end flow. Flow of metal at the ends of steel rails when in service, caused by impact and the pressure of railroad wheels. Bennett, 1962.

end gate. A gate at the front end of a car so that it travels toward the dump. This gate has hooks which are engaged at the dump by stirrups which lift it, so that when the dump pitches forward the coal slides under the uplifted endgate and is discharged onto a chute or over a dump pile. Zern. a. A gate leading to and at right angles to an end face. Also called ending. TIME.

endgate car. A mine car constructed with one hinged end that lifts up as the car is tilted down, permitting the coal, ore, and waste to run out. Kentucky, p. 211. See also end arch.

eend gate books. See endgate. Zern.

eend grade. A road driven at right angles to a main cleat. Mason, b. Eng. An adit driven in a direction with the grain of the coal. Fay.

eend grades; grade end. Corn. A highly jointed part of a granite mass. Arckell.

eend hauling. See endless rope haulage. Foy.

eend joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay, 3.

eend joint. The minor joints in a coal seam. Also called end cleat; butt cleat. Fay.

eend joint. The minor joints in a coal seam. Also called end cleat; butt cleat. Fay.

eend joint. The minor joints in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end cleat; butt cleat. Fay.

end joint. A joint at right angles to the face cleats in a coal seam. Also called end clea
endogenous. Formed by processes interior to the earth's surface, as by aqueous deposition in veins: said of mineral or rock masses. A synonym for endogeneic; endogenetic; endogenetic.

endogenous elements. The group of elements probably belonging to the interior of the earth (siderophile elements, chalcophile elements, and a specific part of the lithophile elements). This group is more or less identical to the metallogenic elements of the earlier classifications.

endolith. A hieroglyph found within a single layer. Pettijohn 3d.

endolith. Pertaining to or characteristic of contact metamorphism that takes place within the cooler eruptive rock: resulting from the penetration of the wall rock upon the peripheral portion of an eruptive rock mass.

endolith. A crystal of one species enclosed in another. Webster 3d.

endolith. Endoliths (siderophile elements, chalcophile elements, and specific part of the lithophile elements).

endolith. A hieroglyph found within a single layer. Pettijohn 3d.

endolith. Pertaining to or characteristic of contact metamorphism that takes place within the cooler eruptive rock: resulting from the penetration of the wall rock upon the peripheral portion of an eruptive rock mass.

endolith. A crystal of one species enclosed in another. Webster 3d.

endolith. Pertaining to or characteristic of contact metamorphism that takes place within the cooler eruptive rock: resulting from the penetration of the wall rock upon the peripheral portion of an eruptive rock mass.

endolith. A crystal of one species enclosed in another. Webster 3d.

endolith. Pertaining to or characteristic of contact metamorphism that takes place within the cooler eruptive rock: resulting from the penetration of the wall rock upon the peripheral portion of an eruptive rock mass.

endolith. A crystal of one species enclosed in another. Webster 3d.
engine barrel

used in sinking shafts. Fay.
engine boy. A young person in charge of the drive for a face conveyor; he starts and stops the conveyor according to the supply of empty cars at the discharge end. NELSON.

engine distillate. A refined or unrefined petroleum naphtha similar to naphtha but of higher distillation range. ASTM D288-57.

engineer. A person who is trained in or who follows as a calling or profession a branch of engineering (as civil, military, electrical, mining, or structural engineering). WEBSTER 3d.

engineered brick. A brick whose nominal dimensions are 3.2 by 4 by 8 inches. ACSG.

engineering geology. a. The application of the geological sciences to engineering practice for the purpose of assuring that the geologic factors affecting the location, design, construction, operation, and maintenance of engineering works are recognized and adequately provided for. ACI J. b. A branch of geological science, forming a link between geology and engineering, particularly civil and mining. It provides a basis of theory to guide engineering practice where earth or rock materials are directly or indirectly involved. See also mining geology; soil mechanics. NELSON.

Engineering News formula. A pile driving formula which is as follows: \( P = \frac{c}{W} \)

where \( P \) is the allowable load on the pile; \( W \) is the weight of a drophammer, or the weight of the moving parts of a single-acting steam or air hammer; \( c \) is the distance through which a drophammer falls or the stroke of a steam or air hammer, expressed in feet; \( W \) is the average penetration per blow for the last few blows, expressed in inches; and \( c \) is a constant equal to 1.0 for a drophammer and 0.1 for a steam or air hammer. The values for \( P \) and \( W \) are expressed in the same units; \( p \) and \( W \) are in tons. The formula as written includes a safety factor of 6. URGHART, Sec. 8, pp. 63, 65.

engineering geology. See human engineering; NELSON.

engineer's transit. Theodolite. Fay.

engineer's turn. Ceramic unique ware that is lined or fluted in a special lathe. ACSG.

engine-turning lathe. A lathe having an eccentric center to provide decoration on pottery ware before it is fired. DODD.

engineer's weight. Mid. A practical man whose duty it is to inspect the machinery, ropes, and other appliances. Fay.

englacial. Embedded in a glacier, as englacial drift; being within the body of a glacier, as an englacial stream. WEBSTER 5th.

englacial till. See till. Fay.

English amber. See British amber. Shipley.

English copper process. Obtaining copper from copper ores in a reverberatory furnace. BENNETT 2d, 1962.

English translucent china. Ceramic body of a porcelain nature that is lined or fluted in a special lathe. ACSG.

English white. See prepared calcium carbonate. BENNETT 2d, 1962.

English zinc furnace. A furnace in which zinc is reduced and distilled from calcined ores in crucibles. Fay.

enamel. Slip coating applied to a ceramic body for imparting color, opacity, or other desired characteristics and then covered with a glaze. BENNETT 2d, 1962 Add.

glazing. The clogging of a furnace. Fay.

genetically valley system. Valley system consisting of originally independent rivers, contracted to one stream in consequence of negative movements of the sea level. SCHIEFELDECKER.

engraving. The process of carving figures, letters, etc., upon glass by abrasive means. ASTM C162-66.

engrhydrite. A mineral (as nodules of chaledony) having cavities containing water. STANDARD, 1964.

enghydrous. Containing water; having drops of included fluid. ENGHYDROUS CHALEDONITE, 1964.

enigmatis. See enigmatical.

enlarging shots. Boreholes driven after the face has been uncorked, and two or three free faces have thus been provided. STAUFTER.

en masse conveyor. A conveyor comprising a series of skeleton or solid flights on an endless chain, or other link which operates in horizontal, inclined, or vertical paths within a closely fitted casing for the carrying run. The bulk material is conveyed and elevated on mass in a substantially continuous stream with a full cross section of the casing. ASA MH4-1958. Also called chain conveyor. einghydrite. See conveyor-type feeder. ASTMH 4-1958.

enochlin series. The middle portion of the classic Jurassic succession of Alaska, consisting of shales, sandstones, and conglomerates; represented in northwest Alaska by a very group of Lent, the South plant-bearing continental strata. C.T.D.

enriched uranium. Uranium in which the percentage of the isotope containing the radioactive isotope U-235 has been increased above the 0.71 percent contained in natural uranium. LLNL Handbook of Chemistry and Physics.
enriched uranium

ent,
entry driver

ries the broken down coal back to another conveyor mounted on a turntable so that the coal is loaded into a mine car, or slate are deposited on the gob side of the entry. The entire machine is mounted on a D.O.T. 1.

entry driving machine operator. See entry driver operator. D.O.T. 1.

entryman. a. A miner who works in an entry. Fay. b. One who enters upon public land with intent to secure an allotment under homestead, mining, or other law. Webster 3d. c. In anthracite and bituminous coal mining, one who is engaged in driving a haulageway, airway, or passageway from one place to another in the mine or to the surface. Also called heading machine operator. D.O.T. 1.

event stumps. Pillars of coal left in the mouth of abandoned rooms to support the roof, entry, or gallery until the entry pillars are drawn. In Arkansas, these pillars are called entry stumps even when the rooms are first driven, before any pillars are pulled or the rooms abandoned. Fay.

entry table or convoy which transports material to the feeding position of a machine. ASA M114.1-1958.

evelope. a. The outer part of a recumbent fold; especially used to contrast the sedimentary cover of a recumbent anticline with the crystalline core. b. Applied to sandblasts, and indirectly by wave action on shores; eolian gradation. c. Applied to shallow seas that cover large parts of continents without being disconnected from the ocean. Stokes and Varnes, 1955.

eplaster. A mineral deposit or horizontal gradient of gravity.

epibatolithk. The third stage in which erosion has gone deep enough to expose small parts of the barren rock that lies below the dead line. A.G.I.

epicontinental. Situated upon a continental plateau or platform, as an epicontinental sea. Webster 3d.

epicycle. Any part of a moving celestial body which is used in direct response to precipitation. F. epicyclic. The deformation of the earth's crust by which the broader features of relief (as continents, ocean basins, and greater plateaus) are produced. Compare diastrophism. Webster 3d.

epicyclic. Of or relating to an epicycle.

epidemic. The lower of two Cenozoic subdivisions, consisting of Palocene, Eocene, and Oligocene. Compots Neogene. A.G.I.

epidemia. The process by which wind modifies land surfaces, both directly by transportation of dust and sand and by the work of sand blasts, and indirectly by wave action on shores; eolic gradation. Standard, 1964.

epifluorescence. olating, relating to, formed by, or deposed from the wind or currents of air. Eolian was formerly spelled aeolian. See also aeolian. Fay. Applied to sand dunes which have been accumulated by the wind. Gordon.

eolite. A fragmental rock, composed of wind-deposited materials. For example, the drift sandrock, the common building stone of Bermuda. Fay.

eolitic. Dawn stone. Oldest known stone implement, believed to have been developed by early man. Found in gravels. Pryor, 3.

epistolize. See acotolotropic.

eon. A period of existence; an age. Used by some geologists to subdivide all geologic time into two broad categories. Bury (of Mining) and Oligocene.

epogene. Originally used for the earlier portion of Paleozoic time, including the Cambrian, Ordovician, and Silurian.Obsolete. A.G.I.

epoedite. A basic silicate of aluminum, calcium, and iron. One form is Ca[Al0H]
epidote (Al₂Fe (SO₄)₃) monoclinc; Mohs' hardness, 6 to 7; specific gravity, 3.25 to 3.3; and a secondary constituent of igneous rocks. Pryor, 3.

epidote. A term generally applied to ore deposits. Drainage by streams is generally assumed to have been effective in hypogene systems. Dr. Johannes. 2, p. 26.

episodic. a. Formed, originating, or taking place on or not far below the surface of the earth. Water 3d. b. Material or a deposit that is not natural to the substances in which it is found. Compare pseudomorph. Water 3d. Fay.

episodic relief. Includes hills, ridges and peaks, valleys, gorges, and canyons, certain plains and plateaus, basins of various sorts, and other minor features sculptured into or constructed upon hypogene or preexisting epigenetic features by the action of surface forces. Rivers, winds, glaciers, oceans, and others, which effect the surface of the earth and the outermost zones of the lithosphere. Stokes and Vernet, 1955.

episodic. The change in the mineral character of a rock due to oxidation. Contrasted with hypogene. As applied to ore deposits, epigenetic deposits are younger than the country rock containing them. Webster 3d. Fay.

epigene. Produced on or near the earth's surface. For example, epigenetic disintegration, epigenetic valleys, etc. In petroglyphy, it is usually applied to mineral deposits of later origin than the enclosing rocks, or to the formation of secondary minerals in a rock which is epigenetic. Johannesen, v. 1, 24, 1939, p. 173.

epigenetic deposit. a. A mineral deposit formed later than the enclosing rocks. Deposits of this nature are formed in openings in the rocks or by replacement. Stokes and Vernet, 1955. b. Deposits formed subsequently to the enclosing rock by the mother liquor penetrating into surrounding rocks and depositing minerals. Most mining districts containing epigenetic deposits are commonly characterized by the presence of intrusive igneous rocks, complex folding and deformation of the geologic structure of the district, and by alteration of the country rock through the chemical action of the circulating mineral solutions. These deposits can be classified into six groups: (1) contact-metamorphic deposits; (2) pegmatitic deposits; (3) deposits of the deep-seated vein zone; (4) deposits of the intermediate vein zone; (5) deposits of the shallow vein zone; and (6) surface deposits formed by springs of magmatic origin. See also deep-seated vein zone deposits; intermediate vein zone deposits; shallow vein zone deposits; pegmatite deposits; pegmatite. Lewis, pp. 273-275.

epigenetic drainage. Drainage by streams whose courses were determined by the conditions of an older, higher land surface now eroded. Stokes and Vernet, 1955.

epigenetic. A term applied to ore (mineral) deposits of later origin than the enclosing rocks. Schieredecker.

epigenetic stream. Proposed by Richtohofer for what is now referred to as superposed stream. Obolote. A.G.I.

epigenetic. Described as a steel-gray metallic mineral with a black streak and an uneven fracture, 4C03.3Fe.5A.As; Mohs' hardness, 2.5. St. Peter's, 3d.

epilith. A hortifol on top of a bed. Pettijohn.

epilithic environment. The marine bottoms to a depth maximum 20 fathoms. Schieredecker.

epitome. a. The essence, core, or kernel of something; essence, 6 to 7; specific gravity, 3.25 to 3.5; hardness, 6 to 7; Mohs' hardness, 6 to 7; fracture, 4CuSsiFeS.AseSs; density at which equal portions of the feed material are wrongly placed in each of two products of a specific-gravity separation. BS. 3552, 1962.

equal-expansion rule of. If two oil wells under similar conditions produce equal quantities during any given year, the quantities produced by the two wells, on the average, will be approximately equal, regardless of their relative ages. A.G.I.

equal-failing product. A category of products possessing equal terminal velocities. They are the oversize material and form the underflow of a classifier. See also Stokes law. Fay.

equalization of winding load. The balancing of the weight of the winding rope which varies considerably during a winding cycle. See also balance rope; winding; winding drum. Nelson.

equal bed. Bed of ballast or concrete in the bottom of a trench on which pipes are laid. Ham.

equal lay. Ropes of which the layers of wires in strands have all been laid to the same length of lay. Also known as parallel lay. Ham.

equal area. Applied to crystals having the same or nearly the same diameter or the same dimensions in all directions. Small crystals may be polyhedral, spherical, or irregularly anhedral. A.G.I.; Schieredecker.

equation. In a chemical reaction no matter what is created and none is destroyed. Hence, the number of atoms of each element is conserved. Hence, the number of atoms of the same elements are not created in the reactants. Hence, the number of atoms of the same elements are not destroyed in the products. The equation is made up of chemical symbols in the form of a balanced equation. The equation for the balanced chemical reaction of water to hydrogen and oxygen is given in the following equation: 2H₂ + O₂ → 2H₂O. Microsystems. A.G.I.

equation, chemical. Expression which shows formulas of reacting components and resulting products (change of state). Conforms with laws of conservation of mass. An ionic equation expresses ion-reaction, for example, Ba₂⁺ + SO₄²⁻ → BaSO₄.
equation, chemical

the arrow showing reversibility tending to
ward equilibrium. Pryor, 3.

equation of motion. The Newtonian law of
motion is stated as the product of mass and
acceleration equals the vector sum of the
forces. In meteorological and oceanograph-
ic use, the components of the equation of
motion are divided by mass to give force per
unit mass. The forces considered in ocean cur-
rents are 3. Coriolis force, gradient force, and
frictional forces. Hj.

equation of state. One connecting pressure
(p), volume (v) and temperature (t) for a
substance. Pryor, 3.

equator. The great circle midway between
the two poles and dividing the grain into
two polar hemispheres. A.G.I.

equal. A combining form meaning equal, or
equally, from the Latin aequis (equal).

 Webster 3d.

equatorial projection. Projection from the cen-
ter of a sphere through a point on its sur-
face to a plane tangent at the south pole
so constructed that areas between merid-
ians and parallels on the plane are equal to
corresponding areas on the surface of the

equated crystals. Polyhedral crystals formed
by a reaction in which the crystallization in the in-
terior of a mass of metal in a mold. Distinguis-
hed from columnar crystals and chill crystals.

equilaxed structure. A structure in which
the grains have approximately the same
dimensions in all directions. ASM Gloss.

equiform. Applied to the crystals of equi-
axial rocks, the essential minerals of which are
all of the same order of size. Holmes, 1920.

equiform. An adjective applied to a force
that will balance two or more other forces.

equiform. When two or more forces act
upon a body in such a manner that the body remains at rest the forces are said to
be in equilibrium, or in a perfect balance.
Morris and Cooper, p. 173. b. Chemical equi-
molar. Is the condition in which each mole of an in-
organic substance is present in the
same number of moles. A.G.I.

equilibrium. Steady unsatisfied state which will undergo
change. Metastable equilibrium is a
state when a fixed proportion of daughter
radioactive elements or gamma-emitters are present
of a substance in two or more phases, such as
necessary to complete its stability. Physical
equilibrium can be understood best when we refer to
the potential energy of the system and
consider the forces acting on it. A.G.I.

equilibrium, a. When two or more forces act
upon a body in such a manner that the body remains at rest the forces are said to
be in equilibrium, or in a perfect balance.
Morris and Cooper, p. 173. b. Chemical equi-
molar. Is the condition in which each mole of an in-
organic substance is present in the
same number of moles. A.G.I.

equilibrium diagram. A graphical representa-
tion of the temperature, pressure, and com-
position limits of the phases produced in a
system at equilibrium. In this type of diagram,
equilibrium is a steady state. The system will not
change unless it is disturbed. A.G.I.

equilibrium, b. Applied to rocks. The moisture
content of a soil when the water is static.
equivalent orifice

opening in a thin plate through which the same quantity of air flows under the same pressure as in the mine:

\[ \text{E.O.} = \frac{\text{W.G.}}{V} \]

where E.O. equals the equivalent orifice in square feet; Q equals flow of air in cubic feet per minute; W.G. equals weight of water gage; P equals pressure in pounds per square inch; V equals flow of air in kilocalories. The formula is based on a venous contracta of 0.63 for the flow through the orifice. *Levett*, p. 712.

equivalent particle diameter; equivalent free-falling diameter. A concept used in evaluating the size of fine particles by a sedimentation process; it is defined as the diameter of a sphere that has the same density and the same free-falling velocity in any given fluid as the particle in question. *Dodd*. *Eq. Proportion law*. See law of equivalent proportion.

equivalent radius. The radius of a spherical particle of density 2.65 (the density of quartz) which would have the same rate of settling as the given particle. *A.G.I.*

equivalent sheathed explosives. Ordinary permutit explosives to which extra common salt has been added and which appear to have the good effects of actual sheathed explosives. Used in many mines. *Cooper*, p. 347.

equivalent temperature. A composite of mean radiation temperature and air temperature also defined as the mean temperature of the environment effective in controlling the rate of temperature change of a rock body in still air when the surface temperature and size of the black body are comparable to those of the human body. Where the enclosure surface (mean radiant temperature) and air temperatures are equal, this temperature is also the British equivalent temperature; when not equal the British equivalent temperature is that temperature at which a body with an 80° F surface temperature will lose sensible heat at the same rate as the given environment. *Stack*, p. 10.

equivalent twinning movement. A twisting moment which, acting alone, would produce in a circular shaft a shear stress of the same magnitude as the shear stress produced by a given twisting moment and a given bending moment acting simultaneously. *Re.

equivalent weight. It equals the molecular weight of the substance or a submultiple of it chosen according to some convention. *A.G.I.*

equivalent at wave. Synonym for distortion wave; secondary wave; shear wave; S-wave; translation wave. *Ex*

erbia. A silvery metallic element of the rare earth group. Found in euxenite and in the same minerals as dysprosion (gadolinite, fergusonite, and xenotimite). Symbol, Er; valence, 3; hexagonal; atomic number, 68; atomic weight, 167.26; specific gravity, 8.95; melting point, 1,497° C; boiling point, 2,200° C; insoluble in water; and soluble in acids. C.T.D.; *Handbook of Chemistry and Physics*, 45th ed., 1964, pp. B-109, B-174.

erbia family. The rare earth elements dysprosion (atomic number, 66), holmium (atomic number, 67), erbium (atomic number, 68), and thulium (atomic number, 69) are a subgroup of the yttrium family. *Hed.*

erbia oxide. Pink; monoclinic; En(SO4)3; soluble in water; specific gravity, 3.217; and loses 814.20 at 400° C. Used for infrared absorbing glass; as a phosphor activator; and in microwave ovens. *Erlich*, p. B-174. Used for infrared absorbing glass; as a phosphor activator; and in microwave ferrites. *Lee.*

erbia oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbia oxides. Synonym for erbia.

erbium. A silvery metallic element of the rare earth group. Found in euxenite and in the same minerals as dysprosion (gadolinite, fergusonite, and xenotimite). Symbol, Er; valence, 3; hexagonal; atomic number, 68; atomic weight, 167.26; specific gravity, 8.95; melting point, 1,497° C; boiling point, 2,200° C; insoluble in water; and soluble in acids. C.T.D.; *Handbook of Chemistry and Physics*, 45th ed., 1964, pp. B-109, B-174.

erbium family. The rare earth elements dysprosion (atomic number, 66), holmium (atomic number, 67), erbium (atomic number, 68), and thulium (atomic number, 69) are a subgroup of the yttrium family. *Hed.*

Erbium. A silver metallic element of the rare earth group. Found in euxenite and in the same minerals as dysprosion (gadolinite, fergusonite, and xenotimite). Symbol, Er; valence, 3; hexagonal; atomic number, 68; atomic weight, 167.26; specific gravity, 8.95; melting point, 1,497° C; boiling point, 2,200° C; insoluble in water; and soluble in acids. C.T.D.; *Handbook of Chemistry and Physics*, 45th ed., 1964, pp. B-109, B-174.

erbium oxide. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbium oxides. Synonym for erbia.

erbium oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbium oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbium oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbium oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.

erbium oxide, pink. A reddish microcrystalline powder; En(GO),10H2O; decomposes at 375° C; and insoluble in water and in dilute acids. Oxalates of the rare earth metals are used to separate the latter from common metals. *CCD* 6d, 1961; *Handbook of Chemistry and Physics*, 45th ed., 1964, p. B-174.
erosional unconformity

ing older rocks, that have been subjected to erosion, from the younger or sedimentary rocks which cover them. A.G.I.

erosional vacuity. That part of a lacuna resulting from the removal of former existing rocks at an unconformity. A.G.I. Supp.

erosion caldera. A large amphitheatrical volcano resulting from the enlargement of a caldera or a crater by erosional processes. An example is the Parnello caldera of Trigile. A.G.I.

erosion channel. See chemical washout. Nelson.

erosion-corrosion. This is the combination of erosion phenomenon and corrosion phenomena which produces a high rate of local attack of the base metal. Since many materials are corrosive-resistant because of a productive oxide film adhering to their surface, when corrosive fluids are present this film is eroded away leaving the base metal unprotected from erosion. HBG.

erosion cycle. The succession of stages through which a newly uplifted surface must pass before it is worn down to a plane or to a surface near sea level. In the initial stages the surface is sharply cut by canyons; in the mature stages, it may disappear and the topography be characterized by high, steep hills and gently worn valleys. In older-stage ages, the land is so worn down that the streams meander sluggishly across a lowland. Stokes and Varvis, 1955.

erratic. a. One of the large water worn and ice-cored blocks or boulders which are scattered generally over the higher and middle latitudes of the Northern Hemisphere. A.G.I. b. A rock which has been transported from a distance, generally by ice. A.G.I. c. A transported rock fragment different from the bedrock on which it lies, either free or as part of a sediment. Generally applied to fragments transported by glacier ice or by floating ice. A.G.I.

erratic scree. An area of a sample that shows a distinctly higher (or lower) value than the assays of other samples in its vicinity. A.G.I.

erratic blocks. Eng. See erratic. Rounded erratic blocks are called boulders. Fay.

erratics. a. A term applied to coal and rock pebbles, boulders and fossil tree trunks found in, or associated with, coal seams. The study of these erratics throws valuable light on the origin and formation of coal seams. Nelson. b. Stones, ranging in size from pebbles to large boulders, which were transported by ice, and on melting, were left stranded on alien soil and far from their original source. As with the Coal Measures, they furnish valuable evidence on the Ice Age. Nelson.

erosion difference. Difference between observed or calculated value and the true one. Pryor, 3.

erosion or curving by erosion. A partition curve drawn to defined conventional scales with the portion showing recoveries over 50 percent being the most convex marks. Pettina.

erosion intensity. The mass of material eroded per unit area per unit time. Its symbol is c. A.G.I. Supp.

erosion refractory. Mechanical wearing away of the surfaces of refractory bodies in service by the washing action of moving liquids, such as water. See also refractory. HW.

erosion proportionality factor. The ratio of erosion intensity to erosion time. It is a measure of the quantity of material removed per unit of applied erosive force. Its symbol is k. A.G.I. Supp.

erosion ramp. A sloping belt of reef rock immediately above the reef flat where marine erosion is active on an atoll islet. A.G.I. Supp.

erosion scarp. A scarp produced by the agents of erosion. A.G.I.

erosion spurs. Term applied to worm casts. Pettinai.

escarpment. a. Applied to igneous rocks that reach the surface of the earth in the molten state. A.G.I. Supp. b. Refers to a raised landform of rock at the surface of the earth. A.G.I. Supp. c. Sometimes applied to any igneous rock, but this usage is not recommended. See also surface. A.G.I.

erosive breccia. Synonymous with volcanic breccia. A.G.I.

escarpment. a. Synonym for erythritol. CDD 66, 1961. b. Cobalt bloom. A natural hydrous cobalt arsenate, Cu(A0)2(S04)·H2O. Formerly oxidized parts of soil and arenic-bearing veins. Crimson, peach, red, pink, or pearl gray in color, with adammantine or pearly luster. Contains 75.7 percent cobalt oxide. Soluble in hydrochloric acid; Mohs' hardness, 1.5 to 2.5; specific gravity, 2.91 to 2.95. Found in California, Colorado, Idaho, Nevada; Ontario, Canada. Used for coloring glass and ceramics. CDD 66, 1961.

escarpment cement. A ferruginous hydraulic cement formerly made in Germany; it has now given place to Ferracement. See also Ferracement. Fay.

escarpment. a. In a contract likely to require labor over a substantial period, a clause providing for readjustment of agreed payments in the event of defined events, for example, change in wages rates. Pryor, 19.

escarpment. a. Eng. A second or additional shaft by which the men may get out of the mine in case of accident to the other shafts. Also an upcast; escape pit; escape-shaft. Fay. b. A waste-way for discharging the entire flow of a stream. Seely, 1.

escarpment apparatus. An apparatus used to give underground workers adequate protection against carbon monoxide and other noxious gases at mine fires and explosions. There are two main types available: (1) simple, lightweight, self-contained breathing sets which can be used in poisonous atmospheres or in atmospheres deficient in oxygen, and (2) carbon monoxide filters which give protection against carbon monoxide poisoning but can only be used when the atmosphere contains sufficient oxygen to support life. McAdam, p. 48.

escarpment. A shaft driven especially to permit egress from the mine in case of emergency. B.C.I.

escarpment. A slope or cliff formed in the face of a wall, etc., by the force of running water, or by wind, etc. Fay.

escarpment. A cliff or a relatively steep slope separating the level of a valley from the bottom of the valley. Fay. b. In gently inclined strata, the abruptly truncated and cliff-like outcrops of the resistant coal or of a ferruginous hydraulic cement. A.G.I. c. The steep face presented by the abrupt termination of a strata.
Esker's mixture. A mixture of 2 parts magnesia and 1 part dried sodium carbonate; used as a reagent for determining sulfur in coal or coke. Haeckel's Chem. Ind.

esker: A deposit of rare earths, (Ce, Fe, Th, Ti, Cb, Ba, Sr, Mo, etc.). An end member of the isomorphic eschynite-precious mineral. A black to brown color, moderately to strongly radioactive. Found in nepheline syenite and in the nepheline-free mica schist, with feldspar, zircon, and garnet, at Miask, in the Ilen Mountains, U.S.S.R.; also found in gold sands in Norway and in the nepheline syenite in Siluria. Also spelled eschynite. Crosby, pp. 18-19; Fromel, p. 179.

cross: A dead ort breed money, or a piece of land owned or divested into the keeping of a third party by one party to a contract or sometimes taken from one party to a contract and put in trust to be returned only upon the performance or fulfillment of some condition of the contract or to induce such performance of fulfillment by some other disposition. Webster 3d.

ed: Abbreviation for electricity force.

es. Sid. p. 39.

eskar: See esker.

eskerite: A mineral, perhaps FeSe, (Fe, Cu-Se), or (Cu,Fe)Se, Very similar to pyrrhotite, chemical properties being much softer. Magnetism highly variable according to orientation. Optically hexagonal or pseudohexagonal, but the ray pattern is cubic, similar to that of sulfanite. American Mineralogist, v. 39, No. 7-8, July-August, 1954, pp. 69:492, 492: v. 46, No. 3-4, March-April, 1961, p. 467.

esker: escar, eskar: a. A glacial-fluvial landform, which is most commonly called an eskers in the United States, It is also called on (singular) and osar (plural) in the United States, having been derived from the Swedish as (singular) and asar (plural). Also spelled eschar; asar. Bureau of Mines Staff. b. A long, winding gravel ridge deposited in the bed of a subglacial stream. C.T.D. c. A long, narrow, often sinuous, ridge or mound of sand, gravel, and boulders deposited between ice walls by a stream flowing on, within, or beneath a stagnant glacier. Compare kame. Webster 3d. c. A mixture of 2 parts magnesia and 1 part dried sodium carbonate; used as a reagent for determining sulfur in coal or coke. Haeckel's Chem. Ind.

estuarine: A classification of the estuarine type in which the settled material is transported by a current up an inclined plane by a stream flowing on, within or beneath the ice. Webster 3d.

esplanade: A broad beach or terrace bordering a bay, especially in the plateau areas of the southwestern United States. Stokes and Stiles. Webster 3d.

espley rock: A conglomerate or breccia with rapid lateral passage through grit to fine sandstone; cement usually ferruginous with some lime and alumina. Characteristically developed in variegated clays of Ettruria Marl group of Upper Coal Measures in the English Midlands. Arkell.

essential: In petrology, necessarily present in a particular type of rock, being required by the definition of that rock type; applied to the characteristic in a particular rock. Fay.

essential ejecta: a. Pyroclastic debris, whether loose or indurated, which is of immediate, juvenile, magnetic origin. A.G.I. b. Fresh magmatic material thrown out in liquid form by a volcano. Synonymous with juvenile ejecta. A.G.I.

essential mineral: One of those mineral constituents of a rock that are necessary to its classification and nomenclature. An essential constituent is not necessarily a major constituent, for the presence in a rock of minor amounts of such minerals, as nepheline, olivine, or quartz may affect its classification. See also accessory mineral. A.G.I. b. A mineral essential to national defense for which no great difficulty of procurement during war is anticipated, but which requires constant surveillance because future developments may necessitate a revision in the list. In 941, essential minerals of the United States included arsenic, copper, helium, iron, lead, magnesium, molybdenum, potash, phosphates, potash, sulfur, and pyrite, uranium, zinc, and zirconium. Hess.

essentialite: A cinnamon-colored variety of heaume- nite; called haysinite when used as a gem, though the term more properly belongs to Zenas. Dana.

established: Some can only be moved by the wind when it is dry and when only a little vegetation is growing on it. In a humid climate, the prevailing moisture and the favorable conditions for the growth of vegetation are factors that tend to arrest the advance of sand dunes. When these conditions become dominant, the dunes are soon covered with vegetation and their movement stopped. They become established dunes. A.G.I.

Estates Department: Gr. Brit. Each Area of the National Coal Board has an Estates Deparragor for matters covering and managing estates and farms owned by the Board. It performs its duties much in the same manner as a good estate agent would for a landlord. A further duty of the department is the investigation of subsidence damage claims by property owners. A.G.I.

estuarine: A name given by Michel-Levy to a variety of diolite porphyry from Esteral, France. The rock shows some peculiarity of chemical composition which have given it special interest in discussions relating to differentiation. Fay.

essentialize: An approximate figure, based on rough application of experience cum mental arithmetic to a problem at an early stage of discussion. Not a firm, basic datum. Prior, 3.

estuaries: Eng. Necessary supplies; especially wood that a tenant is allowed to take from the landlord's premises for the necessary fuel or implements used by himself and his resident servants or for necessary repair. Webster 3d.

estuarine: A massive variety of apatite found in Estramadura, Spain. A phosphate containing apatite and sometimes pyrite, uranium, zinc, and zirconium. Hess.

estuarine: Of, relating to, or formed in an estuary. Webster 3d.

estuarine: A clay deposited in depressed valleys or estuaries of the sea, or in lakes. It is represented by certain Wisconsin types, those of the Hudson River Valley, and by many Columbia clays along the Atlantic Coast. USGS Prof. Paper 11, 1903, p. 19.

estuarine: A delta built into a pre-existing estuary. A.G.I. Supp.

estuarine: A mixed deposit of organics and sediments of both marine and fluvial origin. Along river channels, they grade upstream into typical freshwater river-channel deposits; seaward, they grade into marine deposits; laterally, they grade into deposits consisting of mud-cracked clays, silts, some sands, and a little peat. A.G.I.

estuarine deposition: Sedimentation in the environment of an estuary. The deposits differ from those which form in a deltaic environment, chiefly in their relationship to the strata of the adjacent land, and they are usually found in an area of low sedimentation rate. Both estuarine and deltaic deposits are characterized by brackish water and by their content of marine life. Webster, p. 223.
estuarine sand. Sand produced by the precipitation of finely divided material carried down by the rivers to the sea. Estuarine sands are frequently laminated. Although silt is the chief constituent of estuarine sands, clay is often present.

etch method; etchirs method. A method, etching. A process of engraving in which etching, a. A marking con-
etched. a. Applied to a rough, frosted sur-
etching line. A line of demarcation between etched portions of the acid bottle is clearly discernible. Long.
etched. a. leucite nepheline. A.G.I. b. An rough surface, are said to be affected by acid, alkalis, or other chemical agents or to the tectonic structure. Produced that a pattern of pits or lines is etched in an acid bottle as measured before capillarity corrections are applied. Also called apparent angle. Compare apparent dip. Long.
etch cleaning. Removing soil by dissolving away some of the underlying metal. A.S.M. Gloss.
etched. a. Applied to a rough, frosted sur-
etched. a. fig. etching figures. A marking consisting usually of a minute pit produced by a solvent (or an etchant) on the crystal face of a mineral and revealing its crystaline or molecular structure. Webster 3d.
etched. a. A process of engraving in which the lines produced by the action of an acid or a mordant, or taken on a rough surface, are said to have been etched. Enam. Dict.
etching acid. See hydrofluoric acid. Long.
etching pit. Small cavities formed on the surface of metals during etching. G.T.D.
etch line. A line of demarcation between the etched and unetched portions of the image on an acid bottle, used to determine the inclination of a borehole by an acid dip survey. Long.
etching method. A method, using a soda-lime glass tube partially filled with a dilute solution of hydrofluoric acid, of determining the angle at which a bore-
hole is inclined at any specific point of its course below the collar. See also acid-dip survey. Long.
etch pattern. Regular surface marking developed by etching from the surface of alloy or crystal, and characteristic for that specific substance. The reagent used is an etchant, usually an acid in water or alcohol. Pryor, 3.
etch period; etching period. See etch time. Long.
etch ring. Synonym for etch line. Long.
etch time; etching time. The time required for a dilute solution of hydrofluoric acid, of a specific strength, to etch the inside of an acid bottle enough so that the line of demarcation between the etched and unetched portion of the acid bottle is clearly discernible. Long.
etch tube. Synonym for acid bottle. Long.
ethanne. Colorless; gasous; CaO; contained in the gases given off by petroleum and in illuminating gas. Crispin.
ethanole. See ethyl alcohol. C6H5O. Made by treating alcohol with sulfuric acid. Chiefly used in the manufacture of smokeless powder and as solvent for gums, fats, waxes, etc. Crispin.
ether oxes. See oxes of elasticity. Fay.
etrical geometry. The study of the correct and incorrect nomenclature of gems, with emphasis on names and terms which may mislead or deceive purchasers. Shipley.
etnemolite. A cutting intrusive body of plutonic rock that narrows downward and is funnel-shaped. A.G.I.
etyl alcohol. A colorless, volatile, flammable liquid, C2H5OH, which is fermented and distilled liquors. Also called ethanol. A.P.I. Gloss. See also alcohol.
etylhexene. Colorless; flammable; unsaturated; gas; C6H10. Contained in illuminating gas. Crispin.
etylhexylene. Used as an electrolyte to transform coal into a tan-gray substance resembling asphalt. A.S.M. Gloss.
etylhexylenem. A combining form meaning well.
etylhexylmethane. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylhexylole. A highly explosive liquid, C4H10( NO3 ); somewhat volatile; nonfreezing; explosive base. Used as an antifreeze. Lewis, p. 104.
etyl orthoboricate; ethyl silicate; tetraethyl orthoborate. A. G. I. b. Pierced or corroded in such a manner that a pattern of pits or lines is produced that is related to the crystal structure or to the tectonic structure. See also frosting. A.G.I. c. Weathered so that the surface is roughened. See also centering. ASTM C162-66. d. Treated by etching. ASTM C162-66. etch oxide. A. Natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylsilicate. A. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylsilicate. A. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylsilicate. A. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylsilicate. A. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.
etylsilicate. A. A natural basic aluminum-beryllium silicate, &Al( SiO3 )2( OH )4. Fay.

eutectic point. A eutectic point is the lowest melting temperature obtainable.

eutrecrystalline. A textural term meaning well crystallized and applied to igneous rocks, such as granites, which are well crystallized. A.G.I.

eutrecy. A worldwide phenomenon. Webster 3d.

eutrecymorphic. Applied to a structure of certain volcanic rocks with a streaked or blotched appearance due to the alternation of bands or elongated lenses of different color, composition, or texture; the bands, etc., having been ejected originally as individual portions of magma which were drawn out together in a viscous state and formed a heterogeneous mass by welding. The term is most appropriately used in describing the structure of many welded tuffs. Holmes, 1920.

eutrecy. a. As a noun, an alloy or a solution having its components in such proportions that the melting point is the lowest possible with those components. Webster 3d. b. The characteristic microstructure resulting from the solidification of a metal of a eutectic composition. Webster 3d. c. As an adjective, relating to a eutectic or to its composition (eutectic mixture) or to the temperature at which it melts or freezes (crystallizes) which is the eutectic point. Webster 3d. d. An isolated, eutectic reaction in which a liquid solution is converted into two or more intimately mixed solids formed being the same as the number of components in the system. ASM Gloss. e. An alloy having a composition indicated by the eutectic point in a phase diagram. ASM Gloss. f. An alloy structure of intermixed solid constituents formed by a eutectic reaction. ASM Gloss. eutectic alloys. Such alums as aluminum and silicon, cadmium and bismuth, cadmium and zinc, silver and tin are made up of two metals entirely soluble in each other when liquid but on setting or freezing the crystals of the individual metals form. Crispin.

eutrecy change. The transformation from the liquid state to the solid state in a eutectic mixture. It involves the simultaneous crystallization of two components in a binary system and of three in a ternary system. C.M.D.

eutrecy melting. Melting of localized micro areas whose composition corresponds to that of the eutectic in the system. ASM Gloss.

eutrecy mixture. A discrete mixture (not a compound) of two or more minerals which have crystallized simultaneously from the mutual solution of their constituents, the two or more minerals being in definite proportions. Simultaneous crystallization sometimes gives rise to graphic texture, but it does not necessarily do so, as the development of graphic intergrowth involves other factors besides eutectic proportions. Stokey and Barnes, 1935.

eutrecy point. A eutectic point is the lowest melting temperature obtainable.

eutrecy. A siliconic bismuth, Bi₂SO₄, occurrine usually in minute dark brown or rare fishes, B. bioluminescent. A.G.I.

eutrecycope. A black, hollow copper cylinder heated electrically to the surface temperature of a human being. The heat loss from the cylinder in a given environment is equivalent to that lost by a human being; thus, equivalent temperature. Stock, 10.

eutrecy. Applied to compact felsic rocks without phenocrysts, having the composition of quartz porphyry or porphyry. Also used in a wider sense to cover all anaphylactic, as for composition whether porphyritic or not. A.G.I.

eutrecy. A metallic element of the rare earth group, contained in black monazite, gadolinite, samarskite, and xenotime. Symbol: Eu: ion; isotopic; atomic weight, 151.96. Grenier b. Gray metal; atomic number, 63; valences, 2 and 3; melting point, 826°C; boiling point, 1,439°C; specific gravity, 5.259; insoluble in water; and stable in air and in water. The most sparingly distributed of the terbium family of rare earths. Empedocles. A worldwide phenomenon. Webster 3d.

eutrecy. A name derived from the Greek word eu (good) and oxy (acid) giving a compound to one which filled a gap in his classification of rocks. The same rock had been described by another a little earlier. Empedocles. A worldwide phenomenon. Webster 3d.

eutrecy. a. As a noun, an alloy or a solution having its components in such proportions that the melting point is the lowest possible with those components. Webster 3d. b. The characteristic microstructure resulting from the solidification of a metal of a eutectic composition. Webster 3d. c. As an adjective, relating to a eutectic or to its composition (eutectic mixture) or to the temperature at which it melts or freezes (crystallizes) which is the eutectic point. Webster 3d. d. An isolated, eutectic reaction in which a liquid solution is converted into two or more intimately mixed solids formed being the same as the number of components in the system. ASM Gloss. e. An alloy having a composition indicated by the eutectic point in a phase diagram. ASM Gloss. f. An alloy structure of intermixed solid constituents formed by a eutectic reaction. ASM Gloss. eutectic alloys. Such alums as aluminum and silicon, cadmium and bismuth, cadmium and zinc, silver and tin are made up of two metals entirely soluble in each other when liquid but on setting or freezing the crystals of the individual metals form. Crispin.

eutrecy change. The transformation from the liquid state to the solid state in a eutectic mixture. It involves the simultaneous crystallization of two components in a binary system and of three in a ternary system. C.M.D.

eutrecy melting. Melting of localized micro areas whose composition corresponds to that of the eutectic in the system. ASM Gloss.

eutrecy mixture. A discrete mixture (not a compound) of two or more minerals which have crystallized simultaneously from the mutual solution of their constituents, the two or more minerals being in definite proportions. Simultaneous crystallization sometimes gives rise to graphic texture, but it does not necessarily do so, as the development of graphic intergrowth involves other factors besides eutectic proportions. Stokey and Barnes, 1935.

eutrecy point. A eutectic point is the lowest melting temperature obtainable.
eutectic point

with a mixture of components, provided the components do not form solid solutions. A.G.I.

eutectic system. The ratio of solid phases crystallizing from the eutectic liquid at the eutectic temperature. It is such as to yield a gross composition for the crystalizing from the eutectic liquid, that is identical with that of the liquid. Most frequently stated in terms of weight-percent. A.G.I.

eutectic structure. The particular arrangement of the constituents in a eutectic alloy which arises from their simultaneous crystallization from the melt. See also graphic texture. C.T.D.

eutectic temperature. The lowest melting temperature in a series of mixtures of two or more substances. A.G.I.

eutectic texture; eutectoid texture. Intergrowth of minerals, either along crystallographic or boundaries resembling those precipitated from eutectic solutions. A.G.I.

even-bedded, See eutectophyre. Hsu.

eutic. a. An isothermal reversible reaction in which a solid solution is converted into two or more intimately mixed solids on cooling, the number of solids formed being the same as the number of components in the system. ASM Gloss. A. An alloy having the composition indicated by the ruttedet eutectoid on an equilibrium diagram. ASM Gloss. C. An alloy structure of intermediate solid constituents formed by a eutectoid reaction. ASM Gloss.

eutectoid texture. A graphic texture with radiating grains among the complicated graphic intergrowth. Schieferdecke.
even-crested ridges

plain reconstructed by filling, the surface depressions to the level of the ridge tops in an old pavement. Also called even-crested skyline; even-crested summit areas; accordant summit levels. A.G.I. b. The general accor-
dance of summit levels in a surface of high topographic relief, suggesting that the highest preserved plain that resulted from a previous cycle of erosion. A.G.I.
even fracture. A fracture surface which is flat or nearly flat, as in chert. Nelson.
evening emerald. Peridot, which loses some of its yellow tint by artificial light, ap-
proximately greenish. Shipley.
evenmild. Paraffin wax, C18H34, as white, opti-
ismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
evena. A tract of swampy land that is
mostly with tall grass. A swamp or an in-
tricate biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
event. Seismic. Applied to any definite phase
of a fracture. A fracture surface which is
parallel to the stress direction at right angles to the leaves or
plates, thus opening like a book or extend-
ing like an accordion. For example, ver-
miculite exfoliates when it is heated and
extends its individual crystals into cutting, curved,
or frayed like broken paper. A.G.I.
evenly. Horblende gabbro containing labra-
donite or bytownite as the only light-colored
mineral. The hornblende must be pri-
dorite or brownite as the only light-col-
mendite in the surface, and it makes no difference whether the
word used is excepted or reserved. Rick-
etts, 1.
evenly. Paraffin wax, C18H34, as white, opti-
mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
evenly. Paraffin wax, C18H34, as white, opti-
mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
event. Seismic. Applied to any definite phase
of a fracture. A fracture surface which is
parallel to the stress direction at right angles to the leaves or
plates, thus opening like a book or extend-
ing like an accordion. For example, ver-
miculite exfoliates when it is heated and
extends its individual crystals into cutting, curved,
or frayed like broken paper. A.G.I.
evenly. Paraffin wax, C18H34, as white, opti-
mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.

mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
evenly. Paraffin wax, C18H34, as white, opti-
mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
evenly. Paraffin wax, C18H34, as white, opti-
mismatch biaxial scales in a vein of sulfide
ore. A.G.I. d. The phase of weathering that
results from a number of different local condi-
tions, such as climate, slope inclination, water
flow, and rocks weathering. The conformation
ary process progresses approximately parallel to the
strike or dip of the rocks. Fay.
exhalation

ing either through a conduit or fissure, or from molten lava or a hot spring; an ema-
nation. Fay. c. An exhalation or sending forth of gases or vapor. Sometimes it is exhaled or given off or that rises in the form of gas, fumes, or steam. For example, a foul exhalation from the marsh. Webster 3d.

exhaust fan. In coal mining, a fan which sucks used air from a mine and thereby causes fresh air to enter by separate entries to repeat the cycle. B.C.

exhausting auxiliary fan; suction fan. An auxiliary fan which exhausts air from the face of a tunnel through ducting or piping and discharges it into the return side of the airway off which the tunnel branches. See also auxiliary ventilation. Nelson.

exhaustion. a. In mining, the complete re-
moval of ore reserves. Fay. b. The process of completely extracting from a substance whatever is removable by a given solvent. Fay.

exhaustion purifier. Attached to the exhaust manifold of diesel motors; up to four cylinders, this purifier reduces noxious and irritating fumes by burning in air and other enclosed gases, such as tunnels. The purifier consists of a heavy steel shell enclosing the catalytic action that burns hot gases to carbon dioxide and water vapor. Purified gases are fed through a water-filled tank and condensed. Bests, p. 374.

exhaust system. A system in which the flue exhaust is taken from a device in which the fan draws air through the chimney or blower arrangement and discharges it into the return side of the airway off which the tunnel branches. See also auxiliary ventilation. Webster 3d.

exhaust ventilator. A system of ventilation in which the fan draws air through the windings by suction. Opposite of forced ventilation. B.S. 3618, 1963, sec. 2.

exhume topography. Monadnocks, moun-
tains, or other topographic forms buried under younger rocks and exposed again by erosion. A.G.I.

elixirial; lithophile. a. M. C. Stopes in 1935 used the term exinitie for the constituent represented by the exines of spores in coal. C. A. Seyler in 1932, however, used the term exinite for the constituent represented by the exines of spores in coal. The term lithophile, introduced by A. Ammosov in 1956, refers to the constituent which owes its origin to chemical processes and is exinite. Schieferdecker.

exit table. See runout table. ASA M114.1-

expansion of the intrusion; opposite of endomorphic. Fay.

expansion; exomorphism; exomorphic. The mod-
ifications produced in the invaded rocks by intrusions which transverse them; contact metamorphism in the usual sense as contrasted with endomorphic or exomorphic. A.G.I.

expansions. See exomorphism. Hess. exogeneous; exothermic. A region that is drained by rivers that flow into the ocean. Oppo-

expansion. The process of caving in an outward direction. C.T.D. Compare endo-
nomos.

exosphere. Space beyond the earth's atmos-
phere. It begins at a height of about 1,000 kilometers. A.G.I. Supp.

exothermal; exothermic. Characterized by
or formed with the evolution of heat. Opposite of endothermic; endothermal. Webster 3d.

exothermic reaction. A reaction that pro-
ces with the evolution of heat. A.G.I.

exotic. That which has been introduced from other regions. Fay.

exotic limonite. Limonite precipitated in rock other than that which formerly contained the gel-like limonite. ASTM C716-66.

expanded blast furnace slag. The lightweight cellular material obtained by controlled processing of molten blast furnace slag with water, or with water and other agents, such as steam or compressed air, or both. ASTM C716-66.

expanded clay. See lightweight expanded clay aggregate. Dodd.

expanded foot. The lobe or fan of ice formed where the lower portion of a valley glacier leaves the confining walls of a valley and expands onto a level surface. A.G.I.

expander. An inert material, such as carbon or barium sulfate, added to the active ma-
terial in accumulator plates in order to prevent shrinkage of the mixture. C.T.D.

expanding. A process used to increase the diameter of a cup, shell, or tube. See also bulging. ASM Glass.

expanding cement. Hydraulic cement of special type produced from clinker, gypsum, and blast furnace slag, an experi-
mentally developed cement by Prof. F. C. Joslin. This expands during setting and initial hardening, and the expansion degree can be controlled. Hess. See expanding cutter. C.T.D.

expanding cutter. See expansion cutter. Long.

expanding electrode test. A geophysical test based on the resistivity method to deter-
mine underground geological structure. Nelson.

expanding metals. Alloys of bismuth, which
expand on cooling and solidifying; for exam-
ple, 2 parts antimony to 1 part bismuth. C.T.D.

expanding plug. See expansion plug. Long.

expanding reamer. A reamer which is cap-
able of slight adjustment in diameter by means of a coned internal plug acting in a partially split length of the tool. Nelson. See expanding waterjet. A channel or groove incised into and across the face of a bit, the depth and/or width of which gradually increases from the inside to the outside. Long. A.G.I.

expansion. Synonym for dilatation. Schiefer-
decker.

expansion beam. A bend in a pipeline that takes up movement due to temperature change and that prevents damage. Pryor, 3.
expansion

expansion. a. A drift that may be adapted to various uses of holes. The expansion of nature pores may be accomplished by mechanical means while the hot is either hot or cold, or in the called puddle process. Long

expansion bolt. a bolt equipped with a split or ring-nut as a means of preventing the problem of expansion, as arises in the case of granite spacers, used to attach a strip or a concrete slip. The expansion bolt prevents the loosening of the strip or concrete slip due to expansion and contraction of the surrounding material, which can cause damage to the structure.

expansion pressure. the pressure exerted by the hot on the surface of a system, such as a glass or a metal, when it is subjected to a sudden increase in temperature. This pressure can cause the surface of the system to expand and, in some cases, to crack or break.

expansion pipe. a pipe used to equalize pressure in a system, such as a water or gas system, by allowing the system to expand and contract without causing damage. The expansion pipe is typically made of a flexible material, such as rubber or PVC, and is connected to the system at points where the pressure is expected to change.

expansion, expansion drum. a drum used in the process of expanding metal, such as copper or steel, by heating it to a high temperature and then allowing it to cool slowly. The expansion drum is typically used in the production of pipes, tubes, and other metal products.

expansion. A measure of the rate of expansion with change of temperature.

expansion cutter; expanding cutter. A borehole drill bit used to expand the diameter of a tunnel or tunneling machine. These cutters are typically made of hard materials, such as tungsten carbide, and are designed to withstand the high pressures and temperatures found in tunneling operations.

expansion. A system of underground works that may be rationally used inside a bridge or tunnel. Long

expansion. A measure of the rate of expansion with change of temperature.

expansion system. a system of expansion bolts or pipes that is used to equalize pressure in a structure, such as a bridge or tunnel. The expansion system is typically made of a flexible material, such as rubber or PVC, and is connected to the structure at points where the pressure is expected to change.

expansion. A measure of the rate of expansion with change of temperature.

expansion. A measure of the rate of expansion with change of temperature.

expansion. A measure of the rate of expansion with change of temperature.

expansion. A measure of the rate of expansion with change of temperature.

expansion. A measure of the rate of expansion with change of temperature.

expansion. A measure of the rate of expansion with change of temperature.
explosive Drilling: a method of drilling coal seams in which the explosive charge is placed in the drill holes and the holes are then drilled to the correct vertical and horizontal position. The explosive is then detonated, causing the coal to be broken into small pieces.弱点

exploratory drilling: a method of probing for the presence of mineral deposits, often using a small explosive charge to penetrate the surface and reveal the underlying material.弱点

exploratory work: the process of investigating a new area or region in order to discover potential resources or new markets.弱点

explosibility: the tendency of a substance to undergo an explosive reaction. highlights

explosibility curves: graphical representations of the explosibility of different substances, showing the relationship between the pressure and the distance from the explosion source.弱点

explosive drift: an underground tunnel or passage in which explosive charges are placed to break up the rock.弱点

explosive heading: a. A heading driven horizontally or downwards from mine workings for exploration purposes. b. A heading driven in advance of the workings as a special safeguard when approaching waterlogged workings whose position is uncertain. See also intubation of nozzles. c. A heading driven ahead in an area intersected by faults or washouts to explore the ground and disrupt the drifted coal seam.弱点

explosive limit: the addition of inert dust to coal dust decreases its explosibility, and when enough has been added an explosion cannot occur. The point at which explosion cannot occur is said to be the explosibility limit of the coal in question.弱点

explodable: capable of being exploded.弱点

explosimeter: a. An instrument for testing explosibility by measuring the concentration of combustible gases and vapors in air; b. An instrument for measuring low concentrations of combustible gases and vapors in air. Weakness

explosion: a. A violent and rapid chemical reaction, usually accompanied by a loud report, and a high temperature. b. The phenomenon that occurs when a substance is decomposed by a violent reaction, resulting in a rapid release of energy.弱点

explosion drift: an underground tunnel or passage in which explosive charges are placed to break up the rock.弱点

explosion hazard investigation: The investigation of a mine to determine the possibility of an explosion occurring by reason of the kind, size, purity, and dryness of the coal dust along the mine passages and the presence or absence of fireproofing. It also determines the degree of the hazard of an explosion from natural conditions and of one arising through the neglect or ignorance of the mine personnel. The purpose of such investigations is to make specific recommendations for reducing the hazard to a negligible point; appropriate methods for continued diligence.弱点

explosion pressure: the pressure at the instant of an explosion. Weakness

explosion-proof: a. A term applied to apparatus that is not constructed and maintained so as to prevent the presence of a flammable atmosphere in such apparatus. b. A term applied to apparatus that is not constructed and maintained so as to prevent the presence of a flammable atmosphere in such apparatus.
explosive forming. Shaping metal parts in confined die cavities where the forming pressure is generated by an explosive charge. See explosive fringe. B.S.

expression. 1. The process by which a liquid is caused to pass through a die, or along a cutting-off table, by forcing it through a die or along a cutting-off table. This pressure is produced by an ordinary detonator, and also transmitted through millisecond delay electric cells, or through millisecond delay electric cells containing nitroalycerin. Guncotton, nitrosed mixtures, contain K.CI04: Dynamites, may be used in coal mining. The proportional mass of diamond or other cutting medium, grinding the ore, is determined by the expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A force applied with separate values for the heat liberated by the explosive decomposition and the detonation fragment requirement, but 5 tons per pound is about average in quarry blasting. To minimize secondary blasting, some quarrymen prefer a factor of about 3 tons per pound. See also blasting. Nelson.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.

expression rolls. A pair of steel rolls which, when rotated, will force a clay column through a die or along a cutting-off table (as in shaping of bars for roofing-tile manufacture). Compare crushing rolls. Dodd.
extended discharge trough. Consists of two extension coupling. Coupling consisting of a porous material such as concrete or mineral liquor with headwater. It is part of a discharge system used to control and maintain a desired water level in the discharge area.

extended head pulley. See head pulley, a.

extended stream. When a region near the sea is uplifted and a submerged continental shelf became part of the coastal plain, the streams of the older land are extended across it. A.G.I.

extender. A mineral substance used to dilute and thicken paint which may be used in facilitating the suspension of the pigment, increasing moisture resistance, giving a dull finish, thickening primers for filling porous surfaces, improving abrasion resistance, or improving brushing qualities. Extenders include clays, diatomaceous earth, dolomite, bentonite, and others. Also see bentonite, diatomaceous earth, dolomite, and vermiculite. BuMines Bull. 7264, December 1943, p. 19; Hui.

extendible conveyor. A conveyor which is capable of being lengthened or shortened when in operation. NEMA MM-1943.

extendible discharge trough. Consists of two or more shaker conveyor troughs, nested to be installed on the discharge end of the pipe line so as to provide for adjustment of the position of the discharge point. After adjustment, they are locked in place. Jones.

extensional fault. A normal fault believed to have resulted from the stretching of the earth's crust. A.G.I. Supp.

extension bar. Synonym of extension core barrel. Long.

extension core barrel. A core barrel, the length of which may be increased by coupling similar sections. Long.

extension coupling. Coupling consisting of a threaded tubular section around which a loose or tight-fitting ring is placed. The coupling connects the core barrel to the drill string. Also called guide-ring coupling. Long.

extension fracture. One of the fractures that form during extension. In a sense, they are tension fractures. Billings, 1934, p. 96.

extension joint. One of the joints that form parallel to or perpendicular to the line of fracture. A.G.I.

extinction of a pigment, increasing moisture resistance, giving a dull finish, thickening primers for filling porous surfaces, improving abrasion resistance, or improving brushing qualities. Extenders include clays, diatomaceous earth, dolomite, bentonite, and others. Also see bentonite, diatomaceous earth, dolomite, and vermiculite. BuMines Bull. 7264, December 1943, p. 19; Hui.

extraneous. a. Pertaining to igneous material present on the surface of the earth in a molten state and to fragmental material of all sizes erupted from volcanic vents. Lava flows and fields of extrusive material often contain stones and rocks of various sizes, ranging from small pebbles to large boulders. These extrusive products can be found in many locations around the world, including volcanoes, calderas, and rift zones. The term "extrusive" is often used to describe igneous rocks that were once molten and have flowed onto the Earth's surface as lava. These rocks are typically found in volcanic areas and can be divided into two main types: extrusive igneous rocks and extrusive volcanic rocks. Extrusive igneous rocks are those that were formed from the solidification of magma on the Earth's surface, while extrusive volcanic rocks are those that were formed from the solidification of lava that flowed from a volcano. The term "extrusive" is derived from the Latin word "extrinseca," which means "outside."
facing brick. A brick made especially for facing purposes, often treated to produce greater brilliancy. See also grinding; polishing.

facing machine. Mechanical device for holding stones during grinding or polishing faceted upon them. By these means, certain stones can be placed at the exact angles which theoretically result in producing the most brilliant stone. Rarely used in faceting diamonds or other valuable colored stones where recovery of a greater amount of weight is more important than maximum brilliancy. See also grinding; polishing.

facing point. See transfer point. Nelson.

facing wheel. A walking fitted across the end of a trench and held in position by the ends of the time. A wall built to sustain a face cut in the earth in distinction to a retaining wall, which supports earth deposited behind it. Zena.

face worker. A miner who works regularly at the face. In a coal mine it means a light-faced, face shifter, face parker, etc. Nelson.

facades. The aspect belonging to a geologic unit of sedimentation, including mineral composition, type of bedding, fossil content, etc. Sedimentary facies are generally segregated parts of differing nature belonging to any genetically related body of sedimentary rocks. G.S.A. Mem. 39, 1949, p. 8. In petrography: (1) the general appearance or nature of one part of a rock related to or connected with other parts; (2) a part of a rock body as differentiated from other parts by appearance or composition; and (3) a kind of rock so differentiated from other more or less related kinds. In stratigraphy: (1) a stratigraphic body as distinguished from other bodies of differing appearance or composition; and (2) a kind of rock or rock body so differentiated from other more or less related bodies. (3) a kind of rock or rock body so differentiated from other more or less related bodies.

faceting. The art of improving a gemstone by such processes as cutting, polishing, and faceting. Faceting is essentially a method of polishing the surface of a gemstone in order to improve its appearance and to render it more suitable for use as a gemstone. Faceting is a highly skilled art and requires a great deal of patience and care. The art of faceting is one of the most difficult of all the arts and sciences in the field of gemology. Faceting is an art that requires a great deal of practice and study in order to master it.

facets. The small flat or pointed surfaces on the faces of a crystal. Facets are formed by the action of the crystal on the surrounding medium. Facets are usually larger than the crystal itself and are characterized by their sharp, angular edges.

facing brick. A brick made especially for facing purposes, often treated to produce greater brilliancy. See also grinding; polishing.

facing machine. Mechanical device for holding stones during grinding or polishing faceted upon them. By these means, certain stones can be placed at the exact angles which theoretically result in producing the most brilliant stone. Rarely used in faceting diamonds or other valuable colored stones where recovery of a greater amount of weight is more important than maximum brilliancy. See also grinding; polishing.

facing point. See transfer point. Nelson.

facing wheel. A walking fitted across the end of a trench and held in position by the ends of the time. A wall built to sustain a face cut in the earth in distinction to a retaining wall, which supports earth deposited behind it. Zena.

face worker. A miner who works regularly at the face. In a coal mine it means a light-faced, face shifter, face parker, etc. Nelson.

facades. The aspect belonging to a geologic unit of sedimentation, including mineral composition, type of bedding, fossil content, etc. Sedimentary facies are generally segregated parts of differing nature belonging to any genetically related body of sedimentary rocks. G.S.A. Mem. 39, 1949, p. 8. In petrography: (1) the general appearance or nature of one part of a rock related to or connected with other parts; (2) a part of a rock body as differentiated from other parts by appearance or composition; and (3) a kind of rock so differentiated from other more or less related kinds. In stratigraphy: (1) a stratigraphic body as distinguished from other bodies of differing appearance or composition; and (2) a kind of rock or rock body so differentiated from other more or less related bodies.
A factor, A number or property associated with a particular condition or variable that is used to determine the effect of that condition or variable on a certain result. For example, the factor of safety is used to determine the maximum stress that a material can withstand without failure.

Factor of safety is the ratio of the allowable stress to the maximum stress. It is used to ensure that a structure is safe and can withstand the forces it is expected to encounter. A factor of safety greater than 1 indicates that the structure is safe, while a factor of safety less than 1 indicates that the structure is unsafe.

Failure is the condition of a material or structure when it is no longer able to perform its intended function. Failure can be caused by a variety of factors, including stress, temperature, corrosion, and fatigue. Failure analysis is the process of determining the cause of failure in a material or structure.

Fahrenheit, Gabriel Fahrenheit, a German physicist (1686-1736). His name is given to the common thermometric scale in which the freezing point of water is 32° and the boiling point is 212°. (Griffin.) To convert from the Fahrenheit scale to the centigrade scale, subtract 32° and multiply by 5/9. Symbol, F. C.T.D.

Fahrenheit machines. These include (1) a hydraulic cylinder, (2) a reciprocating cell marketed as the Denver Sub. A. Pryor, 3.

Fadleness. a. Originally the French name for the earthenware made at Faenza, Italy, in

Fadeometer. An instrument used to measure
Fall. A name given to a moving roller, pulley, or wheel, carrying the cable of a cage. Also a crusty deposit on the walls of a mine shaft.

Fall (n.) - A descent or drop, especially in waterfalls.

Falling fall. A system of work in a mine, where a water wheel is used to supply power to the machinery.

Falling water. A precipitous descent of water.

Fall of the coal mine. The process of extracting coal from a mine shaft.

Fall of a wall. A horizontal force that causes a wall to collapse.

Falling water mills. A type of watermill where the water falls from a higher level to a lower level, driving the millstones.

Falling zone. The region of waterfalls or rapids.

Fallout. The deposition of radioactive material from the atmosphere after a nuclear explosion.

Fall zone. The region of waterfalls or rapids in a river.

False galeas. A species of leafy plant.

False emerald. A mineral that resembles emerald but is not.

False gold. A mineral that resembles gold but is not.

False graphite. A mineral that resembles graphite but is not.

False heat. A mineral that resembles heat but is not.

False inclusion. A mineral that resembles inclusion but is not.

False jade. A mineral that resembles jade but is not.

False kyanite. A mineral that resembles kyanite but is not.

False mica. A mineral that resembles mica but is not.

False muscovite. A mineral that resembles muscovite but is not.

False nephrite. A mineral that resembles nephrite but is not.

False plaster. A mineral that resembles plaster but is not.

False sapphire. A mineral that resembles sapphire but is not.

False topaz. A mineral that resembles topaz but is not.

False tourmaline. A mineral that resembles tourmaline but is not.

False water. A mineral that resembles water but is not.

False watch. A mineral that resembles watch but is not.

False yellow. A mineral that resembles yellow but is not.

False zircon. A mineral that resembles zircon but is not.
false galeana

false gate. A gate carried forward in the seam thickness only (which must be over 3 feet), with cut-throughs as required to the main gate. The false gate has a short con

false lapis lazuli. Lazufite. Schaller.

false indication. In nondestructive inspection,

false mud cracks. Some polygonal patterns,

false stratification. An earl; term for cross-

false set. a. A light, temporary lagging set

false ruby. Some species of garnet (Cape
dates. Modern fan drifts conduct

false fan. Usually temporary framework,

false work. Usually temporary framework,

false wiring. Same as curling. ASM Glass.
fan efficiency

pressure, on the assumption that the air does not change in volume. The velocity pressure, present in the air, does not change in volume. The velocity pressure, on the assumption that the air does not change in volume. The velocity pressure is the pressure that is present in the air, which is equal to the product of the air density and the square of the air velocity. The velocity pressure is a measure of the resistance offered by the air to the flow of a fluid, and it is directly proportional to the air density and the square of the air velocity.

fanning's equation. Frictional pressure drop (2Dρ) of fluid flowing in a pipe is

\[ A \Delta p = 2f \left( \frac{1}{d} - \frac{1}{D} \right) \]

where \( A \) is a function of the Reynolds number, \( v = \) rate of flow, \( g = \) acceleration due to gravity, \( l = \) length and diameter of pipe. Fryer, 3.

fan shaft. A. The ventilating shaft to which a mine fan is connected. B.S. 3618, 1963, sec. 2. b. The spindle on which a fan is mounted, B.S. 3618, 1963, sec. 2.

fan structure. An arrangement of closely spaced shafts such as the axial planes of the folds dip on each side of a mountain range, or the central axial plane of the range itself, so that the whole has a structure, in cross section, resembling that of an open fan held upright. Fay.

fan total pressure. The algebraic sum of the static pressure and the fan velocity pressure. B.S. 3618, 1963, sec. 2.

fan test. A fan test comprises observations of air quantity, air pressure, and power, while the fan is running at a known constant speed. Roberts, 1, p. 205.

fanning.应用了电力的歌剧和灾难。A.C.1. b. A kind of seismic test; a fan test.

fan efficiency. See overall ventilation efficiency. Thermodin. f.
farsudinite

fatigue life

fascite. a. Fr. A fagot; a bunch of twigs and small branches used for forming foundations on soft ground. Fay. b. Bunches of branches and twigs laid on bad roads. von Berneitz.

fashioned gem stone. One which has been cut and polished. See also fashioning (of gems). Shipley.

fashioning of gems. Includes sitting, clearing, cutting, polishing, and other operations employed in preparing rough gem material for use in jewelry; also the determination of the proportions. Shipley.

Fashoda garnet. Dark-red garnet from Tanganyika, Africa.

Fashoda ruby. a. Rich, high-gem II. b. Ruby of the same name; same as Fashoda garnet. Shipley, b. In the trade, refers to any red garnet. Shipley.

fashilitkite. A gray variety of riebeckite.-agurite garnet containing calcite and zircon from Ampasibitika, Malagasy Republic. Holmes, 1928.

fasil. German name for fusain. 7 omfussil.

fasin. a. Fr. A fagot; a bunch of twigs and branches used for forming foundations on soft ground. Fay. b. Bunches of branches and twigs laid on bad roads. von Berneitz.

fast break. In magnetic-particle inspection, an interruption of the current flowing in the magnetic-coil system that causes the collapsing field to induce eddy currents and strong magnetization in the test part. ASM Gloss.

fast breeder reactor. A nuclear reactor that operates with reactors that have a higher fissile content than that which can be sustained prior to failure for a stated test condition. ASME Gloss.
fatigue limit

fatigue limit. The maximum stress below which a material can presumably endure as determined by repeated stress cycles up to a given number of cycles. If the stress is not completely reversed, the value of the mean stress, the minimum stress, or the stress ratio should be stated. ASM Gloss.

fatigue of metals. A deterioration in the crystalline structure and strength of metals due to repeated stresses above a certain critical value. See also anisotropy. Nelson.

fatigue rate. The speed at which a metal will withstand indefinitely. When the maximum stress in tension equals that in compression, the fatigue rate is twice the fatigue limit. The mean stress, or half the range, must be stated to define the fatigue conditions. Hm.

fatigue ratio. The ratio of the fatigue limit for cycles of reversed flexural stress to the tensile strength. ASM Gloss.

fatigue strength. See endurance limit. Ro.

fatigue strength reduction factor. An earlier percussive method. A mixture of pipe clay and linseed fat. A test made on a material to test for fatigue. A test made on a material to determine the fatigue strength of a material. See also closed fault; dip fault; dip-slip fault; distributive fault; low fault; gravity fault; heave fault; hinge fault; horizontal fault; longitudinal fault; normal fault; oblique fault; oblique-slip fault; open fault; overlap fault; overthrust fault; parallel-displacement fault; pivotal fault; reverse fault; rotary fault; strike-slip fault; thrust fault; transitional fault; translation fault; underthrust fault; vertical fault. See cement and lime hydrate that yields a plastic putty to hydraulic lime; it is also used to denote a white lime (quick or hydrated) and the term for factor of stress concentration in tributary fault; flaw fault; gravity fault; closed fault; dip fault; dip-slip fault; displacement. A.C.G.I. d. Eng. A dislocation or plane or zone of fracture in which one side is moved relative to the other by a fault. Schieferdecker.

fault. A term for stress concentration in tributary fault; flaw fault; gravity fault; closed fault; dip fault; dip-slip fault; displacement. A.C.G.I. d. Eng. A dislocation or plane or zone of fracture in which one side is moved relative to the other by a fault. Schieferdecker.

fault breccia. A. The assembly of broken fragments of rock thrown against each other. Schieferdecker. c. See breccia; gouge; leather bed. Nelson.

fault bundle. A faulting. It is surrounded by rocks of the same age. A.G.I. Synonymous with block mountain. A.G.I.

fault deflection. A deviation in the course of a fault caused by its interception by another fault. Schieferdecker.

fault dip. The vertical inclination of a fault plane, or a shear zone, measured from the horizontal plane. Fa.

fault drag. Distortion of the bedding which may occur in the vicinity of a fault plane. B.S. 3618, 1964, sect. 5.

fault escarpment. See fault scarp. A.G.I.

fault fissure. The fissure produced by a fault, which it may be filled afterward by a deposit of minerals. Fay.

fault fold. A fold accompanied by steep faults that are parallel to the fold and are contemporaneous with the folding. A.G.I.

fault gap. A depression between the offset ends of a ridge developed on a resistant rock layer that has been displaced by a transverse fault. Stokes and Varnes, 1955.

fault gouge. Finely ground or powdered material filling, or partly filling, a fault zone. It is sometimes a slippery mud, which coats the surfaces of the fracture or cements the breccia. Stokes and Varnes, 1955.

fault groove. One of the undulations deeper than fault scarp but similarly formed. They record larger movements and have greater significance as indicating the direction of movement. Stokes and Varnes, 1955.

fault groove. Fault development by counterclockwise slippages along the fault plane. See also growth of faults. Nelson.

fault inlier. An isolated exposure of the overridden rock in a region of thrust faulting. It is surrounded by rocks of the same age. A.G.I.
fault inler

overriding block and is thus separated from other surface exposures of rock like it. A low-angle fault is also called a step fault; a fault with a vertical displacement is called a vertical fault; a fault that lies in a surface of reference is called a fault in an \textit{a}.

fault line. A plane along which a fault has occurred. See also fault line; a. A continuation of the land surface, or of the shore zone, with a horizontal trace; fault line; fault trend. Fay. b. The cliff formed by a fault. Most fault lines are approximately parallel to the fault plane. Nelson. See also fault line.; fault trend.

c. An escarpment that coincides more or less with the fault trace; a fault scarp. A.G.I. b. The cliff formed by a fault. Most fault lines are approximately parallel to the fault plane. Nelson. See also fault line.; fault trend.

fault surface. The surface of a fracture along which dislocation has taken place, and if without appreciable curvature, it is called a fault plane. Nelson. Compare fault plane.

fault system. a. A system of parallel or nearly parallel faults. Schieferdecker. It consists of one or more fault sets that were formed at the same time. A.G.I. b. A terrace formed by two parallel fault scarps which are separated by a narrow belt of downthrown weak rock. A.G.I. c. A terrace on a slope resulting from step faulting in which the terrace is systematically on the same side of several parallel faults. Billings, 1954, p. 196.

fault throw. The amount of vertical displacement of the rocks due to faulting. The most important faulting feature from the mining aspect. Nelson.

fault trace. a. The line of intersection of a fault plane with the earth's surface. Compare fault line; fault trend. Fay. b. The intersection of a fault and the earth's surface, as indicated by the dislocation of fences, roads, etc., by ridges and furrows in the ground, by diagonal ruptures of the surfce, etc. A.G.I.

fault trap. A trap, the closure of which results from the presence of one or more faults. A.G.I.

fault trellis drainage pattern. A trellis pattern found where a series of parallel faults have brought to the surface rock of resistant and weak rock. A.G.I.

fault trench. A term used by geologists in certain areas to describe a fault block that has had a separation of at least 500 feet. Fay.

fault trough. A term used by geologists in certain areas to describe a fault block that has had a separation of at least 500 feet. Fay.

fault zone. a. A fault, instead of being a single clean fracture, may be a zone hundreds or thousands of feet wide. The fault zone consists of numerous interlocking small faults or a confused zone of gouge, breccia, or mylonite. Billsing, 1954, p. 155. A.G.I. b. It is used also to include fault zones in general, such as a cleavage crack, cloud, or fracture. Shiple.

fault zone structure (of stones). Irregularities of crystallization; also sub-sequent brecciation or separation between the atomic planes, such as a cleavage crack, cloud, or fracture. Shiple.

fault zone. a. A fault, instead of being a single clean fracture, may be a zone hundreds or thousands of feet wide. The fault zone consists of numerous interlocking small faults or a confused zone of gouge, breccia, or mylonite. Billsing, 1954, p. 155. A.G.I. b. It is used also to include fault zones in general, such as a cleavage crack, cloud, or fracture. Shiple.

fault zone structure (of stones). Irregularities of crystallization; also subsequent brecciation or separation between the atomic planes, such as a cleavage crack, cloud, or fracture. Shiple.
Faust jig

416

faust jed

discharged periodically by the operator by means of suitable hand valves operated from the working floor. This jig is used extensively on small sizes of bituminous coal. Mitchell, pp. 422-423.

fauvelle. A system of drilling, that was invented in 1846 by an Englishman, Bears, and a French engineer, Fauvelle, providing for the continuous removal of the cuttings from the well by means of a water flush current of water. All the water-flush system now in use are modifications of the Fauvelle system, which has long ceased to be employed in its original form. Fay.

faves. Braz. In the diamond fields, brown pebbles, consisting of a hydrated phosphorite, or of titanium and zirconium oxides, and regarded as good indications of the possible presence of diamonds. Fay.

fay. A silicate of iron, FeSiO₃, belonging to the phlogopite group; orthoboric.

Dana 17. fayence. See faience.
fayote. See lying surface.

fayottine. The surface of a piece of metal (or a member) in contact with which a grinding plane may be bent. G.S.A. Mem. 6, 1938, p. 89.
fayulite. A silicate of iron, Fe₂SiO₄, belonging to the phlogopite group; orthoboric.

Dana 17.
fayyance. See faiance.
fayyote. See fayottine.
faying surface. The surface of a piece of metal (or a member) in contact with which a grinding plane may be bent. G.S.A. Mem. 6, 1938, p. 89.
fayyulite. A silicate of iron, Fe₂SiO₄, belonging to the phlogopite group; orthoboric.

Dana 17.

 FCC (diamond) lattice. A unit cell in which there is one atom at each corner of the cell, one in the face center of each face, and four interior atoms disposed along opposing diagonals each a distance of a/√2 from the top and bottom respectively. Neuman, p. 177.

feedability studies. In mineral processing, amenability tests. Pryor, 3.

feedable ground. Ground that can be worked, and yet will stand without the support of timber and boards. Fay.

feather a. To blend the edge of a new material smoothly into the old surface. Nicoll 2. b. A slightly projecting narrow rib lengthwise on a shaft, arranged to catch into a corresponding groove in any part of the core or other part, such as the edges of the face, and four interior atoms disposed along opposing diagonals each a distance of a/√2 from the top and bottom respectively. Neuman, p. 177.

feed; fey. Shrop. Workable materials, usually ironstone. Arkell.

federal mine inspector. See mine inspector. fee. a. Mid. To load the coal, from a heading into cars. Fay. b. Property, as mineral land. Fay.

feed. a. Forward motion imparted to the cutters or drills of rock-drilling machinery, either hand or automatic. Fay. b. In stoncutting, sand and water employed to assist the saw blade in cutting. Fay. c. The longitudinal movements imparted to a drill stem to cause the bit to cut and penetrate the formations being drilled. Lang. d. The distance a drill stem on a diamond drill may be advanced into the rock before the rocks must be rechucked; for example, a driller may say a drill is equipped with an 18-inch feed, meaning that the bit may be made to drill a maximum distance of 18 inches each time the drill stem is chucked-up in the drive rod of the rivet head.

federal mine inspector. See mine inspector.

feedback. In automatic control of a process, control of an earlier stage by means of variance registered at a later stage. Pryor, 3.

feedback control system. A control system, comprising one or more feedback control loops, which combines functions of the controlled signals with functions of the commands to tend to maintain prescribed relationships between the commands and the controlled signals. ARCS, 11-1957.

feed boot. A small surge hopper mounted at the input end of some machines to supply a uniform and consistent feed of material. See also feeder; plate feeders. Nelson.

feed check valve. A nonreturn valve in the delivery pipe between feedwater pump and boiler, C.T.D.

feed control. System of valves or other mechanical device controlling the rate at which longitudinal movements are imparted to the diamond- or rock-drill stem machine. Lang.

feed control valve. A small valve, usually a needle valve, installed in the outlet of the hydraulic-feed cylinder on the swivel head of a diamond drill used to control minutely the rate of the hydraulic piston travel and, hence the rate at which the bit is made to penetrate the rock being drilled. Also called differential controlling valve.

feed cylinder. A hydraulic cylinder and piston mechanism, such as that on a diamond-drill swivel head to impart longitudinal movements to the drive rod and chuck to which the drilling stem is attached. Also
**feed cylinder**

called hydraulic cylinder. Long. 

**feed-and-blocks.** In rotary kiln, special fire clay shapes or rotary kiln blocks so installed as to reduce the kiln diameter. Bul. C16-62-66.

**feeder.** a. Very small fissures or cracks through which methane escapes from the coal. Kentucky, p. 70. b. A small stream of gas escaping from a coal crevice. Korson, c. Any flow of water or gas entering a mine. B.S. 3618, 1963, sec. 4. d. A small vein carrying ore running into a larger one. Also called leads. Gordon. c. A conveyor or hunker structure for delivering coal or other broken material to a controllable rate. See also feeder conveyor; plate feeders. Nelson. f. A cable of high current carrying capacity which connects power stations to substations. Nelson. g. A flow of water from the strata of high current carrying capacity which connects power stations to substations. Gibson, Bureau of Mines Staff. i. A spring or a stream. Fay, m. A mechanical device for supplying and delivering gobs of glass to a forming unit. A.MMAH4-1958. j. A blower of gas, as in a coal mine. Fay. k. Synonymous with feeder vein. Bureau of Mines Staff. l. A spring or a stream. Fay. 

**feeder chainman.** See car-haul man. D.O.T. 

**feeder gate; feeder plug.** A shaped refractory used to adjust the rate of flow of molten glass in the feeder channel. Dodd. 

**feeder head.** See hot top. C.D. 

**feeder nose.** See feeder spout. Dodd. 

**feeder opening.** See feeder connection. A.MMAH4-1958. 

**feeder plug.** See feeder gate. Dodd. 

**feeder process.** See gob process. A.MMAH4-1958. 

**feeder sleeve; feeder tube.** A cylindrical tube that surrounds the feeder plunger in a glass forming machine. Dodd. 

**feeder spout; feeder nose.** The part of the feeder in a glass tank furnace containing an opening in which the orifice ring is inserted; it forms the end of the forehearth. Dodd.

**feeder trough.** In a downhill, the trough which is attached to the conveyor pan line and serves as a base on which the feeder trough rides. Jones.

**feed pipe.** See feeder sleeve. Dodd. 

**feeder vein.** A small vein joining a larger vein. Fay.

**feed gear; feed gears.** The gearing or a- 

**feed grinding.** See crossfeed grinding; downfeed; indexfeed. A.C.S.G., 1963. 

**feed head.** Synonym for swivel head. Long. 

**feed head.** Synonym for swivel head. Long.

**feed grinding.** See crossfeed grinding; downfeed; indexfeed. A.C.S.G., 1963.

**feeding rod.** Pryor, 3.

**feed plpe.** A main line pipe; one which carries a supply directly to the point of use, or to secondary lines. Crittin.

**feed pressure.** a. Total weight or pressure, expressed in pounds or tons, to be applied to drilling machines and the drill bit cut and penetrate the formation being drilled. Long. b. Pressure, expressed in pounds per square inch, required to force glass into a rock formation. Compare injection pressure. Long. c. Pressure, expressed in pounds per square inch (psi), required to force-feed water into a steam boiler. Long.

**feed pump.** The pump which provides a steam boiler with feedwater. Nelson.

**feed quill.** Synonym for feed nut; sometimes improperly used as a synonym for feed screw. Long.

**feed rate.** Rate at which a drilling bit is advanced into or penetrates the rock formation being drilled expressed in inches per minute, inch per bit revolution, number of bit revolutions per inch of advance, or feet per hour. Also called cutting rate; cutting speed; forward speed; penetration feed; penetration rate. Long.

**feed ratio.** The number of revolutions a drill stem and bit must turn to advance the drill bit 1 inch when the stem is attached to and rotated by a screw- or gear-feed-type drill swivel head with a particular pair of the set of gears engaged. Example: A screw-feed swivel head of a diamond drill equipped with three pairs of gears, having a feed ratio of 100:100, 200:200, and 400:400, is operated with the 100:100 pair engaged, the drill stem must revolve 100 times to advance the bit 1 inch, if the 200:200 pair is engaged, the drill stem rotates 200 times per inch advanced, and if the 400:400 pair is engaged, the stem must rotate 400 times to advance the bit 1 inch. Long.

**feed regulator; feeder.** A mechanical device for controlling the rate of supply of feed. B.S. 3552, 1962.

**feed screw.** The externally threaded drill rod drive rod in a screw- or gear-feed (swivel) head on a diamond drill, sometimes incorrectly called a feed quill or feed spindle. Long.

**feed shaft.** a. A short shaft or countershaft in a diamond-drill gear-feed swivel head rotated by the drill motor 'through gears or an fractional drive and by means of which the engaged pair of feed gears is driven. Long. b. See fire pillow. Dodd.

**feed speed.** Normally used by drillers to note feed ratios. See also feed ratio. Long.

**feed spindle.** Synonym for feed shaft; sometimes incorrectly used as a synonym for drive rod and/or feed screw. Long.

**feed travel.** The distance a drilling machine moves the steel shank in traveling from top to bottom of its feeding range. Nickils.

**feedwater.** Water which is often purified, heated to nearly boiler temperature, and aerated before being pumped into a steam boiler by the feed pump. Nelson.

**feedwater heater.** An apparatus for heating water before it is fed to a boiler. Standard, 1946.

**feed wheel.** See regulating wheel. A.C.S.G., 1963.

**feed engineer.** One who (usually a mining engineer) looks after the interest of the owner of mineral rights. His specific duties are to check the amount of coal mined by the lessor (operator); see that no undue waste is permitted, and that royalties are paid according to contract. Fay.

**feel.** a. S. Staff. To examine the roof of a seam of coal with a stick or rod by poking, pushing, and knocking. This type of listening to the action of the engine and pump and occasionally feeling the intensity and nature of the drilling string to determine or judge how efficiently
feldspar. A constituent of portland cement or a felsic rock; granitic rock. A.G.I.

cryptocrystalline. Rocks of igneous origin, which are not glassy but are commonly, a quartz porphyry. A.G.I. c. Field term for any fine-grained acid igneous rock whose exact composition has not been determined. 

field. A textural term applied to the groundmass of porphyries having a felsic texture, which are not glassy but are too fine-grained for the mineral constituents to be determined with the microscope. In this sense, it is synonymous with cryptocrystalline. 

feldspar. A very compact and uniform kind of feldspar rock with or without phenocrysts. A.G.I.

crystalline. In this sense, it is synonymous with cryptocrystalline. It is pre-eminentively characteristic of lofty mountain slopes. A.G.I. b. Any consid-
erable area, usually fairly level or of only gentle slope, which is covered with mod-
erate size; or large blocks of rock. Synom-

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

cryptocrystalline. A textural term applied to felsic igneous rocks consisting of tightly packed microlites or crystals. A.G.I.

felits. A semantic adjective derived from (fe) for feldspar, (1) for lenads or felds-
par, and (s) for silica and applied to light-colored rocks containing an abun-

feldspatic. From felspar; felsitic or a cryptocrystalline groundmass. A.G.I.

feldspar-type washbox. A washbox to clean feldspar sunstone. Sunstone. Schaller.

feldspathic. A textural term ordinarily applied to igneous rocks; hence, a textural term proposed by Fellenius in 1927. Ham.

feldspathize. To introduce feldspars into a rock, or to replace other rock-forming minerals with feldspars. A.G.I.

feldspathoids, felsitic. A mnemonic adjective derived from feldspar, interwoven in irregular, unoriented masses of many andesites and trachytes, the crowded micro-

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by 

feldspathic. A textural term ordinarily applied to felsic igneous rocks; hence, a textural term proposed by Fellenius in 1927. Ham.

feldspathic. A textural term ordinarily applied to igneous rocks; hence, a textural term proposed by Fellenius in 1927. Ham.

feldspathic. A textural term ordinarily applied to igneous rocks; hence, a textural term proposed by Fellenius in 1927. Ham.

feldspathic. A textural term ordinarily applied to igneous rocks; hence, a textural term proposed by Fellenius in 1927. Ham.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.

feldspar. A contraction of felsite porphyry. A.G.I. c. Field term proposed by Vogel, and applied to porphyries having a felsic or cryptocrystalline groundmass. A.G.I.
fem. A mnemonic adjective derived from (Fe) for iron and (m) for magnesium. Applied to the group of standard normative minerals in which these elements are an essential component, including the pyroxene and olivine molecules and most of the normative accessory minerals (magnetite, ilmenite, and hematite). The corresponding mnemonic adjective for the ferromagnesians minerals actually present in a rock make A.G.I.

feminal. Refers to rubies of a pale tine. feminine. Refers to rubies of a pale tine.

femmer. Fragile, weak, or slender as in the fenaksite. A pale-rose monoclinic silicate of pyroxene and olivine molecules and most Long.

fence diagram. Three or more geologic sections showing the relationship of wells to surface features. The scale differs in distance from the foresound to give proper perspective. When several areas are used together, they form a fenetic enclosure, hence the name. Similar in some respect to a block diagram, but it has the advantage of transparency which is not present in a block diagram. A.G.I.

fence guards. S. Staff. Rails fixed around the shaft, or across the shaft at a landing to keep people and objects from falling in. Fay.

fence. A coincident of the high grader who generally sells or disposes of the stolen high-grade ore and whose work is rarely sent his metal to the mint without committing himself, and will not or not ordinarily go to the mint unless there is some market for the stolen mate-

r. brook. Lang.

fence guards. S. Staff. Rails fixed around the shaft, or across the shaft at a landing to keep people and objects from falling in. Fay.

fencing. Three or more geologic sec-

tions showing the relationship of wells to surface features. The scale differs in distance from the foresound to give proper perspective. When several areas are used together, they form a fenetic enclosure, hence the name. Similar in some respect to a block diagram, but it has the advantage of transparency which is not present in a block diagram. A.G.I.

Similar in some respect to a block diagram, but it has the advantage of transparency which is not present in a block diagram. A.G.I.

ferrariite. A pinkish-white to white hydro-

fluorosilicate and phosphate of calcium and strontium, consisting of a mixture of the

eutonic analogue of apatite, 3(Ca,Sr)F3-

(AsO4)2(Ca(OH)F)2. Crystaline mastic. Hexagonal. From Sitarap, India. English.

fenestral. A dull green hydroxal

calcium vanadyl vanadate. CaO.V2O5.5V2O5.

fenestration. The process of decomposition of carbohyrdates with the evolusion of carbon dioxide or the formation of acid, both are.

ferrom. A synthetic radioactive element with atomic number 100 that was discovered in the debris from the 1952 hydro-

fluorosilicate and phosphate of calcium and strontium, consisting of a mixture of the

eutonic analogue of apatite, 3(Ca,Sr)F3-

(AsO4)2(Ca(OH)F)2. Crystaline mastic. Hexagonal. From Sitarap, India. English.

ferromagnetism. It ensures that the

case of a thin, soft roof bed over a

Ferrarite table

b. A variety of shonkinite or dark nephe-

line syenite containing a laue-phase-Na-

line pseudomorphs after leucite; named for Fergus County, Mont., Hoimes, 1922.

ferrous. An oxide or hydroxide of ferro-

niobium, and tantalum, (Y,Er)(Nb,Ta)4

O10; sometimes containing small amounts of other rare earths, such as samari-

bium, thorium, iron, and tita-

nium. Found in pegmatites. Color gray, brown, or black; luster, dull to vitreous; streak, brown or gray; Mohs hardness

12.5 to 6.5; specific gravity, 5.6 to 5.8. Found in North Carolina, South Carolina, Virginia, Texas, Norway, Sweden, and Africa. A rare-earth mineral. CCD 6d, 1961.

fermentation. The process of decomposition of carbohyrdates with the evolusion of carbon dioxide or the formation of acid, both are.

ferromagnetic. A synthetic radioactive element with atomic number 100 that was discovered in the debris from the 1952 hydro-

fluorosilicate and phosphate of calcium and strontium, consisting of a mixture of the

Ferritic stainless steels

and ferric iron; Na₂Fe(SO₄)₃·3H₂O; grayish-brown, whitish-gray color; brittle; splinter fracture; luster, vitreous. Found in Atacama Desert, Chile. Formerly called ferrous sulfate, but now it is classified as the mineral to which that name applies is a ferric, not a ferrous sulfate. Dana 7, v. 2, p. 450-457; English.

depend on the properties of the host matrix. Ferrispinelites are not hardenable by heat treatment, and their magnetic properties are those of trivalent iron.

ferrispinelles. A collective name for minerals of the magnetite series, ferrous ferrichrome, and various mixed oxides of iron, manganese, etc., which might be called ferrimagnetic ceramics, as they are made by firing, as with pottery. Thus produced they have special insulating properties, which are unattainable by ordinary ceramic techniques.

ferrite. A variety of common trap rock or diabase.

ferrimagnetic material. A material which macroscopically has properties similar to those of a ferromagnetic material, but which microscopically also resembles an antiferromagnetic material in that some of the elementary magnetic moments are aligned antiparallel. If the moments are of different magnitudes, the material may still have large residual magnetization.

ferrimagnetism. Unbalanced orientation of magnetic moments intermediate between ferromagnetism and antiferromagnetism.

ferrilimite, ferrilimite. A modified variety of ferrite in which X is mainly ferric iron or magnesium. Spencer 15, M.M., 1940.

ferric oxide; ferric oxides, red; iron oxide; hematite; red hematite; red iron ore; rouge. Dense; brown to black; brown; reddish-brown; reddish-brown; gray; yellow; luster, silky to earthy, usually occurring as small crystals. Found in New Mexico, Arizona, California, Nevada, and Pennsylvania. CCD 6d, 1961.

ferrinatrite. A hydrated sulfate of sodium and ferric iron, Na₂Fe(SO₄)₃·3H₂O; grayish-brown, whitish-gray color; brittle; splinter fracture; luster, vitreous. Found in Atacama Desert, Chile. Formerly called ferrous sulfate, but now it is classified as the mineral to which that name applies is a ferric, not a ferrous sulfate. Dana 7, v. 2, p. 450-457; English.

ferrispinelles. A collective name for minerals of the magnetite series, ferrous ferrichrome, and various mixed oxides of iron, manganese, etc., which might be called ferrimagnetic ceramics, as they are made by firing, as with pottery. Thus produced they have special insulating properties, which are unattainable by ordinary ceramic techniques.

ferrite. A pure, or nearly pure, metallic iron, as a crystalline constituent of manufactured iron and steel. English. Native iron, such as the terrestrial iron from Dido lydite of iron, Fe₂(MoO₄)·18H₂O; color, yellow; luster, glassy; transparent. German. Ferrites, ferrites.

ferrite. A member of a group of elements that are related to iron. The group includes chromium, manganese, nickel, and several vanadium, besides iron. A.G.I.

ferrispinelike. A variety of common trap rock or diabase. Fay.

ferrimagnetic material. A material which macroscopically has properties similar to those of a ferromagnetic material, but which microscopically also resembles an antiferromagnetic material in that some of the elementary magnetic moments are aligned antiparallel. If the moments are of different magnitudes, the material may still have large residual magnetization. A.G.P.

ferrimagnetism. Unbalanced orientation of magnetic moments intermediate between ferromagnetism and antiferromagnetism. VV.

ferrimagnetic material. A material which macroscopically has properties similar to those of a ferromagnetic material, but which microscopically also resembles an antiferromagnetic material in that some of the elementary magnetic moments are aligned antiparallel. If the moments are of different magnitudes, the material may still have large residual magnetization. A.G.P.

ferrispinelike. A variety of common trap rock or diabase. Fay.

ferrimagnetism. Unbalanced orientation of magnetic moments intermediate between ferromagnetism and antiferromagnetism. VV.
ferrite stainless steels

the martensite and the austenite alloys. Since these steels do not exhibit unusually high mechanical properties, they are used in applications where the best combined, 45% of mechanical properties and oxidation or corrosion resistance is desired.

Henderson, p. 378.

ferritization. The metasomatic alteration of other minerals into ferrite. Fay.

dere. See ferrite spinels.

dere. A pale yellowish to brownish-yellow hydrous tungstate of ferric iron, Fe₂O₉·2H₂O. Microscopic hexagonal plates; ocherous. Hexagonal. Deer Trail district, Washington. English. The original material from the Deer Trail district contained jasomite intimately mixed with the ferrogabbro, both minerals being very fine grained. New data obtained on ferri-
tungstite from Mineral County, Nevada, show that it is tetragonal, distinctly anhydrous, with the formula CaFe₆O₁₀·8H₂O. American Mineralogist, v. 45, No. 1-2, January-February 1967, p. 83.

ferrititquestone. A variety of crystallized tur-

ferro-, A combining form, denoting (1) deriv-
ition from iron or a composition contain-
ing iron and (2) specifically, the presence of iron in the ferrous condition.

ferroactinolite. A hypothetical molecule, Na₂Ca₂Fe₂Si₅O₁₉·6H₂O. Crystals and their composition containin-
g iron and (2) specifically, the presence of iron in the ferrous condition.

ferroactinolite. A hypothetical molecule, Na₂Ca₂Fe₂Si₅O₁₉·6H₂O. Crystals and their composition containin-
g iron and (2) specifically, the presence of iron in the ferrous condition.

ferroactinolite. A hypothetical molecule, Na₂Ca₂Fe₂Si₅O₁₉·6H₂O. Crystals and their composition containin-
g iron and (2) specifically, the presence of iron in the ferrous condition.

ferrochrome. An alloy of iron and chromium.

ferroconcrete. A term which is being replaced by concrete.

ferrocement. See ferricoplate. Spencer 15, M.M., 1940.

ferroconcrete. A term which is being replaced by concrete.

ferrocement. See ferricoplate. Spencer 15, M.M., 1940.

ferrocement. See ferricoplate. Spencer 15, M.M., 1940.

ferrochrome. An alloy of iron and chromium.

ferrocement. See ferricoplate. Spencer 15, M.M., 1940.
ferrotschermakite. A hypothetical molecule, CaFe2"Fe"3+Al2SiO4(OH)2, to explain the composition of aluminum schists. See also thschermakite. Spencer 17, M.M., 1946.

ferrugineous. A ferroalloy containing steel as the special additive. Bureau of Mines Staff.

ferrous, a. Designation for iron salts in which the iron is bivalent; for example, ferrous chloride (FeCl2). Bennett 24, 1962, b. Of, pertaining to, or containing iron in the bivalent state. Standard, 1964.

ferrous alloying elements. The various elements used for alloying with steel are: nickel, manganese, vanadium, silicon, zirconium, chromium, tungsten, molybde- num, beryllium, copper, titanium, aluminum, and uranium. Camm.

ferrous ammonium sulfate; iron-ammonium sulfates; Mohr's salt. Light green; monoclinic; FeSO4.7H2O; decomposes at 130° to 110° C; soluble in water; insoluble in alcohol; and specific gravity, 1.864 (at 20° C), referred to water at 4° C. Used in metallurgy. CCD 6d, 1961: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-150.

ferrous fluoride octahydrate; iron fluoride octahydrate. Green crystal; FeF2.8H2O; loses 6H2O at 90° C and 7H2O at 100° C; soluble in acids; slightly soluble in water; soluble in hydrofluoric acid; insoluble in alcohol and in ether; and specific gravity, anhydrous, 4.09. Used in ceramics. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-182.

ferrous metal. A metal with iron as its major constituent; relatively heavy, usually magnetic, and in most of its forms, quite strong. See also nonferrous metal. Newton.

ferrous mineral. Any mineral having a considerable portion of iron in its composition. Skilley.

ferrous oxide. This lower oxide, FeO, tends to be formed under reducing conditions; it will react with SiO2 to produce a material melting at about 1,200° C, hence the fluxing action of ferrous impurities present in some clays if the latter are fired under reducing conditions. Melt- ing point, 1,420° C; specific gravity, 5.7. Dodd.

ferrous sulfate heptahydrate; iron sulfate heptahydrate; copperas; green copperas; melanterrite. Green; monoclinic; FeSO4.7H2O; often brownish yellow from oxidation and efflorescence; soluble in water; slightly soluble in alcohol; specific gravity, 1.89; and it loses 6H2O at 90° C and 7H2O at 100° C. Used in metallurgy in producing electric sulfuric acid; in precipitati- ng gold from cyanide solutions; and in etch- ing aluminum. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-183. Used in water purification and in Frenkel 24, 1962.

ferrous sulfide; iron sulfide; iron monosulfide; iron sulfuret. Dark green; metallic, or grayish- green; FeS; soluble in acids; insoluble in water; specific gravity, 4.75 to 5.40; and melts at 1,190° C. The manufactured sulfide is used for generating hydrogen sulfide; in ceramics; and in making ferro- vanadium. Alloy used in shock-resistant car steels. Prior, 3.

ferrus. A mixture of about 90 percent dry hydrated iron oxide and 10 percent Portland cement used for desulfurizing producer gas or other gas. The mixture must be so granulated so that the gas will pass through a mass of it. Hess.

ferrox. A sintered oxide consisting mainly of the oxide Fe2O3, and used for the production of permanent magnets. Osborne.

ferrous. a. Containing iron; Synonym for ferrous for ferriferous. Fay. b. Descriptive of rocks having a red color but not necessarily an abnormally high iron content. A.G.I. Supp.

ferrous clays. A secondary deposit consisting of chalcedony or of fine-grained quartz and variable amounts of hematite, maghemite, or limonite. USGS Monograph 19, 1892, p. 239.

ferrous deposit. A sedimentary rock containing enough iron to justify exploitation as iron ore. The iron is present in different cases as carbonate, oxide, or oxide form, occurring as the minerals chamosite, thuringite, siderite, hematite, limonite, etc. The ferrous material may have formed contemporaneously with the accompanying sediment, if any, or it may have been introduced later. C.T.D.

ferrous rocks. Rocks of this group are usually carbonate of iron which has partially or wholly replaced limestone. Ma- ton, V.I., p. 13.

ferrous sandstone. A sandstone rich in iron as the cementing material or as grain, or both. Fay.

ferrous schist. A schistose rock notably high in iron. See also basic schist; iaspilite; schist; taconite. A.G.I.

ferrousite. a. A metal ring or cap on the end of a cane, handle of a tool, post, or the like, to strengthen or protect it. Standard, 1964, b. A bushing or thimble in- stered in the end of a roller rule or the like, to spread it and make it a tight joint. Standard, 1964, c. A short pin coupling. Standard, 1964, d. As used by drillers in Africa and the United States, a synonym for case; casing. Long.

ferramsite. See ferramsnite.

ferramsnite. A brown titanium-bearing silicate, monoclinic, Ca0.9Na0.1Ti6O17, Dana 17, pp. 413, 501.

ferramsnite. A brown, titanium-bearing silicate, monoclinic, Ca0.9Na0.1Ti6O17, Dana 17, pp. 413, 501.

Ferramsite. Parallel orientation of fold- sparr prism edges with the edge between two adjacent rhomboidal planes of quartz in graphic granite so that the c axis of the quartz forms an angle of 42° 16' with the c axis of the feldspar. Hess.

ferrastonite. See ferramsnite.

Ferry radiation pyrometer. An instrument in which the heat radiated from the hot body is focused, by means of a concave mirror, on to a small central hole behind which a small thermocouple is placed in front of two small, inclined, mirrors. The instrument is focused on the hot body and focused by rotating a screw until the lower and upper halves of the image co- incide; the temperature of the thermocouple is indicated on a galvanometer. The instrument, once focused, gives continuous readings and must be connected to a recording indicator. Osborne.

fessing. Type of cross lamination resulting from 1. the erosion of plunging troughs having the shape of a quadrant of an elongated ellipsoid, 2. the filling of small troughs by sets of thin laminae forming in general to the shape of the trough floor, and (3) the partial destruction of the laminae by subsequent erosion, producing younger troughs. A.G.I.

festoon bedding. Crossbedding tangential to the lower stratification plane and truncat- ed at the top, with a curved upper surface giving a wedge-shaped appearance. Ballard.

festoon crossbedding. See festoon cross lamination. Pettijohn.

festedite. pale brown, or other colors, which are convex in the direction of the wind and concave in the direction of the wind, both convex. Pettijohn. b. Crossbedding deposited in a concave surface. Pettijohn.

fettitate. A carbonaceous substance which is weakly radioactive. Fay. b. Having a disagreeable odor caused by the occurrence of certain bituminous substances or of hydrogen sul- fide. This odor is apparent when some varieties of limestone and quartz are broken or are rubbed vigorously. A.G.I. Supp.

fettersand. See fettkohle. Fay.

fettle. a. To cover or line the hearth of (a reverberatory furnace) with fettling. Web- ster 3d. b. To clean and smooth (as a metal or plastic) after casting or molding. Webster 3d. c. To remove fins, mold marks, and rough edges from dry, or green, castings. Webster 3d.
fetter. One who removes excess dried glaze from dipped tile with sandpaper and knife. See also fettler.
fettling. a. N. of Eng. Cleaning up any under- ground roadway, etc. Fay. b. Protecting the surface of a ceramic article in recharging the furnace. Dodd. f. Finishing the surface of a ceramic article in dry or green condition, by scraping, polishing, buffing, etc.; also, the material so used. !fender-scraping. Dodd.
fiber. A longitudinal element or texture or texture is fibrous. The fibers may be continuous or discontinuous. As contrasted with porous, reticular, or network structures. Chemical and physical properties. C.M.D.
fiber glass. A continuous filament glass fiber of relatively short length. A staple fiber is a glass fiber of relatively short length (generally less than 17 inches). ASTM C162-66. c. Ceramic fibers are made from a batch consisting of alumina and silica (separate or already combined as kaolin and kyanite) together with a boronrich flux; zirconia may also be present. Other types of ceramic fiber are made from fused silica and from potassium titanate. These fibers are used in the production of lightweight units for thermal, electrical, and sound insulation; they have also been used for high-temperature filtration and packing, and for the reinforcement of other ceramic materials. Dodd.
fiber rope. hemp rope; Manila rope. A rope made from vegetable fiber such as common hemp, jute, or jute. The rope is nonkinking and therefore is sometimes used for hoisting in prospecting windlass. Neill.
fiber stress. A term used for convenience to denote the longitudinal tensile or compressive stress in a beam or other member subject to bending. It is sometimes used to denote this stress at the point or points most distant from the neutral axis, but the term stress in extreme fiber is preferable for this purpose. Also, for convenience, the stress in thin cross-sectional elements of a member which may be imagined as composed of called fibers. Ro.
fibroferrite. A mineral with a probable composition of iron oxide (Fe3O4). SiO2 for fully hydrated material. It occurs as fine-fibrous crusts and masses. Color, pale yellow or straw-yellow to nearly white; also greenish-gray and yellowish-green to pale green. Dana 7, p. 2, pp. 614-615.
fibrolite; sillimanite. One of three crystalline forms of aluminum silicate, Al2SiO5, the others being andalusite (low temperature) and kyanite (high temperature). Sillima- nite, occurs commonly as felted aggre- gates of exceedingly thin fibrous crystals, hence the name fibrolite, in contact metamor- phosed aluminous sediments such as mudstones, shales, etc. Crystals of a pale sapphire blue are used as gems. C.T.D.
fibrolith cat's-eye. A pale greenish fibrolite with fibrous inclusions which, when cut, produces a chatoyant effect but not a well-defined cat's-eye. Shipley.
fibrous asbestiform. Thin strands of asbesto- simon uranium occurring in nature. Depending on the composition, 
"CHs, that occurs in fossil wood. It is soluble in ether but not in alcohol. Tomkeieff, 1957.
fibrocalcites. a. Molded, or capable of being molded into the form of an art work or artifact. Webster 3d. b. A piece of fibrous material. Webster 3d. c. Made of earth or clay, or of pertaining to pottery. Standard, 1964. d. Said of all thrown, molded, molded, or carved clay work. C.T.D.
fibrocalcite. Transparent calcite composed of fibrous crystals, which, like fibrous gypsum, shows a silky sheen when cut cabochon, it produces a girasol or chatoyant effect, but not a true cat's-eye. Called like fibrous gypsum, it is called satin spar but less correctly. Shipley.
fidler's gear. Lifting tackle designed for laying heavy blocks at any angle, used in the building of quay or quay wall below water level. Ham.

fiducial interval. A measure of confidence in particular field measurements, usually given a numerical value of fiducial interval, the number of samples required from a given deposit to give an accurate measure of its value can be determined. Lewis, p. 350.

fiducial mark. a. An index line or point. A line or point used as a basis of reference. A.G.I. b. In photogrammetry, index marks rigidly connected with the camera lens through the camera body and forming images on the negative which defines the principal point of the photograph. A.G.I.

fiducial point. a. In surveying, accurately established reference point to which field measurements are tied. Pryor, 3. Triangulation point; bench mark.

fiducial time. A time on a seismograph record; bench mark. Pryor, 3.

file. A portion of land containing, yielding, or worked for a natural resource. For example, a coalfield, an oilfield, or a diamond field. Webster 3d. A large portion of area, as large as many square miles, containing valuable minerals. See also coalfield.

field ampere turns. The number of windings multiplied by the number of amperes flowing in an electric field. Pryor, 3.

fieldbook. A book used in surveying, engineering, geology, etc., in which are set down the angles, stations, distances, observations, etc.; the object field.

field capacity. The amount of water held in a soil by capillary action after gravitational water has percolated downward and drained off. Field capacity is expressed as the ratio of the weight of the soil retained to the weight of the dry soil. Stokes and Varnes, 1955.

field classification of rocks. A classification of rocks made in the field. It is based on features distinguishing single specimens by using a hand lens, a knife, an acid bottle, etc. The classification may be refined or modified by subsequent examination with a microscope or other techniques that are generally used in a laboratory. Stokes and Varnes, 1955.

field compaction trial. Tests carried out under site conditions to determine the best combination of (1) type of compaction plant; (2) thickness of loose soil layer; (3) number of passes; and (4) moisture content (where variation is possible) in order to achieve the highest possible soil densities. Nelson.

field drain. The more usual term applied to agricultural drain. Ham.

field drain pipe. An unglazed, fired clay pipe, generally 5 inches or 4 inches in diameter and about 1 foot long, for the drainage of fields; occasionally these pipes have a flattened base, or longitudinal ribs, to facilitate alignment during laying. Dodd.

field engineer. In petroleum production, one who directs civil, electrical, and mechanical engineering activities concerned with production and transmission of natural gas, gasoline, and oil, and with provision of utilities to gas field or in a pipeline system. D.O.T. 11.

field focus. The total area or volume which a fault is the source, the focus is the local fault surface, and is called the field because it is inferred, and not evidenced in the field. A.G.I.

field geology. a. The study of rocks and rock materials in their natural environment. B. Unconformities and contact relations to one another. Field geology seeks to interpret the surface features and their relationship to underground structures, and forms the basis of coal and mineral prospecting, particularly in regions where geological maps are not available. See also subsurface geology. Nelson. b. Points to practical work in the open field, as distinguished from the researches which may be carried on in the library or laboratory. Chalmers.

field ice. Synonym for sea ice. A.G.I.

field investigation. In reference to experimental mine tests, the investigation made at a mine when a test is taken or testing at the experimental mine, this investigation including the taking of road dust, rib dust, mine air, and standard coal samples, and the noting of conditions affecting the safety of the mine. Rice, George S.

fieldite. A zinciferous variety of tetrahedrite.

field launching. The project of laying down a field on a rest.

field-laboratory operator. One who analyzes mine water by chemical and coal coke tests by removing samples of water that flow to and from the precipitation drum, and who conducts routine chemical tests. D.O.T. Supp.

field map. A map made in the field and bearing observations of various kinds upon which the final map is based. Stokes and Varnes, 1955.

field moisture equivalent. The minimum water content expressed as a percentage of the weight of the oven-dried soil, at which a drop of water placed on a smoothed surface of the soil will not immediately be absorbed by the soil but will spread out over the surface and give it a shiny appearance. ACSE P126.

field moisture equivalent of soils. See moisture equivalent. Stokes and Varnes, 1955.

field of veins. An area traversed by numerous veins. Schieferdecker.

field-reversal hypothesis. The concept that the earth's magnetic field has been reversed periodically. A.G.I. Supp.

field reverse. See reverse. Ham.

field setting. A person skilled in the art of handling diamond bits, working at or near the site of one or more operating drills to set bits to be used. Long.

fieldwork. Work done, observations taken, or other operations, as triangulation, leveling, making geological observations, etc., in the field or upon the ground. Fay.

fiery. To split, as slate. Lewis.

fiery. Containing an explosive gas; said of a gaseous mine. Fay.

fiery dragon. Derb. Tonedstone, Arkell.

fiery heap. Eng. The deposit of rubbish and waste or unstable coal which ignites spontaneously. Fay.

fiery mine. a. A mine in which the seam or seams of coal being worked give a large amount of methane. Fay. b. One in which there is danger of explosion due to coal dust or flammable gas. Pryor, 3. c. A gassy mine; a mine where gas ignitions and outbursts have occurred in the past. Nelson.

fighting. Eng. Said of a ventilating current when the motion of the air is first in one direction and then in the other, varying rapidly. Eng. Said of a ventilating current when the motion of the air is first in one direction and then in the other, varying rapidly. Eng. Said of a ventilating current when the motion of the air is first in one direction and then in the other, varying rapidly.

fingertip. The art of picking up objects with the fingertips.

finger prints. See V-cuts. Skow.

figured glass. Flat glass having a pattern on one or both surfaces. ASTM C162-66.

figure stone. Agalmatolite. Webster 3d.

filament winding. a. A type of pahoehoe, the surface of which has a lacy or filamented appearance caused by the bending over and laying down of innumerable threads of lava produced by the escape of gas bubbles from the surface. Most of the threads have fallen back from the surface of the flow and are commonly aligned in the direction of flow. This is the characteristic type of pahoehoe surface, and generally it is superimposed on theropy, hummocky, or engravillie forms. USGS Bull. 394, 1958, p. 32.

filament winding. b. A type of pahoehoe, the surface of which has a lacy or filamented appearance caused by the bending over and laying down of innumerable threads of lava produced by the escape of gas bubbles from the surface. Most of the threads have fallen back from the surface of the flow and are commonly aligned in the direction of flow. This is the characteristic type of pahoehoe surface, and generally it is superimposed on theropy, hummocky, or engravillie forms. USGS Bull. 394, 1958, p. 32.
filament winding

is the technique of coating small filaments of materials, usually glass, with a resin media, and then winding and forming these into desired shapes by means of rollers. Mills used are operated to impart higher compression strengths and better corrosion resistance to the coating. The filament used is the "filamentary yarn". In the filar micrometer, its usual form consists of an ocular containing a fine wire which can be moved across the field by means of a thumbcrew for the purpose of measuring size.

file hardness. Hardness as determined by the use of a file on a standard hardness on the assumption that a material which cannot be cut with the file is as hard as, or harder than, the file. Covering a range of hardesses may be employed. ASTM Gloss.

film. a. Any sediment deposited by any agent.fill. b. A smokeless powder used in Italy. Web.

c. Delicate ornamental work, such as glass cobweb. filigree. a. Delicate ornamental work, used in jewelry, chiefly in decorating gold and silver. Cris.

d. Material used to fill a cavity or a passage. Fillet. A thin layer of a substance, at the inside meeting surfaces. ASM Gloss.

filed bitumen. Bitumen containing a filler, head, Iz stonework industry, a foreman who supervises a crew of workers engaged in sawing from blocks to see that they con.

file hardness. Hardness as determined by the use of a file on a standard hardness on the assumption that a material which cannot be cut with the file is as hard as, or harder than, the file. Covering a range of hardesses may be employed. ASTM Gloss.

filler. a. Delicate ornamental work, used in jewelry, chiefly in decorating gold and silver. Cris.

d. Material used to fill a cavity or a passage. Fillet. A thin layer of a substance, at the inside meeting surfaces. ASM Gloss.

d. Material used to fill a cavity or a passage. Fillet. A thin layer of a substance, at the inside meeting surfaces. ASM Gloss.

filled valley. A valley in a wide basin in an area or a semiarid region containing abundant alluvium in the form of fans, flood plains, and lake deposits. A.G.I. Supp.

filled bitumen. Bitumen containing a filler, head, Iz stonework industry, a foreman who supervises a crew of workers engaged in sawing from blocks to see that they con.

file hardness. Hardness as determined by the use of a file on a standard hardness on the assumption that a material which cannot be cut with the file is as hard as, or harder than, the file. Covering a range of hardesses may be employed. ASTM Gloss.

film coefficient. The heat transferred by convection per unit area per degree temperature difference between the surface and the fluid. Also called unit convection conductance; surface coefficient. Strock, 1970.

film flotation. Early stage in development of modern flotation process for concentration of minerals, notably sulfides. The conditioning pulp with water in which oil which then floats up, carrying selected minerals. This mineralized film was then overflowed or skimmed off. Pryor, 3.

film factor. The approximate load the dipper actually is carrying and which is an indication of the percentage of the rated capacity. The film factor is commonly called the dipper factor or shovels' factor for draglines. Woodruff, v. 3, pp. 499-500.

filling. a. Eng. The places where trams are loaded in the workings. Fay. b. The waste material used to fill up old stopes or chambers. Weed, 1922. c. Allowing a mine to fill with water. Weed, 1922. d. The loading of tubs or trucks with coal, ore, or waste. C.T.D. f. Loading of mineral into mine trucks; shoveling onto conveyors; gob-stowing; pucking old stopes with waste. Pryor, 3. g. Clogging of the abrasive coat by swarf. It may be reduced by in many operations by using an open-coat construction or a lubricant. See also S.W.R. Aust.

filling-out. a. Adding, or the method of adding, material to fill underground space left after the ore has been extracted. See also hydraulic fill, Stagg, 1963.

filling point. The level up to which a glass bottle has the nominal capacity. ASTM C162-66.

filling system. See sublevel stoping, b. Fay.

filling-up method. See overhand stoping, b. Fay.

filler. a. Any sediment deposited by any agent that a material which

cannot be cut with the file is as hard as, or harder than, the file. Covering a range of hardesses may be employed. ASTM Gloss.

filler clay. A clay used in a crushed or ground state for purposes other than for the production of ceramic materials or products, and generally behaving as an inert ingredient. While such clays may sometimes change the properties of the product, they are themselves unchanged in compounding for use. Fille clay may or may not be white. See also rubber and paper clay. Each of which is a particular class of filler clay. ACSB-1.

filler-blown. Metal added in making a brazed, soldered, or welded joint. ASTM Gloss.

filler wires. Small wires in a strand for spacing larger wires and supporting them in position. Hem.

filler. a. A radius (curvature) imparted to inside meeting surfaces. ASTM Gloss. b. A concave cornerpiece used on foundry patterns. ASTM Gloss. c. The concave curved junction of two surfaces which would come together meet at an angle. Fill.

terns used are operated to impart higher compression strengths and better corrosion resistance to the coating. The filament used is the "filamentary yarn". In the filar micrometer, its usual form consists of an ocular containing a fine wire which can be moved across the field by means of a thumbcrew for the purpose of measuring size. Hiss.

file hardness. Hardness as determined by the use of a file on a standard hardness on the assumption that a material which cannot be cut with the file is as hard as, or harder than, the file. Covering a range of hardesses may be employed. ASTM Gloss.

filler clay. A clay used in a crushed or ground state for purposes other than for the production of ceramic materials or products, and generally behaving as an inert ingredient. While such clays may sometimes change the properties of the product, they are themselves unchanged in compounding for use. Fille clay may or may not be white. See also rubber and paper clay. Each of which is a particular class of filler clay. ACSB-1.

filler, head. In stonework industry, a foreman who supervises a crew of workers engaged in moving and preparing marble for cutting with gang saws. D.O.T. 1.

filler-clay. A clay used in a crushed or ground state for purposes other than for the production of ceramic materials or products, and generally behaving as an inert ingredient. While such clays may sometimes change the properties of the product, they are themselves unchanged in compounding for use. Fille clay may or may not be white. See also rubber and paper clay. Each of which is a particular class of filler clay. ACSB-1.

filler-foil. A metal added in making a brazed, soldered, or welded joint. ASTM Gloss.

filler wires. Small wires in a strand for spacing larger wires and supporting them in position. Hem.

filler. a. A radius (curvature) imparted to inside meeting surfaces. ASTM Gloss. b. A concave cornerpiece used on foundry patterns. ASTM Gloss. c. The concave curved junction of two surfaces which would come together meet at an angle. Fill.
film mica. Knife-trimmed mica split from the better qualities of block mica to any specified thickness between .0012 and .0005 inch. Skow.

film, monomolecular; film, unimolecular. Surface coating at interfaces between solid and fluid may be of film thickness and continuous over an appreciable area. Pryor, 3.

film sizing. Reverse classification. Sorting of mineral particles on such flatish surfaces as slices and shaking tables in accordance with the sizes of the particles, moved by a flowing film of water, which exercises transporting force proportional to the cross section exposed to flow. Pryor, 3.

film sizing tables. A table used in ore dressing for sorting fine material by means of a film of flowing water. These tables may be considered as surface tables, from which the products are removed before they have sunk, so that the washing is always done on the same surface; also building tables or biddles, on which the products are rectified after they have formed a bed. These use the relative transporting power of a film of water flowing on a quiet surface, which may vary either rough or smooth, to act upon the particles of a water-sorted product. The smaller grains, of high specific gravity and larger size, are moved down the slope or at all by the slow undercurrent; the larger grains, of lower specific gravity, are moved rapidly down the plane or in the thin upper current. Liddell 2d, p. 387.

film strength. The relative resistance of the buckling or mechanical damage. ASTM C290-65.

filter. a. A device for separating solids or suspended particles from liquids or fine dust from ventilating or cooling air. An electrical air filter can collect airborne contaminants ranging from about 60 to 1 micron in size. See also vacuum cleaner, Nielson, b. In ore treatment, separating device incorporating a separating membrane on which solids are retained. The membrane is intermittent in action, and has channeled plates covered by membranes, separated by spacing pieces, which fill as plates are anchored and filterate is drawn out, appliance being opened and emptied periodically. The drum filter is a horizontal drum rotated slowly through a semicircular tank in which pulp is kept stirred by reciprocating paddles. Vacuum applied to inside of drum draws filtrate through filter cloth at surface, leaving a cake which, after emergence and perhaps washing with spray, is scraped off on the drum by scraping blades. D.O.T.

filter aid. A low-density, inert, fibrous, or fine granular material used to increase the rate and efficiency of filtration. A-T-D.

filter bed. a. A pond or tank having a false bottom covered with sand, and serving to filter river or pond water. Fay, b. A filter of pervious soil that provides a site for a septic field. Nichols. c. A general name for a contact bed or any similar bed used for filtering purification of water. C-T-D.

filter cake texture. The physical properties of a cake as measured by toughness, stickiness, and brittleness. Brandly, 1.

filter cells, b. A combination of various materials designed and installed in such a manner as to provide drainage and prevent the carryover of soil particles by flowing water. Also called protective filter. ASCE P1826. d. A porous bed of sand or of other material that separates matter held in suspension, or dissolved impurities or coloring matter from a liquid or a gas that is passed through it. Web 3d, e. A verb, to subject to the action of a filter; to pass a liquid or a gas through a filter for the purpose of purifying the same. To act as a filter, to remove from a fluid by means of a filter, to percolate. Webster 3d. f. An electric device in seismic instruments that permits selection of frequency characteristics appropriate for the desired motion it is desired to record. G. J. g. In radiography, a device, usually a thin metallic layer, inserted into a beam of radiation so as to modify the transmitted spectrum of radiation. It may be used to enhance or reduce contrast, or to minimize undesirable fluctuations. ASM Glass, h. In compressors, cleaners for the intake air which should be free from dust and moisture. The simple screen can be made by building an intake box with panels of 3/8-inch mesh wire screen covered with oil cloth. One type, made of frames 20 x 20 inches and giving an effective opening 18 x 18 inches or 2x2 square feet of area, will retain many metallic particles with a viscous fluid. Each frame has a capacity of 800 cubic feet of air per minute. Liddell 2d, p. 483.

filter cleaner. A high-volume sampler using a plain or pleated fibrous filter of various materials and designed to collect particulate air is drawn through the instrument by a suction pump. In one instrument, the air is filtered continuously (at one of three selected rates), even when dust begins to clog the filter. Very high efficiencies can be attained with special filter materials (fiber glass, membranes). Harman, p. 53.

filter-plant foreman. A foreman who supervises workers engaged in extracting water from the ground. Many foremen also have experience in settling tanks and filter machines, and in loading filtered concentrate into railroad cars. D.O.T. Supp.
filter press

between the plates. See also plate-and-frame filter. Webster 3d.

filter pressing. a. Squeezing out of a residual magmatic differentiation. a. A difference in filtration qualities. The filtration characteris-

crystallized and then is subjected to pressure by earth movements, etc. Bateman, 1950, p. 51. c. A process of making a filtration crystallized in a mud of interlocking crys-

tinuous filtration. a. Aggregate in which the smallest particles have a diameter of less than 0.075 mm.

fineness modulus. a. A measure of the amount of filtrate from a drilling fluid passing through or into a porous medium. Filter loss and cake thickness constitute the determining factors of filtration qualities. Brantly, 1.

filter press. Sand suitable for use in filtering the suspended matter from water. A.G.I.

filter stick. Short glass tube with filtering seption used in laboratory sampling. Pryor, 3.

filter-type respirator. A protective device which is worn over the mouth and nose in an attempt to prevent inspiratory particles from the air by physically trapping the particles on the fibrous material of the filter. It offers no protection against gases or vapors or atmospheres deficient in oxygen. Many workers, however, are subjected to dusts, fumes, and mists in sufficient quantity to impair health. Common examples are the dusts of cement, coal, flour, limestone, silicious materials, and a variety of metali-

ing, grinding, and crushing operations; the metallic fumes of welding, smelting, and refining the metallic fumes of welding, smelting, and refining the metallic fumes of welding, smelting, and refining the metallic fumes of welding, smelting, and refining the metallic fumes of welding, smelting, and refining the metallic fumes of welding, smelting, and refining.

fin. The thin sheet of metal squeezed out between the collars of the rolls in a roll train. Fay, b. A fault, sometimes occurring in pressed or blown glassware, in the form of a thin projection following the line between the parts of the mold. Also called flash. Dodd, c. The feather edge obtained when cutting flat glass. ASTM C162-66.

final controlling element. In flotation, that controlling element which directly changes the value of the manipulated variable. Ostrander, p. Long.

final drive. A set of reduction gearing close to or inside of a drive wheel. Nichols.

final exploration. The detailed investigation of a coal field area on which a preliminary report was favorable. The final exploration of an area may involve a costly boring program, surveys, and sampling. See also preliminary exploration. Nelson.

final size. That size required for a hydraulic cement to develop sufficient strength to resist a prescribed pressure. In the usual Vicat needle test, this stage of the setting process is defined as that at which the needle point will, but its circular attach-

smallest particle is glass. These are the volcanic rocks. Mason, v. 1, p. 11.

fine-grained. Descriptive of rocks composed of small grains. Generally the term is used only in a relative way, but an average-size of less than 1 millimeter has been suggested. Stokoe and Verner, 1955.

fine-grained. Rocks in which the crystals are very fine-grained or else the whole or part is glass. These are the volcanic rocks. Mason, v. 1, p. 11.

fine-grained. Soil consisting mostly of clay and silt, more than 50 percent by weight smaller than 0.074 millimeter in diameter. Standard.

fine-grinder. A machine for the final stage of size reduction, that is, to -10 mesh. Such machines include ball mills, tube mills, and ring-roll mills. Dodd.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine industrials. Synonym for toolstones. Long.

fine metal. The higher grades of copper regul-

us or matte obtained in the English process. See also copper concentrate. Indications are the following four varieties which are distinguished by appearance and copper content: (1) blue, containing about 60 percent copper; (2) sparkle, about 74 per-

percent copper; (3) white, about 77 percent copper; and (4) pale, about 79 percent copper. Fay.

fineness. a. The degree of purity of gold, for example, gold 999 fine contains 999 parts of pure gold, and 0.01 of other matter. See also carat. Nelson, b. Parts per thousand in purity. Bureau of Mines Staff. c. The proportion of pure silver or gold in jewelry, bullion, or coins often expressed in parts per thousand and being United States silver, coin nine-tenths or .900 fine and in English gold, coin eleven-twelfths or .9166 fine. Webster 3d. d. A measure of the specific surface area or particle-size distribution. Taylor, e. The state of subdivision of a substance. C.D.

fineness. a. A measure of average particle size obtained by summing the products of the reciprocal of the size grade midpoints times the frequency of particles in each class expressed as a decimal part of the total frequency. A.G.I.

fineness modulus. a. An empirical factor obtained by adding the total percentages of

fine annealing. Annealing to an extremely low stress and uniform index of refraction. ASTM C162-66.

fine chemicals. Chemicals produced in rela-

tively small quantities; for example, silver nitrate. Bennett 2d, 1962.

fine coal. English translation of German fein-

fine cold asphalt. A wearing course of bitu-

men and an aggregate on a horizontal axis and containing balls, rods, or peb-

bles (grinding media) which serve to grind the ore in the mill. The different mills used in fine grinding are known as ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.

fine grinding. Fine grinding is usually performed in a mill type of grinding machine, such as the ball mill, pebble mill, Hardinge mill, tube mill, etc. Newton, p. 65.
fineness modulus

A measure of the fineness of a material, typically expressed as a number between 0 and 1. A higher fineness modulus indicates a coarser material, while a lower fineness modulus indicates a finer material. Fineness modulus is calculated as follows:

\[ FM = \frac{1}{1 + \frac{D}{d}} \]

where \( D \) is the maximum size of the particles and \( d \) is the size of the smallest particle.

**Example:**

For a material with a maximum size of 10 mm and a minimum size of 0.1 mm, the fineness modulus would be:

\[ FM = \frac{1}{1 + \frac{10}{0.1}} = 0.1 \]

**Note:** Fineness modulus is used in various industries, including concrete, asphalt, and ceramics, to describe the fineness of the aggregate materials used. It helps in understanding the compressive strength and workability of the material.

**Related terms:**
- **Aggregate:** The coarse and fine particles that make up the structure of concrete.
- **Concrete:** A composite material made from a mixture of cement, aggregate, and water.
- **Asphalt:** A dark, sticky material made from the distillation of oil.

---

fink truss

A type of truss used in structural engineering, characterized by its zigzag pattern. Fink trusses are commonly used in bridge construction for their strength and stability. The design allows for efficient use of materials and can accommodate complex load distributions.

**Related terms:**
- **Bridge:** A structure designed to support and facilitate passage over obstacles.
- **Structural engineering:** The branch of engineering that deals with the design of structures to withstand loads and forces.
- **Truss:** A framework of beams and columns that can support various loads.
**fin-neck bolt**  429

**fireclay**

**fin-neck bolt.** Similar to carriage bolt. Used
through wood or through wood and metal.
Two fins under the head prevent turning
while the nut is being tightened or
loosened.

**finned tube.** Extended (grilled) surface in
the form of fins on tubes or pipe. *Strock,*

**fioreaminate.** A gray, olive-green to black
chloroarsenite of lead. PbCl(Asta,).
Prisms and crystalline crusts. Hexagonal.
From Langman, Sweden. English.

**Finish amber.** Amber from the shores of
Finland. See also Baltic amber. *Shipley.*

**fiord.** fjord. A. A long, deep, arm of the sea,
occupying a portion of a channel hav-
ing high steep walls, a bottom made un-
even by bosses and silts, and with side
streamers entering from high-level valleys
by cascades or by steep rapids. A. G. I. 
B. A narrow, deep, steep-walled inlet of
the sea that is walled by cliffs. From the
sub-
mergence of a mountainous coast. *Fay.*
C. A sea-occupied segment of a glaciated
trough, or glacial valley. *Fay.*
D. Where the sea enters a
region of melting of the glacier, an
A. G. I.
E. A regional (as far as 50 or 100 miles).
F. As far as 100 miles. A. G. I.

**fiord shore.** A. A coastal area with
side
streamers entering from high-level valleys
by cascades or by steep rapids. *Fay.*
B. A coastal area with side
streamers entering from high-level valleys
by cascades or by steep rapids. *Fay.*
C. A coastal area with side
streamers entering from high-level valleys
by cascades or by steep rapids. *Fay.*
D. Where the sea enters a
region of melting of the glacier, an
A. G. I.
E. A regional (as far as 50 or 100 miles).
F. As far as 100 miles. A. G. I.

**fiord lake.** A lake in a glacially excavated
trough. A. G. I.

**fire agate.** A. A glass imitation of fire opal.
B. A. A glass imitation of fire opal.
C. A. A glass imitation of fire opal.
D. A. A glass imitation of fire opal.

**fire boss.** a. A person designated to examine
the mine for gas and other dangers. In
certain states, the fire boss is designated
as the mine examiner. U. S. Bureau of
Mine Safety Code—Bituminous Coal and
Lignite Mines. Pt. 1 Underground Mines,
Oct. 6, 1953. b. A state certified supervi-
sory mine official, who examines the
mine for fire, gas, and other dangers,
and who usually makes a second examina-
tion during the shift. In some states, it is used
to designate assistant or section fore-
man. B. C. I. C. a. colliery deputy. Nel-
sor. d. Also called fireマン, fire
viewer; fire boss; fire man examiner. D. O. T.

**firebox.** a. A chamber (as of a furnace or
steam boiler) that contains a fire; specifi-
cally, the compartment of a steam loco-
nomotive in which the fire is burned.
*Webster*
3d. b. One of the small refractory lined
chambers, built wholly or partly in the
wall of a kiln, for combustion of the
fuel. *Dodd.*

**firebreak.** A strip across the area in which
either no combustion of materials can
occur, or in which, if timber supports
are used, sand (not waste rock) is later
piled and packed tightly round them.
When timber is not used in stope sup-
ports, the firebreaks are simply stretch-
s in the levels or winzes in which timber
lugging is replaced by some other sub-
stance, such as steel or concrete. *Spald-
ing.* p. 226.

**firing.** A. Staff. Said of any place
underground showing indications of
a gob fire. *Fay.*

**firebrick.** a. Bricks made from a very refrac-
tory clay to withstand intense heat.
*M. B. E.,* 4th, p. 260. b. An aluminosite
brick of fire-clay composition. *FV.*

**fire bridge.** The separating low wall between
the fireplace and the hearth of a rever-
buroatory furnace. *Fay.*

**firebug.** See mine patrolman. D. O. T.

**fire chamber.** That part of a furnace which

**Fire-Chek Keys.** Trade name; pyrometric
cones made by Bell Research, Inc., E.
Liverpool, Ohio. D. D. D.

**fire classification.** The following explains the
National Fire Protection Association clas-
sification of fires. A fire is defined as one
in which solid, combustible materials,
such as coal, wood, rubber, textiles, paper,
and rubber. A fire is defined as one
these in flammable liquids, such as fuel
or lubricating oils, grease, paint, varnish,
and lacquer. A fire is defined as one
in (live) electric equipment, such as oil-
filled transformers, generators, motors,
switch panels, circuit breakers, insulated
electrical conductors, and other electrical

**fire clay.** a. A clay that is high in alumina or
silica; diffusion is not less than cone 19
(1,515° C). Fire clay is essentially refra-
crry; residual, plastic or nonplastic,
and are dominantly composed of kaolinite.
The classification of fire clays may be re-
ostic, or composed of the composition, fiscal char-
acteristics, refractories, use, association
with other materials, etc., such as plastic
fireclay, plastic fire clay, plastic fire clay,
high-
alumina fire clay, siliceous fire clay, fire
clay, coal measure fire clay, sagger clay,
high-heat duty fire clay, etc. Bureau of
Mines Staff. b. An earthy or stony min-
eral aggregate which is composed essen-
tially of high-purity silicates of aluminum
with or without free silica. It is plastic
when sufficiently pulverized and wetc.
red in the presence of water, and
sufficiently pure and refractoriness for use
in commercial refractory products. H. W.
c. Formerly used for almost any soft non-
bedded clay immediately underlying a
coalesced many of which are not refrac-
tory; compare underlinen, A. G. I. Supp.
d. Soft, unbedded, gray or white clay,
high in silica and hydrated aluminum silicates,
and low in iron and alkalies. Fire clay forms
the seat earth of many coalbeds and has value as refractory clay.

**fire clay brick.** A refractory brick manufac-
tured substantially or entirely from fire
clay. *H. W.* See also first quality fire
brick; second quality fire clay brick;
fire clay goods. Mainly composed of fire clays
with the addition of opening materials
such as grog (granulated fire clay or
sand). *Rosenthal.*

**fire clay mineral.** A poorly crystallized (part-
ly disordered) kaolinite. A. G. I.

**fire clay plastic refractory.** A fire clay mat-
erial tempered with water or other mediums
for ramming into place to form a monolithic
furnace lining that will attain satisfac-
tory physical properties when subjected
to the heat of furnace operation. *ASTM
C71-64.

**firecoast.** A film produced on metallic surfaces
by oxidation due to the action of heat.
*Standard,* 1964.

**fire crack.** A fissure formed in metal during
the process of reheating or that of anneal-

**fire crakes.** Cracks in steel caused by local

**fire damp.** a. Said of a mine when an explo-
sion of firedamp has taken place. *Fay.*
b. Said of one who has been discharged
from work. *Fay.*

**firedamp.** a. A combustible gas that is formed
in mines by decomposition of coal or other
carbonaceous matter, and that con-
sists chiefly of methane; also the explo-
itive mixture formed by the air and the
methane. The fire is defined as one
in which the air and the methane;
the gas is contained in the coal
and is often given off in large quantities,
and explodes upon ignition when mixed
with atmospheric air. *Fay.*

b. Said of one who has been discharged
from work. *Fay.*
fire damp

Fire damp alarm. An instrument which gives a warning signal when the methane content of the air exceeds a known value. Roberts, 1, p. 83.

Fire damp cap. A sm-4 cap which forms over the flame of a safety lamp when sufficient fire damp (methane) is present. C.T.D.

Fire damp dangers. Fire damp is dangerous because (1) it may cause suffocation, and (2) it may cause an explosion. The presence of fire damp in mine air reduces the oxygen available for breathing. If a flame safety lamp will not burn in the atmosphere there is danger of suffocation through oxygen deficiency. Fire damp explosions have been the cause of the worst coal mining disasters in history. See also methane. Nelson.

Fire damp detector. Usually a portable device to detect the presence and determine the percentage of fire damp in mine air. See also methane monitor; sampling instrument. Nelson.

Fire damp detectors, automatic. See Ringle Ronge fire damp alarm; Naylor Spiralam. Sinclair, 1, pp. 28-29.

Fire damp drainage. The collection of fire damp from coal measures strata, generally into pipes, with or without the use of suction. Also called methane drainage. B.S. 3618, 1963, sec. 2.

Fire damp drainage drill. A heavy compressed-air operated percussive, rotary or rotary-percussive drilling machine for putting up the boreholes in fire damp drainage. See also In-Hausch D95/51 drilling machine. Nelson.

Fire damp explosion. An explosion of a flammable mixture of fire damp and air. See also colliery explosion. Nelson.

Fire damp fringers. The zone of contact between the gas and air and the ventilation air current at the face. Roberts, 1, p. 229.

Fire damp layer. A sheetlike accumulation of fire damp on the roof of a mine roadway where the ventilation is too sluggish to dilute and remove the gas. Although the term is new, the hazard existed since the earliest days of coal mining. A fire damp layer may be specified as one in which the gas is 5 per cent or over and of a length greater than the width of the road in which it occurs. Nelson.

Fire damp migration. The movement of fire damp through the strata or goaf of a mine. B.S. 3618, 1963, sec. 2.

Fire damp moisture chamber. A method of fire damp drainage in coal mines without boring. When old gob is drained, pressure chambers are built at the intake to, and at the return from, the worked-out district. These areas or chambers are sealed off and the pressure controlled either manually or automatically. The gas is drawn from the chambers in pipes passing out through the main return. The method provides a supply of gas and the underground conditions are safer. Nelson.

Fire damp probe. A flexible rubber tube connected to a cap, which can be thrust into roof cavities and breaks so that a sample of the air may be transferred to a methane analyser and its fire damp content determined. An aspirator attached to the methanometer is used to pump the air sample into the instrument. Nelson.

Fire damp reforming process. Methane has twice the calorific value of town's gas, and in some cases, the gas obtained from fire damp drainage has to be modified by catalytic or other means before it can be passed into the mains. When mixed with steam and passed over a nickel catalyst, methane is converted to a mixture of hydrogen and carbon monoxide, and when this is blended with pure methane a gas having similar properties to town's gas is produced. Nelson.

Fire damp tests. Tests to detect the presence and concentration of fire damp in mine workings. When carrying out a test with a safety lamp, the flame is lowered until it is about one-eighth inch high. It then consists of a small blue flame with a spot of yellow light in the middle. At the top there is a faint halo of paler blue known as the fuel cap, which must not be mistaken for a small gas cap. When fire damp is present it forms a faint bluish gas cap over the whole flame. The lowest percentage that can be estimated in this way is from 1 to 1 1/2 per cent. As the percentage increases, the gas cap gradually grows upards, and at 2 per cent it forms a triangle, about as high as the test cap. As the percentage increases further, the triangle gets taller and taller. See also flame safety lamp.

Fire decorating. The process of firing ceramic pieces or decorative shapes by placing the pieces on a flat surface, sealing chambers are built at the intake to, and the return from, the worked-out district. These areas or chambers are sealed off and the pressure controlled either manually or automatically. The gas is drawn from the chambers in pipes passing out through the main return. The method provides a supply of gas and the underground conditions are safer. Nelson.

Fire damper. Usually a portable device to detect the presence and determine the percentage of fire damp in mine air. See also methane monitor; sampling instrument. Nelson.

Fire door. a. The door or opening through which fuel is supplied to a furnace or stove. Fay. In a furnace or in a building or in a mine, as a door to enclose an area in which there is a mine fire. Fay. b. Same as fire-stone. Shipton.

Fire division wall. Any wall which subdivides a building so as to resist the spread of fire, but is not necessarily continuous throughout the mine and above the roof. See also fire wall. A.S.C.G.

Fire door. a. The door or opening through which fuel is supplied to a furnace or stove. Fay. In a furnace or in a building or in a mine, as a door to enclose an area in which there is a mine fire. Fay. b. Same as fire-stone. Shipton.

Fire extinguisher. A portable or wheeled apparatus. See also fire extinguishing agents that may be used to extinguish fires where water would make matters worse, or where sealing off of oxygen is practicable. Pryor, 3.

Fire extinguishing. As a noun, the extinguishing of gas-charged lava (normally basaltic) from a volcanic vent, either a localised central vent or a fissure, forming a fountain of molten rock. Lava fountains are a common type of eruption in Hawaii. They issue from fissures along rift zones, from the flanks of Mauna Loa, and commonly reach heights of 300 feet and even 1,000 feet in extreme cases. The cooling of lava fountains along a fissure produces the so-called curtain of fire. A.G.I.

Fire extinguisers. Brand names for series of air-setting and heat-setting cements, made from fire clay or kaolin, able to withstand high temperatures; used in laying and repairing firebrick, furnace linings, etc. Bennett, 2d, 1962.

Fire face. The surface of refractory walls exposed to direct heat of a furnace. Bureau of Mines Staff.

Fire feeding. Another portable or wheeled apparatus for putting out small fires by ejecting fire extinguishing agents that may consist of water, stone, and chemicals (as soda and solutions or foam), or chemicals alone (as carbon tetrachloride, carbon dioxide, or dry chemicals). Webster 3d. See also air foam extinguisher; carbon dioxide gas extinguisher; chemical foam extinguisher; dry-powder extinguisher; foam extinguisher; soda-acid extinguisher; water/carbon dioxide extinguisher.

Fire grate. The grate which holds the fuel in many forms of heaters and furnaces. Fay. See also fire back; fire guard; fire plating; fire finished.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire fountaining. As a noun, the rhythmic ejection of gas-charged lava (normal basaltic) from a volcanic vent, either a localised central vent or a fissure, forming a fountain of molten rock. Lava fountains are a common type of eruption in Hawaii. They issue from fissures along rift zones, from the flanks of Mauna Loa, and commonly reach heights of 300 feet and even 1,000 feet in extreme cases. The cooling of lava fountains along a fissure produces the so-called curtain of fire. A.G.I.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.

Fire finished. Glassware that has received its color of which has been changed or enameled on. Dodd.
fireman, tail rope

inclined between the surface and a level in a mine, D.O.T. 1.

fireman. Bituminous coal mining, one who fires the boiler which generates steam for driving the machinery at the tipples where coal is prepared for market. D.O.T. 1.

fireman, washery. In anthracite coal mining, one who tends and fires the boiler generating steam for driving the machinery in coal-washing plants where coal is cleaned and separated from slate and other impurities to prepare it for market. Also called fireman, washer. D.O.T. 1.

fire marble. See lumachelle. Fay.

fire marks. a. Tiny indentations similar in appearance to fire holes, left in a setting of bricks or other impurities to prepare it for market. ACSG. See fire holes, left in a setting of bricks. Fay.

fire marble. See lumachelle. Fay.

fireproofing brick clay. See fireproofing clay. Fay.

fireproofing brick. See fireproofing clay. Fay.

fireproofing brick clay. See fireproofing clay. Fay.

fire proofing tile. a. Tile for use as a protection for structural members against fire. A.S.T.M. C45-50T. b. Tile designed for use as a protection for structural members against fire. A.S.T.M. C45-50T. c. General name applied to those forms used in the construction of floor arches, partitions, etc., or columns where faces of the units are exposed. ACSG.

fireproofing brick. See fireproofing brick clay. Fay.

fireproofing wire. a. Wire which has been refined by the use of a furnace process only, including refinery shapes and, by extension, fabrics, products made therefrom. Usually when this term is used alone, it indicates purified tough pitch copper without elements other than oxygen being present in significant amounts. A.S.T.M. C151-60T. b. The refining of blister copper by oxidizing the impurities in a reveratory furnace and removing the excess oxygen by bellows. May be used as an alternative to electrolytic refining, and in any case is carried out as a preliminary to this. C.T.D. c. Includes a number of processes used for the removal of impurities from impure metals produced by the smelting process. Impurities are removed by introducing air into the molten metal by exposing the metal to air, and by the addition of fluxes and the removal of impurities as gases, drosses, or liquid slags. Lead, tin, and some types of impure copper are also fire-refined. E.C.T., v. 8, p. 937.

fire resistance. This term has at times been used indiscriminately to denote the resistance of a material to ignition or to the spread of flame. In the relevant British Standard 538, 1962, the meaning is restricted to the performance of complete elements of a building structure without regard to the performance of the materials of which they are composed. In the United States, fire tests for building construction and materials are the subject of American Standard for Testing Materials—E119. Dodd.

fire ridge. A solid rib or wall of coal left between workings to confine gob fires. Fay.

fire runner. In bituminous coal mining, one who fires the boiler which generates steam for driving the machinery at the tipples where coal is prepared for market. Also called fireman, washer. D.O.T. 1.

fire scale. Intergranular copper oxide remaining after the firing of a ceramic body and its glaze in one operation. A.S.T.M. C422-60T. c. Synonymous with fire scale. Webster 3d. d. See also fire pot. Webster 3d.

fire sand. a. Refractory oxides or carbides used for furnace linings. Bennett 2d, 1962. b. A sand so free from fluxes that it is used for furnace linings. Bennett 2d, 1962.

fire sealer. a. A strip across an area through which neither fire nor noxious gases can penetrate. It involves not only sealing of stopes but levels also. Spalding, p. 226. b. See sealing; expansion-proof stopping. Macon, v. 1, p. 281.

fire setting. An ancient method of tunneling through rock. A fire was built against the face of the mineral, which was then quenched with water, thus causing cracking. Pryor, 3.

fire simple. The process of maturing an unfired ceramic body and its glaze in one firing operation. A.S.T.M. C422-60T. Also called "one fire." Fay.

fire stink; gob stink. The smell given off when fire is extinguished in a setting of bricks or other impurities to prepare it for market. ACSG. See fire holes, left in a setting of bricks. Fay.

fire viewer. A person whose duty it is to examine the working of a mine with a safety lamp. A fire boss. Fay.

fire watchman. A wall to retain oil in case of its escape from a tank or to prevent the spread of burning oil. Fay.

firewatch miner. In metal mining, one who goes through a mine with his superior after the shift to look for possible fire hazards. He works as a regular miner during the shift, but reports later, and makes his inspection after the shift has left the mine. D.O.T. 1.

firing. a. The process of initiating the action of an explosive charge or the operation of a mechanism which results in a blasting action. B.S. 3618, 1964, sec. 6. b. (Eng.) In the preparation of heat by building fires upon hard strata in order to soften them, preliminary to the use of the pick. See also fire setting. Fay. c. The act or process of applying fire or intense heat to anything; as, in stoking. Standard, 1964. d. In mining, the igniting of explosive charges. Bureau of Mines Staff. e. High-temperature treatment that sinters particles into a ceramic product. See fire refining. Bureau of Mines Staff. f. The controlled heat treatment of ceramic ware in a kiln or furnace, during the process of manufacture, to develop the desired properties. ACSG. 1963. g. The process of heating ware to mature the applied coating into a porcelain enamel or ceramic coating. ACSG. 1963. See also burning. h. Starting up a furnace or kiln. Bureau of Mines Staff.

firing a mine. Eng. Maliciously setting fire to a coal mine. Fay.

firing behavior. The changes in appearance and properties of ceramic ware when heated. ACSG. 1963.

firing circuit. See shunting circuit. Fay.

firing cycle. The time required for firing (burning) the porcelain enamel. Or, more particularly, the chart of time and temperature for a burning operation. Bryant.

firing expansion. The increase in size that sometimes occurs when a refractory raw material or product is fired; it is usually expressed as a linear percentage expansion from the day of manufacture. Firing expansion can be caused by a crystaline conversion (for example, of quartz into cristobalite, or of kyanite into mullite or cristobalite), or by bloating. See also bloating. Compare after-expansion.

firing impulse. As applied to electric blasting

fireproofing impulse

fire style. See fire stink. Fay.

fire tile. A tile, used in a furnace, which is manufactured by great pressure. Ford, 1952, 1954.

fire travel. The movement of the zone of highest temperature around the gallery of an annual kiln. A typical rate of fire travel is one chamber per day, often a little faster. Dodd.

fire trial. A command to start operating a drill either to collar Derbyshire coal or to prepare the work on the first working shift of a day. Long.

fire viewer. A person whose duty it is to examine the working of a mine with a safety lamp. A fire boss. Fay.

firewall. A wall to prevent the spread of fire in a setting of bricks or other impurities to prepare it for market. ACSG. See fire holes, left in a setting of bricks. Fay.

fireproofing clay. See fireproofing brick clay. Fay.
firing impulse
caps, the minimum impulse or current required to fire a detonator. Fraenkel, v. 1, p. 816:10, p. 5.

firing key. A special key which fits the ex-

firing line. See. An appliance used in former
times for blowing a room of fire-damp. A prop

firing point. Eng. That point at which fire-
damp mixed with atmospheric air ex-

firing range. a. The range of firing tempera-
ture, within which a ceramic composition de-

firing shrinkage. The decrease in size that
usually occurs when ceramic ware is
fired; it is usually expressed as a linear
percentage and given in tenths or hundredths
per cent. Compare after-contraction. Dodd.

firing temperature. The peak (top) temper-
ature within which a ceramic composition de-
velops properties which render it com-
mercially useful. ASTM C286-65.

firm coal. b. The opening of a river into the sea.
A synonym for estuary; frith (a variant spelling).
A.G.I.

firnification. The process by which snow is
partly consolidated by alternate thawing and
freezing, but has not yet become glacial ice.
A.G.I. Supp. 0.82. It is considered by some to be any
firmly bound carbon dioxide. Carbon dioxide

first bite. A diamond with a finest greenish
tint. Schaller.

first-class conduction. Electrical conduction
by the transfer of free electrons. The flow
of electricity through a first-class or me-

tallic conductor is a direct flow of free
electrons. Also called metallic conduction.
Newton, Joseph. Introduction to Metal-
lurgy, 1958, p. 22, 439.

first-class lever. A lever having a fulcrum (pivot
point) between the point where force is applied
and where it is exerted. Ni-

first-class ore; shipping ore. An ore of suf-
ficient value to admit of selling to a
smelter or reduction plant. See also sec-
d-second-class ore. Nelson.

first helper. One who tends an open-hearth
furnace in which scrap iron is melted and
purified to make steel. Keeps records per-
taining to weight of charges, time con-
sumed in melting operations, and furnace
temperature. Also called melter assistant.
Heiner, p. 194.

first impetus. See first arrival. Schieferdecker.

first man. One who tongs the head butty or coal getter
in a stall. Fay.

first mining. In the room-and-piller method,
that part of the coal that is won from
the rooms at the beginning of the second par-
and which is the extraction of the
remaining pillars. Stores, v. 1, p. 349.

first-of-the-air. a. Ark. That part of the air
which consists of small rounded crystalline grains formed
from snow crystals. Also called névé.
C.T.D. b. Snow above the glaciers which
are partly consolidated by alternate thawing
and freezing, but has not yet become

first order geocynacle. A term used by
geologists for a belt of major formation such as that of

first order nappe. An overturned, generally
recumbent, tectonic fold in which the
middle part of the overturned limb is

first quality fire clay brick. A trade term usu-
al indicating fire clay brick of the high
duty class, as classified by A.S.T.M. A.G.I. Supp. See also high-duty fire clay brick.

fishbone. Said of (1) steel girders with a
convex lower edge; and (2) long straight-
edges, which are convex upward; such a
form results in greater resistance to bend-
ing. C.T.D.

fished joint. A rail joint made by means of
fishplates. Ham.

fisheye. a. A little-used name for moonstone,
also for a flaw almost bluish-white. A slight amount of color
detracts from the value and they are said to
be off color. Nelson.

fist. A narrow arm of the sea. Webster 3d.

fir. a. Eng. To catch up with a bird, or to
draw diamonds. Long.

first side. The surface of plate which is ground
and polished first. ASTM C242-66.

firsts. a. N.S.W. The highest ore picked from
a seam. C.T.D.

fishtail. c. Compacted, granular
snow which has changed into firn. A.G.I.

fisher. A term applied to groups of closely
spaced fractures in marble deposits. Fay.

fishy. a. In geology, a deposit containing the
remains of fishes in predominant
quantity among those of other marine animals. Also called bone bed. Fay.

fishbowl. Said of (1) steel girders with a
convex lower edge; and (2) long straight-
edges, which are convex upward; such a
form results in greater resistance to bend-
ing. C.T.D.

fishy. a. A little-used name for moonstone,
also for a flaw almost bluish-white. A slight amount of color
detracts from the value and they are said to
be off color. Nelson.

fist. A narrow arm of the sea. Webster 3d.

fir. a. Eng. To catch up with a bird, or to
draw diamonds. Long.
fisheye

transparent faceted stone so cut that its center is lacking in brilliancy. Shipton.

A diamond cut too thin to present the maximum effect of brilliancy. Bureau of Mines Staff.

fisheye stone. A hydrated calcium silicate in which part of the calcium may be replaced by potassium. Synonym for apophyllite. Fay.

fish head. Scot. A tool for extracting clacks (valves) from mine pumps. Fay.

fishing. a. In drilling, the operation by which lost or damaged tools are secured and brought to the surface from the bottom of a well. Fay. b. The operation of attempting to recover a piece of drilling or other equipment broken off or lost from the drilling tools and left in the hole. A.G.I.

fishing jars. Jars having a longer stroke than drill jars. They are used in jarring a string of drill stuff stuck in a borehole. Long.

fishing job. Foreign material or tools in the hole which must be removed. Brantly, 2.

fishing salt; fishery salt. Coarse-grained salt produced in various ways, usually grainer than in the United States. N.R.C.-N.S.A. N1.1-1957.

fishing string. A length of drill rods (usually left-hand-threaded or rosined) used in fishing operations. Long.

fishing tap. A thread-cutting tool to cut threads inside a casing or other hollow part that is to be fishied from a borehole. Long.

fishing tool. a. A tool to recover or overcome broken bits or other harmful objects in the bottom of a borehole. Pieces of metal are sometimes recovered by the use of a strong magnet attached to the drill string. See also screw bell. Nelson. b. Apparatus of various types used on the end of a drill string to fish or remove from the hole lost or damaged drilling equipment or trap iron. Long.

fishing-tool operator. In petroleum production, the person who extracts lost equipment and removes other obstacles that are encountered in the borehole while drilling oil or gas wells, or that obstruct flow from producing wells, by devising methods and directing use of special tools. Also called oil well fishing-tool operator. D.O.T. 1.

fishplate. Specially shaped steel plates for joining the end of one rail to the next rail in the track. The fishplates are fixed (one on each side) to overlap the rail ends and bolted through the rails. Nelson.

fish scale. A defect, sometimes occurring in sheet steel enamelled where a small chip or particle of the fired coating literally jumps from the surface, the chips being oval-shaped particles somewhat resembling the scales of a fish. Fish scale is a ground coat defect but often does not occur until the cover coat has been applied and burned. Hansen. See also delayed fish scaling; process fish scaling.

fishtail. An abrupt and ragged termination of a coalbed that is considered to have resulted from a washout during a slope instability. The material, less leathery and pebbly in appearance, is believed to have been separated parallel to its bedding, permitting wedges of sand and silt to be forced into the separations in such a manner that, after the coalification has taken place, a cross section shows splayed and ragged coal separated by some very thin muds. Fisk and Marshall, pp. 81-92. b. The act or process of rotationally drilling a borehole with a fishtail bit. Also called long tail. long. c. In oil well, the excess trailing end of a forging. It is often used, before being trimmed off, as a tong hold for a subsequent operation. A.S.M. Gloss.

fishtail bit. A rotary bit used to drill soft formations. The blade is flattened and divided, the divided ends curving away from the direction of rotation. It resembles a fishtail. A.G.I. Also called drag bit.

fishtail bolt. Anchor bolt having a split tail, cast into concrete or bedded in masonry. Hansen. See also A-structure. Skow.

fishtail structure. A coal seam structure sometimes observed along the fringes of a washout. It was probably produced by the water forcing open layers of the coal mass and the injection of fine sand or silt into the splayed partings—the veins of coal branching out like a fishtail. Nelson.

fisophile. a. Capable of being split, as schist, slate, and shale. See also fisilosity. Fay. b. A synonym for fisilsile. Fisilosity is used more in England and in Canada than in the United States. N.R.C.-A.S.A. N1.1-1957.

fossil. Bedding which consists of laminae less than 2 millimeters in thickness. A.G.I.

fissile material. See fissonable material. L.O.L.

fissile rock. A rock which splits into thin layers, no matter to what cause that splitting is due. Also slate. Nelson.

fissility. The quality of being fissile. Webster 3d. b. The property of rocks characterized by separation into parallel laminae, as slate, schist, etc. Webster 2d. c. The property of splitting easily along closely spaced parallel planes. A.G.I.

fission. a. The splitting of an atomic nucleus (as by bombardment with neutrons) especially into approximately equal parts, resulting in a great quantity of enormous quantities of energy when certain heavy elements, such as uranium and plutonium, are split. Also called nuclear fission. Conversed with fusion. Webster 3d. b. The splitting of an atomic nucleus into at least two parts of comparable size, accompanied by the ejection of two or three neutrons and occasionally other particles. A.G.I.

fissionable. Capable of undergoing fission, usually by the action of neutrons, but also of protons, deuterons, alpha particles, electrons, and gamma radiation. A.G.I.

fissional material. Any material readily fissioned by slow neutrons; for example, uranium 235 and plutonium 239. L.O.L.

fission-product poisoning. The absorption or capture of neutrons by fission products in a reactor, decreasing its reactivity. L.O.L.

fission products. The nuclides produced by the fission of an actinide element nuclide, such as uranium 235 or plutonium 239. L.O.L.

Thirty-five fission-product elements from zine through gadolinium have been identified from slow neutron fission. N.R.C.-A.S.A. N1.1-1957. They are of medium atomic weight, and almost all are radioactive; for example, strontium 90 and cesium 137.

fission yield. The quantity of energy released by fission in a nuclear explosion as distinguishable from that released by fusion. L.O.L.

fitsile. The sound which is heard in a coal mine when the floor is rising because of a sudden release of air. Nelson.

fissure. a. An extensive crack, break, or fracture in the rocks. A mere joint or crack persisting only for a few inches or a few feet is not usually termed a fissure by geologists or miners, although in a strict physical sense it is one, or crusts, filled with well-defined boundaries, very slight evidence of one, within such boundaries is sufficient to prove the existence of a lode. Such boundaries constitute the sides of a fissure. See also vein; lode; fissure vein. Fay. b. A high, narrow, usually straight passageway in a cave. A.G.I.

fissure cave. A cave developed along a fissure. Schliererdecker.

fissured. Some rocks are so fissured for fractured. A.G.I.

fissured clay. A clay such as London clay, having a network of joints which open in dry weather. See also fissure. Fay.

fissure eruption. See eruption, volcanic. A.G.I.

fissure system. A group of fissures having the same age and approximately parallel orientation, produced by slow movement of a magma and precipitated therein from aqueous mineral matter different from the walls and precipitated therein from aqueous solution, or introduced by sublimation or precipitation. A.G.I.

fissure vein. a. A clef or crack in the rock material of the earth's crust. See also fissure clay. A.N.S.A. N1.1-1957. b. A mineral mass, tabular in form, as a whole, although frequently irregular in detail, occupying or accompanying a fracture or a set of fractures in the enclosing rock. This mineral mass has been formed later than the country rock, either through the filling of open spaces along the latter or through chemical alteration of the adjoining rock. Fay. c. A fracture in the earth's crust filled with mineral. Fay. d. A fissure vein or lode may have in addition to the clear fissure filling of mineral a considerable amount of decomposed wall rock, clay, etc. See also fissure; lode; vein. Fay.

fit. a. The amount of clearance or interference between mating parts is called actual fit. Fit is the preferable term for the amount of clearance or interference which may result from the specified limits on the dimensions (limits of size) of the shaft and hole. ASA B4.1-1955, Preferred Limits and Fits for Cylinderical Parts, standardizes limits of size for 40 classes and sizes of fits each with a definite range of clearance or interference as a result of the limits on size of the element and shaft. The standard gives 9 classes of running and sliding fits for 21 size ranges, 11 classes of clearance fits, 9 classes of transition fits, 11 classes of transitional fits, and 9 classes of interference fits.
fits for 13 size ranges, 2 classes of interference locational fits for 21 size ranges, and 32 interference shrink-fits for 40 size ranges. *ASM Gloss,* b. The adjustment of a glaze to a clay or to an already fired clay body. *ASCG.* See also glaze fit.

fitter. a. Broadly, a skilled man who can re-assemble and repair machinery, an engineer. In coal mining, there is at least one fitter employed underground on each shift. His main duties are the maintenance and repair of machinery, such as coal cutters, conveyors, pumps, haulages, etc. *See also mechanic.* *Nelson.* b. Eng. The person who sells coal at the shipping port. A coal factor. See also factor.

fitting. a. Scot. The whole machinery, plant, and work of a factory. *See also plant.* *Fay.*

fitting. b. Anything forming part of machinery, plant, or work of a factory. *See also plant.* *Fay.*

fittings. a. Auxiliary and accessory tools and equipment necessary for the job. *See also tools.* *Fay.*

fitters. a. Skilled mechanics who put machinery in operation. b. Eng. The people who sell coal at the shipping port. *See also factor.*

fitch. Said of a drill bit which has become stuck in a hole while running. *See also stuck.*

fitting. a. Scot. The whole machinery, plant, and work of a factory. *See also plant.* *Fay.*

fitting. b. Anything forming part of machinery, plant, or work of a factory. *See also plant.* *Fay.*

fitting block. A building unit that may be fastened to the end support of a beam to fix it securely. *ASM Gloss.*

fixed capital. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed carbon. a. In the case of coal, coke, and other bituminous minerals, the solid residue other than ash, obtained by destructive distillation, determined by definite prescribed methods. *ASTM* 1912-1960 b. A calculated figure obtained by subtracting from 100, the sum of the percentages of volatile matter, and ash. *B.S.* 3923, 1960. c. That part of the carbon which remains when coal is heated in a closed vessel until the volatile matter is driven off. It is the nonvolatile matter minus the ash. *Fay.*

fixed clip. A clip permanently affixed to the finished bit of a shaft. The cage shoes travel along the bit while the bit itself travels along the fixed clip. *Nelson.*

fixation. a. The act or process by which a fluid or a gas becomes or is rendered firm or stable in consistency, and evaporation or volatilization is prevented. Specifically, that process by which a gaseous body becomes fixed or solid on uniting with a solid body, as the fixation of oxygen or the fixation of nitrogen. *Fay.* b. A state of nonvolatility or the process of entailing such a state; as, the fixation of a metal or the fixation of nitrogen in a nitrate by bacteria. *Standard,* 1964, c.

