines Staff.

tough pitch. a. A term applied to electrolytic copper refining to designate copper which has set, from the molten condition, with a level surface. See also underpooled; overpooled. Fay. b. A term applied to copper in which the oxygen content has been correctly adjusted at 0.03 to 0.06 percent by polishing, underpooled, and overpooled copper. C.T.D.

tough pitch copper. Copper containing from 0.03 to 0.05 percent oxygen, obtained by refining copper in a reverberatory furnace. ASM G7.

tough way. a. A quarryman's term to denote the direction in rock opposite to the rift and along which the rock is hard to break. Ham. b. Hardway; head. Akeel. c. A work-shift. Sometimes incorrectly spelled tower. Long.

tourmaline. A complex aluminum silicate of hexagonal crystallization containing boron and in some varieties, lithium and other elements. Xy[AlBO3Si3O12], of various colors; the clear pink, blue, and green varieties are used as gems. It occurs in long, usually striated, prisms in the ancient crystalline rocks. Khomohedral. Also called schorl. Sanford; Dana 17; Fay.

tourmaline-cordierite rocks. Very hard and fine-grained rocks of blue-black color, having the mineral composition indicated by their name. Under the microscope, they show olidic structure and usually have a very low index of refraction. Bogue 1928.

tourneaud. a. A peak rising with precipitous slopes from an elevated tableland; a towerlike formation. Local in the Northwest, 44.01. c. A mis-spelling of tower. Long.

tourneaud: mum arch. A channel section of a river, characterized by its winding form. See also hardness. Cummins.

tournette. Fr. In ceramics, a rotating tablet, resembling a small potter's wheel, used in decorating the finer wares with lines. Standard, 1964.

tows. See also hardness. Cummins.

tows. a. To follow the line of a plant or other surface and especially with a plane of projection. Webster 3d. c. To follow the line of a plant or other surface and especially with a plane of projection. Webster 3d. c. To follow the line of a plant or other surface and especially with a plane of projection. Webster 3d.
trace

long pits. Fay, d. Recording on the seis-
mogram of a single seismometer station.
Schiefdecker.

trace plotting. A procedure used in seismic
reflection where reflection times from all
traces, or sometimes alternate traces, are
read and plotted on a graph paper (midway
between shot and detector). When no correction
has been made for normal movement, the plotted
data appear to lie along areas which are
convex upward and straddle the shot
positions symmetrically. Compare center-
trace time. Dobrin, p. 132.

trace elements. Elements present in minor
amount in the earth's crust; all elements
except the eight abudant rock-forming
elements: oxygen, silicon, aluminum, iron,
calcium, sodium, potassium, and mag-
nesium. Synonym for minor elements;
accessory elements. A.G.I.

trace element salt. Table salt or cattle salt
which contains trace elements equivalent to
those found in seawater. Kaufmann.

trace hole. A small horizontal passage or flue
in masonry, or a small opening in a kiln to
facilitate the movement of hot gases.
Dodd.

trace mineral salt. Livestock salt with added
trace elements to supplement mineral
deficiencies. Kaufmann.

tracer: a. An employee who makes tracings,
advancing on transparent paper or cloth. In
Dodd.

tracing. a. The making of tracings, or the
transfer of designs from paper or cloth
to marble or granite.

tracing paper. Paper of high quality suitable
for duplicating by the process of

tracing. a. An employee who makes tracings,
advancing on transparent paper or cloth. In
Dodd.

tracing. a. The making of tracings, or the
transfer of designs from paper or cloth
to marble or granite.

tracing paper. Paper of high quality suitable
for duplicating by the process of

trace by:trace plotting. A procedure used in
tracer gas. A gas introduced in small quan-
tities into the main body of the ar to
track bolts in the crown of a bit. I. o

track bolt. A chair bolt or coach screw used
in fastening cars. Hoffm. h.

track brakings. Track brakes, similar to those
used on surface tramways, may be installed
on heavy downgrades underground to sup-
plement other braking systems; they apply
blocks to the rails from the brakeman's pneu-
matic, or electromagnetic power. The
normal shoe brake must be designed to
work in conjunction with the track brakes
so that the wheels cannot be skidded when
the track brakes utilize part of the weight
of the locomotive. Electromagnetic track
brakes may utilize the braking currents
produced in rheostatic braking to excite
the electromagnets, which are then pulled
down onto the rails and produce a strong

track cable. Steel wire rope, usually a locked
coiled rope which supports the trucks of
the carriers of a cableway.

track cable scraper. This type of excavator
cableway operates in general the slackwire
except that it uses a bottomless scraper bucket which must convey its
load upward from the ground instead of through
the air. Like the slackline cableway, this ma-
chine is operated by a two-drum hoist which
controls the means of suspending an area and a
haulage cable that leads to the front of the bucket.
Both cables are reeved through the hoist and
are attached to a high guyed mast or tower at
the head end of the installation. When
the bucket comes in with a load it reaches
the desired dumping point, a few
rotations of the rear drum of the hoist
serve to tighten the track cable and lift
the bucket off its load; then the brake
is released on the front drum which
controls the haulage cable, permitting the empty
bucket and carrier to slide back down the
inclined track cable. Pit and Quarry, 35rd,
Sec. A, p. 100.

track channelers. In quarrying, a rock chan-
neler designed to operate from a track on
which it is mounted; frequently a com-
plete locomotive and channeling machine.
Steadman, 1964.

track cleaners. In mining, a laborer who
does track maintenance and switches by shoveling
coal, ore, rock, mud, and refuse, and
throwing to one side or loading it into
a train or a crane travels or to the single
track cleaners. A chair bolt or coach screw used
in fastening cars. Hoffm. h.

a train or a crane travels or to the single

track cleaners

the towing motor and observes the dig- 
gging, while another controls the digger. The plate height, adjusts wing plows, and observes loading. Best, p. 372.

track frame. In a crawler mounting, a side 
frame to which the track roller and idler are attached. Also called track frame. 

Nichols.

track gauge. a. The distance between the inside edges of installed railway rails. B.C.I. 
b. The minimum track gage which should be used on a modern haulage system is 3 feet 6 inches. This page has been established as a standard by the American Mining Congress as a result of the 196 

track haulage. Movement or transportation of excavated or mined materials in cars or trucks running on rails. Bureau of Mines Staff.

tracklayer. a. Iron or wooden tramrails. Fay. 
b. Lines of wear on a road surface caused by vehicles following in each other's 

tracting through. N. of Eng. Clearing a path 
along the whole length of the face through the overburden. Fay.

tracklayer; trackman. A workman engaged in 
work involved in putting railway rails in place. Webster 3rd. Also, one employed at mines to lay or repair tracks. Fay.

track laying machine operator. See track 

tracklaying tractor. A tractor moving on 
crawler tracks. Ham. See also halftrack.

tracks. A mine with no rails. In these mines, rubber-tired vehicles operating 

tract, a book maintained in the District Land Office of the Bureau of Land Man-

tracking. Tunneling by means of loaders mounted on caterpillars, with a 

traction, the act of drawing a vehicle 
over a surface and the force exerted in 
doing. Tractiion is the friction developed 
between tracks or tires and the surface of 
the ground on which they are moving. 

traction factors. Also called frictional forces. 

traction force. a. The necessary drawbar pull 

traction train. The vehicle which is driven into a wooden sleeper 

traction train, mine. See mine tractor.

traction. A book maintained in the District 

traction. A. A flexible cable designed 

traction cable. A flexible cable designed 
for conveying electricity to a coal cutter, one 

traction. A. A flexible cable designed 
for conveying electricity to a coal cutter, one 

traction. A. A flexible cable designed 
for conveying electricity to a coal cutter, one 

traction. A. A flexible cable designed 
for conveying electricity to a coal cutter, one
trailing cable

a movable machine such as in mining or quarrying. It is usually paid out from a reel as the machine advances. Grove. d. A flexible, rubber-insulated conductor, or set of conductors, capable of carrying electric power to a crane or other moving machine. Ham. e. A flexible insulated cable used for transmitting power from the main power source, such as a trolley wire, nipping station, or junction box, to a mobile machine. It includes cables or wires for the nipping station and distribution center. BuMines Coal-Mine Inspectors' Manual, June 1956, pt. 3, 18a, p. 52.

trailing points. Points which are approached by a train from such a direction that it first meets the heel of the points. Ham.

trailing spit. See tail, f. Schieferdecker.

train. The practice of pushing tubs, mine cars, or trams, by hand. Tramming was an earlier practice in longwall mining. It is now largely obsolete. On the surface, tramming means moving material in skips or wagons running on light railway track. See also hand putting. Nelson.

tramming motor. May refer to an electric locomotive used for hauling loaded trips, or it may refer to the motor in a cutting machine which supplies the power for moving or tramming the machine. Jones.

tram. Synonym for boomer, drifter, or duster, as applied to a drill-crew member who moves often from job to job, usually after payday. Long.

tram iron. a. Stray metal objects, such as coal-cutter picks or bolts, which have become mixed with the run-of-mine coal or ore. To remove this iron before it damages the crushers or other machines, various types of magnets are widely used. See also magnetic separator. Nelson. b. Any local piece of metal in a borehole. Long.

tram oversize. a. Ore which should not have been released from the previous section at the delivery size. Pryor, p. 818. b. Ore undergoing treatment which is larger than the maximum particle size that can be handled efficiently by the machine into which it is fed. Fay. 1933.

tramroad. a. A mine haulage road. Jones. b. Generally to mean a piece of equipment other than a locomotive; tram car. B.C.I. c. A small wagon, tub, cocoa pan, corf, or hutch for carrying coal or other material in mining. C.T.D. d. S. Wales. A tub. In general, a tram is larger than a tub with a capacity ranging from about 1 to 1 1/2 tons. Nelson. e. A four-wheeled truck to carry a tub, corve, or hutch. Fay. f. The rails of a typical tramroad. See also tram road. Fay. g. A boxlike wagon, now often of steel, running on a tramway or railway track, to carry ore. Weiser, 3d. h. To haul or push trams or cars about in a mine. Fay.

tramcar. Eng. A car used in coal mines; same as at, a. and g. Fay.

tram driver. In mining, one who drives a draft animal to haul coal, ore, or rock in a tram (car) along tracks underground or at the surface of a mine. D.O.T. 1.

tramness. a. An overall appearance as two parallel lines on rolled bars. Osborne. b. Long, straight marks due to drawn out fronts at right angles. Schieferdecker.

tran. Several types of magnets are widely used. See also magnetic separator. Nelson.

transcurrent fault. 1. A fault resulting from movement that is superimposed along one of the fault's planes or fractures, the plane of fracture being vertical or approximately even with the horizontal. Schieferdecker.
transcurrent fault

transcritical. The two phase actuated by one transmission system and supplying related related to another transmission system. The proportion of the transmission system be of different forms. Ultrasonic actuate electrical waves and deliver ultrasonic waves, the reverse also being true. ASL Gloss. A device which measures quantities in a system, that is, pressure, current, voltage, and converts them into related or proportional units. NCB.

transducer loss. The transducer loss of a transducer connecting an energy source and an energy load is the transmission loss measured by the ratio of the source power of the source to the load power of the load. H&G.

transducer. Magnetic amplifier. A device consisting of one or more ferromagnetic cores with winding by means of which an alternating voltage or current can be varied by an independent voltage or current, utilizing phenomena in the magnetic circuit or circuits. NCB. Transfer. a. A vertical or inclined connection between two or more levels and used as an ore pass. Nelson. b. The action of transferring load in prestressing tendons to concrete. Taylor. c. A printed decoration which is applied and burned into the enamel surface. Stove names, trademarks, borders, and heat-control workings are applied in this way, the transfers being made from ceramic inks or overglazes which will fuse at temperatures between 1,200° and 1,500° F. Hansen.

transfer admittance. The transfer admittance of a network made up of an energy source and an energy load connected by a loss is the quotient obtained by dividing the phasor representing the source voltage of the source by the phasor representing the load voltage of the load. H&G.

transfer car. A. A quarry car provided with transverse tracks on which the gang car may be conveyed to or from the saw gang or carriage. B. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. C. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. D. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. E. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. F. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. G. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. H. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. I. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. J. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. K. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. L. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. M. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. N. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. O. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. P. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. Q. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. R. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. S. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. T. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. U. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. V. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. W. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. X. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. Y. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another. Z. A car equipped with rails, used to transfer a drier or kiln car from one set of tracks to another.

transfer carriage. A movable platform or track used to transfer mine cars from one track to another. Zern.

transfer case. A transmission or gearbox that provides drive to secondary drives, winches, etc. Bureau of Mines Staff.

transfer chute. A chute used at a transfer point in a conveyor system. The chute is designed with a curved base or some other feature so that the load can be discharged in a centralized stream and in the same direction as the receiving conveyor. Nelson.

transferring. Generally 50 to 300 feet in length. It is used to transport material only from one conveyor to another. NE-MA MIB-1961.

transferring member. The proportion of the total current carried by the ion of a given kind. Also called transport number. ASL Gloss.

transferring-gang-car system. A system used in quaries in order to save time in handling stone blocks and slabs. In this system, a transfer car which runs on a de-pressed track, to which the gang car is provided with a short section of track across the top. A gang car loaded with marble, etc., is placed on this track and when moved to proper position is shifted beneath the gangsaw. Similarly, a gan car loaded with sawed slabs may be quickly moved from beneath the saws to the transfer car for transportation to the shops. ASL Gloss. p. 322.

transfer gear. Self-acting mechanism at shaft head by which skip is emptied and its contents are transferred to the next stage of handling. Pryor, 3.

transfer glass. Optical glass cooled in the pot in which it is melted. ASTM C152-68.

transfer grinding. In ceramics, a transfer of a pattern in gold, as from paper to un-glassed ware, usually done either by direct transfer of the gold in reverse, or by stamping the pattern in oil and dusting with gold powder. See yard, 1964.

transfer impedance. The transfer impedance of a network made up of a given source and a given load connected by a given load is the quotient obtained by dividing the phasor representing the source voltage of the source by the phasor representing the load current of the load. H&G.

transfer ladle. A large ladle lined with refractory material (usually fire clay bricks) for the transport of molten pig iron from a blast furnace to a hot-metal mixer or to a steelmaking furnace. See also hot-metal ladle. Dodd.

transfer order. A statement in which an invoice of goods is transferred from one position to another. See also invoice of goods.

transfer point. a. The point where coal or mineral is transferred from one conveyor to another. See also loading point, b. Nelson. b. Turning point. Nichols.

transfer printing. An intaglio process of decoration, particularly used for the decoration of pottery ware; a single-colored pattern is transferred directly from a printing plate or roller by means of a paper. The color used is generally dispersed in lined oil; soft soap is the traditional size for the transfer paper but various synthetics have also been used. Dodd.

transfer ring. See holding ring. Dodd.

transfer table. A table connected with rolling mills for transferring work from one mill to the other laterly. Mersenneau, 4th, p. 427.

transformation. A constitutional change in a solid metal; for example, the change from gamma to alpha iron, or the formation of pearlite from austenite. C.T.D.

transformation points. Temperatures at which the coefficient of thermal expansion of a glass changes; for any one glass, there are normally two such points known respectively as the Tg point and the Mg point; the Tg point is the first temperature at which there is a sudden change in expansion when the glass is heated at 4°C per minute is the temperature at which the thermal expansion curve reaches a maximum and is usually equal to the softening temperature. Dodd.

transformation ranges (transformation tem- perature ranges). Those ranges of temperature within which austenite forms during heating and transforms during cooling. The two ranges are distinct, sometimes overlapping but never coinciding. The limiting temperatures of the ranges depend on the composition of the alloy and on the rate of change of temperature, particularly during cooling. See also transformation temperature. ASM Gloss.

transformation temperature. The temperature at which a change in phase occurs. The term is sometimes used to denote the limiting temperature of a transformation range. The following symbols are used for iron and steels: Ac_
_1—_hypereutectoid steel, the temperature at which the solution of cementite in austenite is completed during heating; Ac_
_1—_the temperature at which austenite begins to form during heating; Ac_
_1—_the temperature at which transformation of ferrite to austenite is completed during heating; Ac_
_1—_the temperature at which austenite transforms to delta ferrite during heating; Ac_
_1—_the temperatures of phase changes at equilibrium; Ar_
_1—_hypereutectoid steel, the temperature at which precipitation of cementite starts during cooling; Ar_
_1—_the temperature at which transformation of austenite to ferrite or to ferrite plus cementite is completed during cooling; Ar_
_1—_the temperature at which austenite begins to form during cooling; Ar_
_1—_the temperature at which martensite starts during cooling; Ms—the temperature at which martensite formation finishes during cooling. NOTE: All these changes except the formation of martensite occur at lower temperatures during cooling than during heating, and depend on the rate of change of temperature. ASM Gloss.

transformed flow net. A flow net whose boundaries have been properly modified (transformed) so that a family of orthogonal or curvilinear squares can be constructed to represent flow conditions in an anisotropic porous medium. C.T.D.

transformer. A device which, through electromagnetic induction but without use of moving parts, transforms alternating or intermittent electric energy in one circuit into energy of similar type in another circuit, commonly with altered values of voltage and current. Transformers are frequently classified as stepdown, step-up, radio-frequency, input, output, push-pull, power, etc. A.G.I. Gloss.

transformer oil. A special type of oil of high dielectric strength, forming the cooling medium of electric power transformers. C.T.D.

transformer station. A transformer station is any installation of one or more transformers, either portable or stationary, used for power or lighting service, for increasing or decreasing voltage, or for converting different potential, or for isolation. ASA M2.1-1963.

transformal. One who believes that all granites had a metamorphic or palenegetic origin. Compare magmatist. A.G.I. Supp.

transforma. A term proposed for a process in which a highly leached medium of emanations, rich in alkalis, etc., moves
transference
transfusion
transfusion loss
into the crustal rocks from below and reacts with them to produce either solid altered rocks or even completely liquid material. This is called "transgression." This term is applied in the geologic record when the boundary lines of parallel strata are not conformable, and the unconformity is the result of differential movements of the crustal rocks from below and above. In this process, different phases of matter are capable of existing together in equilibrium. Also called "transition." Webster 3d.

transition elements. The elements that transition from the lanthanum to the mercuric in the periodic table. This includes the transition metals, which are used in alloys and other applications.

transmission point. A single point at which different phases of matter are capable of existing together in equilibrium. Also called "inversion point." Webster 3d.

transmission rocks. See "transition rocks."

transition zone. The area where two opposing currents are manifested by eddies, rippling, and similar turbulent conditions occurring either vertically or horizontally; or a zone between two water masses of differing physical characteristics such as temperature and/or salinity. Hy. transitman. One who operates a surveyor's instrument. Crispin.

translation twinning texture. A texture consisting of the combination of glass and/or plastic residual organic matter, exclusive of the micropore plant entities (phytorels) such as spores, cuticles, resins, and waxes. May also be associated with organic detritus. In bright coal containing little anthracylon it may be the predominant constituent. In semiplastic and split coal, particularly the latter, it is generally a minor constituent. IHC, 1963, part 1.

transmutation. Term used to describe the ability of a system either to amplify or to suppress an input vibration. It is the ratio of the corresponding output voltage or power to that of the input. APQ, 1953. Gloss.translation anomaly. The difference, in decibels, between the total transmission loss in intensity and the reduction in intensity due to an assumed inverse square divergence. Hy.

transmission loss. The level at which the energy at any point in an energy transmission system is the rate of flow of electric energy supplied to a load. This term is often used in connection with (1) a specified reference rate of flow and (2) the transmission loss by which the actual rate of flow is reduced to equal the reference rate. Hy.

transmission lines. Power transmission lines are those that transport electric energy from a source to a load. They are usually overhead lines, although underground cables are also used. Power transmission lines can be divided into two main categories: transmission lines and distribution lines.

transmitting. A device for amplifying alternating electric current by the controlled movement of a crystal of silicon or germanium, of electrons and holes.

transmitting anode. A device for amplifying alternating electric current by the controlled movement of a crystal of silicon or germanium, of electrons and holes.
transpiration. The process by which water vapor is released from a living plant and enters the atmosphere. Led.

transporter. An automated receiver/transporter for transmitting signals when triggered by an interrogating signal. Hy.

transport. A mining term used to cover various means of transporting an mineral to the surface, whether by air, water, or road. Nelson.

transportation. A mining term used to cover various means of transporting an mineral to the surface, whether by air, water, or road. Nelson.

transporter crane. A long lattice girder supported on rails which is used for transporting a load. ASCE P1826.

transverse arch kiln. An annular kiln that is divided into a series of chambers by fixed walls (hence the alternative name continuous chamber kiln). The axis of the arched roof of each chamber is transverse to the length of the kiln. This type of kiln finds use in the heavy clay industry. Dodd.

transverse arch. A arch that is transverse to the direction of working. A.G.I. Sapp.

transverse basin. Synonym of planar basin. Dodd.

transverse fault. A fault whose strike is transverse to the general strike of the structure. Dodd.

transverse to the general strike. See also crossbedding. Maltreat, 4th, p. 329.

transverse reinforcement. Links or helical reinforcement at right angles to the main reinforcement. Taylor.
traverse ripples. See Hungarian ripples.

traverse ripple mark. A ripple mark or- iented at approximate right angles to cur- rent.

traverse scour marks. Scour marks with long axes transverse to main current direc- tion. Scour marks tend to confuse with ordinary transverse ripples; have been called current ripple casts. Pettijohn.

traverse sifting with care. See top slic- ing and covering vane. Fay.

traverse strength. a. A measure of the capability of a bar of stone (or beam) sup- ported at its ends, to bear a weight or load at its center. Fay. b. The strength of a specimen tested in transverse bend- ing; normally synonymous with modulus of rupture but also used to refer to break- ing load. Taylor.

traverse water. See peripheral ven- tilation. Storer, n. 1. p. 528.

traverse wave. a. In seismology, a wave motion in which the motion of the parti- cles, or the entity that vibrates, is per- pendicular to the direction of prog- ression of the wave. b. In geophysics, a body seismic wave advancing by shear- ing displacements. a. c. A wave in which the direction of propagation of the wave is normal to the displacements of the medium, for example, a vibrating string. d. A gravity wave in which fluid parcels move in circular orbits is an ex- ample of a mixed transverse-longitudinal wave. This wave also may persist except in the case of zero current speed, when it is a transverse wave. Also called distourial wave. Hen.

traverse with lipping. See overhead stoping, b. Fay.

trap. a. A door used for cutting off a ventilat- ing current, which is occasionally opened for haulage or passage; guarded by a trapper. Fay. b. Scot. A traveling winch or in- road for miners in edge coal-driven on a tramway. Fay. d. A device in- troduced in the shafts of deep mines to align ladders in a shaft. Fay. e. A natural sub- stance, with specific properties, which is walled on top of permeable rock which is walled on top of impermeable rock, and which is known as trap. The term has no very significant, as rocks such as diabase, bot- tonic, and dacite have been included under it. Pettijohn.

trapdoor. a. A door in a mine passage to regulate or direct the ventilating current. Also called weather door. See also trap, a. Fay. b. Another term for mine door. B.C.I. c. See air door, a. B.S. 3618, 1963, sec. 2.

trapesium. A plane figure contained by four straight lines, no two of which are parallel.

trapezoidal rule. A rule for estimating the area of an irregular figure, by dividing it into parallel strips of equal width, each strip being a trapezium. See also Simpson's rule, Ham.

trap maw. See crusher feeder.

trap maw. A. An employee, normally an ap- prentice, formerly used to open and close mine doors such doors are now some- times needlessly called B.C.I. A door trapper boy; nipper; door tender. Fay. b. An employee who assists the dis- patcher by throwing signals and attend- ing the sight rails. Hem. c. Same as door boy. Kerson, d See door- man, D.O.T. 1.

trappist. A. An employee, normally an ap- prentice, formerly used to open and close mine doors such doors are now some- times needlessly called B.C.I. Also called trapper boy; nipper; door tender. Fay. c. An employee who assists the dis- patcher by throwing signals and attend- ing the sight rails. Hem. d. Same as door boy. Kerson, d See door- man, D.O.T. 1.

trappist. A. An employee, normally an ap- prentice, formerly used to open and close mine doors such doors are now some- times needlessly called B.C.I. Also called trapper boy; nipper; door tender. Fay. c. An employee who assists the dis- patcher by throwing signals and attend- ing the sight rails. Hem. d. Same as door boy. Kerson, d See door- man, D.O.T. 1.

trappist. A. An employee, normally an ap- prentice, formerly used to open and close mine doors such doors are now some- times needlessly called B.C.I. Also called trapper boy; nipper; door tender. Fay. c. An employee who assists the dis- patcher by throwing signals and attend- ing the sight rails. Hem. d. Same as door boy. Kerson, d See door- man, D.O.T. 1.

trappist. A. An employee, normally an ap- prentice, formerly used to open and close mine doors such doors are now some- times needlessly called B.C.I. Also called trapper boy; nipper; door tender. Fay. c. An employee who assists the dis- patcher by throwing signals and attend- ing the sight rails. Hem. d. Same as door boy. Kerson, d See door- man, D.O.T. 1.
A traverse survey. A survey used especially for traverser systems. The basic idea of this system is to confine the mine-car circuit to the smallest possible compass near the mine shaft. This avoids locking up cars on the surface which are better employed underground and reduces manpower requirements. In this system, instead of the use of shunt backs on car circuits, the direction of car travel is changed by running onto a portable platform which then moves the car bodily in a transverse direction. It can be applied, in conjunction with the necessary links, to multideck cars. Such trains may be operated electrically, hydraulically, or pneumatically. Sinclair, V., pp. 77-78.

A traverse survey. A survey used especially for long narrow strips of country in which a series of lines joined end to end are completely determined as to length and azi-
muth and are often used as a basis for triangulation. Webster 3d. Also used for underground surveys. Fay.

A traverse survey. A survey used especially for traverser systems. The basic idea of this system is to confine the mine-car circuit to the smallest possible compass near the mine shaft. This avoids locking up cars on the surface which are better employed underground and reduces manpower requirements. In this system, instead of the use of shunt backs on car circuits, the direction of car travel is changed by running onto a portable platform which then moves the car bodily in a transverse direction. It can be applied, in conjunction with the necessary links, to multideck cars. Such trains may be operated electrically, hydraulically, or pneumatically. Sinclair, V., pp. 77-78.
method very similar to the Foraky system.

Trench. 1. A formation in the arrangement of the boring cable or rope, which is taken in a loop around a central pulley.

Trench. S. Afr. The act of drawing (or hauling; traction; also, the state of the roads; as, the trench was heavy. Standard, 1964.

Trench wagon. A large six-wheeled covered wagon used especially in southern Africa in trekking and designed to provide lodging and storage. It is usually seen as a means for trekkers. Webster 3d.

Trenched drainage. This arrangement of parallel brooks, which swell the volume of a creek, generally flowing at right angles to their courses, resembles a vine from whose central stem branches are trained on a trellis. It is sometimes called the trellis or grapevine system. Synonym for grapevine drainage. A.G.I. Supp.

Trench. To treat or work lots or tin slimes; to toss. An obsolete term. Standard, 1964.

trench. Stom. Shirring the "soins" (tin) in water, so that the lighter mud may run off. Fay.

trench. A box or frame of wood or metal used for depositing concrete underwater. Its upper part forms a hopper above water to receive the concrete, and it may be moved laterally or vertically by any suitable means, as a traveling crane. Standard, 1964.

Trench. An amphibole. Ca,Mg,Si(OH) - (OIII) - (OH)_{2}.

Trench. A heavy tool consisting of vertical chisels fixed to a horizontal bar and used by geologists, or of topographic features that are consequent on the geologic structure. (As used in either sense the term may or may not coincide with the strike, depending on the structural relationships at the place of observation.) Fay. E. c. All mineral deposits have a trend in occurrence of valuable minerals. That is, the ore varies from being fresh to wall and gradually or abruptly from ore to subore grade. A trend is a nonrandom factor and becomes manifest only by a statistical analysis. Lewis, p. 320.

trench agitator. An agitator with arms of the paddle wheel type, but they are hollow, and the pulp solution or air is discharged from nozzles on these arms, thus causing the stirrer to rotate. Liddell 2d, p. 392.

Trenton. A subdivision of the American Ordovician sometimes considered as the equivalent of the whole Middle Ordovician and sometimes restricted to a portion of this series. Webster 3d. b. Formerly, a division of the lower Silurian. Bureau of Mines Staff.

Trench. a. An elongated but proportionally narrow depression, with steeply sloping longitudinal borders, one of which (the continental) rises higher than the other (the oceanic). Trenches are the ends of unsymmetrical basins and lie beside the continental border or island chains. A.G.I. b. A long but narrow depression of the oceanic floor having relatively steep sides. A.G.I. c. A long, narrow, intermontane depression, occupying the center of an area large or more streams (whether expanded into lakes or not) alternately draining the depression in opposite directions. A.G.I.

Trench. An important member of the Ordonvician system in the region of the Adirondack Mountains, lying between the Black River limestone below and the Utica shale above. It is regarded as the highest member of the Chalalmian series; it is typically exposed at Trenton Falls, N.Y., and is used as a standard oil-bearing stratum in the Central States. C.T.D.

Trench process. Agglomeration process sometimes used in coal cleaning and briquetting. Raw coal crushed to 65 mesh is agitated with water and oil. Coal agglomerates and ash-forming fraction is removed in aqueous solution. Pryor, 3.

Trenoc. A large horse used in the Khil-Chandron sinking method. Nelson, b. Fr. A heavy tool consisting of vertical chisels fixed to a horizontal bar and used in boring mine shafts. Webster 3d. c. A boring machine used for shaft sinking known as a trepan. Webster.

Trencher. A cutter loader for continuous mining in longwall faces. Its main cutting unit is the trepanner wheel with cutting arms, one at each end of the machine to enable it to cut in both directions on the face. Also fitted are a vertical, back-shear- ing jib, a floor-cutting jib, duplicated to enable cutting in either direction and, if necessary, a roof-cutting disk. The machine is used in conjunction with an armored flexible conveyor on a prop-free front face, suitable for seams between 3 and 4 feet thick, though it can work in thicker seams if the top coal falls freely.

Trenching. A type of boring where an annular cut is made into a solid material with the coincidental formation of a plug or cylinder. A.G.I. Gloss.

Trench sampler. A new cutter loader in which the trepanner head is incorporated in the shear loader as the principal cutting unit, and the getting medium while the cutting drum is retained to dress the floor and back of the trench.

Trench. a. Working coal from the property or take of another coal mine owner. See also encroachment. Nelson.

Trense. an intrusion upon land occupied by another for the purpose of locating a mining claim is but a naked trespass and initiates no right; although the occupant has no other valid title than possession. Ricketts, 1.

Trench. a. A framework of timbers, carrying tram tracks. Weed, 1922. b. A bridge, usually of timber or steel, that has a number of closely spaced supports, the abutments, Nichols, c. A bent of timber, reinforced concrete, or steel, supporting a temporary or permanent structure. Standard, 1964.

Trench bridge. A bridge supported by trestle piers. Ham.

Trenching. a. The windings of coal cut into shales and slates. Caron, p. 28.

Trenching. The practice of depositing coal underwater. For example, when stockpiled in deep-sea fluor having relatively steep sides.

Trenching. A. Working coal from the property of another or take of another coal mine owner. See also encroachment. Nelson.

Trenching. a. A framework of timbers, carrying tram tracks. Weed, 1922. b. A bridge, usually of timber or steel, that has a number of closely spaced supports, the abutments, Nichols, c. A bent of timber, reinforced concrete, or steel, supporting a temporary or permanent structure. Standard, 1964.

Trench bridge. a bridge supported by trestle piers. Ham.

Trenching. The practice of depositing coal underwater. For example, when stockpiled in deep-sea fluor having relatively steep sides.

Trenching. A. Working coal from the property of another or take of another coal mine owner. See also encroachment. Nelson.
trial pit

trichalcite

1164

trichalcite dihydrate. 3CaO.2SiO2. See also rankinite. Dodd.

trichalcite pseudohydrate. A compound, 3CaO.5Al2O3, formerly believed to be present in high-alumina hydraulic cement. It is now known that a melt of this composition consists of a mixture of CaO·Al2O3, and CaO·Al2O3, the latter compound being responsible for the hydraulic properties. Dodd.

trichalcite silicate. 3CaO.SiO2; associates at approximately 1,900° C to form CaO and 2CaO·SiO2. This compound is the principal cementing constituent of Portland cement, small quantities of MgO and Al2O3 being present in small solution. Trichalcite silicate is also present in stabilized dolomite refractories. Dodd.

trichalcite, Trichalcite (of Hermann, 1858) previously thought to be Cu2(AO)3·5H2O, is sometimes called trihydrate. Trichalcite (of Shannon, 1922) equals the sulphate langite; from Shoshone County,
trichloroethylene, trichloroethene. a. Colorless, low boiling, highly volatile liquid; toxic; liquid; CHCl₃; chloroform odor; will not attack the common metals, even in the presence of moisture; boiling point, 86.7°C; melting point, -73°C; specific gravity, 1.456 to 1.462 (at 25°C), referred to water at 25°C). Refractive index, 1.4735 (at 27°C); and flash point, (ASTM open cup), none at boiling point. CCl₃F, 1961, b. Molecular weight, 131.39; CHCl₃; specific gravity, 1.462 (at 20°C), referred to water at 4°C); boiling point, 88°C; boiling point, 87°C (at 760 mm) slightly soluble in water; and soluble in all proportions in alcohol and in ether. Handbook of Chemistry and Physics, 45th ed., 1964, p. C-314. c. A widely used industrial solvent for fats, resins, bitumens, sulfur compounds, and similar compounds. Used in dry cleaning, in degreasing, and in soap manufacture. Previously commercialized nonflammable, but found to be flammable under combinations of pressures and temperatures often occurring in normal refinery operation. Abbreviation. TCE. Bureau of Mines, Staff.

trichloroform. A property possessed by certain minerals of exhibiting three different colors when viewed in different directions. Fay.

triclorobenzene. A pond overflow pipe set vertically with its open top level with the water surface. Nichols.

tricline scale. Scale which has become detached from a pack of sheets in pack rolling, trickling in between the pack and becoming embedded in the surface of the sheet. Fay.

tricline block. In quarrying, a term applied to a block of stone bounded by 3 pairs of parallel planes, and one or more interfacial angles being right angles. Fay.

tricline crystals. Crystals having no symmetry element, or crystallographic properties of the same. The triclinic crystal has three unequal axes, no two of which are perpendicular. Hendry.

tricline system. That system of crystals in which the forms are referred to three unequal mutually oblique axes. Fay.

trichloroethylene solvent. Solvent, used for the degreasing of steel. They may be applied by immersion of the part, or by vapor or spraying. Osborne.

tricene bit. A roller bit having three cone-shaped cutters in the head of the bit. See also roller bit, b. Long.

triene roller bit. See tricone roller bit. Long.

tritidal mixture. A mixture of trinitrotoluene and di- and tri-nitrophenol used as an explosive in boosting charges. Bennett 2d, 1962.

tritium. A radioactive isotope of hydrogen, like H₂, consisting of silica, SiO₂, but differing in crystallization. In volcanic rocks. Orthorhombic.

Trit process. A process for making concrete with Portland blast furnace cement. The slag is wet ground and fed as a slurry to a concrete mixer together with Portland cement and aggregate. See also Portland blast furnace cement, Dodd. Eng. A spray used to block or stop a wheel or any machinery. Zera.

trolley circuit, trigger. A circuit having a number of states of electrical connection (which are either stable or quasi-stable) or unstable with at least one stable state and so designed that desired transition can be initiated by the application of suitable trigger excitation. By quasi-stable state, is meant a state which persists during the time of interest. NCR.

trigger effect. When rock is subjected to increasing stresses three come into existence, if it is on the point of failure. In some circumstances it may remain at that point for a considerable time. Any small external influence, such as a seismic wave, may then be sufficient to precipitate the failure. This is known as the trigger effect. Spalding.

triggers. Term applied to any number of things which may initiate or trigger rock bursts. Such triggers include explosive charges, changes of temperature, sudden influxes of water, and even rock bursts themselves which sometimes act as a trigger impulse to initiate a second burst. Issacson pp. 164-166.

trigonal. Having, in the ideal or symmetrically developed form, triangular faces; as, the trigonal triclinite. Fay.

trigonometrically. Accordingly to some crystallographers, the trigonal (or rhomboedral) division of the hexagonal system, regarded by some others as a system in itself. Fay.

trigonometrical basis. Basically this method consists of determining the vertical height by measurement of distances and angles of inclination. Angles of inclination are measured either by hand instruments, fixed on survey monuments, from which they Abney level is the best known, or more accurately by theodolite. Mason, c. Eng. A piece of bent wire by which the size of the flame of a safety lamp is regulated without removing the wire by which the size of the flame of a safety lamp is regulated. Webster 3d. D.O.T. 1. b. A short hose bored slowly outwards to trim the drivage to the shape required. Mason. d. N. of Eng.; S. Wales. One who attaches coal in the hold of a vessel (miner- ship) as the coal is discharged into it from bins. Fay, e. Scot. One who cleans miner’s lamps. Fay, i. An apparatus for trimming a pile of coal into a regular form (as a cone or prism). Webster 3d.

trigonometrical arch. An arch, usually of brickwork and of low rise used for supporting the fireplace hearth. A.C.S.C.

trigonometrical arch. A self-contained, light-weight portable conveyor, usually of the belt type, for use in unloading and delivering bulk materials from railway cars or holds of ships and barges during or after loading, using a shovel. May be designated according to material trimmed, as cog trimmer. D.O.T. 1. b. A shothole bored slightly outwards to trim the drivage to the shape required. Mason, c. Eng. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d. One who cleans miner’s lamps. Mason, e. Scot. One who cleans miner’s lamps. Mason, f. Apparatus for trimming a pile of coal into a regular form (as a cone or prism). Webster 3d.

trimming. a. One who distributes loose material, such as coal, rubbish, sand, or other substances in railroad cars or holds of ships and barges during or after loading, using a shovel. May be designated according to material trimmed, as coal trimmer. D.O.T. 1. b. A shothole bored slightly outwards to trim the drivage to the shape required. Mason, c. Eng. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d. D.O.T. 1. b. A short hose bored slowly outwards to trim the drivage to the shape required. Mason, d. N. of Eng.; S. Wales. One who attaches coal in the hold of a vessel (miner- ship) as the coal is discharged into it from bins. Fay, e. Scot. One who cleans miner’s lamps. Fay, f. Apparatus for trimming a pile of coal into a regular form (as a cone or prism). Webster 3d.

triquetral relief holes. Unloaded drill holes closely spaced along a line to limit the breakage of a blast. Nichols.

triquetral, a. Firs to a six-rayed twinned crystals, consisting of three individuals, which occur in chrysotyle. Shipley.

triquetral. A primitive, extinct crustacean, occurring throughout the Paleozoic and abundant in the earlier Paleozoic periods, characterized by segmented bodies divided by longitudinal grooves into three lobes. One of the Trilobita, A.G.I.

trimmable. Coal microtectone consisting of a mass of triangles, characterized by its flakey character, and by longitundinal grooves into three lobes. A.C.S.C.

trim. A rare mineral consisting of the silicates of beryllium, manganese, and calcium. Fay.

trimetric. A solid figure in which the three axes are all unequal, such as a hexagonal prism, another at right angles; orthorhombic. Gordon.

trimmer. A station used in surveying by triangulation on a large scale. Ham.

trim boles. A shothole bored slightly outwards to trim the drivage to the shape required. Mason, c. Eng. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d.

trimmer. A station used in surveying by triangulation on a large scale. Ham.

trim boles. A shothole bored slightly outwards to trim the drivage to the shape required. Mason, c. Eng. A piece of bent wire by which the size of the flame of a safety lamp is regulated. Webster 3d.

trimmer. A station used in surveying by triangulation on a large scale. Ham.
of holes in a tunnel face. Stanfip. c. Using shapes consisting of such items as bases, caps, corn-rs, moldings, and angles, necessary or desirable to make a composite object. E.g., concrete is used in building and structural sanc-
tary purposes as well as architectural design for all types of tilework. ASTM C242-60T. See also fittings, g.

trimming. a. In drawing, shearing the ir-
regular edge of the drawn part. A.S.M. Gloss. b. In forg- ing or die casting, re-
moving the parting-line flash and gates from the part by shearing. A.S.M. Gloss. c. In casting, the removal of gates, risers, and fins. A.S.M. Gloss. d. The finishing work on the surface of an earthwork. Hem. e. The process of removing broken and jagged edges, plus a variety of imperfections from rifted mica. Trimming may be accomplished by fingers, sicle, knife, shear, or guillotine and is then named for the implement; for example, thumb-trimmed mica. Also called dressing.

trimming shed. See mica house. skew.

Trimmed. A. mixture of trinitrophenol and 
mononitrotoluene, employed in 
explosives in mining.

trimorphic. Having the property of crystal-
lizing in three different forms with the 
same chemical composition. a.g.i. sup.

trinaphthalene. Dene asphaltic petro-
leum containing 9 percent sulfur. Tomkert, 1954.

Trinidad asphalt. Same as Trinidad 
petroleum. A natural asphalt removed 
from the natural deposits in Trinidad. API Glossary.

Trinidad pitch. Same as Trinidad asphalt. The 
material is a mixture of three or more 

Trinidad tar. A. Middle Lower Cretaceous. a.g.i. sup.

trinitrotoluene; tnt. A yellow to dark brown 
crystalline substance, C6H2(NO2)3, which melts at approximately 80.9° C and has 
a specific gravity of 1.654. Insoluble in water; soluble in ethyl alcohol, etc.; boils at 205° C, decom-
poses readily at 305° and 320° C. One of the most powerful explosives, having an 
explosive wave of 23,500 feet per second in the open. Used in the 
ammunition of the armored services; some-
times used as a constituent of propelled 
explosives in mining. Cooper, pp. 343-
344; CcD 64, 1961. Yields a very 
powerful gas, and forms a black smoke upon 
boiling. Trinitrotoluene is manufactured 
by nitration of toluene. Nelson.

Trinitrovermiculite. The triad of the three 
divisions into which the Comanchean is divid-
ed. These beds are limestones, and marine orga-
nic strata in Zacatecas, Mex.; they cover half of Texas and part 
of Arizona, where a limestone member (the Glen Rose Limestone) rests upon 
continental Comanchean beds. C.T.D

tripsdrill. A resinsous substance occurring in large 
amounts of masses of a hyacinth-red to 
light yellow color in brown coal near Albana, Istria. Resembles tanasite in composition. a.g.i.

trisalicyl. a. Refers to the structure of 
layered clay minerals in which all possible 
octahedral positions of aluminum are oc-
cupied by magnesium, iron, chromium, or 
zinc. A.G.I. supp. b. Atoms filling all 
of the octahedral positions.

Triolites. A proprietary mixture of 55 per-
cent sodium fluoride, 35 percent sodium 
dichromate, and 10 percent dinitrilotriphenol. This water soluble preservative is used in 
timber preservation. Highman, p. 113.

trip. a. A small train of mine cars. Korson. b. The number of cars moved at one time 
by a transportation unit. Hadson. c. A. The cars hauled at one time by a locomotive, or by 
any motor, or at one time on a slope, 

trip change. A term used in mine transportation 
for the period during which the (loads (loaded mine cars) are taken away 
and a fresh trip of empties is brought 
back. This trip is known as trip change in 
contrast to car change. In this interval, a 
great deal of potential loading time can be 
lost, Korson.

trip check. Eng. A check with one of the 
members set a certain distance out of 
line with those above and below it; in a full 
trip check this distance is equal to the 
width of the members; in a half trip 
check it is about half the width of the members. SMIB, Paper No. 61.

trip coil. A device for opening protective 
equipment or a circuit breaker, operated 
by a solenoid. Han.

tripestone. a. Stalactite resembling intes-
stites. Arkell. b. A variety of gypsum form-
ed of crumbling laminar laminae of 
white pure gypsum and grey argillaceous 
gypsum. Arkell. c. A contorted concres-
cionary variety of anhydrite. Fay.

tripsizer. A. A variety of gypsum form-
ed of crumbling laminar laminae of 
white pure gypsum and grey argillaceous 
gypsum. Arkell. c. A contorted concres-
cionary variety of anhydrite. Fay.

trip hammer. A power hammer operated by 
a tripping mechanism which causes the 
hammer to drop. Crispin.

trip lamp. A removable self-contained mine 
explosive. Bennett 2d, 1962. See also mine lamp.

triplicate. a. A system of opening a mine 
that uses three charges of glass and 
some explosive. Bennett 2d, 1962. See also trip, d. Fay.

trip line. A name for colored-embedded 
beads or parts of stringing. A.G.I. sup.

tripod. a. A three-legged support for a rock 
work of wood or metal over a drill and 
platform composed of three principal 
legs (legs) inclined toward, and fas-
tened to, a common head. A joint with a bolt on 
which a clove and attached sheave is

1172
tripod bolt. A large heavy bolt that pins together the upper ends of the three tripod legs in the tripod. Long. d. A three-legged stand for supporting a theodolite, magnetometer, compass, camera, or any other instrument. G.C.

tripod drill. A reciprocating rock drill mounted on three legs and driven by steam or compressed air. The drill steel is removed and a longer drill inserted about every two feet. Fay.

triplite. An opal. Tripoli; tripoille. An incoherent, jolgitivitily silicate of the siliceous shells of diatoms. See also tripoli.

tripolyte. A very rare, moderately radioactive, yellow, or gray, natrolite, having triangular faces, each with equal intercepts on two axes and a lesser intercept on the third axis; and (2) the tetragonal triactahedron (also called trapelbendrite and icocrysticactahedron), having trapezial faces, each with equal intercepts on two axes and a lesser intercept on the third axis. Fay.

tripolite. A rare, silicate of the siliceous shells of diatoms. See also triplite. Fay.

tripod crane. A crane fitted with tripod legs. Fay.

tripod drill. A device in the run of a conveyor comprising two free drums around which the belt passes S-fashion. Nelson. D. A device having material from a belt conveyed on a conveyor. Nelson. e. A double pulley that turns a short section of a conveyor belt upside down in order to dump its load into a side chute. Nichols. d. One who trips. Webster 3d. e. A device or mechanism that trips, as a device for causing the load on a conveyor to be discharged into a hopper or other receptacle. Webster 2d. f. An automatic car dump. Webster 3d. g. A device for tipping and dumping supporting a charged into a hopper or other receptacle who trips. Webster 3d. e. A device or mechanism that receives and delivers in one stream in the direction of belt movement. Nelson.

trip in. 5th. A trip regulator. Nelson.

tripper. a. The process of pulling and/or lowering drill-string equipment in a borehole. Long. b. To open a latch or locking device, thereby allowing a door or gate to open to empty the contents of a Skip, bailer, etc. Long.

triplet. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

tripple. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

tripple. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.

trippler. A blue green mineral, an arsenate of copper with 1 highly perfect and 1 less perfect cleavage permitting crystals to be broken up into flexible astibolites. Fay.
trolley

truck without a body. The two-wheeled trolley is used in a rolling mill to wheel the work to and from the mill. The four-wheeled trolley is used in buildings and industries. A revolving trolley is used in railroads. A trolley car is a small car used on overhead wires, such as in a factory or a streetcar. A trolley is a part of a railroad track. A trolley is used to move materials in a factory or a warehouse. A trolley is a small car used on overhead wires, such as in a factory or a streetcar. A trolley is a part of a railroad track. A trolley is used to move materials in a factory or a warehouse. A trolley is a small car used on overhead wires, such as in a factory or a streetcar. A trolley is a part of a railroad track. A trolley is used to move materials in a factory or a warehouse.

trump curve. Graph used in float-separation to relate the percentage of a product which floats to the specific gravity of the particles concerned. See also ash curve. Pryor, 3.

trump. See trommel, Fay.

Trooper process. a. The first process to introduce (about 1938) the use of magnetic suspension in dense-medium washers. A magnet is suspended by 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. b. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. c. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. d. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. e. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. f. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5. g. A means of separating solids with high specific gravity at intermediate levels. The process operates within the size range 5.6 to 200 millimeters and in practice is used for raw coal down to 1/4 inch. It gives a reasonably accurate three-product separation. Nelson, 5.
tough cross-stratification

curved surface of erosion. See also festoon

cross bedding; festoon cross lamination

Petjioha.

toughed belt. A belt conveyor in which the

carrying side is made to form a shallow

ough by means of troughing idlers.

toughed belt conveyor. A belt conveyor

with the conveyor belt edges elevated on

the running run to form a trough by con-

forming to the shape of the troughed

carrying idlers or other supporting surface.