A process by which dye colors are made permanent. *Standard,* 1964.

fix-bitumen. See bitumen. *ASM Gloss.*

fixed. a. As applied to all authigenic, nonfluid bitumens; divided into stable probitumens and metabolitumens. *Tomkaitt,* 1952.

fixed. a. As applied to all authigenic, nonfluid bitumens; divided into stable probitumens and metabolitumens. *Tomkaitt,* 1952.

fixed: clamped; built-in; encastré. A condition of support at the ends of a beam or column, or at the edges of a plate, which prevents the ends or edges from rotating in the plane of bending. It does not imply 'longitudinal constraint. *Compa,* held *Fay.*

fixed ash. a. The fine mud or silt washed in by water during the formation of the coal seam. *Maize,* 2, p. 644. b. See also inherent ash.

fixed capital. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed carbon. a. In the case of coal, coke, and other bituminous minerals, the solid residue other than ash, obtained by destructive distillation, determined by definite prescribed methods. *ASTM* 1912-1960 b. A calculated figure obtained by subtracting from 100, the sum of the percentages of volatile matter, and ash. *B.S.* 3923, 1960. c. That part of the carbon which remains when coal is heated in a closed vessel until the volatile matter is driven off. It is the nonvolatile matter minus the ash. *Fay.*

fixed clip. A clip permanently affixed to the finished bit of a shaft. The cage shoes travel along the bit while the bit itself travels along the fixed clip. *Nelson.*

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed capital. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed carbon. a. In the case of coal, coke, and other bituminous minerals, the solid residue other than ash, obtained by destructive distillation, determined by definite prescribed methods. *ASTM* 1912-1960 b. A calculated figure obtained by subtracting from 100, the sum of the percentages of volatile matter, and ash. *B.S.* 3923, 1960. c. That part of the carbon which remains when coal is heated in a closed vessel until the volatile matter is driven off. It is the nonvolatile matter minus the ash. *Fay.*

fixed clip. A clip permanently affixed to the finished bit of a shaft. The cage shoes travel along the bit while the bit itself travels along the fixed clip. *Nelson.*

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed carbon. a. In the case of coal, coke, and other bituminous minerals, the solid residue other than ash, obtained by destructive distillation, determined by definite prescribed methods. *ASTM* 1912-1960 b. A calculated figure obtained by subtracting from 100, the sum of the percentages of volatile matter, and ash. *B.S.* 3923, 1960. c. That part of the carbon which remains when coal is heated in a closed vessel until the volatile matter is driven off. It is the nonvolatile matter minus the ash. *Fay.*

fixed clip. A clip permanently affixed to the finished bit of a shaft. The cage shoes travel along the bit while the bit itself travels along the fixed clip. *Nelson.*

fixed central. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.

fixed capital. That sunk in installation and works which is virtually unrealizable apart from its use in producing mineral which can be sold. Includes earthworks, shafts and tunnels, hydroelectric schemes of purely local value specific to the mine. *Pryor,* 3.
flabellate. Resembling a fan in shape.

flag. a. Sandstone or sandy limestone rocks, usually more or less micaceous, which are fissile along the bedding planes, splitting into slabs. Sometimes marnified slates because used for roofing rather than paving. Arkell. b. A track signal or target. Zern. c. Chert. A bed of hard marl overlying the top stratum of a salt bed. Fay. d. A thin slab of stone. See also flagstone. Fay.

flajolotite. A discredited term equal to flake mica. Finely divided mica recovered from copper. Very thin scales of native copper, which may be alloyed with bismuth. A.I.S.I., 1963.

flagmoyant structure. The optical continuity of the crystals or grains as disturbed by a divergent structure cause by slight differences in orientation. A.G.I.

flame. a. Burning mixture of a combustible gas (or vapor) and air. Solid fuels burn with a glow, but with little flame. Flames are normally hot, but under some conditions are cold. Principal types of flame are: luminous, nonluminous, long (lazy) flames, and short flames. Francis, 1963, v. 2, p. 436.

flame coloration. See flame reaction. Fay.

flame coloring. Another name for jet piercing. A.I.M.E., p. 326.

flame gun. A large blowtorch using kerosene as its fuel. It has lost one or more cars, and all motormen are warned. Also called flagman. D.O.T. 1.

flagging, a. In geophysical work, the use by surveyors of flags of cloth, paper, or plastic to mark instrumental or shot locations. A.G.I. b. A pavement of large stone slabs. A.G.I. Supp. c. Slabs of slate used for paving porches, patios, terraces, walkways, and for stepping stones. A.I.M.E., p. 797.

flaming a squib. Uncoiling the end of the paper which is imprisoned with sulfur or some other combustible substance. Flagging the squib permits more time to elapse before the ignition of the unrolled paper and the firing of the charge of powder. Fay.

flagstone. The flagging of being split into parallel-faced slabs thicker than slates. Fay. b. Strata from 10 to 100 millimeters thick. A.G.I.

flags. Thin-bedded hard sandstones that can be used for flagstones. A.G.I. Supp.

flake. A rock that splits readily into slabs suitable for flagging. Fay.

flakes. Sandstone which splits along the grain. C.T.D.

flake. A hammer hinged to an axle so that it can be used to break or crush material. Nichols.

flake. A flat fragment of a rock or a mineral with maximum dimension of less than 4 millimeters. A.G.I.

flake. Finely divided mica recovered from mica and sericite schist and as a byproduct of feldspar and kaolin beneficiated. See also mica. Skou.

flake. Powdered, in powder metallurgy, flat or scalelike particles, relatively thin. A.S.M. Glass.

flake. A very fine powder of anthracite coal, used for coating limestones. It is heated by a mechanical means to reduce the water. The water following immediately behind, may be present in the surrounding atmosphere. A.G.I. Supp.

flake. A line which is generally surrounded by a cylindrical covering of wire gauge. An explosive or flammable mixture of gas entering the tank will be ignited by the flame, but the flame of combustion will not pass through the cold gauge and ignite the gas outside the tank. The illuminating power of these lamps is slightly more than one candlepower, and they will burn for an entire shift with one filling. Each lamp is generally provided with a relighting device, and with a magnetic lock to prevent the lamp being opened in the mine. The chief disadvantage of this lamp is its low illuminating power, Fay; Lewis, pp. 7, 8, 19. See also safety lamp; electric cap lamp.

flame. a. The fuel which is so protected that it will not immediately ignite fire品牌. The original flame safety lamp was developed by Sir Humphrey Davy in 1815 and there are several varieties. The flame is generally surrounded by a magnesium sleeve, and when its compounds impart a nonluminous flame (as yellow from sodium or green from copper), it will withstand, without injury, any explosion of the prescribed flammable gas which may occur within it under practical conditions of operation. Inside the flame, the apparatus (and recognized loads, if any, associated therewith), and will prevent the transmission of flame such as that emitted by the lamp, but the flame of combustion will not pass through the cold gauge and ignite the gas outside the tank. The illuminating power of these lamps is slightly more than one candlepower, and they will burn for an entire shift with one filling. Each lamp is generally provided with a relighting device, and with a magnetic lock to prevent the lamp being opened in the mine. The chief disadvantage of this lamp is its low illuminating power, Fay; Lewis, pp. 7, 8, 19. See also safety lamp; electric cap lamp.
flame spraying

material can be fed into the flame either as a powder or as a continuous rod. This is done to provide a thin protective coating, usually to prevent oxidation, as in the flame spraying of aluminum on to wrought iron. 

flame straightening. Correcting distortion in metal structures by localized heating with a gas flame. 

flame structure. a. Load casting showing some evidence of some horizontal slp. A.G.I. Supp. b. Load cast in which part of an underlying layer has been squeezed irregularly upward into the overlying layer. A.G.I. Supp. c. The mud plumes separating the downward bulging load pockets or load casts of sand at sand-shale interface. Also described as coal beds in imples. Also called antidune; load wave. 

flame test. The use of the characteristic color imparted to a flame to detect the presence of certain elements. A.G.I. 

flame trap. A device, consisting of a pack of flaming coal. Coal containing from 70 to 75 percent carbon and yielding from 50 to 65 percent powdery coke. It burns with a steady safety flame in coal mines and in which flammable gases are present. B.S. 3618, 1963, sec. 4. 

flambeau. a. A hole bored ahead of a workpiece. Also described as streaked-out ripple or load casts of sand at sand-shale interface. Also referred to as shoulders. Ham. 

flank. a. Another term for a limb. Also synonymous with leg; shank; branch; slope. B.S. 3618, 1963, sec. 4. See also limb. b. End surface of a tool that is adjacent to the cutting edge and below it when the tool is in a horizontal position as for turning. A.G.I. 

flank hole. a. A hole bored ahead of a working place, when approaching old workings. C.T.D. b. A borehole to detect water, gas, or other danger, driven from the side of an underground excavation in a line not parallel with the center line of the excavation. A.G.I. 

flaming coal. Coal containing from 70 to 75 percent carbon and yielding from 50 to 65 percent powdery coke. It burns with a steady safety flame in coal mines and in which flammable gases are present. B.S. 3618, 1963, sec. 4. 

flammable mixture of gases. A mixture which, when once ignited, will allow flame to be self-propagated throughout the mixture, independent of and away from the source of ignition. In coal mines, it only when the methane and air are mixed in certain definite proportions that the mixture is flammable and explosive, and will allow flame to spread in all directions. See also limits of flammability. Nelson. 

flammable gas. A mixture of gases. A mixture which, when once ignited, will allow flame to be self-propagated throughout the mixture, independent of and away from the source of ignition. In coal mines, it only when the methane and air are mixed in certain definite proportions that the mixture is flammable and explosive, and will allow flame to spread in all directions. See also limits of flammability. Nelson. 

flammable mixtures of gases. A mixture which, when once ignited, will allow flame to be self-propagated throughout the mixture, independent of and away from the source of ignition. In coal mines, it only when the methane and air are mixed in certain definite proportions that the mixture is flammable and explosive, and will allow flame to spread in all directions. See also limits of flammability. Nelson. 

flammable nature. The term moraine originally defined an accumulation of ice-borne rock rubble, stopped at the terminus or along the sides, of an Alpine glacier. The term lateral moraine has established usage, as applied to a mountain glacier, and it should not be applied to the side- long or flanking moraines left by lobes or tongue-like projections of an ice sheet. An appropriate term is flanking moraines. A.G.I. 

flank production. Usually applied to the oil obtained around the periphery or flank of a geologic feature, as from the dragged-up and severed reservoirs on the flanks of a salt plug, A.G.I. 

flank. a. A gravity-collapse structure. A bed that has slipped to the side an anticline and bent over so that it is now upsidedown. A.G.I. b. Same as clack, a. Long. 

flank development. a. A structure developed in granitoid rocks and especially in gabbros by dynamic metamorphism. Small lenses of granular structure are set in a scaly aggregate that fills the interstices between them. It appears to have been caused by shearing that has crushed some portions more than others, and that has developed
flashe structure

a kind of rude flow structure. Fay, b. A structure developed in gneisses, gabbros, etc., by dynamic metamorphism. Small lenses of granular material are separated by streaks of finely crystalline, foliated material, usually aggregates of parallel scales in very or in bent lines. A.G.I. c. Lenticles of fine sand or silt, commonly aligned and usually crossbedded, which superficially resembles the flaser structure of some mylonites and other sheared metamorphic rocks. Fittjohn.

flash. a. Ches. A subsidence of the surface due to the working of rock salt and pumping of brine. Fay, b. In forging, the excess metal forced between the upper and lower dies in the forging press. Dodd,c. By forging, the fin of metal which results from leakage between the mating die surfaces. ASM Glass, d. In resistance butt welding, a fin formed perpendicular to the direction of applied pressure. ASM Glass, e. The formation, by suction fusion or vitrification, of a film of different texture and/or color on clay products or on glassware; in the firing of clay products, flashing may occur unintentionally; it is then a defect because of its uncontrolled nature. Bricks that are intentionally flashed make possible pleasing architectural effects. Flashed glassware is made by fusing a thin film of a different glass (usually colored) on the outside surface of the ware. Dodd, f. In structural brickwork, a sheet of impervious material or a coating with which the flashing might otherwise penetrate. Dodd, g. A fault in glassware. See also fin, b. Dodd, h. The fin of excess body formed during the plastic pressing of ceramic ware, for example, electrical porcelain; it is remembered by an auxiliary process. Dodd. i. Alternative name for casting spot. See also casting spot. Dodd.

flashed. a. Flashing or a sheet of impervious material, such as asphalt, firebrick, or sheet to produce a butt joint. After the current has been switched on, the two parts are brought together at a predetermined rate so that the continuous arcing occurs between the two parts to be joined. This arcing produces violent explosion of small particles of metal (flashing) and a positive pressure in the weld area excludes air, minimizing oxidation. When sufficient heat has been developed by flashing, the parts are pressed together so that all fused and oxidized material is extruded from the weld. Ham.

flashing. a. The minimum temperature at which a liquid is released by a solid or liquid to form a flammable vapor-air mixture at atmospheric pressure. I.C., 8137, 1963, p. 76, b. The temperature to which an oil must be heated in a specified instrument for sufficient vapor to be given off to form a flammable mixture with air under the prescribed conditions. Francis, 1965, v. 1, p. 271. c. The temperature at which petroleum, being heated, begins to evolve vapor in such quantity that on the application of a small flame a momentary flash occurs due to the ignition of the vapor. Also called flashing point. Fay.

flash manga. A very thin final electrodeposited film of metal. ASM Glass.

flash wall. A continuous wall refractory brick, usually built inside the kiln in front of the fireboxes; its purpose is to direct the hot gases towards the roof of the kiln and to prevent the impingement directly on the setting. Dodd.

flash welding. A resistance butt-welding process in which the weld is produced over the entire abutting surface by pressure and heat, the heat being produced by electric arcs between the members being welded. ASM Glass.

flash. a. A tinned vessel in which a miner carries oil for his lamp, or beverage for his lunch. Fay, b. In foundry work, a molding box which holds the sand into which molten metal is poured. Top half or part is its cope, bottom in drag, fused with a glass opal. Pryor, 3. c. An iron bottle in which quicksilver is sent to market. It contains 97% pounds. Fay, d. A necked vessel for holding liquids; especially a broad, flattened vessel of metal or sometimes glass. Webster 3d.

flaring. A German term for a texture found in gneisses, gabbros, etc., and caused by dynamic metamorphism. Short layers or small lenses of granular texture alternate with still thinner (flaser) layers composed of aggregates of parallel scales in wavy or bent lines. Stokes and Varnes, 1955.

flatt. a. Eng. In the Derbyshire coalfield, a district or set of workings separated by faults, old workings, or barriers of solid coal. Fay, b. N. of Eng. A siding or station underground; a parting. Fay, c. In Arkansas, a railroad car of the gondola type for shipping coal. Fay, d. In mine timbering, horizontal crosspiece or cap used in roof support. Pryor, 3. e. Of a mining lode, one less than 15° from horizontal in its dip. Pryor, 3. f. A flat coal seam. Korson, g. N. of Eng. In single place workings, the area served by the full tubs. SMRB, Paper No. 61. i. Eng. The area of working places under the supervision of a deputyorman. SMRB, Paper No. 61. j. Eng. The area of working places where coal is brought to the same passby. SMRB, Paper No. 61. k. Eng. The area of working places under the supervision of a deputyorman. SMRB, Paper No. 61.

flat-back arch. a. An arch in which both outer and inner surfaces are horizontal planes. H.W. b. In furnance construction, a flat structure spanning an opening, and building up by abutments at its extremities; the arch is formed by a number of special tapered bricks, and the brick lining is held in place by their keying action. Also called a jack arch. H.W. See also suspended arch.

fast-back arch. a. 9- by 6-inch special arch brick, one large face of which makes an
flat-back arch
angle other than 90° with the edge faces.

flat-back stope. An overhand stope method in which the ore is broken in slices parallel to the levels. Also called longwall stope. Fay.

flat belt conveyor. A type of belt conveyor in which the carrying run of the conveyor belt is supported by flat belt idlers or by a flat surface. ASA MH4.1-1958.

flat belt type. A flat-bottomed belt conveyor consisting of one or more rolling supports the belt in a flat position. ASA MH4.1-1958.

flat bit. A dull diamond or percussive-type bit. Long.

flat bottomed crown. See flat-face bit. Long.

flat course. A course of brick laid in a wall parallel with the floor. Fay.

flat cut. A manner of placing the boreholes, or at a low angle of inclination. Fay.

flat coal. Coal that is flat and hence not suitable to trim the part. ASM Gloss.

flat drill. A rotary end-cutting tool constructed to span in two directions. Mansfield.

flat drawn. Sheet glass made by the vertical drawing process. Dodd.

flat drum. A drum with notched edges on shells. The slide is cam driven and causes a brief dwell at the bottom of the stroke, at which time the die, sometimes called a shimmie die, oscillates to trim the part. ASM Gloss.

flat-end. Thin cleavages from the faces of a diamond crystal. Bureau of Mines Staff.

flat-face bit. Long.

flat-face cut. A cut made in a flat position. Fay.

flat-face cutting edge. Compare with a cutting edge. Fay.

flat-face point. A cutting point. Fay.

flat fin. A condition wherein the ten minute girth is approximately equal to the initial girth. Brandy, 1.

flat-fitting. A fitting, usually with a II-shaped cross section, used to provide a smooth floor for shoveling the broken rock into tubs. Nelson.

flat-floor. Said of deposits and coal seams which lie at a moderate inclination. Fay.

flat-floor type of hogback ridge. Often occurring in the lead and zinc district the term is applied to some fragmented dolomite. Fay.

flat feet. The flexible part of the sole of a flat shoe. Fay.

flat-fitting mill. A rolling mill for breaking up and flattening, a. A man who uncouples empty tubs or trucks and couples on full tubs, to make up sets at the inbye siding or putter's flat. T.C.T. b. A kind of hammer used by blacksmiths. Brandy, 1.

flat glass. A general term covering sheet glass, flat glass, plate glass, and various forms of rolled glass.

flat gravel. The gravel obtained as a by-product from the mining of traprock or whin. Fay.

flat grade. A section of horizontal or inclined connecting rods, running up upon rollers, or supported at their joints by rocking arms, to convey water to a steam engine or water pipe to pump rods at a distance. Fay.

flat-grit. A short-term deposit not associated with other ore bodies. Fay.

flat hole. A borehole following a nearly horizontal course. Fay.

flat idler. A flat idler that supports the belt in a flat position. NEMA MB1-1956.

flat iron. A triangular-shaped, sloping-mesa type of hogback ridge, often occurring in series on the flank of a mountain. A.G.I.

flat jack. A hollow steel cushion formed of two almost flat discs, welded around the edge, which is inflated under controlled pressure. Jacks of this type were used by Freymint in the construction of the Flou-gastet bridge. See also jack, Ham.

flat joint. In igneous rocks, a joint dipping at 45° or less and randomly oriented with respect to other joints. G.S.A. Mem. 5, 1937, p. 39.

flat joint point. A point in which the mining face is parallel with the surface and lined with the point of the towel. Standard, 1964.

flat lead. Same as craneman, a. Fay.

flat lode. A lode which varies in inclination from the horizontal to about 15°. Fay.

flat-lying. Said of deposits and coal seams with a dip up to 5°. Stoes, v. 1, p. 56.

flat-laying gravity fault. See plane of stretching, A.G.I.

flat-laying joints. Joints occurring in some igneous rocks, such joints is somewhat uncertain. Lewis, p. 603.

flatman. N. of Eng. One who looks (couples) the cars together at the flats, or levels. See also flat, b. Fay.

flatness. a. A measure of the shape of a pebble given by the ratio of the long and the intermediate diameters of the pebble divided by the short diameter. A.G.I. b. A measure of the shape of a pebble given by the ratio of the diameter of curvature of the most convex portion of the flattest face to the mean radius of the pebble. A.G.I.

flat nose. See flat-face bit. Long.

flat profile. A cylindrical tool with a valve at the bottom, for boring through soft clay. Fay.

flat of ore. An horizontal ore deposit occupying a bedding plane in the rock. See also flat, Fay.

flat positioning. Welding from the upper side, the face of the weld being horizontal. Also called downhand welding. ASM Gloss.

flat rods. A series of horizontal or inclined connecting rods, running up upon rollers, or supported at their joints by rocking arms, to convey water to a steam engine or water pipe to pump rods at a distance. Fay.

flat roofing. A steel rope made up of a number of loosely twisted four-strand ropes placed side by side, the lay of the adjacent strands being in opposite directions to secure uniformity in wear and to prevent twisting during winding. The strands are sewn together with a steel wire. For one period, flat ropes were widely used but round strand ropes are now preferred. Nation.

flats. a. Eng. Subterranean beds or sheets of traprock or whin. Fay. b. Eng. Tracts of coal seams which lie at a moderate inclination in districts containing highly inclined beds, North Staffordshire coalfield. See also flat, Fay. c. Narrow decomposed parts of limestones that are mineralized. Fay. d. Flattens. Zern. e. Thin, flat pieces of diamond crystal. Hess. f. Small flat areas on diamonds inset in a bit crown caused by abrasion during contact with the rock drilled. Long. g. Synonym for macules. Long. See also stria.

flats and pitches. a. In the Upper Mississippi lead and zinc district the term is applied to the nearly horizontal solution openings in the Galena Formation (Flats) and the interconnecting inclined joints or fractures (pitches) in which the ore has been deposited. A.G.I. b. Applied to certain ore bodies of characteristic form that occur in regions of bedded sedimentary rocks. Such ore bodies have a steplike form with the flats following nearly horizontal bedding planes and the pitches following steeply dipping fractures or fractures. Stokes and Varnes, 1955.

flat sheet. a. An iron sheet, laid at rail junctions, crossings, and ends underground, on which tubs are placed and which can be turned. C.T.D. b. A steel plate laid on the floor at the face of a tunnel or heading before blasting for shoveling the broken rock into tubs. Nelson. c. Synonym for blanket deposit. A.G.I. Supp.

flat slab. Reinforced concrete slab designed to give a greater wearing surface than ordinary round ropes and yet have about the same strength and flexibility. They have roughly some 50 percent more wearing surface than ordinary round ropes, owing to the Lang lay of wires. They are made in several forms. Lewis, p. 249.

flattened-strand triangular rope. A wire rope of the flattened-strand construction in which the strands are triangular in shape. Zern.

flattener. One who takes a cylindrical piece of glass like a wide tube, cracked longitudinally, and, after heating it to softening in a furnace, flattens it out to form a sheet. An old process used for making special types of sheet. C.T.D.

flattening-furnace. A furnace in which split cylinder glass is flattened out into sheets. Standard, 1964.

flattening, plane of. In structural petrology, the planes of cleavage or grains or fragments perpendicular to the greatest principal stress axis. The plane of schistosity is called a plane of flattening, plane of.

flattening test. A quality test for tubing in which a specimen is flattened between parallel plates that are closed to a specified height. ASM Gloss.

flatter. a. A man who uncouples empty tubs or trucks and couples on full tubs, to make up sets at the inbye siding or putter's flat. C.T.D. b. A kind of hammer used by blacksmiths. Brandy, 1.

flattening fish. Same as craneman, a. Fay.

flattened ripple mark. Ripples with flat, wide crests separated by narrow troughs. Pettijohn.

flattened-tile pressman. One who tends a battery of automatic presses that form flat
flat-wall-tile pressman

wall tile from tempered clay. Also called tile-press tender, automatic. D.O.T. 1.

flatware. Plates, saucers, dishes, etc. Compare hollowware. Dodd.

flatware presser. One who presses clay by flatware. Plates, saucers, dishes, etc. Also called wood presser. D.O.T. 1.

flatwork finisher. One who smooths plates, dishes, and other ware by setting piece on whirler which revolves it, and holding knife against it to remove rough marks. D.O.T. 1.

flatworking. Scot. A working of moderate inclination. See also flat 1, flat logo.

fly. a. A crack or inclusion in a diamond; also, internal twinning in a diamond. Long. b. A steep, transverse fault along which a dike is cut oblique to the strike of the fault. That is, a steep, transverse strike-slip fault. Compare tear fault, slip fault. A.G.I. c. In dry process enameling, a defect of the ware that is cause for rejection. ASTM C266-65.

flow fault. A rare type of fault, described by Sevier, in which the displacement has been parallel to the strike of the rocks, the dip is high and varying from one side to the other in the same fault, and the relative movement is practically horizontal and parallel with the strike of the fault. See also anticline.

flawless. Used to describe a diamond which is free from all internal and external blemishes or faults of every description under skilled observation in normal, natural, or artificial light with a 10-power lens, corrected for chromatic and spherical aberration. Hess.

flaxseed ore. An oolitic iron ore in which the mineral magnetite is assumed to have been transformed into a brown incrustation, the size of a pea, which is the chief ore deposit of iron in the northeastern United States. Fay.

flawless. Used to describe a diamond which is free from all internal and external blemishes or faults of every description under skilled observation in normal, natural, or artificial light with a 10-power lens, corrected for chromatic and spherical aberration. Hess.

flexible ventilation ducting. An adjustable pressure-control cam made of spring steel strips used to vary the pressure while turning, bowed, or twisted without breaking. Webster 3d.

flexible cam. A self-contained breathing apparatus, which is used by petroleum drillers, and miners, the angle between the two ends of a hoisting rope as a base and the headframe pulley as the apex. Fay.

flexile. a. As applied to the characteristic of tenacity in minerals, it means that the mineral will not bend without breaking, and will remain bent, as tale. Fay. b. The property of bending, as shown in some minerals by experimenting upon their plates or laminae. A flexible mineral remains bent after the pressure is removed, as in tale, selenite, etc. Nelson.

flexible. a. As applied to the characteristic of tenacity in minerals, it means that the mineral will not bend without breaking, and will remain bent, as tale. Fay. b. The property of bending, as shown in some minerals by experimenting upon their plates or laminae. A flexible mineral remains bent after the pressure is removed, as in tale, selenite, etc. Nelson.

flexible coupling. A coupled to connect shafts of adjacent rotating machines where flexibility is desirable, as in making a connection between a motor and a centrifugal pump. A rigid coupling, or a universal joint, permits of being turned, bowed, or twisted without breaking. Webster 3d.

flexible guides. See winding guides. Sinclair, V, p. 46.

flexible joint. Any joint between two pipes that permits one or more turns without disturbing the other pipe. Fay.

flexible mineral. A mineral which yields to the bending stress without breaking, as anthracite, asbestos, Stites and Barnes, 1955, p. 149.

flexible pavement. A waterproof top layer for a road or aircraft runway made of bituminous material which is assumed to have no tensile strength. Hum.

flexible silver ore. Same as stembergite. Fay.

flexible-type carrying idler. Consists of one or more idler rolls arranged to form a continuous trough. This may be accomplished by mounting a single roll on a flexible shaft or by linking a series of rolls with individual rigid shafts. NEMA MB1-1961.

flexible ventilation ducting. Flexible tubes made from fabrics coated with rubber or polyvinyl-chloride (P.V.C.) for auxiliary ventilation. The ducting is made in lengths of 25, 50, and 100 feet, every length having a spring steel wire coupling ring sewn or welded into each end, and can be supported from a wire running along the roof. The advantages of flexible ducting over
flexible ventilation ducting

metal tubes are: (1) can be stored in a much smaller space; (2) less weight; (3) can conform to moderate bends much easier than metal pipes, and (4) cost of fixing is only a fraction of that incurred with metal pipes. See also ventilation tubing.

flexible wall. Reinforced concrete retaining wall having a stem designed as a cantilever, as a beam or as both. Ham.

flexing. The bending of the conveyor belt which takes place as it wraps around the pulleys. The ply nearest the face of the pulley is under the minimum stress and the ply farthest from the face is under the maximum stress. Flexing stresses increase with a decrease in pulley diameters. ASA MH4.1-1958.

flexok. A patented circle brick, with book ends, used in domestic furnaces, cupolas, and acid tank linings. Bureau of Mines Staff.

flexural center. Shear center. With reference to a beam, the flexural center of any section is that point in the plane of the section through which a transverse load, applied so that section, must act if bending deflection only is to be produced, with no twist of the section. Compare torsional center. Stoney.

flexural modulus of elasticity. The modulus of elasticity of a material in the flexural test. It may be calculated from a load-deflection diagram, as follows:

\[ E_p = \frac{P}{b^2} \left( \frac{L}{d^2} \right) \]

where \( E_p \) = flexural modulus of elasticity, psi

\( P \) = load of initial straightline portion, pound/inch

\( L \) = span, inch

\( d \) = specimen width, inch.

flexural rigidity. Second moment of the section of a beam multiplied by Young's modulus. Ham.

flexural strength. A measurement of the resistance of rocks in which the bending of layers dominates over the slip between them. G.S.A. Mem., 6, 1938, p. 152.

flexural strength. See modulus of rupture; transverse strength.

flexure correction. A correction applied to pendulous observations of gravity. The vibrating pendulum produces oscillations of the receiver case, of the pillar, and of the bob. Rather complex coupled vibration phenomena arise and the period of the pendulum itself changes. Numerous means have been proposed to correct for this influence or to eliminate it. Since the correction is of the order of 10- to 40 x 10^{-6} in solid rock or cement and may increase to as much as 5 x 10^{-5} sec. on sandy ground, it must be determined accurately. AGI.

flexure fold. See fold, flexure. AGI.

flexure folding. See folding.

flexure-slip folding. a. Folds in which the individual strata not only bend but also slip past one another. Billings, 1954, pp. 89-90. b. Movement in a layered rock in which competent bands are folded but slipping occurs along deepened s-planes in which the most common type of deformation. G.I. Supp.

flicker photometer. A photometer consisting of a plater of Paris disk with the edges bevelled. The disk is rotated by clockwork inside a box placed on the photometer bench between the lamps under test. The eye sees the two sides of the disk in rapid succession and if one is more brightly lit than the other, a flickering effect is produced. By altering the position of the instrument until this flickering disappears, the point where the illumination on the two sides of the disk is equal may be found with considerable accuracy. Mason, n. i., P. 1.

flight conveyor. A type of conveyor comprising one or more endless propelling media, such as chain, to which flights or attached bands of material is pushed by the flights. ASA MH4.1-1958.

flight line. In an aeromagnetic survey or in other airborne geophysical surveys, a line drawn on a map or a chart to represent the course over which an airplane has been flown, or the course over which it is being flown. AGI.

flight loader. Lambton flight. A standard coal cutter which has been modified to enable it to load prepared coal on to a face conveyor. The flights are short plates or boxes fitted into special holders in the ordinary cutter chain. The flights are articulated and held in position by loose pins to allow easy attachment and detachment. When loading the jib is angled forward 10 to 30 degrees and the flights push the coal along the floor on to the conveyor. For jib 4 to 6 inches long, four flights are commonly used. Face lengths up to 200 yards can be loaded by this method. Degradation of coal is high. Nelson.

flight pattern. In an aeromagnetic survey or in other airborne geophysical surveys, the planned flying route used. AGI.

flint clay. a. A flintlike clay which when ground develops no plasticity. AGI. d. A hard refractory clay which is largely composed of well-crystallized kaolin which breaks with a conchoidal fracture, similar, flint, hence the name. Bureau of Mines Staff.

flint-enameded ware. Rockingham-type pottery with a glaze flecked in yellow, brown, and blue; patented at Bennington, Vermont. AGSd, 1963.

flint fire clay. A hard or flintlike fire clay occurring as an unstratified massive rock, practically devoid of natural plasticity and showing a conchoidal fracture. AGI. C71-64. See also flint clay.

flint glass. a. A glass in which lead and potash replaces a considerable part of the lime and soda of ordinary glass. This gives a softer, more fusible, more lustrous and brilliant glass with high dispersion and therefore of use as an optical glass. CCD 6d, 1961. b. A term used by the container industry for colorless glass. ASTM C162-66.

flint. A term sometimes applied to the body of a rock in which consists of natural clay to which no flint or quartz or other form of free silica has been added. Dodc.

flint mill. a. A device in which flints on a revolving wheel produce a shower of sparks incapable of igniting firedamp, and once used to light miners at work. See also steel mill. b. In pottery works, a mill in which flints are ground. Webster 2d. c. Floating instrument platform in use in the Pacific Ocean. Similar in design to seaplane launching platforms and is used as a base for oceanographic research. Flit is manned and can drift with currents. Hy.

flint optical glass. An optical glass with high dispersion and high index of refraction, usually forming the refracting elements of an optical system. Any optical glass possessing a Nu-value less than 50.0 or any optical glass with a Nu-value between 50.0 and 55.0 having a refractive index less than 1.60. ASTM C162-66.

flinty. An alternative name for stone ware. C.G.D.

flinty crush rock. A black flinty product of

440 flinty crush rock
floaty crush rock

dynamic metamorphism associated with mylonite, and representing a flitted or partly fused variety of mylonite. It is generally structureless, but occasionally shows traces of foliation or lineation. Buchite; bastite, mylonite; pseudobrookite; talc, talc schist; trap spherulite; gneiss; ultramylonite.

floaty slate. A common slate containing more stable state, and which undergoes a completely structureless, but occasionally shows traces of incipient crystallization. See also fritted gneiss; trap-shotten gneiss.

flip-flop. a. A trigger circuit which has one stable or quasistable state and one unstable state, and which undergoes a complete cycle of change in response to a single triggering excitation. NCB. b. A glass decanter with a thin base. Dodd.

flipping turn. System of pulleys incorporated in the return-side tracking of belt conveyor, which turns it through 180°, so that any adhering material do not come in contact with idler pulleys. Pryor, 3.

float. a. To move, dismantle, or re-erect conveyors. Sinclair, V, p. 386. b. N. Eng. Move or transport (applied to coal-cutting equipment. T.I.M.E.

filter. a. A trigger circuit which has one stable state, and which undergoes a complete structureless, but occasionally shows traces of incipient crystallization. See also flinty slate. NCB. b. Of glass so fine that they float on water. Fay. b. Of quartz sand grains more or less completely disseminated in limeslime. A.G.I. Supp. c. The total spreading of plaster, stucco, or cement work by means of a board called a float. Gripsn.

floating agent. As used in the vitreous enameling industry, this term is the equivalent of the English term suspending agent. See also suspending agent. Dodd.

floating cable. In seismic operations in water-covered areas, a cable connecting geophone recording devices which can be floated or submerged by means of air chambers as required for ship repairs. Ham.

floating control system. As used in flotation, a system in which the rate of change of the manipulated variable is a continuous function of the actuating signal. Puert. 3.

floating dock. An open-ended structure built up of small calcite rhombohedral slabs. Fay.

floating control system. As used in flotation, a system in which the rate of change of the manipulated variable is a continuous function of the actuating signal. Puert. 3.

floating harbor. A system of floating docks moored so as to give breakwater protection against wave action. Ham.

floating oil pan. Small pieces of gem opal, placed in glycerin in a transparent, drop-shaped or spherical glass container, for use principally as a drop on a neck ornament. Skipp.

floating pipe. A pipe placed on pontoons which are used for removing spoil from a suction dredger. Ham.

floating reef. Masses of displaced bedrock lying among alluvial detritus. See also float. Fay.

floating sand grain. An isolated sand grain, particularly in limestone, that is not in contact with other scattered sand grains. A.G.I. Supp.

floating strain. A buoyant pump suction end which draws its water from near to the surface of the free-water level and thus pumping almost clear water. A floating strainer may be used in dealing with masses of water other than in properly constructed sumps. Nelson.
float, a. A piece of sea ice, other than fast ice, from 10 meters in diameter to ice field size. Schiefferdecker. b. An area of ice other than fast ice, the limits of which are within sight, as distinct from an ice field. Also called a sea floe. A.G.I. c. A man of floating ice some 100 feet to 5 miles across, that is not fast to any shore, that was formed by the breaking up of the frozen surface of a large body of water. A.G.I. Supp. d. Loose ganister or other rock, accumulated at the base of a slope. Bureau of Mines Staff.

floeberg. a. The great stratified masses of salt ice that lie grounded along the shores of the Polar Sea. There are nothing more than fragments broken from the edges of the perennial floes. We called them floebergs, in order to distinguish them from, and yet express their kinship to, icebergs. A.G.I.

floe ice. Floating ice of much greater thickness is sometimes seen, but it is doubtful if these great pieces of ice represent the ice formed by the freezing of undisturbed seawater. The ice formed in winter is often broken up in the summer into small floating pieces, floe ice; and the floe ice is sometimes crowded together in ice packs. A.G.I.

floe rock. Rock occurring in or taken from a body of talus; usually refers to ganister. A.R.I.

floc. a. till. See till. Fay.

floc. b. a. A bed or stratum. As used by Werner, means a layer or bed enclosed by soils of different ages. Fay. c. A mass of floating ice some 100 feet or more in diameter, often broken up in the summer into floes. Fay.

floc. e. A rock that contains biotite together with the typical minerals of the green-schist facies. A.G.I.

floc. f. As a verb, to cover or to cause to be covered with water or some other fluid. To fill an oil sand with water to displace and to expel the oil. Webster 3d.

floc. g. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f. As a verb, to cover or to cause to be covered with water or some other fluid. To fill an oil sand with water to displace and to expel the oil. Webster 3d.

floc. h. The flowing in of the tide. The semidiurnal swell or rise of water in the ocean. Opposite of ebh. The highest point of a tide. A.R.I.

floculent. a. As a verb, to cause to aggregate or to coalesce into small lumps or loose clusters or into a floculent mass or deposit. Especially applicable to colloids, clay, and soils. A.G.I. c. A mass of material formed by flocculation of a suspension by adding an electrolyte. A.G.I. Supp. A.G.I. d. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f.

floc. i. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f.

floc. j. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f.

floc. k. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f.

floc. l. A term implying the occurrence of a particular kind of rock, such as granite or limestone, as to constitute almost a pure concentrate. A.G.I. f.
flood casting  443
tary ware industry for the process of slip casting in which excess slip is removed from the mold by draining. In other sections of the pottery industry, the process refers to merely casting slip. In the United States, the process is known as drain casting. Dodd.

flood plain. A flat, low-lying land area in which the water level is even with the surrounding area during periods of high water. SACB-I.

flood plain. The whole area flooded is called the flood plain.ACS-B-1.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. The flat ground along a stream, flooded at the flood stage. A.G.I.

flood plain. That part of any underground gallery upon which a person walks or upon which a tramway is laid. Fay. c. A plank platform under ground. Fay. i. The upper surface of the stratum underlying a coal seam. C.T.D. g. The bottom of a coal seam or any other mineral deposit. Arkell.

flood plain. f. A flat, low-lying area adjacent to a stream. g. Flood-plain clay. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. a. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. The whole area flooded is called the flood plain. Stokes and Varnes, 1955.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. The whole area flooded is called the flood plain. Stokes and Varnes, 1955.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.

flood plain. Any clay underlying the flood channel. Tidal channel in which the flood currents are stronger than the ebb currents. Schieferdecker.

flood plain. The whole arca flooded is called the flood plain. ACSB-I.

flood plain. 1. A low-lying area adjacent to a stream. 2. The flat ground along a stream, covered by water at the flood stage. Fay. 3. Any low-lying ground surface. Fay. 4. The flat ground along a stream, flooding point. The limiting flow rate in two-sided migration of the channel. Schieferdecker.
certain definite horizons in the strata. Arkell 1, loc. cit. 1930. Certain branches of this method branch off laterally, Alston Moor lead mines. Arkell.

flotation. a. The method of mineral separation in which ore is broken in water by a variety of reagents and floaters so finely crushed minerals, whereas other minerals have a variety of reagents and floaters to control the pH of flotation solutions. Bennett 2d, 1962.

flotation time. The time necessary to make the separation into concentrate and tailing depends on such factors as particle size and reagents used, and must be known for determination of the size and number of flotation cells in the plant. Fuertesena, p. 365.

flood. A synthetic reagent of the general nature of pine oil, used as frother in flotation process. Pryor, 3.

floe. See float. Fay.

floc copper. A very finely scaly native copper that floats on water and is very difficult to save in milling. Need, 1922. See also float copper. Fay.

flour. The finely granulated condition of quicksilver, produced by a greater or lesser extent by its agitation during the amalgamation process. The coating of quicksilver with what appears to be a thin film of some sulfide, so that when it is separated into globules these refuse to reunite. Also called thickening; thickening. Fay.

flour mercury. A finely divided mercury. Fay.

flour gold. The finest size gold dust, much of which will float on water. See also float gold. Fay.

flour gypsum. Same as ypsite. New South Wales, p. 56.

flour. Float. Fine-grained soil having the appearance of a flour when wet, but powdery when dry. Fay.

flow. a. That which flows or moves in a fluid state; that which flows or moves in a liquid state. Fay. b. Load casts modified by the sand or mud containing the water, or even by the movement of the fluid in which the objects are suspended. Pettijohn.

flowage differentiation. The retarding effects produced by relatively narrow walls on the movement of individual particles. See also floatation. Fay.

flowable. A characteristic of a foundry sand mixture which enables it to move under pressure so that it makes intimate contact with all surfaces of the pattern or corebox. ASM Gloss.

flowage fold. a. A minor fold that is result of the flowage of rocks toward a central axis, towards which the minor folds are overturned. A.G.I. b. A fold in which the layers of rock are thinned at the crest of the fold and are thickened at the trough of the fold. A.G.I. Supp.

flow banded. A structure of igneous rocks that is especially common in silicate flows. It is due to the movement or flow of magma or lavas. It exists at an alternation of mineralogically unlike layers. Fay.

flow blue. A deep cobalt blue which was used for underglaze printing on pottery. As the name indicates, the color tended to thicken into the glaze, giving a bluer effect; this result was obtained by placing flow powder in the same glaze containing the ware, chlorine evolved from the powder and combined with some of the cobalt, therefore rendering it slightly soluble in the glaze. See also flow powder. Dodd.

flow bog. A peat bog, the surface of which is likely to rise and fall with every increase or decrease of water. The water may come from rains or springs. Fay.

flow casting. Baking by pouring molten filler metal over a joint. ASM Gloss.

flow channel. The portion of a flow net bounded by two adjacent flow lines. ASCE Field Book.

flow characteristics. The rate at which a metal powder will flow through an orifice in a standard instrument, such as a cylinder, according to a standardized procedure. Rolfe.

flow cleavage. a. Cleavage that depends on the parallel arrangement of the mineral surface of a mass of crystals in a magmatic liquid, which may give rise to magmatic differentiation and so the concentration of the minerals. Schieferdecke.

flow cleavage fold. A minor fold that is the result of the flowage of ground. Nickols, 1920.

flowing. a. That which flows or moves in a fluid state; that which flows or moves in a liquid state. Fay. b. Load casts modified by the sand or mud containing the water, or even by the movement of the fluid in which the objects are suspended. Pettijohn.
flow cleavage

constituents of the rock and which developed during rock flowage. Compare fracture cleavage. See also conjugate fracture cleavage. G.A.I. Supp. b. That variety of rock cleavage that is the result of the solid flow of the rock. See also foliation. G.A.I. flow. c. A process of movement of a liquid, gaseous, or solid medium through a porous medium or metal shape by causing the drop to flow over its surface and allowing it to drain. ASTM C286-63.

flow curve. A graph of points obtained in a test for liquid limit. This shows number of blows on the horizontal, logarithmic scale and moisture content on the arithmetic scale. The point of intersection between the flow curve and the 25-blows vertical line is the liquid limit. The flow curve takes the form of a straight line. Ham.

flow failure. Failure in which a soil mass moves and slides along long vertical distances in a fluidlike manner. ASCE P1826.

flow folding. Folding in incompetent beds which offers to little resistance to deformation that they assume any shape impressed upon them by the more rigid rocks surrounding them or by the general stress patterns of the deformed zone. System for pygmatic folding. G.A.I.

flow gneiss. A gneiss, the structure of which was produced by flowage in an igneous mass before complete solidification. G.A.I. Supp.

flow gradient. A drainageway slope determined by the elevation and distance of the inlet and outlet, and by required volume and velocity. Nickell.

flow hole. See throat. ASTM C162-66.

flowing film concentration. In metallurgy, a concentration based on the fact that liquid films in laminar flow possess a velocity which is not the same in all depths of the film. There is a flow at the bottom but maximum at or very near the top resulting from the internal friction of one layer upon another. By this principle lighter particles are washed off while the heavier particles accumulate and are intermittently removed. This is the gravitational settling of elements. Yarrow and round tables have been developed from this basic principle, whereas bumping and shaking tables jointly utilize flowing film and other principles. Gaudin, p. 260.

flowing furnace. A reverberatory with inclined tuyères. Armstrong, Cornwall, England, for treating roasted lead ores by the pre-cipitation process. Fay.

flown, v. See exhaustion. G.A.I.

flowing well. a. A well in which pumping is not necessary to bring the fluid to the surface. Fay. b. A well that discharges water or oil at the surface without the aid of a pump or some other lifting device. Stokes and Varne, 1955. c. A well in which the fluid is flowing to the surface because of pressure or entained gas. G.A.I.

flow, lava. See lava flow. G.A.I.

flow layer. A rock layer, differing mineralogically or structurally from the adjacent layers, and which was produced by flowage before the complete solidification of the magma. G.A.I. Supp. b. A parallel orientation of flow elements in an igneous rock that results in a banded structure. Certain minerals are segregated into such layers or into very flat lames of contrasting appearance. Stokes and Varne, 1955.

flow line. a. Any internal structure in an igneous rock produced by the orientation of crystals. See also flow structure; flow texture. G.A.I. Supp. b. The path that the particle of water follows in its course of seepage under laminar flow conditions. ASTM P1826. c. A conduit, as a pipe, through the hydraulic gradient. Seeley, 1. f. Flowline. Seeley, 1.

flow-line arch. A structure in massive igneous rock similar to a schlieren arch but indicated by more or less obscure flow lines rather than by flow layers. G.S.A. Mem. 5, 1937, p. 1440. 7*4

flow machine. A machine used in glassmaking; molten glass flows into it from a feeder under the action of gravity. Dodd.

flow meter. a. A device installed in a drilling-fluid circulation system that registers the number of rambles, fluid circulated per minute and also indicates when the flow past the bit ceases. Long b. A device which registers the quantity entering the tank, such as quantity of gases, liquids, and fluid pulps. Used in mining dressing and compaction under overburden load. A.G.I. Supp. b. A pillow-sized and pillow-shaped bodies of sandstone which characterize certain strata. Presumed to form by deformation, perhaps a product of large-scale load-casting or of subaqueous slump. See also balland-pillow structure; flow structure; slump block; pseudonodules; storm roller. Pettijohn.

flow, plot. A diagram showing the progress of coal or ore from the preparation or treatment plant. It shows the crushing, screening, cleaning, or refining processes to which the material is subjected from the raw-mine state to the clean and sized products. The size range at the various stages may also be shown. Nelson.

flowsheet, liquids. A flowsheet to indicate the flow liquids throughout a series of operations. B.S. 3532, 1962.

flow, weighted. A materials flowchart including a statement of the capacity in tons per hour at principal points in the plant. B.S. 3532, 1962.

flow rate. a. Weight of dry air flowing per unit time. Measured in pounds per hour. Hastings, p. 8. b. In powder metallurgy, the time required for a powdered sample of standard weight to flow through an orifice in a standard instrument according to a specified procedure. ASM Gloss.

flow rock. Ganister found loose on the side of a mountain. A.I.S. No. 24.

flow, round. A rounded mass of sandstone projecting into underlying argillaceous sediment either lining an eroded depression or produced by differential settling and compaction under overburden load. A.G.I. Supp. b. Pillow-sized and pillow-shaped bodies of sandstone which characterize certain strata. Presumed to form by deformation, perhaps a product of large-scale load-casting or of subaqueous slump. See also balland-pillow structure; flow structure; slump block; pseudonodules; storm roller. Pettijohn.

flowsheet, liquids. A flowchart to indicate the flow liquids throughout a series of operations. B.S. 3532, 1962.

flowsheet, weighted. A materials flowchart including a statement of the capacity in tons per hour at principal points in the plant. B.S. 3532, 1962.

flow rate. a. Weight of dry air flowing per unit time. Measured in pounds per hour. Hastings, p. 8. b. In powder metallurgy, the time required for a powdered sample of standard weight to flow through an orifice in a standard instrument according to a specified procedure. ASM Gloss.

flow structure

are revealed by alternating bands or layers of differing composition, of differing crystallinity, or of differing texture, or by a subparallel arrangement of prismatic or tabular crystals. Holmes, 1920. b. A structural feature found when a magma is solidifying into an igneous rock and while it is sufficiently liquid to flow. See also linear flow structure; planar flow structure. A.G.I. c. A structure due to the alignment of the minerals or the inclusions of an igneous rock so as to suggest the swirling curves, veins, or bands of a flowing stream. Fay. d. An oriented structure that developed in rock during flow. Webster 3d. e. A structure of igneous rocks which is caused by flow in a magma during crystallization. The flow may produce alternating bands or layers of different composition, crystal habit, and texture, or by a parallel orientation of prismatic and tabular crystals. Synonym for fluidal structure; fluxion structure. Schieferdecker.

flow velocity of water in soil. The vector function used to indicate the rate and direction of movement of water through soil, the volume moving per unit of time, and the area normal to the direction of net flow. A.G.I. Supp.

flow surface. The plane separating adjacent flow layers. G.S.A. Mem. 6, 1938, p. 44.

flow symmetry. The symmetry of movement corresponding to the symmetry, and interchangeable parts located with reference to a center or one or more axes or planes. See also axial symmetry; isotropic symmetry; monoclinic symmetry; orthorhombic symmetry; polar symmetry; tetragonal symmetry; triclinic symmetry. A.G.I. Supp.

flow test. A test for the consistency of concrete in terms of its tendency to spread when placed on a metal table and jolted under specified conditions. Dodd.

flow texture. A texture common in the glassy groundmass of extrusive rocks, especially lavas, in which a stream of liquid flows. Flow lines of the once molten rock are revealed by a subparallel arrangement of prismatic or tabular crystals. Synonym for fluidal texture; fluxion structure. A.G.I.

flow unit. One of the nearly contemporaneous subdivisions of a lava flow (usually basaltic) which consists of two or more parts which were poured one over the other during the course of a single eruption. In cross section, a typical flow unit has a lenticular form, ranging from about 100 feet to 300 feet wide and from 10 to 30 feet thick. Longitudinally, the flow unit may be as much as one-half mile long. A.G.I.

flow velocity of water in soil. The vector function used to indicate the rate and direction of movement of water through soil, the volume moving per unit of time, and the area normal to the direction of net flow. A.G.I. Supp.

F.L.P. In Great Britain, tests of every type of apparatus are made in explosive atmospheres before they are approved and allowed to use the official letters F.L.P. (flameproof). Maton, v. 2, p. 432.

floc: A lode having flocan on one or both walls, and sometimes in the center. Fay. 

flocan. See Flocan, Priory, 3.

floculate. In tidal information, generally refers to variations of sea level due to tides, producing forces and are not included in the prediction heights of tide. Hy.

floc, a. S. Wales. A furnace, such as a large coal upfist at or near the bottom of an uptfist for producing a current of air or vapor, or for ventilating the mine. Fay. b. A tube or passageway in a steam boiler for hot gases or water (depending on whether boiler is a fire-tube or water-tube boiler). Bureau Mines Staff, c. Lanc. Shale Arkell. d. A British term used in the same sense as the term tube is used in the United States. Edgell. A passage or channel through which the products of combustion of a boiler or other furnace are brought to the chimney. Fay.

floc bridge. The separating, low wall between the flues and the laboratory of a reverberatory furnace. Fay.

floc brush. a brush made of pieces of wire or steel used to clean the interior of a flue from scales and soot. Fay.

floc clinder. Iron oxide from the reheating furnace, so called because it runs out from the lower part of the flue. Fay.

floc dust. Dust passing into the flues of a smelter or metallurgical furnace and which, unless caught, passes out of the chimney. It is composed of particles of unchanged ore, volatilized lead that has been converted into oxide, carbonate and sulfate ash, and fuel, volatilized products of arsenic, zinc, bismuth, etc. Hets.

floc liner. A fire clay shape for use in the flues and chimneys of domestic heating appliances. Dodd.

floc lining. Low-grade fire clay pipe of cylindrical or rectangular cross section used for lining flues. Fay.

flocillate. Superglacial debris (ablation moraine) that moved laterally as a mass from one indistinct cleavage, having an adjacent lower surface. A.G.I. Supp.

floc unit. One of the nearly contemporaneous subdivisions of a lava flow (usually basaltic) which consists of two or more parts which were poured one over the other during the course of a single eruption. A.G.I.

floc velocity. The vector function used to indicate the rate and direction of movement of water through soil, the volume moving per unit of time, and the area normal to the direction of net flow. A.G.I. Supp.

fluid. a. As an adjective, having particles of a fluid, or relating to or characteristic of a fluid, or containing a fluid. Fay. b. The physical property of a substance that enables it to flow and that is measured by a force at which it is deformed by a shearing stress as contrasted with viscosity: the reciprocal of viscosity. Webster 3d. c. A liquid which, in the broad term, not confined to liquids and slurries, but also used for finely divided solids which flow readily in a current (as a ball-and-pillow reactor, or through dry ball mills. Priory, 3.

fluid catalytic cracking. A cracking process that is fractionally distilled to separate out motor-spirit fractions, fuel-oil blending components and gases. The latter can be used as feedstocks for the manufacture of petrochemicals. See also fractional distillation. Nelson.

fluid circulation. See drill fluid. Long.

fluid clutch. A hydraulic coupling which does not increase torque. Nicholls.

fluid column. The number of feet of drilling fluid standing in a borehole while the drill is operating and/or the number of feet of drilling fluid remaining in a borehole with the drill string withdrawn. Long.

fluid contact. The surface of a formation separating two regions characterized by predominant differences in fluid saturation. Because of capillary and other phenomena, the fluid-saturation changes is not necessarily abrupt or complete, nor is the surface necessarily horizontal. A.G.I.

fluid conveyor coupling. A device for overcoming the starting resistance of a conveyor fed from a fluid clutch. It is used to allow the motor to reach full speed before starting the conveyor. Nelson.

fluid cut. See fluid wash. Long.

fluid drive; fluid clutch. An automotive power coupling that operates on a hydraulic turbine principle, the flywheel being having a set of turbine blades connected directly to it and driving them in oil thereby turning another set of turbine blades attached to the transmission gears of the automobile. Webster 3d.

fluid energy mill. A size reduction unit designed for grinding for its grinding action on the particles being ground, the energy being supplied by a compressed fluid, for example, air or steam (that enters the grinding chamber at high speed. Such mills will give a product of 5s or less; they have been used for the fine grinding of felds, etc., zircon, titania, and calcined alumina, but the energy consumed per ton of milled product is high. Dodd.

fluid flow. See Raleigh's law. Lewis, p. 709.

fluid-fuel reactor. A type of nuclear reactor (for example, a fused-air reactor) for the purposes of which is in fluid form. L.S.I.

fluidimeter. An instrument devised by J. Joshua Phillips for determining the fluidity of oils at various temperatures. Fay.

fluid inclusion. See inclusion, fluid, A.G.I.

fluidity. a. The quality, state, or degree of being fluid: a liquid or gaseous state. Webster 3d. b. The physical property of a substance that enables it to flow and that is measured by a force at which it is deformed by a shearing stress as contrasted with viscosity: the reciprocal of viscosity. Webster 3d. c. A liquid which, in the broad term, not confined to liquids and slurries, but also used for finely divided solids which flow readily in a current (as a ball-and-pillow reactor, or through dry ball mills. Priory, 3.
fluidization. A masting process in which finely divided solid materials are kept in suspension by a rising current of air (or other gas). This produces a fluid bed, which provides an ideal condition for gas-solid reaction because each solid particle is in constant motion and in contact with the moving gas stream on all sides. The solid material must not contain pieces so large that they will not stream. Oxidation of finely ground fluidized bed dryer. A cool dryer which of the principle used in reflection prospecting is withdrawing from the opposite annular space between the tubing and well down to the surface of the fluid. The problem of oxygen entry, a desired exothermic level by control of between mineral and air is maintained at rents of air, blown through a reaction vessel with sufficient force to cause the fluidization, intense turbulence is created in the mass including which is generally in the form of slabs; a current of air or hot gases which is forced up through the material. The principle is used as a method of conveying powders along a slightly inclined porous ceramic trough; the powder can be simultaneously dried and/or calcined. Fluidized bed dryer. A cool dryer which depends on suspension of particles being fluidized by passing a stream of hot air through it. As a result of the fluidization, intense turbulence is created in the mass including a rapid drying action. The coarse dry coal is withdrawn from the opposite side of the bed by a pump, usually expressed in pounds per square inch. Long. b. The forced, expressed in pounds per square inch, exerted by the weight of the column of fluid measured at any given depth in a borehole. Fluid volume. The amount of drilling fluid circulated through the drill string, generally expressed in gallons per minute. Long. fluid wash. The wearing away of core and parts of a drill string or bit exposed to the erosive forces of the rapid passage of the circulated drilling fluid. Also called fluid cut. Long. Fluid volume. The amount of drilling fluid circulated through the drill string, generally expressed in gallons per minute. Long. fluid wash. The wearing away of core and parts of a drill string or bit exposed to the erosive forces of the rapid passage of the circulated drilling fluid. Also called fluid cut. Long. phukan. South Appalachian. Flucan. Fay. Fluke. A rod used for cleaning drill holes before they are charged with explosives. Fluken. a. Corn. Gouge clay. Arkell. b. A crossvein composed of clay. Arkell. Flume. a. A sloping channel or trough usually of wood and often supported on a trestle, for conveying water from a distance to be utilized for power, transportation, etc., as in placer mining, logging, etc. Fay. c. A milltail. Fay. d. To transport in a flume, as log. Fay. d. To divert by a flume, as the waters of a stream, in order to form the bare auriferous sand and gravel forming the bed. Fay. e. An open trough or channel, made of wood or other material, used for conveying water. Also called launder; sluice; race. B.S. 3618, 1963, sec. 4. f. A ravine or gorge with a stream running through it. Fay. Flumed. The transportation of solid by suspension or flotation in flowing water. ASTM STP No. 148-D. Flume man I. In metal mining, one who lays and repairs wooden pipes or flumes used to convey water in and about a mine. D.O.T. 1. Flume man II. In metal mining, a laborer who patrols flume line (usually a wooden structure along a hillside) used to convey water to the mine for washing and separating the gold, platinum, or other metals from the gravel in which it is found. Also called flume tender. D.O.T. 1. Fluorescent lamp. a. Commonly and improperly designates an electric lamp device emitting ultra-violet radiation or black light. Long. b. A glass globe or tube the inner surface of which is coated with a fluorescent substance that produces visible light by a substance exposed to ultraviolet light. It is a useful property in examining well cuttings for oil shows and in prospecting for some minerals. A.G.I. Supp. The absorption of radiation at one wavelength, or a range of wavelengths, and its re-emission as radiation of longer, visible wavelengths. ASTM STP No. 148-D. Fluorescence. Having the property to produce fluorescence. Long. fluorescent penetrant. See fluee man II. D.O.T. 1. Fluorite. See flume man II. D.O.T. 1. Fluorite. A mineral, artificial NaCaMg3Si3Al(OH)6F2, Spencer 21; M.M., 1958. Fluorometry. See fluorimetry. Pryor, 3. Fluorite. A mineral, artificial NaCaMg3Si3Al(OH)6F2, Spencer 21; M.M., 1958. Fluorometry. See fluorimetry. Pryor, 3. Fluorine. An organic compound, CaH4, found in burning of pyritous shale in Bohemia, Czechoslovakia. Later renamed kroptocline. Tomkeiiff, 1954. Fluorite. A trade name for fluo.

fluidity factor

The fluidity factor is the ratio between the fluid's viscosities in two different temperatures. It is a measure of the fluid's resistance to deformation and is used to determine the best conditions for transportation of mud-laden fluid. The fluidity factor is important in understanding the behavior of mud in pipelines, and in predicting its flow characteristics. It is also used in calculating pumping rates and estimating the costs of mud transportation. The fluidity factor is defined as the ratio of the apparent viscosity at the designed temperature to the apparent viscosity at the higher temperature. This factor is used to calculate the flow rate of mud in pipes, and to determine the necessary size of the pipeline. The fluidity factor is also used to calculate the cost of pumping mud, and to determine the most economical method of mud transportation. The fluidity factor can be calculated using the following equation:

\[ \text{Fluidity Factor} = \frac{\mu_T}{\mu_S} \]

where \( \mu_T \) is the apparent viscosity at the designed temperature, and \( \mu_S \) is the apparent viscosity at the higher temperature. The fluidity factor can range from 1 to infinity, with a fluidity factor of 1 indicating no change in viscosity, and a fluidity factor of infinity indicating a change in viscosity of 0. The fluidity factor is also used to calculate the flow rate of mud in pipes, and to determine the necessary size of the pipeline. The fluidity factor can be calculated using the following equation:

\[ Q = \frac{\pi d^4}{128 \mu T L} \]

where \( Q \) is the flow rate, \( d \) is the diameter of the pipe, \( L \) is the length of the pipe, and \( \mu T \) is the apparent viscosity at the designed temperature. The fluidity factor is also used to calculate the cost of pumping mud, and to determine the most economical method of mud transportation. The fluidity factor can be calculated using the following equation:

\[ C = \frac{P}{Q} \]

where \( C \) is the cost of pumping mud, \( P \) is the pressure required to pump the mud, and \( Q \) is the flow rate. The fluidity factor is also used to calculate the flow rate of mud in pipes, and to determine the necessary size of the pipeline. The fluidity factor can be calculated using the following equation:

\[ Q = \frac{\pi d^4}{128 \mu T L} \]

where \( Q \) is the flow rate, \( d \) is the diameter of the pipe, \( L \) is the length of the pipe, and \( \mu T \) is the apparent viscosity at the designed temperature. The fluidity factor is also used to calculate the cost of pumping mud, and to determine the most economical method of mud transportation. The fluidity factor can be calculated using the following equation:

\[ C = \frac{P}{Q} \]

where \( C \) is the cost of pumping mud, \( P \) is the pressure required to pump the mud, and \( Q \) is the flow rate. The fluidity factor is also used to calculate the flow rate of mud in pipes, and to determine the necessary size of the pipeline. The fluidity factor can be calculated using the following equation:

\[ Q = \frac{\pi d^4}{128 \mu T L} \]

where \( Q \) is the flow rate, \( d \) is the diameter of the pipe, \( L \) is the length of the pipe, and \( \mu T \) is the apparent viscosity at the designed temperature. The fluidity factor is also used to calculate the cost of pumping mud, and to determine the most economical method of mud transportation. The fluidity factor can be calculated using the following equation:

\[ C = \frac{P}{Q} \]

where \( C \) is the cost of pumping mud, \( P \) is the pressure required to pump the mud, and \( Q \) is the flow rate.
fluorescent penetrant

the ultraviolet light. Henderson.

fluorescent screen. A screen that emits visible or actinic light when it is exposed to X or gamma rays. It usually consists of a piece of cardboard coated with a phosphor. ASM Gloss.

fluorspar. A name used in some rare minerals, K,Mg,Fe—Li,SiO$_3$F$_2$, where $x$ is between $1/3$ and $1/2$. Hey, M.M., 1964.

fluoride. A compound of fluoride with one or more other elements. A.G.I.

fluorimetry; fluorometry. Method of analysis based on intensity of fluorescence measured with ultraviolet light. Pryor, 3.

fluorine. A nonmetallic element, the lightest of the halogens, isolated as a pungent, corrosive gas that is pale greenish yellow. It is extremely reactive, being the most electronegative (nonmetallic) of the elements. Symbol, F; valence; 1; atomic number, 9; atomic weight, 18.998; and density, 1.696 grams per liter (at 0$^\circ$ C and 1 atmosphere). C.T.D.; Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-110. Small quantities in water supplies promote resistance to dental decay. C.T.D. Supp.

fluorine minerals. Minerals containing fluorine, including amorphous, amebolitic, amphibole, cryolite, fluorite, lepidolite, topaz, and others. Fay.

fluorite; fluor spar; flor spar. A natural calcite or fluorspar, often occurring in veins either alone or with metallic ores. It is the principal ore of fluorspar and is very radioactive. Color green, yellow, purple, pink, red, blue, violet, white, or brown; isometric; luster, vitreous; Mohs' hardness, 4; fracture, 2.18. Found in Illinois, Kentucky, Tennessee, New Hampshire, Colorado, New Mexico, Arizona, Nevada, Utah, Montana, Texas, California, Nevada, Washington; Canada, Mexico, England. Used as a flux in open hearth furnaces and in gold, silver, copper, and lead smelting; manufacture of hydrofluoric acid; manufacture of opalescent glass; glass forming and; and photographic emulsions. Dana 17, pp. 322-328; CCD 6d, 1961; Crosby, p. 123.

fluorosilicates. Salts of fluosilicic acid; hydrofluosilicic acid; silicofluoric acid; and others. Fay.

fluorescent intensities. The logs are prepared by plotting the fluorescent intensity of well cuttings against depth. A.G.I.

fluoroscope. A device for measuring the intensity of fluorescence. Bennett 2d, 1962. The intensity of fluorescence can be measured

fluoroscopy. An inspection procedure in which the radiographic image of the subject is viewed on a fluorescent screen, normally limited to low-density materials or to thin sections of metals because of the low-light output of the fluorescent screen at safe levels of radiation. ASM Gloss.

fluoroscopy. A chronic poisoning resulting from the presence of 0.5 milligrams per liter or more of fluoride in drinking water. Teeth become brittle, opaque white with a mottled enamel. Bureau of Mines Staff.

fluorosilicates. Artificially produced tremolite containing 9.03 percent fluorescent in place of hydroxyl. Spencer 15, M.M., 1940.

fluor·tosilicic acid; fluorosilicic acid. Magnesium fluosilicate is used as a concrete hardener and in magnesium casting. Zinc fluosilicate is used as a concrete hardener. Copper fluosilicate has a similar use and barium fluosilicate is used in ceramic operations. Sodium fluosilicate is used in the electrorefining and in the plating of lead. The zinc, magnesium, copper, and lead fluosilicates are soluble in contrast with the sodium and potassium salts. See also sodium fluosilicate; ammonium fluosilicate. CCD 6d, 1961.

fluorspar. See fluorite.

fluor·tosilicic acid; hydrofluosilicic acid; silico·fluoric acid; and acid fluoride. Transparent; colorless; fuming; corrosive; liquid. R.S.I. X-HO; and soluble in water. Used in ceramics to increase hardness; in the manufacture of sodium, ammonium, magnesium, zinc, copper, barium, lead, and other fluosilicates; and in building (hardening cement, plaster of Paris, concrete flooring, preserving masonry). CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-175.

fluor·tosilicic acid; hydrofluosilicic acid; silico·fluoric acid; and acid fluoride. Transparent; colorless; fuming; corrosive; liquid. R.S.I. X-HO; and soluble in water. Used in ceramics to increase hardness; in the manufacture of sodium, ammonium, magnesium, zinc, copper, barium, lead, and other fluosilicates; and in building (hardening cement, plaster of Paris, concrete flooring, preserving masonry). CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-175.

flushing. The output of roasting applied to finely divided material, in which air with sufficient strength is blown through a heated bed of mineral to keep it fluid, while the reaction is controlled by continuous adjustment of rate of feed, cooling water, added fuel (including oxygen in air). Train apparatus includes instrument controls, air compressor, dust-collecting cyclones, and feed pumps. Pryor, 3.

flush. a. To operate a placer mine, where the continuous supply of water is insufficient, by spraying the water and releasing it periodically in a flood. Webster 3d. b. To fill underground space, as in coal mines, with material carried by water, which after drainage, forms a mass. Webster 2d. To fill out line of a well or of a water line or to fill a depression, etc., by letting in a sudden rush of water. Zern. d. The splitting of the edges of stone under pressure. Zern. e. Forming in the wood or surface. Zern. f. Eng. A small flash due to ignited fire, or Midland. h. A flash or a bright fragment of fire. Fay. h. Any sudden flow of material or water into underground workings. B.S. 3616, 1962, sec. 6.

flush-coupled. Provided with couplings the outside diameter of which is the same as that of the unit pieces on which the coupling is fitted. See also flush-coupled casing. Long.

flush-cored casing. A casing (usually 10 feet) of steel tubing one end of which is provided with a short coupling having pin threads on both ends. The outside diameters of the coupling and the casing tube are equal, and the inside diameter of the coupling is usually about three-sixteenths of an inch smaller than the inside diameter of the casing tube. Long.

flushing. a. A drilling method in which water or some other thick liquid, for instance a mixture of water and clay, is driven into the borehole, through the rod and bit...The water rises along the rod on its outer side, that is between the walls of the borehole and the rod, and with such a velocity that the rock particles are carried up by this water current (direct flushing); or water enters the borehole around the rod and issues upwards through the rod (indirect flushing). Stoces, v. 1, p. 79. b. In a colliery, diversion of ventilation to clear foul atmosphere; a natural gas method. Pryor, 3. c. In oil well production, use of gravitated ground water to force oil or gas to the surface. Pryor, 3. d. Hydraulic stowing. Nelson.

flushing fluid. See drill fluid and flush. Long.

flush joint; flush·joint. Two similar members joined in such a manner that either of the outside diameters of the two members are flush. Long.

flush·joint casing. Lengths (usually 10 feet) of steel tubing provided with pin threads at one end and a matching pin thread on the opposite end. Coupled, the lengths form a continuous tube having a uniform inside and outside diameter throughout its entire length. Long.

flush·joint drivepipe. Thick-walled drivepipe, lengths of which are threaded and coupled together in the same manner as flush-joint casing. See also flush-joint casing. Long.

flush·joint pipe. a. A pipe or casing threaded and coupled together in the same manner as flush-joint casing and flush-joint drivepipe. Long. b. As used by individuals associated with the petroleum-drilling industry, a pipe threaded and coupled together in such a manner that the inside surfaces are flush and the outside surfaces are embossed, forming a Shouldered Joint. Long.

flush cut; flushing out. See flush.

flush·joint swivel. A water swivel of F-19588, used in an oil well during the early period of production. Fay.

flush set. A bit or reaming shell in which the inset diamonds or other cutting points do
not protrude beyond the metal holding them in place. Long.

Flush water. Water used to assist the flow of materials in churns or launders. B.S. 3552, 1962.

Flute. a. A groove parallel or nearly parallel to the axis of a cylindrical piece, such as the grooves of a splitting core lifter or the grooves in a core-barrel stabilizer ring. Also applied to grooves or webs following a break between two shapes forming a core. Sometimes called a scoring. Long.

Fluvial. a. Of or pertaining to streams and rivers. Long.

Fluvial cycle of erosion. The normal cycle of erosion by streams and rivers, leading to the formation of a river plain. Standard, 1964.

Fluvial geomorphic cycle. The normal cycle of erosion by streams and rivers, leading to the formation of a river plain. Standard, 1964.

Fluvial sands. Fluvial sands are usually sharp and consist of irregular fragments of numerous sizes. Quartz is usually the predominant mineral, but other minerals may be present in various proportions according to the conditions under which the rivers or streams are formed and according to the treatment that such minerals undergo during transport. A.G.I.

Fluvio-aerial; Fluvio-aeral. Produced or caused by the action of streams and wind. For example, Fluvio-aeral geologic formations. Webster 3d.

Fluvio-glacial. See gluciofluvial. Webster 3d.

Fluvio-glacial drift. Drift transported by waters emanating from a glacier. Webster 3d.

Fluvio-lacustrine. Of or pertaining to sedimentation partly in lake and partly in stream waters or to deposits laid down under alternating or overlapping lacustrine and fluvial conditions. Webster 3d.

Fluvimarine. a. Formed by the joint action of a river and sea. For example, a deposit at the mouth of a river. Synonym for estuarine. Fay. b. Of or pertaining to a deposit brought into the sea from the land, and then formed by the waters of the sea. Such a deposit often contains the remains of land animals, freshwater animals, and marine animals. A.G.I.

Fluviovolcanic. Relating to the combined action of volcanoes and streams; for example, beds of fluviolcanic ash. Webster 3d.

Flux. a. In ceramics, any readily fusible glass or enamel used as a base or ground. CCD 6d, 1961. b. In physics, the rate of flow or transfer of electricity, magnetism, water, heat, energy, etc., the term being used to denote the quantity that crosses a given surface in a unit of time. CCD 6d, 1961. c. In chemistry and metallurgy, a substance that promotes the fusing of minerals or metals or prevents the formation of oxides. For example, in metal refining an addition of some mineral to the furnace charge is made for the purpose of absorbing mineral impurities in the metal. A slag is formed which floats on the top of the bath and is run off. CCD 6d, 1961. d. In soldering and brazing, a substance which is applied to the portions to be united and which, on the application of heat, aids in the ready flowing of the solder and prevents the formation of oxides while the solder unites with the two parts to form a tight joint. CCD 6d, 1961. e. A substance added to a solid to increase its fusibility. C.T.D. F. Substance to reduce melting temperature. Hrutb. g. The intensity of neutron radiation. It is expressed as the number of neutrons in 10^-10 sec. over the total area of the detector. LBL. h. Any chemical or rock added to an ore to assist in its reduction by heat, such as limestone with iron ore in a blast furnace. von Bernowits. i. In metal refining, a material used to remove undesirable substances, like lead, zinc, or dirt, as a molten mixture. Also used as a protective covering for certain molten metal baths. Line or limestone is generally used for removing iron oxide in copper refining. A.M. Glol. j. A bituminous material, generally liquid, used for softening other bituminous materials. Urquhart, sec. 2, p. 81. k. Any substance or mixture which lowers the normal vitrifying temperature of a ceramic body or composition, (that is, fluxes, nepheline, sodium carbonate, sodium oxide, etc.). Bureau of Mines. l. A, a readily fusible material such as borax, lead, lime, or silica, used in mixing enamels or glasses. C.T.D. m. Passage across a physical boundary, such as the carbon dioxide from the atmosphere to the organic matter. A.G.I. Supp. n. State of change. A.G.I. Supp. o. As a verb, to cause to become fluid; to treat with a flux, especially in order to promote fusion; to become fluid. Webster 3d.

Flux blocks. Refractory shapes which are used in contact with molten glass in furnaces. A.R.I.

Flux box. Refractory furnace blocks used in contact with glass in melting. A.S.G.

Flux field. A factor for determining the quality of steelworks grade silica refractories. It is defined in the American Society for Testing and Materials C416 as the percentage of Al2O3 in the brick plus twice the total percentage of alkalis; for first quality (Type A) bricks the flux factor may not exceed 0.50. Dodd.

Flux gate; Flux valve. A device based on the earth-inductor principle and used to indicate the direction of the terrestrial magnetic field. Webster 3d.

Flux-gate magnetometer; Saturable reactor. The essential element of this instrument, which is used for detailed studies of the earth's magnetic field on a local basis, is the flux-gate. This consists of two identical saturable cores of high permeability, oppositely wound with identical coils. An alternating current in these coils magnetizes them first with one polarity, then in the opposite sense. If an additional field is present, such as the earth's field, it will add to the flux in one coil while decreasing that in the other. As a result, the voltage drop across the two coils will differ. The amount of this difference is proportional to the increasing field, which can therefore be measured by noting the average voltage difference between the two halves of the flux gate. This difference may be done to an accuracy of about ±1 gamma. In use, a part of the earth's field is balanced out by an additional winding surrounding both cores and carrying direct current. In airborne use, the recording flux gate is kept aligned with the magnetic field by the use of two additional flux gates. When these are at right angles to the earth's field, they generate no voltage, but if they depart from this position, they can be made to generate voltages which operate motors returning them to proper alignment. In this fashion, the recording element of this instrument is always parallel to the total field. H.W.C.
fluxing lime

Lump or pebble quicklime used for fluxing in steel manufacture. The term may be applied more broadly to include fluxing of nonferrous metals and glass. It is a type of chemical lime. Boynton, individual fluxing ore. An ore containing an appreciable amount of valuable metal, but smelted mainly because it contains fluxing agents which are required in the reduction of richer ores. Weed, 1922.

fluxing stone. Consists of pure limestone or sometimes dolomite or other carbonate rock. Contains no iron, as is used in blast furnaces and foundries. Usually material below 2 inches in diameter is eliminated. The most desirable size is between 4 and 6 inches. BuMines Bull. 630, 1965, p. 886.

fluxion structure. a. Includes such structures as flow lines, parallel orientation of pheno- crystals, banding, elongation of vesicles, Sponges for flow structure; fluidical structure. Fay. b. Structure in rocks involving one or more swirl axes. A.G.I. Supp. c. Internal structure of igneous rocks indicating flowage of magma. The orientation and arrangement of cry·l's into flow lines, forms in which flow structures are expressed. A.G.I. Supp.; Bureau of Mines Staff.

FLUXION SWIRL. The structure seen in thin sections of tectonites cut normal to B. carrying rotation. G.S.A. Mem. 6, 1938, p. 138.

flux line block. A refractory block for use in the bottom of the walls of a glass tank furnace. The flux line is the surface level of the molten glass and attack on the refractories is more severe at this level than beneath the molten glass. Dodd.

flux lines. a. Imaginary lines used as a means of explaining the behavior of fluids and of permanent magnetism. Sometimes called magnetic lines of force. ASM Gloss. b. Sea metal line. ASTM C162-66.

flux process. Manufacture of thin or tere- plate, in which molten zinc chloride, with or without ammonium chloride, is used as flux on the surface of the fused metal pot. Bennett 2d, 1962.

flux spoon. A small ladle for dipping up a sample of molten metal for testing. Fay.

flux stone. Limestone, dolomite, or other rock used in metallurgical processes to lower the melting temperature of ore. A.G.I. Supp.

fly. a. In Montana, a gate or door in a hop- roof, but not in contact with it except at the ridgepole. Fay. c. The flap or door of a chimney with the waste gases and often recovered for use as a constituent in commercial products. Webster 3d. b. Fine- divided material (which may have po- zolanic properties) from the precipitators near flues of power stations using pulverized coal. Also called pulverized fuel ash. Taylor.

flyback. The recycling period of the saw- tooth-modulated frequency modulated osci- lillator. H.E.G.

flycatcher. Aust. a. Weir to which boards covered with gummy sacking are attached to catch float gold. Hess.

fly cutting. Cutting with a single-tooth milling cutter. ASM Gloss.

fly dope. Insect repellent containing oil. Helfman.

fly gate. An opening in a chute that can be opened or closed at will. In a chute for coal, a fly gate may be inserted so that if rock is deposited in the chute, it may be trapped out by opening the fly gate. Zern.

flygt pump. A submersible pump developed in Sweden where it is used to transfer molten metal in a 1-inch discharge hose size and in a 3-inch size. The 1-inch pump produces about 5,000 gallons per hour at a 20-foot total head static, operating on a 110-volt, single-phase alternating current. Carson, p. 206.

fly rock. The rock material which is removed from the opening of the pipe in the form of a thick sludge. With this method the amount of dust dispersed into the atmosphere is almost negligible and the amount of water used is about 1 gallon per hour. Approximately 30 to 50 feet of fly rock can be done with one filling of the unit. Mason, 1, 1, 204.

foam fire extinguisher. A portable appliance containing a foam and dust mixture for fighting underground fires. Foam extinguishers are of two types: (1) the chemical foam type in which two chemical solutions, an acid solution (aluminum sulf- fate) and an alkali solution (sodium bi- carbonate), and foam-forming compounds are contained in the inner and outer con- centrific compartments respectively of the extinguisher; they are mixed by breaking a seal and inverting the extinguisher, when a stream of thick foamy fluid, consisting of a mass of small bubbles, results which forms a blanket over the fire and also produces a cooling effect which assists in extinguishing the flame, and (2)
the air foam type in which the air foam is produced mechanically. The outer container is filled with water and into it is placed a sealed cylindrical container in which is a charge of foam compound and a small charge of compressed carbon dioxide. When operated, a knob is struck sharply and the cylinder is punctured that mixing the foam compound and the water which is aerated by a special nozzle as it exudes. Sinclair. 1, pp. 280-281.

foam glass. Cellular glass, in the form of blocks, usually made by mixing powdered glass with a gasifying agent (for example, carbon or a carbon compound) the mixture then being heated for a short time to fuse the glass and trap the evolving gas bubbles. Foam glass is used as a structural heat insulating material. Compare bubble glass. Dodd.

foam injection. The injection of foam into shotholes and connecting breaks to displace any firedamp present and to minimize further gas drainage into the shothole, thereby reducing the risk of ignition of the gas during shot firing. B.S. 3618, 1964, sec. 6.

foam line. A line in a tank dividing the foam-covered area from the clear area. ASTM C165-66.

foam plug. A secondary method of fighting foam. In a boiler, the carryover of slugs of water into the piping, due to dirty water. See also priming. Strock, 10.

foam spray. Same as sphrite. Fay.

foam. Applied to the structure of a vesicular rock in which the partitions between the vesicles form a fine network. Schieber-decker.

foamy amber. Frothy amber. Almost opaque chalky white amber. Will not take a polish. Shipley.

foam fire extinguisher. A device designed to focus a stream of water, which is thrown against the fire, on the base of the fire. Webster 2d.

fold. A crack or a break in the roof. C.F.D. Roll. Full. Metal in sheet form less than 0.006 inch in thickness. ASTM Glass.

folds. Proposed by Johannes, derived by contracting the word foldpatioids, and used in his classification of igneous rocks to indicate that group of minerals. A.G.I.

fog. A crack or a break in the roof. C.F.D. Roll. Full. Metal in sheet form less than 0.006 inch in thickness. ASTM Glass.

fog quenching. Quenching in a fine vapor or mist. ASM Gloss.

fogging. In seismology, the source of a given focal sphere. The theoretical sphere enclosing the area with soap bubbles which are moved by an electric current. Curtiss and Rader. 3.

fog mist: cloudy. Dispersion of liquid as minute droplets in a gas. No sharp dividing line from dust. Formation is aided if condensation nuclei are present (dust particles, electrically charged gases, or ions). Pryor, 3.

foaming. A forge for melting tin. Fay.

foam fire extinguisher. See free on board. Pryor, 3.

fold axis. See axis. A.G.I.

folded. Refer to folded rock or strata. The thickness of the sliding prisms which they appear are said to be foliated. Shipley.

folding rule. A collapsible instrument used for measuring. Crispin.

fold mountain. A mountain resulting chiefly from large-scale folding of the earth's crust. Stokes and Varnes, 1955.

folded. A recurrence of the reversed middle limb of which has been completely sheared out as a result of the great horizontal translation. A.G.I.

fold system. A group of folds showing common characteristics and trends and presumably of common origin. A.G.I.

folds. Synonym for sphrite. Fay.

folding boards. Scott. a. Shuts; a shifting frame on which the cage rests, in or at the top of a shaft. Fay. b. Synonym for chairs; dogs; keeps; keeps. Fay. Also called fauling boards. c. In some small coal mines, also refers to as cage fans. Bureau of Mines Staff.

folding door. A door used to cover the shaft top during sinking, and operated by steam, compressed air, or hydraulic power. Balanced weights may be incorporated to assist in opening the door.

folding rule. A collapsible instrument used for measuring. Crispin.

fold. A forge for melting tin. Fay.

foliation. Consisting of thin (leaflet) laminae of a mineral substance. Having the form or thinness of a foliage leaf or a film. Synonym for foliated. Webster 3d.

foliage. Suggested by Bastin in 1909 as a general term for any foliated rock. A.G.I.

foliated. a. Thin, often wavy bands, or laminae, up to 4 inches in thickness, of unlike mineral composition. The rocks in which the bands are said to be foliated. Mother. b. Thin flakes or leaves; lamellae.

foliation. A term includes bedding fissility or layers known as anticlines, synclines, monoclinal, and schistose rocks. von Bernewitt. b. Synonym for foliate. Webster 3d.

foliates. Suggested by Bastin in 1909 as a general term for any foliated rock. A.G.I.

foliate. Foliation. A texture of platy minerals in foliated rocks which have been bent into a dome (anticleine) or into a basin (syncline), a terrace (monocline), or a roll. This structure is observed mainly in mountainous regions, and is characteristic of both the altered and the unaltered sedimentary rocks. Strictly a strong flexure of a stratum, with steeply inclined sides. It may be an indistinct or a prominent, extending over a large area, with steeply inclined sides. Størmer. Referred to as being generated by a line moving in a plane from dust. Formation is aided if condensation nuclei are present (dust particles, electrically charged gases, or ions). Pryor, 3.

folding. The thickness of the sliding prisms which they appear are said to be foliated. Shipley.

folding; fold. A texture of platy minerals in foliated rocks which have been bent into a dome (anticleine) or into a basin (syncline), a terrace (monocline), or a roll. This structure is observed mainly in mountainous regions, and is characteristic of both the altered and the unaltered sedimentary rocks. Strictly a strong flexure of a stratum, with steeply inclined sides. Størmer. Referred to as being generated by a line moving in a plane from dust. Formation is aided if condensation nuclei are present (dust particles, electrically charged gases, or ions). Pryor, 3.
shear planes (cleavage foliation), or fracture planes under the strain of flexure (faulting foliation). Standard, 1964. c. The arrangement of minerals normally presenting a platy habit (such as the micas, the chlorites, and talc) in folia or leaves, lying with their principal faces and cleavages in parallel planes; due to their development under great pressure during regional metamorphism. C.T.D. d. The laminated structure resulting from segregation of different minerals into layers parallel to the schistosity. A.G.I. e. Considered synonymous with flow cleavage, slaty cleavage, and schistosity by many writers due to development of parallel fabrics in metamorphic rocks, and considerable ambiguity attends their current use. A.G.I. f. More less pronounced and rarely developed in particular constituent minerals of a metamorphic rock into lenticles or streaks or inconstant bands, often very rich in one mineral and contrasting with constituent lenticles or streaks rich in other minerals. McKinnity. g. The ability of certain rocks to fracture along parallel planes. Leuci, p. 599.

**foliation, axial-plane.** See axial-plane foliation. A.G.I. Supp.

**follower.** a. Chainman at rear end in chain-drawn load. Eng. b. A bed of shale which occurs immediately over a coal seam and falls as the coal is worked. It causes a high proportion of stone in the material bulked. See also clod. c. A breadth of about 6 yards of coal taken off the working face.

**follower chart.** A table showing the size of casing or pipe that should be placed in a borehole drilled with a specific-size bit and/or which sizes of casing or pipe can be nested inside each other. Long.

**follower rail.** The rail upon which a drill is being worked. Eng. Said of a shift arriving at a working place before the previous shift has finished work. Fay.

**follower road.** A thin argillaceous layer situated between a seam of coal (below) and limestone (above). Arkell.

**following dirt.** a. A thin bed of unconsolidated dirt; a parting between the top of a coal seam and the roof. See also pug. C.T.D. b. See following stone. Green.

**following-in.** Eng. Said of a shift arriving at a working place before the previous shift has finished work. Fay.

**following-up the whole with the broken.** See bord-and-pillar method. Fay.

**footage.** a. Measurement of the distance covered by driving on and off reef, including the distance of shaft sinking in some mines; (2) footage on reef, the distance covered by driving on and off reef, prior to or following the previous shift; (3) footage payable and unpayable, which is applied to the stem of a glass article and then opened out to form a foot. C.T.D.

**footage per bit.** The average number of feet of borehole specific types of bits drill in a given period before the bit becomes dulled and is replaced, discarded, reharped, or reset. Lang.

**foot bath.** Derb. Alc bought with the first day's wages after a man begins work. All the miners join in a jollification. Fay.

**foot block.** Eng. Fragments of wood placed under props, in tunneling to give a broad base, and thus prevent the superincumbent load bearing and attaching to the stemware. Shapes foot by hand, using a clapper (two pieces of carbon fastened together to form a hinged joint) and finishes the foot with a wooden buffer. D.O.T. I.

**foot clamp.** Synonym for safety clamp. Long.

**foot clamp.** a. One who shapes glass foot (base) of stemware or other tableware. Cuts off required amount of molten glass from gob (mass of molten glass) held by gatherer with shears and attaches to stemware. Fay.

**foot forming feeder.** One who inserts glass foot forming mold into a machine that automatically forms the base on the stemware and burns off the excess glass from the stem. Ariz. Weed, 1918.

**foot hill.** a. A distinct lower part of a mountain. One of the hills or minor elevations of a mountain range which lies next to the adjacent lower land and forms a transition between that and the higher portions. Ariz. b. One of the series of low hills at the foot of a mountain, or of higher hills. Commonly used in the plural. A.G.I.

**foot hook.** Holes cut in the sides of shafts or winzes to enable miners to ascend and descend. Zem.

**footbook.** S. Staff. The large hoisting-rose hook that is attached to the skip. Fay.

**footbook chain.** S. Staff. A strong chain at the end of the rope, and connected with the footbook. Fay.

**footing.** a. The characteristics of the material directly beneath the base of a drill tripod, a derrick, or mast uprights. Also, the material placed under such members to produce a firm base on which they may be set. Lang. b. The material on which the floor sills of a drill floor are set. Long. c. That portion at the foundation of a structure that transmits loads directly to the soil. ASCE P1826. d. Ground, in relation to its load-bearing and friction qualities. Nichols. e. The spreading course or courses forming the foot or foundation of a wall. Standard, 1964.

**foot of a specific-size borehole.** The average number of feet of borehole specific types of bits drill in a given period before the bit becomes dulled and is replaced, discarded, reharped, or reset. Lang.
footlambert

reflected factor when its illumination is 1 lumen per square foot. Sinclair, 1, p. 200.

footman. In salt production, a laborer who adjusts height of gate in chute leading from the boom of a lever, to regulate flow of crushed rock salt into vibrating screens which separate salt into various sizes prior to shipment or refining. D.O.T. 1.

footmark. See marker block. Long.

footpieces. See sill, e. Fay.

foot pins. The hinge which attaches the boom to a revolving shovel. Nichols.

foot-pound. A foot-pound is the amount of energy required to lift one pound a vertical distance of one foot. Abbreviation, ft-

foot-poundal. The work done by a force of one pound applied to a body for one foot. Pryor, 3, p. 127.

footwall. In Pennsylvania, a miner's measurement of the distance a working face is advanced. With the heel of one foot on a mark a short step is taken and the tip of the forward toe marks the foot-wall. The next measurement is taken by placing the first foot against the toe of the second and repeating the first step and so on. The foreman checks measurements with a rule. Hess.

forky boring method. A percussive boring system comprising a closed-in derrick over the crown pulley of which a steel rope is passed from its containing drum. The boring tools are swung from the end of the rope and are moved in the hole as required by means of the drum. A walking beam operating with a mechanism gives the boring tools a rapid vibrational motion. Improved methods of boring are now available. Nichols.

forky freezing process. One of the original freezing methods of shaft sinking through horizons which contained water. Although the principle is the same today, the process has been improved in many respects. See also freezing method. Norton.

forsake. A marking in standstone and other sedimentary formations that possibly was caused by a worm. A boring in a stone. Standard, 1964.

forum. Abbreviated term for foraminifer that is common in a marine body. Pryor, 3, p. 177.

foraminiferida, a. A subdivision of the phylum protozoa which includes tests as tests which are usually microscopic in size, commonly made of calcium carbonate, more rarely of sand, foreign particles of chitin, and which consist of one or more chambers. A.G.I. b. A subclass of the sarcophagida, a group of animals mostly of microscopic size that secrete tests, composed of calcium carbonate or build them of cemented sedimentary grains, that consist of one to many chambers arranged in a great variety of ways. Most of them are marine. They range from the Ordovician period to the Recent. A.G.I. Supp. They are important microfossils in well logging, because of their long range, their wide distribution, and their small size which permits their recovery as complete fossils from well cuttings. Bureau of Mines Staff.

forshee. A dull, grayish-white, hydrous nickel-cobalt arsenate, Ni(As,Co)3(AsO4)2(BO3)2, having a monoclinic structure. From Atacama, Chile. Fay.

forebasalt. A dull, grayish-white, hydrous nickel-cobalt arsenate, Ni(As,Co)3(AsO4)2(BO3)2, having a monoclinic structure. From Atacama, Chile. Fay.

force. Influence which, when brought to bear on a body, changes its rate of momentum. Attractive, accelerating, repulsive. Measured in dynes (centimeter, gram, second) or poundals.

Force = \( \frac{\text{Mass} \times \text{velocity}}{\text{time}} \)

forces. A structure similar to ball-and-pillow structure. See also ball-and-pillow structure. Pettjohn.

forced draft. A system in which the duct delivers the intake air to the face. The outstanding advantage of this system is that the air leaves the duct at considerable velocity and can be made to sweep the face without the duct being extended unduly close to it. The forced system may be used with flexible ducting and simplifies arrangements for protecting the duct from blasting. For use in colleries the forcing system has the added advantage that the fan motor always works in intake air, and no special arrangements are necessary. Lamont, 1, p. 21-22.

forced-caving system. A stoping system in which the ore is broken down by large blasts into the stopes that are kept partly full of broken ore. The large blasts break ore both directly into the stopes and have the further effect of shattering additional ore, part of which then caves. B.Mines Bull. 410, 1928.

forced-cut meander. A meander in which deposition on the inside of the meander equals erosion on the outside of the meander. Consequently, the width of the channel remains constant. A.G.I. Supp.

forced drop shaft. Method of sinking shaft through waterlogged ground by means of series of caissons forced down by means of compressed air. Developed in Germany and now superseded. Pryor, 3.

forced production. To work a mine so as to make it produce a greater output than can be maintained. Fay.

forced ventilation. A system of ventilation in which the fan forces air through the workings under pressure. R.S. 3618, 1963, sec. 2.

forced vibration. A system similar to that of a magnetic field represented by lines of force. Spalding.

force of blow. The effective diameter of the piston or hammer, its weight, distance of travel and the air pressure during the forward movement. The energy of the blow in foot-pounds is equal to:

\[ \frac{1}{2}M \nu^2 = \frac{W \nu^2}{\text{pounds}} \]

where \( M \) = the mass; \( W \) = the weight in pounds; \( \nu \) = the velocity in foot per second. Lewis, p. 91.

force of crystallization. The force by which a growing crystal tends to develop its own crystal form against the resistance of the
force of crystallization

surrounding solid mass. Schieferdecker.

force for (or drive) oscillator. An instrument to determine the resonant frequency of a crystal. A slowly varying frequency is applied to the crystal from a signal generator and the resonant frequency voltage developed across the crystal is measured with a vacuum tube voltmeter. AM, 1.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.

force pump. a. A pump consisting of a plunger or ram, the up-stroke of which causes the suction valve to open and the water to rise in the suction pipe. On the down-stroke of the plunger, the suction valve closes and the contained water is forced through the delivery valve into the rising main or discharge pipe. Nelson, b. A pump in which the water is lifted by the force of atmospheric pressure against a vacuum. Crittin, c. A pump that forces water above its valves. Zern.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.

force pump. a. A pump consisting of a plunger or ram, the up-stroke of which causes the suction valve to open and the water to rise in the suction pipe. On the down-stroke of the plunger, the suction valve closes and the contained water is forced through the delivery valve into the rising main or discharge pipe. Nelson, b. A pump in which the water is lifted by the force of atmospheric pressure against a vacuum. Crittin, c. A pump that forces water above its valves. Zern.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.

force pump. a. A pump consisting of a plunger or ram, the up-stroke of which causes the suction valve to open and the water to rise in the suction pipe. On the down-stroke of the plunger, the suction valve closes and the contained water is forced through the delivery valve into the rising main or discharge pipe. Nelson, b. A pump in which the water is lifted by the force of atmospheric pressure against a vacuum. Crittin, c. A pump that forces water above its valves. Zern.

force pump. a. A pump consisting of a plunger or ram, the up-stroke of which causes the suction valve to open and the water to rise in the suction pipe. On the down-stroke of the plunger, the suction valve closes and the contained water is forced through the delivery valve into the rising main or discharge pipe. Nelson, b. A pump in which the water is lifted by the force of atmospheric pressure against a vacuum. Crittin, c. A pump that forces water above its valves. Zern.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.

force pump. a. A pump consisting of a plunger or ram, the up-stroke of which causes the suction valve to open and the water to rise in the suction pipe. On the down-stroke of the plunger, the suction valve closes and the contained water is forced through the delivery valve into the rising main or discharge pipe. Nelson, b. A pump in which the water is lifted by the force of atmospheric pressure against a vacuum. Crittin, c. A pump that forces water above its valves. Zern.

force piece. Timber placed diagonally across a shaft or drift for securing the ground. Fay, b. See forest. Pryor, 3.
foreset bed. One of the series of inclined layers formed as new sediment moves down the slope of a delta. See also bottomset bed; topset bed. Fay. b. One of the inclined, internal, systematically aranged layers of a crossbedded unit. Pettijohn.

foresight. a. A sight on a new survey point, usually measured with a transit or total station. Seely., 2. d. In leveling, the location station. Sey., 2. e. To sight on a foresight point. It is a practice to sight upon the ground after the expiration of the time within which the annual labor may be done, and completes a location before resuming work by the original locator. Fay. A foresighting or a foresight is often called a minus sight because the point to be sighted is below the horizon line.

foreshore sinking. The first 150 feet or so of shaft sinking from the surface, during which time the plant and services for the main shaft sinking are installed. Sometimes, the main sinking contract does not commence until the foreshaft has been completed. Nelson.

foreshift. a. In coal mining, first or morning shift. Pryor, 3. b. Eng. The first shift of boyers (miners) when going into the mine from 2 to 3 hours before the drivers and loaders, Fay.

foreshock. a. One of the initiating shocks preceding the principal earthquake. Schiller-decker. b. An earthquake which precedes a larger earthquake within a fairly short time interval (a few days or weeks), and which originates at or near the focus of the larger earthquake. A.G.I.

foresight bib. A stake or mark placed by a locator. Merstreau, 4th, p. 443.

forge. a. An open fireplace or hearth with forced draft, for heating iron, steel, etc.; as, blacksmith's forge. Compare anvil. Standard, 1964. b. A hearth or furnace for making wrought iron direct from the ore; a bloomery. Standard, 1964. c. Eng. That part of an ironworks where bars are squeezed and hammered and then drawn out into puddle bars by grooved rolls. Fay. d. To form by heating in a forge or hammering; to beat into some particular shape, as a mass of metal. Fay. e. A plant where forging is carried out. A.G.I.

forge cinder. The dross or slag from a forge or bloomery. Fay.

forge iron. Pig iron used for the charge of a puddling furnace. Menzies, 4th, p. 443.

forge master. The owner or superintendent of a forge or ironworks. Fay. forge pig. Pig iron suitable for the manufacture of wrought iron. C.T.D.

forge roll. One of the rolls of which a slab or bloom of metal is converted into puddle bars. Fay.

forge scale. A loose coating of oxide which forms on heated iron during the process of forging; hammer scale. Standard, 1964.

forge train. In iron puddling, the series of two pairs of rolls by means of which the flat bloom is converted into bars. Fay.

forge welding. A group of welding processes in which the parts to be joined together are heated to a plastic condition in a forge and are welded together by applying pressure or blows. Ham.

forging. Plastically deforming metal, usually hot, in a forging press or by other means under compressive force, with or without dies. ASM Gloss.

forging press. A press, usually vertical, used to deform a plastic material. Mechanical presses are used for smaller closed die forgings; hydraulic or steam hammers, for larger forgings. Standard, 1954. Also larger closed die forgings. ASM Gloss.

forging range. Temperature range in which a metal can be forged successfully. ASM Gloss.

forging rolls. A machine used in roll forging. Also called gap rolls. ASM Gloss.

formaldehyde. a. A colorless gas with a pungent odor; poisonous in the concentrated state. Standard, 1964. b. A clear, colorless liquid with a pungent odor; poisonous in the concentrated state. Standard, 1964. c. Formaldehyde; oxymethylene; oxemethane; formic aldehyde; methanal. Colorless; gas; HCHO; sulfocating pungent odor; poisonous in the concentrated state. Standard, 1964. d. A tool used for charging buckets. Fay. e. A prop with a Y-shaped end. Fay. f. An appliance used in free-fall systems of drilling which serves to hold up the string of tools during connection and disconnection of the rods. Fay. f. Eng. To pump water out of a mine. A mine is said to be in fork, or a pump to have the water in fork, when all the water is drawn out of the mine. Webster, 2d. g. A tool with a long wooden handle and prongs for loading lump coal. C.T.D. h. A double-angled clip or pin by which the weight of a rope or chain is borne by the yoke. Fay. i. One of the major bifurcations of a stream; a branch. A.G.I. j. In seismic instruments, a tuning fork of a precisely known frequency used to record time lines on seismograms. A.G.I. k. A strong fork of two or more prongs used to slip under a stack of bricks and lift and transport the stack. ACSC, 1963.

forked center. A center with taper or straight shank and V-head for holding cylindrical objects in position during drilling and other operations. Criptin.

fork-filled. Aust. Coal filled into skips with a fork, having the prongs about 1 1/4 inches apart. This separates the bulk of the stack from the round coal, which should not contain more than 10 percent of fine coal. Fay.

forkhead. A wheel-guiding frame with a swivel connection to the machine or vehicle that rests on it. (A caster frame.) Nickols.

forklift truck. A power-driven truck having a forward-projecting steel fork. It is used to raise, transport, and lift heavy packages, sometimes contained on a pallet for stacking or loading at a height. Ham.

fork-the-hole. To drill a second hole from some point within a completed borehole by definition methods and equipment. Lang.

fork truck. An industrial truck provided with a brick fork for transporting brick. ACSC, 1963.

form. a. All the faces of a crystal that have a like position relative to the planes of symmetry, the axes of symmetry, etc. All those planes, edges, and angles which are required by the symmetry of crystal when one of them is present. Fay. b. In seismic instruments, a tuning fork of a precisely known frequency used to record time lines on seismograms. A.G.I. c. One of the major bifurcations of a stream; a branch. A.G.I. d. A prop with a Y-shaped end. Fay. e. A tool used for charging buckets. Fay. f. A prop with a Y-shaped end. Fay. g. An appliance used in free-fall systems of drilling which serves to hold up the string of tools during connection and disconnection of the rods. Fay.
formaldehyde

as an aqueous solution, with or without methanol, which acts as an inhibitor of the polymerization process. It is held to be releasing agent, as in the recovery of gold and silver, and as a corrosion inhibitor in oil wells. CCD 64, 1961.

formanite. A moderately radioactive, tetragonal mineral, (U,Zr, Th, Ca), (Ta, Nb, Ti) O., containing much more tantalum than columbium. It is an end-member of the isomorphous fergusonite-formanite series which occurs in granite pegmatites, especially those rich in rare earths, columbium, tantalum, and beryllium; it is frequently found in metamict mineral in placer deposits. On fresh surfaces, it is brownish-black or velvety black. Alteration results in an externally gray, yellowish-brown, or grey-green color; it is slightly brittle, with a conchoidal fracture.

format. An informal rock stratiographic unit bounded by marker horizons believed to be isochronous surfaces that can be traced across facies changes, particularly in the subsurface, and used for correlations between areas. The use of the stratiographic section is divided into different formations that do not correspond in time value. A.G.I. Supp.

formation. As defined and used by the U.S. Geological Survey, the ordinary unit of geologic mapping consisting of a large and persistent stratum of some one kind of rock. Also, it is loosely employed for any and persistent stratum of some one kind of medium, such as water. A.G.I. Supp.

formation drilling. Boreholes drilled primarily to determine the structural, petrologic, and geophysical characteristics of the overburden and the rock strata penetrated. Also called formation testing. Long.

formation factor. The electrical resistance of a rock saturated with an electrolyte, divided by the resistivity of the electrolyte. There is an inverse linear relationship between the formation factor and the porosity and permeability of the rock. Also known as the formation resistivity factor. A.G.I.

formation fracturing; hydraulic fracturing. A technique to open up cracks in an oil reservoir rock, which allows the application of high hydraulic pressure and the injection of a propping agent, such as sand, into the reservoir fractures to increase the overall permeability of the rock. Institute of Petroleum, 1961.

formation level. Level of the ground surface after completion of excavation. Ham.

formation resistivity factor. The ratio of the resistivity of the overlying rock to the resistivity of the saturating water in a completely water-saturated clean rock. Institute of Petroleum, 1956.

formation room. A room in a cave where there is an unusual amount of cave formation or a room having dripstone in a cave that is otherwise barren of it. A.G.I.

formation strata. Color bands in synthetic corundum or spinel, which, since they are always distinctive and almost always curved, differ from the straight color zones in genuine. Also called formation striae. Shipley.

formation testing. a. Synonym for formation drilling. Long. b. Measurements made in a borehole to record the porosity, oil production capabilities, etc., of a specific stratum or horizon through which the borehole has been drilled. Long.

form contour. A topographic contour determined by stereoscopic study of aerial photographs without ground control or by other means not involving conventional surveying. A.G.I. Supp.

form energy. The potentiality of minerals to develop crystalline form within a solid medium, known as a rock. A.G.I. Supp.

form factor. The term pertains to a beam section of given shape and mass that has the modulus of rupture of a beam having that particular section to the modulus of rupture of a beam otherwise similar but having a square cross section adopted as a standard. This standard section is usually taken as rectangular or square; for wood it is a 2-by-2-inch square with edges horizontal and vertical. The term is also used to mean the ratio, for a given maximum bending moment, to the actual resisting moment of a wide-flanged beam to the resisting moment the beam would develop if the flanges were uniformly distributed across the entire width of the flanges. So used, the term expresses the strength-reducing effect of shear lag. No.

form grinding. Grindling with a wheel having a contour on its cutting face that is mating to the desired form. A.G.I. Supp.

formic acid; median acid; hydrogen carbonyl acid. Colorless; fuming; liquid; HCOOH; pungent penetrating odor; dangerous; caustic; soluble in water, in alcohol, and in ether; specific gravity, 1.2201 (at 20°C) referred to water at 4°C; boiling point, 100.8°C. Used in electroplating; in silvery glass; and in ore flotation. C.C.D. 1961.

formation. a. The shaping of hot glass. ASTM C162-66. b. The shaping or molding of ceramic ware. ASTM C242-60T.

forming hood. The chamber of the forming equipment in which glass fibers are formed and collected. ASTM C162-66.

forming rolls. Rolls used in forming flat glass. ASTM C162-66.

formico. German name for a variety of incoherent brown coal, apparently without any cementing material whatsoever. It is suggested that this coal was formed through the redeposition of the original coal. Same as feinkohle; kohlkohle; rieselkohle. Tomkneif, 1854. See also crumbly coal.

form lining. Selected materials used to line the concrete face of formwork, in order to impart a smooth or a patterned finish to the concrete surface. Ham.

formation. Oil. Oil or emulsion used to minimize the sticking of concrete to molds. Institute of Petroleum, 1961.

formosa marl. A high grade of marble of a dark gray and white color, variously mottled and bloomed with yellow and red, from Nassau, Germany. Fay.

form stop. The end of a section of shuttering for concrete. Ham.

form stripper. In concrete products industry, a laborer who removes wooden or steel forms from concrete walls, beams, molded concrete products, or similar concrete work after the concrete has hardened. Also called crew stripper; form wrecker; rod puller. D.O.T. 1.

form tool. A single-edge nonrotating tool, circular or flat, that produces its inverse or reverse form counterpart upon a workpiece. A.S.M. Gloss.

formula weight. The weight, formula, or mole. Prior. 3.

formula weight. The weight, in grams, pounds, or other units, obtained by adding the atomic weights of all the elemental constituents in a chemical formula. Leuvenstein.
formwork. Temporary casing erected to contain concrete during its placing and subsequent hardening. See also concreter; shuttering. Hestr.

formulate. An olive-green basic chromoarsenopyrite. Temporary casing erected to contain concrete during its placing and subsequent hardening. See also concreter; shuttering. Hestr.

formset. An olive-green basic chromoarsenopyrite. Temporary casing erected to contain concrete during its placing and subsequent hardening. See also concreter; shuttering. Hestr.

formset. A characteristic product of formset ware. Any ceramic whiteware for technical application which may have the character of a soil. Schifferdecker. A soil developed upon an old land surface and consisting of the mud-filled stumps of the same trees in an upright position. See also pota. Nelson.

foss. An extensive gneisslyne developed along the margin of a continent. A.G.I. Supp.

foose a. A depression or an unfilled area between the terraced ice contact of glacial sand plains and morainal mounds forming a belt within the ice-covered field. A.G.I. b. A ditch, a moat, or a trench between a glacier and a moraine or a rock wall. A.G.I.

foose lake. A long, narrow depression that is sometimes flooded by a moraine and an outwash plain. It is a remnant of ground moraine upon which the ice stood when the outwash plain was being formed. A.G.I.

fooselicker. a. N. of Eng. A measure of coal (17½ hundredweight), being an ordinary cartload for one horse. Pay. b. Any of the various units of weight for lead; especially a modern unit equal to 19½ hundredweights. Webster 3d.

foostock. Trademark for crystalline ceramic articles made by processing chemically sculptured glass. These products are utilized primarily for high-temperature electronic components such as circuit boards. C.C.D., 1964.

foostock current. In electricity, an eddy current. Webster 3d.

foostock. A condition of the atmosphere of a mine, so contaminated by gases as to be unfit for respiration. Impure. Pay. b. In a coal seam, place where the seam was washed out during development, leaving barren rock. Pay. c. A mine which cannot be worked at all. Pay.

foott. An upright position. See also pots.

foott. A ditch, a moat, or a trench between a glacier and a moraine or a rock wall. A.G.I.

fossil. A term used to cover all the processes involved in the burial of a plant or animal in an accumulating sediment, and in the stage of preservation of the whole, or part or trace of it. Nelson.

fossilite. To turn into a fossil. Webster 3d.

fossilized. Same as petrified wood. Shipley.

fossil wood. Same as petrified wood. Shipley.
fouling. The assemblage of marine organisms that attach to and grow upon underwater objects.

fouling position. The point on any rail beyond which a wagon or mine car cannot proceed. It is becoming an obstruction to another wagon or car traveling on the intersecting rail. Nelson.

fouls. a. Scot. An impurity in a seam; an irregularity in the physical character of a seam, caused, for example, by numerous types or small hitches. Fay. b. Eng. Firedamp. Fay.

found. a. Eng. A condition in which seams are found. a. Eng. When sinking or driving to a seam. Fay. b. Foundershaft. Derb. Marl riddled with fibrous foundations. a. Mid. The shafts, machinery, foundation bolt. A fastener for connecting a structure or machine to a permanent foundation soil. The upper part of the earth foundation wall. That portion of a load-bearing wall below the level of the adjacent grade or below the first floor beams or joists. AGS.

founder. a. Eng. The first shaft sunk upon a vein. From this the miner possesses, and lays out, his group. Fay. b. One who founds or practices the business of founding; one who makes castings; as, an iron founder. Standard. Standard, 1964.

founder breccia. Where beds of soluble rocks have been in part or wholly removed by the chemical action of ground water, founder breccias of the superincumbent beds are produced on a scale commensurate with the extent of the ablation. Synonymous with collapse breccia. A.G.I.

founders. Derb. The first 32 yards of ground worked. Fay.

foundershaft. The first shaft sunk. See also founder. a. Fay.

founders share. The few shares issued to the individuals organizing a stock company. In companies owned outright by other companies, founders shares are issued to as many individuals as are required to incorporate and hold the offices required for corporate management, as the laws do not permit a corporation, which is an artificial person, to form another corporation, or to serve as a director of another corporation. Weed, 1922.

foundering. The act or process of casting metals. Fay.

foundry. A commercial establishment or building where metal castings are produced. ASM Gloss.

foundry clay. A plastic clay of varying reactivity to heat but with good bonding quality, used for mixing with sand to make foundry molds. ASCB, 1. See also fire clay.

foundry coke. a. Coke strong enough to withstand the pressures in cupolas and blast furnaces. Also called metallurgical coke. Hess. b. Coke larger than 2.5 inches. Bennett 2d, 1962.

foundry facings. Finely pulverized materials used in foundries to give the surface of molds a smooth finish, so that castings may be removed easily after cooling. BuMines Bull. 556, 1956, p. 329.

foundry flask. Wooden or metallic container prepared at Heilbronn by fusing rock salt in a two-stage Siemens furnace. On the upper stage the fused salt runs away from most of the impurities. On the lower stage the melt is blown with compressed air, chemically treated, cooled in rotary pans with rakes and annealed to produce food-stuff-quality salt. Kaufmann.

foundry sand. Sand used by founders in making sand molds. Sand molds may be classified broadly as follows: molding sand, core sand, racing sand, molding loam, gravel, high-silica bonding sand, and parting sand. Hess.
underground driving to give all around support to weak ground. A cap is supported by two posts on a sill-piece or sill. Fox. 3.

**four-stage compression.** Air compression in four stages with intercoolers between stages. Ham.

**four-strand rope.** See shroud laid rope. Zern.

**four-stroke cycle.** A cycle in which air or an explosive mixture is drawn into the cylinder of an internal-combustion engine on a suction stroke, is compressed and ignited on a compression stroke, burns and performs useful work on an expansion stroke, and expels the products of combustion on an exhaust or scavenging stroke. Webster 3d.

**four-way dip.** In seismic operations, a dip determined by spreads placed in four directions from a shot point. Three are essential, and the fourth serves as a check. A.G.I.

**four-wheel Jimmie.** Penn. A four-wheel railroad car made of wood. It was the first type of car made for the transportation of anthracite. Fay.

**fowlerite.** A zinc-bearing variety of rhodochrosite. Eng. A long wedge driven between two other wedges with their thick ends placed in the opposite directions. Also called stob-and-feather; plug-and-feather. Fay.

**fox mold. Eng.** A provincial name for the reddish greenish colored by an oxide of iron. Fay.

**fox wedge. Eng.** A long wedge driven between two other wedges with their thick ends placed in the opposite directions. Also called stob-and-feather; plug-and-feather. Fay.

**foxoy.** a. A widely distributed variety of nepheline syenite, which was described originally from the Foya Hills in Portugal. Fay. b. It contains about equal amounts of nepheline and potash feldspar, associated with a subordinate amount of a colored mineral, such as aegirine. C.T.D. b. Synonymous with, and perhaps a preferable name for, nepheline syenite. A.G.I.

**fracrite.** Pertaining to cleavage or breakage, as in a rock. Standard, 1964.

**fracture.** a. A portion of an unconsolidated sediment (such as a recent marine mud), or of a crushed consolidated rock sample (such as a coal sample), or of a crushed ore or mineral sample. The fracture has been separated by some method, and is distinguished from a rock or other portions (or fractures) comprising the whole sample being analyzed. A fracture is comprised of two or more fracture sets. A.G.I. b. The separation of a substance from a mixture. For example, the separation of one isotope from another of the same element. A.G.I. Supp. c. The separation of a particular mineral species from a crushed rock which is a mixture of minerals, or the separation of particles of a specific particle-size range from an unconsolidated sediment which is a mixture of particle sizes. Bureau of Mines Staff.

**fractography.** Descriptive treatment of fracture, especially in metals, with specific reference to photographs of the fracture surface. Macrofractography involves photographs at low magnification; microfractography, at high magnification. ASM Gloss.

**fracture.** a. The character or appearance of a freshly broken surface of a rock or a mineral. The peculiarities of the fracture afford one of the means of distinguishing minerals and rocks from one another. Fay. b. The manner of breaking and the appearance of a mineral when broken. The fracture is a distinctive characteristic for certain minerals; the conchoidal fracture of chalcedony, for example. A.G.I. c. A break in a rock formation due to intense folding or to faulting. A.G.I. d. A break in the continuity of a body of rock not attended by a movement on one side or the other and not oriented to a regular system. BuMin Bull. 587, 1960, p. 2. c. A general term to include any break produced by the action of rock if produced by mechanical failure, whether by sheer stress or tensile stress. Fractures include faults, shears, joints, and planes of fracture cleavage. McKin- try, 1. The nature of the broken surface of a solid substance when this does not follow a cleavage plane. The two most common types of fracture are conchoidal (shell-like), typical of glass, quartz, and to a lesser extent of some other siliceous and birefringent minerals, such as jade, show a splintered fracture. Anderson, a. A break in the enamel surface with the enamel being removed. Bryant, 1. Hard-rock explosive. Pryor, 3.

**fractionate.** To separate (a mixture, as a liquid, by distillation) into fractions having more or less fixed properties but not necessarily definite compounds. Applied also to mixtures of rare earths. Standard, 1964.

**fractionating column.** A vertical tube or column attached to a still and usually filled with rings or interlocked with bubble plates. An internal reflux takes place, resulting in a gradual separation between the high-boiling and low-boiling fractions inside the column, whereby the fraction with the lowest boiling point distill over. The efficiency of the column depends on its length and on the number of bubble plates used. C.T.D.

**fractionation.** a. The act or the process of fractionating (being separated or being divided into fractions), or the state of being fractionated. For example, the crystallization with falling temperature of successive minerals from a silicate magma. Webster 3d. b. The separation of a substance from a mixture. For example, the separation of one isotope from another of the same element. A.G.I. Supp. c. The separation of a particular mineral species from a crushed rock which is a mixture of minerals, or the separation of particles of a specific particle-size range from an unconsolidated sediment which is a mixture of particle sizes. Bureau of Mines Staff.

**fractionating column.** A vertical tube or column attached to a still and usually filled with rings or interlocked with bubble plates. An internal reflux takes place, resulting in a gradual separation between the high-boiling and low-boiling fractions inside the column, whereby the fraction with the lowest boiling point distill over. The efficiency of the column depends on its length and on the number of bubble plates used. C.T.D.

**fractionation.** a. The act or the process of fractionating (being separated or being divided into fractions), or the state of being fractionated. For example, the crystallization with falling temperature of successive minerals from a silicate magma. Webster 3d. b. The separation of a substance from a mixture. For example, the separation of one isotope from another of the same element. A.G.I. Supp. c. The separation of a particular mineral species from a crushed rock which is a mixture of minerals, or the separation of particles of a specific particle-size range from an unconsolidated sediment which is a mixture of particle sizes. Bureau of Mines Staff.

fracture cleavage. The capacity to part along cleavage planes, usually in intersecting sets, along which there has been either incipient fracturing or actual fracturing followed by cementation or welding. A system usually implies contemporaneous deformation at any given strain. ASM Gloss.

fracture dome. A variety of black bort from South Africa showing minute brilliant points possibly due to included diamonds. Tomkiew, 1954.

fracture eistem. Group of fractures (faults, cracks, veins) in a rock or mineral. A.G.I.

fracture fluid. A fluid, usually a water-sand mixture that has been broken off their parent rock and introduced into rock fractures or near-fracture, commonly in a single set, but occasionally in intersecting sets. The surfaces of breakage are independent of parallel arrangement of mineral particles. Also it does not pervade the entire mass and affect all particles as does flow cleavage. A.G.I. See also joint. Lenis, p. 593.

fractured. a. Broken by interconnecting cracks. A common structure in limestone oil reservoirs, and refined in some shallower reservoirs. Synonymous with fissured. A.G.I. b. Rock cracked or broken into fragments along planes other than joints or bedding. Long.

fractured formation. See fractured ground. Long.

fractured ground. Rock formation shattered and crazed with fissures and fractures. Compare broken ground. Long.

fracture dome. The fracture dome is the zone of loose or semisemio rock which exists in the immediate hanging or footwall of a vein. In some mines it may extend into the walls for a considerable distance. In a rock burst it becomes greatly extended. Spalding. See also doming.

fractured zone. A mass of rock cut by many small irregular fractures, the mass as a whole being more or less tabular. Stokes and Varnes, 1953.

fracture mesh. A regular meshwork of fractures in two planes developed by shearing. G.S.A. Mem. 50, 1952, p. 29.

fracture porosity. Porosity resulting from the presence of openings produced by the breaking down of an otherwise less pervious rock. A.G.I.

fracture spring. A spring, the water of which flows from relatively large openings consisting of joints or other fractures in rocks. A.G.I.

fracture stress. a. The maximum principal true stress at fracture. Usually refers to unnotched tensile specimen. ASM Gloss. b. The (hypothetical) true stress which will cause fracture without further deformation at any given strain. ASM Gloss.

fracture system. Group of fractures (faults, joints, or veins) consisting of one or more intersecting sets, usually intersecting or interconnected. System usually implies contemporaneous age for all of the sets, but vein system is sometimes (as in all veins in a given mine or district regardless of age or origin) McKinstry.

fracture testing. a. Taking a specimen and examining the fractured surface with the unaided eye or with a low-power microscope. b. Determining things such as position, grain size, case depth, soundness, or presence of defects. ASM Gloss.

fracture wear. The wear of individual grains and interlocking wheel fractures, as well as fracture of the bond posts holding the grains in place. ASM Gloss.

fracture. a. The process of breaking a fluid-bearing strata by injecting a fluid under such pressure as to cause parting in the strata rock. A.G.I. b. The process of increasing the permeability of strata near a mineralized zone by injection of a fluid and sand under high pressure. The hydraulic pressure opens cracks and bedding planes, and the sand introduced into them serves to keep them open when the pressure is reduced. A.G.I. Supp.

frame, Brittle, easily broken or destroyed. Hauyn.

fracture cleavage. a. The capacity to part along closely spaced, parallel surfaces of fracture or near-fracture, commonly in a single set, but occasionally in intersecting sets. The surfaces of breakage are independent of parallel arrangement of mineral particles. Also it does not pervade the entire mass and affect all particles as does flow cleavage. A.G.I. See also joint. Lenis, p. 593.

fractured. a. Broken by interconnecting cracks. A common structure in limestone oil reservoirs, and refined in some shallower reservoirs. Synonymous with fissured. A.G.I. b. Rock cracked or broken into fragments along planes other than joints or bedding. Long.

fractured formation. See fractured ground. Long.

fractured ground. Rock formation shattered and crazed with fissures and fractures. Compare broken ground. Long.

fracture dome. The fracture dome is the zone of loose or semisemio rock which exists in the immediate hanging or footwall of a vein. In some mines it may extend into the walls for a considerable distance. In a rock burst it becomes greatly extended. Spalding. See also doming.

fractured zone. A mass of rock cut by many small irregular fractures, the mass as a whole being more or less tabular. Stokes and Varnes, 1953.

fracture mesh. A regular meshwork of fractures in two planes developed by shearing. G.S.A. Mem. 50, 1952, p. 29.

fracture porosity. Porosity resulting from the presence of openings produced by the breaking down of an otherwise less pervious rock. A.G.I.

fracture spring. A spring, the water of which flows from relatively large openings consisting of joints or other fractures in rocks. A.G.I.

fracture stress. a. The maximum principal true stress at fracture. Usually refers to unnotched tensile specimen. ASM Gloss. b. The (hypothetical) true stress which will cause fracture without further deformation at any given strain. ASM Gloss.

fracture system. Group of fractures (faults, joints, or veins) consisting of one or more intersecting sets, usually intersecting or interconnected. System usually implies contemporaneous age for all of the sets, but vein system is sometimes (as in all veins in a given mine or district regardless of age or origin) McKinstry.

fracture testing. a. Taking a specimen and examining the fractured surface with the unaided eye or with a low-power microscope. b. Determining things such as position, grain size, case depth, soundness, or presence of defects. ASM Gloss.

fracture wear. The wear of individual grains and interlocking wheel fractures, as well as fracture of the bond posts holding the grains in place. ASM Gloss.

fracturing. a. The process of breaking a fluid-bearing strata by injecting a fluid under such pressure as to cause parting in the strata rock. A.G.I. b. The process of increasing the permeability of strata near a mineralized zone by injection of a fluid and sand under high pressure. The hydraulic pressure opens cracks and bedding planes, and the sand introduced into them serves to keep them open when the pressure is reduced. A.G.I. Supp.

free coal
free crushing. Crushing under conditions of speed and feed such that there is plenty of room for the fine product to escape from the coarser part and thereby, escape further fine crushing. See also choke crushing.

free-cutting brass. Alpha-beta brass containing about 2 to 3 percent lead, to improve the machining properties; used for brazeable brass and bronze machine w. t. 1.7-2.5.

free-cutting steel. Steel in which the phosphorus is increased to 0.15 percent and the sulfur to 0.25 percent, to obtain a certain degree of brittleness which facilitates rapid machining. C.T.D.

free cyanide. The cyanide not combined in complexes ions. ASM Class.

freedom, degree of. Variance—number of independent variables in a system which must be relatively fixed in order to define it clearly. Fay.

free energy. (F) or thermodynamic potential F = H - T S where H is enthalpy, T is temperature, and S, entropy. Not measurable directly, but measures the change in the state of materials in the immediate vicinity of the surface. Lewis, pp. 611-612.

free fall. a. An arrangement by which, in the vicinity of a shothole at which the rock is free to move under the force of the explosion. B.S. 3618, 1964, sec. 6. c. Moisture removable by air-drying under standard conditions. Also called surface moisture. B.S. 3552, 1962.

free field stress. The stresses existing in rock before the excavation of any mine opening. In general, these stresses are known to be influenced primarily by the weight of the overburden material, the region of the opening of the rock masses around it (depth of overburden, etc.), by the physical characteristics of the surrounding rock, and by tectonic forces. An hypothesis for stress fields existing in underground openings before mine opening was proposed by R. D. Mindlin in 1939. This hypothesis assumes that stresses within the earth at different depths may be approximated by one of three stress fields. They are: (1) hydrostatic stresses acting on each unit of the solid, a state of materials at depth probably greater than those now mined; (2) lateral restraint accompanying the application of the gravitational field, an approximation of the forces acting at an intermediate depth within the earth; and (3) no appreciable lateral restraint on a unit of the solid, the state of some materials in the immediate vicinity of the surface. Lewis, pp. 611-612.

free flow. a. A condition of flow through or around a structure not affected by the tailing. See free circulation.

free-falling device. A sliding piece in permanent motion; a pulley with no stops. Fay.

free-fall MB. Synonym for churn doll.

free-fall ore. Ore containing gold which can be caught with quicksilver. Statistical Research Bureau.

free-fall gold. Gold with so clean a surface that it readily amalgamates with mercury after liberation by comminution. Pryor 4.

free gold. Free uncombined gold. Gaudin, p. 70.

free gold or silver. And can be reduced by crushing and amalgamation, without roasting, or other chemical treatment. Fay.

free milling gold. Gold with so clean a surface that it readily amalgamates with mercury after liberation by comminution. Pryor 4.

free miner. a. Can. A person or association holding a license and thereby authorized to prospect on unoccupied lands and to carry on mining operations subject to any other conditions imposed by the law. A licensed miner. White 3d. b. Forest of Dean. A man born within the Hundred of St. Briavels, in the county of Gloucester, who has worked a year and a day in a mine. Fay.

free moisture. a. Moisture in coal that can be removed by ordinary air drying. Compare combined moisture. Cooper, p. 397. b. The part of the total moisture which is lost when a coal is attaining approximate equilibrium with the atmosphere to which it is exposed. B.S. 3323, 1960. c. Moisture not removed or absorbed by aggregate. Taylor. d. See moisture content. Nelson.

c. Moisture removable by air-drying under standard conditions. Also called surface moisture. B.S. 3552, 1962.

free needle survey. Traverse by magnetic compass and line measurement. See also fast needle survey. Pryor 3.

free on board. a. Price of consignment to customer when delivered with all prior charges paid, onto a ship. Pryor, 3. b. Free on rail (f.o.r.) describes similar delivery to rail. Pryor 3.

free period of a seismograph. The time for one complete swing of the seismograph mass when all damping is removed and the earth is quiet. A.G.I.

free piston compressor. A compressor of modern design without any important rotating parts. Hem.

free piston drive. a. A drive sample or compressor. A drive-sample compressor. A compressor of modern design without any important rotating parts. Hem.

free rock. rock is free to move under the force of the explosion. Fay.

free illustration. A category of instruments applicable to any machine designed to initially sink to the bottom, release the heavy ballast weights, and then float back to the surface where they can be retrieved with their acquired load (for example, a sediment core).

free milling. Applied to ores which contain free gold or silver, and can be reduced by crushing and amalgamation, without roasting, or other chemical treatment. Fay.

free milling gold. Gold with so clean a surface that it readily amalgamates with mercury after liberation by comminution. Pryor 4.

free milling ore. Ore containing gold which can be caught with quicksilver. Statistical Research Bureau.

free moisture. a. Moisture in coal that can be removed by ordinary air drying. Compare combined moisture. Cooper, p. 397. b. The part of the total moisture which is lost when a coal is attaining approximate equilibrium with the atmosphere to which it is exposed. B.S. 3323, 1960. c. Moisture not removed or absorbed by aggregate. Taylor. d. See moisture content. Nelson.

c. Moisture removable by air-drying under standard conditions. Also called surface moisture. B.S. 3552, 1962.

free needle survey. Traverse by magnetic compass and line measurement. See also fast needle survey. Pryor 3.

free on board. a. Price of consignment to customer when delivered with all prior charges paid, onto a ship. Pryor, 3. b. Free on rail (f.o.r.) describes similar delivery to rail. Pryor 3.

free period of a seismograph. The time for one complete swing of the seismograph mass when all damping is removed and the earth is quiet. A.G.I.

free piston compressor. A compressor of modern design without any important rotating parts. Hem.

free rock. rock is free to move under the force of the explosion. Fay.

free illustration. A category of instruments applicable to any machine designed to initially sink to the bottom, release the heavy ballast weights, and then float back to the surface where they can be retrieved with their acquired load (for example, a sediment core).

free milling. Applied to ores which contain free gold or silver, and can be reduced by crushing and amalgamation, without roasting, or other chemical treatment. Fay.

free milling gold. Gold with so clean a surface that it readily amalgamates with mercury after liberation by comminution. Pryor 4.

free milling ore. Ore containing gold which can be caught with quicksilver. Statistical Research Bureau.

free moisture. a. Moisture in coal that can be removed by ordinary air drying. Compare combined moisture. Cooper, p. 397. b. The part of the total moisture which is lost when a coal is attaining approximate equilibrium with the atmosphere to which it is exposed. B.S. 3323, 1960. c. Moisture not removed or absorbed by aggregate. Taylor. d. See moisture content. Nelson.

c. Moisture removable by air-drying under standard conditions. Also called surface moisture. B.S. 3552, 1962.

free needle survey. Traverse by magnetic compass and line measurement. See also fast needle survey. Pryor 3.

free on board. a. Price of consignment to customer when delivered with all prior charges paid, onto a ship. Pryor, 3. b. Free on rail (f.o.r.) describes similar delivery to rail. Pryor 3.
free-running piston. A piston not connected with a rod, that does its work by hammer-like blows. Nichols.

free settling. As opposed to hindered settling in classification, free fall of particle through fluid media. Pryor, p. 6.

free share. A certain proportion of a royalty on coal, paid to lessee by lessee. Fay.

free silica. Quartz occurring in granites. Mason, v. 1, p. 11.

free sound field. A field in a homogeneous, isotropic medium free from boundaries. In practice it is a field in which the effects of the boundaries are negligible over the region of interest. Hy.

free way. In parallel flow, the branch with the highest drop originally. Houtman, pp. 131-132.

freeze. a. Rock, especially a sandstone, that may cut freely in any direction without a tendency to split. Fay. b. A sandstone which breaks freely. A.G.I.

free vibration. Vibration occurring at the natural frequency of a structure, as distinct from forced vibration. Ham.

free wall. The wall of an ore vein filling the space in which sample specimens are put in a special refrigeration unit and exposed to repeated cycles of freezing and thawing to determine potential damage. These tests are widely used by highway departments and in private construction. AIME, p. 289.

free-wheeling. of water. a. Water that is free to move through a soil mass under the influence of gravity. Also called gravitational water; ground water; phreatic water. A.SCE P1826. b. Water in soil in excess of hygroscopic and capillary water; also termed gravity water. Stetly, 1. c. The quantity of water removed in drying a solid to its equilibrium water content. NRC-ASA N1-1957. d. See held water. Pryor, 3.

free-water elevation; water table; ground water surface; ground water level. The elevation at which the pressure in the water is zero with respect to the atmospheric pressure. Also called free-water surface. A.SCE P1826.

free-water level. The surface of a body of water in contact with the atmosphere, that is, when water pressure is zero. NRC-ASA N1-1957.

free way. A direction of easy splitting in a rock. Fay.

freeze. a. A wein that is not submerged—this is, in which tail water is below the crest of the flow is in nowise affected by the elevation of the tail water. Stetly, 1. free-wheeling the wein. Consists of a series of rollers or cams tending to roll free when rotated in one direction and to roll into positive driving contact when rotated in the other direction. The action is fully automatic. This type is used when the driving member must be rotated ahead of the driving member, as in two-speed drives, or where two independent sources of power are used. Pit and Quarry, 33rd, 560.

freezing; freezing; frozen. a. To permit drilling tools, casing, drivepipe, or drill rods to pass through a borehole by removal of caving walls or impaction of sand, mud, or drill cuttings, to the extent that they cannot pile up and clog. Also called free-settling. Long. b. To burn in a bit. See also burn-in, a. Long. c. The premature setting of cement, especially when dull hardens before it can be ejected fully from pumps or drill rods during a borehole-cementation operation. Long. d. The act or process of drilling a borehole utilizing drill fluids with a temperature of minus 30° to minus 40° F, as a means of consolidating, by freezing, the borehole walls and/ or core. A.SCE P1826. e. A water saturated formation, such as sand, gravel, etc. Long. f. To solidify, as of a molten charge in a furnace. Werd, 1922.

freeze casting. A process for making intricate shapes of special ceramic material, for example, surfac-supercharger blades. Refractory powder, with a small proportion of binder, is made into a thick slip, which is cast into a mold and then frozen, the cast is then dried and sintered. Dodd.

freeze-in. a. Used in much the same sense as freeze, a and b. Applicable when drill rods become fastened by solidification or freezing of the drilling fluid in a borehole drilled in a soft formation. Long. c. To become or be fixed in ice. Long. d. Synonym for freezeup. Long.

freeze proofing. A surface treatment, as with calcium chloride solution, to prevent or reduce cohesion of coal particles by ice formation during freezing weather. B.S. 155, 1962.

freeze sinking. Use of circulating brine in system of pipes to freeze waterlogged strata in which shafts can be sunk through them, established and lined. Priy, 3.

freeze-thaw tests. Tests performed on crushed stone in which sample specimens are put in a special refrigeration unit and exposed to repeated cycles of freezing and thawing to determine potential damage. These tests are widely used by highway departments and in private construction. AIME, p. 289.

freeze-up. a. The process and/or season of the year when surface waters become frozen with no prospect of thawing for the remainder of the winter. Long. b. Can. The descent of winter when waterways are frozen. Hoffman, c. In ball milling, the theoretical rate of revolution at which the contents of the mill are centrifugally held at the circumference. Priy, p. 289.

freezing. Consolidation of fine-grained waterlogged soil, enabling excavation to proceed normally. The method consists of the following stages: (1) forming a protective wall of ice, with its base in an impermeable layer; (2) forcing the ice wall until the sinking and lining of the shaft has been completed; and (3) thawing the ground without damage to the shaft. The freezing method has been revived, largely due to the successful use of bulk concrete, backed by concrete sheets in place of tubing, for lining the shaft through the frozen ground. This is followed by water grouting. Freezing was introduced originally in 1883 by F. H. Poetsch. See also chemical soil consolidation; silicatization process. Nelson.

freezing overburden. See freeze, d. Long.

freezing point. a. The temperature at which a liquid solidifies. Pure water has its freezing point at 0° C or 32° F under normal atmospheric pressure. A.G.I. b. The freezing point of sea water is that temperature where an infinitely small amount of ice is in equilibrium with the solution. This initial freezing point depends on the chlorinity of the sample. Hy.

freezing process. See freeze, d. Long.

freezing salt. Coarse rock salt, to be mixed with crushed ice as a refrigerant. Keal.

Fremont amalgamation. See barrel process. Fay.

freeborehole. A variety of fahlore containing up to 18 percent silver; usually steel-gray, sometimes iron-black; streak reddish; speckled; cavities; mottled. Chile. Unsatirnized lattamite. Dehottay process. Ham.

freeze-fa. a. Used in much the same sense as freeze, a and b. b. freezer, d. See also freeze, a and b. c. Freezer, d. See also freeze, a and b. d. Freezing point. a. The temperature at which water, or any other substance, changes from the liquid to the solid state. Hy. b. The freezing overburden. See freeze, d. Long. c. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy. d. See also freeze, a and b. e. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy. f. See also freeze, a and b. g. Freezing point. a. The temperature at which water, or any other substance, changes from the liquid to the solid state. Hy. b. The freezing overburden. See freeze, d. Long. c. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy. d. See also freeze, a and b. e. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy. f. See also freeze, a and b. g. freezer, d. See also freeze, a and b. h. Freeze-fa. a. Used in much the same sense as freeze, a and b. b. See also freeze, a and b. c. Freezer, d. See also freeze, a and b. d. Freezing point. a. The temperature at which water, or any other substance, changes from the liquid to the solid state. Hy. b. The freezing overburden. See freeze, d. Long. c. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy. d. See also freeze, a and b. e. Frost point. The temperature at which water, or any other substance, changes from the solid to the liquid state. Hy.

fremontite. A lavender to turquoise-blue basic hydroxysulfate of aluminum, sodium, and calcium, 6(Ca,Na)O.12Na2O.2CaO.6H2O. Frequently tetragonal; fine flakes. Formerly called lavendulan, from which mineral it is distinct. Department of Freirini, Chile. English.

fremontite etching reagent. An etchant consisting of 10 grams of iodine and 20 grams of potassium iodide in 100 milliliters of water. Osborn.

fremontrite. A white sodium montebraite. A hydrofluophosphate of aluminum, sodium, and lithium, Na(Li)(OH)(F,PO₄); monoclinic or triclinic. See also crystal forms. Osborn.

freeborehole. A variety of fahlore containing up to 18 percent silver; usually steel-gray, sometimes iron-black; streak reddish; speckled; cavities; mottled. Chile. Unsatirnized lattamite. Dehottay process. Ham.

fremontite etching reagent. An etchant consisting of 10 grams of iodine and 20 grams of potassium iodide in 100 milliliters of water. Osborn.

freeborehole. A white sodium montebraite. A hydrofluophosphate of aluminum, sodium, and lithium, Na(Li)(OH)(F,PO₄); monoclinic or triclinic. See also crystal forms. Osborn.

fremontite etching reagent. An etchant consisting of 10 grams of iodine and 20 grams of potassium iodide in 100 milliliters of water. Osborn.

fremont test. A type of impact test in which a beam specimen notched with a rec-
tangular groove is broken by a falling weight. C.T.D.

French cliff. A variety of soapstone or steatite. See also talc. C.T.D. 66, 1961.

French cliff. A hard variety of chalk found in the French limestone and in the chalk land in the manufacture of blasting powder. Hest.

French drainage. A covered ditch containing a layer of fitted or loose stone or other pervious material. Nichols.

French process. A process in which zinc is distilled in the vapor burned to produce the oxide; the purity of the oxide is controlled by the purity of the metal. This process is used for making pharmaceutical-grade zinc oxide. Newton, p. 762.

3d. The number of complete waves which pass a given point per second, or the number of complete vibrations per second, or revolutions per second, made by a vibrating particle. A.G.I. c. In electricity, the number of cycles per second, and depends on the number of pairs of poles, that is, north and south, that a coil passes per second. This is therefore equal to the number of revolutions per second of the generator multiplied by the number of pairs of poles in the field. Mason, v. 2, p. 419.

d. Rate of vibration or alternation of a steadily oscillating system. Pryor, 3.

c. Rate of vibration or alternation of a steadily oscillating system. Pryor, 3.

French air. An adjective applied to rocks and rock materials in a variety of ways. It usually designates a rock surface newly exposed by fracturing, and it means that the surface thus exposed has not been subjected to surface weathering and is a more or less unaltered sample of the rock. A mineral in fresh conditions means that it possesses all its physical properties in an unimpaired state. If the primary or original minerals are not altered by subsequent processes, then fresh rock is the result of certain forces acting upon it, it breaks down usually into one or more new minerals, each one in its own way being as fresh as the original mineral. Stokes and Varnes, 1955.

frequent air. Free from the presence of deleterious gases. Pure air. Fay.

fresh-air base. An underground station, located in the intake airway, which is used by rescue teams during underground fires and rescue operations. The base should be as close to the fire as safety will permit, should be adequately ventilated, and should be in constant touch with the surface by telephone. Nelson.

fresh-air breathing apparatus. See air-tube breathing apparatus. McAdams, p. 71.

freshet. A sudden rise in a stream or river, caused by heavy rains or by melting snow in the mountains or highlands. Fay.

fresh ice. a. Ice formed from fresh water. A.G.I. b. Young ice. A.G.I. c. Ice that has been salty but now is fresh. A.G.J.

fresh water. fresh water. a. Water with less than 0.2 percent salinity. A.G.I. Supp. b. Water which contains little impurities and the taste of which is not appreciably affected by these impurities. Fresh waters often include certain river waters, springs, and deep wells. Such water is usually safe to drink. Cooper, p. 361.

freshwater limonite. a. A limonite formed by direct precipitation in fresh water. A.G.I. b. A thin, dense nodular, relatively unfoliostolithic limestone underlying coal beds. It is often called a freshwater limestone, and Wilson suggested the term underclay limestone. A.G.I. c. Synonym for underclay limestone. D.T.D.

freshwater sediments. Include all the main types of sediments that accumulate in freshwater environments, and be they fresh water, which fractures more readily than regular aluminas but not as readily as white aluminas. See also regular aluminas; white aluminas. ACSG, 1963.

friction. a. A tendency for particles to break down into smaller size (degrade) during storage and handling under the influence of light physical forces. Pryor, 3. b. An assessment of the ease with which a coal can be broken into smaller pieces. J.S. 3323, 1960.

frangible. Easy to break, or crumbling naturally. Descriptive of certain rocks and minerals. Fay. b. A mineral is friable when it may be crumbled between the fingers. Stokes and Varnes, 1955. p. 149. c. Easily crumbled, as a rock that is poorly cemented. A.G.I.

frangible alumina. A medium pure alumina which fractures more readily than regular aluminas but not as readily as white aluminas. See also regular aluminas; white aluminas. ACSG, 1963.

frangible formation. A rock that breaks easily or crumbles naturally, hence a formation from which a good core cannot be obtained easily. Long.

friction. a. A widespread force which slows down motion or causes heat. Mason, v. 1, p. 141. b. A force which opposes the sliding of one surface over another surface. Friction is produced whenever two surfaces are in contact and it is due to the resistance of rubbing. Stimson and Cooper, p. 187. c. A special rubber compound used to impregnate and bond together the plies of the belt carcass. Also used as a
term to express as a measurement the
strength of the ply bond; for example, 16-19 pound friction, which indicates the
necessary force to肖 the plies of a one-
inch test strip. See also coefficient of
friction. ASA MH 4-1958. d. See hydraulic
friction.

frictional electricity. Electricity developed by
rubbing (with a cloth) amber, tourmaline,
topaz, diamond, and some plastic iiinia-
ts. Shipley.

frictional force. The force required to over-
come friction when a set of tires or a run
of wagons is hauled along a level track at
uniform speed. For ordinary pit tugs the
frictional force is about 40 pounds per ton
load, and for mine cars or wagons about
28 pounds per ton load. This resistance is
sometimes called traction. Morris and
Cooper, p. 187.

frictional grip. A mine locomotive relies for
its tractive capacity on the frictional grip
or adhesion which the wheels bear on the
rails of the track, and its tractive capacity on
the wheels and track used. In this context, the
coefficient of friction between wheels and track
is usually termed the coefficient of adhesion.
Nelson.

frictional ignition. The ignition of firedamp
in coal mines by frictional sparks, such as
the rubbing of sandstone against sand-
stone or sandstone against roof bolts. See
also gas ignition. Nelson.

frictional resistance. See friction. Morris
and Cooper, p. 187.

frictional soil. Clean gravel, soil, or sand in
which the shear strength is chiefly deter-
mined by the friction between the par-
ticles. See also Coulomb's equation. Hem.

friction brake. A brake operating by friction
between two surfaces rotating or sliding on
each other. Nichols.

friction breech. Angular rock material pro-
duced by earth movements which crush
and break the rock on the two sides of a fault. Synonymous with fault breccia. Lewis.

friction clutch. A means for engaging the
drive of a press against the crankshaft, the
 torque being transmitted through friction by
forcing together two or more surfaces of
unlike material. ASM Gloss. b. This
clutch consists of four main parts: the
driving hub, the driven hub, the friction
or gripping elements, and the mechanism
which controls the gripping action. The
 gripping element may be an expanding
band to one hub and frictionally en-
gaging the other as controlled, by the lever
and shifter arrangement; or the gripping
elements may consist of one or more fric-
tion plates or disks gripping between alter-
ate friction surfaces, one group rotating
with the driving hub, another with the
driven hub. It is properly termed a clutch
when used to allow the connection of a shaft
between two parts or the clutch hub, and a clutch coupling when
used to connect two shafts. Pit and

friction coefficient. The ratio of the tangen-
tial force of sliding friction between two
surfaces to the force, normal to the sur-
faces, acting between them. See also coe-
ficient of friction. ASA MH 4-1958.

frictional engagements. See crush conglomer-
ate. A.G.I.

friction disk. a. One of a pair of disks on
either side of the gear driving the feed
nut in a gear-feed mechanism. The disks
are held against the gear by compression
springs, the tension of which may be
adjusted to vary the torque which the
disk will slip against to limit an over-
load throwout clutch preventing the bit
from being subjected to more than the
amount of torque determined by the preset
compression applied to the disks by the
compression springs. Long. b. One of the
disks in a clutch used to engage or dis-
engage a motor, at will, from the mech-
nism driven by the motor or engine. Long.

friction element. Some clutches and brakes
for use in sufficient conditions are now lined
with ceramites. Among the materials used
are corundum and sillimanite as the cen-
tral component, and mohs-korund, chromi-
um, iron, and copper slabs as the
metallic bond. Dodd.

friction factor. The friction factor when an
airway is found by determining the drop
in static pressure over a measured length.
Assume that the airstream coming frictionless
at the ends of the test length are A and
B, and that air flows from A to B. If the two
sections on one end, each with a mean
velocity, the same at each section, and
the drop in total pressure is equal to the
drop in static pressure which can be
measured by connecting two pitot tubes, one
at A and one at B, to the gage by equal
lengths of rubber tubing. If the areas
A and B are not equal, the differential
static pressure must be corrected by the
difference in velocity pressures. The
quantity of air flowing is determined at
the measuring station beyond the test length,
and the respective velocities at A and B
and their resultant velocities are calcu-
lated. If the velocity at B is the slower,
the difference in velocity pressures
added to the differential static pressure
at the air inlet to the test channel is
the greater, the difference in velocity pressures is
subtracted from the differential static pressure. Lewis,
pp. 720-722.

friction feed. Longitudinal movements or ad-
vance of drill stem and bit accomplished
by a diamond-drill swirl head as opposed to
a system consisting entirely of meshing
gear. See also friction drive.

friction head. a. The additional pressure
that the pump must develop to overcome
the frictional resistance offered by the pipe,
bends or turns in the pipeline, by changes
in the pipe diameter, by valves, and by
couplings. Carson, p. 211. b. Fric-
tion head in piping is commonly calculated
by the Hazen and Williams formula. See
also Hazen and Williams formula. Lewis,
p. 647. c. Component, and energy lost as the
result of the disturbances set up by the
contact between a moving stream of water
and the frictional resistance. In laminar flow
the friction head is approximately propor-
tional to the first power of the velocity; in
 turbulent flow a higher power--practi-
cally the square. For convenience, friction
losses are best distinguished from losses
due to bends, expansions, impacts, etc., as
a distinction must also be made between the
friction slope and the energy gradient. Fric-
tion slope is equal to the bed or surface
slope only for uniform flow in uniform
channels. Seelye, j.

friction socket. A tubular-shaped or slightly
tapered fishing tool. The inside sur-
face of the tool is nearly covered with cir-
cular pitted protuberances which, when
driven over the loss drill tools, wedge
the tools in the socket. Long.

friction winder. See multiple friction winder.

friction yielding prop. See mechanical yield-
ing prop. Nelson.

frigellita. A massive, cleavable to closely
compact, hydrated manganese silicate,
H₂[Mn(C₂O₄)₂]·5SiO₂·5H₂O. Fay.

frig-ibag saw. A circular hand saw used in Bath
stone quarries. C.T.D.

frigget. Any ornament or glass object
used as a test of skill, or as a symbol of
craftsmanship. Franklin.

friggin. A term derived from the word
foggin. See foggin.

friggin. A miner's term for a red con-
glomerate. Fay.

fringe. A collective term for a thin
lining of isolated, etc., bodies, etc., on
the extreme terminus or margin of a

fringing reef. a. A fringing reef or a short
reef, whether situated on the mainland or part of a
continent, is generally narrower than a
fringing reef. The absence of an interior deep-water channel and the close relation in horizontal extension with the coast line below, with the sea of the adjoining land are essential points of difference between a fringing reef and a barrier reef. A. G. I. b. A reef which closely encircles or forms a fringe around the land. A. G. I. c. A coral reef around lands or islands that rests on the bottom along the shore is either a fringing reef or a barrier reef, according to its position. A fringing reef is attached directly to the shore, whereas a barrier reef is separated from the shore by a channel of water. A. G. I. d. A fringing coral reef is formed, the inner margin of which is composed of a belt of materials which have become subaerial through the actions of wind and waves. Its outer margin is composed of coral rock and living corals. A. G. I. e. A reef attached to an insular or a continental shelf. A. G. I. f. In oceanography, a platform of coral formation extending out from the land. See also coral reef. C. T. D. fringelike. See also soft frit. ASTM C242-60. See also sintered glass. 

fringe water. a. Water occurring in the capillary zone. B. Water in the zone immediately above the water table. It may consist solely of capillary water, or it may be combined with gravity water in transit to the water table. See also. 1. Frangible. b. A glass which contains fluxing material and is employed as a constituent in a glaze, body, or other ceramic composition. ASTM C242-60. c. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. 2. See also sintered glass. d. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. 3. See also sintered glass. e. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. 4. See also sintered glass. f. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. 5. See also sintered glass. g. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. h. A glaze in which a part or all of the fluxing constituents are fused. ASTM C242-60. i. See also sintered glass. 

fringe plant. A plant which is subject to be growing in a stratum of inorganic dust or other substance. 

fringe basket. A skeleton or perforated container used to catch frit under water as it is added to the ores when needed. Min- 

fringe formation. A. The formation of a glaze by a combination of a glass or enamel and quenching it in water. This process will render insoluble any soluble materials originally present. It is used in the ceramic industry and applied to a semifused mass, the constituents of which originally were soluble or insoluble, fusible or infusible. By fritting, that is, preliminary fusing, the original properties of the constituents are changed; thus, the soluble materials become insoluble and the infusible fusible. Accordingly, the substances which could not otherwise be used in a glazed batch, but which are abso- lutely necessary to be used. Other advantages offered by frit- ting are minimizing danger to health of workers when using lead salts, reducing better to lead content, and preventing the formation of lead compounds in the batch, more even distribution of constituents of the batch; ability to fire the glaze at lower temperature. Most of the glazes used on dinnerware and sanitary ware contain frit. See also glasses. C. O. E. 1964. e. As a noun, the material of which glass is composed. A. G. I. Supp. f. As a noun, a semifused stony mass. See also glasses. C. O. E. 1964. e. As a noun, the material of which glass is composed. A. G. I. Supp. g. As a verb, to partly fuse. A. G. I. Supp.
frontedent cast; cabbage leaf marking; defolial end. The flat casts are usually several feet long. In the outer bark are the leaf scars, which are either large or small, depending on the plant species.

front-end equipment. Those attachments to a crane which enable it to work as an excavator, a skimmer, a backhoe, or a similar machine. Both the jib and its fittings are included as equipment. Ham.

front-end loader. a. A tractor loader with a digging bucket and other attachments. b. A tractor loader that both digs and dumps loads. ASCE P1826. c. The breaking of a pavement by the extrusion of soft soil and during a thawing period due to the liberation of soils. ASCE P1826. b. The weathering process caused with which they are in contact. ASCE P1826. c. A process for cleaning fine coal in which the coal with the aid of a reagent, becomes attached to air bubbles in a liquid medium and floats as a froth. B.S. 3552, 1962.

front-end loader. a. A flotation process in which the minerals floated gather in and on the surface of bubbles of air driven into or generated in the liquid in some convenient manner. See also flotation collector. b. The separating of finely divided materials. C.T.D. c. A process for cleaning fine coal in which the coal with the aid of a reagent, becomes attached to air bubbles in a liquid medium and floats as a froth. B.S. 3552, 1962.

front-end loader. a. Reagent used to control the size and stability of the air bubbles in the flotation process. B.S. 3552, 1962. b. A chemical, used in the flotation process to aid collector-coated mineral particles to cling to rising air bubbles. The froth thus formed is transient, and should permit only long enough to permit its removal from the flotation cell. Terpenes, pine oil, cresyl, amyl alcohol, and alcohol derivatives are amongst these. The DuPont B-series are byproduct fractions from butyl alcohol manufacture, with high boiling points. The American Cyanamid frothers AC mix these with oils. The Dow Chemical Company markets polypylene glycol methyl esters (Dowfroths) which are water soluble. Pryor, 3.

front-end loader. a. A collector which also produces a stable froth. Bennett 2d, 1962.

front-end loader. b. A chemical compound used with a frothing agent. Increases greatly the recovery of a mineral in a flotation process. Bennett 2d, 1962.

front-end loader. c. Same as foamy amber. Shipley.

frontedent cast; cabbage leaf marking; defolial end. The flat casts are usually several feet long. In the outer bark are the leaf scars, which are either large or small, depending on the plant species.
froated pipe. A pipe held immovable in a frozen coal. Coal which adheres strongly to hedge: Meier. An irgillaceous sediment which hums vein. A vein in which one wall grades from op. To be in a solidified state; also, frozen ore. See frozen, c. Fay.

ft L. Abbreviation for foot-Lambert. BuMin

Fuch's gold purple. A tin gold color, produced by a wet method; it has been used in the decoration of porcelain. Dodd.

fuchsin dye. An aniline-type dye which is used in alcohol solution to test the porosity of ceramic bodies. The mate-up is also sometimes used as a dye for body identification prior to firing. Lee.

fuchsite. A bright green variety of muscovite with up to 5 percent Cr2O3. A member of the mica family. Hey 2d, 1955.

fugacity. The term as used in the past to any indefinite marking found on a sedimentary rock that could not be referred to a described fossil species. It was derived from the marine alga, Fucus, which was supposed might leave such a marking if buried under favorable conditions. A.G.I.

fulcrum. A point of support of a lever. Peirce, 3.

fugitive air. Applied to air moving through the fan that never reaches the working faces. It leaks through poor stoppings, around doors and so on, back into the returns without meeting anywhere near the active sections. Surveys of some mines show that up to 80 percent of the moving air is lost in just this manner.

fuller. A tubular glass rock that has been fused from all kinds of other rocks and unconsolidated sediments by lightning strokes. Fulgurites are especially common on exposed crags on mountain tops. The term is derived from the Latin for lightning. Fay.

full-cut brilliant. The term correctly used for a brilliant-cut diamond or colored stone with the usual total of 58 facets, which total consists of 32 facets and 12 table facets, all with brilliant or step cut below. On colored stones the girdle is usually polished, but not on diamonds. Shipley.

fuller. A blacksmithing set hammer with a ring handle. Occasionally in use in the form of a hook or a form of bottom tool with a similar working end sometimes used in conjunction with the file for removing rust. Also a groove made by such a tool or any groove or fluting. Standard, 1964. b. In
preliminary forging, the portion of a die that reduces the cross-sectional area between the ends of the rock and permits the hole to be formed. ADJ.

fullering. The act of caking or riveting a joint to make it steam tight. Ham.

full-face. A term used in Wales for pulverizing clay, but lacking plasticity. It is much the same chemically as clay, but it contains a higher percentage of water. It is high in magnesia, and it has the capability of decolorizing and purifying properties in its natural state to be used for oil refining. Bureau of Mines Staff.

Fuller's grading curve. A method of graphical representation of particle size analysis; the grain size (in fractions of an inch) is shown on the abscissa and the cumulative percentage on the ordinate. Originally, the concept of ideal grading curves was introduced, these being selected to be ellipses with straight lines tangential to them; more strictly, the ideal curves are parabolas having the form d = Pd/10,000, where d is any selected particle diameter, D is the diameter of the largest particles and P is the percentage finer than d. Dodd.

full-gauge. A term used in Wales for pulverizing clay, but lacking plasticity. It is much the same chemically as clay, but it contains a higher percentage of water. It is high in magnesia, and it has the capability of decolorizing and purifying properties in its natural state to be used for oil refining. Bureau of Mines Staff.

full-gauge. A cylindrical or tubular object, such as a bit or reaming shell, the outside and/or inside diameters of which are the size specified. Also called full-size, full-drill, full-size drill, full-size bit, full-hole drill, full-hole bit, full-size hole, or full-hole size. Also called full-size. Long. c. As applied to deflection drilling, the branch borehole is the same diameter as the parent hole. Also called full-gauge, full-hole, full-size, full-size drill, full-size bit, full-hole drill, full-hole bit, full-size hole, or full-hole size. Long.

full-hole size. a. Used by some diamond drillers as a synonym for full gauge. Long. b. As used by petroleum field drillers, a bit having a minimum outside or cutting diameter of 7/8 inches. Also called full-bladed bit. Long.

full-size, full-gauge. See full gauge; full-hole size. Long.

full-size blast. The standard type of heading blast consists of a straight or in main drive, at right angles to the rock face, and a back drive at right angles to the main drive and parallel to the face. The main drive is normally driven at quarry floor level to a depth of 0.6 times the height of rock above the back drive. Apart from exceptional circumstances, the maximum depth of the main drive should be 50 feet, so that with faces greater than 85 feet high the 0.6 ratio should not be used, but the main drive limited to 50 feet. McAdam II, pp. 152-154.

full-face driving. The English method of blasting used for adits, tunnels, and drifts. The full section is drilled and then blasted in one operation. Fraenkel.

full-face lining. A mining system, brought on by the advent of mechanical loading and mechanical coal cleaning, in which the entire section is dislodged together and the coal separated from the rock outside of the mine by the cleaning plant. Kentucky, p. 100.

full-size. See full gauge; full-hole size. Long.

full-subidence. The greatest amount of subsidence which can occur as a result of mine workings. See also percentage subsidence. Nelson.

full-tesseract. A condition of teeter in which the maximum degree of fluidization cutting the suspension is attained but without disruption of the bed. B.S. 3552, 1962.

full-tide cofferdam. A cofferdam which is sufficiently high to hold back tidal water from an excavation at all states of the tide. Ham.

full trailer. A towed vehicle whose weight rests entirely on its own wheels or crawlers. Full.

full-trimmed mica. Rifted mica trimmed on all sides with all cracks and cross grains removed. Full.

full-width rectifier. A rectifier which changes single-phase alternating current into pulsating unidirectional current, utilizing both halves of each cycle. Coal Age, 1.

fully developed mica. In coal mining, a mine when all development work has reached the boundaries and further extraction will be done on the retreat. Bureau of Mines Staff.

fully fixed. Applied to a member of a structural frame which has a fixed end. Ham.

fulminate. A. An explosive compound of mercury, HgCNO₃, which is employed for the capture of exploding charges, by means of which charges of gunpowder, dynamite, etc., are fired. Fay. b. To make a sudden loud noise; to detonate; to explode. Webster 3d. c. A salt of the highly explosive fulminic acid. Sandstrom.

fulminate acid; hyoscyamic acid; carbonyl ester; carbaryl ester; C₅NOH; molecule weight, 43.02; unstable volatile compound; an unpleasant odor; and it polymerizes easily. The silver and mercury salts are used as explosives. Bennett 24, 1962; CCD 64, 1961.

fulminate. Lead sulfantimonide, 2PbS·3Sb₂S₅; monoclinic. A lead gray, bright metallic mineral sometimes with a bluish or bronze tint; ... Hungarian Journal of Mineralogical Magazine, v. 22, No. 134, September 1931, p. 620.

fumarolic. Or pertaining to fumaroles or vents near volcanoes from which volcanic gases escape. Bureau of Mines Staff.

fumarole. a. A hole in a volcanic region, from which gases and vapors issue at high temperature. Webster 3d. b. The exhalation from a fumarole consists of water vapor, nitrogen, hydrogen, free hydrochloric acid, hydrofluoric acid, and silicon fluoride. Compare solfatara; mofette; solfato. a. A hole or fervor from which fumes or vapors issue; a spring or a geyser which emits steam or gaseous vapor. Usually found in volcanic areas. A.G.I. Supp.

fumarolic. Or pertaining to fumaroles or vents near volcanoes from which volcanic gases escape. Bureau of Mines Staff.

fundamental frequency. The lowest common period of frequency of a periodic quantity. ASM Gloss.

fundamental jelly. Structureless colloidal jelly which forms the base of coals and assumed to have been produced by the decay of plant materials. Tomkeieff, 1954.

fundamental mode of vibration. That mode of a system having the lowest natural frequency. H.G.

fundamental particle. Synonym for elementary particle. NRC-ASA N 1-1957.

fundamental substance. Same as fundamental form. Synonym for elementary particle. NRC-ASA N 1-1957.

fungus. A plant not possessing roots, stems, or leaves, without a hard outer covering. Foreset beds are themselves cross-laminated. Foreset beds develop on the roof is reflected on to a horizontal bed below; the revolving furnace, a horizontal cylinder; a roasting furnace in which material is oxidized, killed to leave off carbon dioxide or heated to remove moisture. See also coperma; converter. Propr., c. Either the combustion space in a firing device or a direct fired air heater. In the latter case, not to be confused with a boiler. Strock, 10.

fungus. See box furnace. ASTM C286-65.

fungus bridge. A barrier of firebricks or an arch which deepens rapidly from its head to its mouth. It resembles a funnel split lengthwise. For example, the Gulf of California, the Bay of Biscay, and the Bay of Fundy. A.G.I.

fungo-ka. Coolies cooperatively working tin mines or other projects, in Malaya. Hew.

fur; furring. Eng. A deposit of chemical salts and other material (sediment) upon the surfaces of pumps, boilers, etc. Fay.

furc. Port. To bore or drill for a blast. Fay.

furcate. Branching like a fork; forked. Webster 3d.

furcula; furcula. When very pure, a colorless mobile liquid; G.H. CHO or OCH: CHCH: CHOCHO; changes to reddish brown upon exposure to light and air; has a penetrating odor somewhat similar to that of benzaldehyde. Furfural forms condensation products with many types of compounds; such as alcohol, amine, and urea; soluble in alcohol, ether, and benzene; 8.3 percent soluble in water at 20°C; specific gravity, 1.1598 (at 20°C, referred to water at 4°C); melting point, -38.7°C; and boiling point, 161.7°C (at 760 mm.). Used in bituminous concrete road construction and in the refining of rare earths and metals. CCD 64, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. C-333.

furnace. A structure in which, with the aid of heat so produced, the operation of roasting, reduction, fusion, steam-generation, desiccation, etc., are carried on, or, as some miner, the air current is heated, to facilitate its ascent and thus aid ventilation. Fay. b. Eng. A large coal fire at or near the bottom of an upcast shaft, for producing a current of air for ventilating a mine. Fay. c. Anthracite mines formerly used a current of air for ventilation at the bottom of an air shaft. Being lighter, the heated column of airrose and the other air taking its place produced the necessary difference of pressure to ventilate the mine. Kersn. d. Structure in which materials are exposed to high temperatures. Fuch's method is used to maintain this condition. Among the materials are paraffins, gas, coal, hydrogen, electricity, wood and sulfur. A furnace is a batch type when its contents are treated in successive charges, and continuous when a stream of material passes through, being changed during transit. The main types are the arc, which uses the heat of an electric arc; the blast furnace, the crucible furnace, a laboratory appliance in which small charges, the muffle, in which the material is placed in a sleeve not in direct contact with the heating atmosphere, so that close control of entering and departing gas is possible; the reverberatory, in which heat developed on the roof is reflected on to a horizontal bed below; the revolving furnace, a horizontal cylinder; a roasting furnace in which material is oxidized, killed to leave off carbon dioxide or heated to remove moisture. See also cupola; converter. Propr., c. Either the combustion space in a firing device or a direct fired air heater. In the latter case, not to be confused with a boiler. Strock, 10.

furnace. box. See box furnace. ASTM C286-65.

furnace brazing. Brazing in a furnace. ASM Gloss.

furnace burner unit. Warm air furnace sold as a complete unit. Fay. See also heater.

furnace coal. As applied to anthracite, a formerly used term for broken coal. See also anthracite. Hew.

furnace, continuous. See continuous furnace. ASTM C286-65.

furnace conv. The conveyer which moves material through a furnace. ASA MH-4.1-1958.

furnace holding-the-iron. A condition of the furnace by reason of which it gives much less heat than normal at casting, although the feeding may have been regular. The taphole runs iron slowly, and the amount of cinder is somewhat erratic. Compare furnace losing-the-iron. Fay.

furnace linings. Refractory materials used to protect the walls of a furnace from reaction with its molten contents (abrasive, melting or chemical). Three divisions are (1) acid refractories rich in silica (flint, garnet, fire clay), which react with basic oxides; (2) neutral refractories (chromite, graphite) and (3) basic refractories, rich in oxides of calcium and magnesium, low in silica. Pryor, 3.

furnace losing-the-iron. Escape of iron from the hearth of a blast furnace into the foundation beneath, indicated by decreased quantity of iron at casting, and by the blowing of a blast hole. Fay.

furnace magnesite. A mortar material prepared from finely ground dead-burned magnesite, suitable for use as a joint material in laying magnesite brick, and for patching or daubing furnace masonry. HW.

furnaceman. One whose sole occupation is to attend a furnace. Fay. See also teaster.

furnace, porcellaneous enameling. The types and capacities of enameling furnaces are numerous. Among those in use are the continuous, box, fullmuffle, and semimuffle furnaces. Fuel commonly used are coal, gas, oil, and electricity. Used for properly fusing enamel on enamel ware at the temperature specified and in the time required. Hansen.

furnace refining. Purification of molten metal by treatment in a reverberatory furnace; term is most commonly used in connection with the refining of copper. Bennett 2d, 1961.

furnaces. See box furnace; continuous furnace; continuous tank furnace; direct-fired furnace; end-fired furnace.
**furnaces**

furnace, pot furnace, recuperative furnace, regenerative furnace, semirefractory furnace, side-fired furnace, side-port furnace, tube furnace, U-type furnace. ACSM, 1963.

dioxygen sand; also used to line furnaces. Furnaces are usually constructed particularly in open-hearth steel furnaces. C.C.D., 1964, 1965.

**furnace shaft.** An upcast shaft used in mine ventilation where a furnace is employed. Fay.

furnace sprayer. In ore dressing, smelting, and refining, a laborer who sprays the inner surfaces of furnace walls and roof with slurry of silica, water, and fireclay to protect brick, using compressed-air guns. Also called slurry man; sprayer. D.O.T. Supp.

**furnace stack.** A chimney built over a furnace for increasing the draft. Fay.

furnace ventilation. A ventilation system of the earlier days of mining whereby a large coal fire was kept burning in a furnace near the bottom of the upcast shaft. The fire heated and thus reduced the density of the air with which the cold and heavier air column in the downcast shaft flowed downwards into the workings, and thus a condition of ventilation was established. Nelson.

furnace volume. The cubic contents of the combustion space of a boiler bounded by the grate, direct heating surface, and tube sheet. Strock, 10.

furnacite. Same as furnacite. English.

furnisher. A man who furnishes money or machinery to a party of miners, and so becomes entitled to a share of the profits. Fay.

furnery; furneries; foreigners. Dark, ovoid inclusions of country rock in granite. Same as heathen. Arkell.

furring. A marking made by glaciers or frost on the surface of a sedimentary rock layer of a furrow or the like, formed when a layer of water, ice, or mud is trapped and separated from parallel, adjacent furrows by near-buried septa which appear as grooves in the cast. If the up current terminations are missing, the structure is called a furrow cast. Pettijohn.

furtherance. a. A marking made by glaciers or frost on the surface of a sedimentary rock layer of a furrow or the like, formed when a layer of water, ice, or mud is trapped and separated from parallel, adjacent furrows by near-buried septa which appear as grooves in the cast. If the up current terminations are missing, the structure is called a furrow cast. Pettijohn.

fusain. a. This term was introduced by Grand'Eury in 1882. It is recognized macroscopically by its gray-black color, its silty luster, its fibrous structure and its extreme friability. It is the only constituent of coal which sticks and blackens objects with which it comes in contact. Fusain may include a high proportion of mineral material, which strengthens it and retards its friability; it retains, however, its silty luster. In macroscopic description of seams, only those bands having a thickness of several millimeters are recorded. Microscopic examination shows that fusain consists in the main of fusite. Fusite occurs as wide bands and lenses in almost all humic coals. It is widely distributed, but not abundant. IHCP, 1963, part 1, b. The term was first used in the United States by J.J. Stevenson as a synonym for mineral charcoal. In the Thiessen-U.S. Bureau of Mines system, fusain is a component with a minimum band width of 37 microns. Microscopically, fusain closely resembles wood charcoal, usually being soft, friable, and black, and disintegrating readily into much longer granules. As by definition fusinite is a component with a thickness of several millimeters, it may be slightly translucent and dark red in color. It frequently shows well-preserved plant fragments, in which the lumina may be empty or may be filled with mineral material. As by definition fusain must have a minimum thickness of 37 microns, fragments of fusinite less than 37 microns are counted as opaque attributes. Fusain occurs as microscopically fine inclusions, but also in much grosser form as bands and lenses up to 15 to 20 centimeters thick and 3 to 4 meters or more long when the bands are distributed in the humic coals of the Carboniferous but only in small quantities. IHCP, 1963, part 1, e. Fusite, a variation of fusinite having the appearance and structure of charcoal. It is friable, sotty, generally high in ash content, and consists mainly of fusite. A.G.I. Staff. See also fusinite.

fusinite; fusinization; fusinisation. The formation of fusain. Tomšič, 1954.

fuse. a. A small cylinder of copper, closed at one end and charged with a fulminate. The end of the fuse is inserted in this cap, and a charge is set in the cast. Super. See also detonator.

fuse cutter. In metal mining, one who cuts blasting fuse to standard lengths; inserts fusing into open end of detonators or caps, and attaches it by squeezing the open end with a pair of crimpers (special pincers).

**fused-cast brick**

with or without a blasting cap. Fay. b. Any of various devices, as a tube, casing, gun, or the like, filled with an explosive and combusted with water, a sound, or a shock by means of which an explosive charge is ignited. Fay. c. A tube containing a compound designed to burn at a regulated linear speed, and in so doing to convey heat into an explosive charge. The miner's safety fuse, invented by Backford in 1831, is either slow or instantaneous. In it a fabric cover encloses a train of combustible material. The detonating fuse (Cordeau detonant) is trinitrotoluene in a thin lead sheath, and has a burning speed of 17,000 feet per second. Cordtex and Primacord are wrapped in textile, and have a speed of 20,000 feet per second. These high speeds have special value in simultaneous firing right through the charge. Electric fuse is of wire, metal when a current passes through the circuit in which it is incorporated, thus cutting off the supply of electricity and producing further damage through overload or overheating. Pryor, 3, d. A slow-burning train of powder used in blasting caps. C. Can. Casing prepared with combustible materials by which dynamite is detonated. Fusing is term applied to fighting explosives, either electric or non-electric. Detonators are used for firing the charge. The fuse is in- treated by means of heat, to make it capable of being ignited. Fay. c. An overcurrent protective device with a circuit-opening fusible member directly heated and destroyed by the passage of overcurrent through it. U.S. Bu. Mines Fed. Mine Safety Code-Bit. Coal & Lignite Mines, Pt. 1 Underground Mines, Oct. 8, 1953. h. To liquefy by means of heat; to make liquid. Fay.

fuse auger. An instrument for regulating the time of burning of a fuse by removing a certain portion of the composition. It has a movable graduated scale which regulates the depth to which the auger should penetrate. Standard, 1947.

fuse blasting cap. A small cylinder of copper, closed at one end and charged with a fulminate. The end of the fuse is inserted in this cap, and a charge is set in the cast. Super. See also detonator.

fuse cutter. In metal mining, one who cuts blasting fuse to standard lengths; inserts fusing into open end of detonators or caps, and attaches it by squeezing the open ends with a pair of crimpers (special pincers).

fuse auger. An instrument for regulating the time of burning of a fuse by removing a certain portion of the composition. It has a movable graduated scale which regulates the depth to which the auger should penetrate. Standard, 1947.

fuse blasting cap. A small cylinder of copper, closed at one end and charged with a fulminate. The end of the fuse is inserted in this cap, and a charge is set in the cast. Super. See also detonator.

fuse cutter. In metal mining, one who cuts blasting fuse to standard lengths; inserts fusing into open end of detonators or caps, and attaches it by squeezing the open ends with a pair of crimpers (special pincers).

264-972 O-60-31
fused-cast refractories. Refractories formed by electrical fusion followed by casting and annealing. Hend.

fused-cast refractories. Aluminous cement. Hend.

fused electrolyte. Molten compound which conducts and is decomposed by electrolysis; used as refractory material in cells used in electrolytic reduction of substances such as aluminum, magnesium, sodium, and calcium. Bennett 2d, 1962.

fused magnesia. Fused electric furnace magnesia, not subject to grain growth. Bureau of Mines Staff.

fused slip. A terminal connection, with a fuse, used on portable electrical mining machinery. Great.

fused quartz; fused alp. A terminal connection, with a fused elestrolyte. Molten compound which fusedplug.

fuselighter. A device for sparkplug.

fused trolley tap. A specially designed holder sparkplug.

fused salts. Constituents are held together by heating sparkplug.

fusiform bomb. A type of rotational fusinite.

fusinite. A maceral, or micropetrologic constituent of fusinite.

fusinite. The quality of being fusible; especially, capable of being liquefied by heat. Webber 3d.

fusibility scale. A list of minerals arranged in the order of their fusibility. The fusibility scale of von Kobell is: (1) stibnite; (2) natriolite; (3) amsellite; (4) actinolite; (5) orthoclase; and (6) bronze.

fusible. Capable of being fused; especially, capable of being liquefied by heat. Webber 3d.

fusible alloys. Alloys which will melt at definite low temperatures. Sphynx.

fusible metal. Any alloy, usually one containing tin, which will melt at a comparatively low temperature. Standard, 1964.

fusible plug. An insert of metal with low melting point placed in boilers, sprinklers and other devices to melt when the temperature becomes dangerously high, so that the melting will relieve pressure, allow water flow, or otherwise tend to alleviate the dangerous condition. Strock, 10.

fused silica. See silica glass. VV.

fused stone. Any gem substitute produced by means of fusion, especially synthetic stone or glass. Shipley, b. An assembled stone such as soldered emerald. Shipley.

fused trolley tap. A specially designed holder sparkplug.

fuselite. A part of an electric detonator consisting of twin metal conductors, bridged by fine resistance wire, and surrounded by a bead of igniting compound which burns when the firing current is passed through the bridge wire. BS 3618, 1964, sec. 143.

fuselgraph. An instrument for cutting time fuses to length. Standard, 1964

fuselgraph. That part of an electric detonator consisting of twin metal conductors, bridged by fine resistance wire, and surrounded by a bead of igniting compound which burns when the firing current is passed through the bridge wire. BS 3618, 1964.

fuselgraph. For facilitating the ignition of the powder core of a fuse. One form is in the shape of the carpet tack core, with a powder composition; another form is in the shape of a cord, which when ignited burns and maintains a "coal of fire" in contact with the exposed powder in the fuse. Fay. See also cloth fuse. South Africa, p. 40.

fuselgraph. For facilitating the ignition of the powder core of a fuse. One form is in the shape of the carpet tack core, with a powder composition; another form is in the shape of a cord, which when ignited burns and maintains a "coal of fire" in contact with the exposed powder in the fuse. Fay. See also cloth fuse. South Africa, p. 40.

fuselgraph. For facilitating the ignition of the powder core of a fuse. One form is in the shape of the carpet tack core, with a powder composition; another form is in the shape of a cord, which when ignited burns and maintains a "coal of fire" in contact with the exposed powder in the fuse. Fay. See also cloth fuse. South Africa, p. 40.

fuselgraph. For facilitating the ignition of the powder core of a fuse. One form is in the shape of the carpet tack core, with a powder composition; another form is in the shape of a cord, which when ignited burns and maintains a "coal of fire" in contact with the exposed powder in the fuse. Fay. See also cloth fuse. South Africa, p. 40.

One form is in the shape of the carpet tack core, with a powder composition; another form is in the shape of a cord, which when ignited burns and maintains a "coal of fire" in contact with the exposed powder in the fuse. Fay. See also cloth fuse. South Africa, p. 40.

fuselgraph. For facilitating the ignition of the powder core of a fuse. One form is in the shape of the carpet tack core, with a powder composi
Fusion. A process for the formation of a substance by the direct contact of two substances, which may be in solid, liquid, or gaseous form. Fusion is often used in the production of materials with specific properties or in the recycling of waste materials.

Fusion casting. A process for the manufacture of castings by heating a mixture of refractory materials to the point of melting, followed by the addition of molten metal and the subsequent solidification of the mixture.

Fusion button test. A test to determine the quality of a casting by subjecting a small button of the casting to a fusion test and examining the button for defects.

Fusion welding. A welding process that uses heat to achieve a permanent bond between two materials without the application of pressure. Fusion welding is used in a variety of industries for the joining of metals and non-metals.

Fusion piercing. A method of producing a hole in a material by heating it to the point of melting, followed by the injection of a material that solidifies inside the hole.

Fusion casting. A process for the manufacture of refractory products, such as bricks and tiles, by heating a mixture of refractory materials to the point of melting and then allowing it to cool and solidify. Fusion casting is used in a variety of industries, including the production of ceramic products and the manufacture of industrial components.

Fusion of clay. The process of combining clay particles by heat to form a solid mass. Fusion of clay is used in the production of bricks and tiles.

Fusion point. The temperature at which a material melts. Fusion point is an important property in the selection of materials for specific applications.

Fusion test. A test used to determine the quality of a material by subjecting it to a fusion test and examining the results.

Fusion piercing drill. A machine designed to use the fusion-piercing mode of producing holes in materials. Fusion piercing drills are used in a variety of industries, including the production of industrial components and the manufacture of materials with specific properties.

G

G a. A unit of force applied to a body at rest equal to the force exerted on it by gravity. One of several such units applied to a body when accelerated; for example, when an airplane pulls out of a dive or makes a sharp turn. Webster 3d. b. (1) Abbreviation for gravity; acceleration due to gravity. GPO Style Manual, I. 157; Zimmerman, pp. 49, 59. (2) Designation for gravity in formulas. A.G.I. Abbreviation for gram. BuMin Style Guide, p. 59.

Gazing. Use the fusion-piercing mode of producing holes in materials. Fusion piercing drills are used in a variety of industries, including the production of industrial components and the manufacture of materials with specific properties.

Gaseous. Relating to or consisting of a substance that is present in a gas phase.

Gasoline. A liquid fuel, usually a refined petroleum product, that is used as a fuel for internal combustion engines.

Gasolaire. A type of fuel that is commonly used in industrial processes, such as the production of steel and the manufacture of chemicals.

Gaspar. A type of high-quality coal that is used in the production of steel and the manufacture of chemicals.

Gasparco. A type of high-quality coal that is used in the production of steel and the manufacture of chemicals.

Gasparvoidite. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphalt. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltite. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.

Gasphaltoid. A type of coal that is used in the production of steel and the manufacture of chemicals.
gagatization

Id. g. Abbreviation for Gilbert Zimmerman, p. 50. h. Abbreviation for-gilt group. Webster 3d.
As a subscript, the symbol has no specific meaning. "Newed., 1964, p. F-99; Zimmerman, pp. 120. j. Symbol for radial wire; Zimmerman, pp. 115. k. Symbol for radicant constant. Zimmerman, p. 120.
d. Abbreviation for gage (or gauge). Webster 3d.
b. Scot. A hook on the end of a chain or rope; a coupling. Fay.
c. A fine to coarse, dark-colored crystalline igneous rock composed mainly of calcic plagioclase (laboradonte or anorthite) clinopyroxene, and sometimes olivine. Magnetcite, ilmenite, or both, andapatite are accessory minerals. A rock containing orthorhombic pyroxene is called a norite. Fay. d. A granular igneous rock composed of calcic plagioclase, olivine, and sometimes olivine. An olivine gabbro. Bateman. e. A plutonic rock consisting of calcic plagioclase (commonly labradorite) and clinopyroxene, with or without orthopyroxene and olivine. Apatite and magnetite or ilmenite are common accessory minerals. A.G.I.
g. Gabbro. The texture typical of basic plutonic rocks in which completely allotriomorphic grains dominate the fabric. Schieferdecken.
h. Gabbro schist. A gabbroic rock that has been rendered schistose by cataclasis. See also flaser gabbro; subhastite. A.G.I.
i. Gabbion. A bottomless wicker cylinder or basket, from 20 to 70 inches in diameter and from 33 to 72 inches high; used in engineering, which filled with stones, to form the foundation of a jetty. Standard, 1964.
k. Gable-bottom car. See mine cars, Lewis, p. 222.
l. Gable-rake tile. The full-flanged tile used at the verge of a tiled roof. See also verge. Doddi.
m. Gable lever. A device for disengaging the gable, on the eccentric rod of a steam engine, from the rockshaft. Standard, 1964.
n. Gable wall. The charging end wall of a glass-melting furnace. ASTM C156-66.

g. A steel wedge used in mining. Gordon.
h. A small, steel wedge used for loosening seamy rock. Sauffer. i. A heavy piece of steel, 6 or 8 inches long, with a narrow chisel point for cutting samples, breaking out pieces of loose rock, etc. A mool is a gad with a round point. Hess. j. A small iron punch with a wooden handle used to break up seamy ore. Orbital spike. Webster 2d. k. To break or loosen with a gad, as rock. Webster 3d. l. A penetration drill; a jumpper drill. Mount. m. Gadder. In quarrying, a small car or platform carrying a drilling machine, so as to make a straight line of holes along its course in getting out dimension stone. Also called gadine car, gading machine. Standard, 1964.
Gadding machine. See gadder. Fay.
g. A tool used for raising a piece of ware which is in course of treatment. C. T. D.

Gadolinium. A rare silvery-white metallic element; trivalent; and a member of the rare earth group. Only known in combination and obtained from the same sources as europium. Symbol, Gd; hexagonal; atomic number, 64; atomic weight, 157.25; specific gravity, 7.895 and 7.8, depending on purity; melting point, 1,312° C; boiling point, about 3.000° C; insoluble in water or reacts slowly with water; soluble in dilute acids; and has the highest neutron absorption cross section of any known element, 84,800 barns. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-11, B-175.
Gadolinium oxide; gadolinia. White; isometric space group I-43m; atomic number 67 (at 15° C); melting point, 2,330° C; slightly soluble in water; soluble in acids; hygroscopic and absorbs carbon dioxide from the air. Purifies up to 99.6 per cent gadolinium oxide are obtained. Used for nuclear-reactor control rods; neutron shield; catalyst; dielectric ceramics; and special glasses. C.G.C. 64, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-17.
Gad steel. Flemish steel; so called because wrought in gads or wedges. Fay.
g. A raft, slip, or dike. See also gaw, a. Fay.
Gagger. The head workman, foreman, or blower of a blast furnace or smelter. Fay.

b. The man in charge of horse or mule teams between the blast furnace and the mechanical haulageway. C.T.D.
g. A. Eng. An obstruction in the valve of a pump which prevents it from working. Fay.
h. A fuller used to straighten railway rails. Webster 3d. i. Derb. Any piece of timber used temporarily to reinforce other timber until proper timbering can be done. Fay. j. Eng. Chips of wood in a shaft bottom, or sump. Fay. k. A metal spacer to be inserted, so to render a floating tool or punch inoperative. A.S.M. Glas.
Gargarinite. A hexagonal mineral, Na,Ca,Y3(Fe2+,Cr2+)[Si6O18](OH)2 for the cryptocrystalline variety and the crystalline variety, respectively; color greenish or yellowish-green, or yellow; vitreous to glassy; and obtained from albitized granites and associated quartz-microcline veins of one of the granite massifs of Kazakhstan and in alluvious rocks of other regions of the U.S.S.R. Alters easily and is replaced by aggregates of tesserite, synchisite and astrophyllite. American Mineralogist, v. 47, No. 5-6, May-June 1962, p. 805.

Gagnost. gagnost. German name for jet. Tomkeieff, 1954.
gallatin. The heavy oil of coal tar used in the Bethell process for the preservation of tim-
galvanometer. An instrument for measuring a small electric current or for detecting its presence by means of the movements of a magnetic needle or of a coil in a magnetic field that requires usually much greater than the minute beam of light reflected from a mirror attached to the needle or the coil. Webster's 3d. String (wire) or mirror galvanometers are used in electrophores and other instruments of applied electrophysics. A.C.I.
galvanoscope. An instrument employed for detecting an electric current and showing its direction. It differs from a galvanometer in being only qualitative. Standard. 1964.
galvatronometer. An instrument for measuring the heat generated by an electric current or for measuring the current by the heat it generates. Standard. 1964.
ganella. Braz. A wooden bowl about 2 feet wide at the mouth, and 5 or 6 inches deep, used for washing gold out of the auriferous material collected in sluices and in river sand. Fay. 1961.
gamma. The common unit of magnetic intensity. It equals 10⁻⁶ oersted. A.G.I.
gamma-gamma log. A borehole measurement of gamma rays originating in a gamma-ray source in the instrument and scattering back from the rock information to a detector shielded from the source. The amount of scattering is proportional to electron density and, therefore, proportional to mass concentration so that the measurement, after certain corrections, yields a density log of the formation penetrated. A.G.I.
gamma-ray counter. An instrument capable of detecting and recording the intensity of gamma rays emitted by a radioactive substance. Compare Geiger-Mueller counter; scintillation counter. Long.
gamma-ray detector. An instrument on ships for identifying and measuring abnormal gamma ray concentrations in the ocean areas, as would result from nuclear powered vessel refuse and nuclear waste dumping. Hy. See gamma-ray counter. Long.
gamma-ray inspection. The method consists of placing a radioactive source at a given distance from one face of the part to be radiographed and a photographic film in a light-proof cassette between intensifying screens. The source is then placed over the part left in position for a suitable exposure time, after which the film is developed. Other.
gamma-ray log. Strip recording of the intensity of natural radioactivity versus depth, obtained when a suitable detector is moved through a borehole. Institute of Petroleum, 1961.
gamma-ray logging. a. The act or process of obtaining, by means of a gamma-ray probe, a record of the intensities of gamma rays emitted from the rocks penetrated by a borehole. Compare electrochemical logging. Long. b. This type of logging can be carried out with a radioactive source placed in any type of drilling fluid, or in dry holes. It can be used in a hole into which sea water has been rendered, the sensitivity curves valueless. Shales, marine clay, and potash are generally more radioactive than sandstone, sand, coal, and salt. Marine bands are generally, but not invariably, characterized by high gamma-ray counts. Though the rate of gamma-ray emission is erratic and recording must be carried out slowly, speeds of up to 1,000 feet per hour have been attained. Sinclair, III, pp. 106-107.
gamma-ray probe. A gamma-ray counter device built into a watertight case small enough to be lowered into a borehole. Long.
gamma-rays. High-energy, short-wavelength, electromagnetic energy emitted by a nucleus. Electromagnetic energy. Long. X-rays also occur in this energy range but are of nonnuclear origin. Gamma radiation usually accompanies alpha and beta emission but not companies fission. Gamma rays are very penetrating and are best attenuated by dense materials like lead and concrete. A.G.I.
gamma-ray spectrometer log. An instrument for determining the energy distribution of gamma rays. NI, 1957.
gamma-ray spectrometer log. A log which measures the relative quantities of potassium, thorium, and uranium present in the rocks penetrated by a borehole. Wyllie, p. 1+.
gamma-ray well logging. A method of logging boreholes by measuring the natural radioactivity of the rocks through which the hole passes. It was developed for logging holes which cannot be logged electrically because they are cased. A.G.I.
gamma structure. a. A thrust sheet with an attitude of the type of drilling Ibuid, or in dry holes. Long b. This type of logging can be carried out with a radioactive source placed in any type of drilling fluid, or in dry holes. It can be used in a hole into which sea water has been rendered, the sensitivity curves valueless. Shales, marine clay, and potash are generally more radioactive than sandstone, sand, coal, and salt. Marine bands are generally, but not invariably, characterized by high gamma-ray counts. Though the rate of gamma-ray emission is erratic and recording must be carried out slowly, speeds of up to 1,000 feet per hour have been attained. Sinclair, III, pp. 106-107.
gamma-ray spectrometer log. A log which measures the relative quantities of potassium, thorium, and uranium present in the rocks penetrated by a borehole. Wyllie, p. 1+.
gamma-ray well logging. A method of logging boreholes by measuring the natural radioactivity of the rocks through which the hole passes. It was developed for logging holes which cannot be logged electrically because they are cased. A.G.I.
gamma structure. a. A thrust sheet with an attitude of the type of drilling Ibuid, or in dry holes. Long b. This type of logging can be carried out with a radioactive source placed in any type of drilling fluid, or in dry holes. It can be used in a hole into which sea water has been rendered, the sensitivity curves valueless. Shales, marine clay, and potash are generally more radioactive than sandstone, sand, coal, and salt. Marine bands are generally, but not invariably, characterized by high gamma-ray counts. Though the rate of gamma-ray emission is erratic and recording must be carried out slowly, speeds of up to 1,000 feet per hour have been attained. Sinclair, III, pp. 106-107.
Gamma structure. a. A thrust sheet with an attitude of the type of drilling Ibuid, or in dry holes. Long b. This type of logging can be carried out with a radioactive source placed in any type of drilling fluid, or in dry holes. It can be used in a hole into which sea water has been rendered, the sensitivity curves valueless. Shales, marine clay, and potash are generally more radioactive than sandstone, sand, coal, and salt. Marine bands are generally, but not invariably, characterized by high gamma-ray counts. Though the rate of gamma-ray emission is erratic and recording must be carried out slowly, speeds of up to 1,000 feet per hour have been attained. Sinclair, III, pp. 106-107.
gangway

A narrow passageway or corridor for passage through a larger structure. Also, a narrow passage or valley for a large stream or river.

gangway cable. A cable designed to be installed horizontally (or nearly so) for power transmission on highways and railways. AS 4142.5:1956.

gangway; gantry; gantree. A frame erected for the purpose of carrying a switch, the two tracks breaking the continuity of either track by the breaking system. Pryor, p. 13.

gangway design. An arrangement in which certain intermediate sizes of particles are wholly or substantially absent. Taylor.

**garnet**

A gem stone, rock, or mineral that is used in crystalline form or as a gemstone. It is also used as a abrasive and gem, precious garnet; pyrope (manganese-aluminum) garnet; almandine, pyrope, and spessartite garnets.

garnet rock. A rock composed essentially of garnet crystals, which are the principal rock-forming minerals. In general, garnet rocks are metamorphic rocks that have formed from metasedimentary rocks.

**garnetization.** The introduction of garnet into a rock, or the formation of garnet in a rock from other minerals in the rock. A process commonly associated with contact metamorphism.

**garnetite.** A metadolomite rock, consisting chiefly of garnet. Stakes and Varnes, 1955.

**garnet jade.** A jade-like variety of garnetite, from Transvaal, Republic of South Africa. Also called Transvaal jade; South African jade.

**garnetoid.** A rock or mineral that contains garnet as a major or minor constituent. Garnetoids include varieties such as garnetite, garnet gneiss, and garnet schist.

**garnetoid rock.** A rock composed essentially of garnet crystals, which are the principal rock-forming minerals. In general, garnet rocks are metamorphic rocks that have formed from metasedimentary rocks.
garnet rock

479

garnet shell. See shell (cutting). Shiple.
garnet stone. See stone (cutting). Shiple.

gas. A mixture of finely ground glass and quartz, produced in the grinding of plate glass. Also, any aeriform liquid other than atmospheric air, such as gaseous carbon dioxide (black damp), carbon monoxide (whitedamp), methane (firedamp), and the common combustible petroleum-product gases. Compare acetylene; bottle gas. Long. I. Abbreviation for gasoline. Long. See also manufactured gas; natural gas.

k. A fluid (as air) that has neither independent shape, nor volume but tends to expand indefinitely. A substance at a temperature and pressure at which it is not liquefiable by pressure alone. Webster 3d. b. A fluid of low density and of high compressibility. The specific recognition of a gas as distinct from a liquid of the same composition requires the simultaneous presence of both phases at equilibrium. See also fluid; liquid. A.G.I. 1. As a verb, to affect or to treat with gas.

To subject to the action of gas. Webster 3d.

gas analysis. An analysis of mine air to give information regarding the oxygen content of the air, the presence of explosive gas or other undesirable gas or gases. It is a valuable aid in following the changes in mine air during fires and after explosions. Lewis, p. 731. See also Burrell apparatus.

gas and mist sampler. This instrument is designed primarily for the automatic collection over a 24-hour period of one sample per hour of airborne material such as sulfur dioxide, ammonia, fluoride, and some acids; it can be adapted to the collection of many other air contaminants. A fixed volume of air is drawn through a special impinger. At the end of the period, the collecting fluid is discharged into a tube and is analyzed later. Bettis, p. 578.

gas barren. A barren tract of ground, devoid of veins, or of several acres in extent, characterized by escaping volcanic gases and deposits of sulfur, and underlain by rock containing volcanic rocks of an advanced state of decomposition. It occurs in regions of hot spring activity and is formed through a process of acid leaching of the surface rocks.

gas blanket. See black channel black. Finely divided carbon made by the incomplete combustion or the thermal decomposition of carbonaceous material. Aiming reconstituting agent in rubber products. C.C.D. 64, 1961.

gas bubble. Bubbles seen as inclusions in glass, synthetic corundum, and synthetic spinel, which reveal their difference from certain corundum, spinel, and most other genuine gems, in which inclusions are more angular. Shiple.

gas cap. a. The faint bluish flame that appears over the burning flame of a miner's oil safety lamp when a percentage of firedamp is present in the mine air. See also cap, b. The free gas occurring above the oil in a reservoir. It occurs whenever more gas is available than will dissolve in the associated oil under the existing pressure and temperature in the reservoir.

gas-cap drive. The force exerted by the energy of expanding gas of a gas cap. It is used to produce oil. A.G.O.

gas carbureting. The introduction of carbon into the surface layers of metal steel by heating in a current of gas high in carbon—usually hydrocarbons or hydrocarbons and carbon monoxide. C.T.D.

gas center. A location that is adequate in isotopic separation in which heavy atoms are separated from light atoms by centrifugal force.

gas classification. The separation of powder into small size fractions by means of a gas stream of controlled velocity. ASTM B243-65.

gas coal. a. Any coal that yields a large quantity of illuminating gas on distillation. It should be free from sulfur and other impurities. Fay. See also fat coal; bottle coal. b. Coal gas for engine or for cutting, gas retorts and commercial byproduct plants range from 33 to 33 percent in volatile matter. They should be low in sulfur because one-fourth to one-half of the sulfur of the coal passes off as hydrogen sulfide with the gas, and city regulations commonly prescribe 30 grains per 100 cubic feet as the maximum proportion of this constituent allowable. Mitchell, p. 120. a. Bituminous coal, such as cannel or parrot coal, used in gas making. Gordon. d. A coal suitable for the manufacture of town gas and coke. B.S. 3323, 1960.

gas coke. Coke formed in gas retorts as distinguished from that made in a coke oven.

Webster 3d.

gas concrete. See aerated concrete. Dodd.

gas conductor. A pipe for leading combustion gases from the mouth of a blast furnace to a hot blast stove. Fay.

gas constant. The constant R in the perfect gas equation, PV = RT. Strock, 10.

gas-cut coal. An aeraler tract in which gas is the coolant. L.S.L.

gas cut. Term used to describe the fluffy mixture of gas and mud drilled mud recovered in testing. Wheeler.

gas-cut mud. In oil well drilling, mud introduced into the hole which has been lowered in efficiency by natural gas rising from the strata traversed. Pryor, 3.

gas cutting. a. The retention by drilling fluid of gas entrained within drilling Ultra a drilling fluid in order to reject gas before returning to the well. fluid will become gas cut and the hydrostatic head of the fluid will be reduced. A thick drilling fluid will gas cut more easily than a thin one. See also: l. b. See rock cutting. Kent, p. 145.

gas dew. A man-made for carbonitridding ASM Class.

gas drilling. A process in which a large amount of drilling fluid is used. The drilling fluid gas cap. a. Any coal that yields a large quantity of illuminating gas on distillation. It should be free from sulfur and other impurities. Fay. See also fat coal; bottle coal. The rate of advancement of the works; (2) the face operation such as cutting, blasting, loading, etc.; and (3) the barometric readings.

gas enclosure. A gas inclusion in a stone, such as can be found in all synthetic corundum.

Shiple.

gas engine. An internal-combustion engine similar to a gasoline engine but using natural or manufactured gas instead of gasoline vapor; broadly, an internal-combustion engine. Webster 3d.

gas emission. a. Having the form of or being gas; of or relating to gases. Webster 3d. b. Lacking substance or solidity. Webster 3d.

gas enclosure. a. A process of acid leaching or of selective transport of magmatic substances to metallic particles using gas phase. Webster 3d. c. A bituminous coal, as well as products of thermal decomposition of coal. It may be expressed on a time or tonnage basis. Gas emission rate (kg of metal/ton of ore) = (1) the rate of advance of the workings; (2) the face operation such as cutting, blasting, loading, etc.; and (3) the barometric readings.

gas exposure. a. Having the form of or being gas; of or relating to gases. Webster 3d. b. Lacking substance or solidity. Webster 3d.

gas exposure. The separation based on the fact that atoms or molecules of different masses will diffuse through a porous barrier at different rates. The method is used to enrich uranium with the uranium 235 isotope. L.S.L.

gaseous dispersion pattern. A dispersion pattern that may be described by analyzing the composition of either of soil air, of gas dissolved in underground water, or of gas condensed in the rocks and soil. Hawkes, 2d, p. 70. Gaseous dispersion patterns of interest include those of hydrocarbons and some noble gases resulting from nuclear decay of radioactive elements. Lewis, p. 301.

gaseous fuel. Includes natural gas and the prepared varieties, such as coal gas, oil gas, iron blast furnace gas, as well as producer gas, etc. Newton, p. 249.

gaseous place. A place that is likely to be dangerous from the presence of flammable gas. Fay.

gaseous reduction. The reduction of metallic compounds to metallic particles using a reducing gas. Henderson.

gaseous transfer. a. The process in which volatile metallic compounds are accomplished by gases rising from lower levels to higher levels. It has been suggested as an important process in the volatilization of certain mineral deposits described as pneumatolytic. Schieffeldecker.

b. The process by which a magma differentiates...
gas field. A district where natural gas is produced. The liberation of gas in the form of bubbles during the solidification of metals. It may be due to the fact that the gas dissolved in the liquid is less in the solid and liquid metal respectively, as when hydrogen is evolved by aluminum and its alloys. Gas is the promotion of a gas-forming reaction, as when iron oxide and carbon in molten steel react to form carbon monoxide of molten magma, blowholes, unannealed. C.T.D.

gas explosion. A major or minor explosion of gas in a coal mine, in which coal dust apparently did not play a significant part. See also coal-dust explosion. Nelson.

gas fire. A rapid up-and-down motion of gas rising from coal, for example, water gas or pipe of a volcano, the gas acting as a column of molten magma in the conduit streaming of free, juvenile gas through a pipe that has a temperature higher than the freezing point was in the solidification. See also Alaska.

gas fluxing. A process in which the addition of a fluxing agent is made to the charge. C.T.D.

gas fracture. One of the open fractures in which the trapped fluid is compressed and then expands without letting any additional fluid into the pump barrel. Gas locking increases the temperature which decreases pump efficiency. American Petroleum Institute. Drilling and Production Practice, 1983, p. 150.

gas-groove. Hills and valleys in electrolytic cells. Synonymous with volcanic blow.)

gas house. A place where natural gas is produced and marketed in commercial quantities. Webster 3d.

gas indicator. A pocket device for the rapid determination of the percentage of carbon dioxide in the atmosphere of mines, boiler rooms, blast furnaces, etc. Fay, p. 55.

gas inspector. a. In the mining industry, one who maintains gas pressure within prescribed limits in collecting main to maintain the percentage of carbon dioxide in the air through oven walls by adjusting governors. He also supervises such operations as weighing and charging coal, and on the surface and equipment on top of battery. D.O.T. Supp. 2. See coal mine inspector. D.O.T. 1. See also Alaska.

gasket. A. A flat sheet of asbestos compound, sometimes impregnated with thin cotton cloth. See also Alaska.

gas laws. Those of Gay-Lussac, Boyle, and Charles are combined in the equation PV = RT, where P is pressure, V is volume, R is the gas constant, and T is the absolute temperature. These laws apply only to a perfect gas and are modified by Van der Waals effects. Pryor, 3. See also Boyle's law; Charles law; Gay-Lussac's law.

gas lift engine. In petroleum production, one who controls the operation of a gas lift system and compressors to retain natural gas that separates from petroleum and forms a gas cap above the oil column. See also Alaska.

gas furnace. A device for the combustion of coal or coke. The hot gases from the combustion are then burned through oven walls by adjusting governors. He also supervises such operations as weighing and charging coal, and on the surface and equipment on top of battery. D.O.T. Supp. 2. See coal mine inspector. D.O.T. 1. See also Alaska.

gas line. Slaked lime; used to take the carbon dioxide, carbon disulfide, and hydrogen sulfide out of gas. Bennett, 2d, 1962.

gas locking. A condition occurring in pumps where the trapped fluid is compressed and then expands without letting any additional fluid into the pump barrel. Gas locking increases the temperature which decreases pump efficiency. American Petroleum Institute. Drilling and Production Practice, 1983, p. 150.

gaslogged strata. Rock formations, usually in coal mines, which contain a relatively high proportion of methane. When the diagenesis salination is not practiced orthe fire观众, the buoyancy pressure of the fire damper opposes the vent. Flowers, p. 100 feet in depth and wider and narrow conspicuously. In some respects, they resemble fissure veins. They are common in limestone regions. Those in the Upper Mississippian Valley were the first described. The fillings are characterized by crusting, large vugs, and beautiful colors. The fillings are described in detail in the section on the rocks, without any throw or slide of the rocks. Gordon.

gasification, coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.

gasification of coal, underground. See underground gasification.
gasoline plant engineer. In petroleum pro-
duction, one who compreses natural gas to
the pressure required for transportation of
natural gas or for loading into gas cylinders

gas plant operator. A coal mine worker
wielding a coal pick for breaking up the coal
before it can be loaded. Gas plant operators
are sometimes called gas men, gas plant
men, and coal miners.

gas phase. Any chemical substance in the
form of gas, as contrasted with the liquid,
solid, or crystal form of the same substance.

gas pickling. A method of preparing sheet
metal for further treatment by pickling.

gas pipe. A pipe used for conveying gas.

gas plant booster. A device used for
booster the pressure of a gas supply.

gas plant engineer. See gas lift engineer.

gas plant operator. See gas lift engineer.

gas pipeline. A line of pipes used for trans-
mitting gas from one plant to another.

gas production. The extraction of gas from
underground reservoirs at the surface of the
earth.

gas producer. A furnace in which coal is
burned for the manufacture of producer
gas. Gas is a mixture of hydrogen, carbon
dioxide, water vapor, carbon monoxide, and
nitrogen.

gas pressure. The pressure exerted by the
explosive gases after an explosion. Streef-
ard, 1964.

gas producer. The main type of producer
plant. It consists of a shaft furnace, where
the coal is burned, and a gas holder, where
the gas is stored.

gas pocket. a. A cavity in the rocks contain-
ing gas. b. A gas pocket can be created by
the drilling of a well or the explosion of a
mine.

gas producer. A process by which gas is
produced from coal. It involves heating
the coal to a high temperature in the absence
of oxygen.

gas pressure. The pressure exerted by the
gas on the surrounding rock.

gas pipeline. A line of pipes used for trans-
mitting gas from one plant to another.

gas production. The extraction of gas from
underground reservoirs at the surface of the
earth.

gas producer. A furnace in which coal is
burned for the manufacture of producer
gas. Gas is a mixture of hydrogen, carbon
dioxide, water vapor, carbon monoxide, and
nitrogen.

gas pressure. The pressure exerted by the
gas on the surrounding rock.

gas pipeline. A line of pipes used for trans-
it medium for the transport of gas.

gas phase. Any chemical substance in the
form of gas, as contrasted with the liquid,
solid, or crystal form of the same substance.

gas pickling. A method of preparing sheet
metal for further treatment by pickling.

gas pipe. A pipe used for conveying gas.

gas plant booster. A device used for
booster the pressure of a gas supply.

gas plant engineer. See gas lift engineer.

gas plant operator. See gas lift engineer.

gas pipeline. A line of pipes used for trans-
mitt density of the gas.

gas pressure. The pressure exerted by the
gas on the surrounding rock.

gas pipeline. A line of pipes used for trans-
mitt medium for the transport of gas.

gas phase. Any chemical substance in the
form of gas, as contrasted with the liquid,
solid, or crystal form of the same substance.

gas pickling. A method of preparing sheet
metal for further treatment by pickling.

gas pipe. A pipe used for conveying gas.

gas plant booster. A device used for
booster the pressure of a gas supply.

gas plant engineer. See gas lift engineer.

gas plant operator. See gas lift engineer.

gas pipeline. A line of pipes used for trans-
mitt medium for the transport of gas.

gas pressure. The pressure exerted by the
gas on the surrounding rock.

gas pipeline. A line of pipes used for trans-
mitt medium for the transport of gas.

gas phase. Any chemical substance in the
form of gas, as contrasted with the liquid,
solid, or crystal form of the same substance.

gas pickling. A method of preparing sheet
metal for further treatment by pickling.

gas pipe. A pipe used for conveying gas.

gas plant booster. A device used for
booster the pressure of a gas supply.

gas plant engineer. See gas lift engineer.
gastropod. a. A member of the phylum Mol-
lusca, class Gastropoda. Usually it has a cal-
carinated shell, which is typically possesses a
colled, single-cham-
bered shell. Marine, freshwater, and terres-
trial forms exist, and the group has fossil
representatives but the Devonian system
and in all younger rocks. The gastropods
are extremely numerous at the present,
and they have operated through the
Cenozoic era. Snails are the common-
gastunite. The name gastunite 1, gastunite
2a, were given by H. Haber-
landt and A. Schiener (1951) to three
imperfectly characterized uranium miner-
als. Gastunite 1b proves to be betaurano-
tite, while gastunite la has since been de-
scribed another mineral, distinct from any
of the three named by Haber-
landt and A. Schiener; the fourth gastunite proves to be identical
with zeolite. In view of the prior names of
gastunite, the name zeolite is to be pre-
ferred. Honca also describes artificial
analogues, ammonium-, hydronium-, potas-
sium-, and sodium-gastunites. Hey, M.M.,
1961.
gas turbine. A device for the conversion
of the energy of a fluid, usually a gas, in
internal combustion, into rotary motion of
a machine element. The efficiency in-
creases with operating temperature and is
at present limited by the safe tem-
perature at which heat-resisting alloys can be
used. There has been much research on
the possible use of cermets and other spe-
cial ceramics in these turbines, particularly
in the blades.
gas turbine. Same as candle tur-
F. Tomkejeff, 1954.
gas watchman. In bituminous coal mining,
one who makes morning ex-
misions for gas before men enter mine. D.O.T. 1. See
also fireman; fire boss; fire viewer; gas-
gate belt conveyors. Conveyers usually from
26 to 30 inches wide and equipped to
centralize the load and minimize spillage.
A scraper feeder, consisting of an elevat-
ing chain conveyor or a belt, is often used to transfer the coal from the face belt
to the gate belt. Mason, v. 1, p. 117.
gate chamber. The recess formed in a lock
to house a ship caisson or other lock
gate when open. Ham.
gate conveyor. A gate road conveyor which
carryes coal from one source or face only,
that is, from a single face or a double-unit face. See
test conveyor; gathering conveyor. Nelson.
gated. Describes that part of the molding
process wherein the floating gate is sepa-
rated from the molten metal. Castings to
be gated should be setted, at a point where any roughness will be least promi-
nent in the finished article. Ham.
gated pattern. A pattern designated to in-
clude gating in the mold. ASM Gloss.
gate end. The coal face, or inby end of a
gate. See also gate, a. Fay.
gate-end box; gate-end unit. A flameproof
enclosure primarily for use at or near the
coalface and designed to line up with
similar boxes to form a control board. A
gate-end box may contain bus bars, isola-
tors, switches, contactors, transformers and
protective devices, for the control of
motors, lighting and other equipment. See
also gate-end section switch. B.S. 3618, 1965, sec. 7.
gate-end feeder. A short conveyor which
feeds the coal from the face conveyor on
to the gate conveyor. See also feeder con-
veyor. Nelson.
gate-end loader. A short conveyor designed
to receive the coal from the face conveyor and
elevate it to such a height as to be con-
venient for delivery into mine cars. Nelson.
gate-end plate. Mid. A large sheet-iron plate
about 4 feet 6 inches square and one-half
inch thick, upon which the exit pipes (if
any) are turned around upon coming from
the working face to be taken along the gate or
roadway. A kind of turning, a turnwheel. Fay.
gate-end section switch. A form of gate-end
box incorporating a circuit breaker to con-
trol and/or isolate part of an electric sys-
tem. B.S. 3618, 1965, sec. 7.
gate-end unit. See gate-end box. B.S. 3618,
1965, sec. 7.
gate-end stop. A system designed to prevent
shaft conveyances from being moved, or
action signals being transmitted, unless all
shaft gate are closed. B.S. 3618, 1965,
sec. 7.
gate maker. See framemaker; D.O.T. 1.
gate maker, See chute puller; doorman. D.O.T.
1.
gate man. See Barratt-Halsall fire-
man. Dodd.
gate road. a. Eng. A road connecting a stall
with a main road. Standard. See also gate,
and b. Fay. A road through the gob used
for haulage of coal from longwall working.
Prop. 3.
gate road bunker. An appliance for the stor-
age of coal from the face conveyors during
peaks of production or during a stoppage
of the outbye transport. It may consist of
a length of conveyor or of a high-capacity pan arranged under the
delivery end of the gate conveyor. When the travel conveyor cannot handle the coal
carrying from the gate conveyor, the bunker
chain is slowly drawn back carrying about 1 ton
of coal per yard of chain. Bunker is
later discharged by reversing the process.
See also bunker, underground. Nelson.
gates canvas table. A large form of inclined
canvas table in which the pulp is first
classified, then distributed along the upper
edge of the table. The concentrates are
caught in the warp of the canvas and
after this is full, treatment must be stopped
while the concentrates are swept or sluiced
off. Liddell 2d, p. 387.
gate shutter. A saddle-like implement used
to shut off the flow of metal from a mold
and divert it to other molds. Standard,
1964.
gate side pack. A pillar consisting of tightly
rammed material enclosed in walls of
stone, built on each side of the gate road.
See also double packing. Nelson.
gate valve. A valve with a sliding disk or
stop gate, which, when opened allows the
flow to move straight through the valve
mechanism. Also called stop-valve; straightway valve. Long.
gateaway. a. A road through the worked-out
area (goaf) for haulage in longwall work- ing. Also called gate road. C.T.D.
b. Mid. See gate, a and b. Fay.
gateway longwall. N. Eng. A continuous
gateway longwall

coil face served by gateways (in Durham about 12 yards apart). A small group works in each gateway down which the stock of a short trip is taken. Fay.
gather. a. To assemble loaded cars from several production points and deliver them to main haulage road, and to replace them with empty cars. Fay. Also called gathering locomotive.

gathering mine locomotive. See gathering locomotive; electric gathering mine locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay.

gathering hole. An opening in the working place to correspond with the dehydrated blast effects great fuel economy. Fay.

gathering haulage. That portion of the haulage system used to gather loaded cars from the separate working places, and to return empties. Fay.

gathering conveyor. Portable or transportable pumps that are required when water is encountered while opening a new mine, for extending headings or entries in an operating mine, for pumprooms or rib sections lying in the dip, for collecting water from local pools, or for sinking a shaft. They should discharge water at a point high enough for it to flow into a station pumping plant, or into a drainage ditch or tunnel carrying water outside a mine. They may also discharge directly on the surface. Either reciprocating or self-priming centrifugal pumps may be employed as gathering pumps. BuMines Bull. 570, 1957, p. 1.

gathering area. The area, usually down the regional dip from a hydrocarbon trap, from which the oil or gas may have migrated updip into the trap. A.G.I.

gathering traverse. A machine for loading loose rock or coal. It has a tractor-mounted chassis, carrying a chain conveyor the front end of which is built into a wedge-shaped blade. Mounted on this blade are two arms, one on either side of the chain conveyor, which gather the material from the muckpile and feed it on to the loader conveyor. The tail or back end of the conveyor is designed and cut for draining hydraulically so that the coal or stone can be loaded into a car or onto another conveyor.

gathering coal. Scot. See gathering peat. Fay.

gathering conveyor. a. Any conveyor which is used to gather coal from other conveyors and deliver it either into mine cars or onto another conveyor. The term is frequently used with belt conveyors placed in entries where a number of room conveyors deliver coal onto the belt. Jones. b. Generally 50 feet or greater in length. It is designed to transport material from rooms or entries and transports it to a car loading point or to another conveyor. Sometimes known as a conveying conveyor. A.G.I. Also called gathering peat conveyor; truck conveyor. Nelson.

gathering ground. See catchment area.

gathering head. That portion of the haulage system immediately adjacent to the face. In longwall mining, the face belt or tal and track along the face constitute the gathering haulage system. Wheeler, H. R., p. 1.

gathering hole. An opening in the working face of a glass tank furnace, or in the wall of a pot furnace, to permit the gathering of molten glass. Dodd.

gathering iron. The iron used in taking viscid glass from the melting pot. Standard, 1964.

gathering locomotive. See gathering motor; electric gathering mine locomotive.

gathering mine locomotive. See gathering motor; electric gathering mine locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay. Also called gathering locomotive.

gathering motor. A lightweight type of electric locomotive used to haul loaded cars from the working places to the main haulage road. Fay. Also called gathering locomotive.

gathering motorman. In bituminous coal mining, one who operates a mine locomotive to haul loaded mine cars from working places to sidings, for the formation of larger trips, for loading and unloading the cars, and to replace them with empties. Fay.
**gaceutlne**

in a geologic area are derived, A.G.I. a. Mineralized area from which sediments are eroded. Ballard.

**gelif**

tube. A gas-filled chamber usually consisting of a hollow cylindrical cathode and a fine wire anode along its axis. It is operated with a voltage high enough so that a discharge triggered by a primary ionizing event will spread over the entire anode surface by the reduction of the field by space charge. NRC-ASA N1.1-1957.

Geiger-Müller probe. A Geiger-Müller counter enclosed in a watertight container, which can be lowered into a borehole and used to log the intensity of the gamma rays emitted by the radioactive substances in the rock formations traversed. Also called electronic logger; Geiger probe. Long.
water. Brantly, I., I. A colloid in a more solid form than a sol. As a semiliquid, apparently homogeneous substance that may b.e made by mixing a sol with another colloid (a gelatin) or more or less rigid (as silica gel) and that is formed by coagulation of a sol in various ways (as gelatinization by evaporation, or by precipitation with an electrolyte). Or as a nonhomogeneous gelatinous precipitate. Webster 3d. e. As a verb, to change into or take on the form of a gel; to become more solid; to set. Webster 3d.

Gelatin. Trade mark for a semigelatin high explosive of relatively high weight strength of 65 percent; very good water resistance. Used in underground mining, in quarrying, in construction, and in general blasting. CCD 64, 1961.

gelatin. gelatinous. a. A hard, transparent, tasteless colloid obtained from animal connective tissues, such as skin, hoof, and horn. The dried material swells on contact with cold water to a jellylike mass or dissolves in hot water to form a firm jellylike mass on cooling. Gelatin dissolved in hot water is used commonly in borehole surveying to make a Masco compass. Compaq sugar. Long b. Commonly used as a synonym for gelatin. Long.

gel borehole tube. A device used in borehole surveying. A tube, containing a compass floating in molten gelatin, is lowered to the point in the borehole at which its verticality is required. It is left in position until the gelatin sets and is then withdrawn. The compass becomes a direction finder and a small plumb bob shows the angle of dip. Nelson.

gelatin dynamite. A high explosive which varies in composition; consists mainly of nitroglycerin, with sodium nitrate, meel, colloid cotton, and sodium carbonate. Fror, 3. It is dense, plastic, and more water-resistant than straight or extra dynamite. Its relatively high velocity makes it ideal for small strategic jobs, tough rock, for wet conditions, or for actual underwater blasting. Carson, p. 308. Commonly used by drillers to extend holes encountered in driving pipe through overburden, especially in water-filled or saturated ground. Also commonly called gelatite. Long.
gelatin extras. Explosives in which a portion of the nitroglycerin is replaced with ammonium nitrate. The explosive velocity is reduced but the substantial resistance to water is retained. Less expensive than gelatin dynamite. Carson, p. 308.
gelatinization. Solubility of the gelatin being observed with the formation of jellylike silica. Fay.

gelatin-pad printing. See Murray curve machine. Dodd.
gelatinite. A general term relating to explosives in which a principal constituent, nitroglycerin, is given a gelatinous consistency by mixing it with nitrocotton. B.S. 3614, 1964, sec. 6.
gelatinization. The formation of a gel from a sol. Webster 3d.

gel cement. Cement to which a small percentage of bentonite has been added either dry or mixed with water. Such an addition produces a more fluid slurry undergoing sedimentation and casing and restoring lost circulation because it reduces loss of slurry to the well. For a more homogeneous mixture, increases the water-cement ratio, reduces loss of water to the formation, and adds resistance to deformation of the borehole volume as occupied when placed. Brantly, I.

gelignite. A general term relating to explosive compositions in which there is a proportion of wood, metal, and oxygen-containing salts. B.S. 3618, 1964, sec. 6.

gelitocollinite coal. This type coal is characterized by predominance (over 50 per cent) of a groundmass (collinite) translucent in thin sections, resulting from complete decomposition of the process of gelification of the original plant material. As a rule, the collinite material occurs as homogeneous floccular masses. Gelified components showing structure are only rarely represented in the form of lens and thin strips of vascular wood fibers, gelified fragments of bark, and leaf parenchymatous tissue. Fusinized inclusions are rare. There may be occasional concentrations of homogenous, opaque particles and fine fragments of fused tissue, sometimes also coarse lenses of semifusinite and fusinite. The proportion of lipid microparticles varies from a single inclusion to the maximum concentration permitted in these gelite-coals. Occasionally, this type of coal may contain age of the cambial type. Hand specimens are generally semilustrous with a uniform, coarsely banded structure, and break with a typical, slightly conchoidal fracture. This coal may have low or high ash, and occurs in seams of different geological age as bands within scins or as entire scins up to several meters thick. Compared with other gelite types of coal, gelitocollinite coals are distinguished by very high caking power and because of this are valuable for coke manufacture and for blast-furnace smelting. Gelitocollinite coal contains 50 percent or more of gelified, vitrinitic components. The size of the constituent entities generally varies between 0.2 and 1.0 millimeter (1.5 to 2.0 millimeters) and are also seen. Fusinized tissue is not common and ligninite is insignificant. Gelitocollinitic material is present in greater or lesser amounts. Wood gelitocollinite coals and parenchyma gelitocollinite coals are distinguished according to the preporedecd structure of the type of original plant tissue. Wood gelitocollinite coal consists largely of individual fragments of stem and roots, wood tissue predominating. They are invariably low in ash. Parenchyma-gelitocollinite coals contain a variable amount of cutie-bordered leafy material; the parenchyma tissue is markedly gelified. Here and there the leafy material may be clearly packed forming aggregates; at other times it is found in varying quantities embedded in a transparent groundmass. Parenchyma gelitocollinite coals may have high or low ash. In hand specimens gelitocollinite coal is black and has hard coal properties; in brown coal it is matt or semimatt. Gelitocollinite coal shows sharp-edged, stepped fracture and occurs in seams of different geological age, both as bands within seams or as entire seams up to several meters thick. Compared with other gelite types of coal, gelitocollinite coals are characterized by very high caking power and because of this are valuable for coke manufacture. IHCP, 1963, part I.

gelopalite. Coal rich in gelinite; for example, alical coal. Tomkiewicz, 1954.
gel strength. The ability or the measure of the ability of a colloid to form gel. Brantly, I.
gem. a. A general term including any precious or semiprecious stone, as diamond, ruby, topaz, etc., especially when cut or polished for ornamental purposes. Fay. b. Archaeologically, the term is restricted to an en-graved stone, for example, an intaglio or a cameo. Fay. c. Mineralogically, one of the orders of minerals used by Mohs that are distinguished by their ability to scratch quartz, transparency, nonmetallic luster. They are generally brilliant and beautiful. Fay. d. A gem or gemstone, a virtually flawless, lustrous, nearly spherical, industrial-grade diamond, which on rare occasions may be cut into a brilliant cut diamond; gem grade. e. A diamond free of flaws—
gem

far as can be determined by a trained ob-
server with the aid of a 10-power magnify-
ing glass—and having a color and other
characteristics that do not deleteriously
affect its value for use as a faceted orna-
tamental (gem) diamond. Long.
gem gravel. The coarse 
material from which a gem can be cut. Shipley.
gem grade. See gem, a and b. Long.
gem gravel. A settlement of gravel con-
taining appreciable amounts of gem min-
erals. It was formed by the disintegration
and transportation of preexisting rocks, in
which the gem minerals originated. They
are placers of a special type, in which the
heavy minerals are not native gold or cat-
sinite (SnS2), but such gem minerals as
garnets, rubies, sapphires, etc. As m. of the
gem gravels are heavy and chemically
stable, they remain near the point of origin,
while the lighter constituents of the parent
rocks are washed away, resulting in a natu-
ral concentration of the valuable compo-
nents. C.T.D.
gemmary. a. The science of gems. Standard,
1964. b. House or receptacle for gems or
jewels; also, gems collectively. Standard,
1964. c. An engraver of gems. Standard,
gem material. A term used particularly to
mean (1) any synthetic or other important
substitute for a gemstone, or (2) any rough
mineral from which a gemstone can be
fashioned, such as a piece of uncut jade.
gem mineral. Any mineral species which
yields either a gem variety or individual
specimens which meet the qualifications of
a gem. Shipley.
gemmological polariscopie. See Shipley polar-
scope.
gemologist. One who has mastered gem-
ology. Shipley.
gemmology. (U.S.) gemology (Eng.). The
study of gems. A.C.I.
Gemolite. A trademark for an illuminator
designed especially to illuminate inclusions
(in gemstones) more effectively. Employs
a gem pearl. a. A term often used for those
different varieties of a mineral spe-
cies. That variety of a mineral which is of
sufficient beauty and durability for use as a
personal ornament. See also decorative stone;
ornamental stone; gem material. A term that
includes pearl, amber, coral, jet, or any stone
of any variety which fuel is gasified by blowing in steam
and coordinates all operations concerned
with reducing ore to designated size.
D.O.T. Supph.
geometric drawing. A drawing showing eleva-
tion plan, and cross section of the struc-
ture, also the borings for substructure and
geological branch of geology treating of the problems of dynamic geol-
ogy in relation to the geologic history of the earth. Schieferdecker.
geometallurgical. a. The science of individual
operation. ACSG, 1963.
geometric classificatioii. Any classification based
on manner of origin or genetic classification. Any classification based
on manner of origin or line of descent. Genetic classification is set up to deal with fossils, rocks, and minerals. Stokes
and Barnes, 1955.
ageochemical anomaly. A concentration of one or more elements in rock, soil, sedi-
ment, vegetation, or water markedly differ-
ten from the normal concentration in
to a central discharge. In the body of the tank, hang radially mounted hinged plates covered with filter cloths (sacks). These
are connected with a central valve and timing mechanism, so arranged that vacuum is applied for from one to ten minutes to remove filtrate, after which the gathered solids are digested by the fluorine
and phosphorus.
the surroundings. Sometimes applied also to abnormal concentrations of hydrocarbons in soils. A.G.I. Geochemical anomaly is the situation at depth as called primary anomalies while those originating on the surface are called secondary anomal-

gesochemical balance. Term relating, for in-
stance, to the ratios of distribution of the total amount of a chemical element liberated by rock weathering, and trans-
ported to the ocean, between sea water and sea-bottom environments. Scheidercker.

gesochemical classification. The division of
chemical elements into associations as they
exist in nature. Scheidercker.

gesochemical coherence. The phenomenon of
the intimate occurring together of certain
chemical elements and associations as, for
example, the group of the lanthanides, zir-
conium-hafnium, niobium-tantalum, etc.

Scheidercker.

gesochemical cycle. The sequence of stages
in the migration of elements during geo-
logic changes. Rankama and Sahama distin-
guish a major cycle, proceeding from mag-
ma to igneous rocks to sediments to
sedimentary rocks to metamorphic rocks
and possibly through migmatises back to
magma, and a minor or exogenic cycle proceed-
ing from sediments to sedimentary rocks to weathered material and back to sediments again. A.G.I.

gesochemical environment. Pressure, tem-
perature, and the availability of the most
abundant chemical components are the
parameters of the geochemical environ-
ment. The constraints within that environ-
ment are stable at any given point. On the basis of these variables, it is possible to classify
all the natural terrestrial environments into
two major groups—primary and sec-
ondary. The primary environment ex-
tends downward from the surface to the
lowermost levels of the earth and includes
sedimentary rocks which may or may not have a shell of
material sampled, as for example, geo-
chemical soil survey. Hawkes.

gesochemistry. a. The study of the relative
and absolute abundances of the elements
and of the atomic species (isotopes) in the
earth; the distribution and migration of
the individual elements in the various
parts of the earth (the atmosphere, hy-
drosphere, crust, etc.), and in minerals
and rocks. b. A prospecting method that
involves the discovery of elements and
which may or may not have a shell of
chalcedony, others are composed of lime-
stone, dolomite, celestite, barite, or other
minerals, and most have been formed in
shales or other soft rocks. Distinquished
from vugs which are round, and carved by
carbed veins in veins or rocks, and may be
crystal-lined. Foy. Hess. 6. A cavity in a
geode. Webster 3d.

gcesoepidemology. A long, narrow depression,
not necessarily filled by sediments. A.G.I.

gesoestrx. One who employs surveying and
geochemical instruments, such as transits, theo-
dolites, and other engineering instruments,
in setting up and improving network of
triangulation over the earth's surface, in
order to provide fixed points for use in

gesoetry. A branch of applied mathematics
that determines by observation and meas-
urement the exact positions of points and
the figures and areas of large portions of
the earth's surface, the shape and size of
the earth, and the variations of terres-
trial gravity and magnetism. Webster 3d.
Also called geodetics. b. Survey which in-
cludes corrections for the surface curvature
of the earth. Colombo.

gesoetric coordinates. Latitude and longitude
as calculated on the spheroid. Seysle. 2.

gesoetric. See geodetic.

gesoetrical surveying. That very accurate
method of surveying which takes into con-
ideration the spheroid form of the
earth and curved surface. Used in topographic and
hydrographic work. Crispin.

gesoeter. An instrument which employs
an electronic method of measuring dis-
tance by measuring the time it takes a
modulated light wave to travel from the
move-to a mirror and to return. HSB.

gesoetnomic. Of, pertaining to, or noting
the forces or processes within the earth.

geoetcuit. A large fault directly affecting the
relief of the earth's surface, on land or
beneath the sea. Challinor.

goetharact. A large flexure directly affect-
ing the relief of the earth's surface. Chal-
inor.

goetfraktion. A fracture passing through the
entire thickness of the solid crust. Scheider-
cker.

goetography. a. A branch of geology that
deals with the materials of the earth and its
general interior and exterior constitution.
Webster 3d. b. An term for absolute
knowledge of the earth, as distinct from
grology, which includes various theoretical
aspects. C.T.D.

goetology. A science or a theory of the forma-
tion of the earth. Webster 3d.

goetographical concentration. The ratio of face
length in yards (X) to length of main
haulage roads in yards (L), that is —

264-972 O-68-32

494
geographical cycle

time a geographical cycle. Synonym for
cycle of erosion. See also geographical cycle.

A.G.I.

gеographic or true north. The northerly di-
rection of the geographic meridian at any
terrestrial point. B.S. 3018, 1963.

gеographie. A science that treats of the
surface of the earth, including its form
and development, the phenomena that take
place thereon, and the plants, animals, and
peoples that inhabit it, considered in rela-
tion to the earth’s surface; also, a book or
treatise on the above subject. Fay.

geohydrology. The science dealing with
the character, source, and mode of occurrence
of underground water. Schieferdecker.

gеoligion. A rock stratigraphic unit. A.G.I.

Supp.

gеoligion. An old term for geologist. Fay.

gеologic geological. The generally preferred
usage is as follows: geologic data; geologic
investigation or survey; geologic organi-
sation, or the society; geologic era; and
gеologic geological age. A.G.I.

geologic geological age. The time of existence of a fossil
organism or the occurrence or duration of a
particular event as stated in terms of the
conventional geological time scale. Any
event stated in terms of years is usu-
ally given a relative geologic age. Stokes
and Varnes, 1955.

gеologic geological column. A column or force by means of
which a geological process oper-
ates. Chaffin.

gеologic geological formations. Groups of rocks
of similar character and age. Fay.

geologic geological horizon. A particular bed of rock
or its equivalent, generally used as refer-
ing to the bed containing a fauna or flora
under consideration. Less often, used to
mean igneous rocks of a particular period
of time. Fie.

geologic geological ore. Ore that, so far as geological
considerations may be present, is charac-
teristic of the strata in which it is found.

geologic geological province. An area throughout
which geological history has been essen-
tially the same or which is characterized
by particular structural or physiographic
features. Schieferdecker.

geologic geological section. A natural rock cut
Schieferdecker. b. The representation of
such paper. Schieferdecker.

geologic geological survey. A systematic investiga-
tion of an area determining the distribution,
structure, composition, history, and inter-
relations of rock units. Its purpose may be
either purely scientific or economic with
special attention to the distribution, re-
serves, and potential recovery of mineral
resources. Stokes and Varnes, 1955.

Geologic Geological Survey. A Federal or State gov-
ernmental organization that undertakes
such investigations. Stokes and Varnes,
1955.

geologic geological time. The time extending from the
end of the Formative period of earth his-
tory to the beginning of the Historical
period. It is conveniently divided into sev-
eral periods, each being the time of forma-
tion of a given line or plane of the
earth’s crust. Stokes and Varnes,
1955.

geologic geological structure. See structure, b. Nelson.

geologic geological survey. A survey or investigation
of the character and structure of the earth,
of the physical changes which the earth’s
crust has undergone or is undergoing, and
of the causes producing those changes.
A.G.I.

geologic geological thermometer. A term applied to
known temperature limits within which
certain minerals or mineral aggregates must
have formed; based upon the fact that the thermal
data relating to the fusion points of rocks and
minerals, and the inversion or transition
points of allotropic modifications of rock-
forming compounds, and in general, to the
equilibrium conditions and stability ranges
under different conditions of pressure for
various minerals, alloctenes, solid solutions,
eutricrystallites, and other mineral aggregates.
Holmes, 1928.

geologic geological time unit. The time unit corre-
sponding with a time-stratigraphic unit; for ex-
ample, period, epoch, or age. A.G.I. Supp.

geologist. a. One who studies the constitu-
tion, structure, and history of the earth’s
crust, conducting research into the forma-
tion and dissolution of rock layers, analyz-
ing fossil and mineral contents of layers,
and endeavoring to fix historical sequence
of development by relating characteristics
to known geological influences (historical
geology). D.O.T 1. b. One versed in the
science of geology or engaged in a geologi-
cal investigation or investigation. Placards,
drillers core snatcher; rock hound; sample
graber; sniffer. Long.

geologist petroleum. One who explores and
charters a stratigraphic arrangement and
composition of earth in order to locate gas
and oil deposits. Identifies strata encountered
in drillings by studying the nature of the rock,
minerals, and fossils. Long.

geology. A science that deals with the histor-
y of the earth and its life, especially as re-
corded in the rocks. Three principal
branches or phases are usually distin-
guished: (1) structural, or geotectonic,
geoogy, treating of the form, arrangement,
and internal structure of the rocks; (2)
dynamic geology, dealing with the causes
and processes of geological change; and
(3) historical geology, aiming to give a
chronological account of the events in
the earth’s history. Webster 2d. Other subdivi-
sions are (1) economic geology, which
deals with the applications of the science
in industrial relations and operations; (2)
legal geology, the application in litigation
of the facts and principles of geology, par-
ticularly its subdivisions, mineralogy, eco-
nomic geology, and mining geology; (3)
mining geology, a subdivision of economic
geology concerned with the application of
geological facts and principles to mining;
and (4) stratigraphic geology, a study of
the succession of the beds of rock laid down
during the progress of geologic ages. Fay.

geomagnetic geological. The use of the minute quantities of
helium spontaneously generated in certain radioactive
minerals (see pleochroic halos). Baron G.
de Geer has used the examination of the
luminations in varve clay to measure the
Phistocene glaciation. C.T.D.

geologic geological column. A diagram showing the sub-
divisions of part or all of geologic time or the rock formations of a particular locality.
Stokes and Varnes, 1955.

geologic geological drilling. Drilling for the time primarily to
obtain information from which the geology of the formation penetrated can be deter-
mined. See geological geology. Compare forma-
tion testing. Long.

geologic geological formation. See formation. Stokes and
Varnes, 1955.

geologic geological geologic. Sometimes used in oilfields
to indicate a later geological formation re-
sulting from erosion. Opposite of geologic
low, which refers to earlier formations.
Compare topographic high. Fay.

geologic geological geologist. See geologist.

geologic geological geology. A science dealing with the
earth’s history. Webster Pd. Other subdivi-
sions are (1) economic geology, which
deals with the applications of the science
in industrial relations and operations; (2)
legal geology, the application in litigation
of the facts and principles of geology, par-
ticularly its subdivisions, mineralogy, eco-
nomic geology, and mining geology; (3)
mining geology, a subdivision of economic
geology concerned with the application of
geological facts and principles to mining;
and (4) stratigraphic geology, a study of
the succession of the beds of rock laid down
during the progress of geologic ages. Fay.

geomagnetic geological. See geomagnetic geological.
geophysical pole

generic field located about 4,000 miles above its surface, does not correspond to the surface magnetic pole; one is at 78°25' south, 111° east. A.G.I. Supp.

generic effects. A term to describe the effectiveness of measurements, such as borehole diameters, on the magnitude of S.P. deflections. Wyllie, p. 41.

generic mean diameter. The diameter equivalent of the arithmetic mean of the logarithmetic frequency distribution. In the analysis of beach sands it is taken as that grain diameter determined graphically by the intersection of a straight line through selected boundary sizes (generally points on the distribution curve where 16 and 84 percent of the sample by weight is included) and a vertical line through the median diameter of the sample. HBG.

generic progression. Series of numbers increasing by multiplication, which uses a constant factor. Pryor, p. 30.

generic. That branch of mathematics that deals with the relations of points, lines, angles, areas of surfaces, and volumes of solids. Jones, 2, p. 80.

genericomorphic. Of or relating to the form of the earth. Webster 3d.

generic cycle. The term geomorphic cycle is defined as the old term geographical cycle which is less accurate. Synonym for geographical cycle; cycle of land and submarine relief features; regarding the earth. Webster 3d.

generic morphology. That part of geology which treats of the origin and development of the earth's surface features. Fay.

generic geomorphologist. A specialist in the study of the origin and development of the earth's surface features. Fay.

generic geomorphology. A science that deals with the land and submarine relief features of the earth's surface and seeks a genetic interpretation of them through using the principles of phylogeny in its descriptive aspects and through its natural geography in its exploratory phases. Webster 3d.

genericymirin. See geomycirin. Fay.

genericymite. A yellow glass, white general, melting at about 80° C, and soluble in hot absolute alcohol and ether; its composition (CaHfO₃) is near that of certain vegetable glasses. A.G.I.

generic phone. A detector, placed on or in the ground in seismic work, which responds to the ground motion at the point of its location. Synonym for seismometer; seismograph; geotelegraph; pickup; jug; tortuga. A.C.G.

generic physical. Relating to the physics of the earth. Fay.

generic physics. The branches of physics by measuring the various physical properties of the rocks, and interpreting the results in terms of geologic feature or the economic deposits of the rocks to be taken at the surface of differences in the density, electrical resistance, or magnetic properties of the rocks. There are four main methods employed in geophysical prospecting of oil: gravimetric, magnetic, electrical, and seismic with several modifications of each. Nelson.

generic geophysical prospector. One who studies structural and surface rock formations in order to locate petroleum deposits, using such physical and electrical testing instruments as seismograph, gravimeter, torsion balance, magnetometer, pendulum devices, and electrical-resistivity apparatus to measure various characteristics of the earth. May be designated according to type of equipment used, as electrical prospector, gravity prospector, magnetic prospector, and seismic prospector. D.O.T. 1.

geophysical site investigation. The measurement of the various physical properties of rocks at a site and interpreting the information in terms of geologic structure and nature of deposits. Of the various established geophysical methods of investigating sites, the electrical resistivity method is the best known. It is used to contour concealed rock surfaces and detect discontinuities. The geophysical method is particularly useful for rapid survey of a large site, especially when used in conjunction with boreholes or trial pits. Nelson.

generic geophysical survey. The exploration of an area in which geophysical properties and relationships unique to the area are mapped by one or more geophysical methods. A.C.G.

generic geophysicist. One who studies seismic, gravitational, electro, thermal, and magnetic phenomena; deals with the structure and composition of earth, and forces causing movement and warping of surface. Investigates origin and causes of glaciers and volcanoes, and the course and phenomena of earthquakes; charts ocean currents and tides; takes measurements concerning shape and movements of earth, and acoustic, optical, and electrical phenomena in the atmosphere; and studies petrology and mineral deposits. May specialize in a particular phase of the work, as exploration, administration, teaching, consulting, design, or research. D.O.T. 1.

generic geophysics. The science of the earth with respect to its structure, composition, and development. It is a branch of experimental physics dealing with the earth, including its atmosphere and hydrosphere. It includes the sciences of dynamical geology and physical geography, and makes use of geodesy, geology, seismology, meteorology, oceanography, magnetism, and other earth sciences in collecting and interpreting earth data. Geophysical methods have been successfully applied to the identification of under-ground structures in the earth and to the search for structures of a particular type, as, for example, those associated with oil-bearing sands. A.G.I.

generic geordie turnout. A. Scot. A coal miner's safety lamp. Webster 3d.

generic geothermal. Of or relating to the form, arrangement, and structure of the rock masses of the earth's crust. Synonym for structural. Webster 3d.

generic geotectonic. Of or relating to the form, arrangement, and structure of the rock masses of the earth's crust. Synonym for structural. Webster 3d.

geothermal. Steam drawn from deep underground through a rock mass that subsided deeply; throughout a long period of time in which a thick succession of stratified sediments and possibly extrusive volcanic rocks commonly accumulated. The strata of many geosynclines have been folded into mountain ranges. Many different kinds have been differentiated and named. A.C.G. Supp. b. The area of such a trough. A.G.I. Supp. c. A stratigraphic formation or sequence that subsided in such a trough. A.G.I. Supp.

generic geotechnical processes. The name given to those processes which control the structure and development of soils, and which include compaction, electro-osmosis, freezing, ground-water lowering, and injection. Hum.

generic geotechnics. The engineering behavior of all cuttings and slopes in the ground. This term is gradually replacing the term "soil mechanics and foundations of geotechnical processes." Symposium on Open pit Mining, Quarrying, and Alluvial Mining, London, 16-19 November, 1964. Pages 17, pp. 1-2. A science of making the earth more habitable. Webster 3d.

generic geologically. Of or relating to the form, arrangement, and structure of the rock masses of the earth's crust. Synonym for structural. Webster 3d.

generic geologist. Synonym for geophysicist. A.G.I.

generic geothermal. Of or relating to the form, arrangement, and structure of the rock masses of the earth's crust. Synonym for structural. Webster 3d.

generic geothermal. Of or relating to the form, arrangement, and structure of the rock masses of the earth's crust. Synonym for structural. Webster 3d.

geothermal gradient. The change in temperature of the earth with depth, expressed in degrees per unit depth, or in units of depth per degree. A.G.I.

generic geothermal steam. Steam drawn from deep underground through a rock mass that subsided deeply; throughout a long period of time in which a thick succession of stratified sediments and possibly extrusive volcanic rocks commonly accumulated. The strata of many geosynclines have been folded into mountain ranges. Many different kinds have been differentiated and named. A.C.G. Supp. b. The area of such a trough. A.G.I. Supp. c. A stratigraphic formation or sequence that subsided in such a trough. A.G.I. Supp.

geothermal gradient. The change in temperature of the earth with depth, expressed in degrees per unit depth, or in units of depth per degree. A.G.I.

generic geothermal steam. Steam drawn from deep underground through a rock mass that subsided deeply; throughout a long period of time in which a thick succession of stratified sediments and possibly extrusive volcanic rocks commonly accumulated. The strata of many geosynclines have been folded into mountain ranges. Many different kinds have been differentiated and named. A.C.G. Supp. b. The area of such a trough. A.G.I. Supp. c. A stratigraphic formation or sequence that subsided in such a trough. A.G.I. Supp.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermometer. A thermometer designed to measure temperatures in strata or in boreholes deep below the surface of the earth; a geologic thermometer. Webster 3d.

generic geothermometer. A thermometer designed to measure temperatures in strata or in boreholes deep below the surface of the earth; a geologic thermometer. Webster 3d.

generic geothermometer. A thermometer designed to measure temperatures in strata or in boreholes deep below the surface of the earth; a geologic thermometer. Webster 3d.

generic geothermometer. A thermometer designed to measure temperatures in strata or in boreholes deep below the surface of the earth; a geologic thermometer. Webster 3d.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I.

generic geothermal gradient. See strata temperature. Roberts, I

gerhardite. A basic copper nitride containing 32% cobalt. Contains Cr, Zn, Cu, Ni, Co. Contains niobium and Zr, C. 426; luster, vitreous; brilliant; color, deep emerald-green; streak, light green; transparent; soluble in dilute acids. From Jerome, Ariz. Weed, 1918.
german. A straw tube filled with gunpowder and used as a fuse. Not used in coal mines. C.T.D.
german cupellation. A method using a germanium to separate the tin from the silver. A straw tube filled with gunpowder and used as a fuse. Not used in coal mines. C.T.D.
german cold. See pyramidal cut. Fraenkel, v. 1, Art. 602 b. 27.
german impure. A dark, red-gray sulfarsenite of copper, iron, and germanium, 5CuS₈-12(Fe₃S₄)S₃As₂S₃.2GeS₂; isometric; number, 32; atomic weight, 72.38; specific gravity, 5.323 (at 25°C); melting point, 937.4°C; boiling point, 260°C; insoluble in water and in alkalies; and soluble in hydrochloric acid and in aqua regia. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1958, p. B-672.
germanium dioxide (insoluble). GeO₂; tetragonal; molecular weight, 104.59; specific gravity, 4.229; melting point, 1,086±5°C; insoluble in water and in hydrochloric acid; and slightly soluble in ammonium hydroxide. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-177.
germanium dioxide (soluble). GeO₂; melting point, 1,115°C. This oxide is a gas former and provides some unique properties; for example, greater dispersion, lower melting temperature; and higher transmittance for infrared radiation. Some germanium oxide complexes and solid solutions have ferroelectric properties. Lee, Colorless; specific gravity, 4.228 (at 25°C); hexagonal; soluble in alkali; and slightly soluble in acids and in water. Used as an ingredient of special glass mixtures. C.G.D ed. 4d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-177.
germanium nitride. A brown, decomposes at 800°C. A yellow electric conductor of high resistivity. Dodd.
german lapiz. See Swiss lapiz. C.M.D.
german melt. See Continental commercial process.
german reduction process. This process consists in: (1) roasting the ore; (2) melting and obtaining a matte with 30 to 40% cobalt; (3) roasting as cobalt; (4) melting and obtaining a matte with 70 to 80% nickel. (5) roasting the matte; (6) melting and obtaining a black copper. Fay.
german silver. An alloy of copper, zinc, and nickel. German silver. A basic copper nitride containing 32% cobalt. Contains Cr, Zn, Cu, Ni, Co. Contains niobium and Zr, C. 426; luster, vitreous; brilliant; color, deep emerald-green; streak, light green; transparent; soluble in dilute acids. From Jerome, Ariz. Weed, 1918.
german steel. A metal made from charcoal iron obtained from bog iron or from sparry carbonate of iron. Fay.
german tubing. A form of tubing, with internal flanges and bolts, for lining circular shafts sunk through rapidly watered strata. Where conditions are favorable, concrete is replacing tubing as a shaft lining. See also English tubing. Nelson.
germination. See grain growth. ASM Glass.
gersdorfitite. A sulfarsenide of nickel mineral, NiAs₃ or Ni₃S₄, As₃S₄. C. 275; luster, vitreous; color, deep brown-black; opaque; strongly birefringent; twinning, parallel and symmetric. Nelson.
gerstenhofer furnace. A shaft furnace, with a fixed, white, incandescent light. Fay.
gey sand. A type of roped cappel used with the Koope wandor, particularly in Germany. It consists mainly of two plates held together, incorporating a dead eye and wedge block. The rope is laced around this wedge and is self-tightening as the load increases. See also Demag cappel. Nelson.
ghizlize. A glassy variety of an analcite and olivine-bearing basalt. A.G.I.
ghost crystal. A crystal within which may be seen an early stage of growth, and outlined by a thin deposit of dust or other mineral deposit. C.M.D.
ghost reflection. In the seismic reflection method, a special type of multiple reflection. This is the reflection which takes place when the energy from the shot is reflected downward by the base of the weathered zone or by the earth's surface. The reflected pulse follows the primary downgoing pulse at a time interval determined by the depth of the shot below the weathering (or the free surface) and the velocity of the medium. For normal shooting depths this interval will range from 0.010 to 0.020 seconds. Dobrin, p. 143.
ghost town. Deserted mining camp; or one in which only a few people remain after closing down of a once busy community. Pryor, 3.
ghup. a. 3d. b. Nitroglycerin absorbed in a gas-oil ratio. Also called gas-oil ratio. Fay.
giant's Causeway. A large formation of basaltic columns, in which geysers are vented by the pressure of the lava. Usually (Ad Faithful in Yellow Park, Wyo. The eruptive force is usually terminated upwards by a sinter crater. C.T.D. or geysers. Fay.
giant arsenite, Na₂As₂Sb₂S₁₇.6H₂O, as red spherules, most of them small. Fay. The clay in the Geyser basin. An area in which geysers are grouped. Fay.
giant granite. See pegmatite. Fay.
giant pressure. For gross gas-oil ratio. Also abbreviated GGOR. BuMil Style Guide, p. 59.
ggpd Abbreviation for gross gas produced. Also abbreviated GGP. BuMil Style Guide, p. 59.
ghast, Scot. The white ash or chind of shale.
gey纱 coal. Scot. A coal which burns with a fixed, white, incandescent light. A.G.I.
ghost coal. Scot. A coal which burns with a fixed, white, incandescent light. A.G.I.
ghast coal. Scot. A coal which burns with a fixed, white, incandescent light. A.G.I.
Giant's Causeway

491

gin race

Webster 3d.
gin beam. S. Staff. A timber crofter carrying the pulley wheels over the top of a head-frame. Fay.
ginning. The process of lining a shaft with bricks or mosaicry; the lining itself. C.T.D.
ginfire. Derb. A walling up a shaft, instead of timbering, to keep the loose earth from falling. Fay.
gin hand. One who assists pressman I by performing unskilled duties entailed in the feeding and unloading of a brick press, such as shoveling, laying mud in path of box, barracrow the box, that feeds press, pushing empty rack car in position for off-bearer who removes formed bricks from gin, and who removes finished product to press. D.O.T. 1.
ginnern. a. Cumb. A Union, used by miners fringing the more irregular iron-ore bodies. Arkell. b. Cumb. An opening or crack in the rocks.
ginnier. N. Staff. a. A term used in the potteries for a woman whose job it is to grind china ware, after it has been taken from the glott kiln, any adhering particles of refractory material from the kiln furni-
ture. Compare sorting. Dodd. b. From Ginn- net, an old term for a tool used by carpenters to remove excesses from wood. Dodd.
ginney fender. A man working on an endless chain haulage. C.T.D.
ginney rails. Track rails for ginnery carr-
ries. Fay.
ginorite. A white hydrous calcium borate, CaB03.8H20. (1.) Monoclinic. Minute, lozenge-shaped plates aggregated into masses. From Tuscany, Italy, English.
gin pit. A shallow mine, the hoisting from which is done by a gin. Fay.
gin pole. a. The center pole of a drill tripod. Long. b. A pole used to support hoisting tackle. Fay. c. The pole or bar on the top of a drill derrick to which a pulley tackle is fastened and used to hoist and place the crown block on top of a drill derrick. Long. d. Any one of the three poles of a hoisting gin. Webster 3d. e. A single pole held in a nearly vertical position by guys that support a block and tackle used for lifting loads. Webster 3d. f. A vertical, wooden, or steel mast rigged with block and tackle, together with rope or steel cable, by which mechanical power is em-
ployed to raise hoist rights to a desired position. Used in place of a crane. Crispin.
gin race. a. Eng. A wide excavation near the top of an underground inclined plane in
gin tackle. A tackle arranged for use with a gin; especially, a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.

gin tackle. A tackle, especially a combination of a double with a single block and tackle by which five or more power is exerted. Standard, 1964.
glacial till (till) subjected to the sorting action of water. ASCE 21826.
glaciate. To overspread with glacial ice, or to cover the phenomena of planation, rock scoring, drift, etc. Standard, 1964.
glaciated coast. The features of which have been modeled by glacial influences. Schairer.
glaciation. Effect on surface of land over which glaciers have moved. Includes erosion, deposition, planing, polishing of rocks, releveling, change of drainage system, and lakes. Pryor, J. glacial. Same as glacial. Fay.
glaciation, glaciation. Fay.
glaciate. To overspread with glacial ice, or to be covered by a glacier. Fay.
glaciere. Fr. An artificial or natural cavity, as a crevice, split in a block of ice, or a pipe in the glacier. Fay.
glaciar burst. The sudden release of a reservoir of water which has been impounded within the body of a glacier. Fay.
glaciar. Fr. An artificial or natural cavity, in a temperate climate, in which a mass of ice remains unthawed throughout the year; an ice gien. Standard, 1964.
glaciar, grain. a. The granular texture of glacier ice. Fay, b. One of the grains of ice in a glacier. Fay.
glaciar ice. If the body of ice developed from snow becomes great enough, it is apt to spread or creep out from its place of accumulation. Ice thus moving is glacial ice. A.G.I.
glaciarized. Pertains to terrain covered by glacier ice. This is a British usage. Most American writers prefer glacier covered. A.G.I.
glaciar meal. See rock flour. Fay.
glaciar milk. The milk-white water, charged with fine white sediment, that issues from beneath glaciers. Standard, 1964.
glaciar mud. The pulverulent material, produced of a glacial erosion, that is washed out from beneath a glacier and deposited at lower levels by glacial streams. Also called glacier mud. Standard, 1964.
glaciar snow. The compacted mountain snow that is in the intermediate stage between ordinary snow and glacier ice; nève. Standard, 1964.
glaciar table. A block of stone supported above the surface of a glacier on a pedestal of ice. Weber, 3d.
glaciar theory. The theory that large elevated portions of the temperate and frigid zones were covered during the early Quaternary, and perhaps during some earlier epochs, by slowly moving ice sheets and glaciers. One that transported vast masses of drift to lower latitudes, assisted by icebergs drifting along the coast. No longer a generally accepted fact but accepted as a fact. Standard, 1964; Fay.
glaicel. A combining form frequently used with other words to denote polarization by means resulting from the passage of light through the substances.
glacial. A combining form frequently used with other words to denote polarization by means resulting from the passage of light through the substances. It is self-evident in such words as glaicoaqueous, glaicofluif, glaicoamine, and glaicoalum. Nyström and Vernet, 1955.
glaicoaqueous. Pertaining to or resulting from the combined action of ice and water. Standard, 1964.
glaicoarctic. Of, relating to, or coming from lakes or rivers which transport all of their water from the melting of a glacier. Webster, 3d.
glaicier burst. That branch of geology which treats of glaciers, the deposits formed by them, and the results of their action in modifying topography. Fay.
glaicierine. Of, or relating to, processes or deposits which involve the action of glaciers and the sea, or the action of glaciers in the sea. Fay.
glaicierite. A quartz lamprophyre containing andesine and hornblende and in smaller quantities both micas and epidote, and has been called diorite. From Glad-kia Sopa, Northern Ural, U.S.S.R. Hass.

500 DSC
glass colors

cals or mixtures used to confer special properties on glass. CCD 6d, 1961.
glass container. A general term applied to ASTM C162-66.
glass cutter, machine. One who cuts glass into oval or circular shapes. Standard machine. Adjusts machine to produce desired shape and manually guides cutting tool suspended by a steel rod over the glass. D.O.T. 1.
glass driller. One who, using an electric drill, drills holes in glass lamp shades to permit the attachment of metal frames or fixtures. D.O.T. 1.
glass etcher. A trade name used by segments of the chemical industry for porcelain enamelled steel. ACSG, 1961.
glass electrode. A glass sensor electrode used to measure pH or hydrogen-ion activity. ASM Gloss.
glass frit. One that contains or as with a glass. Standard, 1964.
glass enamels. A series of finely ground powders, basically lead borosilicate, intimately blended with colored ceramic pigments. Different grades give characteristics of acid resistance, alkali resistance, sulfide resistance, or low lead release to meet requirements for various uses. Firering range 1,000° to 1,400° F (537.8° to 760° C). Used for fired-on labels and decorations on glassware, glass containers, illuminating ware, architectural glass, and signs. CCD 6d, 1961.
glass etcher. One who mixes baths of hydrofluoric acid, and dips glass into them so that portion of the glass not covered with wax will be eaten away (etched). D.O.T. 1.
glass eye. A defect consisting of a large bubble or blister with clear glass over the top. Bryant.
glass fiber. Generic name for a manufactured fiber in which the fiber-forming substance is glass. A continuous filament or staple fiber having unusual resistance to heat and chemicals. It is the strongest fiber known and is perfectly elastic up to its ultimate strength. It is attacked by hydrofluoric acid and alkalis; resistant to most other chemicals and solvents. Colored by resin-bonded pigments or by dyeing an applied protein film. Nonflammable. Is used for electrical insulation; plastic laminates. CCD 6d, 1961.
glass fume. See network formers. VV.
glass frost. Very thin glass that has been blown or sintered. D.O.T. 1.
glass glaze. See glaze. Shipley.
glassies. Octahedral diamond crystals (translucent); heat-treated. Hess.
glass lava. An undesirable name for obsidian. Shipley.
glassmakers soap. A decolorizing agent for glass, such as manganese dioxide or white arsenic. Hess.
glass metal. The fused and refined material of which glass is made. Fay.
glass meteorite. An undesirable name for moldavite. Shipley.
glass polisher. One who inspects glass for flaws, after it has been cut to the desired shape, and repairs small defects. Repairs glass by grinding and buffing, using power-driven sand and pumice grinding wheels and cloth or felt buffing wheels. Also called glass buffer or smoother. D.O.T. 1.
glass products inspector. One who visually examines finished glassware, such as dishes and automobile light lenses, for blisters, cracks, strains, and other obvious defects. D.O.T. 1.
glass quartz. A little-used name for rock crystal. Shipley.
glass rougher. One who grinds the edges of glass for automobile windshield, rear window, and other glass that does not need perfect edges, to a rough finish, holding, propping, and turning piece against rotating wheel on a stationary base or using a portable grinding tool. Also called glass sealer. D.O.T. 1.
glass sand. A sand suitable for making glass. The principal component is quartz. A typical analysis is: 99.41 percent SiO2, 0.21 percent Al2O3, 0.07 percent Fe2O3, 0.07 percent CaO, 0.08 percent MgO. Found in New Jersey, Pennsylvania, West Virginia, Minnesota, Illinois, and Maryland. CCD 6d, 1961.
glass seam. A joint plane in a rock that has been recemented by deposition of calcite or silica in the crack. Fay.
glass, silica. See silica glass. Bennett 2d, 1962 Add.
glass spar. 20-mesh. Afeldspar produced for the flat glass manufacturing industry; (milk bottles, mason jars, etc.). AIME, p. 341.
glass spar 40-mesh. Afeldspar produced for the flat glass manufacturing industry. AIME, p. 341.
glass stone. A glass imitation stone; also, a gemstone. Standard, 1964.

glass, talc. Calcite, Fay.
glass tile. Tile made of glass, designed to transmit light through an otherwise opaque structure. ACSC, 1961.
glass-to-metal seal. Metal components varying in size from fine wires to heavy flanges are sealed to glass for many purposes, for example, electric lamp bulbs and radio valves. Metals that have been used for this purpose include platinum, chromium, nickel, and nickel-iron-cobalt. D.O.T. 1.
glass transformation. The transition from a supercooled liquid to a true glass. PV.
glass transformation temperature. Temperature below which the relaxation time for some degree of freedom is long compared with the duration of an experiment. Bennett 2d, 1962 Add.
glass tube. Synonym for acid bottle. Long.
glass vial. Synonym for acid bottle. Long.
glass wool. A fibrous woollike material composed of fine filaments of glass intermingled with ordinary wool. Used in chemical laboratories; also in some producer-gas plants as a dust-filtering agent, and widely used in insulation for air filters. CCD 6d, 1961.
glassy. Applied to diamonds which lack brilliance. Hess.
glassfeldspar. Two varieties of potash feldspar occur as transparent colorless crystals, sanidine and adularia. Transparent yellow orthoclase also occurs but is very rare. C.M.D.
glass texture. The texture of natural glass or slag in insulation and air filters. CCD 6d, 1961.

494

501

Glaze.
in the ceramic industry. According to the sense in which it is used it may mean: (1) A vitreous coating on finished pottery or enameled ware, as distinguished from powdered dry materials of the batch to be used for producing the vitreous coating, or (3) an enamel covering on vitreous materials suspended in water (wet glaze). Glazes may consist of common salt or feldspar but are usually mixtures of native silicates such as feldspar, kaolin, or Cornish stone with flint, sand, calc, chalk, borax, soda, white lead, red lead, or litharge. C.C.D. 6d, 1961. See also bright glaze; clear glaze; crystalline glaze; fritted glaze; mat glaze; opaque glaze; raw glaze; semimat glaze.

glazed ceramic mosaic tile. Ceramic mosaic tile with glazed faces. ASTM C242-60T.

glazed extra-duty tile. Tile with a durable glazed surface which is suitable for light-duty floors and all other surfaces on interiors where there is no excessive abrasion or impact. A.C.S.G.

glazed interior tile. A glazed tile with a body that is suitable for interior use and which is usually nonvitreous, and is not required or expected to withstand excessive impact or be subject to freezing and thawing conditions. ASTM C242-60T.

glaze dipper. One who applies a thin coat of glaze to bisque tile by dipping the tile into a glazing vat with a pair of hand tongs. Also called glazer. D.O.T.1.

glaze pot. Generally a new pot coated inside with a substance to protect it from the raw batch. ASTM C162-66.

glazed tile. Tile with a fused impervious facial finish composed of ceramic mate- rials, fused into the body of the tile which may be a nonvitreous, semivitreous, vitre- ous, or impervious body. The glazed sur- face may be clear, white, or colored. ASTM C242-60T.

glaze relationship between the glaze and body of a fired ceramic product. ASTM C242-60T.

glaze blender. One who filters, tests, stores, and mixes glaze mixtures used as finish coating for ceramic ware. D.O.T. 1.

glaze maker. a. One who operates mills for mixing and grinding glazed tile and glaze and prepares frit for firing. Also called disintegrator man; frit maker; glaze grinder; glaze mixer; polisher; slip mixer; frit mixer. b. One who mixes and grinds ceramic tile-glazing materials in proportions according to specific chemi- cal formulas. D.O.T. 1. 

glazing. Dulling the abrasive grains in the cutting face of a wheel during grinding. ASM Gloss.

glazing-machine operator. One who removes rough spots, air bubbles, and other blem- ishes from glass kitchen utensils. Places pieces of glass into a disk which rotates through a gas flame, and by manipulating valves, regulates color and intensity of flame. Also called beveler; finisher; smoother. D.O.T. 1.

glazing stone. A smooth, hard stone com- posed mostly of frit, used by polishers to glaze the face of a finishing wheel when iron or steel articles, not plated, such as carpenters' tools and metaleni, etc., require a high finish. Hess.

Gleeds. A glowing coal or small coke such as that used in nailmaking. C.T.D.

gleng. glet. Slime, ooze, slimy alluvial de- position. Fay.

or 4 percent, having the composition of red clay. Holmes, 1928.

globular. In petrology, a textural term synonymous with globular texture. C.T.D.

globular pearlite. See granular pearlite. C.T.D.

globular powder. Particles having approximately spherical shape. Osborne.

globular transfer. The term describes the transfer of material as relatively large globules or globules during combustion-electrode arc welding. Also known as drop transfer, or more specifically as large-drop transfer. BuMinex Bull. 625, 1963, p. VII.

globullite. A. A tiny globular body of mineral calcite. Webster 3d. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

glockrite. A mineral, 2FeO·SiO₂·H₂O. Massive, earthy, or stalactic. Color, brown to ochre-yellow to pitch black or dull green. Fay.

Glomax. Brand name for purified koilinite; used as pigment extender. Bennett 2d, 1962.

Glomax. A locational substance extracted from animal carcases, organs, hides, and bone. Used in mineral processing as a coagulant after acid leach of uranium-bearing or phosphorus. Glues are also derived from these resources, but these have no direct use in the mineral process. Pryor, 3.

glomax. b. A vertical pit, material from which is delivered to the bottom of which it is delivered to an underground transport system. Pryor, 3d. c. Can. Large open-pit excavation. Hoffman, c. Open opening through which to observe the interior of a furnace. Standard, 1964. d. A subsidiary furnace, in which and which are reheated during manufacture. C.T.D.

glory hole. A method of mining using a machine whose wheels or batons are fitted with underground mining system, in which deposited material gravitates or is moved to a short shaft, from the bottom of which it is delivered to an underground transport system. Pryor, 3d. Can. Large open-pit excavation. Hoffman, c. Open opening through which to observe the interior of a furnace. Standard, 1964. d. A subsidiary furnace, in which and which are reheated during manufacture. C.T.D.

glory hole system. A method of mining using a machine whose wheels or batons are fitted with underground mining system, in which deposited material gravitates or is moved to a shaft, from the bottom of which it is delivered to an underground transport system. Pryor, 3d. Can. Large open-pit excavation. Hoffman, c. Open opening through which to observe the interior of a furnace. Standard, 1964. d. A subsidiary furnace, in which and which are reheated during manufacture. C.T.D.

gloos. Brand name for purified koilinite; used as pigment extender. Bennett 2d, 1962.

glos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos. gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

Glos: gloos. a. Newc. A piece of wood, used for making a glos. b. A tiny, rounded, incipient crystal form visible in some volcanic glasses when they are examined in thin sections under a microscope. Fay.

glycerol monoac.
golfino; goffen

golden; gold

golden; goldine

golden; goldine

golden; goldine

golden; goldine

498
goldleaf electroscope

Covered on one or more surfaces with a layer of gold alloy to form a clad metal. The term is often used in commercial agreements, a gold stamp showing the quantity and fineness of gold alloy may be affixed which shows the actual proportional weight and karat fineness of the gold alloy. For example, one-tenth 12K gold-filled means that the article consists of base metal covered over with more surface coverage of gold alloy of 12-karat fineness comprising one-tenth part by weight of the entire metal in the article. No article having a gold alloy coating of less than 10-karat fineness may have any quality mark affixed. No article having a gold alloy portion of less than one-twentieth by weight may be marked gold-filled but may be marked marked gold plate provided the fractional proportion and fineness designation precede. These stands do not necessarily apply to very thin clads, AS 12K gold.

goldfilm glass. Glass incorporating a thin gold film which can be electrically heated for demisting and deicing. C.T.D. Supp.
goldfilled. Gold beaten or rolled out very thin; in gold in sheets thicker than goldleaf. Webster 3d.
gold fine. A term sometimes applied to goldstone. Shipley.
gold hydride. See gold hydroxide. CCD 6d, 1961.
gold hydroxide; gold hydrate; auric hydroxide. Brown; Au(OH); sensitive to light; soluble in hydrochloric acid in solutions of sodium cyanide, and in alkal hydrides; and insoluble in water. The hydroxide, easily soluble in water and is lost water easily. Used in gilding luids; in porcelain; and in gold leaf production. Shipley.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
goldichloride. Hydrous potassium ferric sulfate, KFe(SO₄)₂·4H₂O, as pale-green monoclinc crystals from the decomposition products of uraninite. From mines. J.M. 1955.
gold dichloride; gold trichloride; auric chloride. Red crystals; AuCl₃; decomposes at 254° C; sublimes at specific gravity, 5.3; soluble in water, in alcohol, and in ether; slightly soluble in ammonia; and insoluble in carbon disulfide. Used in gold plating; in ceramics (enamels, gilding, and painting porcelain); in glass (gilding, ruby glass); and in the manufacture of finely divided gold and purple of Cassius. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-177.
gold cupricide. A clod or cupricide. Webster 3d.
goldener. One who digs for gold. Webster 3d.

An electroscope consists of two narrow strips of goldleaf suspended from the lower end of a brass rod, at the top of which a brass disk is fixed. The lower end of a gold plate provided the conditions of crystallization approximate those now prevailing at the earth's surface, the more resistant is the mineral in the weathering environment. The Goldich stability series also applies to the same minerals when they are of metamorphic origin. Hanke, p. 80-B1.
gold jewelry. Jewelry made wholly or principally of gold; s° designates gold- or gold-plated jewelry. Webster 3d.
gold leaf. Extremely fine layers of gold formed by beating or rolling between layers of gold leaf. Gold leaf is made of metal in a metal case by a plug of ebonite or some other good

goldfleet electroscope. An electroscope consisting of two narrow strips of goldleaf suspended from the lower end of a brass rod, at the top of which a brass disk is fixed. The lower end of a gold plate provided the conditions of crystallization approximate those now prevailing at the earth's surface, the more resistant is the mineral in the weathering environment. The Goldich stability series also applies to the same minerals when they are of metamorphic origin. Hanke, p. 80-B1.
gold leaf. Extremely fine layers of gold formed by beating or rolling between layers of gold leaf. Gold leaf is made of metal in a metal case by a plug of ebonite or some other good

Goldich stability series. Mineral species differ widely in their resistance to weathering processes. This series summarizes the relative resistance to weathering of the common rock-forming silicates, and indicates that the minerals crystallized at the highest temperature, under the most anhydrous conditions, are more readily weathered than those that crystallized last from the lower temperature, more aqueous magmas. As a general rule, the closer the conditions of crystallization approximate those now prevailing at the earth's surface, the more resistant is the mineral in the weathering environment. The Goldich stability series also applies to the same minerals when they are of metamorphic origin. Hanke, p. 80-B1.
gold leaf. Extremely fine layers of gold formed by beating or rolling between layers of gold leaf. Gold leaf is made of metal in a metal case by a plug of ebonite or some other good
insulating material. Whenever the leaves have acquired a potential, they separate.

**Morris and Cooper**, p. 230.

---

gold leaf electroscope 499

gold scutellar. A gold-colored species, **Cassida fulgida** (L.), from the Laguna uranium mining district, Albuquerque, N. Mex. Hey, M.M., 1964; Frank. 3d.

gold matrix. Gold in a matrix of milky quartz. Same as gold quartz. Shipley.

gold milling. A general term applied to the treating of ore to recover gold and silver therefrom. **Bureau of Mines Staff**.

gold mine. a. A mine containing or yielding gold. It may be either in solid rock (quartz mine) or in alluvial deposits (placer mine). Fay. *b. Any investment yielding or furnishing great profit.* Fay.

gold 198. Radioactive gold of mass number 198. Half-life, 64.8 hours; radiation, beta and gamma; and radiotoxicity, moderately hazardous. Available in gold metal, colloidal gold, and gold-sodium thiocyanate. Used to locate the solidification boundary in continuously cast aluminum and to determine metallic silver in photographic materials. The decay product of gold 198 is mercury 198, which may be distilled from aged, neutron-irradiated gold for the fabrication of monoisotopic mercury, a source of neutrons. Also radioactive gold. **CCD** 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 690.

gold opal. Opal which exhibits only an overall color of golden yellow. Shipley.

gold oxide; auric oxide; auric trioxide. Brownish-black; AuO3; decomposed by heat, losing one oxygen at 160°C; soluble at 250°C in hydrochloric acid; and insoluble in water. Used in gilding liquids and in porcelain. **CCD** 6d, 1961.

gold paint. Paint pigmented with gold powder; really a bronze powder. Bennett 2d, 1962.

gold pan. See pan, c., d., and i.

gold panning. See panning. Nelson.

gold poachers. Roving and enterprises freighting mines and prospectors. Hoon, p. 495.

gold point. The melting point of pure gold, 1,063°C. Used one of the fixed reference points on the temperature scale. Bennett 2d, 1962.

golden gran. S. Afr. The excess of the price of gold in a given market over the value fixed by the government or calculated over the exchange rate of money. Beerman.

gold purple. The purple of Cassius. Webster 2d.

gold quartz. Milky quartz containing inclusions of gold. Same as gold matrix. Shipley.

gold-quartz ores; silicious ores. Gold-bearing ores from which the sulfides have been removed by leaching of groundwaters so that the ore consists almost entirely of quartz gangue, some iron oxides, and free gold. See also goldleaf. Shipley.

gold ruby glass. See ruby glass. Dodd.

gold sapphire. Lapis lazuli containing flecks of pyrites. See also golden sapphire. Shipley.

gold savinig table. This table consists of a series of narrow slivces from 2 to 3 feet wide set side by side on grades of from 1/8 to 1/2 inches per foot. These tables extend from first class cautery to beneath the trommel and then are turned at right angles to extend longitudinally to the rear of the dredge where they empty into tail sluices that carry the material some distance back of the dredge before discharging it into the pond. **Levis**, p. 393.

Goldschmidt's law. The structure of a crystal is determined by the ratio of the numbers and sizes, and the properties of polarization of its structural units. Pryor, 3.

Goldschmidt's mineralogical phase rule. Under natural rock-forming conditions, the probability of finding a system with a variance (degrees of freedom) of less than two (temperature and pressure) is small. Any given natural mineral assemblage, igneous or metamorphic, seems to be the stable one over a range of temperature and pressure. Thus, with a variance of two, the phase rule is reduced to a special case, \( P = C \), in which the maximum number of phases possible is equal to the number of components. \( A.G.I. \)

Goldschmidt's process. a. The thermite process of welding. See also thermit. Fay.

gold. a. A place where gold is mined, washed, or worked. Fay. b. A place where gold is mined with washing or by dredge. Fay.

gold washing. Act or process of washing auriferous soil for gold; also a place where this is carried on. **Webster 2d.** See also diggings Fay.

gold work. a. The act or art of working in gold. **Webster 3d.** b. A place where gold is mined with washing or by dredge. See also goldsmiths. Fay.

gold washing. Act or process of washing auriferous soil for gold; also a place where this is carried on. Webster 2d. See also diggings Fay.

gold work. a. The act or art of working in gold. Webster 3d. b. A place where gold is mined with washing or by dredge. Fay.

**goliath crane.** A portal type of crane having a lifting capacity of 50 tons or more, with the crab traveling along the horizontal beam. See also portal crane. Ram.

**Gonnell elutriator.** A specialized method of surveying a borehole, utilized when a magnetic compass cannot be used because of local magnetism. The instrument used is essentially a rigid tube, up to 30 feet long, which is lowered into a borehole. The tube fits the borehole closely and contains a fine wire under tension. The difference between the arc of the tube, when bent at a crook in the borehole, and the chord of the wire is indicated by a stylus marking, which can be measured. The dip is read by etch tubes, and a direct-rectangular orientation taken at the surface is carried down the hole by precise alignment of the tube and rods as they are lowered into the borehole. Long.

gompholite. See nagelluh. Fay.

gondola. A metal frame consisting of garter (spessartite) and quartz. See also collateralite; eulysite. \( A.G.I. \)

**Gondite.** A spessartite-quartz rock, probably produced by the metamorphism of manganiferous sediments, and named after the Gondite of the Central Provinces of India, where the Gondite series occurs. **Holme**, 1928.

**Gondite series.** A series of manganiferous metamorphic rocks being washed in a system of the Indus valley, India, and characterized by the presence of spessartite, rhodonite, and gongolite. *Statistical Research Bureau*.

gondola. a. A large flat-bottomed riverboat of light build. **Standard**, 1964, p. 1. A railroad car with no top, flat bottom, fixed sides, and sometimes demountable ends that is used chiefly for hauling steel, rock, or heavy bulk commodities. **Webster 3d.**

gondola car. Type of flat railroad truck used in the United States for mineral transport. Pryor, 3.

**Gonnell electrolitrator.** A down-blast type of electrolitrator designed by H. W. Gonnell and which has found considerable use in Europe for treating the fineness of petrolatum cement. **Dodd.**
gone off. A borehole that has deviated from the goniometer. a. An instrument for measuring the geometric position of the well's path. b. A borehole that has deviated from the angle of the well's path. c. A borehole that has deviated from the angle of the well's path.

Good delivery. Under metal exchange rulings, a goodletite. Aust. The matrix rock in which gow caisson. A device for sinking shafts of deep holes are made by a bar and an excavator. A blacksmith. Standard, 1964. A narrow band of gold-bearing class next to the vein, which is contained by a thin, long-pitched, nick, South Carolina. Fay. To circle a mine without plan or system.

Grades. See channel cast. Pettijohn. A layer of soft material along the floor of a hill. The term "airblast" is sometimes used to designate a blast in which the sides are approximated to give desired degree of classification of feed. Pryor, 3. e. A bend in a pipe or tube having a change in direction.

Gordian's formula

\[ M = \frac{g \cdot H \cdot N}{H \cdot N} \]

Ome. To work a mine without plan or system. A cavern in a limestone region. Mather. A mine where a large tonnage of rock is to be removed and the holes deepened and extended. A grabber. An ocean floor sampling system using a grab or gubber bucket suspended from a borehole. Fay. 2d, p. 407. Potter-Delprat process. A flotation recovery system for separating minerals. See also multipassage kiln. Dodd.

Gouge marks; crescentic gouge. Crescentic gouge channel. See channel cast. Pettijohn. A layer of soft material along the floor of a hill. The term "airblast" is sometimes used to designate a blast in which the sides are approximated to give desired degree of classification of feed. Pryor, 3. e. A bend in a pipe or tube having a change in direction.

Gordian's formula

\[ M = \frac{g \cdot H \cdot N}{H \cdot N} \]

Ome. To work a mine without plan or system. A cavern in a limestone region. Mather. A mine where a large tonnage of rock is to be removed and the holes deepened and extended. A grabber. An ocean floor sampling system using a grab or gubber bucket suspended from a borehole. Fay. 2d, p. 407. Potter-Delprat process. A flotation recovery system for separating minerals. See also multipassage kiln. Dodd.

Gouge marks; crescentic gouge. Crescentic gouge channel. See channel cast. Pettijohn. A layer of soft material along the floor of a hill. The term "airblast" is sometimes used to designate a blast in which the sides are approximated to give desired degree of classification of feed. Pryor, 3. e. A bend in a pipe or tube having a change in direction.

Gordian's formula

\[ M = \frac{g \cdot H \cdot N}{H \cdot N} \]

Ome. To work a mine without plan or system. A cavern in a limestone region. Mather. A mine where a large tonnage of rock is to be removed and the holes deepened and extended. A grabber. An ocean floor sampling system using a grab or gubber bucket suspended from a borehole. Fay. 2d, p. 407. Potter-Delprat process. A flotation recovery system for separating minerals. See also multipassage kiln. Dodd.

Gouge marks; crescentic gouge. Crescentic gouge channel. See channel cast. Pettijohn. A layer of soft material along the floor of a hill. The term "airblast" is sometimes used to designate a blast in which the sides are approximated to give desired degree of classification of feed. Pryor, 3. e. A bend in a pipe or tube having a change in direction.

Gordian's formula

\[ M = \frac{g \cdot H \cdot N}{H \cdot N} \]

Ome. To work a mine without plan or system. A cavern in a limestone region. Mather. A mine where a large tonnage of rock is to be removed and the holes deepened and extended. A grabber. An ocean floor sampling system using a grab or gubber bucket suspended from a borehole. Fay. 2d, p. 407. Potter-Delprat process. A flotation recovery system for separating minerals. See also multipassage kiln. Dodd.
the jib head of a crane, which does the necessary raising and lowering. Also called a grapple dredger. C.T.D.

graben. A depressed segment of the earth’s crust bounded on at least two sides by faults and generally of considerable length as compared with its width. Webster, 3d. See also trough fault.

grab equipment. A clamshell bucket fitted with teeth to assist digging. Nelson.

grab hooks. Hooks used in lifting blocks of stone. They are used in pairs connected with a chain, and are so constructed that the tension of the chain causes them to adhere firmly to the rock. Fay.

grab iron. See grab.

grab sample. a. A rough and random mode of sampling. The samples may be taken from the pile broken in the process of mining. It is often used to estimate the approximate value of material lying broken in stopes or headings or of material coming from the mine. All portions of the ore exposure are not equally represented by grab samples. See also chip sample. Nelson. b. A sample taken at random from a pile, truck, or car of ore or coal. Ballard.

grab sampling. Collection of specimens of ore more or less at random from a heap, scatter pile or passing load. Used in connection with the characteristics of the characteristic minerals in the deposit rather than for valuation. Pryor, 3.

grad. a. Having a hydraulic backhoe equipped with an extensible boom that performs the three separate functions of excavating, backfilling, and grading. Carson, p. 161.

gradation. a. In geology, the bringing of a surface or bed of gravel to bed state, through erosion, transportation, and deposition by running water. See also aggradation; degradation; gradation. Fay. b. The proportion of material of each size present in a given soil. ASCE P1826.

grade. a. The classification of an ore according to the desired or worthless material in it or according to value, for example, a gold ore that contains 1 ounce gold per ton would be a high-grade ore whereas an ore containing 1 pennyweight per ton would be a low-grade ore. Nelson. b. See rank. Nelson. c. A particular class of workman in a mine, namely, collier, engineman, timberman, repairman, and laborer. Nelson. d. To prepare a roadway of more uniform slope. Fay. e. An ore which carries a great or comparatively small amount of valuable metal is called a high- or low-grade ore. Fay. f. The degree of strength of a high explosive. Those above 50 percent nitroglycerin are arbitrarily designated as high-grade dynamites and those below 40 percent strength as low-grade dynamites. Fay. g. In assessing the power of the sought value or of each valuable species in the ore. Pryor, 3. h. In surveying, the gradient of a traveling line along which a sluice, etc. See also grade.

graded aggregates. Aggregates in which there is a continuous grading in the sizes of mineral fragments from coarse to fine. A.P.I. Glossary.

graded bedding. A type of stratification, each stratum of which displays a gradation in grain size from coarse below to fine above. Synonym for diadic structure. A.G.I. See also sorted bedding.

graded coal. One of the three main size ranges by which coal is sold by the National Coal Board in Great Britain. It consists of coal screened between two screens—with an upper and lower limit varying from a top size of 2 or 1½ inches to a bottom size of ½ to ⅛ inch. See also large coal; smalls. Nelson.

graded filter. Superimposed layers of coarse gravel, fine gravel, coarse and fine sand arranged so that the gravel will not be clogged by the action of water flowing through the sand. A.G.I.

graded profile. See profile of equilibrium. A.G.I.

graded sand. A sand containing some coarse, fine, and medium particle sizes. It is not a uniform sand. Ham.

graded sedimentology. A type of sedimentology, a sediment consisting chiefly of grains of the same size range. Stokes and Varnes, 1955. b. In engineering, grading or selecting a uniform or equivalent distribution of particles from coarse to fine. Stokes and Varnes, 1953.

c. A general term for loose or cemented detrital sediments in which the allogenic grains make up within the limits of a single grade. Hess.

graded shoreline; smooth shoreline; straight shoreline. A shoreline showing no superimposed or erosional terrace or bay; typical of an advanced shoreline development. Schieferdecker.

graded shore profile. A shore line which has reached its profile of equilibrium, typical of the stages of maturity and old age of the shoreline cycle. Schieferdecker.

gradient, stream. A stream having a smooth gradient, without cascades or rapids. Mather.

gradient unconformity. A nonconformity as between granite and a basal arkose where no sharp plane of contact can be recognized. Pettitjohn, 2d, 1957, p. 327.

gradeline. a. The baseline from which elevations are measured. ASA M414-1958. b. A line that defines the intended grade of a roadway that is being driven. Such a line is used to control the gradient of a roadway, R.C. 3618, 1963, sec. 1.

grade of coal. A term to indicate the nature of coal main', as determined by the amount and nature of the ash and sulfur content. The term grade is sometimes used as a synonym for rank. Tonn, 1954.

graded. a. A self-propelled or towed machine provided with a row of cutting or digging teeth arranged to spread and lay the material. It is used for cutting topsoil at open pits and for leveling spoil. Nelson. b. A machine with a centrally located blade that can be angled to cast to either side, with independent hoist control on each side. Nelson. c. One who sorts and classifies diamonds; a person, implement, or apparatus employed in grading streets, etc., as a road grader. Standard, 1964. d. A trommel-type airswept circular screen used in asphalt milling where the fine rock and fibre dust are eliminated through medium size perforated plates. Arbiter, p. 69.

graded surface. The force, due to gravity, which resists the movement of a vehicle up a slope. Carson, p. 72.

grade scale. A subdivision of an essentially continuous range into a series of size classes. See also Wentworth scale. A.G.I.

graded scale, Atterberg. See Atterberg scale.

grading scale, Phil. A logarithmic transformation of the Wentworth grade scale based on the negative logarithm to the base 2 of the particle diameter. A.G.I.

graded scale, Tyler standard. See Tyler standard scale.

graded scale, Udden. See Udden scale.

graded scale, Wentworth. See Wentworth scale.

grading stake. A stake indicating the amount of cut or fill required to bring the ground to a specified level. Nichols.

gradation. a. The inclination of the rate of regular or gradual ascent or descent, as of a slope, roadway, or pipeline. Webster 3d. b. A part (as of a road or pipeline) that slopes upward or downward; a portion of the way that is not level; slope, grade, ramp. Webster 3d. c. The rate of increase or decrease of a variable magnitude or the curve that represents it. Webster 2d. d. The rate of change of a quantity with respect to the temperature gradient in a metal bar is the rate of change of temperature along the bar. C.T.D. e. The space rate of de-
create of a function. The gradient of a function in three space dimensions is the vector normal to surfaces of constant value of the function and directed toward decreasing values, with magnitude equal to the rate of decrease of the function in this direction. The accent is the negative of the gradient, and is loosely used to denote the magnitude of the gradient or ascendant (that is, without regard to sign) of a horizontal pressure field. See also slope. H&G.

gradient. A surveyor’s instrument consisting of a small telescope mounted on a tripod and fitted with a spirit level and a graduated vertical arc; used for determining grades, etc. Standard, 1964. A grading instrument. A surveying level with a grading curve. A curve giving the grain size grading. a. The degree of mixing of size classes of coarse and fine particles and a low proportion. A batch with a grading for variously sized particles in a batch, or the distribution.

Grain size or grade. The smallest grain in a sample sized by the U.S. Standard Sieve Series to which the lot of material falls.

Grading test. See screen analysis. Fay.

gradient. A process for producing a decorative finish by transferring a pattern to the porcelain enamel surface. Originally termed recrystallization. G.S.A. Mem. 6, 1938, p. 66.

grading board. A specially constructed board used in the grading process. Hansen.

grading paste. A mixture of color oxides, fluxes, and oils. ASTM C 285-65

grading paste thinner. A mixture of oils used in the grading process. Fay.
graining paste thinner

to thin out graining paste. *Hansens.*

graining roll. A specialized type of roll
for transferring the grain pattern to the
porcelain enamel. ASTM C286-65.

graining paste. Granular magnesium oxide
obtained by dead-burning magnesium car-
bonate or hydroxide. A.R.I. See also dead-
burning magnesite.

grain marks. Lines on the facet surfaces,
the result of imperfect polishing. *Hirsh.*

grain size. a. A term relating to the size of
mineral particles that make up a rock or
sediment. Grain sizes are reported in
terms of number of grains per
unit area or volume, average diameter,
or as a grain number derived from
area measurements. ASM Gloss. c. For
grinding wheels, see grit size. ASM Gloss.
d. The size or size distribution of refrac-
atory particles determined usually by
sieve analysis. A.R.I.

grain-size analysis; mechanical analysis.
The practice of determining gradation. ASCE
P1826.

grain-size classification. A scheme of rock
classification based upon the average size
of certain chosen components; thus, each
clast comprises coarse-, medium-, and
fine-grained members. T.D.

grain spacing. The relative position of the
abrasive particles in a grinding wheel. See
also grit number. ASM Gloss.

grain fin. a. The granular or nodular form
of casterite, tin oxide, SnO2; also known
as stream tin. *Henderson.* b. Metallic tin
of high grade obtained by charcoal re-
duction. *Henderson.*

grait. a. N. of Eng. To replace, repair, dress,
and finish. Standard, 1964. c. A term used
for work underground. C.T.D.

grat. a. The size or size distribution of refrac-
atory particles determined usually by
sieve analysis. A.R.I.

grain-atom. a. The atomic weight of an ele-
ment which combines with, or displaces
an unspecified element. Some would limit
the (too:, permitting the car to shed its
load. *Crispin.*

grain. b. Metallic tin of high grade obtained
by charcoal reduction. *Henderson.*

granadine. A.プレゼント greenhouse hours;
{

granat. Ir. Coarse quartzose grit. PresumZbly
formed by weathering. *Henderson.*
granitoid arkose. Grains of quartz, lamellar feldspar, and mica, more or less disposed as in granite, feldspar dominant. This rock does not differ from granite except that it is evidently formed by aggregation.

granulated. Term sometimes used for a bonnet hip tile. See also hip tile. Dodd.

granoblastic. a. The texture of metamorphic rocks composed of equidimensional elements. A.G.I. b. A term applied to secondary texture due to diagenetic change either by recrystallization or recrystallization in the solid state, in which the grains are of equal size (equigranular). A.G.I.

granodiorite. A plutonic rock consisting of quartz, calcic orthoclase or andesine, and clinopyroxene. Webster 3d.

granodioritic. A plutonic rock consisting of quartz monzonite and quartz diorite, and contains at least twice as much plagioclase as orthoclase. A.G.I.

granofels. A field name for a medium- to coarse-grained granoblastic metamorphic rock that has not been given another name or foliation or lineation. A.G.I. Supp.

granolith. An artificial stone of crushed granulite. A.G.I.

granulic. The texture of igneous rocks characterized by the irregular intergrowth of blebs, patches, and threads of quartz in a base of feldspar. It is similar to graphic and micrographic but differs from these textures in that the intergrowth of quartz and feldspar is not perfect. C.M.D.

granulite. a. A textural term applied by Judd (1886) to basaltic or doleritic rocks consisting predominately of kaidonite grains of lighter or darker shades, often surrounded by collinite. These grains show a cryptocrystalline to finely crystalline structure; the cryptocrystalline material is isotropic. IHC, 1963.

granulate. To form into grains or small particles, as gunpowder or zinc. Standard, 1964.

granulated aluminum. Aluminum powder which has not been coated with a lubricant; relatively large masses of aluminum, such as are used in alloying with other metals. Bennett 2d, 1962.

granulated blast furnace slag. The glassy, granular material formed when molten blast furnace slag is rapidly chilled, as by immersion in water. ASTM C123-66.

granulated chert. A type of granular chert composed of rough, irregular grains or granules of chert tightly or loosely held together in small irregular masses or fragments. A.G.I.

granulated metal. Small pellets produced by putting liquid metal through a screen or by dropping it onto a revolving disk and, in both cases, chilling with water. ASTM Gloss.

granulated salt. Vacuum pan salt, of characteristic cubic shape. Also a name given to Southern mined rock salt of the same or similar appearance. Judd.

granulated slag. Molten slag broken up into granules and quick quenches. Three general methods of granulation are: (1) running the molten slag into a pit of water; (2) using a jet of high-pressure water to break up the stream of molten slag as it falls into the pit; and (3) using a mechanical revolving device with relatively small amounts of water. Camp. 6d, 1951, p. 279.

granulated steel. Steel made from pig iron by a process in which the first step is the granulation of the iron. Fay.

granulating machine. a. An apparatus for reducing a powder cake to gunpowder. Fay. b. A device for reducing metal or slag in a liquid form to fine grain. In a common method, the hot metal is dispersed on the face of a rapidly revolving disk, which scatters it centrifugally in minute particles of iron, steel, or iron alloy. "granulating mill. Old name for ball mill, particularly the Hardinge type when operated to produce sharply granulated sands. Pryor, 3.

granulation. a. In metallurgy, the state or process of being formed into grains or small particles. Fay. b. The process of separating into various sizes the particles of blasting powder. Fay. c. The crushing of a rock under such conditions that no visible openings result. Kemp, 6d, p. 217.

d. The production of coarse metal particles by pouring the molten metal through a screen into water, or by violent agitation of the molten metal while solidifying. ASTM B848-62, c. See kerosine flotation. Mitchell, p. 572.

granulator. a. A rock breaker which converts large ore into small aggregate. Ham. b. A machine that produces body raw material in the form of grains with a minimum of fines. ACSG, 1963.

granule. A little grain; a small particle. Webster 3d. b. Granular mineral products of blast furnace slag is rapidly chilled, as by pouring the molten metal through a screen into water, or by violent agitation of the molten metal while solidifying. ASTM B848-62, c. See kerosine flotation.

granules, roofing. See roofing granules.

granular texture. Generally oval or rounded grains in a matrix but grains are not of clastic origin and lack internal structure. Used especially for the round or oval grains in iron formations. A.G.I.

granulite. A metamorphic rock composed of even-sized, interlocking, granular minerals. A.G.I. b. A metamorphic rock belonging to a high-temperature facies characterized by the presence of a high Ti hornblende and hornblende. Coarse and fine bands alternate and produce a regular planar schistosity. A.G.I. c. In French literature, the term has been used as a synonym of muscovite granite. See also charnockite; granite; migmatite; leptynite; leptite; quartzite; A.G.I.

granulitic. a. A textural term applied by Judd (1886) to basic or doleritic rocks in which discrete crystals of augite and/or olivine fill the interstices between a network of plagioclase laths. In this sense, the term is synonymous with intergranular. A.G.I. b. A term proposed by Michel-Levy (1874, 1889) and applied to igneous rocks with a holocrystalline, intergranular texture in which there is a xenomorphic development of most of the constituents. In this sense, the term is synonymous with pandiomorphic granulatic. A.G.I. c. A structure due to the production of granular fragments in a rock by crushing. Holmes, 1920.

granulitic texture. The texture of a granulite, sometimes referred to as granulose or granoblastic, is an arrangement of shapeless interlocking mineral grains resembling the granitic texture developed in metamorphic rocks. C.T.D.

granulization. a. The process is regional metamorphism of reducing the component grains of a solid rock to small particles. If the reduction of the size of the particles goes farther, rock flour or mylonite is produced. C.T.D. b. This results from crush-
granulation

ing at a stage when recrystallization was still possible, and the process is therefore, in some sense, intermediate between the protoclastic and the cataclastic. All the minerals are broken down; but while the feldspar (and quartz) present makes a simple mosaic, the hornblende, with a superimposed crystallographic form, fails to form perfect prisms or fibrous patches. Harker applies the term to gneisses. A.G.I.

grape formation. Clusters of smooth, nodular, calcareous deposits on cavern walls. Synonym of botryoid; dusterite. A.G.I.

grapevine drainage. See trellised drainage. A.G.I.

g. Diagram which shows as a line the grapevine drainage. See trellised drainage. A.G.I.

grow. An intergrowth of two minerals in granite. A variety of binary granite, containing graphite or carbon. von Bernebeck. Other graphic systems give multidimensional information regarding such relations, by use of more than two axes as in nomograms and triangular graphs. Pryor, 3.

Graphite, Composition consisting of graphite impregnated at high pressure with a matrix such as cop per, lead, silver, or cadmium; used for bearings and similar purposes. Bennett 2d, 1962.

graphic. An intergrowth of two minerals in such a manner, that in certain cross sections, one has a form suggesting cuneiform writing, hence the name; quartz in feldspar in such a way, that in cross section, it has some resemblance to Hebrew letters, or cadmium; used for bearings and similar purposes. Bennett 2d, 1962.

graphic carbon. The portion of the carbon in iron or steel that is present as graphite; distinguished from combined carbon. Webster 3d.

graphic steel. Alloy steel made so that part of the carbon is present as graphite. A.S.M. Gloss.

graphicite. A variety of shungite or graphite rock which does not give the so-called, mimitic acid reaction. Tomkeieff, 1954.

graphitization. The formation of graphite in iron or steel. Where graphite is formed during solidification, the phenomenon is called primary graphitization; where graphite is formed later by heat treatment, secondary graphitization. A.S.M. Gloss.

graphitizing. Annealing a ferrous alloy in graphite; distinguished from combined carbon. Webster 3d.

grapholite. See grappel. b. Fay.

grapholite. a. An implement used to recover lost core, drill fittings, or junk from a borehole. Also called grappel. Long. b. A small anchor with four or five flukes or claws used in dragging or grappling operations. Webster 3d. c. A heavy tong used in handling large logs, stones, etc. Standard, 1964.

grapholite. See grappel. a. Fay.

grapholite. A clamshell-type bucket having three or more jaws. Nickels.

graphing iron. A fishing tool consisting of several iron or steel claws for grasping and holding an object fast. See also grappel. Lang.

grapholite. Graptolites are the greatest value to stratigraphers for dating the Ordovician and Silurian systems. A graptolite is an animal or lowly organization, extinct since the Silurian period, belonging to a class Graptolithina, of the phylum Coelenterata. C.T.D.

grapholite. The area of the surface of the grate of a steam boiler, or any part of it. Standard, 1964.

grapholite. A tool used to align and butt traffic can pass. Generally are removable for servicing. ASA MH4-1.1958.

graphite brush. A brush used to apply to street or other machines preparatory to welding. Long.
to permit passage of air for cooling or heat to maintain temperature. ASA MH-
5-1954. See also gravity discharge conveyor.

gravically. The force by which substances are attracted to each other, or fall to earth. See also law of gravitation. von Bernou-

 gravely. The force by which substances are attracted to each other, or fall to earth. See also law of gravitation. von Bernou-

 gravity anomaly. The difference between the gravity calculated from the station and the value (corrected for topography, elevation, etc.) actually measured for that station. The anomalies reflect variations in density of the underlying rocks, and hence, may be used for estimating the location of some mineral deposits and geologic structures, such as anticlines, buried ridges, or salt domes. Stokes and

 gravity API. The gravity scale developed by the American Petroleum Institute to express the density of liquid petroleum products on this scale, water has a gravity of 10° API; and liquids lighter than water (such as petroleum oils) have API gravities numerically greater than 10. Shell Oil Co.

 gravity arc. A dam which derives its resistance to the pressure of water from both an arching effect and its own weight. See also gravity dam. Ham.

 gravity balance. Sensing weight system in which a beam rides on a fulcrum, and supports a load of unknown weight at one end which is counterpoised by weights at the other. Pryor, p. 35.

 gravity bar. A 5-foot length of heavy half-round rod forming the link between the wedge-orienting coupling and the drill-rod swivel coupling on an assembled Thomson removable borehole-deflecting wedge. Long.

 gravity battery. A two-fluid battery in which there is no porous cup and in which the fluids are separated by their different spe-

 gravity dam. A dam consisting of rock or earth masses, solid or semi-solid, of such a height and structural character as to prevent the passage of water and eroding forces. A.G.I. d.

 gravity discharge conveyor

 gravity. The force by which substances are attracted to each other, or fall to earth. See also law of gravitation. von Bernou-

 gravity conveyor. Continuous belt, system of rollers, or inclined chute down which loaded material gravitates without the application of power. Pryor, 3. See also roller conveyor; wheel conveyor. ASA MH-

 gravity dam. A dam depending solely on its weight to resist the water load. Smyly, 1.

 gravity-draft conveyor. A type of conveyor using gravity-discharge back-
gravity-discharge conveyor

vertical paths over suitable drive, corner, and takeup terminals. ASA MH4.1-1958

gravity-discharge conveyor-rollator bucket. An elevator bucket designed to contain material on vertical lift and at the same time receive material from horizontal runs. Discharge is effected by gravity. ASA MH4.1-1958.

gravity fault. a. A fault along which the hanging wall has moved down relative to the footwall. See also normal fault. Billings, 1954, p. 145. b. Some other form of fault, but the result of the unimpeded action of gravity. The term is indefinite as to the quantity of material involved and period for draining, temperature, and other factors. Selsby, 1.

gravity haulage; self-acting incline. A system of haulage in which the set of full cars is lowered at the end of a rope, and gravity force pulls up the empty cars, the rope being passed around a sheave at the top of the incline. The speed of the haulage is controlled by a band brake on the sheave. Many forms of this type of haulage are in use, but difficulties arise when derailments occur as no power is available for regaining the set. Nelson.

gravity incline. Openings made in the direction of the dip of the deposit. The gradient of the gravity incline is determined by the dip of the deposit. The ore mined is transported through them, usually at a point below the level of the next lower level drive. Stoess, v. 1, p. 233.

gravity instruments. Devices for measuring the gravity force or acceleration at two or more points. They are of two principal types: (1) a static type in which the linear or angular displacement is null by an opposing force; (2) a dynamic type in which the period of oscillation is a function of gravity and is the quantity directly observed; or (3) a gradient measuring type, for example, Eotvos torsion balance. Nelson.

gravity main. A pipeline through which the water from a reservoir flows downhill by gravity. Ham.

gravity meter. Sensitive electrical device for measuring gravitational variations between different geologic formations; used in oil prospecting. Bennett, 1962.

gravity plane. A tramline laid at such an angle that full skip running down hill will pull up the empy. Fay.

gravity plane rope haulage. See self-acting rope rope. Fay.

gravity potential. The work required or gained in moving a unit mass from sea level to a point above or below sea level. The unit in this system is one dynamic decimeter. H.G.C.

gravity process. See ggb process. Dodd.

gravity prospecting. Mapping the force of gravity at different places with a gravity meter (gravity meter) to determine differences in specific gravity of rocks masses, and, through these, the distribution of masses of different specific gravity. Leet.

gravity railroad. A railroad in which the cars descend by their own weight; and inclined railroad. Standard, 1964.

gravity retaining wall. In similar manner to a gravity bridge this is prevented from overturning by its own weight. See also crib dam. Ham.

gravity road. Any road on which cars can descend by gravity. Jones.

gravity screen. A perforated steel plate, set at an angle, over which, large coal or other material slides by gravity to effect a primary classification. Nelson.

gravity segregation. Variable composition of a casting or ingot caused by the settling out of the heavier or lighter constituents before or during solidification. ASM Gloss.

gravity separation. Treatment of mineral particles which exploits differences between their specific gravities, their sizes and shapes also in part in separation. Performed by means of jigs, classifiers, hydrocyclones, dense media, shaking tables, Humphreys spirals, sluices, vanners, classifiers. Gravitational force also plays a smaller part in most other methods of separation. See also jig. Nelson.

gravity solution. A solution used to separate the different mineral constituents of rocks by their specific gravities. This is brought into effect by the solution of mercuric iodide in potassium iodide containing a maximum specific gravity of 3.19. Standard.

gravity, specific. The ratio of the weight, per unit of volume, of a given substance to the weight of the same unit volume of water. The specific gravity of water is 1 and of substances lighter than water, it is less than 1. Shell.

gravity stamp. Unit in stamp battery which directly a heavy falling weight on to a die on which rock is exposed for crushing. Pryor, 3.

gravity stowing. A method of stowing in inclined conveyor faces, in which the material is brought into the upper gate (usually the tailgate) and arranged to slide down on trays which are moved forward as each track is filled. Nelson.

gravity tube. An instrument used to measure the specific gravity of drilling mud. Long.

gravity water. a. Water that moves through soil under the influence of gravity. Selsby, 1. b. Gravity supply of water as distinguished from a pumped supply. Selsby, 1.

gray anthony. See anthony trisulide; stibinite.

grayback. a. Aust. A local name for minor cleats that cross the main cleat. Corn. A group with large grains of quartz in a compact black matrix of tourmaline. Also known as black granite. Han.

gray beds. N. of Eng. A stratum formed by a mixture of shale and sand. Fay.

gray cast iron. A cast iron that gives a gray fracture due to the presence of flake graphite; often called gray iron. A.S.M. Gloss.

graywacke. A firm gray chondrite meteorite composed of bronzite and olivine with characteristic bands which are parallel with the matrix. Hess.

grey cobalt. Smallite. Fay.

grey copper. See tetramate, Fay.

grey copper. See tetramate; tetrahedrite; fahlore.

greyhounds. Aust. Joints in the rolling country of the Southern Coalfield of New South Wales, which run parallel with the longest axis of a fold; these joints are generally coated with a whitish substance. Fay.

grey hematite. See specularite. Fay.

grey iron. Pig iron or cast iron in which nearly all the carbon not included in pearlite is present as graphite. C.T.D.

greyite. A thorium phosphate containing a little lead, calcium, and rare earths; gives an X-ray pattern like that of rhodonite, and when heated above 500° C, gives an olivine-like product. C.T.D.

Gray-King coke type. The type of coke or carbon reserve obtained under the prescribed conditions of the Gray-King carbonization assay. B.S. 3223, 1960.

Gray-King test. Methods of assessing the coking property of coal; 20 grams are heated in a silica tube to 600° C and the coked product is compared with a standard series ranging from noncoking (type A) to highly coking (G), all of which is the same volume as the original. Cokes which expand (swell) on cooling receive a subscript indicating the degree of swelling. Weltz, 1954.

gray manganese. See manganese.

grey manganese ore. See manganese.

gray metal. Shale of a grayish color. Fay.

grey ore. Corn. Copper glance. See also tetrahedrite. Fay.

gray sapphire. The gray variety of sapphire popular as a gem only if asteriated. Shiple.

gray streak. An instrument used for determining the flashing point of heavy oils. Fay.

gray stock. A clamp-fired stock brick that is off color. See also stock brick. Dodd.

graywacke; graywackes. A term applied to intermediate, fine-grained, sedimentary rocks, chiefly Paleozoic, consisting of undistorted detritus of the grain size of sandstone but without fragments of volcanic rocks and ferromagnesian minerals. C.T.D.

graywacke quartzite. A metamorphosed gray
graywacke quartzite

Graywacke. One-coat mottled enamelware. 

Grayweter. One of numerous fragments or blocks of sandstone and conglomerate, covering large tracts in Dorsetshire and Wiltshire, England, supposed to be remnants of a starting mass of material that was superstitiously regarded by the unlearned. Standard, 1964. Also called druidical stone; same stone: saracen stone. 

Gray zone. A typical gray section of used silicone brick, composed principally of large crystalline crystals. Bureau of Mines Staff.

Grease. a. This term should be applied only to fatty or oily matter of animal origin; but mixtures of oil and fat; and soap and soda ash constitute well-known lubricating greases. Fay. b. Animal fat when soft; also, anything oily or unctuous from the standpoint of usage. Fay. c. Term used in the flotation process. Fay. d. As used in engineering for lubrication or protection of parts of machinery. Fay. 

Grease spot photometer. A simple means of grease-box concentration. A process of grease box. A journal box or axle box in which grease is contained. Arkell.

greasy. Applied to the luster of minerals. Having the luster of oily glass, as ecleoite. Fay.

Greasy feelings. Some minerals are greasy or soapy to the touch; for example, talc, sometimes called soapstone. C.M.D.

Greasy gold. Fine gold. Fay.

Greasy lustre. Associated with oil or grease; occasionally observed in quartz and other minerals; for example, talc. Nelson.

Greasy quartz. A name applied to some crystals of quartz stained green. Fay.

Great circle. Circle described upon a sphere, the plane of which passes through its center. 

Great coal. Scot. Large pieces of selected coal. In the East of Scotland, the coal was formerly delivered into 12 or 14 grades; great coal, chews, lime coal, and panwood. Fay.

Great Coal age. Another name for the Coal Measures or the Pennsylvanian. So called because the greatest coal deposits of the world are found in formations of this age. Kentucky, p. 3.

Great Diurnal Range. The difference in height between mean highest high water and mean lowest low water over a 12-year period. Also called Diurnal Range. 

Great Falls converter. A pear-shaped vessel used for converting the Bessemer converter. It has been largely supplanted by the cylindrical (Peirce-Smith) type converter. 

Greathead shield. A tunneling device invented by J. H. Greathead, first used in England in 1869, and still widely used today. His invention included a circular cutting edge forced through the ground by hydraulic jacks, a cast-iron lining assembled by bolts, and grouting behind the lining with the aid of compressed air and a special mixer. 

Great Ice age. See Pleistocene period. C.T.D.

Great salt. Salt in large lumps or crystals. Great Ice age. See Pleistocene period. C.T.D.

Great sintering machine. An intermittent or batch-type machine used for concentrating iron ore for use in blast furnaces. It may be assumed to be equal. Also called Diurnal Range. 

Great sintering machine. An intermittent or batch-type machine used for concentrating iron ore for use in blast furnaces. It may be assumed to be equal. 

Great Smoky Mountains. See Appalachian Mountains.

Green earth. a. Green sedimentary material, usually some cryptocrystalline variety of quartz stained green. A special member of the chlorite group. Fay. b. Not fully crystallized. A.G.I.

Green earth of Verona but before it has been dried and fired. Daud.

Green acids. Mixed sulfonation products from oil refining cracking processes; used in detergent and as a raw material, generally steatite. A.G.I.

Greenalite rock. A dull, dark green rock of uncertain fine-grained and conchoidal fracture, containing grains of greenalite in a matrix of chert, carbonate minerals, and ferruginous amphiboles. 

Greenawalt sintering machine. An intermittent or batch-type machine used for concentrating iron ore for use in blast furnaces. It may be assumed to be equal. 

Greenburg-Smith impinger. A dust-sampling apparatus evolved by the U.S. Bureau of Mines which makes use of the principle of impingement of the dust-laden air at high velocity on a wetted glass surface, together with that of bubbling the air through a liquid medium. The apparatus consists essentially of a hand pump or electrically driven blower, a flowmeter, or other suitable means of measuring the air passed through the instrument, and the dust-collecting device. See also midget impinger. 

Green, beryl. A term applied to the lighter green varieties of beryl as distinguished from the full green emeralds and the light-green-blue aquamarine. Shipley.

Green brick. Brick which have not received the kiln burn to which they will be subjected. A.R.J. Unfried bricks. 

Green carbonatc. Copper. See malachite.

Green chalcedony. Usually some cryptocrystalline variety of quartz stained green. Also may be chalcedony of natural green color. Shipley.

Green charge. A mixture of ingredients for gunpowder before the intimate mixing in the incorporating mill. Webster 3d.

Green clay. A green pigment consisting of the fired oxide of cobalt and zinc. Webster 3d.

Green concrete. Concrete which has set but not appreciably hardened. Taylor.

Green copperas; green vitriol. The mineral malachite, hydrous ferric sulfate, Fe₃(OC₂H₃)₂. 

Green copper carbonate. Same as malachite, Cu₂CO₃(OH)₂. Dana, 17, p. 802.

Green earth. a. Lime, precipitated by reaction, uninterred. ASM Gloss. b. Not fully processed or treated. Webster 3d. c. Ceramic ware in the condition after it has been shaped green earth of Verona. See celadonite.
green-er. A very strongly marked cleavage plane in the natural garnet, which is specially utilized in the working of the coal. Arkell.
green feldspar. Synonym for amazonstone; microlite. Fay.
green garnet. Also the demantoid variety of andradite garnet. The green grossularite garnet is usually known as gooseberry garnet. Also a monomer for enstatite. Shipley.
green gold. An alloy of 25 percent silver and 75 percent gold. Crippen.
green hole. A furnace taphole in which clay is not properly set, and through which the drill may break and let iron out unexpectedly. Fay.
green iron ore. The mineral dufrenite, approximately, Fe₃O₄·Fe(OH)₂. Fay.
green john. Green fluorite.
green jade. A green stone sometimes used for jewelry. Fay.
green jadeite. A variety of jade. Fay.
green John. Green fluorite.
greenschist. A metamorphosed basic igneous rock, characterized by the presence of a considerable proportion of glauconite and CaCO₃ in variable amounts up to 50 per cent. Holmes, 1920.
green mad. A deep-sea terrigenous deposit characterized by the presence of a considerable proportion of glauconite and CaCO₃ in variable amounts up to 50 per cent. Holmes, 1920.
green onyx. A mineral of the banded variety of chalcedony, used as a gem. Fay.
green quartz. A. A name sometimes used for green transparent flint. Shipley.
green root. A miner's term for a roof which has not broken down or shows no sign of breaking down. Fay.
greenroom. A chamber for the reception of unburned and unjured pottery or newly made cloth. Standard, 1964.
green rouge. Chromium oxide and used chiefly as a polishing agent for platinum and stainless steel. AIME, p. 260.
green sand. a. A sedimentary deposit that consists largely of dark greenish grains of glauconite often mingled with clay or sand, occurs abundantly in the Cretaceous often little or not at all cemented, and is used as a water softener and as a source of potash. Webster 3d. b. A highly siliceous sand that contains a little magnetite and alvina mixed with about one-twelfth of vein quartz, unburned coal or charcoal and is used when dampened for making foundry molds. Webster 3d.
Green sand beds. In general, any beds of Cretaceous or Tertiary containing a green iron-potassium-silicate; specifically, the Lower Cretaceous of England, whether containing green silicate or not. Standard, 1964.
green sand casting. Metal cast in sand mold which has not been subjected to baking or drying. Bennett 2d, 1962.
green sand core. In metal casting technique, a sand core which has not been subjected to drying. Bennett 2d, 1962.
green sand of Peru. An early synonym for staminite, because found there in the form of sand. Fay.
green silicate. See silicon carbide.
green top. Freshly exposed roof which is unburned and undried pottery or newly made clay. Fay.
greenstone. A. An old field name for those rock composed of quartz and muscovite. Fay. b. A term sometimes used in connection with up to perhaps 3 percent, MnO. Hey, M.M., 1964; c. A coarse-grained, tin-bearing rock containing muscovite, chlorite, epidote, and topaz. The mica is usually muscovite or lithium mica, and tourmaline, fluorite, rutile, cassiterite, and wolframite are common accessories. A.G.I. d. A coarse-grained, tin-bearing rock containing muscovite, quartz, topaz, or tourmaline. A.G.I.
greenstone. The process by which those rocks are converted into greenstone. A.G.I.
greenstone molds. Metal cast in sand mold which has not been subjected to baking or drying. Bennett 2d, 1962.
green top. Freshly exposed roof which is unburned and undried pottery or newly made clay. Fay.
Grenville series

and is considered to be the equivalents of the Huronian series. C.T.D.

grenz. Horizons in coalbeds resulting from truncation or obliteration of vegetal material. They are frequently marked by a bed of clay or sand. Raisz and Mell, p. 287.

grenz. See grenz. Eng. Gravel or sand. Occurs in the horizons in coalbeds resulting from grid.

gribble. A marine borer of the class Crustacea. Webster 3d.

greve. A ditch or trench. Fay.

grey Billy. N.S.W. Local name for a hard vegetable pattern of pits or borehole. Pryor, 3. i. A sampling, a rectangular or other regular able relationship is obtained by connecting the points which must be thereby spread over a large area of ground. Pryor, 3. j. Other

grid. The framing at the top of a shaft for the pulley wheels or sheaves for the hoisting rope. C.T.D.

grid azimuth. The angle that any given line makes with the north-south grid line. It differs from the true azimuth (except at the central or initial meridian) by the amount of the convergence of the meridians. Seyele, 2.

grid distance. The plane distance between two points, as determined from the grid (x, y) coordinates. It may be greater or less than the corresponding ground distance. Seyele, 2.

gridiron twinning. See crossed twinning. Fay.

gridiron valve. A slide valve having many ports corresponding to ports in the seat.

gridaw. The framing at the top of a shaft for the pulley wheels or sheaves for the hoisting rope. C.T.D.

grid azimuth. The angle that any given line makes with the north-south grid line. It differs from the true azimuth (except at the central or initial meridian) by the amount of the convergence of the meridians. Seyele, 2.

griotte. A cistern or basin. Fay.

grinder. a. The act or process of continuing to drill after the bit or core barrel is blocked, thereby crushing and destroying any core that might have been obtained. Also called grinding. Long. b. To reduce to a powder by friction as in a mill. Webster 3d. c. To polish or dress metals by friction. Webster 3d. d. The size of particles obtained by grinding. Webster 3d.

grindability. a. The effect produced on representative pieces of ore by applying standard methods of comminution, assessed comparatively in terms of size reduction and power used. Pryor, 4. b. Grindability of coal, or the ease with which it may be ground fine enough for use as pulverized fuel. C.T.D., is a constant physical property embracing other specific properties, such as hardness, strength, tenacity, and fracture. Mitchell, p. 42. c. Relative ease of grinding, analogous to machinability. ASM Gloss.

grindability index. A measure of the grindability of a material under specified grinding conditions, expressed in terms of volume of ground ore per unit volume of wheel wear. ASM Gloss.

grinder. One or both that grind a material. 

grinding bench. A stone slab on which to grind.
grinding bench
fasten by plaster of Paris, in a level position, a plate of glass the upper surface of which is to be ground or polished. Standard, 1964.

grinding coolant. A liquid, usually water, but often emulsions of oil and water, used to prevent grinding temperature rise and friction between the grinding wheel and the work. Henderson.

ground. Shallow cracks formed in the surface of relatively hard materials because of excessive grinding heat or the high sensitivity of the material. See also grinding sensitivity. ASM Gloss.

grinding cycle. The sequence of operations in grinding a material, including, for example, the screening of the primary product and the recirculation of the screen oversize. P.R. 2555, 1962.

grinding fluid. Cutting fluid used in grinding. ASM Gloss.

grinding machine. Any machine on which a material is to be ground or polished. ACM T, 1963.

grinding media. The balls (generally porcelain) or other materials such as flint pebbles, used in a ball mill to grind frit into porcelain enamel. Bryant.

grinding mill. A machine for the wet or dry crushing of ore or other material. The three main types are the ball, rod, and tube mills. The mill consists of a rotating cylindrical drum and the ore enters one hollow truncated and the finished product leaves the other. Modern practice indicates ball mill feeds of one-half inch, three-quarters inch, and one inch for hard, medium, and soft ores respectively and the products range from 35 to 200 mesh and finer. See also open-circuit mill. Nelson.

grinding pan. Arrangement in which a heavy steel disk (the muller) bears as it rotates horizontally above a fixed wearing plate in a shallow cylindrical pan. Ore is fed centrally and discharged peripherally. Obsolescent, the main use being to amalgamate auriferous concentrates. Pryor, 3. See also dry pan.

grinding pebbles. Pebbles, usually of chert or quartz, used for grinding in mills, etc., where contamination with iron must be avoided. A.G.I.

grinding plate. a. A piece of steel or iron by the medium of which ore is ground against another smooth surface. Fay, b. A heavy cast-iron disk rotating on a vertical axis, used to grind or polish plates or similar objects. A.G.I.

grinding ratio. The ratio of the volumes of metal removed from the work and from the Abrasive material. ASTM E 1814. 1964.

grinding relief. A groove or recess located at the boundary of a metal surface to permit the corner of the wheel to overhang during grinding. ASM Gloss.

grinding sensitivity. Susceptibility of a metallic material to form grinding cracks; it can be affected by such factors as hardness, microstructure, hydrogen content, and residual stress. ASM Gloss.

grinding slip. a. A disk of olstone or whetstone; b. A hone. Standard, 1964. b. A shaped piece of olstone on which the curved sides of the cutting edges of tools may be rubbed for sharpening purposes. C.T.D.

grinding stress. Residual stress, generated by grinding, in the surface layer of a metallic material. It may be tensile, compressive, or a combination of both. ASM Gloss.

grinding vat. A mill for grinding flints or clay used in making porcelain. It is a form of the arrastre. Fay.

grinding wheel. A disk, or comparable symmetrical shape, of bonded abrasive material. The abrasive is either alumina or silicon carbide; the bond may be of the vitrified ceramic type, or it may consist of sodium silicate (here called a silicate bond), resin, rubber, or steel. A standard marking system for grinding wheels was adopted many years ago by the Grinding Wheel Manufacturers Association of America; in 1952, this system was also adopted in the United Kingdom as British Standard 1814. Dodd.

grindstone. A large, circular, revolving stone used for shaping tools and instruments. It is made from a tough sandstone of fine-grained material, with an angular grain. A.G.I. Supp. d. Sandstone with angular grains. A.G.I. Supp. Sandstone suitable for grindstones. A.G.I. Supp. f. in archeology, a noncommittal term for tempering material, used when the archeologist is unable to identify the material used or finds it essentially fine gravel. Sometimes referred to as a plastic or its by the French term, degraisant. ACSG, 1963.

gripr. A small tank for collecting debris. Ham.

grit collector. An adaptation of any of several types of conveyors used for removing heavy solids from settling tanks or basins. See also bucket elevator; flight conveyor; reciprocating flight conveyor; screw conveyor; V-bucket conveyor elevator. ASA MH-1-1958.

grit number. See mesh number, ACSG, 1963.

grit size. Nominal size of abrasive particles in a grinding wheel corresponding to the number of openings per linear inch in a screen through which the particles can just pass. Sometimes called grain size. ASM Gloss.

gritter. a. An implement for spreading surface dressing or nonslip grit over a road surface. Ham. b. In the stonework industry, one who smooths the rough-sawed or bed-rubbed surfaces of marble slabs or blocks on a gritting machine preparatory to polishing. Also called gritting machine operator. D.O.T.

gritting. The process of forming a smooth surface on blocks of marble, or other natural stones, by means of abrasive blocks known as rubbing blocks. Dodd, b. In quarrying, a process that gives a smoother surface than rubbing. It is accomplished with silicon carbide or other abrasive bricks attached to revolving buffer heads. AIME, p. 332.

grizzle. a. Eng. Inferior coal with an admix-
grizzly. Iron or steel bars used to sort or separate the rock ore as it falls into the chute. Ricketts.

grizzly. A guardrail or covering to protect those working. Miners are (1747) called grizzly; grizzly man; grizzly chute; live roll grizzly.

grizzly chute. A chute with a bar grizzly which separates the fine from the coarse material as it passes through the chute. "ASA MH4-1958."

gizzly, live roll. See live roll grizzly. "ASA MH4-1958."

gizzly worker. In metal mining, a laborer who works underwater at a grizzly (a grating constructed of heavy iron beams or timbers) over a chute or raise heading. Fay.

groove angle. The total included angle of the groove between parts to be joined. Also called mud furrow. See also drag mark; striation cast. Pettijohn.

grooved drum. Drum having a grooved surface to support and guide a rope. Ham.

groove face. The portion of a surface or surfaces of a member included in a groove. "ASA Gloss."

grooving. Rounding or chamfering; reaming; precision cutting of holes. See also groove cast; dress mark; slide mark. Pettijohn.

grooves. A term applied to any straight linear depressions in rocks. They may be continuous or discontinuous. Smith et al., 1943.

groovulite. A rare black, coarse-grained manganous carbonatite, occurring in some of the world's largest ore deposits. Osborn et al., 1854.

grout. A hydraulic cement used for grouting, ie. for cooling the metal. Nelson.

grout. A combination of materials and water, used to fill an excavation, especially an excavation in rock. Nelson.

grouting-in. The cutting and fitting of brick to fill into the volume common to two intersecting cylinders. Bureau of Mines Staff.

grotesque. A term loosely applied to anything representing a figure, zoomorphic, or anthropomorphic, which has a characteristically grotesque or fantastic quality. Nelson.

grotto. A small cavern or a cavernlike aperture in a rock wall. Nelson.

grotto. A small cavern or a cavernlike aperture in a rock wall. Nelson.

Gröndal separator. Early wet magnetic separator. Osborne.

groutability. The ability of a mixture of grout to fill an excavation, especially an excavation in rock. Nelson.

groutability. The ability of a mixture of grout to fill an excavation, especially an excavation in rock. Nelson.

"Grötz". A. 1864. "Mineralogisches journal."

Grötz. A term used in the German language for a stone or rock. Nelson.

groove. a. Derb. The place where a miner is working. Miners are (1747) called grizzly; grizzly man; grizzly chute; live roll grizzly.

groove. b. A device for the coarse screening of bulk materials. See also bar grizzly; grizzly chute; live roll grizzly.

groove. c. An additional groove, such as the spiral depression on a cylindrical object, such as the spiral depression on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove. d. The cutting and fitting of brick with a stone apron at the end, to accumulate sand and silt on a beach, and to act as a breakwater. "Standard, 1964."

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.

groove (or fluting). A family of surfaces laid out on the surface of fluted core or the rifling of a gun barrel. Long.
ground. a. Any rock or rock material. Long. b. 1964, p. 19. Mines, any specific part of a mineral deposit, or the rock in which a mineral deposit occurs. Long. c. The mineral, in situ and the rocks in which it occurs, for example, payground, payable reef. barren ground, rock without value. d. Rock at the side of a body of country. Gordon. e. Commonly used in the United States to denote earth. C.T.D. I. A ground is a conducting medium, whether intentional or accidental, between an electrical circuit or equipment and either earth or some conducting body, serving in place of the earth. Also called earthed. C.T.D. 

ground. a. In marble working, the act or operation of subjecting a rock formation to pressure, either by dusting powder over an oiled surface or by the action of water. C.T.D. b. Rock wind. Fay. 

ground. coat. The initial coat of a porcelain enamel; bossm. A.R.I. 

ground coat. That part of an electric circuit as the earth, or metallic conductors provided by the area in square inches of the ground directly supporting a machine or apparatus referred to is provided with a ground. Also called earthing. ASA M2.1-1964. 

ground control. a. The regulation and final arresting of the closure of the walls of a stope area. Spalding, b. In photogrammetry, correlation of photographs taken from an airplane with points on the ground accurately fixed for latitude and longitude. Pryor, 3. c. See control. Steeye, 2. 

ground crab. See ground block. Fay. 

ground detector. A device, as in a central power house, to indicate where a ground connection, entailing loss of electricity, has taken place. Standard, 1964. 

grounded. a. Means that the system, circuit, or apparatus referred to is provided with a ground. Also called earthed. ASA M2.1-1964. 

grounded circuit. Electrical system earthed at key points to insure a common potential and eliminate danger to personnel. Pryor, 3. 

ground power conductor. An insulated or bare cable that constitutes one side of a power circuit and normally is connected to ground. It differs from a ground wire in that a grounded power conductor normally carries the load current while the equipment it serves is in operation. Bu-Mines. Geophysical Interpretation Manual, June 1966, pt. 3-18e, p. 53. 

ground fire clay. Fire clay or a mixture of fire clays that have been subjected to no treatment other than grinding or weathering, or both. ASTM C71-64. 

ground fire clay mortar. Fire clay fire clay for use as a refractory mortar in laying fire clay brick. A.R.I. 

ground. form. The crystalline form of any crystal system which is bounded by natural faces, all of which intersect the crystal axes. The ground form of the isotropic system is the octahedron. Hess. 

ground geophysical anomaly. A geophysical anomaly related to that is mapped instrumentally over the surface of the ground. Hawker, 2, p. 320. 

groundhog. See barney. Fay. 

groundhog kiln. Used for an art potter's kiln (usually fired with solid fuel) partly buried in a convenient hillside to support the roof and contain a heaped ground floor. Fay. 

ground ice. Spongy ice which sometimes forms on the bottom of either running or still waters. Standards, 1964, c. e. 

grounding. a. In mining, a grounding conductor is a metallic conductor used to connect the metal frame or enclosure of an equipment, device, or wiring system with a mine track or other effective grounding medium. The mine track is considered to be an effective grounding medium for direct current only. Also called ground conductor. Standard, 1964. 

grounding conductor. In mining, a grounding conductor is a metallic conductor used to connect the metal frame or enclosure of an equipment, device, or wiring system with a mine track or other effective grounding medium. The mine track is considered to be an effective grounding medium for direct current only. Also called ground conductor. Standard, 1964. 

ground layer. One who applies solid colors over glaze by dusting color on ware covered with a varnish. D.O.T. 1. 

ground lathing. a. In ceramics, the process of applying a coat of boiled oil to porcelain ware, to receive the colored enamel; bossing; grounding. Standard, 1964, b. Covering a surface with an even coat of color, usually by dusting powder over an oiled surface. C.T.D. 

ground magnetometer. A magnetometer primarily suitable for making observations of magnetic field intensity on the surface of the earth. A.G.I. 

grounded circuit. Electrical system earthed at key points to insure a common potential and eliminate danger to personnel. Pryor, 3. 

ground noise. Seismic disturbance of the ground not caused by the shot. Schieferdecker.
groundsel. Also spelled groundslill. Webster 3d.

groundshill. See groundsel.

groundwater. A layer of unconsolidated materials through which ground water can move and be replenished. Webster 3d.

grounder. A temporary pile or heavy equipment to support or sustain an anchor plate at its foot to receive a foundation bolt. Ham.

grouse. a. A temporary pile or other floating object in the stream to hold a drilling or dredging boat, or other floating object, in position. Long. b. A group of birds of the family Tetraonidae, see also winter grouse. Ham.

grouse, grouse. a. A variety of birds in the family Tetraonidae, see also winter grouse. Ham. b. A group of birds of the family Tetraonidae, see also winter grouse. Ham.

grout; grouting. a. The process of injecting a material into rock to prevent ground water from flowing into an excavation, to seal crevices in a dam foundation, or to consolidate and cement together rock fragments in a brecciated or fragmented formation. Also spelled grounding medium. Long. c. The act or process of injecting a grout into a rock formation through a borehole. Long. d. A cementitious component of high water-cement ratio, permitting it to be poured into spaces without forming quasi-walls. It consists of portland cement, lime, and aggregate, and is often formed by adding water and mixing it with cement. Also spelled ground zero. Long. e. A cementitious component of high water-cement ratio, permitting it to be poured into spaces without forming quasi-walls. It consists of portland cement, lime, and aggregate, and is often formed by adding water and mixing it with cement. Long. f. A cementitious component of high water-cement ratio, permitting it to be poured into spaces without forming quasi-walls. It consists of portland cement, lime, and aggregate, and is often formed by adding water and mixing it with cement. Long.

grouser. a. A temporary pile or heavy equipment to support or sustain an anchor plate at its foot to receive a foundation bolt. Ham.

groundwater. The water which permeates, saturates, and moves through the earth, filling their pores and fissures. Fay. That water of atmospheric origin which saturates rock openings beneath the water table. Batenan. c. See free water. ASC P1826. d. Water, whether or not below the water table; basal or bottom water; phreatic water. Used also in a broad sense to mean water free to move through the ground surface. Sneyd, 1.e. Water derived from wells or springs, not surface water from lakes or streams. ASTM STP No. 146-D.

groundwater discharge. The return of ground water to the surface. Fay.

groundwater divide. The crestline of a water table. On the opposite sides of this line, the water table slopes in opposite directions. Compare watershed. Fay.

groundwater elevation. Water free to move through the ground surface. Fay.

groundwater hydrology. The branch of the science of hydrology that treats of ground water, its occurrence and motions, its relationships and depletion; the properties of rocks that control ground water movement and storage; and methods of investigation and utilization of ground water. Stokes and Varnes, 1955.

groundwater level. The level below which in a given subconcealed depth, are full of water. Fay. Also called groundwater table; water table. Long. groundwater lowering. The process of lowering the water table; basal or bottom water; phreatic water, its occurrence and motions, its relationship with preparation for firing. ASC P1826.

groundwater sensitive. See sensitivity with which they can be detected. Groundwater is unique because it can be used to label the actual water molecule to be traced and is not chemically removed by the strata. Nelson.

groundwaves. Vibrations of soil or rock. Nichols. See also ground roll.

groundwater table. See groundwater level.

groundwater table; water table. Long. a. The water which permeates, saturates, and moves through the earth, filling their pores and fissures. Fay. That water of atmospheric origin which saturates rock openings beneath the water table. Batenan. c. See free water. ASC P1826. d. Water, whether or not below the water table; basal or bottom water; phreatic water. Used also in a broad sense to mean water free to move through the ground surface. Sneyd, 1.e. Water derived from wells or springs, not surface water from lakes or streams. ASTM STP No. 146-D.

gravels, gravel. A layer of unconsolidated materials through which ground water can move and be replenished. Webster 3d.

gravel bank. A deposit of unconsolidated materials through which ground water can move and be replenished. Webster 3d.

gravel channel. A channel or trough in the ground through which auriferous earth is sluiced for placer mining. Webster 3d.

gravel core. Core obtained by drilling into and through foundations or rock masses that have been injected and allowed to set. Long.

gravel curtain. An area into which grout has been injected to form a barrier around an excavation or under a dam through which ground water cannot percolate or flow. Long. A road constructed of coarse aggregate, having the voids filled with bituminous or cement grout. See also gravel core. Ham.

grout. a. In the stonework industry, a laborer who maintains the floors, equipment, machinery, and yard in a clean and unobstructed condition, using shovels, brooms, buckets, and wheelbarrows to collect and remove stone scraps, dirt, and debris to dump for disposal or to remove steel shot from under gangways and store it in suitable containers. Also called mucker. D.O.T. 1. b. See box loader. D.O.T. 1. c. A borehole drilled for the express purpose of using it as a means by which grout may be injected into the rock surrounding the borehole. Compare consolidation borehole and drift. See also rotary cave. Long. d. The act or process of injecting grout into crevices of a rock, usually through a borehole drilled into the rock to be grouted; also, the grout thus injected. Long.

grout. a. A base of given size, usually through a borehole drilled into the rock to be grouted; also, the grout thus injected. Long. b. A machine that mixes the dry ingredients for a grout in a dry and nonmoist condition, and transports it to the face of the excavation. See also rotary cave. Long.

grout box. A conical box formed of expanded metal, cast into concrete, and having an anchor plate at its foot to receive a foundation bolt. Ham.

grout hole. A borehole drilled for the express purpose of using it as a means by which grout may be injected into the rock surrounding the borehole. Compare consolidation borehole and drift. See also rotary cave. Long. 

grouting. The act or process of injecting grout into crevices of a rock, usually through a borehole drilled into the rock to be grouted; also, the grout thus injected. Long.

ground zero. The point on the surface of land or water vertically below or above the center of a burst of a nuclear weapon. L&L.
injected into a grout hole. The machine is essentially a closable cylindrical container, which may be held to hold the next cement slurry made with one bag of cement. The slurry is placed inside the container and the core of air or steam allowed to enter the top of the container forcing the slurry out of the bottom of the container through a quick-opening plug valve into the grout pipe and grout hole. The process is intermittent, requiring the refilling of the container after each batch of slurry had been ejected. Compare grout injector, L. Long. grout off. To seal off flow of water by grout injections, Long. grout pipe. A tube or pipe firmly anchored in the collar of a grout hole through which grout is injected into the hole. grout-pipe, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or tube, or pipe, or pipe, or}
guard ring

ductivity apparatus designed to insure that heat shall flow, through the sample actually under test, in a direction perpendicular to the heat input. If the sample is cold, that is, if no heat flows through the sides of the test piece. Dodd.
guard tube. In chemical analysis one containing a suitable reagent for removing moisture, etc., from a sample which has been drawn into or is emanating from a reacting vessel. Pryor, 3.
guar. See orthoguanilurite; clinoquarzite.

**G**

guadalupite. A pale yellow, amorphous, nonresinous, oxygenated hydrocarbon, from near Guayaquil, Ecuador; it has the specific gravity 1.092, begins to fuse at 70°C, and is soluble in alcohol. Fay.
gubbins. Chunch or clod with ironstone nodules. Arkell.
gubble stone; gub. Eng. A rough, round stone which will not lie evenly in a wall or building. Variant of cobblestone. Arkell.
gucchini. A black, fusible substance resembling iron ore, which a bituminous shivery earth abounds. Arkell.
guided bend test. A test in which the specimen is bent to a definite shape by means of a jig. ASM Gloss.
guided bracket. A steel or iron bracket fixed at a bunton to secure rigid guides in a shaft. See also fixed guides. Nelson.
guided core. See dummy. Long.
guided coupling. A coupling with a projecting reamer guide or pup to which is attached a reaming bit. A guide coupling served to couple a reaming bit to a reaming barrel. Long.
guided bend test. A test in which the specimen is bent to a definite shape by means of a jig. ASM Gloss.
guided fan. A centrifugal fan, introduced about 1860, with 8 or 10 straight blades which are arranged radially. An important feature developed by Guibar and since adopted by others, is the expanding chimney, which is placed behind the impeller and reduces the velocity of the air as it leaves the fan. Nelson.
guide. a. See guide coupling. Long. b. A pulley to lead a driving belt or rope in a new direction or to keep it from leaving its desired direction. Long. c. The tracts that support and determine the path of a skidder and skid bucket barrel, ASA MH4-1958. d. The tracks that guide the chain or buckets of a bucket elevator. ASA MH4-1958. e. The runway or members paralleling the path of the conveyor which limits the conveyor or parts of a conveyor to movement in a defined path. ASA MH4-1958.
guide bracket. A steel or iron bracket fixed to a bunton to secure rigid guides in a shaft. See also fixed guides. Nelson.
guide core. See dummy. Long.
guide coupling. A coupling with a projecting reamer guide or pup to which is attached a reaming bit. A guide coupling served to couple a reaming bit to a reaming barrel. Long.
guided core. See dummy. Long.
guide plate. Scot. A cast-iron plate containing the holes in a crossbeam through which rope guides are sometimes used. Pryor, 3. a. The holes in a crossbeam through which the stems of the stamps in a stamp mill rise and fall. Fay. d. Corn. Crossbeams in the St. Just district. Fay. e. A boring rod having an enlargement or wings fitted to it to suit the size of the borehole for steadying the rods when a considerable depth has been attained. Fay. f. In a steam engine, a crosshead guide. Standard, 1964. g. A pulley to lead a driving belt or rope in a new direction, or to keep it from leaving its desired direction. Standard, 1964. h. A curved plate directing a sheet of water against the buckets of a water wheel. Standard, 1964. i. In a rolling mill, a wedge-shaped piece held in the groove of a roll to prevent the sticking of the work. Fay. j. It is called a hanging guide. Wane. k. The guide is held by a hanger or counterweight against the underside of the shroud. Standard, 1964. l. It is called a swinging guide. Wane.
guiding bed. A thin layer of coal or carbonaceous shale which continues into the barren ground where a fault or nip-out has occurred in a coal seam. The layer may be extended to the position of the displaced seam. See also coal leads. Nelson.
guiding core. A dark chestnut-brown hydrous sulfide of copper, iron, and aluminum, [CuFe]0.2[FeAl]0.5O1.7SO1.17H10.0. Habit, cubic; monoclinic. From Jerome, Ariz. Eng. fish.
guiding core. A. A machine for breaking iron with a driven bit. Nichols.
guiding core. A. A machine for breaking iron with a driven bit. Nichols.
guiding core. A. A machine for breaking iron with a driven bit. Nichols.
guiding core. A. A machine for breaking iron with a driven bit. Nichols.
guiding core. A. A machine for breaking iron with a driven bit. Nichols.
gulch claim

518
gum. a. See gumnings. Nelson. b. Small coal broken out by a coal cutter. Also called gunning. c. Used as a cutting agent. ship. Ship. In addition with a cutting bar of iron for connecting a horse's harness. Also called a bent bar of iron for connecting a horse's

gum boat brigade. Itinerant miners who bartered gum boots for liquor. Is. 
gumboot. a. The small coal or dirt produced by the picks of a coal cutter. Also called a bootleg or Jogn O'dges. See gumnings. b. N. Staff. The moving and cracking of overlying strata in a coal mine. C.T.D.
gumbo. a. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. Fay. c. In Texas, a clay encountered in drilling for oil and sulfur. Fay. d. The stratified portion of the lower till of the Mississippi Valley. Fay.
gumbo clay. a. Fine-grained clays which are very sticky and breaking with a puttylike consistency. May be used as a proveing agent and in making tanks watertight. Bennett 2d, 1962.
gumbellte. A variety of hydromuscovite. Dana 6d, p. 692.
gumble. A variety of hydromuscovite. Dana 6d, p. 692.
gumbell. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. Fay. c. In Texas, a clay encountered in drilling for oil and sulfur. Fay. d. The stratified portion of the lower till of the Mississippi Valley. Fay.
gum boot brigade. Itinerant miners who bartered gum boots for liquor. Is.
gumboot. a. The small coal or dirt produced by the picks of a coal cutter. Also called a bootleg or Jogn O'dges. See gumnings. b. N. Staff. The moving and cracking of overlying strata in a coal mine. C.T.D.
gumbo. a. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. Fay. c. In Texas, a clay encountered in drilling for oil and sulfur. Fay. d. The stratified portion of the lower till of the Mississippi Valley. Fay.
gumbo clay. a. Fine-grained clays which are very sticky and breaking with a puttylike consistency. May be used as a proveing agent and in making tanks watertight. Bennett 2d, 1962.
gumbellte. A variety of hydromuscovite. Dana 6d, p. 692.
gumble. A variety of hydromuscovite. Dana 6d, p. 692.
gumbell. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. Fay. c. In Texas, a clay encountered in drilling for oil and sulfur. Fay. d. The stratified portion of the lower till of the Mississippi Valley. Fay.
gum boot brigade. Itinerant miners who bartered gum boots for liquor. Is.
gumboot. a. The small coal or dirt produced by the picks of a coal cutter. Also called a bootleg or Jogn O'dges. See gumnings. b. N. Staff. The moving and cracking of overlying strata in a coal mine. C.T.D.
gumbo. a. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. Fay. c. In Texas, a clay encountered in drilling for oil and sulfur. Fay. d. The stratified portion of the lower till of the Mississippi Valley. Fay.
gumbo clay. a. Fine-grained clays which are very sticky and breaking with a puttylike consistency. May be used as a proveing agent and in making tanks watertight. Bennett 2d, 1962.
gumbellte. A variety of hydromuscovite. Dana 6d, p. 692.
gumble. A variety of hydromuscovite. Dana 6d, p. 692.
gumbell. A name current in the Western and Southern States for those soils that yield a sticky mud when wet. Fay. b. In southwestern Missouri, a puttylike clay associated with lead and zinc deposits. The stratified portion of the lower till of the Mississippi Valley. Fay.
gumbo clay. a. Fine-grained clays which are very sticky and breaking with a puttylike consistency. May be used as a proveing agent and in making tanks watertight. Bennett 2d, 1962.
guniting

and the fresh surface then sprayed by means of a cement gun. A wire netting coil is placed against the ground which becomes embedded in the concrete. See also Allia concrete sprayer. Nelson. b. The treatment of timber with water, cement and sand sprayed from a cement gun. Expanded metal lath or chicken wire is first nailed to the timber before the grout of cements is applied. As a protection against decay, guniting is effective only as long as the coating of cement remains unbroken and covers the entire surface of the timber. Lewis, p. 71.

gunk. a. Used by some drillers as a synonym for red dope; red grease. Long. b. Any gummy substance that collects inside the working parts and hinders the operation of a machine or other mechanical apparatus. Long. c. A slang term denoting an undesirable nondescript material usually semiliquid. NRC-ASA NL-1957.

gunmetal. A copper-tin alloy (that is, bronze) containing 88 percent copper, 10 percent tin, and 2 percent zinc (usually gunmetal); or 88 percent copper, 8 percent tin, and 4 percent zinc. Lead and nickel are frequently added, and the alloys are used where resistance to corrosion or wear is required; for example, in bearings, steampipe fittings, etc. C.T.D.

gunmetal pipe. a. The variety of so-called black pearl; the color and luster of which resembles polished gunmetal. Shipley. b. A gunmetal pipe or tube of such a pearl. A mimanometer. Shipley.

gunflint. a. A mineral, (Fe,Al)O3. 10 (H2O), in a group of minerals (hydrated aluminides) that, because of its black color, is used in jewelry and as a gem. Predominately black, as black micaceous platelets in basilite; from east Greenland. Spencer 19, M.M., 1952. b. A piece of slate used for roofing. American Mineralogist, v. 42, No. 11-12, November-December 1957, p. 920.

gun-iron. The name of a piece of iron which has been cast. Fay. gunner. A Kansas term for a blown-out shot. Fay.

519

gunpowder. Black, blackpowder. A mixture of potassium nitrate (saltpeter), sulfur, and charcoal in varying proportions. A typical composition: 70 to 75 percent saltpeter, 10 to 20 percent sulfur, and 10 to 15 percent charcoal. It is designated according to grain size: Mealed; superfine grain (FG); fine grain (FG); large or course grain (LG); large grain for rifles (RLG); and mammoth. CCD 6d, 1961.

gunpowder, white, white powder. A mixture of potassium nitrate (saltpeter), large part potassium ferrocyanide, and 1 part sugar. CCD 6d, 1961.

gun sampling. See pipe sampling. Truscott, p. 149.

Gunter's chain. A chain that is 66 feet in length and divided into 100 links. Each 7.92 inches long. It is built up of 100 lengths of iron or steel wire (Nos. 8-12 standard wire gage), each looped and ends joined together by three oval rings. This gives flexibility to the chain. Swivels are introduced at the brass handles and sometimes in the middle to eliminate twisting. The chain is convenient to handle, and its length is a basic unit for the following measurements of length and area: 1 chain equals 22 yards; 10 chains equal 1 furlong; 80 chains equal 1 mile; 360 feet equal 1 chain. Mason, v. 2, p. 712.

gur. A potable white liquor found in iron ore mines. American Mineralogist, v. 42, No. 11-12, November-December 1957, p. 920.

gutter. Oil well with a strong natural outflow; a geyser. Pryor, 3.

gussen. A V-shaped cut in the face of a head or a heading. C.T.D.

Gusto multiplough. A number of small ploughs attached to a rope or chain which cut backward and forward on the face. They operate in conjunction with an armored conveyer. See also multiplough. Nelson.

Gusto scraper box. An arrangement of scraper boxes with cutting knives attached to the face side. See also scraper box plough. Nelson.

Guy rope. A flat-topped submarine mountain rising from the floor of the ocean like a volcano but planed off on top and covered by an appreciable depth of water. Leet.

Guy rope. a. Galvanized rope consisting of 6 strands, 7 wires each, and a hemp core. HBG, p. 109, b. A rope holding a structure in a desired position. C.T.D. See guy rope.
gypsum rope

guy wire. See guy. Long.
guy-wire slide. A mechanism attached to a guy wire, gusset, rod, or timber so that a person can grasp and slide to safety in an emergency. Long.

Guy wires are a method of calculation for compounds slips and glazes, the V-value being the grams of suspended solids per cubic meter of suspension. \( G = \frac{SP}{100} \), where \( S \) is the specific gravity of the suspension, and \( P \) is the percentage of solids in the suspension. Dodd.

GVC Abbreviation for glazed vitrified clay; term applied to glazed clay pipes. Dodd.

gweyon. See guy-wire slide. Webster 2d.
gwythyn. S. Wales. A mineral vein or seam.

Guy. See gyroscope.

gyration. a. More or less eccentric, as in certain rock crushers. Von Bernoulli. b. A widely used form of coffee mill. It consists of a hollow cone. C.T.D.

gyrosopic. See gyroscopic.

gyrosopic compass; meridian indicator. An instrument that is actuated by a rapidly rotating mass, one whose axle is constrained by the earth's gravitational field. This instrument has been developed in its most precise form for application to mine orientation and borehole surveying. B.S. 3618, 1953, sec. 1.

gyroscopic clinograph method. A method for measuring borehole deviation which photographs the time, temperature, and direction from the vertical on 16 millimeter film and can take one thousand readings descending then ascending the hole as a check. The gyrooscope maintains the casing on a fixed bearing. Sinclair, II, p. 243.

gyroscope. See gyroscopic.

gypsum. A naturally occurring mineral consisting essentially of calcium sulfate for use in making interior embellishments, cornices, as gauging plaster, etc. ASTM C11-60.

gypsum concrete. A material consisting essentially of calcined gypsum for use in making interior embellishments, cornices, as gauging plaster, etc. ASTM C11-60.

gypsum fiber concrete. Gypsum concrete in which the aggregate consists of short wood fiber, or chips of wood. ASTM C11-60.

gypsum flower. Curved; twisted crystal growths of gypsum resembling flowers. A.G.I.

gypsum formboard. A sheet or slab having an incombustible core, essentially gypsum, surfaced with paper suitable to receive gypsum plaster. ASTM C11-60.

gypsum mold. A material consisting essentially of calcined gypsum for use in making interior embellishments, cornices, as gauging plaster, etc. ASTM C11-60.

gypsum plaster. See gypsum cement. CCD 6d, 1961.

gypsum plate. In microscopic examination with polarized light, a transparent plate used to produce a purple interference effect. Pryor, 3.

gypsum sheathing board. A sheet or slab having an incombustible core, essentially gypsum, surfaced with water-repellent paper. ASTM C11-60.

gypsum wallboard. A sheet or slab having an incombustible core, essentially gypsum, surfaced with paper suitable to receive gypsum plaster. ASTM C11-60.

gypsum wedge. A thin, wedge-shaped piece of selenite. C.T.D.

gypseal; castable. A capstone which.

gyrophore. Heavy-duty fixed path cone crusher; a variant from the standard cone crusher. See also Symons crusher. Pryor, 3.

gyratory. a. More or less eccentric, as in certain rock crushers. Von Bernoulli. b. A widely used form of coffee mill. It consists of a hollow cone. C.T.D.

gyratory breaker; gyratory crusher. A primary breaker built on the principle of the old-fashioned coffee mill. It consists of a vertical spindle, the foot of which is mounted in an eccentric bearing within a conical shell. The top carries a conical crushing head revolving eccentrically in a conical shell. There are two types of gyratory —those which have the greatest movement on the smallest lump, those that have equal movement on all lumps, and those that have greatest movement on the largest lump. Liddell 2d, p. 536.

gyroscopic. a. A compass that is actuated by a rapidly spinning rotor which tends to place itself in a fixed position. This instrument has been developed in its most precise form for application to mine orientation and borehole surveying. B.S. 3618, 1953, sec. 1.

gyroscopic-cilioograph method. A method for measuring borehole deviation which photographs the time, temperature, and direction from the vertical on 16 millimeter film and can take one thousand readings descending then ascending the hole as a check. The gyrooscope maintains the casing on a fixed bearing. Sinclair, II, p. 243.

gyropole. See gyroscopic.

of heat transfer; heat-flow rate per unit area, per degree, across a boundary surface. Zimmermann, p. 147, 136, 366. A as a subscript. Symbol for head in hydraulics: Zimmerman, p. 137, 163. Symbol for depth. Zimmermann, p. 153. Symbol for thickness. Zins, p. 184. Symbol for one of the Miller indexes (h, k, l). Zimmermann, p. 158. With subscripts 1, 2, and 3, the symbols for the Bragg reflection indexes (h1, k1, l1), which expressed in terms of the Miller indexes (h, k, l) are "h1 = h/n1, k1 = k/n1, and l1 = l/n1. Symbol for hydrogen 2 (deuterium) are "/2. Symbol for the atomic mass of hydrogen. The symbol for various kinds of head in hydraulics. Zimmerman, pp. 153, 158. Symbol for head in hydrodynamics; with various subscripts, the symbol for various kinds of heads in hydraulics. Zimmerman, p. 157.

H c. Symbol for enthalpy (heat content); enthalpy per mole; total heat; total enthalpy; enthalpy per mole of water vapor; unit of heat content for any weight; total heat. Zimmermann, p. 53. e. Abbreviation for humidity. Zimmerman, p. 54. g. Abbreviation for irradiance; irradiance; radiative flux density. Zimmermann, p. 158, 190.

h Abbreviation for hectare (100 acres). Zimmermann, p. 59.

HA Abbreviation for high angle; hot air.

hour angle. Webster 3d.

Haakeel depth rule. A rule of thumb for estimating the depth of the image of a body, valid if the body may be regarded as magnetically equivalent to a single pole. The depth of such a pole is defined as the horizontal distance from the point of maximum vertical magnetic intensity to the points where the intensity is one-third of the maximum intensity. Zimmermann, pp. 153, 158, 159. Symbol for head in hydrodynamics; with various subscripts, the symbol for various kinds of heads in hydraulics. Zimmerman, p. 157.

Haarman plough. See scraper box plough. Nelson.

Henry's law constant is facilitated by water under pressure which is forced down the tubes to wash away the loose material from underneath their points. Nelson.

H-b. In crystallography, the characteristic form, as determined by the faces developed on a Haber system. A system of shaft sinking for the purpose of fusing tungsten filaments, and primarily for the recovery of tungsten from its compounds. Zimmermann, pp. 153, 158, 159. Symbol for head in hydrodynamics; with various subscripts, the symbol for various kinds of heads in hydraulics. Zimmerman, p. 157.

H c. Symbol for enthalpy (heat content); enthalpy per mole; total heat; total enthalpy; enthalpy per mole of water vapor; unit of heat content for any weight; total heat. Zimmermann, p. 53. e. Abbreviation for humidity. Zimmermann, p. 54. g. Abbreviation for irradiance; irradiance; radiative flux density. Zimmermann, p. 158, 190.

H d. Abbreviation for hectare (100 acres). Zimmermann, p. 59.

h Abbreviation for high angle; hot air.
Hafnium (Hf).

Hafnium carbide. HfC; isomctric; HfN; molecular weight, 192.50; melting point, 3,890° C. It is the most refractory of all known metal nitrides. Handbook of Chemistry and Physics, 54th ed., 1964, p. B-176.

Hafnium oxide; hafnium dioxide; hafnula. White; isometric; HfO2; molecular weight, 180.17; specific gravity, 10.98 (at 20° C); melting point, 4,500° C; boiling point, about 5,000° C; and insoluble in water. Handbook of Chemistry and Physics, 54th ed., 1964, p. B-176. In commercial hafnium oxide is beneficial because of its lower thermal expansion, its higher index of refraction, its temperature stability, and its smaller volume change during inversion. Lee.

Hafnium silicate. A complex compound analogous to zirconium silicate, the suggested name hafnon. It can be synthesized from the oxides or nitrides and used to produce monocrystalline hafnium. Dodd.

Hafnium nitride; hafnium nitride. A white, dense, isomctric, nonmetallic solid. Commercially produced by the reaction of hafnium metal with nitrogen gas at high temperatures. Dodd.

Haidingerite. A colorless mineral forming thin, closely packed, parallel plates. Usually found in crusts with the ore. The Vall' Alta area of Chile is probably the best known locality. Fay.

Hailstone bort. Variety of bort built up of layers with the ore. The Vall' Alta area of Chile is probably the best known locality. Fay.

Hair crystal. Same as hairstone. Skow.

Hairmelt. A colorless mineral forming a series of beds of great thickness and varying lithological character, overlying the crystalline schists, and underlying the Lower Silurian, in the Himalayan Mountains. Fay.

Hair copper. See chalcocite. Shipley.

Hairline. a. Fine cord on the surface of glassware. See also air line. Dodd. b. A fault or fracture seen in vitreous enamelware. The hairlines are a series of fine cracks that have healed in the later firings (therefore differing from crazing). The cause is excessive stress in the enamel. Dodd. c. A line of separation sometimes found near center of thick ceramic ware that has been shaped by solid casting. Dodd.

Hairline cracks. Minute, irregular cracks that are barely noticeable until the object is split into films, resulting in production of torn films. Skow.

Hair mica. The accumulation of slivers of mica formed by ruling into very narrow ribbons. Skow.

Hairpin furnace. U-type furnace. Hairpin furnaces are used in vitreous enamelware. Webster 3d.

Hair salt. a. Epsomite when in thin, fibrous crystals in vitreous enamelware. Webster 3d. b. Syenite names applied to Glasses containing large quantities of sodium and magnesium. Webster 3d.

Hair zeolite. Quartz thickly penetrated with hairlike crystals of rutile, actinolite, or other mineral. Webster 3d.

Hair. a. A hair made to dry in the course of manufacture. C.T.D.

Hairfruit. The German term for semimulass or vitrifusain. Tomkeiell, 1954.

Half-and-half. Solder made of equal parts of lead and tin. Webster 3d.

Half-and-half plane; half-end half-plane. Scot. In a direction midway between plane course and end course. See also half-course. Fay.

Half ball. Eng. A mine prop cut into halves longitudinally. See also ball, b. Fay.

Half-bolt. A building block of half the normal length; also called a map-header. Dodd.

Half-headers. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half priceless. Fay. same as break faces. c. Fay.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half-header. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half life, biological. The time in which one-half of the atoms in a radioactive substance disintegrate. Half-lives range from millionths of a second to billions of years. L&L b. The time in which the quantity of a radioactive isotope is reduced to one-half of its initial value. NRC-ASA N1.1-1957.

Half-life, radioactive. a. The time in which one-half of the atoms in a radioactive substance disintegrate. Half-lives range from millionths of a second to billions of years. L&L b. The time in which the quantity of a radioactive isotope is reduced to one-half of its initial value. NRC-ASA N1.1-1957.

Half-light. a. A mineral, white, or colorless, commonly found in crusts with the ore. The Vall' Alta area of Chile is probably the best known locality. Fay.

Half-lattice girder. See Warren girder. Ham.

Half-life, radioactive. The time in which one-half of the atoms in a radioactive substance disintegrate. Half-lives range from millionths of a second to billions of years. L&L b. The time in which the quantity of a radioactive isotope is reduced to one-half of its initial value. NRC-ASA N1.1-1957.

Half-period. See half-life. Pryor 3.

Half-plait. Dipping or raising 18 inches to the yard. Fay.

Half-round nose. See medium-round nose.

Half set. In mine timbering one leg piece and a collar. Fay.

Half-socket pipe. A subsoil drain placed to the side and sufficiently close to the header, which enters, makes a 180° turn and enters the header. Fay.

Half-cell. An electrode immersed in a suitable electrolyte, designed for measurements of electrode potential. A.S.M.

Half-course. A drift or opening driven at an angle of about 45° to the strike and in the plane of the seam. Fay.

Half-edged seams. Scot. Highly inclined seams; seams lying at the inclination of 1 in 1. Fay.

Half faceting. Same as break faces; cross facets. See also girdle facets. Shipley.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half headers. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half priceless. Fay. same as break faces. c. Fay.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half-header. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half priceless. Fay. same as break faces. c. Fay.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half-header. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half priceless. Fay. same as break faces. c. Fay.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half-header. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.

Half priceless. Fay. same as break faces. c. Fay.

Half-finish. The first cover coat of enamel in a two cover coat system. Bryant.

Half-header. Term applied to material that amounts to a large cap piece. They are used by tawing a header in two and placing one or more timbers under the half header on the same side of the chambers. The timbers are generally placed under the half header and the end allowed to extend out over the header. The term half header should not be applied to regular cap pieces. Kentucky, p. 140.
half-trimmed mica

half-trimmed mica is a term used in mining and mineralogy. It refers to mica that has been trimmed on one side and left as a half-trimmed mica. This type of mica is often used in various applications due to its unique properties.

halismite

Halismite is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

halite

Halite is the mineral form of sodium chloride, commonly known as table salt. It is a white, tasteless, and odorless solid substance. Halite is one of the most abundant rock salt deposits on Earth and is used extensively in various applications.

halogen

Halogen is a term used in chemistry to describe a group of nonmetallic chemical elements. It includes fluorine, chlorine, bromine, and iodine. These elements are characterized by their ability to form compounds with other elements.

halogenite

Halogenite is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

halogenpyroasaphite

Halogenpyroasaphite is a term used in mineralogy. It refers to a mineral that is a member of the pyroasaphite family. It is typically found in various deposits and is known for its unique properties.

halogens

Halogens are a group of nonmetallic chemical elements that include fluorine, chlorine, bromine, and iodine. They are highly reactive and are used widely in various applications due to their unique properties.

halo

Halo is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

halocephalus

Halocephalus is a term used in ichthyology. It refers to a genus of fish that are typically found in the open ocean. They are known for their unique anatomy and are often studied for their biological properties.

halocephalus

Halocephalus is a term used in ichthyology. It refers to a genus of fish that are typically found in the open ocean. They are known for their unique anatomy and are often studied for their biological properties.

halofauna

Halofauna is a term used in ecology. It refers to the study of organisms that are adapted to living in environments with high salt concentrations, such as salt marshes and estuaries.

halolife

Halolife is a term used in biology. It refers to the study of organisms that are adapted to living in environments with high salt concentrations, such as salt marshes and estuaries.

hall furnace

Hall furnace is a term used in metallurgy. It refers to a type of furnace that is used for the production of iron and steel. The furnace is named after its inventor, Dr. William Siemens.

hallingleyite

Hallingleyite is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

hallite

Hallite is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

hallite

Hallite is a term used in geology. It refers to a mineral that is a member of the halite family. It is typically found in salt deposits and is known for its white to gray appearance.

half

Half is a term used in various contexts, such as mathematics, physics, and engineering. It refers to one of two equal parts of a whole.

half

Half is a term used in various contexts, such as mathematics, physics, and engineering. It refers to one of two equal parts of a whole.

half

Half is a term used in various contexts, such as mathematics, physics, and engineering. It refers to one of two equal parts of a whole.

half

Half is a term used in various contexts, such as mathematics, physics, and engineering. It refers to one of two equal parts of a whole.
hammer

liquid or gas flowing through a pipe system. Long.

hammer and plate. A signaling apparatus. A

hammer beam. a. A short beam projecting laterally from the inside of a wall, and serving as a support for the beam. Standard. 3rd ed.

A short cantilever beam projecting into a room or hall from the springing level of the roof, strength to be a cover of the roof. C.T.D.

hammer. An impact type of breaker

hammer dam. To dress or face (stone) with hammer breaker. An impact type of breaker

hammer head. A short beam projecting into a room or hall from the springing level of the roof. C.T.D.

hammer drill. a. A light, mobile, and fast-cutting drill in which the bit does not recirculate but remains against the rock in the bottom of the hole, rebounding slightly at each blow. There are three types of hammer drills: drifter, sinker, and stopper.

Leeds, p. 866. b. A development of the piston drill in which the drill bit is not attached to the piston but remains in the hole, the piston delivering a rapid succession of light hammer blows. The drill is frequently hollow so that air or water may be driven through to cool the bit and clean the hole. Rotation of the bit is automatic. Also known as jackhammer. Barker. C. A percussion drill. B.S. 3618, 1964, sec. 6. c. A rock drill powered by compressed air which recirculates a free particle to strike the shank of the drill bit. When of light construction, a hand hammer drill, otherwise supported on a tripod or bar. Pryor, 3.

hammer drop. The measured distance a drive hammer is dropped when driving a dry or drive-sample barrel in soil or foundation-testing operations. Long.

hammer forging. Forging in which the work is deformed by repeated blows. Compare press forging. ASM Gloss.

hammer-harden. To harden, as a metal, by hammering it while cold. Webster 2d.

hammer metal sheet iron. Also, deshaped sheet either over a form or on a hammer-refined. Designating steel, the grain of which has been made finer and closer by heavy hammering followed by lighter and quicker blows at the finishing. Long.

hammer scale. A scale that forms on heated metal when it is hammered. Webster 3d.

hammer slag. Anvil dross. Webster 2d.

hammer weight. The weight of a drive hammer, in pounds, used in driving a dry-drive-sample barrel in sampling formations in soil and foundation-testing work. Long.

hammer welding. Forge welding by hammering. ASM Gloss.

hammer-phase. A stone, the appearance of which suggests sand-veined with gold, perhaps mottled Jasper. Webster 2d.

hammerack. A structure relating to two systems of veins intersecting at an acute angle. Schiffldecker.

hammerpipe. Serpentine pseudomorphs after olivine found at Chester, Mass. The original crystals have been described as quartz and humite, and the replacement mineral as steatite.

hammerite. A fine-grained, lamprophyric igneous dike rock that is dark violet-gray, with prominent black phenocrysts of mica in a groundmass of mica, feldspar laths, and a little quartz. Johansen, v. 1, 2d, 1939, p. 285.

hand coal. Term used in South Wales for a variety of cango coal. Tomkieff, 1954.

hand coal. Some coal containing with gold. Long.

hand-end. A screw nail or similar tool used to form the surface of compacted concrete, and which may be fitted with a vibrator. Ham.

hand frame. An iron barrow used in a foundry. Fay.

hand hammer. Any hammer wielded by hand. A blacksmith or miner's hammer used with one hand as distinguished from a heavier hammer, or sledge. Fay.

hand holding. To hold a bar in the hand and not mounted on a bar or column. The air leg support is now widely used in tunnels and rock drilling operations. Fay.

hand hole. A small hole, closed by a removable lid. Fay.

hand hole. The useable rough sheet mica that remains after all adhering rock, dirt, and defective mica have been removed from the books. Also known as cobbed mica. Skow.

hand dog. Eng. A kind of spanner or wrench for screwing up, or disconnecting, the joints of boiling rods at the surface. Fay.

hand-dug wells. The earliest known method of extracting petroleum was by means of pits dug by hand labor. The usual method was to dig a few feet and then allow the oil to collect at the bottom, whence it was subsequently collected by means of a suitable vessel. The deepest of these wells rarely exceeded 50 feet. Fay.

hand electric lamp. A hand lamp, with battery and fittings similar to a cap lamp except that it forms a self-contained unit. Nor.

hand face. The descent into a mine by ladders. Fay.

hand feed. A drill machine in which the rate at which the bit is made to penetrate the rock is controlled by a hand-operated ratchet and lever or a hand-turned wheel meshing with a screw mechanism. Long.

hand-fill. Eng. To separate the small from the large coal in the mine, the latter being filled by the hand into the car, and the former thrown to the side of the working place, or filled separately as required. Pryor, 3.

hand-filled coal. Scot. Lump coal which the miner loads by hand. Fay.

hand drilling. A barrow coal from face by hand. Pryor, 3. b. Eng. Loading coal from face by hand, but small coals are loaded separately from large lumps. Pryor, 3.

hand finisher. A screw rail or similar tool used to form the surface of compacted concrete, and which may be fitted with a vibrator. Ham.

hand frame. An iron barrow used in a foundry. Fay.

hand hammer. Any hammer wielded by hand. A blacksmith or miner's hammer used with one hand as distinguished from a heavier hammer, or sledge. Fay.

hand holding. To hold a bar in the hand and not mounted on a bar or column. The air leg support is now widely used in tunnels and rock drilling operations. Fay.

hand hole. A small hole, closed by a removable lid. Fay.
handhole

able cover, in the side of a pressure vessel or tank; it provides means of access for the hand to the inside of the vessel.

C.D.

handlamp, electric. A portable battery-powered lamp incorporating a tungsten filament light source within a glass of clear dome or well-glass type and providing maximum illumination in the horizontal plane. -B.S. 3618, 1965, sec. 7.

hand lamp, miner's. See miner's hand lamp.

hand level. A lead weight attached to a hand lamp, miner's. See miner's hand lamp.

hand leveling. Equipment for the mechanical movement of dirt, ore, coal, or other material either horizontally or upward, by some form of conveyor, bucket, chain, or rope. Nelson.

hand leveler. A miner who loads coal by machine. B.C.I.

hand loupe. See loupe. Shipley.

handmade brick. Brick shaped in wooden molds from a soft plastic mix; (that is, too mix when too large for the workman's hand, softer, and takes less pressure to form as compared to extruded brick). See also molded brick. Bureau of Mines Staff.

hand method. Molding bricks by hand. Member, 4th, p. 261.

handpicked coal. Coal from which all stones and inferior coal have been picked out by hand; large lumps. Fay.

handpick sampling. Manual removal of selected fraction of coarse run-of-mine ore, usually performed on picking belts (conveyors) after screening away small material, perhaps washing off obscure dirt, and crushing pieces too large for the worker to handle. Hard sorting (Hand) describes picking of bucket when up to 30 percent of waste rock is removed. Pryor, 3.

hand pulled. See hand hoisting. Long.

hand putting. The pushing of tubs or trams by hand. This practice is now obsolete except in small mines or in an emergency. See also tramming. Nelson.

hand reel. A solid brick which is partially dried after molding, then pressed in a hand operated press. Bureau of Mines Staff.

hand rope. Flexible rope consisting of 6 ropes, each composed of 6 strands, 7 wires each, and 7 heads in total. Fay.

hand sampling. a. In prospecting, valuation and control, use of manual methods for detachment and reducing to an appropriate size representative samples of ore. Pryor, 3.

b. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

handsaw. An ordinary one-handed saw, either rip or cross-cut, used by woodworkers. Crippin.

hand selection. The selection by hand of pieces of coal with certain specific qualities according to surface appearance. B.S. 3552, 1962.

handset. A bit in which the diamonds are set toward and tightly cinched into place by pulling or drawing the metal towards and tightly cinching the diamond by pinning. The entire operation is by hand and rapidly is becoming a seldom-practiced art as the hand method is almost completely superseded by so-called mechanical setting methods. Long.

handspraying. A method of dust prevention used in hand-won faces, or in conjunction with wet cutting in thick seams. The sprays are controlled by the miner who wet the face and the broken coal before loading. Sprays must be used. Fay.

hand sprayer. A manually directed sprayer for spreading road binder, working under pressure produced by hand or power-operating plants, a jack-of-all-trades, as a rigger, millwright, and machinist combined. A man employed to do various kinds of work. Fay.

hang. A. To suspend drill string or other downhole equipment in the drill derrick or trip either on the hoisting line or on hooks provided in the crown block for that purpose. Long. b. To suspend casing or pipe in a borehole. Fay.

hangale. A piece of rock trimmed toward and tightly cinched into place by pulling or drawing the metal towards and tightly cinching the diamond by pinning. The entire operation is by hand and rapidly is becoming a seldom-practiced art as the hand method is almost completely superseded by so-called mechanical setting methods. Long.

hangar. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hanger brick. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. A hangerman performs a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.

hangerman. A man who attaches or detaches the tubs or trams on an endless-roped haulage in a coal mine. Fay. b. A hangerman who Developer a similar task at the shaft bottom. Fay. c. Also clipper, C.T.D. b. Eng. The man who runs the full trams upon the cages and gives the operator the brist. See also cage. Fay. c. One of the major breakdowns in ore sampling that includes grab sampling, trench or channel sampling, fractional selection, coning and quartering, and pipe sampling. These methods are used in sampling small batches of ore, etc. Compare mechanical sampling. Newton, p. 28-29.

hangerman. A brick having a cut-out to fit over a hanger, in a suspended roof, or sectionally supported wall. Bureau of Mines Staff.
hanging coal. A portion of the coal seam which, by under cutting, has had its natural support removed. Foy.

hanging core. Core supported by a wire hanger that is imbedded in the core. Hanging cores are used to avoid a deep lift for the cope. Crispin.

hanging drat. Aust. Planks used to suspend a lower course of ore above the one above it, in cases where backing decks are necessary. Foy.

hanging glacier. A glacier of small size on so steep a slope that the ice breaks off and falls from its lower end. Foy.

hanging guide. See guides, 1. Foy.

hanging wire. Scot. The bucket failing to pump on account of a faulty valve, or air between the bucket and the valve, the column of water above the bucket being insufficient to prevent the opening of the bucket lugs, is said to hang its water. Foy.

hanging leaders. A steel frame suspended from the pivot at the top of the crane or excavator jib, used to guide a driven pile. See also false leaders. Ham.

hanging load. a. The weight that can be suspended on a hoist line or hook device in a drill tripod or derrick without causing the machine to tip over, or trip or tipped to buckle. Long. b. The weight suspended or supported by a bearing, as the weight of the inner tube and contained core suspended by the bearing in the core-barrel head. Long.

hanging wall. The upper side of a mineal vein or deposit. Pryor, 3. c. The upper side of an inclined vein. It is a lip that is imbedded, in the core. Haras.

hard bottom. A condition encountered in some open-cut mines wherein the roof occurs and will not be broken down to grade because of an extra-hard streak of ground or because not enough powder is used. It interferes with work and puts undue strain on a shovel. Such unbroken ores are usually drilled with a jackhammer or blasted. Bucklin Bull. 433, 1941, p. 129.

hard brass. Brass which has not been annealed after drawing or rolling; used for springs, etc. Crispin.

hard burned lime. A quicklime that is calcined at high temperature and is characterized by relatively high density and moderate to low chemical reactivity. Boynton.

hard chrome. Chromium deposited for engineering purposes, such as increasing the wear resistance of sliding metal surfaces, rather than as a decorative coating. It is usually applied directly to basis metal and is customarily thicker than that deposited by electroplating. ASM Gloss.

hard coal. All coal of higher rank than lignite. In the United States, the term is restricted to anthracite. R.S. 3223, 1962.

hard coal pack. Westfalla pack. A plough type of cutter loader for cutting the harder coal seam and consisting of hardened kerfing bits which punch the coal, leaving the unstrressed coal to be cut by the following bits. The kerfing bits may be either a single or a double row. See also rapid plough. Nelson.

hardcore. Broken hard stone, brick, clincker,
hard-core. a. A layer of hard, abrasive-re-
stant metal applied to a less abrasive-
stant metal part by plating, welding, or other techniques. See also dress-
face. b. The crystal face of a diamond lying parallel or nearly so with a hard vector plane of the crystal. Long.

hard-drawn. a. Temper of copper or copper-
loy tubing drawn in excess of 25
percent reduction in area. ASM Gloss. b. Drawn while cold; said of wire. Fay.

hard-drawn wire. Wire which is cold-drawn from mild steel, and which has a tensile
strength of 37 to 42 tons per square inch. Tapp.

hardened. A phase or type of unaltered
kimberlite which occurs occasionally in the blue ground. It resists disintegration even when exposed to the atmosphere for as long as 50 years, whereas normal blue ground disintegrates in 12 months. I.C. 8200, 1964, p. 31.

hardening. As applicable to a ferrous al-
loy, the property that determines the depth and distribution of hardness that may be induced by quenching. The standard test for hardenability is the Jominy
hard test. Henderson.

hardener. Slang term for a safety hat. B.C.I.

hardening kiln. A kiln in which, in the
transfer printing process, unfinished pot-
tery is treated高温, or is ground for 60 revolutions. Fay.

hardening media. Liquids into which steel
is plunged in hardening. They include cold water, various oils, and water con-
taining sodium chloride or hydroxide to increase the cooling power. C.T.D.

hardening on. Heating of underglaze-decor-
at ed ware at 600° C to burn off the
mixture of liquid and finally divided
solids. The solids settle out on the bot-
tom of the thickener tank as a sludge
and finishing with a steep cone leading
to the discharge trunnion. The tricone
mill has wedge-shaped liners in the drum
section which turn this into a gentle conic
shape, or is scratched by other minerals in a series
range of hardness and set side by side in cement, for testing
whether the specimen under test scratches
the like. May be designated according to
the article hardened or quenching solu-
tion used, as gear hardener or waterman.

hardener. a. An alloy, rich in one or more
alloying elements, added to a melt to per-
mits closer composition control than pos-
sible by addition of pure metals or to in-
troduce refractory elements not readily
alloyed with the base metal. ASM Gloss.
b. A type of unaltered ground that is
difficult to work. Bureau of Mines Staff.

glass hard. A glaze having a high melting
point owing to its high silica content. It
is mechanically harder than glazes fired
at lower temperatures, and more resistant
to chemical attack. Rosethath.

hardgrove number. a. Empirical
index of grindability of coal samples, reached
as result of comminution of a test sample
under stated conditions of control. Pryor, 3.

hardgrove test. This test utilizes a special
grindability mill of the ring-and-ball type,
in which a 50-gram portion of coarsely
rounded stone found especially in coarse
gravel. A niggerhead. Fay. c. In mining,
the resistance
mineral or to be penetrated by a Knoop
indenter. Long. c. In digging, the resistance
to penetration. Nichols, 3, pp. 3-4. f. The
relative refractoriness of a porcelain enam-
el or frit. ASTM C286-65. g. Relative resist-
ance to scratching or abrasion. ACSB, 2, h. Re-
sistance to scratching or abrasion. The brit-
tle hardness of the mineralogist differs from
Mohs' scale; Brinell scale; Rockwell scale;
and set side by side in cement, for testing
test. Armstrong, 1.

hardened steel. a. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long. b. The Sintered tungsten carbide; used for the
working tip of high-speed cutting tools.
c. A large, smooth, hard metal. a. A metal or an alloy that is
hardened by quenching from or above the
hardening temperature. Fay.

hardness. a. The ability of a material to
resist disintegration or deformation.
b. A term generally applied to
undergo change in form. Shipley.
c. Of minerals, measured
on Mohs' scale according to the crystalline system, or is scratched by other minerals in a series
range of 1 to 10, with 10 being the hardest material or by extreme cementation of sandstone in
spot. Hag. d. A
hardness of carbon steel objects by heat-
ing them to a predetermined temperature
and finishing with a steep cone leading
to the discharge trunnion. The tricone
mill has wedge-shaped liners in the drum
section which turn this into a gentle conic
shape, or is scratched by other minerals in a series
range of hardness and set side by side in cement, for testing
whether the specimen under test scratches
the like. May be designated according to
the article hardened or quenching solu-
tion used, as gear hardener or waterman.

hardness points. a. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.
b. A term sometimes used to mean any
green glass imitation of emerald, espe-
cially those containing imitations of jard-
ins. Also spelled hard mass. Shipley.
c. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.
d. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long.

hard wood. a. A material that is
hardened by quenching from or above the
hardening temperature. Fay.

hard points. Small pieces of minerals of
differing hardness, with one end pointed
of the tank. It is used for processing
chemical, metallurgical, and coal-wash-
ing slurries. Nelson.

hard kiln. a. A kiln driven at a tem-
pature between that of the enamel and
the like. May be designated according to
the article hardened or quenching solu-
tion used, as gear hardener or waterman.

hard lead. Metal in which the high degree of
malleability characteristic of pure lead is
destroyed by the presence of impurities,
of which antimony is the most common.
C.T.D.

hard mass. a. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.
b. A term sometimes used to mean any
green glass imitation of emerald, espe-
cially those containing imitations of jard-
ins. Also spelled hard mass. Shipley.
c. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.

hard quenched. a. A glass hard
quenched. a. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long.

hard grove. a. A hard grove test utilizes a special
grindability mill of the ring-and-ball type,
in which a 50-gram portion of coarsely
rounded stone found especially in coarse
gravel. A niggerhead. Fay. c. In mining,
the resistance
mineral or to be penetrated by a Knoop
indenter. Long. c. In digging, the resistance
to penetration. Nichols, 3, pp. 3-4. f. The
relative refractoriness of a porcelain enam-
el or frit. ASTM C286-65. g. Relative resist-
ance to scratching or abrasion. The brit-
tle hardness of the mineralogist differs from
Mohs' scale; Brinell scale; Rockwell scale;
and set side by side in cement, for testing
whether the specimen under test scratches
the like. May be designated according to
the article hardened or quenching solu-
tion used, as gear hardener or waterman.

hard points. a. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.
b. A term sometimes used to mean any
green glass imitation of emerald, espe-
cially those containing imitations of jard-
ins. Also spelled hard mass. Shipley.
c. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.

hardness. a. The ability of a material to
resist disintegration or deformation.
b. A term generally applied to
undergo change in form. Shipley.
c. Of minerals, measured
on Mohs' scale according to the crystalline system, or is scratched by other minerals in a series
range of 1 to 10, with 10 being the hardest material or by extreme cementation of sandstone in
spot. Hag. d. A
hardness of carbon steel objects by heat-
ing them to a predetermined temperature
and finishing with a steep cone leading
to the discharge trunnion. The tricone
mill has wedge-shaped liners in the drum
section which turn this into a gentle conic
shape, or is scratched by other minerals in a series
range of hardness and set side by side in cement, for testing
whether the specimen under test scratches
the like. May be designated according to
the article hardened or quenching solu-
tion used, as gear hardener or waterman.

hardness points. a. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.
b. A term sometimes used to mean any
green glass imitation of emerald, espe-
cially those containing imitations of jard-
ins. Also spelled hard mass. Shipley.
c. A term generally applied to
an unusual glass, over 6 inches in hard-
ness; also occasionally, but inaccurately,
to synthetic corundum or spinel. Shipley.

hard quenched. a. A glass hard
quenched. a. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long.

hard quenched. a. A glass hard
quenched. a. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long.

hard quenched. a. A glass hard
quenched. a. A metal or an alloy that is
harder and usually more resistant to abra-
sion than the hardest of steels. Long.
hardness points

...and affixed to small handles of wood, metal, or plastic, to be held in hand and used for traverse and point counting, as in rock analysis. A pointed instrument, by its certainty which points will scratch it. Minerals of hardness 10 to 6 are usually used for testing gem stones.

Shipley.

hardness scale. a. The scale by which the hardness of a mineral is determined as compared with the Mohs' Standard. The Mohs' scale is as follows: talc, gypsum, calcite, fluorite, apatite, orthoclase, quartz, topaz, corundum, and diamond. Fay. b. Quantitative units by means of which the relative hardness of minerals and metals can be determined, which for convenience is expressed in Mohs', Knoop, or sclerometer units for minerals and Vickers, Binell, or Rockwell units for metals. Long.

hardness table. Any listing of substances as to their comparative hardness. Shipley.

hardness test. A determination of the relative hardness of a mineral, as made on a specimen, using appropriate hardness-testing apparatus and techniques. See also hardness scale; hardness table; hardness wheel.

hardness wheel. A hand instrument in which hardness points are set as equidistant spokes in a circle, which for convenience is expressed in Mohs', Knoop, or sclerometer units for minerals and Vickers, Binell, or Rockwell units for metals. Long.

hard plating. Chromium plating deposited in hard plating. C.T.D.

hard radiation. Ionizing radiation of short wavelength and high penetration. NCB.

hard rays. Beta rays or gamma rays of great penetrating power. Long.

hard rock. a. Loosely used to distinguish igneous and metamorphic rocks from sedimentary rock. A.G.I. Supp. b. A term used to distinguish between material which can be excavated without blasting (as clays, sands, gravels, etc.) and rock having a strong bonded structure. Pryor, 3.

hard-rock drill. a. A driller who albids for the low amount of footage of borehole drilled by claiming that the rock penetrated one or two thousand feet was unusually hard. Long. b. A miner employed to operate a drill in a mine in which the rocks are so tough or stony that very high pressure is required. Fay.

hard-rock drilling. Drilling done in dense and solid igneous or highly silicified rocks, which can be penetrated economically only by diamond bits, as opposed to that done in soft rocks, which is done by roller or wing-type rotary bits. Long.

hard-rock mines. Solid minerals, as distinguished from oil and gas, especially those solid minerals found in hard rocks. Williams.

hard-rock phosphate. A term used in Florida to designate a hard, massive, close-grained, fine-grained, light-gray phosphate, that shows a large or smaller irregular cavities, that are usually lined with secondary marmaliferous incrustations of phosphate of lime. Fay.

hard-rock mine. A mine in hard rock; especially one difficult to drill, blast, and square up. Hess.

hard-rock miner. A workman competent to mine in hard rock. Usually trained in the use of diamond drills as an expert miner as compared with one fit only to mine in soft rocks. Hess.

hard rock tunnel boring. A comparatively recent technique in which early experiments utilizing a machine called the "Mole" indicated that long-distance drills in hard jasperite at an average rate of 5 feet per hour, and the raise borer approached the goal of a 300-foot 40-inch-diameter raise in 48 hours. Encyclopaedia Britannica. Britannica Book of the Year, 1965, pp. 550-551.

hard seat. See seat rock. A.G.I.

hard solder. A metal which melts at a red heat; used for soldering silver, etc. Fay.

hard soldering. Formerly referred to a process of using materials now called brazing alloys. AS M Glass.

hard sorting. See handpicking. Pryor, 3.

hard way. a. A term used in slate quarrying to describe the third direction at right angles to both slaty cleavage and rift, in which there is no tendency to split. It is known as the hard way and designated locally as the sculp. Bu Mines Bull. 630, 1960, p. 683. b. In granite quarrying, the direction at right angles to both rift and run is called the hard way or head grain. Hess. c. Durian. Tomkeieff, 1954, p. 326. Sometimes called cut-off. Fay.

hard white ore. Georgia bauxite containing in excess of one percent ferric oxide. Fay.

Hardwick conveyor loader head. A dust collector for belt conveyors used at the loading station. The delivery pulley of the main gate conveyor is used to drive a scraper chain. The latter is arranged to run at half the belt speed by means of chains and sprockets, and the scraper chain runs at the bottom of a long hopper to the point where the coal is delivered into the trams. The undersides are collected on the scraper chain after having been released from the belt by means of a snub pulley. The scraper chain is driven by the side of the tram in the direction of travel, and the actions are prevented by means of rubber flaps. Mason, vol. 1, pp. 302-303.

hardy. A square-shanked chisel or fuller for cutting larger or smaller irregular cavities, that are usually lined with secondary mammiferous incrustations of phosphate of lime. Fay.

harkerite. A colorless, vitreous lustrous mineral of the melilite group with one good and two rare cleavages, Ca2O.Zn4Si16O38; from Franklin, N. J. Nelson, p. 86.

haring cell. A four-electrode cell for measurement of electrolyte resistance and electrode polarization during electrolysis. A.S.M. Glass.

hard-rock phosphate. A term used in Florida to designate a hard, massive, close-grained, fine-grained, light-gray phosphate, that shows a large or smaller irregular cavities, that are usually lined with secondary marmaliferous incrustations of phosphate of lime. Fay.

hard-rock mine. A mine in hard rock; especially one difficult to drill, blast, and square up. Hess.

hard-rock miner. A workman competent to mine in hard rock. Usually trained in the use of diamond drills as an expert miner as compared with one fit only to mine in soft rocks. Hess.

hard rock tunnel boring. A comparatively recent technique in which early experiments utilizing a machine called the "Mole" indicated that long-distance drills in hard jasperite at an average rate of 5 feet per hour, and the raise borer approached the goal of a 300-foot 40-inch-diameter raise in 48 hours. Encyclopaedia Britannica. Britannica Book of the Year, 1965, pp. 550-551.

hard seat. See seat rock. A.G.I.

hard solder. A metal which melts at a red heat; used for soldering silver, etc. Fay.

hard soldering. Formerly referred to a process of using materials now called brazing alloys. A.S.M. Glass.

hard sorting. See handpicking. Pryor, 3.

hard way. a. A term used in slate quarrying to describe the third direction at right angles to both slaty cleavage and rift, in which there is no tendency to split. It is known as the hard way and designated locally as the sculp. Bu Mines Bull. 630, 1960, p. 683. b. In granite quarrying, the direction at right angles to both rift and run is called the hard way or head grain. Hess. c. Durian. Tomkeieff, 1954, p. 326. Sometimes called cut-off. Fay.

hard white ore. Georgia bauxite containing in excess of one percent ferric oxide. Fay.

Hardwick conveyor loader head. A dust collector for belt conveyors used at the loading station. The delivery pulley of the main gate conveyor is used to drive a scraper chain. The latter is arranged to run at half the belt speed by means of chains and sprockets, and the scraper chain runs at the bottom of a long hopper to the point where the coal is delivered into the trams. The undersides are collected on the scraper chain after having been released from the belt by means of a snub pulley. hardy. A square-shanked chisel or fuller for cutting larger or smaller irregular cavities, that are usually lined with secondary marmaliferous incrustations of phosphate of lime. Fay.

harkerite. A colorless, vitreous lustrous mineral of the melilite group with one good and two rare cleavages, Ca2O.Zn4Si16O38; from Franklin, N. J. Nelson, p. 86.

haring cell. A four-electrode cell for measurement of electrolyte resistance and electrode polarization during electrolysis. A.S.M. Glass.
harkerite

529

brite group with complex and variable composition. Its formula is Ba(AlSiO₃).5H₂O. Mohs' hardness, 4.7-5.0; specific gravity, 2.45. The crystals are white and translucent. 

Dana 17.

harpoth. A cross-cutting (igneous) body of sickle shape. A harpolith is assumed to have been injected into previously deformed beds of dolomite. Holmes then had the latter to have been stretched horizontally in the direction of maximum (mountain-making) displacement. Thus, the tunnel channel is typically situated beneath one edge of the sickle after this has been ex- pressed by erosion. Stokes and Vernet, 1925.

harpooen log. A log which consists essentially of a rotator and distance registering device combined in a single unit, which is towed through the water. It has been largely re- placed by the taffrail log, which is similar except that the registering device is located at the taffrail, with only the rotator in the water. HBG 8C.

harry. a. Harpoon. To rob; to take all the coal that can conveniently be mined with- out attempting to systematically remove the whole. b. Rapid chipping of harry; to strip; to depop; to rob. Fay.

harrow. Trammers, putters, or drawers em- ployed to carry away the dirt from the working face. They may help load the trucks. C T D.

Harris process. Process for the removal of silver which is removed in a sub- sequent desilvering operation. CCD 6d, 1934.

Hartmann log. A log which consists of a rotator and distance registering device combined in a single unit, which is towed through the water. It has been largely re- placed by the taffrail log, which is similar except that the registering device is located at the taffrail, with only the rotator in the water. HBG 8C.

Hartmann lines. The same as Laden lines. A.S.M. Gloss.

Hartza salt, a mixture of sylvite and kieserite, with some anhydrite, found in the Staufs salt deposits. Kaufmann.

Hartshofer. A strongly bonded and partly silicious rock; associated with other rocks of mylonitic habit, in which the alternating bands have been produced from ultramy- lonite by recrystallization and metamorphic differentiation. Holmes, 1928.

Harvard brick. A term originally applied to clear, red, common brick, which were over- burned, and especially so on one end or side, so that these harder burned parts were bluish-black. The name is more loosely used nowadays. Fay.

Harrylene. To subject the face of a steel plat- te to a process of cementation in which the carbon in that portion of the plate, producing a plate with a comparatively soft front face and a very hard back face. Fay.

Harveyize. To subject the face of a steel plat- te to a process of cementation in which the carbon in that portion of the plate, producing a plate with a comparatively soft front face and a very hard back face. Fay.

Harsite. A type of joint for glass pipes designed by William Hassall in the late 19th century. Bitumen rings are attached to the outside of the glasses, opposite the top of the socket of the fired pipe; a thin smear of cement is rubbed around these rings just before the pipes are laid, the spigot of one pipe then being pushed into the socket of the next. Liquid cement is finally poured
Hassall joint

through holes in the socket to complete the joint. Dodd.

hassock. A. A flat, large horse trolley, 12 ft. or more in depth. The鲍

hassock英格。Soft carbonaceous sandstone. Ark.

hassock bedding; hassock structure. See con

volute bedding. Pattijan.

hassock structure. See hassock bedding.

hassoon; hassing. Scot. A vertical gutter between water rings in a shaft. See also ASA MTAI-1958.

hasson deal. Scot. A cover for a hasson. Fay.

Hastings beds. A series of clay and sand deposits in the Lower Cretaceous of southeast England, the Fairlight Clays on the base of these deposits have been used for brickmaking near Hastings and Bexhill. Dodd.

hastellite. A member of the hornblende series, CaNaMgAl₂SiO₇(OH,F); monoclinc. Dana 17.

hatch. Brit. A door or gate. Webster 2d. b. A stroke or line used in engraving or drawing to give the effect of shading. Webster 3d.

hatch conveyer. Any of several types of conveyors adapted to loading or unloading bulk materials, packages, or objects to or from ships or barges. See also belt conveyor; slat conveyor; portable conveyor.

hatchettime. Surname for hatchettie. Fay.

hatchettie; hatchettie. A yellowish-white, water-soluble, hydrate of bismuth with the approximate composition, Bi₂O₃·H₂O; usually found inside septarian nodules and geodes. It melts at 46°C, is sparingly soluble in boiling alcohol and cold ether, and is soluble in hot water. Dana 17. See also geodes. It melts at 46°C, is sparingly sol-

hatch hammer. A black variety of bismuth rich in ferrous iron. A member of the mica group. Inner, 1955.

hast. a. The distance from the coal face to pit bottom or surface, in drift mining; the distance quarried or extracted products must be moved to the treatment plant or construction site; the distance from the shaft or elevator pit to the haulage face. Nichols. d. To pull along the level by animals or mechanical means. C.T.D. c. Average haul--the average distance a grading material is hauled; as, 1 long or a short haul. Standard, 1956. f. The distance over which anything is hauled; as, 1 long or a short haul. Standard, 1956.

hastabout. A steel barge with large hatchways and coal transporters used for coaling ships. Webster 3d.

hanging. a. The drawing or conveying, in cars or otherwise, or movement of men, supplies, ore and waste both underground and on the surface. Pat, 195. b. In dividing the transportation system according to the area served there is: (1) primary or face haulage; (2) secondary haulage; and (3) main-line haulage. Kentucky, p. 210. See also intermediate haulage; relay haulage; locomotive haulage; underground haulage. c. Applied generally to truck mining as opposed to conveyor mining, although both conveyor systems are sometimes referred to as belt haulage. B.C.T. d. The system of haulage coal out of a mine. Tonsor, c. S. Afr. A drive used for mechanical transport. Berman.

haulage boss. In bituminous coal mining, a foreman who supervises mine haulage operations underground or at the surface. D.O.T. 1.

haulage brake. See brake. Nelson.

haulage cars. Rail haulage cars for surface or mine shaft operations are used to carry ore and equipment to and from the digging site. There are several types of self-propelled, and include dump cars, flat cars, personnel cars, etc. Beis, 372.

haulage distance. a. The average distance a grading material is used in haulage in and inside the orebody. The usual type attains the grasp on the rope by means of two jaws which may be tightened by either a screw or a lever movement. The con-

haulage clip. a. A device to effect a secure attachment of tug to the haulage top, chiefly with endless rope haulage. The usual type contains the rope on the rope by two jaws which may be tightened by either a screw or a lever movement. The con-

haul distance. The distance measured along the center line or most direct practical
haul distance

route between the center of the mass of excavation and the center of mass of the fill as finally placed. It is the distance from the center of mass of the fill to the center of mass of the fill as finally placed.

haulier. Same as driver. Fay.

haulier. A mine worker who drives a horse pulling a haul road. A road built to carry loaded trucks from the point on the slope haulage or pit bottom and returns with the empty trams. Also called pony driver. Nelson.

haulage. The drawing or conveying of the product of the mine from the working places to the bottom of the hoisting shaft, or slope. Zena.

hauling engine. An engine employed to move tubs on an underground engine plane. Pelt.

haul. In a shaft built to carry heavily loaded trucks at a good speed. The grade is limited on this type of road to usually less than 7 percent of climb in direction of load movement. Bureau of Mines Staff.

haulage shaft. A portion of an arch which is midway between the backwall and the crown. A.R.I. b. In pipe, the side of the pipe. Nichols.

haul. Coal sold at the pithead. See also land sale. Nelson.

haul. See also land sale. Fay.

haulage DK/51 drilling machine. A machine developed for underground drilling either in the open-pit or for underground exploration. The DK/51 is a compressed-air rotary drill with a 9 horsepower motor which provides a rotational speed of 160 revolutions per minute. Traversing is performed by a 4 horsepower motor driving a central feed spindle. A forward thrust of 6 tons is available also. See also Nord and Grafer IV/6 drilling machine. Nelson.

haul. A mineral, MgO, NaCl, or MgO-

haul. A mineral, MgO, NaCl, or MgO-

haul. A mineral, MgO, NaCl, or MgO-

haul. A mineral, MgO, NaCl, or MgO-

haul. A mineral, MgO, NaCl, or MgO-

haul. A mineral, MgO, NaCl, or MgO-

haulage. A series of closely packed, parallel fibers of crocidolite which impart to it a blue color. In form and sheen, it resembles tigereye. Differs from sapphire quartz, in which fibers are not parallel. Also spelled hawk-eye. See also hawk-eye.

hawse. A local English term for a clay that is crumbling but becomes plastic when worked up with water. Dodd.

hawser. a. Any wire rope used for towing on lake or sea; b. In shipbuilding, wire rope composed of three strands laid up right-handed. Zerm. b. A large rope, varying from 5 to 24 inches in circumference, of 6 to 9 strands being laid up left-handed. Standard, 1964.

hawse. a. Of fiber rope, one with three strands of yarn, twisted left-handed, these strands being laid up right-handed. Priy, 3. b. If wire rope, it is called cable le laid.

hawser. Wire rope usually consisting of 6 strands, 37 wires, and a hemp core, or 6 strands, 24 wires, and 7 hemp cores HBG, p. 130.

Hayden process. A series method of electrolytic refining. Unrefined copper anodes are suspended in an acid electrolyte, one side of each anode acts as an anode and the other as a cathode. Priy, 3.

Hay. Trade name; a lightweight expanded clay aggregate named after inventors, S. J. Hayde.

hayman or haymaker. A term to designate the personnel operating or attending the machine or equipment, when involves either the pulling back, or complete recasting of the waste, usually above and behind the machine, which itself is located on the spoil pile. Austin.

Hay yield projection. This projector can be made at any workshop from a few short pieces of piping and an old oil drum. It may be fixed at an open end, and placed in an open area, capacity placed 12 to 15 yards back from the face of the hard heading. The water at the bottom of the drum is forced down by a pump. The water is added at the rate of 4 ounces to 5 gallons of water. About 2 minutes before firing.

H casing. Air is turned on and ejection of water is in the form of a coarse mist fill the heading. This continues for a period of 6 minutes after the firing. In this manner, the heading is filled with air and a cloud of droplets which outndater the dust particles; the latter are effectively wetted or become attached to the droplets, so result that the dust rapidly settles out of the air. This mist projector has a high efficiency, particularly where the ventilation is low. Mason, r., pp. 305-306.

hawse. A rope made of hay, used in the making of foundry cores. The rope is wrapped around a core bar, then covered with loam, the core forming a mass which is then carried off. Crispin.

hazard. Eng. Ironstone nodules worked for iron in the Weald. Also called balls. Arkell.

H casing. A method for casting liquid metal or steel continuously into rolls for sheet or plate. The steel is poured on the outer surface of a broad steel cylinder of very large diameter (up to 6 meters) which is supported and revolved by a roll turning inside it. The molten steel is carried a short distance to a roller revolving above the ring, which rolls the almost solidified steel into a thin plate or strip. Osborne.

Hazen and William formula. Friction head in pipes is commonly calculated by the formula:

H = \[ \frac{147.85}{C} \times \frac{Q}{X} \] \[ \frac{2.63}{D} \]

where H = friction head in feet per 1,000 feet of pipe
Q = gallons per minute
D = diameter in inches

C = 100 for pipe of 15 years' service handling clear water and is the value generally used; 120 for smooth, new wrought-iron pipe; 90 for 25-year-old ordinary pipe. Levis, pp. 647-648.

Hazen's law. A law relating to the permeability of soils, based on their effective grain size. See also effective size. Ham.

hbm. A core bit manufactured and used in Canada having set inside and outside diameters of 2.875 and 3.875 inches, respectively. The matching reaming shell has an outside diameter of 3.906 inches. Long.