ASA MH4-1958.

tough fault. In geology, two parallel faults

bounding a dropped mass of rock between

them that has more or less the form of a

wedge. Bureau of Mines Staff.

troughs. A structural formation shaped like

a wide U, riveted or welded to form a

bridge deck with the U-shaped alter-

native. Ham.

b. Making repeated dorser pushes in one

track, so that ridges of spilled material

hold dirt in front of the blade. Nichols.

c. Eng. In Derbyshire, toadstones filling

furrows. Akell.

troughed belt. A belt conveyor

having two rows of rolls set at an angle

to form a trough, over which objects are

conveyed. See also el conveyor. ASA

MH4-1958.

toughing. In geology, two parallel faults

frequently accompanies the abrupt bend-

ing of strata passing through the middle

of the curvature. Fay.

troubleshooting. A system of checking

for the condition:

a. Any wheeled vehicle, usually self-

propelled, used to transport heavy articles

c. material. In mining, usually applied to

dump and/or bottom-dump semitrailers

used to transport 1-ton troy (1 ounce troy:

31.103 grams); 1 ounce avoidoipous ounces:

0.8223 avoirdupois pound, or 373.2599

grams. Fay. Abbreviation, lb t. Zimmer-

man, p. 83.

trow. A wooden channel for air or water.

truck. a. Any wheeled vehicle, usually self-

propelled, used to transport heavy articles

c. material. In mining, usually applied to

dump and/or bottom-dump semitrailers

used to transport 1-ton troy (1 ounce troy:

31.103 grams); 1 ounce avoidoipous ounces:

0.8223 avoirdupois pound, or 373.2599

grams. Fay. Abbreviation, lb t. Zimmer-

man, p. 83.

true crater. In explosion-formed crater no-

true depth. The actual depth of a specific

point in a borehole measured vertically

from the surface in which the borehole

was collared. Also called true vertical

depth. Long.

trucci dip. a. The angle at which veins, strata,

etc., dip, as measured vertically downward

from the horizon along a line at right

angles to the strike of the veins, strata,

etc.; also, the dip of a vein, strata, etc., as
determined on oriented core. See also core

orientation; oriented core. Compare ap-

pendip. Long. b. The maximum angle

excavation which an inclined bed makes with a

horizontal plane. It is the condition which

water would flow if poured on the smooth

upper surface of the bed at the outcrop.

Also called dip. See also apparent dip;

dip level, course. Nelson. c. Synonym

for three-dimension dip. A.G.I.

true emery. A mixture of corundum and

magnetite, with the corundum derived from

the magnetite, such as Greek or Turkish

emery, and usually has a red
dee. Long.

true fissure vein. A fissure vein with promise

of extending to great depth, in contra-

distinction to a gossanized fissure; general-

ized fissures are true fissure veins. Fay.

true folding. Same as flexure folding. A.G.I.

tru Jade. See jadeite.

true marble. The geographical north-south

plane, as distinct from the magnetic meri-

dian which is the direction of the magnetic

needle. Hem.

true middlings; bone coal. Comparatively

high-ash material so nearly homogeneous

that its quality cannot readily be improved

by crushing and cleaning. B.S. 3532, 1962.

true north. The direction from any point

on the earth's surface toward the geo-

graphic North Pole; the northerly direc-

tion along any projection of the earth's

axis upon the earth's surface, for example,

along a longitude line. Except for much

of navigational practice (which uses mag-

netic north), true north is the universal

0° (or 360°) mapping reference. True

north differs from magnetic north by the

magnetic declination at that geographic

location. HBG.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.

true porcelain. See hard porcelain. Rot n-

thal.
true porosity

Porosity of open and closed pores. VV. See also porosity.

trace. Fibrous nodular lignite which when struck emits an odor like that of truffles. The horizontal section resembles a normal lignite of Cretaceous age in France. Tomkrief, 1954.

truging. Removal of an outside layer of abrasive grains on a grinding wheel to reduce its face to running true or alter the cutting face for grinding special contours. ASM Gloss.

truing-machine operator. One who grinds the surfaces of refractory blocks to reduce them to standard dimensions, using a truing machine. D.O.T. 1.

trumpet. A fire clay refractory funnel placed at the top of the assembly of guide tubes to receive molten metal from the nozzle of a battle in the bottom of steel. See also bottom pouring; guide tube, b. S.D.C.

true strain; warand; loprithod arab. Ford

true strain. See also strain.

tree. A high-capacity main road for conveying slimes, for further treatment. Webster 2d.

tree strain; watand; drab; loprithod arab. Ford

true strain. See also strain.

tree vela. An occurrence of ore, usually disseminated through a gangue of veinstone. See also porosity.

true specific gravity. The ratio of the mass of a porous solid to the mass of an equal volume of any pores being neglected. Example, a brick. Webster 2d.

true solatios. One which is homogeneous in density and volume of a porous sad, for example, a brick. Webster 2d.

true topaz. Genuine topaz as distinguished especially from citrine or topaz quartz. Shiple.

ttrue-to-scale print. A contact print made with the cutting of the negative in the dark. Especially from citrine or topaz quartz. Shiple.

true vertical depth. See true depth. Long.

true volume. A term used in relation to the density and volume of a porous solid. For example, a brick. It is defined as the volume of the solid material only, the volume of any pores being neglected. Dodd.

true width. a. The width or thickness of a vein, stratum, etc., as measured perpendicular to or normal to the dip and the strike. The true width is always the least width. Compare apparent width. Long. b. The true width of a vein in sampling may be found by the mathematical formula: w = the true hold or volume of the material; h = the angle of dip; then h = w sin a = w/sin a. In this simple formula the angle a is known from previous observations and the horizontal width sampled can be measured by the use of a level. This leaves only w to determine. It is important in the use of this formula that the horizontal width is measured at right angles to the strike. Hooe, p. 11.

true grit. Fibrous nodular lignite which when struck emits an odor like that of truffles. The horizontal section resembles a normal lignite of Cretaceous age in France. Tomkrief, 1954.

true porosity. Porosity of open and closed pores. VV. See also porosity.

true section. Line or cross section drawn with the same scale vertically and horizontally. Ham.

true solution. One which is homogeneous in nature and can be separated by evaporation or distillation. Cooper.

ttrue specific gravity. The ratio of the mass of a material to the mass of a quantity of water that, at 4°C, has a volume equal to the volume of the material at the temperature of measurement. Dodd.

ttrue strain; natural strain; logarithmic strain. The integral, over the whole of a finite interval, of the strain rate divided by the corresponding specific strain. Calculated from the cutter geometry as well as the actual change in area due to loading. Webster 2d.

true strain. See also strain.

ttrue stress. For an axially loaded bar, the load divided by the corresponding cross-section area. It differs from the stress as ordinarily defined because of the change in area due to loading. See also true stress.

ttrue topaz. Genuine topaz as distinguished especially from citrine or topaz quartz. Shiple.

ttrue-to-scale print. A contact print made with the cutting of the negative in the dark. Especially from citrine or topaz quartz. Shiple.

ttrue vertical depth. See true depth. Long.

true solution. One which is homogeneous in nature and can be separated by evaporation or distillation. Cooper.
1171

**tischernosem**

mus and carbonates, that forms under cool to temperature, semiarid, climatic condi-
sions. Synonym for tischernosem; t chrono-
term. **A.D.T.**

**tschernosem.** A red pigment consisting of stan-
tsebong. A red pigment consisting of white
tsumebite. An emerald-green basic, hydrous'
tsingtau. A variety of granite porphyry
T.U. Takeup. A mechanism for adjusting
tu. Abbreviation for thermal unit. Also ab-
tsunami. A very long water wave caused by
a submarine earthquake or volcanic erup-
ting area, on which is mounted the revolv-
tubbing. a. The watertight cast-iron lining
rubbing space.

tubbing deals. Sect. Plank put behind tub-
bing in a shaft. Fay.
tubbing plate. Eng. A cast-iron segment of a
tubbing wedge. A small wooden wedge ham-
meder between the joints of tubing plates.
tube. a. A cove with nearly circular

tube blower. A man who cleans boiler tubes.
tubing. a. A cove with nearly circular

tube bottom. One form of bottom for a con-
vertor; it is made of monolithic refractory
material, the air passages being lined with
copper tubes. See also converter. **C286-65.**
tube clamp. a. A clamp or clip for gripping a
tube or pipe; especially, a jawed tool
used in hoisting and lowering well tubes.
**D.O.T.**
tube furnace. A muffle furnace in which com-
bustion occurs within alloy tubes. **ASTM C286-65.**
tube grinder. See grinder, tubes. **D.O.T.**
tubing. a. A cove with nearly circular

tubing deal. Sect. Plank put behind tub-
bining in a shaft. Fay.
tubing plate. Eng. A cast-iron segment of a
tubbing wedge. A small wooden wedge ham-
meder between the joints of tubing plates.
tube. a. A cove with nearly circular

tube blower. A man who cleans boiler tubes.
tubing. a. A cove with nearly circular

tubing. a. A cove with nearly circular

tubing deal. Sect. Plank put behind tub-
bining in a shaft. Fay.
tubing plate. Eng. A cast-iron segment of a
tubbing wedge. A small wooden wedge ham-
meder between the joints of tubing plates.
tube. a. A cove with nearly circular

tube blower. A man who cleans boiler tubes.
tubing. a. A cove with nearly circular

and due to automorphic replacement of an
easily replaceable gangue by crystals
showing a strong tendency to automor-
tube reducing. Reducing both the diameter
and wall thickness of tubing with a man-
der and a pair of tapered mandrels. The
Rollite process uses a fixed, tapered mandrel, and the rolls reciprocate
tubbing. a. A cove with nearly circular

tube blower. A man who cleans boiler tubes.
tubing. a. A cove with nearly circular

tubing deal. Sect. Plank put behind tub-
bining in a shaft. Fay.
tubing plate. Eng. A cast-iron segment of a
tubbing wedge. A small wooden wedge ham-
meder between the joints of tubing plates.
tucking space

the pulley driven. This space provides for driving the second set of pulley boards. Stauffer.

tuck pointing. Filling in with fresh mortar of cutout or defective mortar joints in old masonry. ACGC.

tuckstone. A shaped refractory block fitting above the tank blocks of a glass furnace. The general purpose of the shelf stones is to protect the top of the tank blocks from the furnace gases and, in some types of tank furnace, to act as a seal between the tank blocks and the side and end walls. The course of tuckstones is sometimes called the tuck wall. Dodd.

tuck wall. See tuckstone.

tufa. A chemical sedimentary rock composed of calcium carbonate or of silica, deposited from solution in the water of a spring or lake, or from percolating ground water. Not to be confused with tuff. Also called calcareous tufa; calc-tufa. See also travertine; sinter. Fay.

tuff. A rock formed of compacted volcanic fragments, generally smaller than 4 millimeters in diameter. A.G.I.

tuffaceous. Characteristic of, pertaining to, containing, or resembling tuff. Not to be confused with tufaceous. Fay.

tuff breccia. A type of volcanic breccia in which the tuffaceous matrix between the blocks is abundant and comprises between 25 and 75 percent by volume. A.G.I.

tuff cone. A volcanic cone made up chiefly or wholly of tuff and other fragmentary explosively ejected material. Fay.

tuffite. An intimate mixture of finely fragmented country rock and finely divided primary volcanic material. A.G.I.

tuffite. Indurated rocks composed of a mixture of pyroclastic and sedimentary debris, especially ash and fine sand. A.G.I.

tuff lava. Applied to consolidated, lava-like tuff composed primarily of lenses of black and gray obidian lying in a tuffaceous matrix that displays a streaky, varicolored banding or eutaxitic structure. Rocks of this sort are generally considered to be the product of ash flows or nuées ardentes. Essentially synonymous with welded tuff.

tuff palagonite. A bedded tuff lava. Applied to consolidated, lava-like tuff composed primarily of lenses of black and gray obidians lying in a tuffaceous matrix that displays a streaky, varicolored banding or eutaxitic structure. Rocks of this sort are generally considered to be the product of ash flows or nuées ardentes. Essentially synonymous with welded tuff.

tufnol. Laminated plastic, light, wear-resistant; and a good insulator. Tensile strength 30,000 psi per square inch upward. Used in bearings of pressurized parts. Pryor, 3.

tuff. Eng. A soft sandstone; also, calcareous deposit. Probably a variation of tufa. Fay.

tug. The iron hook of a hoisting tub to which a tackle is fastened to pull the tub up a mine shaft. Standard, 1964.
tugger block. A useful little air hoist for small or big mines. c. Corn. tenuis. tugger man. See tugger operator. D.O.T. 1. tugger operator. In mining, one who operates a small machine or semiautomatic hoist (tugger), powered by compressed air or electricity, to raise coal, ore, rock, or supplies in a shaft or stope or along an incline inside a mine. Also called tugger man. D.O.T. 1.
tugwith. Derb. A small pole or stick used as a brake on a windlass or turnstile. Fay.
tumlite. A stone occasionally described (Marshall, 1932) as a variety of amphibole, but later (1936) Marshall thought it to be a distinct mineral. C. O. Hutton now redesignes the mineral as Na,K,Fo_4,X(Fe_2^+), etc. See also tremolite; lazurite; olivine. Fay.
tumphy. a. Used in Scotland to describe some types of amphibole, but later (1936) Marshall thought it to be a distinct mineral. C. O. Hutton now redesignes the mineral as Na,K,Fo_4,X(Fe_2^+), etc. See also tremolite; lazurite; olivine. Fay.
tumble. To smooth, clean, polish, burnish, or de- nickle. Webster 3d. Rel. Webster 3d.
tumbling barrel. A revolving barrel, cask, or box, in which objects or materials (as metal parts, castings, plastics, leather, or clothing) undergo a process (as finishing, polishing, coating, softening, or drying) by being tumbled. Then it is brought into vigorous frictional contact. Also called roller; tumble; scouring barrel. Webster 3d.
tumbling box. A tumbler barrel for small objects. Webster 3d.
tumbling crank. A crank on the end of the pump shaft for giving reciprocating motion. Fay.
tumbling mill. Any horizontally mounted cylindrical mill which tumbles its contents when rotating. Name used in foundries in connection with cleaning of castings. Pryor, 3.
tumbling shaft. The camshaft used in stamp mills. Fay.
tumbling tom. Eng. A car-tipping or dumping apparatus that turns completely over. Fay.
tumescence. In volcanology, the swelling or uparching of a volcano during periods of rising magma preceding an eruption. A.G.I.
tumulus. A swelling, or low domelike hill, or mound. Fay. Also called tumulus; tummels. Corn. A great quantity, or heap, as of ore. Fay.
tumulus. a. Used in Scotland to describe a wide range of materials occurring on top of coal seams and which often fall as the coal is worked. See also following stone, a. Eng. A carbonaceous fire clay. Fay.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tumulose. Full of small or large domelike hills in lava flows. Lewis, p. 599.
tunna. A Wales term for a hoisting bucket; a bowk; a kibble. Fay.

tunnel. a synonym for shaft and often called a tunnel, or a rock tunnel; a. A horizontal or inclined subterranean passageway. ASA MH4.1-1958. b. A horizontal or nearly horizontal underground passage that is open to the atmosphere at both ends. The term is loosely applied in many cases to an adit. Nelson, p. 21. An adit if continued to such a hill would then be a tunnel. Any level or drift in a mine open at one end, or which may serve for adit, is often used as a synonym for adit; drift; gallery. See also adit. Fay. c. A horizontal or inclined stone drivage for development or to connect mine workings, seams, or shafts. It may be open to the surface at one end, and for drainage, ventilation, haulage, or as an egress and man-riding from mine workings. See also tunneling. Nelson, p. 136. d. A chimney flue; a tunnel. Webster 3d.

tunnel blasting. a. A blast effected by the detonation of explosives in small tunnels driven into the face at the level of the quarry floor or at the level of the terrain at the foot of the slope of the deposit. This blasting method is called tunneling. B.S. 3618, 1964, sec. 6. See heading blast. This blasting method is called tapping. Standard, 1964.

tunnel blasting. a. A method of heavy blasting in which a heading is driven into the rock and afterwards filled with explosives in large quantities, similar to a large borehole, except the heading is usually divided in two parts on the same level at right angles to the first heading, forming in plan a T, the ends of which are filled with explosives and the intermediate parts filled with inert material like an ordinary borohole. Similar to

tunnel drilling. a. A system of heading drilling in which a heading is driven into the rock and afterwards filled with explosives in large quantities, similar to a large borehole, except the heading is usually divided in two parts on the same level at right angles to the first heading, forming in plan a T, the ends of which are filled with explosives and the intermediate parts filled with inert material like an ordinary borohole. Similar to

tunneling. a. A horizontal or inclined stone drivage for development or to connect mine workings, seams, or shafts. It may be open to the surface at one end, and for drainage, ventilation, haulage, or as an egress and man-riding from mine workings. See also tunneling. Nelson, p. 136. d. A chimney flue; a tunnel. Webster 3d.

1173

tunnel blasting.

1178

tunnel blasting.

1179

tunnel blasting.

1180

tunnel blasting.
tunnel blasting

gopher hole blasting. *See also* gopher hole blasting.

tunnel borer. Any boring machine for making a tunnel; often a ram carried with cutting faces operated by compressed air. *Standard*, 1904.

tunnel carriage. A new development in rapid tunneling, consisting of a combined drill carriage and manifold for water and air so that tunneling is done by driving the carriage at the face, drilling may commence with no lost time for connecting up, waiting for drill steel, etc. The car is supplied at pressures of 95 to 100 pounds per square inch. *Nelson*.

tunnel cave. A simple cave composed of one passageway into which a surface stream enters and farther on emerges at a second opening. *A.G.I.*

tunnel claim. This is not a mining claim; it only is a means of exploration and discovery. When a lode or vein is discovered in the tunnel the tunnel owner is called upon to make a location of the ground containing the vein or lode and thus create a claim. *Ricketts*.

tunnel column. A heavy bar used for mounting machine drills in large drifts or tunnels, and usually holding two machines. *Fay*.

tunnel dryer. A continuous dryer through which shaped clayware is transported on cars. It is so controlled that the humidity is high at the entrance and low at the exit. *Dodd*.

tunnel excavation. Excavation carried out completely underground and is limited in width, and in depth or height. *Carson*, p. 28.

tunnel face. The working face in an excavation or tunnel or other working place from which driving is carried out. *Franchel*.

tunneling. The operation of excavating, driving, and lining tunnels. *Nelson*.

tunnel kiln. A high temperature used in mines. *Bennett* 2d, 1962.

tunnel kiln. a. A long tunnel-shaped furnace through which ware is generally moved on cars, passing progressively through zones in which the temperature is maintained for preheating, firing, and cooling. *A.R.I.* b. A lime kiln having a tunnel for the consumption of coal, as distinguished from a flame kiln, where wood is burned. *Standard*, 1904.

tunnel-kiln-car setter. One who loads saggars filled with green ware on automatic-conveyor car that carries ware through tunnel kiln for firing. Also called kiln-car setter. D.O.T.

tunnel kiln drawer. One who unloads saggars filled with fired ware from tunnel-kiln cars, and removes them to proper location by hand truck for reuse. D.O.T. 1.

tunnel kiln operator. One who controls the operation of a tunnel kiln in which bricks are fired, and a preheating chamber in which bricks are heated, prior to firing and after drying. D.O.T. 1.

tunnel lining. a. The timber, brick, concrete, or steel supports erected in a tunnel to maintain dimensions and safe working conditions. Tunnel lining is more correctly applied to a continuous and solid casing such as concrete work. *See also* lining, a.

tunnelman. In anthracite coal mining, one who drives a tunnel in rock from one coal seam to another or through a fault (the movement of the earth having separated a once continuous seam into two sections). D.O.T. 1.

tunnel miner. A hard-headed man. A miner experienced in the use and handling of rock drills, shovel loaders, and in tunneling and blasting methods. He is wholly employed out tunneling and is usually paid a fixed rate per shift with perhaps a bonus payment for high rates of tunnel advance. *Nelson*.

tunnel right. A grant of a tunnel right through a specific piece of ground is a right to enter upon and occupy the ground for the purpose of prosecuting the work in the tunnel, and to extract therefrom waste rock or earth necessary to complete the running of the tunnel, and making the tunnel therewith after completion, as may be necessary to work the mining ground or lode owned by the party running the tunnel. By the grant of such a right a carries with it every incident and appurtenant thereto, including the right to dump the waste rock at the mouth of the tunnel on the land owned by the grantor at the time of the conveyance of the tunnel right; such right or easement being necessary for the full and free enjoyment of the tunnel right. *Rick-lett*, 1.

tunnel set. Timbers 6 to 8 inches in diameter and of sufficient height to support the roof of the tunnel and are sometimes set upon sill and usually capped with short crosspieces. *Fay*.

tunnel shaft. A shaft sunk, as in a hill, to meet a horizontal tunnel. Also called tunnel pit. *Standard*, 1904.

tunnel site. A tunnel site is made to secure an area for a tunnel. The locator of a tunnel site is given the right to all veins cut by the tunnel within 3,000 feet of its portal, and to 1,500 feet on the strike of each blind vein cut, this length may be all on one side of the tunnel or divided as desired. The veins must be blind lodes not previously known to exist. *Lewis*, p. 28. b. There is no distinction between a tunnel claim under which a tunnel is run for the development of veins or lodes already located, and one pursuant to which a tunnel is projected for blind veins or lodes. *Lewis*. (1) See steel tunnel support. *Lewis*, p. 54. See also tunnel lining.

tunnel system. A method of mining in which tunnels or drifts are extended at regular intervals from the floor of the pit into the ore body. The extension of the drift beyond the working face is made great enough to facilitate the handling of several cars at a time. The ore is mined above the drift, and the cars are loaded by lifting short boards which span an opening, through the lagging on and above, the ore; the drift is then driven. This method avoids the construction of raises and chutes, and facilitates the filling of the cars. *Fay*.

tuple. a. Eng. An early custom of covering with lighted candles the last corf of coal sent to the bank at the beginning of the fortnight's height of the vein, when stock was taken and no coal hoisted. This was called "sending away the top." *Fay*. b. In a tunnel, to fall, weight of a piledriver, drophammer, etc.; specifically, the heavy head of a steam hammer in which the upper pallet is secured. *Webster* 2d.

tunnel blaster. A very rare, weakly to moderately radioactive, orthorhombic, olive-green mineral, Cu3(VO4)(OH), found with vanadium and uranium minerals in cavities in limestones; from Tuva Mountains, Fergana, Russian Turkistan; occurs as radiomorphs and spherical concretions with a radiolite structure. *Crosby*, p. 83. A vanadium ore. *Osborne*.

turbine. Sp. Dung mixed with coal and molded into adobe and used as fuel in brickklin. *Fay*.

turbary. a. The ground where turf or peat may be dug especially for fuel; prart bog. *Webster* 3d. b. An easement under English law, the right of a person on a common or another's land. *Webster* 3d. A right of turbary is confined to such quantity of land as is sufficient to form a useful mass, the common which is appendant. *Fay*. c. Peaty. *Gordon*.

turbine. a. A rotary engine actuated by the movement of the earth having separated a once continuous seam into two sections. D.O.T. 1.

turbidity. Determination of concentration of very finely divided and slow-settling particles in a liquid. Made by measurement of interference exerted on ray of light, by means of a photoelectric cell. Turbidity also measures average rate of fall (a diminution of concentration and of interference) of these particles. *Pyor*, 3.

turbidity. The state or condition of having the transparent quality of water impaired, as when sediment in water is stirred up, or when dust, haze, clouds, etc., appear in the atmosphere because of wind or volcanic activity. *HGC*.

turbidity current. A large volume, rapid, down-slope underwater current, usually generated by the movement of sediment or water. Causes a slumping of sediment on the slope and start's a flow of sediment and water. With the increased density of the sediment-water mixture the flow increases and picks up additional sediment and water. Velocities of 55 kts. have been estimated. *Hy*. See also density current.

turbidity size analysis. Size analysis based upon the amount of turbidity in a suspension, the turbidity being due to the size of the particles. *HGC*.

turbidity. A current produced by the reaction or impulse or both of a current of fluid (as water, steam, gas, or mercury) subject to pressure and usually made with a series of curved vanes on a central spindle arranged to rotate with the whole being enclosed by a casing provided with redirecting vanes and passageways which permit the inlet and outlet of the fluid in a desired manner. *Com- 

n 1174

turbine

turbine

a pressure head to water. See also steam turbine. Nelson.

turbine blades. See gas turbine. Dodd.

turbine pump. A centrifugal pump with a shrouded
impeller and receiving the water at its cen-
ter. A diffusion ring containing vanes surrounds the pump and direction the
impeller discharge into a circular casing
which delivers into the eye of the next
impeller in use. The diffusion ring con-
verts the high-velocity discharge of the
impeller into pressure head. The turbine
pump is widely used in mines. See also
diffuser chamber. Nelson.

turbozonal fan. An axial flow fan with a tur-
bine air-type impeller. B.S. 3816, 1963,
sec. 2.

turbocompressor. The type of machine com-
monly installed at collieries where a large volume of compressed air is re-
quired. A single unit can deliver 10,000
cubic feet free air per minute, and the floor space occupied is a mini-
imum for these capacities. It is also ideal-
ly suited for direct drive by a steam tur-
bine, and this combination is commonly found at collieries. The compressor con-
sists essentially of a number of impellers
located one behind another and running in a fixed
 casing with specially shaped passages.
Each impeller is in the form of a hollow wheel,
the two sides being united by curved vanes. Mason, V.2, p. 376.

turbodrill. A drill developed in the U.S.S.R.
for drilling deep oil wells. One type is de-
dsigned as a turbine and driven by the
lifting fluid which is circulated at high
speed as it passes through the turbine.

turbodrilling. A system of drilling in which
the bit is directly driven by a turbine at
the bottom of the hole. B.S. 3816, 1963,
sec. 3.

turboglyph. See flute cast. Pettijohn.

turbojet engine. A thermal jet in which the
air is compressed by a rotating compres-
sor, heated either by fuel combustion at compressor pressure, then
thrown through a gas turbine that drives the compressor and finally, ejected at high
velocity through the rearward exhaust
nozzle. Shell Oil Co.

turbulent. a. Same as peat. There are several vari-
eties, as white, brown, black, stone, gas,
or candle turf. Fay.

turfturf. Same as peat charcoal. Standard,
1964.

turfing. Covering a bare earth surface with
gas turf cut from another site. Turf of
selected grass is very suitable for use as a resement to a slope. Ham.

turfing iron; turfing spade. An implement for
revetment to a slope. Ham.

turf peat. Yellow-brown to wood-brown peat containing distinct plant remains.
Tomkeieff, 1954.

turf spade. A long narrow spade for cutting
digging turf, peat, etc. Standard, 1964.

turgide; hydroermatite. An iron ore interme-
tiate between hematite and limonite, con-
sisting of hydrous basic oxide, 2FeO•3H2O.
It is fibrous and red in the mass, with
an orange tint when powdered. Fay; Dana 17.

turjute. A coarse-grained rock consisting
primarily of melilitite, biotite, and nepheline.
A.C.I.

turkey brown; Turkey umber. Natural earth
which serves as a permanent pigment.
Contains iron oxides, manganese oxides,
and some clay. CCD 64, 1961.

turkey fat. In Missouri, a local name for a
variety of smithsonite, colored yellow by
its shape when powdered. Fay; Dana 17.

turn angles. To measure the angle between
directions with a surveying instrument.
Nichols.

turn barrel. Mid. A hand windlass; also
called jackroll. Fay.

turn bat. A wooden stick used in turning the
long, which holds a hook under the
hammer. Fay.

turn beam. Eng. One of the beams which
support the hoist for a hoisting machine.

turnbuckle. a. A form of coupling to threaded
or swiveled that by turning can be regulated. Zern.
b. See screw shackle. Ham.

turn bolt. A bolt turned in a lathe to a close
tolerance and used in steel-to-steel con-
nections. Ham.

turned vertical shaft. A shaft sunk vertically
in the hanging wall block until it inter-
sects the reef after which it continues
down at an angle in the footwall parallel
of a rope or rod may be regulated. Zern.
b. See screw shackle. Ham.

turning point. A point where workings turn
to a slope. Ham.

turning point. The point between survey lines. See also traverse. Ham.

turns. a. A point on which both a minus sign
(south) and a plus sign (backnight) are
taken on a line of direct levels. Sealy,
2. c. A point whose elevation is
taken from two or more instrument po-

turns. A term used with any device used to turn pulley. A sheave fixed at the inside end
turnover. a. In cyclic mining, the moving
turnout boy. One who removes glassware from
turnoff. a. Aust. The point where a branch
turning vane. Curved strips of short radii
rotary table, a. Long.
top drilling pipe. Pryor, 3. d. A base that
verser. Nelson. c. In oil well drilling, a
or twin track. See also shunt back; tra-
treasure. See treasure. Fay.
turn ree. Derb. A sort of windlass for hoisting
Turoelian. Middle Upper Cretaceous A.G.I.
turpentine substances. Petroleum products
usual intermediate between gasoline and illuminating
Turku archipelago. In the language of the
10.
turnoff. a. Aust. The point where a branch
tramsingle or picking place for skips on a haulage road. A turnout. Fay.
turnout. a. A contrivance for passing from one track to another. The principal parts
are the switch, the frog, and two guard-rails. Zern, p. 477. b. The branching off of one rail track from another. Nelson.
c. A siding. Hudson. d. The movable
turnover of the conveyor in a machine-cut
freight train yard. See also conventional
train yard. See also conventional
truss. A. a. A framework of beams, either
independently, or bonded together to stiffen
a large structure such as a bridge or 
arch. b. A girder bridge. c. A frame or supporting framework of girders used to
support a roof. d. A framed framework of
emptying the hopper. See also hoister.
truck. See car trucks. Fay.
turntable. See rotating platform.
twist. A. Ing. A decorator's tool or brush
for laying pattern in clay. b. A decorativ
design made with a twist brush. c. A
design that appears to have been formed
by twisting. d. A decorative design made by twisting. e. An angular compartment or
section resulting from twisting. f. A
pattern or design formed by twisting.
wad. A. a. A mass of clay or other suitable
material that is thrown between rolls or
plungers. b. A mass of clay or a similar
material used as a seal or for holding the
ends of a rod or a wire. c. A mass of clay
or a similar material used as a seal for
holding the ends of a rod or a wire.
having instead of the points, flat terminations, one parallel to the handle, and the other sometimes oval, the latter generally pointed. Webster 2c, 1956.

twill cloth. Weave used in screens and filters, in which two or more warp threads intersect and form a one wood thread. Pryor, 3.

twin. Two portions of a crystal having a definite crystallographic relationship; one may be regarded as the parent, the other as the twin. The orientation of the twin is either a mirror image of the orientation of a twinning plane, or an orientation that can be derived by rotating the twin portion about a twin axis.

twin-arc welding process. The use of two small diameter electrodes in place of one larger electrode in a single submerged welding head. D.O.T. 1.

twin boy. In bituminous coal mining, one who works along a passing or return rib or through the overhand haulage system. D.O.T. 1.

twin cable. An aerial ropeway which has parallel track cables with carriers running in opposite directions; both rows of carriers are in line with other grooves in the rolls. Ham.

Twin Creek series. Dark calcareous shales and shaly limestones representing a marine intercalation in the continental Jurassic strata of Wyoming. Underlain by edian sandstones and succeeded by the Beekmantown formation. C.T.D.

Twin entry. A pair of parallel entries, one of which is an intake air course and the other the return air course. Rooms can be worked from both entries. Often called double entry. Fay.

twin-gear press. A crank press in which the drive gears are attached to both ends of the crankshaft. ASM Gloss.

twining axis. Any direction in a twin that has the same relation to the lattices of both parts of the twin. It is always normal to a twinning plane, and at least one of these is always rational with respect to the lattices. A.G.I.

Twinning laminae. The laminae or thin plates in rocks. See also twin, 1. Shippy.

twining law. The special and characteristic method according to which twin crystals of any minerals are formed in nature. A.G.I.

twining plane. 1. A twin crystal, a plane normal to the twinning axis. Fay.

twinoiloscope. A type of oiloscope used to detect and mark twinning and determine the sense of orientation in etched sections. AM, 1.

Twinscope. An instrument employing a divided beam to examine etched wafer's for twinning. AM, 1.

twin packer. A packer designed so that a borehole can be sealed simultaneously at two separated points. Long.

twin plate process. A process for the simultaneous grinding and polishing of both faces of a glass, and of any produced ribbon of glass; the complete flow line is nearly 1,300 feet long. Dodd.

twin pressure packer. Synonym for twin packer. Long.

twin seam. Aust. Two seams of coal so close together they can be worked in conjunction, or one following closely on the other. Fay.

twin frame. A pair of parallel entries, one of which is an intake air course and the other the return air course. Rooms can be worked from both entries. Often called double entry. Fay.

twin twist drill. A drill made by twisting a length of steel or rectangular or oval section into a spiral form, hence, the term twist drill. Long.

Many bands of coal and drill holes are of this type and the rotation of the drill spiral removes the cuttings from the hole. See also auxiliary ventilation. Nelson.

twin loop splice. Made by holding the bared wires side by side. Half of their length is then bent back to form a loop at the end. The loop is then twisted around the main shank of wire. Carron, p. 326.

twister operator. In the asbestos products industry, one who twists together two or more strands of wire and asbestos yarn for use in weaving asbestos products, such as brake linings. D.O.T. 1.

Twisting force; turning force. A force, such as the force on the drill string, caused by excessive torsional stress. Long.

twister. A single or double cycle engine having an adjustable or rectangular form. Ham.

two-cycle engine. An engine in which only two strokes of the piston, corresponding to one revolution of the crankshaft, are required to complete the cycle. In a two cycle engine, one explosion occurs each downward stroke of the piston, the fresh charge being admitted and the exhaust gases expelled during the upward stroke. For the same number of revolutions of the crankshaft, there are twice as many explosions as there are cylinders in the cylinder of a two-cycle engine as in that of a four-cycle engine. Zern, p. 332.

two-fan auxiliary ventilation; overlap auxiliary ventilation. An arrangement, using two auxiliary fans, for ventilating a mine tunnel at hard hanging. It consists of an exhausting fan with rigid ducting to within about 100 feet of the face, and a forcing fan using a flexible duct discharging air about 20 feet from the face. The duct of the two units overlaps at least 30 feet to minimize recirculation of air. The air delivered by the forcing fan does not exceed about one-third that removed by the exhaust fan. See also auxiliary ventilation. Nelson.

two-high mill. Contains two horizontal rolls, one above the other. In some two-high mills the direction of rolling can be reversed, and these are known as reversing mills, so that it is possible to pass through the rolls, the rolls are stopped and then rotated in the opposite direction, thus inverting and reversing the operation being repeated until the desired reduction is attained. Between passes, adjustment is made by shifting the height of the top roll, and/or the piece is moved sideways by means of manipulators, to be in line with other grooves in the rolls. Osborne, p. 357.

Two-bended arch. A rigid frame which is hinged at both supports. It may have an arched or rectangular form. Ham.

Two intakes; double intakes. The provision of two intake air courses, generally one side to a ventilizing district of a mine. Nelson.

Two-jaw chuck. A chuck equipped with two movable clamping or gripping jaws by means of which the motion of the chuck is imparted to the drill rod. Long.

two-leg sling. A sling having two chains or ropes which hang from a shimplie. See also three-leg sling. Ham.

Two-liquid differential manometer. Consists of two concentric glass tubes, each expanded into a large bulb at the upper end. The lower end of the outer tube is sealed and the inner tube reaches nearly to the bottom of the outer tube. Two liquids are used and the movement of the interface between the two liquids down the central tube is used as an index against which the change in pressure is measured. It is essential that the two liquids do not mix and that neither is soluble in the other. Roberto, p. 28-29.

Two-minute lighter. See cheese stick. South.
two-piece set

A set of timbers consisting of a cap and a single post. If the ground is loose and must be supported over the side of the shaft, two-inch boards are used. These boards extend from the center line of the post or the center line of the cap to the original center line of the post or cap. If they are placed touching each other, such an arrangement is called tight lagging; if a few inches apart, depending on the nature of the ground to be held back, it is called open lagging. Lewis, p. 40.

two-pipe steam system. A heating system in which one pipe is used for supplying steam to the radiator and another pipe is used to return cooled water or condensate to the boiler. Strock, 10.

two-plane idler. A rolling idler in which the rolling trough rolls are in a vertical plane separate from but parallel to a vertical plane through the shaft of the conveyor rolls. NEMA MBI-1956.

two-point press. A mechanical press in which the slide is actuated by two connections.

ASM Gloss.

type-D drift indicator. A single-shot borehole-surveying instrument that records the compass bearing and inclination of the course of a borehole through the action of a strong beam of light directed through the borehole in one direction, and reflected through a special paper disk. It is similar to, but larger than, a type-D drift indicator. Long.

type metal. A series of alloys containing 14 to 25 percent lead, 2 to 28 percent antimony, and 2 to 20 percent tin, used to make printing type. ASM Gloss.

type mineral. The actual mineral specimen used for study resulting in its being identified as a new species. It is not uncommon to find different species resembling each other closely from the same type locality hence importance of a type mineral. Hess.

type of coal. a. The concept type with the restricted meaning recognized by the U.S. Bureau of Mines provides a means for classifying standard varieties of coal microscopically on the basis of simple proportions of anthraxolphor and anthraxolphor and aromatic and naphthenic oil into bands and non-banded coals. There is no term in the Stoesl-Heerlen nomenclature system precise synonymous with the word type as used by the U.S. Bureau of Mines and no similar type classification. IHCP, 1963, part 1. b. Although the word type has the common meaning of variety, it was applied to coal with restricted significance by D. White (1909). According to D. White, a type of coal is a variety initially determined by the nature of the ingredient matter, the conditions of origin, and the way of operation of the first or biochemical process of coal making. Although every individual coal belongs to one or another type of coal, no systematic and comprehensive classification of coal by type exists. Coals designated as humus coal, resinosous coal, spore coal, leaf coal, bark coal, etc., represent coal types. Some coal chemists, at least since 1848, have used the term type with a meaning similar to that of the term rank but such a meaning of type does not have a basis in fact and is not valid by coal geologists and petrologists. IHCP, 1963, part 1.

types. Soot. Irregularities in a mine roof; also called types. Fay.

Type S hydrated lime; special hydrated lime. An ASTM designation to distinguish a structural hydrate from a normal hydrated lime, designation Type N, that possesses specified plasticity and gradation requirements. It may be dolomitic or high calcium and is more precisely milled than Type N hydrates. Boynton.

type specimen. A specimen or individual designated as a type of a species or lesser group and serving as the final criterion of the characterizations of that group. Webster 3d.

type variety. Variations in coal caused by differences in the physical constitution or makeup of coal, that is, differences in the quality or distribution of the combined ingredients throughout the coal specimen. A.O.I.

Type-W drift indicator. A mechanical single-shot borehole-surveying instrument for determining the compass bearing and inclination of the course of a borehole when a strake, or where two veins cross each other or where two pipes cross obliquely. Fay. c. Corn. An addit or drift indicator. A sluicebox as used for the extraction of the heavy sands in tailings. Sometimes spelled tie. Fay.

tyler of pumps. Corn. A set of pumps of particular size; usually in a factory, the first draws in a fresh charge on one cylinder while the second draws on the other. Strock, 10.

tyler stone. A large clay plug filling an open space in the front jackets of a smelting furnace, through which the taphole passes. Standard, 1964.

tyndall effect. The reflection of strong beam of light by colloids suspended in solution. No such refraction is shown by true solutions. Fay.

tyndallometer; tyndalloscope. An instrument which measures the intensity of the light scattered at an angle from the incident beam by a dust cloud. It correlates well with the concentration determined by the thermal conductivity moisture area calculations. Fay. Standard, 1964.

type. a. Those differences in coals that are due to variations in the kind of plant material of which the coal is composed, whereby such varieties as common banded coals, cannel coal, algal coal, and spinit coal are produced. A.O.I. b. A kind, particularly in petrology (rock type); either general (for example, basalt is a rock type) or particularly (for example, a particular basalt from a particular locality is a unique type specified by a description). Chalimor.

type-D drift indicator. A single-shot borehole-surveying instrument utilizing photographic paper on which is recorded the compass bearing and inclination of the course of a borehole. The type-D instrument, when mounted in a special thin-walled protective container, is small enough to be used in an A.O.I. hole. Long.

type locality. a. The place at which a formation is typically displayed and from which it is named; also, the place at which a fossil or other geologic feature is displayed in typical form. Fay. b. The rock outcropping or mine from which a species or rock of mineral was first obtained. Hess.

type-M drift indicator. A single-shot borehole-surveying instrument that records the compass bearing and inclination of the course of a borehole through the action of a strong beam of light directed through the borehole in one direction, and reflected through a special paper disk. It is similar to, but larger than, a type-D drift indicator. Long.
typhon. Synonym for boss; stock. Fay.

typhonic rocks. Broeniat's name for rocks that have come from the depths of the earth, that is, plutonic and eruptive rocks.

typhomorphic. a. Applied to minerals typically developed in only narrow ranges of pressure and temperature. Baume, 1950, p. 161. b. Applied to minerals characteristic of the particular set of physical conditions within which they are normally found. Holmes, 1928.

typhomorphic minerals. Minerals that are stable in a given metamorphic facies; for example, in Eskola's greenschist facies, typical minerals are albite, sercite, chlorite, tale, serpentine, epidote, calcite, and dolomite. All of these minerals are stable under the conditions of the greenschist facies, but some may also occur in other facies. Compare critical minerals. Schieferdecker.

tyre valve. Adjustable annular ring mode of plastic (or metal) to control aperture area at apex of hydrocyclone. Pryor, 3.

tyrifite. a. A variety of fergusonite found near Arzen, France. Fay. Same as sipyrite. Crosby, p. 21.

U a. Symbol for potential energy; total energy; internal energy or intrinsic energy; total internal energy or total intrinsic energy; internal energy or intrinsic energy per mole; radiant energy. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-101. b. Symbol for overall coefficient of heat transfer. Zimmerman, p. 147.

u-bend die. A die, commonly used in press-brake forming, machined horizontally with a square or rectangular cross-sectional opening which provides two edges over which the material is drawn into a channel shape. ASM Gloss.

U-Bit. A popular type rotary bit used in British mining practice. It has two cutting legs; although some American and German bits employ three legs. A core is formed between the legs which is broken off as cutting proceeds, while some bits have a core cutting device consisting of a tungsten carbide tip in the center. Frankel, v.1, Art. 6.21, p. 21.

ugandite. An extrusive rock containing leucoxene, augite, and much olivine in a sodalite-rich glassy matrix. A dark variety of olivine leucite.

U-Power-Selective process. A direct extrusion process for metals that uses molten glass to insulate the hot billet and to act as a lubricant. ASM Gloss.

Uima formation. Stratigraphic term used to describe a unit that forms rounded masses of extremely fine accicular white crystals. Triclinic. Also called boronortocalcite. Fay. See also natronborocalcite. Hey, 24, 1955.

ulmaninite. Sulfitonitrite of nickel, NiSbS or NiSb; arsenic is often present in small amounts. Also called nickel antimonide. Fay.

Ullrich magnetic separators. Spinning devices that separate magnetic materials from non-magnetic materials using magnetic fields. Stanley, 1964.

ulmin. A subvariety of euvitrite. It is composed of completely jellified plant material that may, for example, lie on the end of a partly jellified stem and be observable microscopically. It differs from collinitc, a. as applicable in special cases for vitrinite devoid of structure. Compare collinitc, a. G.I.

ulmin acids. See ulmin. A.G.I.

ulminite. A variety of euvitrite. The micropetrological constituent or matrix of ulmin. It consists of completely jellified but not precipitated plant material. Approved by the Heerlen Committee of 1935 as applicable in special cases for vitrinite devoid of structure. Compare collinitc, a. G.I.

ulmin. The products of decay of vegetable matter and their prototypes occurring in coal as a gel. In the past, variously termed ulmin acids, humic acids, and humic substances.

urichite. A hyphal rock composed essentially of large phycocysts of alkaline feldspars, sodic pyroxenes, amphibole, and naphthene with smaller phycocysts of accessory of olivine. Feldspar, pyroxene, and amphibole occur in the groundmass. A porphyritic variety of olivine-bearing phonolite. A.G.I.

Urea. Ureine. The Devonian A.G.I. Supp. ultimate analysis. a. The determination of the elements contained in a compound as distinguished from proximate analysis, which is the determination of the compounds contained in a mixture. Standard, 1964.
ultimate analysis

b. In the case of coal and coke, the determination of carbon and hydrogen in the material, as found in the gaseous products of complete combustion, the determination of sulfur, nitrogen, and ash in the material as a whole, and the estimation of oxygen by difference.

ultimate baselevel. A baselevel at or below ultimate bearing capacity. The average load ultimate ca. The percent of CO2 which ultimate compressive strength. That at which ultimate recovery. The quantity of oil or ultimate strength. The ultimate strength of ultrabasic rocks. Igneous rocks containing less silica than the basic rocks (that is, less than 45 percent) and characterized by a high content of mafic constituents, particularly olivine (in the peridotites), and amphiboles and pyroxenes (in the peridotites and picrites). C.T.D. Also called ultrabasites.

ultrabasite. A black-gray, basic sulfantimonite of lead, silver, and germanium, 28Pb1,11AgS3,3GeS3,28SbS6. Orthorhombic. Crystals of tetragonal habit. From Freiberg, Saxony, Germany. English, ultra deep. A. Mining below a depth hitherto warranted by conditions of temperature, etc. On the Witzwatertand ultradepo levels are reached at between 8,000 and 10,000 feet below the surface. See also deep level, 1. Beerman, 1956, p. 249.

ultralite. Trademark name for a red-violet synthetic ultramarine. A. A costly pigment formerly made by powdering the product from calcining essentially from lapis lazuli after the natural ultramarine has been removed. Standard, 1964.

ultramarine yellow. A lemon-yellow pigment consisting of barium chromate. Fay

ultrasonic drilling. A vibration drilling technique which can be used in drilling, cutting, and shaping of hard materials. In this method, ultrasonic vibrations are generated by the compression and extension of a core of electrostrictive or magnetostrictive material in a rapidly alternating electric or magnetic field. The more easily assembled is a magnetostrictive transducer and the most common magnetostrictive materials, which vibrate in dimension when magnetized, are nickel and vanadium perendur. Mining and Minerals Engineering, v. 1, No. 5, January, 1965, p. 176.

ultrasonic inspection. A beam of acoustical radiation with a frequency higher than the frequency range for audible sound. A.S.M. Gloss.

ultrasonic cleaning. Immersion cleaning, aided by ultrasonic waves which cause microagitation. A.S.M. Gloss.

ultrasonic equipment. The word ultrasonic signifies vibration at a frequency greater than the maximum audible frequency, and should not be confused with supersonic, which signifies a velocity greater than that of sound. Ultrasonic vibrations can be generated by piezoelectric ceramics, by magnetostrictive devices, or by whistles in which there is a steel blade vibrated by a high-pressure jet of liquid. Ultrasonic equipment has been used in the ceramic industry for the dispersion of clay slips, for metal cleaning prior to vitreous enameling, and for flaw detection, particularly in large electrical porcelain and for nuclear inspection. A device for producing electronic waves of ultrasonic frequency. A.S.M. Gloss.

ultrasonic inspection; supersonic testing. A nondestructive method based upon the fact that ultrasonic waves are reflected and refracted at the boundaries.
of a solid medium, from which it is possible to obtain the echoes of a wave transmitted from the surface of a test piece. In addition to being reflected from the boundary of the specimen at which they are directed, the waves are also reflected back by any flaws which lie in the path of the wave. 

ultrasonic. The acoustic field involving ultrasonic frequencies. ASM Gloss. See also ultrasonic testing.

ultrasonic tests. Those in which ultrasonics. The acoustic field involving ultrasonic frequencies. ASM Gloss. See also ultrasonic testing.

ultrasonography. A modification of the use of ultrasonic waves for the detection of internal flaws in metals. By using a persistent screen cathode ray tube and causing the echoes to brighten the trace in inverse ratio of depth, an ultrasonic image is produced which can be examined and interpreted like a radiograph. Osborne.

ultraviolet. 1. Of radiation beyond the visible spectrum at its violet end; having a wavelength shorter than that of visible light, yet longer than that of X-rays. Webster 3d. 2. Relating to, producing, or employing ultraviolet radiation. Webber.

ultraviolet absorbing glass. Glasses can be made to absorb ultraviolet light, while transmitting visible light, by the inclusion of CeO2 in the batch. Other elements absorbing ultraviolet light include chromium, cobalt, copper, selenium, neodymium, nickel, titanium, uranium, and vanadium. Dodd.

ultraviolet glass. Glass which allows the passage of ultraviolet light rays. Such glasses are low in ferric oxide and titanium oxide and high in boron oxide and silica seem to be advantageous. Clear fused quartz is the most perfect glass but is too expensive for most uses. Wood's glass containing such a small proportion of the oxides; as luminous porcelain enamels. For cutting at floor level a unbalanced shothole. A shothole in which only one cage in a hoist is used, as opposed to the double cage system. Nelson.

ultraviolet light. Black light. Invisible light rays from the portion of the spectrum that lies beyond the violet on the shorter wavelength side. Used to induce chemical activity and produce fluorescence in many substances, as luminous porcelain enamels. Exem. Diet.

ultraviolet rays. Electromagnetic waves in the wavelength between visible light rays and X-rays. The ultraviolet light field furnishes a quick method of finding and identifying certain metals, for example, tungsten. Nelson.

ultraviolet testing. For high transmittance of ultraviolet light, a glass plate is used. A light filter with deep bottom cut in a thin sheet where the vertical distance from the explosive to the inner end of the cut is shorter than the horizontal distance to the exposed face of the specimen. 

unbalanced stress. A stress that acts on a body and is not balanced by another and opposite stress. Whether the unbalanced stress acts on a body, that body is not in equilibrium, and movement (deformation) ensues. Stokes and Barnes, 1955.

unburned brick. Brick manufactured by processes which do not require kiln burning to develop the strength of the finished product. A.R.I.

unburned refractories. Refractories shaped without burning, by use of high pressures after deaeration to reduce voids between grains. Chemical bonding and metal encasement are also used. C.C.D 6d, 1961.

uncertainty principle. A principle in quantum mechanics. It is impossible to assert in terms of the ordinary conventions of geometrical position, and of motion that a particle (as an electron) is at the same time at a specified point and moving with a specified velocity. Frondel, p. 193.

unbutt. A block to bluish-black, rare secondary mineral, close to (UO2) (MoO3). 4H2O, the only known uranium mineral that contains molybdenum as a constituent; contains 47.4 percent uranium. Monoclinic. Frondel, p. 193.

uncontrollable. A person to whose sole decision a controversy or question between parties is referred. Webster 2d. As one who performs control assays. Fay. As an assay made by a third party to settle a difference found in the results of assays made by the purchaser and seller of ore. Fay. Uncontrollable assay. See assay, b. von Berns. U.M. plate. Universal mill plate, or plate which is rolled to thickness by vertical rolls as well as by rolls rolled to thickness by horizontal rolls. Osborne.

unquenchable. A plutonic rock composed largely of melilitie, with pyroxene, opaque oxides, perovskite, apatite, calcite, anatase, melanite, and occasionally phillogpite. A.G.I.

unconfined compression apparatus. A portable apparatus for carrying out shear tests at the site. It consists of two metal platforms, one being fixed, while the other can be moved vertically and supported in position by a coil spring. By rotating the movable platform the height of the soil specimen is varied. The sample soil is held between two coned endpieces attached to the platforms. An unconfined cylindrical compression apparatus is placed in position so that there is no tension in the coil spring and the automatic recording arm is set. For the compression index test the specimen is rolled vertically until the soil specimen fails either by bulging or collapsing, or by shearing at an angle to the vertical axis. The compressive stress required to cause failure in a clay sample is at least twice the value of the shear stress. The sample must be sufficiently firm to be placed in the apparatus. Nelson.

unconfined compression test. A crushing test carried out on a soil or rock specimen without lateral restraint. See also triaxial compression test, a; compression strength. Ham.

unconformability. See unconformity. Fay.

unconformity by erosion. An erosional unconformity, as an exposure resulting from a persistent, irregular, or undulating surface of the sedimentary deposits, above which the erosional surface of the underlying deposits lies. J. T. S. Foreman.

unconformability of dip. The break in the sequence of formations which lies between the previously uplifted and denuded edges of older rock. Standard, 1964.
undercutting

1189

unconformability of overlap

Discrepancy in areal extent between two contiguous superimposed strata, even where they have a common dip, the edge of one stratum overlapping that of the other; indicative of gentle subsidence without perceptible movement, as described by European geologists, unconformability of transgression.