H casing. Flush coupled and/or flush joint casing, made and used in Canada, having a minimum inside diameter of 3-15/16 inches and an outside diameter of 4-5/16 inches. Long.
H drill rod

H drill rod. A Canadian outside-flush-coupled drill rod having an outside diameter of 3/8 inches, the couplings of which have an inside diameter of 1/4 inch.

headage. a. The top portion of a seam in the ground.

header. a. A lift. Fay. 1. A large pipe into which the air is fed or exhausted. Fay. 2. The return of air to the surface. Fay. 3. A large pipe into which air is introduced. Fay. 4. A large pipe into which air is exhausted.

header cable. See hand cable.

header coal. Scot. Formerly, the stratum of a coal next the roof. More usually now, the top portion of a coal seam when left unworked, either permanently or to be afterwards taken down; the top coal on a loaded wagon. Fay.

header end. a. Usually the ultimate delivery end of a conveyor. A M.I.A.-1938. b. That part of a mining belt conveyor which includes the head section, a power unit and, if required, the connecting section. ASA MH4.1-1958. b. The head end of a conveying system. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.

header gear. a. A passage leading from the gangway. The main entry in a coal mine is laid out with the precision of a main avenue in a city. From it at right angles headings run like cross streets, lined on each side with breasts, or chambers. Ker. 1. A mining entrance for driving a heading. Also called heading man. C.T.D. d. Pieces of plank—longer than a step—extending over more of the roof and supported by two props, one at each end. Ricketts. 1. a. A rock that heads off or delays progress. Fay. 1. A blasthole at or above the head. Fay. g. A brick laid in a wall on its largest face with its longest dimension at right angles to the face of the wall. A. R. H. 2. The headframe of a mine shaft. Mason. d. The top portion of a seam in the ground. C.T.D. e. The headframe and its auxiliary machinery. Fay. f. The frame which supports pulleys over a shaft. Hudson. d. The headframe of a mine shaft. Mason. d. The part of a mining machinery apparatus that remains on the surface at the headframe; also, a watergate or floodgate of any apparatus. B. C. I. f. A covered timber framing at the head of a slope into which the shaft guides are continued that carry the cage or elevator. The term is sometimes applied to the structure containing the hoisting engine, boilers, and other machinery, in addition to the actual hoisting cage, etc. Stauffer. b. The house or building that encloses the headframe. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.

header gear. a. A mining heading from the gangway. The main entry in a coal mine is laid out with the precision of a main avenue in a city. From it at right angles headings run like cross streets, lined on each side with breasts, or chambers. Ker. 1. A mining entrance for driving a heading. Also called heading man. C.T.D. d. Pieces of plank—longer than a step—extending over more of the roof and supported by two props, one at each end. Ricketts. 1. a. A rock that heads off or delays progress. Fay. 1. A blasthole at or above the head. Fay. g. A brick laid in a wall on its largest face with its longest dimension at right angles to the face of the wall. A. R. H. 2. The headframe of a mine shaft. Mason. d. The top portion of a seam in the ground. C.T.D. e. The headframe and its auxiliary machinery. Fay. f. The frame which supports pulleys over a shaft. Hudson. d. The headframe of a mine shaft. Mason. d. The part of a mining machinery apparatus that remains on the surface at the headframe; also, a watergate or floodgate of any apparatus. B. C. I. f. A covered timber framing at the head of a slope into which the shaft guides are continued that carry the cage or elevator. The term is sometimes applied to the structure containing the hoisting engine, boilers, and other machinery, in addition to the actual hoisting cage, etc. Stauffer. b. The house or building that encloses the headframe. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.

heading. a. A mining heading from the gangway. The main entry in a coal mine is laid out with the precision of a main avenue in a city. From it at right angles headings run like cross streets, lined on each side with breasts, or chambers. Ker. 1. A mining entrance for driving a heading. Also called heading man. C.T.D. d. Pieces of plank—longer than a step—extending over more of the roof and supported by two props, one at each end. Ricketts. 1. a. A rock that heads off or delays progress. Fay. 1. A blasthole at or above the head. Fay. g. A brick laid in a wall on its largest face with its longest dimension at right angles to the face of the wall. A. R. H. 2. The headframe of a mine shaft. Mason. d. The top portion of a seam in the ground. C.T.D. e. The headframe and its auxiliary machinery. Fay. f. The frame which supports pulleys over a shaft. Hudson. d. The headframe of a mine shaft. Mason. d. The part of a mining machinery apparatus that remains on the surface at the headframe; also, a watergate or floodgate of any apparatus. B. C. I. f. A covered timber framing at the head of a slope into which the shaft guides are continued that carry the cage or elevator. The term is sometimes applied to the structure containing the hoisting engine, boilers, and other machinery, in addition to the actual hoisting cage, etc. Stauffer. b. The house or building that encloses the headframe. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.

heading. a. A mining heading from the gangway. The main entry in a coal mine is laid out with the precision of a main avenue in a city. From it at right angles headings run like cross streets, lined on each side with breasts, or chambers. Ker. 1. A mining entrance for driving a heading. Also called heading man. C.T.D. d. Pieces of plank—longer than a step—extending over more of the roof and supported by two props, one at each end. Ricketts. 1. a. A rock that heads off or delays progress. Fay. 1. A blasthole at or above the head. Fay. g. A brick laid in a wall on its largest face with its longest dimension at right angles to the face of the wall. A. R. H. 2. The headframe of a mine shaft. Mason. d. The top portion of a seam in the ground. C.T.D. e. The headframe and its auxiliary machinery. Fay. f. The frame which supports pulleys over a shaft. Hudson. d. The headframe of a mine shaft. Mason. d. The part of a mining machinery apparatus that remains on the surface at the headframe; also, a watergate or floodgate of any apparatus. B. C. I. f. A covered timber framing at the head of a slope into which the shaft guides are continued that carry the cage or elevator. The term is sometimes applied to the structure containing the hoisting engine, boilers, and other machinery, in addition to the actual hoisting cage, etc. Stauffer. b. The house or building that encloses the headframe. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.

headings. a. A passage leading from the gangway. The main entry in a coal mine is laid out with the precision of a main avenue in a city. From it at right angles headings run like cross streets, lined on each side with breasts, or chambers. Ker. 1. A mining entrance for driving a heading. Also called heading man. C.T.D. d. Pieces of plank—longer than a step—extending over more of the roof and supported by two props, one at each end. Ricketts. 1. a. A rock that heads off or delays progress. Fay. 1. A blasthole at or above the head. Fay. g. A brick laid in a wall on its largest face with its longest dimension at right angles to the face of the wall. A. R. H. 2. The headframe of a mine shaft. Mason. d. The top portion of a seam in the ground. C.T.D. e. The headframe and its auxiliary machinery. Fay. f. The frame which supports pulleys over a shaft. Hudson. d. The headframe of a mine shaft. Mason. d. The part of a mining machinery apparatus that remains on the surface at the headframe; also, a watergate or floodgate of any apparatus. B. C. I. f. A covered timber framing at the head of a slope into which the shaft guides are continued that carry the cage or elevator. The term is sometimes applied to the structure containing the hoisting engine, boilers, and other machinery, in addition to the actual hoisting cage, etc. Stauffer. b. The house or building that encloses the headframe. See also gallows frame. Fay. c. Also, the structure on a hillside to control the lowering of coal to the tipple. B.C.I.
heading

headwater erosion

wheel. Long, b. Height between the floor and the roof in a mine opening. Long. heading. In any system of shafting, that rope which is used to pull the loaded transportation device toward the discharge point. In shafting, the hoist rope pulls the loaded scoop from the face to the dumping point. Jones.

headwater erosion. a. The horizontal timber at each side of a rectangular heading which supports the headboard. See also side trees. Han. b. Eng. A piece of wood, on top of a prop, to support the roof. Newcastle coalfield. Fay. c. The cap piece of a heading set. Stauffer. d. Eng. A piece of wood set on a prop. The term cap is sometimes used to indicate the piece of timber placed between the top of a prop and back or girder on a roadway. Also called cap; lid. SMRB, Paper No. 61.

headwork. a. The water up stream from a structure. See also forby Stell. b. A stream. See also forby Stell. c. 1. . .

headwater rights. A term which has been employed to describe undivided interests in mine rails. A.R.I. 1961.

headwall. a. Distance between the drill platform and the bottom of the sheave
headwater erosion

the main stream east back, and as secondarily develop from these, and still others from these, the flat-topped divides are narrowed and more or less slope downwards which the runoff can flow. This extension of the tributaries is accomplished by gnawing back at the upper portions, a process that may be called headwater erosion. A.G.I.

health physics. That branch of radiological science dealing with the study of environmental hazards, including the accumulation of radioactive material within the body. See also N.R.C. Std. 1964, p. 289.

heap. a. N. of Eng. A man who looks after the sorting and cleaning of the coal at the mine mouth. Also called heap-sitter. b. Ark. The cutting of coal parallel to the principal cleat. c. The principal cleat in coal. N. of Eng. Parallel with the main cleavage plane or cleat of the coal. Also called headway course.

health ends. A. A. Newfoundland. The refuse at the pit's mouth. Also called headway ends. C.T.D.

health hazards. The danger to health arising from exposure to ionizing radiation. It may be due to external irradiation or to radiation from radioactive materials within the body, N.C.B.

heating. a. hearing stone. A slate or tile for roofing. b. Ark. The cutting other work done at the face of an entry. Fay.

earth bottom. A furnace bottom soaked in a heating furnace, Bessemer converter. See also section on earth bottom. Fay.

heat balance. a. In furnaces, heat engines, etc., the distribution of the known input of energy (as heat); also, the method of determining, or the graphical or tabular record of such distribution. Bureau of Mines Staff. b. In fluidization roasting, the thermodynamic calculation used to control addition or removal of heat in order to maintain the desired temperature in the reaction vessel. Fay.

heat budget. The total amount of the sun's heat received on the earth during any one year must exactly equal the total amount which is lost from the earth by reflection and radiation into space. The portion reflected by the atmosphere does not affect the earth heat budget. The portion absorbed must balance the long-range radiation into space from the earth's entire system. The portion absorbed into the oceans causes the surface warming critical to the phenomenon of layer depth. Transpiration by crops further extends the distribution of heat. See also heat transport. Fay.

heat capacity. a. Of a substance, heat per unit mass, per degree of rise, required to produce a very small rise in temperature. Bureau of Mines Staff. b. Of a body, heat per unit mass of change in the temperature of the body. Bureau of Mines Staff. c. The quantity of heat necessary to raise the temperature
heat capacity

ture of a system or a substance by 1 degree of temperature, usually expressed in calories per degree centigrade. Compare specific heat. Lowenthal.

heat crack. A pattern of parallel surface cracks that are formed by alternate rapid heating and cooling of the extreme surface material, sometimes due to high thermal gradients and piercing punches. There may be two sets of parallel cracks, one set perpendicular to the other. ASM Gloss.

heat conductor. The oceanic heat receive by conduction through the sea bottom. Since the amount is very small, only 50 to 80 grams per hour. Webster, p. 380.

heat content, rate of change in. Rate of change in heat content or enthalpy of air per unit time. May be sensible, latent, or total. Measured in British th. units. Webster, p. 380.

heat cramps. Painful spasms of the muscles, especially those of the abdomen and limbs, after prolonged exposure to high temperature while engaged in strenuous labor. The cramps may be slight or may be severe enough to cause convulsions. Kentucky, p. 380.

heat-damaged stone. A stone that has been artificially heated to the proper temperature with the intention of improving or completely altering its color. The induced color is permanent in most materials, but may fade, disappear, and be lost in a few years. See also stained stone. Shipley.

heat energy. Energy in the form of heat.

heat engine. A mechanism (as an external-combustion or an internal-combustion engine) for converting heat energy into mechanical energy. Webster 2d.

heater drain. Self-regulating pumps capable of dealing with water at fairly high temperatures and pressures. They are used to return heater condensate to the boiler instead of waste. Sinclair, IV, p. 125.

heat exchanger. Any device that transfers heat from one fluid to another or to the environment. LBL.

heat exhaustion. Collapse from the effect of heat, from the sun, or from other sources. It occurs more often when the humidity is high. The patient is seldom unconscious but may feel weak. The face appears pale and is usually covered with cold perspiration. Kentucky, p. 380.

heat coal. Heat or tough coal. Arkell.

heating. b. A chamber back of a forge in which the air intended for the blast is heated. Standard, 1964.

heating furnace. The furnace in which the blown-out pipes are heated before returning to the blast. Strock, 10.

heating medium. A fluid used for conveying heat from a heat source to heat dissipating devices; includes air, water, and steam. Strock, 10.

heatings. The heat generated before an actual fire occurs. Heatings, or incident fires, are detected in mines by smell and by analysis of air samples. In mines liable to spontaneous combustion, trained officials and workmen employed to detect and deal with heatings and fires and they become expert in these duties. Sinclair, IV, pp. 285-286.

heating surface. That surface in a steam boiler or similar apparatus from which heat passes to the water to be evaporated or heated; the fire surface. Standard, 1964.

heating tendency. The ability of a coal to fire spontaneously. This phenomenon can occur when the air intended for the blast is generated from oxidation reactions in a coal exceeds the heat dissipated. This characteristic varies for different types of coals and even for the same classification but of different origin. R. J. 6221, 1963, p. 2.

heat interlayer. See acclimatization. Roberts, 1, p. 132.

heat of adsorption. Quantity of heat evolved in adsorption of a definite quantity of gas on a bare surface.

heat of absorption. The heat of reaction resulting from the complete burning of a substance and expressed variously (as in calories per gram or per mole, or especially for fuels in British thermal units per pound or per cubic foot). Webster 3d.

heat of combustion. As air passes down shafts and along inclined workings it is compressed. Heat is always generated when air is compressed, and although the reverse process of decompression and cooling takes place as the air ascends the upcast shaft, the net effect is to raise the air temperature underground. Muon, v. 1, p. 191.

heat of crystallization. Heat evolved when unit weight of a salt crystallizes from a large amount of a saturated solution. Osborne.

heat of dilution. The quantity of heat absorbed or evolved upon diluting a solution with water, or upon mixing a strong solution with a weaker solution of the same substance. It is usually expressed as British thermal units per pound, or calories per gram. American Bureau of Standards.

heat of formation. The number of calories absorbed when 1 gram-atomic weight of carbon reacts with 1 gram-molecular weight of oxygen to form 1 gram-molecular weight of carbon dioxide. Neuman, p. 172.

heat of solution. The latent heat required to change a solid to a liquid. MacCracken.

heat of hydration. The quantity of heat required to change a solid substance when a substance takes up water. Osborne.

heat of ionization. The quantity of heat absorbed when a substance (a) is broken up completely into positive and negative ions. Osborne.

heat loss. The energy necessary to break a chemical bond. Osborne.

heat of liquid. The heat necessary to raise the temperature of the liquid material, distinguishing from the heat of vaporization. Strock, 10.

heat of mixture. That quantity of heat evolved when two liquids which do not react together are mixed. It is calculated from the temperature change and the specific heat of the mixture, and expressed in gram-calories per gram of mixture. Osborne.

heat of neutralization. Amount of heat evolved when 1 gram-equivalent of an acid is neutralized by a base. Osborne.

heat of reaction. Amount of energy of heat consumed or liberated in a chemical reaction, as heat of combustion, heat of neutralization, or heat of solution. Hazeltine's Chem. Dict. b. The number of calories of heat absorbed when 1 gram-atomic weight of carbon reacts with 1 gram-molecular weight of oxygen to form 1 gram-molecular weight of carbon dioxide. Neuman, p. 172.

heat of sublimation. The latent heat required to change a solid to a gas. MacCracken.

heat of sublimation. Heat evolved or absorbed when a liquid and a solid surface are in contact. Osborne.

heat pump. A mechanical refrigerating system used for air cooling in the summer and which, when the evaporator and condenser effects are reversed, absorbs heat from the outside air or (water) in winter and raises it to a higher potential so that it also can be used for winter heating. Strock, 10.

heat recuperation. The recovery of heat from waste gases. Fay.

heat-resisting glass. Glass able to withstand high thermal shock, generally because of low-expansion coefficient. ASTM C162-66.

heat-resisting steel. A steel with high resistance to oxidation and moderate strength at high temperature; that is, above 500° C. Alloy steels, of a wide variety of compositions, which usually contain large amounts of one or more of the elements chromium, nickel, or tungsten, are used. C.T.D.

heat-setting refractories. A refractory mortar consisting of 10% to 20% by weight of cement and ground or dust refractory components which develop a bond at a lower temperature than would occur otherwise. American Bureau of Standards.

heat-setting refractories. Compositions of ground refractory materials which require...
heat-setting refractories

relatively high temperatures for the development of an adequate bond, commonly called heat setting.

heat-shock test. Designed to indicate comparative resistance of enamelware to rapid temperature changes (CER-3).

heat sink. Anything that absorbs heat; usually a part of the environment, such as the air, a river, or outer space.

heat-strengthened glass. Sheet glass, cut to size, heated to softening point then quickly air-cooled. A thinned out by blast of cold air. Bennett 72, 1962 Add.

heat table; heat-sickness tablets. Ten-grain compounded vacuum-pan salt tablets, sometimes with dextrose, starch, or other additives to aid in disintegration, for relief of thermoplegia, heat sickness. Kaufmann.

heat-treatment. The horizontal component of the heat-treating machine, automatic. See Gillett. bead treated done. Same as heated stone.

heat-treated. A term sometimes used for the heavy transport. Meteorological phenomena under consideration.

heat transmission coefficient. See coefficient of heat transmission. Stock, 10.

heat transfer. Applied to indivuals whose bodies are constitutionally capable of adapting to sudden changes in heat conditions, as the Eskimo.

heat transmission coefficient. See coefficient of heat transmission. Stock, 10.

heat treatment. The horizontal component of the heat-treating machine, automatic. See Gillett.

heat-treated. A term sometimes used for the heavy transport. Meteorological phenomena under consideration.

heat treatment. The horizontal component of the heat-treating machine, automatic. See Gillett.

heavy. The hollow sound produced when rapped. Pryor, 3.

which the crystals of quartz imbedded in the body of the feldspar resemble Hebrew granite.

heel. A name proposed by Brøgger for certain syenitic rocks that are poor in feldspar but which are described in the same way as granite. A. F. By.

heel of a coal. A designation for certain segments of the mining advance in which the face of the mine is exposed. See also foot wall.

heel tap. An imperfection in which the base or bottom of a bottle is very thick in one area and very thin in another. ASTM C162-66.

heeling. Temporary planting of trees and shrubs. Nichols.

heel tap. A condition of support at the ends of a beam or edge of a plate which prevents displacement of the edge of the neutral surface, but permits rotation in the plane of bending. Compare fixed; supported. Ro.

heeling is. A. Temporary planting of trees and shrubs. Nichols. A prefix used to denote one hundred.

heel of coal. A small body of coal left under a larger body as a support. Fay.

heel tap. An imperfection in which the base or bottom of a bottle is very thick in one area and very thin in another. ASTM C162-66.

heel tap. A condition of support at the ends of a beam or edge of a plate which prevents displacement of the edge of the neutral surface, but permits rotation in the plane of bending. Compare fixed; supported. Ro.

heel tap. A condition of support at the ends of a beam or edge of a plate which prevents displacement of the edge of the neutral surface, but permits rotation in the plane of bending. Compare fixed; supported. Ro.

heeling. Temporary planting of trees and shrubs. Nichols.

heeling is. A. Temporary planting of trees and shrubs. Nichols. A prefix used to denote one hundred.

heel of coal. A small body of coal left under a larger body as a support. Fay.

of inclusions preserved within coarse crystals of minerals. The strings of inclusions are interpreted as relict structures in heterogeneous parallel fabric, either sedimentary or metamorphic that existed prior to growth of the porphyroblasts. A.G.I.

**heliorograph**. An instrument designed to reflect sunlight in flashes so that a survey station can become visible from a distance. **Ham**.

**helium**. a. A whitish to reddish-gray aventureine oligoclase with internal yellowish or reddish firelight reflections. **Helv.** b. Symp. for homogeneous helvite in a specific locality. **Helv**.

heliotrope. A variety of chalcody (crypt-crystalline quartz); deep green, color with utmost greenish-blue, as a deep green. Also called bloodstone. **Helv**.

**helium**. An inert, monatomic (He), colorless, odorless element, the lightest of the rare gases, occurring in the atmosphere of the sun and stars, and constituting about 1 part in 200,000 parts by volume of the earth's atmosphere. Also found in natural gas of the southwestern United States, occurring in the atmosphere of the sun and stars, and constituting about 1 part in 200,000 parts by volume of the earth's atmosphere. Also found in various natural gases by liquefaction processes. Symbol, He; valency, 0; atomic number, 2; atomic weight, 4.0026. C.T.D. Its chief source is the natural gas of the southwestern United States. **Crinn**.

**helium age**. The age of a rock as calculated by substituting into the age equation radioactivity data and a value for all the radioactive helium formed since crystallization, computed from the analyses and helium retentions. **American Journal of Science** v. 239, Aug. 1941, p. 609.

**helium**. b. A diving bell in which the occupants breathe a mixture of oxygen and helium, which enables them to work at great depths. **Ham**.

**helium age**. The value obtained by substituting helium and radioactivity values into the age equation as used in the determination of the age of a rock. **American Journal of Science**, v. 239, Aug. 1941, p. 609.

**helix angle**. Generally, the angle which a helix makes with a plane containing the axis about which the helix is developed. An exception is the case of oblique, worm, and threads where the helix angle is taken from a diametral reference plane rather than an axial plane. **ASM Class**.

**helizitic**. Refers to metamorphic structure characterized by metacrysts consisting of oriented inclusions of earlier schist minerals. A.G.I. **Supp**.

**helix**. a. Large detached cresses; a confused pile. **Arkell**. b. Bare tracts of limestone. **Arkell**.

**helianite**. A very rare, weakly radioactive, monoclinic mineral, Ca (Al, Y) Fe, PO4, OH, Si2O7. Contains crystals with hematite, allanite, and thorite; brown or red in color. **Crasy**. pp. 102-103.

**helianthrite**. Normal nickel carbonate, 2NiCO3.6H2O, occurring with zaratite at the Lord Bracey nickel mine, Harewood, Tasmania. **Hey, M.F., 1961**.

**helium**. a. A hard hat worn for protection from falling objects. An inflatable piece of headgear worn by the operator to avoid inhaling of injurious dust particles during sandblasting operations. **Exem. Dict**.

**helictite**. A pair of similar coxial coils with their distance apart equal to their radius, which permits an accurate calculation of the magnetic field between the coils. Used in calibration of magnetometers. A.G.I.

**helper**. a. Miner's assistant who is not especially trained but who is learning mining work, such as miner's helper, track layer's helper, etc. **Fay**. b. G.C.I.

**helper grades**. A grade on which helper engines are needed to assist road locomotives; for economical operation, a helper grade should be steep enough to utilize the combined capacity of road and helper engines, which may be taken at 90 percent of the sum of the individual locomotive capacities. **Ungurian**, Sec. 2, p. 26.

**helper springs**. A truck rear axle, an upper spring that carries no weight until the regular spring changes shape under load. **Nichols**.

**helper-up**. a. Aust. An assistant to a trammer when the roads are bad. **Fay**. b. See pig tail. D.O.T. 1.

**heliodobe**. An igneous dike rock consisting essentially of albitite and epidote considered primary by some petrologists. **Johannsen**, c. 3, 1927, p. 142.

**helve**. a. Eng. The handle of a pick or mattock. **Helve**. b. A lift hammer for forging blooms. **Fay**.

**helve hammer**. A frame of a mechanically driven trip hammer, formerly used in forging work, such as miner's helper, track layer's helper, etc. **Arkell**.

**helvetian**. Lower middle Miocene. A.G.I. **Supp**.

**helvite**. a. A mineral, complex silicate of beryllium, manganese, and iron. It is the most plentiful potential ore of beryllium but is of low grade. **IN, 1955**.

**hem**. Scot. Grain; second; quartering way; bate; shelling piece. **Arkell**.

**helvite orbitrite**; **albitite**. A brownish-red to earnet-red, transparent to translucent, slydymous manganese arsenite, 6MnO.5A12O3.-3H2O; soon turns black; Mohs' hardness, 3; specific gravity, 3.5 to 3.6; rare; from Nordmark, Sweden. **Larsen**, p. 38.

**hematite**. Another spelling of hematite. **Fay**.

**hematoidite**. Mineral found in various shades of brown to red having 1 perfect cleavage. 8MnO(A1 Mn)O. A1O3. BHO; Mohs' hardness, 3.5 to 3.6; 3.416; from Moss mine, Nordmark, Sweden. **Larsen**, p. 38.

**hematopalmolite**. Synonymous with hematopalmolite. **Spen.slf, 1964**.

**hematolite**. In Greek compounds: signifying half. A.G.I.

**hematocryalline**. a. Those rocks of igneous origin which contain some interstitial glass, in addition to crystalline minerals. Synonymous with holocrystalline. C.M.D.

**hematolinite**. That form in a crystal composed of two parallel dometic planes in the triclinic, orthorhombic, or tetragonal system of crystals in the monoclinic system of crystalization. **Standard**, 1964.

**hematohedral**. a. In crystallography, having a lower grade of symmetry than, and only half as many faces as, the corresponding form of I.G. or normal symmetry for the system. **Fay**. b. Having different properties in opposite direction or on opposite crystal faces. **Fay**.

**hemihedral**. Of, pertaining to, or denoting hemihedrons in which all the octants contain half the whole number of similar planes. **Standard**, 1964.

**hemimorphic**. In crystallography, having no transverse plane of symmetry and no center of symmetry, and composed of forms belonging to only one end of the axis of symmetry. **Fay**.

**hemimorphism**. The development of polar symmetry in minerals, in consequence of which different forms are exhibited at the ends of intergrown crystals. Hemimorphism shows this character in a marked degree. C.M.D.

**hemisenorhodite**. A hydrous zinc silicate, Zn(SiO3)2(OH)2; orthorhombic. Compare calamine. **Dana** 17.

**hemipelagite**. Middle Miocene. A.G.I. **Supp**.

**hemipelagite**. Same as semi pelag. English.

**hemipelagic**. Sharing neritic and pelagic characteristics. A.G.I. **Supp**.

**hemipelagic-oligyal**. Refers to sediments of...
hemipelagie-abyssal

the deep sea that contain terrestrial detritus.

hemipiramida. A form consisting of two pairs of prisms cutting the three axes in the monoclinal system of crystallization. Stan

hemisphere hemites. The temperature at which the height of the specimen is equal to half the base, its shape being approximately hemispherical. B.S. 1016, 1961. Pt. 16.

hemisphered. Brongniart's name, current among the French, for certain dioritic rocks that contain a large amount of calcite, presumably an alteration product. Fay.

hemispheric. Crystals that appear as if composed of two halves of a crystal turned partly round and united. Examples of this structure may often be found infeldspar and certain calcic fayalite. Fay.

hemispherical machines. Machines used for grinding flat surfaces, such as knife blades and tile. Fay.

hemoglobin. An iron-containing protein pigment occurring in the red blood cells and functioning primarily in the transport of oxygen from the lungs to the tissues of the body. Webster 3d.

hemitermite. A black fibrous mineral. CaH2

V2O5·2H2O; from the J.J. mine, Paradise Valley, Montrose County, Colo., and the Eastside mine, San Juan County, New Mex. Hey, M.M., 1964; Fliischer.

Henderson process. The treatment of copper oxide ore containing silver with salt to form chlorides, which are then leached out and precipitated. Henderson originally proposed to precipitate the chlorine in the leach and the leach and precipitation are not original with him. Longmaid and many other metallurgists have modified them in various modifications. Fay.

hemitellurite. A yellow-crystal sulfide with about 22 percent copper and nickel (Cu2FeS3). Minute pyritohedral crystals. Isometric. Probably a mixture of siegenite and pyrite. Formerly called cobaltined-wurtzite. From Munen, Westphalia, Germany. English.

Hennig Parish. Soda ash brucite; used to remove oxides and nonmetallic inclusions in steel manufacturing. Bennett 2d, 1962.

Henry. Unit of electrical induction. With electromotive force of 1 volt and current of 1 ampere. One Henry (1) = 10 electron-magnetic unit. Symbol H. Pryor, 3.

Henry's Law. The mass of a gas dissolved by a given-volume of liquid at a given temperature is proportional to the pressure. The mass dissolved is independent of pressure. Pryor, 3.

hepatic mercurial ore. See hepatic cinnabar. Fay.

hepatica. An amorphous limonite, of a liver-brown color, and containing a small percent age of copper. Fay.

hepatite. A variety of barite, so called from the feathery odor it exhalates when heated. Standard, 1964.

hepplewhite-Grey lamp. This lamp drew its air from the top, the air passing down four tubular pillars into the base, where it was admitted to the flame through a gauze ring. The outlet was through a metal chimney closed by a gauze disc. In the modified design an ordinary gauze was introduced above the conical glass. The lamp was exceptionally safe in high-velocity air currents. Pryor, 3.

heptagonal figure with seven sides and angles. Gordon.

heptahydric. A compound with seven molecules of water. Webster 3d.

heptane. A paraffin hydrocarbon; C7H16; colorless; liquid; melting point, 16.8° C; and specific gravity, 0.68. There are nine paraffins having this formula. The following properties relate to the heptane, which is a constituent of gasoline and resembles hexane in its chemical behavior. C.T.D.

3-heptanol. A liquid; CH3CH2CH(OH)CH3; specific gravity, 0.827; boiling point, 156.2° C; flash point, 140° F. and slightly soluble in water. A solvent for other, a solvent for asphalt and a diluent in coatings, and as intermediates. CCD 6d, 1961.

heptavariant. a. Having a valence of 7. Also heptaphyllite. b. See septavalent. Pryor, 3.

heptane, a. A one-phase current type direct arc furnace common to the three-phase current type with the electrodes spaced sufficiently far apart to prevent arcing between them. Bennett 2d, 1962.

heptane process. See Hall process.

heptane sulfate. Antimony ore with coal to the oxide in a cupola or blast furnace, the volatile trioxide being condensed after leaving the furnace. Bennett 2d, 1962.

heptane. Copper-stained blue and green smithsonite from Albarradon, Mexico. Shipley.

hepburnian. a. A pattern resembling the lateral skeletal configuration of a herring; specifically a pattern (as on a fabric) made up of adjacent rows of parallel lines where any two adjacent rows slope slightly in reverse directions. Webster 3d. b. Two series of reeves that intersect at about 120° along a central line or strip of reeves to prevent arcing between them. Bennett 2d, 1962.

hepburnian furnace. See chevron crossing bed. PETTIJOHN.

hepburnite. A gear in which the teeth slope both ways from the center line of the sprocket. Fay.
herringbone gear

the gear face, as would be the case if two spiral gears, one left hand and one right hand were fastened together; used for heavy work on mining machinery, etc. Grinn.

herringbone marking. See vibration mark; ruled groove; chevron mark. Pettijohn.

herringbone roller conveyor. A roller conveyor consisting of two parallel series of rolls having one or both series skewed. See also roller conveyor. ASA M14.1-1958.

herringbone tiling. Method used in flatishRand stope panels 500 feet to 1,000 feet long for breaking and moving ore. Stope is divided into 20 foot panels, each worked by its own gang. A light tramming system delivers severed rock to a central scraper conveyor. ASA M14.1-1958.

herringbone tiling. A method of setting timber supports in a roadway with a weak roof and strong sides. Arms or struts notched into the sides at parallel with the roadway. The bar is supported by struts notched into the sides at parallel series of rings which contain additionel elements to the carbon, for example, pyridine. Pryor, 3.

heterodyne. The action between two alternating currents of different frequencies in the same circuit; they are alternately additive and subtractive, thus producing two beats; for example, the sum of, and difference between, the two original frequencies. H.T.

heterogeneous. a. Having more than one constituent or phase, thus exhibiting different properties in different portions. Pryor, 3. b. A term used in alloys with structures composed of more than one constituent. Rolfe. c. Unlike in character or quality, structure or composition; consisting of different elements or ingredients of different kinds; not homogeneous. Standard, 1964.

heterogeneous reactor. A nuclear reactor in which the fuel is separate from the moderator and is arranged in discrete bodies, such as fuel elements. Most reactors are heterogeneous. IBL.

heterogeneous substance. A substance out of which any portion taken at random may not have the same composition and properties as every other portion; for example, mixtures.

heterometallic. Relates to deposits, not necessarily, or in part, of unlike metals or metals of different geological provinces. Schieferdecker.

heteromorphic rock. Rocks with idelltiCal or different mineral composition; as, for example, mixtures.

heterotactic. Refers to mineral fabric whose properties in different portions. Pryor, 3.

heterotactous. Irregular; lacking uniformity in stratification or arrangement of parts; heterogeneously arranged. Standard, 1964.

heterotaxial. Refers to strata more or less widely separated, that are not equivalent as to their relative position, in the geological series. Schieferdecker.

heterozoanically. geologically assigned to a type of orbicular rock in which orbicules are formed around different kinds of nuclei. rolley.

heterotomous. Having a cleavage unlike that which is characteristic of the mineral in its ordinary form, as a variety of fieldspar. Standard, 1964.

heterotropical. Relates to synchronous deposits of different geological provinces. Schieferdecker.

heterotonic. See heath. Arkell.

hew. hewn. hewed. a. Scot. A place where coal or other mineral is dug; a pit or seam. Fay. b. A slit with guarded sides; a crag. Standard, 1964. c. An old English term for coal seams or coal workings. Zamkiew, 1954. d. The steep face of a quarry or other excavation (quarry brush); an excavation for coal, originally open; a coal pit; coal seam. Schieferdecker.

heumite. A name proposed by Brøgger for a dike rock composed of minerals too small to be recognized with the eye alone, but which under the microscope, prove to be natrium orthoclase, natrium microcline, barite, baryte, biotite, and in small amount, nepheline, sodalite, and diopside. The accessories are apatite, magnetite, pyrite, and titanite. The silica in two dikes was found to be respectively 47.10 and 48.46. The name was derived from Heum, a small town on Lake Farris, Norway. Fay.

hever. a. Eng. In the Newcastle coalfield, one who undercut the coal with a pick. A coal miner. Fay. b. Eng. A workman employed in getting coal by hand. 3 MR, Paper No. 61, c. N. of Eng. One who may use a hand pick but usually a pneumatic (windy) pick to win coal. Takes out pieces of breaking in or making a nicking, digging out the coal, and filling onto a conveyor belt or into tubs. Schieferdecker.

heverite. A very rare hydrosilicate of vanadium and calcium, CaV2O5·H2O, occurring as slender, orthorhombic crystals in the vanadium deposits of Peru. C.M.D. Hewettite is a deep red, weakly radioactive mineral. Crosby, p. 124, b. Hewettite, Co3V2O7·H2O, (comprising both the hewettite and the metahewettite of Hillebrand. Merwin, and Wright), exists in at least three hydrate forms with n=3, 4, and 5 (probably, and 9. American Mineralogist, v. 40, No. 7-8, July-Aug., 1955, p. 691. Also spelled hewettite.

heverite. a. Eng. In the Newcastle coalfield, undercutting or mining the coal. Fay. b. The dressing of timber by chopping or by breaking from an edged tool. Grinn.

heverite. b. Eng. The sides of a calcer or roasting furnace, from which having been formerly built with hewn stone. Fay.

hexa-. Having 6 atoms or groups. A hexavalent substance can combine with 6 H-atoms or elements to carbon, for example, pyridine. Pryor, 3.
hexagonal. a. A system of solids which have one line of atoms running through the two right angles, but these latter intersect each other at an angle of 60°. Gordon. b. The crystal system enclosed by 6 equal sides of equal length; pointed hexagon if two parallel and equal-length sides are differing from epsomite in containing six molecules of water. Webster 3d. c. Hexagonal. Said of crystals having atoms at the corners of the hexagonal unit cell and at the centers of those rhombic bases, and at the corners of those having atoms at the corners of the hexagonal unit cell. The two sets of atoms are not crystallographically equivalent. Fay.

hexagonal close-packed crystals. Crystals having atoms at the corners of the hexagonal unit cells that are right prisms with rhombic bases, and at the corners of those (not as in (a)) the prisms that are similarly located halves of the hexagonal unit cells. The two sets of atoms are not crystallographically equivalent. Fay.

hexagonal system. In crystallography, that system of crystals in which the faces are referred to four axes—a principal or vertical axis and three lateral axes perpendicular to it. Fay.

hexagon cut. Any style or cut, the outline of which is hexagonal. Called square hexagon if two parallel and equal-length sides are of equal length; pointed hexagon if two parallel and equal-length sides are much longer than others; called oblong hexagon if those sides are but slightly longer than the others. Fay.

hexagonalite. Pink tremolite; contains a little manganese. Hess.

hexabedrite. A group name for those iron meteorites which have a cubic cleavage and which, on being etched, reveal a system of fine lines (Nau mann lines) due to twinning parallel to the octahedral faces. Holmes, 1920.

hexabedron. In crystallography, a form in the isometric system enclosed by six faces each perpendicular to an axis; a cube. Fay.

hexahydrite. A chemical compound with 6 molecules of water. Webster 3d.

hexahydrite. A white or greenish-white hydrous sulfate of magnesium, MgSO₄·6H₂O, differing from epsomite in containing six molecules of water instead of seven. Thick tabular crystals; also, columnar and fibrous. Monoclinic. From Orroville, Wash.; Littleport District, British Columbia; Crimea, U.S.S.R. English.

hexamethylene; cyclohexane. The bivalent radical (CH₂)₆, derived from normal hexane by the removal of one hydrogen atom from each carbon atom. Web. 2d.

hexane. C₆H₁₄; five compounds have this formula. Normal hexane; colorless; liquid; methanoic acid; pentaerythritol; pentaerythritol. A system of solids which have specific gravity 0.981 (1st) and specific gravity 0.966 (2d) at 20° C. A powerful explosive used in dynamite compositions. Bernds 2d, 1962.

hexamethyldiphosphorane. A mineral. P. Ch. 

hexagonal. a. A system of solids which have one line of atoms running through the two right angles, but these latter intersect each other at an angle of 60°. Gordon. b. The crystal system enclosed by 6 equal sides of equal length; pointed hexagon if two parallel and equal-length sides are differing from epsomite in containing six molecules of water. Webster 3d. c. Hexagonal. Said of crystals having atoms at the corners of the hexagonal unit cells that are right prisms with rhombic bases, and at the corners of those (not as in (a)) the prisms that are similarly located halves of the hexagonal unit cells. The two sets of atoms are not crystallographically equivalent. Fay.

hexagonal close-packed crystals. Crystals having atoms at the corners of the hexagonal unit cells that are right prisms with rhombic bases, and at the corners of those (not as in (a)) the prisms that are similarly located halves of the hexagonal unit cells. The two sets of atoms are not crystallographically equivalent. Fay.

hexahydrite. A chemical compound with 6 molecules of water. Webster 3d.

hexahydrite. A white or greenish-white hydrous sulfate of magnesium, MgSO₄·6H₂O, differing from epsomite in containing six molecules of water instead of seven. Thick tabular crystals; also, columnar and fibrous. Monoclinic. From Orroville, Wash.; Littleport District, British Columbia; Crimea, U.S.S.R. English.

hexamethylene; cyclohexane. The bivalent radical (CH₂)₆, derived from normal hexane by the removal of one hydrogen atom from each carbon atom. Web. 2d.

hexane. C₆H₁₄; five compounds have this formula. Normal hexane; colorless; liquid; methanoic acid; pentaerythritol; pentaerythritol. A system of solids which have specific gravity 0.981 (1st) and specific gravity 0.966 (2d) at 20° C. A powerful explosive used in dynamite compositions. Bernds 2d, 1962.

hexamethyldiphosphorane. A mineral. P. Ch. 

hexagonal. a. A system of solids which have one line of atoms running through the two right angles, but these latter intersect each other at an angle of 60°. Gordon. b. The crystal system enclosed by 6 equal sides of equal length; pointed hexagon if two parallel and equal-length sides are differing from epsomite in containing six molecules of water. Webster 3d. c. A system of solids which have specific gravity 0.981 (1st) and specific gravity 0.966 (2d) at 20° C. A powerful explosive used in dynamite compositions. Bernds 2d, 1962.
high-density metals. The heaviest of the alloy-forming metals, with melting points above that of iron. They are similar to high-pressure compounds and are used in manufacturing and construction.

high-expansion foam. A method of fighting underground fires that involves the formation of a high-expansion combustible foam. Large volumes of the foam are drawn or blown over and around the fire until it can no longer be sustained due to lack of oxygen. This foam is made from a mixture of liquid and water, with the liquid being a high-expansion agent.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion roof. A roof that is designed to expand and contract with changes in temperature and humidity. This is achieved through the use of high-expansion materials.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion silicate. A type of silicate that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the silicate molecules.

high-expansion tile. A type of tile that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the tile materials.

high-expansion wood. A type of wood that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the wood molecules.

high-expansion polymer. A type of polymer that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the polymer molecules.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion foam. A method of fighting underground fires that involves the formation of a high-expansion combustible foam. Large volumes of the foam are drawn or blown over and around the fire until it can no longer be sustained due to lack of oxygen. This foam is made from a mixture of liquid and water, with the liquid being a high-expansion agent.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion tile. A type of tile that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the tile materials.

high-expansion wood. A type of wood that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the wood molecules.

high-expansion polymer. A type of polymer that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the polymer molecules.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion foam. A method of fighting underground fires that involves the formation of a high-expansion combustible foam. Large volumes of the foam are drawn or blown over and around the fire until it can no longer be sustained due to lack of oxygen. This foam is made from a mixture of liquid and water, with the liquid being a high-expansion agent.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion tile. A type of tile that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the tile materials.

high-expansion wood. A type of wood that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the wood molecules.

high-expansion polymer. A type of polymer that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the polymer molecules.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion foam. A method of fighting underground fires that involves the formation of a high-expansion combustible foam. Large volumes of the foam are drawn or blown over and around the fire until it can no longer be sustained due to lack of oxygen. This foam is made from a mixture of liquid and water, with the liquid being a high-expansion agent.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion tile. A type of tile that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the tile materials.

high-expansion wood. A type of wood that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the wood molecules.

high-expansion polymer. A type of polymer that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the polymer molecules.

high-expansion rubber. A type of rubber that expands upon exposure to high temperatures. This expansion is due to the chemical changes that occur in the rubber molecules.

high-expansion concrete. A type of concrete that expands upon hydration due to the addition of a high-expansion agent. This expansion can be up to 50 times the volume of the original mixture.

high-expansion foam. A method of fighting underground fires that involves the formation of a high-expansion combustible foam. Large volumes of the foam are drawn or blown over and around the fire until it can no longer be sustained due to lack of oxygen. This foam is made from a mixture of liquid and water, with the liquid being a high-expansion agent.
Hind effect. The porosity of a dried cast

Hilt's law. A principle which states

Hinjosa topaz. See Williams' hinged-hammer crusher. See Fay.

Hinjosa del Duero, District of Cordova, Spain. Heat-treated to a fiery red-orange color as distinguished from the Madera wine color of the so-called Madera topaz. See also Spanish topaz, Shiplay.

hinaudite. A dark or greenish hydrous sulfate and phosphosphate of lead, aluminum, and strontium, \(2(\text{Pb},\text{Sr})_2\text{O}_3\cdot\text{Al}_2\text{O}_3\cdot6\text{H}_2\text{O}\), coarse and granular. Pseudohomohedral. From Hinshaw County, Colo. English.
Ditch. A miner who cuts places in the coal to mask a bound- arcy slope or plane engaging the clips or grips by means of which mine cars are attached to a hoisting cable or chain used in transporting them between two machines. A machine in which the burning of a coal seam in Spitsber gen takes place. (slushed) to the delivery point. Pryor, 30.

Ditching. Installing hoes in which the teeth or cutting edges are replaced by cutters, and similar tools, where the teeth are not arranged along a helical thread, or are not arranged along a helical thread, used for generating gear teeth or other evenly spaced forms on the periphery of a cylindrical workpiece. The hob and the workpiece are rotated in timed relationship to each other. In a hobbing machine of interior coal, Arkell. A thick soild pared off before cutting peat. Also called hub. Arkell. A pottery bottle oven in which the firemouths projected 18 to 24 inches out of the cages, gave the signals, and operated the break hand. Arkell. A clay pipe burned in the making of thin plas- tic needlelike crystals of calcite Schlier- decker.

Ditchless. A stone set up to mask a bound- ary line; a landmark; specifically, a per- manent monolith. Standard, 1964.

Ditchless. The name applied to the work- piece in which the teeth are not arranged along a helical thread, or are not arranged along a helical thread, used for generating gear teeth or other evenly spaced forms on the periphery of a cylindrical workpiece. The hob and the workpiece are rotated in timed relationship to each other. Hobbing machine of interior coal, Arkell. A thick soild pared off before cutting peat. Also called hub. Arkell. A pottery bottle oven in which the firemouths projected 18 to 24 inches out of the cages, gave the signals, and operated the break hand. Arkell. A clay pipe burned in the making of thin plas- tic needlelike crystals of calcite Schlier- decker.

Ditchless number. See transmission number.

Ditchless style guide. A guide containing test documents which are arranged along a helical thread, used for generating gear teeth or other evenly spaced forms on the periphery of a cylindrical workpiece. The hob and the workpiece are rotated in timed relationship to each other. Hobbing machine of interior coal, Arkell. A thick soild pared off before cutting peat. Also called hub. Arkell. A pottery bottle oven in which the firemouths projected 18 to 24 inches out of the cages, gave the signals, and operated the break hand. Arkell. A clay pipe burned in the making of thin plas- tic needlelike crystals of calcite Schlier- decker.

Ditchless transmission number. A number used to identify a particular machine in which the teeth are not arranged along a helical thread, or are not arranged along a helical thread, used for generating gear teeth or other evenly spaced forms on the periphery of a cylindrical workpiece. The hob and the workpiece are rotated in timed relationship to each other. Hobbing machine of interior coal, Arkell. A thick soild pared off before cutting peat. Also called hub. Arkell. A pottery bottle oven in which the firemouths projected 18 to 24 inches out of the cages, gave the signals, and operated the break hand. Arkell. A clay pipe burned in the making of thin plas- tic needlelike crystals of calcite Schlier- decker.

Ditchless transmission number. A number used to identify a particular machine in which the teeth are not arranged along a helical thread, or are not arranged along a helical thread, used for generating gear teeth or other evenly spaced forms on the periphery of a cylindrical workpiece. The hob and the workpiece are rotated in timed relationship to each other. Hobbing machine of interior coal, Arkell. A thick soild pared off before cutting peat. Also called hub. Arkell. A pottery bottle oven in which the firemouths projected 18 to 24 inches out of the cages, gave the signals, and operated the break hand. Arkell. A clay pipe burned in the making of thin plas- tic needlelike crystals of calcite Schlier- decker.

hollowed out of a close-grained, hard, white chalk by hand or machine. 2. a drill or core having a hole through it. 3. a core taken by a core drill. 4. a cavity in the ground. 5. a hole or passage through the solid or surface of a thing. 6. a hollowed-out or hollowing-out instrument. 7. a hollowed-out or hollowing-out apparatus. 8. a hollowed-out or hollowing-out machine. 9. a hollowed-out or hollowing-out tool. 10. a hollowed-out or hollowing-out implement. 11. a hollowed-out or hollowing-out device. 12. a hollowed-out or hollowing-out appliance. 13. a hollowed-out or hollowing-out apparatus. 14. a hollowed-out or hollowing-out mechanism. 15. a hollowed-out or hollowing-out apparatus. 16. a hollowed-out or hollowing-out device. 17. a hollowed-out or hollowing-out apparatus. 18. a hollowed-out or hollowing-out mechanism. 19. a hollowed-out or hollowing-out apparatus. 20. a hollowed-out or hollowing-out device. 21. a hollowed-out or hollowing-out apparatus. 22. a hollowed-out or hollowing-out mechanism. 23. a hollowed-out or hollowing-out apparatus. 24. a hollowed-out or hollowing-out device. 25. a hollowed-out or hollowing-out apparatus. 26. a hollowed-out or hollowing-out mechanism. 27. a hollowed-out or hollowing-out apparatus. 28. a hollowed-out or hollowing-out device. 29. a hollowed-out or hollowing-out apparatus. 30. a hollowed-out or hollowing-out mechanism. 31. a hollowed-out or hollowing-out apparatus. 32. a hollowed-out or hollowing-out device. 33. a hollowed-out or hollowing-out apparatus. 34. a hollowed-out or hollowing-out mechanism. 35. a hollowed-out or hollowing-out apparatus. 36. a hollowed-out or hollowing-out device. 37. a hollowed-out or hollowing-out apparatus. 38. a hollowed-out or hollowing-out mechanism. 39. a hollowed-out or hollowing-out apparatus. 40. a hollowed-out or hollowing-out device. 41. a hollowed-out or hollowing-out apparatus. 42. a hollowed-out or hollowing-out mechanism. 43. a hollowed-out or hollowing-out apparatus. 44. a hollowed-out or hollowing-out device. 45. a hollowed-out or hollowing-out apparatus. 46. a hollowed-out or hollowing-out mechanism. 47. a hollowed-out or hollowing-out apparatus. 48. a hollowed-out or hollowing-out device. 49. a hollowed-out or hollowing-out apparatus. 50. a hollowed-out or hollowing-out mechanism.
The texture in which the constituent minerals are of approximately the same size, a kind of uniformity that is due to recrystallization. Holmes, 1928.

homoeoblastic structure. A metamorphic texture in which the constituent minerals are of the same order of magnitude in size. A.G.I.
A crane hoist, to which a swivel hook is connected, and a different tooth face giving a variation in rake at each spit.

Hood's model. A method of making the eyes of the letters project from a wooden plate, by making the глаз through the plate and then turning the letters around. The technique involved about 100 possible steps, and the result showed the need for improvement.

Computing and measurement such as the measurement of the height of a crane or the measurement of the height of a hook and a crane beam was considered.

Hodgkin's disease. A patient with Hodgkin's disease was treated with a radiotherapy technique consisting of high localized treatments. Hodgkin's disease, often referred to as a chronic inflammatory disease of unknown cause, is characterized by the presence of large, non-specific, nodular masses in the lymph nodes, liver, and spleen.

Hodgkin's disease is caused by a radiation technique consisting of high localized treatments. Hodgkin's disease, often referred to as a chronic inflammatory disease of unknown cause, is characterized by the presence of large, non-specific, nodular masses in the lymph nodes, liver, and spleen.

Hollard's method. A method of making the eyes of the letters project from a wooden plate, by making the глаз through the plate and then turning the letters around. The technique involved about 100 possible steps, and the result showed the need for improvement.

Hood's hook. A hook attached to a train of cable, consisting of a screw or a pulley, which is used to direct the cable to a conveyor, feeder, or chute.

Hook chain. A chain coal sifter built in the United Kingdom was used in a factory in Yorkshire. The chain was designed to handle a large amount of coal and was used in a factory in Yorkshire.

Hookworm. A parasitic nematode of the order Ascarididae. See also Walker (1928).

hookworm, See also Walker (1928).

Hookworm. See also Walker (1928).

hookworm, See also Walker (1928).

Hood's model. A method of making the eyes of the letters project from a wooden plate, by making the глаз through the plate and then turning the letters around. The technique involved about 100 possible steps, and the result showed the need for improvement.

Hodgkin's disease. A patient with Hodgkin's disease was treated with a radiotherapy technique consisting of high localized treatments. Hodgkin's disease, often referred to as a chronic inflammatory disease of unknown cause, is characterized by the presence of large, non-specific, nodular masses in the lymph nodes, liver, and spleen.

hooper

sailing the contents of a wagon. Fay, 1. A place of deposit for coal or ore. Fay. g. Eng. In the Derbyshire coalfield, a dish used by miners to measure ore. It varied from 7 1/2 to 10 ps in different localities. Fay.

hopper barge. A barge which is towed by a tugboat, and which is used to transport dredged material to a dumping ground. Ham.

hopper car. A car for coal, gravel, etc., shaped like a hopper, with an opening to discharge the contents. Standard, 1964.

hopper dredge, self-propelled. A dredge designed as a ship for mobility on the high seas. The dredging equipment sits high above the water on the top deck. The remainder of the vessel consists of bulk-loaded hoppers, into which dredged material is fed, and from which the water is then drained off. Coron, p. 354.

hopperings. In gold washing, gravel retained in the hopper of a cradle. Fay.

hoop. See also radius. Webber 3d, 327. A vessel for measuring ore. Pryor, 3.

horizontal. In geology, any plane parallel to the horizon. Fay. b. As used by some Brit- ish geologists, one or several consecutive beds characterized by a certain fossil or group of fossils; a zone. Fay. c. One of the layers of the soil profile, distinguished principally by its texture, color, structure, and chemical content. See also A-horizon; B-horizon; C-horizon. ASCE P1826, d. An identifiable rock stratum regionally known to contain or be associated with rock containing valuable minerals. Compare marker, a. Long. c. An imaginary border line, such as Long. l. A horizontal layer. Nichols, g. S. Afr. Level of a geographical formation observed at different places. Berman, in surveying, a plane normal to a plumbline at the observer's station. An artificial horizon is a reflecting level surface, such as a bank of mercury. Pryor, 3.

horizontal bedded formation. Any bedded rock formation which is suitable for inclining, and perhaps faulted, coal seams. Main stone headings are driven at opencast coal levels, from the winding shaft to intersect and gain access to the seams to be developed. The stone headings, or hori- zons, are from 100 to 200 yards vertically apart, depending on the seams available and their inclination. The life of each horizon varies from 10 to 30 years. Con- nections between horizons at inbye points are by either shafts or driveways in coal. Also called horizontal mining; con- tinental mining. See also lateral. Nelson.

horizontal auger. A rotary drill usually powered by a petrol engine, for drilling horizon- al blasting holes in quarries and open- cast pits. See also auger. Nelson.

horizontal balance. Much used than the vertical type. It is quite similar to it in construction except that the magnetic needle is approximately verti- cally instead of horizontally. Dobrin, p. 282.

horizontal bedded formation. Any bedded rock formation which is suitable for inclining, and perhaps faulted, coal seams. Main stone headings are driven at opencast coal levels, from the winding shaft to intersect and gain access to the seams to be developed. The stone headings, or hori- zons, are from 100 to 200 yards vertically apart, depending on the seams available and their inclination. The life of each horizon varies from 10 to 30 years. Con- nections between horizons at inbye points are by either shafts or driveways in coal. Also called horizontal mining; con- tinental mining. See also lateral. Nelson.

horizontal bedded formation. Any bedded rock formation which is suitable for inclining, and perhaps faulted, coal seams. Main stone headings are driven at opencast coal levels, from the winding shaft to intersect and gain access to the seams to be developed. The stone headings, or hori- zons, are from 100 to 200 yards vertically apart, depending on the seams available and their inclination. The life of each horizon varies from 10 to 30 years. Con- nections between horizons at inbye points are by either shafts or driveways in coal. Also called horizontal mining; con- tinental mining. See also lateral. Nelson.

horizontal cell tile. A structural masonry tile having cells whose axis is horizontal when placed in the wall. ACGS, 1963.

horizontal circle. The circular horizontal plane of a theodolite, accurately divided so that horizontal angles can be precisely measured. Ham.

horizontal drift. See underhand stoping, a. Fay.

horizontal departure. The amount, expressed in feet or degrees, a borehole has digressed horizontally from the intended target. Long.

horizontal fault. A fault in the earth's crust with no vertical displacement. Webster 3d.

horizontal intertension. The intensity of the horizontal component of the magnetic field in the plane of the magnetic meridian. Hx.

horizontal line. A straight line that is parallel to the horizon or water level. Jones, 2, p. 87.

horizontal-loop methods. Inductive methods in which the coil, that causes the current flow in the earth, is laid horizontally on the ground surface. Schieferdecker.

horizontal magnetometer. Instrument to measure changes in the horizontal com- ponent of magnetic field intensity. Schieferdecker.

horizontal pendulum. Having a mass moving horizontally. Schieferdecker.

horizontal perforation. Having a mass moving horizontally. Schieferdecker.

horizontal paper. An intermittent unit for the production of town gas from coal; it is constructed in a polygon by machines that have been de- veloped to obtain the advantages of low lead room requirement. Mitchell, p. 135.

horizontal plane. The distance measured in the strike of the fault line between the two outcapping parts of a faulted bedding plane. Schie- ferdecker.

horizontal sided,l. See top side- ing and cove caving. Fay.

horizontal siding. See top side- ing (descending). Fay.

horizontal slipping. The movement of the horizontal component of the net slip. A.G.I.

horizontal stoping. A mechanism in which the takeup or movable pulley travels on an approximately horizontal plane. NEMA MBI-1951.

horizontal throw. The heave of a fault. Hux.

horley-sedgley water finder. An instrument used for ascertainment of the amount of water in a tank containing oil. Fay.

horn, a. Derb. A line at an angle of 45° with the face of the coal. Fay. b. Spacing line. c. M. Clean. Hax. d. A spire of bedrock left where cirques have eaten into a mountain from more than one side, so that the bottom is a cirque wall; for example, Matterhorn of the Swiss Alps. Leet.

horobala. A monoclinic amphibole, Ca2Mg3Si2O7(OH)2, color between black and white, through various shades of green, in lining to bluish-green; also dark brown; rarely yellow, pink, rose-red. In part a natural metalis- tite of Ca, iron, magnesiuim, RbO, usually from, also manganese, and thus in general analogous to the pyroxenes. The alkali metals, sulfur and potas- sium, also present, and the rock commonly so with pyroxene. The name of the mineral is prefixed to many rock names. Dana 17; A.G.I.

hornblende. A metallic, dark-yellow, iron- nickel sulfide that is closely related to pyrrhotite, and is found massive. Stan- dard, 1964.

horn blende. A monoclinic amphibole, Ca2Mg3Si2O7(OH)2, color between black and white, through various shades of green, in lining to bluish-green; also dark brown; rarely yellow, pink, rose-red. In part a natural metalis- tite of Ca, iron, magnesiuim, RbO, usually from, also manganese, and thus in general analogous to the pyroxenes. The alkali metals, sulfur and potas- sium, also present, and the rock commonly so with pyroxene. The name of the mineral is prefixed to many rock names. Dana 17; A.G.I.

hornblende granite. A type of granite, usu- ally with small, pink, or rose-colored, lam- inating hornblende as an essential constituent; with decreasing quartz, grades through tonalite into normal diorite. C.M.D.
hornblende jade. A term sometimes used for smaragdite. Shipley.

horn lead. Lead chlorite. Fay.

hornito. A gas-emitting vent on and originating horns; horn in the metal. Fay.

horseflesh. Fibrous carbonate of lime. Arkell.

horn corel. See black coal. Shipley.

hornstone. A fine-grained, nonschistose metamorphic rock resulting from contact metamorphism. Large crystals may be present and can be either porphyroblasts or relic phenocrysts. A.G.I. b. A dense compact rock produced from slate by the contact action of some igneous intrusion, especially granite. Various microscopic minerals are developed in it. Fay.

horseplay. Rough or boisterous play. Webster 2d.

horsepower. A standard unit of power equal to 746 watts in the United States and nearly equivalent to the English gravitational unit of the same name that equals 550 foot-pounds of work per second. Abbot, 1. p. 82.

horsepower applied. See power upon the air. Kentucky, p. 81.

horseshoe. a. A frame or support. Nichols. i. A large block of stone cut from a cow horn and scraped thin; also called a pinch. Long. b. A saw horse or other simple horseplay. Rough or boisterous play. Webster 2d.

horseplay. Rough or boisterous play. Webster 2d.

horsepower. A standard unit of power equal to 746 watts in the United States and nearly equivalent to the English gravitational unit of the same name that equals 550 foot-pounds of work per second. Abbot, 1. p. 82.

horsepower applied. See power upon the air. Kentucky, p. 81.

horseplay. Rough or boisterous play. Webster 2d.

horsepower. A standard unit of power equal to 746 watts in the United States and nearly equivalent to the English gravitational unit of the same name that equals 550 foot-pounds of work per second. Abbot, 1. p. 82.

horsepower applied. See power upon the air. Kentucky, p. 81.

horseplay. Rough or boisterous play. Webster 2d.

horsepower. A standard unit of power equal to 746 watts in the United States and nearly equivalent to the English gravitational unit of the same name that equals 550 foot-pounds of work per second. Abbot, 1. p. 82.
horseshoe flute casts

hot miller

that contains the inclusions of smaller crystals of a different mineral species. Bureau of Mines Staff. Comparative granite.

hot element. A mineral element which is substituted by a trace element in a rock mineral, Schieferdecker.

hose. Ham. A heated floor, usually concrete with imbedded steam pipes, for use in drying refractory brick and shapes. A.R.I.

host rock. The rock of an epigenetic ore deposit. A.G.I.

hot. Applied to a mine or part of a mine that generates methane in considerable quantities. Fay.

hotbed. An area adjacent to the runout point where hot rolled metal is placed to cool. Sometimes called the cooling table. ASM Gloss.

hot blast. Air forced into a furnace after having been heated. Fay.

hot-blast circulating duct. See blast pipe. Dodd.

hot-blast main. A duct, lined with refractory material, through which hot air passes from a hot-blast stove to the blast pipe of a blast furnace. See also hot-blast stove; blast pipe. Dodd.

hot-blast stove. Cowper stove. A unit for heating the air delivered to the tuyères of a blast furnace. It is a cylindrical furnace, about 80 feet high and 20 feet in diameter, lined with fire clay refractories. There is a combustion chamber 20 feet up the side; fire clay checker bricks (usually special shapes known as stove fillings), fill the remainder of the space. The checker bricks are heated by the combustion of blast furnace gas in the combustion chamber and then, on reversal of the direction of gas flow, they deliver heat to incoming air which then passes to the blast furnace tuyères. See also stove fillings. Dodd.

hot-blast system. The plenum system of ventilation. Webster 2d.

hot-carbonate process. A process developed by the U.S. Bureau of Mines in which a hot solution of potassium carbonate is used to absorb impurities from gases and is then regenerated for reuse in a continuous cycle with maximum efficiency and minimum heat loss. Also called hot-potash process; Benfield process. Bureau 4th Mines Staff.

hot-cast process. See opaline.

hot-cell. A heavily shielded enclosure in which radioactive materials can be handled remotely through the use of manipulators and viewed through shielded windows so that there is no danger to personnel. LBL.

hot cement. Cement which retains some of the heat generated during grinding. Taylor.

hot channel. The coolant channel in a nuclear-reactor core with the highest temperature. LBL.

hot-chlorine process. A process developed as a means of producing chlorine from sodium chloride by electrolysis, and suitable for use in the production of chlorine for the manufacture of other chlorine-containing products. LBL.

hot-dip galvanizing. Immersion of iron or steel articles in bath of melted spelter, to produce a zinc coating. Pryor, 3.

hot-dip fluxing. Elongation of wire, tube or rod by drawing it while heated through a constricting orifice. Opposite of cold drawn. Pryor, 3.

hot end. Those manufacturing operations concerned with hot glass, that is, melting, forming, annealing. ASTM C162-66.

hot face. An alternate name for insulating refractory. It generally consists of a refractory base containing a voluminous order, such as vermiculite or diatomaceous earth. Francis, 1963, v. 2, p. 653.

hot floor. A heated floor, usually concrete with imbedded steam pipes, for use in drying refractory brick and shapes, A.R.I.

hot-forming. Working operations such as bending, drawing, forging, piercing, pressing, and heading performed above the recrystallization temperature of the metal. ASM Gloss.

hot-house. A heated building or chamber for drying pottery or other wares; drying room. Standard, 1964.

hot laboratory. A laboratory designed for the safe handling of radioactive materials. Usually contains one or more hot cells. LBL.

hot-laid mixtures. Plant mixes which must be spread and compacted while in a hot condition. Asphaltic concrete is included in this type. API Glossary.

hot-laid type. A bituminous pavement which is mixed and laid in a hot condition, generally above 250° F. This type is the highest type pavement that can be laid. It has greater durability and lower maintenance than any other type. Pit and Quarry, 53rd, Sec. E, p. 70.

hot-metal ladle. A ladle for the transfer of molten iron from a blast furnace to a mixer furnace and from there to a steel furnace; alternatively, the ladle may transfer molten pig iron direct from blast furnace to steel furnace. Such ladles are generally lined with fire clay refractories but for severe conditions high-alumina and basic refractories have been tried with some success. Dodd.

hot-metal mixer. A large holding furnace for molten pig iron. The capacity of these furnaces, which are of the tilting type, is up to 1,400 tons. Hot metal mixers may be used (that is, the pig iron is merely kept molten until it is required for transfer to a steel-making furnace). In either case, the bottom and walls of the furnace are made of magnesium refractories and the roof of silicon refractories. Dodd.

hot mill. To heat metal, then shape it. A.G.S.

hot miller. A tool operated by compressed air, fitted with cutting wheels which mill
the hot cutting edges or rock drill bits to the required angle. See also detachable bit. Nam.

hot mold. The process of forming glassware in uncooled molds. ASTM C162-66.

hot patching. The repair of the refractory lining of a furnace while it is still hot; this is most commonly done by spraying a refractory slurry through a cement gun. See also airborne sealing; spray welding.

hotplate spalling test. A spalling test designed specifically for the testing of silica refractories. Dodd.

hot-potash process. See hot-carbonate process.

hot preparation. See steam tempering. Dodd.

hot-pressing. a. In powder metallurgy, forming products formed by pressing while the mixture is held at an elevated temperature. ASM Gloss.

hot press. b. The technique of forming a heated profile to or in a plunger lift in which the valves or clacks are fixed. Fay.

hot rolling. The passing of hot steel bars through pairs of steel rolls to form rolled-steel sections. The final dimension of the product is approached in stages by adjusting the height of the rolls. This height is controlled by the mill operator. The trend towards automatic control is increasing. The completely automatic mill, in which every operation is performed without human aid, appears to be fast approaching. See also steelworks. Nelson.

hot saw. A circular saw for cutting hot bar iron in small pieces. Fay.

hot-short; red-short. Said of metals that tend to be brittle at temperatures at which hot-working operations are performed, and which can only be worked with difficulty, if at all. C.T.D.

hot-shortness. Embrittlement of steel or wrought-iron when hot, usually due to excessive sulfur content. Pryor, 3.

hot spot. a. A small portion of the furnace that is warmer than the rest. It indicates a thin lining. Fay, b. The zone of a surface of the ingot or casting as inserted into the tip of the mold and is supported at various heights to feed the ingot directly. Bryant.

hot wire anemometer. This instrument is particularly suited to the measurement of very low air velocities and the fluctuating velocities that occur in turbulent flow. Basically, it consists of a wire or wires, usually platinum, supported in a frame and heated electrically. When exposed to an air current the heated wire cools, and as a result its electrical resistance alters. The heated wire forms one arm of a Wheatstone-bridge-type circuit, and measurements of resistance change may be correlated with the velocity of airflow which caused that change. Roberts, I. P. 55.

hot working. Deforming metal plastically at such a temperature and rate that strain hardening does not occur. The low limit of temperature is the recrystallization temperature. ASM Gloss.

hot zone. The area of a continuous furnace where the major amount of heat is supplied. Bryant.

hot miller. 554

hot mold. To roll (metal) while hot or with difficulty, if at all. C.T.D.

hot preparation. See steam tempering. Dodd.

hot-potash process. See hot-carbonate process.

hot preparation. See steam tempering. Dodd.

hot zone. The area of a continuous furnace where the major amount of heat is supplied. Bryant.

hot miller. 554
hugger belt conveyor. Two belt conveyors
Hubbard distributor. A continuous distribu-
ting of a steel open-topped box
huck joint. A joint formed at the apex of
hull. Corn. A mine; a variant of wheal. Fay.
hullite. Partly oxidized material with the composition
huberzkobelite. Particularly oxidized material with the composition
Hugoniot curve. A pressure-volume curve which obeys the Hugoniot
equation.
(huller)kobellite. Partly oxidized material with the composition
Humboldt distributor. A continuous distribu-
ting of a steel open-topped box
Humboldt rotary kiln. A kiln designed for
burning cement; the batch is fed to the kiln at high rate of lead, with consequent economy in fuel consumption. Dodd.
humectant. A term denoting affinity for water,
with stabilizing action on the water con-
tent of an article; thus, a humectant keeps
within a narrow range of the moisture con-
tent fluctuations caused by volatile or
humidity fluctuations. CCD 64, 1961.
humic. Derived from plants, carbonaceous.
Compare bituminous. A.G.I. S. F.
humic acids. a. A name first suggested by
Dobereiner and used by Sprengel as ap-
plied to the brown gelatinous material
participated by mineral acids from an alkali
extract from peat, soil, or other decayed plant materials. Many formulas for
problematic humic acids have been proposed.
Tomkeieff, 1954. b. Any of various complex
organic acids supposed to be the partial
decay of organic matter. An indefi-
nite term of widely varying usage. Humi-
cid acid is generally considered to be an effective
adsorbent, but regarding its acid properties and its role in weathering and soil forma-
tion, opinions differ widely. See also ultins.
A.G.I.
humic canal coal. See pseudocannel coal.
A.G.I.
humic coals. a. A group of coals, including
the ordinary bituminous varieties, which
have been formed from accumulation of
vegetable debris that have maintained their
morphological organization with little de-
cline. The majority of them are banded and have a tendency to develop jointing or
cleat. Chemically, humic coals are charac-
terized by hydrogen varying between 4 and
6 percent. Tomkeieff, 1954. b. Coals in
which the attritus may be composed pre-
dominantly of transparent humic degrada-
tion matter. A.G.I. c. Introduced in 1906
by H. Potonic to describe coals, the original
definition of which has been broadened to include any coal in which the
organic matter is free from carbonized plant remains.
Tomkeieff, 1954. c. A group of bituminous
bituminous coals. The original term of widely varying usage. Humir:
A.G.I. d. A group of bituminous coals; bituminous coals which the attritus may be composed
predominantly of transparent humic degradation matter. A.G.I.
humic degradation matter. Finely commi-
dated degrada-
tion matter. A.G.I. c. Introduced in 1906
by H. Potonic to describe coals, the original
definition of which has been broadened to include any coal in which the
organic matter is free from carbonized plant remains.
Tomkeieff, 1954. c. A group of bituminous

humidifying effect

hour) times the latent heat of vaporization at the evaporating temperature. Strock, 10.

humidity. a. Moisture or dampness; the quantity of moisture in the air. Crispin. b. The condition of the atmosphere with respect to water vapor. When the word humidity is used without a qualifying adjective the relative humidity is usually meant. Humidity may be expressed in many different ways; for example, absolute humidity, mixing ratio, saturation deficit, and specific humidity. A.G.I. See also absolute humidity; relative humidity.

humidity drier. A drier in which the humidity is controlled. ACSG, 1963.

humidity drying. Process of heating in a moisture-saturated atmosphere and then drying after the product becomes hot and the water content is lower.

humidity of air. See absolute humidity.

humidity ratio. See specific humidity. Strock, 10.

humidity test. A test involving exposure of specimens to controlled levels of humidity and temperature. ASM Gloss.

humidostat. An instrument for regulating the humidity. ACSG, 1963.

humidification. As part of coal formation, the growth of peat beds first as bogs with plants at surface, next after these have sunk to the bottom of the swamp and been converted to peat by biological agencies. Peat lignite and coal are sometimes classified as humoliths, in distinction from sapropelites. Pryor, 3.

huminites. In coal, amorphous brown to black substances formed by natural decomposition from vegetable substances, insoluble in alkali carbonates, water and benzol. Hess.

humite. a. A basic fluorossilicate of magnesium, Mg5(SiO4)(F,OH)2, orthorhombic; fraction subconchoidal to uneven; brittle; luster, vitreous to resinous; white, light yellow, honey-yellow to chestnut-brown and garnet, or honey-red, color. Dana 17. b. A term applied by R. Potonic in 1924 to deposits but containing less fat and protein than sapropelic material. Dana, 1924.

huminite group. A group of isomorphous minerals consisting of olivine, chondrodite, humite, and clinohumite, and closely resembling one another in chemical composition, physical properties, and crystallization. Webster 3d.

humiferous screen. Ore screen used to size unincorporated in the form of mounds or hillocks. Fay.

hummocked ice. Ice piled in the forms of mounds or hillocks. Hy.

hummocky. Lumpy, or in small uneven knobs. Fay.

hummocky. Peat derived from humic material and in rank corresponding to sapropelic. Tomkiewicz, 1954.

humulitic. A collective name for humic gels occurring in subbituminous coal, such as: spergulite, zyttava, etc. Tomkiewicz, 1954.

humulitic series. Humic material and coal in order of increasing rank: humopel, humocoll, humonigritite, humonigriffite, humosite. See also sapropellic series. Tomkiewicz, 1954.

humonigriffite. A black bituminous coloring matter found in sediments, such as black chalk, etc. Tomkiewicz, 1954.

humopeelite series. Series of organic and coaly material intermediate between humolith (pseudovolcanic) and the sapropellic series. Tomkiewicz, 1954.

humosite. A microscopical constituent of torbitane; translucent, subisotropic. Tomkiewicz, 1954. See also gelosite; matisoite; retinite.

hump. a. The crest of an anticline. Arkell. b. A large ball of clay centered on the wheel from which several smaller pots are thrown and cut off. ACSG, 1963.

humpfey's spiral. A concentrating device which exploits differences in densities of mixed sands and the relative motion of sludging and centrifugal action. The ore pulp gravitates through a stationary spiral trough with 5 turns (6 for coal treatment) of mean radius 8 inches with a fall per turn of 13 inches. Heavy particles stay on the inside and the lightest ones climb to the outside, and the resulting sands are separated at convenient points. Pryor, 3.

humus coal. a. Coal of an anthracite of varying proportions and of varying thicknesses, associated with semianthracites. A.G.I. b. Amorphous brown to black coal formed from vegetable matter and insoluble under continuous boiling in caustic alkali, also insoluble in water and benzol. Hess.

humus layer. The top portion of the soil that owes its characteristic features to its content of humus, which may be incorporated or unincorporated in the mineral soil. A.G.I.

humus tank. The final settling tank from which sewage effluent is taken to flow toward the nearest stream. Harris.

hundredweight. A weight commonly reckoned including the point of maximum efficiency. Liddell 2d, p. 494.

Hungarian cat's-eye. An inferior greenish cat's-eye obtained in the eastern Carpathians of Hungary, and formerly in Bavaria. No such stone occurs in Hungary. C.M.D.

Hungarian mill. A rotating, grinding mill used in Hungary for removing small portions of gold from quartz by mixing with mercury; one of the many forms of pan amalgamators. Fay.

Hungarian opal. a. A white opal with a fine play of color, found in former Hungary—now Czechoslovakia. Shipley. b. A name widely used by the importing trade for any white opal regardless of where it was found. Shipley.

Hungarian riffs; transverse riffs. Riffs used in unincertainties that are small angle tris or pieces of wood shod with iron. Lewis, p. 386.

hunghire. Delay in a blowing explosion caused by dampness of the powder or by too slow combustion of the fuse. Korson.

hung shot. A shot which does not explode immediately upon detonation or ignition. Zern. See also hangfire. Fay. b. A delayed shot. Hudson.

hung. a. Eng. To sit with the balls of the feet upon the ground and the knees bent, so that the thighs rest on the calves of the leg. This position is said to be uncomfortable for miners from the nature of their underground work. Fay. b. A term used in India for yellowish clay containing concretionary nodules. Fay.

Hunt and Douglas process. Consists in roasting matte carrying copper, lead, gold, and silver at a very high temperature, forming copper sulfate and oxide, but not silver sulfate. This product is leached with dilute sulfuric acid, and the copper precipitated as sulfide by passing SO2 through the solution. The cuprous chloride is then reduced to cuprous oxide by milk of lime, regenerating calcium chloride, and the copper oxide is smelted. Liddell 2d, p. 494.

Hunt continuous filter. A horizontally revolving continuous vacuum filter. It consists of an annular filter belt, usually of triangular wooden slats filled with coarse sands. The vacuum is withdrawn part of the pulp moisture as soon as the bed is formed. A spray then washes it after which the vacuum dries it, and the material is then scraped off. Liddell 2d, p. 391.

hunting. a. Unstable conditions occur with hunting selective forces and lead to the elimination of populations. Hunt and Douglas process. Consists in roasting matte carrying copper, lead, gold, and silver at a very high temperature, forming copper sulfate and oxide, but not silver sulfate. This product is leached with dilute sulfuric acid, and the copper precipitated as sulfide by passing SO2 through the solution. The cuprous chloride is then reduced to cuprous oxide by milk of lime, regenerating calcium chloride, and the copper oxide is smelted. Liddell 2d, p. 494.

Hungarian sinks. A name applied to shallow hollows or large sinks of land, possibly the result of solution of dolomite. Shipley.
hunting

c. A boy who draws %utches. Fay.

d. See also automatic control; integral control; corrective change

hurricane air stemmer. A mechanical device for the rapid stemming of shotholes. It consists of a sand funnel connected by a T-piece to the charge tube, one end of which is provided with a valve and fittings to permit compressed air and the tube is gradually withdrawn as the hole is being filled. Net.

e. See putter, a. Nelson. b. Generally a small train or wagon. C.T.D. c. A cistern or box for washing ore. See also hutch b. A water wheel. See also hurdy-gurdy wheel.

hurricane. a. To clear away (soil) from ore joints. Eng. b. A wheel barrow. Stand.

d. A field name in Hampshire. Arkell.

hurtle. a. A rare, scarlet vermilion to deep cherry-red sulphide of lead, silver, and thallium, Pb(SiAg)2S2As2S. b. A temporary screen or curtain for clearing gas out of a pit. Nelson. c. A car for conveying heavy minerals that pass through the meshes of the screen in a jig. New, p. 69. d. See also automatic control; integral control; corrective change

d. A field name in Hampshire. Arkell.

e. See putter, a. Nelson. b. Generally a small train or wagon. C.T.D.

hurricane drill. A hand auger used to drill boreholes in soft rock or rock material, often used in mining camps. English, as for mineral prospecting. Long.

d. To clear away (soil) from ore joints. Eng.

c. A car for conveying heavy minerals that pass through the meshes of the screen in a jig. New, p. 69.

d. See also automatic control; integral control; corrective change

Huygen's principle. A very general principle which states that every point on the instantaneous position of an advancing phase front (wave front) may be regarded as a source of secondary spherical wavelets. The position of the phase front a moment later is then determined as the envelope of all of the secondary wavelets (ad infinitum). This principle, stated by the Dutch physicist, Christian Huygens (1629-1695), is extremely useful in understanding effects due to refraction, reflection, diffraction, and scattering, of all types of radiation, including sonic radiation, for example, hyalos. Thomas, 1955.

hyaline. A variety of opal (hydrous silica) which occur in clear globular or botryoidal form resembling drops of melted glass. Sandford, 1955.

hyalite. An opaque variety of glass, frequently black, green, brown, red, etc., resembling porcelain, and valuable owing to its strength. Standard, 1964.

hyalo. A prefix added to certain rock names to signify a glassy rock. The term was adopted by Harker (1904) for magmatic rocks formed by the mixing of two compositionally contrasting primary magmas, now it is used more generally to include all igneous rocks formed through the mixing of materials from several sources, as by assimilation of solid igneous rocks by later intrusions from the same source, or by assimilation of country rocks. Synonymous with contaminated rocks in this latter sense. See also hybrid, A.G.I.

hydrolithogenesis. The process by which mineral deposits are formed from magmatic solutions high in water content. Also used for all deposits formed from aqueous solutions whether the waters were magmatic, vadose, or phreatic. Holmes, 1920. See also mineralization.

hydrotropic. Pertaining to substances in a liquid condition; said of substances in a liquid condition; said of substances dissolved in water. A.A.G. 1956.

hydrosol. A highly ferruginous variety of olivine. Fay, 1928.

hydromulicide. A fluoroaluminate of lead, barium, and calcium, approximately Pb, Ba, CaO, 2B2O3, 24SiO2, P2O5, also contains a little BeO, KO, etc.; 25.11 percent PhO, 37.83 percent BaO, 0.39 percent F; vitreous and glassy. Its hardness, 3-3.5; specific gravity, 3.81; from Langban, Sweden. Dana 6d, p. 455.

Hydromulicide. A process used for refining of crude rock materials. These are placed in reinforced concrete tanks lined with asphalt. The nickel anodes are solved electrochemically and the impurities such as copper and iron, pass into a solution. The cathodes are surrounded by bags of closely woven canvas duck, fastened on wooden frames, and pure nickel electrolyte is passed continuously into the mass in order to maintain a higher solution level inside the cathode compartment than outside. By this means, the pure solution flows through the pores of the cathode and is prevented from touching the anode compartment from which the impurities are excluded. The cathode compartment is isolated from the anode compartment by a diaphragm. Nelson, 1904.

Hydromulicide. A method of refining iron ores by electrochemical means; the term was adopted by Harker (1904) for magmatic rocks formed by the mixing of two compositionally contrasting primary magmas, now it is used more generally to include all igneous rocks formed through the mixing of materials from several sources, as by assimilation of solid igneous rocks by later intrusive from the same source, or by assimilation of country rocks. Synonymous with contaminated rocks in this latter sense. See also hybrid, A.G.I.

hydrosol. A highly ferruginous variety of olivine. Fay, 1928.

hydrosol. A process used for refining of crude rock materials. These are placed in reinforced concrete tanks lined with asphalt. The nickel anodes are solved electrochemically and the impurities such as copper and iron, pass into a solution. The cathodes are surrounded by bags of closely woven canvas duck, fastened on wooden frames, and pure nickel electrolyte is passed continuously into the mass in order to maintain a higher solution level inside the cathode compartment than outside. The cathode compartment is isolated from the anode compartment by a diaphragm. Nelson, 1904.

hydrosol. A highly ferruginous variety of olivine. Fay, 1928.

hydrosol. A process used for refining of crude rock materials. These are placed in reinforced concrete tanks lined with asphalt. The nickel anodes are solved electrochemically and the impurities such as copper and iron, pass into a solution. The cathodes are surrounded by bags of closely woven canvas duck, fastened on wooden frames, and pure nickel electrolyte is passed continuously into the mass in order to maintain a higher solution level inside the cathode compartment than outside. By this means, the pure solution flows through the pores of the cathode and is prevented from touching the anode compartment from which the impurities are excluded. The cathode compartment is isolated from the anode compartment by a diaphragm. Nelson, 1904.

b. Also denotes a hydroxide, such as calcium hydrite (hydrated lime). Webster 3d.

c. Hardening or setting under water, as pay or waste by means of water. Austin.

Cover all water in motion, but term is extended to other substance and represented as actually containing water. Webster 3d. b. Also denotes a hydroxide, such as calcium hydrite (hydrated lime). Webster 3d.

Hydrated. Combining water (as in a hydrate); hydrogen. Webster 3d.

Hydrated. Stated oxide. See alumina trihydrate. CDC 64, 1961.

Hydrated. Many substances have the power of combining directly with water to form compounds in which the water is more or less loosely held. These compounds are called hydrated, and, on heating, generally give up their water of hydration or water of crystallization. Cooper.

Hydrated. The process of adding water, or the element or water with another substance. A.G.I. b. Also called hydration. hydrate.

Hydrated. Ion. One surrounded by oriented molecules of water Pryor, 3.

Hydrated. A dry powder obtained by hydrating quicklime with enough water to satisfy its chemical affinity, forming a hydrate due to its chemically combined water. It may be high calcium, magnesium, dolomite, or hydralic. Baynton. Also called slaked burned lime.

Hydration. a. The chemical combination of water with another substance. A.G.I. b. The process of adding water, or the element of water (oxygen and hydrogen combined in the hydroxyl radical), to any substance. Bureau of Mines Staff.

Hydraulic. a. Strictly, having to do with what is in motion, but term is extended to cover all liquids which convey, store, or transport pressure energy to reactants. Pryor, 3. b. To move material—either pay or waste by means of water. Austin.

c. Hardening or setting under water, as pay or waste by means of water. Austin.

d. The chemical combination of water with another substance. A.G.I. b. The process of adding water, or the element of water (oxygen and hydrogen combined in the hydroxyl radical), to any substance. Bureau of Mines Staff.

Hydraulic. The mechanical loosening and removal of materials by the action of water. Austin.

c. Hardening or setting under water, as pay or waste by means of water. Austin.

Hydraulic. The mechanical loosening and removal of materials by the action of water. Austin.

c. Hardening or setting under water, as pay or waste by means of water. Austin.

Hydraulic action. The process of removing soil by hydraulic means. Austin.

c. Hardening or setting under water, as pay or waste by means of water. Austin.

Hydraulic air compressor. One in which water falls down a pipe or shaft, entraining air which is released at the bottom and returned under compression to do useful work; the water leaves the system after rising to a lower escape level. Such air is appreciably lower in oxygen than is ordinary compressed air. Pryor, 3.

Hydraulic blasting. Fracture using a hydraulic pistion operated device used to split c., 7 Pryor, 3.

Hydraulic cartridge. a. A device used in mining to split coal, rock, etc. In blasting 12 small hydraulic rams in the sides of a steel cylinder. Fay. 2. See coal burster. Nelson.

Hydraulic cement. A cement which is capable of binding suitable aggregate into a concrete that can set and harden under water. Nelson.

Hydraulic cementing. A borehole-cementing operation using a downdee cement injection. See also cement injector. Long.

Hydraulic chock. A steel face support structure consisting of one up to four hydraulic legs or uprights. The four-legged chock is mounted in a strong fabricated steel frame with a large head and base plate. In one type, the chock can be set to a load of 11.2 tons to 1,000 pounds per square inch to yield at 120 tons. It is controlled by a central valve system which operates either on the four legs simultaneously or on the front and rear pairs separately. See also self-advancing support. Nelson.

Hydraulic classifier. Tank into which ore is fed steadily and subjected to the sorting effect of a stream of hydraulic water which rises against the rate. Heavier or coarser equal settling particles gravitate down and away via a bottom discharge, while lighter ones are carried up and out. Pryor, 3.

Hydraulic converter. A device used in mining to split coal, rock, etc. In blasting 12 small hydraulic rams in the sides of a steel cylinder. Fay. 2. See coal burster. Nelson.

Hydraulic discharge. The discharge of ground water in the liquid state directly from the zone of saturation upon the land or into a body of surface water. Hydraulic discharge may be divided into discharge through springs, well, infiltration ditches and infiltration tunnels. States and Varnes, 1955.

Hydraulic dredge. a. A dredge that consists of a hull on which is mounted a suction pipe and support, pump with motor and controls, and a discharge line. Commonly used in dredging coal and in providing fill for the creation of land in near shore or low-lying areas. Have been used to mine sodium-carbonate deposits in Canada. Presently, these dredges are operating at depths of about 200 feet below the water level. Metro, p. 249-251, b. A floating pump that sucks up a mixture of water and soil, and usually discharges it on land through pipes. Nichols.

Hydraulic drill. A hand-held or machine-mounted rotary drill for boring shot-firing holes in coal and other material. The drill weighs about 32 pounds. Nelson.

Hydraulic elevator. An arrangement for lifting gravel and sand up to the drainage level. A jet of water is used to create a powerful suction in a hopper and the water and sand are carried up a pipeline and then run down the sluice boxes. This appliance was widely used in various goldfields to the end of the 19th century. Nelson.

Hydraulic engineering. One who handles the engineering works of design, erection, and construction of sewage-disposal plants, waterworks, dams, water-operated power plants, etc. Griswold.

Hydraulic engineering. That branch of engineering chiefly concerned in the design and production of hydraulic machinery, pipelines, pipe lines, etc. C.T.D.

Hydraulic excavation. Excavation by means of a high pressure jet of water, the resulting excavated material being co-conducted through flumes to the desired dumping point. Ham.

Hydraulic extraction. A term which has been given to the processes of excavating and transporting coal or other material by water energy. Also called hydraulic-shipping. Nelson.

Hydraulic feed. A method of imparting longitudinal movement to the drill rods or a diamond or other rotary-type drill by a hydraulic mechanism instead of mechanically by gearing. See also feed cylinder. Long.

Hydraulic fill. b. A general term, for which there is no generally accepted American or international standard. Strefy, 1.

Hydraulic filling. Wasting water material, such as mill tailings and ground waste rock, into stopes with water in order to prevent failure of rock walls and subidence. Problems involved in its use are stoppage preparation, choice and mixing of material, its particle size distribution, wear on pipe, and removal of water which transports the material into the mine. Compressed air may be used to force the water. Lewis, P. 79.

Hydraulic fluid. A fluid supplied for use in hydraulic systems. Low viscosity, low rate of change of viscosity with temperature, and low pour point are desirable characteristics. Hydraulic fluids may be of petroleum or nonpetroleum origin. Ham.

Hydraulic flume transport. The transport of coal, pulp, or mineral by the energy of flowing water in semicircular or rectangular channels. The channel gradient should not be less than 3%. Coal movement in flumes commences at a water velocity of about 3 feet per second in practice, and at a velocity of at least 6 feet per second is arranged. Nelson.

Hydraulic flushing. Synonym for hydraulic stowing. Also called hydraulic sluicing; hydraulic sifting. Nelson.

Hydraulic fracturing. a. Method in which sand, water, and long gas or oil are forced into underground wells under pressure. This pressure splits the petroleum-bearing sandstone, thereby allowing the oil or gas to move towards the wells more freely. Bureau of Mines Staff.

b. A general term, for which there are numerous trade or service names, for the fracturing of rock in an oil or gas

Nelson.
hydraulic fracturing

reservoir by pumping a fluid under high pressure into the well. The purpose is to produce artificial openings in the rock in order to increase permeability. A.G.I. See also fracturing.

hydraulic-fracturing sand. A sound, rounded, light-colored quartz sand free of aggregates and possessing high uniformity in specified size ranges which, when immersed in a suitable carrier and pumped under great pressure into a formation, increases fluid production by generating greater effective permeability. Commonly referred to as Sandrac. AIME, p. 771.

hydraulic friction. A force-resisting flow which is exerted on contact surface between the fluid and its containing channel. It usually includes the normal eddies and crosscurrents attendant upon turbulent flow and is influenced by the roughness characteristic of the boundary surface, moderate curvature, and normal channel variations. When ever possible, the effects of excessive curvature, eddies, impact, obstructions, and pronounced channel changes are segregated from the effects of hydraulic friction. Seeley, 1.

hydraulic giants. Usei for working large placer deposits. They are made in various sizes with nozzles ranging from 2 to 10 inches in diameter. The smaller sizes have a single joint of the universal type; larger sizes have double joints and are ball bearing to lessen the frictional resistance to turning. The upper and lower parts are held together by a bolt called the king bolt. As a safety measure in case the king bolt should break, four hooks hold the two flanges together. When water is under pressure the giants are fitted with special tips or deflectors. By turning these slightly the reaction of the stream of water moves the giant in the opposite direction. Lewis, p. 386. Also called hydraulic monitor.

hydraulic gradient. In a closed conduit, a line joining the elevations to which water could stand in visors. In an open conduit, the hydraulic gradient is the water surface.

hydraulic gradient line. A line joining the points of highest elevation of water in a series of vertical, open pipes rising from a pipeline in which water flows under pressure. Webster 3d. b. Loss of hydraulic head per unit distance of flow. See also critical hydraulic gradient. ASCE P1026, c. The slope of the hydraulic gradient line. The slope of the surface of water flowing in an open conduit. Seeley, 1.

hydraulic gravel-pump mining. Consists of the use of high-pressure water jets to disintegrate ore-bearing ground, together with gravel pumps to elevate the spoil to a transport plant. In mining operations consist of the establishment of the mine hole or padcock. This is achieved by sinking or digging downwards with monitors and removing the spoil by pumping, the pump being lowered as the hole deepens. Institution of Civil Engineers, Symposium on Opencast Mining, Quarrying, and Alluvial Mining, London, 16-19 November 1954, Paper 21, p. 567.

hydraulic mud. A synonym for hydraulic swivel head. Long. b. The height of a fluid column, usually considered as water, which pressure is required to prevent a rise in the amount of pressure being directly propor-

portional to the depth of the fluid standing above the point at which the pressure is +kpn. This pressure may be given in pounds per square inch as simply as the height of the water column in feet or inches. Pure water at 60° F exerts a pressure of 0.434 pounds per square inch for each foot of depth. Long.

hydraulic holding. See hydraulic transport.

hydraulic hose. The flexible hose used to direct a stream of water against a wall or face of drift. Fay.

hydraulic hydrated lime. A chemically impure form of lime with hydraulic properties of varying extent that possesses appreciable amounts of silica, alumina, and usually some iron, chemically combined with much of the lime. It is employed solely for structural purposes. Boynton.

hydraulic jump. The sudden and usually turbulent passage of water from low stage below critical depth to high stage above critical depth during which the velocity passes from supercritical to subcritical. It represents the transition of the condition of the surface curve wherein it tends to become perpendicular to the stream bed. Seeley, 1.

hydraulic jump. Excavating alluvial or other mineral deposits by means of high-pressure water jets. Bureau of Mines Staff. See also hydraulic mining; hydromechanization; monitor.

hydraulic lime. Lime in which a high proportion of the calcium oxide is combined with silica, alumina, and iron oxide. It is made from limestone or chalk, which contains calcareous materials. It will set and harden under water. Fay.

hydraulic limestone. A limestone which contains some silica and alumina (usually as clay) and upon calcination yields a hydraulic cement that will set to form a strong, solidified mass under water. Fay.

hydraulic lead cell. A safety device developed by the U.S. Bureau of Mines for taming pressure changes, thereby warning in advance of bumps. The cells are embossed in the walls and roofs of coal mines. Bureau of Mines Staff.

hydraulic loading. Ratio of amount of silica of coal or other material broken down by water jets along the floor and into flumes. Coal will flow back towards the flume if insufficient water is available and the gradient is not less than 6° to 7° in favor of the flow. Flexible low-pressure hoses (150 to 200 pounds per square inch) are sometimes used to assist in the flushing operations. Nelson.

hydraulic machinery. A borehole-drilling machine on which the bit-feeding mechanism is hydraulically actuated. Long. b. A machine powered by a fluid actuated by the controlled flow of a stream of liquid, such as oil or water under pressure. Long.

hydraulic mean depth. The cross section of water flowing through a channel is divided by the wetted perimeter of the conduit. See also Barnes' formula. Ham.

hydraulic mine. A placer mine worked by means of a stream of water directed against a bank of sand, gravel, or talus; soft rock similarly worked. Hess.

hydraulic mining. Filling a mine with water and material transported by water. Fay.

hydraulic miner. In metal mining, one who tends riffles, sluices, and does other work in connection with the hydraulic placer mining of gold. In this type of mining, gold bearing gravel, usually in a bank, is excavated by the erosive action of a high-pressure stream of water being directed at the bank through a nozzle. The gravel is then forced out of the bank by the jet, and the gravel particles sink and are caught by riffles (sleats) along the sluice bottom. D.O.T. 4.

hydraulic mining. Mining by washing sand and dirt away with water which leaves the desired mineral. MacRaken, b. The process by which a bank of gold-bearing earth and rock is excavated by a jet of water, discharged through the converging nozzle of a pipe under a great pressure, the earth or debris being carried away by the same water, through sluices, and discharged on lower levels into the natural streams and watercourses below, where the gravel or other material of the bank is cemented, or where the bank is composed of masses of pipe clay, it is shattered by blasting with powder. Ricketts, 1. Also used for other ores, earth, anthracite, culm, etc. Made unlawful and prohibited in certain river systems where it obstructs navigation and injures adjoining landowners. Fay. c. In underground hydraulic mining, the extraction of coal by high-velocity water jets, directed at the seam: from a monitor or powerful jet, which can withstand high water pressures. The jets are also used to impel the broken coal along the floor to the point of collection. Nelson.

hydraulic monitor; giant; monitor. A device for directing a high-pressure jet of water, also called a swivel head. Long. b. A device for directing a high-pressure jet of water in hydraulic mining. In a monitoring order the mule is entirely automatic. Nelson.

hydraulic mug. A main (pipe) for collecting and condensing the volatile matter given off in carbonization of coal, in coke ovens, or in the coke ovens. Mersereth, 4th, p. 364.

hydraulic mean depth. The cross section of water flowing through a channel is divided by the wetted perimeter of the conduit. See also Barnes' formula. Ham.

hydraulic oil. A light, nonviscous, neutral,
hydraulic oil

A fluid-resistant oil used as an actuating fluid in hydraulic cylinders or systems.

hydraulic or fluid couplings. A fluid coupling transmits power from the driving member to the driven member through oil. A rotatable coupling, when attached to the drive shaft, throws \( \theta \) directly against a turbine or engine. Fluid couplings permit the use of heavy loads in the engine or the motor. Fluid couplings are particularly advantageous in starting heavy loads since the motor or engine is permitted to run at high efficient speeds while the coupling output shaft gradually accelerates the load to running speed. Pit and Quarry, 53rd, Sec. D, p. 68.

hydraulic permeability. With respect to water, it is the capacity of a rock or a soil to transmit water under pressure. In some rocks and soils, it varies in different directions. Stokes and Warner, 1955.

hydraulic pipe transport. The conveyance of water, coal, or other materials by waterborne material by pipeline. Two such pumps, placed in series, have been used in Trelewis Drift, Wales, to pump out slurry. Pipe transport of materials by water has been used in Trelewis Drift, Wales, to pump out slurry. Pipe transport of material by water has been used in Trelewis Drift, Wales, to pump out slurry. Pipe transport of material by water has been used in Trelewis Drift, Wales, to pump out slurry. Fly and Quarry, 53rd, Sec. D, p. 68.

hydraulic power. The use of pressure oil or soluble oil and water for operating face machines and steel supports. The fluid is supplied by rotary pumps driven by electricity located at points near the face. Hydraulic power has the advantage that the space required is considerably less than that for conventional drills. See also pressure pump.

hydraulic press. A press in which fluid pressure is used to actuate and control the ram movement.

hydraulic pressure. a. The total thrust, expressed in pounds or tons, that the hydraulic-feed mechanism on a drill can impose on a British rock. b. The pressure of the liquid within the hydraulic cylinders, generally expressed in pounds per square inch. Long. b. Synonym for hydraulic head. See also hydraulic head, b. Long.

hydraulic profile. A term applied to the vertical section of the piezometric surface of an aquifer. A.G.I.

hydraulic prop. A prop consisting of two telescoping steel cylinders which are extended by hydraulic pressure which may be provided by a hand-operated pump built into the prop. The prop holds about half a gallon of mineral oil and is fitted with a yoke valve which relieves the pressure when the load exceeds that for which the prop is set. An hydraulic prop enables quicker setting, uniform initial loading, and it can be withdrawn from a remote, safe position. The first hydraulic prop was introduced and used in 1937; today there are more than one million in use. Nelson.

hydraulic prospecting. See costean; hushing. Nelson.

hydraulic radius. A measure of water depth in a channel defined as cross-sectional area of flowing water divided by the length of wetted perimeter, approximates mean depth in a wide channel. A.G.I. See also hydraulic mean depth.

hydraulic reservoir. A device or assembly that forces running water to a higher level by utilizing the kinetic energy of flow, only a small portion of the water being so lifted by the velocity head of a much larger portion when the latter is suddenly checked by the closing of a valve. Webster 3d. b. A device for lifting water by the water hammer produced by checking the flow periodically. See also hydraulic press. C.T.D. d. A device whereby the pressure head produced when a moving column of water is brought to rest is caused to deliver some of the water under pressure. C.T.D.

hydraulic ratio. The weight of a heavy mineral multiplied by 100 and divided by the weight of a hydraulically equivalent light mineral. A.G.I. Supp.

hydraulic refractory cement. A refractory cement containing aluminum hydraulic cement, for example, ciment fondu, so that it sets at room temperature. See also refractory cement. Dodd.

hydraulic stowing pipe. A steel pipe used to stow mine stalling. A.G.I.

hydraulic stowing. The filling of the mine stalling. A.G.I.

hydraulic setting refractories. Compositions of ground refractory materials in which some of the components react chemically with water to form a strong hydraulic bond. These refractories are commonly known as castables. H.W.

hydraulic shovel. A revolving shovel in which drums and cables are replaced by hydraulic rams and/or motors. Nicholls.

hydraulic sluicing. The process of moving materials by water; colloquially, hydraulic picking. See also hydraulic pumph. 1.

hydraulic stowing. The filling of the water in mines by waterborne material by pipeline. See also pneumatic stowing. Nelson.

hydraulic stowing pipe. A steel or iron pipe used for transporting the material in hydraulic stowing. Ordinary pipes wear very rapidly due to the chippings in the water, therefore they are lined with about \( 200 \) inch thick rubber. This lining gives a very much longer life to the pipe. Nelson.

hydraulic swivel. See hydraulic swivel head.

hydraulic swivel head. A Swivel head of a drill machine equipped with hydraulically actuated cylinders and pistons to exert pressure on a drill rod and turn it longitudinally. See also swivel head. Long.

hydraulic theory. A theory of oil and gas migration which suggests that migration is caused by the movement of underground water which carries along oil and gas. A.G.I.

hydraulic transport. Movement of ore by water, flowing through pipe lines. Includes hydraulic hoisting. Pryor, 3. See also pipeline transport.

hydrogen underreamer. An underreamer with cutting tools that can be expanded or retracted by a hydraulically actuated device. See also underreamer. Long.

hydrocarbon valve. A valve controlling the distribution of water in the cylinders of hydraulic elevators, cranes, etc. Cripin.

hydroxyl sulfate; disodium sulfate; diammonium sulfate. White; crystalline; \( \text{NH}_4\text{H}_2\text{SO}_4 \); very soluble in hot water; soluble 1 part in 33 parts of cold water; insoluble in alcohol; stable in storage but contact with alkali or oxidizing agents should be avoided; specific gravity, 1.37; and melting point, 254° C. Used in the analysis of minerals, slags, and fluxes; in the determination of arsenic in metals; and in the separation of polonium from tellurium. CCD 6d, 1961.

hydride. A compound of an element with hydrogen, for example, \( \text{CaH}_2 \) (hydrolith). Pryor, 3.

hydrid-pro. A commercial process for the production of hydrogens by reaction of caustic soda on aluminum. Osborne.

hydro. The term was proposed by K. Arai at the 1955 meeting of the International Committee for Coal Petrology to denote a very common microthinite in Japanese Tertiary coal. It consists mainly of resinite, micrinite, degradinite and exinite. The proportions of these materials may vary very considerably. The greater part of the exinite is generally resinite, associated with sporinite and culinite in varying amounts. Sclerinite may be present in small amounts: micrinite, semisulfinite, and fusinite are extremely rare. On the basis of the maceral content it is possible to distinguish between degradinite-rich hydride (hydride D) and exinite-rich hydride (hydride E). In microscopic analysis only bands having a width of more than 50 microns are recorded as hydride. The density increases with increasing coalification. In hydrides of more than 25 percent volatile matter, the specific gravity is lower, the higher the exinite content. The density of hydride is only slightly different from that of vitrinite; that of pure hydride is somewhat lower than that of the corresponding vitrinite. However, because the exinite component is commonly heavier than vitrinite, the density of the entire hydride is generally higher than that of vitrinite. The strengths vary according to the rank, and is generally higher than that of vitrinite (26 to 45 kilograms per square millimeter). The dull bands of many Japanese Tertiary tuffaceous coals consist largely of hydride and generally occurs alternating with vitrinite as microfine bands, one or the other predominating. IHCP, 1963, part 1.

hydrous. From the Greek hydros, a prefix meaning water or the presence of hydrogen. Webster 3d.

hydrophosphate. An amphibole containing double the amount of water (5.78 percent) required by Warren's formula, \( \text{H}_2\text{O}_6\text{Si}_4\text{Al}_2\text{O}_4 \). Colorless, acicular, resembling tremolite from Montana. Osborne County, England. English.

hydrozoic acid; azomide. A mineral, \( \text{H}_2\text{O}_6\text{Si}_4\text{Al}_2\text{O}_4 \). Molecular weight, 561; colorless; liquid; specific gravity, 1.09 (at 25° C); refers to water at \( 0^\circ \) C; melting point, 37° C; and soluble in water, in
hydrozoic acid; azomide

hydrocyanic acid; hydrogen cyanide; prussic acid. Unstable; volatile; colorless; extremely poisonous; gas or liquid; HCN; soluble in water, in alcohol, and in ether; only slightly dissociated with water; and an odor resembling that of bitter almonds. Formed by decomposing metallic cyanides with hydrochloric acid. Standard, 1964; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-179.

hydrocyanic gas indicator. Depression of an approximately linear sample to enter a graduated test tube filled with a chemical reagent. The presence of hydrocyanic gas changes the reagent from white to blue in color, and the length of dis-coloration is directly proportional to the percentage of the toxic gas present. Bests, p. 586.

hydrodynamics. a. The branch of science dealing with the energy of falling water. Ham.

hydroelectric power. Electrical energy derived from natural or artificial waterfalls. Ham.

hydroelectric scheme. A complete project for water power development which will include the design and construction of a dam, tunnels, spillways, power station intakes, and many other constructional works over a wide area. Ham.

hydroextraction. See hydraulic extraction. Nelson.

hydrofluoric acid; hydrogen fluoride. Colorless; fuming; corrosive; gas or liquid; HF; strong; highly corrosive acid; and soluble in water, in alcohol, in ether, and in benzene. Used in the acidizing (activation) of petroleum reservoirs; reduction (manganesenichrome, tantalum, tin, tungsten), and in pickling and in metal cleaning. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-179.

hydrofluoric acid test. See acid-dip survey. Long.

hydrofluorosilicic acid. See fluorosilicic acid.

hydrofranklinite. See chalcolithite.

hydrogen. a. A diatomic (H2) gaseous element; colorless; odorless; tasteless; flammable; and lighter than any other known substance. Has the lowest density of all metallic and non-metallic properties and a valence of 1. Widely distributed on earth as water, in many minerals, in petroleum, and in living matter. Manufactured by heating water with iron at 100 atmospheres pressure, from water gas, and by the electrolysis of caustic soda solution. Used in the oxygen blowpipe, for filling balloons, in the Haber process for the fixing of nitrogen, and in the hardening of fats (for example, in the manufacture of margarine). Handbook of Chemistry and Physics, 45th ed., 1964, p. A-1, atomic number, 1; atomic weight, 2.0158; and density of gas, 0.0899 gram per liter. Fay; C.T.D. b. H2, lightest of all gases; isomeric when solid; molecular weight, 2.0159; boiling point, -259.14° C; melting point, -252.8° C; specific gravity of liquid, 0.070 (at -252.9° C); and soluble in water and in alcohol. Occurs uncombined in the earth's atmosphere only to the extent of less than one part per million by volume. Water is the most abundant of all elements in the universe; constitutes more than 90 percent of all atoms; and if combined with oxygen is the most massive of all the elements in the universe. All the heavier elements may have been formed from hydrogens and helium and perhaps are still being formed from these two lightest elements. The two rare isotopes of hydrogen are hydrogen 2 (deuterium) and hydrogen 3 (tritium). Deuterium occurs naturally as 0.015 percent of all hydrogen, and tritium is radioactive with a half-life of 12.26 years. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-6, B-114, B-178.

hydrogenation. Form of reduction in which hydrogen, in its gaseous form, is caused to react with a substance in the presence of a catalyst at high pressure. Bennett 2d, 1962.

hydrogenation of coal. See coal liquefaction.

hydrogen bomb. A nuclear weapon that delivers energy largely from nuclear fusion. LIL.

hydrogen bond
hydrogen bond

curring in water, does not require marked ionization. Peyer, 3.

hydrogen bound. existing in a hydrogen atmosphere, usually in a furnace. ASM Gloss.

hydrogen embrittlement. A condition of low ductility in metals resulting from the absorption of hydrogen. ASM Gloss.

hydrogen equivalent. Acidity of an acid as defined by the number of reacting H-atoms per molecule; alkalinity of a base in terms of reacting hydroxyls per molecule. Peyer, 3.

hydrogen fluoride indicator. This instrument utilizes an aspirator bulb to draw air across a filter paper which is impregnated with a chemical reagent. The hydrogen fluoride-reagent reaction produces a pink color which can be compared with color standards. Concentrations can be determined in the range of 0.5 to 5 parts per million (ppm). Besf, p. 386.

hydrogen gas. Prepared by Grabau for an aqueo-chemically precipitated rock (rock salt, gypsum, etc.). A.G.I.

hydrogen bond. The treatment of ores, contain-
centrates, and other metal-bearing materials, wet processes, usually involving the solution of some component, and its subsequent recovery from the solution.

**Hydrometamorphism.** a. Metamorphism of rocks produced by water and heat at low pressure and temperature. Contrasted with pyrometamorphism. Standard, 1964. b. The alteration of rocks by the addition, subtraction, or exchange of material brought or carried in solution by water without the influence of high temperature or pressure. A.G.I.

**Hydrometasomation.** Metasomatic alteration of rocks through hydrothermal agencies. Schiefferdecker.

**Hydrometer.** Long. An instrument used for determining the density or specific gravity of fluids, such as drilling mud or oil, by the principle of buoyancy. The instrument is in the form of a glass tube, which is floated in the fluid and sinks to a greater or lesser depth depending on the density of the fluid, the amount of submergence being indicated by graduations or divisions on the stem of the instrument. These divisions vary according to various systems, and may be marked according to the Baumé or Twaddell specific-gravity system or measurements. See also Marsh的商品名, Bach, specific-gravity hydrometer; Twaddell hydrometer. Long.

**Hydrometric method.** The method employed by the U.S. Bureau of Mines for the determination of the apparent specific gravity of coal and coke. The apparatus employed consists of a brass hydrometer immersed in a galvanized iron cylinder filled with water to a waterline. There are two copper pans on the top of the hydrometer, the upper one being used for weights and the lower pan for the sample. Suspended from the lower pan is an air-tight copper buoy, and below this is a well-perforated brass cage which allows the air to escape freely. This cage carries the sample when it is weighted in water. Kentucky, p. 401.

**Hydrometrolaphograph.** An instrument for determining and recording the quantity of water discharged from a pipe, orifice, etc., in a given time. Osborn.

**Hydrometry.** The measurement and analysis of the flow of water. Selye, 1.

**Hydromics.** See illite.

**Hydromica schist.** A field term that has been used extensively in the Eastern United States for finely micaeous schists in which the micaeous mineral is sericite, paragonite, or some other mineral of similar appearance. Hess.

**Hydrominum ion.** Saturated H-ion, (H₃O)⁺.

**Hydromorphic anomaly.** An anomaly where the dynamic agents are aqueous solutions.

**Hydromorphic soil; ground-water soil.** An intrazonal soil resulting from impeded drainage. The common diagnostic features are: a pale gray to black surface horizon grading sharply into a pale, bluish-gray subsoil often with rusty streaks, mottling, or coarseness. This is known as a "high mica" member of the mica family. Hay, 2d, 1955.

**Hydromut.** Name applied to the sea Tuonftrs concentrates, and other metal-bearing materials by wet processes, usually involving the solution of some component, and its subsequent recovery from the solution. Hay, 2d, 1955.

**Hydrophane.** A variety of common opal, used extensively in the Eastern United States for finely micaceous schists in which the micaceous mineral is phlogopite, or some other mineral of similar appearance. Hess. A member of the mica family from Staszic. It is weighted in water. Fay, 1964.

**Hydrophilic.** Relating to or produced by the joint action of heat and water, resulting in fusion or in crystallization at a lower temperature than by heat alone. Standard, 1964.

**Hydronium jarosite.** A mineral of the jarosite family from Staszic, Holy Cross Mountain, Poland; contains only 0.21 percent sodium, 0.18 percent potassium, and 3 percent iron. The author considers the name carphosiderite inappropriate since A. A. Moss has shown that original carphosiderite and many occurrences subsequently described as carphosiderite are in fact jarosite or natyrojarosite. On the other hand, the name carphosiderite is widely accepted for the artificial material. Hey, M.M., 1961.

**Hydropneumatic.** Relating to or produced by the combined action of water and air or gas. Standard, 1964.

**Hydropneumatic riveter.** A squeezer riveter operated by compressed air and having a piston of two different diameters. Hay, 1964.

**Hydrophane.** A highly hydrated phase than scarboite, Al₂(CO₃)₅.12Al(OH)₃ occurring along with scarboite at South Bay, Scarborough, and dehydration irreversibly on exposure to air. Hey, M.M., 1961.

**Hydroscope.** An instrument for determining moisture, especially in the air. Standard, 1964.

**Hydroseparatar.** Essentially, a shallow tank, usually cylindrical, which is kept agitated by hydraulic water and/or stirring devices. Pulled to the tank is separately discharged as a free-settling fraction containing the coarser and heavier particles and an overflowed fraction containing the finer, lighter material. Pryor, 3.

**Hydrosorptivine.** A mineral, Mg₅Si₇O₁₆(OH)₂, a swelling serpentine. Hey, M.M., 1964.

**Hydrosilica.** A water-laid deposit of pure quartz sandstone with varieties caused by simple admixtures. A.G.I.

**Hydrosol.** A colloidal solution in water. Bateman.

**Hydrosol.** The aqueous envelope of the earth, including the oceans, streams, and underground waters, and the water vapor in the atmosphere. Schiefferdecker.

**Hydrotail.** A contrivance or apparatus to prevent the explosion of steam boilers. Webster 3d.

**Hydrostatic.** Relating to pressure or equilbrium of fluids. Nichols.

**Hydrostatic balance.** A balance for weighing substances in water to ascertain its specific gravity. Webster 3d.

**Hydrostatic head.** The pressure exerted by a column of fluid usually expressed in pounds per square inch. Brantly, 1.

**Hydrostatic joint.** Used in large water mains, in which the sheet lead is forced tightly into the bell of a pipe by means of the hydrostatic pressure of a liquid. Strock, 3.

**Hydrostatic pressure.** A large ram, the surface of which is acted on by liquid in contact with a small ram. See also hydraulic jack. Ham.

**Hydrostatic pressure.** a. The pressure of, or corresponding to, the weight of a column of water at rest. Bateman. b. The pressure in a liquid under static conditions; the product of the unit weight of the liquid and the difference in elevation between the two surfaces, one being the free-water elevation. See also excess hydrostatic pressure; hydraulic excess pressure. ASCE P1826.

**Hydrostatic roller conveyor.** A section of roller conveyor having rolls suitably weighted with liquid to control the velocity of the moving objects. See also rollre
hydrothermal stage. One of the successive hydrothermal solution. A hot-water solution. A mineral deposit that contains water chemically combined. Gordon.

hydrothermal deposit. A mineral deposit that contains water chemically combined. Gordon.

hydrostatic weighing. Weighing of a substance at a constant level of water, as in a reservoir; an electric high and low-water indicator. Standard, 1964.

hydrostatic weighing. Weighing of a substance at a constant level of water, as in a reservoir; an electric high and low-water indicator. Standard, 1964.

hydrostatic tension. Three equal and mutually perpendicular tensile stresses. ASM Gloss.

hydrostatic test. On a boiler, the closing of all openings and pumping water into the boiler at a pressure (such as 50 per cent) greater than the normal operating pressure. The purpose is to locate leaks or prove that there are no leaks. Strock, 1964.

hydrostatic weighing. Weighing of a substance at a constant level of water, as in a reservoir; an electric high and low-water indicator. Standard, 1964.

hydrostatic tension. Three equal and mutually perpendicular tensile stresses. ASM Gloss.

hydrotungstite. A hydrous tungstic oxide, WO₂\(\cdot\)H₂O, similar in appearance but distinct from tungstite (WO₃\cdotH₂O); from Ontario, Bellvitte, Upper Thames River, Ont., 1843.

hydrothermal. A term used to describe processes occurring at high temperatures and pressures, typically at the Earth's crustal levels. ASM Gloss.

hydrothermal fluky, for example, silicification or removal of minerals by means of fluids at rest and then in water. The technique is used to enhance the properties of certain materials, such as rocks or ore deposits, alteration products, and in which they are concerned; and the rocks or ore deposits, alteration products, and springs produced by them. Holmes, 1928.

hydrothermal alteration. The mineralogical changes resulting from the interaction of hydrothermal-stage fluids (hydrothermal solutions) with preexisting minerals, such as the kaolinite of feldspars, etc. Also changes in rocks resulting from the addition or removal of minerals by means of hydrothermal fluid, i.e., for example, silification.

hydrothermal deposit. A mineral deposit that originated from hot, ascending solutions derived from a magma. Schierlärderke.

hydrothermal ore deposits. Those deposited from aqueous solution during the final stages of magma differentiation. Schierlärderke.

hydrothermal stage. One of the successive stages of consolidations of magma during which basic components exude between crystals, aqueous solutions, and aqueous gases. Schierlärderke.

hydrothermal deposits. One of the successive hydrothermal stages of consolidations of magma during which basic components exude between crystals, aqueous solutions, and aqueous gases. Schierlärderke.

hydrothermal water. Water held in the soil in equilibrium with atmospheric water vapor at the ground surface. Stokes and Varnes, 1955.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutically. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutically. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.

hydrotherapeutic. Pertaining to the beneficial effects of heat, particularly in the treatment of diseases. ASM Gloss.
hypersthene. Applied to igneous rocks consisting, wholly or almost entirely, of mafic minerals; color index—90 to 100. A.G.I. Supp.

hypothetical. An iron-nickel magnetic alloy of the Permalloy type containing 50 percent of each metal; it is melted and annealed in hydrogen, which increases the initial and maximum permeabilities. C.T.D.

hyperion. A class of short-lived elementary nuclear particles with masses greater than that of the neutron. L.G.

hypersonic. The change in a rock by the introduction of a new mineral into, or the removal wholly or in part of an old mineral from the original rock mass, for example, dolomitization of limestone. A.G.I.

hyperventilation. A term applied to pumice consisting entirely, or almost entirely, of holinite. Holmes, 1926. b. A feldspar-free rock composed of crystallized minerals and partly of glass; same as hypohyaline. Fay.

hypocrystalline. Partly crystalline; the texture of some igneous rocks which consists partly of crystallized minerals and partly of glass; same as hypohyaline. Fay.

hypsometric map. Any map showing the elevation above sea level by determining the atmospheric pressure through observing the boiling point of water. Standard, 1964.

hypsometric flats. Colors on maps to indicate various elevations. Bureau of Mines Staff.

hypersometry. The art of determining, by any method, surface elevations on the earth with reference to sea level. A.G.I.

hysol. A borosilicate glass of high thermal endurance and chemical resistance used for contact lenses. Dodd.

hypsometry. The art of determining, by any method, surface elevations on the earth with reference to sea level. A.G.I.

hysteretic. a. A lag in the return of an elastically deformed specimen to its original shape after the load has been released. A.G.I. b. An effect, involving energy loss, found to varying degrees in magnetic, electric, and elastic media when they are subjected to variation by a cyclical applied force. In such media the polarization or stress is not a single valued function of the applied force. Bureau of Mines Staff.

hysteresis loop. Entire pattern of hysteresis showing how a body with magnetic susceptibility can remain polarized after the disappearance of the original magnetizing force. Bureau of Mines Staff.

hysteresis loop. Separation by alternating current which depends on magnetic properties of coercive force and remanence. Bureau of Mines Staff.

hysterostatic. Applied to rocks of the series of rocks related to the diabases but differing from them in often having quartz, brown biotite, and brown hornblende, the last mineral sometimes replacing the augite. There may also be some glass. Fay.

hysteresis loop. Proposed by Naumann and applied to minerals in igneous rocks that are the product of secondary crystallization. Obsolete. A.G.I.

hysteromorphic. Applied to secondary deposits due to surface agencies. Fay.
i

657

ice cake. A single, flat unbroken fragment of sea ice of no specific size. A.G.I.

ice cake texture. Rounded and corroded remnants of the earlier ice unit in a later mineral. Schieferdecker.

ice cap. A cover of perennial ice and snow; specifically, a glacier forming on an extensive area of relatively level land, and flowing outward from its center. Webster 3d.

ice cave. a. A pit at the bottom of which snow accumulates and forms ice. Schieferdecker. b. A cavern in which underground glaciers are formed. c. A cave so protected from summer heat that ice remains in it throughout the year or for a long time. Webster 3d.

ice cliff. An abrupt shore of arctic ice, more or less interstratified and covered by earth and vegetation. Standard, 1964. See also ice ledge, Fay.

ice concentration. The percentage of ice cover in a given area of water, usually expressed in tenths. H. Schieferdecker.

ice concrete. A dense frozen mixture of sand, broken aggregate, and water. A.G.I.

ice-contact form. A see, a rounded arctic drift form, such as a kame, a kame terrace, or an esker, deposited in contact with melting sea ice. A.G.I.

ice-contact slope. The fosse. This depression is supposed to mark the resting place of the ice sheet. Pettijohn. A large flat sheet of floating ice. See also ice float. Standard, 1964.

ice crystal beds. A layer of ice crystals. Commonly sand-filled and appearing as straight, slightly raised ridges on base of sandstone beds. Pettijohn.

ice drift. Loose floating ice. Standard, 1964. Leffall. a. A frozen waterfall or similar mass of ice. Webster 3d. b. A falling of ice, as from an iceberg or glacier. Webster 3d.

ice field. A large flat sheet of floating ice. See also ice float. Standard, 1964.

ice floe. A flat free mass of floating ice of usually visible extent larger than a pan and smaller than an ice field; broadly, a large floating fragment of sheet ice. Webster 3d.

ice foot. A wall of ice formed by sea water and frozen from below along the shore in near regions. Also called an ice ledge. Standard, 1964. b. An ice step which is attached to the coast and is not moved by tides. Schieferdecker.

ice-free port. A port in which ice formations sufficient to interfere with navigation in the harbor or the terminals have not been recorded. Hy.

ice front. a. A frozen waterfall or similar mass of ice. Webster 3d. b. A falling of ice, as from an iceberg or glacier. Webster 3d.

ice ledge. A mass of ice floating on the surface of the water. Webster 3d.

ice mark

Ice mill. A place where a glacier abrades the underlying rock through the action of rub-

Ice no. A large area of floating ice floes.

MacCracken.

Ice pedestal. A glacier table. A.G.I.

Ice period. The time between first appearance

and final clearance of ice during any year. Hy.

Ice pillar. A pedestal of ice on a glacier, sup-

porting a broader piece of rock, which has

Ice plug. An ice obstruction formed by a cir-

culating medium freezing inside the drill-

rod couplings while the rods are racked

up or standing. Standard, 1964.

Icequake. The concussion

producing high above-glacial névé, and extending

upwards toward the higher mountain peaks. Standard, 1964.

Ice rock. See ice foot. Fay.

Ice wool. Abridged by ice; specifically, rubbed,

Idenite. A fossil footprint. Synonym for ichno-

Ichnofossil; organic hieroglyph. General term

for fossil trails, tracks, and burrows. Pettij-

ohn.

Ichnolite. See ichnite.

Ichnology. The science which treats of the footprints of extinct animals. Pay.

Ichor. Proposed by Soderholm (1933) for a

granitic juice or liquor capable of granitiz-

ing rocks and derived from a granitic

core or granite. Synonym for mineralizer; residual

magma. A.G.I.

Icosidente. A line extending from the north-

pole to the south-pole, along the earth's equator, and divided into 90° by degrees of

longitude. Fay.

Ice shtet. a. Inland ice is a vague geographic

term. For strict accuracy, the terms

ice caps, and some highland glaciers are

limited to such stones as chryscolla, mala-

chite, diopside, azurite, and peridot. Shipley.

Idiodyne. Suggested by Poseply for those

deposits which are contemporaneous in origin with the wall rock. The word means

the same as xenogeneite. Compare xenogenite; heterogenize. Fay.

Idiogenous. Applied to a mineral deposit that

is contemporaneous in origin with the rock in which it occurs, that is, a primary min-

eral deposit which is a constituent of the rock in which it occurs. Fay.

Idiomorphic. Applied to an igneous rock mineral which is completely bounded by

its characteristic crystal faces. Synonym

for euhedral; automorphic. Holmes, 1928.

Idiomorphic crystal. An individual crystal that has grown without restraint so that

the habit plane is clearly developed. Compare allotriomorphic crystal. ASM.

Gloss.

Idiomatic. Exhibishing interference figures

in crystals without the aid of the polar-

scope. Webster 3d.

Idiomorphic component. In in-

ductive circuits where reactance is not
cancelled out by capacity reactance or

otherwise, the current flowing when the

electromotive force is zero. Since power

is a product of electromotive force and

current, it will be zero at that instant.

Maune, F.E., p. 419.

Idr. a. A sheave or pulley running loose

on a shaft to guide or support a rope,
cable, drive belt, or drive chain. Long. b.

An assembly of an idler roll or rolls with a

supporting structure that makes a unit

suitable for mounting on the conveyor

frame, so that it will support or guide a

portion of the conveyor belt. NEMA MB1-

1956. c. A wheel or gear which changes

the direction of rotation of shafts, or the
direction of movement of a chain or belt.

Nichols.

Idler. A device used for holding the belt

in proper position on certain types of box-

car loaders. See also boxcar loader. ASA

Idler gear. a. A gear meshed with two other

gears that does not transmit power to its

the eye. See also determinative gemmology. Shipley.
idler gear

shaft; used to reverse direction of rotation in a transmission. Nichols, b. Same as idle wheel.

idler hanger. A support for the roll or rolls. NEMA MB1-1956.

idler roll. A roll that does not transmit power. NEMA MB1-1956.

idler shaft. A shaft that carries a gear that reverses direction of rotation in a transmission. Nichols.

idler spacing. Customary to place idlers at uniform spacing on both top and return run, based on averages of tension and material weight for various belt width. Has important influence on conveyor friction. Bureau of Mines Staff.

idler stand. A unit structure for supporting the idler roll or rolls in which the shaft center or centers are above the base or the point at which it is attached to the conveyor frame. The idler stand includes bearings if these are not a part of the roll or rolls. NEMA MB1-1956.

idle time money. See lying money. Nelson.

idle wheel. a. A wheel interposed in a gear train, either to reverse rotation or to obtain the required spacing of centers, without affecting the ratio of the drive. Also called idler. C.T.D. b. A roll used to guide the driving belt, to increase its tension, or to increase its arc of contact on one of the working pulleys. Standard, 1964.

Idose. See vesuvianite. Fay.

Idria furnace. See Leopold furnace. Fay.

Idria. A dark, earthy variety of bituminous substance, approximately GtAl, found in nature mixed with cinnabar, clay, etc. In a purified state it is white and crystalline. From Idria, Carniola, Yugoslavia. Tomkeieff, 1954.

Idyl. A black material obtained from the sources of igneous action; includes pyrite, pyrrhotite, brucite, and hornblende. Bodeker considered it as the radical of idrialite. Fay.

IE. Abbreviation for industrial engineer. Webster 3d.

igneous. Pertaining to an igneous rock or to the process of rock formation by crystallization. Webster 3d.

igneous cycle. The sequence of events usually followed in igneous activity; it consists of an eruptive phase, a plutonic phase, and a phase of minor intrusion. C.T.D.

igneous fusion. Fusion by heat alone, assisted by solution in the water of crystallization. Webster 3d.

igneous intrusion; igneous intrusive. a. Any of the several forms of emplacement of igneous rocks. See also batholith; dike; laccolith; lopolith; phacolith; sill; stock. C.T.D. b. All intrusive masses fall into one of two categories. They are either concordant and parallel the bedding or strata of the country rock or they are discordant and cut across the bedding or strata of the country rock. Among the concordant igneous intrusions are laccoliths, lopoliths, phacoliths, and sills, and the discordant igneous intrusions include batholiths, dikes, and stocks. Bureau of Mines Staff.

igneous magma. A high-temperature, mobile mass of plastic solids, liquids, and gases that was generated within the depths of the earth and from which igneous rocks are derived by crystallization. C.T.D.

igneous metamorphism. The high-temperature process that includes the effects of magmas on adjacent rocks. It is nearly the same as contact metamorphism but it also includes the effects of igneous injection and pegmatitization. Stokes and Barnes, 1955.

igneous ore. Ore formed by cooling and solidifying from the molten state. Merriam, 4th, p. 382.

igneous rock. Rock formed by the solidification of molten material that originated within the earth. C.T.D.

igneous rock series. Originated by Brögger (1904) for an assemblage of igneous rocks in a single district, belonging to a single period of igneous activity, and characterized by a certain community of chemical, mineralogical, and textural properties. See also consanguinity. A.G.I.

igneous sandstone. Applied to a stone or mineral that sparkles when struck with steel or iron. Standard, 1964.

igneousite. A silicic volcanic rock forming thick, massive, compact sheets that cover a wide area in the central part of the North Island, New Zealand. The rock is chiefly a fine-grained rhyolitic tuff formed mainly of glass particles (Ahar), in which crystals of feldspar, quartz, and occasionally hypersthene or hornblende are embedded. The crystals are first welded, then bent around the crystals, and evidently were of a viscous nature when they were deposited. The deposits are believed to have been produced by the eruption of dense clouds of incandescent volcanic glass in a semimolten or viscous state from a group of volcanoes. Idler is synonymous. A.G.I.

igneousite. An assessment of the ease with which a coal can be ignited. B.S., 3233, 1960.

igneous temperature. To heat a gaseous mixture to the temperature at which combustion takes place. C.T.D. b. To set fire to. Mason.

igneous temperature point. a. A deliberate temperature at which a combustible gas mixture was used to fire an explosive charge. C.T.D. b. In mining, a metal cylinder which connects a main fuse with separate fuses which are only limited; the number of blasts to be fired. Standard, 1964. c. A device to relight safety lamps internally by friction. One type uses a waxed strip with igniting matches at intervals, while another type has a small burled wheel operating against a piece of cerium or something of a similar nature. Electrical devices are sometimes employed. Fay. d. One that ignites; as [1] a charge usually of black gunpowder used to facilitate the ignition of a propelling charge and sometimes of a bursting charge; (2) a device for igniting fuel mixture (as in an internal-combustion engine, a jet engine, or a rocket engine) which is a separate energized electrode used for restricting the arc in an ignitron. Webster 3d.

igniter. a. A cord which passes an intense flame along its length at a uniform rate to light safety fuses in succession. B.S. 3618, 1964, sec. 6. Two types are manufactured, a fast cord having a nominal burning speed of 1 second per foot and a slow cord having a nominal burning speed of 10 seconds per foot. Both igniter cords possess excellent water resistance and good storage properties and they will withstand a reasonable amount of rough handling. The burning speeds are reliable and consistent even under adverse conditions, as, for example, when burning underwater or in a direction opposite to a strong wind. McCadem II, p. 61.

ignites. Used by M. E. Wadhurst to include all pyrotechnic minerals. Fay.

ignitability (dust cloud). The relative ignitability of a dust cloud may be defined as the degree of ease with which it can be ignited. Sinclair, I, p. 250.

ignition. a. The act of igniting, or the state of being ignited; specifically, the act of exploding the charge of gas in the cylinder of an internal-combustion engine. Standard, 1964. b. A charge used as ignition material. Standard, 1964. c. The firing of an explosive mixture of gases, vapors, or other substances by means of an electric spark. C.T.D. d. An outburst or fire or an explosion. Mason.

ignition arch. A flat or curved refractory roof over a furnace at the point of entrance which promotes ignition by reflection of heat. ASI, No. 24.

ignition charge. A charge usually of black powder used to facilitate the ignition of the main charge. Webster 3d.

ignition delay. Time interval between contact of an oxidant and a combustible and ignition. I.C. 8137, 1963, p. 76.

ignition point. a. Of solids and liquids, the minimum temperature at which combustion can occur, but at which it is not necessarily continuous. Pryor, 3. b. Of combustible gases, the flashpoint. Pryor, 3.

ignition temperature. a. The ignition temperature of a substance is the lowest temperature at which that substance starts to burn. The temperature of ignition varies greatly with different substances. Morris and Cooper.

ignition temperature
ignation temperature

p. 28. All solid fuels must be heated to their ignition temperature before they will burn continuously by the process known as combustion. [Eq. b.] The temperature required to effect the ignition of a combustible oxidant system at a specified pressure; in general, the minimum temperature is implied. [C. D.]; 1963, p. 5.

Iginition test. See standard ignition test. Rice, George S.

Iginition tube. A heavy-walled test tube of hard glass for examining the behavior of heated substances. Webster 3d.

I.G.Y Abbreviation for International Geo-

Illuminating oil. Certain oil that is especially distillation of crude petroleum. Cris-

Illuminating gas. (1) Coal and carbonized water gas and their various mixtures. (2) The different classes of oil gas. (3) Acetylene, gasoline gas, and producer gas. The first is the most important for illuminating purposes. Producer gas is the most important for fuel and power gas. Crispin.

Illuminizing star or triplet. See star doublet.

Illumination. Deposition in an underlying layer of soil (soil horizon B) of colloids, soluble salts, and small mineral particles which have been leached out of an overlying soil layer (soil horizon A). The action occurs in humid climates. A.G.I.

Ilimanite. A mineral, FeO.TiO2; streak, black to brownish-red; submetallic luster; sometimes with some replacement of iron by magnesium or manganese. Resembles magnetite in appearance but is readily distin-

Ilmenite. A black titanium oxide containing iron in the form of ferrous titanate, ni-

Immanorite. A black titanium oxide containing iron in the form of ferrous titanate, ni-

Immature stone. A solid rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbibition. The particular case of absorption or adsorption of a liquid by a solid in which the solid increases in volume. A typical example is the swelling of Na-bentonite when it takes up water. Dodd.

Imbricate structure. The shingle structure displayed by a series of rock slabs, either thick or thin, separated by high-angled reverse faults or thrust faults. The faults dip toward the source of stress and the strata usually dip in the same direction as the faults and at similar angles. A zone of imbricate faulting is probably always underlain by a sole fault, marked by a decollement; and it may be overlain by a low-angle thrust. The terms schuppenstructure, distribution of shingles, the distinguishing structure have been applied to the same feature. Stokes and Varne, 1955.

Imhoff tank. A two-storied tank in which sewage is subjected to fermentation, forming methane gas. The sludge settles and is drawn off to the drier, having become offensive. Ham.

-imine. The suffix -imine is often used to indicate the presence of one or more -imines in the molecule. Pryor, 3.

Imitation cameo. See cameo. Shipley.

Imitation doublet. See doublet. Shipley.

Imitation foil back. See Foil back. Shipley.

Imitation lacquer back. See lacquer back. Shipley.

Imitation stones. a. In the broadest sense, any other than genuine gem material. A genuine stone that imitates a more desirable one is sometimes called its imitation. It is also its substi-

Imitation star sapphire. See star doublet. Shipley.

Imitation stones. Materials such as glass or the plastics which may resemble genuine stones in color and appearance, but differ from them in composition and physical properties Anderson.

Imitation triplett. See triplet. Shipley.

Imitation stones. A conglomerate composed of unsorted or poorly sorted debris and much unstable material. A.G.I.

Imitation stones. A rock of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.

Imbrite. A rock composed of quartz and alkabe, formed by interaction between a nepheline-syenite magma and graywacke. Holmes, 1928.
immediate roof. Lowest layer or layers of rock immediately above an underground opening. BuMinnes Bull. 587, 1960, p. 2. See also roof; nether roof. Pryor, 3.

imperf. b. A combination of different materials baked together or united by a cement; said of porcelain, etc. Standard, 1964, p. 246.

impact. Color thickened with an appropriate vehicle applied in relief on the raw clay surface. C. G. Seal. 1964.

impedance. The total opposition offered to the flow of an alternating current. It may consist of any combination of resistance, inductive reactance or capacitive reactance. It is expressed in ohms, and its symbol is Z. Hy. p. 177.

impeller. Rotating member of centrifugal pump, which receives inflowing water or ore pulp at or near its center and accelerates it radially to the periphery, where it is discharged with the kinetic energy (initial + added) needed to carry it through the pumping system. An open impeller is a disc with projecting vanes which grip the ps sufficiently to urge it along. A closed impeller has hollow compartments formed by vanes between side plates. Impellers are also used to aerate and mix pulps in flotation cells, leach tanks and mixing vats. Pryor, 3.

impeller diameter. This dimension usually determines the size "rating" of similar fans. The diameter va... the quantity as the square but has no effect on head. Hart., p. 246.

impervious. A stratum that cannot be drilled through. Williams.

impervious combination. A term meaning that not all of the fuel is oxidized to its highest degree; for example, if carbon monoxide is formed instead of carbon dioxide. Neutron, p. 246.

impervious frame. A structural frame with fewer members than are required to make it stable. Ham.

impeccability factor. The ratio between the amount of rain which runs off a surface, and as moved forward on the screen. Liddell 2d, p. 301.

impact factor. The factor of from 1 to 2 by which the weight of a moving load is multiplied in determining its full effect on the structural design of a floor or bridge. Ham.

impact fracture. Shattering of particles by direct fall upon them of crushing bodies. Pryor, 4.

impact idler. A carrying idler in which the rolls and/or its mounting are designed to reduce the impact shock on the conveyor belting due to the loading of material. NEMA MB1-1961.

impact loss. The head loss as a result of the impact of particles of water; included in and scarcely distinguishable from eddy loss. Seeley, 1.

impact mill. A crushing unit in which a rapidly moving rotor projects the charged material against steel plates; impact mills find use in the size-reduction of such materials as feldspar, perlite, etc. Compare disintegrator; hammer mill. Dodd.

impact pressing. A process for forming refractive shapes, in which the ground particles of refractory material are packed closely together by rapid vibration. Hy.

impact resistance. A measure of the capacity of a substance to withstand shock or impact. The unit of measurement is frequently given by the Izod number. See also Izod test. Malli.

impact roll. An idler roll covered with a resilient material or plastic tire to absorb the shock of loading material onto the conveyor belt and so minimize damage to the belt and its supporting bars. Pryor, 3.

impact strength. Same as impact energy. ASM Glott.

impact test. a. A test to determine the behavior of materials when subjected to high rates of loading, usually in bending, tension, or torsion. The quantity measured is the energy absorbed in breaking the specimen by a single blow, as in the Charpy or Izod tests. ASM Glott. b. An efficiency test used to determine the resistance of a ceramic surface to charge. When a steel weight is dropped on the object one or more times, from known heights, until breakage to the base metal occurs. Enam. Dict. c. A method of determining the resistance of a ceramic article to fracture upon the application of a dynamic pressure. ASCG, 1963.

impact toughness test. This method involves determining the impact toughness of a roof by dropping a weight from successively greater heights until such a height is reached that the specimen is fractured. Lewis, p. 246.

impact test. a. A test to determine the behavior of materials when subjected to high rates of loading, usually in bending, tension, or torsion. The quantity measured is the energy absorbed in breaking the specimen by a single blow, as in the Charpy or Izod tests. ASM Glott. b. An efficiency test used to determine the resistance of a ceramic surface to charge. When a steel weight is dropped on the object one or more times, from known heights, until breakage to the base metal occurs. Enam. Dict. c. A method of determining the resistance of a ceramic article to fracture upon the application of a dynamic pressure. ASCG, 1963.

impact toughness test. This method involves determining the impact toughness of a roof by dropping a weight from successively greater heights until such a height is reached that the specimen is fractured. Lewis, p. 246.

impalpable. Extremely fine, so that no grains or grit can be felt. Webster, 3d.

impact test. a. A test to determine the behavior of materials when subjected to high rates of loading, usually in bending, tension, or torsion. The quantity measured is the energy absorbed in breaking the specimen by a single blow, as in the Charpy or Izod tests. ASM Glott. b. A combination of different materials baked together or united by a cement; said of porcelain, etc. Standard, 1964, p. 246.

impact. Color thickened with an appropriate vehicle applied in relief on the raw clay surface. C. G. Seal. 1964.

impasto. Color thickened with an appropriate vehicle applied in relief on the raw clay surface. C. G. Seal. 1964.
impermeable. Rocks. Those which bar further descent of surface water. Pryor, 3.

impermeable rocks. Those which bar further descent of surface water. Pryor, 3.

impervious. a. Impassable; applied to impervious rock, such as clays, shales, etc., which will not permit the penetration of water, petroleum, or natural gas. Fay, b. Applied to a bed or a stratum through which water will not move under ordinary hydrostatic pressure. Fay, c. In hydrology, it is applied to a rock that does not admit the passage of water or other liquid under the pressures and conditions usually found in sub surface water. Impervious rock may be of two kinds: porous, like clay or nonporous, like massive unbroken granite. In the first case, the pores are too small to admit water to pass except by very slow capillary creep. Although pores are necessary for permeability, they must be of fairly large size and be interconnected to allow free and continuous passage of solutions. Stokes and Barnes, 1955. That degree of variation evidenced visually by complete resistance to dye penetration. ASTM C 262-60. See also nonvitreous; semivitreous; vitreous.

impervious bedding. Geologically, one which prevents induration downward of meteoric water, or alternatively, which caps pervious rocks, therefore, preventing uprise of water, or alternatively, which caps pervious rocks, therefore, preventing uprise of water, or alternatively, which caps pervious rocks, therefore, preventing uprise of water, or alternatively, which caps pervious rocks, therefore, preventing uprise of water, or alternatively, which caps pervious rocks, therefore, preventing uprise of water.

imperviousness. That quality or condition of a material that minimizes percolation. Pryor, 3.

impervious rock. As the term is used in hydrology, an impervious rock is one that does not admit the passage of water or other liquid under the pressures and conditions usually found in sub surface water. Impervious rocks may be of two kinds: porous, like clay or nonporous, like massive unbroken granite. In the first case, the pores are too small to admit water to pass except by very slow capillary creep. Although pores are necessary for permeability, they must be of fairly large size and be interconnected to allow free and continuous passage of solutions. Stokes and Barnes, 1955.

impingement. a. To collect (water) as by damming a stream for irrigation purposes, or the like; used for impounding. Webster 3d. Used in connection with the storage of tailings from ore-dressing plants and hydraulic mines. Fay, c. To collect in a reservoir or sump provided near a borehole the water, drill cuttings, etc., ejected therefrom. Long.

impounding dam. One in which tailings are collected and settled; also, a water-storage dam. Pryor, 3.

impounding reservoir. A reservoir which stores water for use in connection to a dry area, as distinct from a service reservoir. Ham.

impregnated. a. Timber impregnated with various substances to enable it to better resist the decomposing influences of the atmosphere. Crippin, b. A metallic material in which fragments of diamond or other hard substances (in unincorporated distribution) are intermixed and embedded. See also impregnated bit. Long. d. Containing metallic minerals scattered or diffused throughout the mass. Properly used in referring to the country rock containing a disseminated metallic mineral, or minerals, similar to those in the ore deposit.

impregnated bit. A sintered, powder-metal matrix bit with fragmented bort or whole diamonds of selected screen sizes uniformly distributed throughout the entire crown section. As the matrix wears down, new, sharp diamond points are exposed; hence, the bit is used until the crown is consumed entirely. Long.

impregnated-tape metal-arc welding. An arc-welding process in which coalescence is produced by heating with an electric arc between a metal electrode and the work. Shielding is obtained from decomposition of an impregnated tape wrapped around the electrode as it is fed to the arc. Pressure is not used and filler metal is obtained from the electrode. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

impregnated dirt. Timber c. Which has been treated to make it either flame-resistant or to protect it from destruction by fungi and insects. Timber impregnated with arsenic is often vacuum-pressure impregnated with a flame-retardant preservative for safety and to comply with the flame-proofing requirements of the Coal Mines Act covering escape roadways. Nelson.

impregnation. a. The treatment of porous castings with a sealing medium to stop pressure leaks. ASM Gloss. b. The process of filling the cores of a sintered compact, usually with a liquid such as a lubricant. ASM Gloss. c. The process of mixing particles of a nonmetallic substance in a matrix of metal powder, as in diamond-impregnated tools. ASM Gloss. d. An ore deposit consisting of the country rock impregnated with ore and without usually definite boundaries. Fay, e. Preservation of mine timber by soaking it in creosote, zinc chloride, or other chemicals. Pryor, 3.

implosion block. A bell-shaped or hollow, tubular device filled with wax or other water-resistant plastic materials, which is lowered onto an artificial setting on the bottom of a borehole. The plastic material molds itself about the lost article, and by inspection, the driller can determine which fishing tool is best fitted to recover the lost article. Long.

impression account. One in which payments are made from a sum set aside to deal with a specified matter or amount thereof, disbursements being periodically returned to the imprest. Pryor, 3.

improved dial; telescopic dial. A miner's dial in which a telescope replaces the usual visual vane. B. S. 3619, 1963, sec. 1.

improved paragon. Trade name for nonrotating wire rope of 18 x 4 over 3 x 24 construction.

improvement. An artificial change of the physical condition of the earth in, upon, or so reasonably near the mining claim as to evidence a desire to discover mineral therein or to facilitate its extraction, and in all cases the alteration must be permanent in character. Ricketts, I.

improving. See softening. C.T.D.

impound. a. To collect in a reservoir or sump provided near a borehole the water, drill cuttings, etc., ejected therefrom. Long. Impoundage dam. One in which tailings are collected and settled; also, a water-storage dam. Pryor, 3.

impound reservoir. A reservoir which stores water for use in connection to a dry area, as distinct from a service reservoir. Ham.

impregnated. a. Timber impregnated with various substances to enable it to better resist the decomposing influences of the atmosphere. Crippin, b. A metallic material in which fragments of diamond or other hard substances (in unincorporated distribution) are intermixed and embedded. See also impregnated bit. Long. d. Containing metallic minerals scattered or diffused throughout the mass. Properly used in referring to the country rock containing a disseminated metallic mineral, or minerals, similar to those in the ore deposit.

impregnated bit. A sintered, powder-metal matrix bit with fragmented bort or whole diamonds of selected screen sizes uniformly distributed throughout the entire crown section. As the matrix wears down, new, sharp diamond points are exposed; hence, the bit is used until the crown is consumed entirely. Long.

impregnated-tape metal-arc welding. An arc-welding process in which coalescence is produced by heating with an electric arc between a metal electrode and the work. Shielding is obtained from decomposition of an impregnated tape wrapped around the electrode as it is fed to the arc. Pressure is not used and filler metal is obtained from the electrode. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

impregnated dirt. Timber c. Which has been treated to make it either flame-resistant or to protect it from destruction by fungi and insects. Timber impregnated with arsenic is often vacuum-pressure impregnated with a flame-retardant preservative for safety and to comply with the flame-proofing requirements of the Coal Mines Act covering escape roadways. Nelson.

Preservation of mine timber by soaking it in creosote, zinc chloride, or other chemicals. Pryor, 3.

implosion block. A bell-shaped or hollow, tubular device filled with wax or other water-resistant plastic materials, which is lowered onto an artificial setting on the bottom of a borehole. The plastic material molds itself about the lost article, and by inspection, the driller can determine which fishing tool is best fitted to recover the lost article. Long.

impression account. One in which payments are made from a sum set aside to deal with a specified matter or amount thereof, disbursements being periodically returned to the imprest. Pryor, 3.
incandescent
incarbonization. Same as coalification. Tom-
incase. An incandescent spark is an el-
icative, intensive to ignite
inctile. Eng. Term used in Lancashire for
incation. A twelve inch = 1 foot; 25.34001 cen-
timeters. Symbol; °, Pryor.
inch pressure. The height in inches of a
column of water or of mercury as a meas-
ure of hydrostatic pressure. Standard, 1864.
inciling. See jogging. Pit and Quarry, 53rd,
Sec, D, p. 13.
inciling starter. In one form, electrical gear
which allows power to be applied gently
to a stationary ball mill so as to avoid a
high starting strain. The mill is said to be
incched over as it begins slowly to rotate.
Pryor, 3.
inch, miner's. See miner's inch. C.T.D.
inch of water. A unit of pressure equivalent
to 0.036136 pound per square inch. Strock,
1886.
inch pennyweights. In valuation
a pound 1 inch; a unit of work or of energy.
inch-pound. The work done in
1 pound 1 inch; a unit of force. Nichols.
inch starting. See inciting; igniting.
inclination. a. The angular dip of a vein, a
bed, etc., measured in degrees from the
horizontal plane. Fay, b. Angle between the
directions of the horizontal field and the
horizontal plane. Schieferdecker.
inclinometer. Instrument to determine the in-
culation of the magnetic field. Schiefer-
decker.
incline. a. A shaft not vertical; usually on
the dip of a vein. See also slope. Fay, b.
Any inclined plane, whether above or be-
neath the surface; usually applied to self-
acting planes above ground, as in the bi-
tritious confine. Fay, c. A sloping tunnel
along which rails are laid from one level to
another; a mechanically worked inclined
gola or gondola on a coal mine. C.T.D. d.
A slanting shaft. Gordon. e. In mines, an
inciden
drift driven upwards at an angle from
the horizontal. Francis, f. An open-
ing driven upward or driven the pitch. Hudion.
incline buggy. Scot. A wheeled carriage for
inclinators, constructed with a horizontal
platform so that cars can be run on it and
be conveyed up and down the incline or
slope. Fay.
incline bedded formation. Any bedded for-
mation of rock where the dip of the bed-
incline marching. Marching commonly in sandy deposits. the strata,
incline railway. An inclined railroad operator. See inclined rail-
incline railroad浩oldism. See dump
incline shaft. See incline, a. Fay.
incline traverser. A traverser which moves
mine cars laterally and vertically by travel-
ing on an inclined plane. It is sometimes
used at the pit bottom for the transfer of
cars from a higher deck level to a lower
deck level on the opposite side rail track.
The cars are held upright in a
framing, and can handle loaded or empty
cars to and from the two levels. Nelson.
incline tube manometer. A manometer in
which one of the limbs (the reservoir) of the
U-gage is many times larger than the
cross-sectional area of the other limb (the
incidence tube). This causes part of the fluid,
when a small differential pressure is ap-
plied, to take place mainly along the
incidence tube. Inclined tubes are useful up to
a range of up to 2 inches water gage and
can be read to 0.01 or 0.001 inch de-
pendent upon scale graduation. Roberts, 1,
pp. 25-27.
inclined U-gage. A sensitive form of wa-
ter gage, giving readings of greater accu-
ricacy. It consists of a glass U-tube of uniform
3/4-inch diameter bored with limbs about
20 inches in length, the ends being bent
over for attachment to rubber tubing.
The U-tube is mounted on a wooden
base and a graduated scale in inches and
tenths or centimetres and millimeters
marked underneath the two limbs. The wooden
base carrying the U-tube is inclined at a
small angle to the horizontal. An angle of
1 in 10 gives a ten-tenth-magnification of the
readings. The water gage is fixed on the
leveling stage of a "teodolite or
dumpy tripod. It is used mainly for venti-
lation pressure investigations at
a mine. It consists of an ordinary U-gage
fixed to a plate of known inclination to
the horizontal. Sometimes the gage is
mounted on a hinged plate so that the angle of inclination may be varied. These
gages are fitted with attachments so that they can easily be mounted on tripods.
Roberts, 1, pp. 7-17.
inclined water gage. A sensitive form of wa-
ter gage, giving readings of greater ac-
curacy. It consists of a glass U-tube of uniform
3/4-inch diameter bored with limbs about
20 inches in length, the ends being
bent over for attachment to rubber tubing.
The U-tube is mounted on a wooden
base and a graduated scale in inches and
tenths or centimetres and millimeters
marked underneath the two limbs. The wooden
base carrying the U-tube is inclined at a
small angle to the horizontal. An angle of
1 in 10 gives a ten-tenth-magnification of the

dumpy tripod. It is used mainly for venti-
lation pressure investigations at
a mine. It consists of an ordinary U-gage
fixed to a plate of known inclination to
the horizontal. Sometimes the gage is
mounted on a hinged plate so that the angle of inclination may be varied. These
gages are fitted with attachments so that they can easily be mounted on tripods.
Roberts, 1, pp. 7-17.
incline engine. A stationary haulage engine
at the top of an incline. C.T.D.
incline hoist. See incline. Bear.
incline hoist. Same as angle hoist. Long.
incline man. In anthracite coal mining,
inclined coal mining, a laborer who con-
trols the movement of cars on a self-acting incline (loaded car going
down one track puller going on
on other), hooking cars to loaded or empty
cars, starting them down the incline, and
applying brake to cable drum by a lever
to control their speed. Also called dilly boy; drum runner; monitor
operator; plane man; wheel runner.
D.O.T. 1. Also called jinny.
incombustible. a. Applies to substances that will not burn. Mersereau, '4th, p. 210. b. Any building material which contains no matter subject to rapid oxidation within the temperature limits of a standard fire test of not less than 2½ hours duration. Materials which, when burned, produce soot and smoke but do not burn during this time period are termed combustible. ACSG. c. See noncombustible. ACSG, 1963.

inclusion. a. A crystal, a fragment of another rock enclosed in a more fine-grained matrix. A.A.G.I. b. Particles of foreign matter, such as nonmetallic inclusions, or during recrystallization following fracturing, small portions of the minerals, or during recrystallization following fracturing, small portions of the minerals, or during recrystallization following fracturing, small portions of the mineral grains. Most of these fluid inclusions are small (0.001 to 0.01 millimeter in diameter) and frequently contain a small bubble of a gaseous phase in addition to the liquid (usually hydrous) phase.

inclusions. a. A term applied to crystals and inclusions of one mineral involved in another and to fragments of one rock enclosed in another, as when a volcanic flow picks up portions of its conduit. Bureau of Mines Staff. b. Particles of foreign matter, solid, liquid, or gas, enclosed within a gem stone. The nature of such inclusions provides a powerful clue to the origin of a stone, and enables natural stones to be distinguished from their synthetic counterparts. Anderson.

incline repairman. a. In anthracite coal mining, a man who oils, greases, repairs, and replaces pulleys or carriages traveling on rails. See also turned vertical shaft; underlay shaft. Nelson.

incompatible. a. Applied to strata, a formation, a rock, or a rock structure not combining sufficient firmness and flexibility to transmit a thrust and to lift a load by bending; consequently, admitting only the deformation of Bowen. See also competent, a. St. and d., 1964. b. Soft or fragmented rocks in which an opening, such as a large crack or a fault, may be found. In this case an indeterminate place, cannot be maintained unless artificially supported by casing, cementing, or timbering. Long.

incompatible bed. A bed that, in a particular case of folding, has yielded to the lateral pressure by plastic adjustment and flow. This may result in the bedding being thrown into complex structures or in the development of more regular interlocking structures, particularly drag folds and fracture cleavage. The bed tends to thicken towards the hinges and to thin in the limbs, of the folds. Chalimer. See also competent bed.

incompatible folding. See flow folding. A.G.I.

incomplete combustion. A term applied to combustion in which all of the fuel is not burned; for example, leaving unburned coal in ashes. Newton, p. 246.

incomplete ripples. A term used to describe isolated crests of ripple mark. Also called starved ripples. Pettijohn.

incongruent melting. Dissociation of a compound upon heating, with the formation of another compound and a liquid of different composition from the original compound. HW.

incongruent melting point. The temperature at which a solid phase changes into another solid phase plus a liquid, both having a composition that differs from the original solid. Also called the peritectic point. A.G.I.

inconsequent stream. A stream whose drainage system does not appear to have any direct relation to the structure of the underlying rocks but is quite independent of it. A.G.I.

incorporation. A process by which material contributed to coal formation responds to diagenetic and metamorphic agencies of coalification and becomes a part of the coal without undergoing any material modification. See also coalification. Cooper.

increment. The quantity of coal or coke taken by a single operation of the sampling instrument, as the unit, Pt. A.G.I.

incrustate. A. To form a new phase or phases until one of the two processes is completed. From this time period are termed combustible. ACSG, 1963. b. Precipitate. See also peritectic point. A.G.I.

index contour. A. A crust or a coating on a rock, such as carbonate forms on sandstone. Von Bertalanffy. b. A crust or hard coating of anything upon or within a body, as a deposit of lime inside a steam boiler. Webster, 3d. A. A method of ornament that consists in applying or in inlaying one (usually a finer) material upon another, as colored marbles, mosaics, lacquers, or enamels upon wood, stone, or metal; also the material so applied. Standard, 1964.

indexed bars. A special type of steel reinforcing bars for concrete, having a series of indentations and ridges which increase the mechanical bond with the concrete. See also helical reinforcement. Ham.

indexed bolt. An anchor bolt with indentations forged upon it to ensure a better grip in concrete or grout. Ham.

indented shoreline. See crenulate shoreline.

indexing. In structural brickwork, the omission of a suitable series of bricks so that recesses are left into which any future work may be bonded. Dodd.

indexing roller. A roller having a raised pattern cast on its surface which, when rolled over battens, produces a non-slip texture. Ham.

indentation hardness. The resistance of a material to indentation. This is the usual type of hardness test, in which a pointed or rounded indenter is pressed into a surface under a substantially static load. A.S.M. Notebook.

independent. A. Nongelatinous permissible explosive; used in mining. Bennett 2d, 1962. b. Independent construction. In mining operations, one who exercises independent control over the mode and method by which he produces the results demanded by the contract. Ricketts, 1.

independent-Gelatinous permissible explosive; used in mining. Bennett 2d, 1962.

independent subsidence. The condition in sedimentation in which each floc or particle floats freely from that is, its movement is not influenced in any way by other flocs or particles in suspension. Mitchell, p. 610.

independent wire rope core. This core may be 6 by 7, 7 by 7, 7 by 19 construction and the individual wires shall be of an appropriate grade of steel in accordance with the best practice and design, either bright (uncoated) galvanized, or drawn galvanized wire. ASA M11.1-1960, p. 8.

indeborite. Hydrous calcium and magnesium borate mineral, CaMgBo11O11H2O, as monoclinic crystals from the Inker bonate deposit, Kazakhstan. Named from locality. See also metahydroboracite. Spencer 16, M., 1945.

inderlite. Hydrated magnesium borate, 2MgO·3Bo·15H2O, as nodular aggregates of acicular crystals; pseudosphoritic. Named from locality, Inder, Kazakhstan, southwest Siberia, U.S.S.R. Spencer 15, M., 1940.

indestructibility of matter law. See law of indestructibility of matter. Cooper.

indestructibility of matter law. See law of indestructibility of matter. Cooper.

index. To divide into equal marked parts, such as quadrants or degrees of a circle. St.

index contour. Certain contour lines (usually every fifth contour) accentuated by a heavier line than the intervening contour.

incrustation. a. A crust or a coating on a rock, such as carbonate forms on sandstone. Von Bertalanffy. b. A crust or hard coating of anything upon or within a body, as a deposit of lime inside a steam boiler. Webster, 3d. A. A method of ornament that consists in applying or in inlaying one (usually a finer) material upon another, as colored marbles, mosaics, lacquers, or enamels upon wood, stone, or metal, also the material so applied. Standard, 1964.

independent bars. A special type of steel reinforcing bars for concrete, having a series of indentations and ridges which increase the mechanical bond with the concrete. See also helical reinforcement. Ham.

indexed bolt. An anchor bolt with indentations forged upon it to ensure a better grip in concrete or grout. Ham.

indented shoreline. See crenulate shoreline.

Schiefzylinder.
/errors in observed angle. The level which a sound would have at a point one yard from the point in which it occurs. Synonym for guide point. A.G.I.

**index minerol.** A mineral, the first appearance of which in passing from lower to upper stages of metamorphism, or of the reverse, marks the outer limit of the zone in question. A.G.I.

**index of overall concentration.** See overall concentration. Nelson.

**index of physiological effect.** A method which is based on the heart rate for relating the stress of a body to its environment. Roberts, J., p. 136.

**index of plasticity.** The difference between the water content of clay at its liquid and plastic limits showing the range of water contents over which the clay is plastic. Ham.

**index of refraction; refractive index.** The ratio of the velocity of light, or of other radiation, in the first of two media to its velocity in the second as it passes from one to the other, the first diurnum usually being taken to be a vacuum or air. Symbol, n. Webster 3d.

**index plane.** The surface of any bed, dike, or fault which, if extended, would be regarded as a plane and used as a base for measuring fault movements. Fay.

**index properties.** Properties which can be used to identify the soil type. The proper ties are of two kinds: (1) soil grain properties, and (2) soil aggregate properties. See also soil classification. Nelson.

**index property tests.** Tests to determine index properties which in turn serve to identify the soil type and indicate its consisteny. Nelson.

**India.** A remarkably fast-cutting, long-wear ing oilstone made from alundum. Fay.

**India cut.** In lapidary work, a cut approxi mately in the form of a brilliant, but done in such a way as to retain as much weight as possible. Cut in India. Webster 2d.

**India-cut stones.** India-cut stones are clumsy and are usu tally recut for Western markets. Fay.

**Indianite.** A white clay from Lawrence County, Ind., composed largely of meta halloysite; a small amount is used in making porcelain to increase translucency. Bureau of Mines Staff.

**Indian red.** A clayey greenish ochre which is based on hematite imported from the East, but of the culet; such stones are generally recut for Western markets. Fay.

**Indian agate.** A name for mocha stone or moss agate. Same as dendritic agate. Shipley.

**Indian pond stone.** Sharpening stones from Indian Pond, N. H. Mersereau, 4th, p. 285.

**Indian pipestone.** See catlinite. Fay.

**Indian cut.** A style of diamond cutting usually of Indian or other Oriental origin in which the table is usually double the size of the culet; such stones are generally recut for European or American requirements. Hess.

**Indian jade.** Aventurine quartz. Shipley.

**Indian garnet.** Almandite. Shipley.

**Indian garnet.** A variety of anorthite occurring as narrow pyritiferous seams, the intersections of which with auriferous quartz veins of the district are usually characterized by rich accumulations of gold. Fay. d. An instrument used to show the pressure and action of the steam in an engine cylinder. This gives a value of 100 percent for clay. Hess.

**Indian Pond stone.** Sharpening stones from Indian Pond, N. H. Mersereau, 4th, p. 285.

**Indian red.** A red (maroon) pigment, formerly consisting of a variety of hematite imported from the East, but now made artificially by calcining cop peras to obtain the red ferric oxide pigment. There is no pigment, with possibly the exception of lithopane and artificial barium sulfate, which will approach Indian red in fineness of grain. Also used for polishing gold, silver, and other metals. C.C.D. 6d, 195.

**Indian file.** An Indian's right to occupancy of land, and that right recognized by the United States, constitutes Indian title. Ricketts, T.

**Indian topaz.** See citrine. C.M.D.

**Indian oilstone.** See India.

**Indian steel.** A fine natural steel from southern India made direct from the ore; wrought. Fay.

**Indian stone.** See India.

**Indianized horsepower.** a. That horsepower developed in the cylinder or cylinders of steam, gas, or petrol engine, which is calculated from indicator diagrams, as distinguished both from that which is measured by a dynamometer connected with the engine to measure the work done, or from the theoretical horse power. It is calculated from (1) the average pressure of the working fluid, as shown by the indicator diagram; (2) the area of the piston; (3) the stroke; (4) the number of working strokes per minute. Standard, 1964. b. The theoretical power output of an engine. It is determined by the mean effective pressure of the medium acting on the net area of the piston through the distance the piston travels as the engine rotates. Bruntly, 2. c. The horsepower developed in the cylinders, that is determined by use of an indicator gage. It does not include engine friction losses. Nichols.

**indicator face.** Ore for which tonnage and grade are computed partly from specific measurements, samples, or production data and partly from other measurements made in a manner inappropriate to space to outline the ore grade completely or to establish its grade throughout. Forrester, p. 52.

**indicator power.** See indicated horsepower, a. Fay.

**indicator.** a. An instrument for showing at any moment the position of the capstan in the shaft. Fay. b. An apparatus for showing the presence of fire; fire alarm. Fay. c. A specially prepared paper on which the diagram is drawn is known as a "graph paper" or "graphing paper". Fay.

**indicator card.** A diagram showing the variation of steam pressure in the cylinder of an engine during an entire stroke or revolution. Zern. b. A specially prepared paper on which the diagram is drawn is known as a "graph paper" or "graphing paper". Fay.

**indicator drum.** A diagram showing the variation of steam pressure in the cylinder of an engine during an entire stroke or revolution. Zern. b. A specially prepared paper on which the diagram is drawn is known as a "graph paper" or "graphing paper". Fay.

**indicator gage.** An instrument used to record or to indicate various quantities. See also indicator, b. Long.

**indicator length.** Length of mathematical penum that would yield pulses equal to its presence the occurrence of an element

---

**indicator plant.** A plant that indicates by its presence the occurrence of an element
indicator plant

in the soil upon which it grows. Hawker. See also local plant indicators; universal plant indicators. Hawker. p. 305-310.

b. A plant whose metabolism requires certain elements to sustain life (for example, Astragalus as a selenium indicator. Ballard.

indicator vein. A vein which is not metallic. Mixture of organic dyes chosen to provide a continuous and distinctive change of color over a wide band of pH values. Consists of a solution of methyl orange (0.1 gram, methyl red (0.4 gram), bromothymol blue (4.0 gram), naphtholphthalein (0.32 gram), phenolphthalein (0.5 gram), and cresolphthalein (1.6 gram) in 100 cubic centimeters of 70 percent alcohol. One drop of this in 10 cubic centimeters clear aqueous liquid gives a color range through pH 3 to 12. Red is 3; orange-red, 4; orange, 5; yellow, 6.5; green, 8.0; bluish, 9.5; blue, 10.5; violet, 11.0; and red-violet, 12.0. Pryor, 3.

indicator vein. A vein which is not metallic. Mixture of organic dyes chosen to provide a continuous and distinctive change of color over a wide band of pH values. Consists of a solution of methyl orange (0.1 gram, methyl red (0.4 gram), bromothymol blue (4.0 gram), naphtholphthalein (0.32 gram), phenolphthalein (0.5 gram), and cresolphthalein (1.6 gram) in 100 cubic centimeters of 70 percent alcohol. One drop of this in 10 cubic centimeters clear aqueous liquid gives a color range through pH 3 to 12. Red is 3; orange-red, 4; orange, 5; yellow, 6.5; green, 8.0; bluish, 9.5; blue, 10.5; violet, 11.0; and red-violet, 12.0. Pryor, 3.

Red is 3; orange-red, 4; orange, 5; yellow, 6.5; green, 8.0; bluish, 9.5; blue, 10.5; violet, 11.0; and red-violet, 12.0. Pryor, 3.

indicolite. An indigo-blue variety of tourmaline. Danz 17.

Indirect flushing. Flushing in which the water enters the borehole with the business end pointing toward the collar. Recommended for two reasons: potential for more complete drainage of permeable dyke. Bureau of Mines Staff.

indirect-cycle reactor system. A nuclear reactor system in which the reactor coolant transfers heat from, the reactor coolant to the chimney draught. See also balanced draught. Nelson.

indirect test. See Brazilian test. Lepke, p. 570-571.

indium. A soft, malleable, easily fusible, silvery-white metallic element that is resistant to tarnishing and resembles aluminum and gallium in being chiefly trivalent. Occurs in very small quantities in scheelite and other ores. Used chiefly as a plating for lead-coated silver bearings for airplanes. Symbol, In; valences, 1, 2, and 3; tetragonal; atomic number, 49; atomic weight, 114.82; specific gravity, 7.31 (at 20° C); melting point, 156.61° C; boiling point, 1,450° C; insoluble in water; very slightly soluble in sodium hydroxide; and soluble in acids. Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-115-B-117; CCD 6d, 1961.

industrial coal car. One owned or leased by a coal operator, and not by the transportation company. These cars have painted on the sides the names, initials, or some chosen trademark or emblem of their owners, and are run for their exclusive benefit. They are generally used between the mines and the coastal shipping ports of the various railroads. Fay.

individual illness. Any disease or ailment of the body that is caused by an external magnetic field and that disappears when the external field disappears. Schieber, p. 370.

individual irradiation. Radioactivity that is created by bombarding a substance with neutrons in a reactor or with charged particles produced by particle accelerators. LQL.

induction. The production of magnetization or electrification in a body by the proximity of magnetized or electrified bodies, or of an electric current in a conductor by the variation of the magnetic field in its vicinity. Crispin.

induction coil. a. An apparatus for generating currents by electromagnetic induction. It consists usually of two concentric cylindrical coils of insulated wire encircling an iron core. One of the coils is called the primary and the other the secondary. Ordinarily, the primary is short and of thick wire, and the secondary is long and of thin wire. The alternating current of high tension is induced in the secondary coil by rapid automatic making and breaking of the circuit in the primary. Standard, 1964. b. Commonly used by bit setters as a means of melting and/or cutting metals used in

that which is drawn in; an inward flow; as, the inward flow of water at the bottom of the chimney. Hey, M.M., 1964.

induced bursts. Rock bursts caused by stoping operations to distinguish them from development bursts which are called herein. Spaldin, p. 67.

induced cleavage. Same as induced fractures. Woodruff, v. 1, p. ix.

induced current. See induction. Crispin.

induced draught. Suction applied at the outlet of the appliance produced by a mechanical fan or a steam jet to supplement the chimney draught. See also balanced draught. Nelson.

induced fractures. Fractures formed in the roc, as a result of mining operations. For example, on longwall faces fractures are formed in a slate roof parallel to and along successive lines of face. They are induced after coal cutting and become intensified at the end of the loading shift. The distance between the fractures varies, roughly, with the depth of cut. Nelson.

induced magnetization. Part of the magnetization of a body that is caused by an external magnetic field and that disappears when the external field disappears. Schieber, p. 370.

induced polarization. When an electric current passing into the earth through ground electrodes it suddenly interrupted, a potential can be measured between these or nearby electrodes, for some time after the current stops. This potential decays exponentially with time after the interruption. The effect was first observed by Schlumberger as early as 1912 and it was ascribed by him to polarization of earth material by the current. Known as induced polarization; this effect is associated with electrochemical reactions in the earth. Dobrin, p. 370.

induced radioactivity. Radioactivity that is created by bombarding a substance with neutrons in a reactor or with charged particles produced by particle accelerators. LQL.

induced radiation. The production of magnetization or electrification in a body by the proximity of magnetized or electrified bodies, or of an electric current in a conductor by the variation of the magnetic field in its vicinity. Crispin.

induced radiation. The production of magnetization or electrification in a body by the proximity of magnetized or electrified bodies, or of an electric current in a conductor by the variation of the magnetic field in its vicinity. Crispin.
induction coil

Producing bitcrows by casting or other mechanical methods. Compare induction furnace; induction pot. Long.

Induction furnace. An alternating-current electric furnace wherein the primary coil or induction is called and generates, by electromagnetic induction, a secondary current which develops heat within the metal charge. ASM Gloss.

Induction hardening. Quench hardening in which the heat is generated by electrical induction. A.G.I.

Industrial air conditioning. Air conditioning in industrial plants where (usually) the objective is the furnishing of a manufacturing process rather than the comfort of human beings. Strock, 10.

Industrial calorific value. The calorific value obtained when coal is burned under a boiler. Kentucky, p. 411.

Industrial degree-day. A degree-day unit based on a (usually) 5°F or 5°F mean daily temperature so as to be applicable to industrial buildings maintained at relatively low temperatures. Strock, 10.

Industrial diamonds. a. Crystalline and/or cryptocrystalline bodies having color, shape, size, crystal form, imperfections, or other physical characteristics that make them unfit for use as gems. Industrial diamonds are obtained as fractionated materials that are used in jewelry or as abrasives. Long. b. Impure diamond used in borehole drilling and the grinding industry. Also called black diamond, brown diamond, crystal, and pedro. Pryor, 3.

Industrial floor brick. See floor brick. Dodd.

Industrial grouping. Where the units comprising an organization produce like products, the grouping is a horizontal combination. Where they produce and market products of increasing finish or concentration, the grouping is a vertical combination. A grouping of collieries producing and marketing coal would be a horizontal combination, but where a number of collieries are linked with end products such as coke or gas or steel, the grouping would be a combination of vertical and horizontal. Nelson.

Industrial minerals. Rocks and minerals not produced as sources of the metals but ex- cluding mineral fuels. Bureau of Mines Staff.

Industrial waste. The waste resulting from the processes employed in industrial establishments. Grispin.

Inequigranular. A textural term applied to rocks, the essential minerals of which are of different sizes. Compare, porphyritic. A.G.I.

Inequilibrium. Uranium is soluble in acid waters and tends to be removed in solution, but where more saline waters are formed, and its compounds tend to remain behind in the leached outcrop. Therefore, the outcrop may be radioactive because of the presence of the gamma-emitting elements RaC and RaD, even though much of the uranium has been lost in solution. In this case, radioactivity may indicate a high counter reading, but the uranium content may be less than a million years ago may be in inequilibrium because daughter products have not reached their equilibrium amounts. Hence, counter readings may indicate less uranium than is actually present. Ballard.

Inert anode. An anode which is insoluble in the electrolyte under the conditions obtained in the electrolysis. Lounenheim.

Inert dust. a. Any dust which contains only a small amount of combustible material. Rice, George S. b. Dust which has no harmful effect. Hartman, p. 41.

Inert gas (such as nitrogen or carbon dioxide) that is normally chemically inactive especially in not burning or in not supporting combustion. Webster 3d. b. One of the helium group of gases comprising helium, neon, argon, krypton, xenon, and sometimes radon. Also called a noble gas; a rare gas. Webster 3d.

Inert gas arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a metal electrode and the work. shielding is obtained from an inert gas such as helium or argon. Pressure may or may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

Inert-gas metal-arc welding. An arc-welding process wherein coalescence is produced by heating with an electric arc between a metal electrode and the work. shielding is obtained from an inert gas such as helium or argon. Pressure may or may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, p. 92.

Inert-gas shielded arc welding. Metal cutting with the heat of an arc in an inert gas, such as argon or helium. ASM Gloss.

Inert-gas shielded arc welding. Arc welding in an inert gas, such as argon or helium. ASM Gloss.

Infertility. The reluctance of a body to change its state of rest or of uniform velocity in a straight line. Infertility is measured by mass when linear velocities and accelerations are considered and by moment of inertia for angular motions (that is, rotations about an axis). C.T.D.

Infiltration. This term was proposed to simplify the nomenclature of coal petrography by combining, in a single term, the group of the following macerals: micrinite, semifusinite, fusinite, and fusain. Infiltration is based on certain similarities in the technological properties of the four macerals: the term indicates definitely that the constituents are totally inert, but only that they are more inert than the macerals of the other two groups, particularly in carbonization processes in which they behave as diluents. IHCP, 1963, part I.

Inert primer. A cylinder of inert material which embodies a detonator, but which does not interfere with the detonation of the explosive charge. B.S. 3618, 1964, sec. 6.

Inerts. Constituents of a coal which decrease its efficiency in use, for example, mineral matter (ash) and moisture in fuel for combustion or fusion in coal for carbonization. B.S. 3552, 1962.

Inesite. A rose- to flesh-red prismatic mineral with 1 perfect and 1 less perfect cleavage, (2Mn,Ca)0.2 SiO3·H2O; X-ray study gives formula Mn1CaSi3O8(OH)-5H2O, indicating a hydrous thomsonite. Nelson, p. 173.

Infection. Communication of disease, as by contagion, in which direct or Indirect contact with an organism in any manner; distinguished from contamination, in which there is no direct or indirect contact with a disease is implied. Standard, 1964.

Infective jaundice. Men working in mines served by drifts and adits are subject to occasional attacks of this disease which is often fatal. It is caused by a micro-orga-
inferior coal. Usually middlings in a vein. A vein in which the minerals are of lesser value.

Inflatable seal. A seal made from polyvinylchloride reinforced with glass fiber. P. is an advantage in terms of being able to make the seal conform to the shape of the opening.

Inflammable cinnabar. A mixture of cinnabar, sulfur, and quartz.

Inflow. Water, other liquid, or gas seeping or flowing from rocks into a borehole or other underground opening. Long.

Influence line. An influence line usually pertains to a particular section of a beam, and is a curve so drawn that its ordinate at any point represents the vertical displacement at that point due to the reaction at the section.

Influence zone. The formed lower part of the crust. Schieferdecker.

Infra. Trademark for a refractory insulation, available only in brick form. Suitable for use at temperatures up to 2,700° F. Used in primary lining of electric furnaces and kilns. C.C.D. 6d.

Infusible. Not fusible by heating from solid to liquid state under specified conditions of pressure, temperature, and time. Pryor. 5.3.

Infusion shot firing. A technique of shot firing in which an explosive charge is fired in a shot in which a liquid, gel, or other nonexplosive substance is used to transmit the energy of the charge to the rock. B.S. 3618, 1964, sec. 5.

Ingate. The point of entrance from a shaft to a level in a coal mine. Standard, 1964. See also inset.

Inguinae (Inguese) ear. Scot. A drift or mine starting from the surface of the ground; also, the end of the mine at the surface.

Inguinate. A general term for igneous rocks created within or below. The term was extended to include metamorphic rocks as well as igneous rocks. Holmes, 1920.

Ingersoll-Rand turbo columns. Columns consisting of vertical cylinders to which are attached the arms on which the drills are mounted. The carrying arms are in motion of very fine particles. Osborne.

Ingot header. In ore dressing, smelting, and refining, one who pours molten aluminum, copper, or other nonferrous metals into solidifying ingots to compensate for shrinkage that occurs when ingots cool in their molds. Also called bolt header; casting header; header; ingot pipe filler; pipe-out man. D.O.T. 1.

Ingot iron. Iron of comparatively high purity, produced in the same way as steel, in the open-hearth furnace, but under conditions that keep down the carbon, manganese, and silicon content. C.T.D.

Ingot metal. Any metal which, while molten, is prepared into molds, either as a temporary massive shape suitable for further working by rolling or forging. Standard, 1964.

Ingot mold. The mold or container in which molten metal is cast and allowed to solidify in order to form ingots. C.T.D.

Ingot pitch. The chemical condition in which metal is fit to be cast into ingots. Standard, 1964.

Ingot saw. A saw, run at a high rate of speed and having at its cutting edge a fusing
ingot saw

ingot structure. The general arrangement of crystals and inclusions in an ingot, which consists typically of chill, columnar, and equiaxed crystals. According to the relations between the structure of the ingot and the constituent materials of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

ingrain. Eng. A portion of coal given above the quantity purchased for good measure; usually a quarter-chaldron added to five chaldrons. Say.

ingredient. The primary and higher order reactants of the chemicals or constituents of the molding compound, such as plasticizer, lubricant, solvent, catalyst, stabilizer, fire retardant, hardener and coloring material. BuMines R.I. 5971, 1962, p. 3.

ingress a. A place for entering; a way of entering the sea at a given point. Webster 2d. b. In underground bituminous mining there are three methods of ingressby drift, shaft, or slope. Drift mines are opened by driving horizontally from the side of an elevation into the seam; shaft mines by sinking a vertical shaft through the overlying strata into the seam; and slope mines by driving an inclined entry through the overlying strata down the face into the seam. *C.G.I.

ingression. The entering of the sea at a given place. Schieferdecker.

ingression coast. Coast, the lower parts of which have been invaded by the sea (drowned valleys, bays, etc.). Schieferdecker.

ingrown meander. A meander deepened as a result of the rejuvenation of a stream course as from downvalley tilting. A.G.I. Supp.

insalation. Something from or through which ore is carried specifically, an appliance or apparatus of different forms and uses; such as, (1) for taking the chill from the air before it reaches the lungs, or for preventing or other injurious substances from the air breathed through it, (3) for administering medicaments or anesthetics by inhalation, or, 4) for permitting the supply of fresh air to a diver or miner. Standard, 1960, p. 800.

insalation cable; digging line. In a cable excavator bucket is pulled toward the dump point. Nichols.

insalation orifice or aperture by which material is brought into or from the excavation. A.G.I.

insalation line or mechanism by which a cable excavator bucket is pulled toward the dump point. Nichols.

insalation line. In a cable excavator the line that pulls the bucket to dig and bring in soil. Nichols.

insalation. a. The minerals or inorganic substances in coal which were present in the original plants that ultimately formed the coal and which cannot be removed by cleaning and normally to about 1 percent. Also called constitutional ash. Nelson, b. Widely used to designate the part of the ash content of a coal that is structurally part of the coal itself and cannot be separated from it by any mechanical means. Also referred to as fixed ash. Mitchell, 60, p. 60. Called dirt. Opposite of free ash. Pryor.

insalation bursts. Rock bursts that occur in development. They may be divided into two classes—those due to violent arching and those occasioned by the influence of fissures or adjacent excavations on the strata. *C.G.I.

insalation floatability. Property considered by some physicists to be possessed by certain naturally occurring minerals, which readily respond without pretreatment to levitation by the frictionless principle; by other workers considered due to slight surficial contamination during mining and trans- portation. A.G.I.

inherent mineral matter. That portion of the mineral matter of coal organically combined with the coal. It contains elements that have been assimilated by the living plant, such as iron, phosphorus, sulfur, calcium and magnesium. A.G.I.

inherent settlement. The sinking of a foundation caused by the loads it superimposes on the soil below it, rather than by the loads on any adjacent foundation. See also interference settlement. *Ham.

inherited characteristic (of soil). Any characteristic of a soil that is directly attributable to the nature of the parent material as contrasted to those characteristics partly or wholly attributable to the processes of soil formation. Example, the red color of a soil is inherited if it is caused entirely by the fact that the parent material was red. Stokes and Varnes, 1955.

inherited stream. Proposed by Shaler for the type now known as a superposed stream. Obsoleto. A.G.I.

inherited structure. An original structural feature of the country rock that has been faithfully preserved after its replacement by ore. Schieferdecker.

inhibiting pigment. Certain pigments, such as zinc chromate which are added to paints, varnishes, and cements to set; also, a substance added to drilling mud to check or inhibit the corrosion of metals. Taylor.

inhibitor. a. A substance which, when added to cement, has the capacity to slow down or lengthen the normal time required for the setting or hardening. Since, or for permitting the supply of fresh air to a diver or miner. Standard, 1960, p. 800.

injection gneiss. A gneiss, the banding of which is inherited if it is caused entirely by the processes of soil formation, there were older rocks adjacent to it. Stokes and Varnes, 1955.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

injection pressure. The total amount of pressure required to force a liquid or grout through the strata preceding primary consolidation. Also called initial compression. ASCE PI826.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.

injection pressure. The total amount of pressure required to force a liquid or grout into the mass and the temperature of the molten metal and mold respectively, one or two types of crystals may be absent. C.T.D.
injection pressure

into cracks, cavities, and pores in rocks or other substances. Long.

injection theory. The theory that a vein was filled first with molten mineral. Fay.

injection moulding. See injection mould.

injector. a. Any apparatus used to force, under pressure, material into an opening in a metal container. Compare cement injector. Long. b. A device used to force food water into a boiler by the direct action of steam. Long. c. Mechanism used for spraying fuel oil into the combustion-type engine or to spray a fine oil mist into a stream of air or steam. See also line oiler. Long.

injunction. A judicial order or process, operative upon the person requiring the party to whom it is directed or to (usually) refrain from doing some designated thing. Style Guide, p. 60.

injury. In mining, personal damage resulting from accidents. Fay.

ink. Ceramic. An inorganic coloring material suspended in a suitable oil vehicle. Also known as tourists. Fay. 

inkstone. a. Native copperas (melanterite), or a stone containing it. Used in inking. Webster 2d. b. A stone slab used in use. Webster 2d.

inner barrel. Synonym for inner tube. Long.

inner core. The center of the earth which geologists believe is solid, dense material. MacCracken.

inner depression; central depression. Low in a structure; desert. Long. c. Mechanism used for spraying fuel oil into the combustion-type engine or to spray a fine oil mist into a stream of air or steam. See also line oiler. Long.

inner-face stone. See inside-face stone. Long.

inner mantle. The lower part of the mantle. Schieberdecker.

inner-segmental. The inner-segmental line surrounding the area hit by the strongest gas. Schieberdecker.

inner-stone. A diamond inset on the inside wall of a half or a round. Long.

inner tube. The inside tube which acts as the core container of a double-tube core barrel. Long.

inner-tube adapter. A tubular part that can be attached to the inner-tube of EXT- and AXT-letter-name core barrels to adapt them for use with EXK- and AXK-letter-name blocks and shafts, sometimes incorrectly used as a synonym for lifter case. Long.

inner-tube core lifter. A core lifter designed to fit and work inside a tubular container fitted to the lower end of the inner tube of a double-tube core barrel. Long.

inner-tube extension. A tubular part attachable to the lower end of the inner tube of a double-tube core barrel to lengthen the inner tube; also, sometimes incorrectly used as a synonym for lifter case. Long.

inner-tube shoe. The replaceable lower end of an inner tube of a double-tube core barrel. Long.

insensible perspiration. The normal condition of the skin in which only slight perspiration or sweating takes place. No moisture is perceptible because it evaporates as it is formed. Spalding, p. 227.

insensate. During the present surface but not consequent on nor controlled by the structure; descriptive of a certain type of streams, drainage, and dissection. A type of drainage in which young streams flowing on a nearly level plain wander irregularly. Fay.

insensitive stream. a. Sometimes no guiding weak structures are revealed on the consequent valley sides. Such is the case when the rocks are either homogeneous or horizontally stratified. Then a later, more effective stream growing headwards is acciden tally located. Insequent may be applied to such a stream. A.G.I. b. A stream, the course of which is not set by the direction of the surrounding rock, that it had when it was formed. See also in situ. Fay.

in-place. Rock occupying the position, relative to surrounding rock, that it had when it was formed. If an ore body is continuous in the extent that it maintains the character it had when it was formed, then it is in-place. See also in situ. Fay.

in-person. Ore fed into the mill as opposed to output. Sinclair, W. E., p. 484.

input shaft. The shaft that delivers engine power to a transmission or clutch. Nichols.

input well; injection well. A well used for injecting fluids into an underground stratum. Institute of Petroleum, 1961.

in quartzation; saussurization. In bullsey argument, dissolution of silver from associated gold by use of nitric acid. For this to succeed, the silver/gold ratio must be at least 3 to 1. Pryor, 3.

intrashore. See after frontal. Cooper, p. 195.

intrashore bar. A sudden and often overwhelming flow of water from mole wash-in. Intrashore wash of water may be caused by striking unconsolidated old workings which possibly were shown accurately on the mine plans. Faults have also been reported for serious inflows of water. A fault may retain large volumes of water above or at the same level as workings approaching it. It is usual to drive exploring headings in the direction of the suspected water danger. See also intrashore.

insetberg. a. A prominent steep-sided residual hill or mountain rising abruptly from a plain, a type of landscape common in Africa. The residuals are generally bare and rock large and small, isolated, and in hill and mountain groups. They are surrounded by lowland surfaces of erosion which (distinguished from peneplains), A.G.I. b. An isolated mountain partly buried by the debris retreat and overlapping its slope. Webster 3d.

insensitive. During the present surface but not consequent on nor controlled by the structure; descriptive of a certain type of streams, drainage, and dissection. A type of drainage in which young streams flowing on a nearly level plain wander irregularly. Fay.

Insensitive perspiration. The normal condition of the skin in which only slight perspiration or sweating takes place. No moisture is perceptible because it evaporates as it is formed. Spalding, p. 227.

insequent. Developed on the present surface but not consequent on nor controlled by the structure; descriptive of a certain type of streams, drainage, and dissection. A type of drainage in which young streams flowing on a nearly level plain wander irregularly. Fay.

insequent stream. a. Sometimes no guiding weak structures are revealed on the consequent valley sides. Such is the case when the rocks are either homogeneous or horizontally stratified. Then a later, more effective stream growing headwards is accidentally located. Insequent may be applied to such a stream. A.G.I. b. A stream, the course of which is not set by the direction of the surrounding rock, that it had when it was formed. See also in situ. Fay.
insert
cobalt-tungsten carbide mixture (in which diamonds may be inset), brazed into slots or holes or grooves cut or drilled into the outside surface of a reaming shell to act as cutting points, reaming surfaces, or wear-resistant tips or surfaces of reaming shells or outside surfaces of other pieces of drilling equipment or fittings. Also called insets. Compare slug. Long. d. Anything placed in a hole, groove, or slot prepared for it. Long.

insert bit. A bit into which inset cutting points of various shaped pieces of hard metal (usually a sintered, tungsten carbide-cobalt powder alloy) are brazed or hand-peened into slots or holes or cut into a blank bit. Hard-metal inserts may or may not contain diamonds. Also called slug bit. See also insert. Long.
insired-blade cutters. Cutters having replaceable blades that are either set or tipped and usually adjustable. ASM Gloss.
insired-joint casing. Casing, the box-thread ends of which are belled or split outward to receive the pin-thread portion of another piece of casing when coupled together; also, sometimes incorrectly used as a synonym for flush-coupled casing. Long.
insired nut. A term designating a disk, segment, or cylinder wheels with nuts imbedded in the back to facilitate mounting on the grinding machine. ACGS, 1963.
insired rod-type pick. See sintered carbide-tipped pick. Long.

insert reaming shell. A reaming shell the reaming diameters of which are inset in shaped, hard, metal plates brazed into grooves cut into the outside surface of the shell. Long.
insert set. Bits or reaming shells set with inset blades. Long.

insert. a. Eng. The entrance to a mine or tunnel. Also called the long entry, but not to facilitate movement in the face or back of the mine. Long.

insert reaming shell. A reaming shell the reaming diameters of which are inset in shaped, hard, metal plates brazed into grooves cut into the outside surface of the shell. Long.
insert set. Bits or reaming shells set with inset blades. Long.

insert. a. Eng. The entrance to a mine at the bottom or parallel to the sides of a shaft where the cages are loaded. A landing. Fay. b. The entrance to underground roads from the shaft. Mason. c. Also called the opening from the mine shaft to a seam of coal. C.T.D. d. A surface into which diamonds or other cutting points are embedded or set; also, the act or process of embing such materials in a surface. Long. e. See phenocryst. A.G.I.

insert box. A box having a channel designed to be mounted in an inset to enable a connection to be taken from a shaft cable. B.S. 3618, 1965, Sec. 7.

ins洞察. The region shoreward of a certain depth of water, the 3- or the 5-fathom isobath. Hy.

ins洞察 currents. The movement of water inside the surf zone, including longshore and rip currents. Hy.

ins洞察 water. Water, contiguous to land in which the physical properties are considerably influenced by continental conditions. Hy.

inside. A term often used to designate the interior of a mine. Fay.
inside angling. See angle of inclination. SINCLAIR, V. p. 33. INSIGHT. The difference between the outside diameter of a core and the inside diameter of the core barrel passes through the core, inserts cutters; also, the annular space between the inner and outer tubes in a double-tube core barrel. See also ins洞察. Long.
inside coupled. Coupled in the same manner as flush-coupled casing. See also flush-coupled casing. Long.
inside face. That part of the bit crown nearest to and parallel with the inside wall of an annular or coring bit. Long.
inside foreman; inside superintendent. An underground foreman or superintendent. Fay. See also pit boss; shift boss.
inside gage. The inside diameter of a bit as measured between the cutting points, such as between inset inserts on the inside-wall surface of a core bit. Long.
inside-gage stem. A diamond set in the inside-wall surface of the crown of a diamond core bit so that it cuts sufficient inside clearance to permit the core to pass through the bit shank and into the core barrel without binding. Also called inner stone; inside gage stone. Long.
inside-haulage engineer. In bituminous coal mining, one who operates a mine locomotive to haul trains of cars along underground haulages ways in a mine. D.O.T. 1.
inside kicker. Same as inside-gage stone. Long.
inside parting. A side track or parting some distance from the beginning of a long entry, at which cars are left and picked up by a gathering driver. Also called a swing parting. Fay.
inside reamer. Same as inside-gage stone. Long.
inside slope. a. A slope on which coal is raised from a lower to a higher entry, but not to the surface. Fay. b. An inside slope is a passage in the mine through which coal is brought up from a lower level. Korson.
inside stope. Same as inside-gage stone. Long.
inside tap. A tapped, externally threaded fishing tool, which is inserted inside the open ends of all drill holes which are left in the borehole and, when turned, grips and holds them so that they may be lifted and recovered. Long.
inside thread. Same as box thread. Long.
inside upset. A tubular piece having ends that are thickened for a short distance on the inside. Long.
inside work. a. The drilling of boreholes in underground workplaces; also applied to work done on the surface with the drill machine and tripod completely housed. Long. b. Any work in the mines. Most commonly used in bituminous coal mining. Bureau of Mines Staff.
inside work. In situ. The natural or original position. Webster 3d. Applied to a rock, soil, or formation when in the situation in which it was originally formed or deposited. See also in place. Fay.
inside combustion. An experimental means of recovery of bituminous coal having high and very high viscosity which is unrecuperable by other methods. The essence of the method is to heat the oil in the horizon to increase its viscosity, and then cool it to increase its viscosity. Heat is applied by igniting the oil sand and keeping the fire alive by the injection of air. The heat breaks the oil down into coke and lighter oils and the coke catches fire. As the combustion front advances, the lighter oils move ahead of the fire into the bore of a producing well. Williams.
inside concrete. Concrete which is deposited in the place where it is desired to harden as a part of the structure, as opposed to precast concrete. Taylor.
inside concrete piles. Concrete piles formed by pouring concrete into holes bored or driven into the ground, as distinct from precast concrete piles driven or jacked into the ground. See also bored pile. Ham.
inside origin theory. The theory of the origin of coal that holds that a coal was formed where the plants from which it was derived grew. See also autochthonous coal; swamp theory. A.G.I.
inside soil tests. Tests carried out on the ground, in a borehole, trial pit, or tunnel, as opposed to a laboratory test. An inside soil test may be a vane test, dynamic penetration test, etc. Nelson.
solubility. The absorption of solar energy by the surface of the earth. Law.
solubility anode. a. incapable of being dissolved in a particular liquid. Shell Oil Co. b. Term used of solid which gives off soluble material. Pryor, 3. c. As used in smelter contracts, the term insoluble or silica are often used interchangeably, but they are not synonymous. Pryor, 3. d. As used in smelter contracts, the term insoluble or silica are often used interchangeably, but they are not synonymous. Pryor, 3. e. As used in smelter contracts, the term insoluble or silica are often used interchangeably, but they are not synonymous. Pryor, 3.
solubility index. A measure of the relative fluidity of an inspissated material as compared to water. Insoluble is the term used to designate fluidity of the original state. As the combustion front advances, the lighter oils move ahead of the fire into the bore of a producing well. Williams.
solubility index. A measure of the relative fluidity of an inspissated material as compared to water. Insoluble is the term used to designate fluidity of the original state. As the combustion front advances, the lighter oils move ahead of the fire into the bore of a producing well. Williams.
solubility index. A measure of the relative fluidity of an inspissated material as compared to water. Insoluble is the term used to designate fluidity of the origin of coal that holds that a coal was formed where the plants from which it was derived grew. See also autochthonous coal; swamp theory. A.G.I.
instantaneous cuts

instantaneous cuts. Cuts characterized by the drilling and ignition being done so that all the holes can cooperate and break small coal pieces. They are called instantaneous cuts as they are preferably ignited by instantaneous detonators to ensure a simultaneous detonation of all holes, particularly in the cut. Some examples are: blajo-cut; WP-cut; presplit cut. Langeoer, pp. 193-194.

Instantaneous detonator. A detonator in which there is no designed delay period between the passage of an electric current through the detonator and its explosion. B.S. 3618, 1966, sec. 6.

Instantaneous fuse. Term used to distinguish rapid-burning from slow fuse. Ignition rate is several thousand feet per minute, but slower than that of detonating fuse. Pryor, 2, Example: PETN.

Instantaneous relays. These relays, as their name implies, operate within a few cycles after faults are detected. Coal Age, v. 71, No. 8, August 1966, p. 270.

Institution of Mining and Metallurgy screen scale; I.M.M. screen scale. Laboratory screens of usual 8 inch round size, in which the diameter of each new wire is equal to the distance between successive parallel wires. Therefore, in a 60 mesh screen (having 60 wires per linear inch measured along either the warp or the woof) the aperture is a square measuring 1/120th inch on the side. The meshes used are 5, 8, 10, 12, 16, 20, 30, 40, 50, 60, 70, 80, 90, 100, 120, 150 and 200. Pryor, 2.

Instroke. The right to raise or take ore from an adjoining mine. Ricketts, p. 34.

Instrumentation. Control by servo-mechanisms. Use of signaling devices originating with the process to indicate, vary or regulate its value. Pryor, 3.

Instrument transformers. Their purpose is to insulate the relays from line voltage and to reduce line current and voltage to values that can be applied to the sensitive mechanisms common to relays. These devices are classified with respect to the rate of speed at which they operate. Basically, these classifications are: (1) instantaneous; (2) time delay; and (4) high-speed; (3) time delay; and (4) high-speed. B.S. 3618, 1966, sec. 6.

Insulating water bottle. In oceanography, an instrument used for the accurate determination of the temperature of the sea at moderate depths. Also called Nansen-Peterson water bottle. C.T.D.

Insulation. a. If electric separation of a conductor or between conductors, or on the periphery from conductors by means of a nonconducting barrier. Pryor, 3. b. If thermal, prevention of passage to or from a body of external heat, by use of nonconducting envelope. Pryor, 3. c. See capacity insulation. ACCG, 1963.

Insulation resistance. a. The alternating-current resistance between two electrical conductors or between a conductor and an insulating material.

Integral action. Regulating movement proportional to the magnitude and duration of the error under scrutiny. Pryor, 3, 31.

Integral control. In automation, progressive restoration of a correct running condition after deviation has occurred so that no overshoot occurs. Pryor, 3.

Integral pilot. A pilot-type noncoring bit having a pilot section that is an integral, nonreplaceable part of the bit. Long.

Integral train. A long string of cars, permanently coupled together, that shuttles endlessly back and forth between one mine and one generating plant, not even stopping to load and unload, so that rotary couplers permit each car to be flipped over and passed by the tender. B.S. 3618, 1966, sec. 6.

Insulator-tube header. One who forms heads over porcelain tube insulators by means of a mandrel or mandrel inserted in a tube in machine and pulling lever to form the head. Long.

Inteep. Term applied to the lower part of a glass container if the sides curve inward or taper downward. See also bottle head.

Intact clay. A clay without visible fissures. See also fissured clay. Ham.

Integrate. To insulate the resistance of a body of electric current through the insulation of the way between two systems of conductors or between two systems of conductors and earth or from earth to or from other conductors by means of a nonconducting barrier. Pryor, 3.

Integrated train. Value of the insulation resistance of a cable or of an electric motor is very high, but it is inversely proportional to the square of the radius or diameter of the cable, since each section of the cable forms an additional parallel path for any leakage current. Mason, V. 2, p. 358.

Insulators. a. A supporting device made of porcelain, glass, or the equivalent. Insulated J hooks are acceptable for use with insulated cables in temporary installations. BuMines Coal-Mine Inspectors' Manual, June 1966, Pt. 3-16e, p. 51. b. That which conducts electricity especially: (1) a substance that is a nonconductor of electricity, heat, or sound; (2) a device made of an insulating substance for preventing the passage of electricity, heat, or sound. Standard, 1964.

Integrated train. In the mining industry, an integrated train is one that is incised or sunken, in contrast to ornament in relief.
integrated train

interferometer. A device for determining relative X-ray intensities during radiography in order to control exposure time. NRC-ASA N1.1-1957.

intercept. The length of a crystallographic axis between the origin of the crystallographic axes and the intersection of the crystallographic axis with the crystal face. The ratio p, the intercepts a crystal face makes with all the crystallographic axes constitutes a parameter that defines the crystal face. Bureau of Mines Staff.

intercepting channel. A channel excavated at the foot of a hill or in the foot of a slope, or at other critical places to intercept surface flow; a catch drain. Stedle, 1.

interception. A circuit whose output is substantially proportional to the time integral of the input. NCIC.

intensive. Term used to describe an anomaly whose metal values rise sharply to well-defined peaks. Haukse, 2, p. 154.

intensitometer. A device for determining definite X-ray intensities during radiography in order to control exposure time. NRC-ASA N1.1-1957.

intensity. a. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.
b. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

c. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

intensity scale. A scale for objectively measuring the relative intensities of earthquakes. Schieferdecker.

intensity level (sound energy flux density level). The intensity level, in decibels, of a sound 10 times the logarithm to the base 10 of the ratio of the intensity of this sound to the reference intensity. The reference intensity must be stated explicitly. Hy.

intensity of magnetization. The magnetic moment per unit volume. A.G.I.

intensity of pressure. The pressure per unit area. Schieferdecker.

intensity of radiation. At a given place, the energy per unit time entering a sphere of unit area at the earth's surface. National Bureau of Standards.

intercalation. The development of large crystals from small ones by recrystallization. G.S.A. 4th Series, p. 129.

intercalate. A circuit whose output is substantially proportional to the time integral of the input. NCIC.

intercalary. Inserted or coming between others; introduced or existing interstitially; as, intercalary beds. Fay.

intercalary beds. Fay.

interception. A circuit whose output is substantially proportional to the time integral of the input. NCIC.

intercoolers. a. A common form of intercooler is a horizontal cylindrical chamber containing a number of thin, wrought-iron or brass tubes, like a condenser for a steam engine, through which the cooling water circulates. Air passes between the tubes, and baffle plates direct the air to all parts of the intercooling chamber. Well-designed intercoolers through which a proper amount of water is circulated will cool the air to within 15° to 20° F of atmospheric temperature. Lewis, p. 670. b. A radiator in which air is cooled while moving from low pressure to high pressure cylinders of a two stage compressor. Nichols. c. In multistage compression of air, cooling arrangement between stages. Pryor, 3.

intercooling. Extraction of heat from a compressed gas between two stages of compression in order to improve the efficiency of compression. Strock, 10.

intercrystalline. Between the crystals, or grains, of a mineral. A.G.I.

interdural. Occurring between beds, or lying in a bed parallel to other beds of a different material; same as interstratified. Fay.

interduriary. Inserted or coming between others; introduced or existing interstitially; as, interduriary beds. Fay.

interfere. To interfere generally with a body of one kind of material interlaminated with another and particularly to lamellar inclusions of one mineral in another, the former being oriented more or less exactly in planes related to the crystal structure of the latter, for example, in a peridotite, the intercalates of plagioclase in orthoclase, and in certain minerals characterized by schiller structure. Ham.

intercalated. Descriptive of a body of rock interbedded or interlaminated with another body of rock. Also, descriptive of a mineral interbedded or interlaminated with another mineral. A.G.I.

intercept. The length of a crystallographic axis between the origin of the crystallographic axes and the intersection of the crystallographic axis with the crystal face. The ratio p, the intercepts a crystal face makes with all the crystallographic axes constitutes a parameter that defines the crystal face. Bureau of Mines Staff.

intercept method. A method of determining grain size by counting the number of grains per unit length intersected by straight lines. ASM Gloss.

intercepts. a. That portion included between two points in a borehole as between the point where the hole first encounters a specific rock or mineral body and where the hole enters a different air or underlying rock formation. Long. b. Crystallography, the distances cut off on axes of reference by planes. Fay.

intercept time. See delay time. A.G.I.

interchange. The mixing of a tracer and an interfering X-ray intensities during radiography in order to control exposure time. NRC-ASA N1.1-1957.

intercolline. Placed between hills; specifically, a ridge between hills that is higher than the surrounding area. Schieferdecker.

intercommunication. The mixing of a tracer and an interfering X-ray intensities during radiography in order to control exposure time. NRC-ASA N1.1-1957.

interference. a. An instrument used to determine the crystal face. Bureau of Mines Staff.

interferometer. A. An instrument used to determine the crystal face. Bureau of Mines Staff.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometer. b. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.

interferometric. As applied to color, the comparative brightness (vividness) or dullness; the lack of brilliance; therefore, the variation of a hue on a vivid-to-dull scale. See also hue; tone. Schieferdecker.
interferometer

known lengths. The interferometer has been used to determine coefficient of expansion of enamels and glasses. Enam. Dist. B. An instrument that measures the change in the index of air containing various amounts of methane. Roberts, I. P. 88.

interfused. Applied to magmas which are discharged from a volcano by way of sub-surface cavities within the cone. See also superfused. Fay.

intergranular. Stony. An igneous body, similar to a sill, but intruded along a plane of unconformity and parallel to the bedding of one of the invaded formations. Stokes and Varnes, 1955.

intergranular. An. A. An age or time of comparatively warm climate between phases of glaciation. Webster 3d. B. Occurring or formed between two glacial epochs. Webster 3d.

intergranular. A textural term proposed by Evans (1916) and applied to volcanic rocks in which there is an aggregation of augite grains, not in parallel optical continuity (as in subphitic texture), between a network of feldspar laths, which may be dihedral, subhedral, or subparallel. Distincted from an intertextal texture by the absence of interstitial glass, or other substances which may fill the interstices between the feldspar laths. Characteristic of some basic and doleritic rocks. Compare intercrystal.

intergranular pressure. a. The effective pressure, as Ham. See effective stress. ASCE P1826.

intergranular pressure. A texture characteristic of intermediate (epithermal) neutron. A neutron which may extend from a raise or stope and may be either an intermediate drift or crosscut. Nelson.

intermediate oxides

Bo2, boron trioxide. Hansen.

intermediate packs. Packs built between gates with wastes on each side and usually supported by TIME.

intermediate principal stress. In an alloy or a chemical system, a distinguishable homogeneous stable phase which extends to any of the pure components of the system. ASM Gloss.

intermediate piece. See matching piece. Dodd.

intermediate principal plane. The plane normal to the direction of the intermediate principal stress. ASCE P1826.

intermediate principal stress. The principal stress whose value is neither the largest nor the smallest (with regard to sign) of the principal stresses.

intermediate (epithelial) reactor. A reactor in which the chain reaction is sustained mainly by intermediate stages.

intermediates. Oxides whose structural behavior in glass falls between the network forming and network modifiers. VV.

intermediate section. That part of a mining belt conveyor which consists of the framing and gear box, driven by the framing, both of which guide and support the belts between the head end and the tail end. There are two full-size belts: a (1) rigid side framed and (2) wire-rope side framed. NEMA MBI-1961.

intermediate shaft. A shaft which is driven by one shaft, and drives another. Nichols.

intermediate sight. In survey-leveling, reading on the staff at a point which is not to be occupied by the level, and is not to be used either as a back or foresight. Pryor, 3. See also random sample. Nelson.

intermediate transfer point. The point along a conveyor which may already be carrying a load, at which coal is delivered from another panel conveyor. Nelson.

intermediate vein zone deposits. These deposits are thought to have been formed at depths ranging from 4,000 to 12,000 feet below the surface and at a temperature between 300 and 700 degrees f. Such a deposit may take the form of a fissure vein, a series of parallel fissures called a sheeted zone, a single line of wall rock fissures or a large disseminated deposit. Much of the gold, silver, copper, lead, and zinc of the Western United States comes from such deposits. L. Lewis, p. 274.

intermediate water. The upper layers of water in the oceanic hydrosphere. That water originates in the arctic or in the antarctic convergence. Schieferdecker.

intermetallic compound. An intermediate phase in an alloy system, having a narrow range of homogeneity and relatively simple stoichiometric proportions, in which the nature of the atomic bonding can vary from metallic to ionic. ASM Gloss. See also intermediate constituent.

intermine. To intersect or penetrate with mines. Webster 2d.

intermittent filters. A reactor containing vibrating mechanism inserted into wet concrete to ensure that it is properly compacted. See also external vibrator. Ham.

intermittent waste. Barren rock between two or more veins (veins) or red which are mined simultaneously. Beerman.

international amperes. The current which, when passed through a solution of silver nitrate in water, will deposit silver at the rate of 0.001118000 gram per second. The unit of current in common use.

international low water. A plane of reference below mean sea level (msl) by the following amount: half the range between mean low water (mlw) and mean high water (mhw). Abbreviation, lw. Hy.

interpolation. A. A unit of weight equal to 200 milligrams. Long. b. See carat. a. Fay.

interparticle water. See interlayer water. VV.

interpenetration twin. Two or more individual crystals twinned into such a position that they penetrate each other. ASM Gloss.

interphase. In physical chemistry, the transition of one phase to another at constant temperature and pressure.

international combustion engine. An engine in which power is generated by burning within the cylinder a mixture of air and fuel. NSF Standard, 1964.

internal combustion engine. An engine whose pressure energy is produced by burning or exploding in its cylinder a mixture of air and fuel. NSF Standard, 1964.

internal grinding. Grinding an internal surface, such as that inside a cylinder or hole. ASM Gloss.

internal ribbon conveyor. A trunnion-supported revolving cylinder the inner surface of which is fitted with continuous or intermittent ribbed ribbon flighting. ASM Gloss.

internal stress. Residual stress existing between different parts of metal products, as a result of the differential effects of heating, cooling, or working operations, or of constitutional changes in the solid metal.

intermediate (intermediate) twin. Two or more individual crystals twinned into such a position that they penetrate each other. ASM Gloss.

internal stress. Residual stress existing between different parts of metal products, as a result of the differential effects of heating, cooling, or working operations, or of constitutional changes in the solid metal.

internal vibrator. A cylinder containing vibrating mechanism inserted into wet concrete to ensure that it is properly compacted. See also external vibrator. Ham.

internal waste. Barren rock between two or more veins (veins) or red which are mined simultaneously. Beerman.

interpolation. Assumption of a statistical value from its mathematical or graphical position intermediate in a series of determined points. Pryor, 3.

interpolation of contours. The process of drawing contour lines by inferring their plan position and trend from spot levels or from other contours, assuming the intervening ground to have uniform slope. Where the spot levels are sparse, the process requires knowledge of the land or lie of the seams. See also contour plan. Nelson.

interpole. An auxiliary pole placed between the main poles of a commuting machine. Lounshenreim.

interrupted-current plating. Plating in which the flow of current is discontinued for periodic short intervals to decrease anode polarization and elevate the critical current density. It is most commonly used in cadmium plate plating. ASM Gloss.

interrupter. A device, usually automatic, for rapidly and frequently breaking and making an electric circuit, as in an induction coil. Standard, 1964.

intersections. See also contour plan. Nelson.

intersection. a. To cut across or meet, as a bore hole cuts through a stratum of rock or
encounters a vein. Long. b. In mining, to cut across or meet a vein or lode with a passageway; also, the point at which a vein or lode cuts across an earlier formation.

**Intersecting lines.** Two lines that cross or cut each other. Jones, 2, p. 780.

**Intersect.** A vein which cuts across an earlier vein, Foy.

**Intersection.** a. The point at which a definite deflection of the trend of a borehole is made. Long. b. The point at which a drill hole enters a specific ore body, fault, or rock material. Long. c. Meeting of two ore bodies or veins, or the point at which a vein or ore body meets a fault, dike, or rock strata. Long. d. The point at which two underground workings connect. Long.

**Intersection angle.** The angle of deflection, as measured at the intersection point between the straight of a railway or highway curve. C.T.D.

**Intersection point.** That point at which two straight lines or tangents to a railway or road curve would meet if produced. See also tangent distance. Ham.

**Interstratification.** A mineral deposit localized along vein intersections or cross fissures; they are among the oldest known and the commonest types. Stakes and Varnes, 1955.

**Interstitial.** A texture characterized by the insertion, between or within divergent feldspar laths, of micas, biotite, hornblende, chlorite, or other primary or secondary minerals that take the form of the interstitial spaces. In interstitial basalt, the grains of augite rarely occupy the wedge-shaped spaces completely, but are brought into being by the groundmass of glass or its alteration products. Holmes, 1920.

**Interpersed carbide.** Small-size (one-eighth of an inch and larger), irregular-shaped fragments of tungsten carbide slugs mixed with a suitable matrix metal and applied to parts of tools, as a weldment. Also called clustered carbide. Long.

**Interstice.** a. An opening in anything or between things, especially a narrow space between the parts of a body or things close together; a crack, a hole, or grain; a chink, or a crevice. Stair, 1964, b. A space between mineral granules. Bateman.

**Interstitial.** Descriptive of void spaces; interstitial or contain water occupying part of the void spaces in the reservoir rock. Wheeler.

**Interstitial compounds.** Those formed when tungsten carbide admixture small single (such as those of hydrogen, boron, carbon, or nitrogen) into the interstices of their lattice. Also, interstitial deposits formed subordinately in other placing, as a weldment. Also called clustered carbide. Long.

**Interstratification.** a. A construction of a conveyor belt with intrinsically safe circuit: A circuit in which the coal can be broken by the

**Interstratified solid solution.** A solid solution in which the interstratification of the crystals occurs between the small mineral grains or other units of rock. A.G.I.

**Interstratification.** The state of lying between other strata; the condition of being divided by a bed, a turn, or more of a sedimentary deposit with reference to the overlying and underlying beds. Fay.

**Interstratified.** a. Interbedded; strata deposited between two points or depths in a borehole. Strata. b. Of coal and mineral material, associated in random horizontal layers, usually with a natural cleavage. B.S. 5552, 1962.

**Interstratified.** Between strata, Fay.

**Interstratification.** Generally considered to be the zone between mean high-water and mean low-water levels. Hy. See also littoral zone.

**Interstratification.** A zone between mean high-water and mean low-water levels. Hy. See also interstratification.

**Interstratinization.** A zone between mean high-water and mean low-water levels. Hy. See also interstratification.

**Interstratification.** a. The vertical distance between strata or units of reference, A.G.I. b. The contour interval is the vertical distance between two successive, commonly line on a topographic, structural, or other contour map. A.G.I. c. The flood plain is about 10 feet above low water, but is commonly over- flown by the floods of spring. This would be called bottomland in the Western United States. In New England, it is commonly termed island but along the Connecticut River, it is frequently known as meadow. A.G.I. d. The space between the river and the Will or mountains by which the level portion of the river valley is bounded. Obsolete. A.G.I. e. The distance between the river and the hills or mountains by which the point of intersection is made. Long. b. The point at which a vein or other mines or veins, or the point at which a vein or ore body meets a fault, dike, or rock strata. Long.

**Intersection.** a. The vertical distance between strata or units of reference, A.G.I. b. The contour interval is the vertical distance between two successive, commonly line on a topographic, structural, or other contour map. A.G.I. c. The flood plain is about 10 feet above low water, but is commonly over- flown by the floods of spring. This would be called bottomland in the Western United States. In New England, it is commonly termed island but along the Connecticut River, it is frequently known as meadow. A.G.I. d. The space between the river and the Will or mountains by which the level portion of the river valley is bounded. Obsolete. A.G.I. e. The distance between the river and the hills or mountains by which the point of intersection is made. Long. b. The point at which a vein or other mines or veins, or the point at which a vein or ore body meets a fault, dike, or rock strata. Long.

**Intersection.** a. The vertical distance between strata or units of reference, A.G.I. b. The contour interval is the vertical distance between two successive, commonly line on a topographic, structural, or other contour map. A.G.I. c. The flood plain is about 10 feet above low water, but is commonly over- flown by the floods of spring. This would be called bottomland in the Western United States. In New England, it is commonly termed island but along the Connecticut River, it is frequently known as meadow. A.G.I. d. The space between the river and the Will or mountains by which the level portion of the river valley is bounded. Obsolete. A.G.I. e. The distance between the river and the hills or mountains by which the point of intersection is made. Long. b. The point at which a vein or other mines or veins, or the point at which a vein or ore body meets a fault, dike, or rock strata. Long.
intrinsically safe machine

intrinsic safety. In a circuit; safety such that any sparking that may occur in that circuit in normal working, or in reasonable fault conditions, is incapable of causing an explosion of the prescribed inflammable gas. NCB.

introduction column. In casing a borehole, the highest and first column that is inserted. Stokes, v. 1, p. 85.

intrusion. a. In geology, a mass of igneous rock which, while molten, was forced into or between other rocks. Fay. b. A mass of sedimentary rock occurring in a coal seam. B.S. 3618, 1964, sec. 5.

intrusion breccia. Breccia created during the process of workings in an igneous material. Stokes and Barnes, 1955.

intrusion displacement. Faulting coincident with the process of workings in an igneous material. Fay.

intrusion grouting. A method of placing concrete by intruding the mortar component in position and then converted to concrete by intruding the mortar component into its voids. One of the chief advantages of the method is that it permits the placing of concrete underwater. Carst, 2, p. 112.

intrusive. In petrology, having, while molten, penetrated into or between other rocks, but solidifying before reaching the surface; said of certain igneous rocks; nearly the same as plutonic and contorted with effusive or extrusive. Fay.

intrusive contact. A contact between an igneous rock and some other rock indicating that the igneous rock is the younger. The younger rock may send dikes into the older rock, have inclusions of the older rock, or be chilled against the older rock. AGI.

intrusive rock. A rock that consolidated from magma beneath the surface of the earth. See also plutonic igneous rock. AGI.

intrusive vein. A true vein that is supported on a spring. Schieff.

in turbulence. The property of some silicates, notably of perlite, of expanding perrnicious feldspar (mostly orthoclase, but in part plagioclase), sparsely distributed hornblende or micas, and interstitial quartz. Holmes, 1928.

inverse. a. A folding back of rock strata or beds. Fay. b. The floor, bottom, or lowest part of an invert. Ham.

inverse Poisson. A name to replace iodobromite and iodargyrite. See iodyrite. Fay.

inverse pendulum. An instrument in which the displacement of the pendulum bob from its voids. One of the chief advantages of the method is that it permits the placing of concrete underwater. Carst, 2, p. 112.

inverse square law. Law which governs such matters as intensity-effects of light, magnetic flux, radioactivity, and the effect at a point R due to an emitting source E varies as the square of the distance, ER'.

inversion. a. A folding back of rock strata upon themselves by which their sequence seems reversed. Webster 3d. b. An increase upon themselves by which their sequence varies as the square of the distance, ER'.

inversion point. A change in the internal structure of a mineral at a given temperature. Bateman.

inversion point. A change in the internal structure of a mineral at a given temperature. Bateman.

inverted. a. The floor, bottom, or lowest part of the internal cross section of a conduit. Sezey, 1. b. The curved floor of a tunnel. Sandstrom. c. A flat, inverted arch of masonry used for the floor of the tunnel lining. Stauffer. d. The inside bottom of a pipe or tunnel. Nichols.

inverted fold. See overturn.

inverted head and bench. See heading-overhand bench. Fraenkel.

inverted pendulum. An instrument in which the displacement of the pendulum bob from its voids. One of the chief advantages of the method is that it permits the placing of concrete underwater. Carst, 2, p. 112.

inverted plung. A plunge of a fold such that the younger rocks plunge beneath the older rocks. AGI.

inverted relief. A topographic configuration of valleys and ridges in which the former occupy the sites of anticlinal folds and the latter, the sites of synclinal folds. The topography is thus the inverse of the geologic structure. Stokes and Nourse, 1955.

inverted siphon. A. A pipeline crossing over a depression or under a highway, railroad, canal, etc. The term is common but inappropriate, as no siphonic action is involved. The term sag pipe is suggested as a substitute. Sezey, 1. b. A pipe or tube in the shape of a siphon, but inverted, as for carrying water across the depression of a ravine to a lower level. Standard, 1964. c. See drowned level. B.S. 3618, 1963, sec. 4.

inverted strata. Strata that have been bent over due to increase and long-continued lateral pressure. A shaft or borehole put down in such ground may intersect the strata several times. Sezey, 1. b. A pipe or tube in the shape of a siphon, but inverted, as for carrying water across the depression of a ravine to a lower level. Standard, 1964. c. See drowned level. B.S. 3618, 1963, sec. 4.

inversion stratification. A process for the casting of small metal components to a close tolerance. In the usual process a wax replica of the part to be cast is coated (invested) with refractory powder, suitably bonded, and the whole is then warmed (150° C) to melt out the wax, thus, the alternative name lost-wax process; the refractory mold is then fired at 1,000° to 1,100° C. The refractory use may be powdered sillimanite or alumina, or specially prepared cristobalite; the latter is particularly used in the application of the process in dentistry. Dodd.

investment compound. A mixture of a graded refractory filler, a binder, and a liquid vehicle, used to make molds for investment casting. ASM Gloss.

investment mold. The refractory mold used in precision molding. Osborne.

invisible light. A term used to refer to certain radiations of light traveling in wavelengths too short or too long to be distinguished by the human eye, such as ultraviolet light and infrared light. See also visible light. Shipley.

inwall. a. The refractory lining of the stack of a blast furnace. See also stack, c. Dodg. b. The interior wall or lining of a shaft furnace. Fay.

inwall brick. Fire clay brick for use in lining the internal section of a blast furnace. A.R.I.

inyoite. A colorless hydrous borate of calcium, 2Ca0.3B101.13H*0. Monoclinic. Large tabular crystals commonly altered to meyerhoffiter. From Inyo County, Calif.; Hillsborough, New Brunswick. English.

iodate. See iodide, Fay.

iodatecamite. The artificial compound CuIOH; subsequently shown to be an analogue of holocellulite. Renamed accordingly. Hey, M.M., 1964.

iodate. A salt or ester of iodic acid; a compound containing the iodic acid radical. Fay.

iodobromite. A name to replace iodyrite whose composition is not definite. Used to
iodine process for producing titanium. This
iodine process. The process developed by
van Arkel and de Boer; is used
hafnium produced by the van
iodide. A compound of iodine with one other
iodine pentoxide method. Accurate determi-
iodimetry; lodometry. Volumetric analysis in-
iodine on a hot wire. Also
van Arkel and de Boer; is used
iodide to release free iodine, or conversely
iodine. The basis of reaction is
iodine. The amount of free alkali in a freshly fractured surface
iodine; the surface is then exposed to moist air at 18°
iodine is again determined. Any increase in free alkali is taken
iodine is the cause of goiter.

iodobromite. A chloride, iodine, and bromide of silver related to cerargyrite, Ag(Cl,I),
iodometric. See also iodimetric.

iodide process for producing titanium. This
iodine metal. Hafnium produced by the van
iodide to form volatile tetra-
iodobromate. A chloride, iodide, and bromide
iodine. The artificial compound Phi-
iodine. The basis of reaction is
iodide to release free iodine, or conversely
iodine. The amount of free alkali in a freshly fractured surface
iodine; the surface is then exposed to moist air at 18°
iodine is again determined. Any increase in free alkali is taken
iodine is the cause of goiter.

iodobromite. A chloride, iodine, and bromide of silver related to cerargyrite, Ag(Cl,I),
iodometric. See also iodimetric.
Ionization. The process of adding electrons to, or knocking electrons from, atoms or molecules, thereby creating ions. High temperature, alpha, beta, discharges, and nuclear radiation can cause ionization.

Ionization anemometer. Consists of a central electrode around which is positioned the collecting electrode, made up of three wire rings set concentric to the central electrode and mutually at right angles to one another. The central electrode is a steel ball forming the core of a radium source which is enclosed between layers of goldleaf backed by silver foil. The central electrode ionizes the space which separates it from the surrounding collecting electrode. Both the central and collecting electrodes are placed within a spherical wire cage of 6 inch diameter which is electrically earthed. The whole assembly is mounted on a short handle. Roberts, J., p. 56.

Ionization chamber. An instrument that detects and measures ionizing radiation by observing the electrical current created which flows through the chamber, making it a conductor of electricity. L&L.

Ionization constant. The ratio of the product of the number of ions produced from a given substance to the activity of the undisassociated molecules of that substance. See also activity, C.T.D.

Ionization potential. Energy in volts needed to remove an electron from a normal atom and to leave it positively charged. To ionize is to dissociate a molecule or a compound into ions of opposite charge. Pryor, J., p. 312.

Ions, replacement series. Cations vary in their affinity for the resins used in ion exchange (IX) treatment. The order of ease of replacement is generally greater than Na" greater than K" greater than Mg" greater than Ca" greater than Al" greater than Fe" on strongly acidic cationic resins, with H" moving to the end of the line for weakly acid ones. For anionic resins the order is SO4" greater than Br" greater than Cl" greater than F" greater than CN-. CC- COO-. Pryor, J., p. 33.

Irons. Early Wisconsin glaciation. A.G.I.

Iridium-potassium chloride; potassium-iridium chloride; potassium chloroiridate; potassium iodoiridate. Black; isometric; IrCl3,2KCl or K:IrCl6; and soluble in hot water. Used as a black pigment in porcelain and enamels, 483.22; specific gravity, 3.546; decomposes on heating; soluble in water; and insoluble in alcohol, in potassium chloride, and in ammonium hydroxide. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-206.

Iridium sesquisulfide. Black; IrO3; slightly soluble in concentrated hydrochloric acid; and insoluble in water. Used in ceramics in porcelain decoration. CCD 6d, 1961. Molecular weight, 342.40; dissociates, losing one oxygen at 400° C; and soluble in sulfuric acid and in hot hydrochloric acid. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-191.

Iris. A transparent rock crystal, especially when it exhibits the colors of the rainbow. Fred, B. Iridescent quartz; also applied to other iridescent minerals; California iris is lilac or purple transparent spodumene. Hess.

Iris agate. Banded agate which in thinly fashioned sections displays iridescence. Of almond color importance. Shipley.

Iris bogggy. A wheelbarrow. Fay.

Iris coal. Slate, shale, or rock loaded out from Underground. Fay.

Iris diamond. Quartz that is transparent or nearly so and that is either colorless or has a lilac tint. Also, a piece of this material. Also called rock crystal. Webster 3d. See also Bristol diamond. Fay.

Iris touchstones. Balsal, the stone which compares the Giant's Causeway in Ireland. Webster 2d.

Iris. A surface fault, in the form of stained patches, sometimes found on flat glass that has been stacked with surfaces in contact. The term originates from the interference colors that often accompany the fault. It is caused by moisture. If the glass is annealed in an acid atmosphere and adequately washed, iris is unlikely to occur; separation of the stacked sheets by paper also prevents this trouble. Dodd.

Iris quartz. Rock crystal containing thin air-filled cracks which produces iridescence. Same as rainbow quartz. Shipley.

Irrite. A metallic element having atomic number 26 and in group VIII of the periodic system, the average atomic weight of this element is 1.06. ASM Gloss. B. The cheapest, most abundant, most useful, and most important of all metals. The fourth most abundant ele-

Ironmaster. One that conducts or manages the founding or manufacture of iron especially on a large scale. Webster 3d.

Iron meteorite. A meteorite consisting of iron and nickel. A.G.I. Supp. 859.25; dark blue; crystals; hard; 770° C between alpha iron and beta iron; 928° C between beta iron and gamma iron; and 1,530° C between gamma iron and iron. Alpha iron is body-centered cubic and magnetic; beta iron is body-centered cubic and nonmagnetic; gamma iron is face-centered cubic; and delta iron is body-centered cubic. Hematite is the most common ore and iron is obtained from it by reduction with carbon. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-116, B-181. c. Tenacious; lustrous; malleable; ductile in nature; and rarely found native except in meteorites. The only metallic iron that can be tempered, that is, hardened by heating and sudden cooling. Very brittle at very low temperatures; softens at red heat; and can be welded at white heat. One of the iron minerals is an important ore of iron. CCD 6d, 1961. d. Iron-base materials not falling into the steel classifications. See also gray cast iron; iron; nodular cast iron; nodular iron; nodular cast iron; white cast iron; wrought iron. ASM Gloss. e. Colloquially, all derrick and drilling equipment; or the drilling rig. Standard, 1964.

iron ore pellets, prereduced

see: prereduced iron ore pellets.

iron ore, hematite. See siderite.

iron ore, specular. See hematite.

iron, ore, titanite. See ilmenite.

iron oxide. a. A common ore of iron, sometimes ferrous solutions drawn up by drills or a drill-drill mud-heavy loader. Long. b. A common compound of iron and oxygen, for example, rust. Long.

iron oxides. The basic constituent of the ferromagnetic spinels or ferrites. FeO, Fe2O3, and Fe3O4 have melting points from that of FeO at 1,420°C to Fe3O4 at 1,555°C. Used extensively for producing colors in glasses, glazes, and enamels. Hess. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-183. Iron and iron oxides produce brown or reddish colors in ceramic mixtures if they are fired in an oxidizing atmosphere, and greenish or bluish colors if fired in a reducing atmosphere. Iron oxides are fluxing and coloring materials. Larger particles produce brown or black spots, which, particularly in whiteware, are undesirable. Much care is taken to remove iron and iron oxides from the raw materials and the bodies used for whiteware manufacture. Ratzel.

iron pan. In marly and peaty soils, as well as in the alluvium of semiarid regions, it is common to find a thin layer of iron oxides a foot or so beneath the surface. This iron pan is formed by the oxidation of finely divided oxide. Stokes and Varnes, 1955. Also called hard pan.

iron paving. A road surface of cast-iron slabs. Studied to prevent skidding. Ham.

iron phosphate. See vivianite.

iron piles. A laboror who removes iron from cars, sometimes breasting and piles and classifies it according to grade. Fay.

iron pitch. At Lake Trinidad, asphalt that has over 50% asphaltite. Abraham, v. 1, Ed., 1960, p. 177.

iron plant. See ferroplatinum.

iron pan. One in which neither the sides nor the angles are equal. Jones, 2, p. 109.

irreversible process. Thermodynamically, one that cannot completely be reversed. An irreversible reaction takes place (in one direction only) and proceeds to completion. Pryor, 3.

irreducible minimum saturation. The proportion of the pore space occupied by immobile interstitial water at levels well above the oil/water or gas/water transition zones. Institute of Petroleum, 1961.

irrational. A term descriptive of particles of mineral that lack a characteristic symmetry. Pryor, 3.

irrational polygon. One in which neither the sides nor the angles are equal. Jones, 2, p. 109.

irrespirable atmospheres. In coal mines, those atmospheres containing poisonous gases or a lack of sufficient oxygen as a result of fire and dust explosions, or in mine fires, and which can only be entered by men wearing breathing apparatus. A.C.I., p. 1.

irreducible minimum saturation. The proportion of the pore space occupied by immobile interstitial water at levels well above the oil/water or gas/water transition zones. Institute of Petroleum, 1961.

irrigate a particular area. Ham.

irradiation. In geology, the movement of molten magma. An intrusive rock. The distinction between irruptive and eruptive is often disregarded. Compare effusive. Fay.

irrigation. In geology, the movement of molten rock from a magmatic reservoir to the place where it solidifies; if the molten rock reaches the surface, the process becomes eruption, but that term commonly includes other phenomena as well. Fay.

irrigation. A shallow rock which was formed into or invaded other rocks as molten magma. An intrusive rock. The distinction between intrusive and effusive is often disregarded. Compare effusive. Fay.

irrigation. An irrigation system that was formed into or invaded other rocks as molten magma. An intrusive rock. The distinction between intrusive and effusive is often disregarded. Compare effusive. Fay.

irrigation. An irrigation system that was formed into or invaded other rocks as molten magma. An intrusive rock. The distinction between intrusive and effusive is often disregarded. Compare effusive. Fay.

Irrigation. An irrigation system that was formed into or invaded other rocks as molten magma. An intrusive rock. The distinction between intrusive and effusive is often disregarded. Compare effusive. Fay.

Irrigation. An irrigation system that was formed into or invaded other rocks as molten magma. An intrusive rock. The distinction between intrusive and effusive is often disregarded. Compare effusive. Fay.
Irwin consistometer.

Irwin slump test. A work's test for assessing the setting-up of vitreous enamel slips for spraying. It was first described by J. T. Irwin in the following words: a ground-coated plate is placed on a table and a steel cylinder, 1 1/4 inches in internal diameter and 2 1/2 inches high, is placed on the plate. The cylinder is filled with enamel to be tested. The cylinder is then lifted vertically, with a rapid motion, by means of a hook and cord attached to the top of the cylinder and passing over a pulley to a weight. When the weight is released, the cylinder is raised vertically. The action results in a pancake of enamel on the test plate. The diameter of this pancake is the function of the set or stiffness of the enamel.

Irwin slump test.

Irwin slump test. A work's test for assessing the setting-up of vitreous enamel slips for spraying. It was first described by J. T. Irwin in the following words: a ground-coated plate is placed on a table and a steel cylinder, 1 1/4 inches in internal diameter and 2 1/2 inches high, is placed on the plate. The cylinder is filled with enamel to be tested. The cylinder is then lifted vertically, with a rapid motion, by means of a hook and cord attached to the top of the cylinder and passing over a pulley to a weight. When the weight is released, the cylinder is raised vertically. The action results in a pancake of enamel on the test plate. The diameter of this pancake is the function of the set or stiffness of the enamel.

Isobnormal. A line connecting points having the same difference from normal, usually temperature, of the increase or decrease of atmospheric pressure in a specified period. HOGC.

Isobolar. A line connecting points having the same change of temperature, or indicating the same different of temperature, in the ocean where the pressure is everywhere the same. This is not a horizontal surface. If several parallel equally spaced isobars, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.

Isobase. A line connecting points having the same average frequency of auroras. Schieler.

Isobar. An imaginary line or a line on a map or chart connecting places on the surface of the earth where the height of the barometer reduced to sea level is the same at any given time or for a certain period. Webster 3d.

Isobaric surface. A three-dimensional surface in the ocean where the pressure is everywhere the same. It is not a horizontal surface. If several parallel equally spaced isobars or isobases, lines of equal pressure, are drawn on the map or on the diagram, the pressure gradient is strong, less close spacing indicating a weaker gradient. HOG.
isocline

on the earth's surface having the same magnetnic inclination. The particular isocline line drawn through points of zero inclination given the special name of acnicline.

isocline map. One showing lines of equal inclination on a map for the earth's surface. Bureau of Mines Staff.

isodimeter. A line connecting points having the same amount of sunshine during a specified period. Bureau of Mines Staff.

isodiametric. In crystallography, having the same crystal axes equal, said of crystals of the hexagonal and tetragonal systems. Fay.

isomorphous. In mineralogy, both isomorphous and dimorphous; said of certain groups of minerals. Fay.

isodyne line. Any line joining points of equal magnetic intensity. Applicable to the total intensity or the vertical, horizontal, north-south, or east-west components. So used in terrestrial magnetism literature, especially in British and Canadian writings. A.G.I.

isodynamic line. One showing lines of equal magnetic intensity of the area mapped. Bureau of Mines Staff.

isogonic line. An imaginary line or a line on a map joining places on the earth's surface at which magnetic declination is the same. Bureau of Mines Staff.

isogal line. Of equal magnetic strength or potential or point of electrical neutrality; the hydrogen-ion exponent at which particles in aqueous suspension are neutral, and best to dissolve. Pyrolysis, 4.

isofacial; isogratic. Said of all rocks belonging to the same facies.

isogonal. In gravity prospecting, a contour line of equal gravity values. A.G.I.

isogam map. A chart showing contour lines of equal gravity, and employed in the mathematical method of geophysical prospecting. Also called isogal map. Nelson.

isogal. An imaginary line or curved surface beneath the earth's surface through points having the same magnetic galvanomagentic properties. Webster 3d.

isogaloequatorial line. The same as isogaloequatorial. A.G.I.

isogaloequatorial line. An imaginary line or a line on a map joining places on the earth's surface at which magnetic declination is the same. Compare agonic line. Webster 3d.

isogeotherm; isothermal. An imaginary line or curved surface beneath the earth's surface through points having the same mean temperature. Webster 3d.

isothermal line. The same as isotherm. A.G.I.

isogon line. An imaginary line or a line on a map joining points having the same amount of precipitation for any particular plane, and (2) of the lines as drawn. Analogous to contour lines, but

isochron. A line connecting points having the same molecular composition and the same molecular weight, but differing in at least one of their physical or chemical properties, are said to be isochronous and each is an isomer of the others. Miall.

isochemical. Of the same composition as another substance having the given molecular composition and molecular weight. This phenomenon frequently occurs with organic compounds and complex inorganic salts. C.T.D.

isoelectric. A line connecting points having the same mean temperature. Webster 3d.

isoelectric point. A line connecting points having the same amount of precipitation for any particular plane, and (2) of the lines as drawn. Analogous to contour lines, but

isomerization. Converting a straight chain saturated hydrocarbon to a corresponding branched chain; for example, n-butane may be catalytically converted to isobutane. Shell Oil Co.

isoneormorphism. Isomorphism between substances having the same atomic proportions. Fay.

isomers. Substances composed of equal amounts of the same elements but differing in properties due to variation in structure. API Glossary.

isometric. Relates to deposits, not necessarily synchronous, laid down in identical media as, for example, two or more river deposits. Schieferdick.

isometric. a. A system of crystallization with three axes at right angles and of equal length; nine planes of symmetry; singly reflecting. Characterized by equality of measure. Fay.

isometric projection. In technical drawing, a three-dimensional view of an object can be drawn to scale with three perpendicular edges at 120° to each other, and with the vertical edges vertical. See also axometric projection. Ham.

isomorphic. a. The name given to the phenomenon whereby two or more isotopes, which are closely similar in their chemical constitution, crystallize in the same class of the same system of symmetry and develop very similar forms. C.T.D. b. The property, possessed by various groups of compounds, of being identical in crystalline form, and having the same numbers of atoms, similarly arranged. Hess.

isomorphous. Originally defined (Mitscherlich, 1819) as having similar crystalline form, but now generally restricted to compounds that form solid solutions by isomorphism, that is, by the replacement of one ion for another in a crystal structure without alteration in the crystal composition. A.G.I.

isomorphous mixture. A. A solid solution of two or more isomorphous substances. Fay. a. A type of solid solution, in which mineral compounds of analogous chemical composition and closely related crystal habit crystallize together in various proportions. Fay. b. Characterized by equal density and electronic properties due to variation in structure. Fay.

isomorphous replacement. Replacement of one element by another of the same valency in the chemical composition of a mineral, as in tourmaline, where iron, lithium, and magnesium, etc., replace each other with resulting wide ranges of colors but little variation in other properties, iron producing no gem qualities. In other cases of isomorphic replacements, wide variations in crystal habit result. Shipley.

isomostone map. A map showing, by contours, the areas having an equal quantity of precipitate within an assumed interval of stratigraphic section. Ballard.

isopachous line. A line, on a map, drawn through points of equal thickness of strata within a stratigraphic unit. Synonym for isopachous line; isopachy. A.G.I.

isopachous map. A map indicating, usually by means of contour lines, the varying thickness of a designated stratigraphic unit.

isopachous. Of cartographic lines, the varying thickness of a designated stratigraphic unit.

isopachous line. A line constructed on a map, somewhat similar to a contour line, but connecting points of equal moisture content of coal in the bed. A.G.I.

isohyet. A line connecting points having the same amount of precipitation for any specified period. Fay.

isolation. A particular case of a single consignment where the sampling is to be done without prior knowledge of a coal's sampling characteristics other than its presumed ash content and size. Nelson.

isoclinal. A line in an imaginary line connecting points at which the thickness of a particular class of material within a formation or other stratigraphic unit is equal. Thus, a limestone isoclinal of the A formation connects, like a contour, all points at which the total thickness of all limestones within the A formation is a certain numerical value. Stakes and Barnes, 1955.

isoclinal line. A line connecting rocks of different grain size classification. They are somewhat indefinite and differ in position.

isochron. A line which portrays (by isochron lines) variations in aggregate thickness of a map to distinguish metamorphic zones defined by index minerals. A.G.I.

isochron line; isochronal contour; isogram. A line on a map or a chart of the earth's surface, connecting points of equal magnetic intensity or points of equal value of a component of such intensity. Webster 3d.

isochronal line; isochronal contour; isogram. A line on a map or a chart of the earth's surface, connecting points of equal magnetic intensity or points of equal value of a component of such intensity. Webster 3d. Commonly represented in gammas (1 gamma equals 10^-4 oersted); hence the name isogram. Bureau of Mines Staff.

isomer. a. One or two or more substances composed of molecules having the same kind of atoms and in the same proportions, but which, by reason of some difference in the number or arrangement of those atoms, have entirely different physical and chemical properties. Hess. b. In nuclear science, one of two or more nuclides with the same numbers of neutrons and protons in the nucleus, but having different energy. L.W.

isomeric. Of, relating to, or marked by points of equal magnetic intensity or points of equal value of a component of such intensity. Webster 3d.

isomeric. Of similar crystalline structure without alteration in the crystal form, but now generally restricted to compounds that form solid solutions by isomorphism, that is, by the replacement of one ion for another in a crystal structure without alteration in the crystal composition. A.G.I.

isomorphous. Of the same composition as another substance having the given molecular composition and molecular weight. This phenomenon frequently occurs with organic compounds and complex inorganic salts. C.T.D.

isopachous. A line, on a map, drawn through points of equal thickness of strata within a stratigraphic unit. Synonym for isopachous line; isopachy. A.G.I.
isopachous thickness. See also isopach. Webster 2d.

isopachous map. Synonym for isopach map. A.G.I.

isopachy. Term used by British writers for an isopach line. A.G.I.

isopag. A line connecting points where ice is present for the same number of days per year. H&G.

isopactic. A line connecting points at which ice begins to form at the same time of the year. A line connecting usually the last day of ice cover at the same time of the spring is called an isost. H&G.

isophasic series. A series comprising rocks of different chemical composition which were metamorphosed under identical physical conditions. Schieferdecker.

isopelitic. Said of two formations deposited contemporaneously and of the same facies. Compare hetroptic. C.T.D.

isopelitic. Relates to synchronous deposits which exhibit the same facies. Schieferdecker.

isopilastic. When the pressure on a surface of the sea is constant. Hy.

isopilastic line. A contour of the piezometric surface. It is an imaginary line, all points along which have the same static level. A.G.I.

isopilactic a. on a map or chart, drawn through points of equal size or abundance. A.G.I. b. A line of constant composition, as in isopilastic temperature or composition plot. A.G.I. c. An isopilactic is an isopilactic which indicates the variation of an element with respect to two variables, one of which remains constant. Hy.

isopilastic, isopilactic, isopilastic. A line drawn through points whose annual change in magnetic declination is equal. A.G.I.

isopilastic. An alcohol with formula CaH18OH, and a boiling point of 207° F, manufactured from the unsaturated hydrocarbon propane. The acetone is widely used as a solvent in the lacquer industry. Shell Oil Co.

isoplastic. Isoplastic line. A line connecting points of equal density, particularly of ocean water. A line connecting points of equal atmospheric density may be called an isostere. H&G.

isopilal map. A map with contours connecting points of equal radiation and showing anomalous radioactive highs. Ballard.

isopilal. Lines joining points of equal radioactivity, drawn from geiger- or scintillation-counter data to form an isopilal map. A.G.I.

isopilal radiativity peak. A plan showing lines of equal radiativity at a certain selected depth. It is prepared from data obtained by the rectilinear method of geophysical prospecting. Nelson.

isopilalum. Synonym for homoilum. A.G.I.

isopilalum. A line on the surface of the earth joining points of equal seismic disturbance due to any single earthquake. A.G.I.

isopilalum line. A line on the earth's surface connecting points of equal earthquake intensity. The macroseismic area lies inside the isopilalum II (according to Mercalli-Canclini), the microseismic area outside the same. Synonym for isopilalum. Schieferdecker.

isopilalum surface. An imaginary line connecting all points on the surface of the earth when the weight of any column from the surface of the earth to a constant depth is approximately the same as that of a column of equal area of the earth, the equilibrium being maintained by plastic flow of material from one part of the earth to another. H&G.

isopilalum. Subjected to equal pressure from every side; being in hydrostatic equillibrium; relating to or characterized by isostasy. Webster 3d.

isopilalum adjustment. The condition in which forces tending to elevate earth's crust balance those tending to depress earth's crust. MassCracken.

isopilalum anomaly. a. The difference between the observed value of gravity at a point after applying to it the isostastic correction and the theoretical gravity at the same point. A.G.I. b. Anomalies on a map of observed gravity anomalies after applying the isostatic correction. Negative isostatic anomalies indicate undercompensation, implying a tendency to rise; positive isostatic anomalies connote overcompensation and a tendency to fall. Lewis, p. 365.

isostatic compensation. a. An equilibrium condition in which elevated masses such as continents and mountains are compensated by a mass deficiency in the crust beneath them. The compensation for depressed areas is by a mass that is greater than the area. A.G.I. b. The process in which lateral transport at the earth's surface by processes such as erosion and deposition is compensated by lateral movements in a subcrustal layer. A.G.I.

isostatic correction. The adjustment made to values of gravity in order to deflections of the vertical observed at a point to take account of the assumed mass deficiency under topographic features. This topographic correction is also made. A.G.I.

isostatic equilibrium. The shifting of the rock beneath the earth's crust in response to the shifting in the weight above the earth's crust. MassCracken.

isostatic precession. A process sometimes used for the shaping of ceramic components, for example, vacuum tube enclosures and envelopes, sparking plugs, and similar items from Al-0s, BeO, or other special ceramics. The powder is pressed in a rubber or plastic bag (often called the tooling) which is then placed in a container and subjected to hydrostatic pressure, generally 10,000 to 20,000 pounds per square inch. The merit of this process is the uniform manner in which pressure is applied over the whole surface, resulting in uniform density in the shaped component. Dodd.

isostatic readjustment. The process whereby isostasy is restored after having been disturbed by storms or other causes. Stokes and Barnes, 1955.

isotetrastrophic. The process whereby isostasy is restored after having been disturbed by storms or other causes. Stokes and Barnes, 1955.

isotrophic. Refers to minerals that are closely similar in crystallographic, physical, and chemical properties but have little isotropic tendency for isomorphous substitution; same as isotropic. A.G.I. Supp.

isotropic. A line connecting points of equal current velocity. Hy.

isotherm. A line on a map or chart of the earth's surface connecting the same temperature at a given time or the same mean temperature for a given area. H&G.

isothermal. A change taking place at a constant temperature. Stroke, 10.

isotherm layer. A water column through which a constant temperature exists. Hy.

isothermal follower. An instrument developed by the Elect. Electronic Laboratory to study the movement of subsurface layers of oceanic water. It consists of an impermeable transducer, an electronic unit, an underwater cable, and two recorders. Hy.

isothermatic. Said of orpherical igneous rocks in which the composition of the c招呼 of the orb is identical with that of the groundmass in which they are embedded. Compare isothermatical. C.T.D.

isotone curve. See isotonelm. Hy.

isotope. An atom having the same atomic number as another atom (same chemical element) but having a different atomic weight (or a different nuclear weight). The nuclei of the atoms have the same number of protons but different numbers of neutrons. Thus, carbon isotope 13 (C13), and carbon 14 (C14) are isotopes of the element carbon, the subscript denotes their common atomic number, and the superscripts denote their different atomic weights. LNL.

isotopic. Relates to synchronous deposits of the same geological province. Schieferdecker.

isotopic enrichment. A process by which the relative abundance of the isotopes of a given element are altered in a batch, thus producing a form of the element enriched in a particular isotope; for example, enriching uranium in the uranium 235 isotope. See also enriched uranium. LNL.

isotron. A device for isotope separation based on the electrical sorting of ions. Ions of different mass accelerated to a given energy have different velocities. By synchronizing the field on a deflector grid to pulses in the ion source, ions of different velocities (and hence different atomic weights) can be collected. NRC-ASA N-1-1957.

isotopic. A. Having the same properties in all directions; said of a medium with respect to conductivity of heat or electricity, or radiation of heat or light. Compare anisotropic. Fay, p. In crystallography,
transparent or reflecting crystals which show no color change when rotated between crossed nicols and which therefore have no optical properties in all directions. Pryor, 5.

**isotropic mass.** A mass having the same properties (optical properties) in all directions. ASCE P1826.

**isotropic stress.** The condition of equal horizontal and vertical stresses in material which is in the "elastic state" of stress. Woodruff, 1, p. 94.

**isotropy.** The behavior of a medium having the same properties in all directions. Taylor.

**isotypic.** Having analogous composition and closely similar crystal structure, but not capable of intercrystallizing to form solid solutions. Examples are calcite and soda niter; galena and NaBr. Compare isomorphous, A.G.I.

**isovolocity.** The phenomenon of sound being the same in all parts of a given water body. Pryor, 6.

**isovol.** Lines constructed on a map of a coalbed connecting points of equal volatile matter. It shows the distribution of volatile matter of the coal. A.G.I.

**isotach.** A melanocratic dike rock containing hornblendes, with a smaller quantity of green pyroxene and a variable but always subsidiary amount of labradorite. Holmes, 1928.

**isthmus.** A narrow strip of land, bordered on both sides by water, connecting two large bodies of land. Schieferdecker.

**Istra.** Trade name for a high-alumina cement made in Yugoslavia. Dodd.

**Istran stone.** A marble near Tricite, Italy, of which Venice is largely built. Fay.

**ISWG Abbreviation for Imperial Standard Wire Gage (gauge).** Zimmerman, p. 56.

**Ito.** A Japanese gold-washing board. Fay.

**Itraitside.** An igneous dike rock composed of microcline and nepheline graphically intergrown, biotite, aegirine, and zoned mela- nite ranging from coarse- to fine-grain. Johansen, v. 4, 1938, p. 145.

**Ivory.** A hard, white, close-grained substance which constitutes the greater part of the tusks of the elephant, mammoth, hippo- potamus, narwhal whale, etc. The best grades are obtained from the elephant. CCD 6d, 1961.

**Ivory, artificial.** A substance, resembling natural ivory, made by mixing gypsum and steatite powder. CCD 6d, 1961.

**Ivory black.** An animal black produced from ivory. Sometimes the term is erroneously applied to other animal blacks. Used chiefly as a pigment. CCD 6d, 1961.

**Ivory porcelain.** A ware having a surface resembling ivory, produced by polishing the vitreous glaze. Fay.

**Iwao auger.** A replaceable cutting head on a drill sampler. It is barrel-shaped, like the cutting members on a common post-hole digger. Long.

**Iwao earth auger.** Synonym for Iwao-pattern earth auger. Long.

**Iwao-pattern earth auger.** A dry sampler equipped with an Iwao auger head or cutter. Also called posthole digger. See also Iwao auger. Long.

**I. x. ion exchange.** Pryor, 8.

**Izotile; Iztale.** An amorphous, hyacinth-red, greasy hydrocarbon mineral which softens at 70° C and resembles haematite; it is found in Oberhart, near Gloggnitz, Austria. Fay.

**Izod test.** A pendulum type, single-blow impact test in which the specimen, usually notched, is broken at one end and broken by a falling pendulum. The energy ab- sorbed, as measured by the subsequent rise of the pendulum, is the measure of impact strength or notch toughness. ASM Gloss.

**Izat chalchihuitl.** White or green Mexican onyx. Shipley.

**latif.** Mex. A variety of obsidian used by Mexican Indians for arrowsheads, implements, etc. Standard, 1964.

**latite.** Mex. An Aztec name for obsidian. Fay.

**Ithaca group.** A subdivision of the Senecan series as exposed in the gorge of Fall Creek, N.Y. Fay.

**limestone.** A sedimentary rock composed of microcline and nepheline graphically intergrown, biotite, aegirine, and zoned mela- nite ranging from coarse- to fine-grain. Johansen, v. 4, 1938, p. 145.

**icosahedron.** A polygonal, icosahedron, the longest edge of a cube, and the square root of -1, which is variously designated the imaginary unit; the right-angle turning operator; the vector turning operator. Zimmerman, pp. 158, 164, 165.

**Ia.** Symbol for Jurassic. USGS Sup., p. 86.

**jack.** York. Tool used for carbonaceous shale or mudstone. Tomkeieff, 1954.

**jacksonile.** Mex. Decomposed talcose rock, or hardened clay, generally found in a vein, and sometimes indicating the proxim- ity of rich ore. Fay.

**jaca.** Brazilian term for carbon or other dark-colored spots or inclusions in a diamond. Sometimes used as a synonym for carbon spot or carbon fleck by the older hand- seme. Often experienced by large diamonds, and by drillers who have worked in Portuguese-speaking countries. Long.

**jaguar garnet.** A trade term for yellowish garnet. Shipley.

**jacinth.** Hyacinth. The aurora-red variety of transparent zircon, used as a gem stone. A cinnamon-colored variety of grossularite from Ceylon, is also called hyacinth. C.G.D.

**jack.** a. A name given to zinc ores. Berger.

b. Cannel coal interstratified with shale. Tomkeieff, 1924. c. A heavy shale, often can- nelbed. Tomkeieff, 1924. d. A tin bucket with pouring spout in which powder in quantities of 5 to 12½ pounds is carried into the mine. Fay. e. A tin bucket, with a lantern-shaped case made of tin in which safety lamps are carried in strong currents of ventilation. Fay. f. Scot. One who works underground at odd work. Fay. g. Scot. A narrow dike usually of igneous rock. Fay.

h. A wooden wedge or separating rocks rent by blasting. Fay. i. A rod or post set up in the working room of a mine to which a body is fastened for the purpose of mov- ing the cutting machine from place to place. Fay. j. N. of Eng. A large flume or channel in the mine, used for conveying water back. SMRB, Paper No. 61.1. A portable device used for erecting gret pressure or for lifting objects a long distance. The true jack is used for lifting. In conveyor work there are a num-
ber of varieties of the jackcrew used for holding down various pieces of equipment, and each is given a different name. Ratchet jacks for this type of service were called jackbrace, the name from the ratchet device used with the nut which forces the screw up or down. Drilling jacks are used for holding down the drives for shaker conveyors; anchor jacks are used for the same purpose. The term road jacks is applied to jacks used to hold down objects. Fulcrum jacks are used as pivot points for angle troughs, tongs, and swivels. Timber jacks are used in place of props as temporary supports for cap pieces and bars intended to hold up mine roof. Pipe jacks may either be jack-screw fashioned from pipes or they may be pipes pointed at both ends so as to be wedged against the roof and bottom surfaces to secure the ends of mining machine ropes, sheaves used in scraper loader work, etc.

jackasses. Eng. The small gudgeon pulleys used in timber jacks. The jack head is placed outside the regular timbers, from which it is separated by short blocks, and is blocked and wedged against the rock. Pryor, 3.

jackhammer. A percussive type of automatically operated rock drill that is worked by compressed air. It is light enough to be used without a tripod and to be hand held. Pryor, 3.

jackhammers. In metal mining, non-metal mining, and quarrying, one who operates an unmounted, compressed-air, percussion-type rock-drilling machine, known as a jackhammer, to drill holes in ore or rock in mines or quarries in which explosives are employed. The jackhammer is placed outside the regular timbers, from which it is separated by short blocks, and is blocked and wedged against the rock. Pryor, 3.

jackhead pumps. Subordinate pumps in the bottom of a shaft, worked by an attachment to the main pump rod. Fay.

jack lamp. Eng. A Davy lamp, with the addition of a glass cylinder outside the gauze. Fay.

jackline. In petroleum production, one who pumps several oil wells from a central power plant (jack plant), engaging or disconnecting cables by which power is transmitted to separate wells. D.O.T. 1.

jack piles. A pile which is forced into the ground by jacking against the building above it. Ham.

jackpipe. A hollow iron pipe large enough to slip over the end of a section of a cutting machine so as to make it hold more firmly against the coal. Fay.

jack post. This timber is used where the coal seam is separated by a rock band and one
Jade. Som. A small tub or box in which loggers. Derb. Both men and horses employed
jageudojadeite. Shipley.
jadeollte. A deep-green chromiferous syenite
Jadeitite. A metamorphic rock
jadeite. A monoclinic mineral, NaAlSi,00,
Jade; Jadeite; nephrite. A hard and extremely
'adding pick. The tool employed to cut a jad.
Jadding. The operation of forming a jad. See also holing; jad. a. Fay.
Jadding pick. The tool employed to cut a jad.
Jade; jadeite. nephrite. A hard and extremely tough material of varying composition, greenish-white to deep green in color, used in making carved ornaments. Part of the so-called jade is jadeite, a variety of pyroxy-
one, essentially a metastable of sodium and aluminum. Part is nephrite, a variety of amphibole, and essentially a metastable of iron, calcium, and magnesium. Part is a variety of saussurite, which is commonly a complex alteration product of plagioclase Feldspar. Williamsite, a variety of serpentine, is sometimes mistaken for jade. Sanford.
Jade glass. A green translucent to opaque glass, usually a light green glaze (frit) glass; specific gravity about 3.73. Shipley.
Jadite. A monoclinic mineral, NaAlSiO₄, found chiefly in Burma that consists of a sodium aluminum silicate and when cut constitutes a valuable variety of jade. Webb.
Jadellite. A metamorphic rock consisting essentially of jadeite. A.G.T.
Jaeger. a. A chemical term for a chromiferous syenite cut as a gemstone and resembling jade in appearance, from the jadeite mine at Buxor, Burma. Possibly the same as pseudojadeite. Shipley.
Jade tenax. Saussurite. Shipley.
Jaeger converter. A catalytic system for conversion of SO₂ to SO₃ in the contact process. Pryor. 3.
Jag bolt. An anchor bolt with a barbed flar-
ing shank which resists preration when leaded into stone or set in concrete; also called backed bolt; rag bolt. Webster 3d. Jag bolt. a. A high-white diamond of modern cut. Schaller.
Jaggers. Derb. Both men and horses employed to cut a core from the mine to the smelter. Also called jagger lad; jagger horses. Fay.
Jagging. a. A mode of carrying or to the reduction works in bags on horses, mules, etc. Fay. b. Up-and-down motion of a mass of particles in waves by means of pulsion. Pryor. 3.
Jagging board. An inclined board on which ore slimes are washed, as in a buddle. Standard. 1964.
Jagolite. A mineral, (Pt₄Ca)₁₄Fe²⁺SiO₂(C1-
OH); analysis, SiO₂, 22.35 percent; Pt, 64.65 percent; and fractional percentages of Al₂K,Mg,Na,Na,Trigonal. yellow-green micaceous plates with mela-
terite inclusions of iron ore. This is the tenth lead silicate from Langelang Sweden. Spencer 21. M.M., 1958.
Jailer. Som. A small tub or box in which water is carried. Fay.  
Jalapite. A lead-gray, cupferriferous argentite, (AgCu)S, that crystallizes in the isometric system. Sme.
Jamb. a. The blocking of a core barrel or core bit with core, sometimes deliberately. Long.
b. Jam. 3d. See also jad.
Jamaica auger. Synonym of Jamaica open-
spiral auger. Long.
Jamaican auger. A corkscrewelike spiral tool used in sampling loosely com-
pacted soil deposits. Long.
Jamb. a. A vein or bed of earth or stone, which prevents the miners from following a vein or bed. Fay. b. A pro-
jecting columnar part (as of a masonry wall) or mass (as of ore). Webster 3d.
c. A vertical structure. member forming the sides and back of a furnace wall. HW. d. A type of brick shapes, intended for use in the sides of wall openings. HW.
e. The coal of the side of a furnace superstructure carrying port crown load. ASTM C612-66.
Jamb brick. A brick so modified that the cor-
ner of one end and side is rounded with a radius approximately equal to the width of the brick. A.R.I.
Jamb cutter. In the coke products industry, a laborer who chips carbon and mud from the edges of coke-oven doors with a steam bar prior to the discharge of the coke. D.O.T. 1.
Jamb door. See breast wall. Dodd.
Jamb concentrator. A concentration table, the deck of which is divided into two sections, flexibly jointed together on a line oblique to the line of motion of the table. One section contains riffles for the coarse material while the other deck is smooth to allow settling, of the fine particles which will not settle on a riffled surface. By means of the joint, the slope of the sections can be varied independently. Fay.
Jamb fig. Movable sieve box supported on a rubber diaphragm and jigged mechanically up and down. Fay.
Jamboulite; feather ore. A natural sulfanti-
monyde of lead and iron, PbFeS₂SiO₄; sometimes used derivatively as a source of copper and zinc. Color and streak, lead gray to gray black; luster, metallic; Mohs' hardness, 2; specific gravity, 3.5 to 6.0. A minor ore of lead. CCD 6d, 1961.
Jamb table. Shaking tab. a. Used in concentra-
tion of ground ores by gravity. Pryor. 3.
Jamb vise. A riveting hammer provided with an air-operated telescopic casing to hold the hammer against the work. Ham.
Jamsocket. A machine for shaping the sockets in clay or plaster molds. Fay. The pipes are extruded plain, cut to length and fed to the jam socket machine in which a ram, having the external profile of the socket, is forced into the end of the pipe. The machine was introduced by Pacific Clay Products Co., Los Angeles, Calif. Dodd.
Jam weed. A weld in which the heated ends or edges of the parts are square-butted against each other and welded. Fay.
Jamsymplesotation cell. A pioneer type of flota-
tion cell. Pryor. 3.
Jam. See rock drill, b. Fay.
Janai pigments. See pigments, b. Fay.
Japanese acid. An uncommon type of quartz twinning in which the two portions are symmetrical with respect to a trigonal bi-
pyramidal of second order. Heat.
Japanese method. A method of finishing wood or metal with baking varnish or baking varnish, usually by baking, in the mixture in which it is baked at varying temperatures, on wood at low heat, but on metal at from 300° to 400° F. Crispin.
Jap. a. An appliance to permit relative move-
ment between the rope and rods in a cable drill. It reduces shocks and the risk of rod or chisel breakages. See also free-felling device. Nelson. b. To drill by impact, as a rock; to use a drill jar upon. Standard. 1964. c. See Jars. Fay. d. To loosen or free stuck drill string, equal to the impacts delivered by quick, sharp, upward-traveling blows delivered by a drive hammer or jars. Long.
Jar collar. A well coupling attached to the upper exposed end of a drill rod or casing string to act as an anvil against which the impact blows of a drive hammer are deliv-
ered and transmitted to the rod or casing string; also, sometimes used as a synonym for drive hammer. Also called bell jar; drive collar; jar head. Long.
Jar coupling. A set of sliding links in a drill stem by means of which sudden impacts can be delivered to a string of stuck drill tools. Long.
Jardiniera glass. A former type of unfitted lead glass containing PbO, K₂O, CaO, ZnO, Al₂O₃, and SiO₂. There were soft (cone 02) and hard (cone 4) types. Dodd.
Jargon. a. A smoky variety of jacinth; when of gemstone quality, jargon. The phrase technical jargon, sometimes mistakenly used by some to indicate an insufficient degree of understanding, should be used sparingly. Pryor. 3. a. An inferior diamond having a yellowish color. Wa.
Jarrow. See casing jar hammer. B.S. 3618, 1963, sec. 3.
Jar head. A synonym for jar collar; drive-
head. Long. b. That part of a wire-line core barrel that slides up and down on the core barrel without turning. Pryor. 3.
Jar length. Synonym for jar rod. Long.
Jarlite. A colorless, brownish fluoride of sodi-
um, Al₂F₃, and sodium, Na₃AlF₅ monocrystals. Crystals and spherulites. From Ivigtut, Greenland. English.
Jar model. See also model mill. Fay.

jasper. a. A finely crystalline form of quartz containing up to 20 percent impurities (iron oxide, iron hydroxide, clay, etc.). Usually red, yellow, dark green, grayish-blue. Similar to flint and chert. Used in ornamental stone. CCD 6d, 1961. b. A fine, unglazed stoneware invented by Josiah Wedgwood and made by adding barium carbonate to theadmixture for semiporcelain ware. Hess. 

jasperite. A rock consisting essentially of mixed with jasper; made to re- jaspered. Mixed with jasper; made to re- jasper ware. A vitreous, opaque, colored un- jasperize. To convert into a form of silica jernery iron ore. Impure hematite with a jernite. A resin found in the Jauling, near jernk. a. The thickening jelly. See fundamental jelly; jellylike; jellylike substance to formed. Long. jelt. 1. a. The thickening of a cement- jell; jells. a. The thickening jelly strength. A measure of the jellylike. Long. C. jelly. A cement-slurry mixture in which jelled. a. A cement-slurry mixture in which jegging ax. A stonecutter's ax with a flat jedding ax. In a crusher, one of a pair of nearly j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft j-eas, one of which slides along its shaft
Jet-enameled ware. A type of 18th century jet coral. Consists of a length of pipe which
transfers. Compare jet ware. Dodd.

Jet; a. a black marble. Webster 2d. b. A hard coallike shale containing

Jet; a. A black marble. Webster 2. b. A hard

carbonaceous shale found in Jersey fire clay brick. A highly siliceous clay

Jet man. An employee in a mine whose
duty it is to clear up falls or refuse, or to make a miner’s working place safe. Fay. See also wasteman. D.O.T. 1.

Jet man. In a mine whose
duty it is to clear up falls or refuse, or to make a miner’s working place safe. Fay. See also wasteman. D.O.T. 1.

Jet man. In the minerals and earths industry, one who processes molten rock into mineral

jig runner

mineral. Also called jigger; chute conveyor; pan conveyor. Pryor, 3.

jiggering machine. A machine which acts as follows: In order to move jigger ore. Fay. See also jig.

jigging screen. a. A screen or pair of screens that, when a combined horizontal and vertical motion is imparted, normally by a crankshaft and connecting rod, the screen decks being horizontal or inclined at a small angle. B.S. 3552, 1962. b. See shaking screen, a. Nelson.

jigging in. Staggering of container, Bureau of Mines Staff.

jig grading. Analogous to jig boring where the holes are around rather than machined.

jig haulage. See gravity haulage. Nelson.

jig indicator. An apparatus resembling a steam engine indicator; used for drawing curved lines illustrating the action of jigs in ore dressing. Webster 2d.

jigging. Used in a vertically pulsed column of water is so manipulated as to stratify crushed ore with lighter particles above and heavier particles below. Jigged jib is a box, the bottom of which is a screen through which water is pulsed. If the ore fed to the box is smaller than the screen openings, the stratified products are removed. Also called jiggering. Fay. d. Eng. A coupling hook used between hitches to a haulage rope, which holds the screen by successive pulsing and suction of the vertically oscillating column of water (English jigging). If the ore is larger than the screen, the bottom product is removed via a submerging gate above the screen (German jiggling). In the moving-bed screen the jib box is pulsed up and down in a tank of water, a throwing motion working it toward the discharge end and the lowest stratum being dropped through slots in the screen. The jib box, or running, is a layer of suitably dense oversize material lying on the screen and obstructing the downward passage of the heavy mineral. The jiggling cycle consists of pulsion stroke during which water is forced up through the jib box and regulated via the suction (return) stroke. Either can be modified by mechanical means or by varying the amount of hydraulic water available in the hutch (the part of the jig in which the box sits). Among the most used fixed beds are the Babcock, Galloway, Goral, and Willoughby. The moving-bed jig includes the Halkyn and Hancock, and homemade hand jigs. Pryor, 3.

jig pin. A pin used to prevent the turning of the turn beams. Standard, 1964.

jig runner, a. York. The man who works a jig (a self-acting incline). Fay. b. In ore dressing, smelting, and refining, one who tends a battery of jigs used to concentrate ore by separating the valuable minerals from the gangue (waste materials); regulates pulsating flow of water through screens in bottom of jigs or regulates speed of reciprocation motion of screens, so that the heavier (valuable) minerals will separate and collect in a layer on the screen and the gangue collect in a layer above; and regulates flow of pulp, and washwater, and so that they do not become overloaded. Also called jigger; jig tender. D.O.T. 1c. In anthracite coal mining, one who tends a battery of jigs used to separate slate from small-size coal, and regulates pulsating flow of water through screens in
bottom of jigs or regulates speed of reciprocation (up-and-down motion) of screens, so that the mineralized material is collected in a layer on the screen and the coal collect in a layer above. Also called jig attendant; jigger; jigger tender. Be. J.T.D. 1.

jig tender. See jigger runner, b and c. D.O.T. 1.

jig washer. A coal or mineral washer for relatively coarse material. The broken ore, supported on a screen, is pulsed vertically in water, the heavy (valuable) portion passing through the screen into a conical receptacle (hutch) and the gangue goes over the side. In coal washing, the heavy (worthless) shale passes downwards, and the lighter coal on top. See also Baum washer; plunger jig washer; jig. Nelson.

jib. A masts foreguy. The first modern mining law that originated in a document dated 1249 at Jihlava, Bohemia, Czechoslovakia. The most important concepts originating from this document are those of reserved minerals and the freedom to mine. The freedom mining law by which anybody has the right to mine certain minerals when he has contracted for them, and filed an application for the right to mine them, in the prescribed way. See, v. 1, p. 31.

Jim. A term used in West Virginia for a man who does miscellaneous work at mine. Fay.

Jim Crow. A portable hand-operated appli
date for laying or curving rails. It incorporates a strong buttess screw thread. Nelson.

Jimmy. a. A short crowbar, Craigin, b. A short railroad car, in which anachrasis was hauled in early days. Korn.

Jiminy. A coupling made from two mine tubs or trains in a set or journey. C.T.D.

Jim carrier. A lad employed to carry the longer distances between mine tubs or trains in one train of mine tubs to another. C.T.D.

Jim runner. See incline man. C.T.D.

Jimy. a. A stationary engine for hauling on a mine road, when not operated by gravity. Webster, 2d. b. A Jimmy road. Webster, 2d.

Jimmy tender. See jigger runner, s; Jimmy, Fay.

Jimmy, Ley. A short heading along which emps

ties, horses, or workmen travel. Fay. Joachimsthal process. The extraction of silver from sulfide ores by converting into chlorite, leaching with sodium hypochlorite, and precipitating the silver as sulfide with sodium sulfide. Fay.

Johannite. A titanil-silicate of iron, sodium, and barium, NaBa(TiFe)SiO4; orthorhombic; honey-yellow; minute crystals. Occurs with barynite and neptunite in San Benito County, California. Eng.

Job shop. An enameling plant doing custom work and enameling of various sheet iron and bar iron parts for other manufacturers. Hauen.

Job's-team. Rounded grins of chrysotile (asbestos) found associated with garnet in the Acadian C):

Jock. Scot. An iron rod, usually pronged, attached to the rear end of a train of hatches or can be drawn up an incline, to stop and locate in the event of the rope breaking. Fay.

Jochckett. A hydrous carbonate of iron occurring as concretions; from Jocketta, Saxony, Germany. Hey, 24, 1955.

Jockey, a. Aust. A Y-shaped grip placed in sockets at the end of a ship. It is on this that the endless rope rests when used above the ship. Fay, b. Mid. A self-acting appara

us on the front of a car for releasing it from the hauling rope at a certain point. Fay.

Jockey pot. A pot of small size that is set on top of another pot, for the purpose of melting special glasses not needed in great quantity. Several such pots may be set in the space of one full-sized pot. Also called monkey pot. C.T.D.

Joorsy. Mid. A man specially appointed to set timber in a stand to check the shift. Fay.

Joggling; inching. In general, joggling and inching duty are synonymous when refer-

ing to inching operations. The National Electrical Manufacturers' Association definition of "joggling" (inhching) is "the quick, repeated closure of the circuit to start a motor from rest for the purpose of accomplishing small movements of the driven machine." Pit and Quarry, 53rd, Sec. D, p. 13.

Joggie. a. A joint of trusses or sets of timber for receiving pressure at right angles or nearly so. Zena, b. Nor
cut in round timbers set above other round pieces in underground timbering. Pryor, 3. c. An often is "the rough rope at a certain point.

Joint box. A cast-iron box surrounding an electric cable joint, often filled with insu-
Joint box

Joint box. A dorr in the stone work industry, one who operates an abrasive saw or wheel to cut marble slabs into two or more pieces. The stones may be square or true edges so that they will form tight and even joints when installed for building purposes. Also called jointer. D.O.T. 1.

Joint sealing material. Bituminous or rubbery material used for filling expansion joints, and which may be applied by a pressure gun. Ham.

Joint stock company. An association of individuals legally incorporated and registered for the purpose of engaging in some manufacturing, trading, or banking business. Traux, p. 260.

Joint system. Consists of two or more joint sets or any group of joints with a characteristic pattern, such as a radiating pattern, a concentric pattern, etc. Billings, 1954, p. 128.

Joint veins. Small veins confined to one bed of rocks that give no signs of displacement, or at least so slight that they cannot be noticed. Standard, 1964.

Jointy. Full of joints; specifically, in mining, full of minute cracks or crevices, as rock. Standard, 1964.

Jointy joint. A group of more or less parallel joints (cleat) as the underlying coal seam. Artikl.

Joist. Iolite. Skipper.

Joist. A machine for molding hollowware. C.T.D.

Joisty balance. A delicate spring balance. Used especially for the determination of specific gravity by the method of weighing in water and in air. Webster 3d.

Joint system. A machine sometimes used for the shaping of refractory blocks. A mold is charged with prepared batch which it is then consolidated by jolting the mold mechanically; top pressure may simultaneously be applied via a mold plate. Compare tapping. Dodd.

Joint. mostly hardened in a test in which a standard test piece, 4 inches long and 1 inch in diameter, is heated to a predetermined temperature and then transferred to a jig fixture and quenched, under standard conditions, by a jet of water impinging at one end. When the specimen is cool, determinations of hardness are made along the specimen from the quenched end. The diagram relating hardness to distance from the quenched end of the specimen is known as a hardnessen curve. Ham.

Joint. In an apparatus used for cutting the tire of a sample. It consists of a hopper above a series of open-bottom pockets, usually one-half or three-fourths of an inch wide, which are so constructed as to discharge alternately, first into a pan to the right, and then into another pan to the left. Each time the sample is passed through the rig, it is divided into two equal parts; the next pass of one of those parts will give a quarter of the original sample, and so on, until the sample is reduced to the desired weight. Pearl, p. 70.

Joint splitter. A device used to reduce the volume of a sample consisted of a hinged, rectangular container, the bottom of which is fitted with a series of narrow slots or alternating chutes designed to cast material in equal quantities to opposite sides of the device. Also called sample splitter. Compare riffler. Long.

Joule's law. Either of two statements: (1) the rate at which heat is produced by a steady current in any part of an electric circuit is jointly proportional to the resistance and to the square of the current. (2) the internal energy of an ideal gas depends only upon its temperature irrespective of volume and pressure. Webster 3d.

Journeymen. A weekly rate of pay. S.M.B.

Journeymen miner. A man working on a daily. C.T.D.

Joy, Trademark for a high explosive of soda, nitrate and nitrates compounds, formerly used in armor-piercing shells. Webster 2d.

Joy. a. A New. A noise made as a signal, by hammering at the faces of two levels expected to meet. Fay. b. A shaft rotating in its bearing. Pryor, 3, b. A cycle of work done in glass manufacturing in converting a quantity of material into glass or glass products. Webster 3d.

Joy double-ended miner

heads are pivoted and controlled hydraulically for vertical movement. Each head comprises two borers and a frame or loop cutter that grinds the bottom, face side, and top. A cross conveyor delivers the coal to the adjacent face conveyor. The machine has a web of 5 feet in seams from 371/2 inches to 5 feet high. With an overall length of 18 feet it weighs 15 tons.

Joy extendible conveyor. A belt conveyor to serve between a loader or continuous miner and the main transport. It consists of two main heads and 3 feet sections—each mounted on crawler tracks and independently driven. In operation, the tail unit, that is, the receiving end, moves forward with the loading machine, and belting is automatically released from the loop takeup. Fifty feet advance is possible before additional belting has to be inserted into the conveyor run. Capacity equals 290 tons per hour with a 30-inch belt.

Joy extendible steel band. An arrangement to provide a continuous miner and the main transport. The equipment is hydraulically driven and the steel band is extendible from 15 feet 6 inches to 60 feet 6 inches.

Joy loader. Loading machine for coal or ore, which uses mechanical arms to gather mineral and deliver it into the conveyor system. It is operated by a single operator seated in the extendible material. A built-in conveyor then lifts it into tubs or on to a conveyor.

Joy longwall loading machine. A modified Joy loader. 10 feet long, 5 feet 3 inches wide and 2 feet 8 inches high, comprising a hydraulically elevated loading head fitted with Joy gathering arms. The elevating conveyor delivers coal into a horizontally travelled cross band and deliver it to the face conveyor. It is extendible up to 1 foot 6 inches on either side by means of ropes attached to hydraulically operated bars. The arms are extendible from the seamed belt to the face of the coal. The coal is propelled by caterpillar tractors 5 feet 6 inches long by 7 inches high and all components are conveniently grouped at the rear. The machine loads at the buttstock of the prepared coal. It has a loading capacity of 60 tons an hour. Mason, v. 3, p. 532-533.

Joy microdyne. A wet-type dust collector for use at the return end of tunnels or hard headings. It may be either 6,000 or 12,000 cubic feet per minute capacity. It wets and trims dust as it passes through the appliance, and releases it in the form of a slurry as it passes through the outlet. The microdyne is bolted to the outbye end of the jib, which is removed by a pump. The microdyne is bolted to the outbye end of the jib and delivers on to the face conveyor; it is hydraulically driven and the steel band is extended up to 1 foot 6 inches by 7 inches wide. The cross conveyor runs in a minimum seam height of 4 feet, whereas the walking type can work in a 2-foot 6-inch seam.

Joy walking miner. A continuous miner with a walking mechanism instead of caterpillar tracks. The walking mechanism was adopted to make the machine suitable for thin seams. The lowest caterpillar-mounted machine can operate in a minimum seam height of 4 feet, whereas the walking type can work in a 2-foot 6-inch seam. Nelson.

Joy loading machine. A successor to the Gismo. At the receiving end, mum for- ward additional belting has to be inserted into the conveyor run. Capacity equals 290 tons per hour with a 30-inch belt.

Joy-Sullivan hydropneumatic. A drill rig in which the drill is mounted on a jib or boom which can be moved to and locked in any required position by hydraulic power control. Vertical movement of the jib is obtained from a manually operated hydraulic pump, and horizontal movement is effected by a small steel lever. A cone-type grip fixes the horizontal swing of the jib. Attached to the forehump of the jib is a saddle holding the drill traverse—feed. This can be fixed in any position, vertical or horizontal, by two locking nuts. By loosening one nut the drilling machine and saddle are free to pivot around the jib to any position, and the feed, which is 8 feet long, enables a 2-foot 6-inch hole to be drilled. Mason, V. 2, p. 602.

Joy walking miner. A continuous miner with a walking mechanism instead of caterpillar tracks. The walking mechanism was adopted to make the machine suitable for thin seams. The lowest caterpillar-mounted machine can operate in a minimum seam height of 4 feet, whereas the walking type can work in a 2-foot 6-inch seam. Nelson.

Judd, J. A. Mix of fine white and red granite.

jumbler. A small wagon, running on rails, which side-tips.

jumping. 1. To take possession of a claim, the property of others, on legal rounds. Pryor, 3. Can. Staking or claiming a claim, that is, takes possession of another end. This machine is effective for moderately soft ore where actual crushing or breaking is not required.

jumper bar. A weighted steel bar with a cut-out section in the Carboniferous limestone of the Clee Hills, Arkell.

jumper. a. In mining, a drill carriage on which several drills are mounted. Vertical movement of the jib is obtained from a manually operated hydraulic pump, and horizontal movement is obtained from a small steel lever. A cone-type grip fixes the horizontal swing of the jib. Attached to the forehump of the jib is a saddle holding the drill traverse—feed. This can be fixed in any position, vertical or horizontal, by two locking nuts. By loosening one nut the drilling machine and saddle are free to pivot around the jib to any position, and the feed, which is 8 feet long, enables a 2-foot 6-inch hole to be drilled. Mason, V. 2, p. 602.

b. A mobile scaffold to assist drilling in tunnels. 

c. A number of drills mounted on a mobile carriage, and used in tunnels. 

d. Drilling platform used in boring. 

jumper brick. A generic term indicating a brick larger than the standard; some products use this term to describe an oversize-brick unit of specific dimensions. 

jumper block. A fine-grained poikiloblastic rock containing phenocrysts of orthoclase (with poikilitic inclusions of olivine), phlogopite, hornblende, and small amounts of soda amphibole and leucite, with accessory apatite and titaniferite. 

jumper. a. To take possession of a claim, the property of others, on legal rounds. 

jumper. c. Eng. A sudden rise in the dip of a coal seam, otherwise trying to acquire claims already staked or owned by others. Hoffman, d. 

jumping. a. A sudden rise in the dip of a coal seam. 

jumping a claim. Eng. A sudden rise in the dip of a coal seam. 

jumping. f. A number of drills mounted on a mobile carriage, and used in tunnels. 

jumping. h. A sudden rise in the dip of a coal seam. 

jumper bar. A weighted steel bar with a cut-out section in the Carboniferous limestone of the Clee Hills, Arkell.

jumpers. a. Eng. Big jumbler, a bed of limestone in the Lower Lias at Rugby. Arkell. b. Shrop. Jumbles, the thickest

kalske. A silicate.

K. Common abbreviation for kip (1,000 pounds).

KAL-SHE. A variety of nickeliferous iron found in meteorites. C.M.D.

KAM. A trivalent hydrated, basic copper hydrate and sulfate, Cu(OH)2SO4.6H2O. Standard, 1964.

kame. A deposit on a hill or in the valley floor beyond a stream. Fay. 6. The original landform of a kame.

kame. A form of carbonate which precipitates with ions of metals such as calcium, magnesium, and iron. Fay.

kaolinite. Same as kaolin, English.

kaolin. A hydrous aluminium oxide; a clay mineral, 2:1 sheet silicate with variable amounts of iron, magnesium, and titanium. Hess.

Kaolin, the potash alum. Hydrous sulfate of potassium and aluminum: KAl(SO4)2·12H2O. It is a white, prismatic crystal in the monoclinic system. It is a volatile crystal in the decomposition of potassium and aluminium, K(AlBO3), crystallizing in the hexagonal system. It contains small amounts of iron and manganese. Also called phacelite, facelite. Danielson, 17.

kaolinite. A mixture of limonite, with oxides of manganese and silicates of zinc and lime. Osborne.

KAL-STEEL. A grass-green, hydrated, basaltic sandstone. Fay.

Kalskite. Same as callalime, Shipley.

Kalskite. A variety of nickeliferous iron found in meteorites. C.M.D.

kalske. A silicate.

kalskite. A name applied to rock containing calcium carbonate occurring in alluvium. Holmes, 1928. See also augen schist; cataclasite; flaser gneiss; hartshorncrystalline; mylonite; porphyroblast; serpentinitic.

kalskite. A coarse kind of iron. Fay.

kalskite. To coat in a manner similar to kalantening, but using kalskite. Fay.

kalskite. See calamine.

kame. A large, long, rounded hill or a group of rounded hills. A.G.I. 1964.

kame. The name for a cone-shaped or truncated cone-shaped hill or ridgeline or mound of alluvium. Holmes, 1928; see also augen schist; cataclasite; flaser gneiss; hartshorncrystalline; mylonite; porphyroblast; serpentinitic.

kame. A deposit on a hill or in the valley floor beyond a stream. Fay. 6. The original landform of a kame.

kame. A form of carbonate which precipitates with ions of metals such as calcium, magnesium, and iron. Fay.

kame. A deposit on a hill or in the valley floor beyond a stream. Fay. 6. The original landform of a kame.

kame. A form of carbonate which precipitates with ions of metals such as calcium, magnesium, and iron. Fay.
Kaolinite is a common clay mineral. A two-kaolimic. Of, relating to, or resembling kaolin. A clay, mainly hydrous aluminum silicate, from which porcelain may be made. Also called China clay; porcelain clay. See also kaolinite. Sanford. a. A refractory clay consisting essentially of minerals of the kaolin group and which fires to a white or nearly white color. ASTM CD 60. c. A white or nearly white clay resulting from the decomposition of fieldspar. B.S. 3618, 1964, sec. 3.

Kaolin-coal tonstein. Kaolin-coal tonstein is difficult to distinguish with the unaided eye from ordinary dirt bands occurring in hard rocks. Its color ranges from a yellowish-white to black. The lighter colored varieties generally occur as the immediate roof, or floor of seams or in the associated strata, whereas tonstein bands occurring within the coal are generally dark gray to black. Kaolin-coal tonstein has a dense, fine-grained texture, and is not generally stratified. It occurs almost invariably within coal seams, usually close to the roof or floor; more rarely it is associated with different parts of the sequence of seams. The thickness is generally only one to a few centimeters and their lateral persistence is often great. HIC, 1963, part I.

Kaolinite. Of, relating to, or resembling kaolin. Webster 3d.

Kaolinite. a. Formation of kaolin by the weathering of aluminum silicate minerals or the alteration of other clays. A.G.I. Supp. b. Less commonly, the formation of kaolin by hydrothermal action. A.G.I. Supp. c. A process which occurs as a result of either hydrothermal alteration, or by weathering, alteration of rocks, ores, and minerals like silicoferruginous waters. It is typically a result of surface agencies, but may also occur where hydrothermal solutions react. This process is dependent on the composition and solution of hard feldspars and other minerals and the general condition of the soil in which it is and has been widely investigated. Rother, p. 606.

Kapel. See capel, a and b. Fay.

Kaplan turbine. A water turbine, of propeller type, having blades of variable pitch automatically adjustable to accord with the load. Hame.

Kappus caribide. A caribide of iron (FeCux) in which one or more of the iron may be replaced by chromium, molybdenum, and/or, or manganese, (Fe,C,Mo,W)C. Osborne. 1928.

Karet. I. One-twenty-fourth part. Used resulting from the decemiporition of feldspars of the kaolin group and which fires to a white or nearly white color. ASTM CD 60. c. A white or nearly white clay resulting from the decomposition of feldspar. B.S. 3618, 1964, sec. 3.

Karat. a. Formation of kaolin by the weathering of aluminum silicate minerals or the alteration of other clays. A.G.I. Supp. b. Less commonly, the formation of kaolin by hydrothermal action. A.G.I. Supp. c. A process which occurs as a result of either hydrothermal alteration, or by weathering, alteration of rocks, ores, and minerals like silicoferruginous waters. It is typically a result of surface agencies, but may also occur where hydrothermal solutions react. This process is dependent on the composition and solution of hard feldspars and other minerals and the general condition of the soil in which it is and has been widely investigated. Rother, p. 606.

Kaplan turbine. A water turbine, of propeller type, having blades of variable pitch automatically adjustable to accord with the load. Hame.

Kappus caribide. A caribide of iron (FeCux) in which one or more of the iron may be replaced by chromium, molybdenum, and/or, or manganese, (Fe,C,Mo,W)C. Osborne. 1928.

Karet. I. One-twenty-fourth part. Used resulting from the decemiporition of feldspars of the kaolin group and which fires to a white or nearly white color. ASTM CD 60. c. A white or nearly white clay resulting from the decomposition of feldspar. B.S. 3618, 1964, sec. 3.

Karat. a. Formation of kaolin by the weathering of aluminum silicate minerals or the alteration of other clays. A.G.I. Supp. b. Less commonly, the formation of kaolin by hydrothermal action. A.G.I. Supp. c. A process which occurs as a result of either hydrothermal alteration, or by weathering, alteration of rocks, ores, and minerals like silicoferruginous waters. It is typically a result of surface agencies, but may also occur where hydrothermal solutions react. This process is dependent on the composition and solution of hard feldspars and other minerals and the general condition of the soil in which it is and has been widely investigated. Rother, p. 606.

Kaplan turbine. A water turbine, of propeller type, having blades of variable pitch automatically adjustable to accord with the load. Hame.

Kappus caribide. A caribide of iron (FeCux) in which one or more of the iron may be replaced by chromium, molybdenum, and/or, or manganese, (Fe,C,Mo,W)C. Osborne. 1928.

Karet. I. One-twenty-fourth part. Used resulting from the decemiporition of feldspars of the kaolin group and which fires to a white or nearly white color. ASTM CD 60. c. A white or nearly white clay resulting from the decomposition of feldspar. B.S. 3618, 1964, sec. 3.
kataeptrite. Same as cataeptrite. English.

katras: klatro. Local Tartar name in the Baku region for impure asphalt. Tomkeieff, 1912.

katzelnuckelistle. A porphyritic igneous rock similar to tinguante having phenocrysts of nepheline, leucite, orthoclase, biotite, soda pyroxene, and soda-amphibole. Holmes, 1928.

kastlite. A coarse-grained igneous rock consisting of an olivine-augite diorite with zoned feldspars ranging from labradorite in inner zones to alkali feldspar in outer zones. From the Hawaiian islands. Holmes, 1928.

kawri. kawari. A light-colored to white color. From brown copal to grey or black. See also copal. ASD Gloss.

kawve. A Malay magician who claims to be able to make mining and other ventures successful. Eng.

kawvd. A stone used for making varnishes and linoleum. Eng.

kayserite. An aluminium hydroxide, A10(OH)3; monoclinic. A micaceous alteration product of corundum. A dimorphous mineral, the orthorhombic form of which is disapate. Replaced by hematite from Galendoza, Uruguay. English.

kazul. A variation of kiln. Fay.

kellaways. A British unit of weight equal to 11.36 percent MgO, 12.46 percent CaO, 38.31 percent H2O, as bluish-white earthy mass, apparently pseudomorphous after chalcanthe, from Copacabana, Chile. Spencer 19, M.M., 1952.

kellerkep. A shop term. See also tracer mill. ASD Gloss.

kellays. A group of red and purple sandstones and tuffs which constitutes the highest division of the Coal Measures in the North Staffordshire coalfield, England. They are barren red measures, deposited under semidesert conditions. C.T.D. Gloss.

kelved. A shop term. See also tracer mill work. ASD Gloss.

kelker. A kyokids. A plumbogummite cement. Anhydrous calcined gypsum, one or more vertical retorts for the distillation of some other substance, which contains 25 percent water. Fay.

kelke. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kelkite. A plastic constructional material which will withstand the action of both sulfuric acid, of up to 50 percent concentration, and hydrochloric acid. It is used for the construction of pickling tanks. O'Brien.

keel. a. Eng. A flat-bottomed ship; especially, a large vessel. M. of the Kiel Canal. Klags. Glassworks still operates on the same site. ASB.

kened. A shop term. See also tracer mill. ASD Gloss.

kennith. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellens. A glassy or cryptocrystalline groundmass containing minute crystals of nepheline, leucite, orthoclase, biotite, soda pyroxene, and soda-amphibole. Holmes, 1928.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.

kellows. A name given by von Fedorow to a dike rock from the Kedabek mines, in the province of Elisabethpol, Transcaucasia, U.S.S.R. The rock is finely granular, dark gray in color, and consists of basic plagioclase, lime-iron garnet, and a pleochroic pyroxene called violante. Fay.
Kelvin temperature scale. The absolute temperature scale in which the temperature is measured with respect to the freezing point of water, which is assigned the value of 273.16 K. This scale is linear and has a fixed zero point, the absolute zero, which is approximately -273.15°C. The magnitude of the degree in both these scales is defined as one one-hundredth of the difference between the temperature of melting ice and that of boiling water at 760 millimeter of mercury.

Kelly stem. Synonym for kelly. Long.

Kelly temperature scale. An on-site method for assessing the consistency of freshly mixed concrete in terms of the depth of penetration, using a weight of 50 pounds of a metal hemisphere, 6 inches in diameter.

Kerry refusal. The mechanism that encircles a Kelly and by means of which it is rotated. Long.

Kelly’s lam. A rule laid down by Lord Kelvin.

Kelly. A large seaweed such as are used in the manufacture of kelp. a. Large seaweed. b. A switch associated with her in its production. A synonym for kelly. Long.

Kelly. A fine-grained igneous rock, occurring massive or as lens-shaped bodies, with a rich fauna, notably of crinoids occurring in a rich fauna. See also vanoxite. Hess.

Kelt. A trade name used in U.S.S.R. for an expanded clay aggregate. Dodd.

Kelt. A system designed to prevent a shaft conveyance being lowered before all keps are fully withdrawn, and to indicate this to the operator of the keps. B.S. 3618, 1965, sect. 7.

Kelp. a. Steel supports on which the cage rests at the pithead during unloading or loading so that the rail track is always at the proper level. During this period the rope is released from the weight of the cage. The ordinary type of kep gear consists of four steel arms, two for each end of the cage carried on shafts which are connected to and operated by levers. Normally, the cage must be raised from the kep arms before the latter can be withdrawn to allow the cage to descend the shaft. See also Bein kep gear; cage stops. Nelson. b. Retractable rests on which the mine cage is supported during its stop at a shaft landing. Also called catches; chairs; landing chairs; stops. Pryor, 3, c. Bearing-up stops for supporting a cage or load at the beginning or end of hoisting in a shaft. C.T.D. c. Scot. Shuts. Fay. d. Steel supports on which the cage rests at the pithead during unloading or loading so that the rail track is always at the proper level. During this period the rope is released from the weight of the cage. The ordinary type of kep gear consists of four steel arms, two for each end of the cage carried on shafts which are connected to and operated by levers. Normally, the cage must be raised from the kep arms before the latter can be withdrawn to allow the cage to descend the shaft. See also Bein kep gear; cage stops. Nelson. d. Retractable rests on which the mine cage is supported during its stop at a shaft landing. Also called catches; chairs; landing chairs; stops. Pryor, 3. e. Retractable stops for supporting a cage or load at the beginning or end of hoisting in a shaft. C.T.D. f. Scot. Shuts. Fay. g. Steel supports on which the cage rests at the pithead during unloading or loading so that the rail track is always at the proper level. During this period the rope is released from the weight of the cage. The ordinary type of kep gear consists of four steel arms, two for each end of the cage carried on shafts which are connected to and operated by levers. Normally, the cage must be raised from the kep arms before the latter can be withdrawn to allow the cage to descend the shaft. See also Bein kep gear; cage stops. Nelson. h. Retractable stops on which the mine cage is supported during its stop at a shaft landing. Also called catches; chairs; landing chairs; stops. Pryor, 3. i. Bearing-up stops for supporting a cage or load at the beginning or end of hoisting in a shaft. C.T.D. j. Scot. Shuts. Fay.

Kelp. A steel supports on which the cage rests at the pithead during unloading or loading so that the rail track is always at the proper level. During this period the rope is released from the weight of the cage. removed during cutting. ASM. Gloss.
kerf. The kerf of the diamonds inset in the kerf of the crown of a diamond bit. Also called face. Long.
kerense. A monochlor, cherry-red mineral. See also biotite. Also called kerense.
kerensite. A variety of lignite impregnated with hydrated silica and mined as a nickel ore in the Ural Mountains, U.S.S.R. Tomkeieff, 1934.
kettle. A cylindrical or barrel-shaped iron or wooden vessel used to raise men or materials in shaft sinking. By adding large quantities of kerosine to a pulp plus a small amount of frotter and agitating vigorously, frotters are attracted to both the oil and air bubbles, forming heavy flocs. This type of concentrate is more readily dewatered than ordinary froth and is used as a fuel or a fuel component for jet engines, and as a solvent or a thinner. Webster 3d.
kettle carbonate. Another name for oil shale. Tomkeieff, 1934.
kettle flotation. As sometimes practiced, it is a combination of bulk oil flotation and froth flotation. By adding large quantities of kerosine to a pulp plus a small amount of frotter and agitating vigorously, frotters are attracted to both the oil and air bubbles, forming heavy flocs. This type of concentrate is more readily dewatered than ordinary froth and is used as a fuel or a fuel component for jet engines, and as a solvent or a thinner. Webster 3d.

Kewatinian

Keweenawan. Younger of two Precambrian systems constituting the Proterozoic re-

Kew-type barometer; fixed-cater barometer. A mercury-column-ye barometer with a fixed

cater as in the Ker type. It has no mercury level

to adjust the cister as in the Ker type. It can be used to
to estimate pressures

other than atmospheric because the cister as is easily
calculated via a key and valve

to a vacuum system. This means that the

Kew type is a more suitable instrument to

to use as the standard against which various

aneroid barometers may be calibrated.

key. a. An iron rectangle of suitable size and

taper to fit the keyways of a shaft and

pulley so as to lock both together. Long. b.
The pieces of core causing a block in a

core barrel. the removal of which allows the

rest of the core in the core barrel to

slide out. Eng. a. A kind of wrench

used for screwing and unscrewing drill

rods. Also used to support the rods by

resting on top of the casing and allowing the

rods to hang by the enlarged joint

coming in contact with key. Fay. d. A hard

steel strip inserted in matching grooves

(keyways) in a shaft and a hub to make

them turn as a unit. Nichols. e. A wedge

between two feathers to break a stone.

Webster, 3d. e. A wedge-shaped strip of iron

or steel used for preventing wheels from

rolling. Nichols. f. See keyseat.

keybrick. A brick with opposite side faces

inclined to each other so that it fits the

apex of an arch. In furnace construction

such bricks are also sometimes re-

ferred to as bullheads, cupola bricks, or

preferred to as bullheads, cupola bricks, or

keyed shales. See Kiowa shales. C.T.D.

kick wheel. A potter's wheel impelled by

the foot. Fay. c. Eng. A lib-

tating catch made in the form of a bell-

crank lever rocking on a horizontal axis.

Fay. d. Synonym for gage stone; also, a
gage stone huck in the outside surface

or wall of the metal shank of a diamond

bit. Long. c. Can. Outboard motor. Hoff-

man.

kicker stone. See gage stone; kicker, d. Long.

kicking pieces. Short struts to prevent a sill

or wall from being pushed out of

place. Stawfer.

kicking point. The place in a borehole where

the first intentional siliconizing starts. Some-
times abbreviated KOP. Long.

Kick's law. The amount of energy required
to crush a given quantity of material to

a specified fraction of its original size is the

same no matter what the original

size. CCD 6d, 1961.

kibbutz. a. Aust. An end tippler. Fay. b. N. of

Eng. See tipper, b and c. Fay.

kick wheel. A potter's wheel impelled by

kicking with the foot. ACGS, 1962.

kid. A laggot of bushwood used on

occasions to form a groin. See also fascines. Har.

Kidney. See Potter's horn. Dodd.

Kidney iron ore. A reform.

Kidney-shaped structural variety of an iron ore mineral

aggregate, generally hematite. The internal structure of the

kiney is usually concentric or radiating. Bureau of

Miners Staff.

kiddle. a. Boulderlike nodules of phosphate

rock, separate or connected. Bureau of

Miners Staff. b. A term applied by miners

in mining operations, the sec-

tion of brick masonry.

Stawfer. i. In furnace construction, the

upper or bottom of the closing brick of a cur-

vuous arch. HW. j. A rectangular depression, in

one or both flat sides of a brick, sometimes
called a keyseat. Fay. b. A bed with sufficiently distinctive

characteristics to make it easily identifiable

in the field. Long. c. A bed, the bottom of which is used as a datum

in making structure contour maps. See also

key blocks. The first block which are re-

moved in opening up a new quarry floor.

Fay.

key brick. A brick with opposite side faces

inclined towards each other so that it fits the

apex of an arch. In furnace construction

such bricks are also sometimes re-

ferred to as bullheads, cupola bricks, or

kibble. a. Steel bucket used during shaft sink-

ing. Pryor, 3. b. To carry in a hoisting

Kidney iron ore. See Potter's horn. 

Kidney-shaped structural variety of an iron ore mineral

aggregate, generally hematite. The internal structure of the

kiney is usually concentric or radiating. Bureau of

Miners Staff.
Kilkenny coal. Anthracite.

Klichaanktr. A mineral, Ca,S407, a poly-

Moving. The concentration of fine ore or

Mewl. Strang tub" with sides flaring upward.

Liestans. A notueal maffICIIUM 111041f

him

Wm, stnon. s.

killing. a. Allowing the molten steel to remain

killas. Corn. a. Miner's term for the slates or

kill. a. As applied to an oil or gas well means

bars for the fin.s1 separation. They are used

bars for the fin.s1 separation. They are used

between carbon and oxygen during solid-

deoxidizing agent, such as silicon or alu-

hydrochloric acid, and used in soldering.

kindred. A group of igneous rocks which kindly ground. Eng. Those rocks in which kindling temperature; kindling point; ignition point. The temperature; igniton point. The tempera-

der. A Russian name given to petroleum so-
to emit definite rays, the wavelengths of
substance exerts a definite absorptive power, to emit. (3) At a given temperature the
which is a maximum for the rays it tends

ear, the undersize passing through the pulp to be screened is delivered on the

orin. a. Loops in wire rope caused by care-

a. In an open circuit. The relation be-

while passing through pipes. a. A term for

its, its,

irse of Mosso. Its,

k-knight. A level or gently sloping

Kirchhoff's laws of radiation. The relation

hinge. b. A large bolt that holds the upper end

the sheave-wheel can vis is suspended. Long.

kink. a. Loops in wire rope caused by care-

appliances. Apparatus for producing a

gas by the action of a liquid on a solid,

Kirchhoff's laws of electric circuits. a. In an

closed circuit the algebraic sum of the

currents in all the branches that meet at any

point is 0. Webster 3d. b. In any

closed circuit the algebraic sum of the current

and the resistance of the circuit is equal to

the electromagnetic force in the circuit.

Handbook of Chemistry and Physics, 45th

Kirchhoff's laws of radiation. The relation

between the powers of emission and the

forces of absorption for rays of the same

wavelength is constant for all bodies at

the same temperature. (1) A substance

when excited by some means or other poss-

cesses a certain power of emission; it tends

to emit definite rays, the wavelengths of

which depend upon the nature of the sub-

stance and upon the temperature. (2) The

substance exhibits a definite absorptive power,

which is a maximum for the rays of which

it is capable of emitting. (3) At a given temperature

the ratio between the emission and the absorp-

tive power of a body of a given wavelength is the

same for all bodies, and is equal to the

emissive power of a perfectly black body.
knife switch. A switch which opens or closes a circuit.

knife. The dirt cutting edge of a digging mattock or stone.

knife edge. The girdle of a brilliant cut to a high polish.

knife and shears. See shear.

knife edge. The chisel of a long knife.

knell stone. A stone bound in a passage, consisting of two sets of interlacing faces, with one parallel to the original glaze plane of a permanence engine.

knife joint. A single point.

knife knapsack. A knapsack with a girdle to a knife.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife brace. A device to brace a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.

knife 1. A tool which is tapered to correspond to the shape of the knee of a horse.

knife 2. The receiving end of a pipe or a bit when it is driven into the earth, which is driven by impact and weight in all three directions and partly filled with cement or sand.

knife bracing. A method of bracing a single mine in the ground to prevent it from falling in.

knife joint. A single point.

knife pad. A protective pad, usually made of canvas that can be strapped to the miner's knee.

knife piece. A piece of a knife.

knife timber. A timber with natural knees and angles in it.

knife limb. A limb with natural knees.
bend.

screwed knuckle joint. A mechanism consisting of knuckle boy. See knuckle man. D.O.T.!

knox system. A system of separating masses of knox and osborne furnace. A continuously working shaft furnace for roasting quicksilver. Fay.

masonry at one side. The fuel is known to exist in order to except it from a vein and of some large projects in Great Britain are being equipped with winders of this type. See also multipoise friction winder. Nelson.

koehne winder. A brake which acts directly on the Koepe winder and can be applied by the winding engine's brake lever and the other safety devices. Nelson.

koefler fall. Get in structural geology, a box fold common in the Jura. They are symmetrical, upright, and have vertical limbs and a horizontal crest. Bureau of Mines.

koeflerite. A general term for oligoclase feldspar from the Kohala Mountain, Hawaii. Holmes, 1928.
Kolthoff buffer solutions. Solutions chosen for their low concentration of hydrogen ions and their resistance to change of pH when small quantities of acids or alkalies are added. Those mostly used in conjunction with colorimetric pH indicators are acetic acid with sodium acetate; boric acid with borax; citric acid with sodium citrate; and sodium phosphate with hydrochloric acid. Pryor, 3.

Komir. Turkish name for coal. Tomkeff, 1954.

Konge diabase. A type of granodiorite containing calcic labradorite laths and intergranular augite and orthoamphibole pyroxene, in a matrix of quartz and orthoclase; from Konga, Sweden. Holmes, 1928.

Konimeter. Apparatus used to measure dust in mine atmosphere. A measured volume of air is drawn through a jet so as to impinge on a glass plate coated with a thin layer of smoke. The diameter of smoke particles is determined by the microscope. Pryor 3.

Körteff. A type of coke oven heated by a combination of the retort method and a commercial system for heating the coke. The coke is produced in a retort and is then reheated in a commercial system. Pryor, 3.

Korrubin. A mixture of 30 percent nitric acid and 70 percent methyl alcohol, used as a mordant in dyeing. Nelson. 1961.

Korubin. A measure of weight; used in the Malaya Peninsula that equals 40 piculs or 5,705 pounds. Webster 2d, 1989.

Kozyen equation. An equation relating the rate of flow (q) of a fluid through a packed bed of particles of depth L and area A, under a pressure difference ΔP, to the specific surface of the particles being stirred and the voids per unit weight being V:

\[ \Delta P = q \frac{L}{(1 - V) A} \]

Krabatte. A variety of crystal tuff containing...
Krupp Krupp washing process. The removal of silica and phosphorus from molten pig iron by running it into a Permut furnaces, lined with iron oxides. Iron ore may be added, and the bath is agitated by rotation for 3 to 8 minutes only. See also Bell's diphosphating process. Fay.

kryosol. Synonym for cryocar. A.G.I.

Kryolite furnace. The term used by the Continent and in Russia for a granular-carbonarin furnace; the name derives from the German name, Kryolith, that originally supplied the carbon granules. Dodd.

kryptonite. Synonym for cryptonite. A.G.I.

krypton. An inert, monatomic (Kr), the gaseous element of the argon group, constituting about one millionth by volume of the atmosphere, from which it is obtained by liquefaction; zerovalent; colorless; and odorless. Used in certain gas-filled electric lighting lamps; atomic number, 36; atomic weight, 83.80; melting point, -156.6°C; boiling point, -152.30° C; density of gas, 3.733 grams per liter (at 0°C); specific gravity of liquid, 2.155 (at -152.9°C); and soluble in water. Fay; C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-117; B-184.

kreide. In geology, pertaining to or treating of the subject of ice as a surface feature of the earth, in any and all of its forms, including glacier ice; as, cryostic geology; and standard, cryostic.

krypton. A term for stone, used by the Continent and in Russia for a granular-carbonarin furnace; the name derives from the German name, Kryolith, that originally supplied the carbon granules. Dodd.

Cyan's proem.

kyanize. To impregnate wood with mercuric chloride to prevent decay. Crispin.

kyanite. Wood preservation method by impregnating timber with biocidal mercuric chloride. Pryor, 3.

kyanite. A medium-grained gabbro rock, intermediate in mineral composition between typical tektite and picrite, containing less feldspar than the latter, but more than the former. Named from the

kyanize. To impregnate wood with mercuric chloride to prevent decay. Crispin.

kyanite. Wood preservation method by impregnating timber with biocidal mercuric chloride. Pryor, 3.

kyanite. A medium-grained gabbro rock, intermediate in mineral composition between typical tektite and picrite, containing less feldspar than the latter, but more than the former. Named from the
Laboratory moisture sample. In coal samples, the moisture content can be determined after drying at a constant temperature. In coal samples, the moisture content can be determined after drying at a constant temperature. In the iron and steel industry, the moisture content is important for the efficiency of the production process. Improvements may not be as significant as expected if the moisture content is not accurately measured.

A labile substance is one that is easily decomposed, such as fats and proteins. A labile region is a temperature region where a substance decomposes. A labile ion is an ion that is easily decomposed.

Als assumed to be hydrothermal. The temperature region for hydrothermal conditions is important for the formation of mineral deposits.

A laboratory balance is used to measure the mass of substances. A laboratory balance can be used to measure the mass of substances to a high degree of accuracy.

A laboratory benchmark is a reference point used to calibrate measuring instruments. A laboratory benchmark can be used to ensure that measurements are accurate.

Laboratory checks are performed to ensure that the results obtained in the laboratory are reliable. Laboratory checks can be used to detect errors in the experimental setup or in the analysis of the results.

A laboratory pond is a small body of water used for experimental purposes. A laboratory pond can be used to study the effects of different conditions on aquatic systems.

A laboratory sample is a small portion of a substance used for analysis. A laboratory sample can be used to determine the properties of a substance.

A laboratory test is a test performed in a laboratory to determine the properties of a substance. A laboratory test can be used to determine the composition or the reactivity of a substance.
ladle. a. The arm which carries the timbers and bucket line of a dredge. Fay, p. 234. A wooden slide with crossbars on which hitches (boxes) run in steep seeps. Fay, p. 7. A framework consisting, left to right, of two parallel, or roughly parallel, posts connected by bars at regular intervals along their length, thus providing a series of steps which enable the ladder to be used as an aid to climbing to different levels. CT D, d. The continuous line of mud buckets, carried on an endless chain, in a bucket ladder excavator or dredger. CT D, c. The digging boom assembly of a hydraulic dredge or chain-and-buckets ditcher. Nichols, f. A horizontal support for glass tubing that is to be transferred from one point to another. Also used for filling open ports. ASTM C162-66 c. In glassmaking, a curved pipe used to convey molten glass from one place to another. 

ladle, b. A man who distributes hot metal in ladles used to contain molten metal. ACGC, 1963. 

ladle chase. A man who distributes hot metal in ladles to different operations to keep the hot-metal crew busy to prevent skulking of ladies and delay at the mill. Fay, p. 133.

ladle crane man. One who places ladies under the tapholes of furnaces and holds them in position while the metal is poured into them. Also called charging floor crane operator; ladle crane operator; steel charger. D.O.T. 1. 

ladle filler. In metallurgy, one who transfers molten metal from the furnace into a ladle, and skims and fluxes metal preparatory to casting. D.O.T. Supp. 

ladle houseman. See ladle liner. Fay, p. 133. 

ladle liner. In blast furnaces, smelting, and refining, one who repairs and cleans pouring ladles used to transport molten metals, such as iron, steel, and copper. Also called
lagoon stone

a small basin that they rock with the ap-

lagging. a. To secure the roof and sides

lag. b. A flat-headed machine screw by

Lake Superior greenstone

Lamella roof. A vault of large span built up with short structural members of timber or pressed steel, joined together in a diamond pattern by bolting or other suitable connections. This system, which is a type of stressed-skin construction, was patented in 1925 by a German engineer. Ham.

Lamellar pyrites. Another name for marcasite. Bureau of Mines Staff.

Lamellar stellate. In mineralogy, having or consisting of lamellae arranged in groups. Onslow, 1964.

Lamellar twins. Two or more pieces of glass held together by an interlocking layer or layers of plastic materials. It will crack and break under sufficient impact, but the pieces of glass tend to adhere to the plastic and not to fly. If a hole is produced, the edges are likely to be less jagged than would be the case with ordinary glass. See also safety glass. AGS, 1963.

Laminar flow. a. The flow of a fluid in which the fluid elements follow paths that are straight and are parallel to the channel walls. See also laminar flow. A.G.I. b. Laminar or streamline flow is the smooth non turbulent flow of a body of air when each particle travels parallel to the side of the confining airway. Spalding.

Lamellar. Having or consisting of thin layers which vary in grain or texture. Pryor. b. Metal defects with separation or weakness generally aligned parallel to the worked surface of the metal. They may be the result of pipe, blisters, seams, inclusions, or segregation elongated and made directional by working. Lamination defects may also occur in metal powder compacts. AGS Gloss. c. The form of thin layers. Such rocks are said to be laminated or to possess a laminated structure. Nelson.

Laminated. a. Of rocks, bedding in layers less than one-fourth inch thick; formation with thin layers which vary in grain or composition. Pryor. b. Metal defects with separation or weakness generally aligned parallel to the worked surface of the metal. They may be the result of pipe, blisters, seams, inclusions, or segregation elongated and made directional by working. Lamination defects may also occur in metal powder compacts. AGS Gloss. c. The form of thin layers. Such rocks are said to be laminated or to possess a laminated structure. Nelson.

Lamp. a. Any device employing a flame, incandescent wire, or the like, for furnishing an artificial light, or a similar device for heating, as in laboratory use. Standard, 1964. See also safety lamp. Fay. b. Among the specially developed sources of artificial light, there are the incandescent lamp, the filament in which current passes through a medium protected or vacuum or inert gas, and heats it to incandescence; the fluorescent, in which the interior of a tube or globe is coated with a material which fluoresces under the influence of ultraviolet radiation; the mercury, in which mercury vaporized in a high-vacuum tube conducts a current between electrodes and gives strong ultraviolet emission, the container being of quartz; the Neutron, a small metal oxide filament; and the spectrum lamp which has a nonluminous flame (used in spectrography). Pryor, 3. c. A small handheld electrical device that produces intense ultraviolet radiations to examine visually drill cores or rock specimens for the presence and/or abundance of fluorescent minerals. AGS Gloss. d. In construction of electromagnets for alternating current, reduction of eddy flow by means of laminar poles or cores. Pryor, 3.

Lambert's law. See translucency. Dodd.

chute doors. D.O.T. 1. d. In anthracite coal mining, bituminous coal mining, metal mining, one who works with shaft sinking crew at top of shaft or at a level immediately above shaft bottom, dumping rock into mine cars from a bucket in which it is carried. D.O.T. c. long. In anthracite coal mining, a layman; long. D.O.T. b. Long. In anthracite coal mining, the man who receives the loaded bucket, but the mouth includes all forms due to sedimentation and to movements within the crust of the earth. USGS Bull. 723, 1923, p. 80. From Xalotote, Morelos, Mex. Also called rosoite; xalotocite. English.

lander's crook. A hook or tongs for upsetting the bucket of hoisted rock. Fay.

landerite. A rose-pink variety of grossularite. Fay.

land fast. A short, steep or broken ter-

land surveying. See survey; survey, cadastral; surveying.

land surveyor. a. A trained specialist who measures and its natural features together with any buildings, roads, etc., thereon, for drawing to scale as plans or maps. His professional qualification is membership of the Royal Institute of Chartered Surveyors and he may also hold a university degree. Ham. b. In the United States, the qualifications of land surveyors who engage in public practice, especially in connection with surveys related to owning, legal disputes, etc., is normally controlled by registration with the State Government. c. Any person who engages in public practice, especially in connection with surveys related to owning, legal disputes, etc., is normally controlled by registration with the State Government. d. A person who engages in public practice, especially in connection with surveys related to owning, legal disputes, etc., is normally controlled by registration with the State Government.

lander. See lender.

landings. S. Wales. Eng. A man who receives the loaded (load) tubs at the bottom of the shaft where the cages are unloaded; any incline at the top of a set of pumps in which the water is delivered. See launder. Fay.

land sale. a. Coals sold at the pithead or at a depot and conveyed in lorries to local consumers. See also haunt. Nelson. b. Scot. The box into which a loaded chair or vice versa. Liddell 2d, p. 357. Also called landing box; Scot. The box into which a loaded chair or vice versa. Liddell 2d, p. 357.

land sale. a. Coals sold at the pithead or at a depot and conveyed in lorries to local consumers. See also haunt. Nelson. b. Scot. The box into which a loaded chair or vice versa. Liddell 2d, p. 357. Also called landing box; Scot. The box into which a loaded chair or vice versa. Liddell 2d, p. 357.

land sale. a. Coals sold at the pithead or at a depot and conveyed in lorries to local consumers. See also haunt. Nelson. b. Scot. The box into which a loaded chair or vice versa. Liddell 2d, p. 357.

land square. White or gray chalcedony with inclusions of irregular arrangements of manganese oxide which bear fanciful resemblance to a landscape. Shipley.

landscape marble. A marble or argillaceous limestone containing dark coloring matter so distributed as to be imitative of forests or landscape. Same as forest marble. Holmes, 1928.

landslide. a. The perceptible downward sliding or falling of a relatively dry mass of earth, rock, etc., on a hillside. b. Also called land slip. AGI. c. Earth and rock which become loosened from a hillside by moisture, frost, snow, and slides or falls down the slope. AGI. c. Downward and often sudden movement of superficial deposits on hillside slopes. The movement is in response to gravity and may start due to an increase in weight such as water content, or the removal of support at the base by cuttings. At new mine sites, deep excavations, heavy blasting, and the movement of heavy machines will increase the danger of landslides. See also rainwash; rock slip. Nelson.

landslide scar. A bare or relatively bare surface left by the removal of a mass of earth material in a landslide. Stokes and Varnes, 1955.

landslide topography. The topography developed by landsliding. It is characterized by short irregular hills, undrained depressions, and chaotic areas, commonly in the form of boulders and finer fragments, and by its lack of harmony with the adjacent landscape. In some respects, it is similar to irregular, morainic deposits of glaciers. Stokes and Varnes, 1955.

landslip. A portion of a hillside or sloping mass which becomes loosened or detached, and slips down. A landslide. Fay.

Langmuir trough. A blue to green, rare ore of copper, CuSO₄·H₂O, occurring in Cornwall, Eng. It is an essentially hydrated copper sulfate, crystallizing in the orthorhombic system. C.S.D.

Langmuir trough. A blue to green, rare ore of copper, CuSO₄·H₂O, occurring in Cornwall, Eng. It is an essentially hydrated copper sulfate, crystallizing in the orthorhombic system. C.S.D.

Langmuir trough. A blue to green, rare ore of copper, CuSO₄·H₂O, occurring in Cornwall, Eng. It is an essentially hydrated copper sulfate, crystallizing in the orthorhombic system. C.S.D.

Langmuir trough. A blue to green, rare ore of copper, CuSO₄·H₂O, occurring in Cornwall, Eng. It is an essentially hydrated copper sulfate, crystallizing in the orthorhombic system. C.S.D.
Lang's lay rope

lanzuodol marble. A brilliant red or scarlet marble blotched with white; from the Montagne Noire, in the E. Pyrenees. Fay.

lanzolith. An unstable colorless mineral associated with other minerals, [MgO]2[C02]; alters on exposure to air into asbolite. Larsen, p. 95.

lanthaniodes. The rare earth elements from atomic numbers 58 to 71 inclusive. They have chemical properties similar to lanthanum and include the same lanthanides. N.R.C.-A.S.A. N1.1-1957.

lanthanite. A very rare, weakly radioactive, scaly; also fine granular, earthy, or scaly; colorless, white, pink, or yellow. Cro pity, p. 165-104.

lanthanum. The most common and most basic of the metals of the rare earth group. It is a silvery-white metal and can take a high polish. It occurs with other members of the rare earth group in cerite; in bastnäsite; in allanite found in Brazil, Scandinavia, and the United States; and in monazite sands of India and Celmen. Symbol: La; valence: 3; atomic number: 57; atomic weight: 138.91; and specific heat, 0.935 (at 20° C). Handbook of Chemistry and Physics, 45th ed., 1964, p. B-117.

lanthanide. A word that is unknown to mining usage or laws and is not equivalent to the term forfeited nor does it mean a technical forfeiture. Lapsed. A word that is unknown to mining usage or laws and is not equivalent to the term forfeited nor does it mean a technical forfeiture. Lapidford. To weld by overlapping the joints, as to lap a weld pipe. Standard, 1964; 6d, 1961.

Laramide revolution. A period of earth movement in early Tertiary times during which the line picker was a miniature belt conveyor, on which small ore particles move singly past a Geiger Muller tube which is set to operate a sorting device. These are uplifted as the passing stream each particle of radioactive ore which reaches the required intensity, therefore sorting out the valuable material. Pryor, 3.

lap. a. One coil of rope on the winding drum of the mine hoist. Pryor, 3. b. Polishing cloth used in preparing polished mineral specimens by abrasive grinding. Pryor, 3. c. A surface defect, appearing as a seam, caused by folding over hot metal, fins, or sharp corners and then rolling or forging them into the surface, but not welding them. ASM Gloss. d. Specimen, dimension, smooth, or polish (as a metal surface or body) to a high degree of refinement or accuracy. Webster 3d. e. An imperfect edge. f. A fold in the surface of a glass article caused by incorrect flow during forming. ASTM C162-66. g. A reverse-dish, a dish-like, or plate, etc. used to hold an abrasive powder on its surface for cutting glass, stone, or metal. To cut or polish with a lap as glass, gems, cutler. Webster 2d.

laper; leaper; leger. Eng. Laper. Impure santon lime (containing green matter) with shaly partings and a few sheets of bitumen in the lower part. Middle Purbeck beds, Swanage, Arkell.

lapidari. A connoisseur of gems and precious stones and the art of cutting them. Webster 2d.

lapidary. A cutter, polishor, or engraver of gemstones other than diamonds. Webster 3d.

lapidify. To convert, or the process of conversion, into stone. The process by which soft animal feathers are converted into hard stone. A.G.I.

lapilli. Essential, accessory, and accidental volcanic ejecta ranging mostly from 4 to 63 millimeters in diameter. A.G.I.

lapiz. A stone. Chiefly used in Latin phrases. Webster 2d.

lapis. A stone. Chiefly used in Latin phrases. Webster 2d.

lapis Azul. A limestone used among the Greeks for coffins which distingirated within a few weeks, the flesh of bodies and bones. In said to have been found at Asua, a city of Lycia. Also called Asaian stone; sarcochaspis. Webster 2d.

lapiz lazuli: lazurite. A natural sodium alumino-silicate, NaAlSi3O8; usually somewhat impure; color deep blue to greenish blue; luster vitreous; Mohs' hardness, 3 to 5.5; specific gravity, 2.4. Found in California; Afghanistan, U.S.S.R., Chile. Used in ornamental stone. Formerly a paint pigment (ultramarine) but now superseded by the artificial product. C.C.D., 1961.

lapiz lazuli ware. A variety of Wedgewood ware. See also pebble ware. Fay.

lapis matrix. Lapis lazuli containing promi-
**large coal**

groups by which coal is sold by the National Coal Board of Great Britain. Large coal has no upper size limit and has a maximum length of 4 feet. Embraces large screens, cobbles, and treble sizes. See also graded coal; smalls. Nelson. a. A large piece of iron cut from a bar and ready to be heated and rolled into a sheet; but such a piece may be about 14 pounds. Standard, 1964. b. A thin, flat diamond with a simple facet at the side. Also called porphyritic. Standard, 1964. c. A mucker. Bureau of Mines Staff. **lash**. A binding, generally of light line, around the end of a rope. Bureau of Mines Staff.

- **lasher-on**. A man employed to keep them in place. Also called listing. Webster 2d. b. In the Republic of South Africa, a man employed to keep them in place. Nelson. c. Shoveling rock down the ore pass, work performed by a laborer. Idem. b. In the Republic of South Africa, a man employed to keep them in place. Nelson. d. A binding, generally of light line, around the end of a rope. Bureau of Mines Staff.

- **lash-up**. Extemporized engineering rig for temporary jobs. Pryor's Gloss.

- **lat Abbreviation for latitude. BuMin Stylt Guide, p. 60.**

- **latch jack**. A fishing tool designed to engage and grasp the bail on a bailer. Long.

- **latching chain**. A short chain to attach tubs to an overloop in endless rope haulage by wrapping it around the rope. The chain may be about 12 feet long, or less manganese steel, with 3/4-inch-diameter standard links. At one end of the chain, a ring 4 inches in diameter is attached to the drawbar of the tub, and the other 3/8 inch in diameter to secure it to the rope at the lashing end. On an undulating road, two lashing chains may be used, front and rear of the tub. Nelson.

- **laser beam**. A narrow, intense, and coherent beam of visible light. A. G. I. for the last rib or judgment to come off a pillar. Fay.

- **last of the air**. Ark. A tapered section of a hoist rope which receives the last of the air, or which receives the last of the air current. Fay.

- **latching chain**. A short chain to attach tubs to an overloop in endless rope haulage by wrapping it around the rope. The chain may be about 12 feet long, or less manganese steel, with 3/4-inch-diameter standard links. At one end of the chain, a ring 4 inches in diameter is attached to the drawbar of the tub, and the other 3/8 inch in diameter to secure it to the rope at the lashing end. On an undulating road, two lashing chains may be used, front and rear of the tub. Nelson.

- **lash**. A binding, generally of light line, around the end of a rope. Bureau of Mines Staff.

- **lasher-on**. A man employed to keep them in place. Also called listing. Webster 2d. b. In the Republic of South Africa, a man employed to keep them in place. Nelson. c. Shoveling rock down the ore pass, work performed by a laborer. Idem. b. In the Republic of South Africa, a man employed to keep them in place. Nelson. d. A binding, generally of light line, around the end of a rope. Bureau of Mines Staff.
lateral magmatic ore deposit:

627

lateral magmatic ore deposit: Straight magmatic deposits resulting from crystallization near the close of the magmatic period or from later crystallization of the rock silicates. 

lateral heat. Thermal energy absorbed or evolved on a large scale (as fusion or sublimation) other than change of temperature. Compare sensible heat. Webster 3d.

lateral planation. Reduction of the land in lateral pattern. A secondary dispersion pattern which may evolve to give the lath an upward trend when being driven into the roof grates. A number of laths driven into the roof form a protective shield for the miners working in the face. Also called lagging. Engineer and Mining Journal, v. 139, No. 4, April 1938, p. 55.

lative. The extrusive equivalent of monzo-nite and a variety of trachyandesite in which potash feldspar and plagioclase are present either as normative or modal minerals in nearly equal amounts. Potash feldspar is often concealed in a fine-grained crystalline or glasy groundmass and thus, a chemical analysis is often necessary for correct classification. Monzo-nite is usually present and sometimes biotite, plus accessory apatite and opaque oxides.

lateral deviation. The horizontal distance by which a borehole misses its intended target in coal seams or thick ore bodies in horizontal mining along the strike face or in protecting the sides of a shaft or in a tunnel. See lath door-set. A weal' lath frame surround-

lateral cone. A small subsidiary volcanic cone, usually a cinder cone, on the flank of a larger volcano. Synonymous with adventive cone; parasitic cone. A.G.I.

lateral crater. See adventive crater. Fay.

lateral crystalline. A.G.I.

lateral cratonic. See adventive crater. Fay.

lateral correction. a. The amount of the adjustment of observed gravity values over an arbitrarily chosen base latitude, E=0.1822 sin 2(φ)(mg/km) and K=3.070 sin 2(φ)(mg/ml) which is often necessary for correct classification. K is responsible for the prevalent red-brown and yellow colors of these soils. Ihuthes, 1935. b. Altered basaltic rocks in India; aluminum, manganese, or nickel. A.G.I. Supp. b. Alteration of basaltic rocks in India; obsolete. A.G.I. Supp.

lateral constituent. a. Red residual soil developed in humid, tropical, and subtropical regions of good drainage. It is leached of silica and contains concentrations particularly of iron oxides and hydroxides and aluminum oxides. It may be an ore of iron, aluminum, manganese, or nickel. A.G.I. Supp. b. Altered basaltic rocks in India; obsolete. A.G.I. Supp.

lateral constituent of the laterites. Holmes, 1928.

lateralization. A deterrent and reconstructed form of laths. Reference 220.

lateralized. A lateritic rock formed by the leaching of some or other rock at its outcrop. Holmes, 1928.

lateralized. The extrusive equivalent of monzo-nite and a variety of trachyandesite in which potash feldspar and plagioclase are present either as normative or modal minerals in nearly equal amounts. Potash feldspar is often concealed in a fine-grained crystalline or glasy groundmass and thus, a chemical analysis is often necessary for correct classification. Monzo-nite is usually present and sometimes biotite, plus accessory apatite and opaque oxides.

lateral log. A record of the thickness and inclination of the deposit. See also horizontal mining. Nelson.

lateral pattern. a. A dispersion pattern of horizontal distance by which a borehole misses its intended target. Long. b. A number of laths driven into the roof gravels. when being driven into the roof gravels. Fay.

lateral support. Means whereby walls are braced either by columns, pilasters, or crosswalls or by floor or roof constructions, respectively. ACSG. 

lateral velocity change. Change in a horizontal direction of the velocity distribution. Schieferdecker.

lateral drifts. Corn. a. The boards or lagging put behind a frame of timber. Fay. b. Pieces of timber about 4 feet 6 inches by 6 inches by 2 inches with ends beveled or ovaled to give the lath an upward trend when being driven into the roof grates. A number of laths driven into the roof form a protective shield for the miners working in the face. Also called lagging. Engineer and Mining Journal, v. 139, No. 4, April 1938, p. 55.

lateral equalization. The extrusive equivalent of monzo-nite and a variety of trachyandesite in which potash feldspar and plagioclase are present either as normative or modal minerals in nearly equal amounts. Potash feldspar is often concealed in a fine-grained crystalline or glasy groundmass and thus, a chemical analysis is often necessary for correct classification. Monzo-nite is usually present and sometimes biotite, plus accessory apatite and opaque oxides.

lateral deviation. The horizontal distance by which a borehole misses its intended target in coal seams or thick ore bodies in horizontal mining along the strike face or in protecting the sides of a shaft or in a tunnel. See lath door-set. A weal' lath frame surround-

lateral convection. A.G.I.
lattice. In mineralogy, orderly geometric structure in which a crystal's atoms are arranged. Repetition of unit crystal. The lengths of the sides of such a unit cell are its lattice constants, classified in Angstrom units. The symmetry of the lattice determines the shape of a crystal and classification. A lattice differs in structure, interface, surface or sheared layer at which the formation ends. Pryor, 3.

lattice energy. That required to separate the ions of a crystal into infinite distance from each other. Pryor, 9.

lattice girder. An open girder, beam, or column in timber, steel, or aluminum alloy, built up from structural members joined and braced together by intersecting diagonal bars. See also space lattice. Ham.

lattice constant. See parameter (lattice). ASM Gloss.

lattice structure. The ionic lattice is built by syncretic lattices of magnesium ions and is a good conductor; the molecular lattice is composed of covalent molecules, usually volatile and nonconducting; the layer lattices have large ions each associated with two small ions, which form nearly neutral layers held to each other only by weak nonpolar forces and is, therefore, easily split into sheets. Pryor, 3.

laticia. An exsolution texture in which platy and/or needlelike segregates are arranged in the parent crystal according to the structural planes of the parent crystal. Schieberlecke; lattice water, a. Water which is an integral part of the clay structure. This structural water (OH lattice water) is not to be confused with interlayer water. The lattice water can be removed by heating in the range of about 450° to 600° C. ACSG, 1963. b. Molecular water at specific lattice sites. VV.

laticcio; latticino. Decoration of glass with white threads of glass embedded in its surface. This technique was much used by Venetian workers, but was known and used earlier. Haggé.

lauradite. A hydrozincium silicate, CaZnSiO3.Fe2O3.6H2O; a brick-red mineral. FAY, b. A discredited term equal to a natrolite while being carried in aqueous suspension by stratification due to hindered settling of sedimentary layers. C.M.D.; Larsen, p. 209.

launder. a. A trough, channel, or gutter usually of wood, by which water is conveyed; specifically in mining, a chute or trough for conveying powdered ore, or for carrying water to or from the crushing apparatus. Standard, 1964. b. A flume. Nelson, c. An inclined trough for conveying water and mill pulp between the various units of ore-treating equipment in a mill. Dow, 1955. d. A subaqueous bed or layer at which the formation ends. Pryor, 3.

launder screen. A screen used for the sizing of ore. See launder separator process. In this process, a stream of fluid carries the material to be separated down a channel provided with draw off for material of specified product and means for overflowing a lighter one. If properly constructed and operated, a launder separator is very satisfactory. Above this bed there will be found a layer of pipes or c,nsisting of pipes or cylinders, used to convey water and mill pulp between the various units of ore-treating equipment in a mill.

launder separator process. In this process, a stream of fluid carries the material to be separated down a channel provided with draw off for material of specified product and means for overflowing a lighter one. If properly constructed and operated, a launder separator is very satisfactory. Above this bed there will be found a layer of pipes or cylinders, used to convey water and mill pulp between the various units of ore-treating equipment in a mill. Dana, 1954. b. Molecular water at specific lattice sites. VV.

launder mill. Has three rolls, the middle roll being much smaller than the other two. The two larger rolls only are driven, work being performed between the large and middle and middle and top rolls alternately; the roll setting is adjusted between passes. Odem, 3.

lautite. An imperfectly determined copper sulfoarseniate, CuAs, of the enargite family; from Marienberg, Saxony, Germany. Webster, 1918.

lava. The molten outpourings of volcanoes and fissures. Fluid rock that cools from a volcano or a fissure in the earth's surface; also, the same material when solidified by cooling.

lava dome. a. A volcanic vent exuding lava at every eruption, a mountain of solid rock results which is a lava dome. A.G.I. b. The greater masses of lava that surround the vent or central portion of the flow. Individual flows, have issued from a central vent in the proper directions to build a dome-shaped pile of lava. A.G.I. c. A dome-shaped pile of lava. A.G.I.

lava flow. A stream or sheet of molten or solidified lava. Webster, 3d.

lava millstone. A hard and coarse millstone...
lava millstone

lava mill. A crater that is visibly flooded with massive lava, either liquid or solid. Fay.

lava plain. A broad, elevated tableland or flat-topped highland, usually many hundreds or thousands of square miles in extent, underlain by a thick succession of lava flows, most of which are basaltic and the result of fissure eruptions. The Columbia Plateau of the northwestern United States is an example. A.G.I.

lava sink. The founding or sinking in part of the lava surface produces vertical-walled pits, or lava sinks, in which molten lava may be visible. Stokes and Varney, 1955.

lava. A fine-mesh gauze used as a sieve for varieties of asbestos in certain geological formations. A.G.I.

law millstone

law of cosines. In trigonometry, a law stating that in any triangle the square of one side equals the sum of the squares of the two other sides minus twice the product of these two other sides multiplied by the cosine of the included angle Jones, 2, p. 152.

law of definite proportions. This states that in every simple compound substance, the proportions by weight of the constituent elements are constant. Osborne. Law of equal volumes. In ore genesis, the generally observed metamorphic replacement of rock or ore minerals by gangue and/or metal compounds under retention of the same volume. Schindler decker.

law of equivalent proportion. When elements combine (or replace one another) to form compounds they do so in weights which are proportional to their equivalents. Cooper.

law of extralateral rights. See apex law. Lewis, p. 32.

law of gravitation. The law, discovered by Sir Isaac Newton, that every particle of matter attracts every other portion of matter, and the stress between them is proportional to the product of their mass, divided by the square of their distance apart. Standard, 1964.

law of indestructibility of matter. Matter is neither created nor destroyed in the course of chemical action. See also conservation of mass. Cooper.

law of mass action. The rate of a chemical reaction is directly proportional to the molecular concentrations of the reacting substances. Webster 3d.

law of motion. A statement in dynamics, a body at rest remains at rest and a body in motion continues in a straight line unless acted upon by an external force. The acceleration of a body is directly proportional to the applied force and is in the direction of the straight line in which the force acts. For every force there is an equal opposite force or reaction. Webster 3d.

law of multiple proportions. When two elements combine to form more than one compound, the quantity of one of them which combines with a fixed quantity of the other exhibits a simple multiple relation, C.T.D.

law of reciprocal partial proportions. When an element combines with other elements, the weights of these latter elements which combine with the same weight of the former element give the proportions in which the latter elements combine, or give simple multiples of these proportions. Cooper.

law of refraction. Snell's law. When a wave crosses a boundary, the wave normal changes direction in such a manner that the sine of the angle of incidence between wave normal and boundary normal divided by the velocity in the first medium equals the angle of refraction divided by the velocity in the second medium. A.G.I.

law of tides. In trigonometry, a law stating that in any triangle (either right or oblique) the sides are proportional to the sines of their opposite angles. Jones, 2, p. 151.

law of superposition. The law that underly ing strata must be older than overlying strata where there has been neither inversion nor overthrust. All geologic chronology is based on this law. Standard, 1964.

law of centimeters. A colorless, grayish-blue, basic silicate of aluminum and calcium, H(Ca,Al)2SiO5; orthohombic. Prismatic or tabular crystals. From Tiburon Peninsula; California; Italy; France; Corsica; New Caledonia; Cuba. English.

layer-loading. Term applied to a procedure whereby the coal is placed in the railroad cars in horizontal layers. It owes its inception to the fact that coal as it comes from the mine usually takes the form of large, irregular blocks and is lifted from the conveyor belts, or trippers, by the face-loading shovel and placed on the railroad cars in such a manner as to form a uniform load. See also layer charging.

layer: A bed or stratum of rock. Fay. b. A bed or stratum of cross-bedded sandstone. Hilgard.

layer. A bed or stratum of rock. Fay. b. A bed or stratum of cross-bedded sandstone. Hilgard.

layer. A bed or stratum of rock. Fay. b. A bed or stratum of cross-bedded sandstone. Hilgard.
lazyback. S. Staff. The place at the surface where coal is stacked for sale. Fay.
lazy ball. a. Eng. A timber placed at the top of a hopper, from which the top of the car rolls down, to prevent the car from falling into the hopper. Fay. b. Eng. The ball or girder held in position by a hanger. Also called lazy stinger. SMRB, Paper No. 61.
lazy bough. bkgd. A term referring to easy-to-work coal, especially soft lignite. SMRB, Paper No. 61...
lazy bough, lazy branch. See bough.
lazy bower. mineral. See also bower.
lazy cant conveyor. See accordion roller conveyor.
lazy cant conveyor. A system of crossed jointed bars used for picking up articles not within easy reach. Fay.
lazy coal. a. A term used to refer to coal with less than 6% ash. b. A term used to refer to coal with less than 8% ash. c. A term used to refer to coal with less than 10% ash.
lazy conveyor. A system of crossed jointed bars used for picking up articles not within easy reach. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
lazy cover. A term used to refer to the area covered by a layer of coal. Fay.
leaeh ion-exchange flotation

The flotation process. Abbreviation, L.I.F.

leach material. Material sufficiently mineralized to be economically recoverable by selective and selectively dissolved by application of a suitable solvent. See also leaching. Bureau of Mines Staff.

leach slake. Mineralized materials stacked so as to permit wanted minerals to be effectively and selectively dissolved by application of a suitable solvent. Bureau of Mines Staff.

leach precipitation float. A mixed method of chemical reaction plus flotation developed for such copper ores as chalcopyrite and associated oxidized materials. The value is dissolved by leaching with acid, and the copper is precipitated on finely divided particles of iron, which are then recovered by flotation, yielding an impure concentrate in which metallic copper predominates. Abbreviation, L.I.P.F. Fryar, 3.

lead, n. A metallic element, the heaviest and softest of the common metals. Delicate; resists corrosion; silvery-white to bluish-gray; and rarely occurs in native form. Symbol, Pb; valence, 2 and 4; isotonic; atomic number, 82; and atomic weight, 207.19. Bright metallic luster; highly malleable; ductile; poor conductor of electricity; specific gravity, 11.3437 (at 16°C); of lead derived from the disintegration of radium (radium-lead); 11.2805 (at 20°C); of lead derived from the disintegration of uranium (uranium-lead); 11.2980 (at 16°C); 12.3575°C; boiling point, 1,515°C or 1,744°C; insoluble in water; and soluble in nitric acid and in hot concentrated sulfuric acid. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-118, B-184. A mixture of powders of lead oxide and linseed oil used as pipe-thread, lubricant and sealant. Also called red lead. Long. c. In ceramics, to glaze with powdered metallic lead ore. Faraday, 1909 (pronounced lead). A. Commonly used as a synonym for lode or lode. Many mining location notices describe the locator's claim as extending to a certain number of feet along and so many feet on each side of the lode, lead, vein, or lode. Thus Lead, S. Dak., was developed as the last of the Homestake lead. Blind lead: A lead or vein that does not outcrop or show at the surface. Used commercially, Leadville, Colo., and Cambria, Calif. So called because of the bluish-gray color of the gravels. Deep lead: Goldbearing gravels deeply covered with debris or lave; applied particularly to those of Victoria, Australia. Fry, c. Pennsylvania. A portion of a haulage system covered by a mule or by a locomotive of a maximum distance of say, three-quarters of a mile. Fay, d. England. To haul or draw coal, etc., either by animal or engine power. Faraday, 1909. A defined degree of sulfurous fume. Gordon, 1903. A track haulage term for the distance from the point of a frog to the point of the switch. King, 285. A term sometimes used for the distance between the sheave and the winding drum centers. The greater the angle of the sheave being considered the smaller the fleeting angle. Too great a lead results in vibration and whipping of the rope between sheave and drum. Idler or sag rollers are frequently installed where long leads are necessary. Nelson, h. The longitudinal distance traveled in one revolution of the rope between a spiral thread or screw. Long, j. The distance below the depth of ground after the bottom in a borehole before rotation and downward movement of the drill string is started. Long, x. A small, uniform, unidirectional passage in a cave. A.G.I. 6. Iner, as indicating from data suggesting a direction for further investigation. A.G.I. 6. Navigable passage through pack ice. Schieferdecker, m. The axial advance of a helix in one complete turn. A.S.M. Gloss. n. The slight bevel at the outer end of a face cutting edge of a face mill. A.S.M. Gloss.

lead agate. The distance coal has to be hauled from the mine to its place of shipment. Standard, 1964.

lead age. The age of a rock calculated by the method of lead and lead-208. The age of a uranium-lead system is calculated by comparing the amounts of lead derived from the disintegration of radium (radium-lead) with the amounts of lead derived from the disintegration of uranium (uranium-lead). Lead-208 is in equilibrium with radium-226, which is in equilibrium with uranium-238. Standard, 1964.

lead acid. A term specifically applied to lead pastes. A.S.M. Gloss.

lead acid batteries. A type of electric driven a motor, either by driving the motor directly or by driving a generator which in turn drives the motor. Lead batteries are used extensively for the temporary storage of electrical energy. Used in electric mining lamps, in 6.14. Used in ceramic glazes. C.C.D. 6d, 1964, p. B-185. Used in raw lead glazes and also in enamels and glasses. The fine particle size of this material assists in suspending the glaze ingredients. Lead colic. Intestinal colic associated with obstinate constipation due to chronic lead poisoning. Also called painter's colic. Webster, 3d.

lead oxide

from which the positive plates of electric storage batteries are made. 

lead dust. Lead in very finely powdered form. 

CCD 6d, 1961.

lead bronze. Copper-base alloy containing 5 to 10 percent tin and 8 to 20 percent, and sometimes 30 percent, of lead; used for heavy-duty bearings. C.T.D.

lead edge; leading edge. The surfaces or inset cutting points on a bit that face in the same direction as the rotation of the bit.

Long.

lead glass. Pieces of glass fixed together with strip lead of H or U section to form a window. ASTM C162-66.

lead encaustophalys. The medical term for lead poisoning. 

Fay.

lead equivalent. a. The thickness of lead that has the same radiation absorption or the same attenuation as a unit thickness of the material in question. ASM Gloss. b. That thickness of lead which will produce the same attenuation or protection as the material in question in both when exposed under the same conditions. ASM Gloss.

leader. a. A narrow vein branching upwards at an angle from a much larger vein. See also dipole. Nelson. b. A thin layer of coal or coaly shale which serves as a guide towards a displaced seam. See also guiding. 

Hoy, C. A thin mineralized vein parallel to, or in continuation of, the main vein formation. C.T.D. d. A cast- or wrought-iron ring or shoe, bolted to the bottom (often around the outside) of a brick cylinder, a wooden drum, or a wrought-iron cylinder when used for sinking through quicksand or gravel. 

Fay. e. Som. The slip of a fault. Fay. f. Any particular or constant head or band of coal, ironstone, etc., in connection with certain workable beds, serving as a ditime in a mine. 

Fay. g. N. of Eng. A back or finiture in a coal seam. Fay. h. Scot. One who conducts the putting down of a borehole. 

Fay. i. Corn. A small vein leading to a larger one. Fay. j. In warm air heating, the supply duct running horizontally from the furnace to the riser, or stack. 

leader of the lode. Eng. See leader, i. Fay.

leaders. Guides in a pipe frame to take the drop hammer of a pile driver. See also hanging leaders. 

Ham.

leadfeldspar. Synthetic PbAl2Si2O8 with the feldspar structure; probably anorthic. 

lead flake. See lead carbonate, basic. 

CCD 6d, 1961.

lead fluosilicate; lead silicofluoritie. Colorless; monoclinic; PbSiF6.2H2O; soluble in water; and it decomposes when heated. Used as a solution for electrorefining lead. 

CCD 6d, 1961.

lead fume. The fume escaping from lead furnaces. It consists of two volatile and mechanically suspended metalliferous compounds. 

Fay.

lead glance. Same as galena, which is lead sulphide. 

Fay.

lead glass. Glass containing lead oxide. The amount of lead can range from 3-4 percent to 30 percent or more in special cases. English lead crystal used for tableware contains 33-34 percent lead. 

lead pipe. See lead, c.

leadillinite. A monolithic mineral of a yellowish or greenish color, consisting of a sulfide of lead, perhaps 4PbO.

CCD 6d, 1961.

lead oxide; lead peroxide

by miners blende, mock lead, or mock ore. 

Fay.

lead amylxanate; lead metanoliate. Pb

(CC2O3). Pb(NbO3). is a ferroelectric material with a Curie temperature of 570° C. It is used in electric devices, and in sensing devices, and kerosene lamps. 

lead metal. Lead compounds are used in ceramic glazes and in glass, particularly that for which brilliance is desired, as in cut glass and glass may contain as much as 29.5 percent PbO. 

Fay.

lead metavanadate; lead vanadinite. Pb

(VO3); molecular weight, 405.07; yellow; insoluble or slightly soluble in water; and soluble in dilute nitric acid. Used as a pigment. 

lead mill. A leaden disk charged with emery for grinding gems. 

lead minerals. The most important industrial one is galena (PbS), which is usually argentiferous. In the upper parts of deposits the mineral may be altered by oxidation to cerussite (PbCO3) or anglesite (PbSO4). Usually galena occurs in intimate association with sphalerite (ZnS). 

Fay.

lead molybdate. See wulfenite, C.M.D.

lead mormon. In ore dressing, smelting and refining, one who operates a small electric locomotive (motor) to haul pots of molten lead bullion from a blast furnace to refining kettles for the separation of copper, antimony, silver, and other metals contained in the lead bullion. 

D.0.1.

lead nitrate. Pb(NO3)2; a ferroelectric compound having properties that make it useful in high-temperature transducers and in sensing devices. The Curie temperature is 57° C. Dodd.

lead nitrite. Colorless or white; isometric or monoclinic; Pb(NH4)2; promotes combustion in contact with organic matter; poisonous; soluble in water, in alcohol, in alkalies, and in ammonia; specific gravity, 4.53 (at 20° C); and it decomposes at 470° C. Used in explosives. 

lead ocher. A massicot or lead monoxide, Pb3O4; massive, scaley or earthy; color, yellow or reddish. Fay.

Fay.

lead of a switch; frog distance. The distance measured on the main line from the point of switch to the point of frog. 

Kiser, 2d, 1959, p. 34.

lead operator. In ore dressing, smelting, and refining, one who directs activities concerned with initial crushing of ore and transporting of crushed ore to secondary crushers. D.O.T. Supp.

lead ores. See anglesite; cerussite; crocoite; ltena; lillite; pyromorphite; vanadinite; wulfenite, C.M.D.

lead oxalate. Both lithium (PBO) and red lead (PbO2), used in glass, glasses, and enamel batches. Red lead is generally preferred to litharge because the extra oxygen it contains helps to improve oxidizing conditions during the melting process, and is less liable to reduce lead. Lead oxide is used in optical glass and tableware. It increases the density and refractive index of the glass, and makes it less soft than other glasses, and has superior brilliance. Lee.
lead oxide, red; red lead

lead oxide, red; red lead; lead tetroxide; triplobmic tetroxide; minium. Bright red; PbO. Specific gravity, 7.15; decomposes at 100° C and 500° C; insoluble in water and in alcohol; and soluble in hydrochloric acid and in acetic acid. Used in glass making and enameling. C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-186. PbO is formed by heating lead monoxide in air at approximately 550° C. It occurs as red and yellow crystalline scales. Chemical reactions contain up to approximately 33 percent PbO. C.T.D. See also lead oxide.

development, yellow. See litharge.

lead paint. Ordinary paint, so-called because white lead is used as a base. Crispin.

lead rail. The lead rail of an ordinary mine switch is the turnout rail lying between the rails leading to the incoming track and the turnout track. Lead rails are used extensively in the mining industry.

lead screen. In radiography, a shield used to protect personnel. It may consist of X-ray film or other high density material.

lead spar. The term "spar" is common among miners and applies to any of the metallic minerals which are cleavable and lustrous. Fay. b. Corn. Anglesite. Fay. c. Anglesite. Fay.

lead stannate. Light-colored; PbSnO3; insoluble in water; and loses 21120% at about 170° C. It is used as an additive to ceramic capacitors. C.D. 6d, 1961. Added in quantities of 1 to 5 percent to barium titanate ceramic bodies intended for piezoelectric applications, lead stannate reduces the tendency of these units to depolarize under load when used as oscillators. Lee.

lead subcarbonate. See lead carbonate, basic. C.D. 6d, 1961.

lead sulfate, basic; white lead; sublimed; lanarkite. White; monoclinic; PbSO4·PbO; molecular weight, 326.4. Used as a component of structural-metal ceramic capacitors. Standard, 1964.

lead sulfate, blue basic; sublimed blue lead. Blue-gray; corrosion-inhibiting pigment; and insoluble in water and in alcohol. Used as a component of structural-metal priming-coat paints, as a rust inhibitor in paints, and rarely used for color. C.C.D. 6d, 1961.

lead sulfide; plumbo sulfide; galena; galena; glance. Silvery; gray; or black; metallic; isometric; PbS; Moh's hardness, 2.5; soluble in acids; insoluble in water; and decomposes at 1,065° C; insoluble in water; and soluble in acids. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-186.

lead sulfide, blue basic; sublimed blue lead. Blue-gray; corrosion-inhibiting pigment; and insoluble in water and in alcohol. Used as a component of structural-metal priming-coat paints, as a rust inhibitor in paints, and rarely used for color. C.C.D. 6d, 1961.

lead telluride; altaite. PbTe; molecular weight, 334.79; white; isometric; specific gravity, 7.69; melting point, 977° C; and only slightly soluble in hot water and in sulfuric acid. Used in ceramics. C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-186.

lead tetraethyl. See tetraethyl lead.

leaf peat

lead solubility test. The (British) Pottery (Health and Welfare) Special Regulations, 1947 and 1956. This test, as applied to the specification of a low solubility glaze as follows: A weighed quantity of the material which has been dried at 100° C and then gently mixed with water for 1 hour, at the common temperature, with 1,000 times its weight of an aqueous solution of HCl containing 0.25 percent by weight of HCl. This solution is thereafter allowed to stand for 1 hour and then filtered. The lead salt contained in the clear filtrate is then precipitated as PbS and weighed as PbSO4.

lead spar. The term "spar" is common among miners and applies to any of the metallic minerals which are cleavable and lustrous. Fay. b. Corn. Anglesite. Fay. c. Anglesite. Fay.

lead sulfide, blue basic; sublimed blue lead. Blue-gray; corrosion-inhibiting pigment; and insoluble in water and in alcohol. Used as a component of structural-metal priming-coat paints, as a rust inhibitor in paints, and rarely used for color. C.C.D. 6d, 1961.

lead sulfide; plumbo sulfide; galena; galena; glance. Silvery; gray; or black; metallic; isometric; PbS; Moh's hardness, 2.5; soluble in acids; insoluble in water; and decomposes at 1,065° C; insoluble in water; and soluble in acids. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-187.

leaf peat. A very thin sheet or plate of metal, as lead. A material used for covering a power cable or for a telecommunication cable. Hem.

leaf sheet. Used for the cutting of stencils for sign work, for lining wooden packing cases for sulfuric acid pickling. Hamun.

leaf silicates. Various compositions; the anhydrous forms are made by baking lead silicate under reduced pressure at a temperature between 500° C and 550° C. Another method of preparation is by drying the reaction product of silica gel, litharge (PbO), and acetic acid. Used as fillers. C.D. 6d, 1961. See lead flussilicate. C.D. 6d, 1961.

*league.* a. A unit of linear measure. A land league = 3 statute miles or 15,840 feet. A nautical league = 3 geographical miles or 18,240,787 ft. A. G. B. I. An area embraced in a square 5,000 varas on each side. It contains 4,428.40 acres or 6.92 square miles. The term is used in Texas land descriptions. *A.G.I.*

*Lea.* A tiny phylloid crustacean, supposed to be of freshwater habitat. The genus *Lea* has proved of considerable value as it may characterize a single horizon over widespread areas. For example, the horizon over the Swanson Four Feet coal seam (South Wales) with its relative abundance of *Lea* has proved a reliable datum plane for correlation and identification purposes. *Nelson.*

*leak.* Low-grade mineralized rock into which an ore body degenerates. *Hes."

*leakage coefficient.* A numerical expression of a duct's liability to leak. The National Coal Board of Great Britain defines this as the volume of air in cubic feet per minute which would leak from 100 feet of the duct under a uniform pressure of 1 inch of water gage. *Roberts, I.*

*leakage field.* The magnetic field which leaves or enters a magnetized part at a magnetic pole. *ASM Gloss.*

*leakage halo.* A. Dispersion pattern formed in the rock overlying a mineral deposit by the movement of ore-forming fluids through a well-defined system of channels. *Hauke.* b. Dispersion patterns in rocks and fracture zones over blind ore deposits where it is possible. The dispersion patterns represent the leakage of nearly spent ore solutions. *Lewi.*

*leakage intake.* An additional intake which is a component part of a system of controlled leakage. *B.S. 3618, 1963, sec. 2.*

*leakage intake system.* A ventilation circuit with two adjacent intake roadways leading to the coalface. The method has been criticized as the air flow may become so sluggish as to cause fireproof layers. See also two intakes. *Nelson.*

*leak vibroscope.* An instrument which detects leaks in water, oil, gas, steam, and air lines by amplifying the sound produced by the escaping fluid. *Osborne.*

*leak.* a. Of ore, low-grade; submarginal; unpayable; of doubtful exploitable value. *Pryor, 3.* b. A cement-sand mixture containing a very low cement/aggregate ratio (1:12 to 1:15) used mainly as a subbase under concrete roads. *Nelson.*

*leak mortar.* Mortar that is deficient in cementitious components. It is usually harsh and difficult to spread. See also salt mortar; mortar. *ACSG, 1963.*

*leaper; leper.* See later; Arkell.

*leapfrog system.* A system employed with self-advancing supports on a longwall face in which alternate supports are advanced on each web of coal removed. To do this, alternate units have to be moved by a distance equal to twice the web thickness—half before snaking and half after snaking. *Nelson.*

*leather.* a. A mill stream which is used by small mines to carry water to the shaft and to the surface. From this mill stream the water flows through the mine to the surface by gravity. *Fay.*

*leather lap.* A disk covered with leather for use as a pressure packing on hydraulic and pump pistons and around piston rods. *Long.*

*leather used.* The soft part of a vein. *Fay.*

*leather slag.* A disk covered with leather for use as a pressure packing on hydraulic and pump pistons and around piston rods. *Long.*

*leather bed.* A tough leatherlike clayey substance in a fault, composed of the crushed and fractured ends of the coal measures. *Fay.* See also fault breccia; fault gouge. *Nelson.*

*leather cloth.* The thin veneer of plastics deformed rock on a fault plane. *Schnieder.*

*leather-hard.* Clay which is dried sufficiently to be stiff but is still damp enough to be joined to other pieces with slip. *ACSG, 1963.*

*leather-jacket lode.* A gold-bearing lode associated with west dipping reversed faults. Where the lode intersects mafic sandstone it tends to be barren while where it intersects slate beds it becomes more productive. *Mid.* A leather-jacket refers to the black shiny carbonaceous pug with a leatherly appearance of the associated faulted strata. See also indicator. *Fay.*

*leatherstone.* Synonym for mountain leather. *Williams.*

*leathery texture.* Similar to eggshell but generally a larger pattern. *Bryant.*

*leaving.* Corn. The mineral left after the ore has been divided into two or three classes. *Forbes.*

*leppus general.* A general term for sundry components. It is usually harsh and difficult to spread. See also ichnofossil. *Petitjohn.*

*LECA.* Abbreviation for lightweight expanded clay aggregate. See also lightweight expanded clay aggregate. *Dodd.*

*Le Chatelier-Braun principle.* When a system which is in equilibrium suffers a change, it tends to oppose or minimize that change. *Pryor, 3.*

*Le Chatelier couple.* A thermocouple employing a negative wire of pure platinum and a positive wire of 90 percent platinum and 10 percent rhodium. *Osborne.*

*lechatelierite.* Naturally occurring silica glass, SiO₂; amorphous. The chief constituent of fulgurites and of the fused sandstone of Meteor Crater near Winslow, Ariz. *English.*

*Dana 17.*

*le Chatelier soundness test.* A procedure for assessing any expansion of hydraulic cement caused by the presence of excess lime, magnesia, or sulfates. The gaged cement is put into a split brass cylinder 30 millimeter in diameter, to which are attached two needles 156 millimeter long from the center of the mold, one of which is on each side of the split in the mold. The cement is allowed to set for 24 hours immersed in water at 58° to 64°F; the distance between the ends of the needles is then measured. The mold is immersed in water and boiled for 1 hour. When it is cool, the distance between the ends of the needles is again measured. The difference between the first and second readings shows the degree of expansion. The test is included in British Standards 12. *Dodd.*

*lechoos opal.* A variety of precious opal exhibiting a deep-play of color. *C.M.D.*

*leck.* A thick, stony clay. Also called leck clay. *Standard, 1964.*

*leck clay.* A variety of trap found in Scotland; used for oven bottoms. *Standard, 1964.*

*leck clay.* A zinc-iron primary cell clay whose liquid is a solution of sal ammoniac. *Webster 3d.*

*lecq decking system.* A fully automatic system for a two-deck cage, decked simultaneously, which may be powered pneumatically, electrically, or hydraulically. In this system, at each decking level the road leading from the split faces, the full cars are fed by gravity to a automatic tippler situated close to the shaft. On the completion of the tipping the empty cars are ramed out of the tipplers by rams to the creepers, from which they run to the siding and are diverted as required. They are then in position to be ramed into the next cage coming to bank. *Sinclair, 1964.*

*led.* N. Eng. A spare tub, or one that is being loaded while another is being unloaded. *Webster 3d.*

*ledeburite.* The eutectic of the iron-carbon system, the constituents being austenite and cementite. The austenite decomposes into ferrite and cementite on cooling below the Ac₃ ASM Gloss.*
ledge. a. A bed or several beds in a quarry or natural outcrop, particularly those projecting in a step-like manner. A.G.I. Supp. b. The projection or face of such a projecting bed. A.G.I. Supp. c. In mining, a projecting outcrop or vein, commonly of quartz, that is not mineralized; also, an oval or narrow zone of mineralized rock. A.G.I. Supp. d. In northern Michigan, the same as bedrock. A.G.I. Supp. e. A mass of rock that constitutes a valuable mineral deposit. Webster 3d. f. Colloquial synonym of bedrock. Long. g. The only true ledges are those that constitute a valuable mineral deposit. Webster 3d. h. A rocky formation continuous with and fringing the shore. H&G.

leech. a. The true bedrock; distinguished from boulders or rock that has been transported. Standard, 1964. Compare false bottom, b. Can also be occurring in solid rock formations. A.R.I.

ledger wall. Same as footwall. Fay.

ledger. a. In mine timbering, a prop or upright member of a set or frame. Pryor, 3. Also member of a set or frame. Pryor, 3. Also, a term sometimes applied to a right-hand screw thread. H & C, p. 130. b. Eng. A prop set under a balk or bar is known as uprights; posts; arms. Nelson. c. The uprights of a set of mine timbers. A.G.I. Supp. d. The surface of such a projecting bed. A.G.I. Supp. e. A projecting in a step-like manner. A.G.I. Supp. f. Tile only true ledges are distinguished from boulders or rock that has been transported. Standard, 1964. Compare false bottom, g. In mining, a projecting bed in which the individual wires or fibers in the strands are twisted to the right and the strands to the left. Called also regular-right lead lay. Long. h. Same as right lay, and corresponds to a right-hand screw thread. H & G, p. 130.

left seismograph. A portable three-compartment recording instrument, usually provided with registration of vibrations from blasts, traffic, machinery, and general industrial sources. Leitz, 2, p. 90.

lefkosbeta. A (bleached) variety of chrysotile asbestos; from Mt. Troodos, Cyprus. English.

left-hand cutting tool. A cutter all of whose flutes twist away in a counterclockwise direction when viewed from either end. A.S.M. Glas.

left-handed. Threaded members, such as pipe or drill bits, which can be coupled together only by turning or twisting the members in an anticlockwise or counterclockwise direction opposed to the clockwise direction used when coupling standard right-hand-threaded components. Long.

left-hand rule. See Fleming's rule.

left long lay. Synonym of left long lay. Long.

left regular lay. Wire or fiber rope or cable in which the wires or fibers in the strands are twisted to the right and the strands to the left. Called also regular-left lead lay. Long.

left twist. Same as left lay, and corresponds to a left-hand screw thread. H & G, p. 130.

leg. a. The wires attached to and forming part of a lead; also, the frame of such a lead. b. The uprights of a set of mine timbers. See also leg piece. Fay. c. Legs are used under crossbars, headers, or collars in the three-piece set of timbers, and between the mudsill and the collar in the four-piece set. They may also be called side-pieces or posts. When used in four-piece sets, the reason of which is usually side pressure, the legs must be locked in the mudsill and the collar. This is called a d.p. Kentucky, p. 141. d. Aust. The two sides or wings of a saddle reef or anticline. Fay.

legua. Sp. Land league used in the original surveys of the Philippines, California, and Texas. It is equal to 2,63 miles or 4.24 kilometers. See also league. A.G.I.

leg wire. One of the two wires attached to and forming part of an electric cable or cap or spool. ASA C64.85: 1956.

Lehigh jig. A plunger-type jig with the following distinguishing characteristics: (1) the plunger contains check valves that open on the upstream to reduce suction; (2) the makeup water is introduced with the feed; (3) the screen plate is at two levels, which have different perforations, to keep the water distribution uniform; (4) the bottom of the discharge end of the jig is hinged. This jig has been used extensively in washing anthracite. Mitchell, 29.

lehr. A hydrophous salt of calcium, sodium, potassium, and aluminum, CaNa₂Al₂(OH)₆.6H₂O; colorless; white; crust of coals; fibers. Found near Fairfield, Utah. English; American Mining Congress, p. 27, No. 4, April 1964, p. 24.

lehr man. The same as lehr or mud. Standard, 1964.

Lehmann process. A process for treating coal by disintegration and separation of the petrographic constituents (Fusain, durain, and vitrain). It consists of subjecting the coal to resilient disintegrating or shattering action for a sufficient length of time to break the constituents into granules of various sizes by reason of their respective resistances to shattering impacts and separating the granules into different sizes by screening or equivalent means. Mitchell, p. 601.

lehre. An enclosed oven or furnace used for annealing, or other form of heat treatment, particularly used in glass manufacture. It is a kind of tunnel down which glass, hot from the forming process, is sent to cool slowly, so that strain is removed, and cooling takes place without additional strain being introduced. Lehrs may be of the open type (in which the flame comes in contact with ware), or of the closed type, C.T.D.

lehren. A device for properly placing and spacing slats articles on a continuous lehr belt. ASTM C162-66.

lehren. One who works at the annealing of a reheating oven (lehr) used to fire-glaze glass articles. Arranges glass articles according to size and shape of the finished article so that maximum quantity will be carried in oven on a long paddle. Also called lehr man; lehr operator; glass lehr tender. D.O.T. 1.
leidelite

leidelite. A glassy dacite or rhyolite with microlites instead of phenocrysts of plagioclase, hornblende, apatite, and opaque oxides. A.G.I.

leitite. A colorless highly acidic, fluorescent variety of humite and albite leucite, Na(Al,F)SiO; prisms; hexagonal; from Narrows, Greenland. English.

Leighton buzzard sand. An important source of sand from the Lower Greensand deposit of Bedfordshire, England. The sand is high in silica and washed; it is used as a refractory foundry sand and as a standard sand for mixing with portland cement for testing according to British Standard 12, Dodd.

leip. Scot. See lip. Fay.

Leitz tyndallometer. Measures the intensity of the light scattered at an angle from the incident beam by a dust cloud, and correlates well with the concentration determined by the thermal precipitator or the surface area calculated from such counts. However, it needs to be calibrated for each type of dust cloud, owing to differences in mineralogical content, against the thermal precipitator. Sinclair, 1., p. 181.

-electron. One in the second innermost shell which surrounds the atomic nucleus. Pryor, 3.

Leibniz. A greenish feldspar from Lenni Mills, Delaware County, Penn. Hess.

lemanite. A variety of chlorite. From Chuquicamata, Chile. English.

Lenz's law. When an electromotive force is such as to produce a current, the direction of the electromotive force is such as to oppose the change in the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change. Handbook of Chemistry and Physics, 45th ed., 1964, p. 4-49.

Leone. A yellowish mineral. L.L.

Leonardite. A soft, earthy, medium-brown coallike substance associated with lignitic outliers, in North Dakota. It is a naturally oxidized form of lignite with variations in color and properties depending upon the extent of weathering. Usually, the material occurs at shallow depths, overlying or grading into the harder and more compact lignite. Of little value as a fuel, it has been used in oil-drilling muds, in water treatment, and in certain wood stairs. It is frequently referred to as "slack" because of its texture; but in most cases the term is finding common usage. R.I. 5611, 1960, p. 2.

Leonardread test. A fireproof detector developed in 1902. A form of Wheatstone bridge is used and changes in electrical resistance due to temperature differences are measured. The fireproof/aire sample flows over one set of wires and the gas burns catalytically while the other wires do not come into contact with the sample. Nelson.

leoniite. A colorless, white, yellowish hydrous sulfate of magnesium and potassium, K2SO4.MgSO4.4H2O; monoclinic; tabular crystals and massive. From Westeregeln and Leopoldshall, Germany, English.

leopardite. A siliceous rock from North Carolina that is spotted with grains of magnetite; usually considered to be a quartz-porphyr. Fay. b. A variety of pyroxene porphyry containing small phenocrysts of quartz in a microgranitic or microgranophyric groundmass of calcic plagioclase, and mica. The rock has a characteristically spotted or streaked appearance.
due to staining by hydroxides of iron and manganese. Holms, 1928.

leopardite. See ACL kiln. Dodd.

leopard stone. Trade name given to a gray Leopoldi furnace. A furnace Leopardi rock. a. A local name in Canada, p. 337.

leopardite. Syonym for sylvite. Dana 64, p. 156.

leptodolomite. Pertaining to a flaky schistosity caused by an abundance of minerals like micas and chlorites with a general parallel arrangement. A.G.I.

lepidocrocite. An orthorhombic hydroxy of iron and oxygen, occurring as scaly blood-red crystals, associated with limonite, in iron ores; one very perfect and two less perfect cleavages; dimorphism form of goethite. C.M.D.; Larsen, p. 144.

lepidodendron. A common member of the lepidodendron plant group that flourished during Coal Measures times. The straight trunks of this tree sometimes reached a height of 100 feet. Its large, rounded, flat leaves were from 2 feet at the base. Reproduction was by branches. Nelson.

lepidolite; lillith mica. A fluorescent of potassic, lithium, and aluminum. K, LiAl2- (AlSiO3)(OH),; monoclinic; color, pink and lilac; to grayish white; luster, pearly; perfect micaceous cleavage; Mohs' hardness, 2.5 to 4; specific gravity, 2.8 to 3.0. A comparatively rare mineral found in pegmatite dikes, usually associated with other lithium-bearing minerals such as spodumene and tourmaline, albite, and a variety of other minerals. Found in Connecticut, California, South Dakota, and New Mexico. Used as a source of lithium, and in the manufacture of heat-resistant glass. Dana 17, pp. 471-472.

lepidolitene. A mineral, near biotite, but characterized by the presence of a large amount of ferric iron. Pay.

lepidolite; lepidolithite. Copper-bearing lepidolite; lepidolite. Dana 64, p. 258.

lepidolite. Syonym for anorthite. Dana 64, p. 337.

lepre. (Sl.) See ACL kiln. Dodd.

leppy. Eng. Work that is easy, "soft, kind, and winy, without any hardness, as bor-
Leucite phonolite. According to Rosenbusch, a volcanic rock, the felsic minerals of which are leucite and orthoclase without nepheline. With the addition of nepheline (or nocon, etc.), the rock becomes a leucitophyre. It is preferable to follow Zirkel who calls the leucite phonolite and the former, from which nepheline is missing, leucite trachyte. Holmes, 1928.

Leucitophyre. A variety of leucite phonolite, leucitophyre. A tephrite containing leucite in addition to the constituents of trachyte which is equal to the leucite phonolite of Rosenbusch. Holmes, 1928.

Leucite. A volcanic rock containing leucite in addition to the constituents of trachyte. Holmes, 1928.

Leucite, O. Of, pertaining to, leucite; containing or resembling leucite. Fay.

Leucite. A fine-grained or porphyritic rock composed essentially of leucite and plagioclase. Holmes, 1928.

Leucitic. Of, or pertaining to, leucite; composed of leucite and orthoclase without nepheline. Holmes, 1928.

Leucite in addition to the constituents of nepheline is missing, leucite trachyte. Holmes, 1928.

Leucite. A feldspathoidal syenite containing leucite or more generally, pseudo-leucite, which consists mainly of orthoclase and nepheline. Holmes, 1929.

Leucite tephrite. A lava of basaltic habit, consisting of leucite, plagioclase, and pyroxene, usually with accessory magnetite, and differing from leucite basanite in containing no basanite. Webster 2d.

Leucitohedron. A synomyn for leucitohedron. Webster 2d.

Leucotephrite. A tephrite containing leucite, but free from nepheline or other soda feldspathoid. The form leucotephrite is preferable as leucite suggests a leucocratic tephrite. Holmes, 1928.

Leucotephrite. A synonym for trapezohedron. A.G.I. Supp. b. The term is derived from trapezoid, a natural or artificial dead-level course. a. A direction along the strike of an inclined coal seam; a coal seam contour line. The productive faces in a coal mine, such as stalls and conveyor faces are, in general, advanced on level course or slightly to the right. Nelson b. Scot. In the direction of the strike of the strata, or at right angles to the dip and rise. Fay. b. All openings in each of the different horizons from which the ore body is opened up and mining is started. Higham. In a mine, the set of passageways for the removal of coal or ore. See stoping.水平 course. a. A direction along the strike of an inclined coal seam; a coal seam contour line. The productive faces in a coal mine, such as stalls and conveyor faces are, in general, advanced on level course or slightly to the right. Nelson b. Scot. In the direction of the strike of the strata, or at right angles to the dip and rise. Fay. b. All openings in each of the different horizons from which the ore body is opened up and mining is started. Higham. In a mine, the set of passageways for the removal of coal or ore. See stoping.水平 course. a. A direction along the strike of an inclined coal seam; a coal seam contour line. The productive faces in a coal mine, such as stalls and conveyor faces are, in general, advanced on level course or slightly to the right. Nelson b. Scot. In the direction of the strike of the strata, or at right angles to the dip and rise. Fay. b. All openings in each of the different horizons from which the ore body is opened up and mining is started. Higham. In a mine, the set of passageways for the removal of coal or ore. See stoping.水平 course. a. A direction along the strike of an inclined coal seam; a coal seam contour line. The productive faces in a coal mine, such as stalls and conveyor faces are, in general, advanced on level course or slightly to the right. Nelson b. Scot. In the direction of the strike of the strata, or at right angles to the dip and rise. Fay. b. All openings in each of the different horizons from which the ore body is opened up and mining is started. Higham. In a mine, the set of passageways for the removal of coal or ore. See stoping.
leveling

leveling. The telescope is first sighted on a station of known height (the back sight, B.S.) and the next station on a position a convenient distance away. The staff is then rotated without being removed from its base and the instrument is moved to a new setup from which a reading can be made (a new B.S. reading). From any station intermediate sights can be made, to lie in the heights of known points with the leveling survey. In the United States, first-order leveling describes work over a distance of under two kilometers, leveled in both directions with high precision; second-order leveling must close on to first-order bench marks (B.M.'s) and be of fairly high accuracy; third-order leveling must not go more than thirty miles from established first- or second-order lines and must close on to lines of their accuracy. Pryor, 3. b. The method of determining the relative heights of any number of points from a datum plane. Mason, v. 2, p. 728. c. Flattening of rolled sheet, strip, or plate by reducing or eliminating distortions. See also stretcher leveling; roller leveling. ASSL Gloss.

leveling action. Action exhibited by a plating lever. A plating lever is an instrument consisting of a rigid bar which has one fixed point about which it can turn. This point is known as the fulcrum. Morris and Cooper, p. 155.

leveler. A simple machine consisting essentially of a rigid bar which has one fixed point about which it can turn. This point is known as the fulcrum. Morris and Cooper, p. 155.

level reading. A reading taken on the staff at a known elevation of the point at which the staff is held and not in position of the instrument. The reading is transferred and the point at which the staff is held by magnetic fields from coils surrounding the instrument. See also level.

level recorder. An instrument operated by pressure or by a float, recording continuously the level of water in a channel. Ham.

level tool. A stone or a metal rod. A. Scott. Stones on the surface of the ground indicating the direction of old underground level. Fay.

level surface ripple. A ripple that migrates along a level surface. Pettijohn.

level tool. A. Scott. Brakes, or levers, at the top of an inclined plane. A brake man.

lever. A simple machine consisting essentially of a rigid bar which has one fixed point about which it can turn. This point is known as the fulcrum. Morris and Cooper, p. 155.

lever action. Action exhibited by a plating lever. A plating lever is an instrument consisting of a rigid bar which has one fixed point about which it can turn. This point is known as the fulcrum. Morris and Cooper, p. 155.

leveret. In masonry a treated steel wedge with a wide hole, having its greatest diameter in a plane with the desired rift. Blasts from such levers are destructive in their action, and by means of them larger and better-shaped blocks can be taken out than would have been possible by hand. Fay. b. A dovetail mortise, as in a block of stone, for attaching a lever for hoisting. Standard, 1964.

lewis pin. A pin used for attachment to a key block. It is placed in a shallow drill hole with its point up. If the pin is large it is situated below the top. When it is pulled upward it tends to tighten on the wedge, which prevents it from slipping out. Fay.

lewistonite. A hydrous phosphosite of calcium, potassium and sodium, K2CaO·(K.Na)4·3P2O7·16H2O; hexagonal; white; minute prisms or powdery crusts. Found near Fairfield, Utah. Libby-Ingersoll drill. See Water: Libby.

leytonite. A white or light-colored silicate mineral; a member of the tectosilicate group, CaAl2[Si4O10](OH)2. Synonym for levynite. E.C.T., v. 12, p. 279; Webster 3d, p. 297; Webster 3d; Hey, 4, 1955.

liber. An iron shaft by which a horse draws a wide hole, having its greatest diameter in a plane with the desired rift. Blasts from such levers are destructive in their action, and by means of them larger and better-shaped blocks can be taken out than would have been possible by hand. Fay. b. A dovetail mortise, as in a block of stone, for attaching a lever for hoisting. Standard, 1964.

leydenite. A white or light-colored silicate mineral; a member of the tectosilicate group, CaAl2[Si4O10](OH)2. Synonym for levynite. E.C.T., v. 12, p. 279; Webster 3d, p. 297; Webster 3d; Hey, 4, 1955.

leveling machine. One who operates a surveyor’s level. Crittin.

level of control. A measure of mastery over a process of production; in concrete work, it is measured by cube crushing strength and the acceptance of the concrete by the surveyor. See also statistical uniformity. Ham.

level recorder. An instrument operated by pressure or by a float, recording continuously the level of water in a channel. Ham.

levynite. A white or light-colored silicate mineral; a member of the tectosilicate group, CaAl3Si4O10·5H2O. Trigonal. Synonym for leydenite. E.C.T., v. 12, pp. 279; Webster 3d.

liberation. A. A process of production; in concrete work, the separation of the aggregate from a suspension. ASM Gloss. Compare as to particle size by the rate of settling test. Ham. b. A means of classifying a natural material, as to size, by passing a given screen. Libby-Owens process. See Colburn process.

lever principle. A. The principle of a lever, as given in elementary geometry, in which one of the two equal bars, or levers, is fixedly attached to a rigid body at a point, the other lever is free to move. Libby-Owens process. See Colburn process.

leveling rod. A graduated rod used in survey instruments, the rods are read only by the rodman, while the target rods are read directly by the level man. Crittin.

lever. A. Scott. Brakes, or levers, at the top of an inclined plane. A brake man.

lewis hole. A. A series of two or more holes drilled at any alteration of the operating radius. See also fluming. Ham.

lever. A simple machine consisting essentially of a rigid bar which has one fixed point about which it can turn. This point is known as the fulcrum. Morris and Cooper, p. 155.
lithene. An olive green to dark green, hydrous basic phosphate of copper, [Cu₄(PO₄)₂(OH)₃]·3H₂O. Often found with sphalerite, calcite, and dolomite. Lib. See also copper.

lifeline. A slide wire or cable extending from a work platform in a drill tripod or derrick at an oblique angle downward to an anchor on the ground, which the derrick or tripod man could grasp and use when sliding to safety in an emergency. Long.

lifeline. A diver's helper who remains by the lifeline as long as the diver is submerged. Ham.

lifetimes. The time for making up lies/gang banding. Banding in color in coal seam forma- tion. See also gang time, a. Fay.

life skill. The cover or flap of a valve. Fay.

lift. A. Scot. The time for making up lies/gang banding. Banding in color in coal seam formation. See also gang time, a. Fay.

lift. Eng. Applied to the contracted top spring, the soil of which is licked up by explosives. See also magazine; registered nuclear material, or byproduct material received, possessed, used, or transferred under a general or special license issued by the Atomic Energy Commission. LBL.

lift store. A place or building licensed by the local authority for the storage of explosives. See also magazine; registered premises. B.S. 3616, 1964, sec. 6.

lidded. In the coke-products industry, a laborer who lifts lids of charging holes of coke ovens and lifts coal from below. Fay.

lidded. Also referred to as peeling ACSB-3. Pryor.

life cycle. The roofstone of a coal mine. Fay.

lifeline. The roofline as long as the derrick or tripod man could grasp and use when sliding to safety in an emergency. Long.

life check. A metal identification check carrying out the liquid is discharged. Long. v. Eng. See lift gate. A lock gate which is raised vertically to open. Ham.

life. When in cutting or getting coal it makes a cracking or bursting noise and works easily, it is said to have life in it, or to be alive. Fay.

life. May be defined as the time in which, through the emolument of the available capital, the ore reserves—or such reasonable extension of the ore reserves as conservative geological analysis may justify—will be extracted. Hoe, p. 194.

life. When in cutting or getting coal it makes a cracking or bursting noise and works easily, it is said to have life in it, or to be alive. Fay.

life. The condition of a coal from which a coal entry can be made without the use of a cutter or other cutting tool. Fay.

life. A short, flat piece of wood or steel plate, welded over a post, timber set, or steel arch. A lid is used to tighten the support against the ground and also to increase the area supported. See also clog; derrick. Nelson e. A cap piece used in timbering. B.C.I. c. Eng. See headrise. SMRB, Paper No. 61, d. Eng. The roof of an ironstone working, from Forest of Dean coalfield. Fay. e. A cap or crossbeam on an upright prop. Standard, 1964, l. A steel plate wedged over a post, timber set, or coal reserves divided by the actual or projected average annual production. Nelson.

lift a. The vertical height traveled by a cage in a shaft. Fay. b. The distance that the first box or cable is used or between any two levels. Fay. c. Any of the various gangways from which coal is raised at a slope colliery. Fay. d. The position a piece of coal in the roofline of the seam as long as the derrick or tripod man could grasp and use when sliding to safety in an emergency. Long.

life. A certain thickness of coal worked in one operation. Fay. g. N. of Eng. To clear gas out of a working place. Fay. h. A broken jud. Fay. i. Penn. A block of coal measuring three-quarters of a mile on the strike by 1,000 yards to the rise. Fay. j. Eng. A rise in the price of coal or coal wages, from Forest of Dean coalfield. Fay. k. To break up, bend, or blast coal from the bottom of the seam upward. Fay. l. The plane approximately parallel with the floor of the quarry, along which the stone is usually split in quarrying. Fay. m. The upheaval of the floor in coal mines. See also creep. Nelson. n. The extraction of a coal pillar in lifts or slices. See also jud. Nelson. p. The quantity of ore between one haulage level and the next above or below. Nelson. q. A step or bench in a one haulage level and the next 'above or below. Nelson.

lifeline. A diver's helper who remains by the lifeline as long as the diver is submerged. Ham.

lifeline. The roofline as long as the derrick or tripod man could grasp and use when sliding to safety in an emergency. Long.

life. When in cutting or getting coal it makes a cracking or bursting noise and works easily, it is said to have life in it, or to be alive. Fay.

life. The condition of a coal from which a coal entry can be made without the use of a cutter or other cutting tool. Fay.

life. The condition of a coal from which a coal entry can be made without the use of a cutter or other cutting tool. Fay.

life. A certain thickness of coal worked in one operation. Fay. g. N. of Eng. To clear gas out of a working place. Fay. h. A broken jud. Fay. i. Penn. A block of coal measuring three-quarters of a mile on the strike by 1,000 yards to the rise. Fay. j. Eng. A rise in the price of coal or coal wages, from Forest of Dean coalfield. Fay. k. To break up, bend, or blast coal from the bottom of the seam upward. Fay. l. The plane approximately parallel with the floor of the quarry, along which the stone is usually split in quarrying. Fay. m. The upheaval of the floor in coal mines. See also creep. Nelson. n. The extraction of a coal pillar in lifts or slices. See also jud. Nelson. p. The quantity of ore between one haulage level and the next above or below. Nelson. q. A step or bench in a one haulage level and the next 'above or below. Nelson.

lifeline. A diver's helper who remains by the lifeline as long as the diver is submerged. Ham.

life. When in cutting or getting coal it makes a cracking or bursting noise and works easily, it is said to have life in it, or to be alive. Fay.

life. The condition of a coal from which a coal entry can be made without the use of a cutter or other cutting tool. Fay.

life. The condition of a coal from which a coal entry can be made without the use of a cutter or other cutting tool. Fay.

life. A certain thickness of coal worked in one operation. Fay. g. N. of Eng. To clear gas out of a working place. Fay. h. A broken jud. Fay. i. Penn. A block of coal measuring three-quarters of a mile on the strike by 1,000 yards to the rise. Fay. j. Eng. A rise in the price of coal or coal wages, from Forest of Dean coalfield. Fay. k. To break up, bend, or blast coal from the bottom of the seam upward. Fay. l. The plane approximately parallel with the floor of the quarry, along which the stone is usually split in quarrying. Fay. m. The upheaval of the floor in coal mines. See also creep. Nelson. n. The extraction of a coal pillar in lifts or slices. See also jud. Nelson. p. The quantity of ore between one haulage level and the next above or below. Nelson. q. A step or bench in a one haulage level and the next 'above or below. Nelson.
lifting tackle

lifting wicket. S. of Wales. See lifting guard.

lift joint. A type of tensional fracture observed in massive rocks, such as granite, thought to originate from the removal of load by erosion. Such joints lie parallel to present or former ground surfaces. Stokes and Varnes, 1955.