See underbreak. See underhand stoping.

undulation. a. A large, wavelike fold in the uncut value; unreduced value. S. Afr. Value.

undulation theory. A theory of mountain building proposed by van Beuningen that assumes that long broad anticlines of basement rock rise like huge waves in the crust. The sedimentary cover and sometimes the basement itself slide off to form the folds and faults observed in orogeny.

unconsolidated. Uncemented and/or конкрет не залегающий по отношению к нижележащему; не совпадающий с ним с разницей в возрасте и параллельностью расположения.

unconformable. Having the relation of unconformity to the underlying rocks: not succeeding the underlying strata in immediate order of age and in parallel position.

unconformable coast. See transverse coast.

unconformity. a. A surface of erosion or nondeposition, usually the former, that separates younger strata from older rocks. See also angular unconformity; disconformity; local unconformity; nonconformity. (1965, p. 422. b. A substantial break in the continuity of deposition, where one rock formation is overlain by another that is not the next in geologic order.) See also B.S. 3618, 1964, sec. 1.

unconsolidated. Uncemented and/or compacted. Bureau of Mines Staff.

unconsolidated deposits. Deposits consisting of uncremented clastic or organic material.

unconsolidated strata. Rocks consisting of loosely coherent or uncremented particles, whether occurring at the surface or at depth. B.S. 3618, 1965, sec. 1.

unconsolidated-untrained test. quick test.

A soil test in which the water content of the test specimen remains practically unchanged during the application of the confining pressure and the additional axial (or shearing) force. ASCE P1826.

uncouple. To uncouple or disconnect. Long.

unctuous. Greasy or sticky to the touch, as certain mineral or organic materials.

uncut. a. A diamond the original shape of which has not been altered artificially. Long. b. Undated. Bureau of Mines Staff.

uncut stone. See uncut. Long.

cut value. See reduced value. S. Afr. Values and widths of reefs as established by the values which are used for the calculation of ore reserves.

undulation. a. A large, wavelike fold in the earth's crust. A.G.I. Suppliers.

undulation theory. A theory of mountain building proposed by van Beuningen that assumes that long broad anticlines of basement rock rise like huge waves in the crust. The sedimentary cover and sometimes the basement itself slide off to form the folds and faults observed in orogeny.

undercut. See underbreak. See underhand stoping.

undercut. a. A machine cut along floor level in a coal seam, to cast its removal by hand, by machine, or by shotfiring. See also hole cutting. Nelson. d. Excavation of ore from beneath a large block of ore to induce its settlement under its weight. Nelson. e. In stopping, removal either of footwall rock or of lower part of a flattish lode, bed, or seam of ore or coal, thus facilitating detachment of portion of ore. See undercut. Nelson. Used in block caving. Also called resuing. Pryor, 3. f. To enlarge borehole below caving. Bureau of Mines Staff.

underclay. A bed of clay, in some cases highly siltaceous, in many others highly aluminous, occurring immediately beneath a coal seam, and representing the soil in which the Carboniferous forest landscape was rooted. Stoces, v. 1, p. 184. Underclay.

underclay limestone. Synonym for freshwater limestone.

undercliff. a. S. Wales. An argillaceous shale forming the floor of many coal seams. Fay, b. Eng. That portion of a cliff which has fallen en masse along a considerable length of coast, and forms a subordinate terrace between the upper cliff and the original shore. Compare tab. A.T.H.

underclay. Soil deposit. A deposit that is not fully consolidated under the existing overburden pressure. ASCE P1826. Not yet in equilibrium with existing physical environment. Still being compacted.

Bureau of Mines Staff.

undercooling. The same as supercooling.

ASGM Gloss.

undercurrent. a. A short sluice much wider than the main sluice, and set on a steeper grade, generally at right angles to the main sluice. It is designed to save fine gold that does not readily settle. A screen or grizzly that does not readily settle. A screen or grizzly that does not readily settle.

undercut. See underbreak. See underhand stoping.

undercutting. a. The making of a cut, by hand or coal cutter, along the floor level in a coal seam to cast its removal by hand or by explosive. See also undercut. Nelson. b. Applied to the process of cutting under the face of the coal with a machine so it can be sheared off in short lengths. Fay. c. A quarrying method that is intermediate between the open pit and the adit. Nelson. d. Excavation of ore from beneath a large block of ore to induce its settlement under its own weight. Nelson. e. In stopping, removal either of footwall rock or of lower part of a flattish lode, bed, or seam of ore or coal, thus facilitating detachment of portion of ore. See undercut. Nelson. Used in block caving. Also called resuing. Pryor, 3. f. To enlarge borehole below caving. Bureau of Mines Staff.

undercut. a. A machine cut along floor level in a coal seam, to cast its removal by hand, by machine, or by shotfiring. See also hole cutting. Nelson. d. Excavation of ore from beneath a large block of ore to induce its settlement under its own weight. Nelson. e. In stopping, removal either of footwall rock or of lower part of a flattish lode, bed, or seam of ore or coal, thus facilitating detachment of portion of ore. See undercut. Nelson. Used in block caving. Also called resuing. Pryor, 3. f. To enlarge borehole below caving. Bureau of Mines Staff.

undercut. a. A machine cut along floor level in a coal seam, to cast its removal by hand, by machine, or by shotfiring. See also hole cutting. Nelson. d. Excavation of ore from beneath a large block of ore to induce its settlement under its own weight. Nelson. e. In stopping, removal either of footwall rock or of lower part of a flattish lode, bed, or seam of ore or coal, thus facilitating detachment of portion of ore. See undercut. Nelson. Used in block caving. Also called resuing. Pryor, 3. f. To enlarge borehole below caving. Bureau of Mines Staff.
undercutting

the floor space is enlarged gradually. Wings or buttresses of stone may be left at the sides to support the roof. Eng. 2, p. 325. D. Eng. Usually applied to ma-

cine-cut coal. See also kiving. SMRR, p. 128. Extend the floor of the glass result-

ing in an edge that is oblique to the surface of the glass. Dodd.

undercutting machine. An electrically driven machine used to mine a cut about 6 feet deep near the bottom of the coalfield. Hudson.

undermine of old workings. A method of shaft sinking used in steeplyinclined de-

posits, or in a vein which has been worked out at the surface, in which the shaft is sunk alongside the deposit, with a crosscut being made to the vein at a depth below the previous workings. This is done where it might be dangerous to

pierce the old workings because of in-

underdip. Scot. Coal extending below the haulage level at the bottom of the shaft. Fay.

underdraft. A condition wherein a metal

driven off must pass through the ignited

retort

the fuel up through the bottom of the

or hopper by a feed worm

water-tube, and locomotive types.

underground. A. Situated, done, or operat-

ing beneath the surface of the ground;

therefore, tunnelled. Standard, 1964, b.

The place or space beneath the surface

of the ground; a subterranean space or

channel. Webster 3d. c. Ground or soil

lying beneath the surface of the ground;

or something similar. Webster 3d.

underground bunker. A large capacity hop-

per, of 250 tons or more, to absorb partial

deliveries of feed to main transport systems,

or wind-

ing shaft. See also bunker, underground.

underground cable. A single or multiple con-

ductor cable sheathed in lead or other

waterproof material, carried in ducts or

in a duct beneath the surface of the ground. Cripin.

underground connections. Mines or areas

which are connected underground shall be considered as a single mine if the

underfeed stoker. A mechanical stoker suit-

able for small boilers, such as the vertical,

water-tube, and locomotive types. The coal is conveyed direct from the bunker or hopper by a feed worm which forces the

fuel up through the bottom of the retort in which it is burned. Volatiles

driven off pass through the ignited fuel

thus eliminating smoke. The underfeed stoker operates most successfully on

grated coals with a reasonable size of

ash. Nelson.

underfeed, a. In ceramics, to fire (as brick)

insufficiently. Webster 3d. To fire to

benefit. Webster 3d.

underfloor. a. Firing at a temperature lower than that required to produce a proper degree of vitrification in ceramic products. Bureau of Mines Staff. b. Insufficient firing of porcelain enamel to mature the design is applied to the

interior or decorating pottery, filet terra cotta,

and borings, or obtained by geophysical

methods. Also called subsurface geology.

Challinor.

underground glory-hole method. A method

used in large deposits with a very strong

roof. In this method, the deposit is di-

vided by levels and on every level chutes are raised to the next one. Mining starts

from the mouth of the chutes in such a

way as to develop a funnel-shaped exca-

vation (mill, glory) where the depth of the broken ore falls into the chutes and thus to the cars on the lower level. A sufficiently strong pillar is left for pro-

tection at the higher level. This method is also known as underground mullling. 

underground haulage. The transportation of coal or mineral from the working face to the shaft bottom. Haulage consists

of tramways, tracks, or mine cars drawn by horses, locomotives or ropes, and electric or compressed-air haulage engines. Conveyors

are not generally regarded as a haul-

age method. See also gravity haulage;

haulage; locomotive haulage; main trans-

port; subsidiary transport. Nelson.

underground mining. See underhand stoping. Fay. See also underground glory-hole method. Nelson.

underground mine conveyors. Sectional con-

veyors, usually of the troughed belt type,

capable of being lengthened as mining operations advance or retreat, all as contrasted to above-ground con-

veyors having fixed lengths for reasonable permanent installations. According to lo-

cation in the mine or usage, they may be

known as face, room, gathering, main

haulage, or intermediate haulage con-

veyors. See also belt conveyor; drag chain

conveyor; flight conveyor. ASA MHA-1.

underground openings. Natural or man-

underground ore bin. See measuring chute.

Nelson.

underground shaft. A shaft sunk from an

adit, tunnel, or working level, through which mining operations are conducted. The upper term is underground. A winze or raise becomes an underground

shaft when equipped and used for hoist-

ing and the conduct of other mining op-

erations. Fay.

underground station. a. An enlargement of

an entry, drift, or level which is widened

capable of receiving and discharging cars, men, and material. Fay. b. A pump sta-

tion. Fay. c. An underground station at

any location where a necessary electrical

crater power or processed into chemicals

cryogenic.

underground station

underground. Eng. See shorts, d. Fay.

underglaze. Used in the decoration of pot-

ttery, where it is applied to the ware

before it is glazed. Examples of such
coration are incised decoration, combus-

tion staining, and painting. Colors applied

under the glaze are known as under-

underglaze colors. Finely ground calcined

oxides for colored designs beneath the

glaze on ceramic surfaces. Used for color-

ing or decaling pottery, tile, terra previ-

ously, and similar glazed ceramic surfaces.

CCD 6d, 1967.

underground. Insufficient reduction of par-

ticle size to produce effective liberation

value. Pryor, 4.

underground. a. Situated, done, or operat-

ing beneath the surface of the ground.

b. To fire from underground fires;

iary to underground exploration. Nelso.L

may be driven. A study of the

underground gasification. A method of burn-

ing beneath the surface of the ground;

ing shaft. See also bunker, underground.

underground. Has passed through the

underground transformer. A flameproof air-
underground surveying. Distinctive features of
underhand quarrying of panel cores, Mitchell
underhand. The strata or rock occupying a
underground mining engineer and
underlay shaft. a. A shaft sunk in the foot-
underlay; underlie. a. Corn. The departure
underlay or supported by stulls or pillars. Sometimes called horizontal-cut
underlay shaft. a. A shaft sunk in the foot-
underlooker. Undercover worker. a. Undermanager; overman.
Mason. b. Lanc. One who has the care and
underloading. a. A term used to explain
underlay; underlie. a. Corn. See underlay, a and b. Fay.
underpaid. The strata or rock occupying a
underlying beds. The rocks situated under
underpaid copper
underpierced. A term used in copper refining
dergound mining engineer and
underpierced copper
underreamed. To enlarge or ream a borehole below the casing. Long.

underreamer. A tool or device having cutters that can be expanded or contracted by mechanical or hydraulic means and used to enlarge or ream a borehole below the casing or drivage. Also called expansion reamer. Long.

underreamer bit. The assembled device consisting of the lugs or jaws attached to the expanding mechanism used to enlarge or ream a borehole below a string of casing. See also underreamer. Long.

underreamer cutter. See underreamer lug. Long.

underreamer lug. A diamond set or other type of expandable or contractable jaw on an underreamer bit. Also called underreamer cutter. Long.

underreaming bit. An expanding bit used to enlarge the diameter of the hole below the casing to allow the casing to be lowered further down the borehole. B.S. 3810, 1963, see. 3.

underrope haulage. An endless rope haulage system which runs from the bottom of the drum to the load. Nichols, 2.

undersea mining. The working of economic deposits (usually coal) situated in strata below the seabed. Nelson.

undersea satellites. A string of underwater devices strung between Hawaii and California to serve as unmanned explorer units. Pacific satellite contains a gage to measure tides, a seismometer, and a transmitter. Hy.

underwater workings. See submarine mines. Zern.

undersea mining. The working of economic deposits (usually coal) situated in strata below the seabed. B.S. 3552, 1962.

undersize. a. Part of a crushed material which passes through a screen. Fay. b. Particles in a screen overflow which are smaller than the reference size; may be expressed as a percentage of the product. B.S. 3552, 1962. d. The smaller of two classified products. In the case of ore pulp or fine coal, the undersize is the overflow and the oversize the underflow. See also classifier. b. Nelson. c. A drill hole that is not to size because of gage loss on the bit and/or the reaming shell with which it was drilled. Long. i. A bit or reaming shell the dimensional dimensions of which are less than specified as standard. Long.

undersize core. Core the outside diameter of which is less than standard. Long.

undersized. Said of beds or crests of folds that are unevenly fractured. Nelson.

undersized sample. A sample which is as undisturbed as humanly possible, as distinct from a sample disturbed by boring tools. Special appliances are used to obtain such samples from boreholes, and the material is preserved in its natural state in air-tight containers. Undisturbed samples are required so that the in situ properties of the soil may be determined. It is difficult to obtain undisturbed samples of sandy soils without considerable preparation. See also soil core. Nelson.

undersized sample. See undisturbed sample. Long.

undersized core. Core the outside diameter of which is less than standard. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.

undersized core. See undisturbed sample. Long.
monoclinic form is called clinomonomo-
clic. English.
unnatural tile. A hard, dense tile of homog-
one composition throughout, deriving color
and texture from the materials of which
the body is made. The colors and character
istics of the tile are determined by the
materials used in the body, the
method of manufacture, and the thermal
treatment. AS 2426-60.
unbegin. Unworked rock of any kind. Arkel.
unhinged. York. Bordgates or other headings
unglazed tile. A hard, dense tile of homog-
oneous composition throughout, deriving
from the body is made. The colors and
characteristics of the tile are determined
by the materials used in the body, the
method of manufacture, and the thermal
treatment. ASTM C242-60T.
uniform sand. A sand with particles of uni-
form size and shape. See also graded sand. Ham.
uniform strain. The strain occurring prior to
the beginning of localization of strain (necking);
the strain to maximum load in the
tension test. ASTM Gl1o.
Unifrax. A low-density nitroglycerin powder
type of equivalent sheathed explosive. McAdam II, p. 49.
unigex. A semi-gelatinous nitroglycerin equiv-
alent sheathed explosive. McAdam II, p. 49.
unilateral rolling strata. Asymmetrical ripple
or wavy bedding the steeper side of which
indicates the direction of flow. Pettijohn.
unilateral stream. A stream with all tribu-
aries entering from one side. Bureau of
Mines Staff.
unilateral transducer. A transducer which
cannot be actuated at its outputs by waves
in such a manner as to supply related
waves at its inputs. My.
unimolecular layer; monomolecular layer.
Film that is adsorbed deep, absorbed
to surface of solid. Pryor, 3.
union. The usual trade term for a device
used to connect pipes. It commonly con-
sists of three pieces which are: (1) the
thread end fitted with interior threads;
(2) a small exterior shoulder; and (3) the
ring which has an inside flange at
one end while the other end has an in-
side thread and the exterior of the
thread end. A gasket is placed be-
tween the thread and bottom ends, which
are very extensively used, because they
permit connections with little disturbance
of the pipe positions. Strock, 10.
union cell. An cell with a male or female union
at one end. Strock, 3.
unionless. State of substance which has dis-
solved without dissociating into ions;
solute retaining its compound state.
Pryor, 3.
unions. 10th explosions: used in mines.
Bennett 26. 1962.
union shop. A shop or mine run according to
the requirements of a trade union. Com-
pare open shop. Fay.
union fee. A fee with male or female union
at connection on one end of run. Strock, 3.
unique diameter. A line different from any
other in a crystal, for examples, the c
axis in both the tetragonal and hexagonal
systems and the three axes of reference in
the orthorhombic system. American Min-
619.
unfired. A TNT/ammonium nitrate type of
equivalent sheathed explosive. McAdam II, p. 50.
unselective. An electromechanical selector
having only rotary motion. NCB.
unilateral. A salt of ortho-
unit. a. Smelter contracts make frequent use of
the word 'unit' as a term of
percent. Since a ton contains 2,000 pounds, a unit
is equivalent to 20 pounds of ore.
The smelter charge may be sold at
the rate of one dollar per unit,
which is one percent of the
metallic tin would contain 70
per cent metallic tin would contain 70
unions or molecules in their correct spatial
positions. Strock, 3.
unit cell. a. The arrangement of points in
a crystal which forms a single geometrical
figure, with all its points referable to the
axes by which these are conventionally
defined. The orderly repetition of
the unit cell becomes, if sufficiently large, the
visible crystal, while the unit cell itself is
the smallest group of points (as atoms,
ions or molecules in their correct spatial
positions) possible. Pryor, 3. b. Of flotation,
the metals as determined by prizes fixed
by buying authorities, or quotations on the
international metal markets, which vary
time to time. Nelson.
unit bed-material discharge. Discharge
of bed material (material coarser than 0.062
millimeter) per unit width of a stream.
U.S. Geol. Pap. 462-F.
unit cell. a. The arrangement of points in
a crystal which forms a single geometrical
figure, with all its points referable to the
axes by which these are conventionally
defined. The orderly repetition of
the unit cell becomes, if sufficiently large, the
visible crystal, while the unit cell itself is
the smallest group of points (as atoms,
ions or molecules in their correct spatial
positions) possible. Pryor, 3. b. Of flotation,
a single appliance. Pryor, 4.
unit coal. a. Applied to prepared coal as for
analysis, and being the pure coal sub-
stance considered altogether apart from
extraneous or adventitious material (mois-
ture and mineral impurities) which may
be accident or through natural causes
occurring associated with the combu-
table organic substance of the coal. A.G.I.
b. The pure or actual coal substance as
defined from taking into account the
comparative carbon content. The differentiation
between the noncoal substance of a sample being
analyzed and the coal itself is
expressed by the term unit, which again means one-
unit coal
granular material. A.G.I.
uniformly grade(c)ed' soil. A soil with a particu-
lar-size distribution extending over a limit
range with one size predominating. Nel-
son.
uniform sand. A sand with particles of uni-
form size. See also graded sand. Ham.
uniform strain. The strain occurring prior to
the beginning of localization of strain (necking);
the strain to maximum load in the
tension test. ASTM Gl1o.
uniflux. A low-density nitroglycerin powder
type of equivalent sheathed explosive. McAdam II, p. 49.
unigex. A semi-gelatinous nitroglycerin equiv-
alent sheathed explosive. McAdam II, p. 49.
unit die. In die casting, a die block that contains several cavity inserts for making different kinds of castings. *ASM Gloss.*

united veins. Where two or more veins unite, the oldest or prior location takes the vein bounding the point of union, including all the space of intersection. *Ricketts, p. 127.*

unit heater. A forced convection heating device of two types: (1) an assembly of encased heating surface with fan and motor (or turbine) and for connection to a source of steam or hot water; (2) an assembly of the above plus a fuel burner so that the device is for connection to a source of oil or gas (or supplied with coal) and not to steam lines or waterlines. *Strock, 10.*

uniting pressure. The pressure at which the individual particles of a metal powder will unite together to form a solid mass of metal. The following are the uniting pressures of a number of common metal powders: lead, 13 tons per square inch; tin, 19 tons per square inch; copper, 35 tons per square inch; antimony, 40 tons per square inch; zinc, 38 tons per square inch; aluminum, 38 tons per square inch; and bismuth, 36 tons per square inch. *Comm.*

united veins. Where two or more veins unite, the oldest or prior location takes the vein bounding the point of union, including all the space of intersection. *Ricketts, p. 127.*

unite. The number of metal veins. The number of veins that are involved a unique set of principles. *Pryor, 3.*

unit pole. Magnetic repulsive force of 1 dyne acting at distance of 1 centimeter from a pole. *Matson, V. 1, p. 106.*

unit power. The net amount of power required to remove a unit volume of metal in unit time, usually expressed as horsepower per cubic inch per minute. *ASM Gloss.*

unit pressures. The total pressure divided by the number of area units on which the load is imposed, such as the diamonds in a diamond-bit crown, usually expressed as pounds per square inch, tons per square foot, pounds per diamond, etc. *Long.*

unit process. Distinct and roughly self-contained section of series of operations, which can be studied by itself. In mineral processing, unit processes include sections at crushing, grinding, classification, gravity treatment, pulp conditioning, flotation, thickening, leaching, filtration. *Mines Staff.*

unit strain. Unit tensile strain is the elongation per unit length; unit compressive strain is the shortening per unit length; unit shear strain is the change in angle (radians) between two lines originally at right angles to each other. *Ro.*

unit stress. The stress or load per unit area, usually taken per square inch of section. For instance, if a bar is 1 by 2 inches in section the unit stress of the bar will be 1,000 divided by 2 (sectional area). *ASCE P1826.*

unitstrain. A system of ventilation in which each working face is ventilated by a separate air current. B.S. 3618, 1963, sect. 2.

unit ventilator. A unit heater of type (1) but connected to a source of ventilation air and frequently provided with an air filter. *Strock, 10.*

unit water discharge. Water discharge for unit width of a stream. *USGS Prof. Paper 462-F.*

unit weight. Weight per unit volume. *Bureau of Mines Staff.* See also dry unit weight; effective unit weight; maximum unit weight; saturated unit weight; submerged unit weight; unit weight of water; wet unit weight; zero air voids unit weight. *ASCE P1826,* b. The density of a material. *Ham.*

unit weight of water. The weight per unit volume of water; normally equal to 62.4 pounds per cubic foot or 1 gram per cubic centimeter. *ASCE P1826.*

universal clamp. A clamping device used on a drill column by means of which a horizontal arm can be affixed at any point on the vertical section of a drill column. *Long.*

universal coal cutter. A coal cutter with a jib capable of cutting at any height or angle. It may be mounted on crawler tracks. See also turret coal cutter. *Nelson.*

universal coupling. One which joins two driving shafts which rotate about different and slightly slanted axes. *Pryor, 3.*

universal gravity mask. Designed as an all-purpose mask for protection against a variety of toxic gases, vapors, and smokes, including carbon monoxide. It is equipped with an indicator which shows at a glance the remaining service time of the canister for CO. *Ham.*

universal grinding machine. A machine on which cylindrical, internal, or face grinding can be done as required in tool rooms and machine shops. *ACSG, 1965.*

universal joint. a. A connection between two shafts that allows them to turn or swivel at an angle. *Nichols.* b. Articulated joints permitting the transmission of rotary motion from the driving shaft placed at an angle to the driven shaft. *Compare knuckle joint.* *Long.*

universal joint couplings. These couplings are used where a drive is intersected at any angle or where 1 or 2 members must be disconnected. If there is an offset in the two shafts, or if one or both shafts must change location during operation, two of these couplings are used, and one is fitted with a splined joint mating with the connecting intermediate shaft. There is no cut in the shafts for axial movement. *Pit and Quarry, 53rd, Sec. D, p. 68.*

universal machine. A power-driven coal cutter that will not cut horizontal kerfs, but will cut vertical kerfs at any angle, and is designed for operation either on track, caterpillar tracks, or rubber tires. *ASA C42.85:1936. Same as universal cutter.*

universal mill. A rolling mill in which rolls roll the edges of the metal stock between the lamination of the passes through the horizontal rolls. *ASM Gloss.*

universal motor. An electric motor rated at less than 1 horsepower output which operates either on direct or alternating current. See also fractional horsepower motor. *Ham.*

universal pH indicator. Mixture of several indicator dyes, each of which changes color through a specific pH range, so that by reading can be obtained. *Pryor, 3.*

universal plant indicators. Indicator plants with a rotating jib head so that vertical or horizontal cuts can be made in addition to the arcwall cut. *Ham.*

universal shear. A machine with a rotating jib head so that vertical or horizontal cuts can be made in addition to the arcwall cut. *Ham.*

universal arc-shearing machine. A machine with a rotating jib head so that vertical or horizontal cuts can be made in addition to the arcwall cut. *Ham.*

will cut a 12-foot heading to a depth of 6 feet in 10 minutes. Time is required for fitting, so that under good conditions up to twelve places can be cut in one shift. *Matson, V. 1, p. 106.*

universal clamp. A clamping device used on a drill column by means of which a horizontal arm can be affixed at any point on the vertical section of a drill column. *Long.*

universal coal cutter. A coal cutter with a jib capable of cutting at any height or angle. It may be mounted on crawler tracks. See also turret coal cutter. *Nelson.*

universal coupling. One which joins two driving shafts which rotate about differently slanted axes. *Pryor, 3.*

universal gravity mask. Designed as an all-purpose mask for protection against a variety of toxic gases, vapors, and smokes, including carbon monoxide. It is equipped with an indicator which shows at a glance the remaining service time of the canister for CO. *Ham.*

universal grinding machine. A machine on which cylindrical, internal, or face grinding can be done as required in tool rooms and machine shops. *ACSG, 1965.*

universal joint. a. A connection between two shafts that allows them to turn or swivel at an angle. *Nichols.* b. Articulated joints permitting the transmission of rotary motion from the driving shaft placed at an angle to the driven shaft. *Compare knuckle joint.* *Long.*

universal joint couplings. These couplings are used where a drive is intersected at any angle or where 1 or 2 members must be disconnected. If there is an offset in the two shafts, or if one or both shafts must change location during operation, two of these couplings are used, and one is fitted with a splined joint mating with the connecting intermediate shaft. There is no cut in the shafts for axial movement. *Pit and Quarry, 53rd, Sec. D, p. 68.*

universal machine. A power-driven coal cutter that will not cut horizontal kerfs, but will cut vertical kerfs at any angle, and is designed for operation either on track, caterpillar tracks, or rubber tires. *ASA C42.85:1936. Same as universal cutter.*

universal mill. A rolling mill in which rolls roll the edges of the metal stock between the lamination of the passes through the horizontal rolls. *ASM Gloss.*

universal motor. An electric motor rated at less than 1 horsepower output which operates either on direct or alternating current. See also fractional horsepower motor. *Ham.*

universal pH indicator. Mixture of several indicator dyes, each of which changes color through a specific pH range, so that by reading can be obtained. *Pryor, 3.*

universal plant indicators. Indicator plants with a rotating jib head so that vertical or horizontal cuts can be made in addition to the arcwall cut. *Ham.*

universal arc-shearing machine. A machine with a rotating jib head so that vertical or horizontal cuts can be made in addition to the arcwall cut. *Ham.*

will cut a 12-foot heading to a depth of 6 feet in 10 minutes. Time is required for fitting, so that under good conditions up to twelve places can be cut in one shift. *Matson, V. 1, p. 106.*

unsoundness has set. The principal causes of this fault are the presence of free CaO, excess MgO, or excess sulfates. Dodd.

unstable. a. Readily decomposed liable to spontaneous combustion or oxidation. Pryor, 3. b. The description applied to a structure liable to fail as a whole, usually by overturning or sliding. It also refers to a framework having fewer members than are required to make it a perfect frame. Hem.

unstable equilibrium. A body is said to be in unstable equilibrium if on being slightly disturbed, it tends to move farther and farther away from its original position of equilibrium. Morris and Cooper, p. 167.

untrimmed slate. See slate, rough. L.O.L.

unstable protobitumens. These protobitumens, unstable in equilibrium. Morris and Cooper, p. 167.

unstratified. Not formed or deposited in beds; the random thickening of the material, instead of layer upon layer. Skow.

unsteady flow. See steady flow, b. Roberts, 1, p. 347.

upcast shaft. a. A shaft through which air is forced to the mine. Hess.

upcast shaft hole. b. Same as upthrow; opposite of subsidence. Long. See inside upset; outside upset. Long.

upcast. The opening through which the return air ascends and is removed from the mine. The opposite of downcast or intake. Fay, 1. a. Upward current of air passing through a shaft, or the like. Fay, c. To cast up. Webster 3d. d. Turned or directed upward. Webster 3d. e. Material that has been thrown up by digging. Webster 3d. f. Same as upthrow; opposite of downthrow, downcast; as the upcast side of a fault. Standard, 1964, g. The setting of a seam or bed by a dyke. Also called upper. Fay.

up-brown. Lanc. An inclined plane worked to the mine.

upset. a. The opening through which the return air ascends and is removed from the mine. See also upset. b. The upthrow of certain strata. See also upthrow. c. The upthrow or venting of air currents from the firebox through the setting and then through one or more chimney's in the roof. Such kilns are inefficient and are now little used. Dodd.

updraw. The process of continuously drawing glass of various cross sections, such as cane or tubing, by a method similar to the Fourcault process. ASTM C162-66.

updraft kiln. An intermittent kiln in which the air is blown upward through a vertical drawing of glass rod or tubing from an orifice; to produce tubing, the rod is drawn around a refractory cone. This process has also been called the Schuller process, or Wood's process. Dodd.

updrift. The direction opposite to that of the predominant movement of littoral material. H.O.G.

upgrade. a. To increase the commercial value of a coal by appropriate treatment. B.S. 3552, 1962. b. To increase the quality rating of diamonds beyond or above the rating implied by their particular classification. Long.

upgrading streams. In the case of the lost rivers of the Snake River Plains, instances are furnished of upgrading in which the process has not advanced far enough to permit the streams to emerge in the work to cross the flat tract they invade and reach larger drainage channels. The streams from the southeast, coming from high mountains, are well supplied with material in suspension, and have been enabled to upgrade their courses across the comparatively narrow tract of flat country, and thus reach the main channel of discharge. This is especially evident near the older streams, and thus the area is referred to as the Monongahela group of the Pennsylvanian series. Varnes, 1955.

upheaval. A lifting up, if by some force from below, of stratified or other rocks. Fay.

uphill shaker conveyor. Any shaker conveyor which is so designed as to have the proper stroke for making the maximum amount of coal up a grade. On certain types of conveyor, the entire drive unit. Jones.

uphill teeming. See bottom pouring. Dodd.

up-hole hole. a. A borehole collared in an under ground working place and drilled in a direction parallel with the horizontal plane of the drill-machine swivel head. Long. b. A shot-hole drilled in rock at an upward angle. Also called upper. Fay, 3.

up-hole drilling. See up hole. Long.

up-hole shooting. In seismic exploration, the setting off of successive shots in a shot-hole at varying depths in order to determine velocities and velocity variation of the materials forming the hole walls. A.G.I. Supp.

up-hole time. Used to denote the observed travel time of a seismic wave from the point of generation at a given depth in a shot-hole to a detector at the surface; and is measured time equivalent of the corresponding shot depth. A.G.I.

up-hole velocity. The speed, expressed in feet per minute at which, at the time, the nuclear liquid flows upward in a borehole. Long.

up-jet pipe. A common type of heat-recuperating pipe. Fay.

upland. A highland; ground elevated above the lowlands along river; between hills.

upleap. Mid. A fault that appears as an upthrow. Fay.

uplift. a. Elevation of any extensive part of the earth's surface relative to some other part; opposite of subsidence. Fay, b. The upward water pressure on a structure. ASCE P1826.

up-over. Designating a method of shaft excavation by being thrust to a point below, and then raising. Webster 2d.

up-over cith. A wedging cith placed on the face of a slope of a shaft, to shoot off the water in a certain stratum. Fay.

Upper. Being a later epoch or series of the Carboniferous strata of the Appalachian field that is now assigned to the Monongahela group of the Pennsylvanian series. Obiotele. Fay.

upper belt. The upper bed or stratum of a seam. Fay.

upper bubble. The upper porion of a seam that is separated, by a parting, into two distinct layers. Fay.

upper catchment. The area from which water is collected and conveyed to a sewer, a channel, or a body of water. Upstream. Fay.

upper closure. The uppermost part of a shaft, mine or other opening. Fay.

upper deposit. The uppermost part of a stratum or bed. Fay.

upper drift. The direction opposite to the wind or air current, or to the direction of drift. A.G.I.

upper effect. The uppermost part of a shaft, mine or other opening. Fay.

upper explosive limit. The highest quantity of combustible gases which, when mixed with any quantity of air (or oxygen), will just support a self-propagating flame. Francis, 1965, p. 2.

upper leaf. Scot. The upper portion of a seam that is separated, by a parting, into two distinct layers. Fay.

upper limit. The upper value to be added to or subtracted from a variable, as a maximum or minimum. Fay.

upper punch. In powder metallurgy, the member of a die assembly that moves down and inward into the die body to transmit pressure to the powder contained in the die cavity. ASM Gloss.

uprate. An auxiliary shaft, a mill hole, carried from one level up toward another. Fay.

up rate. See post, 1. Dodd.

upright fold. Fold with a vertical axial plane. A.G.I.

upright joints. Eng. Vertical joints. See also thorough joints. Arkell.

upright man. glass. One who smooths the edge of glass that has been cut, using hand tools. D.C.T. 1.

uprush. A sudden flow of water onto the foresheer following the breaking of a wave. Ky.

up-side. a. To increase the diameter of a rock drill by blunting the end. Fay, b. Scot. A narrow heading connecting two levels in an inclined T-section. Sometimes used as a synonym for raise. Fay. c. Aust. A capped or broken ship. Fay, d. In Indiana, a narrow passage driven on a slope and leaving a widen pillar which is to be mined by slacking or otherwise. Hess, e. In Alabama, a break in a course of concrete or coal, from one pair of entries to another for the development of a long face in semi long-wall or long-wall mining. Hess, f. A tubular part such as a drill rod, the wall thickness of which has been increased, by hot forging for a distance of one or both ends, thereby reinforcing the area in which screw threads are cut. See upset also inside upset, up-set. Hess, g. The localized increase in volume resulting from the application of pressure.

1189

1195

upwelling. The phenomenon in which colder water is forced upward percolation. See sand leaching. Foster.

upthrust. An upheaval of rocks; said preferentially to the pillar to be formed. Fay.

upthrow. The block or mass of rock on that side of the surface. Pettijohn.

upseeing. A means of increasing the diameter of a rod at the end by forging. L. & L.

uralitization. The processes whereby the primary pyroclastic rocks are altered to uralsite, a form of secondary hornblende occurring in altered rocks and pseudomorphous after pyroxene. Appleman.

uranides. A name proposed for the elements beyond uranium (pitchblende), and the radioactive isotopes of natural uranium; and the nonfissionable, fertile uranium 238 (99.28 percent of natural uranium) which by capture of a neutron and a decay sequence yields fissionable plutonium 239, which can substitute for uranium 235 as a nuclear fuel or a nuclear explosive. Uranium 234 constitutes 0.0058 percent of natural uranium. Hey, M.M., 1961.

uranium. A radioactive, silver-white, metalloid in group IV of the periodic system. It occurs in the minerals uraninite (pitchblende), coffinite, carnottite, autunite, uaurite, davidite, and tbernite. It is found in phosphate rock, limestones, and monazite sands. There are 16 radioactive isotopes (uranium 227 to uranium 240) which have a half-life of less than 4.5 X 10¹⁰ years and which has been used to estimate the age of the igneous rocks in which it occurs. Uranium has three allotropic forms: (1) alpha uranium (orthorhombic), up to 667°C; (2) beta uranium (tetragonal), from 667°C to 775°C; and (3) gamma uranium (isotropic), from 775°C to 1,132°C (the boiling point). Symposium on Nuclear Energy, 1960; Atomic Energy and the Earth Sciences, 1961.

uranic. Of, relating to, or containing uranium; for example, uranothorite. Webster 3d.

uranite garnet. Occurring as a nodule in ultramafic rocks. Shipley.

uranium borides. Three borides are known: UB₃, UB₄, and UB₅. The most attention has been given to the triboride, which can be obtained by heating the properties of which are: melting point, >2,100°C (but oxidizes rapidly above 1,000°C), specific gravity, 9.3, gram/m³; gray color; and the millimeter, thermal expansion, 7 X 10⁻⁶.
uranium boilide

(20° to 1,000° C), modulus of rupture (20° C), 60,000 pounds per square inch, electric resistivity, 3 X 10^9 ohm-centimeter. Dec 1.

uranium carbide. A compound of uranium and carbon which may have one of three formulas, UC, UC2, and UC3. Brown to black; soluble in dilute acids and in dilute sulfuric acid; and insoluble in water. Said to be used as a nuclear fuel. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-143.

uranium dioxide; uranium oxide. Brown to black; insoluble in water; soluble in dilute acids and in dilute sulfuric acid; frequently pyrophoric; melting point, 2,500° C or 3,000° C. A crystalline or pellet form is used to pack nuclear-fuel rods; also used in ceramics, and is a source of uranium for the fluors used for isotope separation. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-235.

uranium disintegration series; uranium decay series; uranium sequence; uranium chains; uranium series; 4n + 2 series. a. The series of nuclides resulting from the decay of uranium 238. The mass numbers of all members of the decay series are given by 4n + 2, where n is an integer; therefore, the sequence is also known as the 4n + 2 series. It is also known as the uranium-radium series. Many synthetic nuclides decay in a collateral series into this sequence. See also radium. NRC-ASA N1.1-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-86.

uranium galena. Galena containing uranium lead of isotope, Pb 206. From closed uranium ore deposits, altered from uraninite, and uranophane. Pearl, p. 47.

uranium leakage. See breakthrough, d. P. Pryor, 3.

uranium mica. See autunite.

uranium minerals. More than 150 uranium-bearing minerals are known to exist, but only a few are common. The five primary uranium-ore minerals are pitchblende, uraninite, davisonite, autunite, and brevium. These were formed by deep-seated hot solutions and are most commonly found in veins or pegmatites. The secondary uranium-ore minerals, altered from the primary minerals by weathering or other natural processes, include uranyl sulfate and metatyuyamuite (both very similar to carnotite), topiternite and metatorbernite, and metapt time and uraninite. Pearl, p. 47.

uranium, natural; uranium normal. Uranium, as found in nature, is a mixture of the fertile uranium 238 isotope (99.28 percent), the fissionable uranium 235 (0.71 percent), and 0.0058 percent of uranium 234. See: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-143.

uranium nitride. Dark brown; crystalline; UC, specific gravity, 10.09; and is a compound of uranium and nitrogen. Said to be used as a nuclear fuel. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-86.

uranium oxide. The important oxides of uranium are UO2, UO3, UO4, UO2SO4, UO3Cl2, UO3Cl2, and UO3Cl2. Uranium oxide has been used to produce colored glazes and ceramic colors. Dodd.

uranium oxide, brown. See uranium dioxide.

uranium oxide, orange. See uranium trioxide; uranium orange; potassium diuranate.

uranium peroxide; perradionite. A yellow; crystalline; UO2, zH2O (the number of molecules of water of hydration varies according to the conditions under which the oxide is formed); hygroscopic; insoluble in water; decomposes at 115° C; nearly insoluble in hydrochloric acid; and specific gravity 2.5 (at 15° C). Used in ceramics and in pigments. CDD 6d, 1961. b. Pale yellow; tantalinite; UO2H2O; molecular weight, 338.06; hygroscopic; decomposes at 115° C; nearly insoluble in hot water; and decomposes in hydrochloric acid. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-202.

uranium red. A ceramic stain for colored glazes suitable for firing temperatures up to 1,000° C. Increasing the uranium oxide content strengthens the color from orange, through red to tomato red. The stain should be thoroughly 0.5 mol SiO2, 0.1 to 0.2 mol Al2O3, 0.1 mol K2O, and the remaining base chiefly PbO. Boiling should be present in significant quantities.

uranium silicide. Beta USi2 has a slightly anisotropic thermal expansion. Dodd.

uranium oxide; stannidium diuranate. Yellow; SrUO3; molecular weight, 675.77; and soluble in acid. Used for coloring porcelain. Bennett, 2d, 1962.

uranium tetrafluoride; green salt. Green; nonvolatile; trichliric; needles; UF4; molecular weight, 148.96; specific gravity, 6.70±0.10; melting point, 960±5° C; and 1.036; very slightly soluble in water; insoluble in dilute acids; and soluble in concentrated acids and in concentrated alkalis. Used in the preparation of uranium metal and uranium hexafluoride. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-235.

uranium trioxide. See uranium peroxide.

uranium trioxide; uranyl oxide; orange oxide; uranyl oxide. a. Red, orange, and yellow; UO3; molecular weight, 280.03; insoluble in water; decomposes in dilute nitric acid and in hydrochloric acid; specific gravity, 7.29 or 8.34; and it decomposes on heating. Used in ceramic and pigments. See also uranium oxide. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-235. b. An intermediate product in the refining of uranium. LGL.

uranium X: brevium. A name for protactinium 234 (proactinium 234), a member of the uranium disintegration series; symbol, UX; fissionable isotope, UXf, half-life, 24.10 days. NRC-ASN N1.1-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-86.

uranium X: actinumuranium; actinium-uranium. a. The readily fissionable isotope of uranium used in one type of atomic bomb. Concentrated from natural uranium by the process of diffusion, but can be obtained, or by electromagnetic methods. Symbols, U and ACU. CDD 6d, 1961. The parent radionuclide of the actinium disintegration series; emits alpha particles; half-life, 7.13 X 10^10 years; and it occurs at 0.71 percent of natural uranium. See also actinouranium. Glasstone, 2, p. 135; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-86.

uranium Y: americium. The abundant naturally occurring isotope of uranium; 140 t. NRC-ASA N1.1-1957; Glasstone, 2, p. 1. The concentration in natural uranium is 99.28 percent of natural uranium as contrasted with 0.71 percent. It is non-fissionable but can be transmuted in a nuclear reactor to eventually produce plutonium 239, a nucleus which can substitute for uranium 235 as a nuclear fuel or a nuclear explosive. This production of plutonium 239 is called breeding. Uranium 238 (obtained from natural uranium from which uranium 235 has been removed) can be used as a coloring agent, an analytical reagent, and in catalysis. Symbols, U and U. CDD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-86, B-143. b. The parent radionuclide of the americium disintegration series which ends with stable lead 206. It emits alpha particles and has a half-life of 4.51 X 10^10 years. It is the longest-lived isotope of uranium and gives the element its atomic weight. Used to estimate the age of the igneous rocks with which it is associated. Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-86, B-143.

uranium violet. See jojobite.

uranium-uranyl oxide. See triuranium octoxide.

uranium X: thorium. A name for thorium 234, a member of the uranium disintegration series; symbol, UX; emits beta particles; and half-life, 24.10 days. NRC-ASA N1.1-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-84.

uranium X: brevium. A name for protactinium 234 (proactinium 234), a member of the uranium disintegration series; symbol, UX; emits beta particles; and half-life, 1.82 minutes. Sometimes called brevium. NRC-ASA N1.1-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-85. Uranium Xa (protactinium 234) undergoes isotopic
uranium X; brevium

transition in the uranium disintegration series to form uranium Z (also protactinium 234) which has a half-life of 6.66 hours. Carriage by magnetic particles to form uranium II (uranium 234). Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 33d ed., 1964, p. B-85.

uranium Y. A name for thorium 231, a member of the actinium disintegration series. symbol, UY; emits beta particles; and half-life 25.6 hours. NRC-ASA N11-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-84.

uranium Z. A name for protactinium 234 (protactinium 234), a member of the uranium disintegration series; symbol, UZ; isomeric with UX; emits beta particles; and half-life, 6.66 hours. NRC-ASA N11-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-85. b. Uranium Z (protactinium 234) is formed from uranium X (also protactinium 234) by isomeric transition in the uranium disintegration series. Glasstone, 2, p. 133.

uranophyllite. Synonym for torbernite. Webster 3d.

uranopyllite. A very rare, strongly radioactive, tetrhgonal, lemon-yellow to siskin-yellow to orange yellow. Uranophane is one of the more common uranium minerals; found usually as an alteration product of gymnite after uraninite; usually associated with autunite and torbernite and less frequently with betauranotil.

uranophane. A strongly radioactive, orthorhombic, yellow to straw yellow, also pale greenshiney-green to orange yellow. Uranophasite is one of the more common uranium minerals; found usually as an alteration product of gymnite after uraninite; usually associated with autunite and torbernite and less frequently with betauranomica. Crosby, pp. 54-55.

uranolite. A very rare, strongly radioactive, possibly monoclinoic, yellow mineral, (UO2)2(SO4)2( OH)2. From the Tintic mining district, Utah. 

uranostilbite. Thorilinite with uranium in partial substitution for thorium. Crosby, p. 46.

uranosite. Auraniferous variety of thorite. Webster 3d.

uranous. Of, relating to, or containing uranium. Used especially for compounds in which uranium has a lower valence than in uranium compounds. Webster 3d.

uranous oxide. UO2; the least important of the uranium oxides. Ccd 6d, 1961.

uranyl. The bivalent radical UO2, or the ion UO2+ formed by uranitio (UO2) in an acid solution. Webser 3d.

uranyl-ammonium carbonate; uranium-ammonium carbonate; ammonium uranyl carbonate; yellow; monoclinic; UO2CO3·2(NH4)·2H2O; molecular weight, 558.24; decomposes at 100°C in air; specific gravity, 2.773; decomposes in hot water; soluble in cold water, in ammonium carbonate solutions, and in aqueous sulfur dioxide solutions. Used in uranium-yellow glazes. Ccd 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-152.

uro. A hydrous sodium carbonate, Na2CO3·NaHCO3·2H2O. Torna is an impure form of ura.

urbanite. Proposed by Warren for a rock composed of hematite, ilmenite, rutile, sapphire, and garnet. It is found at St. Urban, Quebec, Canada. Hest.

urea; carbamide; carbonyl diamide. Colorless; tetragonal; NH2CONH2; molecular weight, 60.06; specific gravity, 1.335; melting point, 132.7°C; and very soluble in water and in ethyl alcohol. Used as a stabilizer in explosives. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. 540. Specific gravity, 1.32 (at 18°C, referred to water at 4°C); decomposes before reaching a boiling point; very soluble in methanol; soluble in absolute alcohol; insoluble in chloroform. Handbook of Chemistry and Physics, 45th ed., 1964, p. C-589.