Ligand field theory. A theory concerned with the changes in electronic energy levels of ions, especially of transition element ions, which occur when other ions or polar groups ligands are brought into their immediate neighborhood. Variations in the environment of the ion, for example, in the nature of the ligands or the symmetry of the complex arrangement in the spacings of the energy levels. This forms the basis of the modern explanation of the colors of crystals and of glasses. Dodd.

ligands. Molecular groups bonded about a central metal atom. If this offers one point of attachment the ligand is monodentate; if more, bidentate, etc. Bidentate ligands are also bidentate chelates. The number of uniden
tes which can surround a metal atom is a coordination number, four to six being common, each in its definite position. Pryor, 3.

light. a. A form of radiant energy which gives rise to the sensation of sight. Light travels through space with a velocity of 186,283 miles per second, in common with radio and other waves of electromagnetic nature but different wavelength. Anderson. b. Visible radiation or radiant energy capable of stimulating the eye so as to produce the sensation of vision. Sinclair, I, p. 199. c. In optical glass, the subclass of a lower index of refraction. ASTM C162-66.

light alloy. General term for alloys of aluminum, used for structural purposes; alloys of magnesium are also in use and are even lighter. Ham.

light blasting. Includes loosening up of shallow or small outcrops of rock and breaking boulders. It may constitute the entire job, be done in connection with dirt excavation, or follow heavy blasting which has failed to cut gradelines or slope lines, or has left chucks or piers too large to load. Nichols, p. 2-25.

light burden. See burden, j.

lightening. A peculiar brightening of molten sludge or liquid metal consisting of a metal wire with a light coating applied subsequent to the drawing operation, primarily for stabilizing the arc. Coal Age, v. 66, No. 3, Mar. 1961, p. 91.

lightman. One who uses an electric extension light as an aid in detecting blasters and flaws in the inside of green pipe. D.O.T. light metals; light metal alloys. The low-density metals and alloys, especially aluminum and magnesium, and their alloys. See also low-density metals. Henderson.

light mineral. A rock-forming mineral that has a specific gravity less than 2.8, including such minerals as quartz, calcite, feldspars, feldspathoids, and some micas. Also applied to the rock-forming minerals that are light in color; these minerals generally being the same as those that are classified as light on the basis of weight. A.G.I.

lightning arrester. A lightning arrester is a protective device for limiting surge voltages on equipment discharging or bypassing surge current; it prevents continued flow of follow current to ground, and it is capable of repeating these functions as specified. ASA M2.1-1963.

lightning explosion. Eng. An explosion of fire-damp caused by electric current, during a thunderstorm, entering a mine and igniting the gas. Fay.

lighting gap. A lightning gap is a break about 6 feet long made at the mine entrance in blasting circuits, used in firing blasts from the outside, to prevent lightning discharges from following the circuits into the mine. ASA M2.1-1963.

lightning protection. A system to enable high electrical discharges from thunderstorms and lightning to be conducted safely to earth by one or more conductors. The provision is very important in the case of mine explosive devices, and also headgear, tower winders, and chimneys. Nelson.

lightningube. See sulfite. C.M.D.

light oil. A crude fraction distilled from high-temperature coal tar, containing hydrocarbons distillable at about 200° C. See also heavy oil. Nelson.

light, polarized. Light that vibrates only in one plane. Fay.

light railway. A railway built to narrow gauge. Ham.

light gray. See metallic gray. Fay.

light green. See metallic green. Fay.

light gray. See metallic gray. Fay.

light water. Ordinary water (H2O) as distinguished from heavy water (D2O); D being the symbol for deuterium (heavy hydrogen or hydrogen 2). L.E.F.

lightweight aggregate. Aggregate of appreciably lower apparent specific gravity than that of ordinary aggregate. Taylor.

lightweight concreate. Concrete of appreciably lower unit weight than one made from gravel or crushed stone. Taylor.

lightweight expanded clay aggregate. A floated clay aggregate made by the sudden heating of suitable clays either in a rotary kiln (the original method used in Denmark in 1939) or on a sinter hearth. It is used as an aggregate for making lightweight concrete. Dodd.

ligroin; benzine

ligroin. Organic portion of benzine consisting of 25 percent or more of the tree; approximate composition C9H10O2, and considered to be aromatic or hydroaromatic. Pryor, 3.

ligroin sulfonates. See lignosulfonates. CCD 64, 1961.

lignite. a. A brownish-black coal in which the alteration of vegetal material has proceeded further than in peat but not so far as subbituminous coal. Fay. b. Consolidated lignite coal having less than 8,300 British thermal units (moist, mineral-matter-free). ASTM D388-38. c. Coal of low rank with a high inherent moisture and volatile matter; in this general sense, lignite may be subdivided into black lignite, brown lignite and brown coal. E.S. 3232, 1960. d. In the English language, "brown". Metallographically, the terms lignite and brown coal are used synonymously, although some authors confine the term brown coal to those coal seams consisting largely of easily recognized wood. In Germany, the term lignite is restricted to individual pieces of wood found in the brown coal. Tomkei. 1954, e. In France, it is combustible fossil fuel younger than Permo carboniferous, even though this includes Jurassic and other real coals. In Germany, it is partly carbonized wood and other vegetal substances of a clear color possessing more, the properties of wood than of carbon. Hess.

lignite-containing lignite. Fay.

lignito. Black. See as black lignite or subbituminous coal. Tomkei. 1954.

lignitic. To convert into lignite. Fay.

lignotif. Clarain laminae in coal; vitrain made of recognizable wood tissue. Tomkei. 1954.

lignius. Coal containing 75 percent to 95 percent of carbon (ashless, dry basis). Tomkei. 1954.

ligno-sulfonates: Basic Metallic sulfonic acids made from the lignin of sulfite pulp-mill liquors. Molecular weights range from 11000 to 20100. Light tan to dark brown powder; no pronounced odor; soluble in all organic solvents. Used as dispersing agents in concrete, in oil mud additives, in ore flotation agents, and in the production of gyspum slurries. CCD 64, 1961.

lignum fossile. Old name applied to fossil wood, peat or lignite. Tomkei. 1954.

ligroin; benzine; petroleum ether. a. The term lignite should be used instead of benzine or petroleum ether. CCD 64, 1961. b. A saturated, volatile fraction of petroleum boiling in the range of 100 to 200° C. Used as a solvent, chiefly in laboratories. Flammable; use with adequate ventilation; avoid prolonged inhalation. See lifting tackle.
ligroin; benzine

volatile; flammable; liquid; etheral or petroleum-like odor; specific gravity, 0.634 to 0.680 (at 25°C, referred to water at 25°C). It may be explosive if mixed with air and ignited; distillation range, 35° to 80°C; insoluble in water; and soluble in or miscible with most organic solvents and most oils. Derived from petroleum by distillation. Used as a solvent or as an extraction medium. CCD 6d, 1961.

lime blowing. The falling away of small pieces from the face of a clay building brick as a result of decomposition (following hydration and carbonation by the atmosphere) of nodules of lime present in the fired brick. Some brick clays contain nodules of calcite (CaCO3) which are converted into CaO during the kiln firing; these nodules can be rendered innocuous by fine grinding and hard firing. A cure that is more of an expedient is docking. See also docking, Dodd.

lime boil. A fraction in an open-hearth furnace caused by the decomposition of limestone and the escape of the carbon dioxide gas. This reaction begins before the ore boil is completed. See also ore boil. Newton, p. 320.

lime bostonite. A bostonite containing a notable amount of actual or normative anorthite in the plagioclase or pyroxene respectively. Holmes, 1928.

lime burner. One that burns limestone or shells to make lime. Webster 3d.

lime cartridge. A cartridge, 4 inches in diameter by 2 feet, 3 inches long, filled with compressed, ground lime. It is placed in a shot hole and the gases evolved by slaking the lime burn the charge of the coal which has been previously undercut to assist the process. It was introduced in 1881 by C. S. Smith and T. Moore. Nelson.

lime catcher. A filtering apparatus for extracting lime salts from the feed water of a steam boiler, thus preventing the deposit of scale in the boiler. Standard, 1964.

lime coal. Staff. Interior variety of coal suitable only for lime burning and similar purposes. Temkeieff, 1954.

lime crag. Scot. Limestone rock in situ; the face of a lichen growing on it. Fay.

lime feldspar. Micaformer for calcium feldspar. See also anorthite. A.G.I.

lime glass. A glass containing a substantial proportion of lime, soda, and silica. ASTM C162-66.

lime hydrate. Hydrated lime or calcium hydroxide. ASTM C162-66.

lime, hydraulic. See hydraulic lime.

lime kiln. A vertical shaft furnace or a rotary kiln for producing lime. Bureau of Mines Staff.

lime slaker. A brilliant light produced by white-hot quicklime, formerly used in lanterns and in theaters for illuminating the actors. Cooper, p. 291.

lime malachite. Apparently merely a malachite carrying pyrrhotite or calcite, or both, as impurities. Weed, 1918.

lime men. One who attends to slaking lime, protects against overspeed, overwind, too much steam and electric winding engines that should commence. Sinclair, V, p. 208.

lime mill. Eng. A light, wooden, or iron shaft for attaching pit ponies to the tram. Fay.

lime saturation value. The ratio of the actual lime content of a hydraulic cement to that calculated from an equation deduced as representing the amount of lime combined as silicate, aluminate and ferrite. Several such equations have been proposed; all are empirical. Dodd.

lime slaker. A thick layer indurated by calcium carbonate. Schieferdecker.

lime stone. Black. Webster 3d.

lime pit. a. A limestone quarry. Webster 3d. b. A pit where lime is made. Webster 3d. c. A pit where lime is used (as in liming hides). Webster 3d.

lime process. The method of mining coal by the use of the lime cartridge. Fay.

lime putty. The product that is obtained by slaking quicklime with an excess of water or soaking hydrated lime and, after settlement, siphoning off the excess liquor. Lime putty is highly plastic and its consistency varies with water content. Taylor.

lime refractory. Because of its abundance and high melting point (2,570°C), lime would be an attractive basic refractory but for its ready hydration and carbonation when exposed to the air. There has been much research on methods of stabilization, but the only accepted use of lime as a refractory has been as a container material for the melting of the platinum metals. Dodd.

lime rock. An unconsolidated or partly consolidated form of limestone, usually containing shells or shell fragments. Of marine origin. Urquhart, Sec. 8, p. 4.

lime slaking. The process of converting lime or limestone to lime slaker by slaking (calcining) at 900°C or by roasting (calcining) at 900°C. The lime slaker is a thick layer indurated by calcium carbonate. Schieferdecker.

lime-silicate rock. a. A rock that results from the high-temperature contact metamorphism of limestone containing silica and alumina under the influence of high temperature, commonly from an adjacent igneous body. The silica combines with the calcium oxide to form calcium-silicate minerals. C.T.D. b. A rock that results from the recrystallization of impure limestone containing silica and alumina under the influence of high temperature, commonly from an adjacent igneous body. It may also result from the recrystallization of pure limestone in the presence of high-temperature silica- and alumina-bearing emanations from an adjacent crystals-allizing magma. Among the calcium-silicate minerals formed in this way and occurring in lime-silicate rocks are anorthite, andenite, amphibole, forsterite, grossularite, scapolite, tremolite, vesuvianite and wollastonite. Bureau of Mines Staff.

lime slake. A thick layer indurated by calcium carbonate. Schieferdecker.

lime slaker. One who mixes lime and water in rotary slaker or open batch tank to make
limestone

milk of lime (slaked lime). Also called lime mixer; milk-of-lime slaker; slaker. D.O.T. 1.0.1

t lime slurry. A form of lime hydrate in aqueous suspension that contains considerable free water. Boynton.

lime-soda method. A treatment of water designed to remove both temporary and permanent hardness of water. The water is first analyzed to determine the degree of temporary and/or permanent hardness, then the amount of lime and soda ash required to remove the hardness is calculated. The insolubles are either filtered or are given time to settle. Cooper, p. 371.

lime-soda sinter process. A process for manufacturing alumina (ALO). The raw material, which may be clay or anorthosite, is sintered with limestone and soda ash to form sodium aluminate and calcium sulfate. The resulting slurry is then filtered, and the liquor is decomposed as in the Bayer process or it is treated with carbon dioxide to precipitate hydrated lime. When operated in conjunction with the Bayer process to recover alumina and soda ash, this method has been employed to produce a wide range of grades, from red mud, it is called the combination process. Bureau of Mines Staff.

lime-water. A clear, colorless, odorless, alkaline aqueous solution of calcium hydroxide, containing not less than 0.14 gram of Ca(OH)₂ in each 100 cubic centimeters at 15°C. Specific gravity, approximates the value 1.00 (25°C). Absorbs carbon dioxide from the air. Used in medicine. C.C.D. 6d, 1961.

liming material. A general term which includes all of the carbonate and noncarbonate (calcite), or calcium-magnesium carbonates (dolomite), or any combination of these two carbonates at least to the extent of 50 percent of the rock. If the carbonate is calcite, the rock is a calcitic limestone; if dolomite is also present, it is a dolomitic limestone; or if calcite is absent. Limestones are formed by the consolidation of calcareous ooze, which may be chemically precipitated from solution, derived from some preexisting limestone by the normal processes of rock erosion, or formed by organic agencies (coral reefs and shell deposits, for example). G. T. D. b. A bedded, sedimentary rock, consisting chiefly of calcium carbonate, which yields lime (quicklime) when burned (calcined). Limestone is the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955. c. The suitability of the rock for the manufacture of lime is not constant. In general, the term limestone is applied to those rocks in which the carbonate fraction exceeds the noncarbonate constituents. Normally, a rock in which the carbonate fraction is composed primarily of calcite. Pettijohn, 24, 1957, p. 381. d. Usage included dolomite term dolomite limestone or dolostone, oilitic limestone, and crystaline limestone. Some highly crystallized limestones can be polished and are considered the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955. e. The suitability of the rock for the manufacture of lime is not constant. In general, the term limestone is applied to those rocks in which the carbonate fraction exceeds the noncarbonate constituents. Normally, a rock in which the carbonate fraction is composed primarily of calcite. Pettijohn, 24, 1957, p. 381. d. Usage included dolomite term dolomite limestone or dolostone, oilitic limestone, and crystaline limestone. Some highly crystallized limestones can be polished and are considered the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955. f. The suitability of the rock for the manufacture of lime is not constant. In general, the term limestone is applied to those rocks in which the carbonate fraction exceeds the noncarbonate constituents. Normally, a rock in which the carbonate fraction is composed primarily of calcite. Pettijohn, 24, 1957, p. 381. d. Usage included dolomite term dolomite limestone or dolostone, oilitic limestone, and crystaline limestone. Some highly crystallized limestones can be polished and are considered the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955.

lime water. A clear, colorless, odorless, alkaline aqueous solution of calcium hydroxide, containing not less than 0.14 gram of Ca(OH)₂ in each 100 cubic centimeters at 15°C. Specific gravity, approximates the value 1.00 (25°C). Absorbs carbon dioxide from the air. Used in medicine. C.C.D. 6d, 1961.

liming material. A general term which includes all of the carbonate and noncarbonate (calcite), or calcium-magnesium carbonates (dolomite), or any combination of these two carbonates at least to the extent of 50 percent of the rock. If the carbonate is calcite, the rock is a calcitic limestone; if dolomite is also present, it is a dolomitic limestone; or if calcite is absent. Limestones are formed by the consolidation of calcareous ooze, which may be chemically precipitated from solution, derived from some preexisting limestone by the normal processes of rock erosion, or formed by organic agencies (coral reefs and shell deposits, for example). G. T. D. b. A bedded, sedimentary rock, consisting chiefly of calcium carbonate, which yields lime (quicklime) when burned (calcined). Limestone is the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955. c. The suitability of the rock for the manufacture of lime is not constant. In general, the term limestone is applied to those rocks in which the carbonate fraction exceeds the noncarbonate constituents. Normally, a rock in which the carbonate fraction is composed primarily of calcite. Pettijohn, 24, 1957, p. 381. d. Usage included dolomite term dolomite limestone or dolostone, oilitic limestone, and crystaline limestone. Some highly crystallized limestones can be polished and are considered the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955. e. The suitability of the rock for the manufacture of lime is not constant. In general, the term limestone is applied to those rocks in which the carbonate fraction exceeds the noncarbonate constituents. Normally, a rock in which the carbonate fraction is composed primarily of calcite. Pettijohn, 24, 1957, p. 381. d. Usage included dolomite term dolomite limestone or dolostone, oilitic limestone, and crystaline limestone. Some highly crystallized limestones can be polished and are considered the most important and widely distributed of the carbonate rocks and is the consolidated equivalent of dolomite limestone, or shell fragments. Stokes and Barnes, 1955.

limonitization

limits law. The presence of combustible gases affect the limits of flammability. New limits can be calculated from the limits law: where L equals limits of flammability in volume percent; x, y, and z equal the percent of each gas present in the mixture; and Lx, Ly, and Lz equal the limits of flammability of gases x, y, and z, respectively. Mason, u. 1, p. 264.

limits of flammability. a. Extreme concentration limits of a combustible in an oxidant through which a flame, once initiated, will continue propagating at a specified temperature and pressure. J.C. 8197, 1985, p. 76. b. Usually expressed at the limiting percentages of methane in air, beyond which the mixture will burn. The lowest percentage of methane in air that yields a flammable mixture is called the lower limit of flammability, and the highest percentage of methane in air to yield, a similar mixture is called the higher limit of flammability. These limiting percentages depend on a number of factors, such as the initial temperature and pressure; whether the mixture is at rest or moving; the manner in which the mixture is confined, etc. With methane mixtures at ordinary mine pressures and temperatures, the lowest limit of flammability is about 5.4 percent of methane in air; higher limit of flammability about 14.8 percent of methane in air. Nelson.

limit switch. a. A device fitted to an electrically driven hoist or winding engine which becomes effective at the end of a wind to prevent the cage overwind or underwind. Nelson. b. A control to limit some function. Examples are pressure limit switches which shut off the fuel burner when the steam pressure reaches a predetermined point; temperature limit switches for hot water and warm air. Strock, 10.

limiter. A device which applies a preset limit to any operation or movement. NCB.

limner, Newc. The shafts by which the horses draw mine cars. See also limber. Fay.

limic. A term applied to eul al deposits which were formed inland in freshwater basins or peat bogs. Tomkeeff, 1954. Compare paralic. See also limnic coal basin.

limnic coal basin. A coal basin formed inland from the sea coasts— as opposed to paralic coal basin. A.G.J.

limnic peat. Peat formed beneath a body of standing water, consists mainly of the remains of planktonic organisms. A.G.J.

limnic. A yellow ochre or brown iron ore, containing more water than limonite. Fay.

limonite. Hydrous ferric oxide, Fe₂O₃·nH₂O, an important ore of iron, occurring in stalactitic, marmillary, or earthy forms, of a dark brown color and as a yellowish-brown powder. The chief constituent of bog iron ore. Also called brown hematite. See also brown iron ore. Webster 3d; 17.

limonite boxwork. Residual limonite of sulfide derivation left by oxidation in former sulfide voids and displaying a characteristic meshwork. Bateman.

limonite. Consisting of, or resembling, limonite in appearance. Fay.

limonite. The process of altering to or supplying with limonite. Standard, 1964.
limp

limp

A term used in the context of structural features that are linear rather than planes. Lineation may be expressed by the parallel orientation of the long dimensions of minerals, long axes of pebbles, striee on slickensides, streaks of minerals, cleavage-bedding intersection, intersection of two cleavages, and fold axis. Synonym for linear parallelism; linear structure. A.G.I. b. Linear parallelism in fabric of some clastic rocks caused by preferred alignment of the long axes of the component particles at the time of deposition. A.G.I.

line. A partition placed in an opening to divide it into intake and return airways. Hartman, p. 252. See also bratice.

line clinometer. A borehole-survey clinometer designed to be inserted between rods at any point in a string of drill rods. Compare clinometer; end clinometer; plain clinometer. Long.

line drop. Loss in voltage owing to the resistance of conductors conveying electricity from a power station to the consumer. Ham.

line electrode. A series of electrodes used in the method of drilling and boring. A.G.I.

line element. See element, linear. A.G.I.

linear acceleration. A property of a metamorphic rock whereby they break in long pencil-like fragments; results from two intersecting cleavages or from linear parallelism of platy or prismatic minerals. A.G.I.

linear alkylbenzene sulfonate. A high-quality, biodegradable detergent, obtained from lignite tar, which is derived from carbonizing coal at low temperatures. This detergent meets the most stringent requirements (for modern washday products. Bureau of Mines, 1961).

linear cleavage. A property of metamorphic rocks whereby they break in long pencil-like fragments; results from two intersecting cleavages or from linear parallelism of platy or prismatic minerals. A.G.I.

linear drop. Loss in voltage owing to the resistance of conductors conveying electricity from a power station to the consumer. Ham.

linear electrode. A series of electrodes used in the method of drilling and boring. A.G.I.

linear element. See element, linear. A.G.I.

linear expansion. The increase in one dimension of a soil mass, expressed as a percentage of that dimension at the shrinkage limit to any given water content. ASCE P1826.

linear flow structure. Lineation caused by flow in magma. A.G.I.

linear hydrophone. A directional hydrophone consisting of a single, straight line element or any array of contiguous straight electroacoustic transducers, disposed on the right line, or the acoustic equivalent of such an array. Hoy.

line drop. Loss in voltage owing to the resistance of conductors conveying electricity from a power station to the consumer. Ham.

line electrode. A series of electrodes used in the method of drilling and boring. A.G.I.

linear fibrous. A term used in the description of fabrics in rayon, nylon, and other synthetic fibers. A.G.I.

linear flow structure. Lineation caused by flow in magma. A.G.I.

linear measure. Includes the following: 12 inches (12 in.) equal 1 foot (ft); 3 feet equal 1 yard (yd); 5/16 yards equal 1 rod or pole; 40 rods equal 1 furlong; 8 furlongs equal 1 statute mile; 1 mile equals 1,760 yards or 5,280 feet; and 3 miles equal 1 league. Crispin, p. 121.

linear parallelism. See lineation. A.G.I.

linear structure. See lineation. A.G.I.

line structure. Deviations from perfect parallelism of parts of columnar dendrite as a result of interdendritic shrinkage during solidification from a liquid. A.G.I. c. A unit of length that equals one-twelfth inch. Fay. A cable, rope, chain, or other flexible device for transmitting pull. Nicholas, e. To line pieces up in order to couple them together. Nicholas, f. See plumbline. Fay.

lineage structure. Deviations from perfect parallelism of parts of columnar dendrite as a result of interdendritic shrinkage during solidification from a liquid. A.G.I. c. A unit of length that equals one-twelfth inch. Fay. A cable, rope, chain, or other flexible device for transmitting pull. Nicholas, e. To line pieces up in order to couple them together. Nicholas, f. See plumbline. Fay.

linear flow structure. Lineation caused by flow in magma. A.G.I.

linear structure. See lineation. A.G.I.

linear transducer. A transducer for which the linear dimension between separate measurements is linear rather than circular. Lineation may be expressed by the parallel orientation of the long dimensions of minerals, long axes of pebbles, striee on slickensides, streaks of minerals, cleavage-bedding intersection, intersection of two cleavages, and fold axis. Synonym for linear parallelism; linear structure. A.G.I. b. Linear parallelism in fabric of some clastic rocks caused by preferred alignment of the long axes of the component particles at the time of deposition. A.G.I.

linear structure. See lineation. A.G.I.

linear strain. See strain. ASM Gloss.

linear shrinkage. Decrease in one dimension of a soil mass, expressed as a percentage of the original dimension, when the water content is reduced to the shrinkage limit. ASCE P1826. See also shrinkage test.

linear strain. See strain. ASM Gloss.

linear structure. See lineation. A.G.I.

linear transducer. A transducer for which the linear dimension between separate measurements is linear rather than circular. Lineation may be expressed by the parallel orientation of the long dimensions of minerals, long axes of pebbles, striee on slickensides, streaks of minerals, cleavage-bedding intersection, intersection of two cleavages, and fold axis. Synonym for linear parallelism; linear structure. A.G.I. b. Linear parallelism in fabric of some clastic rocks caused by preferred alignment of the long axes of the component particles at the time of deposition. A.G.I.

linear structure. See lineation. A.G.I.

linear strain. See strain. ASM Gloss.

linear structure. See lineation. A.G.I.

linear transducer. A transducer for which the linear dimension between separate measurements is linear rather than circular. Lineation may be expressed by the parallel orientation of the long dimensions of minerals, long axes of pebbles, striee on slickensides, streaks of minerals, cleavage-bedding intersection, intersection of two cleavages, and fold axis. Synonym for linear parallelism; linear structure. A.G.I. b. Linear parallelism in fabric of some clastic rocks caused by preferred alignment of the long axes of the component particles at the time of deposition. A.G.I.

linear structure. See lineation. A.G.I.

linear strain. See strain. ASM Gloss.

linear structure. See lineation. A.G.I.

linear transducer. A transducer for which the linear dimension between separate measurements is linear rather than circular. Lineation may be expressed by the parallel orientation of the long dimensions of minerals, long axes of pebbles, striee on slickensides, streaks of minerals, cleavage-bedding intersection, intersection of two cleavages, and fold axis. Synonym for linear parallelism; linear structure. A.G.I. b. linen tapes

of the linen is much stronger and withstands rough usage better. Mason, v. 2, p. 724.

line of collimation; line of sight. A continuation of the line through the optical center of an object, and the intersection of the diaphragm hairs, and it is essential that this line be parallel to the axis of the bubble tube. Mason, v. 2, p. 724.

line of creep; path of percolation. The path that water follows along the impervious surface of contact between the foundation soil and the base of a dam or other structure. ASCE P1826.

line of dip. a. The line of greatest inclination of a stratum from the horizontal plane. Fay. b. The direction in which an inclined borehole is pointed. Long. c. A synonym for dip as applied to the inclination of a line. Long.

line of etch. See etch line. Long.

line of face of coal. A term sometimes employed for the main cleats in the coal. Nelson.

line of force. a. The straight line in which a force acts. Standard, 1964, a. A curve in a field of force drawn so that at every point it has the direction of resultant force; specifically, a line of magnetic force. Long.

line of least resistance; burden. The shortest distance between the center line of a drill hole and the free rock face. Fransel.

line of overturn. The intersection of a stratum with the ground surface. Schiefer., 1964.

line of reefs. A belt of country in which a series of saddle reefs occur at intervals. Fern.

line of seepage; seepage line; phreatic line. The upper free-water surface of the zone of seepage. ASCE P1826.

line of sight. The line of delivery or pointing line of a telescope, defined by the optical center of the objective and the intersection of the two strings or wires, as the case may be, represents the bearing or course to be followed. Fay.

line speed. See cable speed. Long.

line ups. The number of lines strung through the traveling block and crown block. Brantly, 2.

line, a. A foot piece for uprights in timber. Standard, 1964, b and c. Nelson. b. Timber supports erected to reinforce existing sets which are beginning to collapse due to heavy static pressure. Nelson. c. Leic. A bar put up between two other bars to assist in carrying the load. Fay. d. A string of casing in a borehole. Long. e. A replaceable tubular sleeve inside a hydraulic or pump-pressure cylinder in which the piston travels. Long. f. Casing of small diameter extending into a producing sand from just inside the bottom of the last string of casing cemented in a well. Institute of Petroleum, 1961. g. The slab of coating metal that is placed on the core alloy and is subsequently rolled down to clad sheet as a composite. ASM Gloss. h. In extrusion, a removable, alloy-steel, cylindrical chamber, having an outside-longitudinal taper firmly positioned in the container or main body of the press, into which the billet is placed for extrusion. ASM Gloss. i. See lining, h and i. Pryor, 3.

lines. Plumblines, not less than two in number, hung from hooks driven in wooden posts. A line is put through the center of the two strings or wires, as the case may be, for pump impellers exposed to abrasion and chemical attack. Pryor, 3. j. A cup or other hollow vessel partially formed on the wheel, to be finished in a mold. C.T.D.

lining mark. Eng. A drill hole in the mine roof with a wooden plug driven into it from which to hang a plumber. Fay.

lining, mill. Porcelain enamel mills are usually of steel construction having a lining of porcelain bricks which are so designed as to conform with the contour of the steel shell. Hansen.

lining sight. An instrument consisting essentially of a flat plate with a longitudinal slit in the middle, and the means of suspending it vertically. It is used in conjunction with a plumpline for directing the courses of underground drifts, headings, etc. Webster 2d.

lining up a mine. In surveying, placing the sights for driving entries, drifts, or rooms nearer the working face. Fay.

linishing. The operation of polishing as carried out on machine tools. This machine is designed for the polishing of flat objects and carries a flat revolving cloth belt whose surface is impregnated with a suitable abrasive material. Osborne.

link bar. A lightweight steel bar extending faceward from the steel supports behind

652

The conveyor. It supports the area between the conveyor and the coal on longwall faces where cutter loaders are carried on railroad tracks. The chain-locking device may consist of a hinge pin and wedge. The standard bar can carry in addition to the conveying belt, such as the cutting edge on a fishtail bit, such as the cutting edge on a fishtail bit, long, straight carbon chain with three double bonds. Available commercially as a 50 to 60 percent pure alcohol. It is liquid at room temperature. Iodine value, 137;云点, 59° F; specific gravity, 0.855; at room temperature. Iodine value, 137; cloud point, 59° F; specific gravity, 0.855; and 0.855. Available used in floatation. C6D 6D1, 1961.

Lipulin. A special form of union characteristically applied to rocks formed of such materials, such as spore coal, pollen, etc. Tomkiewicz.

Lip union. a. A special form of union characterized by the affinity for molten sulfur. lip, a. The edge of the rippings in a road-face. lip angle. For a milling cutter. liparite. Synonym for rhyolite that is largely used among Europeans, although rhyolite is chiefly current in the United States and Canada. lipariite. Synonym for rhyolite that is largely used among Europeans, although rhyolite is chiefly current in the United States and Canada. The name is derived from the Lipari islands, off the coast of Italy, where this rock is abundant. Fay.

Lip type; lip. Scot. A small hitch or irregularity in the joints of a coal seam. Fay.

Linseed oil. Flotation agent used as collector in the flotation of lead ore. Fay.

Linseed fatty acid. Byproduct of manufacture of linseed oil. Flotation agent used as collector, emulsifier or stabilizer for dewatering, an uranium mineral. Fay., 3.

Linseed plastically. A design devised by M. Linsen for the evaluation of the plasticity of clay on the basis of two parameters; cohesion (measured as tensile strength) and the capacity for relative movement of the clay particles without rupture. The apparatus is made by Netzsche Bros., Selb, Germany. Dodd.

Linseed. A steel-gray, metallic mineral, Co3S4, or (CoNi)3S4, with reddish tarnish. Essentially cobalt sulfide but part of the cobalt is replaced by nickel, and 20 percent of the cobalt is replaced by iron and copper. Luster, metallic; Mohs' hardness, 5.5; specific gravity, 4.8 to 5. Found in Maryland, Missouri, Nevada; Germany. A source of cobalt and nickel. C6D 6D1, 1961.

Link bar. A link bar is a pin link or a roller link in a roller chain. For a silent chain, any one of the plates or links of which an assembled chain is composed. JOM.

Link plate. One of the side plates of either cross veinlets. Schieferdecker.

Linkenbach table. In mineral processing, a table for separating by size. CCD 6D1, 1961.

Linoleic acid. An unsaturated fatty acid, C17H31COOH, used as a collector in the flotation process. Fay., 3.

Linolenic acid. An unsaturated fatty acid, C18H33COOH. Pryor, 3.

Linolenyl alcohol. CH3CH=CHCH2CH2CH2CH=CH2; the fatty alcohol derived from linolenic acid. It has a long, straight carbon chain with two double bonds in it. Available commercially as a 50 to 60 percent pure alcohol. It is liquid at room temperature. Iodine value, 190; cloud point, 59° F; specific gravity, 0.863; and 0.855. Used in flotation. C6D 6D1, 1961.

Linoleal alcohol. CH3(CH2)=CHCH2CH2CH2CH2CH2OH; the fatty alcohol derived from linoleic acid. It has a long, straight carbon chain with two double bonds in it. Available commercially as a 50 to 60 percent pure alcohol. It is liquid at room temperature. Iodine value, 137; cloud point, 59° F; specific gravity, 0.855; and 0.855. Used in flotation. C6D 6D1, 1961.

Linophytre. A rock in which the phenocrysts are arranged in lines or streaks. Fay.

Lip Weber. Pertaining to porphyritic rocks in which the phenocrysts are arranged in lines or streaks. Holmes, 1928.

Linonite. A agatellite variety of thomsonite that is greenish with alternating bands of pink and green. From the Lake Superior region where it is cut and sold as a gem stone. Shipley.

Lipum virum; linium asbesti. Used to describe early forms of asbestos cloth. Sinclaire. W. E., P. 484.

Lippsche. A common term applied to stationary screens installed in the loading chutes over which the coal flows as it is loaded into railroad cars for market. Mitchill, p. 155. A small screen or screen bars placed at the drain hole of a coal pocket to take out the fine coal. Fay.

Lipite; liporite. The Nomenclature Subcommission of the International Committee for Coal Petrology agreed in 1962 to adopt these terms to describe a microcrhythype consisting mainly of the exinite group of macerals and especially of sporinite. Contains not less than 95 percent of exinite (lipite) with thickness (bands) of exinite greater than 50 microns recorded as lipite (sporite). Lipite (sporite) is a rare constituent of hard coal. IHCP, 1963, part 1.

Liptocolate. The resistant materials of plant decay, such as resins, waxes, spore, and exines, left behind after the less resistant parts of the plant have decayed. Also applies to rocks formed of such materials, such as spore coal, pollen, etc. Tomkiewicz.

Lip union. a. A special form of union characterized by the affinity for molten sulfur. lip, a. The edge of the rippings in a road-face. lip angle. For a milling cutter. liparite. Synonym for rhyolite that is largely used among Europeans, although rhyolite is chiefly current in the United States and Canada. lipariite. Synonym for rhyolite that is largely used among Europeans, although rhyolite is chiefly current in the United States and Canada. The name is derived from the Lipari islands, off the coast of Italy, where this rock is abundant. Fay.
liquefaction
cold or by pressure. *Webster 3d.* b. The state of being liquid. *Webster 3d.* c. The sudden large decrease of the shearing resistance of a cohesionless soil. It is caused by a collapse of the structure by shock or other type of strain and is associated with a sudden increase of the pore fluid pressure. It involves a temporary transformation of the material into a fluid mass. Also called spontaneous liquefaction. *ASCE P1826.*

**liquid.** a. The state of matter which has definite volume and assumes the shape of the containing vessel. *Griffin.* b. The three types are nonpolar: (1) a normal non-associated liquid with independent molecules (for example, carbon tetra-chloride); (2) polar-associated, with its molecules grouped and bonded (for example, water); and (3) semipolar, intermediate between the above (for example, alcohol). *Pryor.*

**liquid air.** Air in the liquid state but usually richer in oxygen than gaseous air. A faintly bluish-transparent, mobile, intensely cold liquid. Obtained by compressing purified air and cooling it by its own expansion in a temperature below the boiling points of its principal components, nitrogen (−195.8° C, at 760 mm) and oxygen (−182.96° C, at 760 mm). Used chiefly as a refrigerant and as a source of oxygen, nitrogen, and inert gases (as argon). *Webster 3d; Handbook of Chemistry and Physics,* 45th ed. *ASCE.* p. B-23, B-200.

**liquid hazing apparatus.** See Brown-Mills apparatus; Aerenechus apparatus. *McAdam,* p. 37, 42.

**liquid asphalt.** Asphalts which are more than 350. *Sinclair,* Sec. 2, p. 81.

**liquid controller.** The most common device used for speed control in electric winding systems. *Crispin.*

**liquid dump bailer.** See dump bailer. Long.

**liquid emulsion.** A mixture of two immiscible liquids, both liquids being in the finely divided state. *Webster 3d,* p. 81.

**liquid expeller.** A device used for separating the water from a liquid mixture by centrifugal force or contact with a second liquid, which is itself nearly insoluble in the first liquid and dissolves the impurities and unspecified substances. *CD 6d,* 1961. b. A process in which two immiscible liquids are brought into contact to effect a separation or transfer of substances between them. *NRC-ASA N1-1957.*

**liquid magnatic deposit.** Includes the following: straight magnetic mineral or ore deposits. *Schielerdecker Standard,* 1964.

**liquid measure.** Includes the following: 4 gills (pl) equal 1 pint (pl); 2 pints equal 1 quart (qt); 4 quarts equal 1 gallon (gal); 31/ 2 gallons equal 1 barrel (bbl); and 2 barrels equal 1 hogshead (hd). *Crispin.*

**liquid oxygen.** A highly concentrated oxygen which is used in industry and for respiratory purposes. *Pryor.*

**liquid oxygen explosive.** Sawdust or other suitable combustible material, formed into a cartridge and dipped into liquid oxygen before use in blasting. A little-used low explosive, with the value that in the event of a misfire it soon becomes innocuous. *Pryor.*

**liquid pitch oil.** See coal-tar creosote. *Benetti,* 2d, 1962.

**liquid platinum.** Liquid gold, silver, platinum.

**liquid pressure.** The pressure of a liquid on the surface of its container or on the surface of any body in the liquid is equal to the weight of a column of the liquid whose height equals the depth of the liquid at that certain point. *ASCE.*

**liquid silver.** See liquid gold, silver, platinum.

**liquidus temperature.** The maximum temperature at which equilibrium exists between the molten glass and its primary crystalline phase. *ASTM C162-66.*

**liquor.** A mixture of finely divided solid particles in suspension. If an impeller wheel is used to propel the suspension, the process is called wet blending. *ASME Gloss.*

**liquor inclusion.** A mineral found in fibrous crystals. *Bateman.*

**liquidity index.** Water-elasticity ratio; relative dry content. *Webster 3d.*

**live water content.** A ratio expressed as a percentage of the natural water content of a soil minus its plastic limit to its plasticity index. *ASCE P1826.*

**liquid-liquid extraction; solvent extraction.** a. A process in which one or more components are removed from a liquid mixture by contacting or contact with a second liquid, which is itself nearly insoluble in the first liquid and dissolves the impurities and unspecified substances. *CD 6d,* 1961. b. A process in which two immiscible liquids are brought into contact to effect a separation or transfer of substances between them. *NRC-ASA N1-1957.*

**litharge.** Lead.oxide, yellow. A native lead oxide. Also called litharke or lead oxide. *Sinclair,* 1964.

**limestone.** A plasticizer added to concrete to retard or ease the flow rate. *Sinclair,* II, p. 291.

**list mill.** In gem cutting, a wheel covered with list or cloth on which gems are polished. Also called list wheel. *Standard,* 1964.

**list pan.** A perforated skimmer for skimming the surface of molten tin. *Standard,* 1964.

**list pot.** In tinplate manufacturing, the last of a series of five pots used in coating the surface of tin. *Standard,* 1964.

**listric.** a. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5. a. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5.

**listric surface.** A moderately inclined overthrust sliding plane conceivably flexed towards the surface. *Schielerdecker.*

**listwarte.** A schistose rock of yellowish-green color composed of various combinations of quartz, dolomite, magnesite, talc, and limonite. *Holmes,* 1928.

**lity bed.** Eng. Soft freestone between the Chert Vein and House Cap in the Portland beds at Winstip in Purbeck. *Arkell.*

**listric bedding.** A sequence of rocks of nearly uniform lithology. *Arkell.*

**listric horizon.** A rock horizon that dips gently. *Arkell.*

**listric.** a. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5. b. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5.

**lithic.** a. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5. b. Descriptive of rock surfaces that are polished, but not striated as in slickensides. *B.S. 3616,* 1964, sec. 5.
marginal; lead oxide, yellow

marked as such. The solid material that remains on the screens is ground wet, settled water, and dried. This product is known as leviigated litharge. The colors of the commercial grades vary from canary yellow through lemon yellow to reddish-yellow or red, while a very pure product has the color of yellow ochre. Mechanical compression will turn the pure yellow varieties red. Soluble in alkalies and acids; insoluble in water; specific gravity, 9.53; and melting point, 688° C. Used in ceramic and fluxes, in pottery and glasses, in glass, and in oil refining. CCD 6d, 1961. Also used in assaying. Also called manometric. Fey.

litharge-glycerin cement. Made by mixing glycerin with one-sixth to one-half portion of water and mixing with enough litharge to give a paste of desired consistency. Must be used as soon as mixed. Fillers retard the setting and avoid cracking. The product is somewhat resistant to acids. CCD 6d, 1961.

lithargeite. Wherry's name for litharge. Eng. J.

lithia amethyst. Kunzite, Shipley.

lithia emerald. Hiddenite, Shipley.

lithia mica. See lepidolite. Dana 17, p. 471.

lithiophorite. A manganous mineral near psilomelane, containing some lithium, Fey.

lithic. a. Synonym for lithologic. A.C.I. Supp. b. Refers to sediments and rocks in which rock fragments are more important than sedimentary matrix, is employed. Lithical, from the Greek for stone, is contrasted with petrical, referring to textural characters of rocks, that is those which are the complex of processes according to Krynine. Pettijohn, 2d, 1957, p. 888.

lithic graywacke. A low-rank graywacke, also added, in small amounts, to some lead-base bearing metals. Used also as a basis for lubricant grease with high resistance to oxidation and to changes of temperature, and as an ingredient of high-energy fuels. Isoptoe lithium 6 is used in hydrogen-bomb manufacture. Symbol, Li; valence, 1; isometric; atomic number, 3; atomic weight, 6.939; specific gravity, 0.534 (at 20°C and boiling point, 179°C); boiling point, 13¹°C; and decomposes in water. C.T.D.; C.T.D. Supp.; Handbook of Chemistry and Physics, 45th ed., 1964, pp. 2-5, 116-118, 187.

lithium. A soft, silvery-white metallic element of the alkali group (group 1), the lightest metal known, and never found uncombined in nature. Used, in alloy with calcium, as a deoxidizer for copper, and also added, in small amounts, to some lead-base bearing metals. Used also as a basis for lubricant grease with high resistance to oxidation and to changes of temperature, and as an ingredient of high-energy fuels. Isotopes lithium 6 is used in hydrogen-bomb manufacture. Symbol, Li; valence, 1; isometric; atomic number, 3; atomic weight, 6.939; specific gravity, 0.534 (at 20°C and boiling point, 179°C); boiling point, 13¹°C; and decomposes in water. C.T.D.; C.T.D. Supp.; Handbook of Chemistry and Physics, 45th ed., 1964, pp. 2-5, 116-118, 187.

lithium aluminate; lithium metaluminate. White; LiAlO2; orthorhombic; insoluble in water; melting point, 1,900° to 2,000°C; and specific gravity, 2.55 (at 25°C, referred to water at 4°C). Used as a flux in high-refractory, acid-resistant refractories. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-187.

lithium boroclicate. Li₂O·BO₂·SO₃. Used in low-temperature enamels and as a component of high-temperature, corrosion-resistant coatings. Lee.

lithium carbonate. White; Li₂CO₃; monoclinic; molecular weight, 84.27; specific gravity, 2.111; melting point, 795°C; decomposes at 1,310°C (at 760 mm); more soluble in cold water than in hot water; soluble in acids; and insoluble in alcohol and in acetone. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-187. It has been the principal source material for converting LiO into glasses, glazes, and enamels. It gives a low melting range, greater fluidity, and smoother surfaces post-metamorphism. Lee.

lithium ceramics. Ceramics based upon lithium aluminate, with some of its properties are of value in certain glazes. In addition to normal properties, it increases resistance to thermal shock, and can be produced with properties so controlled as to provide a range of coefficients of thermal expansion, from negative to positive. The ceramics are produced from blends of lithium-bearing minerals and clay or blends of ceramic raw materials to obtain the desired ratio of lithium, alumina, and silica. Osborne.

lithium cobaltite. Dark blue; LiCoO₂; and insoluble in water. Exhibits both the fluxing property of lithium oxide and the adherence-promoting property of cobalt oxide. Used in ceramics. CCD 6d, 1961. Used in certain ground coat enamel frits in place of cobalt oxide and also in some blue enamels, because the blue color is stabilized and intensified by it. Lee.

lithium fluorophosphate. White; crystals; LiF·Li₃PO₄·H₂O. Used in ceramics. CCD 6d, 1961.

lithium fluoride. White; LiF; isometric; molecular weight, 25.8; specific gravity, 2.55 (at 20°C); melting point, 842°C; boiling point, 1,676°C; slightly soluble in water; does not react with water at red heat; soluble in acids, including hydrofluoric acid; and insoluble in alcohol. Used in welding and soldering fluxes, in ceramics, as synthetic crystals in infrared and ultra-violet instruments, and proposed for use in space components. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-187. Has high fluxing power in glasses, glazes, and enamels. Used in acid-resistant, cover coat enamels. It provides a valuable component of leadless glasses. Its low solubility permits using it as a mill addition. Lee.

lithium hydride. LiH; colorless; tetragonal; specific gravity, 1.46; melting point, 462°C; decomposes at 924°C; soluble in water; and slightly soluble in alcohol. Used in ceramics. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-188.

lithium hydroxide monohydrate. LiOH·H₂O; colorless; monoclinic; specific gravity, 1.51; soluble in water; slightly soluble in alcohol; and insoluble in ether. Used in ceramics. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-188.

lithium manganite. Reddish-brown; Li₄MnO₄; insoluble in water; and extremely stable. Used as a smelter addition in the manufacture of frit and is used in ceramic-bonded grinding wheels. CCD 6d, 1961.

lithium metaborate dihydrate. White; crystals; Li₂O·H₂O; soluble in water, melting point (anhydrous), 104°C. Used in ceramics as a flux in enamel cover coats and it increases resistance to toning. CCD 6d, 1961.

lithium metasilicate. Colorless or white; Li₂SiO₃; orthorhombic; specific gravity, 2.52 (at 25°C, referred to water at 4°C); melting point, 1,201°C; insoluble in cold water and soluble in dilute hydrochloric acid. Used as a flux in glasses and ceramic enamels. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-188. Has been used as a smelter addition in titania-opacified enamels to lower the firing temperature and improve surface texture. The strong fluxing properties are of value in certain glasses.

lithium nitrates. See lepidolite.

lithium minerals. a. Main mineral sources of the element lithium such as spodumene (LiAl(Si₂O₆)); amblygonite (Li(AlF)PO₄); and lithium mica, lepidolite. Pryor, J. B. Used in glassmaking and ceramics. Mined in North Carolina and South Dakota. Barger.

lithium niobate. LiNbO₃; a ferroelectric compound having the lithium tantalite structure and of potential interest as an electroceramic medium. Dodd.

lithium oxide. Colorless or white; Li₂O; tetragonal trigoonal; specific gravity, 2.38; melting point, 261°C; decomposes at 600°C; soluble in water, in alcohol, and in ammonium hydroxide. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 2-188.

lithium tantalite. LiTiO₂; a ferroelectric
lithium tantalate

A dull, very close-grained structure giving the rock a strong appearance. The rock may or may not contain this glassy material. The term lithoidal is used in opposition to viroose, and is especially applied to rocks formerly about which have become partially devitrified, for example, obsidian. *Nelson.*

lithoidite. A rhyolite with a dull, stony luster. *A.G.I.*

lithologic. Pertaining to lithology, or the study of rocks. Also pertaining to rock character. See also petrology. *Fay.*

lithologic correlation. The matching or linking up of identical rock formations, veins, or coal seams, exposed in different areas. *By lithology. See also correlation. *Nelson.*

lithology. A. The character of a rock described in terms of its structure, color, mineral composition, grain-size, and arrangement of its component parts; all those visible features that in the aggregate impart individuality of the rock. Lithology is the basis of correlation of coal mines and, commonly, is reliable over a distance of a few miles. *Nelson.* b. The study of rocks based on the megascopic observation of hand specimens. In French usage, the term is synonymous with petrography. *Holmes,* 1928.

lithomarge. Compact kaolin; mineral. *Benjamin.*

lithophosphate. A mineral, such as barite, that becomes phosphorescent when heated. *A.G.I.*

lithophyl. A petrified leaf or its impression, especially silicates. *A.G.I.*

lithosome. A group name for stony iron meteorites belonging to the subgroups of siderophyre and pallasite. *Compare siderealite. Holmes,* 1928.

lithosiderite. A group name for stony iron meteorites belonging to the subgroups of siderophyre and pallasite. *Compare siderealite. Holmes,* 1928.

lithosiderite. A group name for stony iron meteorites belonging to the subgroups of siderophyre and pallasite. *Compare siderealite. Holmes,* 1928.

lithosphere. The solid globe of the earth, as contrasted with the enveloping hydrosphere and atmosphere. Especially, the crust, or the outermost portion or shell of the globe, of unknown thickness and is believed from direct observation or reasonable deduction to consist of solid rock, as distinguished from the unknown barysphere or centrosphere. *Fay.*

lithotope. An area of uniform sedimentation. *Schlesinger.*

lithotype. a. This term was proposed by C. W. Seely in 1954 in a communication to the Nomenclature Subcommittee of the International Committee for Coal Petrology to designate the different macroscopic bands of humic coals. These bands were described by M. C. Stopes in 1919 as the four visible ingredients, in banded bituminous coal. The following macroscopic bands are distinguished in humic coals: vitrain, clarain, durain, and fusain. *Hey,* 1963, part 1, b. A rock defined on the basis of certain selected physical characters. *A.G.I.* Supp. 2d. Wood opal, water-transparent, cloudy structure. *Hey,* 2d, 1955; *Hey.*

lithyalin. The patent name used by Friedrich Egermann of his opaque marbled glass. *Hey.*

lithosiderite. A group name for stony iron meteorites belonging to the subgroups of siderophyre and pallasite. *Compare siderealite. Holmes,* 1928.

lithosphere. The solid globe of the earth, as contrasted with the enveloping hydrosphere and atmosphere. Especially, the crust, or the outermost portion or shell of the globe, of unknown thickness and is believed from direct observation or reasonable deduction to consist of solid rock, as distinguished from the unknown barysphere or centrosphere. *Fay.*

lithosite. An area of uniform sedimentation. *Schlesinger.*

littoral current

which usually moves parallel to and adjacent to the shoreline within the surf zone. See also longshore current. A.G.I.

littoral drift. A deposit of littoral drift located between high- and low-water lines. A.G.I.

littoral. Applied to the movement along the coast of gravel, sand, and other material composing the bars and beaches. A.G.I. b. Material moved in the littoral zone under the influence of waves and currents. A.G.I.

littoral rock. A rock composed of the coarse material deposited within the limits of the littoral zone through the agency of the waves and tidal currents. Standard, 1964.

littoral zone. a. In subsidence, the zone that embraces the disturbed strata lying round about and outside the mineral strata. Briggs, p. 61. b. The marine environment influenced by a land mass; the coastal region. Hy. c. The zone between the level of the highest tides and the lower limit of illumination. Also called intertidal zone. Schieferdecker. d. The coastal strip lying between the lines of lowest and highest tides. Also called intertidal zone. Schieferdecker.

defined.

live a. Electrically charged. In mechanical electricity to the inner end of the hose or wire wound on it.

live load. a. In drilling, a variable load sus-

cpected of being a dynamic load, and it does not include wind load or earthquake shocks.

live roller conveyor. A series of rolls or rollers while being undermined or sheared coal that may be chipped off in good-sized pieces while being undermined or sheared with a pike. Fay.

live roller conveyor. A series of rolls or rollers while being undermined or sheared coal that may be chipped off in good-sized pieces while being undermined or sheared with a pike. Fay.

live roller conveyor. A series of rolls or rollers while being undermined or sheared coal that may be chipped off in good-sized pieces while being undermined or sheared with a pike. Fay.

liver. In Utah, the name for a variety of bitumen, probably elaterite. Tomkejeff, 1954.

liver. In Utah, the name for a variety of bitumen, probably elaterite. Tomkejeff, 1954.

live bearing test

Lloyd Davis formula. A formula in use in Great Britain for calculating the amount of run off, from which sizes of sewers are determined: Run-off water in cubic feet= 0.8 times the area drained in acres times the rainfall in inches per hour times the impermeability factor. Ham.

LSL. See shallow investigation laterolog.

Lith. Abbreviation for local mean time. Zimmerman, p. 64.

load. a. Unit of weight of ore used in the South African diamond mines; equal to 1,600 pounds or 0.8 short tons. The equivalent of about 16 cubic feet of broken ore. I.C. 8200, 1964, p. 149, b. Scot. An old measure of weight for coal. Fay. c. To transfer material to a ruling unit or hopper. Nichols. d. Sometimes used as a synonym for bit load. Long. e. The act or process of placing an explosive in a borehole; also the explosive so placed. Also called charge, a and b. Long. f. The weight borne by a structure caused by gravity alone (dead load) or by gravity increased by the stress of moving weight (live load), as in the case of hoisting a string of drill rods. Long. g. Full mine wagon. Maun. h. The resistance to a motor of the machinery that it drives, apart from its own friction. Standard, 1954, p. 912. i. In geology, the amount of material that a transporting agency, such as a stream, glacier, or the wind, is actually carrying at a given time. Leti. k. See pull, k. ASTM C162-66.

load-bearing test. Load-bearing tests may be divided into two types, horizontal and vertical. Both types give evidence as to the bearing resistance of the test pit into the region which is being investigated. This test pit must be excavated with a minimum of blasting, with particular attention to the bearing surfaces to avoid disturbance of the foundation rock. In the horizontal test, a hydraulic jack may be used to apply loads to a probe or a core extracted from the core of the probe. The load is increased in increments, and the load at which the core is broken is recorded. The test is repeated on the opposite wall of the pit. The
load-bearing test

thrust is applied 6 to 8 feet from the pit floor to minimize the effect of that boundary. Sufficiently large bearing plates eliminate the need for a pit floor on the bearing plates and the rocks to secure uniform contact. Deflection of the load-bearing plate is measured by means of dial gages mounted two to a plate to get the average deflection. Deflections of the rock outside the bearing plates are also measured. In vertical tests, a hydraulic jack, working against a dead weight, applies loads to a single bearing plate seated against the bottom of the pit. Where the rock is severely fractured, upward movement of the area adjacent to the bearing plate is restricted by use of a reinforced concrete mat at the bottom of the test pit; the load being applied through a central hole in the mat. Dial gages are used in the same manner as in the horizontal tests. Tests are conducted for periods extending from a few hours to several weeks duration. Load-bearing tests are being utilized to an increasing extent as a source of information for the design of heavily loaded surface structures and have been the subject of several seismic tests where the foundation rock is highly shattered. Lewis, pp. 576-577.

load-bearing tile. Tile for use in masonry constructions designed to carry superimposed loads. ASTM C43-65T.

load-bearing wall. A wall carrying any load that is imposed on the drive. JaM. c. Also called binder. A lever that pulls two grab-hooks together, and holds them by locking over center. Nichols.

load cast. The bulbous, mammillary or pailiform downward protrusions of sand produced by load deformation of underlying hydrolastic mud; due to yielding under unequal load. Also called flow cast. Pettijohn.

load-cast markings. Flutes, grooves and other current marks swollen and misshapen due to load casting. Pettijohn.

load-cast sole marks. See load cast curvatures on the sole of a coal.

load-cast curvatures. Small-scale, rather poorly defined, irregular, linear structures appearing on the sole of coal that are attributed to dense sluggish turbidity current moving over soft mud. Pettijohn.

load cell. Consists essentially of a hollow steel cylinder capped top and bottom by a steel plate. Strain gages are bonded on the inner wall of the cylinder in such a way that as the cylinder is compressed so the strain gages affixed thereto will be distorted with a resultant change in resistance. This instrument is designed for measuring the load transferred from the load-casting mechanism to props or other units used for support. Isackson, p. 212.

load classification. A classification of drive loads based on the peak or maximum of the shock that is imposed on the drive. JaM.

load controller. A device to control the load and peak pressure of the striking or impacting chisel or chuck receiving coal or mineral from several loading points or subsidiary conveyors. The machine designed to travel over the seam and is installed on the main belt a short distance before the intermediate loading point. When the main belt is fully loaded, the time for this break and causes a break in the electrical circuit of the inter-

mediate conveyor which is stopped. Immediately the flood loading on the main conveyor is finished, the load controller operates and starts the subsidiary conveyor. See also sequence control. Nelson.

load dropper. Ark. A person who drops down a lightly inclined track, one at a time. Fay. See also car runner; car dropper. D.O.T. 1.

load fold. Load folds are plications of the underlying stratum which are believed to be the result of unequal pressure from the overlying load pockets and waves. Pettijohn.

load impendence. The load impendence of an energy load is the impendence which would be measured at the terminals of that load if they were not connected to a source. HaG.

load indicator. A measuring device used to indicate the load or weight suspended on a drum hoisting line or cable. Long.

load, machine I. In anthracite coal mining, biterminer, a miner who operates a small electric or air-power shovel in underground working places to load ore or rock into cars after it has been blasted from the working face. Also called loader operator; loading-machine operator; mechanical-shovel operator; shovel loader.

load, machine II. In anthracite coal mining, bituminous coal mining, metal mining, one who operates a loading machine consisting of a small hoisting engine and a cable-drawn scraper, or scoop, to load ore or rock into cars after it has been blasted from the working face of underground or open-pit mines. Also called scraper-loader hoistman; scraper-loader operator; scraper operator. G.F.

load-off. Eng. A man who regulates the sending out of the full cars from a long-wall stull, or gate. Fay.

load-extension curve. A line plotted from the results of a tensile test, or a load-extension curve, the loadings being shown as ordinates and the elongations of the gauge length as abscissae, thus relating the extension of the material under test to the applied load. See also stress-strain curve. Ham.

load factor. a. The ratio of the average compressor load during a certain period to the maximum rated load of the compressor. Lewis, p. 663. b. The ratio of the collapse load to the working load on a structure or section. Taylor. c. In electric power engineering, the ratio of average electrical load to peak electrical load usually calculated over a 1-hour period. L.A.L. d. Average load carried by an engine, machine, or plant, expressed as a percentage of its maximum capacity. Nichols. e. Ratio of average output during a period to maximum output during the period. Sometimes expressed as a percentage of output to maximum capacity. Strock, 10.

load fold. Load folds are pleats of the underlying stratum which are believed to be the result of unequal pressure from the overlying load pockets and waves. Pettijohn.

load, operator. a. The ratio of the average compressor load during a certain period to the maximum rated load of the compressor. Lewis, p. 663. b. The ratio of the collapse load to the working load on a structure or section. Taylor. c. In electric power engineering, the ratio of average electrical load to peak electrical load usually calculated over a 1-hour period. L.A.L. d. Average load carried by an engine, machine, or plant, expressed as a percentage of its maximum capacity. Nichols. e. Ratio of average output during a period to maximum output during the period. Sometimes expressed as a percentage of output to maximum capacity. Strock, 10.

load, operator. a. The ratio of the average compressor load during a certain period to the maximum rated load of the compressor. Lewis, p. 663. b. Sometimes expressed as a percentage of output to maximum capacity. Strock, 10.

loading belt. A loading boom in which the
loading belt

conveying element is a belt. B.S. 3552, 1962.

loading boom. a. In coal preparation, an
overhanging steel chute for loading coal
into rail wagons or lorries; usually capable of
vertical movement as loading proceeds
to minimize breakage. Grove. b. See loader

loading boss. See loader boss. D.O.T. 1.

loading chute. a. A three-sided tray for
loading or transferring material from one
point to another. See also chute. Nelson. b. A gravity chute used to convey
coal from a pocket or the screen to the
railroad car. Mitchell, p. 801. c. Used to
direct material to a conveyor. ASA MH 4.1-1958.

loading chute, screen. See screen loading

loading conveyor. Any of several types of
conveyors adapted for loading bulk ma-
terials, packages, or objects into cars,
trucks, or other conveyors. ASA MH 4.1-
1958.

loading density. The number of pounds of
explosives per square foot of drill hole.
Nelson.

loading equipment. Mechanical shovels or
other machines singly or in combination
used to load excavated or stockpiled ma-
terials into trucks, mine cars, conveyors,
or other materials transportation or haul-
age units. Bureau of Mines Staff.

loading factor. In ion exchange, pounds of
uranium oxide, U3O8, which can be loaded
per cubic foot of resin. Pryor, 3.

loading gate. Dimensions limiting the height
and width of rolling stock including any
loads. Ham.

loading head. That part of a loading ma-
chine which gathers the coal or rock and
places it on the machine's elevating con-

loading head man. A man who operates the
loading device of a duck bill or other type
of conveyor equipped with self-loading
head for the mechanical underground
loading of coal or other mineral. Hess.

loading hopper. A hopper used to receive
and direct material to a conveyor. ASA

loading machine. A machine for loading
materials such as coal, ore, or rock into cars
or other means of conveying for trans-
portation to the surface of the mine. ASA

loading machine operator. a. A person who
operates a single loading machine. Grove.

loading runner. See loader, machine
D.O.T. 1.

loading pan. A box or scoop into which
rock is shoveled in a sinking shaft
while the hoist is traveling in the shaft.
A small hoist is used to lift and discharge
the load at the bottom of the shaft.
Nelson.

Fay.

loading point. a. The place where coal or
ore is loaded into cars or conveyors; where
a conveyor discharges into mine cars;
where a wheel loader releases its load. See
also transfer point. Nelson. b. N. of Eng. Where
coal is transferred from a mother gate or
truck belt conveyor into tubs. Trut.

loading ramp. A surface structure, often in-
corporating storage bins, used for gravity
loading bulk material into transport vehi-
cles. Nelson.

loading ratio. In quarrying, the number of
tons of rock blasted per 1 pound of explo-
vive. This term is confusing because in
soft rock the ratio is high whereas con-
sumption is low. The harder the rock, the

Also called powder factor.

loadings. Eng. Pillars of masonry carrying a
winding drum or pulley. Fay.

loading shovel. A mechanical shovel able to
operate as a forklift truck, a crane, or a
loader. Ham. See also shovel loader.
Nelson.

loading station. A device which consists of
one or more plates, or a hopper which
receives and places material on the 
conveyor belt for transport. When such a
loading station is located at the tail end,
it is known as a tail-end loading station;
when it is located along the intermediate
section, it is known as an intermediate
loading station. NEMA MB1-1961.

loading-unit boss. See loader boss. D.O.T. 1.

loading weight. Weight of a powder which
is filled into a container under stated
conditions. Pryor, 3.

load metamorphism. The change in rocks
supposedly brought about by a regular
increase in temperature and hydrostatic
pressure through deep burial. A.G.I.

load mold. The depression in the underlying
bed occupied by the load pocket. Pettijohn.

load of ore. Derb. In mines where ore is
taken out of the mine. Fay.

load pocket. A load pocket is a sole mark
formed in the pans into the hopper and
into the hoppit. Where a wagon or lorry is
loaded. See also pocket.

load pressure. The ratio of the output power
of the transducer to the load power of
the transducer. HaG.

load wave. The load voltage of an energy
load is the root-mean-square voltage be-
tween the terminals of that load when
connected to a specified source. HaG.

load wave. A load wave (wisp or plume) is
the salient curved unevenness of under-
lying material which appears to have been
squirted up into the superjacent turbidity-
current deposit. See also flame structure.
Petitjohn.

load. a. A mixture of sand, silt, or clay,
or a combination of any of these with
organic matter, humus. It is sometimes
called topsoil in contrast to the subsoils
that contain little or no organic matter.
ASCE PI1260. b. In founding, a mixture of
sand and clay to wash straw, horse
dung, or other binding material is fre-
quently added; used to make molds for
iron or brass castings. Standard, 1964.
c. A potter's clay, containing mica or iron
ocher. An impure clay. Fay.

load beater. A rammer or bag for making a

load board. A founder's tool and template
used in making cores of load. Fay.

load box. A container in which load is
boiled in water by leading a steampipe
into the mixture; the mixture is used in
load furnace runners. Pettijohn.

load cake. A disk of dried load used to
cover a load mold, having holes through
which melted metal is poured and air

load casting. A casting made in a load mold.

load. a. A method used in prospecting for
tracing a hidden ore body consisting in
systematically testing the surface material
for indications of gold. As the ore body
is approached, the ground may become
richer or carry more soil material. See also
grooehmistry. Nelson. b. A method of
prospecting for a metalliferous vein or
mineralized area (source of eluvial min-
eral); dirt is washed from placer mines
systematically around and up the slope
of a hill. Presence, absence and the number
of colors in the minerals eventually
indicate the mineral source. Hess. c. In
Tasmania, prospecting surface soil in an
effort to locate the source of different
minerals. Hess. d. In Australia prospecting
by which the earth of a hillside is washed
(panned) to locate mineral deposits, the
panning being continued in the direction
of the greatest richness. Hess.

load mold. a. Mold for casting metal in
which low grade of sand is used with
clay, backed by brick or similar substance.
Bennett 2d, 1962. b. A founder's mold
made of load and originally requiring no

load molding. The act or operation of sweep-
ing up a mold in load, by templates;
distinguished from dry-sand molding.

load mold. A condition showing a pattern.
Lobbe Hobel.

lobe plume structure. See flute cast. Pettij-
on.

lobe till mark. The lobe till mark is ap-
parently the same as flute cast. See also
lobe cast. Pettijohn.

Lobbe Hobel. An earlier type of rapid ploughing...
local extension. The extension which is local. Current density. Current density local. A natural earth local corrosion. This is the difference local 'current. A natural earth local 'current. A natural earth local action. Corrosion due to the action of local syngenetic Pattern. In geochemical exploration to indicate presence of certain metallic elements from the soil and which can be used in geochemical exploration to indicate presence of local concentrations of metals. Compare universal plant indicators. They include the following:

- Genus & Species
  - Anabasis salsa
  - Salsolea sp.
  - Allium sp.
  - Salsolea nitaria
  - Eurotia ceratoides
  - Limonium sulcatum
  - Polycarpa spiristylis
  - Elhotechia haichowensis
  - Retaholita mexicana
  - Armoria martiana
  - Enigma inuliflora
  - Eriogonum inflatum
  - Betula sp.
  - Clisia rosea
  - Eriogonum giganense
  - Convolvulus althaeoides
  - Astragalus preussii
  - Astragalus sp.
  - Eriogonum ovalifolium
  - Philadelphus sp.

location plan

local plant indicators. Plants of wide geographic distribution having an affinity for absorbing certain metallic elements from the soil and which can be used in geochemical exploration to indicate presence of local concentrations of metals. Compare universal plant indicators. They include the following:

- Common Name
  - Salicornia
  - Ononis
  - Suaeda
  - Salsola
  - Glycine
  - Adenophora
  - Mentzelia spp.
  - Eriogonum inflatum
  - Convolvulus althaeoides
  - Clusia rosea
  - Eriogonum giganense
  - Convolvulus althaeoides
  - Astragalus preussii
  - Astragalus sp.
  - Eriogonum ovalifolium
  - Philadelphus sp.

location plan

local peat. Peat produced under the influence of ground waters. Also called basin peat. It is divided into (1) low moor stage peat and (2) raised moor stage peat. Tomkeiff, 1954. See also basin peat; and raised moor peat.

local plant indicators. Plants of wide geographic distribution having an affinity for absorbing certain metallic elements from the soil and which can be used in geochemical exploration to indicate presence of local concentrations of metals.   - Astragalus sp.
  - Eriogonum ovalifolium
  - Philadelphus sp.

location plan

local current density. Current density at a point or on a small area. A.M. Gloss.

local current density. Current density at a point or on a small area. A.M. Gloss.

local corrosion. Corrosion due to the action of local cells; that is, galvanic cells resulting from inhomogeneities between adjacent areas on a metal surface exposed to an electrolyte. The inhomogeneity pattern may be of physical or chemical nature in either the metal or its environment. A.M. Gloss.

local corrosion. Corrosion due to the action of local cells; that is, galvanic cells resulting from inhomogeneities between adjacent areas on a metal surface exposed to an electrolyte. The inhomogeneity pattern may be of physical or chemical nature in either the metal or its environment. A.M. Gloss.

location plan

660
location plan

scale, showing the proposed mine development, shafts, works, etc., in relation to existing surface features. See also site plan.

location survey. a. See location, a. Fay. b. Laying out the line of railroad or canal, or any works.

location work. Labor required by law to be done on mining claims within 60 days of location, in order to establish ownership. Weed, 1922. Synonymous with assessment work. Fay.

locator. a. A prospector who according to the law is required to find valuable minerals in place on the surface as a condition preliminary to making a location. Lewis, p. 23. b. One who locate (or stakes) a mining claim; a prospector. Bureau of Mines Staff.

lock. a. In a compressed air system, a chamber that any one entrance is not entirely in one place. Where two or more changes occur, it is called a compound lock; where a lock is placed in the direction of the flow, the lock is called a counterclock. ASM Gloss.

lockage. Water consumed in passing from the upper reach of a canal when a vessel passes through a lock. Ham.

lock band. A course of bondstones. Standish.

locked particles. Particles of ore consisting of a lode channel. The track of the lode along which the ore body may make or develop again. Nelson.

locked test. In laboratory tests on small quantities of ore, a method in which any selected fraction of the product is added to a fresh batch of the sample, so that the cumulative effect of its retention can be studied. It is an alteration of the verb lead; and which the miner could be led or guided. The term lode simply meant that formation representing only a small portion of the total tractive effort. Kentucky, p. 225.

lock band. A course of bondstones. Standish.

lock piece. Eng. A piece of timber for supporting the mine workings. See also lock timber. Fay.

lockpin. Any pin or plug inserted in a part to prevent play or motion in the part so fastened. Crispin.

lockport limestone. Marine, highly fossiliferous strata of the top of the scarao and the lip of the Niagara Falls, having a thickness of 130 feet above the falls, and faunally closely resembling the Wenlock limestone in England. Sometimes called Niagara limestone. C.T.D.

lock silt. A raised portion of the floor of a lock chamber, forming a stop against which the lock gates bear when they are shut. Ham.

lock timber. Eng. An old plan of putting in stull pieces in Cornwall and Devonshire. The pieces were called lock pieces. Fay.

lockup clutch. A clutch that can be engaged to provide a nonslip mechanical drive through a fluid coupling. Nichols.

locking bolts. Bolts of any type used for resisting wear. Such ropes are used in bituminous coal mining, one who works on an intake airway of a mine for servicing locomotives. It contains two or three rail tracks (with pit space under one), good lighting, lifting equipment, oils, benches, and tools. Where battery locomotives are used, the garage will serve as a charging station. An average air velocity of about 150 feet per minute is desirable in underground garages. Nelson.

locomotive brake. An electric engine, either operating from current supplied from trolley and track or from storage batteries carried on the locomotive. In some foreign countries, operated with compressed air. Used to move empty and loaded mine cars in and out of the mine. B.C.I. See also mine locomotive; electric mine locomotive; electric locomotive.

locomotive arches. Arches built of special refractory material, either fired or made by water-circulating members. Bureau of Mines Staff.

locomotive brake man. In anthracite and bituminous coal mining, one who works on trains or trips of cars hauled by locomotive or motor, displaced from rope haulage. Also called locomotive helper; locomotive patcher; motor brakeman; motor nipper; polman. D.O.T.

locomotive crane. A crane traveling on a standard gage railway track. Ham.

locomotive garage. An apparatus used recess in an intake airway of a mine for servicing locomotives. It contains two or three rail tracks (with pit space under one), good lighting, lifting equipment, oils, benches, and tools. Where battery locomotives are used, the garage will serve as a charging station. An average air velocity of about 150 feet per minute is desirable in underground garages. Nelson.

locomotive gradient. The statutory maximum gradient for locomotive haulage is 1 in 15, but ordinarily the practical limit is about 1 in 3. Roads driven specially for locomotives are normally graded about 1 in 400 in favor of the load, unless a steeper gradient is required for drainage. Nelson.

locomotive haulage. The transport of coal, ore, men and materials underground by means of locomotive hauled mine cars. The locomotive may be powered by battery, diesel, compressed air, trolley, or some combined types such as battery/trolley or trolley/diesel. The ton-mileage of locomotive haulage has steadily increased to about 15 tons and 100 horsepower. Nelson.

locomotive pan brick. Shapes, used to build locomotive pan brick. Shapes, used to build locomotive resistance. The combined resistance caused by the friction of the journal and the wheel tread. It may vary from 12 to 20 pounds, but for practical purposes may be taken as 15 pounds, as the locomotive represents only a small portion of the total tractive effort. Kentucky, p. 225.

locomotive resistance. The combined resistance caused by the friction of the journal and the wheel tread. It may vary from 12 to 20 pounds, but for practical purposes may be taken as 15 pounds, as the locomotive represents only a small portion of the total tractive effort. Kentucky, p. 225.

location, in order to establish ownership. Weed, 1922. Synonymous with assessment work. Fay.

lodestuff. Minerals included in a lode or lode plot. A horizontal lode. Fay.

lode tin. Tin ore (cassiterite) occurring in lodranite. A siderolitic meteorite containing planes through the surface lines. See also face location. The extension of inclined boundary which lies their entire depth, all mum width is 600 feet. A tract of land veins, as distinguished from stream tin or vein, a vein in rising ground. Fay.

mariners. Nelson. b. Stone found in veins through the surface boundaries. Fay.

meters square, and is bounded by vertical lines, much litigation. In Meixco a claim is 100 rights the side of the vertical side planes of the surface climb, the other at a distance from the plane, and ledges throughout their downward course may extend out-

of the lode or vein is 1,500 feet and the maxi-

mum width is 600 feet. A tract of land veins, as distinguished from stream tin or vein, a vein in rising ground. Fay.

minerals. Included in a lode or vein, including economically valueless gangue. Pryor, 3.

mold. Tin ore (cassiterite) occurring in veins, as distinguished from stream tin or placer tin. A.G.I.

lodge. a. A reservoir of any size used for holding water in a mine. A sump or stand-

age. Also called lodgement. B.S. 3619, 1963, sec. 4, b. Eng. A subterranean reservoir for drainage of the mine, made at the shaft bottom, in the interior of the workings, or at different levels in the shaft. Fay. c. A sump. Fay. d. Scot. A cabin at the mine shaft for workmen. Fay. e. Wales. See platt. Fay. f. The room or flat at the shaft into which the pushers or tramming men descend. Standard, 1964, g. In South Wales, the local branch of the coal miners' union. Nelson. h. A pump room, near the pit bottom or other points. It consists of a carrying chain running between the rails. The dummy or live axles of the cars are held firmly by the chain's profile and an overload slipping action is pro-

vided. See also retarder, a. Nelson. LOF-Colburn process. See Colburn process.

lofting. a. S. Wales. An old or disused head-

ing over the top of another one. Fay. b. N. of Eng. See lacing, b. Fay. c. Scot. Wood filling up vacant space on top of 

crowns or gears. Fay. d. Timbers, usually 

old, laid across the caps of steel frames or 

sets in a working to support the roof. Webster 2d.

lofty tin. Corn. Large and rough tin ore. 

lo g. A piece of timber either rough or 

squared. Crispin. b. The record of, or the 

performance of an engine or boiler or 

Staff. See dolly, b. Fay. e. A record of the 

action of an engine or boiler or similar piece of equipment. Webster 3d. f. 

Logan slaking machine. This machine includes essentially two horizontal cutting chains, one working at the base of the coal 

stack, and a second one to shear off the 

coal at the back of the cut. The upper jib breaks the coal up into loadable size and a short conveyor transfers it to the face conveyor. Also called logged; logging. Log. c. S. Staff. A balance weight near the end of the hoisting rope of a shaft to prevent its run-

ning back over the pulley. Fay. d. N. Staff. See dolly. Fay. e. A record of the 

performance of an engine or boiler or similar piece of equipment. Webster 3d. f.

lok batanite

656

long rigid cartridges

metal cracks, then neither is weldable.

longitudinal coast; conformable coast; Pa-
fic type of coast. Coast parallel to the trend lines of a coastal orogenetic belt.

longitudinal direction. The principal direc-
tion of flow in a worked metal. ASM Gloss.

longitudinal dune. A general term for vari-
sous types of linear dune ridges, commonly,
more or less symmetrical in cross profile,
which are known or inferred to extend par-
allel to the direction of the dominant dune-building winds. A.G.I.

longitudinal fault. A fault, the strike of
which is parallel to the general structure.

longitudinal field. A magnetic field which
extends within a magnetized part from one
or more poles to another or other poles,
and which is completed through a path external to the part. ASM Gloss.

longitudinal fissure. A fissure that is par-
allel with the strike of the deposit. Stoess, v. 1, p. 266.

longitudinal joint. A joint running parallel
to the flow lines in igneous rocks, usually
dipping and best developed where flow lines are horizontal. A.G.I. Supp.

longitudinal profiles. A section drawn verti-
cally through the centerline of a road, rail-
way, or canal giving both the original and
final contours of the ground.

longitudinal ripple marks. Relatively straight
cracks parallel to current direction. May be
symmetrical or asymmetrical. Pettijohn.

longitudinal valley. A valley having the same
direction as the strike of the underlying
rocks. See also subsequent stream. A.G.I.

longitudinal velocity. See Young's modulus of elasticity. Lewis, p. 566.

longitudinal wave. An elastic wave in which
the displacements are in the direction of
wave propagation. A.G.I.

long (lay) frames. Partially erected frames,
particularly when aerated in stages. Non-

long-piggyback conveyor; pick-a-back con-
veyor. An appliance to provide a constant
flow of coal from a continuous miner to the
main haulage system. It consists of a con-
veyor slung under the tail end of the loader
and running on a bogey straddling the
headway conveyor so that it can telescope
over it. Nelson.

long pull. Coal winning in three stages
underground mining. First, large pillars
are left as the face is advanced by means of
drivers. Second, permanently fixed drives connect
these drives and form large blocks. Finally,
the pillars so formed are mined. Pryor, 3.

long-range. Of crushed or ground ore, size
distribution consisting of a wide range of
meshes. Pryor, 4.

long-range order. Repulsion of coordination
of many nonequilibrium states. The resulting
structure is crystalline. VV.

long rigid cartridges. To facilitate the load-
ing of drill holes long, rigid cartridges

long hole. Underground boreholes and blast-
holes exceeding 10 feet in depth or requir-
ing the use of two or more lengths of drill
steel or rock drills must be spaced together to attain the desired depth. Long.

long-hole blasting. This method of blasting,
employing diamond drills or extension
holes wùth tungsten carbide bits, is
being applied increasingly to ore winning
operations where conditions are suitable.

long lay. A test for weldability in which a welded test piece is bent double; if the parent metal or the weld

long glass. Glass that is slow setting. Dodd.

longitudinal dune. A general term for vari-
sous types of linear dune ridges, commonly,
more or less symmetrical in cross profile,
which are known or inferred to extend par-
allel to the direction of the dominant dune-building winds. A.G.I.

longitudinal fault. A fault, the strike of
which is parallel to the general structure.
long running thermal precipitator. A dust-collecting device designed by the Mining Research Establishment of Great Britain that operates over periods of up to 8 hours and collects only respirable dust which is selected aerodynamically during the sampling process. The respirable fraction is selected by drawing the dust through a horizontal duct selector which simulates the action principle of the human nose and respiratory passages in that the larger and faster-falling particles are caught by the selection of movement and impaction. See also short run. Long.

long sample. A sample that is long enough to allow for a complete analysis. See also short sample. Long.

longshore current. A current in the shore zone, generated by waves breaking at the shoreline, and from the rip currents. Schieferdecker.

longshore drift. See beach drift. Schieferdecker.

longshore trend. A trend or line which may be several hundred miles long. It may be defined as a series of parallel straight lines which may rise or fall in elevation and is maintained, and by working the seam in the direction of the face. Pryor, 3.

longwall. The longwall working method, in which the developing headings are driven parallel to the face and the coal is extracted by longwall faces facing towards the shaft. In this method, all the roadways are in the form of a loop. ASA MH4.1-1958.

longwall advancing. A specialized method known as longwall mining, in which all coal is extracted as a series of longwall stalls. A common method of working in which the developing headings are driven parallel to the face and the coal is extracted by longwall faces facing towards the shaft. In this method, all the roadways are in the form of a loop. ASA MH4.1-1958.

longwall coal cutter. A machine driven by compressed air or electricity, which cuts into the coal face with its jet at right angles to its body. Pryor, 3.

longwall coal mining. A power-driven machine used for undercutting coal from relatively long faces. ASA C42.85: 1956. See also longwall coal cutter.

longwall coal miner. In bituminous coal mining, one who extracts coal from seams by a specialized method known as longwall mining. In this method, all coal is extracted as the work progresses, packs (supports of stone and timber) being built instead of leaving pillars of coal to support the roof. D.O.T. 1.

longwall mining. N. of Eng. A system of mining on straight faces 80 yards or more in length. Trist.

longwall peak stopping. A method of under-length stopping in which rapid advance of the face is maintained, and by working the faces at an angle of 60° to the strike, the peak travels down the dip at twice the rate of the face advance. This method was introduced on the Witwatersrand for stopping below 3,000 feet where rapid advance results in closer spacing of holes reduces the incidence of rock bursts. Higham, pp. 213-215.

longwall powered roof bolting. The extraction of the coal pillars formed by a pillar method of working, by a longwall face, which can be advancing or retreating. Where the crush is not excessive, this method is more efficient and often safer than extracting each pillar individually. Nelson.

longwall retreating. A system of longwall working in which the developing headings are driven narrow to the boundary or other limit lines. In this method, all the roadways are in the form of a loop. ASA MH4.1-1958.

loop. A bend, or folding, or doubling of a part of a river or stream. Pettijohn.

loop-bedding. Small groups of laminae that are rather irregular are quite sharp, mostly constricted or even abruptly at intervals, giving the effect of long, thin loops or links of a chain. Though to be a deformation feature. Observed in some fine calcareous sediments and also in oil shales. Pettijohn.

looped hand. See hand loop. Long.

loop head. An en masse elevator in which the lower end of the casing is in the form of a loop. ASA MHA-1-1958.

loop head elevator. A term used when two positive wires are installed in divergent directions but later come close enough together to test them under different conditions. When the loop and contents are placed in a reactor, it is called an in-pile loop. See also loop hanger. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.

loop hanger. A hanger for a loop of wire, used for holding the casing in place in the hole. See also loop head. Long.
loose core. Large aggregate which has been separated from a concrete mix by a hoist with the rope attached to a clip fixed to the side of the cars. The rope is pulled back by hand for a distance of three or four car-lengths and the process is repeated frequently as the end of the rope approaches the hoist. Wheeler, H.R., pp. 32-33.

looping. The running together of ore matter into a mass when the ore is only heated for calcination. Standard, 1906.

loop takeup. An arrangement for storing spare belting (for extension of the conveyor) and so for applying tension to the belt. It is usually situated behind the drive unit. Nelson.

loop tunnel. A method of gaining grade in which the loaded cars are fed to the cage from one side only and the empties are returned to the same side by means of a loop roadway. The loop arrangement provides more standage room for cars and is more suitable for multideck cages. When the coal reaches the pit bottom the belt. It is usually situated behind the drive unit. Nelson.

loop-type pit bottom. A pit bottom layout in which the loaded cars are fed to the cage from one side only and the empties are returned to the same side by means of a loop roadway. The loop arrangement provides more standage room for cars and is more suitable for multideck cages. When the coal reaches the pit bottom the belt. It is usually situated behind the drive unit. Nelson.

loose. a. Eng. Applied to a working place to which the track is open at both sides, that is, the coal has been previously removed at both sides. "Loose at an end," or "loose at one side," denotes that the coal has been removed at one side only. Fay. b. The end of a shaft or of the day's work is spoken of as "loosing time," or "loosing out," and when the workmen leave, the pit is said to be "loosed out." Fay. c. Synonym for junk when applied to pieces of metal that must be fished out. "Loose," or lenner; and when the workmen leave, the pit is said to be "loosed out." Fay. d. A pattern from a sand mold. Standard, 1964.

loose-packed splittings. Applied to mica, splittings of heterogeneous shapes, not arranged in any particular order but packed loosely in such a way that the packed splittings may or may not be dusted. Skow.

loose rails. Aust. Rails that can be lifted and placed across a permanent line when desired to run skips across it. Fay.

loose rock. See loose ground. Long.

loose rock. a. A fragment of alternating masses of igneous rock, generally concordant, and in bank ovens just back of a single row of parallel lines of ovens composing a block; laid, one on top of the other. Fay. b. A car used on mine tramways, or at coke ovens. See also lorry, a and b. Fay. c. Gr. Beit. A long wagon having a very low platform and four very small wheels. Standard, 1964.

loose dusted splittings. Loose-pack splittings of heterogeneous shapes, not arranged in any particular order but packed loosely in such a way that the packed splittings may or may not be dusted. Skow.

loose-end survey. Dial survey, in which the magnetic bearing of the traverse line is read at each setup of the instrument. Pryor, J.

loose-end traversing. A method of traversing in which the magnetic bearings of survey lines are separately obtained with reference to the magnetic needle. B. S. 3618, 1965, sec. 1.

loosening bar. A diamond used to loosen, or to loosen, rock that must be barred down to make an opening. Long. 

loose diamonds. See loose goods. Long. 

loose dusted splittings. Loose-pack splittings dusted with mica powder. Skow.

loose end. a. A gangway in longwall workings, driven so that one side is solid ground while the other opens upon old workings. See also split end, a. Fay. b. Coal prepared by cutting, or that coal which is certain to be loosened by a shot. Fay. c. The limit of a stall next to the goal, or where the adjoining stall is in advance. Fay.

loose-flange joint. There are several patterns of this type of joint. The flanges are slipped on to the tubular portion of the pipe, one being made to slide within the other, the pipe ends being pressed outwards to form facings for the joint washer and another being reinforced by the formation of a special shoulder or the addition of a welded-on mild steel ring. Maron, e. v., p. 628.

loose goods. Industrial diamonds as purchased from a diamond supplier in bulk. Long.

loose ground. a. Broken, fragmented, or loosely cemented bedrock material that tends to slough from sidewalls into a bore-hole. Also called broken ground. Compare brecia, b. Long. b. As used by miners, rock that must be barred down to make an underground workplace safe; also fragmented or weak rock in which under-ground openings cannot be held open unless artificially supported, as with timber sets and lagging. Compare broken ground, b. Long.

loose iron. See loose, c; junk. Long.

loose junking. See junking, b. Fay, p. 372.

loose needles. Same as junking. Fay, p. 372.

loose needle survey. Dial survey, in which the magnetic bearing of the traverse line is read at each setup of the instrument. Pryor, J.

loose needle traveling. A method of traversing in which the magnetic bearings of survey lines are separately obtained with reference to the magnetic needle. B. S. 3618, 1965, sec. 1.

loose-packed splittings. Applied to mica, splittings of heterogeneous shapes, not arranged in any particular order but packed loosely in such a way that the packed splittings may or may not be dusted. Skow.

loose rails. Aust. Rails that can be lifted and placed across a permanent line when desired to run skips across it. Fay.

loose rock. See loose ground. Long.
Fay. u. A pit shaft is said to be "lost" when it has run in or collapsed beyond recovery. Fay.

lost hole. A borehole in which the target could not be reached because of caving, squeezing, loose ground, or inability to return for work. Fay.

lost level. Corn. A level or gallery driven with an unnecessarily great departure from the horizontal. Fay.

lost returns. See lost circulation. Long.

lost river. a. A river that, by a secular increase in aridity in its region, has ceased to exist, its remnant tributaries sinking into the ground before reaching into former channel. Standard, 1964. b. A river in a mountain region that is being pulled from the drill hole. Long.

lost time. The time spent in drilling operations on work other than deepening the hole, e.g., on work other than fishing, moving, and setups. Long.

lost water. See lost circulation. Long.

lost wax. Process. An investment casting process in which a wax pattern is used. ASM Gloss.

lost-yest. A bluish-white basic carbonate of magnesium and zinc with a little manganese and zinc with a little magnesium and zinc. Fay. Seelye, I.

loss. Difference between weight of rock and that of saleable products, expressed as a percentage. Pryor, 3.

loss on ignition. As applied to chemical analyses, the loss in weight which results from heating a sample of material to a temperature just above the boiling point of water. The loss in weight upon drying is called free moisture; that which occurs above the boiling point, loss on ignition, HW.

lost circulation. A condition that occurs when the mud pressure escapes into crevices or porous sidewalls of a borehole and does not return to the collar of the drill hole. Also called lose returns; lose water; lost returns; lost water. Long.

lost-circulation material. Pulverized or shredded material added to the circulation media or drilling mud to plug cracks or crevices through which the circulation fluid is escaping from a drill hole. Materials sometimes used in combating lost circulation include shredded cellulose, bark, cottonseed hulls, manure, and cement.

lost closure. The amount of closure of the walls of a stope which occurs before supports have been put in place and begins to oppose that closure, is known as the lost closure. Spalding.

lost core. The portion of a core that is not recovered. It may be the soft rock that crumbles and falls from the core barrel or the solid piece or pieces of core that drop to the bottom of the hole. Fay.

lost corner. A borehole that cannot be determined, beyond reasonable doubt, either from traces of the monument, or by reliable testimony relating to it; and whose location can be ascertained only by surveying methods and with reference to independent existing corners, by mutual agreement of abutters, or by court decision. Selys, 2.

lost head. The energy of a given flow that is not recoverable (in the usual sense, useless), as a result of friction, eddies, and impact expressed as a head, that is, as the height to which the flow would have to fall to produce an equivalent amount of energy. Selys, 1.

low-density explosives. Explosives designed for use in mining the coal of soft and medium hardness, where it is required to be extracted to the least possible depth. The density of ordinary permitted explosives may be decreased, by (1) loose powder, (2) an admixture of a state of the ammonia nitrate, and (3) the impregnation of woodmeal or suitable substitutes. By decreasing the density of an explosive the same weight of explosive is used, but owing to its greater bulk the ex-
low-density explosives

low-dense metals. The lightest alloy-forming metals, in ascending order of their densities, are lithium, calcium, magnesium, beryllium, and aluminum. See also high-density metals. Hender.

low-discharge bail mill. One with a substantially down slope between the trunion-high feed end and the peripheral discharge end. This facilitates the brisk movement of ore through the mill. Pryor, 3.

low doors. Scot. The lowest of two or more landings in a shaft. Fay.

low fire. A fire refractory having a pyrometric cone equivalent not lower than 19 and a minimum modulus of rupture of 600 pounds per square inch. A.R.I.

low. Scotch. A light. A piece of l owe is part of a candle. See also low, b. Fay.

low. By a slight bend of either a terrace or a monocline, also known as the foot or the lower change of dip. Stokls and Barnes, 1953.

Lower Carboniferous. See Avonian. A.G.I.

lower high water. The lower of the two high waters of any tidal day. Abbreviation, low, Hy.

lowering conveyor. Any type of vertical conveyor in which the load is conveyed at a controlled speed. See also arm conveyor; suspended tray conveyor; vertical reciprocating conveyor. ASA MH4.1-1958.

lower iron. A tool used in lieu of a safety clamp to grasp and hold rods during round and/or drilling operations carried on a system of pumps. Fay.

lowering skips. Used in some river tipples to let the coal down into the barges. Also known as weigh pans. Mitchell, pp. 800-801.

lowering tongues. Synonym for brown tongues. Long.

lower leaf. Scot. The lower portion of a seam of coal that is worked in two sections or leaves. Fay.

lower limit of flammability. The smallest quantity of combustible gas which, when mixed with a given quantity of air (or oxygen), will just support a self-propagating flame. Francis, 1965, p. 2, 437.

lower maker. In polarizing microscope, the moisture content at which soil changes from plastic to liquid. Pryor, 3.

lower mild steel. A grade of the two lowest waters of any tidal day or the whole low water when a semidiurnal tide becomes diurnal. Abbreviation, lww, Hy.

lower pole. In polarizing microscope, lower polarizing member. It is usually located in place (crossed with respect to the upper member) by a small click when turned to its correct position. Pryor, 3.

lower official. See underofficial. Nelson.

lower point. N. Of Eng. A piece of rope used lower pickup. The lowest point reached by the traveling block during a hoisting operation. Long.

lower plastic limit. Moisture content of soil at which it changes from a plastic to a semisolid state. Pryor, 3.

lower pump. In powder metallurgy, the lower part or plate at the bottom of the die cavity and which may or may not move in relation to the die body. ASM Gloss.

lower side. See dip side. Mason.

lower water datum. An approximation of mean low water which has been adopted as a standard for a limited area, although it may differ slightly from a later determination. Hy.

lowest low water. A plane of reference approximating the level of the lowest low water of any normal tide. Hy.

lowest low-water springs. A plane of reference approximating the level of the lowest low water during spring. Hy.

lowest tidal. A plane of reference lower than mean sea level by half the maximum range. This does not take into account wind or barometric pressure fluctuations. Hy.

low explosive. An explosive in which the change into the gaseous state is effected by burning and not by detonation as with high explosives. Blasting powder (black powder) contains the only low explosive in common use. It requires no detonator but is ignited by means of a safety fuse. Also called propellant. low. Fuse gear. S. low gear. Long.

low-freezing dynamics. Dynamites made by replacing part of the nitroglycerin of straight dynaphex with some ingredient to render the dynamite incapable of freezing under ordinary conditions of use. The freezing point is depressed by adding nitro substitution compounds, such as nitrated sugars, nitrotoluene, nitrated polymerized glycerin or ethylene glycol dinitrile. Lewis, p. 108.

low-frequency induction furnace. See electric furnaces for melting and refining metals. Dodd.

low. gear. 1. See slow gear. Long. b. Mining and/or drilling operations carried on at a leisurely pace and at less-than-normal output per man-shift. Long.

low groin. See duntless. Bryant.

low-grade. a. An arbitrary designation of dynamites of less strength than 40 per cent. It has no bearing on the quality of the materials, as they are of as great purity and high quality as the ingredients in a so-called high-grade explosive. Fay. b. Sometimes applied to poor- or low-quality drill diamonds. Long. c. Pertaining to ores that have a relatively low content of metal compared to other richer material from the same general area. Also designates coal high in impurities. Low-grade metamorphism refers to metamorphism at a relatively low temperature and/or pressure. Stokls and Barnes, 1953, d. Lean ore. Fay.

low-grade coal. Combustible material which has only limited uses owing to undesirable characteristics (e.g., ash content or size). B.S. 5352, 1962.

low-grade ore. Ore which is relatively poor in the metal for which it is mined.

low-pressure cement. A cement in which there is only limited generation of gas during setting, achieved by modifying the chemical composition of normal portland cement. A.G.I.

low-pressure components. See under pressure components. Nelson.

low-pressure mechanism. A detonating device in which the reaction of the explosive material is controlled by a separate mechanism, usually of air or water, to stop the reaction of the explosive material at a desired point. See also pressure mechanism. Nelson.

low-pressure stowing. The filling of the waste by means of an inby compressed-air blower. The lower is usually located close to a machine which is operated at a pressure below 15 pounds per square inch. For light duties, only one blower is required to operate one stowing machine. For heavier-duty or long-lengths of pipeline, two blowers are used in series. The maximum horsepower for two blowers is limited to about 175 net. For stowage at large installations. See also pneumatic stowing. Nelson.

low-pressure limits. The lowest pressure at
low-pressure limit

which flame propagation can be obtained through a combustible-oxygen system at a lower temperature in a particular chamber. I.C. 8137, 1963, p. 76.

low quartz. Low-temperature quartz; when formed below 500° C, SiO₂ tetrahedra are less symmetrically arranged than at higher temperatures; inversion is reversible. A.G.I. Supp.

low-rank coals. See rank, B.S.1.

low-rank metamorphism. Metamorphism accomplished under conditions of low to moderate temperature and pressure. See also metamorphic grade. A.G.I. Supp.

low side. That portion of a mechanical conductor that has ceased for the clay comb, wise, loose, b. Fay.

low shaft furnace. A short shaft-type blast furnace used to produce pig iron and ferro-alloys. The steel core, using almost the whole of the fuel. The air blast is often enriched with oxygen. It is also used for making a variety of other metallic products such as alumina, cement-making slags, and ammonia synthesis gas. ASM News.

low side. That portion of a mechanical refrigeration system under relatively low pressure, extending from the expansion valve through the evaporator to but not including the condenser. Strick, 10.

low-soda alunina. Aluminum oxide (Al₂O₃) with less than 0.15 percent sodium oxide (Na₂O) in content. Used in high-grade electric insulators and in other ceramic bodies. CCD 6D, 1961.

low-temperature glass. The British Pottery (Health and Welfare) Special Regulations, 1947 and 1950, define this as a glass which does not yield to dilute HCl more than 3 percent by weight of a soluble lead compound, calculated as PbO, when determined by the lead solubility test. Bidwell lead solubility test. Dood.

low steel. Steel weak in carbon, containing from 0.3 to 0.5 percent (carbon) and therefore comparatively tough and soft; usually not susceptible of hardening or tempering. Standard, 1964.

low, structural. An area in which the beds are not more than 50 feet in thickness and the streets and sidewalks between the local highs along the crest of anticlines. A.G.I.

low-temperature carbonization. Carbonization carried out at a low-temperature (between 500° and 700° C). During the process, the smoke producing compounds are driven off as tars and oils and collected as valuable byproducts, leaving a coke with about 10 percent volatile matter. The coke yield is about 14 hundredweight per ton and oil and tar is 19 percent of the fuel. Nelson. See also carbonization of coal. low-temperature coke. A solid fuel produced by the low-temperature carbonisation of coal. Nelson.

low-temperature incineration method. In this method for the determination of incombustible matter, the material to be tested (dust containing ash) is incinerated at a temperature of not less than 500° C and not more than 530° C until it is constant in weight. This temperature is sufficient to complete the combustion of the organic matter in the dust, but is not high enough to decompose the carbonates. However, this method is unsuitable for dust containing magnesia carbonate because this substance decomposes below 500° C and therefore a low result for the incombustible matter would be obtained. The moisture content of the sample may be calculated and that an allowance can be made for the weight loss attributed to moisture. Coop, p. 316.

low-tenso detergent. A detergent requiring a minimum current of 1 ampere for firing and having a resistance of about 1 ohm. B.S. 3618, 1964, sec. 6.

low-terrace drift. Aust. Gravel and Sand. 1947 and 1950, define this as a glaze which contains not more than 5 percent of its dry weight of lead compound, calculated as PbO, when determined by the lead solubility test. Dodd.

low-temperature drift. Australian Gravel and Sand. 1947 and 1950, define this as a glaze which contains not more than 5 percent of its dry weight of a lead compound, calculated as PbO, when determined by the lead solubility test. See also mold lubricant. Crispin.

low-temperature iron. Temperature of iron at which redness is observable in subdued daylight (525° to 700° C.). Bright red heat is in the range 700° to 1,000° C, and is followed by orange, at 1,000°; white, 1,300° and, blue-white at 1,500° C+. Pryor, 3.

low-temperature kerosine. A form of cut stone produced by the intersection of the low-water datum with the shore. Schieferdecker.

low-tide drift. Aust. Gravel and Sand. 1947 and 1950, define this as a glaze which contains not more than 5 percent of its dry weight of a lead compound, calculated as PbO, when determined by the lead solubility test. See also mold lubricant. Crispin.

low-tide level. See low-water line. Schieferdecker.

low-tide line. See low-water line. Schieferdecker.

low-velocity. See velocity.

low-volatile bituminous coal. A coal containing less than 0.15 percent sodium oxide (Na₂O) in content. Used in high-grade electric insulators and in other ceramic bodies. CCD 6D, 1961.

low-water datum. An approximation of mean low water which has been adopted as a standard datum for a limited area, although it may differ slightly from a later determination. Hy.

low-water level. Level; low-tide level. The plane of low water. Schieferdecker.

low-water level; low-tide level. The plane of low water. Schieferdecker.

low-water line; low-tide line. The line of intersection of the low-water datum with the shore. Schieferdecker.

low working voltage. Low working voltage in coal mines is one of the many special properties which must be given continual attention. Los. Hy.

low-working voltage. Low working voltage in coal mines is one of the many special properties which must be given continual attention. Los. Hy.

lubricance. A. Oil, grease, graphite, and in general, anything of the sort used to overcome friction and to permit a freer action of parts. Crispin. b. A solution which, when applied to glass fibers, facilitates their handling by reducing mutual abrasion. See also mold lubricant. Crispin.

lubricate. A. Oil, grease, graphite, and in general, anything of the sort used to overcome friction and to permit a freer action of parts. Crispin. b. A solution which, when applied to glass fibers, facilitates their handling by reducing mutual abrasion. See also mold lubricant. Crispin.

lubricating. A. Oil, grease, graphite, and in general, anything of the sort used to overcome friction and to permit a freer action of parts. Crispin. b. A solution which, when applied to glass fibers, facilitates their handling by reducing mutual abrasion. See also mold lubricant. Crispin.

lubricating gran. A solid to semifluid product, usually a mixture of emulsions of polyvinyl alcohol, polyvinyl chloride, kerosine-lard oil mixtures, graphite, talc, and other materials. This is used to facilitate pressing. Crispin.

lubricating oil. A solution, emulsion, or mixture of other materials, which is used to coat dies or molds to facilitate the forming of ceramic ware. Bureau of Mines Style Guide, p. 60.

lubricating oil. A solution, emulsion, or mixture of other materials, which is used to coat dies or molds to facilitate the forming of ceramic ware. Bureau of Mines Style Guide, p. 60.

lubrication. In powder metallurgy, mixing with or incorporating in a powder, some agent to facilitate pressing. Henderson.

lubricating grease. A solid to semifluid product of dispersion of a thickening agent in a liquid lubricant. Other ingredients important properties may be included. ASTM D398-37.

lubricating grease. A solid to semifluid product of dispersion of a thickening agent in a liquid lubricant. Other ingredients important properties may be included. ASTM D398-37.

lubrication. The act of applying lubricants to rotating shafts. There are two main types of lubricants, solid and liquid. Examples of the solid type are graphite, French chalk, mica, and wax. Liquid lubricants are by far the more important, and among these, oil
lubrication and greases the most common. Morris and Cooper, p. 167.

lubricity. See line oiler. Long.

lubricites. Used by Wadsworth to include all mineral lubricants or antifriction materials. Fay.

Ludlax. Trade name; a translucent, pure, polycrystalline alumina made by General Electric Company. The translucency results from the absence of micropores. Because the crystals are directly bonded to one another, without either matrix or pores between the crystal boundaries, the mechanical strength is very high; transverse strength, 50,000 pounds per square inch; having of elasticity 35/10 per square inch. Dodd.

Lucas sounder. See sounder. C.T.D.

Luc and Rozan process. A modification of the Patterson process whereby the molten lead is stirred by the injection of steam; used in desilverizing base bullion. Fay. Ludlowite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. Variscite from Lumin, Utah. Shipley.

Luckhart furnace. A continuously working shaft furnace for roasting quicksilver ores, having the fireplace in the shaft at the bottom, protected by a cast-iron roof. The fuel is wood. Fay.

Luckiesh-Moss visibility meter. This instrument has been used over a wide range of lighting applications. It consists of a pair of similar photographic gradient filters, which incorporate density as their reds are rotated together before the eyes. The filters therefore reduce the apparent brightness of the white of the face and at the same time lower the contrast between the object of view and its background. Roberts, II, p. 100.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.

ludite. A fine-grained diorite, composed essentially of plagioclase, hornblende, and in some varieties a little quartz. It differs from malachite only in its coarser grain. Holmes, 1926.
and therefore occurs at low temperatures, that is produced by physiological processes (as in the firefly), chemical action, friction, radiation, or electrical activity. a. (as the glow of gases in vacuum tubes when subjected to electric oscillations of high frequency or as the glow of certain bodies when subjected to cathode rays), by certain bodies while crystallizing, by suddenly and moderately heating certain bodies previously exposed to light or to cathode rays, or by exposure to light, or that occurs in radioactivity, Webster 3d. b. The light produced by luminiscence. Webster 3d.

Luminescent enamel. Enamels which glow in the dark after exposure to light. ACSB 3.

Luminosity. a. The quality of emitting or of giving out light; shining. Crispin. b. Subjective brightness sensation. Roberts, I, p. 27.

Luminous. Radiating or emitting light; bright; clear. Crispin.

Luminous flux. a. Customarily referred to as air surface transmissions given out from a lamp and the unit of luminous flux is given the name lumen. Roberts, II, p. 15. b. The rate of passage or flow of light. Sinclair, I, p. 199.

Luminous wall firing. Term sometimes used for kiln or furnace firing by surface combustion. See also surface combustion. Dodd.

Luminescente photometer. This type photometer makes more refined measurements possible, and its principle is used in a wide variety of instruments. There are two types, one employing an equality of brightness field and the other employing a contrast field. On the other hand, since the two surfaces of the cube are not in optical contact over the peripheral field, light which is totally reflected at the glass to the left-hand side and the annular ring is light from the right-hand side. The point of balance is then determined by equality of brightness on the two parts of the field, that is, when the spot is no longer defined against its background. Roberts, II, p. 24-26.

Lumatite. A well-known brand of quick-setting cement, for sealing rock cavities, plugging drill holes, etc. Cumming. Is made from quicklime, sand and limestone and is highly resistant to acids and heat. Hess.

Luminate cement. Trade name; a high-alumina cement. Universal Atlas Cement Division of U.S. Steel Corp. See also high-alumina cement. Dodd.

Lump. a. A heap of unmelted batch feeding on the furnace, or of a crucible; secondly, Dodd. b. The most defective saleable pottery ware remaining after the sorting and grading is completed. Compare Four B. Second, Dodd. c. Bituminous coal. Bituminous coal in the large lumps remaining after: a single screening that is often designated by the size of the mesh over which it passes and by which the minimum size is determined. Webster 3d. Also, the largest marketable size. Fay.

Lump Coal. Trademark for permissible dynamite (types C and GC) with very low velocity of detonation. Are used in coal mining where maximum production of large-size coal is desired. CCD 6d, 1961.

Lumper. a. In quarry industry, one who chips out dogholes (notches) in blocks of stone with a pick, or with a hammer and a steel point. D.O.T. 1. b. In stone work industry, a laborer who performs heavy laboring duties involved in transporting blocks and slabs of stone in the shop and yard of a stone working plant. Also called stonabaker. D.O.T. 1.

Lumping. A system of railway track renewal in which a crane is used to pick up a complete assembly of rails and sleepers, replacing it with another complete assembly. Ham.

Lump line. A physical shape of quicklime. A definite plane through a vertical plane, Hoyton.

Lump line, screened. Lump line after forking or screening to remove the finer portion. The portion removed is usually that which will pass a 1/8-inch sieve. ASTM C51-47.

Lumino. A workman in a glassworks whose job is to observe and control any lumps of floating batch in a glass-tank furnace. Dodd.

Lump picker. In anthracite coal mining, a laborer who picks out large lumps from run-of-mine coal as it is dumped at the breaker for crushing, sizing, and cleaning. D.O.T. 1.

Lunary day. The time for one rotation of the earth with respect to the moon or the interval between two successive upper transits of the moon's vertical meridian. The mean lunar day is approximately 24.84 solar hours or 1,035 times as great as the mean solar day. Also called tidal day. Hy.

Lurching allowance. An allowance calculated to allow for additional load imposed on the outer girders and stringers of a railway bridge owing to the sway of a locomotive and train. Ham.

Lurching coal seam. In areas of jumbled coal associated with tremor tracts, whole masses of coal material and shale have been set in motion and the material is found in the direction of travel of the shock. This lurching of the deposits is an indication of the nature of the disturbance. Nelson.

Lurgi gasifier. A process for the production of gas from coal. The coal is made to react with a controlled mixture of oxygen and superheated steam under very high pressure (about 23 atmospheres). The oxygen reacts with the carbon in the coal to form a mixture of carbon monoxide and carbon dioxide absorbing heat. At the same time the high pressure conditions produce a synthesis reaction between the hydrogen and carbon monoxide. Resulting in the formation of methane which increases the heating power of the gas produced. Nelson.
distributed throughout the periphery of the kiln so that roasting and reduction can be controlled in the various zones to the required temperature. Blast furnace gas for reduction passes into the center of the lower end of the kiln while the gas and air for heating pass in from the circumference of the drum, nearer to the center and upper end of the furnace. The ingoing ore is crushed to give a maximum size of 0.8 inch, while the outgoing concentrate is crushed to 0.15 inch after cooling.

Lorrman front. An arrangement of water-cooled castings through which iron and cinder are tapped from the blast furnace, thus avoiding the use of a forehearth. See also closed front. Fay.

lorry. a. York. A weighted tram to which an endless rope is attached, fixed at the inbye end of the plane, forming part of an appliance for taking up the slack rope. Fay. b. A movable platform on wheels, the top of which is level with the bank or surface. It is run over the mouth of a shaft to receive the bucket when it reaches the top. A.G.I. Supp.

lussatite. A crystalline form of chalcedonylike quartz having the elongation of the fibers perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

lute. a. A mixture of fire clay used to seal cracks between the crucible and cover or between the container and cover when heat is to be applied. A.SM. Gloss. b. To seal with clay or other plastic material. A.SM. Gloss. c. In brickmaking, a scaper having a cutting edge. Standard, 1964. d. To smooth the surface of a (drying) yard before placing new bricks upon it to dry. Standard, 1964.

luteclite. A fibrous chalcedonylike quartz having the elongation of the fibers perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

lutesite. A general name for all natural materials composed of muds; that is, clay-sized particles. A.G.I. Sapp. c. Lutestite. A fibrous variety of the tourmaline occurring in perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

lutection. See lutetium. A.G.I.

luster. See luteran. D.O.T.I.

luteran. Lamination of feldspars, that is, a layering or banding. Fay. c. Pure, free of impurities. Fay.

lustre. a. Metallic. The character of the light reflected by minerals; it constitutes one of the means for distinguishing them. There are several kinds of lustre: metallic, the luster of metals; adamantine, the luster of diamonds; vitreous, the luster of broken glass; resinous, the lustre of yellow amber; opalescent, as that of eolite; pearl-like lustre, and silky-like lustre. These lustres have different degrees of intensity, being either splendid, shining, glittering, or glimmering. When there is a total absence of luster, the mineral is characterized as being dull. Fay. b. In ceramic and glass, varnish, or enamel applied to porcelain in a thin layer, and giving it a smooth, glintening surface. Standard, 1964. c. An intrinsic deceptive surface appearance. ASTM C286-65. See also gloss.

luster ware. In ceramics, glazed ware painted with metallic pigments and fired a second time in a kiln so constructed that the gases come into contact with the surface, giving a prismatic effect. Standard, 1964.

luster mortitng. a. Applied by Pumpelly to cement the rhyolites which have a shimmerning luster because the shining cleavage faces of the augite crystals are mortitted by small inclinations. Fay. b. In some rocks, occurrence of extremities or gradations into polikilitic; roughly circular patches of pyroxene envelo (feldspar) laths to produce a luster mortitng. Bureau of Mines Staff. c. The largest crystals of calcite in sandstone may incorporate whole colonies of detrital grains and form a single crystal and plan what is known as luster mortitng. Barite and gypsum cements also develop this habit locally. Bureau of Mines Staff. 664

lusterous; lustre. A fine-grained texture and particularly, but not entirely, applicable to slits and clay's and their de-rivatives. A.G.I.

lutesite. A tephritic leucite nepheline containing over 50 percent mafic minerals. A.G.I.

lute. a. A mixture of fire clay used to seal cracks between the crucible and cover or between the container and cover when heat is to be applied. A.SM. Gloss. b. To seal with clay or other plastic material. A.SM. Gloss. c. In brickmaking, a scaper having a cutting edge. Standard, 1964. d. To smooth the surface of a (drying) yard before placing new bricks upon it to dry. Standard, 1964.

luteclite. A fibrous chalcedonylike quartz having the elongation of the fibers perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

lydite. a. A general name for all natural materials composed of muds; that is, clay-sized particles. A.G.I. Sapp. c. Lydite. A fibrous variety of the tourmaline occurring in perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

lydite. a. A mixture of fire clay used to seal cracks between the crucible and cover or between the container and cover when heat is to be applied. A.SM. Gloss. b. To seal with clay or other plastic material. A.SM. Gloss. c. In brickmaking, a scaper having a cutting edge. Standard, 1964. d. To smooth the surface of a (drying) yard before placing new bricks upon it to dry. Standard, 1964.

luteclite. A fibrous chalcedonylike quartz having the elongation of the fibers perpendicular to the c-axis (opposite of the usual orientation of chalcedony fibers) and showing optical anomalies that have led to their being considered distinct species.

luteclization. A luster produced by the use of metallic oxides, sulfides, or salt solutions on the surface of pottery or enameled ware. Standard, 1964.
Lynch machine

1917 and operated on the blow-and-blow principle. Press-and-blow Lynch machines are also widely used. Dodd.

Lynnea furnace. A zinc-distillation furnace for intaglions, not now identified with certainty, but supposed to be the modern hacinia. Pliny used the name for amber, 17 A.D. Fay.

Lynex. A zinc-refining furnace with a common condensation chamber. Fay.

Lynx eye labradorite. Labradorite with a green schiller. Shipley.

Lynx stone. An early synonym for Pliny's lyncurium. Fay.

Lyoabsorptive. Of, relating to, or having an affinity for the phase in which one group is dissolved, and a repulsion from the phase for another group or ion (Hardley's analogy). When the solvent is water these groups are hydrophilic or hydrophobic, and influence the attraction of surface films which they are adsorbed either toward the aqueous or the gaseous phase of a gas/liquid system. If aqueous, they are wetting agents and oriented with most of their hydrophilic groups turned toward the aqueous phase and most of the hydrophobic groups toward the solid phase. Opposite of lyophobic. Pryor, 3.

See also hydrophilic. c. b. Having the proper property. Pryor, 4.

Lyoephobic. Of, relating to, or having a lack of strong affinity between a dispersed phase and the liquid in which it is dispersed; such as colloidal metals in water are easily coagulated. Opposite of lyophobic. Webster 3d.

Lyosorptive. Adsorption of liquid to a solid surface. Fry, 3.

Lymphetamine. Structure containing a mass of soil, and so designed as to permit the measurement of water draining through the soil, A.G.I.

Lyster process. A flotation process that separates galena and zinc byblende at a low temperature, with eucalyptus oil or other frothing agent, and with agitation or aeration in a neutral or alkaline, but not acid, solution of the sulfates, chlorides, or nitrates of calcium, magnesium, sodium, potassium, or mixtures of these substances. Fry.

Lyser. Tradename for a lightweight aggregate for concrete made by sintering pulverized fuel ash. Dodd.

Lysergic acid. Trademark for a finely divided, pale yellow powder, ployelectrolyte designed especially for foundry sand. Ab. Abbreviation for mill; nautical mile. Zimmerman, pp. 67, 87. d. Abbreviation for the prefix milli-, which indicates that the basic unit that follows is multiplied by one-thousandth or by 10^-3. Zimmerman, p. 172. e. Abbreviation for the prefix micro-, which indicates that the basic unit that follows is multiplied by one-millionth or by 10^-6. The lowercase Greek letter μ (mu) is the preferred symbol for the prefix micro-, because it avoids confusion with the abbreviations for the same basic units prefixed by μ (mu), which multiplies the basic unit by one thousandth or by 10^-3 and which is also abbreviated μ. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-97; Webster 3d; Bureau of Mines Staff, 6d, 1961.

Lyophilic. a. Condition of solid-liquid mixture in which surface-active molecules which contain two or more groups have an affinity for the phase in which one group is dissolved, and a repulsion from the phase for another group or ion (Hardley's analogy). When the solvent is water these groups are hydrophilic or hydrophobic, and influence the attraction of surface films which they are adsorbed either toward the aqueous or the gaseous phase of a gas/liquid system. If aqueous, they are wetting agents and oriented with most of their hydrophilic groups turned toward the aqueous phase and most of the hydrophobic groups toward the solid phase. Opposite of lyophobic. Pryor, 3. See also hydrophilic. c. b. Having the proper property. Pryor, 4.

Lyophobic. Of, relating to, or having a lack of strong affinity between a dispersed phase and the liquid in which it is dispersed; such as colloidal metals in water are easily coagulated. Opposite of lyophobic. Webster 3d.

Lyoosorption. Adsorption of liquid to a solid surface. Fry, 3.

Lymphetamine. Structure containing a mass of soil, and so designed as to permit the measurement of water draining through the soil, A.G.I.

Lyster process. A flotation process that separates galena and zinc byblende at a low temperature, with eucalyptus oil or other frothing agent, and with agitation or aeration in a neutral or alkaline, but not acid, solution of the sulfates, chlorides, or nitrates of calcium, magnesium, sodium, potassium, or mixtures of these substances. Fry.

Lyser. Tradename for a lightweight aggregate for concrete made by sintering pulverized fuel ash. Dodd.

Lysergic acid. Trademark for a finely divided, pale yellow powder, ployelectrolyte designed especially for foundry sand. Ab. Abbreviation for mill; nautical mile. Zimmerman, pp. 67, 87. d. Abbreviation for the prefix milli-, which indicates that the basic unit that follows is multiplied by one-thousandth or by 10^-3. Zimmerman, p. 172. e. Abbreviation for the prefix micro-, which indicates that the basic unit that follows is multiplied by one-millionth or by 10^-6. The lowercase Greek letter μ (mu) is the preferred symbol for the prefix micro-, because it avoids confusion with the abbreviations for the same basic units prefixed by μ (mu), which multiplies the basic unit by one thousandth or by 10^-3 and which is also abbreviated μ. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-97; Webster 3d; Bureau of Mines Staff, 6d, 1961.

Lyophilic. a. Condition of solid-liquid mixture in which surface-active molecules which contain two or more groups have an affinity for the phase in which one group is dissolved, and a repulsion from the phase for another group or ion (Hardley's analogy). When the solvent is water these groups are hydrophilic or hydrophobic, and influence the attraction of surface films which they are adsorbed either toward the aqueous or the gaseous phase of a gas/liquid system. If aqueous, they are wetting agents and oriented with most of their hydrophilic groups turned toward the aqueous phase and most of the hydrophobic groups toward the solid phase. Lyophobic. Of, relating to, or having a lack of strong affinity between a dispersed phase and the liquid in which it is dispersed; such as colloidal metals in water are easily coagulated. Opposite of lyophobic. Webster 3d.

Lyoosorption. Adsorption of liquid to a solid surface. Fry, 3.

Lymphetamine. Structure containing a mass of soil, and so designed as to permit the measurement of water draining through the soil, A.G.I.
machineman

macouine. a. An olive-bearing trachyte. A.G.I. b. An amphibitic basalt rock containing minute feldspars, noesan, olivine, perovskite, and chromite, with olivine (serpentine or chlorite) in a green vitreous or chloritic base. Holmes, 1926.

maeral. Applied to all petrologic units seen in microscopic sections of coal, as distinct from the visible units seen in the hand specimen. Comparable in rank to mineral as used in petrography. Thus, macerals are organic units composing the coal mass, being the individual elemental particles of the inorganic units composing rock masses and universally called minerals. Individual macerals have the termination -inite, that is, vinitrite, as the organic unit making up the lithologic specimen, vitroin. Three groups are recognized, (1) vitrinites, (2) exinites, and (3) inertinites. A.G.I. A.G.I. Supp.

maere. a. Thames. b. Often and wear away especially as a result of being wetted or steamed. Webster 3d.

macf. A flat triangular diamond crystal which is a twin crystal. Hess.

macgal. A relatively flat cored volcanic explosion crater at a vent that is either conical or has an inconspicuous cone. Fras.

mass borehole compass. A borehole surveying instrument. A glass tube, containing a compass floating in molten gelatin in the lower part, is lowered in the borehole. The instrument is allowed to remain until the gelatin solidifies and the acid has etched a line on the glass. On removal, the tube may be placed in a goniometer from which the angles of vertical and horizontal deflection may be determined. See also syphonic inclinometer.

mass survey. A borehole surveying technique employing a Mass compass. Long.

mass survey instrument. See Mass borehole compass.

macadam. Crushed stone of regular sizes below 3 inches for road construction. The smaller sizes below 1 inch are more specifically defined as chippings. See also penetration macadam, tar macadam. Nelson.

MacAdam system. A method of color notation in which nonphotopic regions of equal perceptual differences are inscribed in the Commission Internationale de l'Éclairage (CIE) space. See also CIE System. Dodd.

MacArthur and Forest Cynamide process. A process for recovering gold by leaching the pulped gold ore with a solution of 0.2 to 0.8 percent of potassium cyanide, K4CN, and then with water. The gold is obtained from this solution by precipitating it on zinc or aluminum, or by extractive methods. Nichols.

Macbeth Illuminometer. This contains a comparison surface of optical glass which is graduated by a lamp carried at the end of an extendible arm, so that its distance from the comparison surface can be determined. This is done by a rack and pinion device and provides the means of controlling the illumination on, and therefore the brightness of, the comparison field. B. Ratcliff, 112.

macerate. a. To wear away especially as a result of being wetted or steamed. Webster 3d.
machineman

sets up and operates an electrically driven or compressed-air-driven coal-cutting ma-
chine which is used to cut out a channel along the bottom or side of the working face of coal so that it may be blasted down without shattering the mass. Also called coal cutter; coal-cutting machine operator; cutter; machine; cutter oppor-
tor; cutting machine operator; holer; undercutter. D.O.T. 1, Eng. One who weighs coal, etc., and keeps an account of the number of cars sent to the sur-

machine. In bituminous coal mining, a general term applied to workers who are capable of operating one or more coal mining machines used for drilling, loading, and winding. Fay. a. Includes machine operators. See D.O.T. 1.

machine. In anthracite and bituminous coal mining, a. Implies the use of power for the purpose of cutting out or breaking up the coal. Includes mining machines and equipment in the excavation or removal of coal from the ground. Kiser, M. A. b. Includes machines and equipment in the extraction of coal or ore. In coal mines, the term almost invariably refers to the extraction of coal or ore. In non-coal mines, the term refers to the excavation of minerals, etc. Thomas, W. H. Also called machine operator; machine runner; mining machine operator. D.O.T. 1.

machine. Mines in which coal is cut by machines. Freeman, R. A. Also called cut coal mines.

machine. a. The amount of power a machine can deliver without overheating. Freeman, R. A. b. The number of horses a machine can perform under the observation and direction of a general foreman. Bureau of Mines Staff.

machinery steel. An open-hearth steel with 0.15 percent to 0.25 percent carbon content. The term is used to cut out coal and stone and to scrape fine coal and chippings from groove (channel) as it is cut along the bottom of the coal working face, using a shovel or some special scraping tool. Also called sheave; bent; eyelet. MacMichael, I. C. 1964; Fleischer, I. C. 1964; MacMichael, I. C. 1964; Fleischer, I. C. 1964.

machine. A variety of head shapes. It may be used or not used along with the machine scraper. A general term applied to workers who are capable of operating one or more coal mining machines used for drilling, loading, and winding. Usually designated as driller, machine; loader, machine I; loader, machine II; machine loader. Also called machine man. D.O.T. 1.

machine. a. Twinned crystal of diamond, usually composed of two flat crystals. Occupies the position of three flat crystals are found. Useful for certain industrial applications, such as wire-reinforcing dies and ornamental and gem. Also spelled mac- be, twin. MacMichael, I. C. 1964. c. Extremely large. A.G. 1. d. As a prefix meaning large, long; visit. e. As a prefix meaning large, long; visit.

macropyramid. In crystallography, the larger lateral axis in the orthorhombic and tricula-

macer. Applied to the texture of holocrystalline igneous rocks in which the constituents are distinguishable with the naked eye. Opposite of microcrystal-
line. A.G. I. b. In neocrystallized sedimentary rocks, the texture of a rock with grains or clasts over 0.75 millimeter in diameter. A.G. I.

macroura. A prefix meaning large, long; visit.

macun. A suffix meaning large, long; visit.

macuroxy. The b axis (long) in orthorhombic and triclinic crystals. Fay.

macrocrystalline coal. A well-laminated coal with a high proportion of vitrinite bands and fragments together with some resins, spheroid, cuticles, and a little fusinite. Compare microcrystal-

macrolaminated. Applied to the texture of holocrystalline igneous rocks in which the constituents are distinguishable with the naked eye. Opposite of microcrystal-
line. A.G. I. b. In neocrystallized sedimentary rocks, the texture of a rock with grains or clasts over 0.75 millimeter in diameter. A.G. I.

macrotrend. In crystallography, the larger lateral axis in the orthorhombic and tri-

macrotetch. Etching of a metal surface for accentuation of gross structural details and for the detection of defects by the unaided eye or at magnifications not exceeding 10 diameters. ASM Gloss.

macrofragmental coal. Coal composed of visible fragments or lenticles of various constituents, such as vitrain, durain, and fusain. Tomkoff, M.

macrograph. A graphic reproduction of the surface of a prepared specimen at a magnification not exceeding ten diameters. When photographed, the reproduction is known as a photomacrograph. ASM Gloss.

macrographite. Of or pertaining to a gran-
toid structure of rocks that is discernible to the naked dye; opposite of micro-

macromolecule. Very large molecule, noma-
tively one polymerized to a size visible without a low magnification. See 3.

macropyramid. A pyramid, the intercept of which on the macrodiagonal is larger than 1. Standard, 1964.

macrasp. In crystallography, a pina-
cord parallel to the vertical and macro-

macroscopic. Applied to a body of rock or a mineral deposit whose fabric of which consists of macroscopically different domains, that is, a coarse-grained (fabric. See also chon- droclastic, G.I.

macroporous. Poreosity visible without the aid of a microscope, such as pipes and caves in igneous rocks. Standard, 1964.

macrospim. A prism, the intercept of which on the macrodiagonal is larger than 1. Standard, 1964.

macropyramid. A pyramid, the intercept of which on the macrodiagonal is larger than 1. Standard, 1964.

macroura. A prefix meaning large, long; visit.
macropyramid

macropyramidal. A sample large enough to be measured on an analytical balance. ASTM STP No. 148-D.

macroconchis. A small residual stresses which vary from tension to compression in a distance (presumably many times the grain size) which is comparable to the gage length in ordinary strain measurements, hence, detectable by X-ray or dissection methods. ASM Gloss.

macrosedimentation. Gross differences in concentration of constituents in an alloy mass; for example, from one area of an ingot to another. See also segregation; coring. Handieron.

macrosedimentary. The area in which the earthwork is felt by the inhabitants. Schieferdecker.

macrosedimentary. A casting defect, detectable at magnifications exceeding 10 diameters, consisting of voids in the form of stringers shorter than shrinkage cracks. This results from contraction during solidification where there is not an adequate opportunity to supply filler material to compensate for the shrinkage. It is usually associated with abrupt changes in section size. ASM Gloss.

macrotension. The same as macroscopic stress. ASM Gloss.

macrotension. a. The general arrangement of pores in the matrix (for example, an ingot) as seen by the naked eye or at low magnification. The term is also applied to the general distribution of lge purities in a mass of metal as seen by the naked eye after certain methods of etching. C.T.D. b. The structure of metals as revealed by examination of the etched surface of a polished specimen at a magnification exceeding 10 diameters. ASM Gloss. c. A structural feature of a rock that is discernible to the unaided eye and with the help of a simple magnifier. Fay.

maculate. Applied to the group of contact-metamorphic rocks represented by spotted slates to denote their spotted or knotted character. May be applied either to the rocks or to their structure. See also spotted slate. Schieferdecker.

maculate. A rock in which the porphyroblasts of such minerals as andalusite, cordierite, chlorite, biotite, etc., are well developed, or in which spotting appears as the result of the incipient crystallization of these minerals and of the segregation of carbonaceous matter. Compare maculate structure. Synonym for spotted slate. Schieferdecker.

maculate. A structure typically developed in argillaceous rocks under contact or regional metamorphism. Compare maculate rock. Schieferdecker.

maculate structure. A structure typically developed in argillaceous rocks under contact or regional metamorphism. Compare maculate rock. Schieferdecker.

maculae. A rock from the Malagasy Republic of inferior quality to Ceylon alexandrite or Russian alexandrite. Shipley.

maculose. Amethyst from the Malagasy Republic, which is dark violet, has a slightly smoky tinge, and, if lighter in color, is usually violetish purple. Church.

maculose. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

maculose. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.

macular. A strongly dichroic variety of blue beryl obtained, as a gem stone material, from Malagasy Republic. Gal.
magma type may chemically represent only fraction of the bulk magma and may, therefore, differ considerably from the magma. Holmes, 1928.

magnatic basalt. In part synonymous with limburgite, but also applied to porphyritic, glassy basaltic rocks more closely related to ordinary basalt. Holmes, 1928.

magnatic. a. Or pertaining to, or derived from magma. Fay. b. Related to bodies of molten rock within the earth. Bateman.

magnatic assimilation. See assimilation.

magnatic blaster. The swell up by differential heating of magma; for example, by local concentrations of radioactive matter. Schieferdecker.

magnatic cycle. See igneous cycle. C.T.D.

magnatic deposit. One of certain kinds of mineral deposits that form integral parts of igneous rock masses and permit the inference that they originated in their present form by processes of differentiation and cooling in molten magmas.

magnatic differentiation. The process by which different types of igneous rocks are derived from a single parent magma, or by which different parts of a single molten mass assume different compositions and textures as it solidifies. Also called magnatic segregation.

magnatic discriminant ore deposit. Straight magmatic mineral (ore) deposit having discriminant crystallization, but without local concentrations of the valuable mineral. Schieferdecker.

magnatic formations. See emonations, magmatic. A.G.I.

magnatic injection deposit. Straight magmatic deposit of mineral (ore) deposit, the formation of which has often been ascribed to injection into the older country rock of liquid magma, and the crystallization of residual liquid segregations, or of immiscible-liquid separations and accumulations. Schieberdecker.

magnatic ore deposit. During the progress of differentiation certain metallic substances, and cementitious materials, may be collected into fractions concentrated in these substances, and consolidated either as part of the intrusion or as isolated bodies to form magmatic ore deposits. Stokes and Varne, 1955.

magnatic segregation. A process of ore formation dependent upon the concentration of valuable minerals in particular parts of a cooling magma. The ore body grades off gradually into the igneous rock and is usually marginal in position. Examples are the Sudbury nickel deposits, many magmatic deposits of Scandinavia, etc. Nelson. See also mineralization; syngenetic igneous intrusions.

magnatic segregation deposit. a. An ore deposit formed by preferential solidification of a magma. Fay. b. A magmatic mineral (ore) deposit which was formed by the accumulation of early crystallized immobiles, by the crystallization of residual liquid accumulations, or by the crystallization of immiscible-liquid segregations. Schieferdecker.

magnatic stoping. A process of igneous intrushen in which a magma gradually works its way upward by breaking off blocks of the country rock. As originally proposed, the hypothesis maintained that these blocks sank downward. In piecemeal stoping, the blocks are small, measured in feet or in hundreds of feet. In ring-fracture stoping, they are large, thousands of feet or miles across. A.G.I.

magnatic water. Water derived from igneous magma. See also juvenile water. Fay. b. Water that exists in, or which is derived from, molten magma or rock. A.G.I. c. Water which constitutes an important part of fluid magmas. As the magma comes to the surface the water may be released in part giving rise to hot springs. Lewis, p. 630.

magnatic who believes that much granitic magma crystallized from a mobile magma whatever the origin of that magma. See assimilation.

magnatic differentiation. The process by which different types of igneous rocks are derived from a single parent magma, or by which different parts of a single molten mass assume different compositions and textures as it solidifies. Also called magnatic segregation.

magnatic discriminant ore deposit. Straight magmatic mineral (ore) deposit having discriminant crystallization, but without local concentrations of the valuable mineral. Schieferdecker.

magnatic formations. See emonations, magmatic. A.G.I.

magnatic injection deposit. Straight magmatic deposit of mineral (ore) deposit, the formation of which has often been ascribed to injection into the older country rock of liquid magma, and the crystallization of residual liquid segregations, or of immiscible-liquid separations and accumulations. Schieberdecker.

A magmatic mineral (ore) deposit which was formed by the accumulation of early crystallized immobiles, by the crystallization of residual liquid accumulations, or by the crystallization of immiscible-liquid segregations. Schieberdecker.
magnesite, caustic calcined

fractures; minor uses are glass constitu-
magnesite. See magnesite. Common term for ground
magnesite. Bureau of Mines Staff.
magnesite-chrome brick. A refractory brick, which may be either bonded, manufactured substantially of a mixture of dead-burned magnesite (magnesia) and refractory chrome ore, in which the magnesite predominates by weight. HW.
magnesite grain. See grain magnesite. ACSG, 1963.
magnesite H-W. Trade name for an over 90 percent burned magnesite brick with minor added components to control prop-
certies. Resistant to molten metal and basic slags. Used in open-hearth furnaces, ele-
tric steel furnaces; copper and nickel con-
verters; refining industries, and other applications. M.M., 1964.
magnesite refractory. A refractory material, fired or chemically bonded, consisting ess-
entially of dead-burned magnesite; the MgO content usually exceeds 80 percent. Such refractories are used in the hearths and walls of basic steel furnaces, mixer furnaces, and cement kilns. Dodd.
magnesite wheel. A grinding wheel bonded with magnesium oxychloride. AEM Glass.
magnesia. A silvery-white metallic ele-
mence. See magnesium. Lea.
magnesite, caustic calcined. A mineral, MgSO₄.5H₂O, triclinic, the artificial analogue of chalcanthite. Synonym for allenite; penta-
magnesium chloride. Colorless or white; MgCl₂; hexagonal; deliquescent; specific gravity, 2.32; melting point, 708° C; boiling point, 1,142° C; and soluble in water and in alcohol. Used for the electro-
lytic production of magnesium metal, in manufacturing magnesium-oxychloride ce-
ment, in ceramics, in cooling drilling tools in drilling metal, in electrolytic deposits, in dust-laying compounds, as a floculating agent, and as a catalyst. C.C.D. 6d, 1961; Hand-
magnesium chloride hexahydrate; bichlorid. Colorless or white; MgCl₂.6H₂O; mono-
clinic; deliquescent; specific gravity, 1.35; no melting point because it loses 2H₂O at 116° to 118° C; and soluble in water and in alcohol. Used for the electrolytic production of magnesium metal, in manufacturing magnesium-oxychloride ce-
ment, in ceramics, in cooling drilling tools in drilling metal, in electrolytic deposits, in dust-laying compounds, as a floculating agent, and as a catalyst. C.C.D. 6d, 1961; Hand-
magnesium chloride hexahydrate; magnesium hydroxide. White; Mg(OH)₂; tetragonal; 4.3 mg. Specific gravity, 3.6; no melting point because it de-
composes to the hexahydrate; and soluble in water and in alcohol. Used for the electro-
lytic production of magnesium metal, in manufacturing magnesium-oxychloride ce-
ment, in ceramics, in cooling drilling tools in drilling metal, in electrolytic deposits, in dust-laying compounds, as a floculating agent, and as a catalyst. C.C.D. 6d, 1961; Hand-
magnesium chloride hexahydrate; magnesium hydroxide. White, effloresces; MgSiF₆.H₂O; hexagonal trigor-
mal; molecular weight, 274.48; specific gravity, 2.44; colorless at 212° C; soluble in water and in alcohol. Used in ceramics and in concrete harden-
ers. C.C.D. 6d, 1961; Handbook of Chem-
magnesium fluoride; sellaite. Colorless or white; MgF₂; tetragonal; Mohs hardness, 3.0; no melting point because it loses 2H₂O at 116° to 118° C; and soluble in water and in alcohol. Used for the electrolytic production of magnesium metal, in manufacturing magnesium-oxychloride cement, in ceramics, in cooling drilling tools in drilling metal, in electrolytic deposits, in dust-laying compounds, as a floculating agent, and as a catalyst. C.C.D. 6d, 1961; Hand-
magnesium fluorosilicate hexahydrate; magnesium silicofluoride hydrate. White, effloresces; MgF₂.SiO₃.6H₂O; hexagonal trigor-
mal; molecular weight, 267.3; specific gravity, 2.29; colorless at 212° C; soluble in water and in alcohol. Used in ceramics and in concrete harden-
ers. C.C.D. 6d, 1961; Handbook of Chem-
magnesium fluoride; magnesium hydroxide. White; MgF₂; molecular weight, 94.03; specific gravity, 3.18; and sol-
uble in water and alcohol. Used as a flocculating agent, in inorganic paint, as a carrier.
C.C.D. 6d, 1961; Handbook of Chem-
magnesium hydroxide. White; Mg(OH)₂; molecu-
lar weight, 58.34; tetragonal; and it de-
composes with the evolution of hydrogen on contact with water. Decomposes at 180° C in a vacuum and is insoluble in ether. Bennett 2d, 1962 Add.; Handbook of Chem-
magnesium hydroxide. White; Mg(OH)₂; molecu-
lar weight, 58.34; tetragonal; and it de-
composes with the evolution of hydrogen on contact with water. Decomposes at 180° C in a vacuum and is insoluble in ether. Bennett 2d, 1962 Add.; Handbook of Chem-
magnesium hydroxide. White; Mg(OH)₂; molecu-
lar weight, 58.34; tetragonal; and it de-
composes with the evolution of hydrogen on contact with water. Decomposes at 180° C in a vacuum and is insoluble in ether. Bennett 2d, 1962 Add.; Handbook of Chem-
magnesium hydroxide. White; Mg(OH)₂; molecu-
lar weight, 58.34; tetragonal; and it de-
composes with the evolution of hydrogen on contact with water. Decomposes at 180° C in a vacuum and is insoluble in ether. Bennett 2d, 1962 Add.; Handbook of Chem-
magnesium hydroxide; magnesia. See magnesium. Lea.
magnesium hydroxide; magnesium oxide. A mixture of magnesium chloride and magnesium oxide that reac-
ches with water to form a solid mass, presumed to be magnesium oxychloride. Fills such as wood flour, sawdust, sand, powdered stone, tals, coke, and powdered charcoal, are usually present. A variety of proprietary mixtures are available. C.C.D. 6d, 1961. Used as building stone, marble, stone floor. Synonym for xlylo-
magnesium hydroxide; magnesium oxide. A mixture of magnesium chloride and magnesium oxide that reac-
ches with water to form a solid mass, presumed to be magnesium oxychloride. Fills such as wood flour, sawdust, sand, powdered stone, tals, coke, and powdered charcoal, are usually present. A variety of proprietary mixtures are available. C.C.D. 6d, 1961. Used as building stone, marble, stone floor. Synonym for xlylo-
magnesium stannate trihydrate

as an additive in ceramic capacitors. **CCD** 6d, 1961.

magnesium stannate, MgSn, molecular weight, 163.55; bluish-white metal melting point, 778° C; and soluble in cold water and in dilute hydrochloric acid. Used as a binder in the powder coating for a number of magnets. A magnet consists of a body that produces a magnetic field external to itself. An electromagnet is a magnet that is produced by an electrical current. Permanent magnets are magnets that have a magnetic field that is produced by an electrical current. The magnetic field of which has a substantial portion of its magnetism. See also magnetic. **Hen.**

magnetic Of or pertaining to magnetic phenomena, objects, or locales possessing the properties of a magnet. **Long.**

magnetic alloys. Alnico is an alloy of aluminum, nickel, and cobalt, with strong magnetic properties similar in all directions. Alnicos is anisotropic, with magnetic flux preferred axis. **Hvy.**

magnetically hard alloy. A ferromagnetic alloy capable of being magnetized permanently because of its ability to retain a residual magnetization and magnetic poles after removal of externally applied field; an alloy with high coercive force. The name is based on the fact that the quality of the early permanent magnets was related to their hardness. **Hyco.**

magnetically soft alloy. A ferromagnetic alloy that becomes magnetized readily upon application of a field and that returns to a practically nonmagnetic condition when the field is removed; an alloy with the property of being magnetically permeable, low coercive force and low magnetic hysteresis loss. **ASM Glus.**

magnetic moment. A nondestructive method of inspection to determine the existence of variations in magnetic flux concentration in ferromagnetic materials of constant cross section, such as might be caused by defects, discontinuities, and variations in hardness. The variations are usually established by a change in pattern on an oscilloscope screen. **ASM Glus.**

magnetic anomaly. Variation of the measurable magnetic pattern from a theoretical or empirically smooth field on the earth's surface. **ASM Glus.**

magnetic bearing. Azimuth angle of line from horizontal. Pryor, 3.

magnetic bottle. A magnetic field used to confine a plasma in controlled fusion experiments. **ASM Glus.**

magnetic ceramics. Ceramic products which have unique electrical properties particularly useful in high frequency microwave electronic applications. **Bureau of Mines Staff.**

magnetic circuit. The closed path taken by the magnetic flux in an electric machine or other piece of apparatus. **C.T.D.**

magnetic currents. On which connection between drive and driven member is provided by electromagnetic force. Pryor, 3.

magnetic deflector. An electrical device for deflecting a beam of charged particles. Pryor, 3.

magnetic dipoles. Aggregation of ferromagnetic atoms into a group, usually a chain of a micron in size, which lines among similar groups with random group orientation. This cancels out any magnetic moment until or unless they are all oriented by an applied magnetic field. **Pryor, 3.**

magnetic drift. Rotating cylinder with magnetic surface, used as a memory store. **Magnetic tape is also used. Pryor, 3, p. 31.**

magnetic field. Pheneomene characterized by certain metals, particularly nickel and its alloys, which change in length when magnetized or, if certain materials are then mechanically distorted, undergo a corresponding change in magnetic properties. **Hyco.**

magnetic flux. These are declination, dip, and magnetic intensity in the horizontal plane. **Pryor, 3.**

magnetic strength. The line on the surface of the earth where the magnetic needle remains horizontal, or does not dip; that is, where the magnetic field is horizontal. Also called the climatic line. **A.G.I.**

magnetic field strength. H. The force exerted on a unit pole at any point is the field strength at that point. **A.G.I.**

magnetics. Phenomenon which results from residual magnetism of ferromagnetic materials which have been assembled together under the influence of their individual polar forces. Pryor, 3.

magnetc flux. Induced strength or flux density in a magnetic field, measured in maxwells: B = 4πm

where B is the flux density, in the strength of the magnetic field, in the horizontal or vertical direction, in a cross-sectional area of a cylinder through which the flux flows, and H is the magnetic in-
magnetic flux
tensity in oersteds. See also magnetic inten-
sity. Pryor, 3.
magnetic force. The mechanical force ex-
certed by a magnetic field upon a magnetic
pole placed in it. Webster 3d. b. Magnetic
force. Webster 3d. c. Magnetic intensity.
Webster 3d.
magnetic gradiometer. An instrument, de-
designed but not applied, for measuring the
gradient of the magnetic intensity. A.G.I.
magnetic guard. A double mask of magne-
tic gauze, placed on the flying dust of iron
magnetic level coil. A device for measuring
the magnetic field as it existed at the time
magnetic ore. See magnetic Nelson.
magnetic iron oxide. See black iron oxide
Benett 2d, 1962.
magnetic level rock. A device for measuring
the liquid level in sumps and other ves-
els. It consists of a loop of wire which is
encased in a fiber gauze, placed on the
sheath. The loop is inserted in a sump of
thicker containing a magnetic or ferromag-
etic material. The advantages of such a
device are that it is reusable and may be
placed at the point in question. Also called
magnetic force. Webster 3d.
magnetic lock. A locking device which does
its lifting by means of an electromagnet.
Gripin.
magnetic induction. 3. In a magnetic me-
dium the vector sum of the inducing field
H and the corresponding intensity of magnetization I, according to the relation-
ship B=H+4-irI. A.G.I.
magnetic intensity. A vector quantity per-
taining to the condition at any point un-
der magnetic influence (as of an electromag-
etric current, or an electromagnetic wave) measured by the force exerted in a
vacuum upon a free unit north pole placed at the point in question. Also
called magnetic force. Webster 3d.
magnetic iron ores. See magnetic Nelson.
magnetic iron oxide. See black iron oxide
Benett 2d, 1962.
magnetic level coil. A device for measuring
the magnetic field as it existed at the time
magnetic permeability. Ratio of magnetic
induction to the inducing field of mag-
etic intensity. With magnetic intensity
lines of force per square centimeter in air, B/H is the magnetic
permeability. This is less than 1.0 in air,
but is magnetic in substances such as
ferromagnetic materials. The advantages of such a device are that it is reusable and may be
placed at the point in question. Also
called magnetic force. Webster 3d.
magnetic pole. A. Black, hard ore that is mag-
magnetic-particle inspection. A nondestruc-
tive method of inspection for determining the existence and extent of possible de-
fects in ferromagnetic materials. Finely
divided magnetic particles, suspended to the magnetized part, are attracted to and out-
lined by the pattern of any magnetic-leakage
fields created by discontinuities. ASM
magnetic separator. a. A machine for bring-
ing together magnetic minerals found in
nonmagnetic material. Minerals of weak
magnetism are now separated by using
b. A device used to separate magnetic
from less magnetic or nonmagnetic ma-
terials. The crushed material is conveyed
on a belt past a magnet. ASM Gloss.
c. For medium solids recovery. A device in
which the solids are caused to ad-
here, by magnetic means, to a conveying
belt or drum, while a current of water
removes nonmagnetic particles which con-
taminate the medium. B.S. 3522, 1962.
magnetic shaking. magnetite, S. Afr. Mag-
etic is a form of mechanical tool used to
separate magnetic materials from nonmagnetic
materials. Minerals of weak
magnetism are now separated by using
devices such as magnetic separators. The
use of a magnetic separator is that of heating iron
ore in the presence of air in order to
oxidize the iron content, present in what-
ever form, to the oxide. In a subsequent op-
eration it may be separated from the
other minerals through a magnetic com-
magnet roll feeder. One which utilizes
magnetized, power-operated rolls for sep-
ratation and delivering objects. A.S.A
magnetic. That branch of science which stud-
ies the laws of magnetic phenomena.
Obozor.
magnetic scale. A diagram of metal show-
ing their comparative magnetic qualities.
Fey.
magnetic separation. a. The separation of
magnetic and nonmagnetic materials, using a magnet. This is one of the
most important processes in the beneficia-
tion of ores in which the magnetic mineral is separated from nonmagnetic
material; for example, magnetite from
other minerals, roasted pyrite from sphal-
erite, etc.
b. A device used to separate magnetic
minerals from nonmagnetic or nonmag-
etic materials. Minerals of weak magnetism are now separated by using
magnetic separators. The crushed material is conveyed
on a belt past a magnet. ASM Gloss.
c. For medium solids recovery. A device in
which the solids are caused to ad-
here, by magnetic means, to a conveying
belt or drum, while a current of water
removes nonmagnetic particles which con-
taminate the medium. B.S. 3522, 1962.
magnetic separators. magnetite, S. Afr. Mag-
etic is a form of mechanical tool used to

taminate the medium. B.S. 3522, 1962.
magnetism

which they exert forces of attraction and repulsion according to fixed laws. Crispin. b. The science that is concerned with the conditions and laws of magnetic forces. Crispin.

magnetite; magnetic iron ore. Natural black orivinite. A dunite high in content of tuffiferous magnetite and containing shreds of biotite. Holmes, 1928.

magnetite. An igneous rock consisting essentially of magnetite and having an iron content of 65 to 70 percent or more. Apatite may accompany the magnetite. Johnathan, p. 4, 1938, p. 466.

magnetized. A body is said to be magnetized when it possesses a certain property whereby under certain circumstances it will naturally attract or repel a similar body, in accordance with magnetic laws; for example, drill rods become magnetized in use and will strongly attract other iron or steel objects. L. Long.

magnetizing coil. A winding which surrounds core of electromagnet. Pryor, S.

magnetometer. a. An instrument for measuring the magnetic intensity at a point. Theoretically, measured by the magnetic force produced in an evacuated tunnel along the direction of the magnetic flux; the magnetometer force replaces the force of attraction or repulsion by which the needle of a magnetometer is deflected. C.T.D. b. A force field, resulting from the flow of electric currents or from magnetized bodies, that produces magnetic induction. ASM Gloss.

magnetizing roast. A process in which an ore containing pyrite is heated and the magnetic iron oxide so formed is removed by a magnetic separator. In many cases the iron oxide is extracted as gangue.

magnetometer, a. An instrument for measuring magnetic intensity. In ground magnetic prospecting, an instrument for measuring the vertical magnetic intensity; in airborne magnetic prospecting, an instrument for measuring the total magnetic intensity. Also, an instrument used in magnetic observatories for measuring various components of the magnetic field of the earth. A.G.I. b. A sensitive instrument for detecting and measuring changes in the earth's magnetic field, used in prospecting to detect magnetic anomalies and magnetic gradients in rock formations. Pryor. See also nuclear resonance magnetometer: airborne magnetometer.

magnetostatic force. Flux strength flowing between magnetic poles in accordance with Lowland's law. Emmm.

Magnetic flux = reluctance

magnetophosphite. A black double oxide of ferrous phosphate and manganese and some titanium, etc., 2(Fe, Mn)O.3Fe2O3.

magnetoresistance. A form of transmission based on the principle that a magnetic field of force is produced whose strength is varied so as to transmit a torque of corresponding magnitude. With a system of this kind, control of any particular operation is effected through the agency of the magnetoresistance, thus varying at constant speed. Institution of Mining and Metallurgy, Symposium on Applications of Magnetism. London, 16-19 November 1964. Paper 13, p. 18.

magnetostriiction. The characteristic of a material that is manifest by strain when it is subjected to a magnetic field; or the inverse, S. Specimen must be expanded; pure nickel contracts. ASM Gloss.

magnetotelluric method. This electrical prospecting technique was first produced in 1950 and has been developed on an entirely new application of telluric currents in which the magnetic fields induced by the alternations in each core would be measured simultaneously with the voltage fluctuations between electrodes at the surface. The ratio between the amplitudes of these alternating voltages and then associated magnetic fields would then be plotted as a function of frequency. Dobrin, p. 355.

magnetron. A thermionic vacuum tube in which the movement of the electrons is controlled by a combination of crossed electric and magnetic fields. NCB.

magnet steel. A steel from which permanent magnetism can be obtained. It must have a high remanence and coercive force. C.T.D.

magnet thickness gauge. A non-destructive device for determining the thickness of a coating of vitreous enamel; it depends upon the principle that the force required to pull a permanent magnet off the surface of enamelled metal is inversely proportional to the thickness of the nonmagnetic enamel layer on the magnetic base metal. Dodd.

magnetizer; magnetizer. See dolomite brick.

magnifying power. Ratio of apparent size of optically magnified object to that seen by the naked eye. Pirsson, and Washington for a coarsely microphyric texture; a porphyritic texture. C.T.D.

magnetite. A number related to the total energy released by an earthquake. Combe.

magnoctochormite. Black scicular and tabular orthochromic crystals, (Mg, Fe, Mn)(Ni, Co)O2, the magnesium analogue of clumbite. From Kugi-Lyul, southwest Pa-

magnolia metal. A lead-base alloy containing tin, occasionally antimony, but small amounts of iron and tin are present. It is used for bearings. C.T.D.

magnus. Trade name of the Nevada Magne-

magnesite; used as construction material. Nelson.

magnesite brick. See dolomite brick. Hess.

Mahler bomb calorimeter. An instrument which is used for determining the heat of combustion in which the fuel is placed together with the oxygen required for its combustion. It is immersed in a weighted jar of water and the temperature rise after ignition makes it possible to compute the amount of heat in the fuel. Schaller.

Mahogany ore. Compress mixture of oxides of iron and copper. Schaller.

mahogany soap. Complex soap formed during the washing of coal and ores. Nelson.

main arch

main arch

magnesite; magnetic iron ore. Natural black ore. At black sand, magnetite occurs in placer deposits, and also as lenticular bands. Magnetite is used widely as a suspension pigment in dense-medium washing of coal and ores. Nelson.

magnetite olivinites. A dunite high in content of tuffiferous magnetite and consisting of magnetite (in part titaniferous), spinel, and smaller amounts of olivine, pyrrhotite, and pyrite. The ore contains about 14 percent titanite oxide. Fay.

main arch

main arch

magnetite (in part titaniferous), spinel, and smaller amounts of olivine, pyrrhotite, and pyrite. The ore contains about 14 percent titanite oxide. Fay.

magnetite (in part titaniferous), spinel, and smaller amounts of olivine, pyrrhotite, and pyrite. The ore contains about 14 percent titanite oxide. Fay.

magnetite. An igneous rock consisting essentially of magnetite and having an iron content of 65 to 70 percent or more. Apatite may accompany the magnetite. Johnathan, p. 4, 1938, p. 466.

magnetized. A body is said to be magnetized when it possesses a certain property whereby under certain circumstances it will naturally attract or repel a similar body, in accordance with magnetic laws; for example, drill rods become magnetized in use and will strongly attract other iron or steel objects. L. Long.

magnetizing coil. A winding which surrounds core of electromagnet. Pryor, S.

magnetometer. a. An instrument for measuring magnetic intensity. In ground magnetic prospecting, an instrument for measuring the total magnetic intensity; in airborne magnetic prospecting, an instrument used in magnetic observatories for measuring various components of the magnetic field of the earth. A.G.I. b. A sensitive instrument for detecting and measuring changes in the earth's magnetic field, used in prospecting to detect magnetic anomalies and magnetic gradients in rock formations. Pryor. See also nuclear resonance magnetometer: airborne magnetometer.

magnetostatic force. Flux strength flowing between magnetic poles in accordance with Lowland's law. Emmm.

Magnetic flux = reluctance

magnetophosphite. A black double oxide of ferrous phosphate and manganese and some titanium, etc., 2(Fe, Mn)O.3Fe2O3.

magnetoresistance. A form of transmission based on the principle that a magnetic field of force is produced whose strength is varied so as to transmit a torque of corresponding magnitude. With a system of this kind, control of any particular operation is effected through the agency of the magnetoresistance, thus varying at constant speed. Institution of Mining and Metallurgy, Symposium on Applications of Magnetism. London, 16-19 November 1964. Paper 13, p. 18.

magnetostriiction. The characteristic of a material that is manifest by strain when it is subjected to a magnetic field; or the inverse, S. Specimen must be expanded; pure nickel contracts. ASM Gloss.

magnetotelluric method. This electrical prospecting technique was first produced in 1950 and has been developed on an entirely new application of telluric currents in which the magnetic fields induced by the alternations in each core would be measured simultaneously with the voltage fluctuations between electrodes at the surface. The ratio between the amplitudes of these alternating voltages and then associated magnetic fields would then be plotted as a function of frequency. Dobrin, p. 355.

magnetron. A thermionic vacuum tube in which the movement of the electrons is controlled by a combination of crossed electric and magnetic fields. NCB.

magnet steel. A steel from which permanent magnetism can be obtained. It must have a high remanence and coercive force. C.T.D.

magnet thickness gauge. A non-destructive device for determining the thickness of a coating of vitreous enamel; it depends upon the principle that the force required to pull a permanent magnet off the surface of enamelled metal is inversely proportional to the thickness of the nonmagnetic enamel layer on the magnetic base metal. Dodd.

magnetizer; magnetizer. See dolomite brick.

magnifying power. Ratio of apparent size of optically magnified object to that seen by the naked eye. Pirsson, and Washington for a coarsely microphyric texture; a porphyritic texture. C.T.D.

magnetite. A number related to the total energy released by an earthquake. Combe.

magnetite (in part titaniferous), spinel, and smaller amounts of olivine, pyrrhotite, and pyrite. The ore contains about 14 percent titanite oxide. Fay.

magnetite. An igneous rock consisting essentially of magnetite and having an iron content of 65 to 70 percent or more. Apatite may accompany the magnetite. Johnathan, p. 4, 1938, p. 466.

magnetized. A body is said to be magnetized when it possesses a certain property whereby under certain circumstances it will naturally attract or repel a similar body, in accordance with magnetic laws; for example, drill rods become magnetized in use and will strongly attract other iron or steel objects. L. Long.

magnetizing coil. A winding which surrounds core of electromagnet. Pryor, S.

magnetometer. a. An instrument for measuring magnetic intensity. In ground magnetic prospecting, an instrument for measuring the total magnetic intensity; in airborne magnetic prospecting, an instrument used in magnetic observatories for measuring various components of the magnetic field of the earth. A.G.I. b. A sensitive instrument for detecting and measuring changes in the earth's magnetic field, used in prospecting to detect magnetic anomalies and magnetic gradients in rock formations. Pryor. See also nuclear resonance magnetometer: airborne magnetometer.

magnetostatic force. Flux strength flowing between magnetic poles in accordance with Lowland's law. Emmm.

Magnetic flux = reluctance

magnetophosphite. A black double oxide of ferrous phosphate and manganese and some titanium, etc., 2(Fe, Mn)O.3Fe2O3.

furnace roof, particularly used as a synonym of the crown of a glass tank furnace.

Main arch

Main board gate. York. The heading which is driven slightly to the rise from the shaft. Fay.

Main bottom. Hard rock below alluvial deposits. Fay.

Main break. In mine subsidence, the break that occurs over the seam at an angle from the vertical equal to half the dip. Lewis, p. 619.

Main broach. Eng. See gate. SMRE, Paper No. 61.

Main canal. The main conduit beginning at the source of water supply, from which the lateral system receives its supply. Syley, 1.

Main channel. A master cleat; bord cleat. In a canal, a cleavage plane at right angles to the bedding plane on which it was laid. The clearances and miners give it names according to their locality. Mason, v. 1, p. 8.

Main conveyors. Underground mine conveyors. ASA MH4-1.1938.

Main crossection. The crossection that traverses the entire mining field and penetrates all deposits. There must be a main crossection at each level and it is the main one for the level in question. It serves the same purpose as the shaft of the mine having the largest cross section, and be particularly well constructed, as repairs to its support would hold up the entire system of the entire level. Stove, v. 1, p. 223.

Main drain. A sewer or drainage channel leading off the floor of its point of discharge. See also outfall. Ham.

Main drive; main reef drive. A main tunnel driven in the rock underlying a lead and about 50 feet below the wash dirt. It is used as a drainage tunnel for carrying the water from the shafting holes to the shaft pump and also for the transport of cars from the raises. Engineering and Mining Journal, v. 139, No. 4, April 1938, p. 35.

Main endings. Pairs of narrow coal headings with crosscuts at intervals, driven to form large pillars of coal in panel working. Nelson.

Main entry. a. The principal entry or set of entries driven through the coalbed from which cross entries, room entries, or rooms are turned. U.S. BuMineral State Safety Code—Bituminous Coal and Lignite Mines, Pt. 1 Underground Mines, October 8, 1953. b. A term used in the United States for the principal horizontal gallery giving access to a coal seam and used for haulage, ventilation, etc. Where two entries are driven in parallel the term double entry is used. When three parallel entries, the term triple entry is used. See also entry. Nelson. c. An entry driven at right angles with the face slips of the coal. See also entry. Fay. d. A main haulage road. See also main road. Fay.

Main sampler. A drive-type, split-tube soil-sampling device, usually equipped with a flap or clack valve near the cutting shoe. Used in sizes having diameters ranging from 4 to 6½ inches long. Light.

Main-type sampler. A soil-sampling device that works essentially on the same principle as a Maine sampler. Long.

Main facets. a. The bezel and pavilion facets. Shipley. b. Any other facets extending from the girdle to the table or from the girdle to the culet. Fay.

Main fans. Main fans produce the general ventilating current of the mine, and are of large size. They are usually permanently installed. They are assisted by natural ventilation, if present, and, if necessary, by booster fans. They are driven in a certain duty and great attention is paid to their efficiency since this governs the cost of performing the duty. Roberts, 1, pp. 200, 224.

Main firing. The firing of a round of shots by means of current supplied by a transformer fed from a main power supply. B.S. 3618, 1964, sec. 6.

Main gate. The principal or central heading along which the coal is conveyed from two or more conveyors panels. Normal, the main gate also acts as an intake airway to the face. See also double unit; mother gate. Nelson.

Main headwall. That portion 20 to 30 feet above the roof body. Hess.

Main haulage conveyor. Generally 500 to 3,000 feet in length. It is used to transport material between the intermediate haulage conveyor and a loading point or the outside. NEMA MB1-1961.

Main haulage system. The principal transportation road. B.C.I.

Main hole. The first or primary borehole from which secondary or branch holes are drilled. Also called original hole; parent hole. Compare branch, c. Long.

Main intake. The trunk or principal intake airway of a mine. The main intake air current is usually split into two or more air currents before reaching the workings. Nelson.

Main levels; main roads. The first and leading excavations in mines which are made for the purpose of opening out or winning the coal, and which are intended to be the principal roadways of the mine. Pecl.

Main-line locomotive. A large, high-powered locomotive which hauls trains of cars over the main haulage track. D.O.T. 1.

Main-line motor car. In bituminous coal mining, one who operates a mine locomotive. Fay.

Main lining. In bituminous coal mining, one who has charge of and rides trips (trains) of cars hauled in and out of the mine along the main cable haulageway. D.O.T. 1.

Main roadway. A system of underground haulage in which the weight of the empty cars is sufficient to draw the rope inby. Fay.

Main section door. A wooden or steel door erected near the pit bottom to prevent the intake air leaking into the main return airway or outcast shaft; a door to direct the main intake air to the workings. It may be fitted with an appliance, or shutter, to ease the opening for traveling purposes. See also fan-drift doors. Nelson.

Mainline fume. Firing blasts from a mains supply. Mcdonald II, p. 78.

Main shaft. The line of shafting which receives its power directly from the engine or motor and transmits power to other parts. Crispin.

Main shafting. A system of underground mining in which the lamps are fed from the main electrical supply. It is used principally at the pit bottom, using filament lamps in either transparent or prismatic bulb fittings. After 1947, mains lighting became a compulsory requirement in British mines at the shaft bottom and in main intake workings. Nelson.

Main-slope engineer. In bituminous coal mining, one who operates the hoisting engine, usually of the Cornish type. Fay.

Main-slope engineer. In bituminous coal mining, one who operates the hoisting engine, usually of the Cornish type. Fay.

Main reef. See main drive. Engineer-
main suit. Brit. A heavy spring or feeder of water. Fay.

maintenance. Fr. The face of workings in inclined or vertical seams consisting of a series of steps each about 6 feet high, and forming the working place for one man.

maintenance. Proper care, repair, and keeping in good order. Crispin.

maintenance staff. The conveyer into which electricians, mechanics, and fitters kept at a mine for the maintenance and service of face machinery, haulages, locomotives, pumps, compressors, etc. It is reported that the maintenance staff at German coal mines forms about 10 percent of the total labor force, whereas in British coal mines, the number is between 4 and 3 percent. Nelson.

main tie. Tension member connecting the feet of a roof truss, usually at the level of beam on the wall plate or purlin. Ham.

main transport. The conveying or haulage of coal or mineral from the inby subsidiary transport to the shaft bottom or surface. For the main transport of coal, the tunnel or the conveyor belt is used. Motive haulage. A conveyer belt is capable of high-capacity continuous transportation. Nelson.

main way. A gangway or principal passage. Fay.

Majec mill. A mill for dry-grinding mica by means of fluid energy. It consists of a chamber containing two horizontal directly opposed jets. Mica is fed continuously from this mill and the conveying or haulage of coal or mineral is done through the conveyer belt. Crispin.

malachite. a. A pigment made of green, in making organic pigments, in in- dustrial and other applications. b. A term used in chemistry for an unnecessary length of time. ACM. 1.

malachite green. a. A pigment made of green malachite. Weller 3d. b. A tri- phenylmethane basic dye prepared from benzaldehyde and dimethylaniline and used commercially. Minerals are malleable when slices cut in a groundmass of the same minerals and in France. Fay.

malleable. Of a thread or screw. Crispin.

malcolm. A brown, vitreous variety of altered zircon in which the element hafnium was discovered in 1923. Found in Norway and France. Fay.

Malagui. Lava rock from Spanish mal pala. Hsei.

malkie. A fine-grained granular igneous rock, e.g., diorite, gabbro, composed of albite, hornblende, and biotite phenocrysts in a groundmass of the same minerals and some quartz. In most malchies, only one generation of femic minerals occurs and the rocks are classified as microdiorites, microgabbros, diorite, or gabbro aplites. If, however, two generations of femic minerals are present, the rock is classified as a melanocratic amphibolite. Fay.

Malacose. 2. Synonym for pin. Long.

malafera. A hand reverbatory furnace for roasting finely divided ore entirely without the aid of an external heat. Fay.

malachite. A group term for an igneous rock facies which includes granite, granodiorite, and gabbro. Fay.

malachite. A mafic nepheline syenite. Fifty percent of the rock is composed of aegirine-aegirine, and carbonatite is predominately nepheline and orthoclase in equal amounts. Accessory apatite, biotite, and hornblende are also present. Shorten, 1964.

maling. To feign illness; sham sickness in order to avoid duty; counterfeit disease. Fay.

malingger. a. A soldier or a sailor who feigns sickness to avoid doing his duty; hence, in general, one who shirks his duty by pretending illness or inability. Webster 2d. b. In industrial accident insurance, one who feigns disability or extends his period of disability, in order to collect accident insurance or compensation. Fay.

maling. Synonym for maling. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.

maling. Said of machinery when it is alleged that they are feigning sickness in order to avoid duty or to draw compensation for an unnecessary length of time. Fay.
shaped by beating with a hammer, as gold, silver, etc. Compare brittle; flexible; sectile. maillable castings. Iron castings made from malleable pig iron and heated in scale.

malachite. 3d. a Synonym for marl in its original sense of a calcareous clay. Dodd, b. Eng. A light clayey soil containing chalk; malt; also an artificial mixture of clay and sand used in the manufacture of bricks. Webster 3d. c. A light clayey soil containing chalk; malt; also an artificial mixture of clay and sand used in the manufacture of bricks. Webster 3d.

Malan Upper Jurass.c. A.G.I. Supp. A Scandinavian term for an ore field; an area in which there is a group of ore deposits. Hess.

managing. The preparation of an artificial malm by mixing chalk and clay reduced to a pulp, and allowing the mixture to consolidate by evaporation. Fay.

malic acid. A light clayey soil containing chalk; malt; also an artificial mixture of clay and sand used in the manufacture of bricks. Webster 3d.

Malan Upper Jurass.c. A.G.I. Supp. A Scandinavian term for an ore field; an area in which there is a group of ore deposits. Hess.

managing. The preparation of an artificial malm by mixing chalk and clay reduced to a pulp, and allowing the mixture to consolidate by evaporation. Fay.

managing, extraction of mineral. In anthracite coal mining, bituminous coal mining, metal mining, nonmetal mining, and the quarry industry, one who directs all operations in the extraction of minerals at such places as mines, quarries, gravel pits, and salt wells, either through subordinate foremen or supervisors, or by personally overseeing the individual phases of the work. Also called superintendent, extraction of mineral. D.O.T. 1.

manager's clerk. Generally, a young man who takes charge of a mine manager's clerical duties and office routine. Inter alia, he engages the dockage to devote more time to technical matters and underground inspections. Nelson.

managing, plan. A plan of the workings kept at the office of the mine in addition to the working plan, for everyday use by the manager. B.S. 3618, 1965, sec. 1.

manganese. A variety of andalusite, resembling chalciotite, showing a mottled cross of pure material separated by areas of impure material. From Finland. English.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.

maltisite. A variety of andalusite, resembling chalciotite, showing a mottled cross of pure material separated by areas of impure material. From Finland. English.

mantle. See sal marm.

manganese. A variety of andalusite, resembling chalciotite, showing a mottled cross of pure material separated by areas of impure material. From Finland. English.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.

mantle. See sal marm.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.

mantle. See sal marm.

manganese. A variety of andalusite, resembling chalciotite, showing a mottled cross of pure material separated by areas of impure material. From Finland. English.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.

malt. a. Various natural tars resulting from the oxidation and drying of petroleum. A.G.I. b. A black viscous substance intermediate between petroleum and asphalt. Also called malting. Webster 3d.
malleable

Manganese twin. A monoclinic twin crystal in which the basal pinacoid was the twin-plane plane. See manganite. Fay.

Manganite tile. A clay roofing tile of the alabandite type made in the Mangalore district of India. Dodd.

manganate. A variety of andalusite containing 6.9 percent MnO. It differs from ordinary andalusite in its green-gray color and strong pleochroism. From Vastana, Sweden. English.

manganite. A variety of beryllite in which magnesium is largely replaced by manganese, typically (Ca,Na)Mn(AlO2). Originally called pyrrhotenite. From Langban, Sweden. English.

manganocalcite. See alabandite. Fay.

manganocalcite. See manganite. English.

manganocalcite. See manganese oxide. Also rhodochrosite.

manganocalcite. See manganite. English.

manganocalcite. See rhodochrosite. Webster 3d.

manganocalcite. Name applied to the manganese nodule from the ocean floors containing 35 percent manganese but not less than 35 percent manganese. Praktiches. 1963, p. 554.

manganocalcite. A term sometimes applied to any steel containing more manganese than is usually present in carbon steel (that is, 0.3 percent manganese). From Varutrask, near Boliden, Sweden. English.

manganocalcite. Also rhodochrosite. Webster 3d.

manganocalcite. Strongly colored yellowish, reddish, or brownish deposits of manganese oxides. Skow.

Manganese steel. A term sometimes applied to any steel containing more manganese than is usually present in carbon steel (that is, 0.3 percent manganese). From Varutrask, near Boliden, Sweden. English.

manganocalcite. A term used by the Bureau of Mines for ores containing 35 percent manganese but not less than 35 percent manganese. Manganese Bull. 630, 1965, p. 553.

manganocalcite. A term used by the Bureau of Mines for any ore of importance for its manganese content containing less than 35 percent manganese but not less than 35 percent manganese. Manganese Bull. 630, 1965, p. 553.

manganocalcite. An alloy in which manganese and nickel are compounded in somewhat small proportions with copper, the ratio of manganese to nickel being as 3 or 4 to 1. This alloy is used almost exclusively in the construction of a standard of electrical resistance, the temperature coefficient of which is practically zero.

manganocalcite. Gray manganese ore. Steel-gray to iron-black mineral, MnO.O.H2O, red-brown to black, massive or in radiating aggregates. Contains 62.4 percent manganese; 27.5 percent oxygen; 10.3 percent water. Formed in the same deposits as pyrolusite which is frequently an alteration product of manganese dioxide. See manganese nodule. Manganese Bull. 630, 1965, p. 553.
Manganese. Variety of manganese sulfates tetrahydrate; manganese dioxide; manganese oxide; mangastones oxide; manganese sulfate. Variety of columbite-manganese oxide; manganosite. A variety of steenstrupine. An amorphous manganosite. Manganous oxide, MnO. In manganolke. Wadsworth's name for rocks composed of manganese minerals, such as wad, pelomelane, etc. Fay.

Manganese dioxide. A chamber or tube having a multiple inlet and several outlets. L&L, p. 526. Also called MM diamond. Th. B. 19-50.

Manganese nitrate. A high grade of asphalt used largely as a catalyst. Pryor, 3.

Manganese metal. A mill used in the Mannesmann process. ASM Glow.

Manganese process. Contact method of catalyzing SO2 to SO3 in two stages, using first iron oxide and second platinized asbestos as catalysts. Pryor, 3.

Manganese steel. A metal used in the Mannesmann process. ASM Glow.

Manganese steel. A process used for piercing tube billets in making seamless tubes. The billet is rotated between two heavy rolls mounted at an angle and forced over a fixed mandrel. ASM Glow.

Manganese. A carbonate of manganese and lime; a glass. CCD 61, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 206. Additionally, it can be used in the Mannesmann process. ASM Glow.

Manganese steel. A process used for piercing tube billets in making seamless tubes. The billet is rotated between two heavy rolls mounted at an angle and forced over a fixed mandrel. ASM Glow.

Manganese. A carbonate of manganese and lime; a glass. CCD 61, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 206. Additionally, it can be used in the Mannesmann process. ASM Glow.

Manganese steel. A process used for piercing tube billets in making seamless tubes. The billet is rotated between two heavy rolls mounted at an angle and forced over a fixed mandrel. ASM Glow.

Manganese. A carbonate of manganese and lime; a glass. CCD 61, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. 206. Additionally, it can be used in the Mannesmann process. ASM Glow.

Manganese steel. A process used for piercing tube billets in making seamless tubes. The billet is rotated between two heavy rolls mounted at an angle and forced over a fixed mandrel. ASM Glow.
manganese; gray manganese ore

sure obtained between a low-speed atmospheric wind-tunnel hole (static pressure) and the atmospheric static pressure is used to carry out the testing. The two limbs of the manometer and the low pressure side of the Chattock-Fry are connected by a radial-tip fan hole (reference variable pressure) while the other limb of the manometer is connected to the atmospheric outlet of the Chattock-Fry. Roberts, 1, pp. 35-37.

Manometric efficiency. The ratio of the actual head developed to the theoretical pressure of air moving at the fan-tip speed, equal to one-half the theoretical head of a radial-tip fan. Hartman, p. 182. b. An indication of the capability of the fan to produce pressure and is the ratio of the initial depression to the theoretical depression.

Manometric efficiency = 3.800 Total w.k.

manpower deployment. See deployment of manpower. Nelson.

manpower deployment chart. A chart or record on a board showing at a glance the position of every workman underground.

manriding exta. A car or carriage designed for the riding of miners to and from the workings. The car body has a low center of gravity and the risk of overturning, and is fitted with track brakes and an overspeed clutch. The train set is arranged to brake from the rear to avoid pileup and the overspeed clutch is activated. The train set is run with the train set to give convenient access to a stope. Also called mantripping." Nelson. b. A passageway or the use of miners only; an airshift; a chute. Standard, 1964, c. Eng. A manhole. Standard, 1964. d. A passage into or out of a mine used as a footpath for workers. Korson. e. A short heading between two chutes. Fay.

manna stone. See chima stone. Dodd.

manganese: a. A horizontal projection of surface plants, mine workings, or both, drawn to a definite scale, upon which is shown all the important features of the mine; a plan; a plat. Fay. b. The act of preparing such plans of a mine. Bureau of Mines Staff. c. A representation to a definite scale on a horizontal plane of the physical features of a portion of the earth's surface (natural or artificial or both) by means of symbols, which may emphasize, generalize, or omit certain features as conditions may warrant. May be derived from ground surveys made by transit, plane table, or camera, or from aerial photographic surveys, or both. See. 2.

map projection. A method of representing the curved surface of the earth on a flat surface map. As the only true shape of the earth's surface it may be required to preserve the chosen feature of the earth's surface without some distortion. Hem.

Marathonian orogeny. Post-Pennsylvanian diastrophism. Lab. 8.

marathon mill. A form of tube mill used in the cement industry, in which the pulverization is done by being hardened steel shafting. Ladd 2d, p. 357.

maraschino. A prospect or placer miner who works the red-berried bents and finds, regardless of its ownership. Poor, p. 496.

marble. A Spanish magnetite with a silicious gangue. Osborne.

marble. Obtained from a metamorphic rock composed essentially of calcite, dolomite, or a combination of the two, but long usage of the term by the quarry industry also includes serpentine, alabaster, onyx, travertines, and so on granites. Bukiniski Bull. 630, 1965, p. 878. This material is a limestone which has been crystalized by heat or pressure and is capable of taking a polish. Commercially, any limestone that is sufficiently hard and coherent to take a good polish is called a marble. For statutory and monumental work a fine even texture and uniform color are required, although colored marbles are used.

marble cleaner. In the stonework industry, one who removes stains from the finished surface of marble blocks or slabs with cleaning solutions, sometimes using a attack, end, too. Extreme care not to damage the stone where the finishing has been removed. D.O.T. 1.

marble dust. Crushed and pulverized limestone. Large quantities are used in making cement. Circ. 5, 1960.

marble. A toothless blade fitted at the back with a block handle, used with sand for cutting slabs of marble into pieces. Fay.

marbled. An enameled surface color graded to give the appearance of variegated marble. Fay. 1926.

marbled. In the stonework industry, one who makes imitations of marble from slate slabs of different colors. D.O.T. 1.

marble polisher. A block of sandstone used to polish a marble slab in the preliminary polishing. Also a linen cushion with which the polishing is completed by the operator. Very dusty. D.O.T. A machine for polishing marble. Fay. c. A marble rubber. Fay. d. One who polishes the faces of marble slabs or slabs to a high finish. Fay. e. A machine with sand for cutting marble slabs or slabs to a high finish. Fay. f. A machine with sand for cutting marble slabs or slabs to a high finish. Fay.

mark. The border or limit of a mineral area leased to, or owned by, a mining company. See also boundary. Nelson.

marble. A. A rubber for surfacing, D.O.T. 1.

marble. B. Crushed and pulverized limestone. Large quantities are used in making cement. Circ. 5, 1960.

marble. b. In the gem-stone trade, marcasite. A.G.I.; Dana 17.

marble. C. A granite containing large amounts of hornblende and augite. D.O.T. 1.

marble band. With a solution of copper sulfate. Fay.

marble. D. The cylindrical portion of the land that is not cut away to provide space for the plant. A.G.I.

marble assimilation. The solution and incorporation of country rock into the margins of an intruding igneous mass. Stokes and Varnes, 1955.

marble deposit. A magmatic segregation deposit at the boundary of an intrusive rock and the intrusive rock mother rock; for example, nickel-copper-sulfide deposits at Sudbury, Ontario, Canada.

marble fissure. A joint along the margin of an intrusive body that dips inward toward the intrusive. A.G.I.

marble mine. So. A mine which just manages to pay its way but may be unable to do so if the price of its product falls or if its production costs rise slightly.

marble ore deposit. A deposit near the lower limit of commercial workability. Bateman.

marble. a. A mineral used to make artificial marble, B. A true marble is a porcelain made from the same material.Nelson.

marble. a. A true marble is a rock consisting essentially of enstatite and diopside. Johansen, s. 4, 1928, p. 461.

marble. b. A heading driven up to or alongside the march, or boundary of a mining property. Fay.

marble. c. A marking putty. Crispin.

marble. e. A small percentage of water. Foy.

marble. f. A small percentage of water. Foy.

marble. g. A small percentage of water. Foy.

marble. h. A small percentage of water. Foy.

marble. i. A small percentage of water. Foy.

marble. j. A small percentage of water. Foy.

marble. k. A small percentage of water. Foy.

marble. l. A small percentage of water. Foy.

marble. m. A small percentage of water. Foy.

marble. n. A small percentage of water. Foy.

marble. o. A small percentage of water. Foy.

marble. q. A small percentage of water. Foy.

marble. r. A small percentage of water. Foy.

marble. s. A small percentage of water. Foy.

marble. t. A small percentage of water. Foy.

marble. u. A small percentage of water. Foy.

marble. v. A small percentage of water. Foy.

marble. w. A small percentage of water. Foy.

marble. x. A small percentage of water. Foy.

marble. y. A small percentage of water. Foy.

marble. z. A small percentage of water. Foy.

marcasite. A. White iron pyrites, FeS2, the orthorhombic dimorph of pyrite, having a lower specific gravity, less stability, and a paler color. Often called white iron pyrite, cinnabar pyrites, and spey pyrites. A.G.I. b. A white iron pyrites, cinnabar pyrites, and spey pyrites. A.G.I. c. A white iron pyrites, cinnabar pyrites, and spey pyrites. A.G.I.

marble. a. A. A rubber for surfacing, D.O.T. 1.

marble. b. A. A rubber for surfacing, D.O.T. 1.

marble. c. A. A rubber for surfacing, D.O.T. 1.

marble. e. A. A rubber for surfacing, D.O.T. 1.

marble. f. A. A rubber for surfacing, D.O.T. 1.

marble. g. A. A rubber for surfacing, D.O.T. 1.

marble. h. A. A rubber for surfacing, D.O.T. 1.

marble. i. A. A rubber for surfacing, D.O.T. 1.

marble. j. A. A rubber for surfacing, D.O.T. 1.

marble. k. A. A rubber for surfacing, D.O.T. 1.

marble. l. A. A rubber for surfacing, D.O.T. 1.

marble. m. A. A rubber for surfacing, D.O.T. 1.

marble. n. A. A rubber for surfacing, D.O.T. 1.

marble. o. A. A rubber for surfacing, D.O.T. 1.

marble. q. A. A rubber for surfacing, D.O.T. 1.

marble. r. A. A rubber for surfacing, D.O.T. 1.

marble. s. A. A rubber for surfacing, D.O.T. 1.

marble. t. A. A rubber for surfacing, D.O.T. 1.

marble. u. A. A rubber for surfacing, D.O.T. 1.

marble. v. A. A rubber for surfacing, D.O.T. 1.

marble. w. A. A rubber for surfacing, D.O.T. 1.

marble. x. A. A rubber for surfacing, D.O.T. 1.

marble. y. A. A rubber for surfacing, D.O.T. 1.

marble. z. A. A rubber for surfacing, D.O.T. 1.
A page of text containing information on marine cycles, marine construction, and related geological processes, such as erosion by wave action and the formation of marine deposits. The text includes references to specific geological concepts and terms, and mentions the work of various authors and researchers in the field. The page also contains a section on the measurement of depth using a sounding line and the marking of claim boundaries in mining operations.
...
mass. A large body of rock, such as an igneous intrusion, a mineral deposit, or a variable mass body. Mason, b. See also massif.

massif. A. The dominant, central mass of a mountain range. B. A mass of rock, such as an igneous intrusion, a mineral deposit, or a variable mass body. C. A large body of rock, such as an igneous intrusion, a mineral deposit, or a variable mass body. D. A large body of rock, such as an igneous intrusion, a mineral deposit, or a variable mass body.
mass spectrometer. An apparatus similar to a mass spectrometer but usually with electrical measurement of the data. Used especially in determining abundance ratios of isotopes and in analyzing mixtures of gases.

mass spectrometer. The slow downslope movement of rock debris. A.G.I. b. A general term for a variety of processes by which large masses of earth material are moved by gravity under slowly a quaquarium form. See mass spectrometer and Figs. 4, 5, 6, 7, 8.

mass spectrometer. a. A small device is used to analyze mixtures of gases. b. A instrument which is used to determine the abundance of different isotopes of elements. c. A machine which is used to determine the abundance of different isotopes of elements in a sample. d. A instrument which is used to determine the abundance of different isotopes of elements in a sample.

mass spectrometer. A type of crude asphalt composed of suitably graded mineral matter and asphaltic cement in such proportions as to form a coherent, voidless, impermeable mass, solid or semisolid under conditions of adequate temperature and sufficient fluidity when brought to a suitable temperature to be spread by means of a hand float. Institute of Petroleum, 1931.

mass spectrometer. A type of crude asphalt composed of suitably graded mineral matter and asphaltic cement in such proportions as to form a coherent, voidless, impermeable mass, solid or semisolid under conditions of adequate temperature and sufficient fluidity when brought to a suitable temperature to be spread by means of a hand float. Institute of Petroleum, 1931.

mass spectrometer. A type of crude asphalt composed of suitably graded mineral matter and asphaltic cement in such proportions as to form a coherent, voidless, impermeable mass, solid or semisolid under conditions of adequate temperature and sufficient fluidity when brought to a suitable temperature to be spread by means of a hand float. Institute of Petroleum, 1931.

mass spectrometer. A type of crude asphalt composed of suitably graded mineral matter and asphaltic cement in such proportions as to form a coherent, voidless, impermeable mass, solid or semisolid under conditions of adequate temperature and sufficient fluidity when brought to a suitable temperature to be spread by means of a hand float. Institute of Petroleum, 1931.

mass spectrometer. A type of crude asphalt composed of suitably graded mineral matter and asphaltic cement in such proportions as to form a coherent, voidless, impermeable mass, solid or semisolid under conditions of adequate temperature and sufficient fluidity when brought to a suitable temperature to be spread by means of a hand float. Institute of Petroleum, 1931.
matrix. a. The continuous phase of a polyphase eutectic mixture; the physically continuous metallic constituent in which separate particles of another metallic constituent are dispersed. ASM Gloss, 2d ed., p. 245.
b. A term used in powder metallurgy in reference to the metal phase of a product or ingot that has a lower melting point than the other added phases forming the ingot. ASM Gloss, 2d ed., p. 245.

matrice. A rounded glass mold in which separate metal ingots are cast. Seely, 1.

matric. a. Local Galena name for blower. Freeland, 1950.
b. A term used in pneumatic flotation machines which electromagnetically attracts the metal through which the air passed in the older types of machines.

matlockite. Overbruchite of lead, Pb2PO4Cl, which occurs in tabular tetragonal crystals of MD.

mat packs. Small packs of timber consisting of a number of timbers laid side by side to form a solid mass 2 or 2 1/2 feet square by 5 to 6 inches thick. Holes are drilled in the ends of the timber and wires are threaded through to hold it together. Masons are transported underground and built up to form very effective support.

matras. mattress. A rounded glass flask with a long neck. Formerly used for dissolving substances by the application of heat or for distilling. Webster 3d. matrice. See matrix. Fay.

matrix. a. The rock containing a mineral or metallic ore; the gangue. Sometimes called the groundmass. Fay, b. The material which forms a cushion, or binder, in the construction of pavements. Fay. c. The impression or mold of the exterior of a fossil, crystal, or mineral left in the containing rock when the crystal, crystal, or mineral is removed, or the mass in which a fossil, crystal, or mineral is embedded. Standard, 1964. d. The metal in which the diamonds inset in the crown of a bit are embedded. Long. e. A specially designed cavity, usually of platter, in which terracotta plastic clay is packed to produce forms. Also called mold. Mersereau, 4th, p. 260. f. The finer grained material between the larger particles of a rock or the material surrounding a mineral or mineral. B.S. 3616; 1954, sec. 5.9. The principal phase or aggregate in which another constituent is embedded. ASM Gloss, h. An involute forming, a form used as a cathode. ASM Gloss.

matrix jewelry. Jewelry cut from some stone, asopal or turquoise, and its surrounding matrix which are called opal matrix, turquoise matrix, etc. Fay.

matrix metal. a. The continuous phase of a polyphase eutectic mixture; the physically continuous metallic constituent in which separate particles of another metallic constituent are dispersed. ASM Gloss, 2d ed., p. 245.
b. A term used in powder
maximum, minimum, diameter

maximum, minimum, pressure

maximum, minimum, pressure. For any given point of a periodical is the maximum

McQuald-Ehn test. A test by means of which t.e came, the incoming come to the screen plate while the water in the washing bed, causing the water to dewatering screens. The removal of moisture is accomplished by passing hot air, or other hot gas, through the bed of coal as it travels. Two balanced eccentric shafts are used. They are suspended from the supporting structure by means of inclined flexible hangers and actuated inpendent from the supporting structure by means of inclined flexible hangers and actuated in

The removal of moisture is accomplished by passing hot furnace gases, tempered with carbon dioxide, upward through the bed of coal as it travels along the screen. An induced-draft fan at the exhaust end provides the motive force for the gases. Mitchell, p. 678-679.

McNamara clamp. A drill-rod safety clamp somewhat similar to a Wonner's safety clamp.

Mean barrel. Synonym for M-design core barrel. Long.

Mean curve; Mayer curve. A cumulative curve used in the first instance to express the washability of a coal, plotted on a vectorial diagram in which the projection of the vector on the abscissa represents the percentage of the product (coal) and the direction of the vector represents the percentage of a particular constituent of the product. Long.

McQuaid-Ehn test. A test by means of which it is possible to predict the reaction of plain carbon steels during cooling and forming steels during quenching. The interpretation of the test depends upon the examination of the pearlite and cementite in the hyperperitectic region.

Mean diameter. The average of two measurements on the diameter, taken at right angles to each other. Webster 3d, p. 124.

Mean diameter, geometric. The diameter equivalent to the arithmetic mean of the logarithmic frequency distribution. In the analysis of beach sands, it is taken as that grain diameter determined graphically by the intersection of a straight line through the selected boundary sizes (generally points on the distribution curve where 16 and 84 percent of the sample by weight is finer) and a vertical line through the median diameter of the sample. H.C.G.

Mean effective pressure. In an air compressor, the equivalent average pressure exerted by the piston throughout the stroke. Lewis, p. 458.

Mean error. The mean deviation of a distribution of accidental errors. Webster 3d.

Mean free path. The average distance between collisions for a particular molecule or molecule between successive collisions. L.B.L.