Ure's process. The treatment of quicksilver ores by heating in iron retorts with admixture of lime. Fay.

urethane foam. Used in fiber board and foam.

usite. a. A plutonic rock composed largely of plagioclase, a.

usasite. A uranium ore. The ore is composed of uraninite and pitchblende, or uraninite, a.

usauropneus. Salvaged diamonds considered as being fit for resetting and reuse in another bit or tool. Long.

usable stone. Synonym for usable diamond.

use charge. An annual rental charge assessed by the Atomic Energy Commission for inventories of enriched fissionable material. L. G. L.

used bit. A diamond bit so dulled by use that it is no longer of any value as a cutting tool. Long.

used diamond. A diamond that has been removed from a used bit. Also, a carbide, the edges and corners of which have been rounded by use but which is reusable. Long.

used stone. Synonym for used diamond. Long. useful area. Working area of a screen. The nominal area, less any area occupied by fixings or supports which obstruct the passage of material over or through the screen deck. R. C., 1952, 1962.

useful beam. Any ionizing radiations from a sealed source that can be employed for the purposes for which the sealed source is used. N.C.B.

useful limit point. See apparent elastic limit.

usual pressure. The usual pressure for a mine fan is the natural ventilation pressure deduced from the total ventilation pressure required to circulate the air through the mine. Roberts, 1, p. 294.

USGS Abbreviation for the United States Geological Survey.

utility arch. An arch of stone with steel arches; steel support; Toussaint-Heintzmann arch. Nelson.

usuramate. Sulfosalts Pb3(Sb5)(Sb)S8, as gray prismatic crystals in bismuth ore from the Ussuraisk deposit in western Trans-siberia, Siberia. Named from locality. Spencer 21, M.M., 1938.

usual mining privileges. By this term in a deed, the grantee has and may enjoy the right to go upon the land and explore for, open and operate mines, take out and sell the products, and do all things incident to that work. Ricketti, 1.

usuranite. A uranium ore. The ore is composed of uraninite, a. and rare sulfates, 3Fe2O3·3SO3·4H2O, from the tintic district, Utah. It has a silvery luster. Fay.

Usuranite. A uranium ore. The ore is composed of uraninite, a. and rare sulfates, 3Fe2O3·3SO3·4H2O, from the tintic district, Utah. It has a silvery luster. Fay.

utahlite. A name for protactinium 234 (protactinium 234), a member of the uranium disintegration series; symbol, UZ; isomeric with UX; emits beta particles; and half-life, 6.66 hours. NRC-ASA N11-1957; Glasstone, 2, p. 133; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-85.

utahllte. A compact, nodular variscite from Utah Jet. An inferior jet which came from the Utah Jet. Aho used to include all amethysts from an area along the border of Utah and Rio Grande do Sul, Brazil, which are mostly small and irregularly colored. Shipley.

usable area. The usable area for mica films is that area into which no edge cracks or open areas extend. Shou.

usable diamond. A resettable salvage diamond. Sm.

usable iron ore. The ore of iron, beneficating, or agglomerating plant which is shipped without further processing to the consumer. Bumines Bull. 630, 1965, pp. 450-459.

usalek diamond. A resettable or reusable diamond. Long.
utahlite

Lewiston, Cedar Valley, Utah. English.

utahlite matrix. An alternate name for amar- trice. Shipley.

Utica shale. An important member of the upper Ordovician succession in the eastern parts of North America, succeeding the Trenton limestone, and placed at the base of the Cincinnati series. C.T.D.

utilites. A general term proposed by Wadsworth for all useful geological products. His subdivisions according to uses are: Ceramics, fritic or ceramic materials; calcichites, binding materials or limes, mortars, cements, etc.; chemites, chemical materials; chalices, pigments, etc.; coprites, fertilizers or manure material; cosmites, decorative materials or monumental stones; and pyrotechns materials; lubricites, lubricants or friction materials; metalites, ores or metalliferous materials; pharmaceutics, mineral medicines; pyrolites, reagent or fire resisting materials; solitites, smelting materials or fluxes; salites, salts and silicates; technites, constructional materials, as building and road materials; thermites, fuels, and buring materials; tribolites, tribulatives, or attrition materials; and vitrites, vitrifying materials or glass, etc. These terms are not used. Fay.

U-tube manometer. The vertical U-tube is the simplest type of pressure gage and consists either of a single U-shaped glass tube having a uniform bore with vertical arms or two separate glass tubes connected in parallel. The level of the liquid in the vertical U-gage, can be read easily to 0.1 inch and in well-made instruments to 0.01 inch wide gage. Roberts, i, pp. 22-23.

U-type furnace. A furnace for the firing of vitreous enamelware, which is carried along a U-shaped path so that ware enters and leaves the furnace at adjacent points. See also hairpin furnace. Dodd.

V. Symbol for total volume; volume per unit mass; specific volume. Zimmermann, p. 117. c. Abbreviation for velocity. Zimmermann, p. 115. d. Symbol for group velocity; linear velocity or particle velocity; for one of the With c; symbol for linear velocity or particle velocity in the y direction; and for velocity of time t. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-101; Zimmermann, p. 166. e. Abbreviation for volt; voltage. Zimmermann, p. 115. f. Abbreviation for voltmeter; vein; viscosity; variable and variation; vertical; visibility; vent; vector; vertex; valve; vacuum tube. Webster 3d.

vacuum chamber

vacuum common fine salt. VCF, evaporated salt made from pans, of ordinary purity and ordinary screen analysis. Kaufmann

vacuum concrete. Concrete poured into a vacuum fan. A fan for creating suction or vacuum deposition. Condensation vacuum degassing. A process utilizing the ad-vantages of vacuum melting or casting and the savings in continuous and pressure casting. One type of operation con-sists of inserting a refractory nozzle ex-tending from a vacuum vessel through the slag layer of a heat of steel in a con-ventional ladle. When vacuum is applied the amount of steel exposed is cycled by lowering and raising the ladle. This method was developed by the Dortmund-Horder-Hutton Union (D-H). Another unit consisted of ladles introduced in this country is called RohrstaHL-Heresus (R-H). This unit has two refractory tubes extending from the vacuum chamber which dips below the surface of the molten steel. After vacuum jets have raised the liquid steel to a certain level in the tubes, argon, or other gases, can be introduced through one tube. BuMines Bull. 630, 1965, p. 59.

vacuum deposition. Condensation of these metal coatings on the cool surface of work in a vacuum. ASM Glass.

vacuum fire. A form of filter in which the air beneath the filtering material is exhausted to hasten the process. Fay.

vacuum filter. a. A form of filter in which the air beneath the filtering material is exhausted to hasten the process. Fay. b. One in which the pulp is drawn into contact with a porous septum by means of a vacuum system. See also vacuum, d. Fay.

vacuum filtration. The separation of solids from liquids by passing the mixture through a filter and where, on one side, a partial vacuum is created to increase the rate of filtration. It may be used to extract fine coal from the suspension or slurry of the coal. Newton, 1946.

vacuum flushing. The separation of solids from liquids by passing the mixture through a filter and where, on one side, a partial vacuum is created to increase the rate of filtration. It may be used to extract fine coal from the suspension or slurry of the coal. Newton, 1946.

vacuum lifting. A process for the firing of special types of ceramic either to prevent oxidation of the ware or to reduce its porosity. Vacuum firing is used, for exam-ple, in the firing of dental porcelain to produce teeth of almost zero porosity. Dodd.

vacuum lifting. Lifting by a crane fitted with a vacuum chamber which dips below the surface of the molten steel. After vacuum jets have raised the liquid steel to a certain level in the tubes, argon, or other gases, can be introduced through one tube. BuMines Bull. 630, 1965, p. 59.

vacuum method. A method of carrying out a traxial test on a sand sample maintaining a partial vacuum in the rubber bag containing the sample. Ham.

vacuum mixer. A machine for the simultaneous de-airing and moistening of dry, prepared clay as it is fed to a pump. In the original design, the clay fell as a powder through a vertical de-airing chamber where water was added as a fine spray; from the bottom of the de-airing chamber the moist, de-aired clay passed into a pump. There have been several de-velopments of this principle. Dodd.

vacuum press wet-air dried brick. Brick formed in a press in which air is evacuated from the die chambers as the brick is pressed. A.I.S.I. No. 24.

vacuum pressing. A method of forming brick shapes by which they are subjected to partial vacuum during pressing in a power press. HW.

vacuum pump. a. A centrifugal or recir-culating pump which extracts steam or air from a chamber or pipe to create a partial vacuum in a vacuum pump, hand, or power operated, is part of a pump station equipment where gravity flow is absent. Nelson. b. Pulsonometer. Webster 3d. c. A pump with a piston or other apparatus to create a partial vacuum during pressing in a power press. HW.

vacuum pov. A pump with a vacuum chamber in which the clay is de-aired before it passes into the vacuum chamber. See also pov. 1. Dodd.

vacuum refining. The same as vacuum melting. ASM Glass.

vacuum system. A two-pipe steam heating system equipped with vacuum pumps to permit maintenance of pressure below atmospheric within the radiators. Strock, 10.

vacuum tube. A sealed tube or bulb with the contained gas exhausted to a pressure low enough to permit the passage of electrical discharges between electrodes within the tube. The performance of the tube is characterized by electron conduction. A.C.G.

vadose. Applied to seepage waters occurring below the surface and above the water table; contrasted with phreatic, which refers to the ground water below the water table. Holmes, 1928.

vadose water. a. Water retained within the soil mass above the standing water level. Nelson. b. Held water. Ham.

vaska. Soft, compact, mixed claylike material with a flat, even fracture found most often in volcanic tuffs. Bureau of Mines Staff. Not recommended.

vallenger cutter. A cutter chain on an armored flexible conveyor which cuts its own stable holes; pushed by pulsating rams to 10 inches (minimum work-able seam 20 inches; on gradients 0° to 20°; maximum length of face 45 yards.)

valbergite. A fine-grained variety of peridotite composed of olivine, hypersthene, and hornblende; locally, pyroxene is an abundant constituent. Holmes, 1928.

valley. Val Corn. The place where the reserve of tin ore is placed to dry before it is put into the smelting furnace. Fay.

valence. a. The degree of combining power of an element; the number of atoms of hydrogen, sodium, fluorine, or other univalent element with which an atom of the element enters combination. The radical will combine by means of bonds, or for which it can be substituted, or which it can be combined with, and which the oxidation state of an element in a com-pound. Webster 3d. b. A unit of valence; as, the valence in the carbonate. Webster 2d. Symbol, z. Zimmermann, p. 166.

valence bond. Linkage of pairs of electrons so as to unite their atoms as a molecule.

valence electron. Crystals whose atoms are held in position by covalent bonds; for example, diamond and silicon.

valence electron. One, usually on the outer shell of the atom concerned, available for transfer. The number of electrons on the outer shell of an atom which, by capturing it, partly or fully completes its own outermost electron shell.

valence electrons. The number of valence electrons thus transferable with relative ease determines the valence of an atom. In the opposite direction the number of holes in the outermost shell of the accepting atom determines its receiving capacity in terms of valence. An atom is negatively electrovalent when ionized by capture of one or more electrons, and positively (or plus valency) number under opposite con-ditions. The valence shell is the outermost shell of the atom. Pryor, 3.

valencite. An orthoclase feldspar similar to adularia. It is from a silver mine at Valencia, Mex. Webster 2d.

valency. The number of hydrogen atoms or their equivalent, with which one atom of a given element will combine. Pryor, 3.

valentine scale. Pocket-sized beam scale of Chinese origin, used in valuation of al-luvial tin gravels. The beam is so cali-brated as to read in catties per cubic yard. A gold ornament from washing of one-fourth cubic foot has a weight. Pryor, 3.

valentinite. Antimony trioxide, Sb2O3, in or-thorhombic crystal. Fay.

vallendar clay. An imported clay universally used in enamels twenty years ago. The clay was used at Vallendar, Germany. Enam. Dict.
valleite. A massive, soft metallic mineral resembling pyrrhotite in color, $\text{Cu}_8\text{Fe}_2\text{Al}_{12}\text{Mg}_2\text{H}_2\text{O};$ a doubtful, impure mineral.

valleus. See hanging valley. Sacrificedeker.

vallevarite. A somewhat leucocratic monzonic rock composed mainly of andesine, biotite, or low-grade microcline antiperthite, with small amounts of diopside, titaniferous, and apatite. Holme, 1926.

valley. A hollow or low-lying tract of ground between hills or mountains, usually traversed by streams or rivers. To receive the surrounding high ground. Deep, narrow valleys are more appropriately termed gorges, ravines, gorges, or canyons, according to their size and the steepness of the valley walls. Usually valleys are developed by stream erosion; but in special cases, faulting may also have contributed, as in rift valleys. C.T.B. A small, subcircular basin eroded by solution of the crest of an uplift, and having a sink through which its sediments escape; used locally in Missour.

valley loop mask. End moraines of valley. Fay. b. A glacier that occupies a continuous elongated valley. They may have a simple anti-clinal form or occur as a series of dislocations of the strata to the condition of camber over the Inland Valley due to superficial disturbance under its sediments escape; used locally in Missouri.

valley brown ore. A local name for limonite. Fay. b. A local name for limonite. 

valley bulge. The condition of strata in a valley due to superficial disturbance under the ice of a glacier. The strata of an elongated landform are tilted toward the direction of flow of the ice. The condition of camber over the Inland Valley due to superficial disturbance under its sediments escape; used locally in Missouri.

valley bulge. The condition of strata in a valley due to superficial disturbance under the ice of a glacier. The strata of an elongated landform are tilted toward the direction of flow of the ice.

valley loop mask. End moraines of valley. Fay. b. A glacier that occupies a continuous elongated valley. They may have a simple anti-clinal form or occur as a series of dislocations of the strata to the condition of camber over the Inland Valley due to superficial disturbance under its sediments escape; used locally in Missouri.

valley loop mask. End moraines of valley. Fay. b. A glacier that occupies a continuous elongated valley. They may have a simple anti-clinal form or occur as a series of dislocations of the strata to the condition of camber over the Inland Valley due to superficial disturbance under its sediments escape; used locally in Missouri.

valley train. A deposit of glacial outwash along the sides and floor of a valley. Fay.

valley glacier. A glacier extending into a valley. Fay. b. A glacier that occupies a valley and is fed from a née reservoir.

valley-loop moraines. End moraines of valley glaciers are usually steep on both sides and flat in the center, as convex on the downvalley side, extending across the width of the valley, and are hence called valley-loop moraines. Stokes and Varnes, 1955.

valley profile. Synonym for talweg. A.G.I.

valley sink. An elongated sink or series of interconnecting sinks forming a valleylike depression. A.G.I.

valley tiles. Specially-shaped roofing tiles for use in the "valley" where two roof slopes meet; these tiles are made to fit into the angle. They lap and course in with the hips of the roof in the valley, as shown in specific gravity layers; and (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of the machine next to the mixing tank of the machine; (2) a baffle in the bottom of the valve; (3) the use of
vanadium ores

vanadinite, descloitite, volborthite, calciocollinite, and saginite. Fay.

vanadium oxide. Yellow to red; orthorhombic; VO₂; molecular weight, 181.88; specific gravity, 3.357 (at 16° C); toxic; melts at 2,980° C; decomposes at 1,750° C before reaching a boiling point; slightly soluble in water; soluble in acids and in alkalis; insoluble in absolute alcohol. Used in ceramics and as a catalyst. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-144, B-236. Also used as a glass colorant, producing various tints of yellow and greenish-yellow.

A pure emerald-green has been produced using this oxide by remelting for a long period of time under reducing conditions. A large excess of alkali leads to the formation of colorless vanadates. When used with cerium dioxide, the green color may be converted to pink or lavender by solution in sulfuric acid. Vanadium in glass inhibits ultraviolet transmission. Lee.

vanadium steel. Steel alloyed with vanadium (usually 0.10 to 0.15 percent), an element which strengthens the steel and serves to remove the oxygen and possibly nitrogen. Webster 3d.

vanadium taurinite. A variety of taurinite containing 5.76 percent VO₃. Spinel, 1959, p. 131.

vanadium yellow; tin-vanadium yellow. A ceramic color produced by the calcination, at about 1,600° C, of a mixture of 10 to 14 percent VO₃ (as ammonium metavananade) and 80 to 90 percent SnO₂. A stronger yellow results if a small amount of TiO₂ is added. These colors can be used in most glasses and either SnO₂ or ZrO₂ can be used as opacifier. Dodd.

vanadium-zirconium blue; vanadium-zirconium turquoise. See zirconium-vanadium blue. Dodd.

vanadium-zirconium turquoise. See zirconium-vanadium blue. Dodd.

vanadoferrite. See ferroferrite. Osborne.

vanados. Of, pertaining to, or containing vanadium. Used especially for compounds in which vanadium has a lower valence than in vanadic compounds. Webster 3d.

vanadyl. Either of two radicals composed of vanadium and oxygen: (1) the univalent, bivalent, or trivalent radical VO; for water, vanadyl sulfate (VOSO₄); and (2) the ditonic radical VO₂⁺. Webster 3d.

vanadyl sulfate; vanadyl sulfate. Blue; crystalline; VO₃SO₄; molecular weight, 163.00; and very soluble in water. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-236. Blue; crystalline; VO₃SO₄·2H₂O; and soluble in water. Used for blue and green colors in glasses and ceramics. CCI 6d, 1961.

vanal. Trade name; a coating for the protection of refractories against slag attack. It contains vanadium and is claimed to prevent slags from wetting the refractory. Dodd.

vanadium. A mineral, Na₃(VO₃)₂·5H₂O, in bright yellow incrustations on weathered shales from northwest Kara-Tau, Kazakhstan, S.S.R. Names from the composition. Handbook of Mineralogy, 1944; Platenker.

Van Allen radiation belts. Several belts of ionizing radiation extending from a few hundred miles to a few thousand miles above the earth's surface. The radiation consists of protons and electrons which originate mostly in the sun and are trapped by the earth's magnetic field.

Van Allen radiation zone. Powerful doughnut-shaped zone of radiation 1,000 to 3,000 miles above the earth's surface parallel with the equator. A.G.I. Supp. vannark and do Boer process. See iodide process. Thomas.

vanadinite. A very rare, strongly radioactive, triglucine, dark green to almost black mineral, Cu₆O·V₂O₅·3H₂O; a secondary mineral found associated with kasolite, sklodowskite, malachite, geomete, chalcocite, chalcopyrite, and uraninite; also found associated with curite, uranophane and cobalt wad; from Karungwe, Katanga, Republic of the Congo. Crosby, p. 58-59; Hey, 2d, 1955.

vanadinite. A very rare, strongly radioactive, amber orange hydrous lead uranate; small pseudohexagonal crystals, commonly barrel-shaped; from Katanga, Republic of the Congo. Crosby, p. 59.

van der Kolk method. A microscopic method for determining whether the refractive index of a mineral grain is higher or lower than that of a liquid medium in which it is immersed and a violet. Light rays from below the stage are cut off by inserting a suitable obstacle, and as the grain acts as a lens, a better focus is obtained. The image, a shadow, appears on the same side as the obstacle when the grain has the higher refractive index, and on the opposite side when the grain has the lower index. Holmes, 1928.

van der Waals' adhesion. Physical, as distinct from chemical cohesion. Normal adhesive forces between molecules, characterized by very low heats of ad- sorption. Pryor, 3.

van der Waals bond. a. A very weak bond found typically in other noble gases, and is due to principally induced polarization resulting from instantaneous dipoles. Aplan, F. F., 1921, 171. b. An intermolecular attraction arising from electrical dipoles, either natural or induced. V.V. c. Weak bonding or a suitable obstacle, and as the grain acts as a lens, a better focus is obtained. The image, a shadow, appears on the same side as the obstacle when the grain has the higher refractive index, and on the opposite side when the grain has the lower index. Holmes, 1928.

van der Waals forces. The weak attraction exerted by all molecules on one another, resulting from the interaction of the electrons and nuclei of the molecules; it has its origin in the electrostatic attraction of the nuclei of one molecule for the electrons of another molecule, which is largely but not completely compensated by the repulsion of electrons by electrons and nuclei by nuclei. These forces are involved in some kinds of adhesion and in the condensation and freezing of the inert gases and nonpolar coherent molecules. The linkage resulting from van der Waals attraction is sometimes called a van der Waals bond. A.G.I.

van Dorn sampler. This sediment sampler consists of a hexagonal cylinder closed at each end by an ordinary rubber force cup. The two cups are connected by a long flexible rubber tubing inside the cylinder, prestressed enough to permit the force cups to retain the sample in the cylinder. In the armature, the two cups are pressed on the cylinder where they are restrained by a releasing mechanism attached to the outside wall. Two short loops on the cups are secured to the releasing mechanism. The cups are released underwater by sending a messenger down the hydraulic wire. This sam- pler does not invert, which prevents use of reversing thermometers in conjunction with sampling. H.G.B.

Vandyke brown. A naturally occurring pigment containing iron oxide and organic matter. Obtained from bog earth, peat deposits, or from other containing bluminous matter. CCI 6d, 1961.

Vandyke red. A brownish-red pigment containing copper oxide and vanadinite. Sometimes used to refer to red varieties of ferric oxide. Used in pigments. CCI 6d, 1961.

van e. The target of a leveling staff; one of the hundredths of a circle or quadrant. Webster 3d.

van e antinodeometer. a. Consists of several light, flat vanes, usually eight in number, mounted on radial arms which are attached to a horizontal spindle. This rotor drives, through a suitable gear train, a counting mechanism which indicates the revolutions of the rotor. The indicating dial, usually graduated in feet of air, may be located either concentrically with the rotor, or in a plane at right angles to the plane of rotation. By observing the number of revolutions over a timed interval, the velocity of flow is found. The instrument is available in a number of forms, to cover velocities ranging from 30 to 6,000 feet per minute. Roberts, I., p. 45-46. See anemometer. Webster 3d.

van e-axial fan. An airfoil (propeller) or disk fan within a cylinder and equipped with air guide vanes either before or after the wheel and including driving mechanism supports either for belt drive or direct connection. A.G.I.

van e feeder. A device for feeding dry ground clay from a hopper to a tempering machine or mixer, for example. Vanes are fixed to a horizontal shaft at the base of the hopper rotate to discharge the material. Dodd.

van e shear test. An in-place shear test in which a rod with thin radial vanes at the end is forced into the soil and the resistance to rotation of the rod is determined. ASCE 1286.

van e shear test. A device used in soil testing consisting of flat blades fixed at the end of a rod. It is forced into the soil, and the torque required to shear the soil, in situ, is determined as a measure of the shear strength of the zone tested by rotating the device. Long.

van e test. A test to determine the shear strength of very soft deposits, such as clays and silts in place (in situ). The values obtained may be used to check the shear strength figures obtained in the laboratory. Boring is first employed to reach the depth required for a test, and the vane is then driven into the deposit. Four vanes or blades project from the end of a rod. It is forced into the soil, and the torque required to shear the soil, in situ, is determined as a measure of the shear strength of the zone tested by rotating the device. Long.

van e test. An intrusive plane parallel to the structure of the country rock but not necessarily following the foliation. G.G.A. Memo. 7, 1959, p. 322.

van e test. A test to determine the shear strength of very soft deposits, such as clays and silts in place (in situ). The values obtained may be used to check the shear strength figures obtained in the laboratory. Boring is first employed to reach the depth required for a test, and the vane is then driven into the deposit. Four vanes or blades project from the end of a rod. It is forced into the soil, and the torque required to shear the soil, in situ, is determined as a measure of the shear strength of the zone tested by rotating the device. Long.

van e test. A test to determine the shear strength of very soft deposits, such as clays and silts in place (in situ). vanner
in which the peculiar motions of the

or vapor as compared with some specific
standard (as hydrogen). Webster 3d. Abbreviation, v d; symbol, P. Zimmerman,

There is an end-shake type, which in-

vapor galvanizing. A process for coating metal

shovel in the miner's hands in the operation of making a van are, or are supposed
to be, more or less successfully imitated.

cludes the triumph concentrator. See also
Frue vanner, for a general description of
the side shake type. Fay. b. A miner who
separates ore with a shovel or pan. Web-

ster 3d. c. A wide, traveling, shaldng
rubber belt, for the concentration (dressing) of ores. C.T.D.
wanner grease belt. Consists of an endless
rubber belt, 36 inches wide, running on
rolls that are 61/2 feet between centers.
The outer surface is coated with grease.
The structural assembly is oscillated transversely, and it is tilted slightly downward

toward the tail pulley. Feed is dropped
onto the greased surface near the tail

pulley, and it is carried up the belt
against a counterflow of water. I.C. 8200,
1964, p. 72.

vannerman. In ore dressing, smelting, and
refining, one who operates a vann:r to
separate the valuable mineral from the
gangue (waste minerals) in an ore. Aho
called vanner operator. D.O.T. 1.
vanning. Corn. a. A rough assay for cassiterite made by washing a pulverized sample

on a flat vanning shovel. Largely superseded by use of vanning plaque, a white
enameled dish on whii.:n heavy and light
fractions of a finely divided wet sample
can be separated and inspected. Pryor, 3.
b. See van b. Fay.
vanning machine. See vanner, a. Fay.
vanoxite. A rare, weakly radioactive, black

mineral, 2V,CIE.V205.8H20, occurring in
the Colorado Plateau area as a cementing

;
P

material in sandstone, and as masses replacing wood; found associated with carnotite, gypsum
hewettite pintadoite,
tyuyaxnunite, and pyrite. See also kentsmit'aite. Crosby, p. 83.

vanthoffite. A colorless sulfate of sodium and
magnesium, 3Na2S0E.MgSO4. Crystalline.

From Wilhelmshall, Stassfurt, Germany.
English.

vanoralite. A mineral, (U0s).A1(VO4)r
(OH) .81120, yellow, monoclinic; occurring at Mounana, Gabon Republic.
Named from the composition. Hey, M.M.,
1964; Fleischer.

vapart mill. A centrifugal grinder for pulverizing ore, coal, and coke. Fay.
vapor. a. Diffused matter (such as smoke, fog,

mist, steam, or an exhalation) suspended
floating

in the air and impairing the

transparency of the air. Webster 3d. b. A
substance in the gaseous state as distinguished from the liquid or solid state; a

gasified liquid or solid; a gaseous substance that is at a temperature below its
critical temperature and therefore liquefiable by pressure alone. Webster 3d.
Abbreviations, V and v. Webster 3d;
Zimmerman, p. 1 15. c.
mine. Fay.

variolite

1197

Foul air in a

vapor barrier. A material intended to prevent

the passage of water vapor through a

building wall so as to prevent condensation within the wall. Strock, 10.
vapor blasting. The same as liquid honing.
ASM Gloss.

vapor degreasing. Degreasing work in vapor

over a boiling liquid solvent, the vapor
being considerably heavier than air. At
least one constituent of the soil must be
soluble in the solvent. ASM Gloss.
vapor demity. The relative density of a gas

the squares of the deviations of several
obruvations. Ham. b. The number of unassigned variables in a materials system.
VV.

p. I 15.

variance analysis.

Isolation by statistical

(usually iron or steel) surfaces with zinc

methods of research, control, or cost ac-

instead of, as in ordinary galvanizing, to

by determination of
their magnitude as a step in process study
or in managerial control by variance.
Pryor, 3.
variance control. Scrutiny of working data as

countancy, of causes of variation in a

by exposing them to the vapor of zinc

process, followed

molten zinc. Also called sherardizing. Fay.
vaporimeter. a. An instrument for measuring

the volume or the pressure of a vapor;

specifically, one used in alcoholometry.

Webster 3d. b. An apparatus in which

the volatility of oils is estimated by heat-

ing them in a current of air. C.T.D.

vaporization. The act or process of changing

means of managerial control. Emphasis
is placed on changes in a conenuous or
repetitive system rather than on performance norms. Pryor, 3.

a substance from a liquid to a gaseous
state. A.G.I.

variance in sampling. In statistical mathematics, the mean squared deviation of

vapor plating. Deposition of a metal or com-

Varian nuclear magnetometer. This mag-

items from the established mean. Pryor, 3.

vapor-phase dispersion. See gaseous dispersion

pound upon a heated surface by reduction or decomposition of a volatile compound at a temperature below the melting points of the deposit and the basis

material. The reduction is usually accomplished by a gaseous reducing agent such
as hydrogen. The decomposition process
may involve thermal dissociation or reaction with the basis material. Occasionally used to designate deposition on cold
surfaces by -vacuum evaporation. See also
deposition, b. ASM Gloss.

vapor pressure. a. The pressure at which a
liquid and its vapors are in equilibrium

at a definite temperatUre. If the vapor

pressure reaches the prevailing atmospheric pressure, the liquid boils. Hackh's
Chem. Dict. Symbol, p. Handbook of
Chemistry and Physics, 45th ed., 1964,

.

F-100. b. A component of atmospheric

pressure which is caused by the presence
of water vapor. It is expressed in inches
of mercury. Taylor.
vapor suppression. A safety system that can

be incorporated in the design of struc-

tures housing water reactors. In a vaporsuppression system, the space surround-

ing the reactor is vented into pools of
water open to the outside air. If surges
of hot vapors are released from the re-

actor in an accident, their energy is dissipated in the pools of water. Gases not
condensed are scrubbed clean of radio-

active particles by the bubbling. L&L.
vapor system. A steam heating Lystem operat-

ing at pressure very near that of the at-

mosphere. Strock, 10.
Vaqueros formation. Strata of shallow water
origin and of lower Miocene age. The formation includes the chief oil-bearing swads
of the Caolinga District, Calif. C.T.D.

var Abbreviation for reactive volt ampere.
vara. An old Spanish unit of length, used in

the southwestern United States and in

Mexico. One vara is equivalent to 331/3
inches in Texas, 33 inches in California,
and 32.9931 inches in Mexico. A.G.I.
V-archIng. Rock failure above a tunnel due
to ring stresses. These cause rock to crack

across a weakness plane and fall. The

final shape is a reentrant V rathei *ban a
rounded arching. Pryor, 3.
variable area method. A method of recording
seismic impulses wherein the area of exposure of a photosensitive film or paper
is

proportional to the intensity of the

seismic impulse. A.G.I.

variance. a. Defined as the square of the
standard deviation, it is the average of

1204

netometer is available in two models, one
for airborne surveys and the other for use

on the ground. Both measure the total
magnetic field of the earth rather than

its components. Dobrin, p. 288.
variation. The angle by which the compass
needle deviates from the true north; subject to annual, diurnal, and secular
changes. Called more properly declination of the needle. Standard, 1964. See
also declinatiln. Fay.
variation compass. A compass of delicate
construction for observing the variation
of the magnetic needle. Webster 2d.
variation diagram. A graphic representation
of the variation in composition of the

members of a series of related igneous
rocks; fo- e:ample, by plotting the bases
as ordinatei against silica as abscissae.

Holmes, 1928.
variegated. Showing variations of color, espe-

cially reticulate patterns or mottling effects. Stokes and Vaults, 1955.
variegated copper me. Bornite, erubescite.
Pryor, 3.
variegated ore. Same as bornite. Fay.
variegated sandstone. Generally, a sandstone
showing color variations or mottling.
More specifically, a proper noun synony-

mous with the Triassic New Red Sandstone of England or the Bunteseldstein

of middle Europe. Bureau of Mines Staff.
variegated slate. See colored slates. AIME,
p. 793.
varietal ruiners!. A characterizing accessory
mineral either present in considerable

amounts in a rock or distinctive of 'he
rock. A mineral that distinguishes one
variety of rock from another. In detrital
rocks, the varietal minerals are usually
of high specific gravity (heavy minerals)

and/or are those most resistant to abrasion. Synonym for characterizing acces-

sory mineral. A.G.I.
variety. In mineralogy, a mineral showing
differences in color, other physical properties, or minor variations ni composition
from the materi.il considered typical of
the species. An cxample is emerald, the
green-colored gem beryl. Hess.
varigradation. In geologyi a process by which
all streams of progressively increasing vol-

ume tend constantly, in a degree varying
inversely with the volume, to depart from

variole. A spherule of a variolite. Webster 3d.
variolite. A fine-grained igneous rock of basic

composition containing small, more or
less, spherical bodies (varioles) consisting
of minute radiating fibers of feldspar,
comparable with the more perfect spheru-


variolite

lites of acid igneous rocks. The term would be better used as an adjective, that is, variolitic basalt, etc. C.T.D. Synonym Veat.

variolitic, Of relating to, or resembling variolite. Webster 3d.

variolite. A coarse-grained dike rock essentially composed of albite and augite, with accessory apatite, magnetite, and chlorite. From Varisvik, Sweden. English.

var. a. Any sedimentary bed or lamination that is deposited within a year's time. A.G.I. b. A pair of contrasting laminae representing seasonal changes. A.G.I.

varved clay. Alternating thin layers of silt (or fine sand) and clay formed by variations in sedimentation during the various seasons of the year, often exhibiting contrasted colors when partially dried. ACSB, P1826.

varves. Clayey soils containing thin alternate layers of different particle sizes; often combine the undesirable properties of clay and silt; formed from seasonal deposits from glacial streams. Nelson.

vaseline. Mixture of hydrocarbons left after distillation off petroleum. See also petroleum. Pryor, 3.

vauguelinite. A green aluminum phosphate, $4\text{Al}_2\text{O}_3\cdot\text{P}_2\text{O}_5\cdot3\text{H}_2\text{O},$ occurring as nodular masses. Holmes, 1928.

vautierite. A mineral used in the manufacture of light bulb filaments. See also light bulb. ACSB, 3d. It is used in Cornish pumping engines. Fay.

vector. a. An entity represented as a directed magnitude, such as velocity, which is defined as consisting of a speed and a direction. See also scalar. Hy. b. See hard vector. Long.

v-bricks. A series of perforated clay building bricks designed by the Building Research Station, England, in 1959-60; the name derives from the fact that the perforations are vertical. Dodd.

v-bucket conveyor elevator. See gravity discharge conveyor elevator. ASA MH4.1-1938.

v-box. A vessel or tub in which ore is washed prior to chemical treatment. See also vat. Fay.

v-cuts, a. In mining and tunneling, a cut where the material blasted out in place resembles the letter V; usually consists of six or eight holes drilled into the face, half of which form an acute angle with the other half. Fay. b. In underground blasting, a type of cut employed in which the cut-holes meet in a V to pull the cut to the bottom of the holes properly. A single pair of holes may do in one kind of rock, but in another, two or three sets of V-holes entirely across the face may be needed. Also called cee cut; wedge cut. Levent, p. 165. c. All edge cuts converging towards the central area of the mica piece. Skew.

v-d Abbreviation for vapor density. Zimmer- man, p. 115.

v-d Abbreviation for vitreous enamel. See also vitreous enamel. Dodd.

v-driving. Somewhat related to double driving but is usually caused by loss of set in the ground coat which allows the driving to sag in a minute V-form. ACSB, 3.

vane. a. A water box or chest, usually on an wheel, for removing water. Also called ghost. Fay.

vaneite. a. A white hydrous borate of calcium, $2\text{Ca}_6\text{O}_5\text{H}_2\text{O},$ or $2\text{Ca}_6\text{O}_5\text{H}_2\text{O}+\text{H}_2\text{O}$. Fay.

vane, vane. English.

vence, veez. v. Abbreviation for vitreous enamel. See also vitreous enamel. Dodd.

vee cut. See wedge cut; V-cut.

vee cut. See wedge cut; V-cut.

vee-jewel. A jewel bearing fitting into a cuplike depression. Hess.

vee; veez. a. A layer of soft clay or earth on the sides of a fault or dike. See also feathered. Nelson. b. The acute angle between the fault plane and a coal seam, for example, working the coal to the vein. From the veering of the fault. Nelson. c. Scot. The line of intersection of the fault. Fay.
velocity head

The velocity head is the product of the density of the fluid, the absolute velocity of the fluid, and the unit weight of the fluid. It is given by the formula:

\[ \text{Velocity Head} = \rho \cdot v \cdot g \]

where:
- \( \rho \) is the density of the fluid,
- \( v \) is the velocity of the fluid, and
- \( g \) is the acceleration due to gravity.

This concept is crucial in understanding the behavior of fluids in pipes, conduits, and other flow systems. It helps in the design and analysis of hydraulic systems, where the pressure and flow rates need to be balanced to ensure efficient operation. The velocity head is particularly important in the study of fluid dynamics and in the design of pumps, turbines, and other hydraulic machinery.
velocity head

If at a given point the velocity is \( v \) feet per second, the velocity heat at this point is

\[ Q = \frac{1}{2} \rho v^2 \]

where \( \rho \) is the density and \( v \) the velocity. The velocity head is useful in determining the energy available from a fluid flow. For instance, in the context of water flow, the velocity head is defined in terms of the velocity of the fluid and its density.

velocity level. The velocity level, in decibels, is a measure of the intensity of a sound wave, which is defined as

\[ L_v = 20 \log_{10} \left( \frac{v}{v_0} \right) \]

where \( v \) is the velocity level in decibels, \( v_0 \) is the reference velocity level (usually 0 dPa), and \( L_v \) is the sound pressure level in decibels.

velocity hydrophone. A hydrophone is a device that responds to the pressure variations caused by moving water. A velocity hydrophone is designed to measure the velocity of sound in water, which is important in underwater acoustics and oceanography.

velocity of approach. In underwater acoustics, the velocity of approach is the speed at which a sound wave travels through water, typically measured in meters per second (m/s).

velocity meter. A velocity meter is a device used to measure the velocity of objects or fluids. It is often used in conjunction with other instruments to monitor specific parameters of a system.

velocity pantile. A velocity pantile is a seismic reflection spread, which is used in geophysical exploration to study the subsurface structure of the Earth.

velocity head. A velocity head is a pressure head that is proportional to the kinetic energy of a fluid. It is important in fluid mechanics and is used to describe the energy imparted to a fluid by a moving object.

velocity head. A velocity head is a measure of the energy available from a fluid flow, which is given by

\[ h_v = \frac{v^2}{2g} \]

where \( v \) is the velocity of the fluid and \( g \) is the acceleration due to gravity.

venetian red. A pigment consisting of a mixture of equal parts of white lead and barite.

venetian glass. A style of glass having an excessive amount of decoration, usually on a very light and delicate foundation. It was developed by the Venetian glassworkers in Murano.

ventilating wall. A wall having a facing (of facing or tile, for example) which is attached to the backing but not in a way to transmit a full share of the pressure and the backing do not exert a common action under load. 

ventilating wall. A wall having a facing (of facing or tile, for example) which is attached to the backing but not in a way to transmit a full share of the pressure and the backing do not exert a common action under load.

ventilating wall. A wall having a facing (of facing or tile, for example) which is attached to the backing but not in a way to transmit a full share of the pressure and the backing do not exert a common action under load.

ventilating wall. A wall having a facing (of facing or tile, for example) which is attached to the backing but not in a way to transmit a full share of the pressure and the backing do not exert a common action under load.

ventilation

ing in a mine. Fay. b. The principal air-conditioning process concerned with control of air circulation. Hartman, p. 73. c. The provision of an adequate flow of fresh air along the drifts while traveling roads, workings, and service points underground. Ventilation is an essential factor in safety, health, and working efficiency and is also necessary to dilute and remove noxious or flammable gases and to abate such problems as fogging, freezing, and high temperatures. See also ascensional ventilation; auxiliary ventilation; descentional ventilation; fan; ventilation planning.

ventilation, auxiliary. See auxiliary ventilation.

ventilation department. A department for the purpose of planning adequate and economic ventilation for all future projects and to provide frequent information on existing ventilation systems. Nelson.

ventilation doors. Doors constructed to close off the unused or existing ventilation systems.

ventilation ducts. Two kinds are available: (1) flexible ducts generally consist of flexible metal, canvas, or rubber with rubber or polyvinyl chloride, a non-flammable substance. They are available in varying sizes and lengths for use in temporary installations as in the bord-and-pillar mining of coal. It is suited also for use in crooked workings of limited extent. It has a higher resistance and a greater tendency to leak than rigid ducting; and (2) rigid ducts are made of steel pipe which has welded seams and a bolted or a quick-release clip joint. See also auxiliary ventilation; flexible ventilation; stoppage; shunt ventilation. Nelson.

ventilation, reversal of. In the case of a centrifugal fan, the reversal arrangement may consist of an auxiliary drift connecting the fan with the downcast shaft. The drift is normally sealed off by air tight doors. In the case of an axial-flow fan, it is only necessary to reverse the rotation of the fan. This arrangement entails a reduction in volume and pressure in the reversed air flow. Nelson.

ventilation, splitting, splitting. Mine workings are usually subdivided to form a number of separate ventilating districts. Each district is provided with a ventilation system and is connected to the main system at the intake and the exhaust. These two systems are connected to supply fresh air to a working place. Long.

ventilation survey. In order to distribute the air in a mine efficiently and economically, ventilation surveys must be conducted. They may be classified as: (1) qualitative surveys to determine the proportion of flammable or poisonous gases, or dust, in the air which is being circulated through the mine, or in hot and humid mines to determine the conditions of air temperature and humidity; (2) quantitative surveys to determine the quantity of air being circulated through the mine workings for a variety of reasons. This is done by measuring the volume of air passing at different points in the circuit by means of the anemometer, in order to investigate the existing air distribution, particularly to the individual faces, the location of leakage, and the possibility of its reduction or elimination; and (3) pressure surveys to determine the pressure induced and the resistance of the roadways and faces included in the survey. This can be done by providing air to circulate the air in the different sections of the circuit and that expended in ventilating individual districts be determined. The total pressure expended in ventilating the mine may then be summed and the cost estimated. Sinclair, J., p. 133. Systematic observation of air pressure, quantity and quality throughout a mine is the best way to allow a detailed analysis of the ventilation of the system. B.S. 3618, 1963, sec. 2.

ventilation symbols. A set of standard letters, signs, or marks used on mine ventilation plans to represent certain appliances or constructions that direct and control the flow of air underground. For example, a regulator is denoted by R inside parallel or opposite a roadway. Nelson.

ventilation tubing; ducting; air pipe. Sheet steel or canvas piping 12 to 24 inches in diameter for conveying or to a tunnel or a hard heading face, or sinking pit. The tubing extends from an auxiliary fan to within a few yards of the face to be ventilated. The National Coal Board, Great Britain, has adopted a standard steel pipe which has welded seams and a bolted or a quick-release clip joint. See also auxiliary ventilation; flexible ventilation; ducting; shaftsinking ventilation. Nelson.

ventilator. a. A mechanical apparatus for producing a current of fresh air. Fay. b. A furnace for ventilating a mine by heating the underground air. Fay. Also called a device for providing fresh air to a room or other space by (1) introducing outside air, or (2) exhausting foul air. Nelson.

ventilation. See ventilation, stoppage.

vent tube. A hose or piping conducted air ejected drill cuttings from the borehole and being connected to the open air. Long. Nelson. b. An exhaust pipe or tube. Long. Nelson. c. A canvas tubing suspended from a winch in a mine to supply fresh air to a working place. Long.

ventubes. Tubes of sheet iron or canvas up to 100 centimeters in diameter through which the air can be easily connected. They are used in mine ventilation to lead the air whereby it is introduced at the face or called ventilation pipelines. Stokes, v. 1, p. 534.

venturi. A contraction in a pipeline or duct producing a current of air underground and increasing the air flow. Nelson.

venturi blower. a. A device resembling a Venturi meter, that is utilized in directing the jet of compressed air for short headings. The device is commonly made at the mine, and one well-proved type is called the Modder Deep. These blowers are mainly used in conjunction with 14- or 16-inch ducting for the ventilation of headings several thousand feet in length. Roberts, 1, pp. 223-224. b. An apparatus to induce a flow of air or gas in a duct by means of a jet of compressed air or water from a small nozzle in the duct. B.S. 3618, 1963, sec. 2.

venturi flume. A type of open flume with a contracted throat that causes a drop in the hydraulic gradient; used for measuring flow. Stokes, v. 1, p. 534. A control flume which consists of a short contracted section in the flume opened by one expanding to normal width. See also control, a. Nelson.

venturi meter. A tracer device in the form of a nozzle arranged to measure the flow of a liquid in pipes. Small tubes are attached to the Venturi meter and at the point where the liquid enters the converging entrance. The difference in pressure heads is shown on some form of display.

Venturi tube. A closed conduit which is gradually contracted to a throat causing a reduction of pressure head by which the velocity through the throat may be determined. The contraction is generally followed, but not necessarily so, by gradual enlargement to original size. Piezometers connected to the pipe above the contracting section and at the throat indicate the drop in the pressure head which is an index of flow. Seeley, 1.

vent, volcanic. See volcanic vent. A.G.I.

vent wire. A wire used by founders to make Venus's hahstone. Quartz containing needle--like pyroxene, originating in an igneous rock, or a sedimentary rock consisting largely of siltstone or sandstone. It is a rock found on the South American continent and is often classed as a marble. Sanford.

verdigris. a. An oxidation on the surface of a metal produced by atmospheric effects. The color is often classed as a marbling. Used in paintings, and the green vernier-reading manometer.

c. A green powder used as an imitation of cinnabar. Schaller.

d. A glassy, basaltic lava containing phenocrysts of biotite, olivine, augite, and sometimes plagioclase and potassium feldspar. Formed on the border of an igneous intrusion, or a lava flow. German Schaller.

verdite. A green rock, consisting chiefly of green mica (fuchsite) and clayey matter, occurring as large boulders in the North Kaap River, Republic of South Africa. C.M.D.

verdigris. a. Verdigris. Webster 2d. b. Either of two basic carbonates of copper used as pigments, and prepared either by grinding the mineral azurite (giving blue verditer), or artificially. Webster 2d.

c. Talcose-dolomitic breccia rock from New Jersey, Schaller.

d. A gable edge of a tilted roof. At the verge the roofing tiles are edge-bedded, preferably on a single or double undercloak of plain tiles. This form of undercloak gives a neat appearance to the verge and slightly inclines the verge tiles so that rainwater is turned back onto the main roof. Dodd.

verge. The direction of overturning of folds. Chalmers.

vermeil garnet. a. A tool used in deep boring for detaching and bringing to the surface portions of the wall of the borehole at the desired level. For gas testing, an apparatus by which the amount of gas required to produce a flame of a given size is measured; a gas verifier. Standard, 1964.

verite. A glassy, basaltlike lava containing phenocrysts of biotite, olivine, augite, and sometimes plagioclase and potassium feldspar, in a glassy groundmass; from Vera, Spain. Webster 2d.

vermell. a. Vermillion. Webster 2d. b. An orange-red garnet; spinel; ruby. Webster 3d. c. A red varnish applied to a gilded surface to give lustre. Webster 3d. d. Gilded silver, bronze, or copper. Webster 3d.

vermell garnet. A trade term for any orange-red garnet; same as garnascite garnet. Also sometimes applied to any brownish-red garnet. Shipley.

vermell ruby. An orange-red to red-brown corundum. Shipley.

vermeculized. Stones, etc., worked so as to have the appearance of having been eaten into by worms. Crispin.

vermiculite. A mineral of the mica group that is soft-bodied and more or less verniform in habit. Forms, and usually held to be a purely phyllosilicate mineral. Schaller.

vermilion; vermilion. a. A red pigment used in enormous quantities. Usually made from mercuric sulfide, HgS, tinted with pararosaniline. Crispin. b. A bright red pigment consisting of mercuric sulfide. Prepared synthetically (as by the reaction of mercury, sulfur, and sodium hydroxide), but formerly obtained from the mineral cinnabar. Color ranges from crimson to nearly orange when finely divided. Both spellings are correct. Webster 3d. c. Synonym for alpha mercuric sulfide and for the mineral cinnabar which is natural alpha mercuric sulfide. See also mercuric sulfide, red. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-194.

vermilion opal. Milky opal impregnated with cinnabar. Schaller.

vermillon. In the Lake Superior region, the lowest of the strata of schists; the crystalline schist. Fr.}

vermeulian process. The technique invented by the French chemist Verneuil for the manufacture of synthetic corundum and spinel by fusing pure precipitated alumina, to which has been added a pre-determined quantity of the appropriate oxide for coloring, in an oxygen-coal-gas furnace. C.T.D.

vermiller. A small auxiliary scale in sliding contact with a main measuring scale on precision measuring instruments. It is calibrated so as to be slightly out of phase with the main scale. This gives a magnified reading of one main division and facilitates reading with an accuracy proportional to the recurrence of the markings which are in phase. If, for example, the main scale is graduated in centimeters and tenths, and the vernier is 0.9 centimeters divided into tenths, then a reading to the nearest 0.01 centimeter is registered where two marking lines meet. Pryor, 3b. In a spudding drill, a brake adjustment that permits the line to lay out automatically as the hole deepens. Nichol.

vermiller closure meter. An instrument consisting of two steel rods, graduated with a vernier scale and sliding over one another through a pair of clamps. Such an instrument may readily be made in a mine workshop and can be designed to read to either one-thousandth of a foot or one-hundredth of an inch without difficulty. Used to measure strain. Isaction, p. 193.

vernier compass. Scot. A mining compass for measuring angles without the use of the magnetic needle. Fay.

vernier-reading manometer; micrometer-reading manometer. This series of manometers covers a range of pressures from 0.001 inch water gage to 1 inch water gage. Essentially the instrument is a U-tube consisting of two reservoirs connected by a flexible rubber tube. One of the reservoirs is fixed while the other may be lowered or raised to balance the applied pressure difference by means of a screw.
vernier reading manometer

arrangement provided with either a vernier or micrometer reading attachment. Roberts, I, pp. 33-34.