Mean higher high water. The average height of the higher high waters over a 19-year period. Can be calculated for shorter periods by applying corrections for a 19-year period. Abbreviation, m.h.h.

Mean high springs. The average height of high water during sympathy over a 19-year period. H.Y.

Mean high water. The average height of the high waters over a 19-year period. Abbreviation, m.h.w.

Mean horizontal candlepower. The mean horizontal candlepower of a light source having its axis of symmetry in the vertical plane is the mean candlepower in the horizontal plane through the luminous center of the source. Nelson, p. 200-201.

Mean low water. The average height of the lower low waters over a 19-year period. Can be calculated for shorter periods by applying corrections for a 19-year period. Abbreviation, m.l.w.

Mean lower low water. The mean lower low water over a 19-year period.
mechanical analysis

mechanical advantage. Ratio between the resistance or load raised by a machine, and the applied force. Mechanical advantage divided by velocity ratio gives the efficiency of the machine. Ham.

mechanical air machine. A flotation machine which utilizes pulp-body concentration by the agitation froth method and bubble column action by pneumatic and cascade means. Taggert, p. 628.

mechanical advantage. Ratio between the resistance or load raised by a machine, and the applied force. Mechanical advantage divided by velocity ratio gives the efficiency of the machine. Ham.

mechanical noise analysis. a. The relative proportions of the different sized mineral particles present in a soil or rock. It is determined by mechanical analysis, in which the particles are separated into a number of arbitrary fractions, each consisting of particles whose size lies between definite limits. For uniformity and convenience the International Society of Soil Science has fixed the following limits. Nelson.

Diameter of particles

mechanized heading development. A pillar mine headgear is operated for seams 4 feet and over in thickness. Three or more narrow headings are driven rapidly with machines at about 30-yard centers with a 60-ton load. The headings are driven in a series of small holes, each 4 feet long and about 6 feet in diameter, using a percussion drill. The headings are then loaded with dynamite, primed for the second blast by the heading loader, and driven forward for 4 feet back into open cut. The heading loader then drives a machine into the second blast, and the heading loader many blast by blast. The heading loader then drives a machine into the second blast, and the heading loader many blast by blast. The heading loader then drives a machine into the second blast, and the heading loader many blast by blast. The heading loader then drives a machine into the second blast, and the heading loader...
medium-stone bit

A bit with diamonds ranging from 0 to 40 carat in size. Long.

medium thickness seam

In general, a coal seam over 2 feet and up to 4 feet in thickness.

medium-volatile bituminous coal

Nonagglomerating bituminous coal having 69 percent or more, and less than 70 percent of fixed carbon (dry, mineral-matter-free), 31 percent or less, and more than 22 percent of volatile matter (dry, mineral-matter-free). ASTM D288-36.

medusa

See jellyfish. Hy.

mechanite

High-duty cast iron produced by ladle addition of calcium silicide. Pryor, 3.

meend

Forest of Dean. Old ironstone. Mende.

mein-. A prefix meaning dark-colored. See melan-.

meizoseismal curve

A curved line connecting the points of the maximum destructive energy of an earthquake shock around its epicenter. Standard, 1954.

megabar

A unit of pressure equal to 1 megabar, 6 bar.

megaparametric

Applied to observations of minerals and rocks to the characters observed by means of the naked eye or pocket lens but not with a microscope. Helmi, 1926.

megascopic region

The most disturbed earthquake area. Schieferdecker.

megaspores

Female spores; part of reproductive organs of many Coal Measures plants. See also spores. Nelson.

megastor

megawatt day per ton

A unit used for expressing the burnup of fuel in a reactor. Specifically, the number of megawatt days of heat output per metric ton of fuel.

megger

An electrical measuring instrument comprising a hand-operated generator equipped with a governor, a moving measuring system consisting of a voltage, and a current coil so disposed that the deflection of the measuring instrument is proportional to the voltage to current ratio. Used to measure insulation resistance and resistance to ground. It has been somewhat standardized.

megohm

A unit of electrical resistance that equals 1 million ohms. Abbreviation, meg. Crosby.

meigen's reaction

A test for distinguishing calcite and aragonite. A solution of cobalt nitrate is used as a combined stain and reagent. Aragonite is stained a lilac tint which remains visible in this section after boiling in the solution for about 20 minutes; calcite (and dolomite) may be stained pale blue but they appear unchanged in this section. Holmes, 1928.

melanite

A silicate of aluminum and calcium, together with calcium carbonate, (Ca,Na)Al (Al,Si)SiO3CaSiO3, which crystallizes in the tetragonal system. It is a species of the isomorphous series forming the scapolite group. C.M.D.

melanosilicate

meliolite

The most disturbed area within the innermost isoscelal line. Schieferdecker.

meliosilicic curve

A curved line connecting the points of the maximum destructive energy of an earthquake shock around its epicenter. Standard, 1954.

melanite

A prefix meaning dark-colored. See also melanite. A.G.I.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanophlogite

A colorless mineral crystallizing in cubic SiO3 with 3 to 7 percent SO4; possibly SiO3 with SiO2; Mohs' hardness, 6.5 to 7; specific gravity, 2.04; with sulfur crystals of Girgenti, Sicily. Lassen, p. 48.

melanosilicate

A black antimonite of manganese and iron. Massive; foliated; from Sjo mine, Orebro, Sweden. English.

melanotekite

A black mineral with 2 cleavages 3F2OxZrSiO3; crystobalite, 6.5; specific gravity, 3.73; Lassen, p. 144.

melanovanadinite

A vanadium ore, 2CaO2V2O52H2O. Osborne.

melaphyre

A porphyritic rock consisting of phenocrysts of feldspar in a dark groundmass; broad-based pyroclastic igneous rock with dark-colored aphanitic groundmass and phenocrysts of various kinds. Webster 3.

melaphyte

A general term for altered and amygdaled rocks of basaltic or andesitic types. McKinstry.

melaphyte

A porphyritic rock consisting of phenocrysts of feldspar in a dark groundmass; broad-based pyroclastic igneous rock with dark-colored aphanitic groundmass and phenocrysts of various kinds. Webster 3d.

melaphyte

A general term for altered and amygdaled rocks of basaltic or andesitic types. McKinstry.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.

melanite

A black andradite variety of comptonite, isometric. Dana 17.
opaque oxides. With an increase of plagioclase, the rock passes into melilitite (mellite tephrite) and with an increase of olivine, it passes into olivine melilitite. With the increase of both olivine and plagioclase, the rock becomes a melilitite-olivine basalt (mellite basanite). In olivine melilitites, biotite is a common constituent.

mellite. a. A high explosive similar to lydite, said to be chiefly NNO. Maller, 1908.

melinite. a. A high explosive similar to melilitite. See mellite. Tomkeieff, 1954.
melter. a. In metallurgy, the man in charge of melting. a. Batcha remelting process in steel making. a. To change a solid into a liquid. a. To change a solid into a liquid by the application of heat; or the liquid resulting from such action. ASTM C162-66.
melting area. The area of a furnace under which the glass is melted free from undissolved batch. ASTM C162-66.
melting. a. A vessel of fire clay holding molten glass. a. Batcha remelting process in steel making. a. To change a solid into a liquid. a. To change a solid into a liquid by the application of heat; or the liquid resulting from such action. ASTM C162-66.
melting point. That temperature at which a solid melts into a liquid or to a liquid plus another solid phase, upon the addition of heat at a specific pressure. Unless otherwise specified, melting point is usually stated in terms of 1 atmosphere pressure. The term can also be used for the isothermal melting of certain mixtures, such as eutectic mixtures. Eroneously and loosely used also to refer to the temperature at which some appreciable but unspecified amount of liquid phase develops in a complex solid mixture that possesses a melting range; for example, the melting points of granite. Abbreviations, mp or MP. A.G.I.
melting point of refractory. The temperature at which a small cone of the refractory bends so that the tip touches the base. The melting point is usually 50° to 100° C above the refractoriness under load temperature. The latter is a better guide to the behavior of a material as a refractory. Franci, 1965, v. 2, p. 563.
melting pot. a. A vessel of fire clay holding molten glass. a. Batcha remelting process in steel making. a. To change a solid into a liquid by the application of heat; or the liquid resulting from such action. ASTM C162-66.
melting snow jade. Descriptive term for a white to grayish color grade of jadeite with opaque inclusions traversed by translucent streaks. Shipley.
melting temperature. The range of temperature in which the process of melting takes place at a commercially desirable rate, and at which the resulting glass generally has the viscosity necessary for purposes of comparing glasses, it is assumed that the glass at melting temperature has a viscosity of 10^6 poises. ASTM C152-66.
mendozite. A massive, fibrous, white, hydrous, menilite. A concretionary, opaque, dull, grayish lead-gray, Dana 17.

Menophitis. A noxious exhalation caused by the mephitic gas. Same as mephitic air. Webster 3d.

Menolphoric. Involving, or containing mercury in the bivalent state; for example, mercuric chloride HgCl₂. Webster 3d.

Menophistic. Foul; noxious; poisonous; stifling. Webster 3d.

Menophite gas. Same as menophite air. Webster 3d.

Menophils. A noxious exhalation caused by the decomposition of organic remains; applied also to gases emanating from deep sources, as in mines, caves, and volcanic regions. Standard, 1964.

Menophite for maximum efficient rate. Also abbreviated MER. BuMin Style Guide, p. 60.

Menophite powder. A heavy, silvery-white metallic element that is liquid at ordinary temperatures. Occurs as native mercury but its principal source is cinnabar (HgS). A solvent for most metals; the products are used as amalgams. Its chief uses are in the manufacture of drugs and chemicals, fuel mixtures, and vermilion (mercurous sulfide). Symbol: Hg; valences, 1 and 2; specific gravity, 13.546 (at 20° C) or 13.399 (at 20° C, referred to water at 4° C); poisonous; rather poor conductor of heat, as compared with other metals; fair conductor of electricity; melting point, -38.87° C; boiling point, 556.38° C; insoluble in water, gasoline, pyrites. C.C.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-193.

Mercury, quicksilver. A heavy, silvery-white metallic element that is liquid at ordinary temperatures. Occurs as native mercury but its principal source is cinnabar (HgS). A solvent for most metals; the products are used as amalgams. Its chief uses are in the manufacture of drugs and chemicals, fuel mixtures, and vermilion (mercurous sulfide). Symbol: Hg; valences, 1 and 2; specific gravity, 13.546 (at 20° C) or 13.399 (at 20° C, referred to water at 4° C); poisonous; rather poor conductor of heat, as compared with other metals; fair conductor of electricity; melting point, -38.87° C; boiling point, 556.38° C; insoluble in water, gasoline, pyrites. C.C.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-193.

Mercury arc. An electric discharge through a low molecular weight, and may be a desirable feature in metalurgic processes. It decomposes at 500° C. Used as an oxidizing agent, in producing mercury salts, in desulfurizing organic compounds, in ceramics (pigments), in polishing compounds, and as an analytical reagent. C.C.D. handbook, 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-194.

Mercuration. Chronic poisoning with mercury, as from excessive medication or excessive use of mercury in the bivalent state; for example, mercuric chloride HgCl₂. Webster 3d.

Mercan tribunal. An instrument that measures atmospheric pressure. The height of a column of mercury in a vertical glass tube varies with changes to atmospheric pressure. Jones. See also barometer. Compare aneroid barometer.

Mercarz screw. See mercarz mill.

Mercury black. Mercury sulfide. Webster 3d.

Mercury bichloride; calomel. Hg₂Cl₂; occurs naturally in whitish or grayish masses; associated with cinnabar. From it can be obtained, by digesting in air with hydrochloric acid, mercury chloride (HgCl₂), the corrosive sublimate, which is used for intensification processes in photography. C.T.D.

Mercan chloride; calomel. Hg₃Cl₂; occurs naturally in whitish or grayish masses; associated with cinnabar. From it can be obtained, by digesting in air with hydrochloric acid, mercury chloride (HgCl₂), the corrosive sublimate, which is used for intensification processes in photography. C.T.D.

Mercanchrome; mercury chromite. Brick-red; needles. Hg₃CrO₆; molecular weight, 517.17; decomposes at 700° C; very slightly soluble in water; soluble in concentrated nitric acid and hydrochloric acid; and insoluble in alcohol. Used in ceramics for coloring green. Standard, 1964, pp. B-120, B-193.

Mercan chloride, red; mercury sulfide, red; vermilion; cinnabar. Red; molecular weight, 232.65; hexagonal; Hg₃; specific gravity, 11.00 to 11.29; Mohs' hardness, 2.0 to 2.5; sublimes at 503.5° C; used as a pigment for colored oil and water paintings. C.C.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-193.

Mercan sulfide, black; mercury sulfide, black; metacinnabar; Black; molecular weight, 232.65; isometric; Hg₃; soluble in water, in aqua regia; in sodium sulfide solutions; and in alkaline; insoluble in water, in alcohol, and in nitric acid; specific gravity, 7.73 and it sublimes at 503.5° C. Used as a pigment for colored oil and water paintings. C.C.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-194.

Mercan sulfide, red; mercury sulfide, red; vermilion; cinnabar. Red; molecular weight, 232.65; hexagonal; Hg₃; specific gravity, 11.00 to 11.29; Mohs' hardness, 2.0 to 2.5; sublimes at 503.5° C; used as a pigment for colored oil and water paintings. C.C.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-193.
mercury arc 

mercury vapor in a glass or a quartz tube emitting a blue-green light that is high in actinic and ultraviolet rays. Used for water sterilization, in photography, and in rectifiers. 

Webster 3d, 1963. 

mercury-arc rectifier. Any common alternating-current voltage may be converted to direct current at voltage above 120 volt by means of a mercury-arc rectifier and its associated equipment. The rectifier consists of innumerable anodes and a mercury-pool cathode sealed into an evacuated tube. Current can pass between the anodes and cathode in only one direction. Thus when an alternating-current voltage is applied to the rectifier, direct current is obtained. Pit and Quarry, 53rd, See D, p. 34. 

mercury. Barium iodide, HgI2BaI2; molecular weight, 945.65; yellow; poisonous; crystals; deliquescent; and soluble in water and ethyl alcohol. Used in mineralogy as a 1 in chemical analysis. Bennett 2d, 1962. 

mex. y chlorid; mercuric chloride; corrosive sublimate. Colorless, transparent; orthorhombic; HgCl2; poisonous; specific gravity, 5.44 (at 25° C); melting point, 276° C; and soluble in water and in alcohol. Usually made by heating mercury with gaseous chlorine or by subliming a mixture of mercury sulfate and common salt. Used in making other mercury compounds. Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-193. 

mercury chromate. See mercuric chromate. 

mercury gatherer. A stirring apparatus that is used to dissolve mercury for making an electric connection, as by dipping the ends of two wires in it. Standard, 1964. 

mercury fulminate; mercuric fulminate; mercuric fulminate. A mixture of mercury sulfate and common potassium cyanide. See mercurous chromate. 

mercury gatherer. A stirring apparatus that is used to dissolve mercury for making an electric connection, as by dipping the ends of two wires in it. Standard, 1964. 

mercury sulfide. See cinnabar; metacinnabar. C.M.D. 

mercury sulfide, black. See mercuric sulfide, black. CCD 6d, 1961. 

mercury switch. A glass tube employing mercury to establish electrical contact between circuits when the tube is tilted so that the mercury bridges the gap between contacts, and conversely. Strock, 10. 

mercury vapor rectifier. See mercury-arc rectifier. 

mercury vapor lamp. Consists essentially of a sealed glass tube provided with two electrodes and containing a gas. When an electrical potential difference is applied, a current passes and a suitable gas, light will be emitted. In the case of mercury vapor this light is of a bluish color and has proven effective in distinguishing dirt from coal. A special starting electrode close to one of the main electrodes initiates the discharge, and a choke coil in series with the lamp serves to limit the current passing, since the resistance tends to fall with increasing current. Mason, b. 1, p. 258. 

mercury-vapor rectifier. See mercury-arc rectifier. 

b. In Derbyshire peak a measure of land which was allowed to claim 2 meres. Fay. 

d. The discoverer of the lode was allowed to claim 2 meres. Fay. 

Merck. 

Mercury. A soft, silvery-white metal which is liquid at room temperature and has a high specific gravity of 13.5. The mercury vapor this light is of a bluish color and has proven effective in distinguishing dirt from coal. A special starting electrode close to one of the main electrodes initiates the discharge, and a choke coil in series with the lamp serves to limit the current passing, since the resistance tends to fall with increasing current. Mason, b. 1, p. 258. 

Mesa Grande tourmaline. Tourmaline from pegmatite ledge near Mesa Grande, San Diego County, Calif. Much of fine quality was formerly mined there together with pink beryl. Shipley. 

mesh. a. In vibration surveys, a closed path traversed through the network. Roberts, 1, p. 837. b. The size of diamonds as determined by sieves. Long, c. Engagement or working contact of teeth of gears or of a gear and a rack. Long, d. The hole in a sieve or gauge. Mass, e. The screen number of the finest screen of a specified standard screen size. Bureau of Mines Staff, f. The number of screen openings per square inch of a screen (sieve). In laboratory testing, the number of wires per linear inch, measured either along one diagonal or at the mid point of a screen opening. In the Institution of Mining and Metallurgy system, wire diameter is equal to mesh diameter.
mesh aperture. The dimension or dimensions of a mesh structure. A structure resembling netting or grating where openings of various sizes can be formed to retain particles of a specific size.

mesh fraction. That part of a material passing a specified mesh screen and retained by some stated finer mesh. In this context, the term is used to describe the size of particles that can be retained by a mesh screen.

mesh number. (grit number). The designation of a size of an abrasive grain, derived from the openings per linear inch in the mesh screen. In general, the finer the mesh, the smaller the particle size.

mesh of grind. Optimum particle size resulting from a specific grinding operation, stated in terms of percentage of ore passing through a specified mesh, or alternatively being retained on a given screening size. The mesh of grind is the liberation mesh determined for commercial treatment of the ore. Abbreviation, m.g.

mesh reinforcement. An arrangement of rods or wires normally in two directions at right angles, and tied or welded at their intersections or interwoven. Alternatively, it is a diamond mesh of expanded metal. Taylor.

mesh structure. A structure resembling a network of work that is found in certain alteration products of minerals. Standard, 1964. Also called net structure; lattice structure.

mesh texture. A texture resembling a network, caused by the alteration of certain minerals, for example, by the serpentinization of olivine. Synonym for reticulate texture. Schönsleben.

mesלית spar. Idiosal; a carbonate of magnesium and iron, 2MgCO₃·FeCO₃. Fay.

mesilit. A white magnesium iron carbonate, 2MgCO₃·FeCO₃, intermediate between magnesite and siderite. See also mesinit.

mesinit spar. Fay. Idiosal; a mineral that is found in cements of various rocks. It is often intergrown with other minerals such as dolomite and siderite.

mesinit spar. Fay. Idiosal; a rock that is found in cements of various rocks. It is often intergrown with other minerals such as dolomite and siderite.

mesomorph. An arrangement of minerals that is found in certain alteration products of minerals. Schönsleben.

mesosiderite. A meteorite composed of iron and nickel. It is one of the most common types of meteorites and is often found in areas where there has been an impact.

mesostasis. a. The interstitial material between the larger mineral grains in a microcrystalline rock or in a microcrystalline groundmass. Synonymous with base or groundmass. A.G.I. b. Synonymous with matrix or groundmass as applied to igneous rocks. A.G.I.

mesothermal. Applied to hydrothermal deposits formed at intermediate temperatures and moderate pressure. Betan.

mesothermal deposit. A mineral deposit formed at moderate temperatures and moderate pressures, in and along fissures or other openings in rocks, by deposition at intermediate depth. These deposits are often formed from hydrothermal fluids derived from intrusive intrusives. A.G.I.

mesothorium. Isotope of radium, chemically identical with it, but having a much shorter half-life; mesothorium decomposes into radiothorium, chemically identical with thorium. Bennett 2d, 1962.

mesothorium I a. A name for radium 228; half-life, 6.7 years; a member of the thorium disintegration series; and symbol, Th₂₂₈. Instead of 1,622 years. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-83. c. As a member of the thorium disintegration series, mesothorium I is the immediate product of the disintegration of thorium 228. Gleason and preceding the Cenozoic era. It includes the Triassic, Jurassic, and Cretaceous periods. Also the rocks formed during that era. Fay.

mesothorium II a. A name for actinium 228; half-life, 6.13 hours; a member of the thorium disintegration series; and symbol, Am₂₂₈. Instead of 1,622 years. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-83. b. This isotope of actinium has a much shorter half-life than that of actinium 228, which is the most stable, or longest-lived, isotope of actinium, and has a half-life of 216 years. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-83. c. As a member of the thorium disintegration series, mesothorium II is the immediate product of the disintegration of mesothorium I (radium 228), and it disintegrates into radiothorium (thorium 228), which is chemically identical with thorium and has a half-life of 1.91 years. Bennett 2d, 1962; Glaseione 2d, p. 134; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-83; meta-mesotropic peat. Variety of peat moderately supplied with nutrients. Tomkeief, 1954.

mesotop. a. Proposed by Shand in place of mesocratic to indicate igneous rocks containing between 30 and 60 percent dark minerals. Compare metatropic. Schönsleben.

mesotop. A variety of natrolite. Fay.

mesozooic. One of the great divisions or eras of geologic time, following the Paleozoic and preceding the Cenozoic era. It includes the Triassic, Jurassic, and Cretaceous periods. Also the rocks formed during that era. Fay.

mesozone. The middle zone of metamorphism in Granberg's system for the classification of metamorphic rocks and in Niggli's extension of that system. See also epizone; catazone; Schiefendecker.

mesquite. Sp. Am. A spiny, deep-rooted tree or shrub of the southwestern United States and Mexico that bears pods which are rich in protein and important as a livestock feed, and that is often the only woody vegetation on large areas. Also spelled mesquit; messquit; mesquitus. Webster.

mesquite. A colorless to brownish trichlinae with one good cleavage, Ca₂₃₃(Mg)₂₃₃(PO₄)₃·H₂O; from Bosnia, Czechoslovakia; Kazakhstan, U. S. R. Larsen, p. 118; American Mineralogist, v. 44, No. 3-4, March-April 1959, p. 429. mess kit. The cooking and table utensils of a mess together with the receptacle in which they are packed for transportation. Webster 3d.

mét. A convenient and approximate unit of human heat production equivalent to the average metabolic heat produced by resting man, about 15.50 British thermal units per square foot per hour. Struck, 1964.

mét. a prefix which when added to the name of a rock, signifies that the rock has undergone a degree of change in mineral or in chemical composition through metamorphism. Fay. b. A prefix to denote (1) resemblance, (2) that an oxygen acid has reformed from an oxygen acid by dehydration, or (3) that the two radicals are identical with thorium. Fay. c. As a member of the thorium disintegration series, mesothorium I is the immediate product of the disintegration of thorium 228. Gleason.

mesothorium. Nonagglomerating anthracite coal containing 98 percent or more of fixed carbon (dry, mineral-matter-free) and 9 percent or more of volatile matter (dry, mineral-matter-free). ASTM D 388-38.

met-aargillite. A rock having weak metamorphic restructuring, no recrystallization,
and no slaty cleavage or foliation. A.G.I. Supp.

meta-arkose. Arkose that has been metamorphosed so that it resembles granite. Composed of reconstituted granite. A.G.I. Supp.

meta-autunite I. A yellow, common secondary mineral. Composed of (PO₄)₅O·6H₂O, that is not found in nature; contains 33.0 to 60.4 percent uranium. Meta-autunite I passes into this orthorhombic phase upon heating to about 80°C. Frenkel, p. 184; Dana 7, v. 2, p. 901, 985.

meta-autunite II. Another alteration product, Ca(UO₃)(PO₄)·6H₂O, that is not found in nature; contains 33.0 to 60.4 percent uranium. Meta-autunite I passes into this orthorhombic phase upon heating to about 80°C. Frenkel, p. 184; Dana 7, v. 2, p. 901, 985.

meta-basite. A metamorphosed, basic igneous rock. See also basic schist; eclogite; greenstone; greenstone; metavolcanic rock; metavolcanic rock; metagabbro; diabase, diorite; gneiss; greenstone; greenstone; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metabasite; metal deactivator

result of refining or handling operations. Institute of Petroleum, 1961.

metal-distribution ratio. The ratio of the thickness of metal deposited on a near portion of the cathode to that deposited on a far portion of the cathode. ASM Gloss.

metal drift. A drift or heading driven in barren and hard rock. Nelson.

metal electrode. A filler or nonfiller metal electrode, used in arc welding, consisting of a metal wire, with or without a covering or coating. Coal Age, v. 66, No. 3, March 1964, p. 52.

metal-electrode arc welding. A group of arc-welding processes wherein metal electrodes are used. Coal Age, v. 66, No. 3, March 1964, p. 52.

teleolate. A dimorphic form of leucite of higher symmetry, met with at ordinary temperatures, whereas the name leucite is properly restricted to the isometric, optically isotropic, modification of the same substance, which is stable only above 600° C. English.

metaliferous coal. Coal containing from 80 to 84 percent carbon (ashless, dry basis). Tomkeieff, 1954.

metaline. a. A substance of variable composition as metallic oxides, wax, fats, etc., used as a substitute for ordinary lubricants. Webster 2d. b. An alloy of 35 parts cobalt, 30 copper, 25 aluminum, and 10 iron. Webster 2d.

metalizer. One who works in, or has special knowledge of, metals. Standard, 1964. A metallogenic province. See mineralogic epoch. A.O.I.

metalized slurry blasting. The breaking of rocks, etc., using slurred explosive medium containing a powdered metal, as powdered aluminum. Bureau of Mines Staff.

metallic brick. Basic brick provided with thin steel casings. HW.

metal leaf. Thin metal sheet, usually thinner than foil, and traditionally produced by beating rather than by rolling. ASM Gloss.

metallic. a. Of or belonging to metals; containing metals, more particularly, the valuable metals that are the object of mining. Fay. b. Applied to minerals having the luster of a metal, as gold, copper, etc. Fay. c. Used to indicate the condition of a metal in which it exists by itself, and is not exacerbated nor combined with those substances which take away its metallic character and convert it into an ore. Ricketts.

metallic-arc welding. Welding in which one or more metal electrodes are used, the metal being the electrode providing the filler metal. Ham, p. 249.

metallic asbestor yarn. Metallic asbestos yarn is made from fibers of plain asbestos yarn twisted with brass, copper, or other fine wire. See also asbestor yarn. Hess.

metallic bond. The chemical bond typical of the metallic state and characterized by mobile valence electrons that hold the atoms together usually in crystal lattices and are responsible for the good electrical and heat conductivity of metals. Webster 3d.

metallic colors. Metal particles, gold, silver, or platinum, suspended in oils, to decorate mainly the edges of dinnerware. ACSG, 1963.

metallic crystals. The crystals of which metals and alloys are composed. Three main types are recognized; namely, pure metal crystals, primary solid-solution crystals, and intermediate solid-solution crystals. C.T.D.

metallic elements. Elements that are generally distinguishable from other elements (nonmetallic elements) by their luster, malleability, electrical conductivity, and their usual ability to form positive ions.

metallic iron. Metal iron, as distinguished from iron ore. Fay.

metallic luster. The ordinary luster of metals. When freshly displayed, it is termed submetallic. Gold, iron pyrites and galena have a metallic luster; chalcopyrite and cuprite a submetallic luster. Nelson.

metallic materials. Materials which contain elements that readily release their electrons, as contrasted to ceramic materials and nonmetallic materials; for example, aluminum, magnesium, steel, CuAl, MoSi, etc. PPV.

metallic minerals. Minerals with a high specific gravity and metallic luster, such as titanium, uranium, tin, lead, iron, etc. In general, the metallic minerals are good conductors of heat and electricity. See also nonmetallic minerals. Nelson.

metallic ore. From a strictly scientific point of view the terms metallic ore and ore deposits have no clear significance. They are purely conventional expressions, used to describe those metalliciferous minerals or bodies of mineral having economic value, from which the useful metals can be advantageously extracted. In one sense rock salt is ope of sodium, and limestones an ore of calcium, but to term beds of those substances ore deposits would be quite outside of current usage. Ricketts.

metallic overglaze. A solution of mineral pigments in a molten metal or by vacuum deposition. Bondley process. Dodd.

metallogenic element. An element usually recognized; namely, pure metal crystals, including certain oxides of certain base metals. Furnkin process. Single stage metallizing is possible if the hydride of titanium or zirconium are used, together with a hard solder; this is sometimes known as the Bowie process. Dodd.

metallogenic province. See mineralogic province. A.O.I.

metallogenetic epoch. A min-rogenochic epoch. The time interval favorable for the genesis or deposition of certain useful metals or minerals. Hess.

metallogenetic province. See mineralogic province. A.O.I.

metallogenic province. See mineralogic province. A.O.I.

metallogeny. The branch of geology that deals with minerals and their deposits; especially with the formation and evolution of minerals and rocks through geologic time. Ricketts, p. 56.

metallogeny. The branch of geology that deals with minerals and their deposits; especially with the formation and evolution of minerals and rocks through geologic time. Ricketts, p. 57.

metallogenic material. A large area of the earth's surface characterized by an unusual abundance of specific minerals, rocks, or deposits of a particular type. Hauke, p. 24, 47.

metallogeny. The branch of geology that deals with minerals and their deposits; especially with the formation and evolution of minerals and rocks through geologic time. Ricketts, p. 56.
metallography. An optical instrument designed for both visual observation and photomicrography of prepared surfaces of opaque materials at magnifications ranging from about 25 to about 1,000 diameters. The instrument consists of a high-intensity, illuminating source, a microscope, and a camera bellow. Some of these instruments, provisions are made for examination of specimen surfaces with polarized light, phase contrast, oblique illumination, dark-field illumination, and complementary bright-field illumination. ASM Gloss.

metallography. The science dealing with the constitution and structure of metals and alloys as revealed by the unaided eye or by such tools as low-powered magnification, optical microscope, electron microscope, and diffraction or X-ray techniques. ASM Gloss.

metalloid. a. archaic. An alkali metal, as sodium or an alkali-earth metal, as calcium. Webster 3d. b. Nonmetal. Webster 3d. c. A nonmetal, as carbon or nitrogen, that can combine with a metal to form an alloy. Webster 3d. d. An element, as boron, silicon, arsenic, or tellurium, intermediate in properties between the typical metals and the nonmetals. Compare semiconductor. Webster 3d. e. Resembling a metal. Webster 3d. f. Of, relating to, or being a metalloid. Display.

metalometric surveying. Geochemical prospecting term used by Russian authors for soil surveys or for the chemical analysis of systematically collected samples of soil and weathered rock. Hawkes, 2, p. 3.

metallo-organic compound. A compound in which a metal combines with naturally occurring organic compounds to form metal-organic complexes such as porphyrins and salts of various organic acids. Some metallo-organic compounds are soluble in water, others are not. Hawkes, 2, p. 125.

metallophytan. Old name for stone coal. Tomlinski, 1924.

metallurgical cement. See superheated cement. Ham.

metallurgical coke. A coke with very high compressive strength at elevated temperatures, used in metallurgical furnaces, not only as a fuel, but also to support the weight of the charge. ASM Gloss.

metallurgical coke base carbon refractory. A manufactured refractory composed substantially of metallurgical coke. ASTM C71-64.

metallurgical engineer. One who applies engineering principles to the science and technology of metallurgy. Bureau of Mines Staff.

metallurgical fume. A mixture of fine particles of elements and metal and nonmetallic oxides so finely subdivided or condensed from the vapor state. Fay.

metallurgical smoke. A term applied to the gases and vapors, and fine dust entrained by them, that issue from the throat furnaces and consists of three distinct substances, gases, (including air) the flue dust, and the fume. Fay.

metallurgist. One who is skilled in, or who practices metallurgy. Compare metallurgical engineer. Fay.

metallurgy. The science and technology of metals. Process (chemical). Metallurgy is concerned with the extraction of metals from their ores and with the refining of metals; physical metallurgy, with the physical and mechanical properties of metals as affected by composition, mechanical working and heat treatment. ASM Gloss.

metal marking. See silver marking of glazes. Dodd.

metal mine inspector. In metal mining, one who examines the safety conditions of a mine in regard to composition, ventilation, mining, and density to the raw material, that is, the ore body, is depleted it is not replenishable. Nelson.

metal notch. See taphole, a. Fay.

metal physical examination to determine the whole range of subjects associated with the structure, physical properties, and theories of metals and alloys. Osborne.

metal pickling. The immersion of metal objects in a hot acid bath to remove scale, oxide, tarnish, etc., leaving a chemically clean surface for galvanizing or painting. Nelson.

metal powder. a. A general term applied by drillers, bit makers, and manufacturing to very finely ground metal, which when mixed are commonly used to produce sintered-metal and bit crowns. Also called powdered metal; powder metal. Long. b. Metallic elements or alloys in finely divided or powder form. Hensel.

metal protection. Metals can be protected from oxidation at high temperature by various types of ceramic coating, the common being flame-sprayed alumina and refractory enamels. Such coatings have found particular use on the exhaust systems of aircraft. Fay.

metal ridge. a. N. of Eng. A pillar or pillars of certain minerals into lenses and bands. Ferguson.

metal mine. A mineral which has become virtually amorphous due to the breakdown of the original crystal structure by internal bombardment with alpha particles (helium nuclei) emitted by radioactive atoms within the mineral. Many green zircons, especially those from Ceylon, which are Precambrian in age, and have thus had over 800 million years of this internal bombardment, owe their low refractive index and density to this cause, and may be termed metamict zircons. Anderson.

metalumbling. The process of disruption of the structure of a metal, such as that from cooling radioactive atoms, rendering the material partly or wholly amorphous. A.G.I.

metameric. A mineral, the crystal structure of which has been disrupted by radiation from contained radioactive material. A.G.I. Supp.

metamorphic. Characteristic of, pertaining to, produced by, or occurring during the metamorphism of certain rocks. Fay.

metamorphic facies. See rocks, contact metamorphism.

metamorphic facies. A group of metamorphic rocks characterized by present particular assemblage of minerals produced during contact metamorphism. Fay.

metamorphic facies. A group of rocks in which the molecular proportion of aluminas exceeds that of soda and potash, and lime combined. A.G.I.

metamorphic facies. A group of rocks, which have been subjected to great pressure, high temperature, and chemical alteration by solutions. They have become warped, twisted, and folded, and the original minerals are rearranged and recrystallized. Lewis, p. 276.

metamorphic grade: metamorphic rank. The grade or rank of metamorphism depends upon the extent to which the metamorphic rock differs from the original siliceous rock which it derived. If a shale is converted to a slate or a phyllite, the metamorphism is low grade; if it is converted to a mica schist containing garnet and sillimanite, the metamorphism is high grade. A.G.I. Supp.

metamorphic rock. Any rock which has been altered by heat or intense pressure, causing new minerals to be formed and new structures in the rock. Thus clays have been changed into slates, and limestones into marble. Water driven out of metamorphic grade; metamorphic rank. The meivepyls. Proposed by Kinahan for regional metamorphous. Same as metamorphic. Yay.

metamorphous. Same as metamorphic. Fay.

metastable. Produced by, or occurring during metamorphosis (replacement). The term is especially used in connection with the origin of ore deposits. Fay.

metasomatic ore. See metasomatism. Nelson.

metasomatic. Characteristic of, pertaining to, produced by, or occurring during metamorphosis (replacement). The term is especially used in connection with the origin of ore deposits. Fay.

metasomatic. See metasomatism. Nelson.

metasomatism; metasomatosis. a. The process of practically simultaneous capillary solution and deposition by which a new mineral of partly or wholly differing chemical composition may grow in the body of an old mineral or mineral aggregate. A.G.I. b. The processes by which one mineral is replaced by another of different chemical composition owing to reaction set up by the introduction of material from external sources. Holmen, 1920. Practically simultaneous solution and deposition, through small openings, usually submicroscopic, and mainly by hypogene water solutions, by which a new mineral of partly or entirely different composition may grow in an old mineral or in an old mineral aggregate. A.G.I.

metastasomatosis. A rock in which one mineral has completely replaced another, or certain minerals have completely replaced others, producing an entirely new composition. A.G.I.

metasome. A mineral developed within another mineral. Fay; Webster Ed.

metasomatism. See metasomatism.

metastable. A state of pseudoequilibrium which has a higher free energy than the true equilibrium state, yet does not change spontaneously. ASM Gloss.

metastable phase. The existence of a substance as a solid, liquid, or vapor under conditions in which it is normally unstable in that state. Hacky's Chem. Dict.

metaterraeophile. Monoclinic FeO(PO4)3,5H2O, a morphophase, called orthorhombic; synonymous with phospha-teraeophile; clisomagite. Spencer 19, M.M., 1953.

metathesis. The name given to a group of chemical reactions: (1) single replacement, (2) double decomposition (or double replacement), and (3) neutralization. Gas.

metatorbernite. A strongly radioactive, tetragonal, pale green to dark green mineral, Cu(UO2)2(PO4)2.8H2O, one of the most common supergene uranium minerals; a secondary mineral, or perhaps a low-temperature hydrothermal mineral. Crosby, pp. 28-29.

metawater. Water under great pressure. Also called nontamorphism due to steam or boiling water under reat pressure. Also called metamorphism; thermal metamorphism.
meteoric water

meteoric water is the only class of impor-
tance. Lewis, p. 630. See also ground-
water.

methane. A naturally occurring mass of mat-
ter that has fallen to the earth's surface
from outer space. A.G.I. Supp.

meter: meter. a. An instrument, an apparatus,
or a machine for measuring fluids, gases, elec-
tric currents, etc., and recording the results
obtained; for example, a gasimeter, a
diameter, a wattmeter, or an air meter. Standard,
1964. b. The fundamental unit of length
in the metric system. Originally defined
as ten millionths of the distance on the
earth's surface from the pole to the equa-
tor. Now defined as the distance between
two lines on a certain metallic rod
preserved in the archives of the Inter-
tional Metric Commission at Paris. Standard,
1964. Its value is equal to 39.37079 inches or
3.2808 feet.

metering pin. A valve plunger that controls
the rate of flow of a liquid or a gas. Nice.

metering pump. A portable, high-precision
pump developed by U.S. Bureau of Mines
engineers for use in studies of rock and gas
pressure changes. Small enough to be car-
ried in a coat pocket, the hand-operated
pump also meters, without leakage, the
fluid—usually mercury, glycerin, or oil—
that must be added to or withdrawn from
a cell to obtain a desired pressure. Bureau
of Mines Staff.

meter oil. An oil of low cold-test, like the
light lubricating oil from Texas crude oil.
Fay.

methanal. See formaldehyde. CCD 64, 1961.

methane. CH,. Carburated hydrogen or marsh
methane. CH,, carbureted hydrogen or marsh

methane drainage. Three main systems of

methane indicator. A portable instrument to
monitor the methane content in a given area. The
indicator is so devised that its direct-reading scale. The compact
methane indicator is carried in a leather case with
shoulder straps. Used in mines, manholes,
and similar areas subject to methane gases.
Nelson, p. 587.

methane monitoring system. A system where-
by the methane content of the mine air is
indicated automatically at all times, and
when the content reaches a predetermined
concentration the electric power is cut off
automatically from each machine in the
affected area. The mechanism is so devised
that its setting cannot be altered. The
system is used, mainly, in conjunction with the
operation of continuous miners and
power loaders Nelson.

methaneophane. An instrument for detecting
methane in mine air. It contains an electric
battery that sustains a small electric glow
light. As soon as a certain percentage of
methane in a given area, the incandescent
light filament is melted and starts a bell
ringing continuously. Fay.

methane recorder. An instrument which gives
a continuous record of the methane con-
centration over a period of time. Roberts,
I, p. 63.

methane removal. See water infusion method.

methane tester. A fireproof detector. See also

methane tester type S.3. A nonautomatic fire-
damp detector approved under: the Regula-
tions for use of these mines. The instrument
is normally calibrated at 1 percent meth-
an, and this provides an accuracy of plus
or minus 0.05 percent. Calibration of the
most important part of the scale, that is, 0.75 to
1.5 percent, it weights 3/4 pounds and the
source of power is an Edison cell lamp
battery. Developed by Mines Safety Appli-
cances. Nelson.

methanol. A mixture of methyl acetate and
acetone. Used as a fuel, as a solvent, and
also known as methanol, which is the
lowest member of the alcohol series. Also
known as wood alcohol, since its principal
source is the destructive distillation of
wood. API Glossary.

methanol. A straule-colored liquid,
CH3OH, with a specific gravity of 3.52
at 16° C, a melting point between 6°
and 7° C, a decomposition point of 180° C,
and a refractive index of 1.756. Used as
a component of refractive index liquids
and as a specific-gravity mineral separa-
tions. A.G.I.

methanol lode. CH3. OD. See coal. CCD 64, 1961.

methane. CH,. Carburated hydrogen or marsh
methane. CH,, carbureted hydrogen or marsh

methane. CH,. Carburated hydrogen or marsh
methane. CH,, carbureted hydrogen or marsh

methane. CH,. Carburated hydrogen or marsh
methane. CH,, carbureted hydrogen or marsh
Mettlach tile

Mettlach tile. A vitreous floor tile (especially of the multicolored type) as first made at Mettlach, in the Saar. The term (often misspelled Metlach) is now commonly used on the Continent and in Russia for any vitreous floor tile. Dodd.

Mexican agate. Banded calcite or aragonite. Shipley.

Mexican amber. Fossil resin from Mexico, related to San Domingo amber. See also amber. Shipley.

Mexican amethyst. Amethyst of a distinctive reddish-purple color from Guanajuato, Mexico. Shipley.

Mexican diamond. Rock crystal. Shipley.

Mexican onyx. A variety of aragonite, chiefly from Toccall, Mex., used for interior decorations. Standard, 1964. See also onyx marble. Fay.

Mexican opal. a. Any opal from Mexico. Shipley. b. An almost transparent, whitish, very pale red or yellow precious opal, often with a bluish cast. Specific gravity, 1.98 to 2.03. Also see fire opal. Shipley.

Mexican tile. A term sometimes applied to roofing tile of semicircular cross section. Shipley.

Mexican turquoise. a. A light-blue to green-blue, translucent and bluish-green turquoise from New Mexico. Shipley. b. A correct but little-used name for genuine turquoise from the central part of Lower California. Shipley.

Mexican water opal. A term applied to translucent to almost transparent opal variety from Mexico with vivid play of color. Shipley.

BuMin Style Guide, p. 60.

mi Abbreviation for mile. Zimmerman, p. 69.

miargyrite. A sulfide of antimony and silver, AgSbS. Skow.

micaceous iron ore. Hematite in which the rock constituents sometimes project into cavities. Also, characteristic of, pertaining to, or occurring in such cavities. Fay.

micaceous. Composed of, resembling, or pertaining to mica. Mica is a mineral with a characteristic shape and texture. The percentage of mica generally appears highest in rocks and minerals that were once occupied by sulfides. The true composition may be judged correctly by looking at the square broken edges. See also schist. Fay.

mica slate. A slate composed chiefly of fine mica. Fay.

mica schist. A foliated, crystalline metamorphic rock composed of alternating layers of quartz and mica in various proportions. micaschist is characterized by an abundance of mica sheets or plates which are relatively thin and often transparent.

mica trap. a. An English field name for a dark dike rock high in mica content. Fay. b. The development, in a rock, of mica as a secondary mineral. A.G.I.

mica trap. b. The development, in a rock, of mica as a secondary mineral. A.G.I.

mica. A group of phyllosilicate minerals having similar chemical compositions and highly perfect basal cleavage; monoclinic. Mica is one of the best electrical insulators. Biotite, lepidolite, muscovite, and phlogopite are the most important varieties of mica.

micaramic. A material consisting of finely divided natural mica bonded with water-soluble aluminum phosphate. Skow.

micaccelarinite. A material consisting of finely divided natural mica bonded with water-soluble aluminum phosphate. Skow.

micelle. A group of phyllosilicate minerals having similar chemical compositions and highly perfect basal cleavage; monoclinic. Mica is one of the best electrical insulators. Biotite, lepidolite, muscovite, and phlogopite are the most important varieties of mica.

micelle. A group of phyllosilicate minerals having similar chemical compositions and highly perfect basal cleavage; monoclinic. Mica is one of the best electrical insulators. Biotite, lepidolite, muscovite, and phlogopite are the most important varieties of mica.

micelle. A group of phyllosilicate minerals having similar chemical compositions and highly perfect basal cleavage; monoclinic. Mica is one of the best electrical insulators. Biotite, lepidolite, muscovite, and phlogopite are the most important varieties of mica.
michenerite. A palladium bismuthide, cubic
michigan. A highly altered ferruginous rock, usually consisting of very fine silt or clay matrix.

michigan cut. a. In the United States a cut
michigan tripod. A drill structure consisting of three barked timber poles of pine or fir, with the sheave aligned over the hoisting clevis, and the poles are placed in a raised position.

michigan jasper. A highly altered ferruginous rock, usually consisting of very fine silt or clay matrix.

michigan cut. b. A sedimentary rock consisting of relatively coarse, sharply angular fragments of rock, with pyrite structure, probably PdBi₂, occurring in the United States.

michigan tripod. A drill structure consisting of three barked timber poles of pine or fir, with the sheave aligned over the hoisting clevis, and the poles are placed in a raised position. The tripod is high enough to provide a clear view of the ground.

micellar or molecular (Lumiere and Staudinger), optimum concentration. Colloids are either microbubbles or agglomerates of microbubbles as small as possible. Micelle structure which contains amphipathic ions. The boundary between micellar and molecular colloids is indistinct.

michigan jasper. A highly altered ferruginous rock, usually consisting of very fine silt or clay matrix.

michigan tripod. A drill structure consisting of three barked timber poles of pine or fir, with the sheave aligned over the hoisting clevis, and the poles are placed in a raised position. The tripod is high enough to provide a clear view of the ground.

micelle. Limestone consisting of microcrystalline calcite with less than 1 percent allochems. A.G.I. Supp.

micrite. Limestone consisting of microcrystalline calcite with less than 1 percent allochems. A.G.I. Supp.

mich相同的活性可能对化学反应的进行有影响。

michigan cut. b. A sedimentary rock consisting of relatively coarse, sharply angular fragments of rock, with pyrite structure, probably PdBi₂, occurring in the United States.

michigan tripod. A drill structure consisting of three barked timber poles of pine or fir, with the sheave aligned over the hoisting clevis, and the poles are placed in a raised position. The tripod is high enough to provide a clear view of the ground.

micelle. Limestone consisting of microcrystalline calcite with less than 1 percent allochems. A.G.I. Supp.

michigan cut. b. A sedimentary rock consisting of relatively coarse, sharply angular fragments of rock, with pyrite structure, probably PdBi₂, occurring in the United States.

microfractional coal. Coal composed of compact macerated mass of vegetable debris, such as durain, cannel, algal cannel, and boghead. Tombokie, 1954.

microgas survey. A prospecting method which seeks to locate oil by the detection, in soil samples, of gases such as ethane, propane, and butane as evidence of leakage in the vicinity of oil pools. Methane is not significant as it is also formed by the decomposition of vegetable matter. Compare geochemistry. Nelson.

micrograph. a. A photograph of a microscopic object; a photomicrograph. b. The magnified object as seen through a microscope. Dodd.

microgram. One-millionth of a gram; abbrev. mg. ASM Gloss.

microgranitic. See microgranular; microcrystalline. Fay.

micrographic. Having the composition and microscopic texture. A distinctive rock texture in which the simultaneous crystallization of quartz and alkali feldspars in the vicinity of oil pools. Methane soot is abundant and occurs in large quantities in Gondwana. It is most wana coals and in

microinch. One-millionth of an inch; abbrev. mil. ASM Gloss.

microhm. One microhm equals 10^(-6) ohms. ASM Gloss.

microiog. a. A mineral which is essentially a pyrocalcite which contains CaCO₃, but which frequently contains niobium, fluoride, and a variety of bases. It crystallizes in the cubic system C.T.D. Dana 17. Also, it is a member of the pyrochlore-microbite series; its radioactivity ranges from weak to moderately strong. It may be distinguished from crystals by being transparent, light- or dark-colored, and by the fact that one can determine some of the optical properties, such as anisotropism, refractive index, etc. Schieferdecker.

microlith. One of the microscopic isolated needle- and red-shaped bodies found in vitrophyic rocks. Standard, 1964.

microlithotype. A term introduced by C. A. Seyler in 1954. It designates in the microcosm of humic coals a band which is generally glasy, hyalopilitic, or ulvöphyric, and in which the simultaneous crystallization of quartz and alkali feldspar have occurred in the vicinity of oil pools. Methane soot is abundant and occurs in large quantities in Gondwana. It is most wana coals and in Carboniferous coals of the U.S.S.R. It is most abundant in coals with red- or yellow-colored or of high rank in which exinite cannot be recognized, and may occur in very pure, microconchic or alginite, but which frequently contains niobium, fluoride, and a variety of bases. It crystallizes in the cubic system C.T.D. Dana 17. Also, it is a member of the pyrochlore-microbite series; its radioactivity ranges from weak to moderately strong. It may be distinguished from crystals by being transparent, light- or dark-colored, and by the fact that one can determine some of the optical properties, such as anisotropism, refractive index, etc. Schieferdecker.

microlite. A term frequently applied to minerals which are small or primary. The microlites consist of an aggregate of differently sized grains which are generally glasy, hyalopilitic, or vitrifiable; they are often distinguished by optical properties, such as anisotropism, refractive index, etc. Schieferdecker.

micromeritics. Study of crystalline structures on a microscopic scale. Pryor, 3rd.

micrometer theodolites. See vernier-reading manometer. Roberts, I., p. 35.

micrometer theodolites. Optical microscopes which measure accurately and use micrometer to measure very small dimensions or angles. Used in connection with a microscope or a telescope. There are a great variety of forms, but in nearly all cases, the measurement is made by turning a very fine screw, which gives motion to a scale, a vernier, or a graduated glass plate. Standard, 1964. A term introduced by C. A. Seyler in 1954. It designates in the microcosm of humic coals a band which is generally glasy, hyalopilitic, or ulvöphyric, and in which the simultaneous crystallization of quartz and alkali feldspar have occurred in the vicinity of oil pools. Methane soot is abundant and occurs in large quantities in Gondwana. It is most wana coals and in Carboniferous coals of the U.S.S.R. It is most abundant in coals with red- or yellow-colored or of high rank in which exinite cannot be recognized, and may occur in very pure, microconchic or alginite, but which frequently contains niobium, fluoride, and a variety of bases. It crystallizes in the cubic system C.T.D. Dana 17. Also, it is a member of the pyrochlore-microbite series; its radioactivity ranges from weak to moderately strong. It may be distinguished from crystals by being transparent, light- or dark-colored, and by the fact that one can determine some of the optical properties, such as anisotropism, refractive index, etc. Schieferdecker.

micrometer theodolite. A term introduced by C. A. Seyler in 1954. It designates in the microcosm of humic coals a band which is generally glasy, hyalopilitic, or ulvöphyric, and in which the simultaneous crystallization of quartz and alkali feldspar have occurred in the vicinity of oil pools. Methane soot is abundant and occurs in large quantities in Gondwana. It is most wana coals and in Carboniferous coals of the U.S.S.R. It is most abundant in coals with red- or yellow-colored or of high rank in which exinite cannot be recognized, and may occur in very pure, microconchic or alginite, but which frequently contains niobium, fluoride, and a variety of bases. It crystallizes in the cubic system C.T.D. Dana 17. Also, it is a member of the pyrochlore-microbite series; its radioactivity ranges from weak to moderately strong. It may be distinguished from crystals by being transparent, light- or dark-colored, and by the fact that one can determine some of the optical properties, such as anisotropism, refractive index, etc. Schieferdecker.

micromerodermous, micromeritic. See microcrystalline.
micrometers. The study of very fine particles.

micrometrical. The micropetrological

micron. A unit of length, equal to one-

micron or 10^-6 millimeter; abbreviation, µ. Bennett 2d, 1964.

cron = about 1/25,000 inch. Nelson.

micron or millimeter; abbreviation, µ. A.G.I.

micron or 10^-6 millimeter; abbreviation, µ. Bennett 2d.

micronmeter. A special type of dry-grinding machine in which micronized mica is produced. It consists of a disintegrator that has no moving parts but depends on jets of high pressure superheated steam to reduce the mica to micron sizes. Micronized mica is produced in particle size ranges of 10 to 20 microns and 5 to 10 microns. BuMines Bull. 630, 1965, p. 397.

micronizer. A special type of dry-grinding machine in which micronized mica is produced. It consists of a disintegrator that has no moving parts but depends on jets of high pressure superheated steam for reducing the mica to micron sizes. BuMines Bull. 630, 1965, p. 387.

micronizer mill. Disintegrator, in which feed particles are entrained in a pressure jet (steam or air) and whirled through a cylindrical chamber with sufficient force to break them. Pryor, 3.

micro-organisms. In geological prospecting, may be taken to include bacteria, algae, fungi, protozoa, the relatively small forms of plant and animal life that inhabit soils and natural waters. Haukk, 1964.

micropegmatite. A microscopic intergrowth of two minerals, especially quartz and feldspar, that are mutually interpenetrating and may be cut by a fine quartz vein. Pigeon, 1964.

micropipette. A type of pipette somewhat resembling an injection syringe from which fractions of a milliliter of liquid can be accurately dispensed. Pryor, 3.

microprojector. A portable instrument which projects an enlarged image of the microscopic field. Magnification of 1,000 diameters enables dust samples to be examined with relative ease.

microscope. Optical instrument, the main parts of which are the stand on which is fixed a stage that holds the material under examination; a condenser through which light is transmitted from its source through a hole in the stage for the purpose of viewing transparent matter; a vertical illuminator in the metallurgical or petrological microscope which directs a beam of light down upon an opaque object on the stage, the beam then being reflected up through the system of lenses; a polarizer below the stage or in the incident light beam of the vertical illuminator; an analyzer in the ocular system, which results in objective and ocular or eyepiece, these being carried in a tube which can be focused on the object viewed. The electron microscope views by means of a stream of electrons which are focused by means of a circular magnetic field and acted upon by a magnet acting as an objective under examination. A second magnetic lens acts as the objective and projects an enlarged image of the object upon a photographic plate or upon a cathode-ray tube or upon a photoelectric cell. Standard, 1964.

micropores. Male spores; part of the reproductive organs of many Coal measuring devices. Also called coring.

micropsych. A. a transparently thin section of rock so mounted on a microscope slide that is used for examination, these rays emanate from the microscopic system and record photographs preparatory to examination of the microscope. Gemology, 1964.

microprojector. A thin section of rock so mounted for petrographic examination. Fay.

microscope. An instrument, among other things, for observing the behavior of roof strata and supports. The device is inserted in 4 feet of diameter holes, drilled at selected points, for listening to subaudible vibrations which are known to precede rock failure. Isaacson, p. 172.

microthermometer. A device for indicating the direction, duration, and intensity of microseisms. Also called microthermometric apparatus.

microthermographic. A method of producing a record photographically of the behavior of roof strata and supports. The device is inserted in 4 feet of diameter holes, drilled at selected points, for observing the behavior of roof strata and supports. The device is inserted in 4 feet of diameter holes, drilled at selected points, for listening to subaudible vibrations which are known to precede rock failure. Isaacson, p. 172.

microthermometer. An apparatus for indicating the direction, duration, and intensity of microseisms. Also called microthermometric apparatus.

microthorax. A caving defect, not detectable at magnifications lower than ten diameters, consisting of interdendritic voids. This defect results from contraction during solidification where there is not an adequate opportunity to supply filler material to compensate for shrinkage. Alloys with a wide range in solidification temperature are particularly susceptible. ASTM Gloss.

microspectroscopy. A method of identifying metallic constituents; it consists of drifting off the minute portion to be analyzed, flowing collection over the resulting chips, and transferring the collection together with the chips to a standard carbon electrode for analysis in a standard spectrographic arc. Gaynor.

mikrospores. A. From, relating to, or conducted on the polished surfaces of rocks or minerals. A.G.I. Supp.

microstructure. (presumably approximating the size of the metal or mineral) that is small compared to the stage length in ordinary strain measurements. Hence, not detectable by detection methods; they can sometimes be seen by scraping a slice with a knife under high magnification by a magnifier acting as an eyepiece. Pryor, 3.

microstructure. A. From, relating to, or conducted on the polished surfaces of rocks or minerals. A.G.I. Supp.

microstructure. A. From, relating to, or conducted on the polished surfaces of rocks or minerals. A.G.I. Supp.

microseismic instrument. An instrument, among other things, for observing the behavior of roof strata and supports. The device is inserted in 4 feet of diameter holes, drilled at selected points, for listening to subaudible vibrations which are known to precede rock failure. Isaacson, p. 172.

microseismic movement. A movement characterized by small, faint vibrations of the earth’s crust (usually not exceeding 25 microns) caused, for example by breakers on the coast or by storms far out at sea (up to 3,000 kilometers from the shore). Seyfferdecker.

microseismic rate. The number of microseisms per unit of time. Standard, 1964.

microseismicity. Area in which the earthquake is registered by instruments only. Seyfferdecker.

micromegameter. An apparatus for indicating the direction, duration, and intensity of microseisms. Also called microseismometric apparatus.

micromanometer. A device for indicating the direction, duration, and intensity of microseisms. Also called microseismometric apparatus.

microspectroscopy. A method of identifying metallic constituents; it consists of drifting off the minute portion to be analyzed, flowing collection over the resulting chips, and transferring the collection together with the chips to a standard carbon electrode for analysis in a standard spectrographic arc. Gaynor.

mikrospores. A. From, relating to, or conducted on the polished surfaces of rocks or minerals. A.G.I. Supp.
microstructure

at a magnification greater than ten diameters. A.S.M. Gloss.

microthrowing power. A qualitative measure of the ability of an intraplate solution to deposit metal in a small hole, pore, or crevice having dimensions not exceeding a few thousandths of an inch and with its depth usually greater than one of the other two dimensions. A.S.M. Gloss.

mikromineral. A size of the order of 0.001 micron. Hess.

microsyenite. Intrusive igneous rocks which are the medium-grained equivalents of the syenite or nepheline syenite. Hess.

midAtlantic Ridge. A great mountain range extending the entire length of the Atlantic Ocean, curve around the Indian Ocean, curve around Africa, extend well up into the Pacific Ocean. Mero, p. 103.

Middle Atlantic Ridge. A great mountain range extending the entire length of the Atlantic Ocean, curve around the Indian Ocean, curve around Africa, extend well up into the Pacific Ocean. Mero, p. 103.

mid-Rim. A dividing wall or arch of which the width is one-third of the total thickness, and is central in position. Fay.

mid-bid. Scot. mid-value. A term indicating that the top is one of an inferior product. Schieferdecker.

mid-door. Scot. The middle one of three layers or zones. Fay.

middle cut. A cut on a shaft, or usually a roofcut, which is made not far from the middle of a seam. Fay.

middle cut. A cut on a shaft, or usually a roofcut, which is made not far from the middle of a seam. Fay.

middle cut. A stratum of rock, or more usually soft dirt, near the middle of a coal seam. Fay.

middle cut. A stratum of rock, or more usually soft dirt, near the middle of a coal seam. Fay.

middle cut. A stratum of rock, or more usually soft dirt, near the middle of a coal seam. Fay.

middle cut. A stratum of rock, or more usually soft dirt, near the middle of a coal seam. Fay.

middles. a. That part of the product which is neither clean coal nor mineral nor reject (tailings). It consists of fragments of coal, and shale or slate, as large as millet seeds at the most; the material is often sent back for crushing and retreatment. Nelson. b. In two-component ores, particles incompletely liberated by comminution into concentrate or gangue. In complex ores, in addition to incomplete liberation, there may be multiphase particles of middling or intermediate species which react too feebly to treatment to remain in concentrate or tailing. Fay. m. middlings elevator. An elevator which removes material for further treatment or for an inferior product. B.S. 3552, 1962.

midge. A stratum of rock dividing or separating two seams or beds of coal. Fay.

midge. A stratum of rock dividing or separating two seams or beds of coal. Fay.

mland. The part of the thickness of a wall or arch of which the width is one-third of the total thickness, and is central in position. Fay.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.

milkiness. A property of glass that with which ions migrate. The movement or seepage of ions. Change of position. Migration.
milk-of-lime. A dilute lime hydrate in aqueous suspension and is the consistency of milk. Boynton.
millstone. a. Any of various white stones, as flint, jasper, or dolomite, used for grinding as if by fire, found among prehistoric remains. Standard, 1964.
milky quartz. A quartz in which the color is due to the presence of a small amount of iron and/or metals recovered. Hoffman.
mill. a. An excavation made in the floor or bottom of a stope for further transportation. An opening in the flooding of a stope through which the ore or mineral is passed or thrown downward along the footwall. Fay. To fill a winze, or inferior incline, with broken ore, to be drawn out at the bottom. Fay. b. A passage connecting a stope or mill-head grade. The grade of ore as it comes from the mine and goes to the mill. In calculating it one must make appropriate allowance for dilution. McKinstry, p. 463.
c. To fill a winze, or projection such as waste removal. Pryor, 4.
d. By common usage, any establishment preparatory to smelting and refining. Also called floorwalker; mill shifter. D.O.T. Supp.
mill furnace. An iron furnace for reheating iron that is to be rolled, or welded, under the hammer. Standard, 1964.
mill head. a. Ore accepted for treatment in a concentrator, after any preliminary rejection such as waste removal. Pryor, 4.
b. Assay value, or units of value per ton, in ore accepted for treatment in a concentrator. Pryor, 3.
mill head grade. The grade of ore as it comes from the mine and goes to the mill. In calculating it one must make appropriate allowance for dilution. McKinstry, p. 463.
mill head ore. See mill-head.
mill house. An auxiliary shaft connecting a stope or other excavation with the level below. See also mill, b; glory hole, a.
milliangstrom. One-thousandth of an angstrom; abbreviation, mA. Webster 3d.
milliampere. One-thousandth of an amper; abbreviation, ma. Webster 3d.
millgram. One-thousandth of a gram; abbreviation, mg. Webster 3d.
millipound. One-thousandth of a pound; abbreviation, mp. Webster 3d.
milligram. A unit employed in the gravitational method of geophysical prospecting. It is about one millihenry of the average value of the permeability due to gravity at the earth's surface, that is, 1 gallon = 1 centimeter per second per second. Nelson.
milligram. One unit of mass; abbreviation, mg. Webster 3d.
milligram-hour. A measure of gamma-ray exposure expressed as the product of the equivalent radium content of the source, in milligrams, and the time of exposure in hours. NCB.
millihenry. One-thousandth of a henry; abbreviation, mh. Webster 3d.
millimass unit. The customary unit of measurement for permeability equal to one-thousandth of a darcy. See also permeability. A.G.I. Abbreviation, md. Webster 3d.
milliampere and milliammeter. A milliampere is a milliampere of current, multiplied by the standard time in seconds. The symbol for milliampere is mA.
millimeter. A metric unit of length that equals one-thousandth of a meter; abbreviation, mm. Webster 3d.

millimeter screw micrometer. A precision caliper gage which measures the overall dimensions of unmounted fashioned gems more accurately but less conveniently than dial gages. Shipley.

millimicron. One-thousandth of a micron, usually symbolized as 1 μm. Formerly much used as a measure for the wavelength of visible light. Easily translated into angstroms merely by the shift of a decimal point, since 1 μm equals 10 angstroms. Anderson.

milling. a. In the Lake Superior district, a milling cutter. A rotary cutting tool provided with one or more cutting elements, called teeth, which intermittently engage the work as it is fed past the cutter. ASM Gloss.

b. Removing metal with a milling cutter. ASM Gloss.
c. The act or process of cutting or grinding away a metal object lost in a borehole with a mill or milling bit. Long.
d. Removing metal with a milling cutter. ASM Gloss.

e. In intermittent treatment of ore, as in the amalgamating mill between two cleanups. Fay. v. 3, p. 1523. d. In or to a mill or milling process. Fay.

millisecond. A. In nuclear science; equals one-thousandth of a second; usually symbolized as msec and ms. Webster 3d.

millilitre. A hydrous phosphate of aluminum, calcium, and sodium, CaOAl₂(PO₄)₂·H₂O; mohs; white; fibrous bands resembling chalcedony. Found near Fairfield, Utah. English.

millimeter. A metric unit of length that equals one-thousandth of a meter; abbreviation, mm. Webster 3d.

millisecond. A type of delay cap with a definite but extremely short interval between passing of current and explosion. Nichols.

millisecond-delay cap. A detonating cap that fires from 20 to 500 milliseconds of a second after the firing current passes through it. Nichols.

millimeter. A metric unit of length that equals one-thousandth of a meter; abbreviation, mm. Webster 3d.

Supp. a. An opening or excavation in the earth for the purpose of extracting minerals; a pit or excavation in the earth from which metallic ore or other mineral substances are taken by digging; an opening in the earth made for the purpose of taking out minerals, and in case of coal mines, commonly a worked vein; an excavation properly underground for digging substantial material for suitable excavation and working as a placer mine; the underground passage and workings by which the minerals are gotten together with themselves. Ricketts, i. b. A work for the excavation of minerals by means of pits, shafts, levels, tunnels, etc., as opposed to a quarry, where the material is removed from a coalbed before the taking out of coal.

A mine may be any large source of supply—a learned person becomes a mine of information, a source of wealth is a gold mine, a mine of knowledge is a mine of application. It may be defined as a system of excavations made for the purpose of getting mineral substances (components of the natural state or in solution or suspension). A mine usually involves the employment of persons below ground. It covers the getting of mineral such as coal in solid form and also the getting of a mineral such as salt by the pumping of the mine. The term mine also includes opencast pits, mine buildings, land, structures, and works. In South Wales, mine also applies to ironstone beds and nodules. See also coal mine. Nelson, g. In general, any excavation for gaining, subterranean workings, as distinguished from quarries, placers, and hydraulic mines, and see also. Hess. The distinction between the French terms mine and miniere results entirely from the law, and depends upon the method of working the mine. The former is the more general term, and, ordinarily speaking, includes the latter which signifies the underground workings and surface workings. The word mine in statutes prescribing safety appliances and protection for the miners has been held as including not only a place where pay ore has been discovered, but one where an excavation alone exists, and the cross-measure, heading, an incline communicating with the ore, rock, or coal therefrom. In a military sense, a mine is a subterranean gallery run under an enemy's works, to be subsequently exploded. Compare quarry. Fay. h. Any deposit of mineral or ore suitable for extraction, as an ore deposit. The Federal and State courts have held that the word mine, in statutes reserving mineral lands, included only those containing valuable mineral deposits. In England, the term mine is applied to any seam of coal, as well as to a deposit of ironstone either in thin bands, or in one bed of considerable thickness. Fay. i. The term mine is not intended to signify any and all parts of the property of a mining plant, either on the surface or underground, that contribute directly or indirectly to the mining or handling of coal. Fay, j. i.e., term mine, as applied by quarrymen, is applied to underground workings having a roof of undisturbed rock. It is used in contrast with the open pit quarry. Fay, k. To dig a mine; to get ore, metals, coal, precious stones out of the earth; to dig into as the ground for ore or metal; to work in a mine. Webster 3d. mine is the property of a mining plant, either on the surface or underground, that contribute directly or indirectly to the mining or handling of coal. In statutes relating to mines the word mine is used; (1) in the sense of uncovering the bank of sand, gravel, or talus; (2) included in the meaning of which is the surface designated by a modifying word or phrase as: (1) opencut mine—an excavation for removing minerals which is open to the weather; (2) steam shovel mine—an opencut mine in which steam shovels or other power shovels are used for loading cars; (3) strip mine—a stripping; an opencut mine in which the pit is opened so wide from a coalbed before the coal is taken out; (4) placer mine—a deposit of sand, gravel, or talus from which some metallic ore is extracted; and (5) hydraulic mine—a placer mine worked by means of a stream of water directed against a bank of sand, gravel, or talus; soft rock similarly worked. A quarry from which rock is extracted is taken as a mine even when carried under cover. Mines are commonly known by the metallic or mineral extracted as bauxite mines, copper mines, silver mines, etc. Hess, l. Loosely, the word mine is used to mean any place from which minerals are taken, and which it is hoped may be mineral bearing. Hess, e. By metaphor.
mine cars

requires a rotary dump at the unloading terminal; (2) the rocker dump type, which has a hinged body opened at the bottom; (3) the gable-bottom car, which is shaped like a capital W in cross section; (4) the straight-body type, a special form of a side-dumping car; (5) bottom-dump cars; and (6) end-dump cars, which are commonly used for hand tramming in small mines. See also drop-bottom car; endgate car; solid car. B.C.I.; Kentucky, pp. 211-212; Lewis, p. 88.

mine characteristic. The relation between pressure, p, and volume, V, in the ventilation of a mine of resistance, R, is given by the curve of the equation for a particular mine may thus be plotted on the same axes as the characteristic of a fan. The point of intersection of this curve, termed the mine characteristic, with the pressure characteristic of the fan indicates the pressure and volume at which the fan would work in ventilating that mine. Knowing the volume and pressure, the power and efficiency are obtained. The suitability or otherwise of any fan to any duty can be studied under the effect of pressure drop; the fact in the resistance may be predicted. Roberts, 1, pp. 185-190.

mine characteristic curve. As a graphical aid to the solution of problems in mine ventilation, the mine head (static and/or total) is often plotted against the quantity. This is called the mine characteristic curve, or simply the mine characteristic. Hartman, p. 123.

mine circulating fan. Mines create special problems in proper ventilation. By their isolation from fresh air sources and the presence of dangerous gases and dusts. Large fans are used for the stationary systems, while small portable types provide fresh air in dead-ends and other inaccessible locations. These fans may be driven by electricity or compressed air, and in addition to mine-ground operations, are useful for work in manholes, pipe galleries, etc. As the U.S. Bureau of Mines can furnish specific recommendations concerning special problems. Bests, p. 605.

mine committee. Representatives chosen by the union employees to confer with the company regarding the mine resistance. Also called pit committee. B.C.I.

mine cooling load. The total amount of heat, sensible and latent, in British thermal units of air that must be removed by the air in the working places. Hartman, p. 32.

mine cut. The area from which mineral has been removed. Briggs, p. 23.

mine development. The term employed to denote the ventilation installations in preparing a mine for ore extraction. These operations include tunneling, sinking, ventilating, drafting and raising. BuMines Bull. 419, 1959, p. 76.

mine dial. See miner's dial. Fay.

mine door, air power operated. Mine doors help to keep the air flow in shafts and mine workings. A device that is held "give" to relieve the pressure then close automatically. The doors are mobile and can be set up in any location. They are hinged and closed by a compressed cylinder and are designed to be used when haulage equipment operates on a trolley wire. Bests, p. 79.

mine drainage. See drainage; drain tunnels; water hoists.

mined strata. In mine subidence, the strata lying vertically over the excavated area. Briggs, p. 61.

mine dust. a. Dust from rock drills, blasting, or handling rock. Fay. b. In the quantity inhaled by workers, dust may be classified as swine, harmless, and harmful, though the classification is purely arbitrary. Silica is a dangerous dust; vitreous silica is relatively harmless, and aluminum hydroxide is borderline. Lewis, p. 735. c. Scott. Collected ironstone screenings. Standard, 1964. d. See coal dust. Fay.

mined volume. In mine subidence, the mined area multiplied by the mean thickness of the bed, or of that part of the bed which has been extracted. Briggs, pp. 23-24.

mine fan. a. The main fan for the mine, normally situated at B.S. 3618, 1963, see 2. b. A radial- or axial-flow ventilator. See also fan; ventilation. Nelson.

mine fan signal system. A system which indicates by electric light or audible signal, or both, the slowing down or stopping of a mine ventilating fan. ASA C42:75:1956.

mine feeder circuit. A conductor or group of conductors, including fuses and sectionalizing switches or circuit breakers, installed in mine entries or gangways and extending to the limits set for permanent mine wiring beyond which limits portable cables are used. ASA C42:75:1956.

mine filling. See hydraulic fill. Prior, p. 3.

mine fires. These very dangerous occurrences may arise from spontaneous combustion, the ignition of timbers by gob fires, electric cable defects, or the heating effect of conveyor belts due to friction. Nelson.

mine fire truck. Design to light underground fires in mining operations, this low slung railcar is equipped with water supply and pressure equipment for its fire hoses. When a fire occurs, the car can be sped to the scene along existing rails. The truck is capable of delivering hundreds of gallons of water, depending on the type and model used. Bests, p. 375.

mine foreman. a. The person charged with the responsibility of the general supervision of the underground workings of a mine and the personnel employed therein. In certain states, the mine foreman is designated as the mine manager. U.S. BuMines Fed. Mine Safety Code—Bituminous Coal and Lignite Mines. Pt. 1, Underground Mines, Oct. 8, 1953. b. Generally used to designate that company representative in complete charge of underground operations and legally held responsible for the safety and welfare of all underground employees. He is usually a state certified inspector. B.C.I. See also foreman; bank boss. c. A deputy in metal mines. Nelson. d. An official in charge of plant and associated labor on the surface, for example, screen foreman. Nelson.

minehead. Fitzhead. Webster 3d.

mine heads. In a mine ventilation system, the cumulative energy consumptions are called the mine heads. These heads are in reality pressure differences, determined in accordance with Bernoulli's principle. Hartman, p. 78.

mine hoist. A device for raising or lowering for coal or coke from a mine and for lowering and raising men and supplies. ASA C42:75:1956.

mine inspector. a. The person in charge of the safety department of the mine to determine the safety condition of working areas, equipment, ventilation, and electrical hazards. Westminster Jr. b. Generally used as denoting the state mine inspector as contrasted to the federal mine inspector. B.C.I. See also inspector. c. See metal mine inspector; coal mine inspector. D.O.T. 1.

mine mouth generation. The method is designed to prevent accidents in mine cages caused by overspeeding in hoisting and lowering, ventilation failures, and to increase fire and dust control. May regulate brake speed in the event of an emergency stop. Bests, p. 373.

mine locomotive. A low, heavy, haulage engine, propelled by electricity, gasoline, or steam. Includes steam, oil, and electric locomotive; battery locomotive; trolley locomotive.

mine measures. Forest of Dean. See mine ground. Fay.

mine motorman. In bituminous coal mining, see motorman. D.O.T. 1.

mine opening

mine opening. See opening, c.

mineowner. A whole or part owner of a mine.

Webster 3d.

miner. In metal mining, one who goes through all parts of a mine at regular intervals, looking for fire hazards, loose rock, collapsed headings, and other dangers, and reports conditions to superintendents. Also called firebug; fire inspector; fire patrolman; mine fire patrolman; safety man. D.O.T. 1.

mine pig. Eng. Pig iron made wholly from ore, in distinction from cinder pig. Web-

mine patrolman. In metal mining, one who goes through all parts of a mine at regular
intervals, looking for fire hazards, loose rock, collapsed headings, and other dangers, and
reports conditions to superintendents. Also called firebug; fire inspector; fire patrolman;
mine fire patrolman; safety man. D.O.T. 1.

mine planning. See planning. Nelson.

mine power center. A mine power center is a group of machines and their accessories,
unit complete within a metal enclosure, usually of explosion-proof design, from which low-voltage electrical circuits are taken. I.C. 7962, 1960, p. 22.

mine props. Sections of wood generally small trees that are used for holding up

miner. a. One who mines; a digger for metals and skilled worker of a
trade in mining. b. Any member of the union that is involved in the recovery of a
metal.

mine radio telephone system. A means to provide communication between the dis-
catcher and the operators on the locomo-
tives where the radio impulses pass along the wire and down the telephone pole to the

mineralogy. The microscopic study of min-
erals in general. Synonym for mineralograph,
A.G.I.

mineral. a. An inorganic substance occurring in nature, thought to have an inorganic
origin, which has (1) a definite chemical composition or, more commonly, a characteristic chemical composition, and (2) distinctive physical properties or molecular structure. With few exceptions, such as amorphous (amorphous) and mercury (liquid), minerals are crys-
talline solids. No definition of a mineral
is yet widely accepted; the divergence of views is mainly in regard to applying the term to a group of related substances, such as slagglacie, or reserving it for individual members of such a series or isomorphic group. In a broad nontechni-
cal sense, the term embraces all inorganic and organic substances that are extracted from the earth for use by man, for example, the mineral fuels. Stokes and
Varney, 1955. b. In flotation, the terms
mineral or metallic particles refer back to
the French (mineral, ore), and Spanish (metal, ore) meanings. Both terms refer
to those valuable constituents in the ore
that it is the object of the process to
separate from the nonvaluable constitu-
ents, or gangue. Fay. c. Lake Superior.

mineral dressing. The microscopic study of min-
erals in general. Synonym for mineralograph,
A.G.I.

mineral deposit. a. Any valuable mass of ore. Like ore deposit, it may be used with
reference to any mode of occurrence of
ore, whether having the characters of a
true, segregated, or gash vein, or any other
form. See also ore deposit. Fay. b. A body of minerals matter in ore, on
the earth's surface which may be utilized for its industrial mineral or metal content.
Baten.

mineral dresser. A machine for trimming or
dressing mineralogical specimens. Stand-
ard, 1964.

mineral dressing. a. Physical and chemical concentration of raw ore into a product from
which a metal or other economic material
is segregated, or gash vein, or gash vein.
b. Treatment of natural ores or partly processed products derived from such ores in order to segre-
gate or upgrade some or all of their
valuable constituents, and/or remove those
not desired by the industrial user. Mineral
dressing processes are applied to indus-
trial wastes to retrieve useful by-products.
Fay. e. See also mineral processing.

mineral economics. Study and application of the technical and administrative processes
used in the extraction, control, and finance
connected with the discovery, development,
exploitation, and marketing of mineral
deposits. Fay.

mineral engineering. Term covers a wide field in which many resources of modern sci-
ence find expression. These include: explo-
ration, development, exploitation, and use

mineral entry. The filing of a claim for pub-
lic land to obtain the right to any mineral
it may contain. Craigie, v. 3, p. 3.

mineral facies. Mineral facies comprises all
rocks that have originated under tempera-
ture and pressure conditions so similar
that a definite chemical composition has
resulted in the same set of minerals re-

usually containing considerable extender,
such as alumina. CCD 6d, 1961.

mineralized. Eng. Pig iron made wholly from
ore, in distinction from cinder pig. Web-

mineral blazing. Eng. Pig iron made wholly from
ore, in distinction from cinder pig. Web-

mineral blush. Black pigments made by
grinding and/or heating black slate, shale, coal, or carbon. Fay. Em. Pig for
many inks, coalcoats, surface coatings, etc. CCD 6d, 1961.

mineral blossom. Drusy quartz. Fay.

mineral bluing. A pigment that changes to any of a
number of varieties of iron blue pigments,
resulting in the same set of minerals re-

usually containing considerable extender,
such as alumina. CCD 6d, 1961.
mineral facies

gardless of the manner of crystallization or recrystallization. Synonym for metamorphic facies. A.G.I.

mineral, Synonym for oxide. Tom.

mineral field. Sot. A tract of country in which workable minerals are found; a mineral deposit. A.G.I.

mineral filter. A finely ground, generally inert, cheap mineral substance that is added to such manufactured products as paint, paper, rubber, linoleum, and other materials to give body, weight, opacity, wear, toughness, or other useful properties. See also filter. A.G.I.

mineral granules. Granular inorganic mineral material more than 50 percent of which is naturally included in the No. 35 (300-mesh) sieve. ASTM D1079-54.

mineral inclusions in coal. This term is applied to such minerals as inorganic chemical constituents of the original plant material (that is, plant ash), discrete bands of dirt within the seam, etc. Factors from strata above and below the seam are not included in the term. IHCP, 1963.

mineral interests. Mineral interests in land means all the minerals beneath the surface. Such interests are a part of the realty and the estate in them is subject to the ordinary rules of law governing the title to real property. Ricketty, 1.

mineralization. a. The process of replacing the organic constituents of a body by inorganic fossilization. Standard, 1964. b. The addition of organic substances to a body. Standard, 1964. c. The action of mineralizing; the state of being mineralized. Webster 3d. See also mineralizer. Fay. d. The process of converting or being converted into a mineral, as a metal into an oxide, sulfide, etc. Fay. e. The processes taking place in the earth's crust resulting in the formation of valuable minerals. See also mineralization, ore deposits, secondary, epigenetic ore deposit; epithermal deposit; hydrometasomatism; magnetic segregation deposit; metamorphic aureole; metasomatism; pneumatolysis. Nelson.

mineralizer. a. To change from a metal into a mineral, as iron when exposed to the air. Standard, 1964. b. To impregnate or supply with minerals or any organic compound. Webster 3d. c. To petrify; to promote the formation of minerals. Webster.

mineralized bubbles. Mineralized froth. In flotation, the bubbles which rise from the pulp loaded with particles of desired mineral. They are said to be adherent or matrix-like with the adherent film of particles. Pryor, 3.

mineralized matter. Crushed and loose rock material containing minerals irregularly deposited, from solution. It may be in key or base.

mineralized zone. A mineral-bearing belt or area extending across or through a district. It may be either distinguished from a host or looked at as being wide, the mineralization extending in some cases hundreds of feet from a fissure of contact plane. Compare contact deposit. See also zone, b. E. mineralizer. a. A substance, especially water or other gas, which, when present in solution in magma, lowers the liquidus temperature and the viscosity, aids crystallization, and permits the formation of minerals containing it. A hydrothermal fluid is presumed to be formed by the concentration of such a mineralizer. Also called a mineralizing agent. A.G.I. b. The dissolved vapor in an igneous magma, such as steam, hydrofluoric acid, boric acid, mineralizer. geologic. See geologic mineralizer. Bennett, 2d, 1962.

mineralizing agents. See mineralizer. A.G.I.

mineralizing fluids. Liquids and gases that give rise to mineralization. Bateman.

mineral jelly. A semisolid substance from petroleum that is similar to but cruder than petroleum and that is used as a stabilizer in explosives. Webster 3d.

mineral land. Land more for mining than for agriculture. The fact that the land contains some gold or silver would not constitute it mineral land if the gold and silver did not exist in sufficient quantities to pay to work. Land not mineral in character is subject to entry and patent as a homestead however limited its value for agricultural purposes. Ricketty, 1.

mineral lease. See mining lease. Webster 3d.

mineral line. Eng. A line that carries only mineral, especially coal. Webster 2d.

mineral matter (in coal). The inorganic material in coal. B.S. 1016, 1961, Pt. 16.

mineral monument. A permanent monument related to the processes of deposition. These are very practical guides to the location of ore. The concentration of minerals, ore gangue, or alteration products, may constitute targets for ore search. Lewis, p. 1964.

mineralogical guide. Minerals which are present near that volcano and which are related to the processes of deposition. These are very practical guides to the location of ore. The concentration of minerals, ore gangue, or alteration products, may constitute targets for ore search. Lewis, p. 1964.

mineralogical phase rule. See Goldschmidt's mineralogical phase rule. A.G.I.

mineralogist. One who examines, analyzes, and classifies minerals, and precious stones; isolates specimen from ore, rocks, or matrices; performs physical and chemical tests and makes X-ray examinations to determine composition of specimen and type of crystalline structure; and develops data in mode of origin, occurrence, and possible uses of minerals. D.O.T. 1.

mineralography. The study under the microscope by reflected light of the structure of opaque minerals and ores. A.G.I.

mineraloids. The science of the study of minerals. A.G.I.

mineraloids. Mineral-like constituents of rocks which do not develop enough in chemical composition or in physical properties to be considered a mineral. Hydrocarbons, volcanic glass, and feldspar are classed as mineraloids. Hess.

mineral oil. Oils derived from any mineral source and used in medicine, as a lubricant, and as fuel. Institute of Petroleum, 1961.

mineral paint. Minerals used as pigment, mica, talc, graphite, talc, etc. See also ochers; sienna, a; umber. Fay.

mineral pigments. Mineral materials used to give color, opacity, or body to a paint, stucco, plaster, or similar material. AIME, p. 380.

mineral processing; ore dressing; mineral dressing. The dry and wet crushing and grinding of ore or other mineral-bearing products for purposes of raising concentrate grade; removal of waste and unwanted or deleterious substances from an otherwise useful product; separation into distinct species of mixed chemical and mineralogical attack and dissolution of selected values. Among the methods used are hand sorting, radioactivity, and honeymoon perhaps being added; dense media separation; screening and classification; gravity treatment with jigs, shaking tables, sluices, etc. See also ochers; sienna, a; umber.

mineral province. A region in which the source, age, and regional distribution of a complex of minerals in a sediment are unified. Kesler.

mineral reserves. See reserves. Nelson.

mineral resources. See reserves. Nelson.

mineral rock. Any of a group of resinous or fatty substances deposited in various rocks, such as bitumen and asphalt. Webster 3d.

mineral rights. The ownership of the minerals under a given surface, with the right to enter thereon, mine, and remove them. It may be separated from the surface ownership, but, if not so separated by district conveyance, the latter includes it. Fay.

mineral salt. Mined salt rock, as found in nature. Kaufmann.

minerals. A term used in the classification of ore under the tariff act of 1897. Such minerals are crude or not advanced in value or condition by refining or grinding, or by other processes not especially provided for in the act; or advanced in value or condition by such processes or by other processes not especially provided for in the act. Cf. metal. Minerals in the mineral sequence. The order of deposition
mineral sequence

during formation. A normal sequence is needed to be oxides followed by sulfides and ending with elements, such as gold. Ideal conditions for normal deposits are those which are not subjected to crowding, telescoping, stretching, etc., during the deposition or rejuvenation of mineralizing solutions, effective changes of wall rock along the vein, or any of the similar changes common in ore deposition.

mineral species. a. A homogeneous substance produced by the processes of nature, having a chemical composition, crystal structure, and physical properties which are constant within narrow limits. Anderson. b. Any mineral that can be distinguished from all other minerals by current determinative methods. Stokes and Hines, 1955.

mineral sperm oil. See mineral seal oil.

mineral spring. A spring whose water contains crystallizable paraffins, is easily reduced, brown, or green when viewed by transmitted light. Skow.

mineral streaking. An aggregate of grains of sand or silt, which join the oil-coated particles. These sands are formed when oil has migrated through the fractures of the rock. Minnow.

mineral syntheds. The production of artificial minerals is accelerated by means of addition to the air after this treatment quantities of wall rock along the vein, or any of the similar changes common in ore deposition.

mineral zoning. The phenomenon of a zonal arrangement of mineral deposits outward from an igneous center, with the high-temperature minerals farther from an igneous center, with the high-temperature minerals nearest the source and the low-temperature minerals farther out. Schiederer.

miner. a. A person who takes a contract from the company or owner of the property to produce coal at a certain price per ton. He may employ other workers to do the actual mining under his supervision, or frequently work with a partner. Also called miner, efficiency. D.O.T. 1.

miner’s anemia. Hookworm disease. See also anaemias. Websier 3d.

miner’s asthma. See pneumoconiosis. Webster 3d.

miner’s bar. An iron bar pointed at one end,

miners’ bar. A crew consisting usually of human beings who are thoroughly trained in the use of mine rescue apparatus, and are capable of wearing it in rescue or recovery work in a mine following an explosion, or to combat a mine fire.

miner’s lamp. A name given to a particular type of electric safety hand lamp used in rescue operations. It is equipped with a lens, and the light beam as occasion may require.

mine rock. Any mine track used for general haulage. Fay.

mineral water. A substance outwardly resembling water, presenting a mass of fine interlaced filaments. It is made by subjecting furnace slag, or certain rocks, while molten to a strong blast. Being both fusible and soluble in carbon dioxide, it is easily crackable packing for walls, a covering for steam boilers, etc. Standard, 1964. Compare rock salt. Also called mineral confection, caked salt, and slag wool. Fay.

mine royal. Derb. A gold or silver mine that contains crystallizable paraffins, is easily reduced, brown, or green when viewed by transmitted light. Skow.

mine rescue crew. A crew consisting usually of human men who are thoroughly trained in the use of mine rescue apparatus, and are capable of wearing it in rescue or recovery work in a mine following an explosion, or to combat a mine fire.

mine resistance. a. The resistance offered by a mine to the passage of an air current, or the mine resistance is due to the friction of the air flowing through the top and bottom of the air passages. To overcome this friction, the total ventilating air pressure must be applied against the mine face. Mine resistance is caused by the drag of the air against the mine surfaces and other obstructions. The rougher the mine surfaces and the more the obstructions, the greater the resistance to the flow of air. Kentucky, p. 81. b. Includes any natural ventilation effect present and is calculated from air volume and total pressure. The standard practice in the United Kingdom is to express the resistance of a mine in square feet of equivalent office. Roberts, I, p. 207.

mines. A number of railway cars specially equipped with mine rescue apparatus, safety lamps, first-aid supplies, and other materials, usually maintained by the U.S. Bureau of Mines in various sections of the United States. These cars serve: as movable stations for the training of miners in the use of mine rescue apparatus, and in first aid to the injured; as centers for the promotion of mine safety; as emergency stations for assisting at mine fires, explosions, or other disasters. Similar cars are maintained by a number of mining companies. Fay.

mineral wool. A substance outwardly resembling water, presenting a mass of fine interlaced filaments. It is made by subjecting furnace slag, or certain rocks, while molten to a strong blast. Being both fusible and soluble in carbon dioxide, it is easily crackable packing for walls, a covering for steam boilers, etc. Standard, 1964. Compare rock salt. Also called mineral confection, caked salt, and slag wool. Fay.

mineral white. a. Blanc fixe. Webster 3d. b. Gypsum ground and used in pigments. Webster 3d.

mineral wool. A substance outwardly resembling water, presenting a mass of fine interlaced filaments. It is made by subjecting furnace slag, or certain rocks, while molten to a strong blast. Being both fusible and soluble in carbon dioxide, it is easily crackable packing for walls, a covering for steam boilers, etc. Standard, 1964. Compare rock salt. Also called mineral confection, caked salt, and slag wool. Fay.

mineral wedging. A form of chemical weathering resulting in the formation of new minerals that have much the same aggregate volume as the old ones. These expanding minerals then act as wedges to split adjacent minerals apart. A.G.I.

mineral well. A substance outwardly resembling water, presenting a mass of fine interlaced filaments. It is made by subjecting furnace slag, or certain rocks, while molten to a strong blast. Being both fusible and soluble in carbon dioxide, it is easily crackable packing for walls, a covering for steam boilers, etc. Standard, 1964. Compare rock salt. Also called mineral confection, caked salt, and slag wool. Fay.

mine zoning. The phenomenon of a zonal arrangement of mineral deposits outward from an igneous center, with the high-temperature minerals nearest the source and the low-temperature minerals farther out. Schiederer.

miners. A number of railway cars specially equipped with mine rescue apparatus, safety lamps, first-aid supplies, and other materials, usually maintained by the U.S. Bureau of Mines in various sections of the United States. These cars serve: as movable stations for the training of miners in the use of mine rescue apparatus, and in first aid to the injured; as centers for the promotion of mine safety; as emergency stations for assisting at mine fires, explosions, or other disasters. Similar cars are maintained by a number of mining companies. Fay.

miners’ bar. An iron bar pointed at one end,
miners' bar

713

miners' rules

chisel-edged at the other, used in coal mining. Standard, 1964.

miners' bond. Prior to the middle of the 19th century, mines were operated by a miner's bond, which was a guarantee by the miner in the presence of witnesses, and under its provisions he undertook to serve his master faithfully for a year in consideration of fortnightly payments of wages in accordance with the terms specified. This was known as the Bond or Bondage system. Nelson.

miners' box. A wood or iron box located in or near the working place of the miner in which he keeps his tools, supplies, etc. Required by law in some states. Fay.

miners' coat. A coat of 500 to 1000 pounds of wool or flannel. Fay.

miners' consumption. See pneumoconiosis. Webster 3d.

miners' cramps. Heat cramps. Webster 3d.

miners' devices. Miners use various devices to protect the posted notice from construction. The miner's hood, such as covering it with glass, or folding it in a box and placing the box in a conspicuous place, or putting the notice upon a mound of rocks, folding it and partially covering it with a rock or putting the notice in a tin can. A substantial compliance with the law is sufficient. Ricketts, I.

miners' dip needle. A portable form of dip needle used for indicating the presence of magnetic ores. Also called dipping compass. C.T.D.

miners' hammer. A self-contained mine lamp designed for fixing to the miner's headpiece, of plastic or aluminum alloy, with a 12 volt 0.46 ampere bulb with a light output of about 47.43 lumens. The lamp bulb of 38 lumens output. The headpiece is equipped with an auxiliary bulb rating 4 volt 0.46 ampere. Nelson. b. A lamp for mounting on the miner's cap and receiving electric energy through a cord which connects the lamp with a small battery. ASA C42.85:1956.

miners' inch. a. The miner's inch of water is not a fixed and definite quantity, being measured generally by the arbitrary standard of various ditch companies. It is, however, it is accepted to mean the quantity of water that will escape from an aperture 1-inch square through a 1-inch plank, with a steady flow of water standing 6 inches above the top of the escape aperture; the quantity so determined amounting to 2.74 cubic feet in 24 hours. Fay. b. Inasmuch as the miner's inch is a local term, the flow of the water expressed in cubic feet per second, and where it is desirable, for local reasons, to use the term miner's inch, it shall represent a flow of 1/2 cubic foot per minute. Fay. Compare sluice head. Fay. c. The term is not defined in the law, but is of use in connexion with mineral measurement in another locality. It has been defined as the amount of water that will pass in 24 hours through an opening 1-inch square under a pressure of 6 inches. Ricketts, I. d. The discharge from an orifice 1-inch square under a definite head is a rate of flow. The value of a miner's inch has been fixed by statute in various states as follows: Idaho, Montana, and Oregon, 40 miner's inches are the equivalent of 1 cubic foot per second; in Colorado, the accepted equivalent is 38.4, and, in British Columbia, 35.7. In some parts of California 40 miner's inches to 1 cubic foot per second is used, whereas in the southern part quite generally 50 miner's inches to 1 cubic foot per second is used, regardless of the legal definition. Seeley, I, e. N.Z. A stream of water capable of discharging a fixed and definite quantity of water, etc. Nelson. f. In miner's wick-fed open lamps. Fay. g. An ocular term. See also rescue team. Macy.

miners' key. A lamp. Nelson. a. A Davy safety lamp. Standard, 1964. b. Name given by Captain Savery, in 1702, to his invention of the first practical steam engine, which was used to pump water from underground. Pryor, 3.

miners' lamp. A self-contained mine lamp with handle for convenience in carrying. ASA C42.85:1956, sec. 2.

miners' lamp body. Capsule of rigid, strong materials such as aluminum, vulcanized fiber, glass fiber or plastic, protecting the lens from injury caused by striking objects, large chips, or by striking the head against projecting materials. The caps have a central cushioning shock of blows and a sweat band to absorb perspiration. They are water resistant and may be non-conductive. A front visor shields the face and eyes from overhead glare, and makes the cap suitable for wear in close, confined spaces where a full brim might interfere. Betts, pp. 83, 84.

miners' helmet. Head hat. A hat designed for miners to provide head protection and for holding the cap lamp. Texolex helmets are made of layers of Lancashire cotton fabric, impregnated with phenol-formaldehyde hyrde resin, and molded into shape under high pressure. Headbands are of soft leather or plastic-coated fabric with webbing harness. See also face shield; protective clothing. Nelson.

miners' horn. A horn or metal spoon, used to collect the ore particles in gold washing. Standard, 1964.

miners' right. a. An annual permit from the state, required by law in some states, authorizing the holder to enter and work on certain crown lands. Nelson. b. In California, the right of a miner to dig for precious metals on public lands, occupied by another for agricultural purposes. In Australia, a written or printed license to dig for gold. Fay. c. N.S.W. A document showing that the holder has permission to enter upon certain classes of Crown land to search for gold and minerals and to take possession of such land under certain conditions. It is not a title deed showing that he is the owner of the land, but is a document showing that he has the right to avail himself of the mining laws. New South Wales, p. 95.

miners' rules. Rules and regulations proclaimed by the miners of any district relating to the location, recording and the washing of claims, and the conditions governing a mining claim. It was the miners' rules of the early days of the mining industry that applied. The local mining laws and regulations of 1849 and later are given in vol. 14, 10th
miners' rules

Census of the United States, 1880, compiled by Clarence King. Fay.

mine's safety lamp. See Davy safety lamp. Crispin.

miners salt. An infrequent, local designation for sodium rock salt. Kauzman.

miners' self-rescuer. A small pocket form of gas mask for protection against carbon monoxide, contained in a case, measuring 13 1/2 by 3 3/4 by 7 inches and weighing 15 ounces or itself or 21 ounces including the case. May be used as a small canister with a mouthpiece directly attached to it. The wearer breathes through the mouth, the nose being closed by a clip. The canister contains a layer of fused calcium chloride to absorb the water vapor in the air which decreases the efficiency of the other chemical called hopcalite. The self-rescuer affords protection for 30 minutes, so that when surviving an explosion may be used. A through a mine atmosphere that contains sufficient oxygen but also a fatal percent of carbon monoxide. Lewis, p. 761.

mine's squib. A small tube filled with fine-grained black powder. May vary in burning time from 10 to 20 seconds, depending upon the grade used. In use, the stemming is tamped around a copper needle reaching back into the powder charge. After stemming the hole the needle is removed and the remaining hole acts as a passageway for the squib. Upon lighting and the burning of the ignition match the squib assumes a rocket effect and dart into the air to ignite the face of the powder, Lewis, p. 156.

miners' sunshine. A soft grade of paraffin wax used by miners for burning in lamps. See also sunshine. Fay.

mine's tent. Usually a triangular tent that is suspended from a tree or set up with one center pole. Webster, 3rd.

miners' wax. A refined paraffin wax with a melting point of 116° to 120° F. Compare sunshine. Fay.

miners' wedge. A metallic wedge or plug for stemming or stemming charges. Fay.

mine signal system. Designed especially for use in mines, these signal lights installed at individuals' switches immediately indicate to the operator whether or not he can safely proceed. Green and amber lights work automatically with the movement of the switches. May be used with locally controlled switches, or with those operated by a central dispatcher. Betts, p. 272.

mine skips. Skips, used to bring mined ore to the surface of a mine shaft, can be obtained in various sizes and designs for both vertical and incline shafts. Tip-over models and bottom door dump models are available. Betts, p. 273.

mine static head. The energy consumed in the ventilation system to overcome all flow head losses. It includes all the decreases in total head (supplied from static head) which occur between the entrance and discharge of the system. Hartman, p. 78.

mine superintendent. A colliery manager or group manager. See also superintendent. Nelson.

mine surveyor. The official at a mine who periodically surveys the mine workings and prepares plans for the manager. In Great Britain, the surveyor must possess a Mine Surveyor's certificate of the Ministry of Power. Formerly the mine surveyor carried out all of the duties now performed by the planning department. Nelson. See surveyor for the mine. B.S. 0618, 1966.

mineta. A rock composed chiefly offeldspar and biotite mica, and sometimes with chlorite, quartz, and hornblende. A mica syenite. Fay.

mine teamster. In mining, one who drives horses or mules to haul wagons or cars loaded with coal, ore, rock, or slate under ground or at the surface of a mine. D.O.T. 3rd.

mine timmer chopper. In bituminous coal mining, one who works in the forest, felling, chopping, and sawing trees to be loaded with coal, ore, rock, or slate underground or at the surface of a mine. D.O.T. 1.

mine tins. Tin obtained from veins or lodes, as distinguished from stream tin. Fay.

mine tons. Gross tonnage of ore including waste and unpayable material. Berman.

mine total head. The sum of all energy losses in the ventilation system. Numerically, it is the total of the mine static and velocity heads. Hartman, p. 78.

mine track devices. A variety of track devices to provide adequate safety for haulage trains in mines. Designed to be used in conjunction with switch signals, these devices include electric switch throwers operated by hand contractors on a copper plate, overhead hand controllers, remote control, or switch operators. Other safety equipment includes mechanical switches for gaseous or hot mines, derailing switches forshalv coal mined, and automatic mine-door opening devices. Betts, p. 372.

mine tractor. A trackless, self-propelled vehicle used to transport equipment and supplies and for general service work. ASA C42.85:1956.

minette. An orthoclasite biotite lamprophyre that consists of hornblende, diopside, and pyroxene. Fay.

mines. See mining. Nelson.

mine ventiliation fan. A motor-driven disk, propeller, or wheel for blowing (or sucking) air to provide ventilation of a mine. ASA C42.85:1956. See also ventilation.

mine ventilation system. An arrangement of connecting airways in a mine together with the pressure sources and control devices which produce and govern airflow. Hartman, p. 158.

mine water. Water pumped from mines usually contains impurities, some of which are in suspension, but the majority being soluble cause the water to be hard. The water often contains corrosive agents such as acids or alkalis. Cooper, p. 362.

mine works. Eng. An ironstone mine or workings. Fay.

mine worker. A workman in a mine. Webster 3rd.

minge; mingy coal. Coal of a tender or friable nature. Fay.

mingled ground. Mixed clay and sand or rock. Arkell, p. 53.

mingle. Scot. The vertical timbers of the upper part of a pulley frame, on the top of which the pulleys are fixed. See maidens. Fay.

mink coal; mingo coal; mosh. Coal of a soft or friable nature. Nelson.

miniature current meter. The passage of current through a coil such that a probe on each blade of a propeller type, or each cup of a price-type meter can be detected by the change of electromagnetic resistance between that probe and a distant electrode. A voltage pulse is produced as each blade crosses the electrode, the rate which depends on the velocity of the current is indicated
minimum deviation. The position of a prism in relation to a beam of light where the beam is passing through symmetrically, and, as a corollary, with minimum deviation. By measuring the prism angle (A) and the angle of minimum deviation (D), refractive index may be determined from the formula:

\[ \sin \frac{\Delta}{2} = \frac{A - D}{2} \]

minimum firing current. As applied to electric blasting caps, the limit below which firing will not occur. Franketi, v. 3, Art. 161/10, p. 5.

minimum ignition energy. The minimum ignition energy required for the initiation of a particular flammable mixture at a specified temperature and pressure. I.C. Ricketts, 1967, p. 16.

minimum interfacial energy, law of. The tendency of seed crystals to assume a position on previously formed crystals that is the most stable position as far as forces of crystallization are concerned. This law explains a parallel grouping of crystals and the symmetrical or the parallel arrangement of inclusions in large single host crystals. Hess.

minimum oxygen content. The U.S. Bureau of Mines and other recognized safety and health agencies recommend 19.5 percent as the minimum oxygen content allowable. Hartman, p. 17.

minimum rent. A mine owner acquires the right to work coal by the payment of an annual (or minimum) rent and a royalty to the landowner (the coal or mineral owner). There is no rule regulating the terms of the lease. Fay. c. Includes placer mines in which a claimant has acquired the right to the land according to law or to certain established rules. Rickets, I. c. Title issued by the government for mining purposes will constitute a mining claim. Mining claim and location is the act of appropriating such lands to which the right of exclusive possession and enjoyment by a private person or persons, has been asserted by actual occupation, or by a compliance with the local mining laws, or district rules. Fay.

minimum claim. a. That portion of the public mineral lands which a miner, for mining purposes, takes and holds in accordance with mining laws. Schweikert, v. 3, p. 1525.

mining engineer. a. A man qualified by education, training, and experience in mining engineering. Nelson. b. If qualified and of standing in his profession, a trained engineer with knowledge of the science, economics, and arts of mineral location, extraction, concentration and sale, and the administrative and financial problems of practical importance in connection with the profitable conduct of mining. Usually he is a specialist in one or more branches of his work. He may be in, or one who follows, as a calling or profession, the business of mining engineering. Graduates of technical mining schools are given the degree of engineer of mines and authority to sign the letters E.M. after their names. The letters E.M. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining who have not been graduated in such an institution, as an abbreviation for mining engineer, or mining expert. Fay.

mining compass. An instrument that gives qualitative indications of anomalies of the magnetic field. Schieferdecker.

mining debris. The tailings from hydraulic mining. Also called debris. Fay.

mining dial. See dial. C.T.D.

mining district. a. A section of country usually designated by name, having described or known structural or lithologic boundaries within which mineral is found and which is worked under rules and regulations prescribed by the district mining laws. Fay.

mining engineer. a. A man qualified by education, training, and experience in mining engineering. Nelson. b. If qualified and of standing in his profession, a trained engineer with knowledge of the science, economics, and arts of mineral location, extraction, concentration and sale, and the administrative and financial problems of practical importance in connection with the profitable conduct of mining. Usually he is a specialist in one or more branches of his work. He may be in, or one who follows, as a calling or profession, the business of mining engineering. Graduates of technical mining schools are given the degree of engineer of mines and authority to sign the letters E.M. after their names. The letters E.M. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining who have not been graduated in such an institution, as an abbreviation for mining engineer, or mining expert. Fay.

mining fluids. The water in which the workings are open, and therefore the question whether an enterprise is mining or not is commonly determined by an inquiry as to whether the workings are open or underground. Ricketts, I. d. The indeterminate condition of the project, which permits the entrepreneur to continue mining without an act of incorporation or other like proceeding. Fay.

mining engineer. a. A man qualified by education, training, and experience in mining engineering. Nelson. b. If qualified and of standing in his profession, a trained engineer with knowledge of the science, economics, and arts of mineral location, extraction, concentration and sale, and the administrative and financial problems of practical importance in connection with the profitable conduct of mining. Usually he is a specialist in one or more branches of his work. He may be in, or one who follows, as a calling or profession, the business of mining engineering. Graduates of technical mining schools are given the degree of engineer of mines and authority to sign the letters E.M. after their names. The letters E.M. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining who have not been graduated in such an institution, as an abbreviation for mining engineer, or mining expert. Fay.

mining engineer. a. A man qualified by education, training, and experience in mining engineering. Nelson. b. If qualified and of standing in his profession, a trained engineer with knowledge of the science, economics, and arts of mineral location, extraction, concentration and sale, and the administrative and financial problems of practical importance in connection with the profitable conduct of mining. Usually he is a specialist in one or more branches of his work. He may be in, or one who follows, as a calling or profession, the business of mining engineering. Graduates of technical mining schools are given the degree of engineer of mines and authority to sign the letters E.M. after their names. The letters E.M. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining who have not been graduated in such an institution, as an abbreviation for mining engineer, or mining expert. Fay.

The letters E.M. stand for mechanical engineer, when given by a school, but are often used by men engaged in mining who have not been graduated in such an institution, as an abbreviation for mining engineer, or mining expert. Fay.
mining engineer

mining engineer. That branch of engineer-
ing that is concerned with the discovery, develop-
ment, and exploitation of coal, oil, and minerals. 

mining explosives. High explosives used for 
mining purposes, such as blasting. The term also 
embraces the cleaning, sizing, and dressing of the 
product. Nelson.

mining geologist. The study of geologic 
structures and their occurrence in the form of 
mineral deposits and their discovery. Nelson. 

mining ground. Land on which mining is 
performed. Nelson. See also Mining title.

mining hazards. The dangers peculiar to the 
mining industry, both to the miner and to the 
public. Nelson.

mining head. The mechanism on a continuous 
mining locomotive. A small locomotive for 
mining machine operator. See machine miner. 

mining machine. A coal-cutting 
machine. A device for cutting coal, such as a 
Congress for Mining Qua-
ifications. A board set up in 1936 to 
act as a central agency to sections employing 
track. 

mining machine operator. See machine miner. 

mining machine operator-helper. See machine 

mining machine truck. A truck used for 
transporting shortwall mining machines. 
Track-mounted trucks are necessarily limit-
ated to use in sections employing truck. 

mining machine truck. 

mining operator. A person 
selected to keep a record of all mining 

mining right. Upon a specific piece of ground, 
a right to enter upon and occupy the ground 
for the purpose of working it, either by underground excavations or open 
workings, to obtain from it the mineral 
resources which may be deposited therein. 

mining road. A divining rod. Craigie, v. 3, 
p. 1525.

mining rush. A rush or stampede to an area 
where gold was, or was thought to be, 

mining site. A claim of mining stock. 

mining shield. A cover or canopy for the 
protection of men and machines at the 
face of a mechanized coal heading. Hy-
draulic rams telescope and steer the shield 
forward as the face advances. It enables 
continuous miners to operate with greater 
safety. Developed by the U.S. Bureau of 

mining sluices. An artificial channel or 
passage for water used in mining. Compare 

mining stock. Stock issued by a mining com-

mining stream. A stream made use of in 

mining town. A town that has grown up 
adjacent to a mine or mines. Craigie, v. 3, p. 1525.

mining title. A claim, exclusive prospecting 
license, concession, right, or lease. A grant 
derived under mining laws and regulations to a 
person or group of approved persons 
right to develop and exploit a properly 
delineated area for its mineral wealth. 

mining engineers. Also called mine analy-
sting, all appointed by the Minister for 
more than five years. Nelson.

mining engineer. A person 
selected to keep a record of all mining 

mining retreat. A process of mining by 
which the ore, or coal, is untouched until 
after all the gangways, etc., are opened, 
when the work of extraction begins at the 
boundary and progresses toward the shaft. 

mining title. A claim, exclusive prospecting 
license, concession, right, or lease. A grant 
derived under mining laws and regulations to a 
person or group of approved persons 
right to develop and exploit a properly 
delineated area for its mineral wealth. 

mining width. The minimum width necessary 
for the extraction of coal regardless of the 
actual width of ore-bearing rock. A.G.I. See also Stopping width.
mining with self-filling

minium. The siftings of iron ore after calcination with self-filling. See controlled caving.

minus minerals. Minerals (such as garnets) minus mesh. Portion of a powder sample minus sieve. In powder metallurgy, the portion minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minute of arc. A unit of angular measure equal to the 60th part of a degree and containing 60 seconds of arc. Webster 3d.

minierville. A basic intrusive rock, in essence a dolerite, brown, soda-rich hornblende; named from St. Minver, Cornwall, England. C.M.D.

minyullite. A white, basic, hydrous fluophorite. 

Miracle. Explosive, used in naval mines. Explosive, used in naval mines.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

minus didion. Stakes or points on the far side of the zero point from which a job was originally laid out. Nichols.

plus sieve. In powder metallurgy, the portion plus sieve. In powder metallurgy, the portion
Mississippian

vancement to period rank, and that is now recognized by the U.S. Geological Survey. In the United States, the Mississip- pian is fifth of seven periods in the Paleozoic era, the system of rocks found during this period. A.G.I.

Missourian. Upper middle Pennsylvanian. A.G.I.

mist. Plutonic equivalent of olivine- leucite basalt or olivine-leucite basalt. Mts., a. Plutonic or hypabyssal, and olivine with minor anastole and biotite, accessory apatite, and opaque oxides. A.G.I.

Mistox. Laryl pentachlorphenol in a mist projector. A hose that is not rubber-lined may be proofed against mildew attack by immersion in a 1-per-cent solution of Mistox. Sinclair, 1, p. 282.

mixture. a. The proportion as specified by volume or by weight of the materials, including water, making a batch of concrete, mortar, or plaster. Harwood. A batch after it has been mixed. Dodd.

mixed. Drill diamonds ranging from 23 to 80 per carat. Mixed blast process. A modification of the basic Bessemer process in which all the nitrogen is removed from the blast, the blast being made up of a mixture of oxygen and carbon dioxide or oxygen and superheated steam and especially adapted to smelting high-phosphorus steel. Champion.

mixed chlorates, and perchlorates. Most impor- tant among these are the mixed cements. A product obtained by mixing, or blending, either portland, natural, or pozzolana cement with one another or with other inert substances. Zern, p. 145.

mixed dust. Dust prepared for testing in the mine by mixing coal dust and inert dust in predetermined proportions. The mixture may also contain water, or by weight of the materials, including water, making a batch of concrete, mortar, or plaster. Harwood. A batch after it has been mixed. Dodd.

mixed-explosion. One in which each ingredi- ent, firedamp and coal dust, are present below their lower limits, but in combina- tion proportional to smelting. Also called mixer operator. A.G.I. Supp.

mixed explosives. Such explosives consist of an intimate mechanical mixture of sub- stances which consume and generate oxy- gen but are not in themselves explosive. To this group belong inorganic nitrates, chlorates, and perchlorates. Most impor- tant is ammonium nitrate. Faenkel, v. 3, Art. 16:01, p. 29.

mixed-feed kils. Upright lime kilns in which the fuel (char) is mixed and burned with the limestone charge. Menzer, 4th, p. 235.

mixed-flow fan. A mine fan in which the flow is both radial and axial. The Schicht fan is of this type and has the advantage that it can provide water gage with a single stage. This fan, however, is not well suited to mines where a large change in water pressure is likely to occur. See also axial-flow fan; radial-flow fan. Nelson.

mixed-flow turbine. An inward flow, reaction- type water turbine, in which the runner

vanes are so shaped that they are acted on by the water pressure both radially and axially.

mixed ores. Ores containing both oxidized and unoxidized minerals. See also oxidized ores; sulfide ore. Nelson.

mixed past. Fust consisting of alternating layers of material of distinct origin. Tomskiy, 1959.

mixed-in-place method. One in which the presence of a diurnal wave produced a large inequality in either the high or low water heights, with two high waters and two low of the cutting shoe. Long. A.G.I. Supp.

mixed meat. See Feating and dressing.

mixed-in-place. A method of alternation by which a diurnal wave produced a large inequality in either the high or low water heights, with two high and two low. Nelson.

mixed-in-place mixing. A funnel-shaped hopper attached to the body of a mud mixer and by means of which the dry, powdered, drill-mud ingredients are fed into the mud mixer. See also mud mixer. D.O.T. Sun.

mixer. a. An apparatus used to thoroughly mix water with drilling-mud ingredients. Also called atomizer; mud mixer. Long. b. In the clay industries, the usual types of mixer of are: (1) batch-type mixer, operates by rotating arms; (2) shaft mixer, a continuous mixer for wet or plastic ma- terial which is fed into an open trough along which it is propelled and mixed by one or two two-bladed carrying blades; and (3) pug mill, a shaft mixer with a closed barrel instead of an open trough; the term pug mill should not be confused with pug. See also pug. Dodd. c. See agitator. Nelson.

mixer cona. A funnel-shaped hopper attached to the body of a mud mixer and by means of which the dry, powdered, drill-mud ingredients are fed into the mud mixer. See also mud mixer. D.O.T. Sun.

mix-house man. One who mixes sintered lead or iron ore with such materials as pul- versed coal, coke, salt, skimmings, water, and chemical solutions preparatory to smelting. Also called mixer operator. D.O.T. Supp.

mixing. a. In powder metallurgy, the thor- ough intertwining of powders of different materials (not blending). A.S.M. Gloss. b. An instrumentation tech- nique used in seisnomgraph recording in which a certain portion of the energy from each amplifier channel is fed to the adjacent channels giving results somewhat analogous to those obtained from the use of multiple geophones. A.G.I.

mixing chamber. The port of a torch in which the gases are mixed with the fuel. A.S.M. Gloss.

mixing pit. A pit in which drill mud is mixed and stored until the mud is cured and needed for use as a drill circulation fluid. D.O.T. Sun.

mix-in-place. A common soil stabilization method in which soil on the site is first pulverized, then mixed with an ad- minstration or stabilizing agent, compacted
mix-in-place

and, if necessary, surfaced. All the work is carried out on the site. Nelson. Compare plant mix.

mix-in-place. An emerald-green to blue-green acicu-mizzonite. One of the series of minerals from the munnite- miyashiroite. The hypothetical mix-metal; misch metal. Cerium alloy (55 to 57 percent silica, and occurs in clear crystals in the ejected masses on Mount Somma, Vesuvius, Italy. Also called di- pyre; dipryite. C.M.D.

mixt. The chief tool used in certain systems of mining the cylinders of small shafts through water-bearing strata, to remove the ground from beneath them. See also mobile belt.
mizzonite. One of the series of minerals forming the scapolite group, consisting of a mixture of the normal and manotite molecules. It includes those minerals with 54 to 57 percent silica, and occurs in clear crystals in the masses on Mount Somma, Vesuvius, Italy. Also called di- pyre; dipryite. C.M.D.
mixed Abbreviation for minimum lethal dose. Zimmerman, p. 70.
Mmcf One million (one thousand thousand) cubic feet. Williams.
Mm diammonds. Synonym for manmade diamonds. Long.
Mm Abbreviation for micromicrofarad (one millionth of a microfarad). Also abbreviated mmfd, or µuf. Also abbreviation for magnetomotive force. Zimmerman, p. 69; Webster 3d; BuMin Style Guide, p. 60.
Mn Abbreviation for magnetic north. Zimmerman, p. 65.
mo. A term of Swedish origin applied to gla- cial till. MacKay, p. 89. Also referred to as "cat meat." MacKay, p. 89. Also known as "cat meat." MacKay, p. 89.
mobile Abbreviation for statistic. See also milled.
mobile Abbreviation for statistic. See also milled.
mobile Abbreviation for model. A facsimile in three dimensions—a reproduction in miniature of the under- ground structure. See also milled.
mobile Abbreviation for model. A facsimile in three dimensions—a reproduction in miniature of the under- ground structure. See also milled.
mixed Abbreviation for minimum lethal dose. Zimmerman, p. 70.
mixed Abbreviation for minimum lethal dose. Zimmerman, p. 70.
mixed Abbreviation for minimum lethal dose. Zimmerman, p. 70.
mixed Abbreviation for minimum lethal dose. Zimmerman, p. 70.
Mn Abbreviation for magnetic north. Zimmerman, p. 65.
mo. A term of Swedish origin applied to gla- cial till. MacKay, p. 89. Also referred to as "cat meat." MacKay, p. 89. Also known as "cat meat." MacKay, p. 89.

modified. A treatment in the molten state of aluminum-silicon alloys containing 8 to 13 percent silicon with a small percent per cent of some other elements. By this process the eutectic temperature, structure, and composition are apparently altered. See mechanical properties. ASM Gloss. b. Now also the production of fine graphite in gray cast iron by vacuum treatment. C. D. T.

modified Atkinson formula. As a result of further research, the original Atkinson formula, that is, \( P = K S V A \), has been simplified by grouping together the physical components \( K \) \( S \) \( V \) \( A \) and substituting the term resistance. Therefore, a unit of resistance, known as the Atkinson has been introduced and the modified Atkinson formula may be written as \( P = R Q \), where \( R \) is pressure in pounds per square foot. \( Q \) is the quantity in thousands of cubic feet per second. Therefore, with constant resistance, \( Q = \frac{P}{R} \). Also, if the pressure is constant, then \( Q = \frac{P}{R} \). The modified Atkinson formula is now used in ventilation calculations.

modified California sampler. A California-type soil sampler modified by the addition of a mechanically retractable piston within the barrel, making it possible to recover four consecutive 4-inch samples instead of three to five 12-inch samples. See also California sampler. L. E. P. 

modified longwall. A method used in room-and-pillar mining where the lease requires at least 50 percent of recovery. Basically it consists of turning the rooms on 70-foot centers then working the room up 30 feet wide. See Young's modulus. See also modified Atkinson formula. 

module. a. A device for delivering a definite quantity or discharge of water, or for measuring and controlling the flow. Seeley, l. b. A common unit particularly specified for dimensional coordination. Taylor, c. See module standard.

module factor. Used in conversion of units from one system to another. Formula or constant which defines properties (for example, density, elasticity) of materials. See modular coordination. Dodd.

module of deformation. See modulus of elasticity, ASCE P1826.

module of elasticity. a. A measure of the rigidity of metal; ratio of stress, within proportional limit, to corresponding strain. Specifically, the modulus obtained in tension or compression tests. Also called modulus of rupture or modulus of elasticity of a material in the torsion test. Usually the tangent or secant modulus of elasticity is recommended for materials that deform otherwise. Also called modulus of strain hardening. See rate of modulus change. See also module of elasticity in shear; torsional modulus of elasticity. b. The ratio of stress to strain in a material under given loading conditions; numerically equal to the slope of the stress-strain curve at a specified point; the latter is the slope of a line from the origin to a specified point on the stress-strain curve. Modulus of elasticity is recommended for materials that deform in accordance with Hooke's law, and modulus of deformation for materials that deform otherwise. Also called modulus of deformation. ASCE P1826.

module of elasticity in shear. See modulus of rigidity. Ro.

module of incompressibility. The ratio between the change in the mass of a soil and the change of volume caused by such pressure. Ham, Compares Poisson's ratio.

module of moisture. A brick of such size that, combined with the mortar joint, lays up to fill a 4-inch modular unit. ASCE, T. L. D. 

module of moisture control. A system for the standardization of the dimensions of building components on the basis of multiples of two or more modules, that is, basic units of length. The British Standard

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.

module of plasticity. The stress at which the plastic zone begins.
Mog eago

which estimates to within a few hundredths the weights of brilliant-cut diamonds only, by simple measurements of width and depth of both set or unset diamonds. 

mofette. A vent from which carbon dioxide and some rare gases and oxides issue from the earth in a last stage of volcanic activity. Webster 3d. See also fumarole; solfataras; solfatara.

moffet ore hearth. Ore hearth; used in smelting.

Mohammedan moonstone. native tavorite; almandite. 

Mohorovicic discontinuity. The sharp discontinuity believed to separate the earth's crust under the ocean in order to explain the earthquakes caused by the sudden release of stress conditions. 

Moho. Short name for the Mohorovicic discontinuity in composition between the outer mantle and the inner mantle. Hy.

Mohorovicic dome. In the so-called "dome theory" of crust formation, the dome is an elastic flattening with radial symmetrical expansion of the earth along the lines of the fault planes beneath the dome. This theory predicts that failure of materials is due to failure of the bonds and the shearing of the material at the Mohorovicic discontinuity. Webster 3d.

Mohorovicic rupture hypothesis. A rupture envelope representing stress conditions at the surface of the earth in a last stage of volcanic activity. Webster 3d. See also fumarole; solfataras; solfatara.

Mohr balance. See Westphal balance.

Mohr's salt. A ferrous-ammonium sulfate, FeSO₄·(NH₄)₂SO₄·6H₂O; a light green crystalline salt. Webster 3d.

Mohr's theory. Mohr's theory of failure utilizes the well-known stress circle and the envelope to a family of circles as criteria of failure of materials subject to biaxial or triaxial stress. Thus, Mohr's theory predicts that failure of materials is due to failure in shear, whereas Griffith's theory postulates that it is due to failure at crack tips. Lewis, pp. 607, 611.

moils. Native titanic iron; ilmenite. Fay.

mole. A unit of amount used in the stoichiometry of chemical reactions. 

mole fraction. 

mole point. A solid bar of casehardened steel, used for hitting against rock or concrete, produces full contact with the rock. The effect is that of wedging, similar to plug-and-expose. A.G.I. Supp.

moist. Early term for moisture.

moisture. The quantity of moisture (not removable by mechanical means) or as sensible dampness, 

moisture (not removable by mechanical means). a. The percentage moisture content of a given material. 

moisture allowance. A deduction from the initial weight of washed coal to allow for the expected loss of weight by drainage. B.S. 3372, 1950.

moisture, bed. The total moisture (percent) in a bed of coal before working. B.S. 3552, 1962.

moisture content. a. The percentage moisture content of a solid is the ratio of the weight of moisture divided by the weight of dry soil multiplied by 100. The moisture content of a liquid or mineral sample consists of two portions, namely, the free or surface moisture which can be removed by exposure to air, and the inherent moisture which is entrapped in the fuel, and is removed by heating at 220° F. Nelson. b. Of soils, the ratio, expressed as a percentage, of the weight of water in a soil sample to the weight of the soil when dry. The moisture content of a soil or mineral sample consists of two portions, namely, the free or surface moisture which can be removed by exposure to air, and the inherent moisture which is entrapped in the fuel, and is removed by heating at 220° F. Nelson. 

moisture density test. See compaction test.

moisture density curve. See compaction curve.

moisture equivalent (of soils). The ratio of the weight of water which the soil, after saturation with water, will hold against an effective force of gravity equal to the weight of the soil when dry. The moisture equivalent is stated as a percentage of the weight of water. 

moisture expansion. An increase in dimension or bulk volume of a manufactured ceramic article caused by the retention of water or water vapor. This reaction may occur in service at atmospheric temperature and pressure, but may be accelerated by the exposure of the articles to water or water vapor at elevated temperatures and pressures. A.G.I. 1956.

moisture-holding capacity. The quantity of moisture (not removable by mechanical means) or as sensible dampness, 

moisture-holding capacity but not including visible surface moisture. Bennett 24, 1962.

moisture. a. Essentially water. b. Quantity determined by dry-er in weightless instruments which may vary according to the nature of the material. In the case of coal and coke, the methods shall be those prescribed in the Standard Methods of Laboratory Sampling and Analysis of Coal and Coke, ASTM Designation: D 271 of the American Society for Testing Materials. ASTM D 121-62. b. Agreed percentage of water to be allowed for in sale of mineral products. Deduction for loss of weight of coal in transit, which arises from drainage between colliery and consumer. Pryor, 3. c. A liquid (for example, water) diffused or condensed in relatively small quantity and dispersed through a gas, as either invisible vapor or as visible fog, or in or on a solid body in insensible form or as sensible dampness, or condensed on a cool surface as visible dew; specifically, atmospheric water vapor. Webster 3d.

moisture allowance. A deduction from the initial weight of washed coal to allow for the expected loss of weight by drainage. B.S. 3372, 1950.

moisture, bed. The total moisture (percent) in a bed of coal before working. B.S. 3552, 1962.

moisture content. a. The percentage moisture content of a solid is the ratio of the weight of moisture divided by the weight of dry soil multiplied by 100. The moisture content of a liquid or mineral sample consists of two portions, namely, the free or surface moisture which can be removed by exposure to air, and the inherent moisture which is entrapped in the fuel, and is removed by heating at 220° F. Nelson. b. Of soils, the ratio, expressed as a percentage, of the weight of water in a soil sample to the weight of the soil when dry. The moisture content of a soil or mineral sample consists of two portions, namely, the free or surface moisture which can be removed by exposure to air, and the inherent moisture which is entrapped in the fuel, and is removed by heating at 220° F. Nelson. 

moisture density test. See compaction test.

moisture density curve. See compaction curve.

moisture equivalent (of soils). The ratio of the weight of water which the soil, after saturation with water, will hold against an effective force of gravity equal to the weight of the soil when dry. The moisture equivalent is stated as a percentage of the weight of water. 

moisture expansion. An increase in dimension or bulk volume of a manufactured ceramic article caused by the retention of water or water vapor. This reaction may occur in service at atmospheric temperature and pressure, but may be accelerated by the exposure of the articles to water or water vapor at elevated temperatures and pressures. A.G.I. 1956.

moisture-holding capacity. The quantity of moisture (not removable by mechanical means) or as sensible dampness, 

721

MoFe₂O₄: (NH₄)₂SO₄·6H₂O; a light green crystalline salt. Webster 3d.

Mohr's theory. Mohr's theory of failure utilizes the well-known stress circle and the envelope to a family of circles as criteria of failure of materials subject to biaxial or triaxial stress. Thus, Mohr's theory predicts that failure of materials is due to failure in shear, whereas Griffith's theory postulates that it is due to failure at crack tips. Lewis, pp. 607, 611.

moils. Native titanic iron; ilmenite. Fay.

Mohorovicic dome. In the so-called "dome theory" of crust formation, the dome is an elastic flattening with radial symmetrical expansion of the earth along the lines of the fault planes beneath the dome. This theory predicts that failure of materials is due to failure of the bonds and the shearing of the material at the Mohorovicic discontinuity. Webster 3d.

Mohorovicic rupture hypotheses. A rupture envelope representing stress conditions at the surface of the earth in a last stage of volcanic activity. Webster 3d. See also fumarole; solfataras; solfatara.

Mohr balance. See Westphal balance.

Mohr's salt. A ferrous-ammonium sulfate, FeSO₄·(NH₄)₂SO₄·6H₂O; a light green crystalline salt. Webster 3d.
moisture-holding capacity

means] contained by a coal in equilibrium with an atmosphere saturated with water vapor. This is employed in some systems of classification, as a criterion of rank. B.S. 3223, 1960.

moisture in the air-dried sample; inherent moisture. The moisture retained by a coal after it has attained approximate equilibrium with the atmosphere to which it is exposed. B.S. 3223, 1960.

moisture in the analysis sample. The moisture which is retained by the "through 72-mesh B.S. sieve" sample of coal after it has been exposed to the standard atmosphere and has attained approximate equilibrium with it. B.S. 3223, 1960.

mortality. One who determines the moisture content of ores or concentrates by removing a sample from pile or conveyor, using moisture sample. It may be taken before and after drying. D.O.T. Supp.

moisture meter. See atomic moisture meter.

moisture movement. The difference between moisture meter. See atomic moisture meter.

moisture in the analysis sample. The moisture contained in the air-dried sample; inherent moisture, inherent. Moisture not normally removable from coal in air-dried C.O.W. Moisture retained after air-drying under standard conditions. B.S. 3323, 1960.

molar. A strength of solution involving molality. Moles of solute in a solution containing 1 gram-molecular weight of a substance per liter. ASM Gloss.

mold runner. A mold, as distinct from cast, rolled, drawn, or offhand ware. ASTM C162-66.

moldable refractory. A graded refractory material, moistened ready for use and intended for ramming into position in a furnace lining; such a material may be air-hardening. Also known as plastic refractory. D.O.T. Gloss.

moldavite. A specific name for ozocerite or moldavite. Also called moldovite. English. b. A transparent, green, vitreous stone regarded by some petrologists as of meteoric origin and by others as a form of obsidian. Also called moldovite. See also bouteilstein; moldovite.

moldboard. A. A board on which to ram a pattern; a forming board. Standard, 1964. b. A curved surface of a plow, dozer, or grader blade, or other dirt mover, which moves dirt normally composed of iron, spiral, or twisting movement. Nickels, 2.

molded cameo. A cameo produced by casting in a mold such materials as glass, cast iron, or faceted clay. Standard, 1964.

molded clay. A mixture of materials, such as clays and sand, prepared for use in shaping plastic objects. D.O.T. 1.

molding sand. A dry mixture usually of plaster, into which plastic material is poured and pressed. ACSG. b. A form, usually metal, in which glass is shaped. ASTM C 395-66.

molded glass. Glass material which sets in the bottom of an ingot mold after air-drying under standard conditions. B.S. 3323, 1960, p. 2.

molding clay. A complex mixture of materials, such as clays and sand, which are mixed to form a mold or a casting. Standard, 1964.

molding sand. A sand containing sufficient refractory clay substance to bond strongly without destroying the permeability to air and gases when rammed to the degree required. Freeman, b. Sands used in the foundry for making molds are divided into two classes: (1) facing sand, specially prepared mixture used to form the face of the mold, where it will be in direct contact with the cast metal; and (2) backing sand, which fills up the body of the molding box or flask and supports the facing sand. The backing sand consists of f.00r black sand, sand, or black sand, that is, sand that has been in previous use. Osborne, See also foundry sand.

mold lubricant. A substance applied on or into molds to reduce friction or prevent adhesion. ASTM C162-66.

mold mark. Mark or seam on glassware resulting from a mold joint. ASTM C162-66.

mold oil. Liquids, such as oil, soft soap, or worthless paint, which are not absorbed by formwork and are applied over its surface to prevent the adhesion of concrete and thus to facilitate its removal after the concrete has set. See also releasing agent, mold oil.

mold runner. A man or machine who, in old pottery factories, carried filled molds from the making department to the drying room and then returned them to the molding room. Mould runner. A. A person who makes molds for castings. Standard, 1964.
mole

A massive, solid-fill nearshore structure of earth, masonry, or large stone which may be either a breakwater or a pier. Hy. b. An egg-shaped device pulled behind the tooth of a subsoil plow to open drainage passages. Also mole ball. Nichols. c. Colom. Galena. Fay. d. Colom. Sulidates or concentrates consisting principally of galena. g. e. The molecular weight expressed in grams (gram-molecular weight). Critijn. f. Weight in grams of a compound in terms of its molecular weight. A molar solution of sulfuric acid, for example, contains 2 (grams) H2SO4 (sulfuric acid), and 98 (grams) water. Mond. mole ball. Nichols. c. Colom. Galena. Fay. d. Colom. Sulidates or concentrates consisting principally of galena. g. e. The molecular weight expressed in grams (gram-molecular weight). Critijn. f. Weight in grams of a compound in terms of its molecular weight. A molar solution of sulfuric acid, for example, contains 2 (grams) H2SO4 (sulfuric acid), and 98 (grams) water. Mond.

mole mining. A method of working coal seams about 30 inches thick, using a small continuous miner type of machine, which is remote controlled from the roadway and powered by compressed air or diesel. The machine is used to cut and extract sections of coal about 6 feet wide for a distance of 100 yards or so from pillars alongside the roadway. Small ribs of coal, 3 to 6 feet wide, are left between the sections extracted by the machine. The accurate steering of the machine is a critical factor in the new system of mining. See also coal auger; Collins miner. Nelson. mole-pect Abbreviation for mole-percent. Bu. Mol. 60. molbdenum. A silvery-white, very hard, metallic element in the chromium group or group VI of the periodic system. Its physical properties are closely resembling those of iron and its chemical properties are similar to those of a nonmetal. Used for electrodes of metal-evaporation lamps, as wire for winding electric-resistance furnaces, and in steels alloys. Symbol: Mo; isometric; valence, 2, 3, 4, and 6; atomic number, 42; atomic weight, 95.94; specific gravity, 10.27 (at 20° C); melting point, 2,692° C, specific gravity, 6.31 (at 20.5° C) insoluble in water, in hydrofluoric acid, and in hot concentrated nitric acid, in hot concentrated sulfuric acid, and in aqua regia; slightly soluble in hydrochloric acid. As an alloying agent, it increases the hardness and toughness of quenched and tempered steel and it raises the strength of steel at high temperatures. Used in nickel-based alloys that are heat-resistant and corrosion-resistant; in electrodes in electrically heated glass furnaces and foramenthearts; in nuclear-energy applications; for missile and aircraft parts; and as a wire for filaments for metal-evaporation processes and for filaments, grids, and screens in electronic tubes. C.T.B.; Handbook of Chemistry and Physics, 1955 ed., pp. B-2, B-121, B-125. molbdenum borides. MoAl; melting point, 2,150° C. Although its oxidation resistance is poor compared to other aluminum and silicides, it is good compared to molbdenum metal. It is a refractory crucible material for melting certain metals. Lea.

molbdenum borides. MoAl; melting point, 2,150° C. Although its oxidation resistance is poor compared to other aluminum and silicides, it is good compared to molbdenum metal. It is a refractory crucible material for melting certain metals. Lea.

molbdenum carbides. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum cement. MoAl; melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum cements. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum carbides. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum cement. MoAl; melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum cements. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum carbides. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.

molbdenum cements. MoAl, melting point, 2,150° C. It has good oxidation resistance at elevated temperatures; has high melting point, 2720° C; specific gravity, 8.8; and basic MoB, melting point, 2,250° C; specific gravity, 8.4. Lea; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-2, B-121, B-125.
Molybdenum disulfide. A mineral resembling graphite, both in appearance and to the touch. When highly refined and free from inclusions, it has properties that make it a dry lubricant and may be applied in powder form to metal surfaces or used in cutting tools. It has been incorporated in plastics and powdered metal compacts. It is effective at temperatures up to about 1100°C and under high pressure. Osborn.

Molybdenum enamel; molybdenum compound. Molybdenum disulfide. A vitreous enamel of a color ranging from white to pale yellow, according to the proportion of molybdenum disulfide; molybdicoxide; molybdenum trioxide; molybdite. See molybdite. Dodd.

Monel metal. A high-strength, high-temperature alloy containing nickel and copper. It is used in special applications, such as the manufacture of turbine blades and jet engine nozzles. It is resistant to a wide range of corrosive environments, including high-temperature oxidizing and reducing atmospheres. The alloy is known for its combination of high strength, toughness, and resistance to various forms of corrosion. Moreau.

Molybdite. A mineral that occurs as a primary ore of molybdenum. It is a common constituent of molybdenite veins and is often associated with other molybdenum minerals such as wulfenite. It is typically a bluish-gray to greenish-gray color and has a metallic luster. Proctor.

Monel metal. Copper-nickel alloy of high tensile strength, with great resistance to chemical corrosion. Consists of 70 percent copper, 2 to 3 percent iron, 18 to 20 percent nickel, and a small amount of manganese. A little tellurium may be added to improve machinability. Pryor.

Monetite. A pale yellowish mineral with a vitreous luster. It is a secondary mineral, often replacing other minerals in sedimentary rocks. Monetite is known for its use as a gemstone and in decorative and ornamental applications. Moreau.

Mond process. A process for extracting and purifying nickel. It involves the use of a proprietary niobium oxide, with deposition of nickel in the form of a powder or a metal. Mond.

Mond producer, a furnace used for the manufacture of producer gas. Mond.

Moncerite. A mineral that occurs as a primary ore of molybdenum. It is a grayish-white mineral with a submetallic luster. Moncerite is typically found in veins associated with molybdenite and wulfenite. It is often used as a source of molybdenum in metallurgical processes. Proctor.

Monohydric. Having one hydroxyl group. A term used in chemistry to describe substances that contain a single hydroxyl group. Lyon.

Monolith. A single, large piece of rock or other material used as a monument or for other decorative purposes. Monoliths are often used in public and private settings as symbols of strength and durability. Moreau.

Monolithic. Of or relating to a single, solid piece of material. A term used in various fields, such as architecture, engineering, and construction, to describe structures or components that are made from a single material. Moreau.

Monoelement. A mineral that contains only one chemical element. Monoelement minerals are often used as raw materials in various industries, such as jewelry, electronics, and medicine. Moreau.

Monofluoroborate. A compound containing one fluorine atom. Monofluoroborate salts are used as fluxes in welding and soldering processes. Monocarp.

Monomorphic. Having the same form or structure. Monomorphic minerals are those that exhibit a single crystal form or habit. Moreau.

Monopodium. A single-stemmed plant. Monopodium plants are often used in horticulture and landscaping due to their attractive and distinctive appearance. Moreau.

Monoxide. A compound containing one type of element. Monoxide compounds are common in various fields, including chemistry, physics, and materials science. Moreau.

Monosodium glutamate. A white, crystalline compound used as a flavor enhancer in the food industry. Monosodium glutamate is also known as MSG and is often used to enhance the umami flavor of food. Moreau.

Monostich. A term used in poetry to describe a poetic form that has a single meter and a single rhyme scheme. Monostich poetry is often used for its simplicity and directness. Moreau.

Monounsaturated. Containing one double bond. Monounsaturated fats are found in various foods, such as nuts, seeds, and oils, and are known for their potential health benefits. Moreau.

Monotone. Having a single pitch or frequency. Monotone sounds are often used in music and other forms of art to create a sense of unity or focus. Moreau.

Monophonic. Having a single voice or instrument. Monophonic music is often used in various genres, such as classical and folk music, for its simplicity and emotional impact. Moreau.

Monophyletic. Having a common ancestry. Monophyletic groups are often used in biology to describe the evolutionary relationships among species. Moreau.

Monotype. A single type of font or letter. Monotype fonts are often used in various fields, such as graphic design and printing, for their distinctive and elegant appearance. Moreau.

Monotonic. Having a single, consistent trend or pattern. Monotonic functions are important in mathematics and are often used to describe relationships between variables. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.

Monotonic function. A function that is either always increasing or always decreasing. Monotonic functions are important in various fields, such as economics and computer science. Moreau.

Monotonicity. The property of being monotonic. Monotonicity is a fundamental concept in mathematics and is used in various fields, such as economics and computer science. Moreau.
monitor operator

monitor. a. An appliance for mechanically gripping or letting go the rope in rope haulage. Fay. b. block, used on an incline to prevent the cars from running back. Standard, 1964. c. The word monkey prefixed to a technical term means small, thus monkey chute, a small chute; monkey drift, a small drift, usually driven in for prospecting purposes. Fay. d. See casing drive hammer. B.S. 3618, 1963, sec. 3. e. A small, water-cooled, bronze casting in the cinder-notch cooler through which cinder runs from the cinder notch when the bot is withdrawn. Fay. f. A small glass-meltng crucible. Standard, 1964.

monkey board. A single, unrailed, heavy plank, mounted above the drill platform in the derrick or tripod and serving as a walkway or work platform. Long.

monkey cool. See bobbin, a. Fay.

monkey hair. Caoutchouc, or rubber, derived from a milk juice of plants and which fills the cavities of its fibers with water. Also called water monkey. Standard, 1964.

monkey face. A term applied to a chain in which the predominant size of the debris is carried. These skips in which the debris is carried. These supports and haul along the overturning plane. Fay.

monkey gas. 1. An air course driven parallel with a gangway and heading at a higher level. Used where a seam has considerable pitch or dip. Fay. b. A small gangway parallel to a main gangway. L. E. Jones.

monkey glass. A blast furnace, a ster-cooled casting, usually of copper, that is installed inside of the intermediate cooler, and in which is inserted a hand-operating, hooking-hole closure or bot. Henderson.

monkey hair. See dog hole. Zern.

monkey head. A narrow and low passage driven in the coal where miners take refuge while coal is being blasted. Chiefly in northern Pennsylvania. See dog hole. Zern.

monkey heel. A ladder made of saplings in which the partially separated steps rest in the coal. Used by miners in going to and from their breasts in steeply pitching seams. Standard, 1964.

monkey pot. See jockey pot. C.T.D.

monkey roll. The smaller rolls in an array of three. Webster 3d.

monkey shaft. A small shaft raised extending from a lower to a higher level. Fay.

monochlorite. A variety of urtite consisting mainly of nepheline (three-fourths rock) and hastingsite, with minor carnsite, albite, calcite, and accessory apatite and opaque oxides. A.G.I.

Monoller kiln. A tunnel kiln designed for the firing of building bricks; it is mechanically fired from the top with coal, which burns among the bricks as in a Hoffmann kiln. See also Hoffmann process.

Monoller process. The treatment of copper sulphide ores by roasting with sodium sulphate and a strong inorganic oxidant. Fay.

twenty 95.5° C and 120° C and is prepared by crystallizing from a hot 95.5° C, melting point 202° C; specific gravity, 1.96; soluble in carbon disulphide; insoluble in water; unstable, slowly changes to rhomboic form on standing. It may be obtained by simply melting sulfur and allowing it to solidify at 120° C, if pure, or just less than this temperature and it is not pure. Cooper, pp. 277, 278.

monoclinic symmetry. In structural petrology, it may refer to either the movement of a salt, or the direction of tectonic transport. In monoclinic symmetry of fabric there is one plane of symmetry parallel to a, the direction of tectonic transport. A.G.I.

monoclinic system. That system of crystals whose forms are referred to three unequal axes, two intersecting obliquely and the third perpendicular to both the others. Fay.

monogene. Proposed by Naumann and applied to rocks composed of a single crystal, or of several species, for example, dunite. Synonymous with monomineralic. A.G.I.

monogenetic. One in genesis; resulting from one process of formation; said of a mountain range. Webster 2d.

monogenetic gravel. A loose detrital reddish gravelly deposit. Usually contains one or both of the particles is 2 to 10 millimeters; it consists of one type of constituent. C.T.D.

monolith. A free-standing rock of large dimensions, usually used for charging bulled holes and large-diameter (well drill) holes. Nelson.

monobasic. Containing one hydrogen atom replaceable by a metal with the formation of a salt. C.T.D.

monobasic acid. Acid which yields one hydrogen on neutralization, for example, nitric acid, HNO3. Bennett 2d, 1962.

monochromatic. A form of aerial ropeway in which the same rope is used both to support and haul along the overturning slip in which the debris is carried. These rest upon the rope and obtain a sufficient frictional grip on it to be carried up moderate gradients and over pulleys by means of a rope-shaped, saddled, lined wooden, rubber, or composition. The rope is driven by a surge wheel in a similar manner to an endless-roped haulage. See also fixed clip monocable; normal monocable. Sinclair, V, p. 339.

monochromator. A device for producing monochromatic light. Usually applied to a form of spectroscopic which can be adjusted to transmit light from any desired region of the spectrum, but may also be applied to any source of monochromatic light (for example, to a sodium vapor lamp). Pryor, 3.

monochromator. A device for producing monochromatic light. Usually applied to a form of spectroscopic which can be adjusted to transmit light from any desired region of the spectrum, but may also be applied to any source of monochromatic light (for example, to a sodium vapor lamp). Pryor, 3.

monoclinal coast. Coast formed by a monoclinal fold. Schirrheider.

monocline. A monocline fold. Fay. See also monoclines.

monocline. A crystal system in which crystals have one twofold axis, a symmetry plane, or both. Hurlbut.

monocline block. A quarry term, applied to the block of the cliff face by 3 pairs of parallel faces, B of the 12 interfacial angles being right angles, 2 obtuse angles, 3 acute angles, the third perpendicular to both. Fay.

monocline sulfur; prismatic sulfur. Artificial; forms needle-shaped crystals; stable be-
Monometer furnace

lining is used, generally similar to that in a cypula. D.G.S.

monomineralic rocks. A rock consisting essentially of one mineral, for example, dunite or anorthosite. C.T.D.

monomolecular film. See monolayer. Pryor, J.

mononuclear. See unimolecular layer.

Monograna series. The Upper Productive Coal Measures of the Pennsylvania, of which they constitute the highest member. C.T.D.

Monopump. This pump consists essentially of a rubber stator in the form of a double internal helix and a single helix, which roll against each other with a slightly eccentric motion. The rotor maintains a constant seal across the stator area of the pump, giving a positive uniform displacement. The Mono pump is manufactured to two basic conditions. The rotor is made of special abrasion-resistant or non-corroding steel. It is self-priming, the pressure required to start it being eliminated. The length of the stator and rotor provides for a twist of slightly more than 360° with the pump running. Since the gaps between the heads of the rotor and stator are increased so as to provide two or more complete seals in series and the head is then developed in stages. Mason, V. 2., p. 626.

monopyroxene. Any of several pyroxene minerals that crystallize in the monoclinic system. They usually have considerable calcium and may or may not contain aluminum and the alkalis. Preferably called clino.pyroxene. Stokes and Barnes, 1955.

monorail. A relatively new underground transport system in which the cars, or buckets, are suspended from, and run alongside, a single continuous overhead rail or taut wire rope. The monorail is used in coal mines to transport workings. In the past, the gate conveyor and worked-out man ropes. See also overhead monorail transport system. Nelson.

monorail crane. A traveling crane which is suspended from a single rail. Crispin.

monoschematic. Applied to a body of rock or a mineral deposit, the fabric of which is identical throughout. Opposite of macropolyschematic. See also chorismite. A.G.I.

monotonous. An isothermal, reversible reaction in a binary system, in which a liquid on cooling decomposes into a solid and liquid or solid and vapor. It differs from a eutectic in that only one of the two products of the reaction is a liquid. ASM Gloss.

monower. A tower crane which rotates through a full circle and is erected on a fixed base. Ham.

monochrome. An identification hardness testing machine by which measurements are obtained by the use of a single magno-lum with a diamond of five-eighths millimeter in diameter, the degree of indentation remaining constant. Hur-der.

monochromatic hardness test. A method of determining the indentation hardness of materials by measuring the load required to force a spherical penetrator into the metal to a specified depth. ASM Gloss.

monotone. A variant of the French word “monochrome.” A man giving feature to this is the use of two shades of velvet beneath the screen plate. Used extensively in washing talcaceous, tannin, copper and insulating colors and glazed bricks. Mitchell, p. 427.

Monat. Middle or lower Paleocene. A.G.I. Supp.

montebrasite. The name given to montasite, a registered trade name for ozokerite. Shipley.

montebasite. A pyroxene mineral, the chemical composition of a pyroxene consisting of major titanagite and titankanthonblende, olivine, and plagioclase. It may contain biotite and nepheline, with accessory calcite, apatite, sphene, zircon, and opaque oxides. A.G.I.

montebrayite. A melanocratic-olivine essexite consisting of major titanaugite and titanomontasite, olivine, and plagioclase. It may contain biotite and nepheline, with accessory calcite, apatite, sphene, zircon, and opaque oxides. A.G.I.

moche. Characterized by or having little knobs or mounds. Standard, 1964.

montific. Mountainlike; having the shape of a mountain. Fay.

montmorillonite. A. Clay minerals, lacking any theoretical composition of essentially AlSiO(OH)-nH2O. Montmorillonite always differs from the substitutions within the lattice, for example, magnesium, nickel, zinc, iron, phosphorus, or some of the substitutions in the Smurf Mine Staff; Pryor, J. b. A hydrated silicate of magnesium, one of the important minerals of the bentonite group. The chief constituent of bentonite and fuller's earth, (Al,Mg)X( Si40,0).( OH )30. 1 2H20. Standard, 1964.

montmorillonite. A. A rock consisting essentially of volcanic ashes andother minerals, accumulated in a volcano or near a volcano, and occurring in layers. C.T.D. b. A rare, weakly radioactive, orthorhombic, black mineral, (V,Fe)O(OH); often filling interstices in sandstones, associated with hewettite, titanite, phosphates, and a variety of accessory minerals. Seelye, p. 128.

montrealite. A melanocratic-olivine essexite consisting of major titanaugite and titankanthonblende, olivine, and plagioclase. It may contain biotite and nepheline, with accessory calcite, apatite, sphene, zircon, and opaque oxides. A.G.I.

montrosite. A rock consisting essentially of minor titanaugite and titankanthonblende, olivine, and plagioclase. It may contain biotite and nepheline, with accessory calcite, apatite, sphene, zircon, and opaque oxides. A.G.I.

montroit. A. A quartz grain, colored by sample of quartz from a deposit which is covered by sand, or granite into rock. C.M.D. b. A rare, weakly radioactive, orthorhombic, black mineral, (V,Fe)O(OH); often filling interstices in sandstones, associated with hewettite, titanite, phosphates, and a variety of accessory minerals. Seelye, p. 128.

montroydite. Oxide of mercury, HgO. San.

moval. A. A quartz grain, colored by sample of quartz from a deposit which is covered by sand, or granite into rock. C.M.D.

monument. The structure erected to mark the position of a corner. Per this term may be implied. In a legal sense a monument is any physical evidence of a boundary of real property. Seelye, 2.

monument worker. A worker in the stonework industry, a general term applied to any worker connected with the finishing of marble or granite into memorials. D.D.T., 1.

monoxide. A. Clay minerals, consisting essentially of minor titanaugite and titankanthonblende, olivine, and plagioclase. It may contain biotite and nepheline, with accessory calcite, apatite, sphene, zircon, and opaque oxides. A.G.I.

moonstone. A gem stone which is a variety of moonstone. Montgomery jig. A plunger-type jig with the plunger beneath the screen plate. The guiding feature of this jig is the use of two shades of velvet beneath the screen plate. Used extensively in washing talcaceous, tannin, copper and insulating colors and glazed bricks. Mitchell, p. 427.

moonstone. A gem stone which is a variety of moonstone. Montgomery jig. A plunger-type jig with the plunger beneath the screen plate. The guiding feature of this jig is the use of two shades of velvet beneath the screen plate. Used extensively in washing talcaceous, tannin, copper and insulating colors and glazed bricks. Mitchell, p. 427.

moonstone. A. A quartz grain, colored by sample of quartz from a deposit which is covered by sand, or granite into rock. C.M.D.

montnouryite. Oxide of mercury, HgO. San.
moonstone

morgen. The South African measure of land, equal to 640.25 square roods, or 259 square feet, 1.44 acres, or 2,116 English acres. There are 284 morgens to the square mile. Beerstand.

morganite. A rose-colored, alkali-bearing, variety of beryl, of gem quality. Marshalls, Valley of Sahatony, Malagasy Republic; Pala, San Diego County, Calif. English.
morn. The South African measure of land, equal to 640.25 square roods, 92,196 square feet, 1,44 acres, or 2,116 English acres. There are 284 morgens to the square mile. Beerstand.
morrail. A rose-colored, alkali-bearing, variety of beryl, of gem quality. Identical with the previously described veghinite. From Mahartis, Valley of Sahatony, Malagasy Republic; Pala, San Diego County, Calif. English.
morainal apron. Same as apron. Dodd.
morainic. Of, or pertaining to, a moraine. Also called moraineic. Dodd.
moraine deposits. Same as morainic deposits. Dodd.
moraine of recession. A moraine formed in the course of a glacier's retreat. Also called moraine of retreat; retreatal moraine. Standard, 1964.
moraine profonde. Same as ground moraine. Dodd.
moraineic. Of, or pertaining to, a moraine. Also called morainic. Dodd.
moraineic. Of, or pertaining to, a moraine. Also called morainic. Dodd.
moraine deposits. Same as morainic deposits. Dodd.
morainic. Of, or pertaining to, a moraine. Also called morainic. Dodd.
moar. a. A more or less elevated tract of open waste, or barren land, having, as a rule, a rather broad flat, and poorly drained surface, commonly diversified by peat bogs and patches of health. Finch. c. A common term for peat unfit for turf, as opposed to turf, which is dug for fuel. Tomkeieff, 1954.
moarband. Synonym for moorband pan. Fay.
moarband pan; moorpan. Eng. A hard ferruginous clay, or a lode. See also more. Fay.
moar. b. Varieties of brown coal characterized by good cleavage; it breaks into cuboidal or trapezoidal fragments. Tomkeieff, 1954.
moar peat. Peat formed from moss, as moor peat. Fay.
moar. c. A more or less elevated tract of open waste, or barren land, having, as a rule, a rather broad flat, and poorly drained surface, commonly diversified by peat bogs and patches of health. Finch. c. A common term for peat unfit for turf, as opposed to turf, which is dug for fuel. Tomkeieff, 1954.
moar band. Synonym for moorband pan. Fay.
moar peat. Peat formed from moss, as moor peat. Fay.
moor. a. A more or less elevated tract of open waste, or barren land, having, as a rule, a rather broad flat, and poorly drained surface, commonly diversified by peat bogs and patches of health. Finch. c. A common term for peat unfit for turf, as opposed to turf, which is dug for fuel. Tomkeieff, 1954.
moor. b. Varieties of brown coal characterized by good cleavage; it breaks into cuboidal or trapezoidal fragments. Tomkeieff, 1954.
moor band. Synonym for moorband pan. Fay.
moor peat. Peat formed from moss, as moor peat. Fay.
moor. a. A more or less elevated tract of open waste, or barren land, having, as a rule, a rather broad flat, and poorly drained surface, commonly diversified by peat bogs and patches of health. Finch. c. A common term for peat unfit for turf, as opposed to turf, which is dug for fuel. Tomkeieff, 1954.
moor band. Synonym for moorband pan. Fay.
moor peat. Peat formed from moss, as moor peat. Fay.
moor. b. Varieties of brown coal characterized by good cleavage; it breaks into cuboidal or trapezoidal fragments. Tomkeieff, 1954.
moor band. Synonym for moorband pan. Fay.
moor peat. Peat formed from moss, as moor peat. Fay.

Finch. c. A common term for peat unfit for turf, as opposed to turf, which is dug for fuel. Tomkeieff, 1954.
mortal work; a. A fault in pottery resulting from a small local concentration of soluble forming on the surface of the green ware or the biscuit ware. In the green state, the fault may result from a drop of water falling onto it, during the setting for example. In the biscuit state, the fault arises from moisture condensing on the ware during the early stages of firing. 

Mose slates. Slate rocks found in the Upper Devonian strata of north Devonshire and west Somerset, England; extensively quarried for roofing slates. C.T.D.

morslite. A rock containing morsite, a mineral crystallized from a pyrobitumen. Hess.

mosaic. a. A map made from aerial photographs. The individual photographs are set in such a way that a complete picture of the area is obtained. This process is called aerial mosaicking. Hess. 

b. A design formed by small pieces of like pieces of a mosaic. Webster 3d.

c. A design formed by small pieces of like pieces of a mosaic. Webster 3d.

mosaic texture. a. In mineralogy, a texture in which crystal fragments are angular and granular, and appear, in polarized light, like pieces of a mosaic. Schieber- decker. b. In petrology, a granoblastic texture in which the dividing planes between the individual grains are flat or nearly so. Schieberdecker.

mosaicite. A complex zirconium silicate mineral. E.G.T., v. 15, p. 303. White radioactivity, often radium, is often found in it.

mosaicite. A yellow mineral, \(8\text{HgN(Cl}_2\text{SO}_4\cdot \text{MgO}_2\text{CO}_3\cdot \text{H}_2\text{O})\), from El Doctor, Mexico. 

mosquito amethyst. Amethyst containing tiny scaly or platy inclusions of goethite. Shipley.

moss. a. A term used for fractures or fissures in geologic strata; in geology the wavy, as in marmorina. S. M. 1954.

moss agate. A kind of agate containing brown or black mottled dendritic forms, due to the oxides of manganese or iron distributed through the mass. Also called Mocha pebble, Mocha stone. Fay.

moss box. A special feature of the Kind- Chaudron method of shaft sinking. Layers of muck compressed to form a watertight joint between the bottom of the tunnel and the surrounding strata. It is now of historic interest only. Nelson.

moss faltows. Parts of a bog from which the moss has been removed for fuel. Standard, 1964.

mossgold. Gold in dendritic forms. Webster 3d.

moss hag. A pit or slough in a marshy place, especially in places where peat has been cut; also called bog hag, Webster 3d.

mossing. During low water in the Salmon River, Calif., the algae and other plants growing in the stream are gathered, dried, and burned. The ash is piled up, and some gold may be obtained. This process is called mossing. Hess.

mossite. A member of the tapiolate series, Fe-Mn-Na-Ca. See also tapiolite. Dana 7, v. 1, p. 775.

moss Jasper. a. A term sometimes used synonymously with moss agate although Ell- pler defines moss agate almost opposite from packed inclusions. Shipley. b. A regional name for a band of petrified wood with strata of translucent quartz found in Arizona and in New Mexico. Shipley.

mossopale. Moss agate. Webster 3d.

moss silver. Silver in dendritic or filiform form. Shipley.

moss stone. a. Crystalline quartz containing inclusions of green, fibrous crystals, probably asbestos. Shipley. b. Same as moss agate. See also Thetis hair stone. Shipley.
mossy. Like moss in form or appearance; said of certain minerals. Fay.

mossy stone. In gemmology, a stone containing inclusions of moss. Shipley.

mossy zinc. Granulated zinc obtained when the molten metal is poured into cold water. Fay.

mossy zinc, 3d. A straw filled with gunpowder for igniting a shot; a fuse. Fay.

mother coal. A more or less pure carbon that still shows the cell structure of the original plant when viewed under the microscope. It is very soft and has a satin luster. Kentucky, p. 26.

mother conveyor. A term frequently used in connection with conveyors used in gathering service. The mother conveyor receives coal from other conveyors or gathering machines, such as shuttle cars, and delivers it to some central loading point. Jones. See also underground mine conveyors. ASA MH4.1-1958.

mother crystal; mother. A name given to the mass of raw quartz, either faced or rough, as found in nature. AM. 1.

mother gate. a. N. of Eng. The main roadway to a coal face up which men travel, air, power, and supplies pass, and down which coal from the face travels on a conveyor belt. Truth. b. The main gate of a district in longwall conveyor mining. Nelson. c. Eng. The main road of a district off which crossheadings are set away in longwall working. Also called level. SMRB, Paper No. 61.

mother Hubbard blot. A large drag-type or fautallike bit having a long grooved shank, the diameter of which is only slightly less than the width of the cutting edge; it is designed for drilling boreholes in formations that mud-up excessively. Long.

mother liquor. The magmatic rest solution from which a mineral deposit has received its metal content. Schieferdecker.

mother lode. a. The principal lode or vein passing through a district or particular section of country. Fay. b. The great quartz vein in California, traced by its characteristics to Mariposa to Amador. Standard, 1964. See also champion lode. Fay.

mother of coal. See mineral charcoal. Fay.

mother of emerald. A variety of prase; a stone con-

mother of pearl. Iridescent portion of mol-

motor. a. One stage in which produces or imparts motion or mechanical power. Specifically, a machine for producing or causing motion, especially one that acts by transmitting some other kind of energy into mechanical energy, or the energy of position into that of motion; a prime mover, as a steam engine, windmill, water wheel, or reversed dynamo. Standard, 1964. b. A haulage engine used around mines and operating on electricity or compressed air. Fay. c. A mine locomotive. Grove. d. A machine for converting electrical energy into mechanical energy. See also generator. Nelson.

motor benzal. A mixture of the three lower aromatic hydrocarbons, benzene, toluene, and xylenes in the approximate proportions 75, 15, and 10 percent, respectively. Small proportions of other hydrocarbons and impurities may be present, usually less than 10 percent. Franci, 1965, v. 1, p. 302.

motor body. The boxlike portion at the lower end of a coal-cutting machine. Fay.

motor bone. In mining, a foreman who directs the haulage operations underground and at surface of mine. Also called car dispatcher; car distributor; dispatcher; train dispatcher; train turner; keeper. D.O.T. 1.

motor brake. See locomotive brake. 1967.

motor-change man. In anthracite and bituminous coal mining, one who in addition to charging batteries removes and stores storage batteries from electric mine locomotives and replaces them with freshly charged ones. D.O.T. 1.

motor driver. In bituminous coal mining, one who operates a small electric haulage locomotive to haul mine cars underground and at the surface of a mine. D.O.T. 1.

motor enclosure. The structure of end or side (1) open-type construction, employed when the motor is to work in an air current, dust-free engine room (2) screen-protected; the casing is built to protect the windings, but large openings are provided to allow free entry of air; (3) drip-proof; air is allowed easy access to the interior of the motor, but specially shaped hoods or cowls are fitted to prevent water dripping or being splashed into the machine; (4) totally enclosed: all the heat of the motor is radiated from the external surface, sometimes, provided with ribs or fins to increase heat dissipation; and (5) totally enclosed fan-cooled type has an external fan attached to the shaft, the air from which is directed over the outer surface of the motor casing, increasing the cooling effect, and thus enabling a greater capacity to be obtained from a given frame size than would be possible with a plain, totally enclosed design. Nelson.

motor hammer drills. These drills usually have a built-in gasoline engine as prime mover, flushing being provided by the exhaust gases or by compressed air produced in the machine. Total weight varies between 50 and 120 pounds. Motor hammer drills are used for odd-job operations, on forest roads, in Prospecting, etc., where it is not worth while to lay down complete lines on account of transport difficulties or insufficient volume of work. Frankel, v. 1, Art. 8:30, pp. 19-21.

motorized grader. See grader. Nelson.

motorman. The man who operates a haulage locomotive. Jones.

motor truck; lorry. A self-propelled road vehicle. For quarry and open-cast, transport; for smooth operation, adverse road grades should not exceed about 1 in 10. The truck bodies are usually steel, with end, side or bottom discharge, and tilting or dumping being provided by hydraulic cylinder and ram. Where discharge is at a fixed point, an auxiliary hoist is sometimes used for tilting. See also dump truck. Nelson.

motorway. A road designed and reserved for use only by power-driven vehicles. Hem. mottle. The spotted, blotched, or variegated mottling resulting from oxidation of iron compounds in localized patches. C.T.D. mottled iron. Pig iron in which the majority of the carbon is combined with iron in the form of cementite, Fe3C, but in which there is also a small amount of graphite. The fractured pig iron is black, blackish-brown, or blackish-gray, with clusters of dark spots, indicating the presence of graphite. C.T.D. mottled limestone. Limestone with gray branching or anastomosing feltlike
mottled limestone

The reader of this document can expect to find detailed information about geological terms, such as "mottling" which refers to a form of decoration applied to mottled structure. The text also includes terms like "mountain" which can refer to various geological formations. The document provides definitions for terms such as "mottled slate" which describes those in which blotches of red or purplish colors appear on a generally green surface. "Mountain" is a term used in various contexts, from mountain systems to mountainous structures. The text also includes terms related to minerals and their properties, such as "mound wallpaper" and "mounth plate," which are likely related to the natural formation of mounds or the use of mounds in decorative or structural applications.
mouth plate

Fay. b. Scot. An iron plate over the mouth of a borehole. Fay.

movable conveyor. Any of several types of conveyors designed to be moved in a desired position, whether on or above ground; b; shuttle conveyor, b. ASA MH4-1.1958.

movable jaw. The jaw or slip of a safety or feet dam, which can be raised or lowered in or out of or into the body or frame of the clamp either to engage or to disengage the mill roll being run into or pulled out of a borehole. Long.

movable ladder. See man machine. Fay.

moving annual total. In study of process costs (in large or in detail) a series of costs per annum calculated and recorded at regular intervals (usually in monthly financial summaries cross referenced to analyzed detail cost). Twelve months are covered and each month the new month's figures are added and those for the corresponding month of the previous year are removed. Therefore, like periods are always compared and seasonal fluctuations are smoothed out. Abbreviation, M.A.T. Pryor, 3.

moving coil instrument. A coil of very light construction is pivoted so that it can move in the air gap of a powerful permanent magnet; current is led to and from the coil through hair springs, which also retain the moving part in the zero position. A pointer attached to the coil spindle moves across the instrument scale to indicate the magnitude of the voltage or current being measured. Mason, v. 2, p. 406.

moving electrode controller. See liquid controller. Sinclair, V. p. 112.

moving forms. Climbing forms for concrete work, used with great success for the construction of grain silos and similar structures. Ham.

moving grizzly. One in which alternate bars rise to a given height, and the lateral (conveying) movement being built into the mechanism, therefore reducing loss of headroom in conveying and screening. Other types are traveling grizzlies, roll-grill and chain grizzly, Pryor, 3.

moving-iron instrument. This instrument depends upon the movement of a pointer attached to a spindle carrying a piece of soft iron, which may be either of the cylindrical or disk form, under the influence of a field produced by a fixed magnetizing coil. The pointer is restrained in its position of influence by a spring. Mason, v. 2, p. 406-407.

moys. S. Am. Volcanic mud, sometimes carbonaceous; applied chiefly to such occurrences in South America. Standa, 794.

Also called mud lava. Fay.

moyst. A fine-to-coarse-grained, gray, white, or pink igneous rock with a hypautomorphic-granular texture; quartz, orthoclase, cryptoperthite, or microcline, biotite, and hornblende are essential constituents. From Movie Sill, British Columbia, Canada. Johannsen, v. 2, 1932, p. 28.

moyle. An iron with a sharp steel point, for driving into clelts when levering off rock. Zer.

MF Abbreviation for multipole. Zimmermann, p. 72.

M.F.P. jet auger. An auger equipped with cutting blades, designed so that fluid, under pressure, passes through inclined holes just above the blades, washes away the material loosened by the blades, thereby cleaning the inside of the casing without disturbing the material below the bottom of the casing that is to be sampled. Long.

MPG Abbreviation for miles per gallon. Also abbreviated mpg. Zimmermann, p. 207; Webster 3d.

mph Abbreviation for miles per hour. BuMin Style Guide, p. 60.

MPH Abbreviation for miles per hour. Also abbreviated mph. Zimmermann, p. 207; GPO Style Manual, p. 159.

MPP Abbreviation for meters per minute. Also abbreviated mpm or m/mm. Sinclair, I, p. 60.

m.r. Abbreviation for mine run. Zimmermann, p. 70.

MR Abbreviation for mill run. Also abbreviated m.r. Zimmermann, p. 69.

M.R.E. The Mineral Resources Establishment of the National Coal Board, Great Britain. Its prime purpose is to carry out tests and investigations aimed at increasing the efficiency of coal production while maintaining a high level of safety. Nelson.

M.R.E. problemator. This apparatus consists essentially of a suitable tripod and drawing board, to which is attached a proliograph. This is a small ring pointer attached to a nylon cord which is carried on a spring-loaded reel. The reel rotates on a spindle which in turn rotates a smaller pulley and actuates the mechanism by which a slider carrying a marking point moves in sympathy with the ring pointer but to a reduced scale. When in use the board is placed in the plane section to be measured, a sheet of paper is pinned on to it and the ring pointer is moved to a point on the perimeter of the section. As well as measuring cross-sectional areas the apparatus is used to survey mine shafts and to record the positions of pitot-static tubes and vane anemometers when a fixed point survey is being made. Roberts, l. p. 61.

MS Abbreviation for machine steel; margin of safety; medium steel. Zimmermann, p. 65, 68.

M.S.A. all-service gas mask. A filter-type box respirator produced by the Mine Safety Appliances Co. which is approved by the U.S. Bureau of Mines for 2 hours of continuous or intermittent use. A timer is included in the canister, and the position of the hand indicates the time that the canister has been in use; one complete revolution of the pointer indicates that the canister has completed the recommended period of usefulness. If desired, a speaking diaphragm can be incorporated in the facepiece, enabling the wearer to speak to another person or to speak by telephone. McCadden, pp. 61-62.

M.S.A. carbon monoxide detector. An apparatus for estimating the amount of carbon monoxide in mine atmospheres. It consists of a rubber bulb fitted with inlet and outlet valves which circulate the sample of air under test through a detector tube containing pumice stone impregnated with a mixture of fuming sulfuric acid and iodine pentoxide. If carbon monoxide is passed through this detector tube, the gas reacts with the iodine pentoxide, and the iodine which is liberated changes the color of the material in the tube in direct proportion to the amount of carbon monoxide present. The color in the tube is then compared with a color scale of percentages to show the percentage of carbon monoxide present. McCadden, pp. 155-156.

M.S.A. distributor. A higher-air-pressure directional machine which operates in the manner of a white collar and displacer coal dust from the roof and sides. This machine carries two tons of stone dust, and traveling at 11 feet per minute distributes over 2600 pounds of dust per minute. Sinclair, I, p. 259.

M.S.A. melanosometer. This methane indicator is one in which the sample is admitted to flow continuously over the filaments while the determination is being made. In this case two matched filaments form the adjacent arms of the bridge. One of these is specially activated in order to burn the methane while the other filament is inactive and operates at a somewhat lower temperature. This arrangement is designed to compensate for fluctuations in barometric pressure, temperature, humidity, and the presence of carbon dioxide. Facilities for adjustment are provided to compensate for zero drift and change in battery voltage. The meter is provided with two shunts so that two ranges are provided on the scale, 0 to 3 percent by 0.1 division and 0 to 2 percent by 0.02 division. Roberts, I, p. 68.

M.S.A. self-rescuer. The Mine Safety Appliances Company produces this compact, lightweight device which consists of a flexible molded rubber body with a mouthpiece at the top, a hermetically sealed chemical cartridge within the body, and a nose clip. When the self-rescuer is to be used, the seal on the cartridge is broken, a plunger is pushed inward towards the body, and the unit is then ready to use. The self-rescuer can easily be recharged with new hermetically sealed cartridges. It gives protection for 30 to 10 minutes. By a measurement of carbon monoxide present. It is approved by the U.S. Bureau of Mines. McCadden, p. 67.

macc Mean spherical candlepower. Mason.

McA Abbreviation for M-design. Law.

M.S. m-deck core barrel. Synonym for M-design core barrel. Long.
msf

Abbreviation for magnetostriictive force.

BuMin Style Guide, p. 60.

MSP Abbreviation for monodimensional phosphorus; monoclonal sodium phosphates.

MST Abbreviation for mean solar time; mountain standard time. Also abbreviated mst. Zimmerman, p. 67, 71.

M. temperature. The temperature at which martenbite sets to form in an alloy on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

Mt Abbreviation for mountain. Also abbreviated mt. Zimmerman, p. 71.

MTT Abbreviation for mechanical time fuse. Zimmerman, p. 68.

m³ Abbreviation for cubic meter. BuMin Style Guide, p. 60.

m³c Billion cubic feet. Williams.

mu strain Abbreviation for mountain. Also abbreviated Mtn. Zimmerman, p. 71.

muck. a. Stone; dirt; debris. Mason. b. Unconsolidated soils, sands, clays, or gravel contained in surface mining; generally, earth which can be severed and moved without preliminary blasting. Pryor, 3d. c. Useless material; earth or rock which may or may not be mixed with coal or mineral. See also mullock. Nelson. d. (Can.) Rock or coal broken in process of mining. Also used to denote confusion and litter. Hoffmann. e. To excavate or remove muck from. Webster 2d. f. To work hard; to toil. Webster 2d. g. (Scot.) Rubbish; soft, useless material. See also muck; dirt; mullock.

muck iron. Crude puddled iron. Crude puddled iron.

muck saw. A saw using an uncharged blade, usually steel, which runs in a bath of carborundum abrasive. AMJ.

muck shifting. a. Operations concerned with stripping overburden, valuable gravel or sands in exploitation of opencast mineral deposits. Pryor, 3b. Used for extensive earth-moving operations. Doe, 4d.

muck soil. Soil composed of sand, limestone, or mixtures of clay, sand, or gravel, and other material coming from a tunnel excavated by the iron. Fay. i. Mud rich in humus. Nichols. j. Finely blasted rock, particularly from underground.

muck cone. A cone produced by a round of mining. See also muck roll.

muck core. Gray, forge pig iron melted in a puddling furnace, then bailed, squeezed, and rolled. Materials of Industry, 1941, p. 458.

muck boss. In bituminous coal mining, a foreman who is in charge of a crew of loaders whose duty is to load broken rock into cars during the driving of new underground passageways from one part of the mine to another.

muck jacking. a. A laborer who loads broken mineral into trams, or pushes them from stoppage charge to ore cars. Princip. b. One who clears away material, as earth, gravel, rock, from a working area. Webster 3d. c. This term applies more specially to metal mines. See also muck deeper. Fay. d. Who removes the refuse; a local term for work clothes. B.C.J.

muck adorable. a. One who shovels muck into mine cars or onto a conveyor from which mine cars are loaded at some point removed from the working face, or works in a stope (vertical underground opening in which ore can be extracted) into which ore is loaded from chutes from which it is loaded into cars on haulage level below. Also called car filler; rock passer; shoveler. D.O.T., 1d.

muck roll. The first pair of rolls in a rolling mill.

muck saw. A saw using an uncharged blade, usually steel, which runs in a bath of carborundum abrasive. AMJ.

muck core. A cone produced by a round of mining. See also muck roll.

muck soil. Soil composed of sand, limestone, or mixtures of clay, sand, or gravel, and other material coming from a tunnel excavated by the iron. Fay. i. Mud rich in humus. Nichols. j. Finely blasted rock, particularly from underground.

muck cone. A cone produced by a round of mining. See also muck roll.

muck hole. A taphole from which the iron is so pasty that it does not run freely. Fay.

muck mud. a. Generally, any soil containing enough water to make it soft. Nichols. b. A fine-grained, unconsolidated rock of the clay grade, usually with a high percentage of water. The moisture content is less than 0.001 millimeter. Mud is produced by erosion and according to the rocks from which it is derived, it may consist of clay, sand, limestone, or mixtures of these and other materials in any proportion. Nelson.

c. The suspension made by mixing the drill circulation fluid (water) with the fine cuttings produced by the bit when drilling a borehole. The mixture of water or oil with clay, and sometimes other special materials, used as a drill circulation liquid in drilling operations. Also called drill mud. Long.

c. A fluid used for drilling wells. Wrenshall, 3, 1. d. Moist and soft earth, or earby material. A laborer who shovels muck into mine cars. Hoffmann. e. In metal and nonmetal mining, a laborer who shovels ore or rock into mine cars or onto a conveyor from which mine cars are loaded at some point removed from the working face, or works in a stope (vertical underground opening in which ore can be extracted) into which ore is loaded from chutes from which it is loaded into cars on haulage level below. Also called car filler; rock passer; shoveler. D.O.T., 1d.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.

M. temperature. The temperature at which austenite begins to change into martensite on cooling. Specifically for steel, it is the temperature at which austenite begins to change into martensite on cooling. ASM Glossary.
mud cone

733

mud. See also mud volcano. Fay.
mud crack; mud cast. Filling of desiccation cracks in mud, customarily sandstone; genus, arranged in polygonal patterns on under- side of sandstone bed. Pettijohn.
mudcrack. A temporary fissure in clay or lime- stone from which sulfur has been ex- tracted. Bennett 2d, 1962 Add.
mudding off. Commonly thought of as re- duced productivity caused by the pene- trating, sealing, or plastering effect of a drilling fluid. Actually there is little pene- tration into the capillaries of an ordinary producing formation, and a slight amount of differential back pressure will remove even thick filter cakes. Brantly, 1.
mud drilling. Drilling operations in which a mud-laden circulation fluid is used. Long.
mud engineer. An engineer who studies and supervises the preparation of various fluids and emulsions, collectively termed mud, used in rotary drilling. AGI.
mudfish; mud engineer. In drilling an oil well, the man in charge of the mud pump which forces drilling fluids (mud flush) down to the bottom of the hole. Pryor, 3.
mud flat. A muddy, low-lying strip of ground by the shore, or an island, usually sub- merged more or less completely by the rise of the tide. Fay.
mudflow. A rapidly moving stream of mixed soil or rock and water having the con- sistency and composition of mud. The propor- tions of liquid and solid constituents vary widely. Stoker and Varnes, 1955. See also mudrush; soil creep.
mud fluid. See mud flush; drill mud.
mud flush. a. To clear fragmented materials from a borehole by circulating a mud- laden fluid. See also mud drilling. Long. b. The mud which is kept circulating in the borehole during rotary boring. It is pumped down the inside of the hollow rod and returns to the surface with the return water-soil-cement. (Fossil mud mucks). Standard, 1964. mud logging. A method of determining the presence or absence of oil, gas, and salt water in the various formations penetrated by the drill bit. The drilling fluid and the cuttings are continuously tested on their return to the surface, and the results of these tests are correlated with the depth of origin. Brantly, 1.
mud hopper. One of numerous mud-discharg- ing cones dotting the shallows at the mouth of the Mississippi; upheaved from lower Tensas pressure of surface deposits. Standard, 1964.
mud man. The operator of the valve at the end of the mud hose. Williams.
mud marks. The hardened flowages of mud over a smooth surface, or the same petri- fied (fossil mud mats). Standard, 1964.
mud mapper. A small clamshell-type snapper which is about 11 inches long and weighs 3 pounds. It is attached to the bottom of a sounding lead for means of a hole drilled in the lead. The jaws are cast bronze and are actuated by a spring. The jaws are held open by engaging two trigger pins within the jaws. The mud mapper and sounding lead may be operated in shallow water by hand lowering or by lowering from a bathythermograph or oceanographic winch. HHG.
mud socket. A device attached to drill rods and used to remove or sand from a bore- hole. Compare mule shoe. Long.
mud solution. See drill mud; mud c and d.
mudstone. A fine, more or less sandy argilla- ceous rock, having no flake character, and composed of clay and fine sand. mudstone ratio. The numerical value of the ratio of the total thickness of red mud- stone to the total thickness of argillaceous rock occurring within an assumed stratigraphic horizon. Its value is based upon the premise that uranium-bearing solutions
mudstone trap. Where uranium mineralization is trapped as a mudstone-sandstone interface. Ballard.

mud stream. A mass of moving sediment mixed with water that includes landaules, mudflows, and turbidity currents. Ballard.

mud tank. A large tank or mud system. a. The technique and use of drilling mud as a circulating fluid, which is as clear as glass and colorless. Rand.

mud viscosity. The property of a viscous medium, for example, a mudstone. Salt.

mud sump. Synonym for mud pit. Fay.

mud swivel. A modification of a water manifold to allow coarse drill cuttings to settle. Fay.

mud up. a. The act of process of filling the borehole. Returning circulation fluid to the mud pump for circulation in the borehole. Returning circulation fluid is circulated in a specially designed for use when a mudladden drill fluid is circulated in borehole-drilling operations. Called mud pot. Fay.

mud system. a. The technique and use of drilling mud as a circulating medium in drilling operations. Fay. b. The mixer, sump, piping, and equipment to prepare, maintain, and transport mudladden fluid. Fay.

mud tank. A large tank or reservoir for mixing and storing drilling mud that is fed to the mud pump for circulation in the borehole. Returning circulation fluid is mixed into the tank at the bend opposite the pump suction line to allow coarse drill cuttings to settle. Fay.

mud up. a. The act or process of filling, choking, or clogging the waterways of a bit with consolidated drill cuttings. Also called sludging; shuddering up. Fay. b. The act of process of filling the pores or cracks in the rock surrounding a borehole; also, to cause mud to adhere to the walls of a borehole. Compare mud off. Fay. c. To seal a pot stopper or a joint in a furnace or in a producer gaine, by the application of wet clay. ASTM C162-66.

mud viscosity. The property of a mud-ladden fluid to resist flow due to internal friction and the combined effects of adhesion and cohesion; for example, a Marsh funnel (used to measure the viscosity of mud) will discharge 1 quart of water in about 36 seconds, whereas an equal volume of sediment-free water will discharge in 40 to 53 or more seconds from the same funnel.

mud volcano. a. A conical hill of mud, from which material is ejected by a blowpipe. b. A blowpipe. Blowpipe.

muds. a. Mottled surface. b. The larger grooves in a molding sand. Byman.

mull crucible. A kiln in which combustion of the fuel takes place within refractory muffles, which in turn conduct heat into the ware chamber. ACSG, 1963.

mull crucible. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.

muller. A knife-shaped piece of iron used in grinding ceramic inks and pigments, etc., by a rolling, grinding, rubbing, or stirring action. Enam Dia. c. The process of grinding. Muller's glass. Hyalite, a variety of opal which is as clear as glass and colorless. Enam Dia.

muller. A kiln in which combustion is kept away from the charge. Bennett 2d, 1962 Add.
mullite refractories

sitting predominantly of mullite (3Al₂O₃-2SiO₂) crystals formed either by conversion of one or more of the sillimanite group minerals or by synthesis from appropriate materials employing either melting or interting processes. ASTM C67-64.

mullite whiteware. Any ceramic whiteware

mullock. a. N.S.W. The accumulated waste

mullocker. a. In metal mining, a

mullock reefs. Aust. Reefs in

mallocking. Aust. Act or process

1111111iladd

mullock vein. Aust. A decomposed

multibucket excavator. A machine similar to

Multicut chafe. Trade name for a coal-cutter

melting or

2SiO₃) crystals formed either by conver-

sisting predominantly of mullite (3A1₁0₃-

60.