Vernon shale. A division of the Middle Si- lurian of Eastern United States; it consists of red shales laid down under continental conditions as lagoonal deposits, underlying the Syracuse salt series. C.T.P.

versant. One side or slope of a mountain range; as, the east versant. Fay.

versed sine. The versed sine of an arc is that part of the diameter included between the extremity of the arc and the foot of the sine. Zern, p. 30.

verteculate. A pigment essentially a bicarbonate of copper. Used for producing a coppery, greenish, effect. Not to be confused with the perpenticular rock, verde antique. C.C. 6d, 1961.

vertical (of curve). See point of intersection, b. Seely, 2.

vertical a. A term used to define a direction which is perpendicular to a horizontal, or level, plane. A.G.I. b. Local usage for vertical fractures, especially in the Black Hills of South Dakota. A.G.I. c. Imaginary vertical line at any point in a stream or other body of water extending from the surface to the bottom. A.G.I. d. Said of deposits and coal teams with a dip of from 60° to 90°. Stoes, v, i, p. 56.

e. In aerial photographic mapping, a vertical line through the exposure station, or rear nodal point. Seely, 2.

vertical accretion deposit. Sediment accumula- tively formed by processes of deposition or by parallel paths. Thus, each pair of opposing shelves or brackets receive objects (usually dish trays) and deliver them to any number of elevations. ASA MH4.1-1958.

vertical circle. Graduated circle on theodo- lite or tachometer, by use of which the slope of the collimation line through sighting telescope is measured in survey work. Pryor, 3.

vertical collimator. An instrument in which the telescope sights vertically (upward or downward); used chiefly for centering a theodolite on a tower exactly over a station mark on the ground. It may be used for any vertical sight. Seely, 2.

vertical component. That part, or component, of a vector that is perpendicular to a horizontal or level plane. A.G.I.

vertical curve. a. The curve between two lengths of a straight roadway which possess different gradients. The curve provides a gradual change for haulages from one inclination to the other. The curve leading to the top or brow of an inclined plane would curve concave and concave at the bottom. Nelson. b. The graduated curve connecting two lengths of a railway or road which are at different slopes. Ham. c. The meeting of different gradients in a road or pipe. Nichols.

vertical drain. Usually column of sand used to vent water squeezed out of humus by weight of fill. Nichols.

vertical exaggeration. In a stereoscopic image, the increase in relief seen by the eye. A.G.I.

vertical fault. A fault in which the dip is 90° with the horizon, or directly downward. Fay.

c. For any vertical sight. Seeley, 2.

vertical hole. A borehole drilled vertically downward or upward. A.G.I.

vertical intensity. The magnetic intensity of the vertical component of the magnetic field, reckoned positive if downward, negative if upward. A.G.I.

d. The vertical component of the magnetic field intensity. Schiefer- decker.

vertical mill. A rolling mill in which the rolls operate vertically, Osborne.

vertical photograph. A photograph of a strip of country taken with an air-survey camera, set truly vertical in the survey air- craft. The camera is provided with a wide angle lens and the photographs are taken at precisely controlled intervals so that stereoscopic pairs can be produced for subsequent detailed mapping. Ham.

vertical-position welding. Welding where the axis of the weld is essentially vertical. A.M.S. Gold.

vertical pump. This pump is often of tic; single-acting bucket or ram type with single or double cylinders and either with or without a flywheel. Vertical pumps may be used where headroom is adequate but area restricted, although horizontal reciprocating pumps are more generally used. Sinclair, IV, p. 51.

vertical recieving convexor. A power or gravity actuated unit which receives objects on a carrier or car bed usually constructed of a power or roller conveyor. The object is then elevated or lowered to other elevations. ASA MH4.1-1958.

vertical sand drain. a. A boring through clay or silt which is filled with sand or gravel to facilitate drainage of liquid from the soil. Ham. b. See perched water table. Nelson.

vertical screw conveyor. A screw conveyor which conveys in a substantially vertical path. See also screw conveyor. ASA MH 4.1-1958.

vertical seismograph. An instrument that registers the vertical component. Schiefer- decker.

vertical separation. In faulting, the separa- tion between the two limbs of the dis- placed index plane (bed, vein, dike, etc.) measured in a vertical direction. A.G.I.

vertical shaft. A shaft sunk at an angle of 90° with the horizon or directly downward toward the center of the earth. Weed, 1922.

vertical shear. Reference is to a beam, assumed for convenience to be horizontal and to be loaded and supported by forces all of which lie in a vertical plane. The vertical shear at any section of the beam is the vertical component of all forces that act on the beam to the left of the section. The vertical shear is positive when upward and negative when downward. The shear equation is an expression for the vertical shear at any section in terms of x, the distance to that section measured from a chosen origin, usually taken at the left end of the beam. Ro.

vertical shift. The vertical component of the shift. See also shift, i. Fay.

vertical slip. The vertical component of the slip; this is the vertical component of the dip slip. Synonym for vertical component. Schieber-decker.

vertical takeup. A mechanism in which the pull is taken up by the rope traveling in a vertical plane. NEMA MB-1961.

vertical theory. The earliest view of subbi-
vergence in which it was supposed that the lines of break (limiting lines) were more or less vertical. Pillars left for support were accordingly formed immediately under the object to be protected, the questions of dip being disregarded. Briggs, p. 37.

very thick band. A field term that, in accordance with an arbitrary scale for use in describing banded coal, denotes a vitrain band exceeding 50 millimeters (over 2 inches) thick. Compare thin band; medium band; thick band. AGI.

vesbian. An extrusive rock composed of leucite, subordinate augite augite, and melilitc, with accessory apatite and opaque oxides. A melilitic leucite. AGI.

vesicle. A small cavity in an aphyric or glassy igneous rock, formed by the expansion of a bubble of gas or steam during the solidification of the rock. Fay.

vesicular. a. Characteristic of, characterized by, pertaining to, or containing vesicles. Fay. b. Having a cellular structure; applied to those clays which have become bloated by overfiring. HW. c. See cellular.

vesiginite. A vitreous lustered mineral, CuBa(Y0,),(OH)2, occurring as lamel-
kalaggregates and as polysynthetic twins with pseudohexagonal outline; yellow- green to dark olive-green; from Friedrich- thuringia, Germany. American Mineralogist, v. 40, No. 9-10, September-October 1955, p. 942.

vesillonite. In geology, the tenth series of the Pennsylvania system of stratigraphy, comprising the Pocomo sandstone of the Lower Carboniferous. Olds.

vesi. The area at the entrance of drier tunnels where cars of greenware can be vibrated by, or, containing vibrators. Fay.

vesibule. A term that, in the English language, signifies the productive part of the testa of an egg. Fay.

duct. A bridge carrying a road or a railway across a valley. See also aqueduct. Ham.

vial. Synonym for acid bottle. Long.

vibrose. A vibrating ore screen in which the feed is from a saucer-shaped distribu-
ter onto a conical surface kept in vibra-
tion by a ratchet motion. Liddell 2d, 192.

vibrate. To have a swinging or oscillating motion; to move or swing back and forth, as a pendulum, to have a period of vibration; to fluctuate; to vacillate; to sound, at the voice vibrates in the ear; to throb. A. G. I.

vibrated concrete. Concrete compacted by vibration during placing. Taylor.

vibrating ball mill. A mill supported on springs so that an out-of-balance mecha-
nism can impart vibration to the mill, usually in the horizontal plane, and typically at about 1,500 cycles per minute. Advan-
tages over the ordinary ball mill are in-
creased rates of grinding (particularly with very hard materials), lower energy consumption per ton of product, and less noise. Dodd.

vibrating conveyor. a. A trough or tube flex-
bly supported and vibrated at relatively high frequency and small amplitude to convey bulk material or objects. See also oscillating conveyor. ASA MH14-1953. b. A metal trough mounted on flexible supports and designed to move in a vertical plane. It is vibrated at an angle of about 30° to the horizontal. The material being conveyed moves in a series of gentle pitches and catches that blend to produce continuous, uniform flow. There is no tumbling or sliding of the material to cause wear of the trough. There are two basic types of vibrating conveyors: (1) the natural frequency type (those sup-
ported by heavy duty stiff coil or leaf springs), and (2) forced vibration types (those sup-
ported by leaf springs and rotating eccentrics). The mine, or more slightly inclined screening surfaces mounted in a robust frame. To in-
crease the capacity and prevent blinding the screening surfaces are caused to vibrate. This may be done by mounting the screen on powerful springs and caus-
ing it to bear down on the underside of the frame. An alternative method used in the Hummer screen is to stretch the wire screen to a high tension and mount at some convenient point on the frame an electromagnet actuated by an alternating current. The magnetic works against the springs on which the screen is mounted and in this way very rapid vibration can be secured and blinding greatly reduced. Mill.

vibrating screens (heated). Wire-mesh screens that are vibrated and heated electrically to increase their efficiency. See also screens. AGC, 1963.

vibrating-type conveyor. See conveyor, vibrat-

vibrating wire transducer. A device that can be used to measure ocean depth. The vibrating element is simply a very fine
vibrating wire transducer

tungsten wire which is stretched in a magnetic field. The wire vibrates at some predetermined frequency which is determined by the length and tension of the wire. Pressure changes by varying the tension in the wire will change the vibration frequency of the wire. H&G.

vibration drilling. Drilling in which a frequency of vibration in the range of 100 to 20,000 cycles per second is used to fracture rock. Ultrasonic drilling is one of the more known methods of vibration drilling. Mining and Minerals Engineering, v. 1, No. 5, January, 1965, p. 178.

vibration mark; chattermark; herringbone marking. A rare modification of a groove produced by the friction of tool against work in unsound rock. Grove.

vibration method of roof testing. The finger test. An approximate grading test of roofs to determine whether the roof is sound or not. Grove.

vibration test. An approximate grading test of roofs to determine whether the roof is sound or not. Grove.

vibratory pressing. A process for forming re-

fractory shapes, in which the ground surfaces are packed closely together, and made rigid by the slow-impact-type vibrations of the top and bottom dies. Also called impact pressing. HW.

vibratory screening: A screening similar to the shaking screen but the reciprocating movement imparted to it is of greater frequency than that of the slow movement of the shaker in preventing binding of holes and the screening is more effective. It may contain one, two or three screen decks with water sprays for washing products when screening. Five products ranging from plus three-fourths to minus one-eighth inch are possible from a double deck screen. In general, the screen is inclined at from 12° to 14° for the coarser sizes and 17° to 21° for the finer sizes with counterflow operation. See also pool washing screen; varioplate screen. Nelson.

Vibrex grease table. A device to concentrate and separate diamonds from gangue material. It is based on the principle that sharp short vibrations in rapid succession transmitted to a greased surface cause diamonds to become imbedded in the grease while water washes away other materials. I.C. 8200, 1964, pp. 66, 72.

Vibrogel. Special gelatin dynamites; used for blasting. A.G.I.

Victoria green. A bright green ceramic color. A typical batch composition is: 38 percent CaO, 20 percent CaF2, 22 percent SiO2.試. This batch is calcined, washed free from soluble chromate, and ground. The coloring agent is said to be uranovite (CaO Ca2(SiO3)2).

Victoria's coupling. A development in which a pair of circular bands, a tool instead of the usual threads. Two ends of pipe are then lined up and a rubber ring is fitted around the joint. A pair of semi-circular bands, a forming, are placed around the ring and are drawn together with bolts. The ridges fit on both edges which fits into the groove of the pipe. As they are tightened, the rubber ring is compressed, making a tight joint, while the ridges fitting in the grooves make it strong mechanically. Victoria's pipe is easier to lay because the bands have not to be aligned perfectly and screwed in. Kentucky, pp. 116-119.

vicinal fluid. A corrosive pipe joint which allows the pipes to move through several degrees after fixing but yet to remain watertight. This joint is designed to allow 12° of movement without causing leakage. The pipes have specially shouldered ends which are contained by a butt-on-flat rubber washer held by a special circumferential-type flange. The water has access to the inner part of the washer, on which it exerts pressure and thereby seals the joint. Mason, v. 2, pp. 628-629.

vicinal piping. Commercial type of pressure piping with some flexibility due to construction of joints. Pryor, 3.

Vicat-Montagne furnace. A mechanical roasting furnace similar to the Ross and Welter type. Fay.

Vicat German silver. See German silver.

Vicat turquoise. An amorphous imitation of Vienna turquoise
Vienna turquoise
turquoise formerly manufactured in Vienna, Czechoslovakia, France, and England. More difficult to detect than the various blue-stained cuttings which have replaced it as a turquoise substitute, it has approximately the same chemical composition, hardness, specific gravity, and fracture. Separate under the talcite name.

Vienna white; Cremnitz white. A paint base composed of pure white lead, imported from Belgium in small cubes. Also called Kremnitz white; Krem white. C.T.D.

virendes girder. An open frame N-truss without diagonal members, with rigid joints between the top and bottom chords and the verticals. Known also as open-frame girder. H. F. Rey.

vivianite. A massive, deep blue form of the pyroxene diopside, quarried at San Marcello, Piedmont, Italy. C.M.D.

violet. a. Same as copiapite. Dana 6d, p. 965. b. To branch in diverging lines. Webster 2d.

c. A magnetic iron ore. Fay.

e. Volute No. 5, L.F. Permissible explosive; Shipley.

villaninite. An iron-black disulfide of copper, nickel, cobalt, and iron with 1.5 percent selenium (Cu,Ni,Co,Fe)(S,Se)a. Small cubic-oval crystals and radiating nodular masses. Isometric. From Villamin, France, and symbols for absolute viscosity, i.e., and 

virgin. a. Unworked; untouched; often said that which has been fired. Standard, 1964. b. Virgin compression curve. See pressure-void ratio curve. ASCE P1826.

c. Virgin coal. An area of coal which is in place that which has been fired. Standard, 1964. d. Virgin clay. Clay, distinguished from that which has been fired. Standard, 1964.

d. Virgin coal. An area of coal which is in place that which has been fired. Standard, 1964.

f. Virgin field. A mineral field in which there has been no mining whatever. Fay.

virgin diamond. See new diamond. Long.

virdiace. A descriptive name given to articles made merely of good cast iron. Fay.

virgin ste. Another name for divining rod. Hooe, p. 337.

virgin steel. A descriptive name given to articles made merely of good cast iron. Fay.

virdiace. A descriptive name given to articles made merely of good cast iron. Fay.

viscosity. A measure to determine that involves dissipation of energy by internal friction. Holmes, 1928. b. In road building, the measure of the resistance to flow of a bituminous material, which is usually stated as the time of flow of a given quantity of the material through a given orifice. Hess. c. Liquid having a high viscosity rating will resist flow more readily than will a liquid having a low viscosity. See also rheological engineers (S.A.E.) standard series of viscosity numbers is used to indicate the viscosities of lubricating oils. NIST, 1996. d. The property of imperfect fluids by which they resist the action of a shearing stress. Measured by the shearing stress required to move a layer of the liquid one centimeter thick. Holmes, 1928. Abbreviations, vis and visc; symbol for coefficient of viscosity, μ; and symbols for absolute viscosity, ν, and a.

viscometer; viscometer. An instrument used to measure the viscosity of liquids. The Marsh funnel type measures the time required for a known amount of drilling mud to flow through an aperture of known diameter; other specific types are the Fann and Stormer viscometers. See also Marsh funnel.

viscosity. See viscometer.

viscosity coefficient. A quantitative expression of the friction between the molecules of water when in motion. It is the amount of force necessary to maintain a unit difference in velocity between two layers of water at a unit distance apart. It decreases rapidly with increase in temperature. A.G.I.

viscosity, kinematic. Ratio of absolute viscosity to mass density. Measured in square seconds per centimeter. See also poise. A.G.I.

viscosity, absolute. a. The force which will make one square inch of a plane surface with a speed of one centimeter per second relative to another parallel plane surface from which it is separated by a layer of the liquid one centimeter thick. This viscosity is expressed in dynes per square centimeter, its unit being the poise, which is equal to one dyne-second per square centimeter. See also poise. A.G.I.

viscosity, relative. The resistance of liquids, semisolids, and gases to movement or flow. H.G.C.

viscosity, absolute. a. The force which will make one square inch of a plane surface with a speed of one centimeter per second relative to another parallel plane surface from which it is separated by a layer of the liquid one centimeter thick. This viscosity is expressed in dynes per square centimeter, its unit being the poise, which is equal to one dyne-second per square centimeter. See also poise. A.G.I.

viscosity, relative. The resistance of liquids, semisolids, and gases to movement or flow. H.G.C.

viscous. a. Adhesive or sticky and having a nonfluid-like consistency. Webster 2d.

b. Imperfectly fluid; designating a sub-

viscous damping. Viscous damping is the dissipation of energy which occurs when a particle in a vibrating system is resisted by a force of which a constant, independent of displacement and velocity, and the direction of which is opposite to the direction of the velocity of the particle. Hy.

viscous flow. A type of fluid flow in which there is a continuous trend or motion of the particles and the motion at a fixed point always remains constant. Also called streamline flow; laminar flow; steady flow. C.D.

viscous resistance. The effect of surface friction between a particle and a liquid when the body moves through it. See turbulent resistance. Newton, p. 77.

Vishnevite. The original spelling of wischnewite. The term wischnewite is now considered incorrect. Hochstrasser, 1956.

visible horizon. The apparent horizon. A.G.1.

visible spectrum. That portion of the electromagnetic spectrum consisting of the visible light. The light of the visible spectrum is seen by the eye (sensory system) and is measured in terms of wave length, frequency, or energy. The visible spectrum is divided into the yellow-red end and the blue-violet end. In the middle of the visible spectrum is a color approximately midway between yellow and blue that is called white. All the colors of the visible spectrum are a mixture of red, green, and blue, and any two of these primary colors can be mixed to produce any one of the other colors. Bennett 2d, 1962 Add.

visible, in terms of the angle subtended at the eye by the object viewed, is the same as apparent. The visual acuity of the eye is the ability to see very small objects. It can be measured in a variety of ways, all of which are designed to detect the smallest detail which is visible. In terms of the angle subtended at the eye by the object viewed, a given distance away. Roberts, II, p. 76.

visual acuity. The ability of the eye to see very small objects. It can be measured in a variety of ways, all of which are designed to detect the smallest detail which is visible in terms of the angle subtended at the eye by the object viewed at a given distance away. Roberts, II, p. 76.

visual brightness range. The eye has the ability to function over a very wide range of brightnesses, from the order of 10,000 foot lamberts to a minimum detectable brightness of 0.0001 foot lamberts. But it cannot respond to the whole of this range at once. In any given environment visual brightness is typically limited to the range of light during the day, the range of light at the upper limit and the lower limit of discernible brightness at the threshold. What those limits are in terms of luminance depends on the eye adaptation and the scene. Roberts, II, p. 79.

visual field. If the eyes are directed straight ahead, the visual field for each eye is determined by the area of the retina from which the image is formed. Two areas, the near field and the far field, are present in the visual field. The near field is the portion of the visual field in which the image is formed by the eye. The far field is the portion of the visual field in which the image is formed by the eye. The near field and the far field are separated by the point of fixation. The point of fixation is the point in the visual field which is used as the reference point for measuring angles.

visual height. A device by which the winding or hoisting engineman can see on a dial or panel the position of his levers in the shaft or the journey on the haulage plane. See also depth indicator. Nelson.

visual performance. The interpretation of visual information by the brain and the outward action signal to the muscles of the body which result from that interpretation. Roberts, II, p. 79.

visual sampling. In evaluation of asbestos ore bodies, infers the measurement of all visible fiber seams in an average cross section of the ore to determine the percentage of fiber contained therein. Sinclair, W. E., 1966.

visual capacity. The term for the greatest volume of air that a man can expel after a forced expiration. In other words, it is the greatest volume of air that can be moved in and out of the lungs in a single breath. The visual capacity is an average of 4 and 5 liters. H&G.

Vital. A trade name for a new chemical additive which eliminates or reduces considerably the danger of diesel locomotive fumes underground. Tests have established that the chemical, added to diesel fuel, reduces the carbon monoxide danger from diesel locomotive exhausts to negligible proportions. The method of testing was by a modern variant of the live canary—yellow P.S. detector tube. The chemical has been approved for use underground in British coal mines.

vital air. Air which has been rendered impure by the breath of men and horses, or by being mixed with the various gases given off in mines. It is frequently called return air. Fei.

vitrail. This term was introduced by M. C. Stoopjes in 1919 to designate the macroscopically recognizable very bright bands of coals. Very bright bands or lenses, usually a few millimeters (3 to 5 in width); thick bands are rare. Oval to the touch. In many coals the vitrain is permeated with numerous angular cracks at right angles to stratification, and consequently breaks cubically—with conchoidal surfaces. In other coals the vitrain is fractured by only a few cracks. In some cases the vitrain is vitreous, although it is extensively cleaved. Examination with the microscope shows vitrain to consist of microfibrillotyes very rich in vitrinite. After clarin, vitrain is the most widely distributed and common macroscopic constituent of humic coals. H&G, 1963, part I. Occurs in lenticular bands, calcified from a partial natural vegetable growth. When it constitutes 30 to 60 percent of total sam, termed abundant; over 60 percent, very abundant; between 15 and 30 percent, moderate; below 15 percent, sparse. Pryor, 3.

vitrine antimony. See antimony glass. CCD 64, 1961.

vitrine china. A white and dense, but not translucent type of porcelain, used for the manufacture of sanitary ware. Rosenthal.

vitrine-china sanitary ware. A high grade ceramic ware used for sanitary appliances and manholes. Mixed with white-burning clays and finely ground minerals. After it has been fired at a high temperature the ware has a vitreous appearance. It is resistant to water absorption greater than 0.3 percent of the ware when dry. It is coated on all exposed surfaces with an impervious nonporous vitreous glaze giving a white or colored finish. A typical batch for this type of body in 20 to 30 percent clay, 10 to 20 percent feldspar, 30 to 40 percent flint, 0 to 5 percent quartz, and sometimes nepheline syenite is used instead of feldspar. Dodd.

vitreous enamel. An inorganic glass which is fused onto a metal article in the form of a relatively thin coating and provides protection against corrosion. Dodd.

vitrine fusion. Gradual fusion: having no sharp melting point. Webster 3d.

vitrine luster. The reflection of light so as to produce the appearance of broken glass.

vitreous silicate; black amorphous selenium. a. One of the allotropic forms of selenium. It is brownish-black and is produced as a brittle, glassy mass having a specific gravity of 4.28. Merriman, b. Black, amorphous; Se; molecular weight 78.96; atomic weight, 78.96; vitreous luster; transformation temperature from amorphous selenium to hexagonal selenium, 60° to 80° C; boiling point (selenium), 684.8° C; insoluble in water; and soluble in sulfuric acid, in carbon disulfide, and in carbon disulfide. Amorphous selenium, which is black in vitreous form, is red in powder form. Six allotropic forms have been claimed for selenium but only three forms are established: (1) amorphous selenium; (2) monoclinic selenium; and (3) trigonal selenium. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-134, B-215.

vitreous silica. A glass made from silica; it may contain numerous small bubbles, in which case it is translucent; when free from bubbles it is transparent. An important test of the vitrification is the required surface expansion, hence a high resistance to thermal shock; vitreous silica tubes, etc., find considerable use in chemical engineering. Dodd.

1207

vitreous silica. See vitreous silicate.

vitreous slip. A slip coating matured on a ceramic body, producing a vitrified surface. ASTM C242-60.

vitrific. An adjective designating (volcanic) glassy or glassy-coated material. It may be advisable to restrict the term to fragments made up of at least 75 percent by volume of glass and amorphous material. In addition, the term vitric crystal for ejecta containing between 50 and 75 percent glass. In addition, to the above usage, vitric may also be applied to any rock having the nature or quality of glass. Stokes and Varnes, 1955.

vitrific. a. Fused silicious compounds, such as glasses and enamels, as distinguished from metallic and aluminous compounds. Standard, 1964. b. The art or history of glass production. Standard, 1964.

d. Tuff. An indurated deposit of volcanic ash dominantly composed of glassy fragments blown out during a volcanic eruption. The term should be properly restricted to tuffs containing more than 75 percent by volume of glass particles. See also tuff. A.G.I.

vitrification. See vitrification. Fay.

vitrification. The manufacture of vitreous or vitrified wares, as glass. Standard, 1964.

vitrifiable. Of, or pertaining to, a substance that can be vitrified. Webster 3d.

vitrification. a. An act or instance or the vitrification range. The maturing range of a vitrifying body. Webster 3d. b. Any process tending to make a body more vitreous. Synonym to tuff. Standard, 1964.

vitrinite. The term vitrinite was introduced by B. Alpern in 1954, and in modified form vitrinite was adopted by the Nomenclature Subcommittee of the International Committee for Coal Petrology to designate a material having characteristics of both fusain and vitrain. See also vitrinite.

vitrinite. The term vitrinite was introduced by B. Alpern in 1954, and in modified form is used to designate a material consisting of coalified plant remains that can be vitrified. A.G.I.

vitrinite. A group name comprising collinite and telinite. Distinction between collinite and telinite depends in part on the method of observation. The distinction is mostly made in thin section or after etching a polished surface. Often there is uncertainty of distinction by reflected light and in such cases it is proper to use the general term vitrinite. See also collinite; telinite. IHCP, 1963, part I.

vitrinite bands. Where defined bands or streaks of a uniform brilliant black appearance about 1/16 inch thick, sometimes up to 2 inches thick, constituting the major portion of bright coal. Under the microscope, these bands are found to be derived from separate small pieces of wood or bark, frequently retaining their original cell structure. Vitrinite bands form an excellent coal that is readily oxidized. Cooper, p. 386.

vitrinod. The process in coalification that results in the formation of vitrinite. See also coalification. Compare incorporation; fusion. A.G.I.

vitrinite. a. A form of any of various metals (as copper, iron, or zinc, for example); especially a hydrate (as the hexahydrate) of such metals and often containing a glassy appearance or luster. Webster 3d. b. To dip (as metal) in dilute sulfuric acid. Webster 3d.

vitrulite. An old name for sulfuric acid. Webster 3d.

vitrulite, oil of. See sulfuric acid. CCD 6d, 1955.

vitrulite stone. A hard crystalline mass that consists chiefly of ferric sulfate and aluminum sulfate. Obtained by exposing pyritic chert to the atmosphere for some years, it is frequently used for incrusting. Used in manufacturing fuming sulfuric acid.

vitrulite. In 1955 the Nomenclature Subcommittee of the International Committee for Coal Petrology resolved to apply this term to the microcellulose consisting principally of collinite and telinite. It must contain at least 25 percent vitrinite and bands of vitrinite having a width of more than 50 microns are recorded as vitrinite. It is the most abundant constituent of humic coals. It is particularly abundant in vitrains, rather less abundant in charaids, and limited to small amounts in durains. IHCP, 1963, part I.

vitrino. A prefix meaning glassy and used before many rock names, as vitrophyre, in order to indicate a glassy surface. Fay.

vitrinida. Basalt glass. Webster 3d.

vitrinoid. A rock-type coal consisting of vitrinite (collinite or telinite) and other matter that is mainly exinite, and in which the other materials exceed vitrinite in quantity. Compare clarovitrinite. A.G.I.

vitrinoid. Pertaining to a structure typical of vitrinite glass in which the particles usually have crescentic, rudely triangular outline, or somewhat concave cross sections. Ford.

vitrinite. A coal constituent transitional between vitrinite and fusain, and showing plant cell structure. The cell walls are soaked with vitrinite, where the cell cavities are empty. It is not a mixture but a transition. Accepted by the Heerlen Congress of 1935 to designate material transitional between vitrinite and fusain with fusain being predominant. Compare fusovitrinite. A.G.I.

vitrinite. A unit of atomic structure, particularly in silica glass. Its basis is a pentagonal ring of five SiO, tetrahedra; these rings can be built up into three-dimensional clusters but only to a limited extent because of increasing distortional stress; a cluster of the pentagonal ring is a vitrinite. Its most important property, as a basis for the understanding of the properties of glass, is its fivefold symmetry which

troctolite. Like glast. Nokes.
vitroleite. Telain (fragments of plant tissue completely soaked with structureless vitreous, that is, cell walls as well as cell cavities). Judged obsolete by the Heerlen Congress of 1935. AGI.

Vitros. Trade name for partly calcined cya- nitic manufactured by the Vitros Company. It must be in two grades—89 per cent through 100 mesh, for use in a pottery body. A coarser grade is made for use as a glaze and called Virovit. AGI.

Vivianite. A mineral, Fe3(PO4)6(OH)2, monoclinic. Colorless when unaltered, or blue to green, grey, brown, or yellowish, usually with a vitreous or glassy luster. Exposure. Also called blue iron earth; blue ocher. A.G.I.; obsolete by the Heerlen Congress of 1935. Compare telovitrain. A.G.I.

vol. a. A general term for porous space or other openings in rock. In addition to pore space, the term includes vesicles, solution cavities, or any openings either primary or secondary. Synonym for pore; interstice. A.G.I. b. Space in a soil mass not occupied by solid mineral matter. This space may be occupied by air, water, or gases, or by a liquid material. ASCP P128c. c. Porosity; unfilled space in unit volume of granular material compacted under stated conditions, and expressed either in percentage or ratio of solid to void. Prior, 4. d. That portion of a borehole from which the core could not be recovered. J. of Petroleum Technology, 1964., p. 237.

volcanic. a. Characteristic of, pertaining to, situated in or upon, formed in, or derived from volcanoes. Fay. b. Of mineral, originating from magma flowing from depths to the earth’s surface through cracks or vents in the rock. A volcanic placer is minute material left when such a channel cools. Pryor, 3. c. Igneous rocks which have been derived from volcanoes. Fay.

volcanic belt. A chain of volcanoes usually in a linear or arcuate arrangement; generally of great extent, and confined to orogen along the margins of the continents or within the ocean basins; the sequence of the granites of the Aeulonian island chain comprise a volcanic belt. AGI.

volcanic bomb. A detached mass of lava shot out by a volcano which, as it falls, assumes a rounded form, like a bombshell. See also bomb. A.G.I.

volcanic breccia. A more or less indurated pyroclastic rock consisting chiefly of accessory and accidental angular ejecta, 52 millimeters or more in diameter, set in a fine tuff matrix. If the matrix is abun- dant, the term tuff breccia seems appro- priate. A.G.I. b. A rock made up of angular volcanic fragments of either pyroclastic or detrital origin coarser than 2 millimeters in a chemical or mineral composition or texture or with no matrix. A.G.I. Supp. c. A rock composed of angular non-volcanic fragments enclosed in a volcanic matrix. A.G.I. Supp.

volcanic butte. A special type of butte re- sulting from the differential weathering and consequent isolation of narrow verti- cal intrusions of igneous rocks. Stokes and Varnes, 1955.

volcanic cinder. Synonym for volcanic ash. A.G.I.

volcanic chrysolite. Vesuvianite. Fay.

volcanic clay. A term sometimes applied to bentonite, which is derived from devitrified and chemically altered glassy volcanic ash or tuff. Stokes and Varnes, 1953.

volcanic cluster. A group of volcanoes, volcanic cones, or volcanic vents without any apparent systematic relationship. Validity uncertain. A.G.I.

volcanic conglomerate. A rock composed mainly or entirely of rounded or subangu-
volcanic doma. A volcanic form consisting of rounded masses of viscous lava squeezed out from the orifice, or of portions of older lavas or ejectamenta elevated by the pressure of new lava rising from beneath. The term dome is also applied as a geographical term to volcanic mountains of the type of Mauna Loa, in Hawaii. Holmes, 1928.

volcanic earthquake. A seismic disturbance which is due to the direct action of volcanic force, or one whose origin lies under or near a volcano, whether active, dormant, or extinct. A.G.I.

volcanic eruption. The breaking forth of lava, pumice, dust, etc., from the mouth of a volcano. Standard, 1964.

volcanic glass. A volcanic form consisting of volcanic glass. Natural glass produced by the volcanic ore deposits. The major group of volcanic mud and sand. Deposits occurring volcanic rock. Any rock of volcanic origin; rounded masses of viscous lava squeezed from formerly solidified lavas. A.G.I. formed by the accumulation of rounded rocks, in a paste of the same material. Lar fragments, chiefly or wholly of volcanic or extinct. A.G.I. which is due to the direct action of volcanic phenomena. Webster 3d.

volcanic glass. Natural glass produced by the cooling of molten lava or some liquid fraction of molten lava, that rapidly to permit crystallization, and forming such material as obsidian, pitchstone, sideromelane, and the glassy mesostasis in the groundmass of many effusive rocks. A.G.I.

volcanic island. An island that is formed as a result of volcanic action. MacCracken.

volcanic mud. a. Mud formed by the mixture of water with volcanic dust, ash, or other fragmental products of volcanic eruptions. These materials often initially hot and flowing down the flanks of a volcanic cone as a hot lahar or mudflow. A.G.I. b. A deposit of fine-grained, usually calcareous, detrital volcanic material, commonly containing a high proportion of clay, on the sea floor around the margins of volcanic islands. A.G.I.

volcanic mud and sand. Deposits occurring around volcanic oceanic islands and coastlines. The deposits near shore contain fragments of volcanic rocks and minerals and vary in size from boulders to clay and silt. Out to sea, the finer particles and alteration products form clayey or chloritic muds. Holmes, 1928.

volcanic ore deposits. The major group of ore deposits of magmatic origin, designated as young by European mineralogists, which have been formed under near-surface conditions and very often in Tertiary or younger volcanic rocks. In a strict sense, deposits formed in relation to surface eruptions. Schaeferdaker.

volcanic pipe. Sometimes the streams of lava are very fluid, and cool at the bottom and upper surfaces much more rapidly than in the interior. The rocks thus formed remain, while the interior molten lava flows on and causes the stream to diminish in size, which are known as volcanic pipes. A.G.I.

volcanic plume. A lava flow, spreading out over a modern slope, fills irregularities and may build a plain; and so also may volcanic ash emptied and strewn over the country on one side of the cone. See also plume. A.G.I.

volcanic plain. A lava flow, spreading over a modern slope, fills irregularities and may build a plain; and so also may volcanic ash emptied and strewn over the country on one side of the cone. See also volcano. A.G.I.

volcanic rock. Any rock of volcanic origin; volcanic igneous rocks are those erupted molten material forming lava flows, dikes in the crater walls, volcanic plugs, etc.; volcanic sedimentary rocks are the fragmental materials ejected in explosive eruptions, forming tuff, agglomerate, etc. Fay. A general collective term for extrusive igneous and pyroclastic material and rocks. A.G.I.

volcanic state. A volcanic basin of engulfment, or downfaulting, with a floor area many times greater than the cross section of the associated vent. Fay. Compare caldera.

volcanic tuff. See tuff. Fay.

volcanic vent. An opening or channel in the earth's crust through which volcanic materials are transported and out of which volcanic materials (lava, pyroclastic detritus) are erupted at the surface. Fay. The name is based on the original occurrence in Volynia, U.S.S.R. Fay.

volcanic zone. In mining, the act of exploding blasts in sections. Standard, 1964. A round of blasting is started at any one time. Fay.

volt. a. The practical meter-kilogram-second (mks) unit of electrical potential difference and electromotive force (emf) that equals the difference in potential between two points in a conducting wire carrying a constant current of 1 ampere when the power dissipated between these two points is 1 watt. Web.

voltmeter. A device used for measuring the potential difference between two points, any point being used as a fixed reference. Fay.

voltage. A. The place where tin ore is stored to be dried before being put into the melting furnace. Nelson.

voltage efficiency. The ratio of the equilib-
voltage efficiency

nium reaction potential in a given electro-
chemical process to the bath voltage.

Lounehim.

voltage regulation. This is the change in out-
put voltage which occurs when the load is
reduced from rated value to zero with the values of all other quantities remaining unchanged. Coal Age, 1.

voltage. A dull oil-green, brown to black
chemical solution of strength proportional
to gravimetric analysis. Quantitative chemical
termination.

volumetric. a. A spiral casing to a mine fan to
provide an area of passage, which gradually
increases in proportion to the in-
creasing size of the fan from the front. See also evase chimney. Nelson. b. A spiral casing for a centrifugal pump or a fan designed so that speed will be con-
verted to pressure without shock. Ham.

volute pumps. This type of centrifugal pumps is the most commonly used. The
impellers may be open, closed or semi-
enclosed, single-suction, double-suction or
nonclogging. The casing housing the rotating elements may be vertically or horizontally split, and a few designs have casings di-
vided on an angle from the horizontal.
Pumps in this class usually have a specific speed below 4,000 with single-suction im-
PELLERS and a specific speed of 5,000 with double-suction impellers. Pit and
Quarry, 53rd, Sec. E, p. 56.

von Neumann spike. The pressure peak
leading the detonation wave prior to the

vonsenite. A black borate of ferrous and
terric iron and magnesium, 3(Fe,Mg)
O.Bo:Fe0O. Coarse granular masses.
Orthorhombic. From Pointe Claire, Calif. English. Synonym for palesite.

von Sterneck-Askania pendulum. A device
for measuring the vertical component of
gravity, characterized by the use of four
pendulums in a single case. A.G.I.

von Wolff's classification. A chemicalmin-
eralogical classification of igneous rocks. A.G.I.

vug. Applied to rocks or mineral deposits
abounding in vugs, as vuggy lode, vuggy rock.

vuggy. A lode or vein in which vugs or
drussy cavities are of frequent occurrence.
Fay.

vuggy porosity. Porosity due to vugs in cal-
careous rock. The term vuggy is used by
some writers but condemned by others.
See also vug. A.G.I.

vuggy rock. Eng. A stratum of cellular struc-
ture, or one containing many cavities. Fay.

vurc-arching. When a pocket of rock in the
periphery of an excavation is weaker than
the remainder, it may
sometimes written vug, vogue, vug, vug, vog, vogue, and incorrectly called bug, bug hole, bug hole, see also geode. Fay; Long. b. A cavity, often with a mineral
lining of different composition from that of the surrounding rock. Holmes, 1928. c. A mining term for an unfilled cavity in a vein, generally with a mineral
lining of different composition from that of the immediately surrounding ore. Holmes, 1920. d. The word is used by
petroleum geologists for any opening from
the size of a small pea to the size of a
boulder. A.G.I.

vug. Applied to rocks or mineral deposits
abounding in vugs, as vuggy lode, vuggy rock.

vughhole. A lode or vein in which vugs or
drussy cavities are of frequent occurrence.
Fay.

vugporosity. Porosity due to vugs in cal-
careous rock. The term vuggy is used by
some writers but condemned by others.
See also vug. A.G.I.

vugy rock. Eng. A stratum of cellular struc-
ture, or one containing many cavities. Fay.

vulg-arching. When a pocket of rock in the
periphery of an excavation is weaker than
the remainder, it may fail under the ring
stress. Fragments split away or fall out until
all the weak rock is removed, form-
ing an artificial vug. This is called vugh-
arching. Spalding.

vug hole. Synonym of vug. Long.

vug. Unfilled cavities remaining in the
midst of cavity-filling ore deposits. Bateman.

vuglar. Synonym for vug. A.G.I.

vulcan coal powder. Explosive; used in

vulcanism. Same as volcanism. Fay.

vulcanist. In geology, one who holds or
ought the plutonic theory of the forma-
tion of rocks. See also plutonic. Compare
neptunist. Usage obsolete. Fay.

vulcanite. a. A dark-colored, hard variety of
vulcanized India rubber that differs from the
softer rubber in having been Vulcan-
ized at a high temperature; ebonite. It
takes a high polish, and is used for
making buttons, ornaments, and in elec-
trical work because of its fine insulating
properties. Standard, 1964. b. A mineral,
CuTe, with nickel and native tellurid-
ium, occurring in patches on rock fragments from the

vulcanites. A general name for igneous rocks
vulcanites

of fine-grain size, normally occurring as lava flows, and thus in direct contrast with phanerites. Cf. D.D.

vulcanized rubber. A rubber which has been heated with sulfur; to change the properties of rubber by treatment with sulfur. Nelson.

vulcanizing. Process used to modify properties of rubber (strength, elasticity, stretch) by combination with sulfur, or a suitable sulfur-based compound, perhaps aided by heat and chemical accelerators. Used, among other things, in repair of damaged conveyor belts. Pryor, 3.

vulcanizing machine. Consists essentially of two heavy metal platens which are placed one on each side of the previously prepared joint and clamped firmly together. Each platten is heated, and this combined application of heat and pressure over a period completes the joint. These machines are used to vulcanize the belt joints of conveyors. Bureau of Mines Staff.

vulcano type. In vulcanology, the activity characterized by a sudden release of ash clouds. Heu.

vulcanic powder. High explosive composed of 40 percent nitrates, 52 1/2 percent sodium nitrate, 10 1/2 percent charcoal and 7 percent sulfur. Pryor, 3.

vulcanizing. Weakening of glass in use, due to scratching and abrasion which makes it more readily subject to breaking. Bennet, 2d ed., 1902.

vulpis. A scaly, granular variety of anhydrite; it is cut and polished for ornamental use. Webster 3d.

vulpile. a. Variety of latite containing phenocrysts of sanidine, andesine, augite, and hornblende; it is cut and polished for ornamental use. Webster 3d.

Vulturnite. a. A variety of latite containing phenocrysts of sanidine, andesine, augite, and hornblende; it is cut and polished for ornamental use. Webster 3d.

W

Waelc process

1213

Wales

zinc is vaporized and converted to oxide fumes by the process of working. Nelson. b. N. of Eng. An underground engine plane or horse road. Fay. c. Eng. See also rolopy.

t. N. of Eng. One who works in the rolo. Fay. wailer. N. of Eng. It is to be noted that the coal, a vitreous substance, when burnt, leaves a black dust that falls through a screen into the mine car with the coal. A variation of wale. Parry. wagon. A wagon used in the 16th century on the overland tracks for conveying coal to the staithes (or warehouse on the river). A trolley. Nelson.

wagon. A wagon used in the 16th century on the overland tracks for conveying coal to the staithes (or warehouse on the river). A trolley. Nelson.

wagon drill. A drilling machine mounted on a light, wheeled carriage. B.S. 3618, 1964. sec. 6. b. A wheel-mounted pneumatic percussive type rock drill. Some- times the name is applied to a wheel-mounted diamond drill machine. Long. c. Dukinfield. d. A hand-held ma- chines, on road construction work, in excavating foundations for bridges, buildings, and ditches and in quarrying. They are driften mounted on a vertical steel frame that is carried on a light, mobile, three-wheeled gabby, having steel or rubber-tired wheels. Holes can be drilled to depths of 40 feet at any angle from the vertical to the horizontal. Louis, p. 88.

wagoner. N. Staff. a. A man or boy who with a horse hauls mine cars underground. Fay.

wagon hole. Eng. The place where the tramway ends in a working place. Fay.

wagon mine. Same as snowbird mine. Fay.

wagon pluck box. A device for moving rail- way wagons and locomotives short dis- tances by hand. It consists of a cast-steel wedge-shaped box with a wood handle. The tip is placed over the rail and under the wagon wheel and the up-and-down movement of the handle exerts suffi- cient pressure on the wheel to move the wagon. Nelson.

wagon retarder. A device for brining a de- railed wagon back on to the track. It usually consists of ramp elements, which can be freed at intervals along the track or temporarily fitted to the track just beyond the end of the wagon. The wagon is then pulled to cause the wheels to ride up the ramp and back on to the rails. Nelson.

wagon retarder. An appliance which re- duces the speed of a wagon traveling in excess of a designed value (say, 3½ miles per hour), while having no effect on wagons moving at speeds less than this figure. The appliance is a self-contained hydraulic unit. See also automatic wagon retarder. Fay.

wagon rooms. Rooms driven in inclined seams in such a way that an adequate gradient is secured for the cars, which are often hauled to the heads of the rooms. Stout. Nelson.

wagon spotting appliance. A wagon spotting appliance. Fay.

wagon spotting appliance. A wagon spotting appliance. Fay.

wagon spotting appliance. A wagon spotting appliance. Fay.

large coal fields and iron smelting works. The South Wales coal field alone covers about 1,500 square miles with deposits ranging from bituminous and steam coal to anthracite. *Encyclopedia Americana.*

**walking.** a. Eng. Cleaning coals by picking.

**Walker bunker conveyor.** Trade name for a walker. A walking dragline. Nichols.

**walking bar.** A trunnion or walking beam. Fay.

**walking.** a. The movement forward or backward. Nelson.

**Walker VACUUM mixer.** See vacuum mixer.

**walking-beam kiln.** A tunnel kiln of unusual type, the ware (set on bats) being moved through the kiln in steps by a mechanism that alternately lifts the boat and sets them down further along the kiln. *Dodd.*

**walking chain.** One of two chains forming a closed endless loop, one over the head and one single rail vertically beneath this in the floor. *Webster 3d.*

**walking delegate.** A business representative of a labor union appointed to visit members and to report and keep in touch, to secure the enforcement of union rules and agreements, and at times to represent the union in dealing with employers. *Webster 3d.*

**walking dragline.** a. A dragline which is equipped with apparatus which permits it to "walk" by the power of a motor placed in front of the working dragline. B.C.I. b. An excavator of very large capacity, equipped with walking beams operated by eccentrics in place of the usual power motor, and with a capacity of 22 hundredweight per hour. Fay.

**walking ganger.** A traveling ganger who is responsible for supervising the work of the ganger in the immediate neighborhood. Fay.

**walking miner.** See Joy walking miner. Nelson.

**walking props.** Another name for self-advancing supports. *Coal Age, v. 71, No. 8, August 1966, p. 201.*

**walking support.** See self-advancing supports. Nelson.

**walkingout.** Act of walking out or leaving; specifically, a labor strike. *Webster 2d.*

**wall.** a. The side of a level or drift. Fay. b. See walling or lining a shaft. Fay.

**wall and hanging wall.** Beerman. f. Eng. A rib of solid coal between two rooms; usually found in long walls. Long.

**wall cake.** Set cake, b. Long.

**wall closure.** See closure. Spalding, p. 76.

**wall controlled shoots.** Ore shoots that occur between a drill string and the walls of a borehole. Long.

**walking crib.** Eng. Oak cribs or curbs upon which the workmen stand when walking or lining a shaft. Fay.

**walking curb.** See curb; foundation curb; water ring. Nelson.

**walking scaffold.** See bricking scaffold. Nelson.

**wall hook.** A fishing tool shaped like a side rasp, but unlike the side rasp, the surface of the wall hook are smooth. Long.

**walking.** a. The brick or stone lining of shafts. Fay. b. Derb. Stacking or setting up ironstone, etc., in heaps, preparatory to being measured or weighed. Fay.

**walking wall.** Long. b. A horizontal member, usually at the side of a reef, shaft, or level; foot; from the mineralizing fluids. Stokes and Varnes, 1925.

**wall cut.** See closure. *Spalding, p. 76.*

**wall coat.** Scot. Breast coal; the middle division of three in a seam, the other two being termed top or bottom, and the middle wall-coal controlled shoots. Ore shoots that occur adjacent to certain favorable wall rocks that have been unusually influenced deposition from the mineralizing fluids. Stokes and Varnes, 1925.

**wall cutting.** Scot. Side cutting or shoring the solid coal in opening working places; trimming the sides of a shaft. Fay.

**wall drift.** The amount of friction resulting from the drill rods rubbing against the walls of a borehole or the inside surface of the casing lining a borehole. Long.

**walking.** a. Laborer who builds walls to support backfilling. *Fay. See pack builder, b. D.O.T.*

**wall face.** Scot. The face of the coal wall; the working face. Fay.

**wall friction.** a. The drag created in the flow of a liquid or gas because of contact with the wall surfaces of its conductor, such as the inside surfaces of a pipe or drill rod or the annular space between a drill string and the walls of a borehole. Long. b. The drag resulting from compaction of loose materials around the outside surfaces of pipe driving, casing, etc. Also called skin friction. Long. c. Friction which arises between two back of a retained wall and the retained soil. Long. d. Frictional resistance mobilized between a wall and the soil in contact with the wall. *ASCE 11966.*

**wall hook.** A fishing tool shaped like a side rasp, but unlike the side rasp, the surface of the wall hook are smooth. Long.

**walking.** a. The brick or stone lining of shafts. Fay. b. Derb. Stacking or setting up ironstone, etc., in heaps, preparatory to being measured or weighed. Fay.

**walling.** a. A dragline which is equipped with apparatus which permits it to "walk" by the power of a motor placed in front of the working dragline. B.C.I. b. An excavator of very large capacity, equipped with walking beams operated by eccentrics in place of the usual power motor, and with a capacity of 22 hundredweight per hour. Fay.

**walking ganger.** A traveling ganger who is responsible for supervising the work of the ganger in the immediate neighborhood. Fay.

**walking miner.** See Joy walking miner. Nelson.

**walking props.** Another name for self-advancing supports. *Coal Age, v. 71, No. 8, August 1966, p. 201.*

**walking support.** See self-advancing supports. Nelson.

**walkingout.** Act of walking out or leaving; specifically, a labor strike. *Webster 2d.*

**wall.** a. The side of a level or drift. Fay. b. See walling or lining a shaft. Fay.

**wall and hanging wall.** Beerman. f. Eng. A rib of solid coal between two rooms; usually found in long walls. Long.

**wall cake.** Set cake, b. Long.

**wall closure.** See closure. Spalding, p. 76.

**wall controlled shoots.** Ore shoots that occur between a drill string and the walls of a borehole. Long.

**walking crib.** Eng. Oak cribs or curbs upon which the workmen stand when walking or lining a shaft. Fay.

**walking curb.** See curb; foundation curb; water ring. Nelson.

**walking scaffold.** See bricking scaffold. Nelson.

**walling stage.** A movable wooden scaffold suspended from a crane or derrick, upon which men stand when walling or lining a shaft. Fay.

**walking up.** The building up of a layer of mud cake or compacted cuttings on the borehole sidewalks; the filling of cracks or caved portions of the borehole walls with cement. Long.

**walking off.** To seal cracks, crevices, etc., in the wall of a borehole with cement, mud cake, compacted cuttings, or the like. Long.

**walking wall.** Long. b. A windlass; a stowe. Fay.

**walking pack.** The compaction of sticky cuttings that collect and adhere to the walls of a borehole. Long.

**wall plate anchor.** A horizontal timber supported by posts resting on sills and extending lengthwise on each side of the tunnel. On these wallplates the roof supports rest. *Steelfer, b.* A horizontal member, usually of wood, bolted to a masonry wall to which the frame construction is attached. Also called headplate. *ACGI.*

**wall plate.** a. A horizontal timber supported by posts resting on sills and extending lengthwise on each side of the tunnel. On these wallplates the roof supports rest. *Steelfer, b.* A horizontal member, usually of wood, bolted to a masonry wall to which the frame construction is attached. Also called headplate. *ACGI.*
wallplates. a. Corn. The two sidepieces of a timber frame in a shaft, parallel to the strike of the beds, used after the shaft is sunk, on the sides. When not sunk on the lode, the two longest horizontal pieces of timber in a shaft, parallel to the lode in a set used in a pole shaft. C.T.D.

Hawkes.

ware. a. An area in a wall, sometimes used synonymously with ball clay. CCD 6d, 1961.

ware cleaner. One who smooths the surface of glazed-dipped vitreous china, such as sanitary fixtures and lavatories, with the fingers, removing checks, cracks, and loose material to prepare the ware for kiln baking. D.O.T. 1.

ware dresser. One who dresses and polishes glastone. Also called buffer. D.O.T. 1.

ware finisher. One who shapes handles and lips and other ends on pressed ware, such as pitchers, vases, and bowls. Cutters off required amounts of molten glass from gob (mass of molten glass), held by gatherer, with nippers and attachments to pressed ware to form handles. Shutters, handles while hot and pliable to desired contours, using a carbon stick. Manipulates carbon stick along top edges of heated ware to form lips and other decorations. Also called glassware finisher. D.O.T. 1.

wareformer. A general term applied to a worker who forms clay into vessels or other objects by hand or by using molds or presses. D.O.T. 1.

ware washer. One who washes all baked pottery or porcelain ware before it is moved to another department. Fay. D.O.T. 1.

wareboy. One who carries bisque ware from the firing room to the dipping room, English. Fay. D.O.T. 1.

ware dresser. One who dresses and polishes glastone. Also called buffer. D.O.T. 1.

ware finisher. One who shapes handles and lips and other ends on pressed ware, such as pitchers, vases, and bowls. Cutters off required amounts of molten glass from gob (mass of molten glass), held by gatherer, with nippers and attachments to pressed ware to form handles. Shutters, handles while hot and pliable to desired contours, using a carbon stick. Manipulates carbon stick along top edges of heated ware to form lips and other decorations. Also called glassware finisher. D.O.T. 1.

ware washer. One who washes all baked pottery or porcelain ware before it is moved to another department. Fay. D.O.T. 1.

wareboy. One who carries bisque ware from the firing room to the dipping room, English. Fay. D.O.T. 1.

ware dresser. One who dresses and polishes glastone. Also called buffer. D.O.T. 1.

ware finisher. One who shapes handles and lips and other ends on pressed ware, such as pitchers, vases, and bowls. Cutters off required amounts of molten glass from gob (mass of molten glass), held by gatherer, with nippers and attachments to pressed ware to form handles. Shutters, handles while hot and pliable to desired contours, using a carbon stick. Manipulates carbon stick along top edges of heated ware to form lips and other decorations. Also called glassware finisher. D.O.T. 1.

wareformer. A general term applied to a worker who forms clay into vessels or other objects by hand or by using molds or presses. D.O.T. 1.

ware washer. One who washes all baked pottery or porcelain ware before it is moved to another department. Fay. D.O.T. 1.

wareboy. One who carries bisque ware from the firing room to the dipping room, English. Fay. D.O.T. 1.

ware dresser. One who dresses and polishes glastone. Also called buffer. D.O.T. 1.

ware finisher. One who shapes handles and lips and other ends on pressed ware, such as pitchers, vases, and bowls. Cutters off required amounts of molten glass from gob (mass of molten glass), held by gatherer, with nippers and attachments to pressed ware to form handles. Shutters, handles while hot and pliable to desired contours, using a carbon stick. Manipulates carbon stick along top edges of heated ware to form lips and other decorations. Also called glassware finisher. D.O.T. 1.

wareformer. A general term applied to a worker who forms clay into vessels or other objects by hand or by using molds or presses. D.O.T. 1.

warning signals. Signals given to men in a mine to notify them that some danger exists as fire, etc., by blinking lights, sounding alarms or bells, or by shutting off the compressed air lines. Fay.

warpage. a. Distortion which may occur in a ceramic shape resulting from bending or bowing during manufacture. A.R.I.

warp dresser. In the asbestos products industry, one who winds strands of asbestos yarn from the filling yarns onto a bobbin by machine, for use in weaving asbestos cloth. D.O.T. I.

warped. Scot. Irregularly bedded, or pliated. Fay.

warped fault. Faulting accompanied or followed by folding or warping, particularly applicable to overthrusts and underthrusts. Nelson.

warping. a. The bending or twisting of a ceramic article in drying or firing. Bureau of Mines Staff. b. Change in the original contour of the enamelware produced during firing. ACSB-3. c. The gentle bending of the earth's crust without forming pronounced folds or dislocations. A.C.I. d. Conversion of a lagoon or tidal-flat area into a marsh. Schiermacker.

warping dam. A dam raised on tidal-flat area to promote marine deposition. Schiermacker.

warrent. a. A general term for the clay floors of coal seams, particularly when hard and tough. Nelson. b. Lanc. Synonymous with clunch; also known as spavin. Compare warren. Fay. Also known as spavin.

warrent clay. Staff. Underclay. Arkell.

warren. Long. Bank; clunch; etc. Compare warrent. Fay.

warrenite. A dark-brownish to dull-black mineral found in prismatic orthorhombic crystals with perfect cleavage, 3(Mg,Fe)2(TiO2),(CO3)6(OH)2, Mohs hardness, 3-4; specific gravity, 3.4. Larsen, p. 139.

Warwick safety device. A safety appliance placed near the entry of an inclined haulage road to stop a tram running wild down the incline. It consists of a heavy beam longer than the height of the road, and normally held up by a rope attached to a haulage hand, which releases the upper end of the beam which drops and stops the tram. Nelson.

Warwickshire method. A method of mining contiguous seams. See also bord-and-pillar.

wash. a. Applied to the defined bed of water-worn gravels, boulders, and sand in alluvial deposits and containing concentrations of the metal or mineral sought. Nelson. b. In coal mining, a washout. Nelson. c. The wet cleaning of coal or ores. Nelson. d. Tail clay, silt, sand, etc. removed from the coal. Hudson. e. A western miner's term for any loose, surface deposits of sand, gravel, boulders, etc. Fay. f. Auriferous gravel. Fay. g. To make a wash of any water, gravel, or objects, or to crush ore, to the action of water to separate the valuable material from the worthless or less valuable as: to wash gold. Webster 3d. h. To pass a gas through or over a liquid for the purpose of purifying it, especially by removing soluble components. Webster 3d. i. To clean cuttings or fragments of coal, rock, etc. from washout. Webster 3d. j. The erosion of core or drill string equipment by the action of a rapidly flowing stream of water or mud-laden liquid. Long. k. The term belongs neither to the terminology of geology nor of law. The wash of a stream is the sandy, gravelly, boulder-bestrewn part of a river bottom. The cone of the stream is not synchronous with wash of the stream; nor contaminates with it. Rickitts, I. I. To overlay with a thin coat of paint. Webster 3d. m. To dephosphorize molten pig iron by adding a molten metal containing less phosphorus than the metal to be treated. Webster 3d. n. In founding, to coat, as a core or mold, with an emulsion, as of graphite, in order to improve the casting. Standard, 1964 o. A coating applied to the face of a mold prior to casting. ASM Gloss. p. Coarse alluvium; an alluvial fan. Webster 3d. q. The dry bed of an intermittent stream often at the bottom of a canyon. Also called dry wash.

webster 3d.

washability. Coal properties determining the amenability of a coal to improvement in quality. B.S. 3552, 1962.

washability curve. A curve or graph showing the results of a series of float-and-sink tests. A number of overlaid curves are drawn to illustrate different conditions or variables, usually on the same axes, thus presenting the information on a single sheet of paper. Washability curves are essential when designing a new coal or mineral washery. Nelson. They are one major type of washability curve: characteristic ash curve, cumulative float curve, cumulative sink curve, ballistic or specific gravity curve. B.S. 3552, 1962.

washback. See wash mill. Dodd.

washbanding. A form of pottery decoration, usually on-glaze, in which a thin layer of color is applied over copper oxide in order to increase the hardness of the ware by means of a brush. Dodd.

washboard. Unintentional waviness on the surface of a washwater; also known as ladded. Dodd.

wash boring. a. Drilling by use of jet water applied inside casing pipe, in unconsolidated ground. Pryor. b. A test hole from which samples are brought up mixed with water. Nichols.

wash boring drill. A drill rig utilizing the jet action of a high-pressure stream of water to produce a borehole in soft or unconsolidated material. Long.

wash-boring gear. The equipment used in wash boring. Long.

wash bottle; washing bottle. a. A bottle or flask fitted with two glass tubes passing through the stopper, so that on blowing into one tube a stream of water issues from the other tube. The stream may be directed upon anything to be washed or rinsed. Hess. b. A nipple for washing dishes by passing them through liquid contained in it. Hess.

washbox. In coal preparation, the jig box in which the feed is divided by transverse division plates, each being capable of separate control. B.S. 3552, 1962.

washbox center weir. An adjustable plate situated between the feed end and the discharge end of a washbox and serving to regulate the forward movement of material into the box. B.S. 3552, 1962.

washbox conglomeration. The sections into which a washbox is divided by transverse division plates which extend above the screen plate to form a weir; each compartment usually contains two or more cells. B.S. 3552, 1962.

washbox discharge sill. That part of the washbox over which the washed coal passes out of the box. Usually the discharge sill is a part of the discharge-end refuse extraction chamber. B.S. 3552, 1962.

washbox feed sill. That part of the washbox over which the feed passes when it enters the box. Usually the feed sill is a part of the feedend refuse extraction chamber. B.S. 3552, 1962.

washbox screen plates; grid plate; sieve plates; bedplates. The perforated plate or grid which supports the bed of material being treated. B.S. 3552, 1962.

wash dirt. a. The tailings or material discarded in the operation of washing an alluvial deposit for gold. Nelson. b. Gold-bearing earth worth washing. Also called wash stuff; washing stuff; wash gravel; wash gravel; washing stuff; wash gravel.

washed clays

washed clays. Purified clays, with low silica and grit. They result from mixing raw clay with water and allowing sedimentation to cause the separation of the impurities from the clay. C.C.D. 64, 1961.

washed coal. Coal from which impurities have been removed by washing in a liquid medium. B.S. 3323, 1960. b. Coal produced by a wet-cleaning process. B.S. 3552, 1962.

washed gases. Purified coal gas from which the chemicals benzene and naphthalene have been extracted by scrubbing with oil. Cooper, pp. 391 and 396.

washed out. Said of a coal seam when the bed thickens out. Mason, V. 1, p. 20.

washer. a. A section, unit, or box in a coal washer. A small washer may comprise only one washbox. Nation, b. Apparatus for the wet cleaning of coal, together with its immediate ancillary equipment. B.S. 3352, 1962. c. An apparatus for washing ore, etc., as a jigger or a slurry table; also, any similar machine used in coal washing. Standard, 1964. d. An apparatus in which gases are cleaned of dust. Webster 3d.

d. A small flat perforated disk of metal or leather, used beneath a nut or pivot head, or at an axle-bearing or joint, to serve as a cushion or packing. Standard, 1964.

washed beltman. In bituminous coal mining, one who repairs belts used to drive coal-washing machines in washing plant. D.O.T. 1.

washed mica. Thumb-trimmed block micas of sufficient area to yield a disk 1 inch in diameter from sheets and open area. Now included in general term punch mica. Stock.

washed wood. A place at which ore, coal, or crushed stone is freed from impurities or dust by washing. Webster 3d. Also called wet separation. See also washing apparatus.

washed yellow gold. PlaceCt gold. Hess.

washed-house. A building on the surface at a mine where the men can wash before going to their homes. A changehouse. D.O.T. 1.

d. Local thinning or thinning or disappearance of a vein or tramline. A.G.I. b. Barren, thin, or jumbled areas in coal seams in which there is no actual disruption and no vertical displacement of the coal and strata. These disturbances may be divided into three main types; namely, (1) classical washouts; (2) pressure belts; and (3) tremor faults. Authentic washouts should be restricted to the first group. Also called rock fault; nip. See also cutout; want.-south. D.O.T. 1.

washed outbreak. A channel cut into or through a coal seam at some time during or after the formation of the seam, generally filled with sandstone—more or rarely with shale—similar to that of the roof. Raistrick and Marshall, p. 79. See also cutout; want.-south. A.G.I. b. Barren, thin, or jumbled areas in coal seams in which there is no actual disruption and no vertical displacement of the coal and strata. These disturbances may be divided into three main types; namely, (1) classical washouts; (2) pressure belts; and (3) tremor faults. Authentic washouts should be restricted to the first group. Also called rock fault; nip. See also cutout; want.-south.

washing. a. In metallurgy, that which is removed from a metal by finishing or cleaning processes, or by removing impurities from small sizes. D.O.T. 1.

washing fault. Eng. A portion of a seam of coal where the coal has been disintegrated and the iron ore is left as a residue. D.O.T. 3.

washing off. a. Removing printing paper from the surface of a piece with an infusible powder which prevents it from sticking to its supports while receiving the glaze. Fay.

washing plant. a. A plant where slimes are removed from relatively coarse ore or gravel. Zern. b. Machinery and appliances erected on the surface at a mine to process, clean, and segregate ore or sand. Marshall, p. 79. See also cutout; want.-south.

washing WOOL Flat screen or trommel on which the wool is sized and washed to produce it for market. Also called washing up.

Washes process. The process of treating silver ores by grinding in pans or tubs with the addition of mercury, and sometimes of chemicals, such as blue vitriol and salt. Fay.

wash gate. See wash mill. Dodd.

wash out. A channel cut into or through a coal seam at some time during or after the formation of the seam, generally filled with sandstone—more or rarely with shale—similar to that of the roof. Raistrick and Marshall, p. 79. See also cutout; want.-south. A.G.I. b. Barren, thin, or jumbled areas in coal seams in which there is no actual disruption and no vertical displacement of the coal and strata. These disturbances may be divided into three main types; namely, (1) classical washouts; (2) pressure belts; and (3) tremor faults. Authentic washouts should be restricted to the first group. Also called rock fault; nip. See also cutout; want.-south. A.G.I. b. Barren, thin, or jumbled areas in coal seams in which there is no actual disruption and no vertical displacement of the coal and strata. These disturbances may be divided into three main types; namely, (1) classical washouts; (2) pressure belts; and (3) tremor faults. Authentic washouts should be restricted to the first group. Also called rock fault; nip.

washed out. Said of a coal seam when the bed thickens out. Mason, V. 1, p. 20.

washed over. A channel cut into or through a coal seam at some time during or after the formation of the seam, generally filled with sandstone—more or rarely with shale—similar to that of the roof. Raistrick and Marshall, p. 79. See also cutout; want.-south.
washout

See also want, d. Fay. Channellike feature which cuts or transgresses the stratification of the underlying beds; may be streams, hill structures or large erosional channels. Also called cutout. Pettijohn.

washout valve. Valve in a pipeline or a dam which can be opened occasionally to clear out sediment. Ham.

washovers. a. To wash away or remove material from around the outside of casing pipe, drill stem, junk, or tramp materials in a borehole. Also see washover shoe. Long. b. See storm delta. Schiferdecker.

washover bit. See washover shoe. Long.

washovers. The material deposited by the action of the overwash. Schiferdecker.

washover shoe. A casing-shoe-like bit used to drill downward around a piece of drilling equipment stuck in a borehole. Also see washover.

washover. The material deposited by the action of the overwash. Schiferdecker.

washout valve. Valve in a pipeline or a dam which can be opened occasionally to clear out sediment. Ham.

washovers. a. To wash away or remove material from around the outside of casing pipe, drill stem, junk, or tramp materials in a borehole. Also see washover shoe. Long. b. See storm delta. Schiferdecker.

washpan. See washover shoe. Long.

wash water. Water circulated through the wash table. An inclined table used for cleaning wash stuff. Sugar.

washout. d. Space from which the coal seam has been removed. Also called condi. See also coal; g. A.S. Water, body; Scot; saving; pneumatic stowing. Nelson. e. Digging, hauling, and dumping of valueless material, or getting out of the way; or the valueless material itself. Nichols. f. Refuse and impurities removed from the coal. Hudson.

g. The refuse from ore dressing and smelting plants; Gob; coal; old workings; also, the fine coal made in mining and preparing coal for market; coal dust; dirt; also used to signify both the mine waste (or coal left in the mine in pillars, etc.) and the breaker waste. Fay. h. Eng. A more or less empty space between two packs. Also see coal. i. N. of Eng. A return airway. Fay. j. In stone cutting, to reduce roughly to a flat surface. Dipping. Webster 2d.

k. Material derived by mechanical and chemical weathering and moved downward to lower levels; also, a deposit in a stream or sea. Webster 2d. l. Cotton and similar material used for wiping machinery. Hudson.

m. A working or shaft which has been abandoned and filled with refuse (goaf or gob), or with material from the fall of the hanging wall. B.S. 3618, 1963, sec. 2. See spoil, a. Bureau of Mines Staff. o. Broken or spoiled castings for remelting. Standard, 1964. p. q. Stagnation of water. Nelson.

t. In stone cutting, to reduce roughly to a flat surface. Webster 2d.

u. The refuse from ore dressing and smelting plants; Gob; coal; old workings; also, the fine coal made in mining and preparing coal for market; coal dust; dirt; also used to signify both the mine waste (or coal left in the mine in pillars, etc.) and the breaker waste. Fay.

v. Eng. A more or less empty space between two packs. Also see coal.

waste drainage. The controlled leakage of air through a waste to prevent large concentrations of mine gases from accumulating in that waste. B.S. 3618, 1963, sec. 2.

waste dumping. A procedure whereby mine waste or spoil materials are disposed of or piled. Bureau of Mines Staff.

waste edge. A waste edge may result from broken timber or steel props or chocks set along the edge of the waste and parallel to the longwall face to induce spalling of the rock to break and to secure caving of the waste area. See also breaker props. Nelson.

waste filled stopes. In these methods, support is sometimes placed on, and intermediate (be- low), normally 2 or 3 feet above the stope. Nelson.

waste-filled stopes. In these methods, support is sometimes placed on, and intermediate (below), normally 2 or 3 feet above the stope. Nelson.

waste-filled stopes. In these methods, support is sometimes placed on, and intermediate (below), normally 2 or 3 feet above the stope. Nelson.

waste-free area. The zone where the toes of the waste stream are sometimes placed on, and intermediate (below), normally 2 or 3 feet above the stope. Nelson.

waste, f. Eng. A return airway. Fay. g. A.S. Water, body; Scot; saving; pneumatic stowing. Nelson. h. Digging, hauling, and dumping of valueless material, or getting out of the way; or the valueless material itself. Nichols. i. Refuse and impurities removed from the coal. Hudson.

j. The refuse from ore dressing and smelting plants; Gob; coal; old workings; also, the fine coal made in mining and preparing coal for market; coal dust; dirt; also used to signify both the mine waste (or coal left in the mine in pillars, etc.) and the breaker waste. Fay.

k. Eng. A more or less empty space between two packs. Also see coal.

m. In stone cutting, to reduce roughly to a flat surface. Dipping. Webster 2d.

n. Material derived by mechanical and chemical weathering and moved downward to lower levels; also, a deposit in a stream or sea. Webster 2d.

o. Cotton and similar material used for wiping machinery. Hudson.

p. A working or shaft which has been abandoned and filled with refuse (goaf or gob), or with material from the fall of the hanging wall. B.S. 3618, 1963, sec. 2. See spoil, a. Bureau of Mines Staff.

r. Utility to the particular process involved. ASTM STP No. 148-D. Abbreviations, p. 148-D.

s. A return airway. Fay.

waste stream. The debris cones along the foot of a mountain range usually so completely covers the land that many years are required to clear it. Also called wash out, often a waste plain or waste slope. See also piedmont alluvial plain. A.G.I.

waste a. The area which the toes of the waste stream are sometimes placed on, and intermediate (below), normally 2 or 3 feet above the stope. Nelson.

b. See also waste stream. Waste material. See also element of mining process; waste stream.

waste景区. The toes of the waste stream are sometimes placed on, and intermediate (below), normally 2 or 3 feet above the stope. Nelson.

waste stream. The debris cones along the foot of a mountain range usually so completely covers the land that many years are required to clear it. Also called wash out, often a waste plain or waste slope. See also piedmont alluvial plain. A.G.I.
waste water. a. Water from old mine workings. Fay. b. Water from any metallurgical process, or the overflow from a storage reservoir. A large excess water allowed to run to waste from the water circuit. Also called surplus water; bleed water. B.S. 3618, sec. 6.

wasteway. a. A channel for carrying off superfluous water. Webster 3d. b. The channel required to convey water, discharged into it from a spillway, escape, or sluice; a spillway. Secely, l.

wastew., waste. a. The waste provided in reservoir construction to discharge all surplus water flowing into the reservoir in flood time so as to prevent the level from rising above the limit allowed for in designing the dam. C.T.D. b. See weir, b. Fay.

wasting asset. Property (as mines or timber tracts) subject to depletion. Webster, 3d.

water-ampul. A water cartridge for water ampule. A fire-resistant plastics container filled with uranium fuel in an aqueous solution. Heat is removed by a cooling coil in the core. L&L.

water-break. A break in the continuity of the water film upon a metal when it is withdrawn from a bath. ASM Gloss.

water barrel. a. A sudden stoppage caused by the discharge of water from the sump at the bottom of a sinking shaft. Water barrels are now obsolete. See also pneumatic water bailer. B.S. 3618, 1963, sec. 4. b. A square, open, wooden tank car used for removing small amounts of water from low places in a mine. Also a tank car used for sprinkling the roadways to settle the airborne dust and the nitrous fumes present in the place. Fay.

water-bearing strata. Beds which yield a large quantity of water when bored or sunk through are said to be water-bearing. Peel.

water barrier. a. A bed of coarse gravel or pebbles occurring in the lower part of the mine water. b. A barrier to prevent the passage of water to contact with air. In flotation, a surface that seems to prefer contact with air. A water-avid surface. Fay.

water-bath. A man who bales water out of dip workings in places where it is not convenient to put in a pump. Fay.

water barrel. a. A barrel-shaped hopper designed to carry water from the bottom of a sinking shaft. Water barrels are now obsolete. See also 4-water barrel; water bailer. b. A tank used for winding water from the sump at the bottom of a shaft; usually self-filling by means of a valve or series of valves in the bottom of the tank. Also called barrel. b. A container filled with uranium fuel in an aqueous solution. Fay.

water-base. a. A solid, colorless liquid; H₂O; practically tasteless and odorless; specific gravity, 1.0000 (at 4°C); melting point, (36°F); boiling point, (212°F). Water is the most common solvent. Molecular weight, 18.0153; density, 0.9970 (at 4°C); and soluble in all proportion in alcohol. Also called ice; steam; water vapor; hydrogen water or hydrogen gas. Also called water-carbon dioxide extinguisher. A plunger-type extinguisher composed of a container for water and a small cylinder of high-pressure carbon dioxide gas. Both the container and the cartridge for the carbon dioxide can be made of copper or copper-lined steel to prevent corrosion. There are two advantages in using this extinguisher: (1) It can be recharged quickly and conveniently from a supply of compressed carbon dioxide gas, and (2) The high-pressure carbon dioxide charge does not deteriorate even if the extinguisher remains unused for many years. It is suitable for use on freely burning mine fires, but not effective against oil fires or in cases where electrical equipment may be live. McAdam, pp. 114-115.

water-bate. A fireproof cartridge surrounded by an outer case, the space between being filled with water, which is employed to destroy the flame produced when the shot is fired, thereby lessening the chance of an explosion should gas be present in the place. Fay.

water chamber. a. A sudden stoppage of water flow past the face of a bit while drilling is in progress. Long. b. A hollow box or block of iron, through which water is circulated, to protect parts of a funnel wall. Fay.

water blocking. Injection of water into a structure in such a way as to prevent drainage to and from adjoining properties. Williams.

water boiler. A reactor research, the core of which consists of a small spherical container filled with uranium fuel in an aqueous solution. Heat is removed by a cooling coil in the core. L&L.

water bob. Aust. The owner or holder of water or water rights, who sells the same for mining purposes. Fay.

water bound. A general term indicating that water is the medium or solvent in filling the voids between mineral fragments and to improve compaction. Nelson.

water box. a. A rectangular wooden pipe used in shafts for conveying water between gourds. B.S. 3618, 1964, sec. 4. b. A square, open, wooden tank car used for removing small amounts of water from low places in a mine. Also a tank car used for sprinkling the roadways to settle the dust. Fay. c. A water case attached to the outside of a furnace, to protect the iron from the effects of fire. Also called water block. Standard, 1964; Fay.

water leak. a. A leak in the continuity of the water film upon a metal when it is withdrawn from a bath. ASM Gloss. b. See barrier pillar. Nelson.

water-coal. a. Coal or rock layer that is laden with water or through which water percolates; sometimes, a swampy surface area. Webster 3d. b. A bed of coarse gravel or pebbles occurring in the lower part of the upper till in the Upper Mississippian Valley. Fay.

water blast. a. The expulsion of water under pressure, in mine workings, caused by trapped air expanding as the water level is lowered. B.S. 3618, 1963, sec. 6. b. Explosion caused by sudden inrush of water (not an ignition). Mason. c. Eng. The discharge of water down a shaft to produce or quicken ventilation. See also trombe. Fay. d. A water-actuated ventilating device. C.T.D.

water blank. a. A sudden stoppage of water inflow.
water-chamber. A hollow core through which water circulates in a mold used for cooling the interior of a casting more rapidly than the outer portion, which is solidifying, as in casting a cannon. Webster 3d.

water-cooling. Passage of water as a river, canal, flume, or drainage tunnel. Long. c. A subsurface opening or passage in rocks through which ground water flows. Long.

water-depth. Movement of water under or around a structure built on permeable foundations. See also piping. Nelson. 

water-cutoff core barrel. A core barrel having a device in its head part that closes and stops the circulation of liquid when a core block occurs in the inner tube of the core barrel. Long.

water-cure. Synonym for hydrologic cycle. A.G.I.

water dam. A permanent stopping to seal off a large body or feeder of water. It consists usually of a block of concrete between two brick endwalls and these are extended well into the surrounding ground. The contact points and all breaks in the strata are sealed by cement injection. The various pipes, pressure gages, etc., may be left through the stopping. Nelson.

water drive. A method of making a high-level oil well, nearing exhaustion, to continue producing by pouring water into abandoned low-level wells in hydraulic communication with the producing horizon. See also repressuring; swabbing. Nelson.

water fall. A drop or cascade of a water column at some point in the natural or artificial discharge of a stream. Long.

water flow. The movement of water under a structure built on permeable foundations. See also piping. Nelson. 

water hammer. A. The hammering noise produced when water flows in a pipe or vessel on a sudden stoppage or opening or passage in rocks through which a stream runs. Webster 3d.

water glass. A. A water-soluble substance consisting of sodium silicate of varying composition that exists as a glassy mass, a stony powder, or a viscous syrup liquid dissolved in water. Used as a fire-proofing agent and in making artificial stone. Webster 3d. Also used in the manufacture of cements, in concrete hardeners, in cementing stones, as water-proofing in hydraulic mortars and in acidproof mortars, in cementing pipe inclusions, in the manufacture of abrasive wheels and abrasive stones, in refining petroleum, in ore flotation, in lining Bessemer converters, as a binder in digestor linings, in acid concentrator linings, in cementing cements, in drilling mud, and in the manufacture of silica gel. C.C. 3d. 1961. c. A similar substance consisting of potassium silicate. Also called potash water glass. Webster 3d.

water grade. a. The inclination of an entry in a mine or a well into the surrounding ground. The vari-ous pipes, pressure gages, etc., may be left through the stopping. Nelson.

water-gas. A. A poisonous, flammable, gaseous mixture mainly of carbon monoxide and hydrogen with small amounts of methane, carbon dioxide, and nitrogen, and usually by blowing air and then steam over red-hot coke or coal, used especially formerly as a fuel (as in welding) and after carburizing as an illuminant but chiefly as a source of hydrogen gas. Webster 3d.

water-gas tar. Tar produced in the manufacture of carbonated water gas by the decomposition of petroleum oil by heat in the presence of blue gas. ASTM D324-41.

water glaze. A. A glass actuated by a water wheel. Fay. 

water glaze. b. Porcelain glaze. Fay.

water glass. Webster 3d.

water glaze. b. Porcelain glaze. Fay.

water glass. b. A water-soluble glass; a soluble glass; soluble glass; water-glass. Fay.

water glass. b. A water-soluble glass; a soluble glass; soluble glass; water-glass. Fay.

water glass. A. A water-soluble substance consisting of sodium silicate of varying composition that exists as a glassy mass, a stony powder, or a viscous syrup liquid dissolved in water. Used as a fire-proofing agent and in making artificial stone. Webster 3d. Also used in the manufacture of cements, in concrete hardeners, in cementing stones, as water-proofing in hydraulic mortars and in acidproof mortars, in cementing pipe inclusions, in the manufacture of abrasive wheels and abrasive stones, in refining petroleum, in ore flotation, in lining Bessemer converters, as a binder in digestor linings, in acid concentrator linings, in cementing cements, in drilling mud, and in the manufacture of silica gel. C.C. 3d. 1961. c. A similar substance consisting of potassium silicate. Also called potash water glass. Webster 3d.

water grade. a. The inclination of an entry in a mine or a well into the surrounding ground. The vari-ous pipes, pressure gages, etc., may be left through the stopping. Nelson.

water-gas. A. A poisonous, flammable, gaseous mixture mainly of carbon monoxide and hydrogen with small amounts of methane, carbon dioxide, and nitrogen, and usually by blowing air and then steam over red-hot coke or coal, used especially formerly as a fuel (as in welding) and after carburizing as an illuminant but chiefly as a source of hydrogen gas. Webster 3d.

water-gas tar. Tar produced in the manufacture of carbonated water gas by the decomposition of petroleum oil by heat in the presence of blue gas. ASTM D324-41.

water glaze. A. A glass actuated by a water wheel. Fay. 

water glaze. b. Porcelain glaze. Fay.

water glass. Webster 3d.

water glaze. b. Porcelain glaze. Fay.

water glass. A. A water-soluble substance consisting of sodium silicate of varying composition that exists as a glassy mass, a stony powder, or a viscous syrup liquid dissolved in water. Used as a fire-proofing agent and in making artificial stone. Webster 3d. Also used in the manufacture of cements, in concrete hardeners, in cementing stones, as water-proofing in hydraulic mortars and in acidproof mortars, in cementing pipe inclusions, in the manufacture of abrasive wheels and abrasive stones, in refining petroleum, in ore flotation, in lining Bessemer converters, as a binder in digestor linings, in acid concentrator linings, in cementing cements, in drilling mud, and in the manufacture of silica gel. C.C. 3d. 1961. c. A similar substance consisting of potassium silicate. Also called potash water glass. Webster 3d.

water grade. a. The inclination of an entry in a mine or a well into the surrounding ground. The vari-ous pipes, pressure gages, etc., may be left through the stopping. Nelson.

water-gas. A. A poisonous, flammable, gaseous mixture mainly of carbon monoxide and hydrogen with small amounts of methane, carbon dioxide, and nitrogen, and usually by blowing air and then steam over red-hot coke or coal, used especially formerly as a fuel (as in welding) and after carburizing as an illuminant but chiefly as a source of hydrogen gas. Webster 3d.
water hammer

STP No. 148-D. d. Sharp pulsations in a water-piping system caused by the intermittent escape of entrapped air or the instantaneous virtual stoppage of water in the system by a reciprocating-piston pump. Long.

water hauler. a. One who collects in a water box (car) water that accumulates in low places at the mine entrance, along haulageways, or at the working face, bailing it into a car with a bucket or using a small hand pump. Also called waterman; water monkey; water tender. D.O.T. 1.

b. A laborer who hauls water cars into a mine to supply water for sprinkling haulage roads and working places. D.O.T. 1.

water holsters. A simple method of disposing of mine water using tanks with the engine or motor on the surface. The machinery can be easily repaired and the plant is in no danger of being flooded. The high cost of the plant and the fact that the shaft cannot be used for other purposes while water is being hoisted are important disadvantages. Water is delivered intermittently and at an increasing rate as the depth of hoisting increases. This method is less economical than pumping but is useful as an emergency measure in reclaiming a flooded mine. Lewis, p. 632.

water-holding capacity. The smallest value to which water content of a soil can be reduced by gravity drainage. ASCE P. 1826.

water hose. The hose running from the water swivel on the upper end of a drill stem on a diamond or rotary drill to the pump. Long.

water hydraulic. A water-actuated mechanism on a diamond drill. Most hydraulic feed now are actuated by hydraulic oil pumped through a closed system. Long.

water inch. a. The discharge of a circular sharp-edged orifice 1 inch in diameter with a head corresponding to the line above the top notch is commonly estimated at 14 pints per minute and that constitutes an old unit of hydraulic measure. Webster 3d. b. A miner's inch. C.T.D. c. See V-inch, etc. Fay. d. See also Pulsed Infusion Shot Firing. Long. Webster 3d.

water infiltration. A technique being used abroad to suppress or prevent the formation of dust, in advance of mining a coal seam. Water (or sometimes foam or steam, which is costlier but more effective) is injected into the coal ahead of the face through long drill holes, as many as four to six per face and 20 to 60 feet in length. The liquid infuses into the seam along fractures and cracks and, under pressure, penetrates a considerable distance into the hole radially, wetting the coal well. It has proved very effective in reducing dust concentrations during subsequent mining, and it is now used on as much as 80 percent. Water infusion originated in Great Britain (it is used in 25 percent of the United States) and has been tried experimentally with some success in the United States. Hartman, pp. 64-65. See also pulsed infusion, etc. Fay.

water infusate. A special tube which acts as a borehole seal in the water infusion process. The tube has a small orifice at the injection end of the infusate, the other admits hydraulic fluid to actuate the piston expanding the seal in the borehole. The hydraulic fluid is supplied by a high pressure pump and is infusion water by a power pump, Nelson.

water infusation method. A method being used by the U.S. Bureau of Mines to remove methane from mines. It consists of injecting water under pressure into the coal to push the gas out of the coal seam. Holes are drilled horizontally into the coal face and water is pumped into some of the holes at pressures varying from 200 to 650 pounds per square inch. This forces the methane out through the other holes and also from the exposed part of the coal seam. Bureau of Mines Staff.

water infusant pump. A power pump, mounted on wheels, to supply the high pressure water for the infusation of water. It consists of an oil hydraulic circuit which drives two reciprocating rams which are in turn directly coupled to the two rams of the water pump, Nelson.

water injection. Method of recharging large bodies of plain water while the body is steadily losing chlorides through sweating. This is harmful because by so doing the saline content of the body fluids becomes diluted and in extreme cases water intoxication occurs. Spalding, p. 263.

water incrustation. A condition caused by the erosive power of a stream of water, of a furnace so constructed as to allow the free circulation of water for keeping the furnace cool. Also called water block and water box. Long.

water jet. a. A high-pressure stream of water ejected from an orifice. Long. b. The orifice through which a high-pressure stream of water is ejected. Long.

water jet drilling. The drilling of boreholes in unconsolidated or earthy formations using the erosive power of a small-diameter stream of water forcefully ejected as the cutting tool. See also Fay, etc. Long.

water kibbs. A large iron bucket with a valve in the bottom for self-filling; sometimes used in hoisting coal seam infum. Standard, 1964. See also water barrel. Fay.

water level. See ground-water lowering. Ham.

water mains. In coal mining, pipes made of cast iron or steel for the conveyance of water. The former are used when the water has corrosive properties and the greater thickness of metal will give a much longer life. Cast iron, however, has the disadvantages of great weight, low tensile strength and brittleness. When used under the latter conditions, the strata movements disturb the alignment of the pipe range, the flanges are likely to be broken away completely when subjected to strain. Water mains are most often used because of their lighter weight for a given bursting pressure and because of convenience of alignment. The metal allows the pipe to be readily bent. Mason, v. 2, pp. 628-627.
waterman. a. A laborer who quenches coke with water so that it may be drawn from the oven, using a sprinkling system of perforated pipes. D.O.T. 1. b. See water cooler. D.O.T. 1.

watermark. a. Any mark indicating the level at which the water has stood for a certain length of time. Schieferdecker. b. Eng. Oxford masons' and quarrymen's term for calcite veins in building stones, as in the Forest Marble at Bladon, and characteristic of Bath stones. Arkell. c. A shallow depressed spot sometimes appearing as a defect in vitrified enamelware. Also called water spot. Dodd. d. During transfer printing on pottery, a watermark may form if a drop of water dries on the ware, leaving a deposit of soluble salts. Also called water spot. Dodd.

water, mechanical. Water which is mechanically added to a clay mixture to produce plasticity for forming and which is lost by evaporation during drying or early stages of firing. ASCG, 1963.

water treatment. Applied to treatment-line, the center of which is pink and the edge of which is seen in crystals but not in cut stones. See also bocco de fogo. Shipley.

waterproof. a. Water which a clay mixture contains when it is workable or useable. Fay. b. A cement with waterproof properties. See waterproof cement. ASCG, 1963.

waterproof cement. A cement with waterproof properties which resists the movement of water through the mass. ASCG, 1963.

waterproof stone dust. The proofing of stone dust to prevent the particles from caking or becoming sticky in humid atmospheres. Waterproofing is considered essential if stone-dust barriers are to operate effectively at humidities above 85 percent. Nelson.

waterproof electric joint. A joint not intended to secure reliability of firing when used in wet work. ASA C42-85:1956.

waterproofing. a. The process of rendering surfaces or materials impervious to water. Waterproofing can be effected (1) by the deposition of a protective film or insoluble soaps, which process renders fabrics rain-proof but does not interfere with the ventilating properties; (2) by impregnation with oils; and (3) by coating with rubber or varnish. The latter processes prevent the transmission of air. C.T.D. b. Concrete or other masonry units that are made more waterproof by surface treatment of the set concrete or by the addition of an integral waterproofer. For surface treatment, a solution of sodium silicate or of a silicofluoride can be employed. Integral waterproofers include calcium chloride solution and/or various stearates. Dodd. c. Silicones have been recommended for the waterproofing of brickwork. Dodd.

waterproofing walls. Making them impervious to water or dampness, by mixing a compound with the concrete, or by applying the compound to the surface. Crispin.

water pressure. Pressure at which water is discharged from a pump. Long.

waterproof cement. A cement with waterproof properties which resists the movement of water through the mass. ASCG, 1963.

waterproof stone dust. The proofing of stone dust to prevent the particles from caking or becoming sticky in humid atmospheres. Waterproofing is considered essential if stone-dust barriers are to operate effectively at humidities above 85 percent. Nelson.

waterproof electric joint. A joint not intended to secure reliability of firing when used in wet work. ASA C42-85:1956.

waterproofing. a. The process of rendering surfaces or materials impervious to water. Waterproofing can be effected (1) by the deposition of a protective film or insoluble soaps, which process renders fabrics rain-proof but does not interfere with the ventilating properties; (2) by impregnation with oils; and (3) by coating with rubber or varnish. The latter processes prevent the transmission of air. C.T.D. b. Concrete or other masonry units that are made more waterproof by surface treatment of the set concrete or by the addition of an integral waterproofer. For surface treatment, a solution of sodium silicate or of a silicofluoride can be employed. Integral waterproofers include calcium chloride solution and/or various stearates. Dodd. c. Silicones have been recommended for the waterproofing of brickwork. Dodd.

waterproofing walls. Making them impervious to water or dampness, by mixing a compound with the concrete, or by applying the compound to the surface. Crispin.

water pressure. Pressure at which water is discharged from a pump. Long.

waterproof cement. A cement with waterproof properties which resists the movement of water through the mass. ASCG, 1963.

waterproof stone dust. The proofing of stone dust to prevent the particles from caking or becoming sticky in humid atmospheres. Waterproofing is considered essential if stone-dust barriers are to operate effectively at humidities above 85 percent. Nelson.

waterproof electric joint. A joint not intended to secure reliability of firing when used in wet work. ASA C42-85:1956.

waterproofing. a. The process of rendering surfaces or materials impervious to water. Waterproofing can be effected (1) by the deposition of a protective film or insoluble soaps, which process renders fabrics rain-proof but does not interfere with the ventilating properties; (2) by impregnation with oils; and (3) by coating with rubber or varnish. The latter processes prevent the transmission of air. C.T.D. b. Concrete or other masonry units that are made more waterproof by surface treatment of the set concrete or by the addition of an integral waterproofer. For surface treatment, a solution of sodium silicate or of a silicofluoride can be employed. Integral waterproofers include calcium chloride solution and/or various stearates. Dodd. c. Silicones have been recommended for the waterproofing of brickwork. Dodd.

waterproofing walls. Making them impervious to water or dampness, by mixing a compound with the concrete, or by applying the compound to the surface. Crispin.

water pressure. Pressure at which water is discharged from a pump. Long.

waterproof cement. A cement with waterproof properties which resists the movement of water through the mass. ASCG, 1963.

waterproof stone dust. The proofing of stone dust to prevent the particles from caking or becoming sticky in humid atmospheres. Waterproofing is considered essential if stone-dust barriers are to operate effectively at humidities above 85 percent. Nelson.

waterproof electric joint. A joint not intended to secure reliability of firing when used in wet work. ASA C42-85:1956.
outside wall of a noncoring bit that serves as a waterway. Synonym for waterway. Long.

water smoke. To fire (a kiln) slowly in order to remove moisture from the bricks, before firing. Standard, 1964.

watersmoking. The first period of firing in which all mechanical held water is removed from the clay by the advancing heat. ACSG, 1963.

water streak. A fault in vitreous enamelware that results from the cutting away of a grit or inclusions by water while the ware is in a molten state. Arkell.

water string. Casing used to shut off water supply. The undertaking by a public, or private, corporation of water works for the use of consumers. See water service.

water struck In brickmaking, made in e part of the clay by the advancing heat. ACSG, 1964.

water table. a. The upper limit or surface of the groundwater; it follows approximately the profile of the land surface. See also contour of depression; perched water table; waterlogged. Nelson. b. A gutter on the side of a road to carry off water. Webster 3d. c. The upper limit of the portion of the ground wholly saturated with water whether very near the surface or many feet below. Also called ground water level. Webster 3d. See also ground water elevation. ASCE P1826. d. A slight projection of the lower masonry on the outside of the wall and slightly above the ground. ACSG.

water-table contour. A line drawn on a map to represent an imaginary projection of the lower masonry on the outside wall of a noncoring bit that serves as a waterway. Synonym for waterway. Long.

waterway. a. A groove or slot incised in the water table of a definite level. These contours are constructed from the data provided by water-table levels, corrected for differences in surface level at the respective boreholes. A site investigation or opencast plan sometimes shows water-level. Nelson.

water-table level. Levels showing the depth of the water table below the surface; the depth at which water is encountered in trial pits or boreholes. Nelson.

water-table stream. Concentrated ground water flow at the water table in a formation or structure of high permeability. Stokes and Varnes, 1955.

water tender. A boiler house employee attendant to the equipment of boilers, and usually also to blow-off valves. Fay.

water test. See floc test. Dodd.

water-tight. a. A borehole in which the conditions are such that no loss of the circulated fluid occurs. Long. b. A borehole for the passage of water. Fay. c. A borehole in which the ordinary water pressure would be inadequate for distribution to consumers in the area. C.T.D. water transport. Water used for transport in some instances, especially in placer and in eluvial, and generally in mines in an elevated position and in cases of exposed mineral. Also filling the mine is often transported into the mine by water. The broken material is simply mixed with a sufficiency of water to raise the ratio of 1:1.5 to 1:1.5 (solid to liquid by weight)

water-wash. Another name for dowser, or water witch. Another name for dowser, or water witch. Webster 3d.

water-yardage. Another name for dowser, or water witch. Webster 3d.
yard of progress or the ton of coal mined.

Fay. water-year. The year through which a flow of water is measured—as July 1 to June 30.

Hess. wave-beveled. Cylindrical pellets (½ inch high, ½ inch in diameter) made of a blend of ceramic materials and fluxes so proportioned that, when heated under suitable conditions, they fuse at stated temperatures. They are numbered from 1 (600° C) to 99 (2,000° C).