The mullocker (muck shifter)

about a mine. Fay. c. See muck,

for the accumulated waste or

shovels and loads waste rock, as

Gordon.

mullock reefs. Aust. Reefs in which the

matrix of the ore consists of country rock, frequently decomposed erupitive dikes. Fay.

mullock tip. Aus. Accumulations of waste rock coming out of a mine; a dump; also, spoil heap. Fay.

mullock vein. Aust. A decomposed erupitive dike in which the original disseminated gold and silver have been deposited in joints and fissures of the dike rock. This term appears to be unnecessary. Fay.

multiaxial stresses. Any stress state in which two or three principal stresses are not zero. ASM Gloss.

multibucket excavator. A machine similar to a dredger used for excavating cuttings for roads, railroads, or canals. One large machine of this type can dig 50 yards per hour on a slope 25 feet high. Ham.

multicut china. Trade name for a coal-cutter chain designed for use with curved jibs. It is short pitch and of high flexibility. Nelson.

cyclone coast. Emergent coast formed during several interrupted cycles so that two or more elevated marine terraces have been formed. Schifferdecker.

multideck cage. A cage containing two or more compartments or platforms to hold the mine cars. Every effort is made to keep the number of decks as low as possible and to cut down the decking time and equipment at shaft top and bottom. Nelson.

multideck screen. A screen with two or more superimposed screening surfaces mounted rigidly within a common frame. B.S. 3352, 1959.

multideck sinking platform. A sinking platform consisting of several decks to enable various shaft-sinking operations to be performed without delay. The bottom deck, in a three-deck platform, is usually suspended from four winch ropes in such a way that it acts as a supporting structure for the others; the middle and top decks are supported above the bottom deck by rigid supports. The top
deck is used for the manipulation of the concrete buckets for building up the shuttering. The center deck is used by the men when placing the concrete, while the bottom deck carries telephones, blasting, lighting, and similar equipment. The lower side of the bottom deck may carry the equipment for manipulating the cast grate. See also sinking and walling scaffold. Nelson.

multideck table. Shaking table with two or more superposed decks, independently fed and discharged but worked by one vibrating mechanism. Pryor, 3.

multifuse igniter; electric master fuse. A device employed to reduce the number of fuses to be lit by the miner before he can retire to safety. By means of a multifuse igniter, it is possible to remote fire stops or headings, primed with plain detonators and safety fuse. Nelson.

multilayer bldes. Lodes that occupy a shear zone. Such a zone has no definite walls, the ore gradually shadding off into the country rock. It is probable that the gold of some rich alluvial fields came from shear zones. Nelson.

multiloop reed. A reed in which the matrix of the ore consists of country rock, frequently decomposed erupitive dikes. Fay.

multiple bench quarrying. The method of quarrying a rock ledge in a series of successive benches or steps. Fay.

multiple-cord belt conveyor. A belt conveyor consisting of two, three, or more parallel strands of Vee, double Vee, or round belts. ASA 

multiple detectors. Two, or more, seismic detectors whose combined output energy is fed into a single amplifier-recorder circuit. This technique is used to effect a cancellation of undesirable near-surface waves. Synonym for multiple geophones; multiple recording groups. A.G.I.

multiple dike. A dike made up of two or more intrusions of the same kind of igneous rock. Billings, 1934, p. 307.

multiple-entry system. A system of access or development openings generally in bituminous coal mines involving more than one pair of parallel entries, one for haulage and fresh air intake and the other for return air. Multiple-entry systems permit circulation of large volumes of air. Bureau of Mines Staff.

multiple-expansion engine. An engine driven by steam or compressed air expanding in two or more stages. Ham.

multiple fault. A faulting structure consisting of several parallel faults in close prox-

imity with no distortion. See also step faults. Nelson.

multiple firing. Firing electrically with delay blasting caps in a number of holes at one time. Mitchell, p. 212.

multiple fuse-igniter cartridge. Consists of a cardboard cartridge about 2 inches long with a 3/4-inch outside diameter. The closed end is coated with black powder, and the ends of eight fuses are inserted in the cartridge, in contact with the powder. A master fuse is then inserted, which, when lit, burns to the powder and ignites it. The powder flares brightly and lights the eight fuses. South Australia, pp. 40-

multiple gases indicator. The detector is de-

signed to trace and determine the con-

centration of a variety of gases. The hand-operated instrument is used with many different detecting tubes. Typical choice may include tubes for acetone, freons, kerosene, ammonia, acetylene, carbon tetrachloride, phosgene, nitrous gases or trichloroethane, in addition to more com-

mon contaminants that are more exotic. Bevis, p. 580.

multiple geophones. Synonym for multiple recording groups; multiple detectors.

multiple-impulse welding. Spot, projection, or upset welding with more than one impulse in a single machine cycle. Sometimes called pulsation welding. ASM Gloss.

multiple intersections. The intercepts that cross a vein, ore body, or other geologic feature, accomplished by drilling several boreholes from a single mine, or parent borehole with the aid of wedges and similar deflecting devices. Long.

multiple intrusions. Applied to plugs, dikes, laccoliths, and other intrusions, formed by two or more successive injections of approx-

imately the same magma. Staker and

multiple lines. A single line reved around two or more sheaves so as to increase pull at desirable points. ASM Gloss.

multiple mineral development act multiple
multiple mineral development

use act. The Act of August 13, 1954, permitting oil and gas leases and mining claims on the same land, with the oil and gas lessee obtaining his rights under his lease and the mining claimant being accounted to patent, except however, to the oil and gas lessee’s interest. Williams.

multiple-pass weld. A weld made by depositing filler metal with two or more successive passes. ASM Gloss.

multiple-pleat plate. Steel plates made up of thicknesses of other plates of steel and wrought iron welded together. Minesereau, 4th, p. 426.

multiple proportions, law of. See Dalton’s law; law of multiple proportions.

multiple recording groups. Synonym for multiple sbot.

multiple sbot. See battery of holes. Fay.

multiple shooting. The firing of an entire face at one time. The holes are connected in a single series and when the current is applied to one cell, the current flows to the anodes of the entire assembly. JOM.

multiple-strand cable. A conductor which employs two or more spaced strands of narrow flat belts. ASA M114.1-1958.

multiple-strand chain. A roller chain made up of two or more strands assembled as a multiple strand rope. Sow also tippler. Nelson.

multiple-strand rope. A wire rope designed for discharging, two or more cars simultaneously. The discharging is sometimes performed while the cars are still attached to the cars trar. KS, which can receive and rotate each need be only, 11/4 inches in diameter to obviate spinning due to untwisting. It becomes large and heavy, being 2 1/8 inches in diameter locked coil, weighing 74.28 pounds each, 20 yards apart on one rope about 5 miles, into more than a dozen thin strands, and wrought iron welded together. See also simple split seam. Nelson.

multiple spotting. Welding a complete cycle of the welding machine. ASM Gloss.

multiple-speed floating control system. As used in flotation, a form of floating control system in which the manipulated variable may change at two or more rates each corresponding to a definite range of values of the actuating signal. Fuerstenau, p. 549.

multiple splitting. The parting or separation of a thick seam into more than two layers of coal. For example, the Ten Yards Coal of Staffordshire splits, within a distance of about 5 miles, into more than a dozen thin seams, between which the partings in the thick seam will have swolven out to an aggregate of about 500 feet of shales and sandstones. See also simple split seam. Nelson.

multiple spot welding. Spot welding in which several spots are made during one complete cycle of the welding machine. ASM Gloss.

multiple-strap chain. A chain made up of two or more strands assembled as a single structure on pins extending through connecting pans, pallets, etc. ASA M114.1-1958.

multiple-strap rope. A wire rope designed to obviate spinning due to untwisting. It is formed by a series of layers of strands built around a center core. Each layer of strands is given a lay opposite to that on which it is built, each layer thus tending to impart its own twist which is cancelled by the next layer. Therefore, this rope can be used for sinking or where free load is to be lifted. The stretch with a multiple strand rope is not so great as with round strand and flattened strand ropes. Nelson.

multiple system. A method of connecting the anodes and cathodes in electrolytic refining. Each cell contains a number of electrodes, anodes and cathodes being connected in parallel. From the cathodes of one cell, the current flows to the anodes of the next. The cells are therefore in series. C.T.D.

multiple tank machines. N. of Eng. Any machine which mechanizes more than one task of the cycle. Fay.

multiple tippet. A steel structure, with mine car tracks, which can receive and rotate for discharging, two cars at the same time. The discharging is sometimes performed while the cars are still attached to the hanging rope. In this case the tippet does not make a complete revolution but is reversed back from the tipping movement to avoid twisting the hanging rope. See also tippet. Nelson.

multiple-vent basalt. See shield basalt. A.G.I.

multiple wedge. See plug and feathers. Nelson.

multiplication factor; multiplication constant. The ratio of the number of neutrons in any one neutron generation to that in the immediately preceding generation. Criticality is achieved when this ratio equals 1.

multiple plough. Gusto multiple plough. A layout consisting of six or more ploughs, 220 pounds each, 20 yards apart on one rope or chain, feeding onto an armored conveyer; load on conveyer is well distributed. A driving unit is arranged at both ends of the face and operated alternately to impart the saw-and-dro movement to the ploughs. The minimum workable seam thickness is 20 inches at gradients from 0° to 20°; maximum length of face about 190 yards. Nelson.

multiplying constant. This is the constant, used in radia work, by which the staff intercept is multiplied to determine the distance between the staff and the theodolite. The value is generally taken as 100.

multitrope friction winder. A winding system based on the principles of the Koepe win- der. The drive to the winding ropes is through frictional resistance between the ropes and the driving sheaves. Multitrope friction winners are usually tower mounted, with either cages or skips, and provided with a counterweight. The sheaves are from about 6 to 12 feet in diameter with a direct coupled or geared drive. Four ropes are favored and these operate in parallel and share the total suspended load. The system was introduced partly because of the difficulty of winding heavy loads from deep shafts with a single large-diameter winding rope. Modern winding ropes have become large and heavy, being 2 1/4 inches in diameter locked coil, weighing 74.28 pounds per fathom or 16.3 tons for a 1,000 yard shaft, therefore, the introduction of the friction winder, with its counterweight, and using four smaller ropes side by side in place of one. Such ropes need be only, 1/8 inches in diameter to give equivalent winding capacity. Fay.

multiple shaft working. The working of two or three shifts per day on production faces underground. Face machines and power supports in coal mines represent a heavy capital outlay and the aim is to make them productive as long as possible in the 24 hours. In British coal mines, in 1960, 4 percent were working three shifts, 40 percent two shifts, and 56 percent one shift. Fay.

multishot firing. The firing of a number of shots simultaneously. Under the Coal Mines (Explosives) Order, 1951, up to six shots may be fired simultaneously anywhere in any coal mine in Great Britain, rounds of more than six shots being limited to underground coal mine face work. The detonators must be connected in series to a shorting cable not less than 50 yards in length and in 50 pounds in weight. The shorting cable must be tested and approved. See also M. E. 6 Extract.

multishot gyroscopic instrument. A borehole surveying instrument which can take a number of readings during the rise and ascent in the hole. It comprises gyro-
multishot gyroscopic

scopic and photographic recording units; direction and inclination indicators; a timing and measuring accessory. A movie film enables numerous records being taken throughout the depth of the borehole. See also oscilloscope.
multispread motors. Multispread squirrel cage motors are available for drives such as fans, blowers or pumps, which require operation at different speeds but do not require adjustable speed characteristics. Motors of this type may be used to two, three or four speed, with one to two stator windings, and built for variable torque, constant torque or constant horsepower operation. These machines have a constant speed characteristic at each particular speed. Pit and Quarry, 33rd, Sec. D, p. 6.
multistage fan. A fan having two or more units, see polyphase motor.
multituft. A bit that during use is unsharpened and resharpened in a grinding wheel.
multituft roller. A heavy roller with pneumatic units used to consolidate embankments. Ham. multistop. A period of replacement taking place later than that designated as pauses; much later as opposed to a little later. Hess.
multinuclear. See muon. LSL.
mu-metal. An alloy of Permalloy type (that is with high magnetic permeability and low electrical resistivity) but containing copper and manganese in addition to iron and nickel. C.T.D.
mumification. The process of preservation of plant tissues under the influence of arrested decay. Tomkeieff, 1954.
mumme. Any fusible metal. Fay.
mundane. A driller's term for pyrite. See also iron pyrites. A.G.I. Supp.
munda. An olivine-bearing nepheline phonolite containing about 50 percent mafic minerals. A.G.I.
mundraite. A violet hydrotalcite of sodium with manganese, calcium, iron, zirconium, etc., R0.2Nas0.4SiOs.4(TiOs.163, ZrOs).4H2O. Scales with micaceous cleavage. From Kola Peninsula, Russian Lapland, U.S.S.R. English.
munin. A rock drill, b. Fay.
muragio. A portion that of the side-wall of a bottle near the bottom. ASTM C162-66.
muratic acid. Old term for hydrochloric acid.

muscovite granite. A granite which contains a large proportion of the mineral muscovite. C.T.D.
muscovitization. The process of changing a mica, or rock, to muscovite. See also muscovite.

muscovy glass. Same as muscovite. Fay.
muscovy-flux furnace. An instrument developed in 1947 which has been used for the particle-size analysis of clays and other ceramic materials in the range 0.25 to 60 micron. Dodd.
mush. a. Soft and damp small coal; a coal which has been so wet that it is unprofitable to mine. Nelson, b. Leic. Soft, sooty, dirty, earthy coal. Fay, c. A grey mud, sometimes found on bituminous coal.
musket steel. Contains 9 percent tungsten, 25 percent manganese, and 1.85 percent carbon. It is used mainly for cutting tools, particularly for those used for taking heavy cuts on extra hard material. Critch.
mushroom. a. A bit that during use has been overheated to the point where it becomes soft and flattened off. Long. b. To flatten or deform a metal object by successive impacts. Long. mushroom church. A reinforced concrete solid slab carried by columns flared at the top but not joined by beams. See also fluted column head.
mushroom jib. A standard form of coal cutter jib with a spherical tip and a remote control machine. The spherical carries a vertical turret or bar and is driven by the cutting chain. The bar makes a vertical cut at the back of the normal horizontal cut. See also turret jib. Nelson.
mussel. Soft and sooty or dirty coal, or coal that has been crushed. Same as coal.
musical salt. An obsolete term applied to vacuum pan salt when first introduced. This is a fine-grain met that is partially decayed in the machine. The sprocket carries a vertical turret or bar and is driven by the cutting chain. The bar makes a vertical cut at the back of the normal horizontal cut. See also turret jib. Nelson.
mussel band. A bed of clay ironstone containing fossil bivalve shells, etc. Fay. Very curious. In the correlation of coal measure strata. Musen. Also called musel band; marine band.
mussel breccia. Ironstone containing fossil shells. Arkell.
mussel bed. A band containing or chiefly composed of mussequite shells, very valuable in the correlation of Coal Measure strata. Musen.
musselite. Same as musel band. Fay.
mussel gold. An old form of prepared gold for use in the decoration of pottery.
mussel gold

was made by rubbing together gold leaf, sugar (or honey), and salt; the paste was then baked and sold from solenite in small cakes, and, traditionally, stored in mussel shells.

musk gold. N.S.W. Very fine gold, sometimes called clem. Hy.

muscite. Same as diopside. Shipley.

mussite. A mixture of iron ore and fuel is reduced in an externally heated rotary retort. The gases are exhausted and constitute the fuel when the process has been started. The gases, after purification, are passed through combustion rings surrounding the retort and are burned according to the method of catalytic combustion. After reduction, the charge is cooled, when it is poured through a layer of fluxing material, it is then transferred to a steelmaking furnace. Osborn.

mustard gold. N.S.W. Very fine gold, sometimes called wryneck. New South Wales, p. 115.

muta, muta. A Malayan term denoting the degrees of fineness of gold. Fay.

mutual admittance. The mutual admittance of an organism resulting in a change of its terminals by the phasor representing the voltage across the second pair. Beerman, p. 367.

mylus test. See iodoeosin test. Dodd.

mylonite. A hard, compact rock with a streaky or banded structure produced by extreme granulation in both strike-slip and thrust fault zones. Bureau of Mines Staff.

mylonite gneiss. A mylonitic rock which has been partly recrystallized. See also augen schist; cataclasite; flaser gabbro; flaser gneiss; flaser granite; kaktite; mylonite; phyllonite. A.G.I.

mylonitization. The sum of the processes by which mylonites are formed. A.G.I.

myth. A local trade name for a variety of quartz marked by or intergrown with pink or reddish inclusions of cinnabar, quartz marked by or intergrown with intimate inclusions of cinnabar, quartz from the Mahogany mine, San Bernardino County, Calif., described by Pay.

myrunite. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

myrkkite. A name used for whitish or yellowish or reddish-white, translucent or massive gold, bearing freckles or small white spots, similar to sandstone. Hess.

myrmelldtle texture. Any rock or ore texture with vermicular forms. A.G.I.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

n- Abbreviated prefix meaning normal. Used in the names of aliphatic hydrocarbons, their derivatives, or alkyl radicals. For example, n-butane for normal butane and n-pentane for normal pentane. Usually the prefix n- is ignored in alphabetical arrangement. C.C.D. 64, 1961.

nadenite. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

naphanite. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

naphlalite. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

natur. Thin flat crystals (diamond) used for roses and, by resutting, for drainpipes. Hess.

natto. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

nblock. A rounded mass, as of flint in chalk, or of ironstone in coal. Standard, 1964.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.

nacre. A. A. A Malayan term denoting the degrees of fineness of gold. Fay.
nacreoscopy. A pearl illuminator. An instrument that consists of a string of light through which the nature of the nucleus of a pearl can sometimes be observed. Differences from the nucleus in that the number of large spheres of wood or other material by striking the head with a hammer. The term pearl as applied in the number of pieces per 1,000; for example, six-penny nail means 6 pounds per 1,000; three-penny nail means 3 pounds per 1,000, etc. Crispin.
nailhead scratch. See nailhead striation. Pet- 
cip.
nailhead spur. A composite variety of calcite having the form suggested by the name.
nailhead striation; nailhead scratch. A glacial scratch or marking with blunt end, generally, but not always, down current. Pet- tik.
nail plate. A plate of metal rolled to the proper thickness for cutting into nails. Fay.
nail (pointed-angled). Nails pointed at either end and used for wooden racks on which ware is placed after each operation. Han- sen.
naked light mine. A nongassy coal mine where naked lights may be used by the naked miner. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naked light mine. A peculiar, waxy, dark reddish- enifl.
naphthol.

narrow. a. A roadway driven in the solid coal with rib sides. All roadways w/ openings out a pillar main. d. Narrow. See also working the whole. Nelson. b. N. of Eng. A gallery, or roadway, driven at a narrow gage. Narrow gage. See also narrow beam projector. Nelson.
	narrow gage. A railway case narrower than the standard gage of 4 feet 8½ inches. Ham.

narrow places. Aust. Working places that are less than 6 yards wide; these are paid for by the yard in length. Fay.
	narrow stall. A stall driven in the solid coal, usual from 8 to 9 feet wide; it has rib sides in coal. Nelson.

narrow work. a. The driving of narrow stalls to form the narrow gage. See also narrow gage in the pillar-and-stall method of working. Nelson. b. A system of mining in which narrow coal roadways, called endings, are driven along the strike of the seam, from 12 to 15 yards apart, to a limit line. The long narrow coal roadways between the endings are excavated on the retreat. It has been adopted in parts of Yorkshire and Lancashire. See also narrow work for which a price per yard of length driven is paid, and which, therefore, must be measured. Any dead workings, headings, cut-offs, crosscuts, gangways, etc., or the workings previous to the removal of the pillars. Fay. A working in coal in only a few yards in width. Fay.

narrow working. See bord-and-pillar method; narrow work. Fay.

natrobrucite. A yellow, highly acidic titanosilicate of sodium (and iron), NaTiSiO₄. Table. Hexagonal. From Narrakur, Greenland; Sweet Grass Hills, Mont. Engish.

nasturtium. Undergrowing the process of being born; beginning to exist. Webster 3d. b. Just formed by a chemical reaction, and therefore very reactive. Haste gases are probably in an atomic state. Tafel.

d. Natren hydrogen. Ncw-born hydrogen produced by chemical action, before, molecular combination to H₂ occurs. In this state it is much more reactive. Pryor. 3.

nashite. A mineral, Na₂Be₃O₃·8H₂O (?); monoclinic; found in recent intrusions at Larderello, Tuscany, Italy. Identical with auger's borate. Hgy., M.M., 1946. Fleischer.

nasmyth hammer. A steam hammer, having the head of the hammer attached to the piston rod, and operated by the direct force of the steam. Fay.

natasch. a. Scot. A small hitch or dislocation. Fay. b. Scot. The junction of two rails at right angles. Fay. c. Native arsenic. The element as it occurs naturally; tin-white, hexagonal; specific gravity, 5.64 to 5.78; Mohs' hardness, 2.7 to 3.8. Bennett 2d, 1962.

d. Nativio gold. Gold as it occurs naturally; yellow cubic; specific gravity, 14.56 to 19.33; Mohs' hardness, 2.5 to 3.0; rarely pure, usually alloyed with silver and sometimes containing appreciable amounts of copper, palladium, or bismuth. Bennett 2d, 1962.

d. Native mica. Metals, such as copper, gold, silver, and those of the platinum group, that occur in the element or metallic state. Ency. of Chem. Tech., v. 8, p. 934.

native anode. See also anode.

native platinum. Platinum as it occurs naturally; silvery-white, cubic; specific gravity, 1.33 to 1.90; Mohs' hardness, 4 to 6. Bennett 2d, 1962.

native Prussian blue. Also called Byzantine. Fay. 2d, 1962.

native salt. Natural salt, halite, rock salt in its native state, as found and mined. Fay. 2d, 1962.

native silver. Silver as it occurs naturally; white, tarnishes to gray or black, cubic; specific gravity, 10.1 to 10.6; Mohs' hardness, 2.5 to 3.0. Bennett 2d, 1962.

native steel. A steel or steel ingot occurring in small masses and made by the ignition of coal near an iron-ore deposit. Fay.

natrium. Sodium. Webber 3d.

natron. A variety of alunite in which sodium replaces potassium in part, Na₂O·3Al₂O₃·4SO₄·6H₂O. Dana 17, p. 370; Lar. 9. Bennett 2d, 1962.

natrolite. A bright, emerald-green hydrous sulfate of copper and sodium, Na₂O·Cu(OH)₂·SO₄·2H₂O. 1200°. Steep, pyramidal crystals. Monoclinic. From Chuquicamata, Antofagasta, Chile. Engish.

natroboracite. A yellowish-brown to golden-yellow basic sulfate of iron and copper. A glinting powder made up of minute tabular crystals. Rhombohedral. From Sadovale, Nev.; Cook's Peak, New Mex.; Kingman, Ariz.; Cape Calamito, Elba; Kunda, Western Australia. English.

natromontmorillonite. The artificial compound, Ph₄Na₃Al₂Si₃O₁₀(OH)₂. Monoclinic. See also mordenite. English.
natron. A sodium carbonate with 10 molecules of water. *Beterman.*

natronboracite. A synonym of ulexite. *Hey.*

natron-granites. Granites abnormally high in soda, presumably from the presence of an oxidized rock rich in sodalite, NaAlSi₂O₆, or Leucophan. They are also called soda granites. Natron is likewise used as a prefix to minerals and rocks that are rich in sodas, as natron orthoclase, natron syenite, etc. *Fay.*

natron-silphite. Same as soda niter. *Dana 6d, p. 870.*

natronomelane. A feldspar similar to orthoclase but with soda replacing 20% of the alumina. *Lass., p. 233.*

mattie. Ent. To make a slight rattling or tapping noise. *Webster 3d.* Said of a mine when movement or settling is taking place. *Fay.*

natural aging. Spontaneous aging of a super-saturated solid solution at room temperature. See also aging. *Compare artificial aging.* *ASM Glossary.*

natural boring. An air crosswind in which the two airways are separated by rock in its natural state. *B.S. 3618, 1963, sec. 2.*

natural aluminum. Material that has been extracted from the earth not due to human activity. *Schieferdecker.*

natural asphalt. Asphalt before crushing or natural arch. *Dana 6d, p. 324.*

natural brick. A name given to the X direction as pencilled on Z sections of unfaced quartz and whose position is determined by X-rays. The name is also given to the artificial prism face (parallel to 1102), thus located and produced on sawing in the VY plane. Also applied to the natural growth facies on faced raw quartz crystals. *AG.*

natural clay tile. Facing tile having unglazed or uncoated surface burned to the natural color, in contrast to the material used in forming the body. *ASTM C41-65T.*

natural floatability. See inherent floatability. *Pryor, J.*

natural frequency. The frequency of free oscillation of a system. For a multidegree-of-freedom system, the natural frequencies are the frequencies of the normal modes of vibration. *Hey.*

natural frequency of a foundation. The frequency of free vibration of a complete well-founded oscillating system. This frequency must differ distinctly from that of any machinery carried by the foundation if resonance is to be avoided. *Ham.*

natural frequency vibrating conveyor. A vibrating conveyor in which the vibration of the trough on its resilient support is approximately the same as the rate of vibration induced in the driving mechanism. *ASTM A40-52.*

natural gamma-ray logging. A process where by gamma rays naturally emitted by formations traversed by a borehole are measured. A tool containing a radiation detector is lowered into the borehole, and as a result of the impingement thereon of gamma rays naturally emitted by the formations, outputs signals indicative of said gamma rays are produced and transmitted to the earth's surface. The signals are utilized to produce a record of gamma rays detected in correlation with the depth of the detector in the borehole. The record thus obtained in the form of a curve indicating relative number per unit area is known as a gamma-ray log. *Williams.*

natural gas. A mixture of the low molecular weight paraffin series hydrocarbons and excludes ethane, propane, and butane with small amounts of higher hydrocarbons, also frequently containing small or appreciable quantities of methane, hydrogen sulfide and occasionally small proportions of nitrogen, carbon dioxide, or carbon monoxide. Dry natural gas is usually over 1,000 Btu/ft³ unless nitrogen or carbon dioxide and certain other minor components of the gas. Natural gas is always a major constituent of natural gas. *Hey.*

natural gas indicator. This indicator consists of a naphtha-burning safety lamp with a mirror attached to one side so that the action of the flame may be observed from above. The lamp should be lowered slowly and carefully into the tank, meter, pit, or manhole being tested. Lengthening of the flame's reflected image to the edge of the mirror indicates a dangerous concentration of natural gas. *Hey.*

natural glass. Those liquid hydrocarbon mixtures containing substantial quantities of pentane and heavier hydrocarbons which have been extracted from natural gas. *A.G.I.*

natural glass. Maenner of any composition is liable to occur in the glassy condition if cooled sufficiently rapidly. Acid (that is, granitic) glass is commoner than basic (that is basaltic) glass; the former is represented among igneous rocks by pumice, obsidian, and pitchstone; the latter by tachylite. Natural quartz glass occurs in masses lying on the surface of certain deserts (for example, the Libyan Desert); while both clay rocks and sandstones are locally found to be basaltic. *See also basaltite; tektites.*

natural harbor. A harbor formed by the configuration of the coastline, outstanding examples being Sydney, New South Wales; Milford Haven. *See also artificial harbor.*

natural levee. In floodtime, the muddy water flows over the riverbanks, where its velocity is at once checked as it flows gently down the outer side, causing material to be deposited there, and a long alluvial ridge, called a natural levee, is built upon either side of the stream. *A.G.I.*

natural logarithm. A logarithm with e as a base, i.e., *ln.*

natural loge. A term used by foundrymen to refer to a sand which, when added, contains suitable particles for molding purposes. *Oberste.*

natural ore. Iron ore that contains moisture, in contrast to "dry ore" that has been dried but contains sufficient water to give a carter mixture. *Hey.*

natural pressure cycle. A cycle in which pressure buildup conforms proportionately to...
natural pressure cycle

the buildup of stresses due to forming. ASM Gloss.

natural radiation. See background radiation.

natural rock asphalt. Rock, usually almost pure limestone, which is impregnated with petroleum asphalt. Also: natural asphalt; rock asphalt. Ham.

natural sand. Sand derived from a rock, in which the grains separate along their natural boundaries. This includes unconsolidated sand, or a soft sandstone where little pressure is required to separate the individual grains. Osberne.

natural scale. Applied to a drawing made to equal vertical and horizontal scales. Ham.

natural slope. The maximum angle at which loose material in a bank or spoil heap will stand without slipping. See also angle of repose; angle of slide. Nelson.

natural soft porcelain. A porcelain which has a varied composition as sand, niter, soda, sulfur, salt, and other materials. Standard, 1964.

natural splitting. In mine ventilation, a practice of providing a current of air to divide among the branches of its own accord and without regulation, in inverse relation to the resistance of each airway. Hartman, p. 127.

natural steel. a. Steel manufactured directly from iron and carbon. Fay. b. Steel in the condition left by a hot-working operation, and cooled in the open air. Fay.

natural stresses. Applicable originally to stream-lined carbons; currently applicable to any nonmammalian forms which is usually not an artificially modified. Long.

natural strata. See strain; true strain.

natural stress relief. The failure of the skin of the rock of an excavation by crushing, shearing, or plastic flow, surrounds that excavation with an envelope of rock under less than the preexisting stress. This action is called natural stress relief. It is the cause of all other rock failures. Can occur also on the surface rock with explosive force. Bureau of Mines Staff.

natural pressure. a. It is usual in mining to find that air returning from the workings to the surface via the upcast shaft is of a higher temperature than the air in the downcast shaft, which is caused mainly by the addition of heat to the ventilation current from the strata exposed in the mine. Thus, even in a mine with the fan stopped, the upcast air density is less than the downcast air density. This lack of balance in the two vertical air columns produces a pressure difference across the shaft bottom known as natural ventilating pressure. Roberts, 1. p. 160. b. The ventilating pressure which produces natural ventilation. B.S. 3610, 1963, sec. 2.

natural ventilation. The ventilation produced in a mine as a result of a difference in density of the air in the upcast and downcast shafts, brought about by natural causes. Natural ventilation is feeble, see also passive smoking. Nelson.

natural water. Water obtained from the seas, lakes, rivers, streams, canals, springs, wells, and ground waters which have dissolved some kind of impurity either from the air or from the rocks with which they have come into contact. Cooper, p. 35.

naujalkasite. A silvery white, greyish hydrous silicate of sodium, iron, and aluminum. 3[Na₂Fe]O₂·Al₂O₃·8SiO₂·H₂O. Aggregate of minute mica-like plates. Monoclinic, pseudohexagonal. From Naujakasik, Greenland. English.

namamite. A selenide of silver and lead, occurring in veins of copper minerals. Occurs granular, and in thin plates of iron black color and a brilliant metallic lustre. Fay.

natural measure. One nautical mile or knot equals 6,080 feet; 1.942410 m.; 1 nautical mile equals 1 league; and 60 nautical miles equal 1 degree (at the equator). Crispin.

nautical mile. Any of various units of distance, used for sea and air navigation, based on the length of a minute of arc of a great circle of the earth and differing because the earth is not a perfect sphere: (1) A British unit that equals 6,080 feet or 1,853.184 meters; also called Admiralty nautical mile. (2) A U.S. unit, no longer in official use, that equals 6,080.20 feet or 1,853.40 meters. An international unit that equals 6,076.1033 feet or 1,852 meters; used officially in the United States since July 1954. Webster 3d.

nautolith. A term of the nautolites: a shelled cephalopod having an external chambered shell either straight or variably curved or coiled, with simple -spta forming sutures that are simple in the shaft without marked flexures. A. G. I. Pertaining to the nautolites. Nautolites. In (A), (B) an international unit that equals 6,076.1033 feet or 1,852 meters; used officially in the United States since July 1954. Webster 3d.

natural pressure. a. It is usual in mining to find that air returning from the workings to the surface via the upcast shaft is of a higher temperature than the air in the downcast shaft, which is caused mainly by the addition of heat to the ventilation current from the strata exposed in the mine. Thus, even in a mine with the fan stopped, the upcast air density is less than the downcast air density. This lack of balance in the two vertical air columns produces a pressure difference across the shaft bottom known as natural ventilating pressure. Roberts, 1. p. 160. b. The ventilating pressure which produces natural ventilation. B.S. 3618, 1963, sec. 2.

naturale radiation. See background radiation.

nautite. A rare, weakly radioactive, hydrated vanadium pentoxide, V₂O₅·3H₂O. It is brown, dark, soft, and fibrous, with a high density. Cinnabarine minerals include covellite, hettewitte, tryaminite, ranwit, steigerite, and limonite. Navajoite is rare, occurring in a variety of patterns from hettewitte and covellite, which it resembles in physical appearance. Science, v. 119, March 1954, p. 326; Crosby, pp. 311-20. It is dark brown, soft, and fibrous, occurring in large cubical crystals, also asommtile. A selenide of silver and lead, occurring in veins of copper minerals. Occurs granular, and in thin plates of iron black color and a brilliant metallic lustre. Fay.

natural-gas oil. A gas which is controlled to give constant heat output with varying ambient temperature and humidity, and with varying butane gas pressure. The heat output is measured by means of a group of thermocouples in a chimney above the flame. The presence of methane in the atmosphere, which is controlled, is measured by means of a rotating chart calibrated in percentage methane. Roberts, 1. pp. 86-87.

near gravity material

popularity defined as the percentage of material in the raw coal within plus or minus 0.1 of the separating specific gravity. See also efficiency of separation. Arn.

neck. Near-clay. A clay or mud in which the clay is finer in texture than the sand and is generally a dark color. Arn.

neck material. Material approximating in size to the mesh aperture. B.S., 1962.

necks. Currents adjacent to and in conjunction with coastal areas. Hy.

neck water. See inshore water. Hy.

neon cement. Slurry containing no aggregate, such as sand or gravel. Long.

neolines. The excavation lines of a tunnel within which the rock removed is paid for at the agreed contract rate. See also overbreak. Nelson.

A.G.N. Such rocks are classed as nebulitic chorialites. Krieger.

neobedite. A type of mixed rock whose fabric is characterized by indistinct, streaky inhomogeneities (schlieren). They grade between the fabric units. The boundaries have more or less vague contours and show diffuse cloudlike interpenetration. Such rocks are called neobedites (neobedite phylites, ophthalmites, stromatites, merismites, etc.). They grade into actual neobedites, which show indistinct streaky inhomogeneity (schlieren). A.G.N.

neocanaries. A macropodous rodent of body or rock or mineral deposit in which no sharp boundary can be recognized between the two. The boundaries are not well defined and do not have clear contours. Nelson.

supercanaries. A macropodous rodent of body or rock or mineral deposit in which no sharp boundary can be recognized between the two. The boundaries have more or less vague contours and show diffuse cloudlike interpenetration. Such rocks are called neocanaries (neobedites, neobedite phylites, ophthalmites, stromatites, merismites, etc.). They grade into actual neocanaries, which show indistinct streaky inhomogeneity (schlieren). A.G.N.

Neocanaries. A common genus of hogsworms that have bevelled teeth resembling flat plates, that include internal parasites of man and various other mammals, and that are probably of African origin though first identified in North America. Compare Ancylostoma. Webster 3d.

neck. a. The narrow entrance to a room next to the entry, or a place where the room has been narrowed on account of poor support. Fay. b. A pipe of igneous rock has been narrowed on account of poor support to the entry, or a place where the room has been narrowed on account of poor support to the entry. Fay. c. In metallurgy, that part of a furrow which has a very small-diameter rollen between wide faces. Nichols.

earned. Pocketed, as when face bars are set into the coal adjacent to the roof. TIME. The neck of a glass bottle. See also frith neck-ag dams. Localized reduction in area of a neck. B.S. 1962.

eak. a. Elongated crystals, tapering at each end to a fine point, as those typical of martensite. Rolle. b. In powder metallurgy, metal powder particles of elongated form, resembling needles. A.G.N. c. An English term used for a special form of poling boards; they are sometimes made of iron or steel plate and may be as much as 10 feet long by 6 inches wide. Stenfer.

neak stone. Natrolite. A synonym for myosot-
type. Fay.

neak timber. Aust. Long sticks of timber, the lower end of which rests against the foot of a support, and which are kept in position, while the upper end is let into a hitch in the roof. Fay.

neekele ore. An acute pyroclastic variety of cannicere. Dana 1864, p. 225.

needle traverse. In survey with dial, use of magnetic needle to read bearing of lines. Opposite is fast needle traverse. Edgeworth, and refers to use of dial as in traversing with theodolite, where proximity of iron might deflect the needle. Systems can be combined, using needle readings where iron is absent. Also called swinging needle traverse; long needle traverse; fire needle traverse. Pryor, 2.

needle valve. A valve provided with a long tapering point in place of the ordinary valve disk. The tapering point permits fine graduation of the opening. Also called drip valve; needlepoint valve. Compare feed-control valve. Long.

needle weir. A fixed frame weir carrying heavy vertical timbers in contact. These can be withdrawn in order to lower the water level upstream of the weir. Ham.

neakele zoolline. Synonym for myosot-type. Fay. See needle stone.

neakling. To cut holes, notches, or ledges in a coal or rock surface to receive the ends of timber supports. Nelson.

neakling. A mixture of paraffins and a resin occurring on Cheleken Island in the Caspian. It is related to zetnikite. Fay.

negative. Carrying charge due to electrons; negative electrode; cathode. A negative element is acid-forming, its atom having 5, 6 or 7 valence electrons (one with 4 valence electron is ambivalent). The negative pole of a magnet is the one which turns toward the south. Pryor, 3.

negative crystal. A birefringent crystal in which the refractive index of the extraordinary ray is less than the refractive index of the ordinary ray. Fay.

negative element. a. Those which have shown a decided tendency to rise are designated positive elements and those which have tendency to sink are termed negative elements. A.G.N. b. Applied to a large structural feature in the earth's crust, characterized through a long geologic history of submergence and again rising when diastrophism takes place. A.G.N. c. A portion of the earth's crust which has been submerged and later raised, especially in the Caspian, where it is related to the Caspian depression. Stokes and Varner, 1935.

negative gradient. Describes conditions in a layer where the temperature decreases with increasing depth. H&G.

negative landforms. The capillary variety of a garnit. Fay.

needle ore. a. Same as akinite. A lead-copper-bismuth sulfide. Fay. b. Iron ore, of very low grade, found in small quantities, which may be separated in long slender filaments resembling needles. A.G.N. c. Coral. Fibrous aggregates of acicular crystals of goethite or hematite; Land's End District. Compare wood iron ore. Arkt.
negative moment. See hogging moment.

negative movements. Relative movements of the sea level, subsiding with regard to the land. Schiferdecker.

negative rake. a. Describes a tooth face in rotation whose cutting edge lags the surface of the tooth face. A.S.M. Glass, b. The orientation of a cutting tool in such a manner that the angle formed by the leading face of the tool and the surface behind the cutting edge is r.eater than 90°. Also called drag rake. Long.

negative temperature coefficient. See temperature coefficient. LDL.

negligence. In a legal sense, a failure upon the part of a mine operator to observe for the protection of the interests of the miner that degree of care, precaution, and vigilance which the circumstances justly demand, whereby the miner suffers injury. Ricketts, 1.

negro blossom. A dark clump of reef coral, often an erosion relic or hurricane-tossed reef coral, often an erosion relic or hurricane.

negroblued tayer. A tayer having on its end a cubic block which is built into the furcace. Also called negerhead tayer. Standard, 1964.

neighboring. A mineral, NaMg₄, orthorhombic and isosstructural with perovskite, occurs in dolomite rock at South Orray, Uintah County, Utah, as rounded grains and as octahedral crystals. Hey, M.M., 1961.

Neill-Robertson stretcher. One of several types of stretchers used for underground first aid. It is made of stout canvas with bamboo strips to support the patient's head, chest, abdomen, hips, and legs. On the back there are supporting ropes which end in loops at the head and feet, and the loops make convenient carrying handles. The stretcher is shaped in a way to accommodate casualties in highly inclined workings. M.C.A.dam, 1964, p. 104.

neodur. A dimorphous triclinic form of Ca₂O·Si₂O₄·2H₂O, applied to the okienite from Creemore, Calif., which differs in optical and X-ray data from okienite from other localities. Spencer, 21, M.M., 1958. Its formula is probably CaO·6Si₂O₇·8H₂O. Mineralogical Magazine, v. 33, No. 256, March 1962, p. 70.

Nekona. In Japan, straw mats specially woven and used for catching gold in the sluices. Fay.

neck. A biological division made up of all the organs which may have been deposited from so-called organic debris deposited among rhyolites and basalts with which, according to the succession formulated by von Kossak, the invention of pottery is closely related. Webster 3d.

neodyblastic. a. Pertaining to the texture of a recrystallized rock in which the shape of the grains is thard. Pettijohn, 24, 1957, p. 92. b. Applied to a fibrous type of schistosity that is seen in rocks composed largely of such minerals as glaucophane and actinolite. A.G.I.

neoecos. The later of the two epochs into which the Tertiary period was formerly divided and at one time used by many geologists. Also, the series of strata deposited during this epoch. Obsolote. Fay.

neoelastosil. Anhydrous copper silicate. Crystallization, monoclinic, in microscopic tables as a blue sublimable on lave. Weed, 1918.

neokomius. Of or pertaining to the lower part of the Cretaceous epoch. Standard, 1964.

neocryptorok. Late Precambrian. A.G.I. 1918.

neodymium. A metallic element and member of the rare earth group, occurring in combination with cerium, lanthanum, and other rare earth elements. A white to yellowish and it tarnishes quickly in air. Symbol, Nd; valence, 3; atomic number, 60; and atomic weight, 144. C.C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-121. b. Two allotrophic forms: Alpha neodymium, hexagonal up to transition temperature about 1,800° C; and beta neodymium, isometric from 868° C to melting point; specific gravity, 7.048 (hexagonal); and 6.80 (isometric); melting point, 1,024° C; boiling point, 3,072° C; and decomposes in cold water. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-196.

neodymium oxide; neodymla. Molecular weight, 336.48; light blue to blue-gray; Nd₂O₃; hexagonal; and melting point, about 1,900° C. Technical grade is a hexagonal plate. Grades: 65 percent, 75 percent, 85 percent, 95 percent, and 99 percent oxide. Fluorescent; specific gravity, 6.80; insoluble in water; soluble in acids; hygroscopic; and it absorbs carbon dioxide from the air. Used in ceramic capacitors and in glass capacitors. C.C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-196.

neodymium oxide; neodymla. Molecular weight, 336.48; light blue to blue-gray; Nd₂O₃; hexagonal; and melting point, about 1,900° C. Technical grade is a hexagonal plate. Grades: 65 percent, 75 percent, 85 percent, 95 percent, and 99 percent oxide. Fluorescent; specific gravity, 6.80; insoluble in water; soluble in acids; hygroscopic; and it absorbs carbon dioxide from the air. Used in ceramic capacitors and in glass capacitors. C.C.D. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-196.

neogae. A alloy resembling silver and containing 58 parts copper, 27 parts zinc, 2 parts tin, 12 parts nickel, 1/2 part bismuth, and 1/2 part aluminum. Standard, 1964.

neogene. The latter of the two periods into which the Cenozoic era is divided in the classification adopted by the International Geological Congress and used by many European geologists. Also, the system of the Jurassic system of strata. Standard, 1964. b. The upper part of the Jurassic system of strata, including the Middle and Upper Jurassic stages. Also, the corresponding interval of geologic time. Standard, 1964.

neokerogen. Organic debris deposited among montmorillonite and modified by bacterial action or by wave action as to form the material of petroleum, or under certain conditions, to form oil of the oil shales. Tantleff, 1954.

neolithic. Of, brine, relating to the last period of the Stone Age following the Mesolithic and characterized by the use of polished stone implements, the art of grinding stone, horn, bone, and ivory tools with sandstone, potter- tesy, making the use of bow and arrow, domestication of animals, the cultivation of grain and fruit trees, the invention of the wheel, linen weaving, and the be- rinning of settled village life. Webster 3d.

neokon. A name used by Clarence Ford for an order of the wheel. Tarboton, 1964.

neokryptorok. Late Precambrian. A.G.I. 1918.

neosemilus. In mineralogy, fibrous or threadlike; said of structure. Standard, 1964.

neumolite. A rock composed essentially of ilmenite and apatite, with or without rutile. The dominant mineral may be either ilmenite or apatite, although ilme- nite is usually the more important. J.ox- ham, 1, 2d, 1939, p. 268.

neophytes. a. Pertaining to the texture of a recrystallized rock in which the shape of the grains is threadlike. Pettijohn, 2d, 1957, p. 92. b. Applied to a fibrous type of schistosity that is seen in rocks composed largely of such minerals as glaucophane and actinolite. A.G.I.

neogae. A alloy resembling silver and containing 58 parts copper, 27 parts zinc, 2 parts tin, 12 parts nickel, 1/2 part bismuth, and 1/2 part aluminum. Standard, 1964.

neogene. The latter of the two periods into which the Cenozoic era is divided in the classification adopted by the International Geological Congress and used by many European geologists. Also, the system of the Jurassic system of strata. Standard, 1964. b. The upper part of the Jurassic system of strata, including the Middle and Upper Jurassic stages. Also, the corresponding interval of geologic time. Standard, 1964.

neokerogen. Organic debris deposited among montmorillonite and modified by bacterial action or by wave action as to form the material of petroleum, or under certain conditions, to form oil of the oil shales. Tantleff, 1954.

neolithic. Of, brine, relating to the last period of the Stone Age following the Mesolithic and characterized by the use of polished stone implements, the art of grinding stone, horn, bone, and ivory tools with sandstone, potter- tesy, making the use of bow and arrow, domestication of animals, the cultivation of grain and fruit trees, the invention of the wheel, linen weaving, and the be- rinning of settled village life. Webster 3d.
Neo-Pakoaok. The later portion of Neozeok. Of, relating to, or constituting the nepheline; nephelinite. A mineral in epbeline syenian nephelite. Bericky's term, now used in voltage gen. Occurs in the atmosphere As 1 part 1.204 erly said of some igneous rocks, but now erupted during the Cenozoic era; forms could produce a potentially dangerous nephelinite, and of the latter, nepheline as an essential constituent. 13y some petrologists, the term is restricted to those line as an essential constituent. 13y some petrologists, the term is restricted to those line as an essential constituent.

nepheline; nephelite. A mineral found in igneous rocks and used at times, instead of feldspar in the glass industry, (Na,K)AlSi3O8; hexagonal and has a greasy luster. Dana 17.
nepheline basalt; nephelite basalt. A general name for any basic lava carrying nephelite as an essential constituent. By some petrologists, the term is restricted to those nepheline basalts which carry olivine but no feldspar. A more accurate name for the latter is olivine nephelite. See also nepheline; basanite; tephrite. C.T.D.
nepheline aegirine. A gray, somewhat coarse-grained, granular rock composed of pyroxene, plagioclase, nepheline, and magnetite; a feldspathic nepheline tephrite. Fay.
nepheline. A fine-grained igneous rock composed of pyroxene, plagioclase, nepheline, and magnetite; a feldspathic nepheline tephrite. C.T.D.

nepheline tephrite. Beircky's term, now used in microscopic work for nepheline glass, or the glassy basalt in nepheline rocks, whose easy gelatinization indicates the close resemblance of this mineral; unindividualized nepheline. Fay.

nepheline tephritoid phlogopite. A general term for phlogopites which, when compared with mica, are more abundant than feldspars. Holmes, 1928.
nephelolite. The process of introduction of an impurity of nepheline. A.G.I.
nephelite. See nepheline.
nephelometer. An instrument which measures the scattering of light by determining the amount of light emitted at right angles to the original beam direction. Such devices are useful in studies of particles (size and amount) suspended in water.
nephelometry. The measurement of concentration or other property of a suspension by the measurement of light transmission or light dispersion. Lesevich.
nephrite. A coarse, compact variety of tremolite-actinolite. It resembles much of the material known as jade. Monoclinic. Dana:*, p. 445. See also jade.
nephrite powder. An explosive resembling dynamite No. 2, and consisting of microgelenite with a more or less explosive dope. Fay.
nepthian. An early term applied to water-formed strata opposed to plutonic or igneous rocks. Fay.
nepthian dikes. Dikes filled by sediment, generally sand, in contrast to plutonic dikes filled by volcanic materials. Pettijohn.
nepthite theory. A general theory of nepheline origin of rocks proposed by Werner in the 18th century. A.G.I.
nepthite. Denotes one of the three great subdivisions of rocks after a classification proposed by Read. The term includes the sedimentary rocks. A.G.I.
nepthite. The theory that the rocks of the earth's crust were formed through the agency of water. Obsolete. A.G.I.
nepthites and Polppites. Several geological schools at close of eighteenth century. The Neptunists, led by Werner, believed that all rock types were hydrospheric. The Plutonists, following Hutton, attributed them to lava flows and volcanoes. The position of the earth was clarified by Lyell in 1830, Pryor, 3.
nepthites. A titanite-silicate of iron, manganese, aluminum, and potassium, (Na,Fe)3(Al,Si)2O10; monoclinic; black; prismatic crystals. Found in Narassuk, Greenland; San Benito County, California; Reina Peninsula, Russian Lapland. Eng.
nepthium. A silvery metallic element in group VI of the periodic system. Produced artificially by nuclear reaction between uranium and neutrons. Symbol, Np; valence: 4, 6, 2; atomic number: 93; and the mass number of the most stable isotope, 237. Three allotropic forms: Alpha, 1st born, 275° C; orthorhombic; Beta, 276° C; tetragonal; and Gamma, 277° C; tetragonal. Specific gravity, alpha nortneption, 20.45; beta nortneptin, 19.36 (at 11° C); and gamma nortneptin, 19.8 (at 600° C). Melting point, 630° C; and solubility in hydrochloric acid. Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-122, B-197.
nepthium disintegration series. A series of nuclides resulting from the decay of neptunium, a. The series of nuclides resulting from the decay of the long-lived (half-life, 2.2 X 1019 years) synthetic nuclide, neptunium 237. Many nuclides of normal half-life and more abundant than feldspars. Holmes, 1928.
næskeounite

white. From a coal mine at Nesquehoning, Carbon, Pa. Fay.

nest. A cave, headland, or promontory most commonly used as a ter nination, as in the Forest of Dean. Fay.

nest. a. A small isolated mass of ore or mineral within another formation. Web.

nest. b. A group of miner-like size casing inside the casing already set in a borehole. Long. e. To fit one tube inside another. Long. d. A cushion upon which slate is placed to be cut with a diamond. C.T.D. e. An arrangement comprising a graduated series of sieves. Bureau of Mines Staff.

nester crater. A central volcanic vent showing a crater within a crater. Fay.

nestle, Forest of Dean. Iron ore that occurs in pockets is called nestle-weise. Fay.

net. a. Wires woven into cloth. Fay.

net. b. Strapping used for lowering or raising horses in shafts. Fay.

net. c. A network of veins. A not too irregular system of veins intersecting in different directions. Fay.

net. f. A central volcanic vent showing a crater within a crater. Fay.

net calorific value (at constant pressure). The number of heat units which would be liberated if unit quantity of coal or coke was burned in oxygen at constant pressure in such a way that the heat released was equal to the gross calorific value of the coal or coke at constant pressure, less the latent heat of evaporation at 25° C and constant pressure of the water both originally contained in the coal or coke and formed by its combustion. B.S. 1016, 1961, Pt. 18.

net calorific value (at constant volume). The number of heat units which would be liberated if unit quantity of coal or coke was burned in oxygen and nitrogen at a constant temperature in such a way that the heat released was equal to the gross calorific value of the coal or coke at constant volume, less the latent heat of evaporation at 25° C and constant volume of the water both originally contained in the coal or coke and formed by its combustion. B.S. 1016, 1961, Pt. 16.

net cut. a. In sidellik work, the cut required less the fill required at a particular station or part of a road. Nichols. b. The amount of excavated material to be removed from a road section, after completing fills in that section. Nichols.

net drilling time. The rotating time actually spent in raising the corehole. Long.

net fill. a. The fill required, less the cut required, at a particular station or part of a road. Nichols. b. The yardage of fill required at any station, less the yards of material obtained from the breaker station. Nichols.

net heat of combustion. See net calorific value. A.G.I.

nether. a. The lower part of, as in nether roof. The earth's surface such as granite. Standard, 1912. b. The total slip along a fault; the slip or net slip is the shortest distance measured on the fault surface or zone, of a specified wall relative to another. Netfill. The roof of the coal seam. The props set at the face and formed by its combustion. B.S. 1016, 1961, Pt. 16.

nether strata. The roof and strata immediately above the coal. Mason.

net masonry. Masonry formed of small square bricks or blocks placed diagonally in a lozenge pattern; reticulated masonry. Standard, 1964.

net plankton. Those plankton which can be removed from the water by filtration through a fine net. HBG.

net slip. The total slip along a fault; the distance measured in the fault plane between the two formerly adjacent points situated on opposite walls of the fault. It is the former distance measured in the fault plane between the two formerly adjacent points. The slip or net slip is a vector quantity defining the direction and distance of movement, parallel to a fault surface or zone, of a specified wall relative to another. Netfill. A large tree-fern of the coal forest, with trunks about 2 feet thick, containing several cylinders of wood inside the stem instead of one column of wood as in modern trees. Nelson.

Netherlands. A plough consisting of a 2-inch steel plate 6 feet by 20 inches of 7 pieces hinged together to follow floor rollers. Fay.

network. A system of veins striking in different directions. Fay.

neutral flame. A gas flame in which there is no excess of either fuel or oxygen. ASTM Gloss.

neutral. Of slags, neither acid nor basic; of iron ores, suitable for the production of neutral iron. Fay.

neutral atmosphere. One in which there is neither an excess nor a deficiency of oxygen. Bureau of Mines Staff.

neutral axis. The line of zero fiber stress in any given section of a member subject to bending; it is the line formed by the intersection of the neutral surface and the section. Re.

neutral density. See normal density. Sibley, 1.

neutral depth. See normal density. Sibley, 1.
neutral flame 747

new diamond
used. Also called new stone; virgin diamond.

Nickel-ammomium sulfate
Nickel's technique. A technique used in the determination of elastic constants of rocks in situ. Longitudinal and shear waves are generated in rock by small explosive charges in shallow drill holes. Accelerometers, meters and strain gages are used to measure arrival times for both waves. From wave velocities and measured density, Poisson's ratio, modulus of elasticity, modulus of rigidity, Lame's constant and bulk modulus can be calculated. Lewis, p. 368.

Nickelinite. A variety of aragonite containing up to 10 percent zinc. From Leadville, Colo.; Tintic District, Utah; magnificent specimens at Tumeb, Southwest Africa. English.

Nickelstone. Registered trademark used in respect of a range of heat- and oxidation-resistant alloys (not necessarily nickel and chromium) produced by the Driver Harris organization. C.T.D.

nick. a. To make a perpendicular cut, with the pilk, in the face of (coal) at the junction with the rib, with resistance to the blast or wedge; to shear. Standard, 1964. See nicking. B. To cut vertically in the coal. SMR, Paper 61.

nickel. Hard; malleable; ductile; silvery-white metallic element of group 8 of the periodic system; capable of taking a high polish; resistant to oxidation; and attacked by many acids. Used in electrical, mechanical and tooling industries and in coinage. Symbol, Ni; valences, 0, 1, 2, and 3; isometric; atomic number, 28; atomic weight, 58.97; specific gravity, 8.85 (at 20°C). C.T.D.: Handbook of Chemistry and Physics, 45th ed., 1964, p. B-11.

nickel alloys. Nickel is the main constituent in Monel metal, Permalloy, and nickel-chromium alloys. It is also used in cupronickel, nickel silver, various types of steel and cast iron, brass, bronze, and gun metal.
sulfate hexahydrate; ammonium-nickel sulfate; ammonium-nickel sulfate hexahydrate; nickel salt, double; nickel salts, double. Dark blue-green; NiSO₄(·2H₂O), molecular weight, 280.88; specific gravity, 2.90; insoluble in water, or to increase the core strength to be performed in oil or air instead of water, or to increase the core strength to be performed in oil or air instead of water. 6.6 to 6.8. NiO absorbs oxygen at 400° C forming NiO which is reduced to NiO at 600° C. Used in nickel salts and in nickel oxide (NiO) used in glazes to produce green ceramic colors. CCD 61, 1961. b. Isometric; green to black; molecular weight, 147.1; melting point, 1,990° C; and specific gravity, 6.07. Used for painting or china. Bennett 22, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B199. Used in nickel dip solutions and is more economical to use than double nickel salt(s). Hansen. c. Used in nickel plating, in blackening zinc and brass, and in ceramics. CCD 61, 1961.

nickel carbonate, basic. a. Used in electroplating, in the preparation of nickel catalysts, and as an ingredient in ceramic colors and in glazes. CCD 6d. 1961. b. Applied to two different compounds: (1) Light blue; NiCO₃·2H₂O; molar weight, 857.67; decomposes on heating; insoluble in hot water; and soluble in acids in ammonium salt solutions; and (2) emerald green; Ni₂CO₃(OH)·4H₂O; molar weight, 376.23; specific gravity, 2.6; insoluble in hot water and in cold water; and soluble in hot dilute hydrochloric acid and in ammonium hydroxide. Handbook of Chemistry and Physics, 45th ed., 1964, p. B122. Nickel ocher. An easy name for anagabergite. Fay.

nickel carbonate. Lee.

nickel carbonate, green; green nickel carbonate; bassemik. a. Of, pertaining to, or containing nickel in the trivalent state; for example, nickel nitrate (Ni(NO₃)₂). Webster 3d.

nickeliferous. Containing nickel. Fay.

nickel. Of, pertaining to, or containing nickel in the trivalent state; for example, nickel nitrate (Ni(NO₃)₂). Webster 3d.

nickel molybdenum iron. A class of alloys containing (90 to 40 percent molybdenum) and up to 60 percent nickel and found in a small amount of carbon. Such alloys are much used on account of high acid resistance. Crispin. Nickel nitrate. Green; deliquescent; monoclinic; Ni(NO₃)₂·6H₂O; molecular weight, 329.81; specific gravity, 2.065; melting point, 56.7° C; boiling point, 136.7° C; and soluble in water, in ammonium hydroxide, and in alcohol. Used in nickel plating, in the preparation of nickel catalysts, and in the manufacture of brown ceramic colors. CCD 61, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B199. Solu-

crystallized nickel sulfate hexahydrate; nickel salt, single; nickel salts, single; momoreenette. A. Green; orthorhombic; NiSO₄·7H₂O; molecular weight, 211.0; at 103° C; and soluble in water and in alcohol. Handbook of Chemistry and Physics, 45th ed., 1964, p. B198. Used in nickel dip solutions and is more economical to use than nickel sulfate (Ha). Hansen. c. Used in nickel plating, in blackening zinc and brass, and in ceramics. CCD 61, 1961.

nickel oxide; nickel monoxide; nickel protioxide; green nickel oxide; bassemik. a. Of, pertaining to, or containing nickel in the bivalent state; for example, nickel oxide (NiO) used in enamel. Webster 2d.

nickel oxides; nickel oxides; nickel oxide; bassemik. a. Of, pertaining to, or containing nickel in the trivalent state; for example, nickel nitrate (Ni(NO₃)₂). Webster 3d.

nickel-antimony glance. Sulfantimonide of nickel, crystallizing in the cubic system. Also called ulmominite. C.M.D.

nickel bloom. Hydrated and oxidized patina on outcropping rocks indicating existence of primary nickel minerals. Called nickel indicators, they are green carbonate (emerald color), sulfate (apple-green) or arsenic (apple-green). Pryor, J.

nickel carbonate, basic. Used in electroplating, in the preparation of nickel catalysts, and as an ingredient in ceramic colors and in glazes. CCD 6d. 1961. b. Applied to two different compounds: (1) Light blue; NiCO₃·2H₂O; molar weight, 857.67; decomposes on heating; insoluble in hot water; and soluble in acids in ammonium salt solutions; and (2) emerald green; Ni₂CO₃(OH)·4H₂O; molar weight, 376.23; specific gravity, 2.6; insoluble in hot water and in cold water; and soluble in hot dilute hydrochloric acid and in ammonium hydroxide. nickel oxide; nickel monoxide; nickel protioxide; green nickel oxide; bassemik. a. Of, pertaining to, or containing nickel in the bivalent state; for example, nickel oxide (NiO) used in enamel. Webster 2d.

nickel oxides; nickel oxides; nickel oxide; bassemik. a. Of, pertaining to, or containing nickel in the trivalent state; for example, nickel nitrate (Ni(NO₃)₂). Webster 3d.

nickel-antimony glance. Sulfantimonide of nickel, crystallizing in the cubic system. Also called ulmominite. C.M.D.

nickel bloom. Hydrated and oxidized patina on outcropping rocks indicating existence of primary nickel minerals. Called nickel indicators, they are green carbonate (emerald color), sulfate (apple-green) or arsenic (apple-green). Pryor, J.
slimes are washed. Fay.

nickled. Composite sheets, made by rolling together metal and mild steel to obtain the corrosion resistance of nickel with the strength of steel. C.T.D.

Mello silver. A bluish composition of silver, containing nickel (18 percent), iron, zinc, etc. (Zn,Mg,Fe')(Sn, P, S)04, previously thought to be PtTe. American Mineralogist, v. 39, No. 7-8, July-August 1954, p. 691. Probably PtFe. American Mineralogist v. 40, No. 7-8, July-August 1955, p. 695.

nickleite classification. A classification of rocks on the basis of their chemical composition, similar in some respects to the norm system. A.C. Mining, H. pumps; impellers and balls in ball mill. J. Sup., 3.

night shift. The coal miners' shift from about 10:30 p.m. to 6 a.m. It may be a coal-winning shift, but in general it is a preparation shift. Nelson.

digite. A. American. Fay.

nitrogen narcosis. A nonmetallic element in group V of the periodic system; atomic number, 7; odorless; chemically relatively inert; and a diatomic gas (N2). It constitutes about 78 percent by volume and 75.5 percent by weight of the atmosphere. It occurs combined as nitrates, as ammonium salts, in the soil, and in all living matter. The gas is obtained from liquid air. Used in gas-filled electric lamps and large quantities are fixed by various methods. Symbol, N; valences, 1 and 3; atomic number, 7; atomic weight, 14.0067; density, 1.2506 grams per liter; molecular weight, 28.015; boiling point, -298°F (at 76.1 mm) ; soluble in water; and slightly soluble in alcohol. Constitutes 78 percent by weight of the air, by volume. Obtained from liquid air by fractional distillation. Used in the production of ammonia and other nitrogen compounds, as a blanketing medium in the electronics industry, as a refrigerant, and for forcing crude oil from oil wells. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-123, B-129. nitrogen, available. See available nitrogen. Bennett, 2d, 1962. nitrogen base. The compound of carbon, hydrogen and nitrogen that is generally present in crude oil obtained in California. Shell Oil Co. nitrogen case hardening. See nitriding. C.T.D. nitrogen dioxide. This reddish-brown gas is considered the most dangerous of mine gases and is produced by the incomplete detonation of some explosives. It is very irritating to the air passages; a few hours after exposure bronchitis develops and is fatal if the concentration of the gas was high. It can be detected by paper soaked in a solution of potassium iodide and starch blue, which it turns blue by liberating iodine. Lewis, p. 696. See also nitrogen peroxide. Bennett, 2d, 1962. nitrogen dioxide indicator. Nitrogen dioxide detectors provide a field method for determining the concentration of nitrogen oxides, while automatic indicators and recorders provide continuous monitoring of combustion gases and of operations involving its use as an oxidizer. The detector comes in a kit which includes syringes, needles, solution bottles, and color chart. Detection is by comparison of air samples, treated with a reagent, with the standard color chart representing known gases and elements. The automatic type is based on an electrochemical reaction of the gas sample with a sensing solution. Bezi's, p. 356. nitrogen fixation. Applied to methods of abstracting nitrogen from the air in commercial quantities and fixing it in some comparatively inexpensive and stable form so that it can be used in either agricultural or industrial operations. Bennett, 1957. nitrogen hardening. See nitriding. Nelson. nitrogenite. To combine with nitrogen, or to introduce nitrogen into. Linn, p. 532. nitrogen narcosis. Like most inert gases, nitrogen in air or nitrogen-argon mixtures breathed at high ambient pressure can de-
nitroglycerin; nitrogen trioxide; nitrogen pentoxide. Nitroglycerin powders.

(relevant mental, impact, judgement, and produce poor muscle coordination in a manner similar to that produced by chronic intoxication. The narcotic effect is related to the partial pressure of inspired nitrogen. It is therefore a function of depth of diving and the percentage of nitrogen in the inspired gas. Nitrogen narcosis is not in itself harmful, but when air (80 percent nitrogen) is breathed as open-circuit scuba equipment at depths below about 60 to 80 feet, the resulting impaired judgment and coordination begins to interfere with the diver's performance and predispose him to accidents. The narcotic effects increase progressively with depth until at about 280 to 300 feet even routine effects dispose him to accidents. The narcotic effects are more closely related to the partial pressure of nitrogen than to the actual depth reached.

nitrogen pentoxide: nitrogen dioxide; nitrogen peroxide; nitrogen tetroxide. C; soluble in water to give nitric acid. Specific gravity, 1.491; melting point, 30° C; soluble in water. Bennett 2d, 1962.

nitrogen tetroxide: nitrogen dioxide; molecular weight, 46.01 (or 92.02); colorless solid or liquid, N2O3; molecular weight, 152.06; colorless or yellow; specific gravity, 1.918 (at 20° C, referred to water at 4° C); melting point, -22.3° C, boiling point, 197° ± 3° C (at 760 mm); insoluble in water; soluble in alcohol; and very soluble in alkalies. Used as an explosive. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. C-309.

nitroglycerin: 1-nitroglycerin. Yellow needles; HNC(NH)NO; molecular weight, 104.07; melting point, 246° C; slightly soluble in water and in alcohol; and very soluble in alkalies. Used in explosives and in smokeless powders. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. C-344. nitrolite. An excellent and cheap explosive in powder form, consisting of the constituents, ammonium nitrate + trotyl + nitroglycerin + silicon. This quality is sensitive to moisture owing to the high ammonium nitrate content. Frankel, v. 3, Art. 16.02, p. 27.

nitramine. A hydrous magnesium nitrate, Mg(NO3)2; molecular weight, 120.31; melting point, 102° C; soluble in water. Bennett 2d, 1962.

nitroglycerin: trinitrate glycerol; trinitrin; explosive oil. CH3(NO3)CH2(OH)Cl; pale yellow; flammable; explosive: thick liquid; soluble in alcohol; soluble in ether in all proportions; slightly soluble in water; melting point 100° C; and melting point, 256° C. Used as an explosive, in the production of dynamite and other explosives, as a plastic explosive for use in solid rocket propellant, and as a possible liquid rocket propellant. Molecular weight, 227.09; tri-}
The chemical properties of element 102 are unknown, but like the other elements of the actinide series, the properties of this very short-lived element may resemble those of the rare earth metals. The three known isotopes of mass numbers 254, 255, and 256 have half-lives of about 10 minutes, 3 seconds, and 15 seconds, respectively.

2. Noble metal(s). A metal whose potential is more positive than that of copper. 
3. Noblestone. Same as precious stone. 
4. Nodular powder. In powder metallurgy, irregularly shaped, highly condensed, round, nodular, or rounded particles. 
5. Nodules. A rounded mineral accretion built up by the action of fine coal of a gyratory, rotary or oscillatory motion, without the use of pressure. 
7. Nomograph. A chart or set of scales used to represent one of the variables in an equation. 
8. Nomogram. A simple diagram for representing the approximate tonnage expected to be supplied to the plant during the hour of greatest load. B.S. 3552, 1962.

**Nonahelium**

*Nonahelium* pyrobituminescence. A series of short-lived element that is used for its half-life of 30 minutes. It is a member of the actinide series, the properties of which are generally similar to those of other elements in the same group. In its ground state, nonahelium has an atomic number of 82 and an atomic weight of 208. It is a soft, silvery metal that is highly reactive with other elements. Nonahelium is primarily used in the production of high-energy electrons and in the study of fundamental processes in atomic physics.

**Nonahelium in mineralogy**

Nonahelium is used in mineralogy to express superior properties of a mineral or rock. For example, a mineral with a higher nonahelium content may be more resistant to weathering or have a higher density. Nonahelium is also used in the study of the composition and structure of minerals and rocks, and in the dating of geological formations.

**Nonahelium in geology**

Nonahelium is used in geology to express the age of a rock or mineral. For example, a rock with a higher nonahelium content may be older than another rock with a lower content. Nonahelium is also used in the study of the history of the Earth and its atmosphere.

**Nonahelium in chemistry**

Nonahelium is used in chemistry to express the reactivity of a substance. For example, a substance with a higher nonahelium content may be more reactive than another substance with a lower content. Nonahelium is also used in the study of the properties and behavior of molecules and chemical reactions.

**Nonahelium in medicine**

Nonahelium is used in medicine to express the biological activity of a substance. For example, a substance with a higher nonahelium content may be more biologically active than another substance with a lower content. Nonahelium is also used in the study of the biology of organisms and the effects of substances on living systems.
nonemergents. Algae and sea grasses which are not exposed at lowest low water or chart datum. *p. 754.

nonemergent. With orthochloric pyro- tome. The name was given by Lepeus. *p. 754.

nonemerging slate. Slate in which color is virtually unchanged even after many years of exposure. *AIME p 779.

nonferrous. Metals and compounds not contain- ing appreciable quantities of iron; ores not worked primarily for their iron content. *Pryor, p. 3.

nonferrous alloy. Specifically, an alloy containing no iron. Generically, any alloy that has as its base any element other than iron. Common commercial nonferrous alloys are hard upon aluminum, copper, lead, magnesium, nickel, tin, and zinc. *Henderson.

nonferrous metalurgy. That branch of metal- lurgy which deals with the broad field of metals other than iron, or alloys other than of iron base, as distinguished from ferrous metalurgy. *Henderson.

nonferrous metals. Metals other than iron and its alloys in which normally applied to base metals, such as copper and lead. *AGI.

nonfreezing explosives. Explosives to which have been added. This acts as a freezing-point depres- sant, and prevents freezing at ordinary temperatures. Polar or Arctic explo- sives are nitroglycerin explosives of this type. *Higham, p. 247.

nonfreezing. Materials that cannot be frozen at ordinary temperature. *P. 22.

nonflowing well. A well that does not dis- charge water at the surface except through the operation of a pump or other lifting device. *Stokes and Varnes, 1955.

nonfreezing explosives. Explosives to which 15 to 20 percent of nitroethylen glycol has been added. This acts as a freezing-point depressant, and prevents freezing at ordinary temperatures. Polar or Arctic explo- sives are nitroglycerin explosives of this type. *Higham, p. 247.

nonferrous. Metals other than iron and its alloys in which normally applied to base metals, such as copper and lead. *AGI.

nonflowing well. A well that does not dis- charge water at the surface except through the operation of a pump or other lifting device. *Stokes and Varnes, 1955.

nonstoichiometric. A chemical compound is nonstoichiometric if the ratio of its constituents differs from that demanded by the chemical formula. This may happen with oxides that are readily reducible, or with compounds containing an element of variable valency, or when interstitial atoms play a part in the lattice. Nonstoichiometric ceramics are of interest as being nonconducting.

nonslip floor. In concrete work, a floor surfacing which is impregnated with iron fillings or Carborundum powder to roughen its surface. Long. a. A rock unit that is nonweathering coal. Coal having a water-soluble bituminous content equal to or exceeding 1 percent by volume (usually over 3 percent). Nonuniform flow. A flow in which the velocity changes. If the flow is constant it is referred to as uniform flow.

nonslip cable. A wire or fiber cable so constructed as to deliver the coal in a mixed state rather than having the large lumps tend to be dropped and separated from the fine.

nonslip valve. See check valve.

nonslip floor. In concrete work, a floor surfacing which is impregnated with iron fillings or Carborundum powder to roughen its surface. Long. a. A rock unit that is nonweathering coal. Coal having a water-soluble bituminous content equal to or exceeding 1 percent by volume (usually over 3 percent). Nonuniform flow. A flow in which the velocity changes. If the flow is constant it is referred to as uniform flow.

nonslip floor. In concrete work, a floor surfacing which is impregnated with iron fillings or Carborundum powder to roughen its surface. Long. a. A rock unit that is nonweathering coal. Coal having a water-soluble bituminous content equal to or exceeding 1 percent by volume (usually over 3 percent). Nonuniform flow. A flow in which the velocity changes. If the flow is constant it is referred to as uniform flow.

nonslip floor. In concrete work, a floor surfacing which is impregnated with iron fillings or Carborundum powder to roughen its surface. Long. a. A rock unit that is nonweathering coal. Coal having a water-soluble bituminous content equal to or exceeding 1 percent by volume (usually over 3 percent). Nonuniform flow. A flow in which the velocity changes. If the flow is constant it is referred to as uniform flow.
normal arc

normal arc. A term specifically intended to differentiate between the arcs that are described in connection with the low-pressure "skittering arcs" Bulletin Bull. 625, 1963, p. 717.

normal beach ridge. A ridge having its base well below low tide level, along medium to high energy shores. Schieferdecker.

normal color. The quantity of heat required to raise 1 gram of water from 15.5° to 15.7° C. Newton, p. 122.

normal corrosion. When used in connection with galvanic corrosion it may refer to corrosion of the anodic metal when there is no contact with the dissimilar metal. Bulletin Bull. 619, 1964, p. 206.

normal depth. The depth of water in an open conduit that corresponds to uniform velocity for the given flow. It is a hypothetical depth under conditions of steady non-uniform flow: the depth for which the surface and bed-parallel velocity, also termed the neutral depth. Seeley, I.

normal dip. The regional or general inclination of strata. This dip may be distinguished from the marine, eroding agencies, as contrasted to local dip due to the presence of local structures. A.G.I.

normal displacement. Used by Tolman to denote dip slip, A.G.I.

normal erosion. The subaerial, as distinguished from the subaqueous, erosion agencies, are divided into two groups, normal and special, and it is by the normal group, running water and the actions of running water, that the shaping of the land surface is mainly effected. Chalmor.

normal fault. A fault at which the hanging wall has been depressed, relative to the footwall. A.G.I.

normal field. In magnetic prospecting, the smoothest value of a magnetic field component as derived from a large scale survey, world-wide or of continental scope. The normal field of the earth varies slowly with time, and maps of it are as of a certain date. A.G.I.

normal flow. An anticline, or syncline, with normal dip. Seeley, 1.

normal fold. The horizontal component of the stress in a rock mass which acts perpendicular to the lode plane or any other plane parallel to it. A.G.I.

normal fracture. A fracture at right angles to the direction of stress. A.G.I.

normal ground. A zone of ground water which is included in the course of excavation, so that no separate charge is made for it. Nichols.

normal heat. A rate of interest on the money laid out equal to the prevailing rate paid on sound securities or on savings deposits. A.G.I.

normalized steel. Steel that has been given a normalizing heat treatment intended to bring all of a lot of samples under consideration into the same condition. Fay.

normalizing conveyor. A conveyor which moves material through a normalizing furnace under heat. ASTM A253-1958.

normal lime. One which is right side up; the overturned, inverted, or reversed limb, which has been rotated through more than 90° to attain its present position. McKinstry, p. 641.

normalized consolidated soil deposit. A soil deposit which has never been subjected to an effective pressure greater than the existing overburden pressure and one that is also considered to be undisturbed by the existing overburden. ACSE P1266.

normal mineral. A mineral which is firmly mounted on the rope, but leaves it while still running to run on to a shunt tail for unloading and loading. Individual loads are about 1 ton and total capacity 100 tons per hour or more. See also bricke. Nelson.

normal order of crystallization. A term which perpetuates a misconception. Generally there is no applicable order of crystallization, but for any particular rock the study of thin sections enables the observer to deduce the order in which the minerals finished crystallizing. The order in many rocks is: accessories, mafic minerals in the order olivine, orthopyroxene, clinopyroxene, amphibole, micas, and secondary minerals, quartz and pyrite; but there are many exceptions. C.T.D.

normal pressure; standard pressure. Usually equal to the weight of a column of mercury 760 millimeters in height. Webster 3d. Approximately 14.7 pounds per square inch. Fay.

normal price. As applied to metal prices, it is the average price paid on sound securities or on savings deposits for the given flow, it is a hypothetical price, Fay.

normal pyroxene. A mineral of the general formula 

normal shift. The horizontal component of the stress to a given plane. ASCE P1826. See also stress.

normal stress. The stress component normal to a given plane. ASCE P1826.

normal uranium. See uranium, natural.

normal water. The standard used in determining chlorinity. It is prepared by the Hydrographical Laboratories in Copenhagen, Denmark. Chlorinity of this water is adjusted to approximately 10.4 [per thousand] and accurately determined by analysis.

normal winter. Refers to normal ice season, that is, the average ice conditions based on a number of recorded winters in a given area.

normal year. A year of normal or average water supply. Seeley, 1.

normal cubic. Those whose normal dimensions are 2 1/2 x 4 x 12 inches. ACGS, 1963.

Norman slabs. A type of glass for stained windows; it is made by blowing into square section and cutting slabs of glass from the four sides. Dodd.

normative. In petrology, characteristic of, pertaining to, agreeing with, or occurring in the norm; used in the quantitative or norm system of classification of igneous rocks, a normative mode being one which is essentially the same as the norm. Fay.

normative mode. A mode which is so nearly the same as the standard mineral composition calculated from the rock that either may be used to classify the rock correctly. Schieferdecker.

norm system. A system of classification and nomenclature for igneous rocks based on the norm of each rock. Only undecomposed rocks of which accurate chemical analyses are available are classifiable, in this system, which consequently is more used in detailed petrologic studies than in ordinary geologic or mining work. The system was devised by Cross, Iddings, Pirsson, and Washington, and by them originally designated the quantitative system, and later the C.I.P.W. system, which has also been referred to as the American system. Fay.

Norsk-Stal process. A process for the direct production of iron from carbon monoxide and hydrogen is used as the reducing agent. The equipment consists of three vertical stages, in which heat is added, reducing and cooling the charge, and apparatus for regenerating the spent gases. The ore is contained in a series of muffle trays,
Norsk-Staal process

Each trial holding about 3 tons of ore. These trials pass through the preheating oven, over the ore is heated to 1000°C, and are then transferred to the reducing oven, where they are raised slowly through the tuyeres and downward gas current, then transferred to the cooling shafts and slowly lowered down it. The transfer of a trial from one oven to another is possible at contact with air. The ore is preheated in the first oven by part of the gases from the reduction oven, and the carbon is cooled in the third oven to 500° by cold gases from a gas holder. Oslohke. Northampton sand ironstone. Eng. An important stratified iron ore deposit in the east Midlands and forms the feature known as the Oolite Cliff. It occurs at the base of the lower Oolites. The ore bvez sinks from 12 to 25 feet, of which only 6 to 14 feet are worked. The iron content is between 28 and 34 percent as quired. Nelson.

North end. York. The rise side of the coal in the Northumberland coalfield. A.N.I.

Northumberland sand ironstone. Eng. An important stratified iron ore deposit in the east Midlands and forms the feature known as the Oolite Cliff. It occurs at the base of the lower Oolites. The ore beds sink from 12 to 25 feet, of which only 6 to 14 feet are worked. The iron content is between 28 and 34 percent as required. Nelson.

Northfield. An obsolete name for a quartz-muscovite pegmatite. A.G.I.

Northern dust filter. A device for trapping the dust during the extraction ventilation of a shaft. The filter unit is attached to the discharge end of the ducting and contains 67 fabric sleeves or bags, giving an approximate total surface area of 20 ft² per foot of shaft. The sleeves are attached at their upper ends to a shaking mechanism. The dust collected in the bags can be removed from the filter by gravity. Developed by the Central Engineering Establishment in collaboration with the Mining Research Establishment of the National Coal Board, Great Britain.

Northwardly. A stratum is said to nose in... Standard, 1964.

Notch. In a cylindrical test specimen, the notch is defined as the ratio of one-half the width of the narrowest cross section, the acuity may be expressed as the ratio of the notch depth to the notch radius. ASM Gloss. Notch: The distance from the surface of a test specimen to the bottom of the notch. In a cylindrical test specimen, the percentage of the original cross-sectional area removed by machining an annular groove. ASM Gloss.

Notchable. See notch brittleness. ASM Gloss.

Notched-bar test. A test in which a notched metal specimen is given a sudden blow by a striker carried by a pendulum or a falling weight and the energy absorbed in breaking the specimen is measured. Also called impact test. See also Izod test; Charpy test; Fremont test. C.T.D.

Notchant. A machine tool in a steel fabrication shop by which the flanges are stripped from the ends of rolled steel plates. ASM Gloss.

Notching press. A mechanical press used for notching internal and external circumferences and also for notching along a straight line. These presses are equipped with automatic feeds, since only one notch is made per stroke. ASM Gloss.

Notch plate. V-shaped overflow; used to measure rate of overflow of liquid or to control that rate. Pray, 3.

Notch. A stratum is said to nose in... Standard, 1964.

Notch plate. V-shaped overflow; used to measure rate of overflow of liquid or to control that rate. Pray, 3.

Notch depth. The distance from the surface of a test specimen to the bottom of the notch. In a cylindrical test specimen, the percentage of the original cross-sectional area removed by machining an annular groove. ASM Gloss.

Notch. In a cylindrical test specimen, the notch... Standard, 1964.

Notch. In a cylindrical test specimen, the notch... Standard, 1964.
notch test. A test for the assessment of the low-temperature-spalling tendency of fireclay refractories. A notch is made in a specimen, usually forced by the effect of this on the strength at 800° C is determined. If the transverse strength is but little reduced by the notch, the low-temperature spalling resistance of the fireclay refractory will be good. Dodd.

notch toughness. The energy in foot-pounds required to break standard specimens under the standard conditions realized in the test or Charpy test. It may also mean the fracture toughness C.T.D.

note. N. Of Eng. Authorized list of payments due to a man or a set of men for work done during a week. Trist.

not previously known to exist. These words refer to the time of the location and measurement of the tunnel and not to the respective times of the discoveries of the various veins in the tunnel. Brekin, J. Nottingham system; Barry mining.

novatch. A very rare, strongly radioactive, secondary mineral found in veins with other minerals. Causing or tending to cause injury, especially to health; hurtful; poisonous; for example, nosous gas Standard, 1964.

nucleus. The central part of a large mold, corresponding to a small work Standard, 1964. b The bottom or drag of a molding flask, as distinguished from the turret. Stopblocks.

nucleus. Causing or tending to cause injury, especially to health; hurtful; poisonous; for example, nosous gas Standard, 1964.

nucleus gas. A gas which is injurious to health. B.S. 3618, 1983, sec. 2.

nuzzle. A short tube, usually tapering, forming the vent of a hose or pipe. Webster Thd. b. The front nosepiece of a bellows or a blast pipe for a furnace. Faw c. A short piece of pipe with a flange on one end and a saddle flange on the other end; may be made in a cast temperature, or wrought steel. Faw. a. Side outlet attached to a pipe by such means as riveting, brazing, or welding. Faw. c. A cylindrical fireclay shape traversed by a central line of uniform diameter: the top of the nozzle is contoured to form a seating for a stopper; nozzles are very fine in ladles used in the terming of steel. See also stopper.

nuzzle brick. A tabular refractory shape used in a ladle with a hole through which steel is teemed at the bottom, of the ladle, the upper end of the shaft serving as a seat for the stopper. A.R.I.

nuzzleman. In metal mining, one who operates a hydraulic giant or monitor (nuzzle) used to direct a stream of water under high pressure against a bank of gold-bearing gravel to erode and wash it into sluiceboxes where the gold separates out and is caught by riffles (cleats). Also called giant tender. D.O.T.

N.P.A. The initials of the National Petroleum Association. API Glossary.

N.P.N. Process. A modification of the basic Bessemer process. The main feature is the shortening of the blow by increasing the pressure of the blast as much as possible. Normally the melt is cooled by the addition of scrap of iron ore but it is claimed that a fairly high temperature can be maintained without an undue increase of the nitrogen content, so that ladle sculls can be avoided. Osborne.

N-truss. A bridge or roof truss which has parallel upper and lower chords and an arrangement of web members consisting of tension or compression verticals, with the vertical struts separating the panels. Also known as a Pratt truss. Ham.

rubber. A. Mfd. In the American iron manufact, 12 inches square for throwing mine cars off the road in case the couplings or ropes break. Faw. b. See stopblocks. Nelson.

nuclear magnetism log, spec. As used in cores containing oil or invert muds; (2) provides a means of qualitatively distinguishing those formations from those containing only water; (3) provides a means of measuring quantitatively what proportion of the total fluids in a formation are mobile and thus potentially recoverable; and (4) provides a means of estimating the permeabilities of formations. Wyllie, pp. 15-16.

nuclear magnetometer. See nuclear resonance magnetometer.

nuclear power plant. Any device, machine, or assembly thereof that converts nuclear energy into some form of useful power, such as mechanical or electric power. In a nuclear electric power plant, heat produced by a reactor is used to make steam. and the steam drives a turbine generator in the conventional way, L&L.

nuclear power station. An assemblage of machineries and equipment, including the necessary housing, where electrical energy is produced from nuclear energy. The heat generated in the graphite-moderated uranium reactors is conveyed to the steam plant by carbon dioxide under pressure. The hot gas gives up its heat to the reheating, evaporating, and superheating sections of the steam plant, and after passing through the steam-raising towers, the cooled gas in reheated by blowers to the reactor where the cycle is repeated. See also power station.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.

nuclear reactor. A device that converts the energy of the nucleus of the atom, such as fission, neutron capture, radioactive decay, or fusion; and directly from a chemical reaction, which is limited to changes in the electron structure surrounding the nucleus. L&L.
nuclear reactor

to describe its mechanism. LBL.

nuclear reactor communism. These special re-
commendations to LGS, U. S., and I.C. control materials used earth
nuclei, and B.C. moderators — Bo and C.

nuclear resonance magnetometer. With this
instrument the measurement of the earth’s
magnetic field depends on the moment
of the atom. Hydrogen atoms are
nevertheless, and these can be in a
compound such as water. Each hydrogen atom
can be looked upon as a tiny electromagnet
whose strength and direction are
determined by the revolution of the electron
of the atom about its nucleus. In a magnetic
field, atoms of hydrogen have a tendency
to align themselves in opposition to the field.
If the direction of the field is suddenly
changed, there will be a moment pulling
the atoms toward the new direction. But each atom is a minuscule gyroscope, and in
stead of shifting directly to the new field
direction, it will proceed along this direc-
tion. The pendulum effect which will be a function only of the strength of the
magnetic field. To measure the strength of the
magnetic field, a bottle of water
is subjected to a strong magnetic field at
right angles to the earth's field. The volt-
age induced in a coil of wire wrapped
around the bottle is observed when the
auxiliary field is suddenly removed. This
voltage will have a frequency of alterna-
tion of the order of 2,000 cycles per sec-
ond, its exact value depending on the strength
of the magnetic field. The time of 2,000
cycles of this voltage can be meas-
ured using a 100-kiloscope oscillator and a
high-speed counter, giving an accuracy of
measurement of 1 part in 10³, or of the order of ± 0.5%. HRC. See also
Varian nuclear magnetometer.

nuclear rocket. A rocket powered by an en-
engine that obtains from a nuclear reactor,
which is used synonymously with isotope. A radio-
nuclide. Any species of atom that exists for
a measurable length of time. A nuclide can be distinguished by its atomic weight,
nuclear number, and energy state. The
term is used synonymously with isotope. A radio-
uclide is the same as a radioactive nuclide,
nuclear superheating. Superheating the steam
nuclear rocket. A rocket powered by an en-
terminated, that is engaged on an
atom which exists for
a measurable length of time. A nuclide can be distinguished by its atomic weight,
nuclear number, and energy state. The
term is used synonymously with isotope. A radio-
uclide is the same as a radioactive nuclide,
nuclear superheating. Superheating the steam
nuclear rocket. A rocket powered by an en-
terminated, that is engaged on an
atom which exists for
a measurable length of time. A nuclide can be distinguished by its atomic weight,
nuclear number, and energy state. The
term is used synonymously with isotope. A radio-
uclide is the same as a radioactive nuclide,
nuclear superheating. Superheating the steam
nuclear rocket. A rocket powered by an en-
terminated, that is engaged on an
atom which exists for
a measurable length of time. A nuclide can be distinguished by its atomic weight,
nuclear number, and energy state. The
term is used synonymously with isotope. A radio-
uclide is the same as a radioactive nuclide,
O

oakum. Loosely twisted fiber usually of hemp or jute impregnated with tar or with a tar derivative (as creosote or asphalt) and used in caulking seams (as of the wood hulls and decks of ships) and in packing. Stew. B. Webster 3d.

Oamaru stone. Aust. A white, granular limestone found in large quantities in Oamaru, New Zealand, and valued as a building stone. Fay.

objective. The system of lenses in a microscope which furnishes the initial magnification of the object being examined. The image formed by the objective is picked up and further magnified by the ocular.

obligate anaerobe. An organism growing only in the absence of free oxygen. I.C. 8075, 1952, p. 64.

oblique air photograph. A photograph taken from the air, for purposes of aerial survey work, with the optical axis of the camera inclined from the vertical, generally at some predetermined angle. C.T.D.

oblique block. A quarry term applied to a block of stone bounded by 3 pairs of parallel faces, 4 of the 12 interfacial angles being right angles, 4 obtuse, and 4 acute. Fay.

oblique fault. A fault whose strike is oblique to the strike of the strata. A.G.I.

oblique joint. A joint of the plane of which forms an acute angle with dip joints and strike joints. Lewis, p. 592.

oblique offset. The distance of a point from a main survey line measured at an angle to the latter which is not a right angle. Stayley.

oblique photograph. See oblique air photograph. See also aerial mapping.

oblique projection. A pictorial view of an object showing its elevation, plan, or section to scale with parallel lines projected from the corners, at 45° or any other angle, indicating the other sides. See also conic projection, monocular projection. New.

oblique dip fault. A fault in which the net dip lies between the directrix of dip and the directrix of strike. A.G.I.

oblique stratiification. See oblique bedding. Pettijohn.

oblique structure. A survey of mining claims where no visible evidence remains of the work of the original miner. Ricketts.

obsequent faultline scarp. A warp along a faultline, but where the topographically low area is in the block that has been relatively uplifted. See also recurent faultline warp. A.G.I.

obsequent stream. A stream flowing in a direction opposite to that of the dip of the strata or the tilt of the surface. Also called reverse stream. Fay. b. A stream which flows in a direction opposite to that of the consequent drainage. A.G.I.

observation error. An error caused by misreading a level or measuring device, or to faulty recording. Prorer, p. 159.

observer. a. In seismic prospecting, the man in charge of the recording crew, including the shooters and linemen. He must maintain the electronic equipment and decide on the best shooting and detector arrangement as well as the best instrumental settings for getting records of optimum quality. He operates the recording equipment in the field, often with the help of an assistant. In conventional recording, or in tape recording when photographic monitors are run, the observer or his assistant develops the record in the recording truck immediately after it is shot. Also called operator. Dobrin, p. 56. b. In gravity and magnetic prospecting, a fieldman who secures the instruments used, for example, on the torsion balance or magnetometer. A.G.I.

observer helper, gravity prospecting. In petroleum exploration, one who transports equipment and gravity prospecting party personnel to field locations and assists in making gravity observations that provide data for petroleum exploration activities. Also called gravity prospecting operator helper. D.G.T. I.

obsidian. a. An ancient name for volcanic glass. Most obsidians are black, although red, green, and brown ones are known. They are often banded and normally have conchoidal fracture and a flasby luster. In recent years, the name has been somewhat restricted to glasses having a very low water content as contrasted with pitchstones and perlites. Most obsidians are rhyolitic in composition. A.G.I. b. A highly siliceous natural glass. ASTM C162-66.

obsidianite brick. Lightweight, siliceous fire brick, acid-resistant brick, burned to a light grayish color. Ges. Staff.

obtuse bisectrix. That axis which bisects the obtuse angle of the optic axes of biaxial negative amphiboles. Fay.

Ocean’s razor. If the facts established by an experiment are explicable without the need for developing a new hypothesis, there are no valid grounds for such an experiment. Proyer, p. 7.

oculometer. A trade name for certain yellow-colored varieties of quartz used as semiprecious gem stones. See also Spanish topaz. C.T.D.

oculometer. A trade name for certain yellow-colored varieties of quartz used as semiprecious gem stones. See also Spanish topaz. C.T.D.

occupation. As used in the mining law, it is equivalent to possession, and the right to locate is included in the right to occupy, and incident to a location is the right of possession; but mere occupancy of the public lands and making improvement thereon gives no vested right therein against a location made in pursuance of law. Ricketts, I.

occurrence. In geology, the existence or presence of any phenomenon or thing in any recognized position or in any specified relation to other objects or phenomena; at, the occurrence of gold in a vein. Standard, 1904.

ocean. The great body of salt water surrounding the land of the globe in its major subdivisions. Schiffner. German.

ocean basin. That part of the floor of the ocean that is more than about 600 feet below sea level. A.G.I.

ocean current. A. The current name is usu-
ocean current

ally restricted to the faster movements of the ocean, while those in which the movement is slow to only a few miles a day are termed drifts. A.G.I. b. A nonidal current constituting a part of the great oceanic drifts. Examples are gulf stream, kuroshio, and equatorial currents. A.G.I.

ocean depths. The greatest depth (over 10,400 meters) discovered in the various oceans lies in the Pacific; depths of over 8,500 meters and 7,000 meters have been recorded in the Atlantic and Indian Oceans, respectively. C.T.D.

ocean bottom. This term is appropriate when the platform has a depth less than 100 fathoms. Schieferdecker.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic province. See pelagic division. Hy.

oceanic stratosphere. The cold, deep layers of the ocean consisting of waters of polar or subpolar origin. Schieferdecker.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanography. The broad field of science which includes all fields of study which concern with the ocean, its characteristics as the fuel sample in question. Shell Oil Co.

ocean acid. See carpylic acid. CCD 6d, 1961.

ocean. An outermost atomic shell of eight valence electrons, completion of which confers chemical stability and inertness. Elements are octavalent when these shells are filled by gain or loss of valence electrons. Fro, Pt, Pi.

oceanus. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanographer. One who studies the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanographic survey. A study or examination of conditions in the ocean or any part of it, with reference to animal or plant life, chemical elements present, temperature groups, etc. Also called marine survey. H. & G.

oceanography. The broad field of science which includes all fields of study which concern with the ocean, its characteristics as the fuel sample in question. Shell Oil Co.

oceanus. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

ocean salinity. Total amount of solids in 1 kil of seawater after all carbonates have been converted to oxides, the bromine, iodine replaced by chlorine and all organic matter has been completely oxidized. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

oceanic. A rock texture characterized by radiating groups of prismatic or platy minerals, such as biotite or pyroxene, disposed around the borders of larger euhedral crystals. Equations are gulf stream, kuroshio, and equatorial currents. A.G.I.

oceanic. A term used to describe the characteristics of the ocean for use in navigation, geography, meteorology, and other sciences. J. J. H. & G.

odometer. a. An instrument for performing a consolidation test. Nelson. b. A device for measuring distance traveled; it is attached to the hub of the wheel. Crispin. c. In oceanography, a recording thermometer with line and weight sounders and other machines when it is necessary to know how much warp or wire has been paid out. C.T.D.

O'Donahue formula. A formula used for calculating the thickness of tubbing: \[ t = \frac{bdf}{2C} \] where \( t \) is the required thickness of tubbing in inches, \( h \) is the pressure of water in pounds per square inch, \( d \) is the diameter of the shaft in inches, \( C \) is the crushing strength of east iron in pounds per square inch which may be taken as 95,000, \( F \) is the factor of safety adopted between 5 and 10, and \( A \) is the allowance for possible flaws and corrosion and may vary from one-fourth inch to 1 inch averaging one-half inch. Sinclair, II, 1918.

O'Donahue's theory. A mine subsidence theory based on an extension of the theory of the normal. In it, subsidence is regarded as taking place in two stages. There is, first, a breaking of the rocks in which the fracture tends to run to right angles to the stratification. This is followed by an "after slagging" or inward movement of the sides, resulting in a pull or draw beyond the edges of the workings. Briggs, p. 43.

odontolite. A bluish fossil bone, or tooth (fossil). Naturally colored blue by phosphates of iron and rarely, green, by copper. Mohs' hardness about 5; specific gravity, 3.0 to 3.5; sometimes as low as 2.4. Same as bone turquoise. Shipley.

odor of metals. Some metals emit a faint but characteristic odor when they are rubbed, particularly in the warm state. This phenomenon has never been adequately explained. In the case of highly specific metal, such as mercury and arsenic. Camm.

odor test. One made by heating, breathing upon, rubbing, or striking a mineral. Rarely of value in gem identification except in distinguishing amethyst from its substitutes. Shipley.

Oehman and Payne-Gallwey instrument. A borehole surveying instrument. It consists of a plumb bob suspended over a gimbal-supported carrier on which a disc of sensitized paper records the shadow of the plumb bob suspended over it. A compass needle on a similar carrier likewise records its shadow upon a sensitized paper disc. Small lamps are so placed as to flash at a predetermined interval by a clock mechanism and dry batteries. A series of measurements are taken at known depths and the bored hole is traced by plotting the results. See also Maas borehole compass. Nelson.

Oehman's survey instrument. A drill-hole surveying apparatus that makes a photographic record of the compass and clinometer readings. Long.

offset. Derb. A piece of wood on which the sieve is placed after washing the ore in a vat. Fay.

oersted. a. The practical, centimeter-gram-second electromagnetic unit of magnetic intensity. A unit magnetic pole, placed in a vacuum in which the magnetic intensity is 1 oersted, forms by a force of 1 dyne in the direction of the intensity vector. A.G.I. b. Prior to 1932, the practical, centimeter-gram-second electromagnetic unit of magnetic reluctance. A.G.I.

Oesterheld method. A form of asbestos cement in which the cement is sprinkled onto the blanketlike fleeces of asbestos, which is passed around on rollers and after it has been thoroughly mixed with water. This process is repeated several times so that alternating layers of cement and asbestos are successively pressed together by pressure. Sinclair, W., E., p. 307.

Oelling freezing method. A method of shaft freezing by freezing the wet ground in sections as the sinking proceeds. The permanent lining is also inserted at the shaft is sunk. The freezing equipment is a cylinder equal in diameter to the shaft and 44 inches in height, with the lower end closed by a plate. The cylinder is in sections, each of which can be removed. Each section is provided with freezing coils. After freezing the ground, two sections are removed, the ground is thawed locally and removed, and a segment of the permanent lining is inserted. The process is repeated. See also freezing method. Nelson.

off. N. of Eng. Worked out; gotten; wrought; as, the mine is off. Fay.

off-beam. To carry (bricks) from the mold to the kiln. Dodd.

off-center waterway. A waterway port in a wall at a predetermined interval by a clock suspended over a gimbal. A borehole surveying instrument. It consists of a plumb bob suspended over it. A device for measuring distance traveled; it is attached to the hub of the wheel. Crispin.

oetling freezing method. A method of shaft freezing by freezing the wet ground in sections as the sinking proceeds. The permanent lining is also inserted at the shaft is sunk. The freezing equipment is a cylinder equal in diameter to the shaft and 44 inches in height, with the lower end closed by a plate. The cylinder is in sections, each of which can be removed. Each section is provided with freezing coils. After freezing the ground, two sections are removed, the ground is thawed locally and removed, and a segment of the permanent lining is inserted. The process is repeated. See also freezing method. Nelson.

off-highway. A condition existing when the drive rod of the drill swivel head is not centered and parallel with the borehole being drilled. Long. A borehole that has deviated from its intended course. Long. c. A condition existing wherein any linear measurement (shift, drift, borehole, etc.) is out of tolerance. Long. q. A condition wherein any linear measurement (shift, drift, borehole, etc.) is out of tolerance. Long. d. A condition wherein there is a harmful deviation of the borehole from its intended line or course. Standard, 1964.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway. A method of shaft freezing by freezing the wet ground in sections as the sinking proceeds. The permanent lining is also inserted at the shaft is sunk. The freezing equipment is a cylinder equal in diameter to the shaft and 44 inches in height, with the lower end closed by a plate. The cylinder is in sections, each of which can be removed. Each section is provided with freezing coils. After freezing the ground, two sections are removed, the ground is thawed locally and removed, and a segment of the permanent lining is inserted. The process is repeated. See also freezing method. Nelson.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.

off-highway refers to certain standards of off-highway equipment such as tractors, trucks, and off-highway trucks. Bureau of Mines Stall, 1959.
more distant diagonal offsets. Wheeler.

k. Of a fault, the horizontal separation measured perpendicular to the strike of the fault. Wheeler.

l. A short distance usually measured at right angles from a line as to a boundary, or to continue a line parallel to itself at some little distance away to avoid an obstruction, or the like. Fay. m.

A spur or minor branch from a principal range of hills or mountains. Fay. n.

The distance along the strain coordinate between the initial portion of a stress-strain curve and a parallel line that intersects the stress-strain curve at a value of stress which is used as a measure of the yield strength.

It is used for materials that have no obvious yield point. A value of 0.2 percent is commonly used. Wade and Class.

d. A imperfection resulting from mold parts not properly matched, for example, a finit or base offset from body or neck. ASTM C162-66.

offset clipping bit. A chisel clipping bit with one wing considerably wider than the other, as measured from the center of the bit. Long.

offset deposit. Applied to magmatic segregation, intrusive diapir, or hydrothermal character which were injected into the country rock at a moderate or small distance from the mother rock, especially to nickel-copper-sulfide deposits of this kind at Sudbury, Canada. Schieferdecker.

offset digging. In a ladder ditch, digging with the boom not centered in the main channel.

offset drilling. See directional drilling, c. Nichols.

offset horizon. Horizontal separation measured perpendicular to the strike of the disrupted horizon. McKInstry, p. 639.

offset fact. See finish. Dodd.

offset line. In surveying, a line established parallel to a line in the main survey line, and normally also parallel to it. Fay.

An oil well of which the drilling is done in a parallel direction to a line in a former well pattern. Seely, 2.

offset link. A combined pin-and-roller link in a roller chain, consisting of two offset link plates, a single bushing with roller, and a single pin. JBM.

offset point. The bottom of a bottle if it is asymmetric to the axis. Dodd.

offset ridge. A ridge held up by a resistant layer which had been displaced by a dip or a diagonal fault. Billings, 1954, p. 153.

offset section. For a roller chain, a factory assembled section. The main survey line, and usually not far from it, for examples, a line on a sidewalk, 2 feet from the established street line; or a line parallel to the centerline of a bridge and 50 feet from it. Seely, 2.

offsets. A combined pin-and-roller link in a roller chain, consisting of two offset link plates, a single bushing with roller, and a single pin. JBM.

offset shot point. A shot point that has been displaced from the shooting line in a perpendicular direction. Schieferdecker.

offset show. A rod, usually 10 links long, used in measuring short offsets. Webster 2d.

offset yields offset h and i.

offset yield strength. See yield strength. HOG. Schieferdecker.

offsets. Situated at a distance from the offshore bar. An accumulation of sand in the form of a ridge, built at some distance from the shore and under water. It results clearly from A.G.I.

offshore barrier. See barrier beach. HOG.

offshore currents. Nontidal currents outside the surf zone, the ocean currents affected by shoaling and river discharge. Hy.

offshore slope. A ridge held up by a resistant layer which had been displaced by a dip or small distance from the mother rock, especially to nickel-copper-sulfide deposits of this kind at Sudbury, Canada. Schieferdecker.

offshore terrace. A deposit of sand which is built out into deep water by the combined action of waves and currents. It trends parallel to the shore. The materials are draped over its outer edge. Its upper surface is a continuation of the shore bench or wave-cut bench with which it is associated. Shore terraces are not exposed except by sufficient subsidence of the water level. Stokes and Varnes, 1955.

offshore track. A depression of the offshore, parallel to the trend of the coast. Schieferdecker.

offshore water. Water adjacent to land in which the physical properties are slightly influenced by continental conditions. Hy.

offshore winds. Winds blowing seaward from the coast, Hy.

offset drilling. See directional drilling, c. Nichols.

offset level. a. Eng. The raised portion of an underpass above the sururface, for carrying off smoke, steam, etc. Fay. b. A length of boring rods unscrewed and detached at the top of a drilled hole called rod stand; setout BS 3618, 1969, sec. 3. c. Scot. A deduction from workmen's wages for house rent, coal, etc. Fay. d. A channel for taking ash or air water; also, t. i. point of beginning of such a channel. Webster 2d.

offset drift. Offtake level. a. Scot. A water level driven from the surface to a point in a pumping shaft where the water is delivered. Fay. See delivery drift. BS 3618, 1963, sec. 4.

offset joint. Eng. The joint by which the bucket is attached to the hauling chain. Fay. See shackle. C.T.D.

offset rods. Auxiliary rods at the top of a winding shaft for guiding and steadying the cages during docking or loading and unloading operations. Nelson.

off-the-road hauling. Hauling which takes place off the public highways, and generally on the mining site or excavation site. The hauling units used are generally higher and wider than those used in over-the-road hauling since highway restrictions do not limit size, weight, etc. Compare over-the-road hauling. Carson, p. 345.

off the solid. In this type of blasting the coal is blasted from the solid with no pre-cutting or shearing. McAdam II, p. 106.

off time. In resistance welding, the time that the electrodes are off the work. This term is generally applied where the welding cycle is repetitive. ASM Glou.

o. The space before the fire in a kiln. Also called killogie, Standard, 1929.

O'Hara furnace. A horizontal, double-hearth furnace for calcining sulfide ores. Fay.

Oil furnace. A furnace. Dodd.

Oil samples. A single tube or pipe with a pipe thread on the top and the bottom bevel-edged and hardened for driving into the ground to make a well. Long.

Ohmimeter. A type of galvanometer which directly indicates the number of ohms of the resistance being measured. Grippin.

Ohm-meter-galvanometer. A special instrument for measuring the resistance of an electric circuit or the potential difference of 1 ampere in a circuit connected in the circuit and adjusted until a point of balance is reached on the galvanometer. The resistance of the circuit is then read on the calibrated scale. Lentz, 124.

Oil line. a. The electric current flowing in a circuit is proportional to the electromotive force and inversely proportional to the resistance. Frequently expressed in the form: E = I R.

R. I. Which is the electric current in amperes; E is the electromotive force in volts; and R is the resistance in ohms. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-52.

Oil mass. A suffix meaning in the form of. A.G.I.

Oil matrix. A matrix or host crystal through which smaller crystals of a kind at Sudbury, Canada. Schieferdecker.

Oil oikocryst. A matrix or host crystal through which smaller crystals of other minerals are distributed as poikilitic inclusions. Holmes, 1920.

Oil. a. A general term given to various mixtures of natural hydrocarbons. To the minor oil is petroleum. Nelson. b. Any of various substances that typically are unctuous, viscous combustible liquids or solids easily liquefiable on warming and are not miscible with water. Including in addition to the usual, naphtha and other alcohol and other organic solvents, that leave a greasy not oily feeling on the skin, such as petroleum, mineral or synthetic origin, and that are used according to their types, chiefly as lubricants, fuels, and illuminants. Webster 3d. c. This term includes: (1) fatty oils and acids; (2) essential oils, mostly of vegetable origin, such as eucalyptus and turpentine; and (3) mineral oils, such as petroleum products, including lubricating oils. Used in the flotation process. Fay. d. A common name for mineral oil or petroleum. Tomkiewicz, 1954, c. Any fluid lubricant. Nichols. f. Any liquid petroleum derivative that is less volatile than gasoline. Nichols. g. As used in an oil and gas well, the fluid produced from a well, or crude petroleum in its natural state. Ricketts, 11.

Oil and gas lease. Contract conveying mineral interest for drilling purposes. Wheeler.

Oil base mud. A mud-laden drill-circulation fluid which is used as the basis of the circulating fluid. Nichols. f. Any liquid petroleum derivative that is less volatile than gasoline. Nichols. g. As used in an oil and gas well, the fluid produced from a well, or crude petroleum in its natural state. Ricketts, 11.

Oil-bearing shale. Shale impregnated with petroleum. Not to be confused with oil-bearing shale (mks) unit of electric resistance that equals the resistance of a circuit in which a potential difference of 1 volt produces a current of 1 ampere, or to the resistance in which 1 watt of power is dissipated when 1 ampere flows through it. The standard in the United States is 1-ohm; 1-ohm, 13d. Symbols, Ω and Ω. Zimmermann, pp. 76, 208.
oil-bearing shale

T. M. Kiefer, 1954.

Shale. Gloss. Oil canning. The same as canning. ASM

Oil circuit breaker. A circuit breaker used on medium, high, and extra-high tension systems to control feeder cables and motor circuits. Staff, 3rd. Contact is made on strong tank containing oil, which rapidly quenches the arc which forms when the circuit is opened. Mason, 7th, p. 439.

Oil coal. Another name for stellinite. T. M. Kiefer, 1954.

Oil cut. a. Term used to describe a mixture of oil and drilling mud recovered in testing. Wheeler.

Oil derrick. A towerlike frame used in boring oil wells, to support and operate the various tools. Standard, 1964.

Oil edger. A fine-grained stone used for sharpening edged tools or other similar metal surfaces. Fay.

Oil refinery. A plant where petroleum is dissolved in mineral oil to form an oil thickener. Fay.

Oil pump. A hydraulic pump supplying oil under pressure to the hydraulic-feed cylinder and pistons of a hydraulic-type swivel head on a diamond drill. Long.

Oil recognition. A prinicple for keeping machinery properly lubricated. Also called grease monkey. Long.

Oil-rich shale. An accumulation of oil in sedimentary rock that yields petroleum on drilling. The oil occurs in the pores of the rock and is not a pool or pond in the ordinary sense of these words. Fay.

Oil rock. A spring issuing from underground at the top of the well casing and having a latex appearance. Fay. Also called oilfield casing. Long.

Oil (or) sandstone. Sands which have been bonded with oil, for example, liased oil. Such sands are partially suitable for the production of large cores where high strength and considerable permeability are required. D. O. T., 1962.

Oil seepage. The slow leakage of petroleum. Fay. Also called oilfield casing. Long.

Oil shale. A mineral deposit containing such a proportion of hydrocarbons as to be capable of yielding mineral oil on dow distillation. See also shale, shale oil, Pennsylvania oil shale, kerogen, bitumen, shale. Fay.

Oil sheath. A compact rock of sedimentary origin, with an ash content of more than 33 percent and containing a vitrich mineral that yields oil when destructively distilled but not appreciably when extracted with the common solvents. ASTM D 288-57. c. A fine black or dark brown shale containing sapropelic material (kerogen) and characterized by having a brown streak, a leathery appearance with parting planes often smooth and polished, and a finely laminated structure. It differs from an ordinary carbonaceous shale by curling when it is cut into thin flakes, and by its toughness and resistance to disintegration by weathering. It is capable of yielding oil or gas on distillation. T. M. Kiefer, 1954.

Oil shale lands. Lands on or under which oil shale is present. Bureau of Mines Staff.

Oil smelter. Men who were employed to indicate where oil-bearing strata is to be found, and locate places for successful well boring, by the sense of smell. Fay.

Oil spot. A surface fault, seen as a mottled circle, on electric lamp bulbs or valves; it is caused by carbonization of a contaminating drop of oil. Dodd.

Oil springs. Lustrous metallic markings on dark iron glasses. ACS, 1961.

Oil stone. A fine-grained stone used for sharpening edged tools or other similar metal surfaces. Fay.

Oilstone. A region rich in petroleum deposits; especially, a region containing numbers of producing oil wells. Webster 3d.

Oilstone dressing. Syonym for oilwell casing. Long.

Oilfield. A region rich in petroleum deposits; especially, a region containing numbers of producing oil wells. Webster 3d.

Oilfield cement. A hydraulic cement which may be used in oil well boring, by the sense of smell. Fay.

Oilfield drilling mud. See drilling mud.

Oilfield packer. A packing inserted between the pipe and the interior surface of the bored in an oil well to keep surface water or water from the sides of the hole from running into the well, and to prevent oil in some wells from being forced out around the pipe by a pressure of gas. Fay.

Oil-greasy. Usually a mixture of lithopone and white lead or zinc white. May also contain gypsum, magnesia, whiting, or silica. Used as a white lead substitute. C. D. 64, 1961.

Oil greasy. These are substantially equivalent terms. All oils are greasy. Greatness suggests more viscosity than oiliness. A term used in the filtration process. Fay.

Oil zone. A formation that contains capillary or supercapillary voids, or both, that are
full of petroleum and will move under ordinary hydrostatic pressure. Fay.

oligoclase. Same as delphinite.Shipley.

oligoclase. A feldspathoidal, ultamafge rock composed primarily of melilite and haline and containing accessory biotite, perovskite, apatite, calcite, and opaque iron oxides. A.G.I.

oligoclase. A. A compact or fibrous mineral. Composition: 

(3Al2O3·2SiO2•CaO)•CaO = 14. Gillette, 9. a. Mixture of zoconite and resin with caoutchouc and sulfur, used as an insulating material for electric conductors. Fay.

old age. That stage in the development of strata and landforms when the process of erosion are decreasing in vigor and efficiency, or the forms are tending toward simplicity and reduction of relief; said of streams and landforms. Fay.

old mead fire clay. A molding sand rendered friable by the application of graphicite and grease. Fay.

old mine workings. Ancient mine workings. See also old workings, weeldrous. Nelson.

old iron ore. See olivenite. Fay.

old iron oxide. Metallic iron. Webster 3d.

old mine fire clay. A fire clay occurring in the Bingham Hill district near Stourbridge (England); it usually contains 56 to 64 percent SiO2, 25 to 30 percent Al2O3, and not greater than 2.5 percent Fe2O3. A smooth plastic fire clay formerly much used for making clay pots, but now largely worked out. Dodd.

old plain. Synonym for peneplain. A.G.I.

Old Red Sandstone. A red sandstone, conglomerates, and shales, of nonmarine origin, which constitute the Devonian system in parts of Great Britain and is regarded as equivalent in age to the normal marine Devonian strata. In North America, the name was formerly applied to rocks of the Os unmistak group, which display some striking analogies to the Old Red Sandstone of Europe. Fay.

old river. It has been suggested that any river whose members are all graded should be termed an old river. There is no critical change between mature and old age. Usually in old age, the valley is several times the width of the meander belt. Stake and Grant, 1925.

old sand. A molding sand rendered friable and porous by frequent high-temperature. Fay.

old sand. Scrap from metal articles that have outlived their usefulness; it includes discarded trolley wire, battery plates, lithographer's plates, old rails, etc. Newton, p. 38.

old silver. Silver made to appear old by the application of graphicite and grease. Fay.

old stage of the shoreline cycle. Stage of the wide wave-cut platform and a sea cliff, a faint vestige of the theoretical case, as shoreline cycles usually are interrupted before this stage. Schieferdecker.

oldtimer. A drill runner with 30 to 40 years of experience. Long. b. An antiquated drilling rig; generally applied to a steam-motivated diamond drill. Long.

old waste. Scot. Old or abandoned workings. Fay.

old workings. Mine workings which have been abandoned and have collapsed, and perhaps sealed off. Unless proper safeguards are taken, old workings can be a source of dangerous works in production, particularly if they are waterlogged and their plan position is uncertain. See also old mine fire clay and alteration products. Fay.

oleic acid. A, 9-octadecenoic acid. An important fatty acid, which is present in most vegetable oils and animal fats. It is also present in the human body, being a component of the human brain. Pryor, 3d.

olive ore. See olivenite. Fay.

olive ore. See olivenite. Fay.

Oliver filter. A continuous-type filter made in the form of a cylindrical drum with filter cloth stretched over the convex sur
comma gabbro. A gabbro containing olivine; omphacite. A greenish, vitreous variety of olivinite. A foliated rock with olivine as the principal constituent. Also used for hornblende picrite with augite and anorthite. A.G.I.

olivine. Olivine is a common mineral in many igneous rocks. It is a pyroxene that is a common constituent of basalt and andesite. Fay.

olivite. A greenish, vitreous variety of pyroxene that is a common constituent of the garnet rock, eclogite. Fay.

olivine norite. A variety of norite characterized by abundant epidote, phenocrysts. Fay.

olivine picrite. A blende picrite with augite and anorthite. Fay.

olivine rock. See dunite. C.M.D.

olivine streak with olivine as the principal constituent. Also used for hornblende picrite with augite and anorthite. A.G.I.

olivine. A magnesium iron silicate, (Mg,Fe)SiO_4, usually olivine green, occurring in basaltic igneous rocks; orthorhombic. The clear green variety is used as a gem stone under the name peridot. The word olivine is prefixed to the names of many rocks that contain the mineral. Fay; Dow, 17.

olivine norite. A variety of norite characterized by abundant epidote, phenocrysts. Fay.

olivine picrite. A blende picrite with augite and anorthite. Fay.

olivine norite. A variety of norite characterized by abundant epidote, phenocrysts. Fay.

olivinite. A foliated rock with olivine as the principal constituent. Also used for hornblende picrite with augite and anorthite. A.G.I.

olivine. Olivine is a common mineral in many igneous rocks. It is a pyroxene that is a common constituent of basalt and andesite. Fay.

olivite. A greenish, vitreous variety of pyroxene that is a common constituent of the garnet rock, eclogite. Fay.

olivine. A magnesium iron silicate, (Mg,Fe)SiO_4, usually olivine green, occurring in basaltic igneous rocks; orthorhombic. The clear green variety is used as a gem stone under the name peridot. The word olivine is prefixed to the names of many rocks that contain the mineral. Fay; Dow, 17.

of which is not deviating from the intended direction. Long. c. Said of a diamond drill when its drive rod is centered on the hole, as opposed to a borehole. Long.

on the run. A face between end and cross-cut. Sinclair, VI, p. 9.

O'Neill machine. A machine for making glass bottles originally designed in 1915; it was based on the use of blank molds and blow molds. The principle in modern O'Neill machines is the same, they are electrically operated and are capable of surveying outputs. Dodd.

onofrite. Sulfoselenide of mercury, Hg,Se; contains 81 to 82 percent mercury. It is a honey amber-colored mineral.

Onondaga limestone. The coastal reef limestone in the Utlerian of the Middle Devonian; forming a belt from New York to Ohio, Michigan, and Kentucky. Famed for its well-preserved fossils; an important oil-bearing formation in Ontario, Canada, and in the Eastern-Central United States. CT.D.

on plane. Scof. In a direction at right angles to, or facing, the plane or main joints. Fay.

onsetter. a. The man in charge of the loading and unloading of the cages or skips at the pit bottom, and also the signaling to the pithead. In modern mines, the onsetter is stationed in a cabin and all controls are within his reach for the loading and unloading of the cages and other car control equipment at the shaft bottom. Nelson. See also bottomor; cages; head hitcher; hitcher. b. The person in charge of winding operations underground. He is stationed at the shaft side and gives all signals from his inset to the winding engineman. Maron.

onsetting machine. Eng. A mechanical apparatus that removes the fan blasts, the fan dust, and discharging the empties, or vice versa, at one operation. Fay.

onshore. A. Being on or near the shore. B. A workman whose signal lights and who is stationed at the shaft bottom. C. A workman who operates the cages and other car control equipment at the shaft bottom. D. A workman who operates the cages and other car control equipment at the shaft bottom. E. The part of a blasthole which cannot be broken by the blast. Fay. a. That part of a blasthole which cannot be broken by the blast. Fay. b. A practice of blasting coal with heavy charges of explosives, in lieu of undercutting or channeling. Fay.

on the track. Diamonds inset in the crown of a bit in concentric circles so that the diammonds in any one circle follow the same groove cut into the rock. Long.

onychite. An alabaster, or calcite (stalagmite) rock, weathered on the surface or retouched by nature, with the markings of ancient rites, and with brown veins, carved by the ancient into vases, etc. Standard, 1964.

Onyx. A crystalline variety of quartz, consisting of different colored layers, chiefly white, yellow, black, or red. Fay. a. Translucent layers of calcite from cave deposits, often called Mexican onyx or onyx marble. A.G.I.

onyx alabaster. Minimover for parallel-banded calcite. See also onyx marble.

onyx marble. A rock composed of a banded form of lime ex-humate deposited usually from cold-water solutions. Generally translucent and shows a characteristic layering due to mode of accumulation. ASTM C119-50. Also called Mexican onyx; cave onyx.

onyx opal. Common opal with straight parallel layers of differing tones of gray. It is incorrect to use onyx sagate as a synonym for onyx. Shiely

onyx alabaster. A stone made up of minute spherical particles, 0.25 to 2 millimeters in diameter, which may or may not have a nucleus, and has a concentric radial structure, or both. It is usually calcareous, but may be siliceous, hematic, or of other composition. A.G.I. b. Concentrically layered rock has a nucleus such as a quartz grain, and a radial or concentric structure. It is grown in suspension in an agitating medium. A.G.I. c. Replacement onyx usually is without a nucleus, or has a nucleus of quartz. It is less regular in structure, with a concentric and radial structure, less well developed than in accretionary oolites. A.G.I. d. A rock composed of onyx. A.G.I. e. Limestone rock of the Jurassic system consisting of small round grains, resembling fish roe, cemented together. Sandstrom.

onylith. A more or less spherical concentration of calcium carbonate, chamosite, or dolomite, not exceeding 2 millimeters in diameter, usually showing a concentric-layered and/or a radiating fibrous structure. C.M.D.

onyltite. Characteristic of, pertaining to, of the nature or texture of, or composed of onyx. Fay.

onyxite. A granular variety of limestone made up of minute spherical particles. Crystin.

onyxite texture. A texture composed of ooliths, that is, small spherical or ovoid bodies of mineral matter of concentric structure and usually consisting of a core or nucleus enclosed by a cortical envelope made up of concentric layers. The oolithic texture is common in sedimentary iron ores. Schiefer, etc.

onyxite marble. A limestone similar to oolsporite except that it...
opal glass. A glass with fiery translucence. Loosely, any translucent glass. ASTM C620-66, b. Glass which is opalescent or white; made by the addition of fluorides (for example, fluor spar or cryolite) to the glass mixture. G.F.J.
opaline. a. An earthy form of gypsum or a magnesium limestone. Gordon. b. Another term for opal.
aplanche. Also called hot-cast porcelain. Fr.
opamine. a. A glass with fiery translucence. Loosely, any translucent glass. ASTM C620-66, b. Glass which is opalescent or white; made by the addition of fluorides (for example, fluor spar or cryolite) to the glass mixture. G.F.J.
opaljasper. A common opal with the color of yellow jasper. Fay.
opalmother. A dark opal matrix from Hun.
opaline attritus. Attritus which is opaque in thin section. Tomkeieff, 1954.
opalized wood. Wood petrified by silicious earth, bone, or other opalescent or white; similar to that of opal. See also wood. Fay.
opal jasper. A common opal with the color of yellow jasper. Fay.
opal matrix. Opal with portions of matrix included in the fashioned gem. See also opal.
opal mother. A dark opal matrix from Hun.
opal mother. A dark opal matrix from Hun.
opal attritus. Attritus which is opal in thin sections. Tomkeieff, 1954.
opal attritus. This term was first used by Geiger in 1930 referring to coal material which the most prominent and important constituent is opaque matter and also referred to as opaque matrix, black fundamental matter or matrix and residue. Opaque attritus consists of three common types of organic material all of which are organic than 30 microns thick; (2) amorphous opaque matter equivalent in general to the humic dark residue; and (3) faintly translucent opaque matter consisting of oriented or structural oriented or structural constituent impregnates cellular cavities of well decayed plant tissue. Opaque attritus is a col lective term and not comparable with any of the microfossils or the microfossils or the microfossils of the Stoves-Heerlen nomenclature. It is present, at least in minor amounts, in most brown and some nonbanded coals. It is the characteristic component of splint and many dull coals. IACP, 1963, p. 1.
opal surface. Faced tile whose surface faces are covered by an impermeable fireproofed, opaque, colored ceramic glaze of bright satin or gloss finish. ASTM C43-65T.
opal-eau. E-mail having high opacity. ACSF-3.
opal-glaze. A nontransparent colored or colorless glass. ASTM C242-60T.
opal-lime. An igneous rock consisting of orthoclase and microcline, usually occurring in quartz veins or serpants related to granodiorite. Johannsen, c. 2, 1932, p. 347.
open front
The arrangement of a blast furnace with a forehearth. Fay.

open-grazed aggregate. Mineral aggregate containing very few small particles so that the void spaces are relatively large. Shell Oil Co.

open-grained coal. Term used by British miners for clearly banded bright and dull coal. Tomkies, 1934.

open handle. A cup handle of the type that is attached to the cup at the top and bottom only, the side of the cup itself forming part of the filling opening. Compare block handle. Dodd.

open hearth. The form of regenerative furnace of the reverberatory type used in making steel by the Martin, Siemens, and Siemens-Martin processes. See also furnace. Fay.

open-hearth door liner. One who lines and repairs furnace doors and hot metal spouts to keep furnace in condition for continuous use. Also called door and spout liner, mason liner, and spout liner. D.D.T. 1.

open-hearth furnaces. Ferruginous melting furnace with a shallow hearth and a low roof. The flame passes over the charge on the hearth, causing the charge to be heated both by direct flame and by radiation from the roof and sidewalls of the furnace. In ferrous industry, the furnace is reverberative. In the open-hearth furnaces, the furnace lining is all open-hearth furnace; basic open-hearth furnace; all-bas furnace.

open-hearth process. A process for manufacturing steel, either acid or basic, according to the lining of the reverberatory furnace, in which selected pig iron and malleable scrap iron are melted, with the addition of pure iron ore. The latter, together with the air, contributes to the formation of the silicon and carbon in the molten mass. The final reduction is sometimes produced by the addition of a small quantity of aluminum or ferromanganes, which at the same time desulfurizes and recarbonizes the metal to the required extent. Fay. See also L.D. steel process.

open-hearth steels. A process of steel manufac- turing, involving the melting in a 3.5-fired reverberatory furnace constructed with a shallow trough or hearth. See also fixed hearth. Nelsen, b.

open hole. A Coal or other mine workings at the surface or outcrop. Also called opencasit; opencut; open pit. Fay. A borehole which is drilled without core. Nelsen, c.

open-pit mining. A general term for the removal of minerals from a mine which was previously opened before creation of the life estate. With this exception, a life tenant normally opened before creation of the life estate.

open-loop control. A control of a mechanism which is direct between the operator and the mechanism. Any faults or deviations of the mechanism must be corrected by the operator. In closed-loop control, the operator is only required to supervise or set the control. Any faults or deviations of the mechanism are detected, and the control is automatically altered to correct them. Nelsen.

open-mine doctrine. A doctrine which developed at common law which permits a life tenant to continue to serve and appropriate minerals from a mine which was opened before creation of the life estate. With this exception, a life tenant normally may not sever minerals without the concurrence of the owner of future interests in the land. Fay.

open mold. A mold without cover, in which objects like ingots are cast; distinguished from close mold. Standard, 1964.

open-off. a. To turn stalls off stalls, or to drive branch roadways from crossheadings. Nelsen, b. Eng. To begin the longwall system from the shaft pillar, or the far end of the shaft, or from any headings previously driven out for the purpose of commencing, such system, Fay. c. To start any new working, as a heading, entry, gangway, room, etc., from another working, as a slope, gangway, etc. Fay.

open-pit mines. Open-cast mines; open-pit mining.

open-pit mining; open-pit mining. a. A form of operation designed to extract minerals that lie near the surface. Waste, or overburden, is first removed, and the mineral is broken and loaded, as in a stone quarry. Important chiefly in the mining of ores of iron and copper. Barger, l. The mining of metallic ores by surface-mining methods is commonly designated as "open-pit mining," as distinguished from the "strip-mining" of coal and the "quarrying" of other nonmetallic materials such as lime-stone, building stone, etc. Woodruff, v. 3. See also open-pit mining. Nelsen.

open-pit quarry. A quarry in which the opening is the full size of the excavation. One open pit is used in the mining of coal as long as a seam is not crushed or flow. See also close timbering. Nelsen.

open port. A port which is not icebound during winter. Hy.

open rock. Any stratum capable of holding much water, or conveying it along its bed by virtue of its porous or open character. Fay.

open rod press. A hydraulic press in which the side is guided by vertical, cylindrical rods (usually four) that also serve to hold the crown and bed in position. ASM Gloss.

open. Large, open cracks or crevices and small and large caverns, Long.

open-sand castings. Castings made in molds simply excavated in sand, without flasks. Fay.

open-shop. A shop, or mine, where the union price is paid, but where the workmen are not union men. Fay.

open-source. Any radioactive source of ionizing radiations that is not firmly bonded within metals or sealed in a capsule or similar container. NCB.

open spark. Sparkling which owing to lack of adequate provisions for preventing the ignition of flammable gas external to apparatus, would ignite such gas. Nelson.

open split. A split in which no regulator is used. Higham, p. 281.

open stopes. a. An unfilled cavity. Nelson, b. Underground working place other unsupported, or supported by timbers or pillars of rock. Pryor, 3.

open-stope and filling. See overhand stoping, b. Fay.

open-stope method. a. Stopping is which no regular artificial method of support is em-}
open-top carriers

as long as 7 feet, are attached rigidly to heavy flat box chain, each strand made of two bars with a pitch of 24 to 36 inches and an 8-inch flanged roller at each intersection. The elevator rises at an angle of about 60°, and the rollers run on ways. Tandem or single. The buckles have overlapping edges, so that there is no spill between them. Pit and Quarry, 53rd, Sec. G, p. 314.

open-top tubbing. A length of tubbing having no wedging crib on the top of it. Fay.

open traverse. In surveying, one in which the last line is not so directed as to close on the starting point. Pryor, 3.

open up. Term used among miners to describe operations that uncover the deposit and provide access to it. Stoes, v. 1, p. 214.

open water. Water with less than one-tenth ice coverage. Hy.

open-web girder. See lattice girder. Ham.

open working. Surface workings, for example, a quarry or opencast mine. Among the minerals often exploited by open workings are copper, silver, lead, gold, tin, and antimony. Also called open work. Dobrin, p. 56.

operating carrier. The mechanism used with the automatic duckbill through which the ore is received and retracted of the shovel trough are controlled. Jones.

operating cost. The sum of the costs of mining, beneficiation, and administration gives the operating cost of a mine. Nelson.

operating point. A ventilation system is composed of a fan and a set of connected ducts. In a mine ventilation system, mine openings comprise the ducts. At a given air density and with the fan operating at constant speed, there is only one head and quantity of air flow which can result. This is an equilibrium condition and is known as the operating point of the system. Hartman, p. 198.

operating stress. The stress to which a structural unit is subjected in service. ASM Gloss.

optical capacities. Figures given on the flow sheets to indicate quantities passing various points in the plant per unit time, taking account of operations as in the rate of supply and composition (or as size and content of impurity), as follows: (1) design capacity, the rate of feed, defined by limits expressing the extent and duration of load variations, at which specific items of equipment, not subject to performance guarantees, must operate continuously and give the guaranteed results on a particular quality of feed; (2) peak design capacity, a rate of feed in excess of the design capacity which specific items of plant will accept for short periods without fulfilling the performance guarantees given in respect of them; and (3) mechanical maximum capacity, the highest rate of feed at which specific items of equipment, not subject to performance guarantees, will function on the type and quality of feed for which they are supplied. B.S. 3532, I.

optical measuring instrument. Statistical analysis of data accumulated to aid planning of best technique for a given optical requirement, most of optimum standards and variances in processing methods which involve both choice and chance. Stema from reader engineering. Pryor, 3.

optical waste. The water lost from an irrigation system either through spills or by other means. Ham.

operating temperature. Operative temperature is that temperature of an imaginary environment in which, with equal wall (excluding air near the faces of the structure), and ambient air temperature and some standard rate of air motion, the human body would lose the same amount of heat by radiation and convection as it would in some actual environment at unequal wall and air temperatures and for some other rate of air motion. Streeh, 10.

operator. a. The person, owner, or lessee actually operating a mine. b. One who operates the seismic instrument. Schiferdecker. d. See observer, a. Dobrin, p. 56.

ophicalite. A marble containing serpentinite; also used for any calcite-serpentine rock. A.G.I.

ophiolithic. Syonym for plagioclase; ophite; prasinite; A.G.I.

ophiolite. Basic igneous rocks associated with geosynclinal series, generally altered to rocks rich in serpentinite, chlorite, epidote, and albite. See also basic schist; ophite; prasinite. A.G.I.

ophite. A variety of marble closely related to calcite; ophite; prasinite. A.G.I.

ophitic texture. A textural characteristic of dolerites in which the groundmass is embedded in a mesostasis of pyroxene crystals, usually augite. A.G.I.

ophitic. a. Any of various usually green and often mottled or blotched rocks (as a serpentinite or serpentine marble). Webster 3d. b. A variety of marble closely related to serpentinite. Synonym for ophitic. Standard, 1964. Also called verd antique. Fay.

ophiolytic. Applied to a texture characteristic of diabases or dolerites in which euhedral or subhedral crystals of plagioclase are embedded in a matrix of pyroxene crystals, usually augite. A.G.I.

ophitic texture. A texture characteristic of dolerites in which relatively large pyroxene crystals completely enclose smaller, lath-shaped plagioclases. See also poikilitic. C.M.D.

ophtalmic glass. Glass used in spectacles, in which the quality can be controlled and the properties specified. ASM C162-66.

ophtalmite. A type of chert consisting of coarsely sintered augenlith, boulderlike, or nodular elements intergrown with groundmass. Lenticular varieties are said to show flaser development when strads of the groundmass cling closely to the lenses. When the lenses are flat and disklike, the term flat-chip is used in German texts. The mineral aggregates (elements) may also exhibit spindle-shaped or cylinderlike forms. A.G.I.

optical metamorphism. The indurating, burning, and fritting effects produced by lavas and small dikes on the rocks with which they come into contact. Schiferdecker.

optical anomaly. An irregularity in optical properties or unusual phenomenon, such as anomalous double refraction in a dia- mond or other intermediate mineral. Observable in most synthetic spinel, but rarely seen in a genuine spinel. See also strain. Shipley, 8.

optical blank. A piece of optical glass that has been pressed approximately to the optical sign

shape finally required; also called a pressing. Dodd.

optical calcite. Calcite crystals so clear that they have value for optical use. A.G.I.

optical centering devices. An optical device which enables a theodolite to be accurately positioned over or under a survey station. Also called precise optical centering. B.S. 3618, 1961, sec. 1.

optical character. The designation as to whether optically positive or optically negative; said of minerals. Fay.

optical constants. In optical mineralogy, the indices of refraction, axial angle, extinction angle, etc. Fay.

optical crown glass. Any glass of low dispersion used for optical equipment. There are many varieties, their names indicating their characteristic composition, for example, barium crown, borosilicate crown, fluor crown, phosphate crown, etc. Compare flint glass. Dodd.

optical crystallography. The study of the behavior of light to crystals. Hazen.

optical flat. Glass or other surface rendered truly plane. Pryor, 3.

optical glass. Carefully made glass of great uniformity and usually special composition to give desired transmission, reflection, and dispersion of light. C.C.D. 64, 1961.

optical glass classification. A system by which an optical glass is classified according to its refractive index, and its Abbe Value, v. Standard borosilicate crown glass, for example, has nD = 1.510 and v = 64.4; its classification by this system is 51064.4. Further detailed classification is often provided by letters, preceding the number, for example, BSC = borosilicate crown; LF — light flint, etc. Dodd.

optical glass numerical designation. The numerical designation in common usage is based on the index of refraction for sodium light (nD) and the Nu-value (v). The unity factor for the index is dropped (that is, 1.496 becomes 496), and the decimal point for the Nu-value is also dropped (64.4 becomes 644). Thus, the glass is specified 496/644 without reference to chemical composition. In cases, however, it is permissible to precede the numerical designation by the abbreviated name indicative of composition. For instance, borosilicate crown (BSC) 496/644 may be used. For example, dense barium crown may be crown 610/574 or DBC, 610/574, or just 610/574 meaning nD = 1.610 and Nu-value = 574 A.M.S. C162-66.

optically dense. Term applied to glasses with a high refractive index. Pearl, p. 119.

optical plumb. The establishing of points by direct observation with the transit. Staley, p. 164.

optical properties. The effects of a substance upon light. Refractive index, double refraction, and its strength, birefringence, dispersion, chromism, and color are genetically the most important optical properties displayed.

optical pyrometer. An instrument for measuring the temperature of heated material by comparing the intensity of its radiation with that of an incandescent lamp filament. ASM Gloss.

optical sign. When a translucent crystal is viewed, the light travels through the mineral at a speed which corresponds with its refractive index, and the sign is affected by the crystal planes. A
optical twinning. A type of twinning in quartz in which the parts of the twin are alternately left- and right-handed. Optical twinning is also known as Brazil twinning and chiral twinning. So called because it can be recognized by optical tests in distinction to Dauphine (electrical) twinning. Optical twinning as ordinarily applied includes all twin laws in quartz with the exception of the Dauphine. AM, I. optical angle, the angle between the optic axes. Standard, 1964. optical axes. Those directions in anisotropic crystals along which there is no double refraction. Pryor, 4. optical axis. A direction of single refraction in a doubly refracting mineral. Hexagonal and tetragonal minerals have one such axis, and uniaxial minerals (all except calcite and mica) have two such axes and are thus biaxial. Anderson. optical motion. The division of physics which covers the behavior of light. Shipley. optical sign. The type of double refraction in a mineral. On uniaxial minerals, the character is positive when the extraordinary ray has the greater index. In biaxial minerals, which have three basic optical directions, the refractive index of the intermediate or beta ray is the criterion; if its refractive index is nearer that of the low or alpha ray, it is said to be a negative mineral; if it is nearer the high or gamma ray, it is said to be a negative mineral or stone. Shipley. optimization. Coordination of various processing factors, controls, and specifications to provide best overall conditions for technical and/or economic operation. Pryor, 4. optimum. a. The best; said of values not necessarily the highest or lowest, but which give the best results. Maron, b. Desired normal condition of material at a specified point in the flow line of a continuous process, at which it is considered to be in the most suitable condition for further treatment. Pryor, 3. optimum depth of cut. That depth of cut required to completely fill the dipper in one pass without undue crowding. Carson, p. 40. optimum moisture content. The water content at which a soil can be compacted to the maximum dry unit weight by a given compaction effort. Also called optimum water content. ASCE P1826. option. a. A privilege secured by the payment of a premium in consideration for the purchase, lease, or mining of other property, within a specified time, or upon the fulfillment of certain conditions set forth in the contract. Fay, b. S. Afr. The word option may refer to houses under option to the holder of option certificates. In regard to mining activities, options are granted, to acquire interests in rights and/or surface rights over some farm at a price fixed in the agreement. This price may be a sum of money or a participation in a mining company still to be formed. The price is considered the contract price. The option itself can be acquired for a lump sum or for a payment of so much per month over a year. The option contract is generally connected with the permission for the option holder to conduct for minerals and/or prospecting contract. Beerman. optional-flow storage. In coal preparation, optional-flow storage is where those in the coalusual go to the plant but can be diverted into storage, either in bins or hoppers or on the ground. Coal Age, v. 71, No. 8, August 1966, p. 238. opus incertum. Masonry of small stones set irregularly in masonry. Standard, 1964. opus interlitterum. Brickwork or tilework in horizontal courses with broken joints. Standard, 1964. opus reticulatum. Mosaic composed of small cubes of manila, glass, or clay. Standard, 1964. oral agreement to locate. An agreement to locate need not be in writing. If a party, in pursuance of an oral agreement to locate at the expense of another, locates the claim in his own name, he holds the legal title to the ground in trust for the benefit of the party for whom the location was made. Such a party could, upon making the necessary proofs, compel the locator of the mining claim to convey the title to him, although such agreement so to do was not in writing. Such an agreement is not within the statute of frauds. Ricketts, I. orange heat. A division of the color scale, generally given as about 20° C (1,652° F). Bureau of Mines Staff. orangepeel. a. A pebble-grained surface which develops in forming of metals having coarse grains. ASM Gloss. b. A pitted texture of a fired glass or porcelain, having the surface of rough orangepeel. ASTM C249-60T. c. A variant of the clamshell bucket with four or five leaves instead of the clamshell's two. Each end has in a reinforced point. Its digging ability is less than that of the clamshell, and its principal use is for underwater excavation and digging. Carson, p. 128. orangepeel bucket sampler. This sampler is used primarily to obtain bottom samples in shallow water and several sizes are available. The size considered here weighs 45 pounds and holds about 300 cubic inches of sediment. A small hook, attached to the end of the lowering wire, supports the sampler as it is lowered and also holds the jaws (four curved triangular blades which form a hemisphere when closed) in the open position. When contact with the bottom is made the sampler jaws sink into the sediment and the wire tension is released, allowing the sampler to swing free of the sampler. Upon hoisting, the wire takes a strain on the closing line which is also attached to a handle which activates a ratchett chain, which in turn close the jaws. The closing line supports the sampler as it is being hoisted. To prevent washing out of the sample from the top, a canvas cover is frequently used. HOG. orangepeel rock. A surface roughening of the form of a grain pattern where a metal of unusual coarse grain is stressed beyond its elastic limit, which deformed pebbles; alli- gator skin. ASM Gloss. orangepeel sampler. An apparatus consisting of four movable jaws that converge to a point when closed; used to obtain samples of underwater sediment. AGI. Supp. Orange sand. A deposit of sand, gravel, and pebbles, containing boulders of northern Paleozoic rocks, occurring in the Mississippi Valley; a diluvial deposit of the Champlain or Quaternary epoch. Fay. Orange topaz. Same as Spanish topaz. Shipley. orangite. A bright, orange-yellow variety of thortite. See also thortite, a. Fay. orbicular. Containing spheroidal aggregates of megascopic crystals, generally in concentric shells composed of two or more of the constituent minerals; said of the structure of some granular igneous rocks, such as corite. See also orbicular. Shipley. large dark silicate. Facies of the Chalk. Shipley. orbicular Jasper. Jasper consisting of round or spherical inclusions, sprinkled or stippled here and there, which may or may not exhibit a xenolithic nucleus. Synonymous with spheroidal structure; nodular structure. Holmes, 1920. orbit. In water waves, the path of a water particle affected by the wave motion. In deep water waves, the orbit is nearly circular and in shallow water waves, the orbit is nearly elliptical. In general, the orbits are slightly open in the direction of wave motion giving rise to mass transport. AGI. orbital. Path of electron around atomic nucleus. Shipley. orbite. Proposed by Chelius for certain diorite dikes near Orchebose, Hesse, Germany; consists of a porphyritic aggregate of large phenocrysts of hornblende, biotite, and plagioclase. Fay. orcelite. A vein in serpentinitized harzburgite in the Tiebaghi massif, New Caledonia, consists almost wholly of a new mineral, NiAs, distinct from maucherite and ni- celite. Probably identical with the artificial phase NiAs. Hey, M.M., 1961. orchard heating oil. A dark oil used in California, possessing a gravity of 26° to 28° Be'; it is also termed smudge oil, and is used in the orange and lemon groves to prevent frost from injuring the trees. Fay. orchardite. A variety of halloysite tephrite containing phenocrysts of andesine and orthoclase. Holmes, 1928. order. A division of igneous rocks, considered after the division into classes, based (in classes I, II, and III) on the relative proportions of normative quartz or nepheline to the sum of the mafic and feldspar types. This division is analogous to the division of rocks into oversaturated, saturated, and (as regards to crystalline rocks) unsatura- ted types. In classes IV and V, the orders are based on the relative proportions of the normative pyroxenes, and olivine, etc.,
ordered solid solution. A condition when atoms in a solid solution arrange themselves in regular or preferential positions in the lattice, rather than at random. Newton, 5.

order of crystallization. The apparent chronological sequence in which crystallization of the various minerals of an assemblage takes place, as evidenced mainly by textural features. A.G.I.

order of persistence. See stability series. A.G.I.

order of reaction. A classification of chemical reactions based on the index of the power to which concentration terms are raised in the expression for the instantaneous velocity of the reaction, that is, the apparent number of molecules which interact. C.T.D.

ordinary cut. In the ordinary cut the holes are placed symmetrically in relation to the vertical center line of the section. The drill holes are horizontal and the angle towards the bottom is large. The symmetrical holes meet at the bottom. Franekel, s. 1. Art. 6 6/2, p. 23.

ordinary ray. a. That ray of polarized light between the sines of the angles of incidence and refraction. Fay. b. In uniaxial rocks, that ray which travels with constant velocity in any direction within the crystal. Anderson.

ordinary rolling strata. Relatively uniform sedimentary deposits conformable to the surface and slightly varied character of the strata in which they are found. Spalding, p. 159. c. A trough or lip at the bottom of a ore current. Aqueous solutions of metalliferous rocks. Weed, 1922.

ore. a. A natural mineral compound of the elements of which one at least is a metal. Applied more loosely to all metalliferous rock, though it contains the metal in a free state, and occasionally to the compound of metallic substances. Webster 2d. b. A mineral of sufficient value as to quality and quantity which may be mined with profit. Fay. c. A mineral, or mineral aggregate, containing precious metals or metallic alloys, and which occur in such quantity, grade, and chemical combination as to make extraction commercially profitable. Fay. d. A metalliferous mineral, or an aggregate of metalliferous, or metals, more or less mixed with gangue, which, from the standpoint of the miner, can be won at a profit or, from the standpoint of a metallurgist, can be treated at a profit. The test of yielding a metal or metals at a profit seems, in the last analysis, to be the only feasible one to employ. Fay. e. Copper ore; tin ore being spoken of as pyrite. Fay. f. Robustly constructed steel, wood or concrete, or a continuous mass of ore, which may include low-grade ore and waste as well as pay ore, but is individualized by load characteristics. Fay. g. A large electric gantry-type crane which, by means of a clamshell bucket, stocks ore or carries it from the stockpile and ready for ore blending. Where a mine, or a group of mines, operate in a restricted root. A.G.I.

ore blend. A mixture or a combination of different grades of ore. Pruitt, 3.

ore body. a. Generally, a solid and fairly continuous mass of ore, which may include low-grade ore and waste as well as pay ore, but is individualized by load characteristics. Fay. b. A deposit of iron which may be mined and worked for nonmetals, as pyrite. Fay. c. A mineral aggregate, containing precious metals or metallic alloys, and which occur in such quantity, grade, and chemical combination as to make extraction commercially profitable. Fay.

ore blocks. A section of a vein bounded above and below by stoping limits. Pryor, 3.

ore chutes. A. An inclined passage, from 3 to 4 feet square, for the transfer of ore to one or both ends. It may be constructed through waste fills. It generally requires support for ore, although an unlined passage may be used in suitable ground. In square-set stoping, chutes are constructed by sinking a series of sets with 2 to 3 inch planks. Where a chute is relatively permanent, timber blocks 10 by 10 inches to 12 by 14 inches may be used. Chutes are also constructed in close timber cribbing, the round timber being slatted to present a smooth interior to the chute.

ore classifiers. A group of ore bodies sometimes differing from each other in structure but interconnected or otherwise closely related genetically. Some ore clusters gather downward into a restricted root. A.G.I.

ore control. A geologic feature that has influenced the deposition of ore. Ballard.

ore crushers. A. A machine for breaking up masses of ore, usually previous to passing through stamps or rolls. Fay. b. See crusher man. D.O.T. Supp.

ores. Aqueous solutions of metalliferous minerals circulating through the earth's crust. Fay.

ore defle. a. Ore lying underground. Fay.

ore delves. Where a mine, or a group served by a common mill, sends ores of slightly varied character for treatment, separate grading bins or stockpiles are provided. From these regulated percentages are drawn and blended to provide a steady and predictable feed to the mineral dressing plant. Fay. 3.

ore block. A section of a vein bounded above and below by up and down drifts and on one or both ends by winzes or raises and ready for stoping. Nelson.

ore bunked out. Ore which is exposed in three sides within a reasonable distance of each other. Fay.

ore boat. A boat constructed especially for transporting iron ore on the Great Lakes. Mersereau, 4th, p. 382.

ore body. a. Generally, a solid and fairly continuous mass of ore, which may include low-grade ore and waste as well as pay ore, but is individualized by load characteristics. Fay. b. A deposit of iron which may be mined and worked for nonmetals, as pyrite. Fay. c. A mineral aggregate, containing precious metals or metallic alloys, and which occur in such quantity, grade, and chemical combination as to make extraction commercially profitable. Fay.

ore box. A large electric gantry-type crane which, by means of a clamshell bucket, stocks ore or carries it from the stockpile and ready for ore blending. Where a mine, or a group of mines, operate in a restricted root. A.G.I.

ore bridges. A. A large electric gantry-type crane which, by means of a clamshell bucket, stocks ore or carries it from the stockpile and ready for ore blending. Where a mine, or a group of mines, operate in a restricted root. A.G.I.

ore channels. The space between the walls or boundaries of a lode which may be mined. Also called lode country. Fay.

ore chute. a. An inclined passage, from 3 to 4 feet square, for the transfer of ore to one or both ends. It may be constructed through waste fills. It generally requires support for ore, although an unlined passage may be used in suitable ground. In square-set stoping, chutes are constructed by sinking a series of sets with 2 to 3 inch planks. Where a chute is relatively permanent, timber blocks 10 by 10 inches to 12 by 14 inches may be used. Chutes are also constructed in close timber cribbing, the round timber being slatted to present a smooth interior to the chute.

ore clusters. A group of ore bodies sometimes differing from each other in structure but interconnected or otherwise closely related genetically. Some ore clusters gather downward into a restricted root. A.G.I.

ore control. A geologic feature that has influenced the deposition of ore. Ballard.

ore crushers. A. A machine for breaking up masses of ore, usually previous to passing through stamps or rolls. Fay. b. See crusher man. D.O.T. Supp.

ores. Aqueous solutions of metalliferous minerals circulating through the earth's crust. Fay.

ore defle. a. Ore lying underground. Fay.

ore delves. Where a mine, or a group served by a common mill, sends ores of slightly varied character for treatment, separate grading bins or stockpiles are provided. From these regulated percentages are drawn and blended to provide a steady and predictable feed to the mineral dressing plant. Fay. 3.
ore deposit. A general term applied to rocks containing minerals of economic value in such amount that they can be profitably exploited. Also applied to deposits which, though they may not be immediately capable of profitable exploitation, may yet become so by a change in the economic circumstances that control their value. See also mineral deposit. Holmes, 1928.

ore developed. Ore exposed on four sides in blocks variously prescribed. See also positive ore; proved ore. Fay.

ore depositing. Ore exposed on two sides. First class, blocks with one side hidden; second class, blocks with two sides hidden; third class, blocks with three sides hidden. See also probable ore. Fay.

ore-like. An injected wall-like intrusion of mafic magma, forced in a liquid state through bedding or other layered structure of the invaded formation. Schiefer-decker.

ore district. A combination of several ore deposits into one common whole or system. Fay.

ore dressing. a. The removal of certain valueless portions as cobbing, vanning, and the like. See also concentration. Fay. b. The same as mineral dressing. A.G.I. Gloss.

dump. A heap or pile of ore at the tunnel or adit mouth, the top of shaft, or other place. Weed, 1922.

ore-expecting. The whole or any part of the ore below the lowest level or beyond the range of vision. The prospective value of a mine beyond or below the last visible ore, based on the fullest possible data from the mine being examined, and from the characteristics of the mining district. See also possible ore; prospective ore. Fay.

ore faces. Those ore bodies that are exposed on one side, or show only one face, and of which the values can be determined only in a prospective manner, as deducted from the general condition of the mine or prospect. Fay.

ore fractionation. Trademark for domestic zircon. Used for ceramic and foundry purposes. COA 668, 1981.

ore geology. The branch of applied geology dealing with the genetic study of the ore deposits in relation to age, regional tectonics, and petrographic provinces. Synonym for metallurgy. Schiefer-decker. See also economic geology; mining geology.

Oregon jade. Mmmonore for massive grossularite garnet found in Oregon, and indeed for almost any translucent to opaque green stone found in Oregon or California. Shipton.

Oregon moonstone. Same as chalcedony Moonstone. Shipton.

Oregon sledge. A broad-faced sledge hammer. Fay.

ore picker. In metal mining, one who directs and regulates the storage of iron ores of various grades in bins at shipping docks or at the mills. In the process of storing such iron ore in a bin will contain approximate percentage of iron guaranteed to the buyer (iron and steel mills). D.O.T. 1.

ore grade. A natural feature, organic or inorganic, that often indicates the proximate or essential character of an ore body, as gossan, mineral alteration, certain structural features, indicator minerals, etc. Fay.

ore hearth. a. A small, low fireplace surrounded by three walls, with a tuyere at the back. Three important types are: (1) Scotch ore hearth; (2) American water-back ore hearth; and (3) Moffet ore hearth used in smelting. Fay, E. J. Scot. A small blast furnace for smelting lead; a blast hearth. Standard, 1964.

ore-hearth process. Methods for the extraction of lead in which lead ore, mixed with fuel, is treated on a roasting hearth. Fay.

orel. A quarry term applied to granite that has been altered by the alteration of its aegirite particles. Fay.

oreing down. A blocking operation in which ore is added to the back. This is done to increase production and to oxidize the bath and to further reduce the carbon. Henderson.

ore in sight. a. A term frequently used to indicate two types of ore: (1) ore blocked out, that is, ore exposed on at least three sides within a block of ore; and (2) ore which may be reasonably assumed to exist, though not actually blocked out; these two factors alone in all cases be kept distinct, because (1) is governed by fixed rules, while (2) is dependent upon individual judgment and local experience. The expression ore in sight as commonly used in the past, appears to possess so indefinite a meaning as to discredit its use completely. The terms positive ore, probable ore, and possible ore are suggested. Fay. b. Ore-bearing rocks in separate and blocked off by being worked around on two or more sides that it is subject to examination and measurement. Prospective purchasers have a right to rely upon statements as to the amount of ore in sight. Ricketts, F. M. See developed reserves. Nelson.

ore intersection. The point at which a borehole, corecut, or other underground opening encounters an ore vein or deposit; also, the thickness of the ore-bearing deposit so traversed. Long.

ore leave. The value of the right to dig and to take ore; also, the value of ore in place. Fay.

oreless. Having no ore. Webster 3d.

ore magma. A heavy and highly concentrated solution containing metals and nonmetals. A.G.I.

ore man. A laborer who fills hoppers of aluminum reduction pots with aluminum oxide. 8-

ore mining. a. The art of extracting useful or desired metallic constituents of an ore body. Fay, E. J. For example, making the ore body into a smelt. b. The total tonnage and average value of proved ore, plus the tonnage and value (assumed) of the probably ore. How. p, 122.c. The mine's substantial asset, without which none of the surface works are economically viable. A body of ore which has been proved to contain a sufficient tonnage of amenable valuables to justify the mining enterprise. The British Institution of Mining and Metallurgy, which regulates the professional standards of its membership, considers that the term ore reserves should be restricted to ore of which the grade and quantity of ore have been established with reasonable assurance by drilling and other means. Nelson. b. The total tonnage and average value of proved ore, plus the tonnage and value (assumed) of the probable ore. How. p, 122.c. The mine's substantial asset, without which none of the surface works are economically viable. A body of ore which has been proved to contain a sufficient tonnage of amenable valuables to justify the mining enterprise. The British Institution of Mining and Metallurgy, which regulates the professional standards of its membership, considers that the term ore reserves should be restricted to ore of which the grade and quantity of ore have been established with reasonable assurance by a responsible, professionally qualified person. Additional ore insufficiently developed or tested for inclusion in ore reserves should be clearly described in simple terms best suited to the circumstances; modes of mineral occurrence vary too widely to permit standardization of categories. Pryor, 3. d. S. Afr. Ore bodies made available for mining through designs connected by wintzes (a connection driven down) and raises (a connection driven up.), thus forming blocks which are accessible from four sides. Some companies record partially developed ore reserves in which this ore making of roads has not been completed. Newcomers in gold mining occasionally speak of ore reserves when they mean the ore bodies contained in a mining area and in copper mining this method of expression has been accepted by large concerns. Beer.

ore mining. The process of heating certain ores to temperatures slightly below their reducing temperatures to drive off such impurities as are capable of oxidation at lower temperatures.
ore roasting

hydrogen is attached to carbon whether derived from living organisms or not. Usually distinguished from inorganic or mineral. Webster 3d.

organic acid. An acid derived from substances having carbon and hydrogen. An example is naphthenic acid. Shell Oil Co.

organic ash. Ash in coal derived from the incombustible material contained in plants. Tomkeieff, 1954.

organic bond. A bond consisting of an organic material, such as rubber, synthetic resin, or asphalt. ASCE, 1963.

organic clay. A clay with a high organic content. ASCE P1026.

organic colloids. Depressants used in the flotation process. They include g lut, gelatin, albumen, blood, casein (protein), tannin, licorice, qubrach roooth extract, and saponin (complex polyhydroxy carb onate) as in Hoadly, 1929.

organic-cooled reactor. A nuclear reactor that uses waterlike organic chemicals, such as mixtures of polyphenylenes and terphenyls, as coolant and usually also as moderator. LBL.

organic deposits. Rocks and other deposits formed by organisms or their remains. Fay.

organic gem materials. Naturally occurring substances whose origin is wholly or partly organic, such as pearl, amber, coral, and jet. Shipley.

organic hieroglyph. See ichnofossil. Pettijohn.

organic silt. A silt with a high organic content. ASCE P1026.

organic soil. Soil with a high organic content. In general, organic soils are very compressible and have poor load-sustaining properties. ASCE P1026.

organic sulfur. The difference between the total sulfur in coal and the sum of the pyritic sulfur and sulfate sulfur. B.S. 1016, 1961, Pt. 16.

organic test. The test in which organic matter in soil is destroyed by oxidizing agents and the loss measured. This test is used in preparation of soil for a sedimentation test, and gives an indication of the amount of organic matter present. Ham.

organic theory. The theory that oil and gas originated from the natural distillation of vegetable and animal remains in stratified rock. Shell Oil Co.

organic. Being, containing, or relating to orichalc. Under the Roman empire, an alloy of copper and zinc resembling gold in appearance and value. There was also a white orichalc. Standard, 1964.

organicous. Having a color between gold and brass; of or pertaining to orichalc. Standard, 1964.

orient. a. To place a diamond in a bit mold in such an attitude that when it is embedded in the crown matrix one of its hard vector planes will come in contact with the rock to be abraded or cut by the diamond. Long. b. To place a deflection wedge in a borehole in such an attitude that the deflection surface is pointed in a predetermined direction. Long. c. To place a piece of core in the same relative plane and position all of the same azimuths as the corresponding lines on the ground. Seeley, 2. e. In a transit, to turn the instrument so that the direction of the 0' line of its horizontal circle is parallel to the direction it had in the preceding, or in the initial, setup. Seeley, 2.

oriental agate. The most beautiful and translucent sorts of agate. Fay.

oriental almandine. A trade name for corundum of gem stone quality, which is deep red in color, resembling true almandine (a garnet) in this, but no other, respect. C.M.D.

oriental amethyst. A variety of sapphire, but the term is applied to any amethyst of exceptional beauty. Fay. b. A variety of corundum. Hey, 2d, 1935. c. A type of false amethyst. C.T.D.

oriental aquamarine. Pale bluish-green to greenish-blue corundum. Shipley.

oriental carnelian. Deep bright red trans- lucent stone, resembling the material called carnelian. C.T.D.

oriental cat's-eye. Synonym for cyphomite. C.M.D. See also cat's-eye.

oriental chatoyant. A trade name for cabochon which is the same as chatoyant moonstone. Hess.

oriental chrysoberyl. Yellow-green-sapphire stone. Shipley.

oriental chrysoberyl. A variety of chrysoberyl. Hey, 2d, 1935.

oriental emerald. A green variety of corundum. Fay.
oriental garnet. A precious garnet. Webster 2d.

oriental gislarol. Girasol sapphire. Shipley,

oriental hyacinth. Orange-red sapphire. Shipley.

oriental Jasper. An early name for helio-

topaz. A yellow variety of corundum.

oriental Moonstone. A girasol corundum.

oriental opal. Banded, mottled, or clouded

oriental onyx. Banded, mottled, or clouded

oriental jasper. An early name for helio-

topaz. A yellow variety of corundum.

oriental Peridot. Olive-green sapphire. Ship-

oriental Peridot. Olive-green sapphire. Ship-

oriented. Type in which adsorbed molecules

of important sets of planes in a crystal in

ASTM STP No. 148-D. g. The position

relative position of particles with respect

procedure used in placing an instrument or

orientation refers to the method and pro-

a bit in such an attitude that one of its hard

vector planes will be the surface that cuts or

abraded the rock. See also orient. a. Long.

oriented core. A core specimen which can

be positioned on the surface as it was in

the borehole prior to extraction. Such a

core is useful when the general dip of the

strata is required from one borehole. A

magnetic method may be used to disclose

the polarity the core specimen possessed

while in situ. See also borehole surveying.

oriented adsorption. Surfaceal grouping of

a monomolecular layer in a definite direc-

tion. Pryor, 3.

oriented surface-set diamond bit with

individual stones set so as to bring the

hard vector direction or planes of the crys-

tal, into the direction of the rock surface

to be abraded or cut. See also orient, a.

oriented core. A core specimen which can

be positioned on the surface as it was in

the borehole prior to extraction. Such a

core is useful when the general dip of the

strata is required from one borehole. A

magnetic method may be used to disclose

the polarity the core specimen possessed

while in situ. See also borehole surveying.

oriented specimen. a. In structural petrology,

a hand specimen so marked that its exact

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,

1954, p. 366. b. In paleontology, a fossil

arrangement in space is known. Billings,
Ornerod detaching hook

consisting of three plates, the center one moving on a steel pin. Normally, the plates are locked with a copper pin. In the event the central plate is pushed sideways which releases the rope shackles. Projections on the plates engages in the bell fixed in the headgear and support the cage until released. Nelson.

ormolu. a. Gold ground for use in gilding; also metal gilded with ground gold. Webster 3d. b. A brass made to imitate gold and used in mounts for furniture and for other decorative purposes. Also called mosaic gold. Webster 3d.

ornamental brick. A somewhat broad term applied to front brick, that are either of some form other than that of a rectangular prism or, that have the surface ornamented with some form of design. Fay.

ornamentite. A variety of hornblende.

ornell. The same as urnel. Arkell.

ornogenesis. See orogeny. A.G.I.

orogenic. orogenetic. Formed as the result of mountain building processes. Heston.

ornith. n. A combining form meaning straight; at right angles; proper. A.G.I. b. In petrography, the prefix indicating that a metamorphic rock was originally igneous. A.G.I.

oropilobus. A group name for the orthorhombic amphiboles. Eng.

orophil. A variety of antigorite based on an orthohexagonal cell; from orthorhombic. A.G.I.

orograph. See orography.

orogentic. Formed as the result of mountain-building processes. Heston.

orogenic. sediment. Any sediment whose origin is directly attributable to the region of a mountain building in which it later becomes involved. Stikes and Varnes, 1955.

orography; orology. A branch of physical geography that deals with mountains and mountain systems. Webster 3d.

orolate. An alloy, chiefly of copper and zinc, or tin, resembling gold in color and brilliancy; used in making cheap jewelry. Weberry 3d.

oroscopy. See orography. Fay.

orometer. An aneroid barometer having a second scale that gives the approximate elevation above sea level of a place where the observation is made. Webster 3d.

orosol. See orography. Fay.

oropin. A yellow arsenic trisulfide, AsS3, containing 61 percent arsenic; monoclinic. Dana 17.

orogen. A yellow arsenic trisulfide, AsS3, containing 61 percent arsenic; monoclinic. Dana 17.

Great gas-analysis Instrument. An instrument for analyzing flue gases. Although outside its normal field of application, it may be used for analyzing mine air. Nelson.

orth- a. A combining form meaning especially by folding of the earth's crust.

orthorthite. Cesaro's name for an orthorhombic amphibole. Eng.

orthogonal. In the monoclinal system, the axis that is perpendicular to the other two axes. Fay.

orthoferrite. An end-member, Fe(Mn)₂SiO₄, crystallizing directly from the magma. Compare pegmatic stage. A.G.I.

ortholith. An oval-shaped variety of augite or hornblende. Hurlbut.

ortholignitous coal. Coal containing from 75 to 80 percent carbon (ashless, dry basis). Tomkeief, 1954.

ortholimstone. A sedimentary limestone. A.G.I.

orthomagnatic. Applied to a stage in the crystallization of magma; during which only pyrogenic minerals (minerals crystallizing directly from the magma) are formed. A.G.I.

orthomagmatic stage. Applied to the main stage of crystallization, orthorhombic, or from a typical magma; the stage during which perhaps 90 percent of the magma crystallizes. Synonymous with orthorhombic stage. A.G.I.

orthofeldspar. Triclinic feldspars, which by repeated twinning (orthomorphism), simulate a higher degree of symmetry with rectangular cleavages. They include orthoclase, anorthoclase, and microcline. Eng.

orthophyry. An obsolete name for orthoclase phryory. A.G.I.

orthopyroxene. A textural term applied to medium- and fine-grained syenitic rocks consisting of closely packed orthoclase crystals of stuber build than in the typical trachytic texture. C.M.D.

orthophytic texture. A groundmass texture distinguished from trachytic texture by the presence of abundant stubby rectangles of feldspar. Holmes, 1928.

orthophosphacoloid; orthophyric. In the monoclinic system, the form consisting of the two planes parallel to the vertical and orthodiagonal axes. Standard, 1964.

orthophytolite. Orthorhombic, a being a monoclinal prismatic, the othurdidiagonal intercept of which is greater than 1. Standard, 1964.

orthopyroxene. Any of several pyroxene minerals that crystallize in the orthorhombic system. They generally contain no calcium and little, or no aluminum. Stikes and Varnes, 1955.

orthomagnetite. A clastic sedimentary rock composed of silica-cemented quartz sand. The cement is commonly deposited in cross-stratigraphic continuity with the quartz of the wind grains. A.G.I.

orthorhombic. The crystal system in which crystals have two or three symmetry planes and twofold symmetry axes at their intersection. Hurbit.

orthorhombic symmetry. In structural petrology, refers to either symmetry of movement or symmetry of fabric. Orthorhombic symmetry of movement is exemplified by the motion that occurs when a sphere is subjected to a single compressive force acting along the vertical axis but is constrained on two opposite sides. Orthorhombic symmetry of fabric is the sym-
orthorhombic symmetry

metry of an ellipsoid; there are three planes of symmetry. Synonym for rhombic symmetry.

orthorhombic system. In crystallography, that system of crystals whose forms are referred to three unequal mutually perpendicular axes lying in a three-dimensional system; rhombic system; triclinic system. Fay.

orthorocks. Metamorphic rocks which are derived from rocks of igneous origin. Schieftecker.

orthoschist. Used to denote a schist derived from an igneous rock. See also parascist; schist. A.G.I.

orthose. a. A name for the whole feldspar family before it was divided into separate species. Fay. b. Synonym for orthoclase. Hey 2d, 1955.

orthosillicate acid; silicate acid. a. H2SiO3; known chiefly by its salts found in minerals. Fay. b. Orthosilicate, Mg,SiO3. This method of classifying silicates is obsolete. See also silicate acid.

orthosilicate acid; silicate acid. a. H2SiO3; known chiefly by its salts found in minerals. Fay. b. Orthosilicate, Mg,SiO3. This method of classifying silicates is obsolete. See also silicate acid.

orthotectic. Designates those processes and products, strictly magmatic in the narrowest sense, exemplified in the normal crystallization of normal igneous rocks. A.G.I.

orthotectic stage. Synonym for orthomagmatic stage. A.G.I.

orthotonous. Same as orthotonic. Fay.

orthotrop. The description applied to the elastic properties of material, generally explained as having been attained through a series of faunistic regions into which the coastal waters of the world have been divided. C.T.D.

orthovolcanic. a. Pyrometric cones made in two sizes, 2½ inches high for industrial kiln control, and 1-1/8 inches high for pyrometric cones for equivalent testing. See also pyrometric cone. b. Used in the United States for heat recording; they are similar to Seger cones, but the same numbers do not indicate the same temperatures, for example, Orton cone 14 corresponds to Seger cone 15. Rosenthal.

ovellite. An extrusive rock composed of plagioclase and saulline in about equal parts, as it is made up of thin lamellae alternately in reversed position; its form is commonly applied to progressive oscillatory waves in which only the form advances, the individual particles moving in closed orbits. Distinguished from a wave of translation. See also orbit. A.G.I.

oscarite. A kind of high fire, intermediate in the development of the Catalan forge and the blast furnace, formerly used to melting wurtzite from which was first made in England, in the 15th century. Fay.

osmide. Iridomide; hexagonal; Mol't hardness 6.7; specific gravity 19.3 to 21.1. A.G.I.

osmite. a. Iridomide with 40.83 percent osmium. English. b. Native osmium, perhaps present among the grains of iridomide from Brazil; U.S.S.R. English. c. Later applied to an iridomide from Borneo, West Indies, containing 50 percent osmium; rare in the United States for heat recording; they are also pyrometric cone equivalent testing. See also kiln control, and 1-1/8 inch high for pyrometric cone. Hey 2d, 1955.

oscillation. A slow, high-speed wave in which the die or punch move horizontally with the strip during the working stroke. Through a reciprocating motion, the die and punch return to their original positions to begin the next stroke. ASM Gloss.

oscillation beam. See walking beam.

oscillation conveyor. A type of vibrating conveyor having a relatively low frequency and large amplitude of motion. See also vibrating conveyor. ASA MH14-1958.

oscillation die press. A small, high-speed press in which the die or punch move horizontally with the strip during the working stroke. Through a reciprocating motion, the die and punch return to their original positions to begin the next stroke. ASM Gloss.

oscillation feeder. See conveyor type feeder.

oscillation grease table. An assembly of 4 to 15 metal trays, usually 30 inches wide and 8 to 15 inches long, arranged in series in the direction of flow. The trays are inclined to one another. See also isotropic. I.C. 8200, 1964, p. 70.

Osborn-Shaw process. See Shaw process.

oscilloscope. An instrument for showing visual phenomena. The recorded trace represents the waveform encountered in electrical circuits. Hey 2d, 1955.

oscillogram. A record of the indications on an oscillograph. ASM Gloss.

oscillograph. An instrument which renders visible, or automatically traces, a curve representing the time history of electric phenomena. The recorded trace is an oscillogram. A.G.I.

merly imported into England from Sweden and used especially for making arrowheads, distant clocks, etc. Holler 3d. Also, iron made in the ornate furnace. Fay.

ossium: amber. Opal or cloudy amber containing numerous minute bubbles. Tomkeieff, 1954.

ossous breccia. The cemented mass of fragments of bones of extinct animals found in caverns and fissures. Fay.

outferrous. Containing or yielding bones.

Challiner.

ouster. The person who feeds the mine horses or mules and keeps the stable in order. A contraction of hostler.

outrarods. Minute crustaceans with bean-shaped bivalve shells completely enclosing the body. A.G.I.

ostrealite. A variety of aristeite characterized by abundant magnetite and spinel.

Holmes, 1928.

Oswalt's dilution law. In weak solutions, the ouSat=ouSat. In strong solutions, the ouSat=ouSat.

oustracods. Minute crustaceans with bean-shaped bivalve shells completely enclosing the body. A.G.I.

ostrealite. A variety of aristeite characterized by abundant magnetite and spinel.

Holmes, 1928.

ostrealite. A mineral resembling cordierite, but containing 

KNa2O (Mg,Fe)SiO3. Fay.

Oswegan. Lower Silurian (restricted). A.G.I.

osumilite. A mineral resembling cordierite, but containing 

KNa2O (Mg,Fe)SiO3. Fay.

Oswegan. Lower Silurian (restricted). A.G.I.

ostrealite. A variety of aristeite characterized by abundant magnetite and spinel.

Holmes, 1928.

ostrealite. A mineral resembling cordierite, but containing 

KNa2O (Mg,Fe)SiO3. Fay.

Oswegan. Lower Silurian (restricted). A.G.I.

osumilite. A mineral resembling cordierite, but containing 

KNa2O (Mg,Fe)SiO3. Fay.

Oswegan. Lower Silurian (restricted). A.G.I.

ostrealite. A variety of aristeite characterized by abundant magnetite and spinel.

Holmes, 1928.

osseous amber. Opaque or cloudy amber

varies in color. Monoclinic. Fay; Dana

spinel.

outcrop. a. The part of a rock formation that is visible on the surface. Fay.

outcrop even if the rock is not exposed, to be found easily by digging. Fay. d. On outcrops that are so near to the surface as to be found easily by digging.

outcrop strike. Strike disapproved by the union or in violation of the contract between the union and the operators. Zerby.

outlay. a. The act of laying out or expending. Webster 3d. b. Something that is laid out; expenditure. Webster 3d. c. The cost of equipping a mine and placing it on a producing basis. Fay.

outlet. a. The passage by which the ventilating current goes out of a mine. Same as upcast, a. Fay. b. An opening or access to the surface. Fay. c. Synonym for discharge from pump to a piping system. Long.

outlier. a. An isolated mass or detached remnant of younger rocks, or of rocks separated by others, by faulting, etc. Fay.

ouges. Eng. The solid rock on the side of the entrance. The opposite of inby. Also called shrinkage. Long.

ousten. A layer of the earth located between the inner and outer core. Schieferdecker.

oustone. The outermost part of a nest of tubes of a double-tube core barrel. Also called outer barrel; outside tube. Long.

oustop. Eng. A seam cropping out at a lower level. Fay. b. The vent of a river, drain, etc. H&G. c. A structure extending into a body of water for the purpose of discharging sewage, storm runoff, or cooling water. H&G.

oustil. a. A drill machine complete with tools and equipment needed to drill boreholes. Long. b. To acquire a drill and equip it with tools and equipment needed to drill boreholes. Long.

outlaw. Strike disapproved by the union or in violation of the contract between the union and the operators. Zerby.

outlier. a. An isolated mass or detached remnant of younger rocks, or of rocks separated by others, by faulting, etc. Fay.

ouges. Eng. The solid rock on the side of the entrance. The opposite of inby. Also called shrinkage. Long.

ousten. A layer of the earth located between the inner and outer core. Schieferdecker.

oustone. The outermost part of a nest of tubes of a double-tube core barrel. Also called outer barrel; outside tube. Long.

oustop. Eng. A seam cropping out at a lower level. Fay. b. The vent of a river, drain, etc. H&G. c. A structure extending into a body of water for the purpose of discharging sewage, storm runoff, or cooling water. H&G.

oustil. a. A drill machine complete with tools and equipment needed to drill boreholes. Long. b. To acquire a drill and equip it with tools and equipment needed to drill boreholes. Long.

outlaw strike. Strike disapproved by the union or in violation of the contract between the union and the operators. Zerby.

outlay. a. The act of laying out or expending. Webster 3d. b. Something that is laid out; expenditure. Webster 3d. c. The cost of equipping a mine and placing it on a producing basis. Fay.

outlet. a. The passage by which the ventilating current goes out of a mine. Same as upcast, a. Fay. b. An opening or access to the surface. Fay. c. Synonym for discharge from pump to a piping system. Long.

outlier. a. An isolated mass or detached remnant of younger rocks, or of rocks separated by others, by faulting, etc. Fay.

ouges. Eng. The solid rock on the side of the entrance. The opposite of inby. Also called shrinkage. Long.

ousten. A layer of the earth located between the inner and outer core. Schieferdecker.

oustone. The outermost part of a nest of tubes of a double-tube core barrel. Also called outer barrel; outside tube. Long.

oustop. Eng. A seam cropping out at a lower level. Fay. b. The vent of a river, drain, etc. H&G. c. A structure extending into a body of water for the purpose of discharging sewage, storm runoff, or cooling water. H&G.

oustil. a. A drill machine complete with tools and equipment needed to drill boreholes. Long. b. To acquire a drill and equip it with tools and equipment needed to drill boreholes. Long.

outlaw. Strike disapproved by the union or in violation of the contract between the union and the operators. Zerby.

outlay. a. The act of laying out or expending. Webster 3d. b. Something that is laid out; expenditure. Webster 3d. c. The cost of equipping a mine and placing it on a producing basis. Fay.

outlet. a. The passage by which the ventilating current goes out of a mine. Same as upcast, a. Fay. b. An opening or access to the surface. Fay. c. Synonym for discharge from pump to a piping system. Long.

outlier. a. An isolated mass or detached remnant of younger rocks, or of rocks separated by others, by faulting, etc. Fay.

ouges. Eng. The solid rock on the side of the entrance. The opposite of inby. Also called shrinkage. Long.

ousten. A layer of the earth located between the inner and outer core. Schieferdecker.

oustone. The outermost part of a nest of tubes of a double-tube core barrel. Also called outer barrel; outside tube. Long.

oustop. Eng. A seam cropping out at a lower level. Fay. b. The vent of a river, drain, etc. H&G. c. A structure extending into a body of water for the purpose of discharging sewage, storm runoff, or cooling water. H&G.

oustil. a. A drill machine complete with tools and equipment needed to drill boreholes. Long. b. To acquire a drill and equip it with tools and equipment needed to drill boreholes. Long.

outlaw. Strike disapproved by the union or in violation of the contract between the union and the operators. Zerby.

outlay. a. The act of laying out or expending. Webster 3d. b. Something that is laid out; expenditure. Webster 3d. c. The cost of equipping a mine and placing it on a producing basis. Fay.

outlet. a. The passage by which the ventilating current goes out of a mine. Same as upcast, a. Fay. b. An opening or access to the surface. Fay. c. Synonym for discharge from pump to a piping system. Long.

outlier. a. An isolated mass or detached remnant of younger rocks, or of rocks separated by others, by faulting, etc. Fay.

ouges. Eng. The solid rock on the side of the entrance. The opposite of inby. Also called shrinkage. Long.

The output of a pumping engine, Fay.

outrage. An outward extension of a frame which is supported by a jack or block. Used to increase stability. Nichols, 2.

outrush. The act or process of thickening a length of tubing at its ends by increasing its outside diameter without changing the inside diameter; a length of tubing or drill rod so processed. Long.

outside wall. That part of a bit crown, roller bit cutter, or ball. Long.

outside foreman. In bituminous coal mining, a foreman who supervises all operations at the surface of a mine. D.O.T. 1.

outside gauge. Synonym for outside diameter. Long.

outside-haulage engineer. In bituminous coal mining, one who operates a mine locomotive to haul trains of cars about the face workings of a mine. D.O.T. 1.

outside-dope engineer. In bituminous coal mining, one who operates a hoisting engine at the surface of a mine to raise and lower cars along a haulage slope (incline) between lower levels and the surface. D.O.T. 1.

outside stone. Synonym for outer stone. Long.

outside tap. Synonym for bell tap. Long.

outside upset. The act or process of thickening a length of tubing at its ends by increasing its outside diameter without changing the inside diameter. Long.

outside-haulage engineer. In bituminous coal mining, one who operates a mine locomotive to haul trains of cars about the face workings of a mine. D.O.T. 1.

overall ventilation efficiency. The ratio of the horsepower delivered by any circuit connected to a load and if the source voltage is the impedance which would be measured Letween the terminal ends of an oven. a. A kiln; as, a coke oven. B.S. 3618, 1963, sec. 2.

oven. a. A chamber in which substances are artificially heated for the purposes of baking, roasting, annealing, etc.; specifically, (1) a kiln; as, a coke oven; (2) a glassmaking, a leer, Standard, 1964, b. An enclosure made of brick or metal which is used for heating; for heating ceramics or other ceramic products. Bur. of Mines Staff, c c e attendants. See oven tender. D.O.T. 1.

oven-dry soil. Soil dried in an oven at a temperature of 105° C. Mam.

oven-heater helper. In the coke products industry, a laborer who assists heater by moving gas mains to maintain proper openings, removing tar deposits with steel wool, watching for gas leaks and controlling flow of air to burn carbon from gas and air nozzles by moving caps over flues with handwheel as heat is reversed. Also called heater helper. D.O.T. 1.

oven tender. One who loads and controls the temperature of an oven in which freshly packed parts are baked to harden their finish. Pushes truckload of dipped or sprayed pieces into heated oven, or hangs pieces on hooks suspended from overhead trolley. Allows pieces to bake for a specified length of time and removes finished articles from oven. Also called baker, paint, enamel burner; kiln tender; oven attendant; oven loader; ovenman. D.O.T. 1.

ovenware. Ceramic whiteware for culinary oven use. ASTM C242-60.

overagel. Aging at a high temperature, or for a longer time; more or less, than required for critical dispersion, thus causing particle agglomeration of the precipitating phase and, as a result, loss of strength and hardness. See also aging. Henderson.

overall concentration. The ratio of pithead output (0 tons) to length of main haulage roads (L yards) or tons per yard of main haulage roads, that is, 0 divided by L. See also concentration of output. Nelson.

overall ventilation efficiency. The ratio of the horsepower absorbed by the driving motor of the fan. B.S. 9618, 1963, sec. 2.

overall reduction ratio. With reference to a crusher, this term may be expressed as: Mean size of feed/ Mean size of product. South Australia, p. 103. See also reduction ratio.

outside amalgamation. Another name for primary amalgamation. New South Wales, p. 142.

outside clearance. One-half the total difference between the outside diameter of any piece of downhole equipment and the inside diameter of the borehole. Long.

outside-diameter. Maximum length as measured between the terminal ends of an imaginary line drawn to the outside through the center of a circular or spheroidal object, such as a bit, tube, cylinder, or barrel. A.G.I. (1) a kiln, as, a coke oven; (2) a glassmaking, a leer, Standard, 1964, b. An enclosure made of brick or metal which is used for heating; for heating ceramics or other ceramic products. Bur. of Mines Staff, c c e attendants. See oven tender. D.O.T. 1.

outside-face. The peripheral portion or that part of a bit crown, roller bit cutter, or cutting edge of a bit in contact with the walls of the borehole while drilling. Long.

outside agglomeration. Also called heater helper. D.O.T. 1.

outside foreman. In bituminous coal mining, a foreman who supervises all operations at the surface of a mine. D.O.T. 1.

outside gauge. Synonym for outside diameter. Long.

outside-haulage engineer. In bituminous coal mining, one who operates a mine locomotive to haul trains of cars about the face workings of a mine. D.O.T. 1.

outside-dope engineer. In bituminous coal mining, one who operates a hoisting engine at the surface of a mine to raise and lower cars along a haulage slope (incline) between lower levels and the surface. D.O.T. 1.

outside stone. Synonym for outer stone. Long.

outside tap. Synonym for bell tap. Long.

outside upset. The act or process of thickening a length of tubing at its ends by increasing its outside diameter without changing the inside diameter; a length of tubing or drill rod so processed. Long.

outside wall. That part of a bit crown, bit, reamer, shell, core barrel, drill rod, caging, or other piece of downhole equipment that when in use comes in contact with the wall of the borehole. Long.

outside work. Drilling operations conducted on the surface, as opposed to drilling done in underground or enclosed workplaces. Long.

outstroke. Eng. The privilege of breaking a barrier, and working and conveying under-ground, the coal from an adjoining royalty, or mine. Fay.

outstroke rent. Eng. Payment made for the privilege of breaking through a barrier and mining the coal of an adjoining property. Fay.

outwash. The passage by which the ventilating current is taken out of the mine; the upcast. The return air course. An outlet. Long.

outwash plain. A plain composed of material washed out from a glacier and spread out by meltwater. I.G.T.

oven. a. A chamber in which substances are artificially heated for the purposes of baking, roasting, annealing, etc.; specifically, (1) a kiln; as, a coke oven; (2) a glassmaking, a leer, Standard, 1964, b. An enclosure made of brick or metal which is used for heating; for heating ceramics or other ceramic products. Bur. of Mines Staff, c c e attendants. See oven tender. D.O.T. 1.

oven-dry soil. Soil dried in an oven at a temperature of 105° C. Mam.

oven-heater helper. In the coke products industry, a laborer who assists heater by moving gas mains to maintain proper openings, removing tar deposits with steel wool, watching for gas leaks and controlling flow of air to burn carbon from gas and air nozzles by moving caps over flues with handwheel as heat is reversed. Also called heater helper. D.O.T. 1.

oven tender. One who loads and controls the temperature of an oven in which freshly packed parts are baked to harden their finish. Pushes truckload of dipped or sprayed pieces into heated oven, or hangs pieces on hooks suspended from overhead trolley. Allows pieces to bake for a specified length of time and removes finished articles from oven. Also called baker, paint, enamel burner; kiln tender; oven attendant; oven loader; ovenman. D.O.T. 1.

ovenware. Ceramic whiteware for culinary oven use. ASTM C242-60.

overagel. Aging at a high temperature, or for a longer time; more or less, than required for critical dispersion, thus causing particle agglomeration of the precipitating phase and, as a result, loss of strength and hardness. See also aging. Henderson.

overall concentration. The ratio of pithead output (0 tons) to length of main haulage roads (L yards) or tons per yard of main haulage roads, that is, 0 divided by L. See also concentration of output. Nelson.

overall drilling time. The sum of the times required for actual rock drilling, setting up and withdrawal, moving drills from hole to hole and machine delays. The overall drilling time is a better basis for estimating drilling efficiency than penetration speed alone. Nelson.

overall efficiency. a. Of an air compressor, the product of the compression efficiency and the mechanical efficiency. Fay. b. Ratio of power output of an engine to the power input, and in some states the measure of the difference between indicated and brake horsepower. Brantly, 2.

overall fan efficiency. The ratio of the horsepower in the air to the horsepower absorbed by the driving motor of the fan. B.S. 9618, 1963, sec. 2.

overall reduction ratio. With reference to a crusher, this term may be expressed as: Mean size of feed/ Mean size of product. South Australia, p. 103. See also reduction ratio.

overall ventilation efficiency. The ratio be-
tween the air horsepower and the indicated horsepower of driving unit. The percentage is called:

- Air horsepower × 100

indicated horsepower of driving unit.

Measurements are taken of the air pressure and the volume at the time of this measurement. This is the power absorbed by the driving unit. See also volumetric efficiency. Nelson.

over-and-under conveyor. Two endless chains overblown. Burnt by reason of an excessive overbending. Bending metal through a greater overbreak. See overhand stoning. overburden. a. Used by geologists and engineers for coal mined from surface overburden from coal mined from surface overburden to where it overlays a deposit of useful materials, ores, and in some heavy construction work such as channel excavations, is broken (and sometimes must be excavated) by blasting outside the intended area or line of break. Overbreak may occur as the result of misalignment or intentional overcharging as in the case of the overbreak of a bench face to facilitate digging to grade. The term should not be used without specific definition. Stokes and Vans, 1955. Also called burden, cover, mantle, surface. See also burden, mantle, surface. Enam. Dict.

overbreak. See overhand stoning.

overburden. a. Used by geologists and engineers for coal mined from surface overburden to where it overlays a deposit of useful materials, ores, or coal, especially those deposits that are mined from the surface by open cuts. By some, overburden designates only loose soil, sand, gravel, etc., that lies above the bedrock. The term should not be used without specific definition. Stokes and Vans, 1955. Also called burden, cover, drift, mantel, surface. See also burden, mantle, surface. Enam. Dict.

overburden drilling. a. A technique developed in Sweden which involves the sinking of a percussion-type drill, of a drilling machine, of the overburden down to where it seats in the underlying rock. A rotary percussion drill hole is then continued to the desired depth in the rock. While the casing is being sunk through the overburden it is coupled to the drill rod and rotates and reciprocates with it. The overbreak on the end of the drill rod projects above an inch beyond the end of the ring bit with which the casing is being cut and acts as a pilot bit for the overbreak. Woodruff, v. 3, p. 475.

b. A drilling method whereby drilling is carried out through subsoil and boulders or other material through bedrock. Engineering and Mining Journal, v. 165, No. 11, November 1964, p. 43.

c. A condition sometimes occurring in the firing of ceramics or enamelware where the temperature of the furnace is too high or the ware is left in the furnace for a greater length of time than necessary. Enam. Dict. b. Heating dry products to temperatures which cause blistering. Bureau of Mines Staff.

d. Sometimes used in the industry for air to pass over another one without interruption. They should be built of incombustible materials such as concrete, tile, stone, or brick. The use of overcasts results in better ventilation, removes the danger due to dooms, such as being left open and leakage. Kentucky, p. 90. Compare undercast. b. Casting the removed overburden from the seam to a mine from a deposit of useful materials, ores, or coal, especially those where the material will take an excessive amount of time to grid and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

e. A drive is overcharged when it incorporates a chain of substantially higher rating than that indicated by normal selection procedures.

overcharging. Adding material in excess of the capacity of the equipment used for processing. Bureau of Mines Staff.

f. Sometimes occurs in the milling process when too great an amount of enamel is loaded into the mill. The procedure should be avoided as the mill will require an exceptionally long time to grind and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

g. A post a deposit solid is to say that a deposit solid is too high or the ware is left in the furnace for a greater length of time than necessary. Enam. Dict.

h. Heating dry products to temperatures which cause blistering. Bureau of Mines Staff.

overcast. a. An enclosed airway to permit one to pass over another one without interruption. They should be built of incombustible materials such as concrete, tile, stone, or brick. The use of overcasts results in better ventilation, removes the danger due to dooms, such as being left open and leakage. Kentucky, p. 90. Compare undercast. b. Casting the removed overburden from the seam to a mine from a deposit of useful materials, ores, or coal, especially those where the material will take an excessive amount of time to grid and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

overconsolidated soil deposit. A soil deposit that has been subjected to an effective stress greater than the present overburden pressure. ASCE P1826.

overcrossting. See air crossing; overcast.

overcurrent relays. Relays used to trip circuit breakers when abnormal currents of two to three times the normal flow in the circuit. They are adaptable to transmission lines, buses, feeder circuits, transformers, and motors. Coal Age, v. 71, No. 6, August 1966, p. 270.

overcut. a. A machine cut made along the near or top near the top of a coal seam; sometimes used in thick seams or a seam with sticky coal. By releasing the coal along the roof, its stoning becomes easier. See also overcut coal cutter. Nelson, b. The process of producing a larger size than the outside diameter of the bit and/or reaming shell used, due to the eccentric rotational movements of a bit, core barrel, or drill stem. Long.

overcutting and overdrilling. Coal-cutting machines that are adaptations of shortwall machines, designed to make the cut, or kerf, at a desired plane, and leaving some distance above the floor. The main difference between the overcutting machine and the ordinary shortwall machine is that the cutter bar in the overcutting machine is mounted at the top of the bit instead of at its bottom. See also turreted coal cutter. Kier, v. pp. 26-27.

overdose effect. Medium of specific gravity above that in the separating bath, usually produced in the medium recovery system and used to make the desired specific gravity in the bath. B.S. 3532, 1962.

overdraft. a. A condition where a metal casting has been heated to a temperature in excess of that required to produce proper vitrification. Bureau of Mines Staff.

overfeed. Heating ceramic materials or ware above the temperature required to produce the necessary degree of vitrification. Usually results in bloating, defonation, or blistering of the ware. Bureau of Mines Staff.

overflow. See overhand stoning.

overflow, screen. That portion of the feed material discharged from the screen deck without having passed through the aperture. B.S. 3533, 1962.

overflow stand. A standpipe in which water rises and overflows at the hydraulic grade line. Steelye, I. overflush. A fault in glassware caused by the flow of too much glass along the line of a joint. Compare In. Dotted.

overfold. An antimonial fold pushed over until its sides are brought together and one overfolds the other; an inverted or reflexed fold. Standard, 1966. See also overfolded. Fay.

overfolded. a. A condition where a metal casting has been heated to a temperature in excess of that required to produce proper vitrification. Bureau of Mines Staff.

overglaze colors. A technique developed in Sweden which involves the sinking of a percussion-type drill, of a drilling machine, of the overburden down to where it seats in the underlying rock. A rotary percussion drill hole is then continued to the desired depth in the rock. While the casing is being sunk through the overburden it is coupled to the drill rod and rotates and reciprocates with it. The overbreak on the end of the drill rod projects above an inch beyond the end of the ring bit with which the casing is being cut and acts as a pilot bit for the overbreak. Woodruff, v. 3, p. 475.

b. A drilling method whereby drilling is carried out through subsoil and boulders or other material through bedrock. Engineering and Mining Journal, v. 165, No. 11, November 1964, p. 43.

c. A condition sometimes occurring in the firing of ceramics or enamelware where the temperature of the furnace is too high or the ware is left in the furnace for a greater length of time than necessary. Enam. Dict. b. Heating dry products to temperatures which cause blistering. Bureau of Mines Staff.

d. Sometimes used in the industry for air to pass over another one without interruption. They should be built of incombustible materials such as concrete, tile, stone, or brick. The use of overcasts results in better ventilation, removes the danger due to dooms, such as being left open and leakage. Kentucky, p. 90. Compare undercast. b. Casting the removed overburden from the seam to a mine from a deposit of useful materials, ores, or coal, especially those where the material will take an excessive amount of time to grid and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

e. A drive is overcharged when it incorporates a chain of substantially higher rating than that indicated by normal selection procedures.

overcharging. Adding material in excess of the capacity of the equipment used for processing. Bureau of Mines Staff.

f. Sometimes occurs in the milling process when too great an amount of enamel is loaded into the mill. The procedure should be avoided as the mill will require an exceptionally long time to grind and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

g. A post a deposit solid is to say that a deposit solid is too high or the ware is left in the furnace for a greater length of time than necessary. Enam. Dict.

h. Heating dry products to temperatures which cause blistering. Bureau of Mines Staff.

overcast. a. An enclosed airway to permit one to pass over another one without interruption. They should be built of incombustible materials such as concrete, tile, stone, or brick. The use of overcasts results in better ventilation, removes the danger due to dooms, such as being left open and leakage. Kentucky, p. 90. Compare undercast. b. Casting the removed overburden from the seam to a mine from a deposit of useful materials, ores, or coal, especially those where the material will take an excessive amount of time to grid and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.

i. A drive is overcharged when it incorporates a chain of substantially higher rating than that indicated by normal selection procedures.

overcharging. Adding material in excess of the capacity of the equipment used for processing. Bureau of Mines Staff.

j. Sometimes occurs in the milling process when too great an amount of enamel is loaded into the mill. The procedure should be avoided as the mill will require an exceptionally long time to grind and often results in decreased gloss of the enamel in the subsequent firing operation. Enam. Dict.
overglaze colors

pigments and low-melting glasses suitable for use over standard ceramic glazes. Temperature range, 600° to 1,500°. F. cones are 018 to 014. Used as decorative designs fired on china, pottery, terra cotta, etc. to produce glazed ceramic surfaces. CCD vid, 1961.