Dodd. wave-height. Vertical distance between wave trough and wave crest, usually expressed in feet.

wave interferometer. The phenomenon which results when waves of the same or nearly the same frequency are superposed, characterized by a spatial or temporal distribution of amplitude of some specified characteristic differing from that of the individual superposed waves.

wave length. For instance, when the waves, either of lake or sea, may saw into the land, forming wave-cut plains which are generally of small extent and lie beneath the water. Later, these may, perhaps, be raised above the surface. Synonym for marine-cut terrace; plain of marine abrasion; shore platform; wave-cut terrace.

wave meter. An instrument to measure and record the wave spectra. Hy.

wave period. The time interval between the appearance of two consecutive wave segments at a given point, usually expressed in seconds. The wave period must be the same, that is, the crests, troughs, etc. Hy.

wave pressure. The pressure imposed on an antenna of r-f energy into space, or on the surface of the medium, with speed dependent upon the properties of the medium. Hy.
wave ripple marks. Ripple marks with symmetrical slopes, sharp crests, and rounded troughs produced by oscillation. Wave motion is periodic, and the Clamper growths of the circular orbits change to elliptical with the longer axes horizontal. Close to the bottom the ellipses are nearly flat and the motion is essentially a swinging back and forth. Any prominence on the bottom determines vortices alternately on the two sides, and ultimately a ridge develops with symmetrical slopes and a sharp apex. Wave ripple marks are formed on all sand bottoms of which overlying waters are agitated by waves or wave-like waves. Also known as aqueous ripple mark; oscillation ripple mark; oscillatory ripple mark; oscillatory burrowing ripple mark; symmetrical ripple mark; A.G.I. Supp. 3.

wave velocity. A vector quantity which specifies the speed and direction of the wave motion. A.G.I. Supp. 3.

wave spectrum. A concept used to describe the distribution of energy among waves of different period. Wave speed increases with wave length, so distant storms may be detected by the increase of energy in long period waves. The concept is useful when all possible wave frequencies possess energies appropriate to the spectrum for the prevailing wind speed. H.S.

wave velocity. A vector quantity which specifies the speed and direction of which a wave travels through a medium. H.S.

waveability. A waveability variation from a perfect surface to a surface much rougher and wider than the toughness caused by tool marks or grind marks. A.S.M. Gloss.

wave bedding. A concept used to define a bedding characterized by undulatory bounding surfaces. May be related to ripple bedding if regular and to nodular bedding if less regular. A.S.M. Gloss.

wave extinction. An irregular extinction of a mineral under the microscope due to the wave action. A.S.M. Gloss.

wave lamination. See wave bedding. Pettijohn.

wave-win. A vein that alternately enlarges or pinches at short intervals. Fay.

wave. a. Used loosely for any of a group of substances resembling boulders in appearance and character. In general, waves are distinguished by their composition of cutters of the higher alcohols and by their free-forming character. Substances include oncorite and paraffin. A.P.I. Glossary. b. Leic. Soft or puddled clay used for brickmaking. Fay. c. A.S.M. Gloss. b. A surface or rubberlike material of nominal thickness that is placed between the diaphragm to lessen the wear on it. Also also diaphragm, b. A.S.M. Gloss. b. A surface characterized by the wear or abrasion-resistant metal; a surface in which an abrasion-resistant substance is embedded. Long. d. Wear resistance. See abrasion hardness. H.S.

weathered. A term applied to weathered or worn material. H.S.

weathered layer. A layer of a material that has been altered by weathering processes. H.S.

weathering. The process resulting from the breakdown of rocks and minerals due to the action of physical, chemical, and biological agents. H.S.

weathering. The process of the weathering of rocks and minerals due to the action of physical, chemical, and biological agents. H.S.
weatheted layer extending from the surface to a limited depth, usually characterized by a low velocity of transmission which abruptly changes to a lower value in the underlying rock. The name is erroneous, and the zone is more properly called the low-velocity layer. A.G.I.

weatheted rock. Rock the character of which has been changed by exposure to decaying conditions found in the zone of weathering. See also weathered zone. Long.

weathered zone. A more or less indefinite surface zone wherein, the rocks have been exposed to the chemical action of air, water, plants, and bacteria, and to the mechanical action of changes in temperature. The rock so exposed usually crumbles and decays. Long.

weathering. a. The group of processes, such as the chemical change of air and water and of plants and bacteria, and the mechanical action of changes in temperature, whereby rocks on exposure to the action of the weather, particularly frost action, may become oxidized and washed away by the rain. Osborn. d. See seasoning. Osborn. e. The attack of a glass or enamel surface by atmospheric elements. ASTM C162-66. f. The deleterious action of coal ir surface stockpiles under the influence of temperature, whereby rocks on exposure to the action of the weather, particularly frost action, may become oxidized and washed away by the rain. Osborne. d. See seasoning. Osborn. e. The attack of a glass or enamel surface by atmospheric elements. ASTM C162-66.

weatherometer. An instrument or apparatus used for accelerated weathering tests on concrete. Fay.

weatherometer test. A 500 to 1,000 gram sample of coal is weathered in a test: A 500 to 1,000 gram sample of coal is weathered for a period of 30 days at a temperature of 21°C (70°F) and a relative humidity of 65% by running bulk samples through a snW and finally crumble into lumps approximately 1

weatherometer test. A 500 to 1,000 gram sample of coal is weathered for a period of 30 days at a temperature of 21°C (70°F) and a relative humidity of 65% by running bulk samples through a snW and finally crumble into lumps approximately 1

weathering. A measure of the degree of susceptibility to weathering of a rock or a mineral, computed from a chemical or petrographic analysis. A.G.I.

weathering shot. In seismic work, a small charge of explosive detonated at or just below the surface of the earth for the purpose of recording refraction seismic information about the shallow-surface layers, particularly the low-velocity layer or layers, the so-called weathered layer. In modern seismic work, such shots are seldom used, and the data is derived from uphole times recorded at shot holes, or from first arrival reflection times recorded in connection with the reflection shot. Long.

weatherproofing. a. A measure of the weathering potential index. A measure of the degree of susceptibility to weathering of a rock or a mineral, computed from a chemical or petrographic analysis. A.G.I.

weatherproofing. a. A measure of the weathering potential index. A measure of the degree of susceptibility to weathering of a rock or a mineral, computed from a chemical or petrographic analysis. A.G.I.

wedge brick. A brick with both large faces low-grade gold ore bodies. Hoo, p. 69. weber. Equivalent in meter, kilogram, second (m.k.s.) system of the maxwell in the cgs system. One weber equals 10^8 maxwells. Abbreviation, wb. Pryor, 3.

weber. Equivalent in meter, kilogram, second (m.k.s.) system of the maxwell in the cgs system. One weber equals 10^8 maxwells. Abbreviation, wb. Pryor, 3.

weber process. A method for the manufacture of pig iron in which the ore is mixed with a proportionate amount of coal. Sufficient to smelt it, and after adding a binder the mixture is briquetted by means of a roller press into ovoids, which are subjected to low temperature carbonization between 550° and 600°C, followed by smelting in a low shaft furnace. Osborne. 13, M.M., 1949.

wedding. A. The accidental meeting or collision between a loaded and an empty bucket in a mine shaft when hoisting with a swinging rope, without guides. Fay.

wedding. A. The accidental meeting or collision between a loaded and an empty bucket in a mine shaft when hoisting with a swinging rope, without guides. Fay.

wedding. a. A wedge-shaped piece of wood for tightening timber or steel props or to tighten timber sets against the roof and sides of a tunnel. See also lag; lid; clamp; cleat. Nelson. b. A piece that tapers from a thick end to a chisel point. Nicholls. c. The act or process of changing the location of a borehole by a deflecting wedge. Long. d. The tapered wedge used to initiate the deflection of a borehole. Also called a set-ting wedge: Halt-Rowe wedge. Long. d. Tapered pieces of core that tend to bind and block a core barrel. Long. e. A piece of metal which, on rotation, becomes thicker at one end than at the other. Snow. f. In ceramics, to cut (clay) into wedge shaped masses and work them together to expel air bubbles. Webster 3d.

wedged and-sleeve bolt. A bolt designed for use in rock bolting. It consists of a 34-inch-diameter rod, at one end of which is a cold-rolled threaded portion, the other end being shaped to form a solid wedge forged integrally with the bolt. Over this wedge is fitted a loose split sleeve of 1/4 inch external diameter. The anchorage is provided by the bolt being placed in the hole and the bolt is pulled downwards while the sleeve is held by the thrust tube. Split by the head of the bolt, the sleeve expands until it grips the sides of the hole. Snow.

wedged and-sleeve bolt. A bolt designed for use in rock bolting. It consists of a 34-inch-diameter rod, at one end of which is a cold-rolled threaded portion, the other end being shaped to form a solid wedge forged integrally with the bolt. Over this wedge is fitted a loose split sleeve of 1/4 inch external diameter. The anchorage is provided by the bolt being placed in the hole and the bolt is pulled downwards while the sleeve is held by the thrust tube. Split by the head of the bolt, the sleeve expands until it grips the sides of the hole. Snow.

wedged and-sleeve bolt. A bolt designed for use in rock bolting. It consists of a 34-inch-diameter rod, at one end of which is a cold-rolled threaded portion, the other end being shaped to form a solid wedge forged integrally with the bolt. Over this wedge is fitted a loose split sleeve of 1/4 inch external diameter. The anchorage is provided by the bolt being placed in the hole and the bolt is pulled downwards while the sleeve is held by the thrust tube. Split by the head of the bolt, the sleeve expands until it grips the sides of the hole. Snow.
equally inclined toward the small end.

wedge brick. See slugged bottom. Dodd.

wedge capping. A winding rope-capping consisting of two tapered wedges which encircle the rope, the end of which is prevented from unravelling by casting on the end. The greater the pull on the rope, the more the wedges grip it as they are drawn into the encircling hoops. Mason, V. 2, pp. 462-463.

wedge clinometer. An end clinometer the bottom end of which is shaped to match the wedge-guide pin on the drive wedge; hence, the clinometer can be fastened together with copper shear rivets. When the drive wedge is driven into the wood plug in the borehole, the copper rivets break, and after the clinometer has been removed from the borehole the relationship of the bearing and inclination readings can be compared for the flat face of the projection on the bottom of the clinometer case can be used to orient and place the instrument in it.

wedge core lifter. A core-gripping device consisting of a series of three or more serrated-face, tapered wedges contained in slotted and tapered recesses cut into the inner surface of a lifter case or core barrel. The case is threaded to the inner tube of a core barrel. As the core enters the inner tube, it is drawed to the opening made by the cut holes. When the barrel is raised, the core is broken and the cut holes converge to form a V or wedge. The other holes are drilled vertically in a 12-foot-wide drift with wedge-shaped outline in a vertical section. Pettijohn.

wedge cut. a. A cut in which the central holes are positioned to break out a wedge-shaped section of strata when fired. B.S. 3618, 1963, sec. 3. b. A drill hole pattern with the cut holes converging to form a V or wedge. The other holes are bored in a 12-foot-wide drift with wedge-shaped outline in a vertical section. Pettijohn.

wedge driller. To delineate or change the course of a borehole by using a deflecting wedge. See also bypass; deflect. Long.

wedge end. A. Edges or line of pinch-out of a truncated rock formation.

wedges. a. A method used in quarrying whenever the stone is so shaped that a wedge-shaped core of building stones such as syenite, granite, marble, sandstone, etc. In this method a row of holes is drilled, either by hand or by pneumatic drills close to each other so that a longitudinal crevice is formed into which a gently sloping steel wedge is driven. Usually several wedges are driven in, and the block of stone can be detached without any further effort. See Wedge sbot. Pryor, 3. b. Wedge-shaped core of a Hall-Rowe deflecting wedge. Long.

wedge inclination. The greater the inclination of a borehole, the greater the wedge-shaped core, which can be used. Normally, the borehole inclination must be kept below 12° to 14° so that pull on the rope tightens the wedge when deviating a borehole.

wedge inclinometer. A deflecting wedge, hardend-metal, noncorring, cone-shaped bit used primarily to mill off part of the stabilizing material, moss, or wood used to render a watertight packing between the tubbing in a shaft and the rock walls, by means of split deals, moss, and wedges, driven in between the curb and the rock. Also called wedgeing curb. Fay, b. See wedge curb. Nelson.

wedge down. Breaking down the coal at the face with hammers and wedges instead of by blasting. Fay.

wedge cut. a. Eng. Cropping out, or thinning out; said of coalbeds. Fay.

wedge deck. A screen deck comprising wires of wedge-shaped cross section spaced from each other at a fixed dimension; the underflow passes through a supernumerary of increased size. See also wedge deck. Fay.

wedge diameter. A screen deck designed to reduce or eliminate clogging of material. It consists of wedge-shaped parallel wires with their wide edges uppermost; used for dewatering coal on shaking or station-ery. Nelson.

wedge piloted. a. A method used in quarrying whenever the stone is so shaped that a wedge-shaped core of building stones such as syenite, granite, marble, sandstone, etc. In this method a row of holes is drilled, either by hand or by pneumatic drills close to each other so that a longitudinal crevice is formed into which a gently sloping steel wedge is driven. Usually several wedges are driven in, and the block of stone can be detached without any further effort. See Wedge sbot. Pryor, 3. b. Wedge-shaped core of a Hall-Rowe deflecting wedge. Long.

wedge pyrometer. An instrument for the approximate measurement of high temperatures. It depends on a wedge of colored glass, the position of which is adjusted so that the wedge heat is no longer visible when viewed through the glass; movement of the wedge operates a scale calibrated with temperature. Dodd.

wedge reaming bit. a. A tapered or bullnose rotary bit used to start drilling after a deflection wedge has been fitted into a borehole. B.S. 3618, 1963, sec. 3. b. See wedge reaming bit. Long.

wedge rock. Multi-cored, earth vertical furnace. Rabbles rotating on circular horizontal hearth work the continuously fed material across alternately to periphery and then on next hearth below toward center, so that it gravitates through either a central or a peripheral opening and is at the same time exposed to rising heat or air blown through rabble arms. Pryor, 3.

wedge rock. An expression used on the Comstock mine in a shaft too poor to be classed as "pay ore" or even "second-class ore," but better than waste. It usually assays under five dollars per ton. When a car is placed on the cage to be hoisted, it is specially tagged in the case of good ore. If it be waste no tag is used; it became the custom to throw a wooden wedge on top of the car of very low-grade ore, hence the term "wedge rock." Fay, b.

wedge玫瑰 bk. A serrated-face, tapered wedge. The other holes are drilled vertically in a 12-foot-wide drift with wedge-shaped outline in a vertical section. Pettijohn.

wedge shot. a. Wedge cut; Pryor, 3. b. Rocker fitting. A wire rope attachment in which the rope lies in a too-small groove between a wedge and a housing, so that pull on the rope tightens the wedge. Nichols.

wedge theory. The analysis formulated by Coulomb in 1776 of the force tending to overturn a retaining wall. Its basis is the weight of the wedge of earth which will slide down the face of the retaining wall. See also plane of rupture. Ham.

wedge toroidal crossbedding. Toroidal crossbedding. Crossbedding for which wedge-shaped cross section spaced from each other at a fixed dimension; the underflow passes through a supernumerary of increased size. See also toroidal crossbedding. Pettijohn.

wedge-wire deck. A screen deck comprising wires of wedge-shaped cross section spaced from each other at a fixed dimension; the underflow passes through a supernumerary of increased size. See also wedge deck. Fay.

wedge-wire screen. A screen designed to reduce or eliminate clogging of material. It consists of wedge-shaped parallel wires with their wide edges uppermost; used for dewatering coal on shaking or station-ery. Nelson.

wedge-wire deck. A screen deck comprising wires of wedge-shaped cross section spaced from each other at a fixed dimension; the underflow passes through a supernumerary of increased size. See also wedge deck. Fay.

wedge-wire screen. A screen designed to reduce or eliminate clogging of material. It consists of wedge-shaped parallel wires with their wide edges uppermost; used for dewatering coal on shaking or station-ery. Nelson.
zinc ore and other materials to be sidered, and crushes sidered ore preparatory to further reduction. D.O.T. Supp.

weight breaks. The breaks or fissures in the nether roof in consequence of the weightings. TIME.

weightisp. The occurrence of fracturing of the roof consequent on weightings. TIME.

weightings. A statistical theory of the amount of material being handled. Can be designed for batch or continuous weighing and can be equipped with either visual indicators or automatic registering equipment or both. Can also be arranged to control conveyor speed to compensate for lag in processing or nonuniform material load on conveyor. ASA MFA-1-1958.

weight feeders. These feeders usually handle the feed continuously over a belt which it is necessary to give a weighed weight, e. Fay.

weight in-motion system. An electronic system which weighs individually loaded coughs as they roll over a scale rail, feeding the information into a totalizing printer which automatically prints out gross and net weights. It employs hermetically sealed lead cells which accurately convert physical weight into electrical impulses. See also weightometer, Nelson.

weigh larry. A traveling hopper for receiving, weighing or measuring, and disturbing bulk materials. Usually fitted with a scale either manually-operated or of the automatic recording type. Weight larrys may be suspended between overhead tracks, or carried on railed mounted below them. They may be hand-pushed or power-propelled, and some designs provide a riding platform or cab for the operator. A remote-control device for operating the bunker or bin gates is usually mounted on the larry chassis. ASA MH4.1-1958.

weigh pan. See weigh basket. Fay.

weight. a. Roof movement, especially when it can be seen or heard. Also called weight break. Briggs, pp. 171-172. b. Eng. A...
timber and packing supports the roof, and distinct from the fracturing of the nether roof. TIME.

Weir. A channel which may be a notch or opening in the weir itself. The term usually applies to rectangular notches in the upstream of the notch to the surface of the water upstream of the weir. The velocity of approach is not included in this. Ham.

Weir head. The depth of water is a measuring weir as measured from the bottom of the notch of the surface of the water upstream of the weir. The velocity of flow in a given time over a weir of a given width at different heights of the water.

Weisbach triangle. a. In survey, for orientation of mine, use of theodolite at bottom of vertical shaft to sight on two plumb wires. Instrument set to a horizontal reading between the wires of about 30 feet of arc. By reiterations methods, close accuracy is obtained so that the azimuth angle of the shaft surface stations from which these plumb wires are suspended can be transferred to the underground workings. Pryor, 3. b. The highly attenuated triangle formed by the plan position of two shaft plumb lines and one observation station. B.S. 3618, 1963, sec. 1.

Weisbergite. A variety of microphorphyritic dolerite having a microlitic texture resembling that of augite andesite. Crystals of labradorite, augite, and hornblende are embedded in a groundmass composed of plagioclase and augite microlites with interstitial glass. Rice.

Weisie. a. A bluish-black tuffler of copper, Gille, massive. From Vulcan, Colo., English. b. Cordierite; fahlunite. Dana 6d, Steel. c. That part of dam, Fay. c. That part of dam, embankment, canal bank, etc., which contains gates and over which surplus water flows; specifically called a spillway. Standard, 1964. See also measuring weir; spillway.

Weir head. The depth of water is a measuring weir as measured from the bottom of the notch of the surface of the water upstream of the weir. The velocity of approach is not included in this. Ham.

Weir table. A record or memorandum used to estimate the quantity of water that will flow in a given time over a weir of a given width at different heights of the water. Fay.

Weisch triangle. a. In survey, for orientation of mine, use of theodolite at bottom of vertical shaft to sight on two plumb wires. Instrument set to a horizontal reading between the wires of about 30 feet of arc. By reiterations methods, close accuracy is obtained so that the azimuth angle of the shaft surface stations from which these plumb wires are suspended can be transferred to the underground workings. Pryor, 3. b. The highly attenuated triangle formed by the plan position of two shaft plumb lines and one observation station. B.S. 3618, 1963, sec. 1.

Weisbergite. A variety of microphorphyritic dolerite having a microlitic texture resembling that of augite andesite. Crystals of labradorite, augite, and hornblende are embedded in a groundmass composed of plagioclase and augite microlites with interstitial glass. Rice.

welding transformer

weld interval. The total heat and cool times in making one multiple-impulse weld. ASM Gloss.

weld interval timer. A device used in resistance welding to control heat and cool times and weld time when making multiple-impulse welds singly or simultaneously. ASM Gloss.

weld iron. Wrought iron. A term suggested by an International Committee of the American Institute of Mining Engineers. Fay.

weld line. The junction of the weld metal and the base metal, or the junction of the base-metal parts when filler metal is not used. ASM Gloss.

weldment. A base or frame around a single piece made of pieces. ASM Gloss.

welding transformer. See transformer. ASM Gloss.

weld time. In single-impulse and flash welding, the time that the welding current is applied to the work. ASM Gloss.

weld timer. A device used in resistance welding to control the weld time only. ASM Gloss.

welding. Care of the health, both mental and physical, of the men employed in an undertaking. Spalding, p. 363.

weld properties. A department which deals with matters of welfare at mines, such as pithead baths, canteens, making meals, and at times advising on the organization of social functions connected with the mines. The welfare department is closely allied to the labor department. Nelson.

welfare officer. An appointment sometimes made at large mines or a group of mines. He is a good organizer and handles all welfare activities; he often deals with personal problems of the workmen which they may be reluctant to discuss with the manager. Nelson.

well. a. A shaft or hole sunk into the earth to receive oil, gas, water, etc. Webster 3d. See also oil well; shallow well; deep well; artesian well. b. A hollow cylinder of reinforced concrete, steel, timber, or masonry built in a hole as a support for a bridge or building. Webster 3d. Comford.

well bore. A synonym for borehole or drill hole, especially by individuals associated with the petroleum-drilling industry, but not in the front of a hydraulic dredge hull in which the digging ladder pivots. Nichols. c. A wall around a roof or the like built to protect one from fire. Nichols. f. A small dark or non-reflective area in the center of an improperly cut, too thick diamond. Heub. g. The crucible of a furnace. Fay. h. A cavity in the lower part of some rocks, into which the falling metal. Standard, 1964. f. See trap, i. Fay.

well bored. See well sinker. Fay.

well-boring jar. See jar. Fay.

well-conditioned triangle. A triangle which is equilateral or nearly so. In such a triangle any error in the measurement of an angle will be reduced to a minimum. Ham.

well core logging. a. A widely used technique which involves probing of the earth well with instruments lowered into boreholes, their readings being recorded on the surface. Among rock properties considered are electrical resistivity, self-potential, gamma-ray generation (both natural and in response to neutron bombardment), density, magnetic susceptibility, and acoustic velocity. Dobrin, p. 9. b. In deep bores, measurement of resistivity of the formations drilled through. Dobrin, p. 9. c. Explosives are drilled into the drilling mud at controlled spacings. Pryor, 3. c. See electric log. Nelson.

well driller. A furnace used for the manufacture of producer gas. Fay.

wells. a. A bag of flexible or other absorbent material packed around the tube of an oil well to prevent access of water to the oil in the well. Standard, 1964.

well-point. a. A vertical tube terminating in a perforated pointed shoe, connected with others in parallel by means of a header pipe to a drainage pump, used to dewater an area. Pryor, 3. b. A pipe fitted with a driving point and a fine mesh screen, used to remove underground water. Nichols. c. A complete set of equipment for drying up ground, including well points, connecting pipes and a pump. Nichols. d. See screen pipe. Long.

well-point pump. A centrifugal pump that can handle considerable quantities of air, and is used for removing underground water to dry up an excavation. Nichols.

wells. a. The natural pressure of the oil or gas in a well. It is often several hundred pounds per square inch and sufficient to cause the oil to rise to the surface. The well pressure is not related to the depth of the oil deposit below the surface. Nelson.

well-rotting formula. The Engineering News formula for calculating the load-bearing capacity of driven piles. Ham.

well rig. a. A record of the formations penetrated by a borehole and their approximate thickness, as determined by an examination of the cutting or core recovered. See also Long. Fay.

well rigging. a. A record of the formations penetrated by a borehole and their approximate thickness, as determined by an examination of the cutting or core recovered. See also Long. Fay.

wellrodding. a. The running of rock driven by a process of well drilling and removal from the hole by pumping or bailing. Wellrodding collected at closely spaced intervals provides a record of the strata penetrated. A.G.I. Supp.

well drill. A drill, usually a churn drill, used to drill wells. See also churn drill. Long.

well driller. See cable driller. D.O.T.

well-drilled holes. Holes drilled by means of an apparatus known as the well drills, or similar to that, and used for blasting on comparatively large scale. Such holes are usually 5 or 6 inches in diameter and from 30 to 150 feet deep. Fay.

well foundation. A type of foundation excavated by sinking a small-diameter caisson which has made it. Ham.

wellgrained fittings. A transparent lighting device widely used of all mains lighting devices in mines. Its distribution characteristics are simple, since there is no control of light other than that provided by the interior of the upper part of the fitting which absorbs a large proportion of the upward flux component from the lamp arc, and reflects the remainder. It is usually found spaced at intervals of 20 to 50 feet, 6 to 7 feet high, along the centerline of roads 12 to 14 feet wide. In general, the most noticeable effect of such a layout is glare. Roberts, II, p. 214.

well-graded soil. A soil with a particle-size distribution such that it passes evenly over a wide range of sizes. Nelson.

wellhole. a. A large-diameter (about 6 inches) vertical hole used in quarries and open-cast pits for taking samples of rock. Fay. b. A place where slips are caged at the bottom of the shaft, in which water collects. Fay. c. Change room. Fay.

wellbore. A method of quarry blasting in which the explosive charges are placed in rows of vertical holes. Hole diameters vary from 1 to 10 inches, 6 inches being a popular size. In general, 6-inch holes drilled in a 60-foot face are usually spaced 20 to 25 feet and spaced 12 to 20 feet apart. The loading ratio varies from about 3 tons of rock per pound of charge to about 7 tons under favorable conditions. Deck loading is usually employed and a powerful explosive is loaded at the bottom of the holes. Fay.

wellbore blasting. This type of blasting is virtually benching on a large scale. The depth and burden of the holes are much greater, and in consequence the hole diameter should also be increased to insure sufficient concentration of the explosive charge. Wellbore blasting is used in mines operating especially if the beds are horizontal and well-defined. It is not often used in highly abrasive igneous rocks because of the cost of drilling. Prouty, 2, Art. 8:40, p. 5.

wellbore pipe. One of the short fire clay pipes that were used to carry the flame upwards from the wellhole in the bottom of a bottle oven. Dodd.

Wellington formula. The Engineering News formula for calculating the load-bearing capacity of driven piles. Ham.

well log. A record of the formations penetrated by a borehole and their approximate thickness, as determined by an examination of the cutting or core recovered. See also Long. Fay.

Wellman producer. A furnace used for the manufacture of producer gas. Fay.

wells. A bag of flexible or other absorbent material packed around the tube of an oil well to prevent access of water to the oil in the well. Standard, 1964.

well point. A vertical tube terminating in a perforated pointed shoe, connected with others in parallel by a header pipe to a drainage pump, used to dewater an area. Pryor, 3. b. A pipe fitted with a driving point and a fine mesh screen, used to remove underground water. Nichols. c. A complete set of equipment for drying up ground, including well points, connecting pipes and a pump. Nichols. d. See screen pipe. Long.

well-point pump. A centrifugal pump that can handle considerable quantities of air, and is used for removing underground water to dry up an excavation. Nichols.

well pressure. The natural pressure of the oil or gas in a well. It is often several hundred pounds per square inch and sufficient to cause the oil to rise to the surface. The well pressure is not related to the depth of the oil deposit below the surface. Nelson.

wellrodding. a. The running of rock driven by a process of well drilling and removal from the hole by pumping or bailing. Wellrodding collected at closely spaced intervals provides a record of the strata penetrated. A.G.I. Supp.
The text contains various definitions and explanations related to geology and mining processes. Here are some highlights:

- **Well**: A vertical or inclined excavation in the earth's crust, made for the purpose of producing gas, oil, water, or some other substance.
- **Well survey**: Method of determining the velocity distribution by recording in a deep well.
- **Wells**: A skilled tradesman, often native to the district, who digs for and forms a well, usually with hand-operated implements.
- **Wells of Stromboli**: Cavities at the summit of the volcano Stromboli, in Italy, containing water, probably condensed from the interior.
- **Wells velocity survey**: Method of determining the velocity distribution by recording in a deep well.
- **Wells sinker**: A skilled tradesman, often native to the district, who digs for and forms a well, usually with hand-operated implements.
- **Wells survey**: Method of determining the velocity distribution by recording in a deep well.

The text also includes references to specific locations and processes, such as the extraction of coal, the use of seismographs in mining, and the application of geophysical methods in geological surveys.
Westphalian. Middle Upper Carboniferous.

wet money. N. of Eng. Payment made to face workers who have to work in wet conditions. Nut. 1222.

Weston photronic cell. 1232.

wet bulb thermometer. An instrument which measures the temperature of the air, or relative humidity. The bulb of the wet bulb thermometer is covered with a layer of muslin which is kept moist with water. As water is evaporated, heat is absorbed, and the thermometer is cooled below the dry bulb temperature. By determining the quantity of water evaporated in a given air by the evaporation of water from a wet bulb thermometer, and which is lower than the dry bulb temperature, moisture content of the air, or relative humidity. The bulb of the wet bulb thermometer is covered with a layer of muslin which is kept moist with water. As water is evaporated, heat is absorbed, and the thermometer is cooled below the dry bulb temperature. See also dry-bulb thermometer.

wet cleaning. A coal-cleaning method that involves the use of washers plus the equipment necessary to dewater and dry-dust the coal. This method is generally used when cleaning the coarser sizes of coal. It is a more expensive method than air cleaning and involves the addition of a water stream for cleaning and creating the additional problem of water pollution. Coal can, however, be cleaned more accurately by this method than by air cleaning. Kentucky, p. 300.

wet cyclone. See cyclone.

wet density. The ratio of the weight of a bottom sediment sample to its volume. Hy. wt. deck. A dock in a tidal estuary on the north coast, the water being maintained at the high-tide level by dock gates. These are opened only at high tide. Ham.

wet drill. A percussive drill with water feed either through the machine or by means of a water swivel, to suppress the dust produced when drilling. See also dust trap. Nelson.

wet drilling. In rock drilling for blasting purposes, injection of water through hollow drill shank to bottom of hole, to allay dust and danger of pneumokoniosis. Prp. 142.

wet dust. Dust which has been mixed with moisture or which has become wet from water in the mine. Nelson.

wet gas. a. Natural gas that contains more than 0.1 percent of water vapor. b. Gas which is saturated with liquid hydrocarbons. Wheeler.

wet gas wells. Wells in which gas production is continuous and which do not produce crude oil. Merseycourt, 4th, p. 159.

wet gaylussite. Ores containing lead.

wet hole. A borehole that traverses a water-bearing formation from which the flow of water is great enough to keep the hole almost full of water. Long, Westerholt.

wet kiln. The wet kiln thermometer consists of a body-temperature instrument with the bulb enclosed in a close-fitting, loosely woven, fabric thimble which remains wet while the cooling time is being measured. The cooling of the bulb is controlled by the effects of convection, radiation, and evaporation. The dry- and wet-bulb temperatures, moisture content, and air velocity of the surroundings will all affect the reading. Robert, 1, p. 133.

wet metallurgy. See hydrometallurgy. Banett.

wet method. Any hydrometallurgical process, as the cyanide process, flotation process, etc. See also wet process. Fey. 2d, 1962.

wet mining. The grinding of the finely divided enamel material with sufficient liquid to form a slurry. ASTM C285-65.

wet mining fleet. A mill in which a wet process is employed. Fey.

wet mining. In wet mining, water is sprayed into the air at all points where dust is liable to be formed, and no attempt is made to prevent the air from picking up moisture. It therefore soon becomes saturated and remains so through out the ventilation circuit. Spalding. b. Mining for salt and other water soluble minerals as brine, rather than in the dry state. Kaufmann, p. 142.

wet mill. A concrete mix to which too much water has been added. See also water-to-ground ratio.

wet money. N. of Eng. Payment made to face workers who have to work in wet conditions. Trist.

wet natural gas. Natural gas which contains readily combustible gasoline, that may be used in the field and necessitates the installation of a plant. Fey.
wet- or dry-ground hollow

wet pan. An edge runner mill used for grinding relatively wet material in wet or dry processes and for reclaiming clays and clayses. The bottom has slotted grids with a proportion of solid plates on which the material is ground.

wet pan charger. One who adds water to the mixture, in addition to clay, shale, or brick, in grinding pans in order to make it plastic. May be designated according to clay ground in pans, as silica-wet pan charger. Also called wet-pan feeder. D. O. T. 1.

wet pan operator. One who tends and supervises loading of ore in a pan used for grinding and tempering clay, performing essentially the same duties as described under dry-pan operator. Also called clay temperer; wet-mill man. D. O. T. 1.

wet place. Aust. A place considered wet if men have to work constantly for 3 inches of water or more, or when water is constantly dripping on them from the roof. Fay.

wet-plant operator. One who works as a member of a crew, performing any one or a combination of duties concerned with extracting cadmium, lead, and zinc oxide from dust recovered in Cottrell precipitators. D. O. T. 1.

wet-process. Plastic processing. Forming certain articles of suitable plastic body by direct pressure. ASTM C142-60T.

wet process. a. A metallurgical process in which the valuable constituents of the ore are dissolved by acid or other solvents; a leaching or lixiviation process. Opposed to dry process. Fay. b. The method of preparation of a ceramic body wherein the constituents are blended in sufficient liquid to produce a fluid suspension for use as such or for subsequent processing. Also called slip process. ASTM C242-60T.

wet sanding. The ordinary process of puddling in which the furnace is lined with material rich in oxide of iron. Fay.

wet sand. Same as core sand inside the pipes in a box or a lift. Fay.

wet shot. Timber decay set up when mine props have not been treated with dry salts or have been exposed to alternations of moisture and drying out. Pryor, J. 3.

wet rubbing test. A test to determine the degree of attack of a vitreous-enamed surface after an acid-resistance test. Dodd.

wet sample. A sample consisting of sludge, drill cuttings, or other material wetted by the water-drill circulation medium. Long.

wet screen analysis. See wet sieve analysis.

Bureau of Mines Staff.

wet screening. The addition of water to a screen to increase its capacity and improve its screening efficiency. The water is introduced either by adding it to the feed or by spraying it over the material on the screen deck. The latter method is also used in rinsing sludge deposits, to recover media in the heavy-media process. Nelson.

wet screen analysis. A term used in connection with coal washing or other processes using fluid. See also coal-preparation plant; washery. Nelson.

wet sphere device. An instrument developed in Germany for the purpose of assessing climatic conditions in mines such as the wet- and dry-bulb temperatures, air velocity, humidity, and radiation. The field of usefulness of the instrument is limited to mines where the workers are normally wearing freely and wet few clothes. Roberts, J., p. 134-135.

wettable. a. Term used in connection with flotation processes to describe extent to which a specific mineral's surface attracts or rejects water (is hydrophobic or hydrophilic). Can be modified by wetting agents. Pryor, J. 3. b. A term used in wet separation to indicate the ease with which a solid can be wetted by a liquid. It is often an advantage to feel the raw coal or ore into a washer, in a wet condition. Nelson.

wet tare weight. The total length of surface in a channel or pipe which is in actual contact with water. See also hydraulic mean depth.

wetted dyed. Originally, only guth dye-mettes to which were added salts containing water of crystallization, as Glauher's salts, sodium oxalate, etc., with the view of making them available in mines containing firetamp. Fay.

wet well. cistern; a worker who detaches the blown glass from the pipe by touching it with a wet tool. Fay.

wetting. a. A phenomenon involving a solid and a liquid in such intimate contact that the adhesive force between the two phases is greater than the cohesive force within the liquid. Thus, a solid that is wetted by being removed from the liquid bath, will have a thin continuous layer of liquid adhering to it. Foreign substances, such as grease, may prevent wetting. Addition agents, such as detergents, may induce wetting by lowering the surface tension of the liquid. For a contrast, see water break. ASTM C242. b. A natural phenomena that affects both a solid-air phase, by adsorption of a liquid to the rock, the fiber pores, and the corners adjacent to the grain contacts. The non-wetting fluid occupies the larger openings, thus reducing the relative permeability of the rock. Williams, c. Liquid contact angle of less than 90°. PV.

wetting agent. When surface-active agents cause water to displace air at the surface of a solid-water-air system the surface tension of the solid-water-air phase has been lowered in comparison with that of the solid-air phase, by adsorption of the wetting agent (adhesional wetting). For a small particle, this can be analyzed in three stages: adhesion, immersion, spreading. Wetting out is a preliminary step in deflocculation of the solid. Fay.

wetting agents. a. Substance that lowers the surface tension of water and thus enables it to mix more readily. Wetting agents, such as bone and sodium carboxymethyl-cellulose, may be used for binding coal dust on mine roadways. Also called surface-active agents. See also wettabiliy. Nelson. b. A reagent to reduce the interfacial tension between a solid and a liquid and so facilitate the spreading of the liquid over the solid surface. B.S. 3552, 1962. c. A chemical promoting adhesion of a liquid (usually water) to neutral surface. Pryor 2. d. See plasticizer. Taylor.

wetting coal dust. The spraying of mine roadways with dust treated, with a wetting agent in order to (1) increase the difficulty of raising the dust deposit into the air to take part in an explosion, and (2) reduce the flammability of the dust raised in an explosion. Nelson.

wetting off. The severing of a seamless glass tube by means of a fine jet of water. Dodd.

wet unit weight; units weight. The weight (solid plus water) per unit volume of total volume of soil mass, irrespective of the degree of saturation. A.S.C.E P1828.

wet weight. Eng. A certain amount of moisture, 10 tons, upon which a royalty is paid. Fey.

w. B. A. J.

wetback. See whaleback dune. A.G.I.

wetback dune. A general, self-explanatory descriptive term for dunes, consisting of drifts; has been applied to features ranging widely in size. A.G.I.

wetback. A horizontal beam in a bracing system.

wetback type. A coal-cutter jet which enables water to be taken, during cutting, to the back of the cutter and for dust suppression and prevention of gas ignition from frictional sparking. With an undercutting jet, it consists of a feed water pipe and four or five distributor pipes terminating in jets all arranged in the top plate of the jet. See also dust-suppression jet. Nelson.

wetback with shielding, which is constructed parallel to the waterfront. Ham.

wetback. A laborer who observes coke as it is drawn onto the machine, checks the sparks from the coke, and quenches them with water hose to prevent burning of conveyor belts; also regulates flow of coolant water onto conveyor belts by manipulating levers of gates. D.O.T. Supp.

wheeler bridge. See Whedestone bridge-type instruments. Roberts, J., p. 87.

wheeler bridge-type instrument. These instruments are able to make use of electrically heated filaments which burn the methane and measure the heat output by resistanceometry. One or more of the filaments form the arms of a Wheatstone bridge circuit, the out-of-balance current being a function of the methane percentage. Roberts, J., p. 87.

w. Corn. An abbreviation of water wheel, implying a water driven wheel. Fay.

wheelabrator. A shotblasting machine of a type used for cleaning castings prior to vitreous enameling. This equipment has also been adapted to the testing of re-
wheelabrator

wheelbase. The rate of movement of the wheel across the work. ACSG, 1963.

wheel brush. Scot. A prop to which the pulley on a short self-acting incline is fastened.

wheel conveyor. A series of wheels supported in a frame over which objects are moved manually or flow by gravity. ASA MH 4.1-1958.

wheel conveyor. A wheel equipped with digging buckets, carried and controlled by a tractor unit. Nichols. A machine that digs trenches by rotation of a wheel fitted with toothed buckets. Nichols.

wheel conveyor. A tool for cleaning, reshaping, and truing the cutting faces of grinding wheels. Crispin.

wheel conveyor. For abrasion resistance. Dodd.

wheel conveyor. A horizontal Al or lava hollowware are often revolved on a turning wheel. Pettijohn.

wheel conveyor. A device used to deflect and guide the bit away from the bedding planes, it is called a whipstoke. Wheeler. b. See deflection wedge. BS.

wheel conveyor. A bucket or small tub used in connection with a whim for hoisting ore, coal, or rock in a shallow shaft. Becoming rocky. D.O.T. 1.

wheel conveyor. A series of rubber-tired wheels which can travel comparatively fast over rough ground. Hem.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A series of wheels supporting the transport of objects which are moved manually or flow by gravity. ASA MH 4.1-1958.

wheel conveyor. A wheel equipped with digging buckets, carried and controlled by a tractor unit. Nichols. A machine that digs trenches by rotation of a wheel fitted with toothed buckets. Nichols.

wheel conveyor. A tool for cleaning, reshaping, and truing the cutting faces of grinding wheels. Crispin.

wheel conveyor. A device used to deflect and guide the bit away from the bedding planes, it is called a whipstoke. Wheeler. b. See deflection wedge. BS.

wheel conveyor. A bucket or small tub used in connection with a whim for hoisting ore, coal, or rock in a shallow shaft. Becoming rocky. D.O.T. 1.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A series of wheels supported in a frame over which objects are moved manually or flow by gravity. ASA MH 4.1-1958.

wheel conveyor. A wheel equipped with digging buckets, carried and controlled by a tractor unit. Nichols. A machine that digs trenches by rotation of a wheel fitted with toothed buckets. Nichols.

wheel conveyor. A tool for cleaning, reshaping, and truing the cutting faces of grinding wheels. Crispin.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A series of wheels supported in a frame over which objects are moved manually or flow by gravity. ASA MH 4.1-1958.

wheel conveyor. A wheel equipped with digging buckets, carried and controlled by a tractor unit. Nichols. A machine that digs trenches by rotation of a wheel fitted with toothed buckets. Nichols.

wheel conveyor. A tool for cleaning, reshaping, and truing the cutting faces of grinding wheels. Crispin.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.

wheel conveyor. A horizontal H or lava stone used for giving a smooth edge to cutting tools. Ackell.
whitely, Scot. A hut, hutch, or tub. Fay. whirled, whirling beymeter. a. In mining, a hygrometer used to obtain wet-bulb temperatures. The instrument is spun round and round at a speed of about 200 revolutions per minute, for at least 1 minute, and then read as quickly as possible. Medlam, p. 160. b. See Sorrow whirlng hygrometer. Nelson.

whirling table. Any of various apparatus for producing rapid rotary and usually horizontal motion. Webster 2d.

whirlstone. Eng. Usually applied to sandstone (not a freestone) in the Carboniferous Limestone Series of Cumberland. Sometimes applied to a dolomite, limestone, or shale. Arkel.

whistle pipe. Obsolescent form of a small pipe, which is placed vertically and is blown through at a speed of about 200 revolutions per minute used to obtain wetbulb temperatures. ASG, 1963.

whistle-blower pipe. Obsolescent form of fixed sampler. Webster 2d.

white. A recrystallized product produced from molten bath of 99 percent pure alumina. It is considered to be the most friable of the aluminas abrasives. ASG, 1963.

white asphalt. A mixture of ammonium biphosphate and hydrochloric acid. Used for etching glass. CCD, 6d, 1961.

white and black. Same as chaledony. Fay.

white alkali. a. A mixture of salts (as sodium sulfate, magnesium sulfate, and sodium chloride) forming a white crust on some alkali soils. Webster 3d. b. Re-fined soda ash. Webster 2d.

white alumina. A recrystallized product produced from a molten bath of 99 percent pure alumina. It is considered to be the most friable of the aluminas abrasives. ASG, 1963.

white ash. The mineral valentinite, As$_2$O$_5$. The mineral valentinite, As$_2$O$_5$. A term used by Hodson.

white arsenic. arsenious oxide, As$_2$O$_3$. The most important compound of arsenic. Obtained from the roasting of arsenical ores. C.T.D.

white asbestos. Coal leaving a white ash. Fay.

white athabasca. A blasting compound to be applied directly to the steel as soon as a ground is available. ASGB, 3.

white cement. Portland cement made from secondary materials that, is chalk, or low-lithium limestone and china clay. The Fe$_2$O$_3$ content is <1 percent. Webster 3d.

white china. See kaolin.

white chloride. See kaolin.

white chloride. A 2,000-foot thick sandstone named from its outcrop in the Ogdin Canyon; a dense sand originally, of desert origin and of Jurassic age. Equivalent to the La Plata sandstone of southwestern Colorado. Fay.

white coal. A name frequently applied to calamine and cobaltite. Fay.

white copper. A white alloy of copper; pak-tong. Usually German silver. Synonym for dorkyrite. Webster 2d; Fay; Hey, 1955.

white copper ore. A. A safety fuse used for lighting fuses, or to obtain wetbulb temperatures. ASG, 1963.

white cement. The mineral valentinite, As$_2$O$_5$. The mineral valentinite, As$_2$O$_5$. A term used by Hodson.

white enamel. A translucent variety of glass, jade in appearance. Fay.

white emulsion. See one-coat ware. ASG.

white feldspar. Synonym for albite. Fay.

white furnace. See Howell furnace. Fay.

white gale perch. A safety fuse used for lighting fuses, or to obtain wetbulb temperatures. ASG, 1963.

white gale perch. A safety fuse used for lighting fuses, or to obtain wetbulb temperatures. ASG, 1963.

white gasser. A mixture of sodium carbonate (Na$_2$CO$_3$), sodium nitrate (NaNO$_3$), and sodium nitrate (NaNO$_2$). Used as an oxidizer in metalurgy. Buttress 2d, 1961.

white gasser. See one-coat ware. ASG.

white galler. Small; pale, rough nodules in hard shale. Arkel.

white gneiss. Commercially called arnica. A. A term used by Hodson.

white gold. Gold alloyed with nickel or iron. Webster 2d; Hey, 1955.

white gold. Gold alloyed with nickel or iron. Webster 2d; Hey, 1955.

white ground coat. White or opaque enamels to be applied directly to the steel as soon as a ground is available. ASGB, 3.

white ground coat. White or opaque enamels to be applied directly to the steel as soon as a ground is available. ASGB, 3.

white hat. Gold alloyed with nickel or palladium to give it a white color. C.T.D.

white hat. Gold alloyed with nickel or palladium to give it a white color. C.T.D.

white iron. An extremely hard cast iron, resulting when the casting is chilled in a metallic mold. Cripin.

white iron ore. An early name for siderite. Fay.

white iron ore. Pyrite. See marcasite. Fay.

white lead. Basic lead carbonate or lead hydroxy carbonate. Made by several processes of which the oldest and best known is the Dutch or Stack process. Used extensively as a paint pigment and for pottery glazes. C.T.D.

white lead ore. a. The mineral cerussite, PbCO$_3$. b. A decomposition product of sphalerite. Webster 3d. c. Usually German silver. SY.

white lead ore. The Upper Rh exeas, as opposed to the overlying Blue Lias. Arkel.

white limestone. The principal limestone deposit of the Permian system. Arkel.

white metal. a. A general term covering a group of white-colored metals of relatively low melting points (lead, antimony, bismuth, tin, cadmium, and zinc) and of the alloys based on these metals. ASM, 1964. b. A copper matte containing about 77 percent copper obtained from the smelting of sulphide copper ores. ASM, 1964. c. A term used for ing bearings and winding rope cappings. Nelson. d. N.S.W. Term applied to quantizes hard sandstones used as roadstones. New South Wales, p. 60.

white metal alloys. A mixture of zinc, tin, and copper, much used for the die casting of automobile hardware. Cripin.

white metal alloy. A capping in which the end of the winding rope (separated out into a brush) is embedded in a plug of white metal inside a socket. Nelson.

white metal alloying. A winding rope cap- ping by the bonding of the wires of the rope for a length equal to that of the socket, cleaning them thoroughly of all grease, cutting out the hemp core, and finally drawing them into the warmed socket and running in the white metal which is an alloy of lead, antimony, and tin. Mason, p. 2, 1962.

white metal. Muscovite. Webster 3d.

white mica. A machine for briquetting flue dust. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. A machine for briquetting flue dust. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.

white mica. Muscovite. Fay.

white mica. Mica containing large areas of white micas. Shipley.
white ore

white plate. A straight-grained softwood, light in color; used especially for pattern-made joinery. Crispin.

white portland cement. Essentially the same composition as other portland cement (but more expensive), being made from pure calcite limestones and white clays which exist in eastern Pennsylvania and in France. Ure, Chem. Sec. 7, p. 12.

white powder. See gunpowder, white. C.C.D. 6d, 1911.

whiteprint. See blueprint, white. H. E. 34, 1911.

white rent. Eng. An annual tax of eightpence upon every tinner in Cornwall and Devon, paid to the lord of the soil. Standard 1864.

white sand. Staff. White clay in the Coal Measures. Compare blackberry. Arkell.

white salt. a. Salt dried and calcined; de-creptitated salt. Fay. b. Salt refined and prepared mainly for household use. Also, vacuum salt used for salting slabs. They are said to have a distinct rock. Kauffman.

white sands. Sands which are usually quartzaceous, and must be pure enough to resist heat and slags. They are used for the final layer in Siemen's steel furnaces. Nelson.

white sapphire. More widely called white corundum; the colorless pure variety of crystallized corundum, 

white soaka. Salt dried and calcined; de-creptitated salt. Fay. b. Salt refined and prepared mainly for household use. Also, vacuum salt used for salting slabs. They are said to have a distinct rock. Kauffman.

whole diamond. A diamond (as mined), the shape of which has not been modified artificially. Black.

whole flat. Fay. b. Eng. The operation left to support previous work. See also pillar work, or the extraction of pillars to pillar work, or the extraction of pillars when it is drawn up to or over the pulleys. Fay.

whole stone. Synonym for whole diamond. Long.

whole stone bit. A bit of the crown which is either surface cut or impregnated with whole diamonds, as opposed to an impregnated or surface-cut bit in which the inset diamonds are fragmented diamonds. Long.

whole working. A. New. Working where the ground is still whole, that is, has not been penetrated as yet with breases. Opposed to pillar work, or the extraction of pillars to support previous work. See also flat. Fay. b. Eng. The operation of the working of the seams from which the form to it into pillars (bord-and-pillar). SMR, Paper No. 61. See also working the whole.

wholeworking. Scott. The case is said to be whelbed when it is drawn up to or over the pulleys. Fay.

wholeworking. Scott. Pithead or shaft pulleys. Fay. w top Abbreviation for water horsepower. Pit and Quarry, 53rd, sec. E, p. 82.

Wiancko pressure-measuring system. This pressure-measuring system is used to measure and record water pressure changes of 0.1 inch to 80.0 inches to a depth of 200 feet. The system includes three WAC units. The underwater unit consists of a differential pressure gage in a housing which also contains a hydraulic filter to compensate for static pressures and a calibration relay circuit. The differential pressure gage produces an electrical signal which is proportional to the pressure variation. The signal is used to change the ratio of two inductances. The electromagnetic unit of the system which consists of a bridge circuit with the two inductances. The bridge is used to produce a direct-current voltage across the proportions of the pressure variations. The recording unit is a recording milliammeter which serves as the indicating device for the pressure variations. H.W.G.
wick. Celtic for salt spring; often used in England as the termination of names of places where salt is or has been found. Northumberland. *Nelson.

widespread diaba or balsalt, named from a Finland locality, With and Wimper. Synonym for divining as a glassy phase of diabase or balsalt. Jeffery.

wildcat. A kind of pillar-and-stall, or bord-and-pillar, system of working a seam of coal, with pillars up to 15 yards and stalls up to 24 yards wide. Also called wicket work. *Fay. b. A wall built of refractories to close an opening into a kiln or furnace; it is of a temporary nature, serving as a partition wall, in intermittently or annular kilns. *Dodd.

wildcat conveyor. A conveyor comprising two or more endless chains, one driven by a crank and bar and to which vertical rods are attached at spaced intervals. The crossbars are also provided with the required projecting chains which can be lowered or raised to form a continuous carrying surface through which product cannot fall. *A.S.M. *1949-1958.

wildcat dip. A method of rapid-cotton string used to wick drill rod joints; the act of placing the cotton string on the rod joints. See also wildcat. *Fay.

wildcat driving. Long. Said of liquid steel, especially rimmed steel, that is being violently agitated, forcibly ejecting metal from the mold or other container. *Fay.

wildcat perf. Any old term used by colliers for fireplank. *Fay.

wild gas. Blast-furnace gas that does not burn steadily or properly. *Fay.

wild heat (of steel). A heat of molten steel which is boiling violently, and so, if poured, hardens in the ingot. *Fay.

wild mill. The drilling of boreholes in unproved territory. See also wildcat. Long. b. To act or to drill wells in unproved territory. See also wildcat. Long.

wild mill. Any rock not fit for commercial use.

wild parrot. Term used by Scottish miners for the term is now used as follows: Specifically applied to a mining or oil company organized for the purpose of unproved ground far from the actual point of discovery. Any risky venture in mining. *Fay.

wild drilling. The driving of boreholes in an unproved territory. See also wildcat. Long.

wildside. A borehole drilled in an unproved territory. See also wildcat. Long.

wilder. a. A borehole and/or the act of drilling a borehole in an improved territory where the prospect of finding anything of value is questionable. It is analogous to prospecting in mining. Long. b. To act or to drill wells in unproved territory. See also wildcat. Long.

wilder. Nickname for hand-rotated wilder. c. Organizing and exploiting a risky venture in mining. Long. d. A poor well or a well that is a failure. *Fay.

wilder. Said of liquid steel, especially rimmed steel, that is being violently agitated, forcibly ejecting metal from the mold or other container. *Fay.

wilder. A well drilled while out of control. *Brantly. 2.

wilder. A kind of bord-and-pillar system of coal mining in which the very narrow part of a seam supporting the roof is not recovered. *Fay.

Wileys' process. A method of reducing iron ore by which the electrode furnace is fed with two or more hollow electrodes, through which the finely divided ore intimately mixed with reducing materials is introduced. Osborn.

Willey table. A form of shaking canvas table which is given a vaner motion. *Henderson. 24. P. 1895.

Willey table. Long-established and widely used form of shaking table. Plane rectangle is mounted horizontally and can be rotated about its long axis. It is covered with linoleum (occasionally rubber) and has longitudinal ribs at discharge end to table, longitudinally. Sands, usually classified for size range are fed continuously and worked along table, by means of a water sprayer, and across ribs by downslope by gravity tilt adjustment, and added wash water. At discharge end the sands have separated into bands, the heaviest and smallest uppermost, the largest and lightest lowest. Pryor. 3. The Dodd, Cammet, 1237

Willey table. Long-established and widely used form of shaking table. Plane rectangle is mounted horizontally and can be rotated about its long axis. It is covered with linoleum (occasionally rubber) and has longitudinal ribs at discharge end to table, longitudinally. | Wimmer        | A tunnel kiln of the combined direct flame and muffie type for the firing of wall tiles and sewer pipes. This kiln differed from earlier tunnel kilns in that the hot combustion gases passed across, rather than along, the kiln. Wimble, a. A natural zinc orthosilicate. See also jadite, Sanford. b. A translucent bright green variety of serpentine usually containing species of chrysotile, used as a semiprecious stone. Dune 64, pp. 460, 669. c. An old misspelling of wilkmite. Dune 64, pp. 460, 669. Wimblestone. Wimble. A natural zinc orthosilicate, Zn-SiO₂. Troosite is a manganese-bearing variety. winder brake

and smoothness of control which previously had been obtained only with Ward-Leonard control was at considerable expense. See also brake; semi-automatic control. Nelson.

wind gauge An instrument for testing the velocity of the air in mines. Fay.

wind gap a. The low slope or notch in a ridge where a stream formerly flowed, and that is utilized for highways in crossing the ridge. A.G.I. b. Sometimes a river that has been cutting a water gap it diverted by capture while the general low-

evitis of the land surface is in progress. Nelson.

wind gap furnace A form of furnace using the natural draft of a chimney without the aid of a bellows or blower. Fay.

windlass Eng. A shaft or other opening for various purposes. Nelson.

windlass operation The machinery and equipment for lowering and raising loads through the shaft or staple shaft. Nelson.

windlass box The appliance on drop bottom ore or coal cars by which the doors are

closed and held tight. Fay.

windlass cycle In general, a cycle refers to any series of changes or operations performed by or on a system, which brings it back to its original state. It is usually terms of a complete wind.

windlass, which comprises three phases: (1) acceleration to full speed; (2) full-speed running; and (3) retardation to rest.

The time of the winding cycle is the sum of the winding time and the deckling time in seconds. The time for changing mine cars is from 10 to 12 seconds for each deck of mine cars. The winding time is made for cylindrical or ellipsoidal forms, and the term usually refers to a complete wind.

windmill A windmill is driven by the air stream, and its rotation transmitted through gearing to dials or other recording mechanism. In some instruments the windmill and dial are in the same plane, that is, both vertical, while in others the dial is horizontal. In the windmill type of wind instrument the readings of the dials at the beginning and end of a measured period, and a watch or clock is required. The instruments may be fitted with an extension handle providing a form of remote control, and used to measure the air speed of an otherwise inaccessible spot. Mason, v. 1, p. 274-275.

windmill anemometer An anemometer in which a windmill is driven by the air stream, and, its rotation transmitted through gearing to dials or other recording mechanism. In some instruments the windmill and dial are in the same plane, that is, both vertical, while in others the dial is horizontal. In the windmill type of wind instrument the readings of the dials at the beginning and end of a measured period, and a watch or clock is required. The instruments may be fitted with an extension handle providing a form of remote control, and used to measure the air speed of an otherwise inaccessible spot. Mason, v. 1, pp. 274-275.

windmill pipe A dredge discharge pipe with one or more openings in the bottom. Nelson.

windmill-type sample Synonym for door-type sampler. Long.

windmill velocity Pressure on a structure due to wind, which increases with wind velocity approximately in accordance with the formula \( v = \frac{P}{0.03} \), where \( v \) is the wind velocity in miles per hour. Horn.

windmills a. A device used for hoisting, limited to small-scale development work and prospecting because of its small capacity. Lewis, p. 239. b. A drum, or usually a section of tree trunk wrapped horizontally on rough bearings above shallow pit or shaft, and provided with handles at each end for manual rotation. Used to raise or lower buckets of spoil in exploratory pit ing. Pryor, 3. c. Commonly used in England, Africa, and Australia to designate a hoist or winch. Long. d. A horizontal drum for winding, or for hoisting by winding; properly, one operated by radial arms, removable bars, or a pulwl-and-ratchet mechanism; loosely, any form of horizontal hoisting drum, especially that form of winch familiar in well curbs, consisting of a drum and cranks. Standard, 1954.

windmills a. A device used for hoisting, limited to small-scale development work and prospecting because of its small capacity. Lewis, p. 239. b. A drum, or usually a section of tree trunk wrapped horizontally on rough bearings above shallow pit or shaft, and provided with handles at each end for manual rotation. Used to raise or lower buckets of spoil in exploratory pit ing. Pryor, 3. c. Commonly used in England, Africa, and Australia to designate a hoist or winch. Long. d. A drum, or usually a section of tree trunk wrapped horizontally on rough bearings above shallow pit or shaft, and provided with handles at each end for manual rotation. Used to raise or lower buckets of spoil in exploratory pit ing. Pryor, 3. c. Commonly used in England, Africa, and Australia to designate a hoist or winch. Long. d. A horizontal drum for winding, or for hoisting by winding; properly, one operated by radial arms, removable bars, or a pulwl-and-ratchet mechanism; loosely, any form of horizontal hoisting drum, especially that form of winch familiar in well curbs, consisting of a drum and cranks. Standard, 1954.

windmills a. A device used for hoisting, limited to small-scale development work and prospecting because of its small capacity. Lewis, p. 239. b. A drum, or usually a section of tree trunk wrapped horizontally on rough bearings above shallow pit or shaft, and provided with handles at each end for manual rotation. Used to raise or lower buckets of spoil in exploratory pit ing. Pryor, 3. c. Commonly used in England, Africa, and Australia to designate a hoist or winch. Long. d. A horizontal drum for winding, or for hoisting by winding; properly, one operated by radial arms, removable bars, or a pulwl-and-ratchet mechanism; loosely, any form of horizontal hoisting drum, especially that form of winch familiar in well curbs, consisting of a drum and cranks. Standard, 1954.
windrift dune

oped forms have more or less parallel wings. Usually found along shores; few, if any, are found in the interior of the United States. *J. Geol.* 46, No. 2, Feb.-Mar., 1940.

wind rose. A diagram which shows the proportion of winds blowing from each of the main points of the compass at a given locality, recorded over a long period. The prevailing wind with its average strength is thereby revealed at a glance. *Ham.*

windrow. a. A row of peats or sod set up to dry, or cut in paring and burning. *Standord*, 1966, b. A ridge of soil pushed up by a grader or bulldozer. *See also travel mixer.* *Ham.*

windrowed. A variety of rippled mass consisting of straight, tapered ridges parallel to current. *Petijohn.*

windsortie. A leucocratic, spilitic variety of quartz monominite, containing a small percentage of biotite. *Holmes*, 1923.

windup. The amount of twist occurring in a mine shaft or incline, as where long-walls are advanced to reveal at a locality, recorded over a long period. The main points of the compass at a given point are thereby revealed at a glance. *Ham.*

windvane. a. A vertical or inclined opening, or excavation, connecting two levels in a mine shaft or incline, as where long-walls are advanced to reveal at a locality, recorded over a long period. The main points of the compass at a given point are thereby revealed at a glance. *Ham.* b. A subsidiary shaft which starts underground. It is usually a connection between two levels, and is sunk in the ore body. *Higham*, p. 36. c. Can. Interior mine shaft. *Hoffman.*

winder. In metal mining, one who operates an unmounted, compressed-air, percussion-type rock drill in sinking winders (passageways) from the surface to lower levels of the mine, or from one level to another. D.O.T. 1.

winding. In metal mining, one who operates an electric or compressed-air hoist to raise and lower men, ore, rock, and supplies (in some, small underground shaft or incline connecting two or more underground levels). Also called winze hoist operator. See *wind hoistman.* D.O.T. 1.

wiped joint. a. A joint wherein filler metal is applied in liquid form and distributed by mechanical means (such as phosphate coatings). *ASM Gloss.* b. A joint in which the molten solder is poured upon the joint, after scraping and fitting the joint in place, and the joint is wiped up by hand with a cloth pad while the metal is plastic. *Steck*, 1903.

wiper. a. A rod or bar which is held in place by a piece of cotton waste or other absorbent material and used for drying a drill hole before charging with black powder. *Fay.* b. A follower of cam. *Fay.*

wiper forming. A method of curving sections and tubing to a desired shape by rotating either the wiper block, shoe, or roll. *ASM Gloss.*

wiping. a. The extraction, loading, and removal of coal or ore from the ground; winning follows development. *Nelson.* b. The operation of (1) mining an ore, and (2) opening up a new portion of a coal seam, C.D. to a mine opening. *Fay.* d. The portion of a coalfield laid out for working. *Fay.* e. Mining. *Fay.* f. Scot. A pit (mine) and its associated equipment and machinery. *Fay.* g. Eng. See heading. *SMRB, Paper No. 61.* h. The combined process of getting (that is, extraction) and transporting a raw material, such as clay to a brickworks or stockpile. *Dodd.*

wining bord. Aust. A room from which coal is being mined. *Fay.*

wining headings. The development headings off which oblique headings and conveyor panels are formed and worked (longwall) or the development drivages in the solid coal. *Dodd.* 15 yards apart, and off which bords and pillars are formed (pillar method of working). *Nelson.*

wining headway. a. N. W. A headway driven to explore and open out the coal seam. *Fay.* b. N. of Eng. A crossheading, or one driven at right angles to the main gangway. *Fay.*

wining-out. Aust. A leading heading or drive in advance from which rooms, or bords, are opened. Any leading heading is termed a "winning." *Fay.*

wining gold. Air blowing. Tossing up dry powdered auriferous material in air, and catching the heavier particles not blown away. *Fay.*

wining coal. A heavy rain-carry-over and engine fire which is a solidifying point of below -20°F. *Fay.*

wire-cut process

wirette. a. A vertical or inclined opening, or excavation, connecting two levels in a mine shaft or incline, as where long-walls are advanced to reveal at a locality, recorded over a long period. The main points of the compass at a given point are thereby revealed at a glance. *Ham.* b. A subsidiary shaft which starts underground. It is usually a connection between two levels, and is sunk in the ore body. *Higham*, p. 36. c. Can. Interior mine shaft. *Hoffman.*

wister. A cast shape, particularly of tough pitch copper, which has a cross section approximately square with tapered ends, designed for hot rolling to rod for subse- quent drawing into wire. *ASM Gloss.*

wire brush. A hand brush fitted with wire or thin strips of steel instead of bristles. Used for removing rust, dirt, or foreign matter from a surface. *Crispin.*

wire cable. See cable. c. Long. *Wire cloth. Screen composed of wire or rod woven or crimped into a square or rectangular pattern. *Nichols.*

wire cut brick. Brick made by wire from a column of clay extruded by an auger ma- chine and not repressed. *A.R.I.*

wire-cut process. In the United Kingdom, the shaping of brick by extruding a column of clay through a die, the column being subsequently cut to the size of bricks
wire-cut process

by means of tools. Wire. The equivalent term in the United States for this process is known as the stuff feed process. BEAD

wire drawing. A process in which small solid wire is reduced in size by rolling. The metal to be rolled is hardened by a small amount of the ribbon of glass so that it acts as a reinforcement and holds the fringes together in the event of the glass being fractured. C.T.D.

wire drag. A buoyed wire towed at a given depth to determine whether any isolated rock is present. A gauge or scale is set above that depth, r for determining the least depth of an arc. HUG.

wire glass. a. Reducing the cross section of wire by pulling it through a die. See also Taylor process. ASM Gloss b. The operation, accidental or otherwise, of reducing the pressure of steam between the boiler and the cylinder. Fay.

gate gage. a. A gage for measuring the diameter of wire or thickness of steel wire. B. A standard series of sizes arbitrarily indicated by a set of standard holes or by a set of gages of the dimension of wire. Most widely used in the United States is the U.S. Standard Steel Wire Gage, which names sizes of steel wire without legal effect. The Birmingham gage is recognized in acts of Congress for tariff purposes. American Bureau of Shipping and Lloyd's gage are used for copper wires and all nonferrous metal wires. Crispin.

wire packs. A gage of fine wire, as that used for the chimneys of flame safety lamps. Fay.

wire rod. Hot-rolled coiled stock that is to be drawn into wire, as in the rope. Also called wire rod. Fay.

wire rope. A rope made of twisted strands of wire or threads. A.G.I.

wire strand. Several steel wires twisted together to form one strand of a wire rope. A.G.I.

wire-string core. A core in which the number of wires shall not be less than the number of wires in each strand. A.G.I.

wire-string core barrel. Long. Wire-string drilling. In this method, digging-under rock or buckets are suspended on a steel core barrel that rests on the surface of rocks in which they are bored and removed. Includes the use of drill-buckets, clamshell dippers, and muck forks. Fay.

wire-string drilling. The drilling of bore-holes with wire-string core barrels. Fay.

wire-string drill core. A core in which the number of wires shall not be less than the number of wires in each strand. A.G.I.

wire-string drill core barrel. Long. Wire-string drill string. The drill string of wire-string drill core barrels. Fay.

wire-string drill string. A rope made of twisted strands of wire. See also绝不. a. In some operations, wire-string drill string may be used in place of the shorter and lighter wire-string drilling. Fay.

wire-string helper. See wireman helper. D.O.T. I.

wireless. A device for stealing off and securing the tension in the wire ropes of a wire-rope side-framed intermediate section. NEMA MBI-1961 wire-tender. wire-tender is a term for an alternative to a return idler. NEMA MBI-1961.

wire-tender support. That part of the wire-rope side-framed intermediate section which maintains a horizontal plane a fixed distance between wire ropes but does not support the wire ropes. NEMA MBI-1961.

wire-tender tests. To insure that new rope for use in mines comply with the appropriate British Standards, it is recommended that a percentage (10 to 20 percent) of all new hawse ropes be tested. The test is carried out on rope samples taken either when the ropes are delivered or when put into service. The former practice is preferred. The three main tests are tensile, torsion, and reverse-bend, which are covered by British Standard 236 and 330. Nelson.

wire rope grade. A rope used as a cable or cables. Used for conveying ore and supplies in rough mountainous districts; a tramway. See also aerial tramway. Fay.

wire safety glass. A single piece of glass with a layer of meshed wire completely embedded in the glass, but not necessarily in the center of the sheers. When the glass is broken, the wire mesh holds the pieces together to a considerable extent. See also safety glass. ASTM C162-66.

wire saw. A saw consisting of one- and three-strand wire cables, up to 10,000 feet long, running over pulleys as a belt. When fed by a slurry of sand and water, and held against rock by tension, it cuts by abrasion. It cuts a narrow, uniform channel. This saw is used for cutting granite, limestone, marble, slate, and sandstone into smaller blocks. BuMines Bull. 630, 1965, p. 278. Nelson.

wire saw operator. See wire sawyer. D.O.T. I.

wire sawyer. In a stone industry, one who operates a wire saw to cut very large blocks of granite, limestone, marble, slate, or sandstone into smaller blocks that can be handled on gang or circular saw. Also called wire saw operator. D.O.T. I.

wire silver. Native metal in the form of wire or threads. A.G.I.

wire strand. Several steel wires twisted together to form one strand of a wire rope or cable. A.G.I.

wire-tender. A device for stealing off and securing the tension in the wire ropes of a wire-rope side-framed intermediate section. NEMA MBI-1961 wire-tender support. That part of the wire-rope side-framed intermediate section which maintains a horizontal plane a fixed distance between wire ropes but does not support the wire ropes. NEMA MBI-1961.
wittallite. A natural calcium silicate, CaSi2O5, or wollastonite.

2242

wollastonite. A natural calcium silicate, CaSi2O5 or wollastonite. A natural calcium silicate, CaSi2O5 formed by the reaction of calcium hydroxide (Ca(OH)2) with silica (SiO2) in the presence of water (H2O).

Wollastonite is a common mineral found in a variety of rock types, including metamorphic rocks, igneous rocks, and sedimentary rocks. It is often associated with other minerals such as quartz, feldspar, and mica.

Wollastonite is known for its high purity, optical properties, and thermal stability, making it a valuable mineral resource. It is used in a variety of applications, including as a filler in paints and plastics, as a thermal insulator in ceramics, and as a abrasive in polishing and grinding.

The term "wollastonite" was coined in honor of the British mineralogist, Edward Wollaston, who first described the mineral in 1804.
wood copper. See wood anneate.

Woodchuck cut. See burned cut. Hess.

wood coal. a. Charcoal. Webster 3d. See also board coal. Fay.

wood coal. a. Charcoal. Webster 3d. See also board coal. Fay.

wood coal. a. Charcoal. Webster 3d. See also board coal. Fay.

wood coal. a. Charcoal. Webster 3d. See also board coal. Fay.

wood coal. a. Charcoal. Webster 3d. See also board coal. Fay.

workability

A property determining the ability to place or use a material in proper form for the desired purpose. Working time refers to the length of time within which a mixture, slurry, or paste may be placed and carried from one process to the next. Working time may be stated as a cloudy viscosity range or a window of viscosity range of the mixture. See also workability range.

working beam

Eng. A beam having a vertical motion on a rock shaft at its center, in which a pump piston works. Fay.

working beam furnace

In glassmaking, a small open-end reverbatory furnace supplied with fresh air from the downcast shaft. Fay.

working balance

In glassmaking, a small opening over pots enabling workers to introduce or withdraw material required. Bureau of Mines Staff.

working beam. Eng. A beam having a vertical motion on a rock shaft at its center, in which a pump piston works. Fay.

working balance. See whole working balance.

working beam furnace. See mold.

X

X-ray; roentgen ray. a. Any of the electromagnetic radiations emitted by the disintegration of the nuclei of radioactive substances or by the impact of an electron stream on a target. b. Electromagnetic radiation, of wavelength less than 500 angstroms, emitted as the result of nuclear disintegration.

deep. A. Abbreviation for extra fine. Webster 3d.

effect. A product utilizing a layer of photoconductive material on an aluminized mylar sheet upon which is placed an electron image for transmission of light but a wavelength approxi-

xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

X-yellow. A sedimentary rock composed of yellow sandstones and shales. Webster 3d.

X-1 hydrophotometer. A new transistorized self-calibrating device. The electrooptical system gives direct measurement of light transmission through a fixed distance in sea water. Heart of system is a sensor unit which contain a light source, photocell, and lens system in a watertight assembly.

X-ray; roentgen ray. a. Any of the electromagnetic radiations emitted by the disintegration of the nuclei of radioactive substances or by the impact of an electron stream on a target. b. Electromagnetic radiation, of wavelength less than 500 angstroms, emitted as the result of nuclear disintegration.

Xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

X-ray roentgen ray. a. Any of the electromagnetic radiations having the nature of visible light but a wavelength approxi-

X-ray; roentgen ray. a. Any of the electromagnetic radiations emitted by the disintegration of the nuclei of radioactive substances or by the impact of an electron stream on a target. b. Electromagnetic radiation, of wavelength less than 500 angstroms, emitted as the result of nuclear disintegration.

Xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

Xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

X-yellow. A sedimentary rock composed of yellow sandstones and shales. Webster 3d.

X-1 hydrophotometer. A new transistorized self-calibrating device. The electrooptical system gives direct measurement of light transmission through a fixed distance in sea water. Heart of system is a sensor unit which contain a light source, photocell, and lens system in a watertight assembly.

Xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

Xenothermal ore deposit. Deposit formed at high temperature but at shallow to moderate depth. McKinstry.

X-ray; roentgen ray. a. Any of the electromagnetic radiations emitted by the disintegration of the nuclei of radioactive substances or by the impact of an electron stream on a target. b. Electromagnetic radiation, of wavelength less than 500 angstroms, emitted as the result of nuclear disintegration.
X-ray analysis. Use of X-rays by Laue method, by X-ray spectrometry, crystal rotation, or powder rotation method to photograph and establish lattice structure of crystals. This gives identification of species and shows the structural bonding of the constituents' elements. The hardness of an X-ray refers to its penetrating power and is in inverse proportion to its wavelength. 

X-ray crystallography, the determination by Max von Laue that the planes of atoms in crystals act as a diffraction grating to X-rays, which are scattered by them and provide a means of determining the details of the inner atomic structure. X-ray photography of metals provide information which in many cases cannot be obtained by ordinary microscopic methods. The lines produced by each element, or phase, are characteristic; the general pattern enables the crystalline structure to be identified. 

X-ray diffraction. Reflection at definite and characteristic angles from space lattices of crystals which are characteristic; the general pattern enables the crystalline structure to be identified. 

X-ray microscope. An instrument in which X-ray diffraction patterns of crystals are translated into pictures showing the relative positions of the atoms in a crystal as if in a photomicrograph of very high magnification. 

X-ray spectrometer. Apparatus developed by Bragg for beaming X-rays on a crystal, from the sources of which they are then reflected. 

X-ray spectrograph. An instrument in which the material being analyzed is subjected to an intense beam of X-rays. Secondary X-rays are emitted, separated according to element (by passing through a crystal such as lithium fluoride) and the intensity measured; used to analyze ores, slags, refractories, and other nonmetallic materials. 

X-ray spectrometer. A small portable drill making X-ray diffraction. Reflection at definite and characteristic angles from space lattices of crystals which are characteristic; the general pattern enables the crystalline structure to be identified. 

X-ray spectrometer. Glass that remits the penetration of X-rays and gamma rays and ordinarily contains a high content of lead. 

X-ray analysis. Use of X-rays by Laue method, by X-ray spectrometry, crystal rotation, or powder rotation method to photograph and establish lattice structure of crystals. This gives identification of species and shows the structural bonding of the constituents' elements. The hardness of an X-ray refers to its penetrating power and is in inverse proportion to its wavelength.

X-ray crystal analysis. The process of passing X-rays through crystals to determine the spacing of atoms and hence the nature of the crystal structure; the spacing of the rays are recorded on photographic film and from their interpretation the desired information is obtained. 

X-ray crystallography, the determination by Max von Laue that the planes of atoms in crystals act as a diffraction grating to X-rays, which are scattered by them and provide a means of determining the details of the inner atomic structure. X-ray photography of metals provide information which in many cases cannot be obtained by ordinary microscopic methods. The lines produced by each element, or phase, are characteristic; the general pattern enables the crystalline structure to be identified. 

X-ray diffraction. Reflection at definite and characteristic angles from space lattices of crystals which are characteristic; the general pattern enables the crystalline structure to be identified. 

X-ray microscope. An instrument in which X-ray diffraction patterns of crystals are translated into pictures showing the relative positions of the atoms in a crystal as if in a photomicrograph of very high magnification. 

X-ray spectrometer. Apparatus developed by Bragg for beaming X-rays on a crystal, from the sources of which they are then reflected.
yard price. The price paid per yard driven by yardmen. Dosonctive Lundforms carved out of yarn. As applied to minerals, an asbestos trough. A trough excavated by wind or water. graveyard. A place where the dead are buried. A.G.I., American Geographical Union. yardage, man. In plowing, the laborer who plows down rows of rock with a bar after coal has been blasted from the surface. yardage trough. A trough excavated by wind action, between two line of cleavage. yard. A unit of linear measurement. yardage with poikilitic inclusions of magnetite and titaniferous series of diopside syenites. Sinclair, W. E., p. 484. yard-long scale. Crispin. yard of metal would properly be called a 36-inch yard of the value one in a three-dimensional rectangular coordinate system. Webster 3d. yard of yellow. Yellow boy. Deposit from the acid waters of a mine or partial neutralization. Ferrous sulfate. Yellow, yellow. A pigment consisting of barium chromate. Standard 1964. yellow ochre. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ocher. same as yellow ochre. yellow ocher ore. Bellard, b. Corn. Chalcopyrite. yellow ochre. Yellow and decomposed emanation of sulfur oxide. King's yellow, Aso.S.. Webster 2d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. Yellow and decomposed emanation of sulfur oxide. King's yellow, Aso.S.. Webster 2d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. Yellow and decomposed emanation of sulfur oxide. King's yellow, Aso.S.. Webster 2d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ocher. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d. yellow ochre. A mixture of limonite usually with clay and silica. Used as a pigment. Webster 2d. A moderate orange yellow that is yellower and darker than deep chrome yellow. Webster 3d.
yielding support. A support which incorporates a sliding or flexible joint to accommodate early damage and thus delay damage and distortion of the support. Friction or hydraulic devices may be used so that a support, when subjected to a load above its set load, yields mechanically rather than by distortion. Nelson.

yield loss. The difference between the actual yield of a product and the yield theoretically possible (based on the reconstituted feedstuff). B.S. 3552, 1962. Also called washing error.

yield point. The lowest stress at which extension of the strain test piece increases without increase in load. It is determined by observing the fall of the testing lever and checking by a pair of dividers on the original stage length. Many materials do not indicate a defined yield stress and in such cases the proof stress is used. See also working stress; high tensile steel; mild steel.

yield strength. A measure of the ability of a material to resist strain or elongation corresponding to the yield stress.

yield strength of concrete. The minimum stress at which continuous flow takes place. This yield point will be evident in mass, compression, tension, and shear tests when yielded at a given rate of stress and will depend on the manner of specimen preparation. A.S.C.E. 1963.

yield strength of metals. A stress at which a material exhibits a specified deviation from proportionality of stress and strain. An offset of 0.2 percent is used for most metals. A.I.M. 1968.

yield strength terminology. A measure of the ability of a material to resist creep.

young. That stage in the development of streams when they are increasing in vigor and efficiency; or in land sculptures, when topographic forms are being accentuated and are tending toward complexity. Compare maturity; old age. See also young.

young, see young.

youth. That stage in the development of streams when they are increasing in vigor and efficiency; or in land sculptures, when topographic forms are being accentuated and are tending toward complexity. Compare maturity; old age. See also young.

youth. A device used in conjunction with belt conveyors that consists of a short reversible pan or flight conveyor, set at right angles to the belt and driven by it. When a mine car has been loaded with coal, the yo-yo is reversed, and this causes the coal to be dumped into the empty car behind, without having to step the belt between loads. Kentucky, p. 232.

YP. Abbreviation for yield point. Webster 3d.

ytong. A cellular (lightweight) concrete made in block form from shale and lime, and subsequently hardened by autoclave treatment. Compare thermalite.

Y-track. A track at approximately right angles to a line of railroad, and connected with it by two parallel tracks abutting the whole approaching the form of a Y with a line joining the ends of its arms; used in passing trains.

yttrium. A metallic element in group III of the periodic system. Obtained by reduction of the fluorides or chlorides. Symbol, Y; valence, 3; atomic number, 39; and atomic weight, 89.008. C.T.D.; Fay; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-277. Also used in special ceramics, in optical glasses, and in arc welding. C.D., 1961.

yttrium garnet. A variety of garnet containing a small amount of yttrium. See also ytterglow. Fay.

yttriflite. One of the rare-earth minerals. It is a silicate of yttrium metals (43 to 47 percent); thorium (10 to 20 percent), and cerium metals (5 to 10 percent). Color on the fresh fracture olive-green, changing to orange-yellow on surface. Specific gravity 4.575. Found in Texas. C.D., 1961.

yttrium. A metallic element in group III of the periodic system. It is usually classed with the rare earths. Found in gadolinite and other rare minerals. Symbol, Y; valence, 3; atomic number, 39; and atomic weight, 88.905. C.T.D.; Fay; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-277. Also used in special ceramics, in optical glasses, and in arc welding. C.D., 1961.

yttrium sulfate. White; Y₂(SO₄)₃; molecular weight, 465.99; specific gravity, 2.52; decomposes at 1,000° C; soluble in water and in a saturated sodium carbonate solution. In the Handbook of Chemistry and Physics, 45th ed., 1964, p. B-277.

Z. a. Symbol for unknown quantity. Webster 3d. 1. One of the three rectangular coordinates (x, y, z). Webster 3d. c. Symbol for the valency of an ion. Zimmermann, p. 59. d. Symbol for altitude. Zimmerman, p. 7. c. Symbol for elevation above datum plane or distance above datum plane. Zimmerman, p. 41. f. Abbreviation for zero. Webster 3d. g. Abbreviation for Zone(s). Webster 3d. 2. a. Symbol for Greenwich (England) Mean Time, also abbreviated GMT; for example, 0730 Z; and (x, y, z). Zimmerman, p. 171. d. Symbol for Greenwich (England) Mean Time, also abbreviated GMT; for example, 0730 Z.

Z. a. Symbol for unknown quantity. Webster 3d. b. Symbol for atomic number. Webster 3d. c. Symbol for gram-equivalent weight. Zimmermann, p. 51. d. Symbol for the number of molecular collisions per unit time or molecular collision frequency. Zimmermann, p. 75. e. Symbol for elevation above datum plane or distance above datum plane. Also given as Z. Zimmerman, p. 41. f. Symbol for impedance. Webster 3d. g. Symbol for self-inductance. Zimmerman, p. 57. h. Abbreviation for zinc, but usually the chemical symbol Zn is used. Webster 3d. i. Abbreviation for Zone(s) and for Greenwich (England) Mean Time, also abbreviated GMT; for example, 0730 Z; and (x, y, z). Zimmerman, p. 171. d. Symbol for Greenwich (England) Mean Time, also abbreviated GMT; for example, 0730 Z.
Z

Zaffer blue. Same as cobalt blue. Fay.

Zelas cup. An orifice type viscometer; it has been used for the determination of the viscosity of glaze suspensions. Dodd.

Zarnich; Zarnec. Native sulfide of arsenic, including sandarac and orpiment. Webster 2d.

Zaws. A cavern. C.T.D.

Zax. A tool for trimming and puncturing roofing slates. Webster 3d.

Z-axis; Z-axis. a. One of the three optic axes (Y, Z, and Z) in a biaxial crystal. The Z-axis is the axis of least ease of vibration. Light vibrating parallel to the Z-axis travels with minimum velocity and is called the slow ray, the Z-ray, and the y-ray. The highest index of refraction n, in biaxial minerals is the index of the slow ray vibrating parallel to the Z-axis. Bureau of Mines Staff. b. One of the axes in a three-dimensional rectangular coordinate system. Webster 3d. c. A line perpendicular to the plane of a polar coordinate system at the pole. Webster 3d.

Zemboite. Z. One of the three coordinates in a three-dimensional rectangular coordinate system. Webster 3d.

2d. Abbreviation for zenith distance. Webster 3d.

Zedralite. An old name for a variety of fire opal. Fay.

Zebra enstatite. Z. Zebra stone with lighter brown streaks. From India. Same as zebra stone. Shipley.

Zebra rock. A banded quartz and felsite rock of lower Cambrian age found in East Kimber- ly, Western Australia. Heu.

Zebra rock. A type of rock for basic open-hearth steels, the feldspar or quartz occurs as alternate rings of chrome magnetite and of silica refractories, hence the name from the colors and light stripes across the rock. The zebra rock was introduced in 1947 with a view to combining the merits of the two types of refractory; by 1952 there were 300 such roofs in service in the United States alone, but the zebra roof has now been displaced by the allisilic roof. Dodd.

Zeiss green. An underglaze color that has been used for pottery decoration. It is made by calcining a mixture of 10 parts barium chromate, 8 parts whiting, and 5 parts borax and soda. Zedke.

Zeiss konimeter. A portable dust-sampling instrument. See also konimeter. Netzos.

Z-ellweger furnace. A long-hearth reverberatory furnace used at Messel. Fay.

Zeolite mfnictite. Same as dicha diving. English.

Zeolite process. a. A base exchange method of treating hard water, in which the zeo- lites, contained in a tank, removes the salts. The zeolite layer is regenerated by back flushing with brine. The process is not suitable for water containing sulfates of magnesium or any chloride, but in other respects it is a simple and effective method. See also colloidal water treatment. Nelson, b. See base exchange process. Cooper, p. 371.

Zeolites. A class of hydrated silicates of alu- minum and either sodium or calcium or both, of the type Na2O·Al2O3·nSiO2·xH2O. The term originally described a group of naturally occurring minerals. The natural zeolites are analcime, chabazite, heulandite, natrolite, stilbite, and thomsonite. Artificial zeolites are made in a variety of forms ranging from gelatinous to porous and sandlike and are used as gas adsorbents and drying agents as well as water softeners. Both natural and artificial zeolites are now used extensively for water softening. The term zeolite now includes such diverse groups of compounds as sulfurated organics or basic reines, which act in a similar manner to effect either cation or anion exchange. OCR 6d, 1961.

Zeolite mimetica. Same as dachiardite. English.

Zeolite process. c. A method of treating water to produce a water that is free of hardness. Nelson, b. See base exchange process. Cooper, p. 371.

Zeolite process. d. A method of treating water to remove calcium and magnesium ions and to produce a water that is free of hardness. Nelson, b. See base exchange process. Cooper, p. 371.

Zeolite process. e. A base exchange method of treating hard water, in which the zeo- lites, contained in a tank, removes the salts. The zeolite layer is regenerated by back flushing with brine. The process is not suitable for water containing sulfates of magnesium or any chloride, but in other respects it is a simple and effective method. See also colloidal water treatment. Nelson, b. See base exchange process. Cooper, p. 371.

Zenzilite. A zeolitic deposit. Deposits, particularly native copper, which occurs in basaltic accompanied by autunite and torbernite and contains A.G.I. minerals of the zeolite group.

Zenzilization. The process by which a min- eral is converted into zeolite by alteration, for example, nepheline into thomsonite. Fay.

Zenzilite. A. To convert into a zeolite. Webster 3d. b. "fill (as the openings in a rock) with zeolites. Webster 3d. c. To treat in a process using zeolite. Webster 3d.

Zero air voids curve. Saturation curve. The curve showing the zero air voids unit weight as a function of water content. ASCE P1826.

Zero air voids density. See zero air voids unit weight. ASCE P1826.

Zero air voids unit weight. The weight of solids per unit volume of a saturated soil. ASCE P1826.

Zero group. The group of inert gases, hav- ing zero length spring. Special type of gravim- eter spring for which the length is propor- tioned to the applied force. Schiefer- decker.

Zero-concretion reaction. One which proceeds at a constant rate, virtually independent of pressure changes. Pryor, 3.

Zero-concretion remaining in a substance at the absolute 0 of temperature. Webster 3d.

Zero potential. The actual potential of the surface of the earth taken as a point of reference. Webster 3d.

Zero-power reactor. An experimental nu- clear reactor operated at such low power levels that a coolant is not needed and little radioactivity is produced. Critical experi- ments are said to run at zero power. Hey.

Zero time. When conducting a mine ven- tilation pressure survey, zero time is the time of the commencement of the survey from the base station, and the reading of the control barometer there is taken as the zero pressure datum to which subsequent pressures are referred. Sinclair, I, p. 160.

Zeovienal. Having a valence of 0. Webster 3d.

Zero-zero gel. A condition wherein the drill- ing fluid fails to form measurable gels during a quiet 10-minute time interval. Brantly, 1.

Zeta potential; electrokinetic potential. The potential difference across an electric double layer, usually between a solid surface and a liquid. Webster 3d.

Zeven. They consist of soft rock with a layer of hard rock at the summit, and beneath the hard cap the soft rock is carved into caves which resemble the typical de- nudation curve. Synonym for earth pillars. A.G.I.

Zevmo. A mineral, Cu2O·2(AO)·8·10-16H2O. Material which is instructional with autunite and torbernite and contains 10-16 H2O has not yet been found, but the name zevo is being reserved in the event that such a discovery is made. Arti- ficial zevo is tetragonal. Crosby, p. 61.

Zeuxanthozankovite. A mineral, Mn2Mg(AlFe3+)2+(OH)6·H2O. Material which is instructional with autunite and torbernite and contains 10-16 H2O has not yet been found, but the name zeux is being reserved in the event that such a discovery is made. Arti- ficial zeuxite is tetragonal. Crosby, p. 61.

Zieglerite. Incorrect spelling of pietrilekite, a mineral hydrous carbonatite similar to zoekerite. Trombeijssel, 1954.

Zighry; zigger; sicker. Corn. To percolate, trickle, or ooze, as water through a crack. From the German, sicker, Perk.

Zigzag fold. A form of vertical chute in which the chute is divided into independ- ent sections by earth pillars that are ra- ised on a track arrangement. It is flexible and can be lowered to the bottom of the case. By 1952 there was a new type of loading pocket to car. Mitchell, p. 802.

Zigzag fold. See chevron fold. A.G.I.
zinc kiln. A transverse-arch kiln with staggered dividing walls, the fire travel thus being forced to a zigzag path. Such kilns find use in the firing of structural clay products. See also transverse-arch kiln, Dodd.

zigzag rule. A wooden rule (generally 6 feet long, folded zigzag fashion in 6-inch lengths), used by drillers, craftsmen, etc., to measure short distances. The rise in 1.879; feet, and hundredths of a foot. Long.

zigzag transformer; grounding transformer. A zigzag transformer is a transformer intended primarily to provide a neutral point for grounding purposes. I.C. 7962, p. 23.

zinc glass. A glass in which zinc oxide, B2O3, and impurities, incidentally produced in the manufacture of spelter. It is sometimes referred to as colorless glass.

zinc green. A pigment not yellow and having a green shade. CCD 6d, 1961.

zinc green. A pigment not yellow and having a green shade. CCD 6d, 1961.

zinc. A lustrous, bluish-white metallic element in group II of the periodic system. Symbol, Zn; atomic number, 30; atomic weight, 65.37; valence, 2; hexagonal; brittleness, 2; density (of cubes), 7.133; melting point, 419.47° C; boiling point, 2740° C; specific gravity, 7.133; molecular weight, 125.39; specific gravity, 4.398, and ranges from 4.30 to 4.45; Mohs' hardness, 4.5 to 5.0; soluble in cold water; and crystals are colorless; 45th ed., 1964, p. B-237. Also see Merrill-Crowe Process, Prory, 3.

zinc oxide. A white, amorphous, non-crystalline white or greyish-white powder obtained by the reaction of zinc oxide, or zinc, with solutions of alkalies. Webster 3d.

zinc bloom. See zinc hydrosulfite; zinc oxide.

zinc borate. Of variable composition; contains zinc oxide, water, and boric oxide, B2O3, in various ratios. A typical specific gravity is 4.5 percent zinc oxide and 34 percent boric oxide on a weight basis. The term is used more accurately to refer to any of the basic zinc-borate minerals which are essentially a mixture of zinc oxide and boric oxide. See also zinc boric oxide, zinc chromate, zinc glass.

zinc chromate. A yellow crystalline powder said to be zinc chromate heptahydrate, ZnCrO4.7H2O. Also called variegated pigment, yellow zinc chromate, and hydrated zinc-potassium chromate. CCD 6d, 1961; Webster 3d. Another zinc chromate is not yellow and having a green shade. CCD 6d, 1961.

zinc oxide. A lustrous, white, amorphous, non-crystalline white or greyish-white powder obtained by the reaction of zinc oxide, or zinc, with solutions of alkalies. Webster 3d.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.

zinc carbonate; smithsonite; calamine. White; soluble in hot acids; slightly soluble in water; and crystals are colorless; 45th ed., 1964, p. B-237.
zinc oxide; zinc oxide, white; zinc white.
zincous. Synonym for zincic, Webster 3d.

zincolyte. A body or compound that is de-

zinco. The combining form meaning zinc;

zincky; zbky; zincy. Relating to, contain-

zincing. The act or process of heating iron
plate with zinc or zinc salts; galvanization.

zincold, Of, relating to, or resembling zinc.

zinco. Relating to, containing, or resembling zinc.

zincolyte. A body or compound that is de-

zincify. To coat or to impregnate with zinc;

zincification. The act or process of zincify-

zincifcrous. Containing zinc or yielding zinc.

zinc green

zinco. The combining form meaning zinc;

zincky; zbky; zincy. Relating to, contain-

zinco. The combining form meaning zinc;

zincky; zbky; zincy. Relating to, contain-

zinco. The combining form meaning zinc;

zincky; zbky; zincy. Relating to, contain-

zinco. The combining form meaning zinc;

zincky; zbky; zincy. Relating to, contain-

zinc green
**Zirconium**

Zirconium is a lustrous, ductile, steel-gray or silvery-gray metallic element in group IV of the periodic table. Zirconium resembles titanium chemically; these three elements are in the same subgroup of the periodic table. Zirconium, like titanium, is isomorphous with hafnium, and commercial-grade zirconium contains less than 2 percent hafnium.

Zirconium is the principal source of zirconium dioxide, which is extensively used in the ceramics industry. Zirconium dioxide, also known as zirconia, is a white, high-temperature refractory material that is resistant to corrosion by acids, alkalies, and in hydrofluoric acid. Synthetic zirconia is used in various forms, such as powders, bricks, and coatings, in high-temperature applications such as thermal insulation, electric arc furnaces, and nuclear reactor fuel pins.

Zirconium dioxide is also used in the production of zirconium oxide, which is a major constituent of zirconium ceramics. Zirconium oxide is a white, high-temperature, high-strength material that is used in the production of zirconium dioxide-based ceramics, such as zirconia ceramics.

Zirconium oxide is also used in the production of zirconium diboride, which is a high-temperature and high-strength material that is used in the production of thermal insulation and refractory materials.

Zirconium oxide is also used in the production of zirconium nitride, which is a high-temperature, high-strength material that is used in the production of thermal insulation and refractory materials.

Zirconium oxide is also used in the production of zirconium carbide, which is a high-temperature, high-strength material that is used in the production of thermal insulation and refractory materials.

In conclusion, zirconium is a versatile and valuable material that is used in a wide range of applications, from high-temperature and high-strength materials to thermal insulation and refractory materials. Its unique properties make it an ideal material for many applications, and its potential for further development is significant.
The document contains a detailed discussion on the various forms and properties of zirconium. It describes the elements, their properties, and their applications in different fields such as ceramics, refractories, and in the formulation of zircon enamels. The text covers topics such as zirconite, zirconium dioxide, zirconium silicate, and zirconium carbonate, explaining their uses and characteristics. The document also includes references to various chemical and mineral properties, such as melting points, hardness, and density, and mentions the use of zirconium in the production of various materials like whiteware, zircon syenite, and zircon whiteware.
unaltered zone which consists of the original sulfide formation. Fryer, S. f. In minerals, a part of a mineral, crystal, or particle; to a single crystal, a zone is a region of surface differentiation (for example, of oriented molecules, passivation, etc.), not to be confused with a zone of crystal modification. A local variation in the lattice discontinuities may set up a zone of differentiated surfeice or chemical quality. Fryer, S. e. In geology, used in the same sense as horizon to indicate a certain geological level or chronobiologic position, without reference to the local crystal; or dip of the rock. Fay. h. An area or region more or less clearly set off or characterized as distinct from surrounding or adjoining parts; as, in a metamorphic region, the mineral zone. Webster 3d. i. Any of the five great divisions of the earth's surface with respect to latitude and temperature: (1) Torrid Zone, bounded on the north by the Tropic of Cancer and on the south by the Tropic of Capricorn; (2) North Temperate Zone, bounded on the south by the Tropic of Cancer and on the north by the Arctic Circle; (3) South Temperate Zone, bounded on the north by the Tropic of Capricorn and on the south by the Antarctic Circle; (4) North Frigid Zone, bounded only on the south by the Arctic Circle; and (5) South Frigid Zone, bounded only on the north by the Antarctic Circle. h. A region of oriented molecules. C.T.D. zone axis. A straight line to which all faces of a crystal are parallel. Webster 3d.

zone of weathering. a. Down to the level at which ground water stands, the rocks are full of fractures and are exposed to atmospheric agencies, such as oxygen, carbon dioxide, water, etc. Hence the rocks tend to decay, to be converted into carbonates and hydroxides, and to form soils. This zone is called the zone of weathering and is the zone of rock destruction. Stokes and Varnes, 1955. b. In amosite and crocidolite ore deposits in South Africa, these occur from surface downward as: silicified zone, leached zone, and fresh zone. Sinclair, W. E., p. 494.

zone refining. A method used in refining germanium and silicon to produce the ultra-pure elements used in making transistors. Neston, p. 378.

zones. In a shaft lumine, the different portions (horizontal sections) are called zones, and characterized according to the reactions which take place in them, as the zone of fusion or melting zone, the reduction zone, etc. Fay.

zones of lode. A lode may be divided into three main zones: the oxidized zone, the altered ore at depth; (2) the gossan or altered surface portion of the lode, containing native metals, oxides, and oxysalts, the result of oxidation of the ore; and (3) the zone of secondary enrichment which occurs between the first two zones, in which interaction between water and ore has resulted in the production of new materials, often of considerable economic value. Nestor, p. 378.

zone time. Standard time applied at sea in which the surface of the globe is divided into 24 zones of 15° each. The 0 zone extends 7.5° east and west of the meridian of Greenwich (England), (the Prime Meridian), and the zones are designated by the number of hours that must be applied to the local time to obtain Greenwich time. Abbreviation, ZT. Webster 3d.

zonolite. a. Concentric layering parallel to the periphery of a crystalline mineral, similar in color banding in such minerals as war-maline, and by differences of the optical reactions to polarized light in colorless minerals like feldspar. C.M.D. b. Applied to a structure of a mix-crystal that is composed of isomorphous compounds arranged in layer or zones of different composition; successive zones having been deposed from a magma (or other liquid solution) which gradually changed in composition owing to the separation of crystal phases. Rice. c. In a mineral deposit, the occurrence of successive minerals or elements outward from a common center. A.G.I. d. Arrangement of minerals or mineral assemblages in zones. McKinstry. The division of a building or group of buildings into separately controlled spaces where different conditions or uses are simul- taneously maintained. Strick, 10.

zonolite. A name which has been used in Arizona for locally occurring jasper or chert of various colors. Clay and Nauck, p. 113.

zonorhinite. A light and dark green gemstone similar to chlorastrolite. Rogers, p. 437.

zonolite. A trade name for a light, flaky material obtained locally in the western United States, which swells to fifteen times its original volume, forming golden yellow scales; from
zonolite

Libby, Mont. A titanium-bearing jefferisite from Westcliffe, Colo., is similar. English.

zoogene. In geology, of, pertaining to, consisting of, resulting from, or indicative of animal life or structure. Standard, 1964.

zoogenic. Originating from animals or as a result of their activities. A.G.I.

zooplankton. The portion of plankton composed of unattached animals which are at the mercy of the currents. Hy.

Zopaque. Trademark for pure titanium dioxide manufactured from ilmenite and specially processed to control crystal growth. It is used in nearly every industry requiring a white opacifying agent. CCD 6d, 1961.

Z reagents. The Dow series of xanthate flotation reagents consisting of:
- Z. 3 = Pot. ethyl xanthate.
- Z. 4 = Sod. ethyl xanthate.
- Z. 5 = Pot. secondary amyl X.
- Z. 6 = Pot. amyl xanthate.
- Z. 8 = Pot. secondary butyl x.
- Z. 9 = Pot. isopropyl xanthate.
- Z.10 = Pot. hexyl xanthate.
- Z.11 = Sod. isopropyl xanthate.
- Z.12 = Sod. sec-butyl xanthate.

Pryor, 3.

ZT Abbreviation for zone time. Webster 3d.

zueing. See zur. Fay.

zunderez Ger. Tinder ore; an ore of antimony occurring in the Saxon mines in soft, flexible, tinderlike masses, of a blackish-red color and little luster. Fay.

zungite. See zunyige. Fay.

zungite; zunyite. A rare basic orthosilicate of aluminum in transparent tetrahedral crystals, containing fluorine and chlorine; it occurs in minute cubic crystals at the Zuni mine, Silverton, Colo. C.M.D.

zur; zueing; dezuing. Eng. The same as hulkling a lode, viz, removing the soft side for facilitating the breaking down the harder part thereof. Fay.

zurron. A rawhide sack, holding about 150 pounds, used by miners for carrying ore. Nelson.

zwieselite. A clove-brown variety of triplite. Fay.

zwiter. A Saxon miner’s term for a variety of greisen. Only of significance in connection with tin ores. Fay.

zwiterion. Complex ion which carries charges opposite in polarity, for example, \( \text{H}_2\text{NCH}_2\text{COO}^- \). Pryor, 3.

zyglo. See fluorescent penetrant inspection. Henderson.
